About the General Editor

Mehmet Odekon, Ph.D., has been a member of the Economics Department at Skidmore College, New York, since 1982, arriving from Fontainebleau, France, where he was a research associate at the European Institute of Business Administration. His most recent publication, *The Cost of Economic Liberalization in Turkey*, was published by Lehigh University Press in 2005.

He also has edited (with T. Nas and P. Dabir-Alai) and/or authored several books and articles on neoliberalism and globalization. His current research focuses on the effects of globalization on labor and on the relief of poverty as a human right. Odekon received his B.A. in economics from Bogazici University, Turkey, and his M.A. and Ph.D. in economics from the State University of New York at Albany. He lives in Saratoga Springs, New York.

WORLD POVERTY

Introduction

THE THREE VOLUMES of the Encyclopedia of World Poverty contain some 800 original, previously unpublished articles written by over 100 independent or affiliated scholars. This encyclopedia is intended for use as an authoritative and rigorous source on poverty and related issues. It provides extensive and current information and insight into the contemporary debate on poverty. It can also be used as a reference to other sources through its cross-references and bibliographies. It is a timely project; 2005 was marked by a declaration of concern with poverty by world leaders at the G-8 summit and at the World Economic Forum.

Furthermore, poverty as a pressing issue was brought to public attention thanks to the efforts of high-profile individuals, such as Bill and Melinda Gates and U-2 lead singer Bono, who were named Persons of the Year (2005) by *Time* magazine. In a time when public attention is directed to poverty, the *Encyclopedia of World Poverty* can be an indispensable source for all students of poverty.

Personally, my first encounter with poverty was during a summer break in the 1960s as a high-school student in Turkey, in a village in mid-Anatolia. A group of us had volunteered to go to the village to build a sewer system and repair the run-down school building.

There were no water, no electricity, no gas, no teachers, and no doctors. The local economy at best could be described as a non-monetized village barter economy without much even to barter. Most villagers worked for a bare minimum as sharecroppers. Unfortunately the experience was more helpful for me in drawing the future path of my professional career than it was for the villagers. At the ages of 16 and 17, we just did not have enough physical power, or the necessary equipment, to complete our projects.

It is hard to visualize poverty and the living conditions of the poor without personal exposure. Without that encounter, poverty mostly remains a statistic that we are lucky not to be part of, and dealing with the corresponding human condition is then usually left to those with the willingness and imagination to think about it. Poverty is anything but a statistic, and not all aspects of it are quantifiable. As the 1998 Nobel Prize Laureate in Economics Amartya Sen has eloquently elaborated, poverty is more than just lack of income, even though this is an important factor.

Poverty is deprivation from basic capabilities, rights, and freedoms that provide individuals the necessary choices and opportunities they need to lead a life they value. Income is a necessary part of life, but alone

it is not sufficient. Unless it is coupled with social, political, and economic freedoms, it does not suffice to enhance individual capabilities. In this respect, income is not an end itself but just one of the means to healthy life, to education, and to participation in the surrounding political, cultural, and economic life. It is important to take poverty out of the narrow context of income. Otherwise poverty would be an issue only in developing countries and not in affluent, industrial countries, where even many of the poor have an income higher than most in the world.

I do not mean to say that statistics related to poverty do not matter. They help us to frame the magnitude of the problem. According to the latest official data, about 1.2 billion people currently live in extreme poverty, defined as living on less than \$1 a day at Purchasing Power Parity (PPP). If we raise the threshold income to \$2 a day (PPP), the number rises to 2.5 billion. Of course, the geographical distribution of poverty is not even. Over one billion of the extreme poor live in South Asia (488 million or 42 percent), in sub-Saharan Africa (315 million or 27 percent), and in east Asia and the Pacific (279 million or 24 percent). The incidence of extreme poverty differs among countries. In Ethiopia and in Uganda, plagued by internal strife, it is 82 percent; in oil-rich Nigeria, it is 70.2 percent; while in Tanzania, Kenya, and Senegal, the corresponding figure is significantly less, 20, 23, and 26 percent respectively.

The discouraging aspect of the overall poverty data is that in the 1990s, which is promoted as an era of sustained economic growth and prosperity, income poverty increased in 37 of the 67 countries for which longitudinal data are available. These countries are mostly located in central and eastern Europe. In other countries, mostly in eastern and southern Asia and a few in Latin America (for instance Brazil and Chile), however, poverty has significantly decreased. At this juncture, it is worth mentioning that official poverty rates based on threshold income measures tend to underestimate the actual extent of poverty. Is there any reason to believe that a person who makes \$1.10 a day (PPP) is not living in poverty?

In spite of its shortcomings, income poverty gives an idea about the extent of the destitution of the poor. Malnutrition, hunger, and starvation; HIV/AIDS, tuberculosis, malaria, and other life-threatening diseases; high child and maternal mortality; high illiteracy; and lack of basic needs are all concentrated in poverty-stricken countries. In Niger in sub-Saharan Africa, one of the poorest countries in the world if not the poorest, 36 percent of the population are undernourished, the

under-5 mortality rate per 1,000 live births is 265, the maternal mortality ratio per 100,000 live births is 1,100, and about 2,000 children per 100,000 die because of malaria. Only one percent of children benefit from the insecticide-treated bed nets that could cut malaria-related deaths significantly. Tuberculosis and HIV/AIDS are other diseases with a high death toll. In 2001, tuberculosis claimed 196 lives per 100,000 people in Niger. The HIV prevalence estimate runs a high range, 0.7–2.3 percent of the 15–49 age group. The probability at birth of not surviving to age 40 is 39 percent. In this measure, Niger compares favorably to Lesotho, where the probability of not surviving is 68.1 percent. Just these few statistics are enough to give an idea about the level of destitution in these countries.

The poor in affluent societies face similar measures of destitution, even though its magnitude is significantly lower. The United States, the highest per capita income country in the world, is ranked 17th according to the Human Poverty Index. Over 13 percent of the population live below the poverty income threshold of \$11 a day, a threshold more than 10 times that of developing countries. The under-5 and overall child mortality rates are 8 and 7 percent, respectively. The maternal mortality ratio is 12 percent. About 10 percent of 1year-olds are not immunized against measles. The probability at birth of not surviving to age 60 is 12.6 percent. Over 20 percent of the age group 16–65 lack functional literacy. The data clearly reflect the fact that a certain low-income group is not sharing the economic growth and the affluence enjoyed by most in the United States. These findings can easily be extended to other industrial countries as well.

The poor in developing and industrial countries share similar characteristics. Unmistakably, women, children, the elderly, racial and ethnic minorities, those in rural areas, urban unemployed, and slum-dwellers make up the bulk of the poor. They constitute a socially and economically vulnerable group subject to Sen's "unfreedoms" that worsen their destitution by limiting their opportunities to break through the walls of poverty surrounding them. An additional complication of this gender, age, and race composition is that these are the groups with the least potential to access markets and therefore their poverty becomes a long-term phenomenon.

In the *Encyclopedia of World Poverty*, 191 country entries provide current vital statistics on poverty—on its composition and characteristics, on mortality, disease, literacy and illiteracy. These articles also incorporate information on geographic, political, social, cultural, and

other economic characteristics of each country. Each country's ranking according to the Human Development Index and the Human Poverty Index, whenever available, is listed as well. The Human Development Index combines life expectancy, education, and adjusted income into an indicator of overall human development. The content of the Human Poverty Index depends on whether it is being used for developing or for affluent industrial countries. For the former group, it combines life expectancy, education, nutrition, and access to water and health services. For the latter group, the access to water and health is replaced by long-term unemployment. Even though these are by no means perfect or comprehensive indices, they attempt to overcome the difficulty of quantifying human development and poverty, both of which do not lend themselves easily to quantification. There are 78 entries in the encyclopedia dealing with the various definitions and measurement techniques of poverty. Absolute versus relative poverty, the headcount index of poverty versus the relative-income-based measure of poverty, and various others measures inevitably yield different results regarding poverty rates. These are important technical issues in that they ultimately affect public policy decisions geared to combating poverty.

Information on the causes of poverty is equally important for public policy purposes. The level of poverty and changes in it can be an economic phenomenon, for instance the result of a recession. If so, it may be of a temporary nature and is likely to disappear with an improving economy. In this case the policy choice would be very different than when poverty is more permanent and is caused by structural factors. It could be the result of historical, cultural, or social factors, such as colonialism, international economic relations, or apartheid. In these cases, different policies to combat poverty are called for. Inequality in the distribution of income and wealth tops the list of long-term causes of poverty.

If a disproportionately large share of total income generated in the economy is held by a relatively small group of people or households, the share of the remaining people or households is inevitably limited. Inequality also can deepen poverty by perpetuating it. The pattern of income and wealth distribution determines the pattern of consumption and production in the economy. Consumption preferences of high-income groups are such that they favor luxurious consumption goods, which are produced using relatively more capital-intensive techniques.

Hence, increases in their production do not necessarily reduce unemployment. This encyclopedia distin-

guishes among 25 different potential causes of poverty, ranging from discrimination to climate factors, such as draught and famine. In-depth analyses show that, in general, no one single factor causes poverty. It is usually like the movie *Murder on the Orient Express*, each potential suspect contributing a fair share. Hence, the entries emphasize the importance of all economic, social, and political aspects of poverty.

Vulnerability, insecurity, powerlessness, social exclusion and disqualification, and stigmatization are among the more than two dozen articles in the encyclopedia on the potential effects of poverty. Some of these effects are quantifiable but some are not. To some degree we can measure the crime rate and environmental degradation associated with poverty, but it is almost impossible to measure the stigmatization and powerlessness a poor person feels. We can somehow measure the output loss associated with poverty, and the cost of welfare programs associated with poverty, but we can hardly quantify a feeling of self-worthlessness and insecurity. A thorough understanding of these tangible and intangible effects is necessary for the reader to realize that combating poverty would benefit not only the poor but society as a whole.

Understanding the difficulties associated with the definition and measurement of poverty, along with its causes and effects, is essential for the conceptualization of poverty. The design and prioritization of anti-poverty policies depend heavily on how poverty is conceptualized.

A successful fight against poverty calls for engagement from governments, civil society organizations, and individual people, to improve the coordination, collaboration, and implementation of antipoverty policies. There is evidence that in countries where local organizations and people assumed the ownership of antipoverty programs, success has been significantly higher. civil society organizations, secular charities, religious charities, and nongovernmental organizations are therefore important players in the fight against poverty, and the encyclopedia acknowledges their importance by allocating over 150 articles to them.

The political environment also plays an indispensable role in the effectiveness and success of the anti-poverty policies and programs. Their importance is captured by over 20 in-depth analytical entries. Without the engagement of these organizations and institutions, eradication of poverty and human development might well be impossible. A notable example of the importance of civil society organizations and grassroots movements is the recent revival of interest in poverty

and its eradication by the political leaders of industrial countries; these organizations have been instrumental in both bringing the urgency of poverty to the attention of world leaders and forcing them to commit themselves to its eradication.

Conventional fiscal, monetary, and industrial policies, especially in developing countries, have either completely failed or have been of limited success in combating poverty. Structural rigidities in the economy, political factors, and the inadequacy of the policies themselves have contributed to their failure to meet their objectives. One of the important factors that underline poverty is asset distribution in an economy. Members of high-income groups rarely derive their income as labor income; their income is derived from asset ownership. Since labor is a relatively abundant factor of production, return to labor relative to capital is relatively low.

Under these circumstances growth increases the income gap between owners of labor and capital, increasing income inequality and deepening poverty. Asset redistribution is then a necessary component of a full-fledged antipoverty program.

This is one of the main difficulties with antipoverty programs: how the elite can be convinced to support the redistribution of assets, existing or newly created, as the growth-with-redistribution advocates claim. The literature on antipoverty programs is cluttered with such proposals—intellectually appealing but in practice impossible to implement successfully. Numerous entries in the encyclopedia cover public policy issues related to poverty.

Limited resources, existing economic rigidities, and political bottlenecks have been reasons for developing countries to expect help from industrial countries. The industrial world, on the other hand, has traditionally been reluctant to provide that help. The G-8 Summits and World Economic Forums have frequently discussed targeting global poverty and helping very poor nations, especially those in Africa, but they have been reluctant to commit the financial resources to back their promises.

At the turn of the new millennium, the highly publicized Millennium Development Goals targeted global poverty, aiming to halve it by 2015. Other goals included universal education, gender equality, reduction in child mortality by two-thirds by 2015, improvement in maternal health, combating HIV/AIDS and other diseases, ensuring environmental sustainability, and finally halving the number of people without access to safe water.

The financial resources needed for these ambitious goals, however, proved to be enormous and industrial countries as a whole failed to allocate the funds required for the project. Five years later, at the 2005 G-8 Summit in Gleneagles in Scotland, leaders renewed their commitment to fight extreme poverty in Africa with a promise of debt relief and economic and humanitarian assistance. The fine print, however, includes conditions for such assistance, with an emphasis on trade liberalization.

Economic liberalization and globalization have been promoted by some as a panacea to poverty. Economic growth achieved through liberalization and trade is supposed to trickle down to low-income groups by creating employment in areas where each country has a comparative advantage. Others regard globalization and liberalization as having contributed to poverty, as a result of outsourcing, offshoring, and labor market liberalization that has marginalized labor, especially the low-skill, low-wage workers.

Most likely, in some countries globalization and liberalization have been positive forces, but not in all. Thus, relying on liberalization and globalization as a one-size-fits-all-policy in combating poverty might not be that desirable. Different conditions in each country call for different antipoverty policy approaches. A common denominator in the successful fight against poverty, however, involves unconditional commitment to political and economic democracy, to good governance, and to transparency and accountability.

WORLD POVERTY

Chronology of Poverty

10th century B.C.E.: The first use of the word *poverty* surfaces in the biblical world, referring to landowners who forced peasants to sell land.

495–429 B.C.E.: Under the rule of Pericles, Athens undertakes large-scale public works projects as a means of providing employment for the poor.

550 C.E.: Pope Gregory I of the Roman Catholic Church establishes the world's first orphanage in the city of Milan, Italy.

1349: King Edward III of England issues the Statute of Labourers, giving greater power to feudal lords and prohibiting begging and giving, except for senior citizens and the physically disabled. Edward made a distinction between the "worthy poor," which included widows, dependent children, and the disabled, and the "unworthy poor," which included able-bodied adults.

1351: Pedro the Cruel of Castile orders all able-bodied, unemployed men in his kingdom to be flogged.

1381: Wat Tyler leads a peasant revolt against King Richard II of England. Following the invasion of the

city of Canterbury, where Tyler's mob murdered the Archbishop of Canterbury, England's leading religious figure, King Richard was forced to abolish feudal serfdom. The decision was later reversed.

1500–1600: The population of Europe nearly doubles in size, from 30 million to 60 million people.

1526: Juan Luis Vives publishes *De Subventione Pauperum*, in which he provides a theoretical justification for state-run poverty relief.

1529: The city-state of Venice (Italy) enacts a law requiring impoverished people to perform community service in order to receive a license for relief.

1531: England passes a law requiring local officials to interview people to determine whether they are suitable applicants for poverty relief. Emperor Charles V bans begging in the territories of Spain, Austria, Mexico, and Peru.

1534: The French city of Lyons creates a comprehensive system of relief for the worthy poor and banning begging by those deemed unworthy.

1536: King François I of France bans begging throughout the whole of France.

1596: The first workhouse for the poor is built in Amsterdam, the Netherlands.

1601: British legislators pass the Poor Law Act, providing financial relief to children and the physically handicapped. The act would later be updated in 1795.

1623: Philosopher William Petty, who would lay the basis for modern census-taking, is born in Hampshire, England, as the son of a clothier.

1642: The newly settled Plymouth Colony creates the first poor law in the English-speaking New World.

1651: Philosopher Thomas Hobbes publishes *Leviathan*, the book for which he is most known. In the book, Hobbes adopts a pessimistic view of the state of human nature, writing that life is nothing more than "nasty, brutish, and short."

1750: One of the first almshouses, or ramshackle living spaces designed to house the extremely poor, is built in the United States.

1789: Six thousand French women march on the palace of King Louis XVI in Versailles, demanding bread.

1795: British legislators update the 1601 Poor Law Act, extending relief eligibility to the physically able.

One of the first poverty lines is created in the English city of Speenhamland. When a worker's wage fell below this line, which was based on both the price of bread and the number of dependents, or children, the worker is required to support, a worker would be eligible to receive relief.

1818: Karl Marx, considered the father of communism, is born in Trier, Germany, to a wealthy Jewish family.

1820: Friedrich Engels, who would cowrite with Karl Marx six books on the subject of communism, is born in Wuppertal, Germany, to a successful textile industrialist. Sent to work at a cotton factory in Manchester, England, as a young man, Engels's discovery of the working conditions inspires his social consciousness.

1833: French author Frédéric Ozanam founds the Conference of Charity, later known as the St. Vincent de Paul Society.

1848: Karl Marx and Friedrich Engels publish *The Communist Manifesto*, which is summed up by its opening line: "The history of all hitherto existing society is the history of class struggle."

1851: The first American chapter of the Young Men's Christian Association (YMCA), an organization devoted to providing relief to young people despite religious affiliation, is founded in the city of Boston.

1853: The Children's Aid Society of New York, which would eventually serve over 120,000 needy children annually at a cost of \$70 million, is founded by Protestant minister the Reverend Charles Loring Brace.

1859: Charles Darwin publishes the first edition of *Origin of Species*. While credited as being a significant contribution to evolutionary science, the book has been criticized for its influence on the theory of "economic survival of the fittest."

1861: Upon the election of Republican candidate Abraham Lincoln, an opponent of slavery, seven southern states officially secede to spark the Civil War in which 500,000 Americans were killed, the most of any conflict in American history.

The war leads to the passage of the Thirteenth, Fourteenth, and Fifteenth Constitutional Amendments, which granted political and economic rights to a class of people who were previously powerless.

1864: Author Karl Marx, Italian revolutionary Joseph Mazzini, and English Carpenter's Union secretary Robert Applegarth found the International Working Men's Association in Saint Martin's Hall in London, England.

1865–70: The South American nation of Paraguay loses over two-thirds of its male population in the War of the Triple Alliance.

1866: The first congress of the International Working Men's Association is held in Geneva, Switzerland. The adoption of an eight-hour workday is voted as one of the primary goals of the association.

1870–1901: The world's working-class population grows from approximately 20 percent to 33 percent.

1873: The first chapter of the charitable organization United Way is founded in Liverpool, England.

1879: American economist Henry George publishes *Progress and Poverty*, in which he advocates a socialist society based on high taxes for the wealthy. The book would go on to sell more than three million copies.

1882: The U.S. Congress passes the Chinese Exclusion Act, prohibiting poor Chinese immigrants from entering the country.

1884: The Fabian Society, a socialist organization emphasizing gradualism and legislation as a means of achieving reform, is founded in Great Britain by such noted intellectuals as George Bernard Shaw and H.G. Wells.

1889: Industrial magnate Andrew Carnegie publishes *The Gospel of Wealth*, largely considered the most influential of his some 70 essays.

1890: Alfred Marshall publishes his magnum opus, *Principles of Economics*, in which he advocates a classless society.

1892: Anticapitalist Ignatius Donnelly is nominated by the American People's Party for vice president of the United States.

1897: The first chapter of the Catholic Caritas charitable organization is founded in Freiburg, Germany. The organization would later expand to Hong Kong, Switzerland, and Austria.

1899: Seebohm Rowntree publishes *Poverty:* A *Study of Town Life*, in which he coins the term *secondary poverty*, meaning poverty resulting from a failure of character rather than from a lack of financial resources.

1900–70: American agricultural production increases at an average rate of 42 percent per year.

1912: Massachusetts becomes the first U.S. state to voluntarily institute a minimum wage.

1913: U.S. President Woodrow Wilson signs the Underwood-Simmons Tariff Act into law. The act curbed the cost of living for Americans by lowering average tariff rates from 40 percent to 26 percent.

1914–18: Nearly 10 million people worldwide are killed in combat during World War I. Russia's and Germany's casualties, which both amounted to approximately five

million, created unstable conditions that led to the rise of communism in Russia and Nazism in Germany.

1915: British Army chaplain the Revered Philip Clayton founds one of the largest World War I refugee centers, the Talbot House, in the bordertown of Poperinge, Belgium.

1916: The U.S. Congress passes the Adamson Act, establishing a required eight-hour workday for railroad workers.

1917: U.S. President Woodrow Wilson signs the Vocational Education Act into law, providing job training for thousands of low-income Americans.

The American Friends Service Committee, an organization devoted to providing conscientious objectors with alternatives to joining World War I, is founded. Russia's army grows to 15 million men and the countryside is left devoid of farmers needed to feed the populace. An ever-increasing communist movement that had arisen at the turn of the century capitalizes on the discontent and Russia plunges into its first revolution since the Romanov monarchy took power in 1613.

1919: Western European nations institute a food blockade against Germany and Austria as a punishment for instigating World War I. In response, journalist Eglantyne Jebb founds the Fight the Famine Council, later known as the Save the Children organization, to feed hungry children in central Europe.

The signing of the Treaty of Versailles creates the League of Nations' International Labour Organization, which sought to improve working conditions and quality of life. After becoming one of the few surviving League of Nations agencies to be included in the United Nations in 1944, the ILO would receive the Nobel Peace Prize in 1969.

A group of U.S. Catholic bishops meet at the National Catholic Welfare Conference, where the organization's Social Action Department, later known as the Department of Social Development and World Peace, is created.

Representatives from the Red Cross chapters of Great Britain, France, Italy, Japan, and the United States assemble to create the League of Red Cross Societies. Within five years, the five nations had raised a sum of 685 million Swiss francs.

1921: Edgar Allen founds the National Society for Crippled Children, later known as the Easter Seals Society.

The 10th Congress of the Russian Communist Party is held in the capital of Moscow. Premier Vladimir Lenin disbands the policy of War Communism, which enabled officials to forcibly seize agricultural surpluses and divide estates and thus had the result of reducing output to pre-World War I levels. War Communism is replaced with the New Economic Policy, granting farmers compensation for surplus seizures.

1922: Civil rights leader Roy Wilkins, who would become elder statesman of the NAACP, founds the Center for Human Relations and Social Justice.

1929: On October 24, the Dow Jones Industrial Average, the leading U.S. stock market index, falls by 50 percent, creating an economic tailspin that would last for over a decade. The day would come to be known as "Black Tuesday."

1929–32: The unemployment rate in the United States rises from 3.2 percent to 23.6 percent.

1930: Great Britain officially bans workhouses, or houses where the poor are forced to work for long hours with little pay.

1930–31: Following the Wall Street crash of 1929, the unemployment rate in the United States rises from 8.9 percent to 15.9 percent, an increase of nearly 50 percent.

1932: Just two days after being inaugurated as president of the United States, Franklin D. Roosevelt issues an executive order requiring all U.S. banks to close for four days until an emergency session of Congress is held.

Four days later, Congress passes the Emergency Banking Relief Act, which provided for federal inspectors able to declare the banks financially secure.

President Franklin D. Roosevelt signs into law the Economy Act, which alleviated the U.S. federal budget deficit by reducing government salaries and veteran pensions by as much as 15 percent.

1933: The U.S. Congress passes the Agricultural Adjustment Act, creating the Agricultural Adjustment Administration, which sought to raise the price of crops by paying U.S. farmers to reduce the production of certain ones, including corn, cotton, dairy products, hogs, rice, tobacco, and wheat.

1934: The U.S. Congress creates the Securities and Exchange Commission, the regulatory body of the stock market which provided insurance deposits to investors. President Franklin D. Roosevelt appoints Joseph P. Kennedy, father of future President John F. Kennedy, as the first chairman of the commission.

1935: Franklin D. Roosevelt signs the Social Security Act into law, providing many programs for relief to needy families, one of which was the Aid to Dependent Children organization, which required potential benefactors to pass a "morally worthy" examination to receive benefits.

1937: President Franklin D. Roosevelt estimates in a speech that one-third of his countrymen are "ill-housed, ill-nourished, and ill-clad."

1938: The U.S. Congress passes the Fair Labor Standards Act, establishing a federal minimum wage, guaranteeing overtime pay, and prohibiting most forms of exploitative child labor.

Franklin D. Roosevelt founds the National Foundation for Infantile Paralysis, later known as the March of Dimes.

1940: Bishop Herbert Welch founds the Methodist Committee for Overseas Relief (MCOR).

1940–42: As Pearl Harbor is bombed and the United States switches from a peacetime to a wartime economy, the unemployment rate drops from 14.6 to 4.7 percent, a reduction of nearly 68 percent.

1940–46: An estimated 30,000 Spaniards die from starvation, prompting President/General Francisco Franco to issue ration cards.

1940–80: The amount of substandard housing in the United States decreases by approximately 50 percent.

1944: The International Bank for Reconstruction and Development, later known as the World Bank, is created. Delegates from 44 nations meet in Bretton Woods, New Hampshire, to create the International Monetary Fund, an international fiscal aid organization designed to circumvent the debt problems that greatly contributed to the Great Depression.

1946: The United Kingdom becomes the first nation besides Soviet Russia to implement a universal healthcare

system with the establishment of the National Health Service (NHS).

Based on a proposal by British economist William Beveridge, the NHS was completely taxpayer-funded and provided healthcare to all Britons regardless of income or class.

1947–73: The amount of income earned by American families doubles.

1948: The United Nations General Assembly adopts the Universal Declaration of Human Rights. Described by First Lady Eleanor Roosevelt as a "Magna Carta for all mankind," the work would become the world's most translated document, with 321 foreign-language editions.

1948–51: The U.S. sends approximately \$13.3 billion in aid to European countries devastated by the ravages of World War II.

1950–2000: The urban population of underdeveloped Third World nations increases from approximately 14 percent to 50 percent.

1952: Jonas Salk develops the first polio vaccine.

1953: U.S. President Dwight Eisenhower establishes the Department of Health, Education, and Welfare, which would later merge into the Department of Health and Human Services.

1953: Robert Louis Heilbroner publishes *The Worldly Philosophers: The Lives, Times, and Ideas of the Great Economic Thinkers,* in which he discusses the economic differences between advanced, modernized societies and primitive ones.

1954: U.S. President Dwight Eisenhower approves the expansion of Social Security to cover an additional 10 million Americans.

1955: Dr. Wilbert Saunders founds Medicine for Missions, a private organization dedicated to providing medical supplies for missionaries working overseas.

1959: Twenty nations from North and South America assemble to form the multibillion-dollar Inter-American Development Bank, of which the United States is the principal shareholder with over 30 percent of the total assets.

1960: Following the implementation of certain social programs, the infant mortality rate in Algeria drops by 42 percent.

1961: Amnesty International is founded by British lawyer Peter Benenson after he reads an article describing two Portuguese students who were unjustly imprisoned. The organization's goals are to free political prisoners and to increase international awareness of human rights abuses.

The United Nations creates the Organization for Economic Cooperation and Development to help centralize foreign aid efforts.

1962: American socialist Michael Harrington publishes *The Other America: Poverty in the United States.* Personally read by presidents, the book would become a driving inspiration behind the War on Poverty, and antipoverty programs such as Medicare, Medicaid, and Food Stamps.

1963: E. Goffman publishes *Stigma*: *Notes on the Management of Spoiled Identity*, largely considered to be the foremost resource on the economic concept of stigmatization.

1964: In his first State of the Union address since being sworn in as president following the assassination of John F. Kennedy, President Lyndon Johnson says, "This administration today, here and now, declares unconditional war on poverty in America." The results of Johnson's proposal are marginal. While poverty for children and senior citizens has fallen sharply since 1964, the percentage of average Americans in poverty fell by only 0.4 percent in 40 years, from 10.5 percent to 10.1 percent.

The U.S. Congress creates the federal Office of Economic Opportunity (OEO), which would be replaced by the Community Services Administration (CSA) 10 years later.

The Nation of Islam creates the Three Year Economic Savings Program, designed to correct the problems of poverty, unemployment, hunger, and housing problems for needy African Americans living in the United States.

1965: U.S. President Lyndon Johnson signs the Social Security Act into law. The act created two of the largest government social service programs, Medicare, which provided healthcare for retirees, and Medicaid, which provided healthcare for low-income workers.

The U.S. government adopts the Mollie Orshansky Method, which defines poverty as any income below three times the cost of minimal nutrition, as its official formula for determining the poverty line.

The number of participants in the United States' Food Stamp Program, created by Congress a year earlier, reaches 561,261 people.

The United Nations General Assembly merges the United Nations Special Fund and the Program for Technical Assistance to create the United Nations Development Program (UNDP).

1968–72: American Social Security benefits rise by 51 percent under the first term of Richard Nixon.

1970: A group of American Catholic bishops founds the poverty relief organization Campaign for Human Development, which would later be changed to the Catholic Campaign for Human Development in 1998 at the request of certain bishops.

1970–95: The amount of income per person in Sweden falls from a world ranking of fourth to a world ranking of sixteenth.

1970–2005: The infant mortality rate for the Middle Eastern nation of Syria decreases from 90 deaths per 1000 births to 23 deaths per 1,000 births, a 74 percent reduction.

1971: Dr. Larry Ward establishes Food for the Hungry International, a 1,000-member organization with an annual budget of dozens of millions of dollars, in Geneva, Switzerland. The Swiss philanthropist Klaus Schwab founds the not-for-profit World Economic Forum in Geneva, Switzerland.

1973–2000: The income of poor American households grows 12 percent, as compared to a growth of 76 percent for wealthy American households.

1973–2004: The poverty rate for Hispanic Americans increases from 10.3 percent to 24.7 percent.

1974: The U.S. Congress creates the Supplemental Security Income program, providing funds not included in Social Security for permanently disabled individuals.

U.S. President Richard Nixon creates the Community Development Block Grant (CDBG) program, one of the last efforts by the U.S. government to address urban poverty.

1974–76: The cost of living in Argentina rises by 355 percent.

1976: Linda and Millard Fuller found Habitat for Humanity International, a nonprofit organization devoted to constructing houses for those with substandard dwellings. By 2005, Habitat had constructed over 50,000 houses in the U.S. and 150,000 houses worldwide.

1978: Still reeling from postwar debts, Vietnam signs an agreement with the Soviet Union, allowing the southeast Asian communist nation membership in the Soviet Council for Mutual Economic Assistance.

1979: The organization Second Harvest, a group of 13 food banks with the collective ability to distribute 2.5 million pounds of food annually, is founded.

The Save the Refugees Fund, later known as the Mercy Corps, is founded to assist Cambodian refugees fleeing their country from the ravages of war, famine, and hunger.

1980: The U.S. Congress establishes the African Development Foundation, an independent federal agency that distributes small grants of \$50,000 to African economic development programs.

Feed the Children, a Christian organization that ships millions of pounds of food to needy children every year, is founded in Oklahoma City, Oklahoma.

1980–90: China experiences an average 10 percent annual growth rate in both agricultural and industrial production, making it one of the world's fastest-growing major economies.

1980–2002: Primary school completion for students in the African nation of Tunisia increases from approximately 80 to 100 percent.

1980–2003: The infant mortality rate of the sub-Saharan African nation of Togo decreases from 128 deaths per 1,000 births to 66.61 deaths per 1,000 births.

1980–2004: The life expectancy for citizens of the Middle Eastern nation of Syria rises from 60 years to 68.75 years, an increase of 12.72 percent.

1980–2005: The illiteracy rate for the Central American nation of Honduras falls from 38.1 to 23.9 percent for males and from 42 to 23.7 percent for females.

1980–2005: The life expectancy for citizens of the South American nation of Suriname increases from 64 years to 68.96 years, an increase of 1.5 percent.

1980–2005: The infant mortality rate of the African nation of Sudan falls from 104 deaths per 1,000 births to 62.5 deaths per 1,000 births, a 39 percent reduction.

The illiteracy rate of the Middle Eastern nation of Syria drops from 27 to 19.3 percent for males, a 28.5 percent reduction, and from 66.2 to 36 percent for females, a 45.6 percent reduction.

1981–90: The Squared Poverty Gap Index, a measurement calculating both the prevalence and depth of poverty in a given country, falls from 6.4 percent to 3.6 percent for developing countries, a 43.75 percent reduction.

1982: Former U.S. President Jimmy Carter founds the Carter Center. Based in Atlanta, Georgia, the Carter Center devoted itself to overseeing foreign elections and providing mediation in international disputes. Carter would win a Nobel Peace Prize in 2002 for his efforts.

1983–2005: Some two million citizens of the African nation of Sudan, or 5 percent of the overall population, flee their homeland due to widespread famine.

1985: Spain's unemployment rate increases to an unprecedented 21.6 percent.

The United Kingdom-based charitable organization Comic Relief is founded in a refugee camp in Sudan in response to the ongoing African famine.

1987: On October 19, the Dow Jones Industrial Average, the leading U.S. stock market index, loses 22 percent of its value, ending a five-year period of positive gains. The day would come to be known as "Black Monday."

The U.S. Congress passes the McKinney Act, the first piece of federal legislation to address rising levels of homelessness.

1989: Sociology Professors Melvin Oliver and Jim Johnson of the University of California found the Center for the Study of Urban Poverty.

1989–2004: The Gross Domestic Product of the central Asian nation of Tajikistan decreases by approximately 60 percent.

1990: The Discovery Institute, a conservative think tank advocating, among other things, supply-side economics, is founded.

1990–95: As the former Soviet Union attempts to switch to a more capitalistic economy after nearly 80 years of communism, its Gross Domestic Product decreases by approximately 50 percent.

1990–2000: Male illiteracy in the African nation of Sudan drops from 40 percent to 30.8 percent, while female illiteracy drops from 68.3 percent to 53.8 percent.

1990–2002: The spread of the HIV/AIDS epidemic increases the infant mortality rate in the small sub-Saharan African nation of Swaziland from 77 deaths per 1,000 births to 106 deaths per 1,000 births, an increase of 27 percent.

1990–2003: The infant mortality rate for the South Pacific island nation of Tonga decreases from 25 deaths per 1,000 births to 15 deaths per 1,000 births, a 40 percent reduction.

1991: The Employment Policies Institute, a nonprofit research organization specializing in employment growth, is founded in Washington, D.C. American philanthropist Alan Shawn Feinstein founds the Feinstein Foundation, a charitable organization whose goals are to end world hunger and improve education.

1992: The 14th session of the Chinese Communist Party Congress is held in the capital of Beijing. Party members agree to institute a "socialist market economy" in China, reversing revolutionary pledges made 50 years ago of a completely communist state.

As civil war in the Central Asian nation of Tajik-istan results in the loss of 50,000 lives, the country's Gross Domestic Product decreases by an estimated 30 percent.

1992: The United Nations Educational, Scientific, and Cultural Organization creates the Comparative Research Program on Poverty.

1992–2003: The infant immunization rate for the Caribbean nation of Trinidad and Tobago rises from 80 percent to 90 percent, an 11 percent increase.

1993: The U.S. Congress abolishes the House Select Committee on Hunger. In response, Representative

Tony Hall of Ohio, the chairman of the committee, fasts for 22 days in protest. Congress capitulates and the Congressional Hunger Center is created.

The research facility, Institute on Race and Poverty, is founded at the University of Minnesota by law Professor John A. Powell.

1994: The value of the Russian ruble on foreign exchange markets falls by 27 percent in one day.

1995–2005: The amount of people in the world living in extreme poverty reaches approximately 1.2 billion, and those living in general poverty reaches some 2 billion.

1996: U.S. President Bill Clinton signs the Personal Responsibility and Work Opportunity Reconciliation Act, a welfare reform bill. Among the bill's provisions, no American can receive welfare payments for more than a total of five years.

1996–2004: The percentage of American women in poverty falls from 16.3 percent to 13.9 percent, while the percentage of impoverished men falls from 13.0 to 11.5 percent.

1998: The sub-Saharan African nation of Mozambique receives from the U.S. \$1.4 billion in debt relief.

Delegates from over 30 educational institutions meet in New York City to form the Students Against Sweatshops organization.

1998: The International Labour Organization estimates there are 150 million unemployed people in the world, of which only 25 percent receive any unemployment insurance.

2000: Officials of the small, poor South Pacific island nation of Tuvalu greatly increase their country's rev-

enue by leasing the internet domain suffix ".tv" to private business interests.

Lawyers Without Borders, a group of legal experts dedicated to correcting human rights abuses *pro bono*, or without pay, is founded.

2003–04: The number of millionaires in the world increases by 8 percent, while at the same time the international poverty rate rises from 12.5 percent to 12.7 percent.

2003–05: As the AIDS epidemic ravages the small sub-Saharan African nation of Swaziland, the country's life expectancy drops from 43 years to 35.65 years, a 17 percent reduction.

Due to the AIDS epidemic, the infant mortality rate in South Africa rises from 53 deaths per 1,000 births to 61.81 deaths per 1,000 births, an increase of 14 percent. The rate of increase for blacks is four times greater than the rate of increase for whites.

2005: The United Nations reports the central African nation of Burundi is officially the world's poorest country with over 68 percent of the population below the poverty line and an estimated Gross Domestic Product per capita of \$106.

The United Nations releases its Human Development Index, ranking each country according to a formula encompassing life expectancy, education, and Gross Domestic Product. The African country of Niger is ranked as the nation with the lowest Human Development Index, while the European nation of Norway is ranked as the highest. The United States, the world's most economically advanced nation, is ranked 10th behind such countries as Canada and Ireland.

WORLD POVERTY

Absolute-Income-Based Measures of Poverty

POVERTY IS COMMONLY thought of as a state of deprivation in which individuals lack sufficient food, housing, clothing, medical care, and other basic items to maintain a decent standard of living. Income measures of poverty are rooted in the perspective that an individual, family, or household that lacks sufficient income to cover basic needs such as food and shelter is among the poor.

Absolute-income measures of poverty are relatively straightforward and simple to use. Some experts argue, however, that such measures are simplistic and do not capture the multidimensional complex nature of poverty. A common alternative measure to an absolute measure of poverty is a relative measure of poverty. Relative-income measures of poverty are characterized by comparing one income or standard of living to the living standard of a reference group, commonly the mean or median national income of a similarly structured household. Relative measures of poverty tend to produce a higher number of people defined as poor compared to using an absolute-income-based measure. Alternatively, poverty in the United States is different

from poverty in developing nations. A person might be considered poor in the United States, but relative to people in developing countries, this person would be considered as not poor.

Absolute-income-based measures of poverty provide a monetary figure as a cutoff for being counted among the poor, and families fall either at the level, above it, or below it. This minimum level is generally referred to as the poverty line. The line that designates descent into poverty is somewhat arbitrary. For example, two families of similar structure, one that lives at \$10 above the line and one that lives at \$10 under the line, are really not different, even though one is officially counted among the poor. Critics of absolute measures of poverty argue that it results in undercounting the number of people who live in poverty conditions.

What is needed to meet basic needs varies across time and societies. Therefore, different countries establish poverty lines that are appropriate to their levels of development, society norms, and values. The official rate of poverty in the United States is estimated by the U.S. Census Bureau based on an absolute measure of poverty, which is collected in an annual survey. The official rate is determined by combining the money income of individuals and families before taxes with cash

assistance received from government programs and comparing this level of financial income with established poverty thresholds. In the United States, such absolute-income-based measures of poverty are established using a set of money income thresholds that vary by family size and composition (ages of members). If a family's total income is less than the threshold, then that family and each individual in it are considered to be in poverty. These poverty thresholds are a national measure and do not vary geographically, but are updated for inflation using the Consumer Price Index.

This absolute definition of poverty uses money income before taxes and does not include capital gains or noncash benefits such as Medicaid, food stamps, or public housing. Thresholds and poverty status are intended for use as a statistical yardstick, not a complete description of what people and their families need to live. For example, for a family of five with two children, with a mother, father, and grandmother, the poverty threshold would equal \$22,509 dollars in 2003. Based on official poverty thresholds, 12.5 percent of American households were in poverty in 2003. Despite imperfections, official poverty thresholds are widely used and have been for decades. They continue to be especially useful for assessing long-term changes in the national rate of poverty. Additionally, eligibility for many means-tested social welfare programs are based on poverty thresholds or a percentage thereof.

The World Bank uses reference lines for developing nations set at \$1 and \$2 per day (more precisely \$1.08 and \$2.15 in 1993 purchasing power parity) as two absolute measures that enable international poverty comparisons. It has been estimated that in 2001, 1.1 billion people lived below \$1 a day and 2.7 billion lived on less than \$2 a day. The capacity to measure and monitor poverty levels is essential in order to reduce it. Absolute-income-based measures are one such tool.

Access-to-Enterprise Zones

ACCESS-TO-ENTERPRISE ZONES are geographic areas in which taxes and government regulations are lowered or eliminated as a way to stimulate business activity and create jobs. The zones are also referred to by different writers as enterprise zones, free trade zones, export zones, empowerment zones, and market zones. The argument for access-to-enterprise zones rests on the idea that by reducing taxes and regulations in poverty-stricken areas, government can induce businesses to invest in those areas. The investment is expected to create jobs and other opportunities for the area residents. The ultimate goal is to reduce poverty, dependence on tax-supported welfare programs, and crime rates.

Access-to-enterprise zones have historical antecedents going back to the Middle Ages. In modern times, however, the idea is credited to Peter Hall (1981), a British economist who specialized in urban planning. Since 1980, zones have been widely implemented in the United States, the United Kingdom, and to a lesser extent in other countries. The theory of access-to-enterprise zones is simple. Their practice has proven more complicated. Four factors seem to be significant in their success or failure.

First, studies have found that if an area has good general economic conditions and infrastructure, a zone is more likely to stimulate business investment and employment. However, good economic conditions and infrastructure are seldom found in areas that house substantial numbers of lower-income people, the improvement of whose welfare is the reason for creating the zones.

Second, a zone must offer the right mix of incentives to encourage development. However, the right mix depends on the geographic region, the existing tax and regulatory environment, economic conditions, and the types of businesses that might be induced to invest in a zone. As of 2005, no one had discovered a formula for determining what the mix should be. The wrong kind of incentives can actually be harmful: Leslie E. Papke

notes that certain types of investment subsidies can reduce wage levels in the zone, making the inhabitants worse off than they were before.

Third, incentives must be large enough to motivate businesses to invest in a zone, but not so large that they choke off funding for public services and infrastructure that is also part of investment decisions.

Fourth, it must be possible to measure the effect of establishing the zone. Some firms might have invested in the area even without the extra incentives, so the zone itself had no effect on their investment decisions. Other firms might have invested nearby, so that a zone simply causes investment to move around in the area without causing any growth in total business activity. Still other firms see the prospect of a slight extra profit from zone incentives as less important than good infrastructure and public services, so a zone either has no effect or actually discourages them from investing.

Other studies have had similarly ambiguous results.

Evidence that the zones help to reduce poverty is uneven. Papke found that most zone programs in Britain only caused businesses to relocate from outside the zone, leading to no net increase in economic activity. In the United States, Indiana's zone programs in the 1980s led to a 19 percent drop in unemployment claims. However, the same zones also experienced a \$172 drop in per capita income, while per capita income grew by \$568 in nearby nonzone areas. Other studies have had similarly ambiguous results. However, if designed carefully and administered conscientiously, access-to-enterprise zones can be one option for improving the material condition of the poor.

SCOTT PALMER, Ph.D. RGMS ECONOMICS

Adams, John (Administration)

THE PRESIDENCY OF John Adams was dominated by tensions between the United States and France. Engaged in a long, ongoing conflict with Great Britain, France insisted that it had the right to seize American as well as British ships carrying goods between the two nations. Despite considerable pressures from New England Federalists, whose ships were being seized, John Adams wished to avoid war with France. Adams recognized that any war would have serious consequences on the economy of the new nation. Furthermore, a war with France would deepen America's continuing economic dependence on Great Britain and undercut the Hamiltonian tariffs that provided some protection for nascent American industries, most of which were also located in New England.

While the negotiations with France were in progress, Adams, however, prudently called for new taxes to support a military build-up in the event that war should become unavoidable. These taxes were especially abhorrent to farmers. Indeed, under the leadership of John Fries, 700 Pennsylvania Dutch farmers initially succeeded in driving off the federal tax collectors. Adams responded by sending in troops and capturing Fries, who was tried and sentenced to death for treason. Although Adams eventually pardoned Fries, the farmers denunciations—"Damm de President, damm de Congress, and damm de Arischdokratz"—echoed in the popular memory long after the rebellion was suppressed.

Although John Adams was commonly characterized as embodying patrician arrogance and was demonized by his Democratic-Republican opponents for favoring the development of an American aristocracy, Adams actually advocated the development of a meritocracy by which men of talent, regardless of their backgrounds, would rise to positions of influence.

Adams was very wary of grand schemes to stimulate economic growth, believing that such schemes would benefit speculators and financiers at the expense of ordinary citizens. Ironically, like the Democratic-Republicans, Adams believed that the economic stability of the new nation depended on the establishment of stable agricultural communities in which independent farmers achieved and sustained a moderately prosperous livelihood. Under Adams, the Federalists pushed through Congress legislation that became known as the Naturalization, Alien, and Sedition Acts. Of particular interest here is the Naturalization Act, which required immigrants to reside in the United States for 14 years

before they could apply for U.S. citizenship. Although the Naturalization Act may not have had a discernible impact on immigration, it did very much reinforce the notion that Adams and the Federalists were antagonistic to those in the lower economic classes.

Martin Kich Wright State University

Adams, John Quincy (Administration)

THE ADMINISTRATION OF John Quincy Adams (1825–29) failed to achieve its ambitious agenda, yet was the first to seek to address urban poverty as one of the asserted benefits of nationally instituted "internal improvements." The hardworking Adams (1767–1848) entered the White House in 1825 with the attributes of a brilliant and creative mind and unparalleled diplomatic experience, gained as an ambassador and secretary of state. However, his aloofness played into the hands of his enemies in an era when the "common touch" in politics was of increasing value.

From the beginning, Adams's administration was irreparably damaged by the bitter presidential campaign of 1824, in which Adams lost the popular and the electoral vote to Andrew Jackson, and only secured the presidency when the election was thrown into the House of Representatives after no candidate received a majority in the Electoral College. Soon thereafter, Jackson and his supporters started their campaign to win the White House in 1828, while alleging a "corrupt bargain" between Adams and House Speaker Henry Clay after Adams named Clay his secretary of state. Nevertheless, there was no evidence of an untoward deal, and Clay's political philosophy was much more in keeping with Adams's ideas, especially the desirability of internal improvements, such as the construction of roads, canals, and bridges by the national government. Further hindering the administration was Adams's refusal to re-

John Quincy Adams envisioned prosperous citizens united in defense of individual rights and equality.

move political opponents from government positions and his failure to forge a national party in a time of rising sectionalism.

Despite these difficulties and the lack of a popular mandate, Adams presented a stunningly imaginative nationalist agenda in his inaugural address. His program, as outlined in his speech and elsewhere, consisted of traditional internal improvements focusing on transportation along with a national university; scientific explorations; laws aiding commerce, manufacturing, agriculture, science, and the arts; and astrological observatories or what he called "lighthouses of the skies." It was such a bold initiative that many of Adams's friends considered it immature and his opponents called it an arrogant and dangerous plan for concentration of power in the national government.

Although Adams's agenda may have failed to comport with political reality, it did reflect a well-considered political philosophy. The goal of his nationalism was social unity founded upon equality of citizenship within a great societal compact. In such a national bond, he envisioned prosperous citizens united in defense of individual rights and equality. He believed that the chief means of strengthening unity was nationally

financed, economically binding, and broadly defined internal improvements, but his theory failed to fully appreciate the growing contradictions of sectionalism, states' rights theories, and slavery, although he detested each.

Adams did show foresight in recognizing the growth of urban poverty. He observed the difficulties of economically isolated urban workers, limited in resources and diversity of skills, in obtaining basic necessities. He further recognized a corresponding concentration of wealth, resulting from the efficiencies of division of labor in an increasingly urbanized and industrialized society. Accordingly, he believed that social stability required both political equality and some measure of economic equalization.

Adams contended that the law of self-preservation naturally comes to guide those in poverty and thus replaces the obligations that compose society. Furthermore, poverty destroys the barrier to radical and destructive political theories that foster disunity, resentment, and violence against property owners and obliges society to care for the poor in order to preserve itself. To avoid these hazards and burdens, Adams sought to keep a happy and prosperous urban working class and viewed his expansive plan of internal improvements as an indispensable step in doing so. Congress, however, refused to enact his proposals, and he was denied reelection in 1828. The Whig Party would soon emerge in opposition to the Jacksonian Democrats, and its leaders would adopt Adams's advocacy of internal improvements, but not with such eloquence or on such a grand scale.

Adjustment Programs

STRUCTURAL ADJUSTMENT Programs (SAPs) are fiscal, monetary, and trade policies designed by the

World Bank and the International Monetary Fund (IMF) for economically distressed and debt-ridden developing countries. Adjustment programs have become a standard economic recipe for developing countries that are burdened with a huge external debt, slow economic growth, balance of payments disequilibria, inflation, and budget deficits. Debtor countries are often required to adopt and implement SAP before they can benefit from debt rescheduling, access to new lines of credit, and other economic assistance from bilateral and multilateral organizations. A major objective of SAP is to promote a strong and stable macroeconomic environment for attracting private investment and spurring economic growth. As one example, the experiences of African countries illustrate why the World Bank and the IMF often prescribe SAP as a way out of economic crisis.

AFRICAN ECONOMIC CRISIS

African states began implementing adjustment programs in the early 1980s, following the traumatic economic crisis that they experienced during a time that is often referred to as the "lost decade." For instance, the average annual rate of growth of Gross Domestic Product (GDP) for the whole of sub-Saharan Africa (SSA) fell from 3.9 percent in 1960–70 to minus 1.1 percent during 1980–84. Export volumes also plummeted from an average annual growth rate of 5.9 percent in 1960–70 to minus 8.0 percent during 1970–79.

Debt as a percentage of Gross National Product (GNP) rose from 13.1 percent in 1970 to an alarming level of 80.8 percent in 1987. This was accompanied by a jump in the debt service ratio from 5.3 percent in 1970 to 22.3 percent in 1987. The overarching effect of the African economic crisis during the 1980s was an unprecedented decline in the living standard of the average African.

In one of its reports, the World Bank blamed internal factors for the inexorable decline in the economic fortunes of African states. It specifically identified the following culprits: rapid increases in public-sector expenditure (including parastatals) without corresponding increases in public-sector revenues; policy biases against agriculture, which is still the mainstay of African economies; declining domestic savings, coupled with ready availability, in the 1970s of concessionary and nonconcessionary external finance (the latter mostly supply driven); and overvalued exchange rates that dampen the incentive for production and export. To address the above economic problems, the World Bank

and the IMF put together a package of economic reforms for developing countries.

Under adjustment programs for the African nations, economic policy instruments included:

- 1) Strengthening of demand management policies, including cuts in government expenditures on social programs such as health, education, infrastructure, as well as a freeze in wages and public-sector employment.
- 2) Adoption of measures to stimulate production and broaden the supply base of the economy.
- 3) Adoption of a realistic exchange rate policy through devaluation of the local currency.
- 4) Rationalization and restructuring of tariff regimes in order to promote industrial diversification.
 - 5) Progressive trade and payments liberalization.
- 6) Reduction of complex administrative controls and fostering reliance on market forces.
- 7) Adoption of appropriate pricing policies for public enterprises.
- 8) Deregulation, reduction of administrative controls, and greater reliance on market forces for allocation and utilization of available resources.
- 9) Rationalization, commercialization, and privatization of public-sector enterprises.
- 10) Reform of the banking system, which, among other things, allows banks to lend where they please, and also requires them to adopt internationally accepted accounting rules and standards.

POSITIVE AND NEGATIVE IMPACT

Median annual per capita GDP growth was almost 2 percentage points higher after the implementation of reforms and was 2.6 percentage points lower for countries with deterioration in macroeconomic policies. Median industrial growth was up 6.1 percentage points in adjusting countries, compared with an improvement of 1.7 points for countries with deteriorating policies.

Median exports increased 7.9 percentage points in countries that had implemented reform policies, but declined 0.7 percentage points for countries where policies worsened. Median gross domestic savings climbed 3.3 percentage points, while those of nonadjusting countries deteriorated. Domestic investment also increased, albeit slightly.

Negative impacts of the reforms included a rising cost of living: the removal of subsidies on goods and services often leads to an increase in the cost of living in the short term. Thus, consumers undergo a very painful period of transition from an era of subsidies to one of market forces. For instance, in Mozambique food prices

rose 400–600 percent after the implementation of SAP. There was also deterioration in living standards. Observers have noted that many African countries that implemented SAP had a lower standard of living than they did before structural adjustment. A case study of Zambian women and children reported a substantial reduction in food consumption, especially of expensive foods like milk, meat, and poultry—foods high in proteins critical to good nutrition.

Further negative impacts included reduced access to critical social services. Removal of government subsidies has also reduced access to health, education, transportation, and housing. Some studies have found a spike in mortality rates and a decline in life expectancy following the implementation of adjustment programs.

Despite the implementation of SAP in many African countries, the poverty rate has not only been rising, but is also being increasingly feminized because of the rising number of female-headed households. About 45 percent of households in Africa (almost half) are headed by women; 29 percent in Malawi, 22 percent in Sudan, and 28 percent in Zambia. This trend has been attributed to the decrease in the life expectancy of African men (following economic hardships from SAP as well as the AIDS epidemic), which is leaving many women widowed.

STEVE ONYEIWU ALLEGHENY COLLEGE

Afghanistan

POVERTY IN the south Asian country of Afghanistan has historically been affected by political upheaval and civil unrest. In 1979, the Soviet Union invaded Afghanistan, remaining in power until anticommunists rebelled in 1989. In the ensuing fight for power, extremists known as the Taliban led the fight to unite the country by promoting terrorism and an anti-Western

mentality. When terrorists with connections to the Taliban and its leader Osama bin Laden attacked the World Trade Center and the Pentagon on September 11, 2001, American forces invaded Afghanistan and overthrew the Taliban. Democratic elections were held for the first time in 2004.

The new government faces a daunting task because Afghani society has long been characterized by inequality and a severe lack of essential social services for the poorest segment of the population. While the country continues to face economic woes, international aid of over \$2 billion has mitigated the problem. Nevertheless, the government continues to deal with a shortage of food, jobs, housing, electricity, and access to adequate sanitation. Though not included in the rankings, based on quality-of-life indicators, Afghanistan would rank near the bottom on the United Nations Development Programme Human Development Index.

Despite rampant poverty, the fertility rate for Afghani women is 6.9 births per woman.

The low-income economy of Afghanistan is heavily dominated by agriculture (80 percent), and approximately 53 percent live below the national poverty line. Some 70 percent of the population are undernourished. Only 12 percent of Afghanis have access to adequate sanitation. The health and well-being of the Afghani people is also threatened by a lack of potable water and basic access to healthcare. Health coverage is inconsistent, and many Afghanis lack access to health information and facilities. Approximately 40 percent of medical facilities have no females on staff, and the government has launched a program to train midwives to address this problem.

The spread of communicable diseases such as tuberculosis and malaria also poses significant risks to Afghanis, and health officials have become concerned about the increasing rate of HIV/AIDS, which is related to the expanding use of drugs. Epidemics of cholera, Congo-Crimea hemorrhagic fever, measles, meningitis, and scurvy have also occurred. With a median age of 17.57 years and a life expectancy of 42 years, only 2.4 percent of Afghani people are over 65 years of age. The World Health Organization estimates that owing to poor health Afghani men lose 6.6 years of life and Afghani women lose 7.7 years of life.

Education is traditionally viewed as a means of combating poverty. However, only 51 percent of Afghani

males over the age of 15 are able to read and write. Comparably, only 21 percent of females over the age of 15 are literate. According to World Bank statistics, in 2000, 85 percent of Afghani males and 74 percent of Afghani females attended primary schools. Of those who attended primary schools, 79 percent of males and 68 percent of females completed this educational level. Only two percent of the population receive education beyond the primary level.

Women and children are disproportionately victimized by poverty. Despite rampant poverty, the fertility rate for Afghani women is 6.9 births per woman. According to World Bank estimates of 2003, only 10 percent of Afghani women between the ages of 15 and 49 use contraceptives of any sort. The World Health Organization reports that in 2003, the probability of dying for Afghani children under the age of 5 was 258 for males and 257 for females out of every 1,000 live births. At 168 deaths per 1,000 live births, the Afghani infant mortality rate is unacceptably high, as is the 1,900 maternal mortality rate per 100,000 live births.

High infant and maternal death rates are due in part to the fact that professional medical staff attend only 14 percent of births. The low immunization rate for child-hood diseases is also a contributory factor to the high infant mortality rate. In 2003, only half of Afghani children under 23 months had been immunized for measles, and 54 percent had been immunized for DPT3.

The international watchdog group Social Watch reports that Afghanistan has made significant progress in infant immunizations for DPT, polio, and measles but only slight progress in infant tuberculosis immunizations, under-5 child mortality, and increased availability of the food supply. On the other hand, Social Watch notes that overall immunizations for tuberculosis have significantly regressed and undernourishment has regressed slightly. Afghanistan has maintained parity in the fields of infant mortality, telephone mainline availability, tertiary education, public health expenditures, and the number of women in decision-making positions. Improvements in Afghanistan have come in large part from grassroots organizations working with the government to increase educational opportunities, particularly for girls, and to improve the quality of life for themselves and their neighbors.

In conjunction with international organizations such as the United Nations, the World Health Organization, and the World Bank, Afghani officials have identified the following goals for the 21st century: eradicating poverty and hunger, achieving universal primary education, attaining gender equality, reducing child

mortality, improving development, and enhancing global partnerships.

Africa Faith and Justice Network

THE AFRICA FAITH and Justice Network (AFJN) is a Washington, D.C.-based nongovernmental organization (NGO) advocacy group composed of Catholic religious and social justice groups and individuals seeking to transform American attitudes toward Africa and influence U.S. policies that affect Africans. AFJN focuses on issues of human rights and social justice that are directly related to Catholic social teachings. AFJN advocates U.S. economic and political policies that benefit Africans in poverty, assist in the cessation of armed conflicts, establish fair trade and investment with Africa, and promote sustainable economic development that is sensitive to the environment. In an effort to promote peace, economic justice, and human rights, AFJN staff members publish articles, provide leadership on congressional resolutions, and collaborate with other coalitions and NGO partners. AFIN efforts to promote peace and security include resolutions and letters to U.S. political leaders to promote an end to the conflicts in Liberia and Sudan. Other initiatives address the effects of U.S. counterterrorism policies on Africa and the influence of U.S. military training programs.

AFJN economic justice efforts include the creation of the Africa Grassroots Initiative (GRI) in June 2000.

The GRI is a network of organizations in Africa, Europe, and North America that share information for use in their respective advocacy efforts. In November 2001, AFJN assisted in the introduction of a U.S. House of Representatives resolution to protect the rights of African farmers to use, save, and share crop seeds. This was a response to attempts by global agricultural corporations to control access to the seeds. The rights of African farmers remain at risk in global and regional trade negotiations and are an ongoing issue.

Other key components of the GRI project are fairness in global trade and the acceptance of water as a human right. AFJN also monitors government programs designed to assist in African economic development, such as the New Partnership for Africa's Development (NEPAD), an initiative of African governments, and the Millennium Challenge Account (MCA), a U.S. government development assistance program.

AFJN receives most of its support from the Catholic missionary community in the United States and Africa. AFJN organizational members include Adorers of the Blood of Christ, Adrian Dominican Sisters, Carmelite Sisters of Charity, Comboni Missionaries, Congregation of the Holy Spirit, Franciscans, Franciscan Sisters of Perpetual Adoration, Holy Cross Missions, Jesuit International Ministries, Marianists, Medical Mission Sisters, Missionary Oblates of Mary Immaculate, Missionary Sisters of Our Lady of Africa, Missionhurst, Maryknoll Fathers & Brothers, Order of Friar Servants of Mary, Religious of the Sacred Heart of Mary, School Sisters of Notre Dame, Sisters Servants of the Immaculate Heart of Mary, Sisters of the Holy Names of Jesus & Mary, Sisters of the Holy Cross, Sisters of the Sacred Heart of Mary, Society of African Missions, Society of Missionaries of Africa, Society of the Divine Word, and Society of the Holy Child, Jesus.

JOHN B. BUCK JACKSONVILLE UNIVERSITY

African Americans and Poverty

POVERTY RATES AMONG African Americans are persistently higher than those observed for white Americans in the United States. Recent data, historical data, and even figures from periods in which poverty rates have declined nationwide, all indicate that the proportion of African Americans who are poor routinely exceeds the proportion of white Americans who are poor. This means that while the absolute number of whites who are poor exceeds the number of poor blacks, the probability of being poor is greater for any given black person (on average) than it is for a white person. To many this seems at odds with a fundamental premise of U.S. society—that the United States is a land of equal opportunity, where every individual has an equal shot at doing well.

Why are poverty rates higher for blacks than they are for whites, and are there any substantive implications? To answer this question one has to think first about the nature of poverty in the United States, because the presence of poverty among African Americans can only be understood after one has a clear understanding of the forms that poverty takes.

At the level of the individual, poverty is observed both among persons who are working and among the nonworking. The existence of the "working poor" means that explanations of poverty cannot focus exclusively on lack of work. Instead, some poverty can be attributed directly to the fact that some jobs pay wages that are so low as to prevent a worker from escaping poverty even if he works full-time throughout the entire year, as noted by Lawrence Mishel et al.

A second characteristic of poverty in the United States, and one that has particular relevance for African Americans, is that poverty can be conceptualized in spatial-geographic terms. It is a phenomenon that affects neighborhoods as well as individuals. Researchers such as William Wilson have identified neighborhoods in which the majority of residents are poor and not working because jobs are virtually nonexistent, thus giving rise to the term *ghetto poverty* or concentrated-poverty neighborhoods.

On average, according to the Census Bureau, African Americans are more than twice as likely to be poor as white Americans. They are also more likely to experience long spells of poverty. What is the reason for the higher incidence of poverty? While several theories exist, William Darity identifies two recurring themes throughout the different explanations. Some theories of poverty, called "individualist" explanations,

argue that individuals make specific choices that lead to poverty. Other theories offer "structuralist" explanations that attribute causality to the structure of society and its institutions. To understand African-American poverty one cannot rely on theory alone, however. Knowledge of the empirical research testing the validity of different theoretical propositions is also crucial.

One theory offered by those who believe that individual-oriented explanations are important is the theory that it is people's unwillingness to work that explains the poverty that exists. In theory, this is a possible explanation for African-American poverty. Traditional labor market models note that some individuals choose to enter the labor market while others opt to remain out of the labor force. To the extent that an individual freely chooses not to work, he or she can be argued to be responsible for his or her poverty since working is the way that most people generate income.

To understand African-American poverty one cannot rely on theory alone.

Does this theory have merit in the context of African Americans? Unfortunately, it is not possible to obtain direct evidence about people's preferences; it therefore is impossible to know how many people do not work simply because they do not feel like doing so. Moreover, it is not possible to infer that an individual has freely chosen not to work based on the simple observation that she is not working. Individuals may be jobless for structural or institutional reasons, too. While empirical evidence reveals that labor force participation rates historically have been lower for black men than they are for white men, the unemployment rate among black men typically is higher, by Edward Wolff's calculations. Given the way economists define unemployment, this suggests that many blacks who are not working have not chosen to be in this situation.

One contributory factor, according to Wilson, is the fact that many of the neighborhoods that poor African Americans reside in saw rapid job "flight" during the 1970s and 1980s, as jobs moved to the suburbs and away from inner cities. This occurred with the decline in manufacturing in the United States and the industrial shift toward more service-sector jobs, as theorized by Mishel et al.

Renowned scholar Dr. William Julius Wilson was the first to argue that this trend left many African Americans stuck in communities where they could not find work, noting that because of their poverty it was difficult for these people to move to follow the jobs. There has been a large amount of research testing aspects of this "spatial mismatch" hypothesis. Existing empirical evidence supports the proposition that there has been job flight away from poor, black neighborhoods and that many urban areas contain concentrated poverty neighborhoods as a result.

Individuals also may face constraints in looking for work because of childcare responsibilities. Mary Corcoran finds that single women head a disproportionate number of African-American families, and femaleheadship is associated with a greater likelihood of being poor. While viewing poverty through the lens of individual choice can prompt one to argue that being a single parent is a decision that an individual makes, the processes underlying divorce and nonmarital childbirth are complex. Moreover, research shows that given the problems of joblessness in many impoverished African-American communities, it is incorrect to assume that marriage alone can improve the financial status of the single-parent families living there. This is one reason that policy initiatives, such as those targeting "fragile families," actually concentrate on improving the social and psychological skills that parents need to function as a team.

It is difficult to separate free will from structural constraints.

Why, among those who are working, do African Americans often fall in the group of individuals whose wages are too low to permit them to escape poverty? One reason is that, on average, African Americans have lower levels of education than white Americans do. This could be construed as suggesting that one of the reasons a disproportionate number of African Americans are poor is because of the educational choices that they have made. Again, however, it is difficult to separate free will from structural constraints. While secondary schooling is provided free of charge in the United States, college is not. Accordingly, researchers disagree about how much choice individuals exercise in the educational domain.

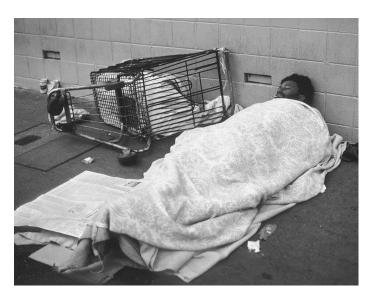

Moreover wages in labor markets are determined by a complicated mix of productivity-related, bargaining, and institutional wage-setting mechanisms, so factors other than educational levels affect wages. Empirical research suggests that some of the lower wages observed among African Americans relative to whites can be explained by differences in education levels. However, a portion of the wage gap cannot.

To what extent does racial discrimination still exist? And does it contribute to African-American poverty either because it means that some African Americans will be denied jobs or because it means that they will experience wage discrimination when they are given jobs? These are also areas of debate. Because it is difficult to directly determine whether discrimination exists, social scientists typically rely upon statistical techniques that try to account for all other factors that might explain an individual's labor market outcomes, and then they infer the existence of discrimination if these factors do not account statistically for all of the difference observed between blacks and whites.

Other researchers, such as Marianne Bertrand and Sendhil Mullainathan, have conducted "audit studies" that send similarly qualified blacks and whites to actual job interviews, or "experiments" where researchers construct resumes for fictional applicants whose qualifications are the same and submit them for actual job openings to determine whether callback rates will be higher for the white applicants than for blacks. These studies suggest that employers do still treat blacks and whites differently, exhibiting a preference for white workers when faced with a similarly qualified black worker.

A final hypothesis that has much currency in popular discourse, even though the empirical evidence for it is not strong, is that there is a "culture of poverty" or a "culture of welfare" among African Americans. Contemporary research on media imagery provides interesting examples of popular portrayals of poor African Americans and their purportedly distinct culture. The theories emphasizing culture assert that the poor have deviant values and behaviors that they pass on to their children, thereby transmitting poverty from one generation to the next. For example, one contemporary version of the argument states that seeing one's mother on welfare takes away the stigma of welfare receipt making one more willing to "choose" welfare (rather than work) as a source of income when one becomes an adult. Culture-based theories have been espoused by scholars such as Oscar Lewis, Charles Murray, and Larry Meade. The hypotheses are difficult to test empirically, however. Cross-generational correlations can exist for many

For example, if employers refuse to hire African Americans for decades, then successive generations of African Americans can be expected to be jobless or

On average, African Americans are more than twice as likely to be poor as white Americans.

poor, and the similarity observed across the generations will have nothing to do with a distinct African-American culture. Similarly, it is known that poor parents have fewer resources to use for educational purposes than nonpoor parents do. Yet having books in the home and sending one's children to good schools are important actions that parents can take to enhance their children's educational prospects.

Parental investment is critical in determining children's outcomes, and this provides another reason the poverty can be correlated across generations. Because it is difficult for empirical studies of the cultural transmission of poverty to eliminate competing explanations for the cross-generational correlations that are found, there presently is no definitive evidence to support the claim that African-American poverty results from a unique or perverse culture that is transmitted from parents to children.

What is clear from empirical research is that African-American children experience more economic disadvantage during childhood than white children do, on average, and that this has effects that persist into adulthood because childhood poverty is associated with lower rates of economic success later in life. It is particularly true for young people who are isolated in neighborhoods with concentrated poverty, where schools can be bad and jobs sparse.

Accordingly African-American poverty is an important issue for policymakers interested in designing remedies for the disadvantages that poor children face starting out in life.

African Development Foundation

THE AFRICAN DEVELOPMENT Foundation (ADF) is an independent federal agency and a nonprofit corporation created by the U.S. Congress in 1980. The foundation supports community-based, self-help initiatives that are designed to alleviate poverty and promote sustainable development in Africa.

As part of U.S. foreign assistance efforts, the ADF seeks to promote greater economic prosperity and political stability on the African continent. Toward these ends, ADF works to strengthen the bonds of friendship and understanding between the people of Africa and the United States; support self-help activities at the local level calculated to expand opportunities for community development; stimulate capacity-building and assist with effective and increasing participation of Africans in the development process on the continent; and encourage the establishment and growth of development institutions that are indigenous to African countries capable of responding to the requirements of the poor in those countries.

The foundation began field operations in 1984; its efforts complement larger bilateral aid programs by approaching development projects from the ground up.

This method of funding innovative models of participatory development provides incentives for local entrepreneurs to craft profitable schemes. Through the provision of small (\$50,000 to \$250,000) grants, loans, and loan guarantees to African entities, ADF seeks to support projects that are indigenous in origin and that have the potential to be replicated on a larger scale by the private sector, other development agencies, and African governments.

In conjunction with nongovernmental organizations that serve as national partner organizations, ADF provides funds directly to African community-based groups, registered cooperatives, economic interest groups, producer associations, community development associations, and registered limited liability companies in order to stabilize economic opportunity, security, and sustained productivity in local communities.

ADF supports African expertise and knowledge-building capacities by ensuring that project activities are locally conceived and implemented and local African experts provide technical assistance. Unmediated assistance to carefully screened clients provides a catalyst for development for micro- and small enterprises, producer groups, and marginalized communities. The assistance is intended to encourage an entrepreneurial spirit and alleviate poverty. The larger goal is to enable long-term development and modernization of African communities by promoting strategic trade and investment opportunities for small and medium-scale enterprises.

Under its trade and investment program, ADF provides African businesses with access to technology, working capital, market information, and technical and managerial assistance. ADF has initiatives in nine African countries to help small businesses tap regional and overseas markets. The African Development Foundation enters into strategic partnerships with publicand private-sector entities to enhance trade linkages. All ADF projects are fully monitored and regularly undergo participatory evaluations supported by African experts to help ensure the success and longevity of projects. ADF fosters the development of indigenous partner organizations that are wholly African led and designed to become self-sustaining national development resources.

ADF requires that successful clients participate in the Community Reinvestment Grant program whereby profitable grant recipients reinvest a portion of their profits into community development projects within their country. This payback approach creates a multiplier effect and generates renewable pools of capital used for grassroots-level development projects. The foundation has developed a model of venture philanthropy that combines the rigor of investment banking with the values of conventional development. Before a project is funded it is evaluated for profitability, socioeconomic impact, and sustainability with potential for replication or scaling up. The African Development Foundation has funded over 1,300 activities in 34 African nations.

LORNA LUEKER ZUKAS NATIONAL UNIVERSITY

Age Discrimination

AGE DISCRIMINATION INVOLVES any differential treatment of a person because of his or her age. Many forms of age discrimination are perfectly legal. For example, Social Security and Medicare are only available to people over a certain age. Life or health insurance companies may charge older people higher rates because of the actuarial likelihood that they will become sick or die sooner. Numerous laws discriminate between the treatment of children and adults. Thus, age discrimination laws have a more narrow focus than many other antidiscrimination laws such as those prohibiting discrimination based on race or sex.

LEGAL PROTECTIONS

Federal laws barring age discrimination are primarily focused on employment discrimination. The first major legislation in this area was the Age Discrimination in Employment Act (ADEA) of 1967. This act has been amended many times since then. Many states also have separate laws protecting people against age discrimination. Those laws largely replicate federal law, with some variations such as providing greater coverage.

The ADEA was modeled after the 1964 Civil Rights Act, which bars discrimination based on race, color, religion, sex, or national origin. The ADEA's statement of findings and purpose asserts in part, "... older workers find themselves disadvantaged in their efforts to retain employment and especially regain employment when displaced from jobs." Thus, the law sought to protect workers from losing their job, being denied advancement, or being refused a job because of their age.

Ironically the ADEA itself discriminates on the basis of age. Only people aged 40 or older receive protection under the act. The reason for this limitation is that the act is designed only to protect older workers perceived as being "too old" for a job, not younger workers perceived as being "too young" for a job. The Supreme Court has gone even further by holding that even workers over the age of 40 are not protected when they are treated less generously than even older workers. In the case *General Dynamics Land Systems, Inc. v. Cline*, in 2004, ending retiree health benefits for employees aged 40–50 while retaining them for employees over age 50, was ruled permissible under the ADEA.

REASONS FOR AGE DISCRIMINATION

In order to better understand the sources of age discrimination, one can categorize age discrimination on the basis of the motivation of those who engage in the perceived discriminatory act. The first, most base form of so-called ageism is that of animus discrimination. It is present if the motive is to discriminate due to an inherent prejudice against older workers, that is, a potential employer simply has a personal bias against older people. Animus discrimination is less of a factor in age discrimination as compared to other groups because most people making employment decisions are either in the protected group or soon will be.

Moreover a firm that practices animus discrimination on the basis of age would most likely find it hard to recruit workers in their preferred age group because, unlike the potential biases for other protected groups, such discrimination is one that current young workers and recruits could potentially be subjected to in due time—thus decreasing for all age groups the desirability of working for such an employer. Possibly recognizing this, the Department of Labor report that first advocated passage of the ADEA did not even address this type of discrimination.

Statistical discrimination occurs when hiring or promotion decisions are based on age, even if this characteristic itself is unrelated to the individual's relevant

In age discrimination, job applicants with equal abilities (yet differing future potentials) are treated differently.

abilities, provided that age statistically correlates with a characteristic that is relevant to performing the job well. Thus, a printing shop that refuses to hire applicants above the age of 50 because they cannot rely effectively on a short-sighted employee may have a rational hiring policy since the incidence of short-sightedness increases with age. However, they are engaging in statistical age discrimination against any applicant above the age of 50 with perfect vision. The ADEA forces such an employer to take the additional step of putting in specific eyesight requirements and most likely to assume the costs of giving the necessary tests. It would also require continued tests to ensure that eyesight does not deteriorate. Since the ADEA prohibits subjecting only older employees to such tests, an employer would have to test everyone, incurring greater expense.

Finally, there may be other economic reasons for age discrimination. If a worker who is hired or promoted to a new job requires substantial training before becoming effective at the new job, then it may only make sense to hire or promote someone who is expected to remain in the job for a minimum time period.

If this time period is sufficiently long, it may not make economic sense to hire or promote an older worker who is expected to (voluntarily) retire before training and start-up costs that the firm incurs are recouped. Thus, applicants with equal abilities (yet differing future potentials) are treated differently. An employer may recoup such costs, however, by requiring reimbursement by the employee if he or she fails to remain with the company for a certain number of years.

There are some cases where an older employer will cause a very clear and definable cost for an employer. For example, employer-provided health insurance or life insurance will cost more for an older employee. The Older Workers Benefit Protection Act of 1990 amended the ADEA to clarify the point that while an employer may not deny the more expensive benefits to older employees, it may spend the same amount for both employees, even though that amount will buy less benefit for the older employee.

It is difficult to prove the actual motivation in hiring.

Under the theory of disparate impact no employer may use any facially neutral employment policy if that policy might have more of an impact on a protected group. For example, in the context of race discrimination, the Supreme Court held that requiring applicants to have high school diplomas and do well on a standardized aptitude test violated the law because it excluded many more black applicants than whites and could not be shown to have a direct enough relationship to actual work performance, in the case of *Griggs v. Duke Power Company*, in 1971.

In 2005 the Supreme Court held that disparate impact law also applied to age discrimination cases, in the case of *Smith v. City of Jackson*. Application of disparate impact is much more burdensome on an employer since it requires that it spend much more time and resources evaluating all neutral employment tests to see if it has some impact on a particular group. Then it must determine whether the practice is so closely related to a legitimate business performance that no jury could second-guess that decision. Because the *Smith* case is very new and left open many questions, it remains to be seen what impact it will have.

EFFECTS OF THE ADEA

Age discrimination laws have helped older employees avoid arbitrary rules that might end their professional careers earlier than they would like. The cost for this falls on employers who must discontinue personnel practices that are age discriminatory but which might have been more cost-efficient than alternatives. It also raises potential legal costs for practices that may be questionable, and results in more expensive defensive policies that may cost even more money, such as having lawyers and highly trained human resource professionals evaluate all employment policies.

While the ADEA covers hiring, promotion, and termination decisions, it turns out that in fact the vast majority of age discrimination claims involve denied promotion or wrongful termination—bias in hiring is rarely argued. One reason for this is that it is much more difficult to prove the actual motivation in hiring. There are so many factors that go into a hiring decision that proving age was the decisive factor is very difficult in most cases.

Thus potential plaintiffs are much less likely to win a case involving hiring. The higher risk makes potential plaintiffs and their attorneys less likely to risk the expenses involved in litigation.

Higher-income white males are the most common plaintiffs in age discrimination cases. Higher-income plaintiffs who prevail will likely receive larger damage awards based on denied pay and benefits. Therefore, they are more likely to risk the expenses of litigation. White males on average have higher incomes than other groups. It is also possible that women or minorities will be more likely to attribute an adverse employment action to race or sex rather than age. While rationales may differ, it is clear that age discrimination legislation has largely benefited older white male employees with high incomes.

Employment statistics from the 1980s and 1990s show that over 20 years, unemployment has grown from 0.9 percent to 1.7 percent for white males aged 45 to 54, and from 1 percent to 2.1 percent for those 55 to 64. Some experts argue that the ADEA may be partly at fault for this. Employers may be wary of potential liability from such groups and perceive less risk from suits for failing to hire such people in the first place.

Thus the empirical implications of statutes protecting workers from age discrimination are somewhat at odds with the stated intent of the laws as quoted at the outset. However, as many researchers nonetheless detect overall beneficial effects of the laws in preventing

discrimination, there is support for this type of legislation, even if the main beneficiaries as a group are not generally thought of as a disenfranchised minority in need of special legal protections.

Aged and Poverty

THE INCOME SITUATION for older adults has remarkably improved over the last three decades. U.S. Census Bureau data indicate the median income of the elderly increased 60 percent between 1970 and 2001. The poverty rate among Americans over age 65 was 35 percent in 1959. Today it is only about 10 percent.

In reality, however, the economic status of the elderly has still not changed much. This trend is most pronounced in Europe and Japan and least pronounced in Africa and the Middle East, but it is a reality in nearly all countries. Some experts argue that the true rate is even lower because the improvement is due to increasing income not from private sources but from government support—particularly Social Security and Supplemental Security Income (SSI) benefits. In addition, major disparities exist, with older African Americans and older women reporting fewer financial resources.

While the income of elderly married couples has risen significantly in the 21st century, there have been only modest gains for older women and no improvements for single older African-American women.

Among the older population, poverty rates are higher among women (12.4 percent) than among men (7 percent), among the nonmarried (17 percent) than the married (5 percent), and among minorities (African American, 21.9 percent, and Hispanic, 21.8 percent) than non-Hispanic white persons (8.9 percent) in 2001. Divorced African-American women between the ages of 65 and 74 had a poverty rate of 47 percent, one of the highest rates for any subgroup of older adults. Loss of earnings at retirement, loss of a spouse, health deterioration, and discrimination worsen the economic status of these groups and lead to poverty.

INCOME SOURCES

The introduction of Social Security benefits has contributed to the better income situation of older adults in the United States. The Social Security office reported that among the elderly age 65–69 in 2000, 23.1 percent have income from their earnings and 27.8 percent have income from Social Security. On the other hand, the elderly age 85 and older have 4.7 percent of their income from earnings and 56.7 percent of their income from Social Security.

Social Security is a more important income source for African Americans, especially single women. Elderly African-American single women are the most dependent upon Social Security for all their income, compared with one-quarter of their white counterparts. Elderly African-American men fare only somewhat better, with 39 percent of them totally dependent upon Social Security, compared with 23 percent of their white male counterparts. African-American married couples fare the best, with only one in five totally dependent upon Social Security, but it is still twice the level of their white counterparts. Earnings, property income, and private pensions are other significant sources of income for the elderly.

Approximately 22 percent of the elderly receive income from working. Since labor force participation rates decline dramatically with age, the likelihood of earnings income varies greatly by age, declining from 44 percent of elderly units aged 65 to 69 to four percent of those aged 85 and older. Only five percent of the elderly receive public assistance, generally Supplemental Security Income (SSI).

In the Eastern countries, the income sources are somewhat different. The aged are more likely to live with their children than by themselves. According to Luxembourg Income Studies in 1995, for instance, only eight percent of the aged in Taiwan are living alone

Loss of earnings at retirement, loss of a spouse, health deterioration, and discrimination worsen the economic status of the aged in poverty. Sometimes a helping hand, whether figurative or literal, is essential.

while 33 percent of American aged and about 43 percent or more of the German and Finnish aged live alone. They are largely supported by their children in the East countries. A Korean survey in 1994 reported that main income sources of Korean aged were their children (45 percent) and earnings (38 percent). Social insurance is not present or is limited to provident fund schemes that cover only a small, often the wealthiest, section of the labor force. Thus, selective groups have pension arrangements while other groups do not, and occupational pensions are present but are more limited and industry specific.

EMPLOYMENT

The World Bank (2005) reported that there are changed employment patterns among the aged in the world as follows: more women in the workforce; changing work patterns to the reduction in full-time salaried jobs, and the increase in part-time work, self-employment, and temporary jobs; and lack of pension coverage. Some older adults continue to work after reaching retirement age, but older workers constitute a small proportion of the workforce.

In the United States, only 15 percent of the nation's 138 million employed were aged 55 or older in 2003. They confront more restricted job opportunities based on biased perceptions that younger workers are faster and more efficient than older ones, and that older individuals are more difficult to train for new jobs and to use new technology. Thus, those who continue working are for the most part employed in part-time positions.

In 2003 the Bureau of Labor Statistics reported that while only 11 percent of all men in the labor force work part-time, the proportion was 17 percent among men aged 55 or older. The portion rises to 55 percent among those aged 65 or older. In addition, many older people are self-employed. According to Bureau of Labor Statis-

tics, while only seven percent of all employed workers aged 16 or older are self-employed, 19 percent of workers aged 65 or older work for themselves. More and more older men retire early, even before they become eligible for Social Security retirement benefits at age 62 or for Medicare benefits at age 65.

RISK FACTORS

The higher poverty rates among the elderly are the result of a combination of rapidly diminishing financial resources and declining health. The minority elderly population suffers from additional negative social attitudes, such as stereotypes and discrimination in hiring and rate of pay. These factors not only impose immediate financial hard times, but also reduce the possibility of having adequate pension benefits at retirement. For example, Social Security payments are based on an average yearly income and working period; intermittent employment or a low salary history decreases monthly benefits eligibility. Also, many minority elders worked at manual labor or temporary/part-time jobs that do not offer pensions or Social Security benefits. Therefore, they have little chance to accumulate assets to use in their later years.

Marital status, educational attainment, living arrangements, and health status are also risk factors of the poverty among older people. Marital status can strongly affect a person's economic status by influencing living arrangements and availability of caregivers among the elderly with an illness or disability. Educational attainment influences economic status, and thus can play a role in well-being at older ages. Higher levels of education are usually associated with higher incomes.

Like marital status, the living arrangements of the elderly are important because they are closely linked to income, health status, and the availability of caregivers. Older persons who live alone are more likely to be in poverty than older persons who live with their spouses. The increase in life expectancy during the 20th century has been a remarkable achievement. Older age, however, is accompanied by increased risk of certain diseases and disorders. Health care expenditures and use of services among older people are closely associated with their economic status.

DOUBLE JEOPARDY

Most researchers agree that the experience of being old varies across ethnic groups. This research concerns whether being old and being a member of an ethnic minority group create a situation termed "double jeopardy" (discrimination based on ethnicity and ageism). The Bureau of Census 2000 reported that elderly foreign-born men are more than twice as likely as their native-born counterparts to live in poverty (14 percent versus 6 percent).

Agriculture

AGRICULTURE SERVES as a major source of income for nearly 49 percent of the world population. Fifty-five out of 147 countries identified by the World Bank for World Development Indicators are predominantly agriculture-based economies, with 25 of them having three-fourths of their population eking out a living on farms—and these, interestingly, are located mostly in sub-Saharan Africa and southeast Asia. It is disheartening to note that majorities of the people bearing the brunt of abject poverty (living below poverty line) are members of the farming community worldwide, which underlines the importance of agriculture development in uplifting people from poverty. Agriculture and poverty are closely interrelated. And that agriculture forms the backbone of the economy is well-known.

Perhaps nowhere is the link between agriculture and poverty more apparent than in the Third World. Out of the 55 predominantly agriculture-based nations (where

more than half of the population depends on agriculture for living) only 18 (Albania, Cambodia, Central African Republic, Ethiopia, Sierra Leone, etc.) are earning a sizeable chunk of foreign exchange from agriculture. Added to that, only 10 countries in the segment (Burundi, Congo Democratic Republic, Guinea Bissau, Laos, Myanmar, etc.) have agriculture contributing to more than 50 percent of their Gross Domestic Product (GDP). It is regrettable to note that in a majority of the agricultural economies, the annual growth rate of agriculture remains much below that of industry, manufacturing, and service sectors.

According to United Nations projections, the world population is expected to exceed 8.0 billion by 2025. On average, 73 million people will be added annually, and 97 percent of the projected growth will take place in the developing countries. Nearly 1.2 billion people live in a state of absolute poverty. About 800 million people are food insecure, and 160 million preschool children suffer from malnutrition. A large number of people also suffer from deficiencies of micronutrients such as iron and vitamin A. Food insecurity and malnutrition result in serious public health problems and lost human potential in developing countries. The major problems faced by the rural poor include low productivity, food insecurity, and poor nutrition.

The availability of land is decreasing over time, and such a decrease is expected to be much greater in the developing countries than in developed countries especially in Asia. Grain production has shown a remarkable increase between 1950 and 1980, while a marginal increase was recorded between 1980 and 1990. There is a need to increase production foods to meet the demands of increasing population.

The south Asian region is home to the largest number of poor people in the world. Nearly one-third of all malnourished people in the world live in this region and they need access to affordable and nutritious food. Food security is a critical concern in south Asia, especially against the current background of rapid population growth. The resource-poor, small-scale farmers, who contribute substantially to food production in this region, need to be empowered with appropriate technologies to enhance sustainable agricultural productivity and production.

RELATIONSHIP WITH POVERTY

Across the globe there is a nexus between agriculture and poverty in low-income countries. It is necessary to

appreciate the paradox in this relationship. In many developing countries about 60 to 75 percent of the aggregate national labor force either works or depends on the output of land for sustenance.

This sharply contrasts with the situation in advanced countries, even though they usually have a flour-ishing agriculture. Thus, in the United States about 12 percent and in the United Kingdom about 5 percent of the workforce are engaged in agricultural pursuits. Even in countries like Canada and Australia, in which agriculture is one of the major sectors of the national economy, only about 25 percent of the workforce is engaged in agriculture. In India, as in China, a staggering 65 percent are engaged in or dependent on agriculture.

The World Bank has stated: "Absolute poverty blights the lives of millions in many (developing) countries. They have barely adequate (and often uncertain) diets, and incomes so low that they can spend little for clothing, fuel, shelter, and other essentials. Past experience clearly shows that a combination of the growth of agriculture and of the economy is essential for long-term alleviation of (such) poverty.

THIRD WORLD AGRICULTURE

When we look at the state of contemporary agriculture in most poor countries, we realize the enormity of the task that lies ahead. A brief comparison between agricultural productivity in the developed countries and the underdeveloped nations makes this clear. World agriculture, in fact, comprises two distinct types of farming: 1) the highly efficient agriculture of the developed countries, where substantial productive capacity and high output per worker permit a very small number of farmers to feed entire nation; 2) inefficient and low-productivity agriculture of developing countries, in many instances, which barely sustains the farm population let alone the burgeoning urban population, even at a minimum level of subsistence.

The gap between the two kinds of agriculture is immense. This is best illustrated by the disparities in labor productivity. In 1960 the agricultural population of the developed nations came to about 115 million people. They produced a total output amounting to \$78 billion, or about \$680 per capita.

In contrast, the per capita product of the agricultural population in the underdeveloped countries in 1960 was only \$52. In other words, agricultural labor productivity in developed countries was more than 13 times that in the less developed countries. By 1995, this productivity gap had widened to more than 50 to one.

For example, in least developed countries, the value added per agricultural worker in 1995 was \$459 while in other countries like Norway, Sweden, and Japan it was \$34,809, \$28,590, and \$16,712 respectively. Another manifestation of the productivity gap relates to land productivity. The table below, from the World Bank, shows variations in land productivity (measured as kilograms of grain harvested per hectare of agricultural land) between Japan and the United States on one hand, and six heavily populated countries in Asia, Africa, and Latin America on the other.

Land productivity in sample developed and developing countries included in 1995:

	Average Grain Yield	Population
	(kg per hectare)	(million)
Japan	6,119	125
United States	5,136	263
Bangladesh	2,602	120
Mexico	2,506	92
Brazil	2,383	159
India	2,136	929
Pakistan	1,943	130
Nigeria	1,172	111

In the developed countries, there has been a steady growth of agriculture output since the mid-18th century. This growth has been spurred by technological and biological improvements, which have resulted in ever higher levels of labor and land productivity. The growth rate accelerated after World War I and particularly after World War II. The end result is that fewer farmers are able to produce more food. This is especially the case in the United States, where in 1998 only two percent of the total workforce were agricultural, compared with more than 70 percent in the early 19th century.

For example in 1820, the American farmer could produce only four times his own consumption. A century later, in 1920, his productivity had doubled, and he could provide enough for eight persons. It took only another 32 years for this productivity to double again, and then only 12 more years for it to double once more. By 1987, a single American farmer could provide enough food to feed almost 80 people. Moreover, during the entire period, average farm incomes in North America rose steadily.

The picture is entirely different when we turn to the agricultural production experience of developing nations. In many poor countries, agricultural production methods have changed relatively slowly over time.

Much of this technological stagnation can be traced to the special circumstances of peasant agriculture, with its high risks and uncertain rewards. Rapid rural population growth has compounded the problem by causing great pressure to be exerted on existing resources. Where fertile land is scarce, especially throughout south and southeast Asia, but also in many parts of Latin America and Africa, rapid population growth has led to an increase in the number of people living on each unit of land. Given the same farming technology and the use of traditional nonlabor inputs (simple tools, animal power, traditional seeds), we know from the principle of diminishing returns that as more and more people are forced to work on a given piece of land, their marginal (and average) productivity will decline. The net result is a continuous deterioration in real living standards for rural peasants.

To avert massive starvation and raise levels of living for the average rural dweller, agricultural production and the productivity of both labor and land must be rapidly increased throughout Asia, Africa, and Latin America. Most developing nations need to become more self-sufficient in their food production; others can rely on their successful nonagricultural exports to secure the necessary foreign exchange to import their food requirements. But for the majority of debt-ridden, inefficient, and unsuccessful exporters, unless major economic, institutional, and structural changes are made in farming systems, their food dependence, especially on North American supplies, will increase in the coming years.

In many developed countries, various historical circumstances have led to a concentration of large areas of land in the hands of a small class of powerful landowners. This is especially true in Latin America and parts of the Asian subcontinent. In Africa, both historical circumstances and availability of relatively more unused land have resulted in a different pattern and structure of agricultural activity; however, in terms of levels of farm productivity, there is little to distinguish among the three regions.

A common characteristic of agriculture in all three regions, and for that matter in many developed countries, is the position of the family farm as the basic unit of production. As Raanan Weitz points out: "For the vast number of farm families, whose members constitute the main agricultural work force, agriculture is not merely an occupation or a source of income; it is a way of life. This is particularly evident in traditional societies, where farmers are closely attached to their land and devote long, arduous days to its cultivation. Any

change in farming methods brings with it changes in the farmer's way of life. The introduction of biological and technical innovations must therefore be adapted not only to the natural and economic conditions, but perhaps even more to the attitudes, values, and abilities of the mass of producers, who must understand the suggested changes, must be willing to accept them, and must be capable of carrying them out."

Thus in spite of the obvious differences among agricultural systems in Asia, Latin America, and Africa and among individual nations within each region, certain similarities enable us to make some generalizations and comparisons. In particular, agrarian systems in many parts of Asia and Latin America show more structural and institutional similarities than differences, and subsistence farmers in all three regions exhibit many of the same economic behavior patterns.

GROWTH OF AGRICULTURAL POVERTY

Land, the dominant factor in agricultural production, is no longer an importance source of livelihood. Farm size is very small and has been declining under continued population pressure. Up to 50 percent of rural households are "functionally landless." The average size of a holding is less than one hectare in many countries. The small and poor farmers, however, were able to increase land productivity and farm income by adopting high-yielding modern varieties of rice and wheat, the dominant food staples, supported by public-sector investment for irrigation, flood control, and drainage.

The shift of land from traditional to modern varieties contributes to an increase in income of \$100 to \$150 per hectare, which is less than 10 percent of annual rural household income. The technological progress has helped reduce the unit cost of food production, enabling farmers to market the surplus food to consumers at affordable prices without taking a cut in profits. The sectoral decline in the real price of staple foods was the main factor behind the moderate progress in poverty alleviation.

Fertile land is becoming scarcer due to demographic and economic growth and resource depletion, including climate change. Greater competition for land resources, increased mobility, and the incorporation of rural areas into market economies through diversification and/or specialization are placing increasing pressure on governments to introduce policies that give the poor secure access to land.

Agricultural growth and poverty reduction depend significantly on increasing agricultural productivity;

this will be particularly true for future progress in Sub-Saharan Africa. There is widespread evidence that, whether a tenure system is communal or individual, freehold or leasehold, farmers are more likely to invest in their land and achieve productivity gains, when they have secure land rights.

An important component of tenure security in market economies is the confidence with which rights transactions can be made. Governments should be encouraged to underwrite security of land tenure (a widely recognized public good) by providing the legal and institutional capacity needed for just, equitable and efficient land administration and, where necessary, intervening in the land market to make reforms related to land distribution.

Although developing-country government land departments are aware of the need for land reform and for efficient and equitable land administration, their performance is notoriously poor. They face various problems, including:

- 1) weak legal and institutional frameworks;
- 2) over-centralized and inaccessible land registries;
- 3) corruption and arbitrary land acquisition and eviction;
- 4) inadequate arrangements for land dispute resolution;
- 5) the demise of customary systems of common property resource management;
- 6) unsustainable systems of land use; and
- 7) political conflict, civil war and humanitarian disasters (in extreme cases).

Politicians and officials continue to use their discretionary power and influence over land allocation and revocation for political and personal advantage. Landowners and land professionals often have vested interests in perpetuating the status quo.

Consequently they impede the adoption of more simple, accessible, and efficient systems for land transfer, land survey, and the registration and collection of land information, which would facilitate the development of land markets and the levying of land taxes in rural areas.

Land reform entails redistribution of land, remodeling of land rights, and improvement of land administration in a manner that fits the requirements of the political system promoting the reform. For the purpose of this article, it is helpful to subdivide land reform initiatives into actions involving direct land redistribution for productive use, land policy reforms that strengthen

tenure security, and actions that improve the efficiency of the land market.

Redistributive land reform, which can include the restitution of land to the dispossessed, is generally taken to mean the redistribution of property rights in land for the benefit of the landless, poor tenants and farm laborers. Invariably, the motivation for redistributive land reform is political and coincides with a shift in the balance of power between conservative and more radical forces. Throughout history, opportunities for redistributive reform have been associated with specific political moments; for example, at the end of World War II in southeast Asia, following the overthrow of President Ferdinand Marcos in 1986 in the Philippines, after the collapse of the Soviet Union in 1989, and with the transition to majority rule in South Africa in 1994. In all these situations new constitutions were adopted with amended principles concerning land and property.

Reforms have contributed to increases in farm output, productivity, and political stability.

The political stimulus for land redistribution affects the extent to which agricultural systems are transformed, the degree of productivity increase, and the extent of economic growth that will benefit the poor. There are a number of possible scenarios, but we can learn most about agriculture and poverty reduction when land redistribution has enabled or coincided with increases in farm output and productivity from which the poor have benefited, and when land redistribution has not resulted in increases in farm output and productivity and/or has not been beneficial for the poor. A third interesting scenario exists when redistribution has indirectly contributed to agriculture and production, for example, when agrarian conflict has been avoided.

Ownership of land within many large estates in south and southeast Asia has been transferred to tenants during the past 60 years and the new systems have all proven to be successful. Redistribution has been limited largely to the transfer of land rights to sharecropping tenants and did not necessarily involve the breakup of operational holdings.

Reforms have contributed to increases in farm output and productivity and to political stability. In China, land reform under Chairman Mao Zedong took place initially as a result of peasant mobilization against landlords. This occurred in 1949 and 1950 when landless la-

borers and peasants subdivided large landholdings and organized cooperatives. Communes were then established, but during the 1970s, households were assigned individual responsibility for crops and livestock and were allowed to dispose of farm products in excess of the fixed quotas that had to be sold to state marketing organizations.

In 1988 the constitution was amended to legalize land use rights and land transfers. The reforms have generated farm and nonfarm rural employment and eliminated the rural landlessness of the prerevolutionary era that still afflicts much of Asia, Africa, and Latin America today. The reforms have encouraged urbanization, since peasants leaving the countryside are able to rent out or cash in their property assets.

In Africa repossession of land occupied by colonial settlers was a central issue in the latter half of the 20th century. Under the so-called one million acre scheme in Kenya, more than 1,000 white-owned farms were transferred to Africans between 1962 and 1966, with Britain underwriting the land values paid in compensation. Originally the plan was to transfer private (freehold) land to three categories of African farmers: large-scale commercial farmers, small-scale commercial farmers, and subsistence smallholders.

However, the demand for small-scale commercial farms was fewer than expected, which led to resettlement of many more smallholders than had been planned. During the 1970s, small-scale African producers greatly expanded their dairy and cash crop production. This took place on redistributed farmland in the former "White Highlands" to the north of Nairobi, and on private and customary (traditional) land in the former African reserves. The expansion was a result more of the waiving of restrictions and the opening up of markets for small-scale producers than of land redistribution per se. However, productivity by small-scale African farmers on newly acquired high-potential land exceeded that of their European predecessors (and neighboring commercial farmers) in terms of returns to land and to scarce foreign exchange.

Interestingly beneficiaries in the large-scale commercial category were less successful. The new owners were expected to acquire the land with government loans, but many defaulted. By the 1980s, the largely absentee large-scale commercial farmers had become a new class of landlords. Unable to farm their newly acquired property, they had rented out their land to landless peasants rather than subject it to invasion by squatters. Although the government-run program came to an end after 10 years, most of the 10 million hectares

In developed countries of the First World, access to basic technology has transformed agricultural practices and crop yields.

of land formerly owned by white settlers has now been transferred to Africans through the land market, the operation of which has been partly fuelled by political patronage.

Between 1980 and 1989, 3.3 million hectares were redistributed to 54,000 families. An evaluation of the program in 1988 found that it had made impressive strides toward achieving its principal objectives. The evaluation stated that the orderly settlement of so many families in such a relatively short time was a major accomplishment for the new regime. The majority of families resettled benefited from increased opportunities for income generation and from the availability of health and education facilities. These findings were partly confirmed by the results of long-term research some 15 years later.

There are several lessons that may be particularly pertinent in efforts to reduce poverty through agricultural growth. It is important to place the evidence in its geographical and historical context. Care is needed in drawing conclusions for one country (or region) on the basis of experience from another. Land policies have to be sensitive to local historical, cultural, and agro-ecological circumstances. Thus, of all redistributive land reforms, those in east Asia (Japan, South Korea, and Taiwan) are regarded as the most successful in terms of their comprehensive nature, their creation of a class of independent property-owning peasants, and their im-

pact on poverty and landlessness. However, these changes were wrought in exceptional circumstances and opportunities for their application are limited.

A cyclical element is often evident in redistributive reform policy. An initially strong political commitment to land redistribution is often followed by caution as the opportunity costs and organizational complexities become apparent. Modification of the initial policy and a switch of emphasis to so-called economic goals, rather than the eradication of landlessness and poverty, may accompany this phase. Governments may then again reaffirm the needs of the landless, but in more modest terms than in the initial phase. However, in many unequal societies, extreme poverty and the threat of rural violence are endemic.

It is important to be clear whether land redistribution is about equity and social justice (especially redressing past dispossession) or whether it is about driving agricultural production. These twin goals are not automatically complementary. South Africa is an important contemporary case.

The cost of inaction can be very high. If the legitimate claims of the rural poor are ignored, the negative consequences of failing to act can be huge. Social mobilization for land reform can be fuelled and sustained by a deep sense of grievance. Initially, moderate means will be used to present the demands for land reform, but if people meet with intransigence, their demands are likely to become more radical, and farm killings and land invasions may occur.

For land reform to have a significant impact on poverty reduction it must be part of a broader process of political, social, and economic change, rather than a narrow intervention simply to redistribute land. Greater democratization is often closely linked to the reform of land rights.

Agro-industrialization of the food processing industry will bring immense benefits to the economy, raising agricultural yields, meeting productivity, creating employment, and raising the standard of a very large number of people throughout the country, especially in the rural areas. Economic liberalization and rising consumer prosperity are opening up new opportunities for diversification in the food processing sector. Many economists believe liberalization of world trade will open up new vistas for growth.

India, a developing country, wastes more fruits and vegetables than the United Kingdom's annual consumption. Also in India, more food grains are wasted than what Australia produces annually, due to lack of post-harvest facilities and food processing industries.

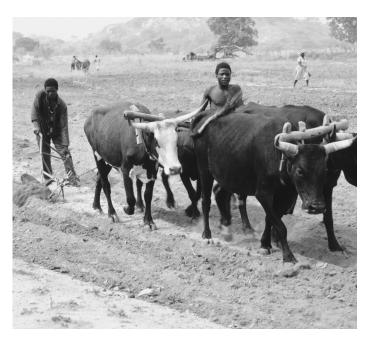

The drawbacks of agro-industrialization in developing nations are low-quality raw materials, which are not suitable for processing; post-harvest losses due to lack of proper storage and transport facilities; low linkage between farmer and industry; a shortage of technical manpower in food processing and packaging; poor agronomic practices and farm management, thereby creating poor raw materials for processing; high cost of processing, distribution, and promotion and inadequate market information; and most of the fruits are of table variety and as such are costly and not suitable for processing.

Demand for highly processed convenience food is constantly on the rise. Only two to three percent of India's agri-produce is processed as compared to 65 percent in the United States and 50 percent in Brazil. Based on the huge gap between the demand and supply in international markets and untapped domestic markets, availability of cheap labor, raw materials, and favorable government policy are all encouraging investment in the food-processing sector in many Asian countries like India and China.

With the proliferation of the highly capital-intensive information technology (IT) industry, unemployment levels are bound to shoot up, compounded by expansion of higher education facilities and falling death rates. Against this backdrop, experts say governments should take corrective action to contain the alarmingly high growth in unemployment in developing small agro-based industries (food processing). Owing to food processing's relatively low investment, high labor-intensive nature, and short gestation periods, it may be the only means of effective utilization of the rich human resource base in India, causing uplifting of the rural poor from below the poverty line and achievement of self-sufficiency.

Unless the rural economy is improved, the burden of poverty cannot be lessened.

About 65 percent of the people in developing countries are living in rural areas; many of them are still dependent on agriculture for their livelihood. Unless the rural economy is improved, the burden of poverty cannot be lessened nor can the working population overflowing from the villages be curtailed. The complementarity between agriculture and industry enables the economy to use the by-products of agriculture

In less developed countries of the Third World, agriculture is sometimes still practiced according to ancient methods with small yields.

and improve the technological base of agriculture, brining about a transformation in the rural economy.

In addition to the development of agriculture, emphasis may be laid on rural industrial and subsidiary activities for a rapid transformation of the rural economy. The advantages may be multifold: establishing linkage between agriculture and industry, increasing employment opportunities, improving economic well-being, and preventing migration of rural population to cities and thereby reducing the pressure on urban land. Many social and economic problems will be warded off when rural development takes place through this possible means of setting up agro-based small industries.

If agriculture is to be more effective in poverty reduction, farm and nonfarm linkages need to be strengthened and fostered. As far as the Bangladesh experience is concerned, the rural nonfarm economy has grown at a faster rate (about seven percent annually) than the growth in agriculture (about four percent). These have developed as backward and forward linkages of Green Revolution technologies and are characterized as rural construction and manufacturing, rural trade and other services, and rural transports.

The local-level manufacturing of irrigation equipment, growth of metal workshops and repair services, development of house-building materials, carpentry and masonry, and grain trading are the examples of dynamic segments of rural nonfarm activities.

GREEN REVOLUTION

Science and technology underpinned the economic and social gains in Asia over the past 30 years. In agriculture, these gains came to be known as the Green Revolution. Between 1970 and 1995, cereal production in Asia doubled, calorie availability per person increased by 24 percent, and real food prices halved. Although the region's population grew by 1 billion people, overall food production more than kept pace with population growth. These food production increases were achieved largely by the cultivation of high-yielding varieties (HYVs) of rice and wheat, accompanied by expansion of irrigated areas, increases in fertilizer and pesticide use, and greater availability of credit.

The scientific basis for the Green Revolution stemmed from national and international research programs that led to the development and distribution of new HYVs, particularly of rice and wheat. The first generation of these new varieties was based on the introduction of new genes for dwarfing that made the HYVs shorter, more responsive to fertilizers, and less prone to falling over or lodging when fertilized and irrigated. Subsequent varieties also carried genes that gave increased pest and disease resistance and improved taste and grain quality.

Despite these successes, problems remain. The intensification of agriculture and the reliance on irrigation and chemical inputs have led to environmental degradation, increased salinity, and pesticide misuse. Deforestation, overgrazing, and overfishing also threaten the sustainable use of natural resources. Green Revolution technologies had little impact on the millions of smallholders living in rain-fed and marginal areas, where poverty is concentrated.

Furthermore the Green Revolution has already run its course in much of Asia. Wheat and rice yields in the major growing areas of Asia have been stagnant or declining for the past decade, while population continues to increase. The key lessons learned from the Green Revolution are that it has benefited farmers in irrigated areas much more than farmers in rain-fed areas, thus worsening the income disparity between the two groups; it overlooked the rights of women to also benefit from the technological advances; and it promoted an excessive use of pesticides that are harmful to the environment.

As countries became self-sufficient in food, government investments declined in the agricultural sector and in science and technology across the region. This reflects a worldwide trend toward declining public invest-

ments in the rural sector and in agricultural research and development (R&D), nationally and internationally.

In Asia, private-sector investments in the rural sector and related R&D have concentrated on export commodities. The downward trends in public investments by governments and development agencies in small-holder agriculture over the past decade have not been matched by a concomitant rise in private investments. Similarly, there is little (and few incentives for) private R&D on the food crops, livestock, fisheries, and aquaculture systems important for food security and poverty reduction in rural Asia.

The population of Asia is projected to increase from 3 billion to 4.5 billion in the next 25 years. During the same period, the urban population will nearly double from 1.2 billion to 2 billion, as rural people move to the cities in search of employment. These increases will place massive pressure on developing countries to increase food production. Food demands will be influenced by population growth, urbanization, income, and associated changes in dietary preferences.

In this new millennium, we face a food, feed, and fiber production challenge.

Urbanization and income growth frequently lead to shifts from a diet based on root crops (cassava, yam, and sweet potato), sorghum, millets, and maize to rice and wheat, which require less preparation time, and to more meat, milk, fruits, vegetables, and processed foods. This dietary transition has already happened in much of the region. Meeting the food needs of Asia's growing and increasingly urbanized population requires increases in agricultural productivity and matching these increases to dietary changes and rising incomes.

To meet this demand, cereal production will need to be increased by at least 40 percent from the present level of about 650 million tons annually, most of which will have to come from yield increases.

In addition, meat demand will double during the period. Production increases will have to be achieved by increasing yields in a sustainable way to conserve diminishing and degraded natural resources. Nearly all of these production increases will need to take place in developing countries because on average 90 percent of the world's food is consumed in the country where it is produced. Food imports are not only expensive but discourage the creation of employment, which is badly

needed in the rural areas. In this new millennium, we face a food, feed, and fiber production challenge in highly complex farming systems for several reasons:

- 1) Water will become the most important limiting factor in agricultural production because the quality and quantity of water will decline as a result of pollution, forest degradation, and increased agricultural, domestic, and industrial use.
- 2) Urbanization will mean the loss of agricultural land to residential and industrial development, and a decline in the number of farmworkers.
 - 3) Most farmers are poor with small landholdings.
- 4) Farming systems are commonly heterogeneous with mixes of food crops, livestock, and trees.
- 5) About 70 percent of the cultivated land is rain-fed with unreliable distribution and intensity of rainfall.

Thus, the increase in food production during the next 25 years will have to be achieved using less labor, water, and cultivated land. This can be done only if scientists can develop new crop varieties with high-yield potential and high-water-use efficiency. New understanding of plant and animal genes may offer ways to increase crop yields to the levels required to adequately and sustainably feed the growing population in Asia. Thus, developments in modern biotechnology could make extremely important contributions to future agricultural growth, food security, and poverty reduction. Increasing smallholder agriculture productivity will increase food supplies, and will reduce poverty and malnutrition, increase food access, and improve living standards of the poor.

POVERTY REDUCTION

While the need for further intensification of agricultural production in Asia and several developing countries in Latin America is clear, intensification strategies must change to avoid adverse environmental impact and to reverse the effects of earlier practices. Enhanced but inefficient use of irrigation and mineral fertilizers over the past three decades has had negative side effects such as soil salinity and nutrient leaching. With crop intensification, incidences of pests and diseases also increased.

According to agricultural experts, the following strategies are needed to meet the food demand in developing countries over the next 25 years: sustainable productivity increases in food, feed, and fiber crops; reducing chemical inputs of fertilizers and pesticides and replacing these with biologically based products; integrating soil, water, and nutrient management; im-

proving the nutrition and productivity of livestock and controlling livestock diseases; sustainable increases in livestock, fisheries, and aquaculture production; and increasing trade and competitiveness in globalized markets.

As rural poverty persists in Asia, Africa, and Latin America, agriculture will play a prominent role in achieving equitable and sustainable rural growth in the 21st century. Even when rural people do not work directly in agriculture, they rely on nonfarm employment and income closely related to agriculture. Where there are large numbers of rural poor, agricultural growth is a catalyst for broad-based economic growth and development. Agriculture's linkages to the nonfarm economy generate employment, income, and growth in the rest of the economy.

The poverty reduction strategy sees three factors—pro-poor, sustainable economic growth; good governance; and social development—as key elements for reducing poverty. Biotechnology may contribute toward achieving the poverty reduction goals in several components of the strategy: increasing priority for agriculture and rural development, addressing environmental considerations; increasing the public- and private-sector roles in poverty reduction, encouraging regional and subregional cooperation, and coordinating efforts of funding agencies.

Based on the available trends, one can only infer that the Third World countries are not paying the necessary attention to agriculture. The share of agriculture in their GDP, diminishing growth rate in agriculture, and decrease of agriculture's share in foreign exchange stand as testimony to this.

The availability of vast cultivable land, rich natural resources, and a productive labor force will all help the development of agriculture if the developing nations properly utilize developments in agriculture like organic farming and the use of genetically modified seeds for producing globally competitive products. Embarking on the path of scientific farming and organic cultivation backed by sound human resources management practices will see the Third World occupy pride of place in the immense potential of developed world markets.

Agriculture-Nutrition Advantage

THE AGRICULTURE-NUTRITION Advantage project was initiated in 2002 to address hunger and malnutrition in Africa. Funded by the U.S. Agency for International Development (USAID), the Agriculture-Nutrition Advantage involves the International Center for Research on Women (ICRW) and the International Food Policy Research Institute (IFPRI). Through a variety of projects, situated in Ghana, Kenya, Mozambique, Nigeria, and Uganda, the program employs multiple approaches to develop links among agriculture, nutrition, and gender. Of these five countries, Mozambique and Uganda are considered "unlikely" to reach the Millennium Development Goal of reducing under-5 mortality by two-thirds by 2015, while Ghana, Kenya, and Nigeria are considered "very unlikely."

The Agriculture-Nutrition Advantage recognizes that an increase in agricultural production does not necessarily lead to reductions in hunger, since larger harvests will likely be sold for cash. Similarly, income from agricultural production may be diverted toward areas that do not promote health and nutrition. In addition, as others such as Food First have suggested, the production of greater quantities of food does not guarantee that those who are hungry will gain access to food. Neither does it guarantee that the nutritional quality of the food accessed by poor people will be adequate.

Project participants argue that while growing attention has been given to issues of poverty and hunger in Africa, issues of malnutrition have received far less notice. The Agriculture-Nutrition Advantage stresses that hunger and malnutrition are related, but not identical,

and too few policies and programs recognize that reducing hunger does not necessarily reduce malnutrition.

The project was initiated after a study of institutions in Uganda, Mozambique, and Nigeria carried out by IFPRI, ICRW, and USAID revealed that nutrition concerns were absent from most policy approaches to reducing poverty and hunger. The study also found a lack of collaboration between agriculture and nutrition workers. The study concluded that such collaboration across sectors might provide a powerful strategy in combating malnutrition along with poverty and hunger.

Based on its ongoing research projects the Agriculture-Nutrition Advantage works to promote the links between agriculture and nutrition with the intention of improving people's nutritional intake in a timely and sustainable fashion. Some of the linkages provided within the Agriculture-Nutrition Advantage include health education directed toward improving food care, consumption, and feeding practices; improving the preservation, processing, and distribution of food to reduce waste and postharvest nutrient loss; improving access to food by the hungry; and breeding crop varieties for better nutrient content. Yearly workshops are held bringing participants from the various country teams together to share information and develop effective strategies. During the year each country team works locally to advocate changes in policies that are informed by agriculture, nutrition, and gender linkages and to allocate resources adequately.

A key part of the Agriculture-Nutrition Advantage is the gendered analysis of food and nutrition. Women and men occupy different roles within different contexts, and have varying access to resources and decision-making processes. Such factors influence the contributions that women and men are able to make toward family nutrition. Agriculture is the mainstay of most economies in sub-Saharan Africa and women are playing central roles in food production and household nutrition. Presently, African women farmers produce up to 80 percent of food crops for family consumption and are the ones primarily responsible for providing their families with an adequate diet.

Yet at the same time, men maintain primary control over resources and decisions concerning what agricultural production will involve. Economic policies to increase agricultural production and income often do not benefit women and the rural poor because such policies commonly overlook the fact that within and among households, people do not have equal access to the goods and services that might reduce hunger and malnutrition. The Agriculture-Nutrition Advantage sug-

gests that agricultural outputs could increase by six percent to 20 percent if women had the same use of agricultural inputs as men. Reducing malnutrition requires a gender-focused approach to agriculture and nutrition as well as a reduction of gender inequities and the time and labor pressures that disproportionately impact women.

Aid to Families with Dependent Children

CASH ASSISTANCE to families in capitalistic economies is known generally as welfare. Such assistance is typically limited in amount and restricted in provision so only the most income-needy families qualify. This residualistic approach to poverty reduction is exemplified in the United States.

In the 1930s, the United States experienced wide-spread unemployment. In response, Franklin Delano Roosevelt signed the Social Security Act of 1935, which created numerous federal programs to provide relief to families. One program was Aid to Dependent Children (ADC), which targeted aid to children who experienced loss of support due to death, absence, physical incapacity. or, with limitations, unemployment of the parent. Typically, only white single mothers and their children could participate. Recipients were required to be "morally worthy" and meet an income means test.

At its inception, ADC supported few families. However, in the 1950s, the rolls grew quickly. The program became known as Aid to Families with Dependent Children (AFDC). AFDC was amended to include counseling services, in hopes recipients could be

"cured" off welfare. However, federal funds were never allocated. In 1962, John F. Kennedy expanded AFDC to provide families with more support. Promised counseling services, coupled with employment supports, were funded. Further, unemployed fathers could, in limited cases, receive services. The program was renamed AFDC-UP. The program also lowered the income means test and expanded access for minority women. Families were allowed to keep a portion of employment earnings, rather than surrender them, as an incentive to work. Despite these changes (and some would argue due to them), the rolls continued to grow, chiefly because services were inappropriate and ineffective in ameliorating the conditions causing poverty.

In the late 1960s, widely held misperceptions about who received aid and why they received it fueled public criticism of AFDC. The face of welfare became the mythological "welfare queen" (an urban, unemployed, African-American woman with multiple children by numerous fathers who failed to support their children). In response, government changed AFDC to a more punitive program. A cap on the number of "illegitimate" children in each family eligible for cash aid was instituted.

Another attempted change to AFDC was work mandates for recipients who were deemed work-eligible. Failure to comply with mandates would result in income sanctions. The program, entitled the Work Incentive Program (WIN), and the amended program, WIN-II (which increased punitive sanctions for noncompliance), are viewed historically as failures in reducing dependency on AFDC. The promise of supportive services such as childcare and transportation assistance was never delivered to the extent necessary to free parents to find employment. Further, jobs needed to enable families to become independent from cash aid did not exist within the grasp of such families (due to geographical differences between job and family, as well as other challenges). Because WIN was expensive and too few parents actually obtained jobs, it was abandoned.

In 1977, Jimmy Carter introduced the Program for Better Jobs and Income, which provided work incentives, work mandates, public works programs, and supportive services. It also differentiated between so-called deserving and undeserving recipients. Because the so-called JOBS program did not address the causes of poverty, it fared no better than WIN in reducing the welfare rolls and was subsequently abandoned.

Ronald Reagan did not worry about work mandates in AFDC so much as about lowering cash benefits. His argument was that welfare clients were too comfortable and would not therefore go to work. By lowering the amount of cash paid, it was hoped recipients would find employment. This approach did not fare any better than earlier attempts at reducing dependency.

Despite the failure of work-based AFDC programs to reduce dependency, George H.W. Bush required mandatory employment as a condition of participation. Bush's program did not reduce the rolls largely because of lack of employment opportunities in the economic market coupled with entrenched barriers to employment (such as lack of childcare, transportation challenges, and health issues).

After several decades of failed work-based AFDC, the stage had been set for a major change in the nature of cash aid programs. AFDC under Bill Clinton required work-eligible clients to take the first job available, whether it paid wages sufficient to end dependency on cash aid or not. Claiming to "end welfare as we know it," Clinton signed into law the Personal Responsibility and Work Opportunity Reconciliation Act. The AFDC program was retitled Temporary Assistance to Needy Families (TANF). Not only were recipients required to work, they could only receive cash aid for a total of 24 consecutive months and a lifetime total of five years. In addition, recipients could not receive increases in cash aid when they had more children (the "family cap").

There is much policy debate about the effects of TANF. Clearly, many recipients leave the program. Such an effect is built into the program. But to what extent TANF reduces poverty is not so clear. Numerous studies show families are worse off economically under TANF than they were under AFDC. Studies also provide emerging evidence indicating long-range effects of TANF may cause negative outcomes in child well-being indicators, such as lower educational attainment, increased child abuse, and increased health issues.

Albania

IN THE 1990s, the Republic of Albania became a multiparty democracy after almost half a century under communism. The transition process ushered in a period of high unemployment, widespread corruption, inefficient infrastructure, energy shortages, and increased criminal activity.

Over half of Albania's population is involved in agriculture; however, frequent droughts and obsolete technology inhibit agricultural success. Poor transportation and highway systems present further obstacles to a healthy economy. An important source of revenue for Albania is regular remittances by Albanians who work abroad, chiefly in Greece and Italy. Government officials are in the process of dealing with economic problems by promoting economic growth and trade while derailing violent crime. Further growth may come from exploitation of Albania's natural resources, which include petroleum, natural gas, coal, bauxite, copper, and hydropower.

As a communist country, Albania did not recognize the concept of poverty. Since the transition, the Albanian economy is one of the poorest in Europe. Albanians live on an average annual income of \$1,450, and estimates for 2005 suggest that at least one-fourth of the population lives in poverty. While the official unemployment rate is 14.8 percent, unofficial estimates place it as high as 30 percent. Unemployed workers do not qualify for social assistance.

Government data on poverty indicate that in the late 1990s, Albania had begun reducing the number of people receiving social assistance when disaster struck as hundreds of thousands of Albanians lost investments in collapsed pyramid schemes and more than 150,000 refugees poured into the country from Kosovo. Albanian poverty is particularly persistent in rural areas, and many children walk to nearby cities to sell cigarettes or shine shoes to help their families survive. Even though pensions are higher than social assistance payments, the elderly often lack basic necessities. The poorest 20 percent of the population share 9.1 percent of resources, while the richest 20 percent claim 37.4 percent of capital. Albania is ranked 38.2 on the Gini Index of Human Inequality. The United Nations Development Program Human Development Reports rank Albania 65 of 177 on general quality-of-life issues.

The social unrest of 1997 resulted in decreased access to and quality of basic healthcare in Albania. The population of 3,563,112 experiences a life expectancy of 77.24 years, and it has been steadily increasing since

1980. The median age is 28.52 years in Albania. Nearly 27 percent of the population are under the age of 14, and 8.6 percent have seen a 65th birthday. Nine percent of Albanians do not have access to safe drinking water, and three percent lack access to proper sanitation. There are 136 physicians per 100,000 residents, and 50 to 79 percent of the people have access to affordable essential drugs.

When compared to Europe as a whole, Albania's infant mortality is high, but mortality rates have declined. Between 1970 and 2002, infant mortality fell from 68 deaths per 1,000 live births to 26 deaths per 1,000. Among all children under the age of 5, the mortality rate decreased from 82 deaths per 1,000 to 30 per 1,000 during that same period. Fourteen percent of all children under 5 are malnourished. Eleven percent of under-5s are moderately to severely wasted, and 32 percent are moderately to severely stunted.

In 2005 it was estimated that Albanian women bear an average of 2.04 children each. The fertility rate has declined slightly since 2003 when it was reported at 2.2 children per woman. Adolescent fertility occurs at a rate of 15 per 1,000 births. Three-fourths of all Albanian women use birth control. Trained medical staff attends 99 percent of all births in Albania. According to modeled estimates for 2000, maternal mortality occurs at a rate of 55 deaths per 100,000 live births. This mortality rate, which is one of the lowest in Europe, is due to the low family status of women, a lack of healthcare in rural areas, and general ignorance of proper healthcare for pregnant mothers.

Literacy in Albania is defined according to the percentage of the population over the age of 9 who can read and write. Great strides have been made in reducing illiteracy. Approximately 87 percent of Albanians are literate. Over 93 percent of all males in the relevant group can read and write, but only 79.5 percent of females in the group have mastered these skills. In 1980, 78.8 percent of males and 52.6 percent of females were literate

All children in the relevant age group complete primary school. The rise in female completion rates has been particularly significant since only 93 percent of girls completed this level of education in 1990. Less than half of young children attend preschool, and there are few provisions for disabled children in Albania's educational system. Dropouts are particularly high among Roma children.

Alcohol and Drugs

DO THE POOR USE illegal drugs and abuse alcohol more frequently than the wealthy or middle class? Is substance abuse a cause of poverty or a result? A 2001 survey found that Americans living in poverty listed drug abuse as a principal cause, not a result.

Since the 1960s, much American political debate has centered on the causes of poverty. Political progressives traditionally argued that the causes of poverty include society's systematic injustices, technological change, and America's shift from a manufacturing to a service and information economy. Conservatives have rebutted that poverty preceded such problems and results from a long list of causes, including wrong personal choices, such as drug abuse, exacerbated by bad government policy.

A variety of studies support the concept that poverty and substance abuse go hand in hand. One survey found that the rate of monthly drug use among welfare recipients in northern California was almost four times that of the area's general population. Another found levels of drug use among welfare recipients twice that of the general public. Another found a high inci-

For those trying to escape poverty, alcohol and drug abuse only provides temporary relief and often exacerbates the problem.

dence of substance abuse among the homeless, particularly those in urban settings living on the street.

Are the poor more susceptible to substance abuse? Stressful conditions with which the poor cope often include unemployment, underemployment or off-and-on employment, low-status and low-skill jobs, unstable family and relationships, low involvement in the community, a sense of being isolated from society, low ambition, and feelings of helplessness. Such conditions can cause a person to seek relief by indulging in illegal drug use and/or alcohol abuse.

Feelings of destitution and hopelessness often cause the despairing to seek transcendence by abusing substances. Long-term strategies typically elude those who suffer, as they seek immediate escape or release. Substance abuse can seem therapeutic, at least for the moment.

But such behavior severely impairs an individual's ability to cope with the very factors causing hopelessness, compounding personal aimlessness and intensifying the sufferer's sense of destitution. Furthermore, indulging expends the poverty-stricken individual's meager economic resources, providing only a temporary, impermanent solution at best.

Hence many individuals are trapped in a cycle of poverty and substance abuse: a man drinks because he is depressed at not having a job or being able to provide for his children; because he is frequently intoxicated, he cannot find or keep a job; because he is spending his money on substance abuse, his financial inability to provide is intensified as well as his sense of guilt—and so, he drinks more heavily to escape the hopelessness.

Can this cycle be broken? The U.S. Department of Health and Human Services' National Institute on Drug Abuse (NIDA) identifies what it calls protective factors within society that can reduce risk factors leading to substance abuse. These protections, also referred to as prevention assets, result in reduced potential for substance abuse or make substance abuse less likely. Among these are a family consensus that drug use is unacceptable; clear rules of conduct that are consistently enforced within the family; involvement of parents in the lives and activities of their children; parental monitoring of children's activities and scrutiny of their peers; strong and positive family bonds; strong bonds with local institutions, such as school and church; and recognition by parents for their children's successful school performance.

Each of these protective factors exists in poor as well as wealthy families. By the same token, the risk factors identified by NIDA describe a diminished quality of life, indeed a "poverty," that can exist even in wealthy families: a lack of parent-child attachments and nurturing; chaotic home environment, particularly in which parents abuse substances; conflicts between family members; existence of verbal, physical, or sexual abuse within the family; families that don't spend much time together; family members with a history of alcohol or other drug abuse; inappropriately aggressive behavior in the classroom; ineffective parenting, especially with children with difficult temperments or conduct disorders; lack of clear rules and consequences regarding alcohol and other drug use; loss of employment by the key family income provider; parents who have trouble keeping track of their teens, particularly in regulating whom they are with and where they go; parents who have trouble setting rules, consistent expectations, and limits; poor social coping skills on behalf of students and parents; student failure in school performance; use of drugs and alcohol by parents, particularly involving youth in that use or tolerating use by youth; youths belonging to a group, such as a street gang, where drug use and alcohol abuse are accepted and even expected and applauded by the peer group; youths who associate with drug-using peers; youths who begin exhibiting problem behaviors at an early age, such as early sexual activity, illegal drug and alcohol use, and antisocial attitudes; and youths who think most of their friends use illegal drugs and abuse alcohol.

It is noteworthy that the American government's current War on Drugs was an outgrowth of the 1960s War on Poverty and has been the predominant theme of American drug policy for over four decades. That ef-

fort is multifaceted and is directed at the well-being of the nation as a whole with the reduction of poverty as an identified strategy.

Algeria

NEARLY ONE-fourth of the population lives below the poverty line in the North African nation of Algeria, which is ranked as lower-middle-income by the World Bank. Approximately six percent of Algerian children are malnourished. While efforts to alleviate poverty have been successful to some extent, progress has been tempered by terrorist attacks and by earthquakes, droughts, and floods. Resources are unequally divided, with the lowest 20 percent of the population receiving only seven percent of the total per capita income. Between 1988 and 2000, the poorest 20 percent of the Algerian population consumed only 7.5 percent of all goods, while the richest 20 percent consumed 43.2 percent. According to the United Nations Human Development Report, Algeria ranks 108 out of 177 nations in quality of life.

Algeria's resources have been drained by the political infighting that resulted in over 100,000 deaths in the 1990s. While the government has become more stable, the Algerian government must deal with high unemployment (25.4 percent), housing shortages, tenuous access to electricity and water, continued political unrest, and corruption. Efforts are under way to diversify the Algerian economy, which has been historically dependent on petroleum products. Hydrocarbons provide some 60 percent of Algerian budget revenues, almost

on-third of the Gross Domestic Product, and more than 95 percent of all export earnings.

The median age of Algerians is 24.36 years, and life expectancy is 73 years. Almost one-third of the population of 32,531,853 is under the age of 14 and only 4.7 percent are over the age of 65. The health of Algerians is affected by diseases such as bacterial diarrhea, hepatitis A, and typhoid fever, which are spread through infected food and water. Algeria has been more effective in checking the spread of HIV/AIDS than some other African nations, and fewer than 500 Algerians have died from this disease. Algeria has an 89 percent success rate for curing individuals diagnosed with tuberculosis.

The Algerian government has made significant progress in improving the lives of its children. In 1960, the mortality rate for children under 5 was 243 per 1,000 live births. After the introduction of new programs and policies, that number decreased to 140 deaths per 1,000 live births. Infant mortality is now reported at 31 deaths per 1,000 live births. Algerian male infants have a higher chance (34.83) of survival than Algerian females (26.98).

Immunization rates in Algeria are relatively high, and 84 percent of children ages 12 to 23 months are immunized for measles and 87 percent are immunized for DPT3. Immunization rates for Algerian infants increased significantly between 1990 and 2000. Immunizations for DPT rose from 58 to 86 percent; polio immunizations increased from 72 to 86 percent; and measles vaccinations rose from 53 to 81 percent. Professional medical staff now attend 92 percent of all Algerian births.

In order to improve reproductive health, the National Solidarity Fund underwrites medical costs for poor women, supplementing free services already provided by government-operated clinics. The dissemination of birth control has resulted in a low fertility rate of 2.8 per female. Approximately 57 percent of Algerian women ages 15 to 49 use some method of contraception.

Algeria has made education a priority, enforcing free and compulsory education for all children from the ages of 6 to 16. During the 2003–04 school year, primary school enrollment reached 100 percent. In order to improve access to education, Algeria increased the number of neighborhood schools. Because of the new programs, the numbers of both males and females attending secondary and tertiary schools have also risen. Concentrated efforts have been directed at reducing illiteracy rates. In 1980, 50.5 percent of males and 75.5 percent of females in Algeria were illiterate. Illiteracy

rates had declined to 9 percent for males and to 19.4 percent for females in 2004.

In response to pressure by the Commission on the Status of Women, and the goals that arose out of the Beijing Declaration and Platform for Women, Algeria established new priorities concerning quality-of-life issues and instituted new social programs designed to eradicate poverty by 2005.

The Algerian plan to eradicate poverty included targeting specific areas and groups where poverty is most prevalent and developing programs and policies designed to solve the problems that allowed poverty to flourish.

Algeria pledged that by 2015 it would slash extreme poverty to 2.85 percent.

In 2001 the Ministry of Employment and National Solidarity announced that it had identified 12 antipoverty objectives, including upgrading healthcare for mothers and children and ending sex discrimination and violence against women. A budget increase of five percent was approved for the Social Development Agency and Social Activity Directorates.

The Algerian government pledged that by 2015 it would slash the rate of extreme poverty to 2.85 percent and cut the rate of individuals living on one dollar a day to one percent. Antipoverty measures also include reduction in Algeria's infant mortality rate, controlling the spread of HIV/AIDS and other infectious diseases, and increasing the number of deliveries in medical facilities to 99 percent.

Almshouses

THE PREAMBLE to almshouses is the act of almsgiving, a gift of charity to the less fortunate in the form of money, property, or bequest. It arises from the basic impulse of humans to help those who cannot help themselves. While practiced by many religions including Buddhism and Islam, almsgiving is especially important in Judaic and Christian religions where it is seen as an obligation.

The giving of alms became increasingly important with the rise of Christianity and the formalization of church structure. The collection and administration of alms were the responsibility of the local deacon reporting to the bishop, and the early recipients of alms were travelers, slaves, and prisoners. In this and later contexts, alms were a form of outdoor relief and were disbursed from the monasteries (or almshouses).

Increased religiousness, coupled with a growing sense of obligation, led individuals to greater charitable acts. These culminated in endowments for the creation of residential almshouses for the indigent, usually attached to a particular monastic order or parish. Such almshouses were based on the Christian hospitals that were founded in the 4th century and are among other religious charitable institutions such as orphanages and schools. In England and Europe, almshouses for the aged, poor, and infirm were established in the 10th and 11th centuries. By the early 14th century, the endowment of almshouses had become a common charitable bequest. In England, the number of almshouses grew after the Reformation.

Contrary to popular notion, the intention of the almshouse was not to offer care to all those in need. Residents were selected according to the particular standards and religious practices of the almshouse and were expected to follow certain rules and participate in obligatory activities such as attendance at church or chapel. The creation of almshouses was part of the movement toward the institutionalization and control of the poor, elderly, and infirm. In Europe, changes in attitudes toward the poor began in the 14th century and included provisions such as the control of begging and the issu-

ing of badges for licensed beggars. This attitude was cemented in England with the Poor Law of 1531, which provided for punitive measures for able-bodied beggars who did not work and were seen as a threat. In some regions, almshouses became synonymous with workhouses for the able-bodied poor. The creation and management of institutions such as almshouses moved from the exclusively religious domain toward secularization through civic charity and the work of lay confraternities.

Jails and almshouses were two institutions that migrated from England to colonial America. Throughout the early 19th century, almshouses provided some level of care and shelter to a wide variety of individuals including orphans, unwed mothers, the infirm, and mental defectives. A move to separate people into groups by age and infirmity began in the latter part of the century, resulting in specific institutions for orphans, the destitute aged, the tubercular, the feeble-minded, and the crippled. Throughout this period, almshouses evolved from institutions containing a mix of ages and infirmities into homes for the aged. By 1923, those over the age of 60 accounted for approximately two-thirds of all almshouse residents in the United States, compared with one-third in 1880. This trend is reflected in the U.S. Census of 1940 where the classification of almshouse changed to "home for the aged." Almshouses had clearly moved away from their religious roots, as these newly named institutions were eligible for subsidization under the federal welfare program of Old Age Assistance. However, some exceptions to the secularization of this period exist, such as the work of the Society of St. Vincent de Paul and other religious groups, catering to the needs of specific religions.

Most almshouses were built following a similar general plan that included self-contained units under one roof, plus a chapel and a common meeting room. As examples of physical buildings, almshouses provide distinctive forms of architecture that are sought after, prized, and conserved. In Britain, many almshouses, also known as Bedehouses, are still used for their original purpose of providing communal shelter. While these usually exist without the previous ties to monastic orders or parishes, they continue to serve the needs of the aged as charitable organizations.

American Friends Service Committee

THE AMERICAN FRIENDS Service Committee (AFSC) was formed in 1917 as an organization uniting American and Canadian Quakers to enable them to promote international peace and reconciliation after American military forces entered World War I (1914–18). The AFSC helped conscientious objectors to work as ambulance drivers and relief workers as an alternative to military service, to which Quakers, as pacifists, objected.

This public service was extended in World War II (1939–45) to allow a wider range of occupations for those wishing to take advantage of them. In recognition of its actions, the AFSC was, jointly with its British counterpart the Friends Service Council, awarded the Nobel Peace Prize in 1947. Both before and after the war, AFSC workers were active in helping provide relief to civilians caught up in warfare and disaster, from Russia to Biafra and Vietnam.

Its program of Voluntary International Service Assignments, which sent professionals overseas for temporary postings, was adopted as a model in the establishment of the U.S. Peace Corps. More recently, the scope of the AFSC has broadened to include consideration of the victims of injustice and inequality in the United States, including Native Americans, Mexican Americans, African Americans, migrant workers, prisoners, and the poor.

The AFSC has adopted the slogan "Quaker Values in Action" to describe its mission to bring about change in society, motivated by religious beliefs. Its values statement (adopted in 1994) states that "we cherish the belief that there is that of God in each person, leading us to respect the worth and dignity of all. We are guided and

empowered by the Spirit in following the radical thrust of the early Christian witness. From these beliefs flow the core understandings that form the spiritual framework of our organization and guide its work." A consequence of this is the struggle to understand poverty and other forms of injustice and to oppose it wherever it is found: "We seek to understand and address the root causes of poverty, injustice, and war. We hope to act with courage and vision in taking initiatives that may not be popular. We are called to confront, nonviolently, powerful institutions of violence, evil, oppression, and injustice. Such actions may engage us in creative tumult and tension in the process of basic change. We seek opportunities to help reconcile enemies and to facilitate a peaceful and just resolution of conflict." The AFSC is funded by individual and organizational donations and beguests and these exceeded \$47 million in the financial year 2004.

The AFSC's opposition to violence and to military action have brought it into debate and confrontation with government officials and politicians of differing opinions, and the supporters of the latter make their views known in the popular media. The Eyes Wide Open campaign travels across America with a pair of combat boots representing each deceased U.S. service person and a large number of shoes and sandals to represent the unknown thousands of Iraqi civilians who have died as a result of the war in Iraq.

America's Second Harvest

AMERICA'S SECOND Harvest is the largest domestic hunger relief organization in the United States. Through a national network of food banks, the organization helps feed 23 million hungry people annually by distributing food that is consumable but cannot be sold by grocery stores. More than 500 national grocery and

food service companies contribute surplus food to America's Second Harvest regional food banks where it is sorted, warehoused, and distributed to organizations that provide food directly to hungry people.

America's Second Harvest defines hunger as the inability to purchase enough food to meet basic nutritional needs. It distributes food, educates the public about hunger in the United States, and advocates for public policies that address the needs of hungry people.

The concept of food banking began in the late 1960s when a volunteer at a local food bank in Phoenix, Arizona, began soliciting donations of food products that would otherwise go to waste. Soon, more food was generated than the soup kitchen could use, and a warehouse was established to store the donated products for distribution to other hunger-focused charities. The practice spread throughout the United States assisted by federal grants and the 1976 Tax Reform Act, which provided corporate tax incentives for the donation of surplus food.

Second Harvest was founded in 1979 as a network of 13 food banks and distributed 2.5 million pounds of food that year. In 1999, the organization's name was changed to America's Second Harvest with a new goal—ending hunger in the United States. In 2005, America's Second Harvest secured and distributed 1.8 billion pounds of food and grocery products to more than 200 regional food banks and food rescue operations in 50 states, the District of Columbia, and Puerto Rico. Products were distributed to 50,000 food pantries, soup kitchens, women's shelters, Kid's Cafes, and Community Kitchens.

In 2002, the organization merged with Foodchain, the nation's largest food rescue organization. Food rescue programs are designed to distribute to hungry people ready-to-eat surplus food from banquets, cafeterias, and restaurants. Distribution of prepared meals through food rescue programs reduces food waste and complements the distribution of unprepared food, the traditional staple of food banking.

America's Second Harvest educates the public by producing research, disseminating information about hunger through the media, and sponsoring activities such as National Hunger Awareness Day 2005. Its reports Hunger in America 2001 and Hunger in America 2005 are comprehensive studies of emergency food providers and consumers in the United States. America's Second Harvest frequently partners for education and advocacy with organizations such as Food Research and Action Center, Bread for the World, and the Congressional Hunger Center. The organization's Hunger

Action Center provides information about current federal and state hunger-related legislation and facilitates contacting policymakers.

Community Kitchens train underemployed persons in basic food preparation skills while using donated food to prepare balanced meals for hungry people. During disasters America's Second Harvest works with the American Red Cross providing relief supplies to emergency feeding centers. A network of 1,000 Kid's Cafes provides free and prepared food and nutrition education to hungry children in schools and other locations where children congregate. The National Backpack Program provides children with food for the weekend when they do not have access to free and reduced-price school breakfasts and lunches.

Ancient Thought

THE FIRST USE of the word poverty surfaced in the biblical world around the 10th century B.C.E., referring to landowners who forced peasants to sell land. The term was used in the Bible, turning from adjective into noun, to indicate a situation of precariousness (that is, physical, material, or relational). This was a new condition because up to then most societies were gift-based: poverty as a social condition was not present; reciprocity, redistribution, and domestic administration were the ruling principles. Then gift economies changed into barter economies, and the concept of poverty as a social condition began to be registered (during the 10th to 8th centuries B.C.E., in the Book of Proverbs). It coincided with the institution of monarchy in Israel in the 10th century B.C.E. and the advent of merchant civilization in Greece in the 8th and 7th centuries.

As a concept, poverty expresses two main conditions: destruction of the ties of social solidarity (destituteness, relational lack, and dependence on others) and the choice of virtue (humbleness, call for justice, and voluntary poverty), according to M. Rahnema. Thus, the concept of poverty began to appear in literature around the same time as tribes began to trade using money, instead of just exchanging objects. Although some forms of money were present among the peoples of the Near East already in the 13th century B.C.E., it was the Greeks who first used metal coins as a currency, thus giving birth to money as concept, as a common medium of exchange (during the 8th century B.C.E., money was called *nomisma* in Greece). In the same period, ancient Greek philosophy began to assign value to different types of abstract thought and to develop the first Western metaphysics.

We see thus that the time of the production of the concept of poverty was the time of the first coinage and of the first production of abstract thought. The concept of poverty can be read in relation to money and to abstract thought. In relation to money, poverty is the expression of a relational lack: it is the rupture in the equivalence established by the economy of exchange, the expression of the breaking of the social tie. In relation to thought, poverty is the material expression of the operation of abstraction done by the first philosophers of Western metaphysics. Poverty expresses at once a relational lack and the material side of knowledge.

In biblical and classical antiquity, poverty is perceived in two ways: one designates poverty as "disempowerment" of any kind (mental and material) and one connects poverty to justice, happiness, and virtue, according to Rahnema. Disempowerment (the Greek penia, the Persian and African meskîn and deha, the Persian faqir, darvîsh, bî kas, the biblical rash) forms a concept opposed to the one of economic value; the second expresses a moral line of voluntary poverty and is a force connected to self-realization.

A further mutation of the concept occurred in the later Roman Empire, with the advent of Christianity and its emphasis on charity, when, with the notion of "love of the poor," the "poor" was invented for the second time. As it became a virtue to patronize and protect the poor, they became better integrated into society. Paul expresses this idea with the figure of the "cheerful giver," a person prepared to make sacrifices for the sake of the community; an *isotés*, a levelling out or equalizing of resources between the brethren, was promoted. In medieval Christian society, regarding the conceptualiza-

tion of capital and value, the poor of ancient Israel expressed the lack of solidarity and became, from one side, an image of misery; from the other, virtue was replaced by the flourishing of the uses of poverty (from the use of poverty in Peter John Olivi, to Francis's choice of poverty, and Claire's privilege of poverty).

Andorra

THE SMALL PRINCIPALITY of Andorra is located in the Pyrenees Mountains on the border between Spain and France. It is a landlocked country. The summers in this mountainous region are generally warm and dry. Andorra's natural resources include timber, iron ore lead, and hydroelectric power generation. Arable land is limited to just over two percent of the total land area. As such most of Andorra's food is imported from other countries, mainly Spain and France. The country is the focus for several important land routes through the Pyrenees.

The economic mainstay of Andorra is tourism. Approximately 80 percent of its Gross Domestic Product (GDP) derives from this thriving industry. Andorra boasts of a duty-free status, a factor that accounts in large measure for its success in attracting over nine million tourists per year. The Andorran labor force reflects

the country's emphasis on services: agriculture represents only one percent of the workforce. Industry claims 20 percent (primarily in tobacco and wood products), while the service sector accounts for over 80 percent of total workers. In addition, Andorra's banking industry is highly efficient. Not surprisingly, Andorra's chief trading partners are Spain and France, together accounting for over 90 percent of both imports and exports. A number of significant environmental issues are currently being addressed in the country; these include deforestation and overgrazing, both contributing to significant soil erosion, and air pollution primarily emanating from the capital and largest urban area, Andorra la Vella (population 21,000).

Andorra became a sovereign state in 1993. For several centuries prior to attaining sovereignty and beginning in 1278, Andorra existed under the joint governance of France and Spain. A French count and the Spanish bishop of Urgel jointly held all executive, legislative, and judicial power in the government. A series of reforms was initiated in 1966, resulting in the formation of a parliament and eventually in the granting of suffrage to women in 1970. Clarifications in the requirements for Andorran citizenship were also accomplished in the 1970s.

The population of Andorra is 70,549 (July 2005). Its population growth rate is slightly under one percent per year, a rate lower than the world average and on a par with the most developed countries in the world. Life expectancy at birth in Andorra is exceptionally high: for the total population it is 83.5 years, for males 80.6 years, and for females 86.6 years. Ethnic groups in Andorra include Spanish (43 percent), Andorran (33 percent), Portuguese (11 percent), and French (seven percent). The literacy rate for the country is reported to be 100 percent.

Although Andorra was a very poor region for most of its existence, it now exhibits no poverty. The country's GDP per capita is over \$27,000 and its unemployment rate in the last 10 years remains at or near zero.

Angola

WHILE ANGOLA ENJOYS relative wealth on a national level as a result of its thriving oil and diamond industries, the percentage of the population living in poverty is astonishingly high. The chaos and destruction resulting from a colonial revolution that lasted from about 1961 to 1975 and a civil war that raged off and on from 1975 to 2002 have left Angola with a dire human rights situation.

The lack of a stable government over the past 30 years has led to reliance on disparate statistical information, but it is estimated that in Angola's urban sectors, in which 50 percent of the country's population reside, nearly 90 percent of individuals are living below the poverty line. If extrapolated, these statistics suggest that a vast majority of Angolans may be living in poverty at the beginning of the 21st century.

The prevailing cause of Angolan poverty has been the destabilization of society for nearly half a century during the wars for independence and governance. At the end of the civil war in 2002, four million Angolans were displaced either internally or externally. While this number made up 30 percent of the population at the time, it does little to demonstrate the debilitating role displacement has played in modern Angolan history.

Forced migration became a reality for Angola's predominantly rural population in 1961 when rebel groups began fighting separate battles against Portuguese colonial forces. In 1974–75, when Portugal relinquished control of Angola, almost all of the 330,000 Europeans living in Angola fled at the outbreak of civil war, leaving Angolan cities virtually vacant. Rural populations, whose safety was threatened by local conflicts, began flooding into cities. This trend of rural Angolans taking refuge in urban areas has been a major factor in the poverty crisis that affects Angola to this day.

It is impossible to calculate just how many Angolans have been displaced over the past 30 years, but what was a predominantly rural country in 1975 now has 50 percent of its population living in city centers. This constitutes a colossal demographic change, which

War refugees fleeing to urban centers have been a major factor in the poverty crisis that affects several nations in Africa.

has given rise to massive impoverishment. Today, rural regions are devastated by the effects of war, underpopulated, unequipped for agricultural renewal, cut off from markets, and lacking basic social services.

In the urban environs, the influx of refugees has caused major overcrowding in areas unequipped to deal with the populations they were intended to hold. Lack of infrastructure has caused a gross shortage of clean water, waste collection, crime prevention, medical services, and most importantly food. Overcrowding has compounded these structural woes and created a crisis in urban Angola.

Since 2002, Angola has been governed under a peace treaty, with elections taking place in 2006. In the interim peacetime, the majority of internally displaced Angolans have returned home along with many of the refugees who fled to neighboring countries. The reintegration process, and with it the alleviation of mass poverty, is a lot more complicated than just returning citizens to their homes.

However, a burgeoning government, which promises civil stability and social services, in conjunction with international and private aid, brings the hope that the rampant poverty that has plagued the Angolan people for so many years will soon begin to be a thing of the past.

Anti-Defamation League

The Anti-Defamation League (ADL) was founded in 1913 in response to a climate of anti-Semitism and racism that permeated American society of the time. The stated mission of the ADL is: "to stop, by appeals to reason and conscience and, if necessary, by appeals to law, the defamation of the Jewish people. Its ultimate purpose is to secure justice and fair treatment to all citizens alike and to put an end forever to unjust and unfair discrimination against and ridicule of any sect or body of citizens."

The history of the ADL has repeatedly demonstrated the organization's commitment to its mission. In its first decade, stereotypical anti-Semitic cartoons and stories were common in newspapers and magazines in the United States. Adolph Ochs, an early member of the ADL and publisher of the New York Times, successfully convinced fellow publishers to stop such submissions. In the 1920s, the ADL took on Henry Ford, a vehement anti-Semite, who promoted his views in the Dearborn Independent newspaper, forcing him to apologize for his anti-Semitic propaganda. The 1930s and the Great Depression brought out anti-Semitic sentiment in the United States and other countries, and allowed for the growth of Nazism in Europe. Radio personalities such as Father Charles Coughlin popularized the stereotypical view of Jews. The ADL's reaction was to discredit Father Coughlin with evidence countering his words.

In the 1940s, the ADL used legal means to fight housing, education, and immigration quota discrimination. The 1950s brought the fight against McCarthyism, and support for the civil rights movement, including an amicus brief in *Brown v. Board of Education*. In the 1960s the ADL supported passage of the Civil Rights

and Voting Rights Acts. Since the 1970s, the ADL has fought various attempts by the anti-Israel movement, white supremacists, and terrorists to support their anti-Semitic missions.

In recent years, the ADL has continued to take an active role in countering threats to the liberties of Jews and non-Jews alike. It has worked to increase dialogue between Jews and Christians by educating each about the other's religion. The ADL also is involved in providing educational materials to teachers and students dealing with a variety of issues, such as discrimination against persons with physical disabilities, the Holocaust, internet rumors regarding a variety of topics, and laws promoting religious discrimination. For example in 2005, the U.S. House of Representatives passed H.R. 2123, which would allow federally funded faith-based Head Start programs to base hiring and firing decisions on religious beliefs of the organization, a probable violation of the First Amendment right to freedom of religion.

The ADL has also taken an active role in antiterrorism activities. The organization's website maintains information on both domestic and international terrorist organizations. Also, the ADL is active in the dissemination of current information about the state of terrorism to law enforcement agencies around the world, as well as providing training opportunities to law enforcement, military, and intelligence officers, through cooperative agreements with agencies and governments around the world.

Antidiscrimination

THE RIGHT TO EQUALITY and the principle of nondiscrimination are among the most fundamental elements of international human rights law. As humankind faces the dilemma of poverty, a powerful tool

is the Universal Declaration of Human Rights, articles 1 and 2, adopted in Paris in 1948, which proclaim: "All human beings are born free and equal in dignity and rights. They are endowed with reason and conscience and should act towards one another in a spirit of brotherhood. Everyone is entitled to all the rights and freedoms set forth in this Declaration, without distinction of any kind, such as race, color, sex, language, religion, political or other opinion, national or social origin, property, birth or other status. Furthermore, no distinction shall be made on the basis of the political, jurisdictional or international status of the country or territory to which a person belongs, whether it be independent, trust, non-self-governing or under any other limitation of sovereignty."

But with mankind empowered since 1948 with such profound antidiscrimination principles, have prejudice and resulting institutionalized poverty that it inflicts been abolished? A glance across the globe finds:

In July 1983, armed groups of ethnic Sinhalese of the Buddhist religion attacked the homes of ethnic Tamil of the Hindu religion in the Sri Lankan capital of Colombo, attacking the Tamils and driving them out with a death toll of more than 3,000, destruction of millions of dollars of property, and the creation of thousands of refugees as their homes and property were burned, looted, or seized.

Between December 1998 and December 2001, an estimated 2,000 native Christians on the Indonesian island of Sulawesi were killed in attacks by bands of Muslims from the nearby Maluku Islands, where an estimated 8,000 Christians had been killed in a four-year period from 1999 to 2002 and thousands were driven from their villages and land, resettling on predominantly Christian Sulawesi as destitute refugees.

In March 1999, Human Rights Watch denounced slavery practiced in Sudan conducted by governmentbacked and armed militia of the Baggara tribe in western Sudan, directed mostly at the civilian Dinka population of the southern region of Bahr El Ghazal. The tribal militia, often operating with government troops, raided Dinka villages, looting cattle and food as well as abducting women and children for use as domestic slaves and for sale in adjacent countries. The abducted children and women often lead lives of extreme deprivation and cruelty at the hands of their masters. They are denied their ethnic heritage, language, religion, and identity as they are cut off from their families and are held by Arabic-speaking captors, most of whom rename the abductees with Arabic names and coerce the children and women into practicing Islam.

In July 2005, the United Nations' World Food Program estimated that 2.9 million Zimbabweans would require food aid over the year ahead, an estimated 36 percent of Zimbabwe's population. The famine was blamed on food shortages and limited tillage after millions of acres of farmland owned by the white descendants of European colonials were confiscated by the Zimbabwe government, divided into small parcels, and given only to blacks belonging to the political party of President Robert Mugabe.

In December 2005, relief workers in Guatemala reported, despite laws prohibiting such discrimination, that native tribal Kacquikels continued to be denied education since tradition holds that they are cursed to lives of poverty and will never prosper; hence teaching their children to read or engage in enterprise would be futile.

Antigua and Barbuda

The Caribbean islands of Antigua and Barbuda have been independent states within the British Commonwealth since 1981. Tourism dominates the economy of the islands, and Antigua and Barbuda have experienced an economic slowdown since the beginning of the 21st century.

Around seven percent of the labor force on the islands are involved in agriculture, which furnishes food for the islands. Fresh water is limited, making irrigation difficult. Periodic droughts are also a danger to crops. Manufacturing centers on bedding, handicrafts, and electronic components. Local manufacturers run into problems when trying to hire workers because islanders are able to make more money working in the tourist in-

dustry than in other industries. Nevertheless, there is an 11 percent unemployment rate.

Data are not always available for Antigua and Barbuda on major social indicators, making poverty analysis more difficult. The islands have a Gross National Income (GNI) per capita of \$9,160. The poverty level is estimated at 12 percent, but the number may be higher. Most of the poor are single mothers and their dependent children. About 10 percent of island children under the age of 5 are malnourished. Based on partial data, the United Nations Human Development Report ranks Antigua and Barbuda 55 of 177 on general quality-of-life issues. This ranking is high for the region.

The population of 68,722 enjoys a life expectancy of 71.9 years and a median age of 26.97 years. Life expectancy has increased steadily over the past decades, particularly among females, who can expect to outlive males by at least five years. Approximately 28 percent of the population are under the age of 14, and 4.1 percent of the people have reached the age of 65. Most islanders have easy access to safe water (91 percent) and proper sanitation (95 percent). There are 105 physicians for every 100,000 residents, and 50 to 80 percent of the population can afford essential drugs.

Infant mortality is relatively low at 19.46 deaths per 1,000 live births. Female infants are hardier, with a 15.29 per 1,000 death rate as opposed to 23.43 for male infants. In 2003, infant mortality was reported at 11 deaths per 1,000, and the mortality for all children under the age of 5 was recorded at 12 deaths out of 1,000. Around 10 percent of all children under the age of 5 are malnourished, and four percent are severely underweight. Approximately 11 percent of island babies are underweight at birth. About 10 percent of children under the age of 5 suffer from moderate to severe wasting, and seven percent experience moderate to severe stunting. Childhood immunizations are almost 100 percent among children from birth to 23 months, with only one percent failing to be immunized.

Since 1990 the total fertility rate of women on the islands has been recorded at 1.7 children per woman. Adolescent fertility stands at 62 per 1,000. Between 1980 and 2005, the number of women using birth control increased from 48 to 53 percent. Trained medical staff attend 100 percent of all births, and all women on the islands have easy access to prenatal and antenatal care. Maternal mortality is estimated at 150 out of 100,000 live births.

Illiteracy among Antiguans and Barbudans is relatively low. About 10 percent of males and 12 percent of females over the age of 15 cannot read and write. Liter-

acy rates have steadily increased since 2000 when rates were reported at 80 percent for males and 83 percent for females. Education is available to all children, and 98 percent of all children attend primary school. Numbers are not available on completion rates.

Human Development Index Rank: 60 Human Poverty Index Rank: Not included.

Antipoverty Organizations

AT THE BEGINNING of the 21st century there is an ever-increasing gap between the rich and poor in both developing and developed countries. Although this disparity began in the 19th century, it has expanded more rapidly since the end of World War II.

In fact, over the last 60 years poverty has become such a problem that many organizations, agencies, and philanthropists have devoted significant time, energy, and funding to combat it. An indication of just how severe the problem is can be seen by the fact that the world's poor—the some 2.5 billion people who subsist on less than \$2 per day—are now more hungry, less sheltered, and more insecure in their living situations than at any time in modern history. The irony is that while the poor are experiencing extreme hardships, cor-

porations, executives, and the wealthy are increasing their net worth at unprecedented levels. For example, the number of millionaires and the wealth they have accumulated have continued to grow by 8 percent from 2003 to 2004 alone, while the number of people, most of whom live in Least Developed Countries (LDCs) on less than \$1 per day, is pervasive, persistent, and increasing according to a 2002 United Nations report.

Due in part to this imbalance, antipoverty organizations have sprung up to advocate for and provide assistance to people who cannot meet their own needs. While the United Nations and developed countries have many departments charged with alleviating poverty, many are inefficient and underfunded. Agencies such as the United Nations Development Programme (UNDP) typically furnish emergency aid, but do little to sustain development projects that would cut poverty in the long term. In an effort to meet this need, nongovernmental organizations (NGOs) such as Focus on the Global South, Global Exchange, Third World Network, and the 50 Years Is Enough Network have been working diligently to combat world poverty from the grassroots level. The following are some of the foremost antipoverty organizations that work to redress the problems of world poverty on an international level.

50 YEARS IS ENOUGH

50 Years Is Enough is a coalition of over 200 U.S. grass-roots, women's, solidarity, faith-based, policy, social and economic justice, youth, labor, and development organizations dedicated to the profound transformation of the World Bank and the International Monetary Fund (IMF). It was founded in 1994, 50 years after the World Bank and the IMF were created at Bretton Woods, New Hampshire. The network is active in more than 65 nations and is committed to making IMF and World Bank development programs democratic and accountable to those receiving assistance through programs of education and action.

JUBILEE USA NETWORK

Jubilee USA Network (formerly Jubilee 2000) is a Washington, D.C.-based group that advocates international debt cancellation for the world's poorest countries. It has over 60 member organizations, including labor, churches, religious communities and institutions, AIDS activists, trade campaigners, and over 9,000 individuals. Jubilee insists that the debt charged to many countries, most considered LDCs, is unjust, unpayable,

and that paying back these debts exacts too great a social and environmental toll on the poor.

GLOBAL EXCHANGE

Founded in 1988, Global Exchange is an international human rights organization dedicated to promoting social, economic, and environmental justice around the world. By sponsoring and guiding "reality tours," they aim to increase public awareness of root causes of injustice while building international partnerships and mobilizing for change. Tours are founded on the principles of experiential education and focus on the social, economic, political, and/or environmental issues that are pressing in the country that is visited.

ALLIANCE FOR DEMOCRACY

Alliance for Democracy (AFD) is an organization fashioned after the Populist movement of the 1880s. Its goal is to challenge corporate power in the global economy and in politics. The organization conducts specific campaigns to achieve its goals, such as its campaign finance reform program in Oregon, one of only five states that have no limitations on campaign contributions or expenditures. This AFD program attempts to reduce the power of corporations and wealthy individuals by limiting the amount of money they can contribute to any one candidate. AFD also sponsors campaigns for universal healthcare, access to clean and safe drinking water, and education programs dealing with the General Agreement on Trade in Services and the Central American Free Trade Agreement.

PEOPLE-CENTERED DEVELOPMENT FORUM

The People-Centered Development Forum (PCDF) is an organization started by David Korten, author of *When Corporations Rule the World*. PCDF works to create societies in which justice, inclusiveness, and sustainability serve as organizing principles of public policy. Toward this end, PCDF encourages voluntary citizen action guided by an international secretariat, a network of cooperating organizations, and an international advisory board to create social change.

Its most recent focus has been on the dysfunctions of corporate globalization and life-centered alternatives to money-centered corporate rule. The group also works to strengthen the voices of civil society in global dialogues on food and agriculture policy. PCDF seeks to reach beyond critique to awareness that there are

democratic, market-based, ethical alternatives to the excesses of global capitalism.

INTERNATIONAL FORUM ON GLOBALIZATION

Formed in 1994, the International Forum on Globalization (IFG) is an alliance of leading activists, scholars, economists, researchers, and writers formed to stimulate new thinking, joint activity, and public education in response to economic globalization. IFG represents over 60 organizations in 25 countries that share the concern that the world's corporate and political leadership is undertaking a rapid restructuring of global politics and economics with little public disclosure of the profound consequences affecting democracy, human welfare, local economies, and the natural world. IFG produces numerous publications; organizes high-profile, large public events; hosts many issue-specific seminars; coordinates press conferences and media interviews at international events; and participates in many other activities that focus on the myriad consequences of economic globalization.

FOCUS ON THE GLOBAL SOUTH

Founded in 1995, Focus on the Global South (FGS) engages in policy research, analysis, advocacy, and grassroots capacity building on issues critical to poor people who live predominately in the southern hemisphere. It also promotes sustainable development, demilitarization, and economic policies that put the good of the poor in front of corporate profit. Through the use of campaigns and programs, FGS organizes segments of civil society in efforts to build peace and security, reform global finance, and ensure fair trade. FGS's Trade Campaign has protested the policies of the World Trade Organization while also lobbying governments in Geneva; provided good and timely research and analysis; coordinated with national social movements, particularly in Asia; and organized mass demonstrations. Focus on the Global South is directed by worldrenowned economist Walden Bello, author of numerous books, including Dilemmas of Domination, Deglobalization: Ideas for a New World Economy and Global Finance.

THIRD WORLD NETWORK

Third World Network (TWN) is a nonprofit international network of organizations and individuals that work toward eliminating poverty by focusing on many

areas such as trade, global finance, biotechnology, women's rights, and healthcare. It conducts research on economic, social, and environmental issues pertaining to north-south development and publishes its research in books, magazines, and journals. Some of its publications include the daily SUNS (South-North Development Monitor) bulletin, the bimonthly Third World Economics, and the monthly Third World Resurgence. TWN has offices and affiliates in over 10 countries and is directed by Martin Khor.

TRANSFAIR USA

Started in 1998, TransFair USA is a California-based nonprofit organization that guarantees that the farmers and farmworkers behind Fair Trade Certified goods are paid a fair, above-market price for their products. They are one of 19 members of Fairtrade Labeling Organizations International (FLO) and the only third-party certifier of Fair Trade products in the United States. TransFair USA returns more of each dollar spent on any of the products it certifies goes back to the farmers and farmworkers who produce them. The U.S. Fair Trade market has empowered farmers and farmworkers around the world to determine their most pressing local economic development needs for themselves and reinvest in their products, cooperatives, and communities in appropriate and sustainable ways.

WOMEN'S EDGE COALITION

The Women's Edge Coalition advocates to make sure that U.S. international trade and assistance programs create economic opportunities and self-sufficiency for women and their families worldwide. The coalition, with over 40 organizational members and over 15,000 individual members nationwide, supports international economic policies and human rights that enable women worldwide in their actions to end poverty in their lives, communities, and nations. Women's Edge works through three main strategies: educating and influencing U.S. legislators to increase opportunities for women, analyzing the success of worldwide programs for women, and mobilizing American women to help shape American foreign policy toward women.

AFRICA ACTION

With roots extending back to 1953, Africa Action is the oldest U.S. organization working to change U.S. foreign policy and the policies of international institutions in

order to support African struggles for peace and development. The work of Africa Action is grounded in the history and purpose of its predecessor organizations, the American Committee on Africa, the Africa Fund, and the Africa Policy Information Center. Africa Action provides information and analysis to effect positive change in policies and attitudes about Africa. Some programs that Africa Action has recently undertaken are the stop the genocide in Darfur campaign, Africa's right to health campaign, and ongoing public outreach.

OXFAM INTERNATIONAL

Founded in 1995, OXFAM International, a confederation of 12 organizations working together with over 3,000 partners in more than 100 countries, is one of the largest and most influential antipoverty organizations worldwide. OXFAM raises issues to educate the public through its popular campaigning, alliance building, and media work. It also engages in high-level research and lobbying aimed at changing international policies and practices while working directly with people affected by humanitarian disasters. OXFAM runs development programs in more than 10 worldwide regions, lobbies on behalf of the poor, undertakes popular campaigning, and provides emergency assistance. The organization is specifically known for its expertise in water and sanitation projects.

RAINFOREST ACTION NETWORK

Founded in 1985, Rainforest Action Network (RAN) protects rainforests and the human rights of those living in and around those forests. Based in the United States, RAN supports activists in rainforest countries as well as organizing and mobilizing consumers and community action groups throughout the United States. RAN organizes grassroots organizations to actively support its campaigns, such as its boycott of Burger King for its unsound beef importing practices. It uses media campaigns, conferences, publications, and consumer education programs to teach people about the impact of their consumption patterns.

RAN works with environmental and human rights groups in 60 countries and is distinguished by its emphasis on grassroots education and its commitment to mobilizing citizen activists. Some of RAN's programs include Don't Buy Old Growth to preserve old-growth forests; Jumpstart Ford to pressure Ford and other automakers to pursue zero-emissions vehicles; and the Global Finance Campaign to bring social and environ-

mental accountability to all aspects of global financial business practices.

GLOBAL CALL TO ACTION AGAINST POVERTY

The Global Call to Action Against Poverty is a world-wide alliance including existing coalitions, community groups, trade unions, individuals, and religious and faith groups who are committed to making world leaders live up to their promises and to making a breakthrough on overcoming world poverty. Its focus is on securing more and better aid without harmful conditionalities that may be tied to contracts with donor countries, achieving debt cancellation from wealthy nations, creating trade justice by enacting measures to protect public services, ending commodity dumping and rich country subsidies, securing the right to food, affordable access to essential drugs, and strengthening corporate accountability.

Apartheid

APARTHEID MEANS "separateness" in Afrikaans, and was the social system enforced by the white minority in South Africa from 1948 to 1994 when Nelson Mandela was elected president in the first elections opened to all races. Under apartheid, the black majority was segregated and was constantly discriminated against. Black South Africans did not have the same political, legal, and economic rights as whites. The eco-

nomic legacy of apartheid, which impoverished the vast mass of black South Africans as well as blacks in neighboring countries, is still palpable today. According to a 2004 survey, 61 percent of Africans and 38 percent of mixed-race "coloureds" live in poverty, compared with five percent of Indians and one percent of whites.

Apartheid was adopted after World War II as the National Party led by Daniel François Malan won the 1948 general election, together with the Afrikaner Party. The two-party coalition defeated the Union Party (UP) by a narrow margin in an electoral campaign where apartheid had figured prominently. Jan Smuts, the leader of the UP and prime minister, had branded the idea of apartheid as "nonsense."

Yet as Malan replaced Smuts, stricter laws were passed to ensure the country's racial separation, thus giving rise to apartheid. While segregation might have been a reality of life before 1948, after Malan's victory it became institutionalized. Mixed marriages and sex were banned; segregated hospitals, buses, schools, and park benches were created; and restrictions on the possibility of blacks living in, or visiting, urban areas were passed.

"Colored" South Africans were compelled to carry identity documents at all times, and the Bantu Authorities Act (1951) established the legal basis for the creation of theoretically independent microstates called "homelands," where blacks would be forced to live. During the premiership of J.G. Strijdom, the transition to apartheid was fully completed with the suppression of voting rights for blacks except for segregated bodies. Strijdom also brought the Senate and the Appeal Court, which had rejected several governmental acts, under the firm control of the National Party.

The clear relationship between the apartheid system and black poverty can be seen in the data on the ratio of black income to white income. From 1946 to 1960, despite a decrease in the white proportion of the population, a constant 70 percent of South Africa's national income went to whites. Between 1970 and 1980, when violent protests began to spread throughout the country, this fell to 60 percent, still a huge proportion considering the whites' minority status. When the homeland policy was finally enforced, 29 million black South Africans were squeezed into 13 percent of the national territory.

The "homelands" were remote, devoid of economic activities, and extremely overpopulated. Soon they were among the world's poorest and most degraded areas. Institutions obviously spent money on white areas while leaving black enclaves without the most

basic of services. The system of apartheid was preserved also by impoverishing neighboring states. South Africa waged a full-scale war against Mozambique and Angola and imposed an economic blockade on Lesotho, Botswana, Zambia, Zimbabwe, and Malawi.

In the end, therefore, apartheid did not impoverish black communities only, but the whole of the South African state and the South African region. South Africa was forced to borrow phenomenal sums of money to keep the expensive system of surveillance and segregation in place and, especially in the late 1980s, was the target of economic sanctions. Neighboring states had to borrow equally phenomenal amounts of money to defend themselves from South African aggression and destabilization.

The economic legacy of apartheid is still very visible today. People are no longer discriminated against for their race, yet they continue to be discriminated against on the basis of class. Studies point out that economic inequality has deepened since the rise in power of the African National Congress in 1994. While a black elite has joined the white one at the head of South African society, and the black bourgeoisie is finding more opportunities thanks to a free market economy, the poor are becoming even poorer. Communities have been forced out of South African townships because they can no longer afford to pay mortgage rates imposed by banks, while others have faced substantial rises in electricity and water bills. Entire areas have been denied such services.

Because its economic legacy is still visible after a decade of its demise, apartheid has become synonymous with poverty. Tellingly, the former South African President Nelson Mandela linked the two concepts in his speech before a G-8 meeting in 2005. Speaking at the first rally of the campaign "Make Poverty History," Mandela claimed, "Like slavery and apartheid, poverty is not natural. It is man-made and can be overcome and eradicated by the actions of human beings. I say to all those leaders [of the G-8]: do not look the other way; do not hesitate. Recognize that the world is hungry for action, not words. While poverty persists, there is no true freedom."

Apostolic Sects

THE CHURCH DESCRIBED in the New Testament's Book of the Acts of the Apostles was founded on the preaching and teaching of the disciples of Jesus of Nazareth, who were thereafter called Apostles. After his crucifixion, his followers declared that he had risen from the dead, had ascended to heaven, was the Christ (in Greek) or Messiah (Hebrew) of God, and is now "seated at the right hand of God," that is, holds the place of power.

The early history of the church in New Testament times and for two centuries afterward is sketchy. However, in subsequent centuries the church came to confess that it was apostolic in its teachings and, until the Protestant Reformation, apostolic in its succession of bishops through the line of ordination, as each succeeding generation has "laid hands" on its successors as an anointing sign of ordination or divinely marked setting aside for ministry.

In the 19th century, the great missionary work of Roman Catholics and Protestants established numerous mission churches in the southern hemisphere. In the 20th century, numerous evangelical and pentecostal movements spread over much of Latin America, Africa, and Asia.

The apostolic sects are religious movements with many being splinter groups from traditional Christian churches. Others were more spontaneously inspired. Numerous evangelical and pentecostal groups now refer to themselves as "apostolic." Some make the claim that they are restoring the original Apostolic Church of the New Testament, which is presumed to be purer than the older churches existing today. Globally they may number 18 million people. They tend to be evangelical or fundamentalist, charismatic or pentecostal, and very independent.

Most of the sects that can be referred to as apostolic are conservative in theology. Some stress faith healing. Their biblical theology directly affects their social theology and social ministries. They can be found over most of the world, but are strongest in Africa. Many are found in the United States.

The number of apostolic sects, often called "Vapostori," and other religious groups in Africa is difficult to judge because they are constantly forming, splintering, and reforming. It is certain, however, that they are growing in number rapidly and are becoming a social force in dealing with issues of poverty.

At the present time the greatest problem in Africa is HIV/AIDS. Zimbabwe, where the apostolic sects make up six percent of the population and three-quarters of the rural population, has the third highest incidence of the disease in the world.

Some of the apostolic sects in Africa are meeting the HIV/AIDS crisis with a theology that demands abstinence in sexual behavior. Other sects, such as the Apostolic Church of God, numbering perhaps 50,000, have refused polio vaccinations on religious grounds.

The ban on polygamy was a major step: it was a recognition of the AIDS crisis.

In 2005, 70 apostolic churches met in Harare, Zimbabwe, and agreed to ban polygamy. Traditional African marriage practices had allowed multiple wives. The ban on polygamy was a major step because it was a recognition of the HIV/AIDS crisis that many of the conservative apostolic churches had denied; it was viewed as the fruit of a sinful lifestyle. Moreover, the ban reduced the danger of the spread of the disease from older men who marry young virgins.

President Bishop Xavier Chitanda of the Johane Masowe sect helped to organize the apostolic sects' umbrella body, the Union for the Development of Apostolic Churches in Zimbabwe-Africa (UDACIZA). It was this group that launched the ban on polygamy as a solution to the HIV/AIDS crisis, which has killed two million people in Zimbabwe. UDACIZA has developed programs for defeating the crisis.

UDACIZA began as a response by the apostolic sects (independent churches) in Zimbabwe as a way to provide relief from poverty, to promote education and reduce ignorance, and to address long-term poverty issues. The ban represents a change in theological attitudes. The apostolic sects inherited a premillennialist theology from their American mission roots, which was pessimistic and quietist, as they awaited the imminent return of Christ.

In 2005, shortly after the apostolic sects' ban was announced, the Zimbabwe Council of Chiefs backed the ban of the apostolic sects on polygamy. The Coun-

cil of Chiefs approved the ban to help prevent the spread of HIV/AIDS.

Aguinas, Thomas (c. 1225-74)

THOMAS AQUINAS was an Italian Dominican theologian and the foremost medieval Scholasticist, usually credited for the integration of the recently discovered philosophy of Aristotle into Christian thought. As a Dominican friar, St. Thomas was part of the mendicant orders, which required their members to live in extreme poverty and beg alms. By choosing the newly established Dominican order, Aquinas renounced his feudal background and the traditional spirituality that his parents hoped he would follow.

Born at Roccasecca in the Kingdom of Naples, Aquinas's family owned a feudal domain in a territory torn by constant battles between the emperor and the pope. Young Thomas was first sent to study at the Benedictine abbey of Monte Cassino, but later transferred to the University of Naples when the abbey became a disputed site in the medieval struggles between empire and papacy.

In Naples, Aquinas came into contact with the Dominican order and dashed his family's hopes for his future as a Benedictine abbot. Aquinas appreciated the more active attitude toward life of the new order, where preaching and teaching were more relevant than contemplative prayers and manual labor. When he was sent to Paris to pursue his studies, Aquinas was kidnapped by his family and was kept prisoner for more than a year. Yet his obstinate resistance convinced his parents to allow Aquinas to continue his life and career as a Dominican.

In 1245, Thomas arrived in Paris where he studied under the renowned scholar Albertus Magnus. After

In Thomas Aquinas's thought and writings, poverty is not an end in itself but a means to reach God.

four years spent in Cologne with Albertus, he returned to Paris, where he first obtained his degree and then the license to teach. In 1259, he was appointed theological advisor and lecturer to the Roman Curia, a prestigious and influential position that put Thomas at the center of humanism.

In his later years, Thomas was sent to Naples where he was given the task to establish a Dominican house of studies at the local university. He died in 1274 at the monastery of Fossanova while en route to the Council of Lyons where the pope had summoned him in an attempt to prevent the schism of the Roman and Byzantine church.

Although Thomas's work was shaped by the encounter with academic life in Paris and the discovery of Aristotle, St. Francis of Assisi and the centrality of per-

sonal and corporate poverty in the Dominican order were also important influences in his thought. Aquinas's intellectual accomplishment was to stimulate a renewal at both a personal and a larger, institutional level of Catholic life. At a time when the discovery of Aristotelian philosophy and its emphasis upon reason was putting Catholic faith in danger, Aquinas was able to reconcile both reason and revelation in his major work, Summa Theologica, on which he worked until his death. Both in the Summa and in the earlier Contra impugnantes Dei cultum et religionem, Saint Thomas defined poverty as a means to perfection, an "instrumentum perfectionis."

He was involved in the controversy over mendicant orders against William of Saint-Amour who, in the 1250s, had argued that the ministry of the religious who pretended to dedicate themselves to study and teaching, but who lived not from their work but from mendicancy, was not legitimate. While Aquinas conceded that religious orders could belong to professional bodies, he also forcefully asserted that mendicant orders were forbidden manual labor and thus advocated for them the right to absolute poverty.

As he put it in *De Perfectione*, "if one examines attentively the words of the Lord, it is not in the abandonment even of riches that he places perfection. It only shows a way that leads there, as well as it proves his manner of speaking when he says, if you want to be perfect, go, sell all that you possess, give it to the poor and follow me. This is to say that perfection consists in following Christ and that the renouncement of riches helps walk in this way."

Arab Definition of Poverty

FROM THE ATLANTIC OCEAN to the Persian Gulf, from the southern shores of the Mediterranean to the

Sahara wilderness, the Arab region has enormous wealth along with the deepest poverty. Over the last half century, significant strides have been achieved in impacting Arab regional poverty with the discovery and development of vast Arabian petroleum reserves. However, wide economic disparities continue.

According to the Committee for Research on Poverty (CROP), the Arab definition of poverty is "an inability of an individual to satisfy his own basic needs and the needs of his dependents." But the reality of poverty takes different forms in the Arab world. As just one example, consider Saudi Arabia, the world's largest oil exporter, which possesses 25 percent of the world's petroleum reserves.

Amid such vast wealth, according to a 2005 study by Rashid Bin Sa'd al-Baz, a professor of social sciences at Imam Muhammd Bin Sa'ud Islamic University in the Saudi capital, poverty persists. In the absence of any official governmental poverty standard, he identified the Saudi poverty level at 1,120 Saudi riyals a month. He also calculated the average Saudi citizen's income at 2,083 Saudi riyals monthly. The World Bank in 2002 calculated the Saudi per capita income at 2,260 Saudi riyals per month. If either report is correct, the average Saudi is living well above the poverty line as calculated by Sa'd al-Baz.

Yet slums have grown up around the larger Saudi cities and beggars can be seen on the streets. Acknowledging an emerging problem, in 2003 the Saudi government announced a "national strategy to combat poverty," marking the kingdom's first official admission that poverty exists. The announcement followed a visit to the poorest neighborhoods of Riyadh Crown Prince Abdullah, who visited cramped shanties and met with families whose food comes from charities.

How to measure poverty in Saudi Arabia? One indicator would be the Gross Domestic Product (GDP) per capita, which establishes an average annual income figure for a nation's citizenry. The Human Development Index (HDI) would be perhaps a better indicator in defining Arab poverty. It is a comparative measure of income, literacy, education, life expectancy, and other factors. Another useful indicator of Arab poverty is the Gini Index, which measures the degree of inequality in a nation's distribution of family income.

Saudi Arabia's oil-based economy is strongly controlled by the ruling royal family. No poverty figures are published, but the GDP per capita is \$12,000. No Gini index is reported by the United Nations. The literacy rate is 78.8 percent. The Saudi HDI improved between 1990 and 2002 from .602 to .707 to .768.

Area Deprivation

AREA DEPRIVATION CONCERNS areas or communities populated by a large proportion of individuals having essential disadvantages in reaching the minimum living conditions, where the problem of social justice due to individual deprivation has additionally become a problem of spatial justice. The individual weakness develops into area economic depression, as in urban slums or shantytowns in cities, with populations in a state of poverty compared to contiguous affluence levels. The uneven spatial distribution of affluence is present at every geographical scale, within cities as inner cities, and remote rural areas, but also regions, states, and continents. The measure of the spatial variation of inequality and exclusion allows the detection of area deprivation.

The process of unbalanced economic development produced by capital accumulation creates leading and lagging areas. The structural and spatial reorganization of capital produces investment or disinvestments of industries in cities while price oscillations, subsidies regulation, and tariffs have an effect on the competitiveness of agricultural production and drive rural economies to a structural subsistence livelihood or to a viable marketoriented development.

Area deprivations are defined by common attributes of a material, economic, social, participative, and relational kind as less income; fewer employment opportunities; insufficient public infrastructures, services, and facilities; and a general poor ratio between resources and population exist. Area-specific features can be political conflicts and war; declining regions with factory closures; environmentally degraded areas by pollution, deforestation, erosion, or droughts; and hazard-prone areas.

Urban deprived areas have poor physical conditions as a result of an unhealthy environment with high levels of pollution, affected by industrial decline, poor housing conditions, large areas of derelict land, insufficient green areas and community facilities to satisfy leisure needs, and few public basic services.

Remote rural areas have increased disadvantages for their lack of accessibility. The deficiency and bad quality of road and communication infrastructures increase costs in transport and traveling and favor a low competitiveness. Reduced income is prevalent, and some areas show persistent poverty levels higher than in metropolitan areas. Environmental degradation by unsustainable exploitation of resources reduces the main active assets of these areas, including land, water, and biodiversity, and limits the opportunities for prospective development.

Social inequality in deprived areas results in higher unemployment rates, low educational levels and educational attainment, lack of qualification, greater frequency of health problems, and exclusion from social relations and civic activities. Social disorganization and weak social cohesion favors alcoholism, drug abuse, and crime. Strong migration processes in various directions are observed, while impoverished people in inaccessible areas leave for cities, causing rural age-selective depopulation. Deprived urban areas let middle-class people out, while poor foreign immigrants and rural expellees go in, reinforcing deprivation. Demographically urban areas have a younger population and a higher percentage of minority people, while rural areas and historical districts have aging populations.

Whereas areas of deprivation are common to areas and cities in developed and developing countries, they are structurally heterogeneous for they include nondeprived individuals, who nevertheless become socially excluded. Old people who live in declining and aging

historic districts are a group vulnerable to potentially experience poverty and deprivation.

Policy options ought to address both individuals—to tackle problems of those living in or out of deprived areas—and area poverty with social class, sector, and area-based initiatives. Among these initiatives, urban redevelopment and renewal, and local development are strategies to tackle deprivation at the urban and rural scales.

U. Fra Paleo University of Extremadura, Spain

Argentina

THE ARGENTINE REPUBLIC is the second largest country in South America. Argentina has had a long history of internal strife since winning independence from Spain in 1816. After World War II, Argentina spent years under the authoritarian control of Juan D. Perón until he was overthrown by a military coup in 1955. Thereafter, political power within Argentina changed hands frequently, including another period under Perón.

Following his death in 1974, Isabel Martinez Perón, Juan's third wife, led the country to economic ruin as the cost of living rose 355 percent. A military junta seized control in 1976, ushering in a reign of terror in which 2,300 people were murdered and tens of thousands of others vanished or were arrested. Economic and political chaos continued until 1983 when democracy was restored. During the late 1990s, the Carter Center of Emory University, founded by former president Jimmy Carter, convinced the Argentine govern-

ment to agree to a two-year moratorium on the purchase of sophisticated weapons.

In addition to the fertile land of the Argentine pampas, the country's natural resources include petroleum and deposits of lead, zinc, tin, copper, uranium, manganese, and iron ore. Service industries account for 53.5 percent of Argentina's Gross Domestic Product (GDP), and a variety of industries provide an additional 35.9 percent of the GDP. The export-oriented agricultural sector accounts for the remaining 10.6 percent.

Over 43 percent of the Argentine population live in poverty.

Argentina is an upper-middle-income nation with a per capita income of \$12,400. Inequality flourishes, and the poorest 20 percent of the population claim only 3.1 percent of available resources. On the other hand, the richest 20 percent of Argentines share 56.4 percent of resources. Argentina is ranked 52.5 percent on the Gini Index of Human Inequality.

Since the mid-1990s, Argentina has experienced high rates of inflation, capital flight, severe external debts, and budget deficits. At the beginning of the 21st century, the Argentine economy spiraled further downward with negative growth rates, massive bank withdrawals, and eroding consumer confidence. By the middle of 2002, recovery had begun.

Nevertheless, over 43 percent of the Argentine population live in poverty, and 14.8 percent of the labor force are unemployed. Some 14.3 percent of the people live on less than \$2 a day, and 3.3 percent live on less than \$1 a day. The United Nations Human Development Reports rank Argentina 34 of 177 on general quality-of-life issues.

Antipoverty efforts in Argentina have focused on the Program for Unemployed Heads of Household. The program links financial assistance to school attendance of dependent children and to training and education for adults. In 2001, 67.3 percent of those receiving benefits were female, and 26 percent of that group were heading a single-parent family. Most recipients were under the age of 35. About 43 percent of recipients had not finished secondary school, and 11 percent had not completed primary school. Around 14 percent of recipients were college graduates.

While only one-fourth of poor Argentine families receive public assistance, the government determined that the employment program had reduced poverty in Argentina by four percent and prevented 20 percent of recipients from sliding into absolute poverty. Modifications were made to the program in 2004 when it became a feeder plan for the "Let's Get to Work" plan. While Argentina spends 18 percent of its GDP on social programs, most funds are used to provide pensions and unemployment for the segment of the population that is not poor.

Argentines enjoy a life expectancy of 75.91 years. Women (79.85 years) outlive men (72.17 years) an average of over seven years. Among the population of 39,537,943, the median age is 29.42 years. Approximately 26 percent of the population are under the age of 14, and nearly 11 percent are over the age of 65. Six percent of Argentines do not have access to safe drinking water, and 18 percent lack access to improved sanitation. While healthcare is available, it is not always affordable. There are 304 physicians for every 100,000 residents. From 20 to 50 percent of Argentines are unable to afford essential drugs.

Mortality rates in Argentina are high, although there has been some progress. Between 1970 and 2005, infant mortality fell from 59 deaths per 1,000 live births to 15.18 deaths per 1,000 live births. During that same period, the mortality rate of all children under the age of 5 dropped from 71 to 20 deaths per 1,000. Five percent of all Argentine children are malnourished, and seven percent of infants are underweight at birth. Immunization rates for children from birth to 23 months range from 88 to 99 percent.

Fertility rates are high in the country, in part because Argentina is 92 percent Catholic. Since 2004, sex education classes have been compulsory for first-year college students. The fertility rate for teenage mothers is 54 per 1,000 births. Between 1980 and 2005, total fertility rates fell from 3.3 children per woman to 2.19 children per woman. Only one percent of births in Argentina take place outside the presence of trained medical staff. Based on modeled estimates for 2000, maternal mortality is high at 82 deaths per 100,000 live births.

Literacy is high in Argentina, and 97.1 percent of the population over the age of 15 can read and write. The government allots grants to the poorest students and provides soup kitchens in the schools to furnish nourishment to poor children. The School Learning program promotes preschool education, particularly among children who live in rural areas. All students complete primary school and most students attend school for 16 years. Females outnumber males at both the second and tertiary levels.

Armenia

EARLY IN THE 4th century, Armenia became the first nation to adopt Christianity. In 1828, the country was annexed by Russia and later became part of the Soviet bloc. In 1988, Armenia began fighting Azerbaijan, its Muslim neighbor and fellow bloc member, over rights to the area of Nagorno-Karabakh. The fight continued after both countries won independence from the Soviet Union in 1991. A cease-fire was negotiated in 1994, but the war had taken an economic toll on both countries. In 1995, guided by the International Monetary Fund (IMF), the Armenian government initiated reforms that began a period of economic recovery.

Despite its status as a lower-middle-income country, Armenia faces a poverty rate that encompasses 55 percent of the population, with 8.5 percent of the people living in extreme poverty. Single mothers with children under the age of 5 make up 60 percent of Armenia's poor. Poverty has spread in part because of the 30 percent unemployment rate, which has created an environment in which 51 percent of the population are undernourished. Income is distributed unequally, and the poorest 20 percent of Armenia's people share 6.7 percent of the country's income, while the richest 20 percent hold 45.1 percent of the wealth. Armenia is ranked 37.0 on the Gini Index. The United Nations Human Development Report ranks Armenia 82 of 177 on general quality-of-life issues.

Armenia's economy is diversified, with 45 percent of the population engaged in small-scale agriculture. The agricultural sector does not generate sufficient food to feed the country, so Armenia imports most of its food. Some 25 percent of Armenians are employed in industries that revolve around the production of machine tools and textiles. While Armenia's natural resources include gold, copper, molybdenum, zinc, and alumina, none of the deposits are large and mining is limited.

The Armenian population of 2,982,904 enjoys a life expectancy of 71.55 years. Females have a distinct advantage over males, with a projected life span of 75.75 years as compared to 67.97 years for males. This may be partially due to the fact that 64 percent of the male population smoke, but only one percent of the female population smoke. With a median age of 30.07 years, 21.6 percent of the population are under the age of 14, and 10.9 percent have reached the age of 65. There are 287 physicians for each 100,000 residents in Armenia, and roughly half of the population has access to affordable essential drugs.

Armenian infants have a mortality rate of 23.28 deaths per 1,000 live births. Again, females are hardier than males, with a mortality rate of 17.13 per 1,000 as compared to 28.51 for male infants. Infant mortality has steadily declined over the last decade. The mortality rate of children under the age of 5 is 33 deaths per 1,000. Among children in this age group, chronic malnutrition increased from 12 percent in 1998 to 14 percent in 2000. Some 13 percent of under-5s suffer from moderate to severe stunting, and two percent suffer from moderate to severe wasting. Some 7.9 percent of all babies are underweight at birth. Childhood immunizations are stable in the 90 percent range for all children from birth to 23 months, and polio has been eradicated. Approximately 40 percent of Armenian children receive lifesaving oral rehydration therapy when they are ill.

Literacy in Armenia is high, and 98.6 percent of the population over the age of 15 can read and write. At 99.4 percent, male literacy is almost 100 percent; however, two percent of Armenian females are illiterate. Education is a constitutional right in Armenia, and school

is compulsory except for the final two years of high school. As a result, most Armenians attend school for at least 11 years. Some 20 percent of Armenians attend college or university, and one-third of all students at this level are enrolled in science, math, and engineering programs.

Because Armenia has an extensive family planning network, fertility is low. In 2005, the total fertility rate was estimated at 1.32 children per woman. Among adolescents, the fertility rate was 35 per 1,000. Over 60 percent of Armenian women use contraceptives. However, birth control methods are not always effective, and abortions are common. Maternal mortality is low in Armenia because healthcare is accessible and the population is well educated. Professional staff attends some 97 percent of births. Maternal mortality is estimated at 55 deaths per 100,000 live births.

Single mothers tend to be among the poorest segment of the population, and the government grants minimum social security benefits to these women. In the past, some mothers have chosen to grant the state guardianship of their children because they were unable to care for them. UNICEF, the United Nations' organization for children, is working with the Ministry of Labor and Social Affairs to provide financial assistance that will enable such children to return to their families. The government has also established education and job training programs for poor women and opened statesponsored daycare centers to allow poor women with small children to work.

Arthur, Chester (Administration)

THE ARTHUR administration's most lasting legislative legacy is undoubtedly the Pendleton Act of 1883. Responding to the assassination of President James Garfield by a deranged office seeker, the Congress passed and Arthur signed legislation creating the first Civil Service Commission. Because the bill's sponsors were Democrats and because many of Arthur's most generous supporters were beneficiaries of the spoils system, Arthur supported this reform at considerable political cost.

The legislation established competitive examinations for federal civil employees, prohibited office-holders from requiring political contributions or partisan service from these employees, eliminated much outright nepotism, and directed that alcoholics be fired from federal civil service positions. This federal legislation soon became the model for similar reforms on the state and local levels. The Pendleton Act did much not only to professionalize the federal work force, but, given the percentage of American workers subsequently employed by the government at all levels, it also ensured that the civil service offered a stable livelihood and brought many American families into the middle class.

Another important piece of legislation enacted during the Arthur administration was the Chinese Exclusion Act. Initially, the Congress passed legislation prohibiting Chinese immigration and naturalization for 20 years, but after Arthur vetoed that legislation, it was revised with the term reduced to 10 years. Renewed in 1892 and 1902 and not formally repealed until 1943, the legislation not only soured relations between the United States and China for many decades, but it also ensured that even naturalized Chinese Americans would be treated as second-class citizens culturally, politically, and economically. Chinese Americans were, for instance, specifically prohibited from engaging in mining. The practices of the few Chinese American professionals were restricted to Chinatowns, Chinese-American skilled workers could find employment only with businesses owned by other Chinese Americans. Unskilled Chinese Americans labored for substandard wages, exploited by firms that knew that Chinese Americans had few other employment options and few means of protesting the conditions of their employment.

Lastly, although the so-called Mongrel Tariff of 1883 was the sort of compromise that satisfied almost no one, it is often cited as the starting point for the ongoing conflict between protectionists and free-traders. As with other dramatic shifts in political philosophy, the Democratic and Republican positions on the issue have reversed as their political bases have changed. Initially the Republicans supported protectionism and the Democrats supported free-trade. But as unionized workers became a major part of the Democratic base and as multinational corporations began to proliferate, the Democrats began to support protectionism, and the Republicans, free trade. As displaced American factory workers are painfully aware, this issue continues to directly affect the economic standing of almost countless American families.

The civil service brought many American families into the middle class.

Arthur was born on October 5, 1829 in Fairfield, Franklin County, Vermont. He graduated in 1848 from Union College in Schenectady, New York and worked several jobs including teacher, school administrator, and lawyer. During the Civil War he served as a brigadier general for the Union Army. In 1871 President Ulysses Grant appointed him as collector of the Port of New York City. After returning to his law practice in 1878, he was elected as vice president on the Garfield Republican ticket in 1880.

By 1884 Arthur was ready to make a run for the presidency. However, he had alienated many of his Republican colleagues. The Republicans turned to James Blaine as their candidate, abandoning Arthur who by then was suffering from a rare kidney disease. Arthur quietly retired from politics and returned home to New York where he peacefully died on November 18, 1886.

Asset-Based Antipoverty Programs

THE PUBLICATION OF Michael Sherraden's Assets and the Poor ushered in an era in which the focus of poverty scholars and policymakers broadened so that income no longer served as the sole basis for conceptualizing poverty. The basic arguments of the literature covering asset-based antipoverty strategies are that income is a narrow measure of the economic resources that any given family has; that owning assets can confer economic and sociopsychological benefits, such as creating an orientation toward the future, increasing self-efficacy, and enhancing individuals' sense of belonging to society; and that this can have spillover effects for society in addition to the positive effects it has on the individual who owns the asset.

U.S. policies to provide social support to the poor traditionally have focused on income maintenance, that is, ensuring that families are able to obtain enough goods and services to meet a minimal consumption standard. This policy focus has been implemented via programs that provide cash transfers, such as the former Aid to Families with Dependent Children (AFDC) program, which was once commonly known as welfare, or through programs providing in-kind assistance, such as the food stamp program and public housing.

The primary criticisms that proponents of asset-based strategies have of these types of policies are that the asset tests of the traditional income maintenance programs have been restrictive historically, and that focusing on income maintenance does not allow one to focus on capacity-building, which might lift people out of poverty. For example during the 1970s, 1980s, and 1990s many states did not allow the poor to have much in a savings account if they wanted to be eligible for public assistance. This can be seen as discouraging savings and limiting opportunities for individuals to take steps that might permanently remove them from poverty, such as saving enough money so they can acquire additional schooling. Proponents of asset-based policies argue that not only should public policy not

discourage asset accumulation among the poor, it should be proactive in encouraging asset accumulation. The best example of the way this philosophy has been implemented is the passage of national legislation in 1996 to fund state-level programs promoting individual development accounts or IDAs.

IDAs are saving accounts that eligible individuals maintain at a financial institution, where the individual's contributions to the account are matched with funds from the government and private sources. De facto, this means that these savings accounts carry an above-market interest rate (one that is subsidized by the program). Funds can be withdrawn without penalty for specific purposes. Permissible uses typically include education, acquiring a home, and starting a business. It is argued that helping individuals to accumulate these types of assets—human capital, property, and business equity—can be transformative, allowing them to make changes in their lives that might provide an escape route from poverty in the long run.

The movement toward asset-based antipoverty strategies has not occurred without controversy. While those on the political right have lauded the new programs because they are consistent with an emphasis on private ownership, individual responsibility, and self-help, some on the political left have expressed concerns that the switch marks the beginning of an erosion in public support for helping others.

NGINA CHITEJI, PH.D. SKIDMORE COLLEGE

Australia

ONLY 20 MILLION PEOPLE populate Australia, which is a continental country. Much of the interior of the continent is desert. Most of the people in Australia

live along the coasts of the east and south. Aborigines were the only inhabitants until British settlers arrived as the first Europeans to settle the land in the late 1700s. Since the end of World War II, large numbers of immigrants have come from Europe and Asia.

Australia has a federal government with its capital in Canberra. The states of the union are autonomous from one another. The management of poverty is the responsibility of both levels of government. States such as Queensland provide services to prevent, to relieve, or to end poverty. It has departments that carry out children's services, disability services, employment, housing, health, and education. The other Australian states—Tasmania, New South Wales, Victoria, Western Australia, South Australia, along with the Northern Territory—all have similar programs for dealing with poverty.

Within Australia there are an estimated 3.5 million people living in poverty.

Domestically the Australian federal government uses AusAID to work in partnership with the Australian state governments, volunteers, academic institutions, think tanks, and nongovernmental organizations (NGOs) to reduce poverty in the Asia-Pacific region and beyond. Both the Australian state governments and foreign governments are involved. Within Australia there are an estimated 3.5 million people living in poverty, including nearly 900,000 children. Many of these are Aborigines or South Pacific islanders who are helped by the Australian federal government.

The Australian federal Department of Family and Children's Services administers domestic welfare programs used to provide for the indigent, the handicapped, children who need child support, the unemployed, the aged, the homeless, and the economically distressed. A major initiative is focused on reducing domestic violence, since the negative effects of marital strife can include an increase in poverty. It also develops policy proposals for consideration by the government.

AusAID works outside of Australia with foreign governments, multilateral organizations, and NGOs to reduce poverty. Currently, Australia has poverty partnerships with Papua New Guinea; the countries in the Pacific islands—the Cook Islands, Fiji, Kiribati, Micronesia, Nauru, Niue and Tokelau, Samoa, the Solomon Islands, Tonga, Tuvalu and Vanuatu; the

countries of south Asia—Afghanistan, Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan, Sri Lanka; East Asia—Burma, Cambodia, China, East Timor, Indonesia, Laos, Mongolia, the Philippines, Thailand, and Vietnam; and the Middle East—Iraq. Many of the countries immediately neighboring Australia have significant poverty problems that range from virtual state collapse in the Solomon Islands to the area of East Timor, which was recently ravaged by war. These countries have the will but lack the resources to meet the needs of their people.

AusAID works in partnership with other Australian federal and state government departments to reduce poverty in the Asia-Pacific region. The Australian government recognizes that to ignore the poverty problems of the fragile countries in its region is likely to increase economic stagnation and prospects for violence, which could last generations. Australia has engaged recently in initiatives that follow a comprehensive approach to solving the problems of poverty. Australian poverty initiatives follow a range of missions to meet a diverse set of needs.

To meet the needs in the Solomon Islands, AusAID led a Regional Assistance Mission. In Tonga, AusAID aided the government with services designed to prevent criminal elements from operating freely. In Nauru, Aus-AID helped the Nauru government with organizing its departments so that more effective services could be delivered. AusAID has entered into formal strategic partnership agreements in order to create a unified strategic plan of action. Its partner governments sign Records of Understanding, which govern the implementation of aid. By acting as a partner with those who receive aid, problems of paternal direction are avoided. AusAID provides several types of aid. It invests in basic services of education, health, water supplies, and sanitation. It promotes trade, improved governance, regional security, and sustainable resource development and management to protect the environment, develop local infrastructure and rural areas. In addition, it seeks to improve the human condition with respect to gender issues and human rights.

In 2004–05 Australia spent over \$2.5 billion (Australian dollars) on development assistance. This was 0.25 percent of its Gross National Income. Most of the aid went to the Asian Pacific. In addition, 1.6 million Australians contributed nearly \$400 million to NGOs for overseas aid operations. Much of this aid is directed at programs designed to reduce poverty. Australia's poverty alleviation programs are currently reaching over 58 million people a year.

Australian Definition of Poverty

DIFFERENT COUNTRIES and organizations have struggled with the need to define poverty in order to develop standards for identifying the people who are actually poor. The measure that defines poverty must at the least be an indicator of the number and proportions of people who lack incomes necessary to provide themselves with sufficient food, goods, and services to not only maintain life, but to do so at a level that approximates the level for most people in a particular society.

Australia has developed a definition of poverty based on a family in which the household lacks enough weekly income to support a man, his wife (who is not working), and two children. This definition is not unanimously accepted. Many authors on poverty have produced different results when evaluating whether or not Australia is providing adequately for its poor.

The issue of the proper definition of poverty is very important; however, the problems associated with measurement have been so debated that a consensus or level of inequality and poverty has emerged in Australia that have found acceptance. The amount of poverty in Australia has become a point of dispute because some authors has claimed that it has risen, while others claim that it has fallen. These disparate claims also report widely varying statistical differences. The reason for the differences, analysts argue, is the different aspects of income and the different methods used to analyze poverty. Poverty trends vary because the statistical interpretations of data do not agree.

An important contributor to the issue of the definition of poverty in Australia is the significant limitations inherent in the Henderson poverty line. The Henderson measure was developed in the late 1960s. At that time it

Aborigines in Australia are among the country's poor who are supported by the federal government.

measured poverty closer to an "absolute" poverty line. It was defined as the basic wage plus child endowment for a couple with two children. The assumption was that this 1960s definition was so austere that it would be unchallengeable.

The Commission of Inquiry into Poverty used the Henderson poverty line in 1973. The commission constructed the first national standard for the amount of poverty in Australia. It issued a report in 1975 that updated the Henderson line to reflect the changes in average weekly earnings then current in Australia. The commission's updating line was named the Henderson poverty line (HPL) after Professor Ronald Henderson, the chairman of the poverty inquiry.

Since the 1970s updates of the HPL have been made, but it has remained a benchmark that govern-

ment measures benefits as sufficient or not. Despite criticisms and recognized problems to date, an adequate replacement has not been advanced.

Austria

AUSTRIA IS A RELATIVELY affluent country with a 2004 population of 8.1 million. As the former seat of the Holy Roman Empire (described by the 18th-century French writer Voltaire as "neither holy, nor Roman, nor an empire"), Austria historically has had less poverty than some of its neighbors in south-central Europe. These neighbors include Germany, Italy, and Hungary; the latter, until World War I, was part of Austria. However, even Austria has been and continues to be troubled by at least some problems of poverty and inequality.

Many of Austria's historical poverty problems resulted from disputes between the nobility and the peasant class about unpaid labor or about land. In 1830, 71 percent of the Austrian population lived on farms. Most of those people were peasants who stood in semifeudal (seigneurial) relationships with the nobles who owned the land on which they worked. Landowners frequently insisted that peasants work without pay for at least part of their time, a demand that exacerbated the inequalities of wealth that already existed.

Another aggravating factor was similar to the enclosure movement in England. In the 18th and early 19th centuries, some arable land in Austria was unclaimed by anyone. Peasants could farm that land or use it as pasture to generate extra income. Between 1790 and 1848,

however, the Austrian government let nobles claim a substantial amount of the common land, thereby capturing its income. This worsened both poverty and inequality, according to R. Okey.

At the turn of the 21st century, Austria was smaller, less powerful, and less grand than its pre-World War I incarnation as the Holy Roman Empire, but it also suffered less poverty and inequality. With a 2003 per capita income of \$26,720, it is better off than Ireland, Belgium, Germany, and France, although it trailed Switzerland, Denmark, Sweden, and the United Kingdom. With a Gini coefficient (measuring inequality) of 0.31, it is about in the middle of European Union countries in terms of income inequality. Its 2003 infant mortality rate was 4.5 deaths per 1,000 births, compared to 4.2 in Germany, 4.4 in France, 5.3 in the United Kingdom, and 6.9 in the United States. One hundred percent of the population have access to clean water and complete at least primary education.

In spite of this sunny picture, Austria is not without its problems. Three percent of Austria's population fall into the category of the "long-term poor," while (depending on the year) 11 to 13 percent fall below the poverty line, compared with 16 percent in Germany and France and 19 percent in the United Kingdom. Typical for a European Union country, Austria defines poverty not merely in terms of income but also in terms of social exclusion. Adequate income should enable Austrians "to play the roles, participate in the relationships, and follow the customary behavior which is expected of them by virtue of their membership in society," according to Michael F. Förster et al.

Austria's efforts to combat poverty focus mainly on relief ("social transfer") payments to poor families and pensioners. Overall, 23 percent of poor households' income came from pensions, 16 percent from family benefits, and eight percent from unemployment compensation. Excluding pensioners, poor families received 40 percent of their income from relief payments. However, some influential Austrians (such as the Roman Catholic Bishop Maximilian Aichern) have also called for lower taxes on wages and higher taxes on capital and wealth as a way to alleviate poverty and inequality in the country.

SCOTT PALMER, Ph.D. RGMS ECONOMICS

Axiom of Monotonicity and Axiom of Transfers

IN WELFARE ECONOMICS, the axiom of monotonicity and the axiom of transfers are simplifying assumptions used to assess the effect of different income distributions on the general well-being (the social welfare) of a society.

Although they are not true axioms in the logical sense of being self-evident and undeniable propositions (for example, A=A), the axioms of monotonicity and transfers represent common sense, plausible generalizations about human nature and human society. For that reason, they are often referred to not as axioms but simply as principles. In welfare economics, the two principles are usually stated in relation to the social welfare function, which tries to match different income distributions with different levels of social welfare.

Social welfare is conceived, albeit with many complications, as the sum total of individual welfares in the society. Hence, if one person is two units better off while another person is one unit worse off, and everyone else's welfare stays the same, then social welfare increases by one unit. In essence, the principle of monotonicity states that it is better to have more money (or any other good) than it is to have less of it. Yoram Amiel and Frank Cowell (1997) formulate the idea as follows, where x and x' are incomes, X is the income distribution, and W is the welfare function: The social welfare function is monotonic if, for any x, x' in X, x' > x implies that W(x') > W(x).

The mathematical formulation is not merely a case of academic obfuscation. By stating this commonsense principle in mathematical terms, economists can work out its implications in complex and powerful econometric models.

Carl P. Simon and Lawrence Blume (1994) formulate the idea in terms of consumer goods instead of income. Where X is a bundle of consumer goods, $x_1 ... x_n$ are goods in the bundle, and $U(x_1 ... x_n)$ is the individual's welfare derived from a particular bundle, the individual's goal is to buy just the right combination of goods $x_1 ... x_n$ to maximize his or her welfare. Then for each bundle of goods X, there is some good x_n such that having more of it will increase the individual's welfare—as Simon and Blume put it, "increasing consumption increases utility." That this principle is generally true is evident; that it fails always to be true is evident to anyone who has consumed six hamburgers instead of

The principle of transfers states that in a society, greater equality of income is better than greater inequality. In practice, this means (according to the U.S. Department of Agriculture) "any transfer of income from a wealthier household to a poorer household will increase social welfare." At its root, this simply applies the idea of marginal utility to the income distribution in a society. Marginal utility states that, other things being equal, a person who has many units of good X will tend to value the next unit of X less than would an identical person who has very few units of X.

When applied to money income, this means that a person with a high income will tend to value an additional unit of money less than a person with a low income. If a unit of money is transferred from the high-income person to the low-income person, the latter gains more welfare than the former loses. As a result, the transfer increases total social welfare.

Azerbaijan

THE SOUTHWEST ASIAN nation of Azerbaijan was still caught up in 2005 in a battle with neighboring Armenia over the contested land of Nagorno-Karabakh that began in 1988. As a result of this battle, Azerbaijan has lost 16 percent of its territory and is coping with an internally displaced population of 571,000. Additionally, one-seventh of the Azerbaijani population is composed of refugees from Armenia and Uzbekistan.

As a result, Azerbaijan has the largest number of refugees in the world proportional to its population. To combat poverty, the government has initiated a number of antipoverty programs over the last decade. While these programs have been successful to some degree, 49 percent of the population remain under the poverty line and 21 percent continue to be malnourished. There is high inequality in Azerbaijan, where the poorest 20 percent hold only 3.1 percent of the country's resources, as opposed to 44.5 percent for the richest 20 percent. Azerbaijan is ranked 36.5 percent on the Gini Index of Human Inequality.

Some 41 percent of the Azerbaijani population are involved in agriculture and fishing, and periodic droughts frequently threaten general livelihood. The leading export is oil, but Azerbaijan has failed to realize the full potential of this resource. The government is slowly making progress in its transition from a socialist economy, but it is hampered by widespread corruption. Azerbaijan also faces the daunting task of dealing with extensive air, soil, and water pollution. The Apsheron Peninsula is considered to be the most ecologically devastated area in the entire world as a result of oil spills and the use of pesticides and defoliants. Despite economic woes, Azerbaijan has held unemployment to 2.1 percent.

The Azerbaijani population experiences a life expectancy of 63.35 years and a median age of 27.53 years. Females can expect to outlive males by approximately eight years. Some 26.4 percent of the people are under the age of 14, and 7.8 percent have reached the age of 65. Approximately 19 percent of the population lack access to safe water, and 22 percent lack access to proper sanitation. There are 359 physicians, most of whom are women, for every 100,000 residents. Some 20 percent of the population, however, lack access to affordable prescription drugs.

Infant mortality is relatively high in Azerbaijan at 81.74 deaths per 1,000 live births. This rate has increased since 2003, when 75 deaths occurred out of every 1,000 live births. Female infants are slightly

hardier at a rate of 79.8 deaths per 1,000 as compared to 83.58 deaths per 1,000 for male infants. Mortality for children under the age of 5 is reported at 91 per 1,000. Seven percent of all Azerbaijani children are malnourished, and 11 percent of infants are underweight at birth. Childhood immunizations have remained in the 90 percent range for the past decade for all children from birth to 23 months. Some 27 percent of children receive essential oral rehydration therapy when needed.

Between 1980 and 2005, fertility rates in Azerbaijan dropped from 3.2 children to 2.33 children per woman. Adolescent fertility is currently estimated at 44 out of 1,000 births. Some 55 percent of women use birth control of some sort. The National Program for Reproductive Health and Family Planning was initiated to prevent the spread of HIV/AIDS and other sexually transmitted diseases in addition to controlling fertility. Professional medical staff attend 88 percent of all births, but this is a decrease from 100 percent in 1990. Despite the accessibility of medical care, maternal mortality has increased over the past two decades. According to the 1995 model for determining maternal mortality, 37 deaths occurred out of every 100,000 live births. Using the 2000 model, however, that rate increases substantially to 94 per 100,000.

Literacy is almost universal among males with a 99 percent literacy rate. However, four percent of Azerbaijani women over the age of 15 cannot read and write. Education is a constitutional right. Therefore, it is free and compulsory for 11 years. All children are enrolled in primary and secondary schools. This fact is particularly impressive when compared to 1990 when half the males and 56 percent of females did not complete primary school. Approximately 22 percent of Azerbaijanis pursue education at the tertiary level. The ongoing battle with Armenia has been blamed for a general decline in the quality of education in Azerbaijan. At least 616 schools have been destroyed, and many teachers have lost their jobs. Most schools suffer from a lack of supplies.

WORLD POVERTY

B

Bahamas

THE BAHAMAS, a chain of islands, is situated in the north Atlantic Ocean off the coast of Florida. The islands are a mecca for American tourists. Unfortunately, the location of the Bahamas also draws drug dealers and would-be immigrants seeking a port of entry into the United States. Half of the labor force is employed in the tourist industry, which provides more than 60 percent of the Gross Domestic Product.

A high-income nation with a high standard of living and a stable economy, the Bahamas benefits economically from international banking, investment management, and internet commerce. In 2000, the government initiated new financial regulations that resulted in the withdrawal of a number of international businesses. This withdrawal contributed to the 10.2 percent unemployment rate.

Only five percent of all Bahamians are employed in agriculture, which is subject to extensive wind and rain during tropical storms. Data on social indicators are not always available for the Bahamas, and the exact extent of poverty is not known.

However, unofficial reports suggest that nine percent of the population are poor. Life expectancy in the Bahamas is 65.54 years, and islanders have a median age of 27.55 years. On average, females live seven years longer than males. Some 27.9 percent of Bahamians are under the age of 14, and 6.2 percent are over the age of 65.

Some 84 percent of islanders are likely to live to the age of 40. With a population of only 301,790, the islands have been devastated by a rising HIV/AIDS prevalence rate of three percent. In 2003, it was estimated that 5,600 people were living with this disease, which had killed close to 200 people. All Bahamians have access to proper sanitation, and only three percent lack access to safe water. There are 163 physicians for each 100,000 residents, and less than 20 percent of the population are able to afford essential drugs.

Between 1970 and 2005, infant mortality decreased from 38 deaths per 1,000 live births to 13 deaths per 1,000, and the mortality of children under 5 declined from 49 to 16 per 1,000. Estimates for 2005 indicated that male infants are much likelier to die than females, with a rate of 31.02 deaths per 1,000 as compared to 19.28 deaths per 1,000. Seven percent of Bahamian babies are underweight at birth. Childhood immunizations for children from birth to 23 months are in the 90 percent range, a 10 percent increase since the 1990s.

Total fertility in the Bahamas is estimated at 2.2 children per woman, and adolescent fertility occurs at the rate of 56 out of 1,000 births. This fertility rate decreased from 3.3 children per woman in the 1970-to-1975 period. Trained medical personnel attend virtually all births in the Bahamas. Despite the ready availability of healthcare, maternal mortality at 60 deaths per 100,000 live births as estimated by the 2000 model was six times the mortality rate of 10 per 100,000 as estimated by the 1995 model. The HIV/AIDS epidemic has played a role in this increase.

Literacy rates are high on the islands, with 94.7 percent of the male population over the age of 15 having the ability to read and write and 96.5 percent of all females in this age group having the ability to do so. In 2002, primary school completion rates for males and females stood at 78 and 84 percent respectively.

Bahrain

THE BAHRAIN ARCHIPELAGO is located in the Persian Gulf. Now that oil reserves are diminishing, Bahrain has begun placing greater emphasis on petroleum processing and refining, which account for 60 percent of government revenues and 30 percent of the Gross Domestic Product. Bahrain has become an international banking center with well-developed communi-

cation and transport facilities, and a number of multinational firms are now headquartered in the country. As a member of the volatile Middle Eastern community of nations, Bahrain is careful to maintain balance in foreign affairs. In 2001, Amir Isa Al Khalifa launched a program designed to liberalize the politics and economy of Bahrain. The following year, he proclaimed himself king.

With a healthy per capita income of \$19,200, Bahrain is considered an upper-income nation. Some 79 percent of the Bahraini labor force are involved in industry, commerce, and services, and only one percent is engaged in agriculture. Approximately 15 percent of the people are unemployed. Bahrain's constitution contains a guarantee that the government must provide social security and other protections against ignorance, poverty, and fear to all citizens. Monthly stipends are paid to widows and orphans, and some 10,000 families receive government assistance. No poverty rate for Bahrain is available.

Bahrain's population of 688,345 enjoys a life expectancy of 74.23 years, with women generally outliving men by more than five years. Life expectancy has been steadily rising over the last several years. In 1999, the projected life span was 66 years for males and 70 years for females. The median age in Bahrain is 29.19 years. Almost 28 percent of the population are under the age of 14, and 3.4 percent have reached the age of 65. The Bahraini population has universal access to safe drinking water and proper sanitation, and healthcare is widely accessible. There are 169 physicians for every 100,000 people, and only five percent of the population lack regular access to essential drugs.

In 2005, the Bahraini infant mortality rate was estimated at 17.27 deaths per 1,000 live births. Female infants have a distinct advantage over male infants at 12.28 deaths per 1,000 live births as compared to 20.17 for males. In 2003, overall infant mortality was recorded at 12 deaths per 1,000 live births, and the mortality rate of all children under the age of 5 was reported at 15 per 1,000. Nine percent of Bahraini children under the age of 5 are malnourished, and nine percent of infants are underweight at birth. Ten percent of under-5s suffer from moderate to severe stunting, and five percent experience moderate to severe wasting. Childhood immunizations range from 99 to 100 percent.

Fertility rates have been substantially reduced in Bahrain over the last several decades. In the 1970s, the fertility rate was reported at 5.9 children per woman. By 2005, that number had dropped to 2.63. Adolescent fertility is 15 per 1,000 births. Over 60 percent of all

women use some sort of contraceptives. Bahraini women receive medical care free of charge, and professional staff are present at 98 percent of all births. Using modeled estimates for 2000, the maternal mortality rate is predictably low at 28 deaths per 100,000 live births.

Great strides have been made in reducing illiteracy in Bahrain, particularly among males. Approximately 92 percent of the male population over the age of 15 can read and write, but only 85 percent of females can do so. In 1980, male illiteracy stood at 21.6 percent and female illiteracy at 40.7 percent. Education is readily accessible in Bahrain, and most children attend school for at least 14 years. Between 1990 and 2002, however, primary school completion rates dropped from 100 to 85 percent among males and from 100 to 99 percent among females. Bahraini schools suffer from a lack of trained teachers.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Bangladesh

IN 1971, AFTER the liberation war, East Pakistan seceded from its union with West Pakistan and became a

new nation, Bangladesh. The new government of this poor country faced the problem of massive rehabilitation and reconstruction in a war-ravaged economy. The Human Development Index (HDI) was 0.336 in 1974. There are annual floods during the monsoon season, affecting about one-third of the country. There are also frequent cyclones. The famine in 1974 raised food prices and severely hit the agricultural laborers because of crop failure. A sustained economic growth was not possible due to the tardy pace of economic reforms, corruption, and an apathetic bureaucracy. Obsolete legal systems, a weak civil society, lack of opportunities for women, unemployment, an inefficient public sector, and an inadequate power supply have been impediments to economic growth.

Bangladesh is an overpopulated nation with 144,319,628 persons (2005). The birth and death rates are 30.01 and 8.4, respectively, per 1,000 inhabitants. The Gross Domestic Product in terms of real growth is 4.9 percent by a 2004 estimate. The unemployment rate in Bangladesh is 40 percent from figures of the same year. Its Gross National Income (GNI) per capita was \$735 in 2002. About 45 percent of the population live below the poverty line per a 2004 estimate. The agricultural sector employs about two-thirds of the population.

In spite of heavy odds, there have been sincere efforts from different quarters like the government, international organizations, and many nongovernmental organizations (NGOs) to alleviate poverty in Bangladesh. But much more is to be done. In the mid-2000s, the growth rate has been five percent. The per capita income is rising along with a declining trend in poverty. Whereas the "headcount" ratio of poverty was 58.8 percent in 1991–92, it decreased to 49.8 in 2000–01. But the reduction rate is slow and it will take about 50 years to attain a zero poverty line at this rate.

The absolute number of poor people is increasing, with about 65 million in 2000–01. It is enshrined in the constitution of Bangladesh that it is the duty of the state to guarantee food security for its people. Although grain production had doubled in the last 15 years, population growth has neutralized this advantage. There were reports of starvation in some pockets of northern Bangladesh in 2004. Although the government is taking steps toward a better distribution system, more has to be achieved. Infectious diseases, malnutrition, and infant mortality have affected the country in a substantial way.

A disorganized and poor healthcare system impacts the deprived sections of society in both urban and rural

Though poverty rates are improving in Bangladesh, child mortality and malnutrition remain pervasive issues.

regions. The government is trying to revamp the public health system in so that the poor will have access to it, since they cannot afford the high cost of private medical services. The women belonging to marginalized groups suffer more with a high infant mortality rate, and neglected care of mothers during pregnancies. It has been reported that there are about 26,000 casualties per year for pregnant women. A perennial problem for underdeveloped countries is access to safe drinking water. Presently, about 95.44 percent of the population of Bangladesh have access to it. Facilities regarding sanitation have increased from 21 percent in 1990 to 43.4 percent in the beginning of this century.

The efforts of NGOs are commendable for uplifting the condition of the poor in Bangladesh. The notable ones among 2,000 organizations working in Bangladesh are Asha, Bangladesh Rural Advancement Committee (BRAC), Proshika, and CARE. The NGOs

are working closely with the government, and some are in partnership with international organizations. Providing various kinds of aid to the poor, microcredit loans, improvement of healthcare, and income generation are some of the activities of these organizations.

The Bangladesh Grameen Bank (village bank) has done yeoman's service in changing the face of rural Bangladesh. A separate bank for the poor for providing loans without collateral was established in 1983. It has given loans totalling some \$3.75 billion to 2.5 million people, of which women constitute 95 percent.

About five percent of borrowers cross the poverty line each year with loans for houses, income-generating loans, and scholarships to needy students. Through these village banks, information technology and education have reached poor people through the creation of Grameen companies (village companies). The Grameen phone (village phone) is the largest mobile service company in the country. In the villages, it is the women who manage the telephone; services number about 21,000. With an all-out effort made by all concerned, the hope of the Millennium Development Goal is to reduce poverty by half by 2015.

PATIT PABAN MISHRA SAMBALPUR UNIVERSITY, INDIA

Bankruptcy

BANKRUPTCY IS A CONCEPT that often is directly tied to poverty. Persons are technically bankrupt when

their debts exceed their assets and they lack the ability to pay for their debts. For the purposes of Title 11 of the U.S. Code, bankruptcy debtors can be individuals (including married couples), family farmers, corporations, and municipalities.

Generally speaking, a number of entities are not allowed to be debtors under the code, including banks, railroads, and insurance companies. The federal bankruptcy code actually includes a number of types of bankruptcy. Chapter 7 allows for total liquidation of individual assets to pay for debt. Chapter 9 pertains to bankruptcy by municipalities that are unable to pay their debts. Municipal bankruptcies are rare, but do occur.

For example in 1994, Orange County, California, was forced into bankruptcy after losing approximately \$1.7 billion in the high-risk derivatives market, and was unable to meet its financial obligations. Chapter 11 pertains to bankruptcy of corporations. Some of the largest corporate bankruptcies have involved companies such as Enron Corporation and WorldCom, both of whose cases resulted in the loss of billions of dollars, forcing many employees, retirees, and investors into personal bankruptcy. Chapter 13 bankruptcy allows debtors to reorganize their debts in an effort to pay off at least part of the debts without forced liquidation of assets.

There is a multitude of reasons why individuals file for bankruptcy. One of the most common reasons is excessive medical debt. Approximately one-third of all Americans lack health insurance, and may be forced into bankruptcy when they are unable to pay for unexpected medical expenses. In that sense, expensive medical care has a negative impact on the poor, and may force those in the middle classes into poverty.

While many hospitals are willing to work with patients and their families, even not-for profit entities will take legal action against those persons who are perceived as unwilling to pay their medical debts. Faced with legal actions to collect medical bills, individuals may find themselves forced into filing for bankruptcy. Another common reason for bankruptcy filings is excessive nonmedical debt. Faced with social expectations for acquiring wealth, many individuals may choose to overextend their credit to purchase items such as cars, boats, and other consumer items that they cannot afford. Still others are forced into bankruptcy when they lose their job and cannot immediately find new employment.

In recent years, a number of corporate bankruptcies have been the result of criminal acts. For example, Enron was declared insolvent after it was determined that through a series of questionable transactions the value of earnings and stock had been illegally inflated to make the corporation appear to be profitable when it was not. WorldCom corporation bankrupted after it was found that it too engaged in illegal and unethical behaviors such that the value of the corporation was inflated far beyond its true worth.

On October 17, 2005, Title 11 was amended to make it harder for individuals and corporations to file for bankruptcy, particularly in terms of total liquidation of assets. In the past, many debtors chose to claim Chapter 7 bankruptcy. Under the new law, only individuals whose income is below the median and those high-income filers who pass a means test may qualify to file under Chapter 7. All others will have to file under Chapter 13.

Also, regardless of which chapter persons file under, they must first seek credit counseling with a service approved by the U.S. Bankruptcy Trustee. Once a debtor has left bankruptcy, he or she must attend mandatory financial management workshops. Previously, under Chapter 7, assets were valued at what they would sell for in a sale. Under the new law, assets are valued at current replacement value. One change that actually helps women and children who might otherwise fall into poverty is that spousal maintenance and child support obligation have been placed at the top of the list, ahead of all other creditors.

Barbados

FOR MUCH OF ITS HISTORY, the economy of the Caribbean island of Barbados was dependent on the production of sugar, rum, and molasses. After gaining independence in 1966, the government initiated social

and political reforms that led to a more diverse economy. By the 1990s, tourism and manufacturing had become the island's major sources of revenue, along with offshore finance and information services. The island's natural resources include petroleum, fish, and natural gas. Around 37.21 percent of the land on Barbados is arable, but only 10 percent of the labor force are now engaged in agriculture.

While Barbados is an upper-middle-income nation, its poverty rate is eight percent, and women and children tend to be the poorest segment of the population. In 1998, the Barbadian government established the Poverty Alleviation Bureau to oversee antipoverty programs and to accept applications for the Poverty Eradication Fund, which dispenses government assistance. To qualify for this program, individuals must have incomes lower than the projected poverty line of \$5,503 per year. Most of the beneficiaries of this fund are single mothers and elderly females. Needy individuals may also apply to Relief 2000, a program that offers financial assistance, housing, employment, and training.

Women and children tend to be the poorest segment of the population.

The projected life span has been steadily increasing in Barbados. The population of 279,254 enjoys a life expectancy of 71.41 years, with females living an average of four years longer than males. The median age is 34.15 years. Some 20.6 percent of the population are under the age of 14 and 8.8 percent have reached the age of 65. Over 97 percent of Barbadians are likely to see the age of 40. All Barbadians have access to safe water and proper sanitation. There are 136 physicians for every 100,000 residents, and only five percent of the population are unable to afford essential drugs.

Between 1970 and 2002, infant mortality declined from 40 deaths per 1,000 live births to 12 per 1,000. During that same period, the mortality rate of children under the age of 5 decreased from 54 to 14 per 1,000. Ten percent of Barbadian babies are underweight at birth. Six percent of under-5s experience malnutrition, and one percent are severely underweight. Seven percent suffer from moderate to severe stunting, and five percent suffer from moderate to severe wasting. Childhood immunization rates are in the 80 to 90 percent range.

Fertility in Barbados is low at 1.65 children per woman. That rate decreased from 2.7 children during

the 1970s. Adolescent fertility is recorded at 51 out of 1,000 births. Some 55 percent of all Barbadian women use contraceptives of some sort. Trained medical staff attend 91 percent of all births, but the rate of attended births has declined from 100 percent in 1990. In 2000, maternal mortality was estimated at 95 deaths per 100,000 live births.

Illiteracy has been steadily declining over the past decades. Barbadians define literacy as having attended school. Using this criterion, 98 percent of males and 96.8 percent of females are literate. Most Barbadians are expected to attend school for 14 years. From 1999 to 2002, the primary school completion rate of males rose from 99 to 110 percent while the completion rate of females increased from 96 to 109 percent. Approximately 21 percent of all Barbadians attending school at the tertiary level are enrolled in math, science, and engineering.

Basic Income

BASIC INCOME REFERS to a system in which a subsistence-level income is provided to all individuals in a political community on a regular and guaranteed basis. It is a break with contemporary welfare and workfare programs since money is guaranteed without a means test or requirement to work and there is no compulsion for recipients to accept a job if offered.

There are numerous versions of basic income proposed by advocates, depending on cultural, national, or historical context. These proposals vary with regard to income amounts, sources of funding, ages of eligibility, and possible levels of taxation of other incomes.

Most versions share the belief that economic security is a right of citizenship rather than a conditional benefit that depends upon employment status or family situation. Thus basic income is to be provided regardless of income from other sources or potential for employment and it is to be paid to individuals rather than households. Most versions of basic income emphasize universal and unconditional payments made to all residents upon birth.

More recently advocates of basic income have argued for a global basic income to be made available to everyone regardless of national origin. In keeping with the emphasis on social justice and fairness motivating most appeals for basic income, this payment would be subsidized by wealthier nations.

Basic income advocacy has made its strongest gains in Europe where persistent levels of high unemployment have not been addressed by more conventional social policies. Many activists and educators, including Nobel laureates in economics, have come to see basic income as the best means for addressing issues of poverty as well as employment in Europe.

Basic income offers an approach to poverty with potentially far-ranging and durable benefits since it would also contribute to the development of some of the conditions that are necessary for a longer-term reduction of poverty. For one thing it would strengthen the bargaining position of individual workers in the labor market by lessening the hardship of unemployment as an incentive to accept relatively low-paying, insecure jobs.

Basic income, by providing something of an unconditional and permanent safety net, would also improve the capacity of workers to organize collectively since the possible impact of job loss or workplace reprisals would be lessened. Basic income may further allow for increased participation in community organizing, social movements, or, more broadly, the social economy of neighborhood services since it contributes to freeing up people's time away from work while providing the resources necessary for people to sustain themselves in such activities.

Basic income also allows for the decommodification of labor since, given the presence of a basic income at an acceptable subsistence level, people can meet their needs without the compulsion to enter the labor market. As many advocates of basic income argue, it breaks the link of necessity between a decent standard of living and participation in the capitalist labor market.

Critics of basic income contend that it is an idealistic wish.

In addition, because basic income is to be paid to individuals rather than households, without regard to marital status, it offers the possibility of freeing people from oppressive familial relations within the home. Because it is provided to children it also offers some means of addressing child poverty, which in many countries represents the area of poverty that is growing most dramatically.

Taken as a whole these outcomes of basic income, advocates would argue, contribute to broader and longer-term efforts to reduce poverty, even beyond the immediate financial impact of the basic income itself. For these same reasons, however, critics of basic income contend that it is an idealistic wish to which governments and their corporate backers will never consent.

Basic Needs

BASIC NEEDS ARE THE fundamental requirements sustaining healthy development, survival, and the inherent value of human beings, or the tools necessary to achieve full personal growth. Basic needs are socially and culturally determined and can be classified as phys-

ical (nourishment and health needs), material (clothing and housing needs), and cultural (educational and service needs). However, the capacity of a society and its members to produce life's requirements depends upon the cooperation of government authorities, citizens, and implementation of just laws and programs that ensure basic needs are met.

The idea of basic needs originates from an instinctive desire to survive; it also comes from a society's aspiration to ensure the survival of its members. Because communal values of cultures differ in conceptualizations of individual well-being and distributive justice—each having unique notions of abundance, moderation, and deprivation, as well as methods of sharing and using public resources—a basic need also embodies an unconditional and universal human right promised to all, an ethical notion reinforced by international law.

The Universal Declaration of Human Rights was signed on December 10, 1948, and it consisted of 30 articles, proclaiming the natural rights and freedoms fundamental to all human beings. The adoption of this declaration acknowledges a person's basic needs according to the precept that "all human beings are born free and equal in dignity and rights" (Article 1). Of relevance to the concept of basic needs, for instance, are sections 22, 23(3), and 25(1):

Article 22. Everyone, as a member of society, has the right to social security and is entitled to realization through national effort and international cooperation and in accordance with the organization and resources of each state, of the economic, social, and cultural rights indispensable for his dignity and the free development of his personality.

Article 23(3). Everyone who works has the right to just and favorable remuneration ensuring for himself and his family an existence worthy of human dignity, and supplemented, if necessary, by other means of social protection.

Article 25(1). Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing, medical care, and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age, or lack of livelihood in circumstances beyond his control.

Created to generate a global perception of the inherent worth of all humankind, the Universal Declaration of Human Rights presents a modern framework for a valuable and shared definition of basic needs across cultures. The outcome of such a legislative declaration, however—unless it can be suitably enforced by

international laws and the governments that honor them—can only represent an ideal of human justice—a vitally democratic end toward which civil societies should eventually strive.

INEQUALITY AND BASIC NEEDS

Some politicians, economists, and policymakers attribute the rise of universal progress and human achievement to the success of capitalism. Others question the growing problem of economic inequality, claiming it has produced a gross imbalance in the distribution of resources among the world's inhabitants.

On one end are those whose basic needs are met because of their steady access to a limitless supply of goods afforded by high income and abundant wealth. On the other extreme are those people unable to acquire life's necessities. Scholars, analysts, critics, and activists are beginning to accept the reality that many of the planet's inhabitants continue to be deprived of basic needs.

According to the United Nations, of the 5.7 billion people living on the planet, as of 2004 an estimated 1.7 billion require access to clean water; over 2 billion children die each year from vaccine-preventable diseases; more than 840 million people starve daily, while 200 million children suffer from malnutrition; over 1.4 billion people face severe housing conditions, while more than 100 million are without a home. Such statistics indicate the massive crisis of basic needs in today's world, especially considering that foreign aid from countries of abundance are still unable or unprepared to eliminate poverty.

SUSTAINABLE SOLUTIONS

As global awareness of deprivation of basic needs increases, more projects and creative strategies for sustainable, needs-based stability worldwide can emerge. Models for real global change are presented by the work of aid programs (International Red Cross), international debt relief efforts (JUBILEE 2000), religious groups (Salvation Army), nonprofit organizations (50 Years Is Enough, Free the Children), global awareness education initiatives (Rethinking Schools Press), and alternative media (ZNet).

Finally, efforts like the World Food Summit (2002) and the United Nations' Millennium Development Goals 2015 have provided hopeful programs committed to forming global solutions to widespread deprivation.

CHRISTINA BRAID INDEPENDENT SCHOLAR

Basic Security

ECONOMIC DEPRIVATION—a lack of financial resources—is the basis by which most define poverty. But how can poverty be measured in cultures that circulate no money? Poverty figures are unavailable for the nation of Somalia since it has no government and no official currency. Does this mean that everyone in Somalia lives in poverty? Obviously not, as the country is ruled by local warlords with their own private armies.

Is money the only gauge of prosperity? Is the chief of a tribe in an innermost rainforest poor because he has no money? He has 40 goats and eats his fill daily with his children and wife, who live in the tallest structure in their village. He is guarded day and night by the two most feared warriors in the area. The tribe lives on a ridge over a beautiful river, safe from flood and invasion. The chief's tribe may not have income, but still enjoys basic security.

"The lack of basic security connotes the absence of one or more factors enabling individuals and families to assume basic responsibilities and to enjoy fundamental rights," wrote Father Joseph Wresinski, founder of ATD Fourth World, an international nongovernmental organization based in France that engages individuals and institutions to support the daily efforts of people in extreme poverty. "The lack of basic security," wrote Wresinski, "leads to chronic poverty when it simultaneously affects several aspects of people's lives, when it is prolonged and when it severely compromises people's chances of regaining their rights and of reassuming their responsibilities in the foreseeable future."

Nobel Prize-winning economist Amartya Sen, drawing attention to the fundamental link between development and freedom, emphasized that poverty must be seen as the deprivation of basic capabilities rather than merely as lowness of income. Sen's vision of poverty includes capability deprivation as well as the availability of choices, security, and power needed for an individual or a society to enjoy an adequate standard of living along with fundamental civil, cultural, economic, political, and social rights.

"Insecurity," wrote Confucius, "is worse than poverty." In this point of view, even a person born to vast wealth lives in a condition worse than poverty if he lacks basic security—suffering constant anxiety, humiliation, and oppression inflicted by those who wield power; being ostracized; and being continuously reminded one is inferior.

"Human rights are about ensuring dignity, equality, and security for all human beings everywhere," wrote the late Sergio Vieira de Mello, United Nations High Commissioner for Human Rights from 2002 to 2003. "Dignity, which reflects both autonomy and responsibility, concerns the individual. Equality is the cornerstone of effective and harmonious relationships between people; it underpins our common systems of ethics and rights, whether we are discussing equality before the law or the need for equity in how states and international systems conduct their affairs. Neither dignity nor equality, of course, can take root in the absence of basic security."

Begging

SOME WOULD SAY BEGGING, not prostitution, is the world's oldest profession. According to the creation account in the Book of Genesis, the first job given to

Begging is not restricted to poor nations. Above, a beggar in Japan shows that the practice is common even in wealthy nations.

humankind was gardening, then came tilling the soil and animal husbandry. Anthropologists would rebut that the first profession was actually hunting and gathering. Either way, begging probably showed up next, with the world's first beggar being a disabled or failed hunter, gatherer, or farmer who was forced to seek charity from his peers.

Beggars show up in mankind's earliest literature. Kagemni was an Egyptian writer who around 2575 B.C.E. served as vizier to the pharaoh Snofru and wrote in the Papyrus Prisse, which is said to be the world's oldest known manuscript: "The king and beggar are as one." Around 540 B.C.E., the inventor of satire, Greek lyric poet Hipponax, was banished from Ephesus and lived as a beggar in nearby Clazomenae. According to Homer, Ulysses, during his long odyssey after the Trojan War, lost all of his comrades and ships and made his way home to Ithaca disguised as a beggar. Around that time in India, Buddhist legend has it that Siddhartha

Gautama lived a sheltered life as a prince being trained to be king. At about 29 years old, he asked his charioteer to take him around the city, where he saw an old, sick beggar, then a body being carried by mourners to its cremation. He was stunned, having had no idea such miseries existed. He gave up his life of pleasure, went out as a beggar in search of truth, and became the Buddha.

Norse mythology tells the story that the goddess Gefjon, disguised as a beggar, visited the king of Sweden, and tricked him into agreeing that she could have as much of Sweden as she could plow with four oxen in one day. She traveled to Jotunheim and found her four oxen sons whom she had by a giant, then plowed all of the land now known as Zealand so it became part of Denmark.

From ancient times in Japan, it has been believed that to ward off bad luck, one should always throw salt where a beggar has just been. In most ancient cultures, it was disgraceful to turn away a beggar or one who came to your door requesting alms. The ancient Greeks believed that on occasion a god or goddess would come disguised as a beggar to a mortal's door, testing the hospitality and morality of the person.

During the Middle Ages, a number of Roman Catholic mendicant or "begging" orders were founded, whose members made a formal vow of poverty. Today only four survive, the Order of Preachers (also known as the Dominicans), the Friars Minor (the Franciscans), the Carmelites, and the Hermits of St. Augustine (Augustinians).

Mention of begging turns up in medieval times in *Proveres* by John Heywood: "Beggars should be no choosers." By 1561, English street beggars had taken on specialties, such as rufflers, who begged from the strong and robbed the weak; palliards, beggars who evoked compassion by means of artificial sores made by binding something corrosive to the flesh; fraters, who pretended to be soliciting on behalf of hospitals; Abraham Men, who pretended to be insane; whip-jacks, who pretended to be shipwrecked sailors; counterfeit cranks, who pretended to suffer from a "falling sickness"; dommerers, who were false deaf-mutes; and Demanders for Glimmer, who pretended to have suffered major losses by fire.

Modern-day researchers at the University of Glasgow, Scotland, reported a close relationship between modern British begging and homelessness, with more than 80 percent of beggars homeless. That study also found that British street beggars often came from dysfunctional family backgrounds. Many had an acute lack

of self-esteem, suffered from a substance-abuse problem, and admitted to begging to get money for alcohol or drugs.

Research carried out by Luton University near London showed that 86 percent of beggars reported recently using drugs and that 49 percent of those were using heroin. Most said that they had experimented with a range of drugs and 52 percent reported using alcohol. Of those, 54 percent did so every day and spent more than \$50 per week on alcohol use.

Only 25 percent reported begging as their only source of income, with the rest citing disability checks, military pensions, and other public assistance. More than half (59 percent) said they brought in more than \$40 a day while 12 percent reported making more than \$100 a day. Sleeping outdoors on sidewalks and in alleys was reported by 49 percent and about a third said they spent their nights at hostels or homeless shelters. The vast majority (86 percent) said they spent some of their proceeds on food, 58 percent said they bought drugs and 49 percent reported spending some of their money on cigarettes or alcohol.

An overwhelming number identified at least one background problem that led to their begging, including drug abuse (44 percent), relationship difficulties (61 percent), accommodation problems (27 percent), and involvement with police (21 percent). Most reported having begged for some time, 68 percent for a year or more, including 30 percent for more than five years. Only 18 per cent had been begging for less than six months. A large proportion (81 percent) said they tended to beg several times a week or daily.

Beggars in Mexico reflect that country's income inequality, where the richest 30 percent take in 77 percent of the national income.

A woman, cradling a baby, begs on the street of a modern Arab city, where women have few options if abandoned by their husbands.

Of the general public, just over half (52 percent) told Luton University researchers that they had ever given money to a street beggar. Of those who had never done so, 83 percent said they were unlikely to do so in the future and 82 percent said they would rather give money to a charity than a beggar.

Begging occurs in the poorest corners of the world, but also in the most prosperous. On Wall Street in New York City, sidewalk panhandlers are a common sight. In the Metro stations of Washington, D.C., ragged musicians play violin, guitar, or flute for donations. In Mexico City, tourist destinations are often crowded with small children pleading for pocket change. In some countries begging is much more tolerated and in certain cases even encouraged. In India, to give alms to a beggar earns points toward entry to heaven, and some families have been beggars for multiple generations and have sizeable wealth, which they accumulate by employing and training other beggars. Some Indian beggars have territories and even engage in verbal and physical abuse of encroaching competitors.

Belarus

BELARUS DECLARED ITS independence in August 1991 after 70 years of being a constituent republic of the Soviet Union. Today Belarus, with its 10.1 million population, is the only remaining dictatorship in Europe. Since 1994, its authoritarian leader, Alexander Lukashenka, has imposed various restrictions on economic and political freedoms. He has established closer ties to Russia than any of the other former Soviet republics and in 1999 signed a treaty on a two-state union providing for future political and economic integration of the two countries. Russian troops stationed in Belarus are guarantors of the Lukashenka regime.

Belarus has the least reformed Soviet-type command economy, dubbed by the Lukashenka government as "market socialism." It continues to be based on inefficient, state-supported industrial and agricultural enterprises and is hampered by heavy-handed government regulation, administrative controls over prices and currency exchange rates, high inflation (114 percent in 2004), corruption, and persistent trade deficits with Russia, Belarus's largest trading partner and energy supplier. Economic growth was strong, however, during the last three years (five to six percent annually), mainly caused by increased Russian demand for otherwise noncompetitive Belarusian goods. Belarus remains self-isolated from the West and even from its immediate neighbors—Poland, Lithuania, and Ukraine.

Economic and social statistics in Belarus are unreliable owing to political influences and questionable methodology. According to the World Bank, the Gross National Income of \$6,052 per capita in 2004 is one of the lowest in Europe, with 48.1 of the economy being in the "informal" (that is, the black market) sector. According to the Belarus Ministry of Statistics and Analysis, poverty in Belarus is endemic: the population with disposable monthly income per capita below the subsistence level, set by the government at 130,000 Belarus rubles (\$60) per person, is 12.3 percent, and that with income of 130,100 to 250,000 Belarus rubles is 43.0 percent, with 28.6 percent of households with children. The share of foodstuffs in the household budget amounts to 50.5 percent. According to Engel's Law, with rising incomes the share of expenditures for food declines. In the United States it is 9.7 percent, and in other developed countries, lower than 18 percent; a 50 percent food expenditure in the budget is characteristic of the lowest-income economies.

The dramatic increase in poverty after independence is due to the overall decline of productivity and income rather than an increase in the inequality of income distribution, which was the case in most other transitional economies of eastern Europe and the Soviet Union. In Belarus, society witnessed an increase in the absolute poverty of the population, with single parents, one-worker families, and large, less educated families with children being the most affected.

Roughly one third of the Belarusian people have become poor since the mid-1990s.

Standards of living in agricultural areas have declined relative to cities owing to inefficient and unreformed collective and state farms. Agricultural workers, however, have focused on self-sufficiency rather than working on state farms. Urban populations have also turned to small-scale agriculture and self-employment to survive. While roughly one-third of the Belarusian people have become poor since the mid-1990s, some groups acquired significant wealth. These groups include the new entrepreneurs, corrupt government officials, and those engaged in criminal activities.

Belarus's social safety net was largely intact during the first years after the collapse of the Soviet Union, and was first expanded in 1993-94 to alleviate the socially explosive cost of high inflation: 2,059.9 percent in 1994 alone. Now both welfare benefits and other public-sector incomes are adjusted to the rate of inflation. The government's greatest social expenditures are for pensions. The relatively low retirement age (55 for women and 60 for men) and the country's demographic structure account for the large number of pensionerstwo million old-age pensioners and 600,000 persons receive other types of pensions (military, disability, and special Chernobyl pensions for those affected by the 1986 Soviet nuclear plant disaster).

The minimum monthly pension is equal to \$40, the same as the minimum wage, and the average pension is \$82. Pensions are determined on the basis of income earned at the time of retirement and of the length of employment; the pensions of those who did not contribute to the pension fund during their years of employment are linked to the minimum wage. Unemployment is low—about two percent of the labor force—and compensation is provided for six months. Benefits are related to forgone earnings.

The government provides a number of other benefits, including lump-sum grants upon the birth of a child; temporary disability allowances; trips to sanatoria, spas, health homes, vacation resorts, and other facilities; and benefits for victims of the Chernobyl nuclear disaster. The level of benefits is very low.

The fertility rate in Belarus is 1.3 children per female, which does not provide for a stable population, and is among the world's lowest, while the Belarus abortion rate is one of the highest in the world. Low fertility, coupled with high mortality, especially among workingage men, led to a situation where the annual number of deaths exceeds the number of births. One of the explanations of increased mortality is widespread alcoholism. Rates of homicide and suicide are among the highest in the world.

Yuri N. Maltsev, Ph.D. Carthage College

Belgium

THE KINGDOM OF BELGIUM is a small and prosperous country in western Europe. One of the so-called Benelux group (Belgium, the Netherlands, and Luxembourg), the country has prospered economically in the

years since the end of World War II, in large part because of its strategic location within the region. Belgium is relatively small in area and the country shares borders with France, Germany, Luxembourg, and the Netherlands. Access to other economically successful western European countries, especially France and Germany, has worked to Belgium's advantage and helped to bring it to prominence as well. Another decided advantage for Belgium is access to the North Sea by way of its 50-mile coastline. A number of important port cities are located either on the North Sea coast or along navigable rivers flowing inland.

Belgium has a temperate climate with mild winters and cool summers. Rainfall is abundant due to the country's proximity to the Atlantic Ocean. Approximately 24 percent of the overall area of Belgium is arable. Coastal plains in the northwest transition to a hilly regime south of Brussels and then to mountainous terrain in the Ardennes Forest near the border with Luxembourg. Belgium has reclaimed land along the northwest coast and the country is protected from flooding by a series of concrete dikes.

Belgium is a modern country in every sense of the word. It boasts of a highly diversified economy, one of the highest per capita gross national incomes in western Europe, and life expectancy measures of 76 years for males, 82 years for females, and 79 years overall. Despite these successes, recent estimates indicate that about four percent of the population live below the poverty line. Less than two percent of Belgium's labor force are engaged in agriculture while 25 percent are in industry and 73 percent are found in the service sector.

Although Belgium is small in area, its array of agricultural products is quite varied. The country produces sugar beets, a staple in Europe, a variety of fruits and vegetables, some grains, and meat. The variety of industrial activities in the country is a clear indicator of its economic success: transportation equipment, scientific instruments, textiles, metal products, chemicals, and processed foods are produced in abundance for both domestic consumption and export. Belgium's trading partners are primarily in the western European region, with Germany, France, and the Netherlands leading in both imports and exports. Belgium is wholly dependent on foreign sources of both crude oil and natural gas, crucially important energy sources for its thriving industrial sector.

Belgium has been both proactive and innovative in its approach to poverty. Government surveys of poverty conditions in the country included input from people living in poverty conditions. In addition, the sur-

In a First World country such as Belgium, poverty has less to do with a lack of material goods than a lack of social opportunities.

veys went beyond the collection of the usual poverty measures, such as financial income and job availability, and dealt with the accessibility of citizens' rights among the poor and the emotional aspects of being poor. The primary goals of the investigation were to find out first-hand what the realities of life are for the poor and determine ways to change the conditions that create and sustain poverty. This approach is similar to ones successfully used in conflict resolution, where those involved in the conflict are given the opportunity to take part in its resolution.

GERALD R. PITZL NEW MEXICO PUBLIC EDUCATION DEPARTMENT

Belize

IN THE LATE 18th century, Great Britain and Spain fought over possession of the Central American area now known as Belize. The British won, and colonization proceeded in what became known as British Honduras. A subsequent move toward independence was stymied by disagreements between the United Kingdom and Guatemala. Although self-government was established in 1964, independence was not accomplished until 1981, nine years after the country had changed its name to Belize. It was not until 1991 that Guatemala recognized Belizean independence. Territorial disputes continue, however, and Guatemala claims more than half of the area known as Belize.

Belize is an upper-middle-income nation with a percapita income of \$6,500. The economy is diversified, with 55 percent of the labor force employed in services, and tourism is the largest revenue producer. High unemployment, increasing urban crime, and involvement in the South American drug trade have hampered economic growth. Some 18 percent of the labor force are engaged in industry, mostly in the production of garments and marine products. Approximately 27 percent of the workforce are employed in agriculture, producing mainly citrus fruits, cane sugar, and bananas. Reforms instituted in 1998 have signaled a period of growth, but officials are still coping with a considerable trade deficit and a huge foreign debt.

One-third of Belizeans live in poverty, and 12.9 percent of the workforce are unemployed. The international community is heavily involved in antipoverty measures in Belize, and a social net has been constructed to aid the poorest individuals and families. Because women are more likely than men to be poor in Belize, the government has attempted to alleviate the situation by recognizing the importance of childcare and domestic work when determining economic assets and obligations at the time of legal separations and divorces. Social security for elderly women is allotted on a cocontributory basis to prevent these women from sliding into poverty.

Life expectancy in Belize is 67.49 years. With a projected life span of 70.08 years, females outlive males (65.02 years) by some five years. Among the population of 279,457, the median age is 19.35 years. Just over 40 percent of the population are under the age of 14, and over 14 percent have lived to the age of 65. While 92 percent of Belizeans have access to safe drinking water, only half of the population has access to improved sanitation. There are 102 physicians for every 100,000 residents in Belize. From six to 20 percent of the people are unable to afford essential drugs. With a prevalence rate of 2.4 percent, HIV/AIDS presents a growing threat in Belize. Some 3,600 Belizeans are living with this disease, which has killed around 200 people.

Infant mortality is high in Belize, with 25.69 deaths occurring out of every 1,000 live births. This figure has been slashed from 56 deaths per 1,000 live births in the 1970s. Female infants (22.25 per 1,000 live births) are hardier than male infants (28.97). The mortality rate of children under the age of 5 has declined significantly from 77 deaths per 1,000 in 1970 to 39 deaths per 1,000 in 2003. Six percent of all children under the age of 5 are malnourished, and six percent of infants are underweight at birth. Childhood immunization rates for children vary from 89 to 97 percent.

Belizean fertility is also high, partly because nearly half the population is nominally Catholic. Some 56 percent of women use some method of birth control, an increase from 47 percent in 1980. Between 1970 and 2005, the fertility rate declined from 6.5 children per woman to 3.68 children per woman. Among adolescents, the fertility rate is 80 per 1,000 births. Trained medical staff attend 83 percent of all births in Belize. According to modeled estimates for 2000, maternal mortality is extremely high at 140 deaths per 100,000 live births.

Literacy rates for both males and females over the age of 15 are 94.1 percent. Great gains have been made in reducing illiteracy since 1980, when 15.5 percent of males and 19.5 percent of females were illiterate. Most students attend school for at least 12 years. Primary completion rates are reported at 96 percent and secondary attendance rates are recorded at 60 percent.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Bellamy, Edward (1850-98)

IN 1888, EDWARD Bellamy, an American journalist and author, published a utopian novel entitled *Looking Backward*: 2000–1887, which significantly influenced the social reform movement throughout the Western world. Bellamy, the son of a Baptist minister, was born in 1850 and raised in predominantly rural Chicopee Falls, Massachusetts. In 1871, he was admitted to the bar but left the legal profession after a single case to take up journalism.

Bellamy's early works, particularly *The Duke of Stockbridge* (1879), reflect a concern with the nature of society and the need to protect farmers and workers from the "greed" of capitalists. *Looking Backward* represented a technological-utopian solution to the impending crisis that many social commentators believed was inevitable and the book was a success, selling 300,000 copies by 1890 and over a million copies worldwide by 1898. It propelled Bellamy to the forefront of the social reform movement in the United States. One indication of the depth of Bellamy's influence is seen in the fact that between 1889 and 1900, 46 utopian novels were published in the United States either as responses to or elaborations on *Looking Backward*.

Bellamy argued that the development of industrialization and urbanization had destroyed the tradition of individualism and economic self-reliance, as "plutocrats" and "monopolists" had taken control of the political process and used their economic power to dominate the lives of their workers. Bellamy believed that the continued amalgamation of business into ever larger monopolies, and the concurrent creation of a disenfranchised industrial proletariat, would ultimately result in a wave of popular unrest that would force the state to nationalize all industries, a process that Bellamy conceptualized as the replacement of private capitalism with public capitalism.

Bellamy's economic, social, and political views were based on the combined concepts of social contract and social inheritance. According to this synthesis, all members of society had specific rights and duties and all shared an equal inheritance of the social and economic resources of society. This inheritance was manifested both in terms of material wealth and through intangible elements such as scientific knowledge and cultural traditions. Bellamy rejected traditional arguments against collectivism, which emphasized the unjustness of equal distribution when individuals produced at different rates, by emphasizing the interdependence of all individuals. He argued that the "achievements" of industrialists and wealthy businessmen were only possible because they benefited from the social resources created by previous generations.

Bellamy's vision had a significant influence on the platform of the People's Party.

In the United States, the popularity of Looking Backward translated into direct political influence through the formation of Nationalist clubs and the publication of two journals: The Nationalist, from 1889 to 1891, and the New Nation, published under Bellamy's editorship from 1891 to 1894. Although scholars disagree concerning how many Nationalist clubs were established and how long they remained active, conservative estimates indicate that over 150 clubs were established by the early 1890s and that as many as 500 clubs may have been created. While this Nationalist movement never became an independent political force, the Nationalists and Bellamy's vision had a significant influence on the platform of the People's Party (1891–1906).

CHRISTOPHER DAVID O'SHEA, Ph.D.
UNIVERSITY OF GUELPH

Benin

THE SUB-SAHARAN nation of Benin holds the distinction of being the first African nation to successfully move from a military dictatorship to a democracy. With an average annual income of \$380, 37 percent of the population live in poverty, and 22.9 percent of all children under the age of 5 are malnourished. Approximately 37 percent of the population lack access to improved water sources, and 23 percent lack access to improved sanitation.

Poverty has flourished in Benin because development has been limited, and the Beninese economy is heavily dependent on subsistence agriculture, cotton production, and regional trade. Because many of its exports have been banned by neighboring Nigeria, smuggling and other criminal activity have increased along their common border. Efforts are under way to diversify the economy by emphasizing tourism and technology and promoting foreign investment. New privatization policies are also expected to enhance the shaky economy.

In 2005, Benin's population was estimated at 7,460,025. This population is constantly threatened by low life expectancy coupled with high infant mortality and HIV/AIDS rates. The median Beninese age is 16.56 years, with a life expectancy of only 50.51 years. Some 46.5 percent of Benin's population are under the age of 14 and only 2.3 percent are over the age of 65. Almost half of the population (45.7 percent) is at risk of dying before the age of 40.

Between 1990 and 2000, the number of malnourished Beninese increased by six percent. To deal with this problem, the Sasakawa Africa Association and the Carter Center joined with the Beninese Ministry of Agriculture to increase the food supply, assisting some 100,000 farmers in gaining knowledge of new agricultural technology designed to increase production of velvet beans, quality protein maize, and rice. Even though

the food supply has increased, general health continues to be threatened by a lack of access to potable water.

Other health concerns include the very high risk of developing food- and waterborne diseases such as bacterial and protozoal diarrhea, hepatitis A, and typhoid fever. In certain areas, the risk of contracting malaria and yellow fever is also high. Incidences of meningococcal meningitis are common. Before 1993 when the Carter Center began working with health officials and local communities to eradicate Guinea worm disease, which is caused by infected water, thousands of new cases were reported each year. By 2003, only 30 cases were reported. Government and health officials have also become increasingly concerned about the rising number of people with HIV/AIDS: in 2003, it was estimated that 68,000 people had contracted the disease, and an additional 5,800 had died from the disease.

Beninese children are particularly vulnerable to the extreme poverty, and the infant mortality rate is 85 deaths for every 1,000 live births. Male infants are more likely to die than females. The Beninese government has worked with international organizations to increase rates of childhood immunization to cut down on rates of communicable diseases. In 2003, 83 percent of all children aged 12 to 23 months had been immunized for measles, and immunizations for DPT3 rose to 88 percent. Among infants, immunization rates for DPT, measles, and tuberculosis increased slightly since 1990, but immunizations for polio decreased by nine percent during that period.

Women are also particularly affected by extreme poverty. The high fertility rate of 5.86 children per Beninese woman drains available resources. Only 18.6 percent of Beninese women aged 15 to 49 use any method of contraception. Estimates for 2000 indicate that 850 Beninese women died out of every 100,000 live births. At the beginning of the 21st century, only 65.5 percent of births in Benin were attended by trained medical staff.

Low literacy rates, especially for females, affect the quality of life for the Beninese population. In 2000, female literacy was estimated at only 26.5 percent, compared to 56.2 percent for males. Most children receive only seven years of schooling. However, access to education has improved since 1990 when only 65 percent of males and 32 percent of females attended primary school and only 31 percent and 18 percent respectively completed primary programs. By 2000, 85 percent of males and 74 percent of females attended primary schools, and 79 and 68 percent respectively completed primary programs.

In June 2005, the economic outlook for Benin improved when the United States and Great Britain proposed a plan to free 18 of the poorest nations, including Benin, from outstanding debts by allotting funds to be used for economic development and social programs as well as for debt relief.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Better Safer World

BETTER SAFER WORLD is a campaign that aims to change the way Americans respond to global poverty and instability. Moreover, it is also seeking to increase the humanitarian assistance for projects seeking long-term changes in the social and economic systems that allow, foster, or profit from poverty. The Better Safer World campaign is sponsored by nine international humanitarian organizations. These organizations are CARE, Childreach, International Medical Corps, International Rescue Committee, Mercy Corps, OXFAM, Save the Children, World Concern, and World Vision.

The nine sponsoring agencies for the Better Safer World campaign met together after the terrorist attacks on New York City and Washington, D.C., on September 11, 2001. The organizations involved concluded that it was absolutely necessary that the needs of over one billion people in the world who live in desperate

poverty be met. The Better Safer World campaign was launched in order to force the American people, especially the American electorate, and the government of the United States to address poverty and instability.

It was officially launched on November 6, 2003, in Des Moines, Iowa. The reason that Des Moines was chosen was its agricultural role in the heartland of America. The farmers of Iowa and the surrounding states grow crops that feed much of the world. As food producers they have a more complete understanding of the issues of global hunger than most Americans. Moreover, Iowa is home to the Iowa caucuses where Iowa's educated and informed voters often set the issues to be discussed during American presidential races. The goal of the nine groups then was to affect the policy debates of the 2004 presidential election.

Further, Better Safer World was launched in order to recruit Americans to work to address poverty and global instability. The sponsors of the campaign have cited statistics that show that the United States is among the 21 wealthiest countries in the world. Yet it is 20th in the amount of foreign giving. Since the United States government contributes only one-tenth of 1 percent of its Gross National Product to foreign humanitarian assistance, it seems obvious to the sponsor of the campaign that the United States can and must do more.

Its goal is the ambitious elimination of poverty altogether.

Observing that the United States is the world's superpower with extensive resources, it should also have the most support for lending aid. The nine organizations supporting the Better Safer World campaign have thus called on the American people and the elected officials of the United States to increase their assistance to impoverished nations. The goal of the organizations sponsoring the Better Safer World campaign is not simply to increase relief to the suffering but also the ambitious elimination of poverty altogether. The appeal of the Better Safer World campaign is not simply to the United States government and its elected officials. The appeal is directed toward individual Americans as well. The Better Safer World campaign influenced the rhetoric used in the Republican Party platform in the 2004 election. The "One Campaign" is a follow-up campaign.

Beveridge Scheme

A WIDELY CIRCULATED report commissioned by the British government and named for its author, Sir William Henry Beveridge (1879–1963), the Beveridge Scheme outlined a social assistance plan to reduce poverty in postwar Britain. In spite of its limited implementation, the plan greatly influenced post-World War II British social welfare policy and the development of the modern welfare state. What became known as the Beveridge Report is drawn from the Social Insurance and Allied Services manuscript published in 1942, quickly receiving widespread approval.

In 1941, Beveridge, a prominent British economist and known social reformer, was commissioned to formulate policy recommendations that would alleviate poverty in postwar Britain. The Beveridge Committee was set up in response to the pressure for social reform at a time when Britain's military position during World War II remained uncertain and fears were increasing among the populace that the economy would collapse once the wartime stimulus ended.

The primary goal of the Beveridge Scheme entailed providing a subsistence level "below which no one should be allowed to fall" to all British families via a "socially just" welfare state. The cornerstone of his plan was a comprehensive system of social security for every citizen "from the cradle to the grave." Specifically, Beveridge's intent was to ensure protection for all British citizens against the five giants of want, disease, ignorance, squalor, and idleness.

The key revolutionary objective of Beveridge's plan was the elimination of means testing and, in turn, establishing a system of social protection based solely on the principle of social insurance. Beveridge believed that benefits ought to be a universal right. His plan stipulated that all people of working age pay a weekly national insurance contribution.

This system of social protection would then grant flat-rate benefits to all citizens in case of sickness, unemployment, retirement, or widowhood. The Beveridge Report, however, did not include public works or employment programs.

Beveridge saw full employment (unemployment at no more than three percent) as pivotal to his social welfare regime and grounded his reform programs in previously developed social insurance measures. His plan was predicated on three assumptions: it would be accompanied by a general system of family allowances, a comprehensive national health service, and economic policy designed to maintain employment.

The Beveridge Report was well received and widely debated, yet never fully implemented. Between 1945 and 1948 the British Parliament passed legislation that constructed a universalistic welfare state. The legislation was enacted in large part because of Beveridge's recommendations, yet it differed significantly from the initial report. The legislation established a national minimum poverty level with national assistance playing a residual role to protect those who fell below the baseline. Above that minimum, an individual was free to provide extra benefits for himself and his family through savings, investments, or private insurance.

A fundamental aspect of the Beveridge Scheme was self-help through contributory insurance. Many historians and scholars have argued that this component proved more important in the development of 20th-century state welfare in Britain than either philanthropic or state provision. Ultimately, the impact of the Beveridge Report was seen in the manner in which it focused political attention squarely on social security and the welfare state.

The Beveridge Report, although it was not fully adopted by the British government, set the tone of comprehensive social welfare policy changes in Britain and led to the establishment of social security and the National Health Service. The transition to a fully implemented national minimum income was never achieved because of postwar inflation that outpaced the value of an individual's check. The lack of a true minimum income caused an increased reliance on means-tested social assistance to supplement the social insurance system, meaning that a central objective of the Beveridge Scheme had failed.

DUANE R. NEFF REBEKAH M. ZINCAVAGE BRANDEIS UNIVERSITY

Bhutan

BHUTAN IS A VERY small Himalayan kingdom between India and China (Tibet). By contract, Bhutan's foreign policy is conducted by India; nevertheless Bhutan has been an independent state since the beginning of the 20th century. It is ruled by a hereditary Buddhist monarchy. Prior to that time Bhutan was, like Tibet, a Buddhist theocracy.

Most parts of the country are mountainous; only the Indian border is a small strip of low land, where the climate and natural vegetation are subtropical and mostly used as farmland. The middle region is alpine with pine forests and is partly arable. The whole northern region includes some Himalayan peaks and is extremely cold and barren. This topography explains why Bhutan is only very thinly populated at about two million, but the enumeration is difficult because the government usually estimates the Bhutanese population at much less. The reason is to be found in the increasingly ethnicized politics of the monarch and his dominant ethnic group, the Ngalong, who speak Dzongkha, a Tibetan-derived language that the king declared the only official Bhutanese language, not accepting that Bhutan is in reality a multiethnic and multicultural country. Especially the Nepali-speaking ethnic groups in the southern region are deprived of their civil rights and flee to Nepal where thousands live in refugee camps.

This short description of a rather unknown country points out some of the reasons why Bhutan still remains very poor, though the king began in the late 1950s to modernize the secluded country. This means that with a per capita income of \$375 per year, Bhutan no longer belongs to the LDC (Least Developed Countries). It must be mentioned that it is difficult to calculate the per capita income because the king/government

does not accept the Nepali-speaking large minority as real Bhutanese, so in some publications the per capita income is given at \$594 per year.

Since the beginning of modernization, economic development has been controlled by five-year plans setting different priorities, with the two first ones focused on education. This was extremely necessary because until about 1960 no modern education existed; there were only religious schools belonging to monasteries. Only very few children had private, especially foreign, teachers. Today a free public educational system exists; one college exists, but no university. The adult literary rate rose from an estimated 10 percent in 1970 to 47.5 percent in 1994. Still, today there is a lack of well-trained indigenous teachers, so many foreign teachers, especially Indians work in Bhutan.

The medical system and access to free primary healthcare also improved, so life expectancy has risen from 37 years in 1960 to 66 years in 1994. The infant mortality rate was one of the highest in the world in 1960 (203 infant deaths of 1000 live births). An indigenous, Tibetan-based medical system coexists with the modern healthcare system; the government supports this coexistence.

There are prevailing gender differences; for instance women are more often illiterate than men, but—probably influenced by a Tibetan-based social system—gender differences are not so severe as in other parts of south Asia. The law treats Bhutanese men and women equally. Everyday culture does not seem to discriminate against women as much as, for instance, in India. Bhutanese parents do not prefer boys, so there is no female foeticide. There are Bhutanese women who are economically independent, but women do not occupy high government posts.

It can be said that Bhutan, a small Himalayan kingdom, is still a very poor country, but it is no longer among the poorest in the world. During the last four decades the country has made progress in some aspects of relieving poverty, including growth in per capita income, health services, and education, but it seems as if the improvement does not reach all ethnicities living in Bhutan, especially the large Nepali-speaking minority, which is still excluded and even driven out of the country.

RUTH ERKEN INDEPENDENT SCHOLAR

Big Brothers Big Sisters

THE BIG BROTHERS Big Sisters program, long a oneon-one mentoring program within the United States, pairs single-parent youth with adult mentors who agree to participate in recreational and beneficial activities, ranging from visiting the zoo to doing homework or discussing the dangers of drug, alcohol, and tobacco use.

A volunteer Big Brother or Big Sister, generally recruited from the community, helps a young person have a better sense of self and a more positive view of his or her future. The mentoring relationship empowers both the youngsters and the adults working with them to be more active in their community, creating possibilities for both what the program refers to as "the Littles" and "the Bigs" through their relationships.

Educated and trained staff members recruit and select volunteers, assess the needs of children and youth, communicate with parents and other primary caretakers, create the matches of volunteer adult and needy child, supervise the relationships over the lifetime of the match, and officially intervene to sever the matches when appropriate. Big Brothers Big Sisters states that research and more than a century of experience demonstrate that success of a local program depends on the following essentials: the program is voluntary for all parties involved; the program is professionally managed; all volunteers are screened for their appropriateness, ability, and safety; all volunteers are provided with an orientation and training in mentoring, child development, and expectations; the needs of all children and youth are assessed before being matched; all match relationships are supervised by a professional; matches are professionally closed and all parties informed in writing; a board of volunteers provides connections with the community, monitors the service delivery system,

and assists in fundraising; policies and procedures for service delivery are developed that adhere to international standards and reflect the community in which the program is being carried out; and steps are taken to measure the impact of the mentoring relationship and to monitor quality and safety.

While not a formal antipoverty program, Big Brothers Big Sisters is built on the principle that vulnerable children may not be able to reach their full potential in growing up without an interested nonparent adult filling the role that extended family members provided in years past.

The philosophy behind the program since its founding in the United States in 1904 is that without caring adult support during the crucial times in their life, children will be ill-equipped to develop their skills and knowledge to become important contributors to their country's future and shape their own destiny. Volunteers are encouraged to help children make important decisions, apply themselves at school, and achieve personal as well as academic excellence. Mentors discourage violent behavior and encourage the avoidance of substance abuse.

Big Brothers Big Sisters claims to be the oldest and largest mentoring program in the world, with country-specific programs that recruit, train, and supervise volunteers in one-to-one mentoring relationships with children-at-risk around the world who are not reaching their potential because of family or environmental constraints or limitations.

Big Brothers Big Sisters says that its model has been evaluated and proven that an ongoing friendship relationship with a young person has significant impact. These evaluations indicate that children's lives are enriched and strengthened, leading to more positive and constructive behavior with regard to education, peer relationships, family relationships, use of drugs and alcohol, and acts of violence.

In 1998, after a century of outreach in the United States, Big Brothers Big Sisters International began offering its assistance to national entities wishing to provide mentoring to young refugees throughout Europe, street children in South America, young victims of HIV/AIDS in Africa, social orphans in Russia, and, in general, children growing up in poverty around the world—children and youth who lack inspiration and experience to move beyond their daily survival to experience positive youth development.

ROB KERBY
INDEPENDENT SCHOLAR

Black, Hugo L. (1886-1971)

BORN IN ALABAMA, Hugo Lafayette Black came from humble origins. He received his law degree from the University of Alabama at Tuscaloosa. He started working as a personal injury lawyer, and also served briefly as a prosecutor and as a police court judge. Although successful, Black refused to work for large corporations and institutions. He preferred to represent the workingman and had many clients of all races. During World War I, he volunteered and served as an artillery officer.

Hugo L. Black established himself as a populist, taking sides for the workingman and against big business.

During the 1920s Black joined the Ku Klux Klan. Later, trying to minimize his involvement, he said that he objected to the Klan's use of violence, but joined it to meet people and attract clients. The Klan in 1920s Alabama was not the fringe organization it is today. Most community leaders were members. Membership opened doors to an aspiring lawyer. However, it was violently racist and anti-immigrant, and intolerant of Catholics and Jews. While there is some evidence that he objected internally to the Klan's use of violence and illegal activity, Black was an active speaker and took a leadership role within the local organization. The Klan was instrumental in Black's election to the U.S. Senate in 1926. Thousands of Klansmen turned out to vote for him and work as election volunteers.

In the Senate, Black established himself as a populist, taking sides for the workingman and against big business. He remained part of the southern block of conservative senators who opposed an antilynching law and immigration reform. When Franklin Roosevelt became president, Black was an ardent supporter of New Deal policies.

Roosevelt appointed Black to the Supreme Court in 1937. As a member of the Senate, Black was quickly confirmed with little investigation. When newspapers then published evidence of his Klan membership, there were protests and calls for resignation or impeachment. Justice Black, however, was determined to remain. Black joined a conservative Supreme Court—his views on legislative deference and a more powerful federal government left him in the minority. For example, Black held the then-radical view that the Bill of Rights should bind state governments as well as the federal government.

His majority opinion, overturning the convictions of four black men who had been coerced into murder confessions, Chambers v. Florida (1940), helped to assuage concerns about his prior Klan relationship. Throughout his tenure, he supported efforts to strike down other impediments to minority civil rights. He joined a majority in striking down racially restrictive covenants in property deeds with Shelley v. Kraemer (1948). He also joined the unanimous decision that outlawed segregation in schools in Brown v. Board of Education (1954). However, he also wrote the decision approving of the government wartime detention of Japanese Americans in Korematsu v. U.S. (1944).

Black supported the Court's expansion of the rights of criminal defendants. He supported the exclusion of illegally seized evidence in *Mapp v. Ohio* (1961). He wrote the majority opinion guaranteeing government-paid attorneys to indigent defendants in *Gideon v.*

Wainwright (1963). He supported prohibiting the use of confessions unless suspects in custody were first advised of their rights in Miranda v. Arizona (1966).

In First Amendment cases, he supported striking down laws mandating that students salute the flag and say the Pledge of Allegiance in West Virginia v. Barnette (1943). He dissented from a decision upholding the conviction of someone who refused to testify before the House Committee on Un-American Activities in Dennis v. United States (1951). His majority opinion struck down state-sponsored school prayers in Engel v. Vitale (1962). However, he also opposed broadening free speech rights in schools in Tinker v. Des Moines (1969) and the protected use of foul language in Cohen v. California (1971). Black opposed efforts to find the death penalty unconstitutional in Witherspoon v. Illinois (1968). He also did not accept the Court's recognition of a constitutional right to privacy in Griswold v. Connecticut (1965).

After suffering a stroke, Justice Black resigned from the Court. He died several days later on September 25, 1971.

Bolivia

BEFORE THE SPANISH came to the area now known as the Republic of Bolivia, the land was part of the ancient Incan empire. During harsh Spanish rule, many natives were enslaved. Since freeing itself from Spanish rule in 1825, Bolivia, which received its name from freedom fighter Simón Bolivár, has experienced close to 200 coups and countercoups. Constant internal strife has made Bolivia vulnerable to attacks by neighboring countries, and territory has been lost to Chile, Brazil,

and Paraguay in various conflicts. Although democracy was ostensibly established under civilian rule in 1982, ongoing social unrest and widespread corruption have hampered the ability of governments to deal with deeprooted poverty and illegal drug production.

It has been argued that Bolivia has been in a war against globalization over the last few years because the indigenous population has forced international businesses to close their doors, blocked an income tax proposed by the International Monetary Fund, and ousted presidents who supported globalization. Some experts argue that any future economic progress for Bolivia is dependent on solving these problems and on improving the educational system, because a well-educated population is necessary to attract and maintain foreign investment and to improve the quality of life in this central South American nation of 8,857,870 people.

Historically the Bolivian economy was dependent on cocoa. When the cocoa fields were eradicated to make way for illegal drug crops, farmers were plunged into abject poverty. Slash-and-burn tactics in modernday Bolivia have stripped the country of essential forests. Overgrazing and poor cultivation have weakened the soil, making agricultural productivity difficult. Approximately 13 percent of Bolivia's Gross Domestic Product (GDP) is generated from agriculture. Services account for 59 percent of the GDP, and industry furnishes the remaining 28 percent.

Businesses owned by foreigners generate 65 percent of the GDP, while employing only 10 percent of the workforce. The small businesses that employ 80 percent of the labor force account for only one-fourth of total GDP. In urban areas of Bolivia, the unemployment rate is 9.2 percent and rates of underemployment have been estimated as high as 59 percent. Bolivia has no unemployment insurance benefits, so the unemployed are likely to become poor fairly quickly.

Bolivia is one of the least developed countries in Latin America. Although it has the second largest natural gas reserves in South America, Bolivia has been unable to use this resource to grow the economy, in part because of the violent protests against import policies. Exports of natural gas to Brazil have been more successful, but have not been productive enough to turn the sluggish economy around. Other Bolivian resources include tin, zinc, tungsten, antimony, silver, iron, lead, gold, timber, and hydropower.

With a per capita income of \$2,600, Bolivia is one of the poorest countries in South America. Some 64 percent of the population live in poverty. Over a fifth of the population is malnourished. More than 34 percent

of Bolivians live on less than \$2 a day, and 14.4 percent subsist on less than \$1 a day. Women are more likely than men to be poor, and this is particularly true of women in rural areas where close to one in four households is headed by a female. Among those families, 24.8 percent are moderately poor, 24.3 are extremely poor, and 22.9 percent are totally excluded from the mainstream economy. Without foreign aid, the rate of poverty would be even higher.

Vast income inequalities continue to exist between the descendants of the Incas, who comprise two-thirds of the Bolivian population, and white elites. The poorest 20 percent of Bolivians live on four percent of the country's resources, while the richest 20 percent share 49.1 percent of the nation's wealth. Bolivia is ranked 44.7 on the Gini Index of Human Inequality.

Some 64 percent of the Bolivian population live in poverty.

Industrial pollution has threatened general health by tainting water supplies used for drinking and for irrigation purposes. About 17 percent of Bolivians lack access to safe drinking water, and 48 percent lack access to improved sanitation. There are only 76 physicians for every 100,000 residents, and 20 to 50 percent of Bolivians cannot afford essential drugs. Bolivians experience a life expectancy of 65.5 years. Females (68.25 years) tend to outlive males (62.89 years) by over six years. The median age is 21.47 years. Nearly 36 percent of the population are under the age of 14, and 4.5 percent have reached the age of 65.

Infant mortality is high in Bolivia, and 53.11 infant deaths occur out of every 1,000 live births. Even so, infant mortality rates have fallen since 1970 when they were reported at 56 deaths per 1,000 live births. Between 1970 and 2003, mortality rates of all children under the age of 5 plunged from 243 to 66 deaths per 1,000. Ten percent of children under 5 are malnourished, and nine percent of infants are underweight at birth. Immunization rates for children between the ages of birth and 23 months are abysmally low, ranging from 64 to 81 percent, with one exception. Approximately 94 percent of infants have been immunized against tuberculosis.

In 1970 the fertility rate was 6.5 children per woman. Since that time, the fertility rate has steadily declined to the current rate of 2.94 children per woman. Among teenage mothers, the fertility rate is 70 per

1,000 births. Even though 95 percent of the population of Bolivia are ostensibly Catholic, 58 percent of Bolivian women use some method of contraception, an increase from 30 percent in 1980. In 1990, trained medical staff attended only 22 percent of Bolivian births. The rate of attended births has risen to 65 percent. Modeled estimates for 2000 indicate that maternal mortality in Bolivia occurs at the excessively high rate of 420 deaths per 100,000 live births.

Among the Bolivian population over the age of 15, 87.2 percent can read and write. With a literacy rate of 81.6 percent, females lag behind males, at 93.1 percent. Despite the inequity, Bolivia has substantially reduced illiteracy over the past decades. In 1980, 20.4 percent of males and 41.7 percent of females were illiterate.

In 1980 only 84 percent of males and 74 percent of females in the relevant age group were enrolled in primary school. By 2000, 95 percent of all children were attending primary school. Completion rates in urban areas have also been improving over the last few years as more attention has been paid to education.

From 1999 to 2003, primary school completion rates for males rose from 97 to 101 percent and from 93 to 99 percent for females. Most Bolivian students in urban areas now attend school for 14 years. In rural areas, however, only seven percent of the children complete eight years of school. More than 50 percent finish only three grades. More than 800,000 Bolivian children under the age of 18 are working rather than attending school.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Bosnia and Herzegovina

BOSNIA AND HERZEGOVINA is the former republic of the Socialist Federal Republic of Yugoslavia, with a total total population of 4,025,476 (2005). Bosnia and Herzegovina borders Croatia and Serbia and Montenegro. Bosnia and Herzegovina was among the poorest republics in the old Yugoslav federation. The interethnic warfare in Bosnia caused production to plummet by 80 percent from 1992 to 1995 and unemployment to soar. The Gross Domestic Product (GDP) rate of growth in 2004 was estimated at 4 percent, with a GDP per capita of \$6,400 (purchasing power parity).

Today the official unemployment rate is 44 percent, with 25 percent of population living below the poverty line. Furthermore, an additional 30 percent of the population are in danger of falling below the poverty line. The causes of poverty include the destruction from the war, slow implementation of reforms, low labor force participation, human rights violations, an inadequate social protection system, low-quality education, and corruption.

Following the arrival of the South Slavs in northern parts of Bosnia in the course of the 6th century, Bosnia appeared as a separate political entity after the death of Serbian king Konstantin Bodin in 1101. The medieval Bosnian state reached its peak during the rule of King Tvrtko I Kotromanic. Bosnia and Herzegovina was conquered by the Ottoman Turks in 1463 and 1481, respectively. In 1878, Bosnia and Herzegovina became a protectorate, and in 1908 was annexed by Austria-Hungary.

Anti-Serbian policies of the Austro-Hungarian administration provoked a deep discontent among local Serbs. On June 28, 1914, Gavrilo Princip, a member of the revolutionary organization Mlada Bosna (Young Bosnia), assassinated the Austrian crown prince Franz Ferdinand in Sarajevo, sparking World War I. After World War I, Bosnia and Herzegovina was incorporated into the Kingdom of the Serbs, Croats, and Slovenes. During World War II, the entire territory of Bosnia and Herzegovina became a part of the Nazi-puppet Independent State of Croatia. Following the war, the area became a federal unit in Yugoslavia.

The declaration of sovereignty in 1991, and proclamation of its independence from Yugoslavia, led to the outburst of a bitter civil war in Bosnia and Herzegovina. While Bosniak/Muslim leadership insisted on preservation of unified and independent Bosnia and Herzegovina, both Serbs and Croats living in the republic insisted on the country's partition along ethnic lines.

The civil war ended by signing of the Dayton Agreement on November 21, 1995. According to the agreement, Bosnia and Herzegovina consists of two parts: Federation of Bosnia and Herzegovina (51 percent of the territory) and Republika Srpska (Republic of Srpska, 49 percent of the territory). The federation is divided into ten cantons, and Republika Srpska is split into seven regions.

Bosnia and Herzegovina is an emerging federal state. The chair of the presidency of Bosnia and Herzegovina rotates among three members (Bosniak/Muslim, Serb, and Croat). The three members of the presidency are elected directly by the people.

The ethnic composition of the country in 2000 was Serb 37.1 percent, Bosniak/Muslim 48 percent, Croat percent, and other 0.6 percent. The religion is Muslim 40 percent, Serbian Orthodox 31 percent, Roman Catholic 15 percent, and other 14 percent. As the name suggests, the region consisted of two distinctive parts: Bosnia in the north, and Herzegovina in the south. The country is predominantly mountainous with ferial plains in the north. The climate in Bosnia is continental, while Herzegovina has a distinct variant of the Mediterranean climate.

UNIVERSITY OF NEW HAVEN

Botswana

TO ITS POORER NEIGHBORS, the southern African nation of Botswana stands out because it has transformed itself from one of the world's poorest nations into a middle-income country with an economy that has one of the healthiest growth rates in the world.

Children in sub-Saharan Africa are particularly vulnerable to the consequences of poverty and to the HIV/AIDS epidemic.

Gains have been particularly significant in the diamond export and tourist sectors. Nevertheless, Botswana suffers from many of the same social crises that plague other African nations. Nearly half (47 percent) of Botswana's people fall below the national poverty line. Subsistence farming continues to flourish, and the government faces high unemployment (unofficially estimated at 40 percent), low life expectancy, and unacceptably high rates of infant mortality, malnutrition, and HIV/AIDS.

Inequality is persistent, with the poorest 20 percent of Botswana receiving only 2.2 percent of income while the richest 20 percent receive 70.3 percent. Some 23.5 percent of the population live on less than one dollar a day, and over half live on less than two dollars a day. At least 40 percent of the Botswana population have no access to improved sanitation, and five percent lack access to a stable improved water source. With low population and growth rates, Botswana's median age is 19.29 years. Almost 40 percent of Botswana are under the age of 14, and less than four percent are over the age of 65. Botswana's life expectancy is 33.87 years, and the people have a 61.9 percent chance of not surviving past the age of 40.

Children in Botswana are particularly vulnerable to the consequences of poverty and to the HIV/AIDS epidemic: the outlook has grown worse since 1990 when the infant mortality rate was 45 deaths for every 1,000 live births. By 2000, that number had risen to 80 deaths per 1,000 live births. During that same period, the mortality rate for all children under 5 years of age increased from 58 to 110. Some 12.5 percent of the country's

children are malnourished, and 10 percent of all infants suffer from low birth weight. In the general population, almost one-fourth of the population is undernourished.

In response to global emphasis on childhood immunizations, by 2003, 90 percent of Botswana children between the ages of 12 and 23 months had been immunized for measles and 97 percent had received DPT3 immunizations. Immunizations for infants improved significantly between 1990 and 2002: DPT immunizations increased from 56 to 97 percent; polio immunizations increased from 78 to 97 percent; measles immunizations increased from 55 to 90 percent; and tuberculosis immunizations rose by seven percent.

On the average, Botswana children complete 11 years of schooling. Among females, 96 percent complete primary school, but only 91 percent of Botswana males do so. Over half (53.6 percent) of Botswana's children attend secondary school. The literacy rate for Botswana females is 82.4 percent, compared with 76.9 percent for males. From 1990 to 2001, illiteracy rates for individuals aged 15 to 24 dropped from 16.7 to 11.3.

Women are disproportionately poor in Botswana, particularly single mothers. While 48 percent of Botswana women between the ages of 15 and 49 employ some method of contraception, the fertility rate is 3.7 births per female according to the World Bank. This is due in large part to the 66 percent fertility rate for women aged 15 to 19. Overall, fertility rates have begun to decline in response to dissemination of birth control information and higher female educational levels. Maternal health has improved in recent years, and professional health staff attend 98.5 percent of all births.

Botswana has had a long history of legal discrimination against women and has suffered from a shortage of women in decision-making positions. In 1995, the government pledged to improve the lives of women through a series of reforms that included funding programs designed to empower women, increasing opportunities for female education and training, enhancing credit opportunities for women, and working with nongovernment organizations and women's groups to improve the market for products produced by Botswana women. The government also created the Women's Affairs Department and increased funding for various ministries that were targeted for women's programs.

Botswana's HIV/AIDS rate of 37.3 percent is the highest in the world, and the World Health Organization (WHO) reports that Botswana girls are four times more likely to contract HIV/AIDS than are Botswana

boys. In 2003, it was estimated that 350,000 Botswana were living with HIV/AIDS and that another 33,000 had died from the disease. WHO estimates that 78,000 Botswana children under 15 have been orphaned. The government is committed to dealing with the problem through programs designed to educate the public while dealing with the medical realities of the disease. The risk of other diseases is also high in Botswana, particularly food- and waterborne diseases such as bacterial diarrhea, hepatitis A, and typhoid fever.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Brandeis, Louis D. (1856-1941)

LOUIS DEMBITZ Brandeis was a renowned litigator, social justice advocate, and widely celebrated U.S. Supreme Court justice. Throughout his career Brandeis sought to reconcile modern forms of government and social institutions and the growing inequalities fostered in large part by the Industrial Revolution with maintaining and protecting individual rights and liberties.

The son of Jewish parents who emigrated from Prague, Brandeis was born in Louisville, Kentucky. Graduating from high school with high honors at the age of 14, Brandeis immediately went on to attend Dresden University in Germany for two years prior to entering Harvard University. In 1877, Brandeis graduated from Harvard Law School at the head of his class. In 1891, Brandeis married Alice Goldmark, with whom he had two daughters.

Brandeis quickly established himself as a prominent attorney in Boston, where he used his knowledge and commitment to social justice to represent the public in-

As a Supreme Court justice, Louis D. Brandeis tried to use the law to protect the powerless from the powerful.

terest in numerous controversial cases. Brandeis's extraordinary success, coupled with his investments allowed him to achieve financial independence at a young age. This enabled him to take on pro bono cases fighting for the progressive causes he supported and led to him becoming known by many as the "the people's lawyer." Demonstrating sympathy for both the trade unions and the women's rights movement, Brandeis also advocated establishing minimum wage and maximum hour regulations.

In 1908, Brandeis, acting as a litigator in the case of *Muller v. Oregon* before the United States Supreme Court, composed what became known as the "Brandeis Brief." Brandeis collected empirical data from hundreds of sources, compiling an extensive presentation with detailed accounts of the impact of long working hours on women. Notable as one of the first instances that social science was used in informing law in the United States, the brief influenced the direction of the Supreme Court and has since become the model for presentations to the Supreme Court.

Prior to his appointment to the Supreme Court, Brandeis was associated with the progressive wing of the United States Democratic Party and was an active Zionist leader. He served as head of the Provisional Executive Committee for Zionist Affairs from 1914 through 1921 and again from 1930 until his death.

Additionally, Brandeis published two influential books: Other People's Money and How the Bankers Use It (1914) and Business: A Profession (1914). Each expressed Brandeis's support of competition rather than monopoly in business and reflected his staunch advocacy for trade unions and workers' rights.

Brandeis, as an advisor to President Woodrow Wilson on policy matters, was highly influential in Wilson's New Freedom economic doctrine. In 1916 he was appointed by Wilson to the Supreme Court of the United States, becoming the first Jew to serve on the Supreme Court. Despite significant opposition to his appointment, primarily from business interests and anti-Semites, Brandeis became one of the most influential justices in the history of the United States.

While on the bench, Brandeis authored opinions that envisioned greater protections for individual rights, specifically the rights of privacy and freedom of speech. Brandeis was persistent in his efforts to rid government of corruption and to ensure democracy by using the law to protect the powerless from the powerful. His interpretation of the United States Constitution was progressive, antimonopoly, anti-big business, in favor of flexible government economic regulation, and pro-state government.

Brandeis retired from the Supreme Court in 1939 and died in Washington in 1941. Brandeis's legacy remains in the numerous schools and awards named in his honor—among them Brandeis University (founded in 1948), the Brandeis Award, the Louis D. Brandeis School of Law at the University of Louisville, and Brandeis High School in New York City.

Brazil

BRAZIL IS THE LARGEST and most populous country in Latin America. Its territory is rich in natural resources. Most of it is arable and well endowed with minerals. In spite of these positive premises and the progress achieved in the first years of the new millennium, Brazil is still a country of social and economic inequalities where poverty remains high when compared to the country's average income levels.

Poverty is particularly concentrated in the northeast region and in small rural and urban areas. Many different political regimes have governed the country in the 20th century, yet they have been unable to defeat the plague of poverty. The promised economic reforms of President Lula Da Silva, elected in 2002, have had limited impact so far, and the president's credibility was seriously damaged by a series of financial scandals regarding the funding of his own political party.

HISTORY

Brazil was part of the Portuguese empire from 1530 to 1822, when the country obtained its independence mainly as a result of the Napoleonic Wars, which had even forced the Portuguese king to flee there in 1807. During these centuries, Brazil's economy supported the Portuguese empire, first thanks to the exploitation of sugar production and then to the extraction of gold.

As an independent country, Brazil mainly relied on agriculture until the world economic crisis of the 1930s. The production of coffee played a particularly significant role in the country's economy and accounted for more than half of Brazil's exports. The gold cycle and the production of coffee kept the flow of immigration from European countries and from Japan steady during the 18th and 19th centuries. It was only after the 1930s that the country started to diversify its economic activities and industrialize.

The flow of European immigration and the emigration of peasants to urban areas, particularly to Rio de Janeiro, caused, together with the economic crisis, the massive growth of *favelas* (shantytowns or slums; the term comes from the name of a plant that grows on the hillsides of Rio), a phenomenon that still characterizes the country today and has even been turned into a tourist attraction for foreigners.

The industrialization process started in the 1930s, aimed at the containment of imports through support for domestic industries. The government played an important part in the industrialization of the country with

direct investments. Thus the state, no matter the political orientation of the politicians who ruled it, held the control of large parts of the Brazilian economy for much of the 20th century. On the contrary, the private sector was weak and relying on public funding. Since the 1990s, Brazilian economy has become more market-oriented.

The interventionist policy of the government caused substantial growth in the 1960s and 1970s. Yet the benefits of this growth were unequally distributed so that questions of social and economic inequality remained unanswered. During the 1980s, however, the Brazilian economy fell dramatically. The process of making Brazil a developed country stopped abruptly in this decade.

Between 1980 and 1994, this fall brought the yearly average growth of the Gross Domestic Product to a limited 1.07 percent. In turn, per capita incomes were badly hit during the period. Inflation experienced a disproportionate four-digit growth that penalized citizens with low incomes and contributed to raise the already high social inequality.

PREVAILING INEQUALITY

Since the mid-1990s, governments have started to devise plans to control inflation. The success of these plans was limited, for although inflation declined, income inequality has remained one of the most crucial issues in the country. A large section of Brazilian society still cannot afford access to basic necessities and services because of low income. Poverty is widespread both in rural and urban areas, although the fast process of urbanization has increased the number of poor in urban areas. Some studies claim that the separation between rural and urban poverty in Brazil is a spurious one, as many urban poor are dependent on agricultural activities to earn their living.

In the northeast region of the country, 29 percent of poor urban families have agricultural activity as their main source of living, pointing to the impossibility of separating rural and urban poverty. In the north-east, the poor make up 32 percent of the total population of the area, which represents 55 percent of the Brazilian poor.

Poverty is also apparent in big urban centers. The southern metropolises of São Paulo (with more than 15 million inhabitants) and Rio de Janeiro (with 9.8 million inhabitants) have a high concentration of poor, who are discriminated against in the labor market and marginalized by social exclusion and the stigma of living in the

favelas. The Rio de Janeiro Master Plan, ratified in 1992, defines a favela as "an area, predominantly of housing, characterised by the occupation of land by low-income populations, precarious infrastructure and public services, narrow and irregular layout of access ways, irregular shaped and sized plots and unregistered constructions, breaking with legal standards."

The *favelas* on the hillsides of Rio de Janeiro exemplify the juxtaposition of wealth and poverty in Brazilian society, as they are positioned side by side with the most luxurious of mansions. They are the most concrete expression of the unequal distribution of wealth in the country. It was calculated that 19 percent of the population of Rio de Janeiro live in *favelas* (more than a million people), while 18 percent of São Paulo's inhabitants live below the poverty line. The areas where the *favelas* were built are often occupied by displaced farmers and are located on the fringes of urban centers. These slums are usually built with no license by the people who occupy them illegally. People who live there have no ownership title over their houses.

Houses have little sanitation and are characterized by the absence of the most basic services, such as electricity, telephone, and plumbing. Because of poor construction, dangerous locations, and overcrowding, heavy rainfalls often cause serious accidents. People in favelas often live on less than \$100 a month. Unemployment is high in the favelas, as is the rate of crimes connected to drugs and gang warfare, favored by a vast and illegal gun trade. Drug-related crimes have become particularly frequent with Brazil's emergence as an increasingly important transit country for cocaine from the Andean countries to Europe and the United States.

Favelas are veritable cities within the city, often with a large population, their own codes of living, and their own associations to be heard in the larger society. Rocinhas, Rio's largest *favela*, is home to about 56,000 people. According to statistics and forecasts of Brazilian institutions, *favela* dwellers are on the increase.

Between 2000 and 2004, the population of the *favelas* around Rio de Janeiro grew by 210,000 and, since the 1980s, *favela* dwellers have increased by 71.3 percent. In 2010, *favelas* will include 21.1 percent of the Rio de Janeiro population. The growth of these areas is even more impressive when compared to the rest of the urban sectors.

In Rio de Janeiro, between 1990 and 2000, *favelas* grew six times more than other neighborhoods. Yet, as cities within a city, *favelas* also have their own cultures and their inhabitants cannot be represented through the stereotypes of urban poverty. Many of them point out

Urban poverty is prevalent in Brazil, especially in Rio de Janeiro, where children live precariously in blighted neighborhoods.

that several neighborhoods within a favela are safe as long as the police stay outside. Several reports agree that efforts to enforce law and reduce crime have led to serious human rights violations and that corruption is widespread within Rio de Janeiro's police, who have reportedly resorted to indiscriminate shooting. Some favela dwellers have gone so far as to say that they feel safer with drug dealers than with policemen. To respond to these concerns, Lula's government has launched stricter laws on gun trade and a major operation to crack down on police brutality. Since 1995, the government has also tried to raise standards of living in the favelas with the Favela-Barrio program to provide better infrastructure and service to 300 favelas. The program also tries to organize self-help services among residents.

Brazilian Definition of Poverty

IN BRAZIL THERE is a great variation in climate and resources. In the northeast of Brazil the conditions are often semiarid, while in the Amazon basin the jungle and the rivers provide fish and game. The resources for subsistence living are readily available in much of the country. Clothing needs are very limited. However, in the great cities, which are as modern as any on earth, there are great pockets of poverty formed by millions of people who have moved to find work and a richer life.

In Brazil one definition of poverty has been the income that is necessary to fulfill the food needs of an individual. However, another definition has been offered. It is the "minimum basket of goods" needed to fulfill all the basic needs of an individual.

The distinction between the definitions is between the indigence line, which includes only the food needs, and the poverty line, which includes all basic needs. The first definition would apply, for example, to natives along a river in the Amazon basin who wear the traditional clothing of a loincloth or a simple grass skirt, live in a palm thatched hut, sleep in a hammock, and eat what they gather from the river or forest. The second definition would apply to the millions who live in the cities and towns of Brazil. Many of these people would be the landless and impoverished.

The term *poverty basket* is used not only to measure poverty, but to track the costs of goods for the poor. Studies have shown that the set of household goods in the basket varies in price in different cities across Brazil. It has been found that there is a correlation between the cost of the goods and the poverty of the cities, respectively. The relationship is inverse because the poorer the city, the higher the cost of goods.

The implication is that using the poverty line basket can be misleading as an indicator of poverty. Brazil tries to adjust for the differences by using a Poverty Consumer Price Index (CPI) to weigh the two different poverty groups.

The Bolsa-Escola movement began in Brazil in the 1980s. It sees the solution to the problem of poverty as greater equity in distributing wealth rather than the creation of wealth. This means that poverty is not defined as a lack of income, but as a lack of access to essential goods and services along with adequate infrastructure. Poverty from this perspective is an ethical imperative for the haves of the world, and not an economic predilection.

Child labor is rejected as an economic solution for a family. Instead the family is given a stipend so that children can attend school. This strategy is long-term, but strikes at ignorance as one of the roots of poverty. The benefits include creating a culture of education as well as an educated workforce for the future.

Brot für die Welt

BROT FÜR DIE WELT (Bread for the World) is a German charity that sponsors 1,200 programs each year to fight poverty and related problems around the world. It has programs targeted geographically (Africa, Asia and the Pacific, Latin America and the Caribbean), for specific issues (AIDS, clean drinking water, and human rights), and to help the victims of specific catastrophic events (wars and hurricanes).

In September 2005, the group launched an internet site featuring animated cartoons of "the global gang," a group of children (complete with a super-intelligent dog) whose activities were intended to raise awareness of worldwide poverty issues among young people.

Though Brot für die Welt is operated on behalf of a broad coalition of Protestant Christian churches in Germany, the group also sponsors ecumenical scholarship programs and other outreach activities. Its charitable efforts do not depend on the religious affiliations of the intended recipients. Some of Brot für die Welt's programs are the following.

Action Alliance Against AIDS (Aktionbündnis gegen AIDS): The group promotes both private and governmental efforts worldwide to combat AIDS (Acquired Immune Deficiency Syndrome) and other diseases such as malaria and tuberculosis. One branch of the program helps provide medicine for AIDS victims who are children. In December 2004, Brot für die Welt cosponsored a worldwide event with the rock band U2 and the band's lead singer, antipoverty activist Bono, to raise awareness and funds for anti-AIDS treatment in poverty-stricken countries. In part because of the group's efforts, the German federal government increased its contribution to AIDS relief from 72 million to 82 million euros per year.

Brot für die Welt cosponsored a worldwide event with the rock band U2.

Human Right to Water (MenschenRechtWasser): Noting that in 2004, one out of every five people in the world lacked access to safe drinking water, Brot für die Welt sponsors a worldwide campaign promoting a human right to water.

Africa: Brot für die Welt sponsors a wide range of programs for the poor in Africa, including food assistance, drugs, and AIDS prevention and education. It focuses especially on sub-Saharan Africa, where inadequate diet and illness have affected most of the population and have crippled two-thirds of the farms, leading to even greater shortages of food.

Asia and the Pacific: In addition to hunger and disease, Brot für die Welt's programs in Asia and the Pacific focus on providing relief for the victims of natural disasters, such as the 2004 tsunami that devastated parts of south Asia. Other programs target problems that are most severe in particular countries. In Bangladesh, for example, slum residents have little access to drinkable water, sanitary disposal of sewage, or schools, and most people cannot read or write. In that country and others, "Hilfe für Slumbewohner" (Help for Slum Residents) provides not only material assistance but also literacy education and job training.

In 2004, Brot für die Welt raised \$85 million for its various programs around the world. The money went

to sponsor 306 projects in Latin America, 380 projects in Africa, 298 projects in Asia and the Pacific, and 82 other projects around the world in addition to smaller, local activities.

SCOTT PALMER, Ph.D. RGMS ECONOMICS

Brotherhood of St. Laurence

THE BROTHERHOOD OF St. Laurence is an Australian charity that was established in 1934, during the Great Depression, by Father Gerrard Tucker, who was motivated by a combination of Christian belief and a desire to end social injustice.

The Brotherhood has a vision of an Australia free from poverty. Consequently, it works with other partners to try to achieve "an inclusive society in which everyone is treated with dignity and respect; a compassionate and just society which challenges inequity; connected communities in which we share responsibility for each other and a sustainable society for our generation and future generations." This leads to the priority objectives and values: "Ensure that what we do for one we for many.... Establish the eradication of poverty as a national priority.... Promote a movement for social change.... Support a sustainable society." This combines both research and advocacy.

Father Tucker conceived of the Brotherhood as a religious order, based on the example of St. Laurence, the patron saint of the poor, who worked in Rome in the time of Pope Sixtus (258–276 C.E.). However, this aspect of the organization failed to attract much interest and Father Tucker remained for a number of years its only member. Subsequent leaders of the Brotherhood have instead developed its social research and policy aspects and have launched programs relating to campaigns calling for greater levels of social security, higher minimum wages, and food for all. Based in Melbourne,

the Brotherhood now works across Australia. It has established programs aimed at helping older Australians, families and children, job seekers, and refugees. These include HIPPY, the program aimed at helping parents to prepare children for school, and the Transition Project, which is aimed at helping young people who leave formal education early. Its main activities are the production of high-quality research, the consideration of what implications this has for policy, and the advocacy of the policies it believes should be followed. The Brotherhood has achieved revenues exceeding \$40 million (Australian) annually.

The Brotherhood explicitly acknowledges the role of indigenous Australians.

Australia has a long and famous reputation for fairness and equality. However, the recent electoral dominance of Prime Minister John Howard and his Australian Liberal Party has been accompanied by a hardening of attitudes toward asylum seekers and anyone considered to be a member of the undeserving poor. This has led to the Brotherhood receiving criticism for adopting and promoting policies supporting the low-paid, refugees, and other vulnerable groups. Nevertheless, the Brotherhood has been recognized as one of the great institutions of Australia.

The Brotherhood explicitly acknowledges the role of indigenous Australians as stewards of the continent who have suffered disproportionately from processes of economic development and industrialization. It has also spoken up for the rights of immigrants and asylum seekers at a time when the Australian government has maintained a very determined attitude of toughness and maintained its role as an ally in the American-led War on Terror.

JOHN WALSH SHINAWATRA UNIVERSITY

Brunei Darussalam

BRUNEI DARUSSALAM means "Abode of Peace." It consists of two noncontiguous areas of Kalimantan on the coast of the South China Sea. They are separated by the Gulf of Brunei and, on land, by Sarawak, Malaysia. Brunei is the remnant of a larger sultanate. A hereditary monarchy since 1415, Brunei Darussalam became a British protectorate in 1888. In 1959, Brunei's first constitution provided for a mostly appointive Legislative Council. The last legislative election was held in 1962. Upon government refusal to seat the winners, Sheikh A.M. Azahari's Partai Rakyat Brunei (People's Party of Brunei) revolted. British troops quickly crushed the rebellion. Many leaders received asylum in Indonesia and Malaya.

The domestic and international repercussions have been felt for more than 40 years. Under the Internal Security Act, the sultans have ruled with emergency powers. In 1963, Brunei was the only British protectorate or colony that refused to join the proposed Federation of Malaysia. In 1967, Haji Hassanal Bolkiah became the 29th sultan. In 1970, the Legislative Council was reconstituted as a purely appointive body. In 1984, Brunei Darussalam regained independence and it joined the then-anticommunist Association of South-East Asian Nations (ASEAN). Political parties were tolerated in 1985–88, but government employees were not permitted to join. The legislature met only in 1984 and 2004. The sultan and family members hold the key cabinet portfolios.

Two-thirds of Bruneians are Muslims. The largest religious minority is Buddhist (mainly Chinese). Since 1991, Islamization of Bruneian society through Malaya Islam Beraja (MIB) or "Malay Muslim monarchy" ideology has intensified.

Economic stability came with the discovery of the Seria oil field in 1929. Extraction and processing of oil and natural gas are done by Brunei Shell Petroleum—a joint venture of the Brunei government and Royal Dutch/Shell. In 1973, Brunei opened the world's largest liquified natural gas facility. The Organization of Economic Cooperation and Development recognizes Brunei as a developed country. By 1999, Japan was importing half of Brunei's oil. Crude oil and natural gas production and processing account for almost 25 percent of the domestic labor force and about 50 percent of the Gross Domestic Product (GDP).

Otherwise, Brunei's local economy is dominated by the Chinese. In Asia, Brunei's GDP per capita is exceeded only by Japan and rivals that of Singapore. A member of the World Trade Organization (WTO), Brunei has not joined the Organization of Petroleum Exporting Countries (OPEC) but does not challenge OPEC pricing. Brunei claims an exclusive economic zone in the oil-rich South China Sea. In 2003, competing claims led to a naval dispute with Malaysia.

Free healthcare and nine years of education are guaranteed free for citizens of Brunei. Qualified students receive free higher education. Malay is the national language, but the educational system also uses English. In 1999, adult literacy was 94.3 percent for males and 87.3 percent for females.

In 2004, more than 100,000 foreign nationals were employed in Brunei. That number equals almost a third of the Bruneian population (365,000). The economy does not attract a sufficient number of Bruneians into key industrial and service jobs. Oil and natural gas reserves are not limitless, and capital exports have exceeded the value of oil and gas exports in recent years. Although losses incurred during the Asian financial crisis of 1997–98 harmed Brunei's economy, the effects were less severe than in Indonesia or Thailand.

VINCENT K. POLLARD UNIVERSITY OF HAWAIʻI, MANOA

Bryan, William Jennings 1860–1925

WILLIAM JENNINGS BRYAN (1860–1925) was born in Salem, Illinois. He attended Whipple Academy and graduated from Illinois College in Jacksonville in 1881. Studying law at Union Law School in Chicago, he passed the bar in 1883. Bryan moved to Lincoln, Nebraska, in 1887, establishing a law partnership with a

Bryan was inspired by his evangelical Protestantism to care deeply about the needs of the poorest in society.

Union classmate. In 1890 he was elected to Congress, where he forcefully argued for both tariff and monetary reforms.

After serving two terms, Bryan's strong advocacy of the free coinage of silver cost him the favor of President Grover Cleveland and his seat. He continued his crusade by becoming editor of the *Omaha World Herald*. Pro-silver delegates controlling the 1896 Democratic convention made Bryan the party's candidate after he eloquently delivered his famous "Cross of Gold" speech.

Losing the election, Bryan became a long-standing critic of the policies of the Republican majority. Though Bryan ran unsuccessfully for the presidency on two more occasions, President Woodrow Wilson named him secretary of state. Known for instigating numerous "treaties of reconciliation" with other countries, Bryan resigned in 1915, believing Wilson's vocal responses to the sinking of the *Lusitania* would lead to America's involvement in World War I.

In the last years of his life, Bryan focused on moral issues, including Prohibition. In 1925 he went to Dayton, Tennessee, to defend a state law forbidding the teaching of evolution in public schools. His main concern was that the teaching of evolution would help buttress the theory of social Darwinism. Though Bryan technically won the case, remembered as the "Scopes Monkey Trial," he was humiliated by his opponent, Clarence Darrow, who put Bryan on the stand as an expert on the Bible and attacked his apparent hypocrisy and pomposity. As he died shortly after the trial, Bryan's last campaign served to obscure his many years of dedicated service to issues of reform.

With the exceptions of Theodore Roosevelt and Woodrow Wilson, "the Great Commoner" was probably the most influential American politician of the late 19th and early 20th centuries, but he never lost his sympathy and compassion for poor, struggling people or his deep suspicion of big business. As LeRoy Ashby has written, Bryan "helped to define the great issues and policy questions that the nation faced," including "the relevance of the nation's democratic traditions in an industrialized, corporate society [and] the role of common citizens in an age of specialized knowledge and expertise."

He was a tireless crusader for the adoption of numerous causes that eventually became law: income and inheritance taxes; organized labor's right to exist and bargain collectively; sharp reductions in tariffs; women's suffrage; strict control over monopolistic railroads, industries, and financial institutions; government aid to farmers; strict controls of banks and currency; federal insurance for bank deposits; child and female labor laws; and direct election of senators.

According to Arthur Link, Bryan was one of a large minority of Democrats in 1912 who supported legislation "to destroy the oligarchical economic structure." His policies as secretary of state were high-minded, but not always effective or universal. He and Wilson both failed to intervene on behalf of Japanese citizens who were forbidden to own land or earn citizenship in California.

Bryan rather naively and chauvinistically dreamed of making quasi-protectorates of Central American and Caribbean nations, but these impulses were tempered by a humanitarian side that often benefited the poorest citizens of these nations. As Link has asserted, Bryan was often more mindful of their rights than their own leaders, whom Bryan often kept from entering into exclusive agreements with U.S. companies and banks. Unlike many of his late 20th-century counterparts,

Bryan was inspired by his evangelical Protestantism to care deeply about the needs of the poorest in society, while holding the wealthy and powerful to a high ethical standard they rarely, if ever, met in his eyes.

PAUL HILLMER CONCORDIA UNIVERSITY

Buchanan, James (Administration)

JAMES BUCHANAN WAS born on April 23, 1791 in Cove Gap, Pennsylvania, into a wealthy family. A life long bachelor, he was the only president to never marry. Buchanan received academy education before going on to attend Dickinson College in Carlisle, Pennsylvania. He graduated in 1809 and immediately began studying law. He opened a law practice in 1813. He joined a brigade, which helped defend Baltimore during the War of 1812.

In 1814 he was elected to a two-year term in the Pennsylvania House of Representatives. In 1820 he was elected to the U.S. House of Representatives, serving until 1831. Buchanan then left Congress and was U.S. minister to Russia until 1934, when he resigned after being elected to the U.S. Senate. In 1845 Buchanan left the Senate to become secretary of state under President James K. Polk, where he secured the annexation of Texas, settled the Oregon question, and directed the Mexican-American War. He retired from politics in 1849.

Franklin Pierce appointed him minister to Great Britain in 1853 and Buchanan served until 1856. With myriad political experiences the Democrats tapped him as their candidate in 1956 and he defeated John C. Fremont, the Republican candidate, and Millard Fillmore of the Know-Nothing Party. Buchanan's presidency was controversial. Just two days after he took office, the U.S. Supreme Court interjected the slavery issue into national politics with its decision in the *Dred Scott* case.

The case involved a slave who sued for his freedom claiming that he had lived in territory declared free by the Missouri Compromise. Buchanan advised the Court to make a broad decision, which would settle the issue. The high court ruled that Congress had no power over slavery in the territories and blacks were not citizens and therefore could not use the courts. Buchanan welcomed the Court's decision, believing that the issue was settled. However, northern Democrats and Republicans both condemned the decision and organized opposition to it. In Kansas a small-scale civil war erupted that cost the lives of several thousand Americans. Proslavery and antislavery forces battled in Kansas.

The proslavery faction wrote a constitution and requested admission to the Union as a free state, even though the overwhelming majority of the state's residents were antislavery. In an election that was clearly bogus, proslavery forces declared victory in the state and were attempting to set up a government at Lecompton. The so-called Lecompton Constitution was a fraudulent document, but Buchanan accepted it and tried to push it through Congress. When Congress rejected the Kansas admission and instead established it as a free territory, the slavery-in-the-territories issue took center stage.

On October 16, 1859, the radical abolitionist John Brown staged a raid on Harper's Ferry in Virginia. When Brown was tried and then executed on December 2, feelings in both the north and south intensified. In 1860 when Abraham Lincoln was elected president, seven southern states left the Union and created the Confederate States of America. Buchanan denounced their action as illegal but refused to act. Buchanan refused to turn over Fort Pickens in Florida and Fort Sumpter in South Carolina. Buchanan left office in 1861 and returned to his home in Wheatland, Pennsylvania. He supported Lincoln's policies during the war, but wrote a defense of his administration in 1866. He died on June 1, 1868, at his home.

ABEL A. BARTLEY, Ph.D. CLEMSON UNIVERSITY

Bulgaria

IN 1990, THE Republic of Bulgaria began the transformation from a communist satellite of the Soviet Union to an independent nation. The socialist government was ousted in 1996, setting the stage for democratic elections. Originally, the move toward a market economy brought corruption and crime along with high inflation and unemployment. Subsequent political and economic reforms resulted in Bulgaria's entry into the North Atlantic Treaty Organization (NATO) in 2004 and should eventually allow Bulgaria to join the European Union. Bulgaria's diverse economy is heavily dominated by services, which employ 56.3 percent of the labor force.

Bulgaria's posttransition economy has resulted in steady growth and low inflation; however, an unemployment rate of 12.7 percent, corruption, and a weak judiciary continue to present problems. Bulgaria has one of the the highest poverty rates of any country in Europe. The official figure is 13.4 percent, but unofficial estimates suggest that as many as 45 percent of the population may be poor. Approximately 22 percent of Bulgarians live on less than four dollars a day, and 16 percent of the people are undernourished. Women and children are particularly vulnerable to poverty. Inequality also exists, with the richest 20 percent claiming 38.9 percent of resources and the poorest 20 percent living on 6.7 percent of remaining resources. Bulgaria is ranked 31.9 on the Gini Index of Human Inequality.

Bulgaria has one of the highest poverty rates of any country in Europe.

The population of 7,450,349 enjoys a projected life span of 72.03 years. The median age is 40.66. Some 14 percent of the population are under the age of 14, and 17.2 percent have lived to see the age of 65. All Bulgarians have access to safe drinking water and proper sanitation. The country has 344 physicians for every 100,000 residents, and 80 to 94 percent of Bulgarians have access to affordable essential drugs.

Between 1970 and 2003, Bulgaria's infant mortality rate dropped from 28 to 12 deaths per 1,000 live births. At the same time, the mortality rate of children under the age of 5 fell from 32 to 17 deaths per 1,000. Ten percent of Bulgarian children are underweight at birth. While the childhood immunization rate is high, it continues to be lower than is advisable. Immunization rates

for children from birth to 23 months range from the low to the high 90s. Six percent of infants have not been immunized against polio even though two cases of polio were reported in Bulgaria in 2001.

The fertility rate in Bulgaria is low in response to the wide availability of family planning information. About 42 percent of Bulgarian women use birth control of some sort. On the average, women produce 1.38 children each. Teenage mothers give birth at a rate of 49 per 1,000. Maternal mortality is low in Bulgaria, occurring at a rate of 32 deaths per 100,000 births.

Literacy is nearly universal in Bulgaria, and only 1.4 percent of the population over the age of 15 are unable to read and write. Males have a slight advantage over females since only 0.9 percent of males are illiterate while 1.8 percent of females are so classified. School attendance is compulsory for the first eight years, and most students attend school for 13 years. Some 63 percent of children attend preschool, and completion rates for primary school are at 96.5 percent. Approximately 94 percent of Bulgarians are enrolled in primary schools, but a recent rise in dropouts has been a cause of concern. This rate is particularly high among Roma (32 percent) and Turkish (six percent) children.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Bureau of Labor Statistics

TO CALCULATE THE NUMBER of Americans living in poverty, the U.S. Bureau of Labor Statistics uses

an approach originally developed in 1964 by Mollie Orshansky at the U.S. Social Security Administration. Though other agencies sometimes use different formulas, the Orshansky approach is still the most common. To account for inflation, the poverty line is updated each year by the U.S. Department of Health and Human Services.

To define poverty, Orshansky turned to a 1955 study from the U.S. Department of Agriculture (USDA). The study had concluded that families of three or more members spent about a third of their after-tax income on food. Thus, Orshansky set the poverty line at an after-tax income of three times the cost of the USDA's "economy" food plan, which was the USDA's cheapest food plan and provided minimum acceptable nutrition. Because the USDA's economy food plan was designed for emergency situations, Orshansky developed a second poverty threshold that allowed for slightly higher family incomes. Though she considered the second threshold to be a more realistic measure of poverty, it has rarely been used.

Apart from each family spending a third of its income on food, Orshansky's poverty threshold made no other assumptions about how the family would spend its money. Her model did distinguish between families in different circumstances, such as whether the family was headed by a male or female, was older or younger, was farm or nonfarm, and how many people were in the family. Including all these factors, she generated a matrix with 124 different poverty thresholds for different types of families.

Orshansky emphasized that her poverty thresholds showed when family incomes were clearly inadequate—not when they were adequate, which she thought impossible to determine in general. In May 1965, the U.S. government adopted the Orshansky method as its official approach to defining poverty. In 1969, the government indexed the poverty level so that it would rise to match changes in the Consumer Price Index (CPI).

In 1973 the Office of Management and Budget formed several committees to study poverty standards. One committee recommended that the formula used to calculate poverty, as well as its assumptions about nutrition and family budgets, be updated every 10 years. The recommendations were not implemented. Various other studies were done in the 1980s, but no significant changes were made.

In 1990, Congress asked the National Research Council to study updating the definition of poverty and the methods used to calculate it. The council published its study, *Measuring Poverty: A New Approach*, in

1995. The study recommended changes in how poor families' incomes were calculated, such as adding non-cash income from food stamps and public housing while subtracting medical costs, taxes, and work expenses. It also noted that the poverty line had been the same (in constant dollars) since 1965, and recommended that the line be raised to match increases in living standards. The study's recommendations were not implemented.

The poverty line put 12.5 percent of U.S. residents at or below the poverty threshold.

In 2004, the latest year for which data were available, the official poverty line puts 12.5 percent of U.S. residents at or below the poverty threshold: a total of 37 million people, or 1.1 million more than in 2003. The poverty threshold has been criticized on various grounds.

In particular a 2000 study by the Economic Policy Institute argued that the National Research Council's 1995 recommendations would vastly improve the accuracy of determining which families are and are not living in poverty; childcare costs should be included in the poverty threshold to ensure that parents in poor families need not choose between going to work and ensuring the safety and well-being of their children; and the national poverty threshold should be replaced by regional thresholds that take account of local differences in living expenses.

SCOTT PALMER, Ph.D. RGMS ECONOMICS

Burkina Faso

BURKINA FASO IS A landlocked country in west Africa with limited natural resources, fragile soil, and a high population density that contribute to it being one of the poorest nations in the world. Burkina Faso was formerly known as Upper Volta. It achieved independence from France in 1960.

The country has a highly unequal distribution of income, with 45 percent of its population living below the official poverty line. Most of the population is engaged in subsistence farming, primarily growing cotton for export. Agricultural production in Burkina Faso suffers from drought, desertification, and soil degradation. Another export product, livestock, contributes to overgrazing. A large percentage of the male population migrates to neighboring countries for seasonal farm work. Conflicts in southern neighbors Ghana and Cote d'Ivoire sometimes limit this seasonal migration, thus contributing to the poverty problem. The limited industrial production in Burkina Faso is primarily controlled by the government and thus remains inefficient and unprofitable. The 2004 per capita Gross Domestic Product in Burkina Faso was estimated to be \$1,200, which implies the average person lives on less than \$3.29 per day.

Burkina Faso works with developed nations and international organizations, such as the International Monetary Fund (IMF) and the World Bank, to reduce its level of poverty. It developed a Poverty Reduction Strategy Paper (PRSP), which was approved by the IMF and the World Bank in 2000. The PRSP describes the country's economic development objectives for 2000–15, serves as a guide for the country in its actions to reduce poverty, and outlines the conditions necessary for it to maintain financial support from the IMF and the World Bank. The PRSP recommendations include improvements to the education and health systems of Burkina Faso and the privatization of its publicly owned industries.

These reforms are key components of mainstream economic development theory. Increased spending on health and education typically increases the productivity of workers and results in higher incomes and thus a higher standard of living. Private businesses are usually more efficient than those operated by the government. Thus privatization may be beneficial in increasing the quantity of goods and services produced and available to a society.

Burkina Faso participates in the Highly Indebted Poor Countries (HIPC) initiative, which is a program de-

veloped by the IMF and the World Bank to reduce the external debt burdens of poor countries to sustainable levels. Under the initiative, Burkina Faso agreed to economic and social policy reforms in exchange for a reduction of the amount of money owed to other countries. Burkina Faso was a beneficiary of a 2005 decision by the Group of Eight, which is an informal organization of some of the world's wealthiest countries: Canada, France, Germany, Italy, Japan, Russia, the United Kingdom, and the United States. Under this agreement, the World Bank, the IMF, and the African Development Fund agreed to cancel 100 percent of the money owed to them by 18 of the world's poorest countries, including Burkina Faso.

Burundi

PLAGUED FOR OVER 10 years by an unstable government and intermittent civil war, Burundi is one of the poorest nations in the world. Burundi is the second most densely populated country in sub-Saharan Africa, with over half its population living on less than \$1 per day. Agriculture, which supports 90 percent of the population on the basis of subsistence, has faltered in recent years as a result of overpopulation, soil erosion, and armed conflict, causing a rise in poverty levels.

The most pervasive factor stifling Burundi's economy is the nationwide instability caused by a controversial ethnic conflict between Hutu and Tutsi groups. The diversification of separate ethnic groups and their eventual disparity were instilled by colonizers who deemed Tutsi individual's more apt to manage the majority pop-

Burundi's poverty was exacerbated by ethnic conflict and refugees. Above, refugees line up vessels to collect foreign aid food.

ulation of Hutu workers. From the start, the so-called ethnic tensions felt in Burundi and neighboring Rwanda were a type of abstracted class system that has continued to have far-reaching economic consequences.

Since the inception of full independence in Burundi in 1962, the political parties have been divided according to these "ethnic" categories and both groups have been enmeshed in a bitter competition for power. Minority Tutsi parties have for the most part remained in control of the government and the military, and have violently objected whenever popularly elected Hutu parties have taken power in failed attempts at democratic government. Their Hutu counterparts have responded in kind, protesting Tutsi rule.

Under the influence of rampant bigotry, the bifurcated Burundian polity, which has undergone four successful coups and multiple ethnic cleansings in the past 40 years, has failed to maintain the infrastructure necessary for a functional economy. It was on this unstable basis that Hutu-Tutsi relations reached a boiling point in the early 1990s, when the Hutu leaders of both Burundi and Rwanda were assassinated, plunging both countries into civil war. Since then, peace has been a fleeting reality in Burundi. Even in the wake of the 2001 inauguration of a provisional government, armed opposition has persisted.

The current state of impoverishment in Burundi is a direct result of the civil conflicts that have ravaged the small nation for over a decade. Hundreds of thousands of Burundi's agriculturist population have been displaced within Burundi, and some have fled into neighboring countries because of political violence in recent years, effectively squandering their livelihood. These displaced persons cause an overwhelming strain on the already overpopulated areas in which they seek refuge, tipping the balance of already tenuous social and economic systems.

Burundian communities, which are not equipped to produce surplus food, face famine when refugees from bordering regions augment their populations. The uncultivated land left behind in turmoil quickly declines, and when unplanted, becomes susceptible to severe erosion. Leadership by waves of military forces has seen much of the country's available resources squandered on the war effort, while the attendant social services have suffered. Access to clean water and medical care, which waned considerably during the later years of the civil war as a result of structural instability, has not helped to alleviate the high incidence of poverty in the country.

While record numbers of refugees returned to Burundi in 2004, pending elections and potential peace, the nation is still trying to repair years of misfortune and curb the remaining disparate forces. Reintegration is not an easy task and Burundians will no doubt continue to face impoverishment until their land is recultivated and their social services are restored.

A greater obstacle threatening to undo the efforts made toward conflict resolution in Burundi, and which must be overcome on a local and national level if aspirations of peaceful coexistence are to be entertained, is the historically entrenched Hutu-Tutsi hostility. However, with the election of a National Assembly in July 2005 and the prospect of the first Burundian president in 15 years decided in late August 2005, stability may return to Burundi and with it the framework needed to build a working economy that will alleviate the poverty situation.

MATTHEW EVANS TETI NORTHWESTERN UNIVERSITY

Bush, George H.W. (Administration)

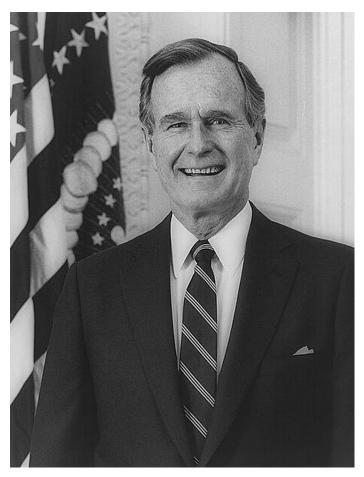

ALTHOUGH HE WAS A conservative who derided most forms of government involvement in alleviating social ills, President George H. W. Bush's administration was characterized by a more magnanimous attitude toward the plight of the poor than that of his predecessor. Whereas President Ronald Reagan had sought to actively dismantle many government antipoverty programs, Bush was perceived as more moderate in his approach to the poor, a perception that was borne out by his rhetoric during his campaign and presidency. Still, the president showed little urgency in tackling the problem of poverty with public policy during his term.

Major international events, including the fall of communism in the Soviet Union and eastern Europe, the first Gulf War, the massacre of prodemocracy protesters in China, and the famine in Somalia, monopolized the president's attention, leaving his comparatively lackluster domestic policy agenda vulnerable to partisan attack during the 1992 presidential campaign. The perceived absence of a clear domestic "vision" was a target of criticism from within the president's party and from the majority Democratic opposition in both houses of Congress.

Underneath the veneer of inactivity, however, Bush made a series of symbolic efforts to raise the issue of poverty, providing a stark contrast to Reagan. Yet, an economic downturn that began in 1990 tested Bush's avowed concern for the poor, culminating in a recession that provoked a spike in unemployment and forced a greater number of Americans below the poverty line. In the four years of Bush's presidency, the poverty rate climbed from 13 percent to 14.8 percent, higher than it had been in a decade, diminishing Bush's credibility as a poverty fighter and contributing to his 1992 defeat.

BIOGRAPHY AND PHILOSOPHY

Born to an influential family, Bush had an early life marked by privilege. An Ivy League education, a distinguished record as a navy pilot during World War II, and a measure of financial success in the oil fields of Texas all paved the way for a political career that would last for three decades. Uncomfortable with rigid ideological labels, Bush shifted between the conservative and moderate poles of his own party, as his congressional career in the tumultuous 1960s demonstrated. On the social issues so central to the legislative agenda of the period, Bush had a mixed record, bowing to pressure from conservatives to oppose the 1964 Civil Rights Act, but later

George H.W. Bush promised America would be a "kinder and gentler" place for the needy, but his efforts were not wholly effective.

angering that constituency by voting for President Lyndon Johnson's 1968 Fair Housing Act. In 1980, Bush ran for president in the Republican primary against the brash antigovernment crusader Governor Ronald Reagan. Bush lost the nomination, but Reagan made him his running mate. Although he had run a campaign considerably more moderate than Reagan's, Bush moved to the right in supporting the unapologetically conservative party platform.

After eight years as vice president, during which he supported supply-side fiscal policy, conservative positions on social issues, and the dismantling of much of the social safety net, Bush ran for the presidency again in 1988, seeking to define his own distinct social philosophy. Recognizing problems that his predecessor had largely ignored, and promoting voluntarism and private charity as the most desirable means to address them, Bush painted his opponent, Governor Michael Dukakis of Massachusetts, as a wayward "tax and spend" liberal. A Dukakis victory, Bush warned, would

mark a return to the "noble" but misguided social policies of the 1960s, a dangerously soft approach to crime and communism, and the national "malaise" of the Jimmy Carter years. Bush emerged from the campaign with the support of an increasingly vocal base of social conservatives and a key to the White House.

POVERTY POLICY AND ECONOMIC AGENDA

During a period of skyrocketing budget deficits and sluggish economic growth, the fate of Bush's domestic goals were thrown into question from the start. A campaign promise to balance the budget without raising taxes further complicated matters for the president. In 1989, despite these realities, Bush convened an Inter-Agency Advisory Group to revisit antipoverty programs, proof of his campaign promise to make America a "kinder and gentler" place for the needy.

The group recommended various ways to improve government efforts, including "community intervention," a minimum child-support benefit, uniformity in food stamp and welfare benefits, improved family planning services, and a revision of the formula used to determine eligibility for welfare and Medicaid. Citing budgetary and political obstacles, the administration rejected the group's recommendations. By 1990, the deficit had grown to \$220 billion annually, three times its 1980 level, dampening the will to enact any antipoverty program. Thus ended Bush's large-scale efforts to address poverty.

A supply-side conservative himself, Bush preferred to provide aid to the poor through tax credits. Using one of the only fiscal tools available to him, Bush expanded the Earned Income Tax Credit (EITC) to provide help for the working poor. Established in 1975, the EITC targets families who live below the poverty line despite the employment of at least one parent. After vetoing an increase in the minimum wage from \$3.35 to \$4.65, Bush negotiated a deal with Congress to further expand the EITC and increase the minimum wage to \$4.25 over three years. Bush also proposed a child-care tax credit aimed at making it easier for low-income parents to stay off the welfare rolls. The tax credits Bush supported were in keeping with the fiscal conservatism of his party and the worsening budgetary conditions he and the Congress faced throughout his term.

WELFARE

In 1992, responding to growing public concerns about the costs of welfare, conservative demands to dismantle a program seen as wasteful and destructive of family values, and his Democratic opponent's rhetoric about "ending welfare as we know it," the administration proposed an overhaul of the welfare program. The cornerstone of the proposal was allowing states to initiate experiments with their own welfare programs, aimed at moving recipients off the rolls and into jobs. Bush supported Aid to Families with Dependent Children and the Women with Infants and Children programs, especially praising the latter. Incentives for work, savings, family cohesion, and job training were guiding principles of Bush's welfare reform proposal.

EDUCATION

Having proclaimed his ambition to be the "Education President," Bush leaned on education policy to establish poverty-fighting credentials. While budget constraints hampered his ability to make major increases in education spending, Bush put forth initiatives to improve school performance in low-income neighborhoods.

Notable among these were proposals to provide poor parents with money for private school tuition, following a controversial pilot program to give education vouchers to parents in Milwaukee, Wisconsin. The Democratic Congress, deeply suspicious of using public dollars for private education, objected to Bush's voucher proposal, which had long been a priority for conservative education reformers.

In a break with his long-held criticism of Great Society programs, Bush praised the Head Start program, requesting funding increases in every year of his presidency that amounted to a 23 percent increase in overall funding and extended services to an additional 180,000 children. Reflecting the First Lady's advocacy of literacy initiatives, Bush also proposed funding for adult literacy classes for Head Start parents.

HOUSING AND HOMELESSNESS

In a move that was widely interpreted as a sign of his intention to address poverty issues more vigorously, Bush nominated Representative Jack F. Kemp to serve as the secretary of Housing and Urban Development. Well liked on both sides of the aisle, Kemp was seen as a maverick by members of the Washington, D.C., establishment.

An ideological conservative who preached both the virtues of supply-side economics and innovative public policy aimed at finding solutions to the problems of the poor and homeless, Kemp sought to replace the Republican Party's ad hominem attacks on the Great Society edifice with a recognition of the imperative for government to promote opportunity for all. At the announcement of his nomination, Kemp uttered words that many conservatives had to hear twice to believe: "I want to wage a war on poverty." To the president he added, "You cannot balance the budget on the backs of the poor."

During the Reagan years, federal spending on housing had fallen from \$28.7 billion to just \$9.5 billion, provoking what many advocates for the poor deemed a full-blown housing crisis. Homelessness had become rampant in American cities, with the homeless population ranging between cautious estimates of 250,000 and as many as 3 million according to housing advocates.

George H.W. Bush strove for what he called an "opportunity society."

Bush twice supported expansions of the McKinney Act (PL 100-77), which remains the only legislative effort to address homelessness specifically. At Kemp's urging, Bush proposed several supply-side initiatives to improve home-ownership in poor communities, all based on the premise of public-private partnerships through which tax breaks and subsidies would help poor families find affordable housing. Congress enacted some of these proposals in 1990 and again in 1992, but the plague of homelessness and inadequate affordable housing persisted.

CHILDREN'S ISSUES

Much of Bush's rhetoric about the need to combat poverty centered on the plight of poor children whose sad lives, he said, "haunted" him. With varying levels of success Bush promoted policies to improve child support enforcement; crack down on gang activity in urban centers that threatened the safety of neighborhood children; establish radon, asbestos, and lead paint detection programs in urban areas; and make laws more conducive to adoption of children born into difficult circumstances.

HEALTHCARE

Bush's approach to the healthcare crisis among the working poor was to expand eligibility for Medicaid. In

his first State of the Union address, he asked the Congress for full funding of the program, increasing appropriations by some 9.6 percent and extending coverage to expectant mothers who were near eligibility, encouraging better prenatal care. While supporting Medicaid coverage for poor people throughout his term, Bush suggested a more ambitious policy under pressure from his Democratic opponent in the 1992 campaign, proposing a program through which poor people would receive vouchers to buy private insurance from employers who did not already provide coverage.

Committing the United States to the standards set by the United Nations' World Summit for Children in 1990, Bush also proposed new funding to combat the alarming rates of infant mortality in the United States in the 25 hardest-hit communities. Deeming the proposal inadequate because the new funding would be culled from other initiatives to aid poor mothers and children, Congress passed an alternative, appropriating the \$25 million without cutting existing programs.

MAJOR EVENTS

War, recession, and social unrest were among the major events that took place during Bush's term, each contributing new factors to the ongoing debate over how to address poverty in America. The 1991 Persian Gulf War distracted the president and the nation from domestic issues. After the war, the nation refocused on the home front, with the effects of the 1990 recession still being felt around the country. Despite a belt-tightening budget deal brokered by the president and Congress, federal spending during the recession came home to roost with soaring deficits. Middle-class families were beginning to feel the squeeze of rising unemployment rates and seemingly unfettered increases in healthcare costs, making a vigorous debate about poverty unlikely, even if the president had initiated such a discussion.

That would all change in April 1992 when the Los Angeles riots instigated a new national debate over poverty, in particular the poverty suffered by inner-city African Americans. The administration's reaction to the riots demonstrated the systemic vagrancies of its poverty policy. Provoked by the acquittal of four white policemen who were videotaped beating an African-American suspect, rioting broke out in the most economically distressed parts of the city. Motivated by resentment over what was perceived to be brazen racial discrimination in the legal system, the rioting lasted for several days, resulting in 30 deaths and the large-scale destruction of property. After the immediate crisis

The plague of inadequate housing and homelessness persisted throughout the George H.W. Bush administration.

passed, the nation began to examine the riot's causes. Civil rights leaders and many on the left pointed to the substantially unspoken scourge of racial prejudice and inequality that cleaved American society, much of it embodied in the staggering rates of unemployment and poverty among African Americans.

Bush responded to the crisis by sharply condemning the violence, admitting that the verdict in the beat-

ing case was surprising, and acknowledging that poverty and racism contributed to the situation; but, his response seemed to many to be distant and uninterested. In the immediate aftermath of the riots, the president and many in his administration made controversial statements about the underlying causes of this perceived new urban crisis that seemed to reflect this lack of engagement with the actual magnitude of the events.

Instead of addressing the possibility that persistent socioeconomic inequality and government neglect during the 1980s had provoked much of the anger that spilled over in Los Angeles, Press Secretary Marlin Fitzwater blamed the riots on the failed social programs of the 1960s. Vice President Dan Quayle blamed a "poverty of values" for the breakdown of order in Los Angeles, and the president himself blamed the welfare system for "trapping" poor people in a cycle of despair.

Under the weight of mounting pressure from the press and his political opponents, the president pledged to devise a new strategy to address some of these social ills, but also emphasized the importance of individual public service and community-building, a common mantra for his administration. Public opinion indicated that many felt that the president's response was disappointing; with polls showing that the majority of Americans felt that too little money was being spent on antipoverty efforts.

In an election year and with conservative Republicans pounding a drumbeat of the national crisis of morality, the administration responded not with a new strategy but by promoting some of its long-standing proposals, including welfare and education reforms, strengthened drug and crime enforcement efforts, Secretary Kemp's housing initiatives, and strengthening traditional values. The president also proposed an emergency appropriation of \$638 million to address rebuilding efforts, which Congress passed.

By November the anxieties of the middle class over sluggish economic growth and rising jobless rates had stolen much of the thunder of the debate about urban poverty provoked by the riots. Yet the president's opponent in the 1992 general election would use the riots and Bush's response to talk about the need for a more activist government role in addressing socioeconomic inequalities and the troubled state of American race relations.

CONCLUSION

Throughout his presidency, Bush highlighted what he believed to be the cornerstones of appropriate poverty

policy, striving for what he called an "opportunity society." The tangible elements of this policy included tax credits for the working poor, education reform based on the principle of private choice, efforts to encourage home ownership among low-income communities, and long-standing personal support for volunteer and private charitable endeavors in needy areas—all reflecting the conservative preference for community-oriented, nongovernmental approaches.

A 1991 address best summarizes Bush's preference for relying on private charity rather than public policy to address socioeconomic inequalities. "We don't need another Great Society with huge and ambitious programs administered by the incumbent few. We need a Good Society built upon the deeds of the many, a society that promotes service, selflessness, action."

Inspired by a belief in the ideal of *noblesse oblige*, Bush's poverty policy was essentially confined to using the bully pulpit, removing some government obstacles to economic mobility, and supporting modest tax policies that directly benefited the working poor. Perceived by many critics, including some members of his own administration, to be inadequate to address the ever more urgent socioeconomic inequalities that the Los Angeles riots of 1992 laid bare, Bush's legacy on the issues of poverty and deprivation, though seemingly insignificant at the time, did become cornerstones of the antipoverty strategies of his successors.

SHEYDA JAHANBANI BROWN UNIVERSITY

Bush, George W. (Administration)

ALTHOUGH GEORGE W. Bush claimed "compassionate conservatism" to be one of the defining characteristics of his presidency, the post-2001 poverty rate increased steadily. In 2001, the U.S. Census Bureau's

poverty rate stood at 11.7 percent. By 2004, the last year for which data are available, the poverty rate jumped by one full percent to 12.7 percent, an increase of about 4 million people. An interesting feature of recent poverty statistics is that, in addition to high poverty among racial and ethnic minorities, poverty among whites rose at an unprecedented rate, from 9.9 percent in 2001, to 10.9 percent in 2004.

Offshoring and/or outsourcing led to the erosion of the economic and social status of labor, and thus contributed to the rise of poverty among the white working class. Another disheartening aspect of these statistics is that child poverty has been extremely high. In 2004, the poverty rate among children under 18 reached 17.8 percent, signaling that poverty is a long-term problem in the U.S. economy.

The growth in incomes from 2001 to 2004 affected different income groups differently. Whereas the real average income of the top five percent increased by 1.7 percent, real average incomes of the bottom 40 percent decreased by 0.5 percent, exacerbating the income inequality and income concentration. The data is also reflective of the Bush administration's efforts to redistribute income to high income groups as a supply-side trickle-down policy, unfortunately at the expense of the low-income groups.

The economic policies of the administration, especially tax policies, did not help to alleviate poverty. Budget cuts and/or freezes in healthcare, education, and other social programs inevitably hurt the poor and other socially and economically disadvantaged groups and raised their vulnerability, pushing them further into poverty.

One of the more controversial aspects of the Bush administration has been to outsource poverty and related problems to faith-based charities and organizations. This approach has been criticized on many fronts. Some argue that using faith-based groups helps to promote neoconservative values and views among the poor. Others maintain that federal financing of these groups is a violation of the principle of separation of church and state. Nevertheless, the failure of this antipoverty approach is evident in the rising poverty figures.

The Bush administration's failure to combat poverty at home also extends to the international arena. In the summer of 2005, at the G-8 Summit, in Gleneagles, Scotland, the leaders of the eight rich, industrial countries committed themselves to halving poverty and hunger by 2015. A corollary to this agreement was devoting 0.7 percent of Gross Domestic Product to development assistance to fund poverty, health, and education

expenditures in countries stricken by extreme poverty. Unfortunately, the Bush administration has so far failed to meet the targeted 0.7 percent.

POLITICS

As the son of President George H.W. Bush and brother of Florida Governor Jeb Bush, it was inevitable that Bush would follow in his father and brother's footsteps and go into politics. Bush began working in politics in 1964, when he worked on his father's U.S. Senate campaign. He again aided his father during his 1970 campaign for the same office. In 1972 his National Guard unit transferred him to Alabama to help work on a senate campaign for a Republican U.S. Senate candidate. In 1978 Bush challenged Democratic State Senator Kent Hance for a seat in the U.S. House of Representatives. Ronald Reagan endorsed Bush's opponent in the Republican primary and Bush lost the general election.

Bush remained out of politics choosing instead to work on campaigns until 1994 when he surprised many by challenging the very popular Democratic incumbent governor of Texas, Ann Richards. Many people, including his mother, questioned the decision believing that Richards was unbeatable. The popular Richards boasted of several accomplishments including a reduced crime rate, rising scores on standardized test in schools, a growing economy, which was creating jobs, no new taxes, and a 60 percent approval rating. Bush's campaign demonstrated the shrewd calculating political strategy that Bush would use in later elections. He concentrated on three wedge issues to hammer the popular governor and drive her out of office in a humiliating defeat.

Bush cultivated a relationship with Karl Rove, a political strategist from Utah, who developed a strategy of attacking Richards on her political flanks. Rove could see the handwriting on the wall and realized that Republicanism was on the rise. He also knew that Christian conservatives were becoming increasingly active and there were growing frustrations with the liberal politics of the Democrats.

There was a backlash against President Bill Clinton's politics, which in two years had seen a tax increase, homosexuals admitted into the military, and failure to pass healthcare reform. Bush's campaign came at a fortunate time for Republicans, as the midterm 1994 elections produced 73 freshman Republicans elected to Congress. Newt Gingrich orchestrated a Republican takeover of the House, catapulting himself into the speaker's chair.

Bush, who had been a rabble-rouser as a youth, once getting arrested for drunk driving and losing his driver's license for 30 days, had a religious experience in 1985 after meeting with Evangelist Billy Graham. The meeting transformed Bush's life, forcing him to reassess his values. He stopped drinking and left his family's Episcopal Church and joined his wife's United Methodist Church. Rove advised Bush to concentrate on his Christian values, opposition to gun control, and emphasis on family values. Bush cultivated a relationship with the National Rifle Association (NRA) by promising to support a concealed weapons bill vetoed by Richards. He also publicized the six openly gay officials appointed by Richards to state boards and commissions. Finally, he was able to attack Richards's prochoice stance on abortion. Bush accused Richards of being soft on crime, arguing that juvenile crime was out of control.

He was able to energize his base and they pulled off a stunning 53 to 46 percent victory over Richards. Bush then forged a political alliance with powerful Democrats to run Texas. In 1998 Bush crushed his Democratic opponent, Gary Mauro, 69 percent to 31 percent to win reelection. Bush had suddenly become the Republicans' best hope for recapturing the White House and immediately began to pick up endorsements from powerful conservative sectors.

PRESIDENCY

In 2000 Bush entered the Republican primary as a compassionate conservative and a throwback to the Ronald Reagan era. Bush campaigned on issues like allowing religious charities to participate in federally funded programs, cutting taxes, educational reforms including school vouchers, support for drilling in the Arctic National Wildlife Refuge, maintaining a balanced budget, and restructuring America's armed forces. Bush opposed the Clinton-era practice of using the armed forces in nation building. Bush was able to beat back a challenge from maverick Arizona Republican Senator John McCain to win the Republican nomination where he faced the formidable incumbent, Democratic Vice President Al Gore.

In a controversial election, Bush was declared the victor when the U.S. Supreme Court ordered Floridians to halt recounting votes. In the first presidential election since 1888, Bush, the Republican victor, did not receive the most votes. Also, for the first time since 1876, the U.S. Supreme Court became the final election arbitrator, when the election showed no clear winner. Gore

challenged the election results in Florida, where initial tallies suggested a Bush victory.

However, there were numerous charges of voter irregularities in the way the votes were tallied, which placed the returns in question. A series of court cases followed, challenging the legality of county-specific and statewide recounts. After a four-county hand and machine recount showed Bush still in the lead, the Florida Supreme Court ordered a statewide recount of all 67 counties, prompting a court challenge by the Bush campaign. The Supreme Court ordered the recount stopped and the state declared Bush the victor. With the recounting stopped, Bush won Florida by a mere 537 votes in an election with nearly six million voters statewide.

Issues of homeland security and foreign policy dominated Bush's first administration. He attempted to push through his grand domestic agenda, which included the largest tax cut in American history—a 10year, \$1.35 trillion tax cut. Bush then signed legislation giving a \$300 to \$600 rebate to taxpayers as a way to simulate the sagging economy, promising to retire budget deficits with surpluses in future years. However, as the economy continued to decline, the budget surplus Bush inherited and used to pass his tax cuts disappeared. Once again, in 2003 Bush went to Congress and asked for a \$350 billion tax cut to stimulate the economy, which Congress passed. Unlike his predecessor Clinton, Bush preferred tax cuts to deficit reductions to stimulate the economy. The results were predictable: skyrocketing deficits.

NO CHILD LEFT BEHIND

In December 2001, Bush pushed Congress to pass his landmark educational reform bill, entitled No Child Left Behind. This bill required states to provide annual performance tests to all elementary students. Bush then worked with liberal Democrats to ensure a \$4 billion increase in federal spending on education, raising the annual federal contribution to \$22 billion and mandating state tests in reading and math for all students in grades three through eight, and at least once during the 10th through 12th grades.

In early 2001, Congress passed Bush's so-called faith-based initiative, which changed the way government regulated, taxed, and funded charities and non-profits run by religious organizations. Bush allowed these organizations to separate their charitable functions from their religious functions, creating the White House Office of Faith-based and Community Initia-

tives. Although Bush became the first Republican to appoint an openly homosexual person to office, when Michael Guest was appointed American ambassador to Romania, he pleased conservatives by opposing recognition of same-sex marriages, even publicly endorsing a Constitutional amendment defining marriage as a union between a man and a woman. He further strengthened his conservative credentials when he sided with opponents of the University of Michigan's affirmative action policy, which favored minorities and women in admissions decisions.

The Bush administration seemed to have no answer for the failing economy, which saw an increase in the unemployment rate from 4 to 6 percent. The economic downturn was coupled with the collapse of several major U.S. corporations, such as Worldcom and the massive energy company Enron. The Enron failure proved catastrophic to investors as the stock's value fell from \$100 to less than \$1. More than \$50 billion was lost when the company failed. Later it was learned that executives in the company had engaged in patently scandalous business practices. Also, there were several corporate scandals as executives at Tyco International were accused of stealing more than \$600 million from the company.

SEPTEMBER 11

On September 11, 2001 Al Qaeda terrorists, under the leadership of Osama bin Laden, flew airplanes hijacked in America into the World Trade Center, the Pentagon, and the Pennsylvania countryside, killing some 3,000 Americans. Within a week, Bush announced that the United States would be engaging in a "war on terrorism." On September 20, 2001, Bush addressed a national television audience of more than 80 million, promising the United States would be proactive and preemptive with threats to the nation's security. He threatened unilateral action if necessary to protect the nation from terrorist attacks. After an initial investigation, on October 7, 2001, the United States, with international support, launched an offensive against Afghanistan to drive out the Taliban government, which harbored and protected bin Laden and his lieutenants.

As part of his war on terrorism Bush called for the creation of an agency he referred to as Homeland Security to coordinate threats to the American home front. Bush envisioned combining the Customs, Coast Guard, and Immigration and Naturalization services under one department. In November 2002, Congress approved the

establishment of a new cabinet-level department called Homeland Security. Former Pennsylvania Governor Tom Ridge was appointed the first secretary of Homeland Security.

Next, Congress wrote and then passed a controversial Patriot Act designed to defend America's home front against internal attack. Officially titled the Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism Act of 2001, this act proved to be one of the most controversial pieces of legislation passed during the Bush administration. Signed into law on October 26, 2001, just six weeks following the attack on the World Trade Center, the measure passed in the House 357 to 66 and in the Senate 98 to 1.

The act gave broad new powers to the federal government to conduct the war on terrorism. It allowed such things as real-time tracing of private calls, interception of computer information, government use of cable and electronic companies to spy on citizens, secret searches, so-called sneak and peak warrants, nationwide surveillance, roving wiretaps, and federal authorities' monitoring of computer usage at public libraries. Though civil liberties organizations criticized the measure as unconstitutional, most Americans believed that extraordinary measures were required to protect the country from terrorism.

A part of America's new aggressive foreign policy was a determination to reestablish American dominance on the international scene. Bush announced that the United States was pulling out of the Kyoto Protocol, an international agreement to control global warming, citing disadvantages to American industries. He announced his intention to pull out of the Anti-Ballistic Missiles Treaty signed with Russia in 1972. He also announced that he would not expose American service members to prosecution by the International Criminal Court for possible crimes committed in worldwide peacekeeping efforts.

In January 2002, Bush began to focus America's foreign policy on a search for weapons of mass destruction (WMDs), which might be used by terrorists to threaten or attack the United States. Immediately, his attention turned to Iraq. The United States demanded that Iraq allow United Nations inspectors to search for weapons, as Iraq had promised to do in 1991 as a condition to ending the Gulf War.

The United States began to plan for a unilateral strike against Iraq to force Iraq to disarm. In October 2002 Congress passed a resolution authorizing the president to use force to disarm Saddam Hussein if he did

not comply with United Nations (UN) resolutions. In November the UN Security Council voted unanimously to send its weapons inspectors back to Iraq to search for WMDs.

Despite their inability to find any evidence of Iraq's possession of biological, chemical, or nuclear weapons, the Bush administration pressed the body for a resolution authorizing the use of force to compel Hussein to comply. Both France and Britain chose not to endorse the plan, and the Bush administration decided to exercise its first unilateral action.

On March 18, 2003, U.S. missiles fired on a compound believed to house Hussein. The next day a multinational force that included 65,000 American troops crossed the border and invaded Iraq. By the summer of 2003 the war was basically over as most organized Iraqi military resistance had ended.

What followed was a long drawn-out insurgency, which continued into 2006. The United States was gracious in victory, securing \$30 billion from foreign and domestic sources to help reconstruct Iraq. In December 2003, U.S. forces captured Saddam Hussein, who was hiding in Iraq.

In 2004 Bush won reelection to a second term, narrowly defeating Democratic challenger Massachusetts Senator John Kerry. Once again Bush returned to his familiar themes, emphasizing family values, tax cuts, and his willingness to press the war on terrorism. Bush, with the help of Karl Rove, painted Kerry as a dangerous, weak, tax-and-spend Democratic liberal who could not be trusted to protect Americans. He also took advantage of his support for a Constitutional amendment

to protect marriage as a union between a man and a woman and Kerry's preference of allowing voters in each state to make the decision.

Bush's second term was mired in his efforts to build a working democracy in Iraq, inept government responses to natural disasters, and economic stagnation. Iraqis loyal to Saddam Hussein joined forces with foreign insurgents allied with Al Qaeda and carried on a guerrilla war that cost the lives of more than 2,000 American soldiers by the end of 2005. There were also concerns about the growing federal debt, which had reached more than \$8 trillion. Bush continued to remain optimistic, arguing that the economy was stable and the country was safe.

WORLD POVERTY

Calvin, John (1509-64)

JOHN CALVIN CRITICIZED the French Catholic Church's interpretation of the Bible. He turned to Protestantism for fresh ideas, even though quite a number of so-called heretics were burned at the stake for their dissident ideas. Calvin moved around constantly, until he settled in Geneva, and when he died, his version of Protestantism, instead of the one propagated by Martin Luther, increased in popularity.

Even though Calvin insisted that church and state should be separate, he believed the state should be run according to Christian principles. The government had to be theocratic. After all, God was primary, and God's ideas were the foundation for the whole of society. Calvinism contained views on all aspects of life: politics, economics, and culture. Regrettably, Calvin believed man was essentially sinful and nothing but God's predestination for salvation in heaven could save a person. Other human beings were condemned to hell.

Thomas Hobbes (1588–1679) expressed that humans are alone, nasty, brutal, and aggressive in a more direct political meaning in his book *Leviathan*. Even if one led a perfect sinless life, one might still go to hell, as decided by God, but at least one died with inner peace.

As an individual, one was to make certain decisions. You and nobody else could make the decision as to which way to go—even though, of course, in the very end God's word overruled everything.

Besides the centrality of God, Calvin also emphasized the importance of the individual rather than that of the organized church (the pope's followers in Rome). Max Weber, in his *Protestant Ethic and the Spirit of Capitalism*, encouraged the individual to work industriously and never wastefully on this earth, rather than seeing life on earth as passive preparation for the afterlife of hell, heaven, or purgatory. Rational capitalism needs ongoing investment. It needs an individual's ascetic lifestyle rather than wasting money made in business on personal luxury or indulgences such as the building of castles, gambling, or fanciful clothes, or in Thorsten Veblen's words, "conspicuous consumption."

Personal wealth could be seen as a favor from God, maybe even as a sign of predestination. This, of course, meant that one would have to work as hard as possible to receive this sign. Material prosperity was now seen as positive, not as a sign of greed and exploitation. Max Weber sees this ascetic lifestyle as encouraging capitalist production and behavior; he links the Calvinist ethic of frugality and serving God to the "spirit of capitalism,"

the "accumulation of wealth" in a continuous, rational manner, rather than that capitalism comes about through economic changes, as Karl Marx analyzed it. According to Weber, because of Calvinism, capitalism developed in northern Europe and not in China (Confucianism), India (Hinduism), or the Arab world (Islam).

Weber understands Calvinism as breaking through the feudal order and preparing the ground for the acceptance of private profits and capitalism. The feudal political, economic, and cultural order fell apart and Calvinism was one of the responses. However, Calvin never advocated capitalism; he lived a God-fearing life on earth, but he did emphasize the importance of the individual and his decision for leading a life as God had intended—and the individual is also the key decision-maker in capitalism.

Calvin was no revolutionary. Until the end he advocated "render unto God what is due to God and to Caesar what is due to Caesar." Calvin advocated obedience to political authority, as Jesus had done earlier, but once the individual was set free from papal edicts, he was also set free economically. The unintended consequences of Calvinism led to capitalist industrialization and breakthroughs in the natural sciences. Protestantism, particularly in its Calvinistic form, is essentially individualistic in its outlook. Salvation is a matter between the individual and his or her creator in Protestantism, even though the ultimate decision may be a rather one-sided affair and every individual is to work for the greater glory of God. Calvinism became the ideology of the newly risen bourgeoisie.

Cambodia

CAMBODIA IS A country of some 11 million people located in tropical mainland southeast Asia. The major-

ity of the people are involved with subsistence rice agriculture. Despite being home to the powerful and socially and technologically advanced Khmer Empire, Cambodia suffered from colonization by the French, and then monstrous misrule by Pol Pot and the Khmer Rouge, the communist Cambodians who seized power in the chaotic scenes following the defeat of American forces in Vietnam. The Khmer Rouge regime murdered an unknown number of Cambodians either directly or through overwork and starvation.

The United Nations reports that poverty in Cambodia is characterized by low income and consumption, poor nutritional status, low educational attainment, little access to public services including school and health services, little access to economic opportunities, vulnerability to external shocks, and exclusion from economic, social, and political processes. Poverty has also contributed to the spread of HIV/AIDS.

Additionally, one of the legacies of Khmer Rouge rule has been the destruction of the intelligentsia in the country and, hence, the effects of poverty are exacerbated by the lack of medical, teaching, and scientific professionals, whose role in alleviating some of the effects of poverty is essential. Approximately 90 percent of the poor are located in rural areas, where incomes and educational and economic opportunities are lower than in the small urban areas. Around 40 percent of rural people and 36 percent of the population as a whole live below the poverty line of \$1 per day.

The government of Cambodia has established a poverty monitoring and assessment mechanism and is also working with neighbors and with donor nations and organizations to reduce poverty. Priority policy goals include the provision of education for all and awareness of health issues. Basic minimum needs for people in rural locations are being established with a view to strategy formulation. The government has also been working to develop some export industries to generate income, although at a very low level.

However, low levels of capacity in the government, together with the threat of pervasive corruption in government, threaten to reduce the effectiveness of government achievements. These problems are worsened by poor resource management, the presence of unexploded ordnance such as mines and bombs across much of the country, and unresolved issues relating to the previous genocide.

Tackling poverty will require considerable strengthening of civil society institutions to promote greater government and private-sector accountability. Promotion of potentially valuable economic activities such as

tourism, garment manufacture, and exploitation of natural resources must also continue. However, the great lack of government resources has prevented necessary funding of health and education services and is also threatening to derail the long-running, multilateral process aimed at bringing to justice former members of the Khmer Rouge.

John Walsh Shinawatra University

Cameroon

IN THE LOW-INCOME western African nation of Cameroon, where 48 percent of the population live below the national poverty line and where almost one-third of the people are unemployed, inequality continues to thrive. The lowest 10 percent of the population share less than two percent of national income, while the richest 10 percent possess 36.6 percent. Over half of Cameroon's population lives on less than \$2 per day. Cameroon continues to be dominated by the agricultural economic sector, in which 70 percent of Cameroonians labor.

Democracy has made slow inroads in this country, but the ruling ethnic oligarchy has achieved relative stability by promoting the agricultural and petroleum sectors and through improved infrastructure. In conjunction with the International Monetary Fund (IMF) and the World Bank, Cameroonian officials have instituted economic reforms that include poverty reduction and increased privatization.

Cameroon's population suffers from low life expectancy, and the median age is 18.6 years. Some 41.7 percent of the population are under 14 years of age. Be-

cause Cameroonians have a 40.2 percent chance of not surviving to see their 40th birthday, only 3.3 percent live past the age of 65. Approximately 42 percent of the population have no sustainable access to an improved water supply, and 21 percent lack sustainable access to improved sanitation.

The HIV/AIDS epidemic has become a major threat to Cameroonian health, and the 6.9 percent prevalence rate is a constant drain on the country's resources. By 2003 estimates, some 560,000 Cameroonians were living with HIV/AIDS, and 49,000 individuals had died from this disease. Other health problems include very high risks of contracting food and waterborne diseases such as bacterial diarrhea, hepatitis A, and typhoid fever. Under the guidance of the Carter Center, health officials and local groups have waged war against river blindness, which has affected an estimated 5.1 million Cameroonians. This debilitating disease is spread by bites of the blackflies that inhabit fast-flowing rivers.

In 1997 in conjunction with the Carter Center, Cameroon successfully eradicated Guinea worm disease, which is caused by contact with infected water. In some areas, vectorborne diseases such as malaria and yellow fever pose a serious threat, as do schistosomiasis and meningococcal meningitis. Health problems are complicated by the fact that Cameroon has only 0.1 physician and 2.6 hospital beds for every 1,000 people.

Children in Cameroon suffer disproportionately from poverty, and some 22.1 percent of Cameroonian children are malnourished. Infant mortality is estimated at 68.26 deaths per 1,000 live births. Poverty is responsible in great part for the mortality rate of 166 for children under the age of 5. Less than one-quarter of Cameroonian children receive oral rehydration therapy when necessary, and almost one-third lack access to affordable drugs. The result is that children die from what should be treatable diseases. Cameroon has improved its childhood immunization rates in recent years. In 2002, the measles immunization rate for infants was 62 percent, and the tuberculosis rate was 77 percent. By 2003, 61 percent of all children between the ages of 12 and 23 months had been immunized against measles, and 73 percent had received DPT3 immunizations.

Cameroonian women continue to suffer from the high fertility rate of 4.47 children per woman. Barely a quarter (26 percent) of Cameroonian females between the ages of 15 and 49 use contraception, and the adolescent fertility rate of 123 per 1,000 live births is unacceptably high. Cameroon's maternal mortality rate of 730 per 100,000 live births also poses problems for

health authorities. Since the mid-1990s, the Cameroonian government has pledged to end sex discrimination and has instituted new policies and programs that promote education and opportunities for women and which place increased attention on reproductive health. By the beginning of the 21st century, 60 percent of all births were attended by trained health workers.

While 84.7 percent of Cameroonian males are literate, almost one-quarter (26.6 percent) of females lack this necessary skill. Literacy rates have improved over the last decades. Between 1990 and 2000, the rate of illiteracy among males and females dropped from 43.8 to 20.9 percent and from 69.0 to 36.3 percent, respectively. Primary education is now free, and between 1999 and 2003, Cameroon saw a rise of 17 percent in total primary school enrollment and a 15 percent increase in the number of females completing primary school.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Campus Compact

CAMPUS COMPACT IS a consortium of over 900 university and college presidents, representing more than five million students, across the United States, whose stated mission is to advance the public purposes of colleges and universities by deepening their ability to improve community life and to educate students for civic and social responsibility.

The organization was founded in 1985 by the presidents of three private universities (Brown, Georgetown, and Stanford) as well as by the president of the Education Commission of the States, an organization that

serves a clearinghouse function for advising education institutions on helping state leaders shape educational policies. At the time, the media was apt to portray college students as nothing more than money-hungry and self-centered individuals who were unconcerned with the world around them.

The four institutional presidents felt that that perception was incorrect and wanted to demonstrate that college students could make a difference in the lives of their fellow Americans. Thus, they founded Campus Compact to give students the opportunity to make that difference through voluntary work in their communities.

Through Campus Compact, students are taught the importance of public service and helping to improve the lives of those persons less fortunate than themselves. To this end, Campus Compact provides services to its member schools, such as training for students, faculty members, and administrators; research on programs that work; advocacy toward volunteer community partnerships; and leadership development.

The success of this organization can be measured in terms of organizational growth and student participation in volunteer opportunities. For example, Campus Compact estimates that student volunteers at member campuses contribute at least \$4.45 billion per year in services to their communities. Also, Campus Compact has enjoyed a large increase in both membership and activities in the five-year period between 1998 and 2003, the last year for which statistics are available.

Membership had increased from 548 to 924, and the percentage of students on member campuses who were volunteering their time had increased more than threefold, from 10 percent to 36 percent. Faculty involvement had increased from 10,800 to 22,000 faculty volunteers. Volunteers participated in a variety of programs, including those dealing with widespread hunger, housing and homelessness, environmental issues, and voting rights.

While Campus Compact is a national organization it also has state Compacts in each of the 31 states that have participating universities. The state Compacts are engaged in a variety of activities in support of the mission of the national Compact. For example, the California Compact has organized 40 conferences, workshops, and other events to provide training and opportunities to volunteers and others within their communities. In Indiana, the Compact became involved in 522 literacy programs, 85 percent of which resulted in an improvement in reading skills. The ability to read and write can have a major impact on helping people lift themselves

out of poverty by providing them with better opportunities to succeed.

LAWRENCE M. SALINGER ARKANSAS STATE UNIVERSITY, JONESBORO

Canada

THROUGHOUT THE DECADE of the 1990s the United Nations Human Development Index regularly ranked Canada first in its quality of life survey. While this ranking has slipped slightly in recent years, Canada continues to be presented as one of the most affluent nations in the developed world.

This image, combined with Canada's vast natural resources, strong manufacturing sector, growing technological industries, and history of strong social policies, suggests that Canada provides a secure "safety net" to protect its citizens from the consequences of poverty. Despite this assumption, Canada's poverty rate remains inordinately high. According to a 1996 United Nations Children's Fund report, the poverty rate for families with children in Canada was the second highest of 18 industrialized nations, double the poverty rate of the Netherlands and six times higher than that of Finland or Sweden.

While these figures provide a shocking counterpoint to Canada's affluent image, conditions are worse for Canada's indigenous peoples, who have been isolated in remote communities and excluded from resource and industrial development. Consequently, despite its legacy of social security and welfare reform following World War II, the Canadian state has failed to effectively address poverty as a social issue. Rather than strengthen the state's role, policy changes since the 1980s have abandoned a universal approach and have increasingly returned social services in Canada to a "residual" model relying on private charity, a transition that drew effectively on the antiwelfare backlash throughout the 1990s and which has resurrected older social attitudes separating the "deserving" from the "undeserving" poor.

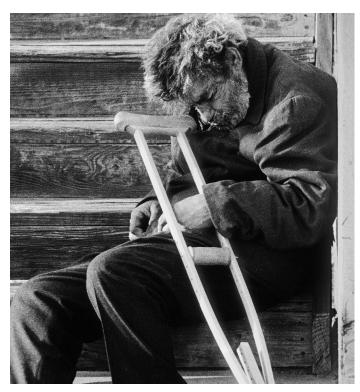

Well into the 20th century in Canada, the state had little direct role in providing for social welfare. The resistance to government involvement concerning social welfare reflected the socioeconomic structure of Canada during the mid-19th century. In a predominantly rural nation whose economy was driven by both the agricultural and resources sectors, it was assumed that anyone who was capable of working could find gainful employment and that charity would naturally account for the deserving poor.

Consequently poverty relief was based on a residual model where destitute individuals were expected to turn to their families, church, and philanthropic organizations, and only subsequently municipal or provincial governments, for relief. The residual system placed the emphasis on family and the local community to determine the level at which the indigent would be supported, and allowed for a simplistic separation at the community level between the deserving and undeserving poor. Essentially, outside of direct family-based charity, only those individuals whom the community deemed to deserve it would receive support. The elderly, widows with small children, the blind and deaf, and men crippled through work-related injuries could expect to receive community support.

Others, who were characterized as simply unwilling to work, could not find support. The underlying assumption behind this restrictive measure was the belief that charity inevitably produced dependency. Consequently, following practices that dated back to the Elizabethan Poor Laws, relief payments were customarily kept below the lowest level of wages that could be earned in the community and, to further discourage dependence, often required able-bodied recipients to perform some community service (cutting logs, breaking rocks, or sweeping the streets). These payments were usually made in kind (necessary goods and supplies), as it was generally assumed that individuals who were incapable of supporting themselves could not effectively manage cash relief payments.

In urban areas, this was particularly true in the case of relief provided to temporarily unemployed workers, seasonal workers, or recent immigrants, who were seen to have mismanaged their personal finances and who were often perceived to have succumbed to vices such as drinking or gambling.

In this manner, relief from poverty was dependent on both community attitudes (often toward the applicant personally) and local economic circumstances. This emphasis on community standards inevitably increased surveillance of relief recipients and encouraged

One of the most developed nations, Canada still wrestles with issues of poverty and state support of the "deserving poor."

the enforcement of strict codes of personal morality and behavior.

The initial crisis for the residual system began in the late 19th century as rapid urbanization and industrialization radically altered the socioeconomic nature of Canadian society. Canada's urban population increased dramatically in the late 19th and early 20th centuries from only 13 percent in 1851, to 35 percent in 1901, and 47 percent by 1921. While urbanization and industrialization provided new opportunities for some Canadians, for unskilled workers and recent immigrants the low wages, sporadic employment, and poor living conditions of urban tenements also heightened their vulnerability to poverty.

Although workers in skilled trades were able to establish contributory benevolent societies to provide limited security from illness, injury, or temporary unemployment, this option was beyond the reach of the majority of Canadian workers who lived at or slightly above the poverty line. These issues were highlighted by the Royal Commission on the Relations of Labour and Capital (1887), which revealed the exploitative working conditions and substandard housing experienced by Canadian workers. While rural workers had usually been able to turn to family for short-term assistance, the

demographic dislocation caused by urbanization severed many of these traditional family ties and forced an increasing reliance on private, church, and state systems of social welfare.

Consequently the late 19th century saw both an increase in working-class agitation for social reform, and the expansion of a middle-class reform movement. While labor leaders focused on unionization, improved working conditions, and higher wages as solutions to poverty, middle-class social reformers were more concerned with transforming the working-class itself to make workers both more industrious and more thrifty.

Although these middle-class reformers were deeply concerned with issues such as child poverty, they frequently blamed the structure of working class families, rather than low wages, for the poor living conditions experienced by working-class children. In response to this concern with child poverty, which the middle class intrinsically associated with juvenile delinquency, the state empowered private agencies, such as J.J. Kelso's Children's Aid Society (1887), to act to protect children by removing neglected children, and those in danger of becoming delinquents, from their homes.

In many instances these categorizations represented little more than a clash between the normative assumptions of middle-class social reformers and the realities of working-class family-oriented economic strategies, which frequently required the economic contributions of children and adolescents. Of particular concern to middle-class reformers was the practice of taking in paying boarders, either by having opposite-sex children share the same bedroom or by having male boarders share a room with adolescent boys. While working-class families viewed these practices as necessary economic arrangements, middle-class reformers viewed these arrangements as potentially dangerous sources of immorality.

Canada's social welfare system had a direct influence on the lives of all Canadians.

Beyond its support of quasi-state agencies such as the Children's Aid Society and its financial support of private institutions such as asylums for the insane or reformatories for delinquents, the state's involvement with social welfare in the early 20th century was largely restricted to efforts to address the growing issue of poverty among the elderly. At the federal level the first attempt to address this issue was the Government Annuities Act (1908), which allowed individuals to contribute to government-secured pension funds.

However, as with other private pension schemes, this did little to address the needs of the average worker who lacked the surplus income to contribute toward a pension. In 1927 the federal government passed the Old Age Pensions Act, in which the federal government funded 50 percent (increased to 75 percent in 1931) of provincial spending on old-age pensions. However, the "means-tested" qualifications continued to assume that family, not the state, had the primary responsibility for the care of the elderly.

While the need to support crippled soldiers and war widows following the First World War served to legitimize the state's role in maintaining social welfare, beyond the establishment of various mothers' allowance programs at the provincial level, little was done to restructure the residual model of social welfare in Canada. This failure was evident in Canada's response to the Depression, which emphasized local responsibility for relief programs with only minimal support from provincial or federal agencies.

While Canadian Prime Minister R.B. Bennett's Employment and Social Insurance Act (1935) attempted to establish a national system of unemployment insurance, these efforts were sidetracked by constitutional objections. This failure contributed to Bennett's electoral defeat by W.L. Mackenzie King, who turned the jurisdictional questions raised by Bennett's policies over to the protracted Royal Commission on Dominion-Provincial Relations (1937–40). Following constitutional alterations, which gave the federal government increased powers over taxation and employment policies, Mackenzie King's Unemployment Insurance Act (1940) initiated Canada's transformation into a modern welfare state.

Beginning in the early 1950s and continuing throughout the 1960s, numerous pieces of legislation were introduced to expand and support the creation of a universal social safety net within Canada. Key elements in this legislative initiative were the Old Age Security and Old Age Assistance Acts (1951), which were replaced by the Canada Pension Plan (1965) and the Guaranteed Income Supplement (1966), the Unemployment Assistance Act (1956), and the Canada Assistance Plan (1966).

Combined with a nationally funded healthcare system, by the early 1970s Canada's social welfare system had a direct influence on the lives of all Canadians. This switch to an institutional model of welfare reflected a reversal of the earlier social attitudes that had character-

ized the residual model. Under this institutional system, Canadians qualified for government assistance simply by virtue of their citizenship. Social assistance was transformed from charitable acts intended to assist the "deserving poor" to a government mandate, which reflected the state's obligation to protect all Canadians. This changing attitude was most evident in the Canada Assistance Plan, which, by providing direct financial assistance to the working-poor, sought to break the spiral of intergenerational poverty.

By the mid-1980s the decline of Canada's welfare system was already evident.

However, as the costs of these institutional programs increased through the 1970s and 1980s, the potential to achieve a fundamental restructuring of Canadian society was not realized. Rather than eliminating poverty, Canada's social safety net simply functioned as an ameliorative system, which sought to provide continued social stability for capital development.

By the mid-1980s the postinstitutional decline of Canada's welfare system was already evident and, throughout the 1990s, the rapid reduction of federal funding for welfare programs essentially returned Canada to a residual model as the burden of poverty relief was increasingly shifted back to charitable institutions. This process was contributed to by a virulent backlash against welfare programs throughout the 1990s, which recharacterized poverty as a problem for the lazy and irresponsible.

One example of this process can be seen in the transformation of Canada's unemployment insurance program during the 1990s from an almost universal system into an increasingly restrictive and punitive program where only 40 percent of all applicants qualify for benefits. Partially, this transition also reflects structural changes to Canada's economy, which have increasingly emphasized part-time and contract labor, changes that have increased the financial pressure on the working poor while undermining the minimal security that government programs had previously provided. For working families with young children, this transition has been particularly traumatic. Between 1984 and 1996 government assistance for working families with children was reduced by \$800 million (Canadian).

In 1996 the long-standing Canada Assistance Plan was replaced by the Canadian Health and Social Transfer, which further reduced federal funding for social services. A clear indication of the effect of these program changes on poor families can be seen in the expansion of charitable food bank programs across Canada, increasing from 75 food banks in 1984 to 625 in 1996. Consequently, despite the Canadian federal government's commitment in 1989 to eliminate child poverty by the year 2000, poverty has continued to be a daily issue for many Canadian families.

According to Statistics Canada's 2003 figures, 52.5 percent of children in female-headed, single-parent families live below its "low income cutoff" line. While Canada's rate of child poverty has improved since the mid-1990s, dropping from 23.6 percent in 1996 to 17.6 percent in 2003, this rate remains far higher than in western Europe. As a result, given the increased business reliance on part-time and contract work, the increased utilization of food banks by working families with children, and the reduction of real earning across the three lowest economic quintiles, it seems evident that poverty will continue to be a major social issue for Canada.

Capability Measure of Poverty

THE CAPABILITY MEASURE of poverty (CMP) is a response to the growing recognition that income poverty is only a part of what constitutes conditions of poverty. The impetus for developing capability measures of poverty comes from the 1996 Human Development Report (HDR), produced by the United Nations Development Program (UNDP).

In that report, human development is defined in relation to the expansion of capabilities while deprivation is defined as the lack of basic or necessary capabilities. The 1996 HDR attempted to better understand both the extent of poverty and experiences of poverty by considering factors beyond income. Addressing links between poverty and human development and attempting to assess the multiple needs of poor people, the report introduced the CMP criteria to provide a multidimensional measure of deprivation. The capability measure of poverty shifts focus from means or input, such as income, toward ends by focusing on outcomes that reflect people's quality of life. Emphasis is placed on understanding how, and under what circumstances, people are able to act toward meeting their needs.

The CMP focuses on the percentage of people who lack basic or essential capabilities that are necessary to allow people to escape income poverty in a manner that can be sustained. Of particular concern is the lack of three basic capabilities for which the CMP provides a composite index. The first is the lack of nourishment and health as reflected in the proportion of children under 5 years old who are underweight. The second concerns the capability for healthy reproduction, as represented by the proportion of births unattended by people with proper training. The third factor is the extent of female illiteracy, which expresses a lack of capability to access education.

These factors are taken to speak to broader issues, such as overall health and nutrition and access to health services as a whole and to education. Significantly the measures emphasize women's deprivation because this has such a crucial impact on the development of families and social relations.

Applying the capability measure of poverty suggests that almost twice as many people in developing countries are poor than would be identified as such if one focused only on those below the income poverty line. Looking at poverty beyond the lack of income and addressing capability poverty reveal that the number of poor people in developing countries may be underesti-

mated by almost 700 million people where only income poverty is accounted for. In addition to the problem of underestimating the extent of actual poverty, failure to improve people's capabilities will contribute to the further growth of income poverty.

The Human Development Report of 1996 concluded that poverty cannot be eradicated simply by increasing income. Properly addressing poverty also requires a broadening of human capabilities as well as the productive deployment of those capabilities.

More recently there have been efforts to develop more comprehensive or refined measures of people's capabilities. Among the difficulties facing more comprehensive approaches remains the lack of available data across contexts.

Perhaps the most influential contribution to a capability measure of poverty is offered in the work of the economist and Nobel laureate Amartya Sen. Sen notes that the relationship between income and capabilities can vary greatly between communities and between individuals in the same community. Thus a numerical poverty line based on means such as income does not address variations in personal or social characteristics. Sen's work benefits from comparative analysis, which shows, as in comparisons between the United States and Europe or China and India, that countries with a similar Gross Domestic Product (GDP) can show widely differing capabilities for survival and education.

Cape Verde

POVERTY IN THE ARCHIPELAGO of Cape Verde is a result of lack of natural resources, a crowded job market, and poor agricultural conditions. Although in the mid-1990s, nearly half of the population of Cape Verde lived below the national poverty line, conditions have steadily improved and the United Nations Development Program (UNDP) has recently declared the islands to be a medium developed country (MDC). Existing in this developmental margin means that while some of Cape Verde's poverty problem has been alleviated, the country is still a nation at risk of pervasive impoverishment. The persistent problems affecting poverty in Cape Verde include a high unemployment rate (16 percent) and the fact that at best, Cape Verde can supply food for only 15 percent of its population, relying heavily on international food aid.

Poverty in Cape Verde is dependent on variables outside the citizens' control.

Emigration and migration as a result of insufficient resources and opportunities have been a consistent theme in the history of Cape Verde. Today it is estimated that as many Cape Verdeans live outside the country as within, and the economy is greatly bolstered by support from its diasporan community. This trend of emigration is a major factor stifling the development of Cape Verde, because half of the employable population works in foreign markets. Domestic migration has overwhelmingly been from rural to urban areas, where well over half the population resides, and where the service and manufacturing industries provide 70 percent of the nation's jobs.

This migration has caused a great strain on available social services in city centers and the saturation of the job market, which accounts for some of the unemployment and poverty in Cape Verde. The government of Cape Verde has both implemented a welfare program and has widely instituted public works projects, which provide permanent and temporary employment as well as public services in order to alleviate these pressures. However, poverty in Cape Verde is frequently believed to be a result of the structural inferiority of a young nation, in regard to the equitable dispersion of employment, healthcare, education, and sanitation facilities and the improper management of the public works programs. The country had only been independent for 30 years in 2005.

A large portion of the poverty in Cape Verde lies in the rural regions, where a quarter of the employed population shares less than seven percent of the Gross Domestic Product. Poor agricultural conditions resulting from persistent drought and a nationwide scarcity of fresh water yield erratic harvests from year to year. Periodic famine as a result of crop decimation is the cause of widespread hunger and poverty on the islands.

Farmers or agriculturalists in Cape Verde maintain a tenuous existence wherein their economic security is frequently upset by a harsh climate, which is known for decimating entire harvests every few years. This level of economic risk and uncertainly extends beyond the agricultural sector to be a theme for Cape Verde's economic fragility. Relying heavily on international aid (both nutritional and monetary), support from the diasporan community and international trade, all of which are not secure resource streams, poverty in Cape Verde is dependent on variables that are outside the citizens' control, and thus subject to sporadic fluctuation. While Cape Verde is now enjoying a period of economic growth and prosperity, its future sustenance hangs in the balance.

Human Development Index Rank: 105 Human Poverty Index Rank: 45

MATTHEW EVANS TETI NORTHWESTERN UNIVERSITY

Capitalism

THE CHARACTER OF capitalism has been changing since its inception. Great changes have taken place since the emergence of the capitalist mode of production, particularly in the second half of the 18th century, when the great Industrial Revolution was born, first in England, and then in other European countries. *Laissez faire* capitalism, based on pure capitalism, or a perfectly competitive market model, was exercised in these countries until the end of World War I (1914–18). After World War II (1939–45), capitalism transformed into modern capitalism, which may also be called managed, welfare, guided, or regulated capitalism.

At present, the perfect market model or pure capitalism is not exercised in any country of the world. Even the United States and the United Kingdom do not

have pure capitalism and are indeed exercising mixed economies. But their economies are still based on a free-market economy or capitalist mode of production, since the major role in these economies is played by the private sector.

DEFINITION OF CAPITALISM

Capitalism is a mode of production, based on the principles of institutional privatization, the maximization of profits, and a free-market economy. Under capitalism, all means of production are owned and operated by individuals or firms with the sole consideration of the desire to earn a profit.

Sidney Webbs defines capitalism with the necessary implications of the system. He states that "by the term 'capitalism,' we mean the particular stage in the development of industry and legal institutions in which the bulk of the workers find themselves divorced from the ownership of the instruments of production in such a way as to pass into the position of wage-earners whose subsistence, security and personal freedom seem dependent on the will of a relatively small proportion of the nation, namely, those who own and, through their legal ownership, control the organization of land, the machinery and the labour forces of the community and do so with the object of making for themselves individual and private gains."

FEATURES OF CAPITALISM

A wide study of capitalism reveals the important features or characteristics of this system with an assumption of *laissez faire*. The following are some of the common features of capitalism as experienced in different capitalist countries in the world.

The most important feature of capitalism, as experienced in various capitalist countries, is the individual ownership of private property and the existence of the system of inheritance. It results in the vital inequalities in respect to the distribution of wealth and property in the society. Rich persons become richer and, on the other hand, the poor become poorer.

Moreover, capitalism also consists of the private ownership of the means of production, which are utilized exclusively by a few individuals in their own interest. The result is that the lion's share of national income goes to a few rich people and the masses share the rest.

Economic freedom means the freedom of a producer or an individual to select his or her own enterprise, to operate it on a contract or agreement basis, and

to utilize personal property and wealth in his or her own way. It is a very outstanding feature of capitalism. An individual has the full liberty to establish and operate any firm in a capitalist society wherever he or she likes, provided that he or she has the desired capital and ability.

Another very important characteristic of capitalism is its operation on the basis of self-interest and the profit motive. Under capitalism, the profit motive is the main inspiration of an individual to undertake any productive activity. Capitalism does not rely on the sentiments and love of society, and all economic decisions are made by an individual in order to get maximum profit.

It was with this view that the classical economists, including Adam Smith and others, imagined an "Economic Man" under the capitalist mode of production who was merely a selfish and cruel person, and always thought of his profit rather than that of the welfare of the society. Alfred Marshall has explained the Economic Man as a person "who was under no ethical influence and who pursues pecuniary gain warily and energetically, but mechanically and selfishly." Thus, it was a hypothetical man who is at least not found at present in the world, and who appeared after the emergence of the Industrial Revolution, especially in England.

The other important feature of capitalism is the presence of consumer's sovereignty in a capitalist economy. It is thought that under capitalism the "consumer is king," which refers to the consumer's sovereignty in the real sense of the term. Broadly speaking, every consumer has a freedom of choice to get any service or commodity from wherever he wishes to purchase it, provided he has the desire and the ability to purchase the commodity or service. But in practice, since the income and the availability of goods and services are limited, and there are state interventions, the consumer's sovereignty is restricted even in the economies of the United States and the United Kingdom.

The open competition in the market, whether it is the resource market or the goods and services market, is another important feature of capitalism. All economic decisions depend on the conditions of the market, which are made by the private owners of the firms or the factories. Producers compete with each other to affect the consumer's choice through the media of publicity or advertising. They can depreciate the price or improve the quality of the products and/or offer other rebates or concessions to their customers. On the other side, there is also competition among customers to get

the commodities who may offer a higher price for them. Similarly there is also a competition among the owners of the various means of production, including land, labor, and capital.

Another remarkable feature of this economic system is the presence of class conflict in society. Society is divided into two classes, the rich and the poor. Since the rich people, small in number, dominate over the millions who are poor and belong to the exploited class, it leads to the conflict between capital and labor in capitalistic countries. The class struggle in such economies seems to be an inherent character, which does not have any immediate solution.

The masses do not find themselves in a position to get even two square meals a day.

The capitalist society is always followed by the inequalities of income and wealth, a very important characteristic of such a society. A few rich people enjoy all sorts of conceivable luxuries, and, on the other hand, the masses do not find themselves in a position to get even two square meals a day. The most painful thing is that the gap between the rich and poor is continuously getting wider.

Every economic decision is governed by the price mechanism in a free-market economy. The whole economic functioning in capitalism depends on the price system, that is, the demand and supply of the commodities and means of production determine their price in the market. Price is a very important factor in capitalism in order to operate the economic system and control it.

The absence of central economic planning is also a very remarkable characteristic of a private-enterprise economy. In such an economy producers and consumers, on the basis of the price mechanism, make the important economic decisions independently. The economies of the United States and the United Kingdom, characterized by the capitalist mode of production, do not have central planning. However, such economies depend on microlevel planning.

ACHIEVEMENTS OF CAPITALISM

Capitalism, as experienced in various countries of the world, has certain remarkable achievements. One of the main achievements of capitalism is its automatic functioning. This type of economy works out automatically

For critics of capitalism, the entire society is assumed to be divided into two major classes—the rich and the poor, that is, the "haves" and the "have-nots." The exploitation of the latter by the former gives rise to the class struggles in the society.

through the price system, as we have learned earlier. It does not require any central and comprehensive planning, but mainly depends on competition and the openmarket economic system.

Under capitalism, the personal profit motive works as the most powerful incentive. The producers in such an economy always try to maximize their profits. To achieve this objective, they manage and operate all economic activities in such a way that the target of maximum production may be fulfilled at the lowest cost with the largest amount of profit. According to the law of returns, it will be possible when the optimal use of resources is ensured.

On the other hand, the functioning of capitalism also provides incentives to the workers through higher wages, bonuses, and overtime. It improves the efficiency of workers and all factors of production work in a coordinated manner and efficiently, which accelerates national output and the economic growth of the country.

The incentive of profit stimulates entrepreneurs to take risks, and new avenues of production are explored, with the result that the growth of the country increases significantly and the standard of living of the people rises. In this respect, in the United States and European capitalist economies, the economic system based on

personal profit motive has ensured a high level of productivity along with an increasing rate of per capita income and standard of living.

The economy of the United States generally supplies annually all sorts of goods and services abundantly, and even the common people of the country enjoy them with pleasure. In this respect, Professor J.A. Schumpeter states: "The capitalist achievement does not typically consist in providing more silk stockings for queens but in bringing them within the reach of factory girls in return for steadily decreasing amounts of efforts. The capitalist process, not by coincidence but by virtue of its mechanism, progressively raises the standard of life of the masses."

Another very important achievement of the capitalist economy, as observed in several capitalist countries like the United States, the United Kingdom, Japan, and other European countries, has been the good chances for individuals. All factors of production, including land, labor, capital, management, and entrepreneurs, get good opportunities for progress in these countries. Moreover, the special features of a capitalist economy, such as the right of private property and inheritance, private profit motive, and personal freedom, have encouraged productive forces to mobilize and direct all re-

sources into productive works. Besides the fast developments in different spheres of life, capitalist countries have attained remarkable progress in respect to technological developments. Individual freedom in the U.S. economy, followed by the personal profit instinct, has explored new avenues.

The production of high-quality goods follows the latest inventions, new processes, and technological developments. U.S. technological developments are advanced compared to the progress of technology in the countries of other economic systems. In this respect, the United States has attained remarkable progress in the development of space technology and cost-reducing technology.

In the capitalist economy, where people enjoy not only economic freedom (that is, the freedom of consumption, freedom of production, and freedom of savings and investments) but also political freedom, democracy is regarded as essential for the sound and regular progress of individuals in the country. It is with this view that during the 20th century, the monarchy of capitalist countries was replaced by democracy. Even in England, the monarchy is merely formal and ornamental; the real power is in the hands of the government elected by the people.

CRITICISM OR FAILURES OF CAPITALISM

Though there have been many remarkable achievements of capitalism, it has also been criticized from all directions. A capitalist economy, or a free-market economy, gives birth to useless and wasteful cutthroat competition. It sometimes leads to sheer waste of money, time, and property on a large scale. Some economists may say a huge amount of money is wasted on publicity or advertising. Moreover, the person who has employed a large degree of resources in production and has been defeated in the race may suffer from a big loss. Cutthroat competition does not ensure any corresponding social benefit to the public in general, though it may be in the interest of the firm concerned.

Capitalism has been criticized for the recurrence of economic instability, particularly in Western capitalist economies. In such an economy, economic decisions are made in the absence of planning on the basis of the demand of the customers.

The overestimation of effective demand by producers in the prosperity period leads to the position of overproduction, and that further leads to the economic instability in the economy. The Great Depression of the 1930s is the best example for explaining economic insta-

bility, when capitalist countries were seriously under the cloud of depression and were the victims of unemployment.

In the boom period, there may be a danger of inflation, which may cause large-scale suffering to the poor and create political instability in the country.

Under capitalism the entire society is assumed to be divided into two major classes—the rich and the poor, that is, the "haves" and the "have-nots." The exploitation of the latter by the former gives rise to the class struggles in the society. The class struggle sometimes causes the replacement of capitalism by a socialistic pattern of society.

The economies of industrial countries or capitalist countries assume that such an economy is supposed to be stabilized at the level of full employment. Unfortunately, the assumption of full employment in the openmarket economies failed. Many economists state that the capitalist economy may stabilize somewhere above the level of full employment because of various rigidities and distortions in the economy.

It is a very serious charge against an economy based on a price system that the capitalist economy promotes the economic disparities in society. The general observations of capitalist economies, particularly in the context of the U.S. economy, reveals that the distribution of income and wealth is quite uneven, and there is a wide gap between the rich and the poor. Despite state intervention, the gap between the two is improving. As G.D.H. Cole observed, "there is a world of difference in terms of happiness between the high priest and the slaves in the temple of industry."

The monopolists, once in control, try to exploit consumers on a large scale.

Free competition in a free-market economy leads to the emergence of monopolies and the concentration of economic power in the hands of a few people. It thus becomes difficult for an ordinary producer to compete with them in the market. These big businesses, through their command and control over the means of production, defeat small producers in the open-market competition and establish monopolies in the market. The monopolists, once holding control over the market, always try to exploit consumers on a large scale by charging high prices for their products.

Sometimes the capitalist is blamed for the misallocation and misuse of the means of production. Under capitalism, production is not undertaken merely to fulfill the basic requirements of the poor people. Resources are generally used to produce luxury goods for the rich, and the interests of the poor are crushed significantly.

The alignments of big industrial countries like the United States, Great Britain, France, Germany, Japan, and Russia, which are mostly capitalist, enforce the terms of trade against backward countries. Moreover, the policy of big industrial countries consists of applying several restrictions against the under-developed countries so as to bring down their growth and hence enhance their dependence on them. Ultimately, poor countries have to depend largely on rich and powerful countries for undertaking their development programs, as we know that poor countries get their requirements fulfilled through foreign aid exclusively extended by the rich.

Their alignments also lead to several socioeconomic distortions. Some historians have pointed out that the big powerful countries may indeed take interest in provoking wars between two or more countries so that their leadership and supremacy may exist on the one hand, and their armament factories may be able to achieve success in selling arms to these countries, on the other.

ECONOMIC CRISIS UNDER CAPITALISM

The first stage of the economic crisis of capitalism started with World War I and the Russian Revolution. In this stage, the Soviet Union was fully under the influence of the capitalist world. But the economic benefits of the socialist system as compared to the capitalist economy were clearly visible. In due course, the Soviet Union by the end of 1930 appeared to be a powerful state, as it had been transformed from a backward agrarian country into a highly developed industrial country. The proportion of industrial output of socialist countries in the world rose from 3 percent in 1937 to 10 percent in 1977.

The crisis of the capitalist economies began with the struggle of independence, which spread over the imperial colonies and semicolonies. The proletariat, the most consistent fighter against colonialism, strongly protested against imperialism and forced all the working classes, including the peasantry, to join the struggle against the capitalist mode of production.

The most important feature of the national liberation movement in that period was the spontaneous attack of the oppressed and exploited masses against colonialism. Such class struggles started not only in Soviet Russia but also in Indochina, the Philippines, and China.

The economic crisis of capitalism was thus characterized by the gradual intensification of all contradictions of capitalism. The bourgeoisie was unable to use productive forces, the unemployed army of youths provided instability in the capitalist pattern of the society, and the movement of establishing socialism carried on with success.

The second stage of the economic crisis of capitalism developed during World War II with socialist revolutions in various European and Asian countries. The revolutionary transformation of capitalism to socialism, which began with the great Russian October revolution, continued, registering the victories of socialist revolutions in various European and Asian countries.

The victory of the Soviet people in World War II stimulated national liberation movements in various countries and strengthened the liquidation of colonial regimes. It also encouraged the breakup of the colonial system of imperialism. China, North Vietnam, and North Korea undertook socialist movements and established communalism in their countries, replacing the old capitalist system. American imperialism, converting into a new form of colonialism, spread its capitalist influence.

The third stage of the economic crisis of capitalism started in the mid-1950s, a period of rather peaceful co-existence and competition between the two economic systems. This proved the claim of some people that so-cialism could come only with war. According to the Marxist approach, the development and deepening of the crisis of capitalism are basically the output of the internal contradictions of the capitalist mode of production.

The final stage of the economic crisis of capitalism is characterized by the development and formation of the state-monopoly nature of modern capitalism, consisting of all its economic and social contradictions.

The capitalist economy became unstable with the new crisis of overproduction, which the capitalist world faced from 1957 to 1961 and from 1969 to 1971. The new crisis of overproduction seemed to be the worst and deepest of all crises experienced since the beginning of the 1930s. It affected all major capitalist countries significantly.

The economic disparities among the developing countries have led to interimperialist contradictions and to competition among three imperialist regions—the United States, western Europe, and Japan, causing

further decay of imperialism and emergence of new military powers.

Schumpeter has widely discussed the growth, development, and fall of capitalism in his book *Capitalism*, *Socialism*, *and Democracy*. Schumpeter understands the entrepreneur as the most important agent to be held responsible for the growth and development of capitalism, and describes him or her as a lever that plays a key role in a human body, whereas Karl Marx calls him or her a parasite for the failure of the capitalist system.

According to Schumpeter's analysis, the internal inspiration of an entrepreneur encourages him or her to invent new methods of production and management so as to produce new products of good quality, and to put the economy on a strong economic foothold. As an organizer, the entrepreneur has to find new sources of raw materials, new methodology, new products, and wide markets for every increasing output. Thus, it is the entrepreneur who with his or her intellectual and other capacities brings capitalism to its highest level of success. It is with this view that the class of capitalists or entrepreneurs may be a catalyst to improve the general standard of living in a country.

CARE

CARE IS AN INTERNATIONAL humanitarian organization with headquarters in Brussels, Belgium. There are 11 separate CARE organizations serving millions of poor people in the poorest nations in the world. CARE, USA is headquartered in Atlanta, Georgia. CARE is

governed by a board of directors, elected by its members at an annual meeting. All of the board members are uncompensated volunteers. The acronym CARE today stands for Cooperative for Assistance and Relief Everywhere.

World War II witnessed enormous dislocations of millions of people who were suffering hunger, sickness, and starvation. Part of the suffering was due to the events of war, but much of it was the result of policies by the combatant nations that were designed to starve the enemy. By the end of World War II millions of people had fled their homes, factories were destroyed, and farms were often abandoned. The need for relief in postwar Europe was great. To provide relief, a consortium of 22 American charities united to create the Cooperative for American Remittances to Europe (CARE). The consortium, CARE, has been providing relief ever since.

CARE's relief operations in 1946 saw the first CARE packages arrive at Le Havre, France. During the Soviet blockade of occupied Berlin in 1948, CARE packages arrived on the airlift to supply the city. CARE's relief work during the Korean War (1950–53) encouraged Congress in 1954 to pass Public Law 480, which authorized the distribution of surplus American food to reduce hunger in foreign countries. Contributions were encouraged by celebrities like Ingrid Bergman who made CARE package household words. CARE has been involved in providing civilian relief in numerous conflicts. Eventually over 100 million CARE packages went to people in need.

In 1949 CARE began aiding the poor in the developing world with resources for development. Its first program was opened in the Philippines. When President John F. Kennedy signed the law establishing the Peace Corps, he sought help from CARE in training the first volunteers in Latin America. After 1966 CARE expanded its mission from relief work to self-help projects in developing countries, often with financing from indigenous governments. In 1974 CARE provided relief supplies for drought victims in Niger and Chad. Famine relief was greatly expanded in 1985 in Africa following drought in the Sahel. Expanded famine relief was undertaken in the politically unstable situation in Somalia in 1992.

In 1993, famine relief for people in Haiti was undertaken. In 1994 CARE was again on the front line providing relief as the civil war and ethnic massacres in Rwanda sent great numbers of refugees into Zaire (now Democratic Republic of Congo) and into Tanzania. A shift in developmental mission was initiated in 1986

with CARE's program for small-business development. A new family planning program to reduce poverty was begun in 1990. Family planning was expanded in 1997 into a holistic program embracing all aspects of family life in order to fight poverty systemically.

CARE's importance in humanitarian work in the last half of the 20th century was recognized in 1996 when the Smithsonian Institute included a CARE package in its permanent collection. In 2002 CARE reorganized and refocused its mission toward achieving lasting victories over poverty in the years ahead. Today CARE is one of the world's leading international humanitarian organizations dedicated to fighting global disease and poverty. Each year, its programs directly improve the lives of tens of millions of people in some 70 countries around the world as CARE helps poor communities create lasting solutions to their most threatening problems.

Caritas

CARITAS, AN INTERNATIONAL confederation of more than 150 Roman Catholic relief, development, and social service organizations, coordinates aid to the poor in over 200 countries. Taking its name from the Latin word for charity, the organization is headquartered in Vatican City, providing a structure for collaboration between Church-sponsored charitable agencies. As one of the most significant networks in the world supplying humanitarian aid, Caritas has provided assistance to tens of millions regardless of race, gender, ethnicity, or religion.

The first local organization of Caritas was founded in 1897 in Freiburg, Germany. Similar organizations were soon founded in Switzerland (1901) and the United States (National Conference of Catholic Charities, 1910). The confederation represented 60 organizations by 1924, when delegates from 22 countries met in Amsterdam. Four years later the organization took the name Caritas Catholica, though it remained an informal collaborative grouping. The confederation members agreed to meet biennially to discuss how they might collaborate to address the needs of the poor, migrants, and displaced persons. World War II interrupted their meetings, but they resumed in 1947 to organize war-related relief. That same year the Vatican secretary of state authorized Caritas to represent Catholic charitable organizations at the United Nations.

In 1950 a weeklong International Congress of Catholic Charities was summoned in Rome at the suggestion of Giovanni Battista Montini, then an official of the Vatican secretary of state and the future Pope Paul VI. At that meeting, it was decided to found an official international confederation of Catholic charities. After the Vatican approved the organization, the first official meeting of Caritas was held in December 1951. The official founding organizations represented 13 countries including Austria, Belgium, Canada, Denmark, France, Germany, Holland, Italy, Luxembourg, Portugal, Spain, Switzerland, and the United States. In the United States, the affiliated entities include Catholic Relief Services and Catholic Charities USA.

Under the leadership of Karl Bayer (1915–77), a German priest and first secretary-general of Caritas, the organization evolved into a major aid network. In 1957 the confederation changed its name to Caritas Internationalis to reflect its increasingly multinational membership. The Caritas-affiliated organizations focus their efforts on economic development, emergency relief, supporting human rights, and care for the environment. Significant emergency relief efforts have included airlifts of food and medical supplies to Nigeria during the Biafran civil war (1969–70), airlifts during the lengthy civil war in Angola, aid to refugees of the war in Rwanda (1994), and Asian earthquake and tsunami relief (2004–05).

Caritas roots its work in the teachings of Jesus Christ in the Gospels, literally following Christ's injunction to feed the hungry, clothe the naked, and give shelter to the homeless. Influenced by the social teachings of the Catholic Church that have developed since the late 19th century, Caritas' work stems from its belief in the dignity of every human person by emphasizing social justice, solidarity with the poor, and advocacy.

David J. Endres Catholic University of America

Carnegie, Andrew (1835–1919)

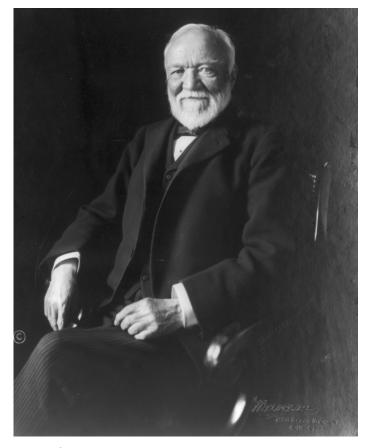

ANDREW CARNEGIE ROSE from poverty to become an industrial magnate as well as a prolific and influential writer. His writings celebrated individualism, democracy, competition, and economic growth, while challenging the wealthy to practice a philanthropy that would elevate humankind.

When Carnegie immigrated to the United States from Scotland at age 13, poverty compelled him to work as a bobbin boy in a cotton factory. Making opportunities for himself, working hard, and learning quickly, he rose to become superintendent of the Pennsylvania Railroad's western division by age 24. Desiring greater autonomy, Carnegie left the railroad in 1865 to run his own enterprises. By the end of his career, the vertically integrated Carnegie Steel Company was the world's largest steel producer

Carnegie owed his incredible business success to a strategy of relentlessly cutting costs, reinvesting profits, constantly rationalizing production via scientific research, and buying out financially strapped competitors during business downturns. He was a master at organization and at finding, rewarding, and keeping the best talent as his business partners. In 1901 he sold his interests to J.P. Morgan's syndicate for \$300 million, making himself one of the world's richest men. Thereafter he turned his attention to distributing his wealth and promoting international peace.

The voluble and eloquent Carnegie became the period's self-appointed spokesman for capitalism and democracy. Although he had only four years of formal education, between 1882 and 1916 he wrote 63 articles and eight books, and had 10 of his major public addresses published as pamphlets. Carnegie stood for a meritocracy in which, with integrity, thrift, self-reliance, and hard work, any man and his family could ascend the economic ladder—an optimistic creed that many Americans eagerly accepted.

His general thesis was that America's democratic institutions and the economic and social freedoms they

Andrew Carnegie dismissed complaints that the American economy had made the rich richer and the poor poorer.

encouraged were responsible for its ascendance over monarchical Europe and its progress in reducing poverty.

Citing statistical evidence (with which modern economic historians concur), Carnegie dismissed complaints by populists and socialists that the American economy had made the rich richer and the poor poorer. Although he admitted that income inequality had increased, he concluded, "much better this great irregularity than universal squalor," admonishing that the "poor enjoy what the rich could not before afford. What were the luxuries have become the necessaries of life."

To cure poverty, he championed the era's relatively laissez-faire economic policies and the ameliorative power of competition, to which "we owe our wonderful material development." He acknowledged that the growing economic and social distance between rich business owners and poor workers was breeding mutual distrust, but argued that the interests of capital and labor were not in conflict. In his most influential essay, "The Gospel of Wealth" (1889), he warned the wealthy

against spoiling their heirs with large inheritances—"I would as soon leave to my son a curse as the almighty dollar"—and supported an inheritance tax as a goad to force the wealthy to give away their riches during their lifetimes, because "the man who dies rich dies disgraced." He identified the "duty of the man of wealth: to set an example of modest, unostentatious living, shunning display or extravagance; to provide moderately for the legitimate wants of those dependent upon him; and after doing so, to consider all surplus revenues which come to him simply as trust funds, which he is called upon to administer, and strictly bound as a matter of duty to administer in the manner which, in his judgment, is best calculated to produce the most beneficial results for the community—the man of wealth thus becoming the trustee and agent for his poorer brethren, bringing to their service his superior wisdom, experience, and ability to administer, doing for them better than they would or could do for themselves."

The ideal philanthropist gave away wealth for large projects, which could be a "more potent force for the elevation of our race than if distributed in small sums to the people themselves." Traditional charity and almsgiving were destructive: "It were better for mankind that the millions of the rich were thrown into the sea than so spent as to encourage the slothful, the drunken, the unworthy. Of every thousand dollars spent in socalled charity to-day, it is probable that nine hundred and fifty dollars is unwisely spent—so spent, indeed, as to produce the very evils which it hopes to mitigate or cure." Instead, "in bestowing charity, the main consideration should be to help those who will help themselves. ... The best means of benefiting the community is to place within its reach the ladders upon which the aspiring can rise"—especially libraries, colleges, research laboratories, museums, concert halls, and parks.

Carnegie practiced what he preached, giving away over \$350 million before he died. Among the projects he funded were 3,000 libraries, the Carnegie Institute of Technology in Pittsburgh, and pensions for college professors. Atypical for his era, his donations went to many African-American organizations and he championed equal rights for blacks.

Critics attacked Carnegie on both the right and left. Many on the left found him hypocritical—celebrating the radical egalitarianism of his Chartist father and grandfather and making pronouncements about the sacred right of workingmen to combine—while living in a restored Scottish castle and trying to wash his hands of the use of force and strikebreakers in hardnosed labor relations practices that included the infa-

mous strike at his Homestead steel mill in 1892. Some on the right saw his call for giving away surplus wealth as dangerous and decried his turn toward trust-busting and government regulation—which, conveniently, occurred after he had sold his own company to help create a powerful trust.

ROBERT WHAPLES
WAKE FOREST UNIVERSITY

Carter Center

U.S. PRESIDENT JIMMY Carter and his spouse, Rosalynn Carter, founded the Carter Center as a nonprofit and nonpartisan organization in 1982 in partnership with Emory University in Atlanta, Georgia. The Carter Center and Emory University appoint the members of the Carter Center Board of Trustees.

The mission of the center is to "advance human rights and to alleviate human suffering." To this end, it has launched a variety of domestic and international programs on human rights; disease control, prevention, and eradication; agricultural development and hunger alleviation; peace and conflict resolution; and international sustainable development. In this regard it has been an effective domestic and international antipoverty agent.

The center's Human Rights Program works with other human rights organizations to promote legal and institutional changes in developing countries—especially in the newly emerging democracies in Africa—to establish and protect universal human rights. The center has been active in advising governments and policymakers on a wide range of human rights issues, such as their incorporation into the constitution and other civil and military laws, and their enforcement if human rights are violated.

The center's Health Programs focus on mental health and infectious diseases, especially the eradication of Guinea worm (Medina worm) disease and onchocerciasis (river blindness), and the control and prevention of trachoma and schistosomiasis (Bilharziasis or fluke). The center has been remarkably successful in controlling these diseases in Africa and Latin America. In addition, the center holds regular conferences on mental health, blindness, and other handicaps to increase global awareness and to fight the stigma and discrimination associated with them.

The center has several peacemaking initiatives, most notably observing elections globally to guarantee an honest and fraud-free election. In the early 2000s, for example, it has been an observer in the presidential elections in the Palestinian Authority, Mozambique, Indonesia, Guatemala, Nigeria, Kenya, Jamaica, Sierra Leone, Nicaragua, and other nations. Another peace initiative of the center is the Conflict Resolution Program, which mediates conflicts to avert crises.

In 2004, for example, President Hugo Chavez of Venezuela requested that Jimmy Carter mediate between him and the opposition group. The result of the deliberations and negotiations led by Carter was a democratic recall vote on Chavez, monitored together by the Carter Center and the Organization of American States (OAS), which Chavez won overwhelmingly. The mediation most likely averted an armed confrontation between the two factions in Venezuela.

International development initiatives by the center focus on the domestic ownership of development strategies in developing countries, and an international cooperation among donor countries. The center promotes and mediates increased participation at the policymaking stage by civil society organizations and other stakeholders, such as the business community, labor groups, and governments, to facilitate wider ownership of the long-term social, political, and economic development strategies. In addition to these national development strategies, the center has been successful in promoting agricultural training and new techniques to enhance crop yields and sustainable development in developing countries.

M. Odekon General Editor

Carter, James (Administration)

THE CARTER ADMINISTRATION will be remembered for its promise to discontinue "immoral realpolitik," Watergate-type secrecy, and destabilizing CIA interventions by reducing military budgets, bringing some of America's overseas forces home, cutting arms sales abroad, slowing nuclear proliferation, and discontinuing the U.S. support of dictatorial regimes.

James "Jimmy" Earl Carter, Jr. (1924—) was elected 39th president of the United States on January 21, 1977, on the slogan "A Leader, for a Change." During the campaign he depicted himself as an outsider who could "clean up the mess in Washington" and restore credibility to the presidency. He portrayed himself as an embodiment of a revived national consensus and claimed that U.S. politics should reflect basic American values. Carter argued that the common people were his constituency and that it was their common sense that guided him instead of relying on the recommendations of power brokers or the calculations of the Washington, D.C., establishment.

Carter, a devout Baptist who became a "born again" Christian, was a profoundly and unequivocally religious person who endeavored to construct administration policies on moral principles, and committed the country to supporting human rights more than any president in the past. He ran the country with unassuming austerity to distinguish his administration from those of Richard Nixon and Gerald Ford. Carter's inauguration festivities were low-key and he wore a business suit instead of formal wear. To fortify his image of simplicity he walked to the White House instead of being driven in the limousine, to the horror of the Secret Service.

DOMESTIC POLICY

Carter's first act as president was to extend full pardon in January 1977 to the resisters of the Vietnam War, draft dodgers, military deserters, and all others who violated the Selective Service Act from 1964 until 1973, expanding the partial pardon Ford granted in 1974. Carter's pardon generated renewed controversy among the general public, who had been deeply divided on the issue.

The opponents in all branches of government were acutely frustrated with this decision because there was no constitutional mechanism to challenge the president's apparent unilateral decision. The pardon significantly contributed to the further alienation of the

Jimmy Carter is much more highly regarded today than when he lost his reelection bid in 1980 against Ronald Reagan.

executive branch of the federal government. It also demonstrated that Carter had a dislike for the backroom dealing that tends to be pervasive in Washington, D.C. A pattern of mutual distrust and contempt between the new president and Congress was strengthened when the consumer-protection bill and the labor reform package were shot down, to which Carter responded by vetoing a public works package in 1978. Carter never managed to bridge the chasm that continued to grow throughout the presidency and prevented him from establishing good working relations with Congress. Carter's only successes with Congress were when he backed existing Democratic programs like raising the minimum wage; deregulating the airline, railroad, and trucking industries to lower transportation costs; and establishing a fund to clean up toxic waste sites.

The Gerald Ford administration passed on a deeply tormented economy that has been ravaged by high inflation, unemployment, and a federal fiscal deficit. One of Carter's election pledges was to stabilize the economy and to end the period of stagflation (galloping inflation and a recession), but despite frequently changing the policy course, he was unable to inspire public confidence and fulfill his promises. Notwithstanding several

anti-inflationary measures that were put in place, the annual rate of inflation rose from 5.8 percent in 1976 to 13.5 percent in 1980, the federal budget deficit for 1980 grew to a staggering \$59 billion, while the unemployment rate remained around seven percent, amounting to about eight million people out of work by the end of Carter's term in the White House.

The program to solve the energy crisis, sparked in the early 1970s by the OPEC (Organization of Petroleum Exporting Countries) embargo, was among the more successful domestic legislative propositions. The president made public appeals for conservation of energy, which he stimulated by tax reductions for installing energy-saving devices and using a range of alternative energy sources.

The Carter administration also proposed energy taxes, limits on imported oil, and greater reliance on domestic sources of energy. Additional legislative accomplishments include successful deregulation of the nation's airline industry, the passing of major environmental legislation to protect the environment and instigate cleanup of hazardous waste sites, the revamping of the civil service, and the creation of the Department of Education.

Carter was given little credit for the administration's accomplishments, but gained a reputation for political ineptitude. He did not like to bargain and was portrayed by the media as both sanctimonious and arrogant, or as utterly incompetent. Carter was impersonal with reporters who mocked his moralistic attitudes and portrayed him as a cynical and manipulative politician. Though Carter was not physically clumsy like Ford, his media appearances frequently eroded his public image and added to his inability to control the Democratic majority in Congress and to rally the support of the general public.

One of the most far-reaching blunders was Carter's "malaise speech," which he delivered on July 15, 1979. He castigated American citizens for their extravagance as consumers and evoked the image of a nation plunged into crisis by the excesses of affluence, even though most of the nation had grown anxious about their purchasing power in the wake of the second major energy crisis of the 1970s.

FOREIGN POLICY

Carter believed in the rule of law in international affairs and in the principle of self-determination for all people. He also believed that American power should be exercised sparingly and he hoped that relations with the Soviet Union would continue to improve and relax Cold War tensions. Human rights were the main tenet of the administration's foreign policy, demonstrating the full extent of Carter's idealism. He frequently criticized foreign nations for violating human rights and attempted to link economic and military cooperation with the country's commitment to the American ideals of freedom and equality.

The Middle East policy and the ratification of the Panama Canal Treaty were two success stories of Carter's diplomacy. Carter invited Egyptian president Anwar el-Sadat and Israeli Prime Minister Menachem Begin to Camp David in September 1978, where, after two weeks of intense negotiations, the deal was brokered for a peace treaty between Israel and Egypt that was eventually signed in March 26, 1979. Though the Camp David Accords were never fully executed, the agreements provided a framework for settling the problem of the occupied territories and helped to temporarily reverse the president's downward spiral in popularity.

The Iranian hostage crisis was the most difficult problem of the Carter presidency and sealed the president's reelection hopes. In the wake of the overthrow of U.S.-supported Mohammad Reza Shah Pahlavi by the Ayatollah Ruhollah Khomeini in November 1979, the militants seized the U.S. embassy in Teheran, taking 60 American hostages. The failed attempt of April 1980 to rescue the hostages, and an inability to resolve the hostage crisis through negotiations for over a year, paralyzed Jimmy Carter as a leader and tainted his presidency. Ironically, the Iranians released the hostages in January 20, 1981, once Ronald Reagan was sworn in, and after Reagan promised to unfreeze the Iranian assets in the United States.

AFTER THE PRESIDENCY

Though challenged from within his party by Senator Edward Kennedy of Massachusetts, Carter won the nomination of the Democratic Party for president in 1980. He subsequently lost the election to Republican Reagan by nearly 10 percent of the popular vote and by 440 electoral college votes.

Carter continued actively promoting human rights in the years after he left office, and in 2002 he was awarded the Nobel Peace Price for "his decades of untiring effort to find peaceful solutions to international conflicts, to advance democracy and human rights, and to promote economic and social development." Carter is much more highly regarded today than when he lost

the reelection. His exemplary postpresidency includes mediation in disputes between nations, untiring leadership in the protection of human rights and democracy around the world, and seeking to eradicate hunger, malnutrition, and homelessness through the work of the Carter Center and Habitat for Humanity.

Catholic Campaign for Human Development

THE CATHOLIC CAMPAIGN for Human Development (CCHD), a program administered by the United States Conference of Catholic Bishops, attempts to address the root causes of poverty among Americans. It is among the largest privately funded, self-help initiatives aiding the poor in the United States. Founded in 1970, the Campaign for Human Development has attempted to move beyond traditional forms of charity by promoting and supporting community organizations that

offer opportunities for men, women, and families to break free from poverty. In the wake of a heightened interest in humanitarianism brought on by President Lyndon B. Johnson's Great Society initiatives, the U.S. Catholic bishops began their own social justice program to aid minority groups and the poor in gaining economic strength and political power while educating Catholics about the need to be in solidarity with the poor.

The campaign is funded primarily from the contributions of Catholics in the United States, obtained through a special collection at churches throughout the United States each November before Thanksgiving. In the 30-plus years of the campaign, American Catholics have donated hundreds of millions of dollars. Of the money collected, 25 percent is retained by individual dioceses to be used at the local level. The remaining funds are allocated for individual projects in communities throughout the country. A committee of 15 that includes eight Catholic bishops and seven other members determines the policies and funding decisions of the campaign.

Though the funds allocated by the initiative are derived from private sources, the campaign's work has been scrutinized. Some detractors have argued that the charity practiced by the campaign is politically motivated. The CCHD has been criticized for siding with the aims of the Democratic Party in the U.S., while others charge that organizations supported by the campaign are frequently apathetic, if not hostile, to the Catholic Church, advancing contrary positions on abortion and euthanasia. In 1998, at the request of the United States bishops, the word *Catholic* was added to the organization's name and guidelines for funding were enacted to more closely adhere to the Catholic Church's teaching on social issues.

Some 4,000 local projects have received financial support from the Catholic Campaign for Human Development during its history. While direct aid to the poor is not provided from CCHD funds, local initiatives include job creation and vocational training, neighborhood improvement, and programs for students and young children.

To be eligible for funding from the campaign, initiatives must aim to attack the root causes of poverty; the beneficiaries of the initiative must be from low-income communities; and those who plan and implement the initiative must be poor themselves. A secondary aim of the campaign is to offer initiatives that educate Americans about poverty and its causes. A recent educational initiative, Poverty USA, raises awareness of the extent

of poverty in the United States and what citizens can do to curb its impact.

DAVID J. ENDRES CATHOLIC UNIVERSITY OF AMERICA

Catholic Church

THE CATHOLIC CHURCH'S teachings and activities about poverty reflect the church's own view of itself as an institution with a dual nature: an institution that is "in the world, but not of the world." This dual view of itself and its mission leads the Catholic Church to hold two views of poverty that, if not actually in conflict, are in tension with each other.

On one hand, the church teaches that this world is our preparation for the next, and that material poverty is a less serious problem than spiritual poverty: "Before all else, man must be concerned about his soul; gaining the whole world is not the purpose of this life," as stated by the Pontifical Council in 2005. In this, the church affirms Jesus' Gospel admonition through Matthew: "Lay not up treasures for yourself on earth, where moth and rust doth corrupt and where thieves break through and steal; But lay up for yourselves treasures in Heaven, where neither moth nor rust doth corrupt, and where thieves do not break through nor steal; For where your treasure is, there will your heart be, also."

On the other hand, the church teaches that all human beings have a duty to help those who are in material poverty. According to St. Gregory the Great, who served as pope from 590 to 604, "When we attend to the needs of those in want, we give them what is theirs, not ours. More than performing works of mercy, we are

paying a debt of justice." The Catechism of the Catholic Church (a document used to teach the church's doctrines to its lay members) affirms that "giving alms to the poor is one of the chief witnesses to fraternal charity; it is also a work of justice pleasing to God." The Catechism goes on to admit that the church and its members have not always carried out these duties perfectly: "The church, since her origin and in spite of the failings of many of her members, has not ceased to labor for [the poor's] relief, defence, and liberation through numerous works of charity which remain indispensable always and everywhere."

CHURCH ACTIVITIES AGAINST POVERTY

Because of the church's dual mission, its antipoverty activities have been both material and hortatory. On the material side, the church has founded and managed many charitable programs around the world, often serving as an intermediary for donations from its parishioners to the poor. Many orders (organizations) of priests and nuns throughout history have devoted themselves to aiding the poor by providing them with food, shelter, money, and spiritual guidance.

Usually members of these orders take vows of personal poverty, renouncing worldly goods for themselves so that they can focus their resources on helping the needy. If such vows have at times been followed imperfectly, the church would say it was a foreseeable result of imperfections in human nature: imperfections shared no less by the clergy than by the lay population. That we cannot perform these tasks flawlessly does not release us from the obligation of doing what we can.

On the hortatory side, the church has preached about the importance of helping the poor. It has preached not only to its own members, but also to people of all faiths around the world, as well as to governments, international organizations, local businesses, and global corporations. The impact of these efforts cannot be measured, but in the long run it is probably significant. As the economist John Maynard Keynes remarked in a different context, ideas "are more powerful than is commonly understood. Indeed, the world is ruled by little else.... The power of vested interests is greatly exaggerated compared with the gradual encroachment of ideas."

SOCIAL AND PERSONAL DUTIES TO THE POOR

One of the earliest sources of the church's view of social and personal duties to the poor is in the Hebrew Bible, which Christianity shares with Judaism and Islam, but sometimes interprets in different ways. In the Book of Deuteronomy (derived from the book's Greek title and meaning "second law," though the book's Hebrew title is *Devarim*, meaning "words," and is derived from the first sentence in the book), Moses told the Israelites, "If there is among you a poor man, one of your brethren ... you shall not harden your heart or shut your hand against your poor brother, but you shall open your hand to him, and lend him sufficient for his need."

The church harbors no illusions that poverty can be eliminated once and for all.

The Catholic Catechism expresses the same view even more strongly: "It is by what they have done for the poor that Jesus Christ will recognize his chosen ones." In the European Middle Ages—from the fall of Rome in 410 to the Renaissance in the 15th century—this view spurred wealthy people to give alms to the poor in hope that the prayers of the poor would secure forgiveness of their sins and admittance into heaven.

At the same time, the church harbors no illusions that poverty can be eliminated once and for all. First, beyond the most abject inability to secure food and shelter, poverty is relative: in any society, those people who have the least are poor. Most poor people in developed Western countries of the 21st century are better off than most wealthy people in medieval Europe.

Second, poverty—real, not relative poverty—still seems to be an intractable feature of a world in which wealth naturally flows most easily to those who already have it, as described in the *Catechism*: "Christian realism, while appreciating on one hand the praiseworthy efforts being made to defeat poverty, is cautious [about] the illusion that it is possible to eliminate the problem of poverty completely from this world. This will happen only on Christ's return.... In the meantime, the poor remain entrusted to us and it is this responsibility upon which we shall be judged at the end of time."

The church applies its thinking not merely to relations within society but to international relations as well. It opposes protectionist policies that further impoverish poorer countries by restricting trade in their goods. Paul VI espouses this idea in *Populorum Progressio*, published in 1967; as does John Paul II, in his *Encyclical Letter Sollicitudo Rei Socialis*, published in 1988. The Catholic Church holds that trade should promote

the common good, combined with "attention to the rights and needs of the poor in policies concerning trade and international cooperation."

HISTORY OF CHURCH WORK

From early in its history, and even earlier, Christianity and the teachings of Jesus appealed to the poor and powerless in society. In the Roman Empire, Christians were persecuted until the emperor Constantine made Christianity the state religion. In 360, Constantine's successor Julian ("the Apostate") tried to restore the empire's pagan religion and stamp out Christianity. His attempt failed, at least in part because of the church's untiring efforts to help the poor, which are described by T. Bokenkotter: "One of the most potent reasons for the appeal of the church to the masses was its magnificent system of charity, which aroused the admiration even of Julian the Apostate. Eventually, it broadened out to include a whole organism of institutions, including orphanages, hospitals, inns for travelers, foundling homes, and old-age homes—so much so that as the state became increasingly unable to cope with the immense burden of social distress brought about by the barbarian invasions of the fourth and fifth centuries, it relied more and more on the church."

Julian's successors gave official authority over poor relief and social welfare to the bishop of Rome (the pope), who ate his meals with the poor every day. Church law also required bishops to spend a portion of their region's revenues on help for the poor. Usually, they did this by founding a *hospitium*, which means a home for the poor.

In the Middle Ages, the collapse of the Roman Empire left a void of public services (and of the educated bureaucracy that was needed to deliver them). The church stepped into the breach. It continued and expanded its historic programs of poor relief, all centered on its hospitals (descendants of the *hospitia* of Roman times), which both cared for the sick and sheltered the poor. In England in the 14th century, for example, there were 17 hospitals in London and 18 in York.

One of the important aspects of the church's work was the formation of clerical orders dedicated to helping the poor. One of these orders, the Franciscans, was founded by St. Francis of Assisi (1181–1226), an Italian priest. St. Francis also founded a similar order for women, the Order of St. Clare. St. Francis and his followers took personal vows of poverty and devoted all their possessions to helping the poor with food, housing, and, of course, religious instruction.

The seriousness with which members of Catholic orders took their commitment to the poor is shown by a vignette from the life of St. Francis as told by Bonaventure, a 13th-century theologian. Even if the story is apocryphal, it shows how the priestly orders aspired to behave: "Once it happened that one of the friars responded gruffly to a beggar who had asked for an alms at an inconvenient time. When [St. Francis] heard this, he ordered the friar to strip himself, cast himself at the beggar's feet, confess his guilt, and beg for his prayers and forgiveness. When he had done this humbly, [St. Francis] added sweetly: 'When you see a poor man, my brother, an image of the Lord and his poor mother is being placed before you.'"

The church continues its help for the poor via material and spiritual ministry.

At the time of the Industrial Revolution in the late 18th and early 19th centuries, the church was uncertain what position it should take about factory working conditions, slum overcrowding, and the subsistence wages received by workers. Several leaders of the church urged that it take an active role in trying to make the system more humane, such as through legislation to limit work hours, permit rest days, inspect factories for safety, and discourage labor by women and children. However, as related by Bokenkotter, "Catholics had to take cognizance of the exceptional gravity of the social problems and the need to talk no longer of the poor but of poverty and to undertake collective action for reform rather than trusting to individual charity. Secondly, there had to be a sufficiently optimistic attitude toward the future."

The church vacillated on the issue until finally taking a strong stand in the 1870s, led by the English Bishop Henry Manning. Manning was an advocate of workers' rights who in 1874 gave a lecture on "the rights and dignity of labor" wherein he denounced child labor, defended the right of workers to form unions, and suggested legal limits on working hours. He worked with the British government on those issues as well as on a commission to make better housing available to the poor.

From the 19th through the 21st centuries, the Catholic Church continued its help for the poor via material and spiritual ministry. In the 20th century, the church became more involved in campaigns for economic justice in both Western societies and poor coun-

tries of the world. The church worked through the religious orders, such as the Franciscans; through national Catholic charities in each country of the world; and administered some aid directly from the Vatican.

In the United States, the national organization for poor relief is called Catholic Charities USA, and is fairly similar to its corresponding organizations in other countries. It manages a network of local Catholic charitable groups across the United States. These local groups administer relief for the long-term poor and homeless by the distribution of food, money, housing, and spiritual advice. They also help victims of personal misfortune and natural disasters, such as hurricanes. About two-thirds of Catholic Charities USA's 2005 budget of \$2.69 billion came from grants and contracts with local, state, and federal government agencies to provide poor relief, daycare, welfare-to-work programs, and other services. Another 14 percent came from the church and from individual donors. In 2005, the organization employed 51,000 paid staff members and had 175,000 volunteers for its relief programs.

CDF Black Community Crusade for Children

THE BLACK COMMUNITY Crusade for Children (BCCC) is an initiative of the Children's Defense Fund (CDF), which is a nonpartisan, not-for-profit organization aimed at providing a head start for all American

children and the creation of generations of young people able to achieve political and personal freedom.

As part of the CDF, the BCCC was created to "weave and reweave the rich fabric of community that historically has been the cornerstone of the healthy development of black children. Tap into and strengthen the strong black community tradition of self-help. Rebuild the bridges between generations and between the black middle class and poor. Assist and galvanize current black leadership around specific goals for children. Identify, train, nurture, link, and empower a new generation of effective black servant-leaders younger than 30." There has been concern that breakdown of relations between generations and classes in the African-American community has contributed to increased inequality and social problems.

BCCC programs include the Student Leadership Network for Children, the Ella Barker Child Policy Training Institute, and the CDF Freedom Schools. One of these schools is the CDF Haley Farm program, which features community building; spiritual, character, and leadership development; intergenerational mentoring; interracial and interethnic communication; interdisciplinary networking, and training.

The activities held to further BCCC objectives include community building; spiritual, character, and leadership development; intergenerational mentoring; interracial and interethnic communication; interdisciplinary networking; and training. The Social Leadership Network for Children is a partnership of college interns and faculties that helps operate the CDF's Ella Baker Child Policy Training Institute and the CDF's Freedom Schools.

These are aimed at producing generations of young people willing and able to celebrate academic and societal achievements and to work toward the continued need for the emancipation of black people from poverty and discrimination. It is connected on several levels with faith-based organizations, more especially as many preachers articulate the link between faith and the need for social justice and equality.

One of the focal points of this collaboration is the Annual Samuel DeWitt Proctor Training Institute for Child Advocacy Ministry, which is due to meet for the 12th year in July 2006. Morning devotions and periods of meditation and prayer will be mixed with more practical workshops, training sessions, and information exchange aimed at revivifying advocates and activists who may have found their enthusiasm waning as a result of constant opposition and the relentless stream of evidence of increasing inequality in American society. The

BCCC offices are located in Washington, D.C., and also in Jackson, Mississippi.

Center for Community Change

THE CENTER FOR COMMUNITY Change (CCC) is an organization that was established in 1968 as a result of ideas prevalent in the 1960s, which featured social change led by community involvement in the United States. The CCC works, therefore, to establish and develop community organizations nationwide that can raise awareness of all issues related to poverty and affecting community affairs to national attention and government action. Original partners influential in its formation include the Robert F. Kennedy Memorial Fund, the Ford Foundation, and the leaders of the United Auto Workers.

The CCC has provided expert advice and organizational capability on a wide range of issues, such as income support and job creation, affordable public housing, economic development, transportation, hunger and malnutrition, and immigrant rights. It has endeavored to be active in both rural and urban areas, as well as in all areas, and takes special care to represent as many different ethnic groups as possible. Its actions have been instrumental in creating initiatives such as the food stamps program, the Community Reinvestment Act, and the incubation of organizations such as the Coalition on Human Needs, the Workforce Alliance, the Environmental Support Center, and the National Campaign for Jobs and Income Support.

The National Campaign for Jobs and Income Support was an initiative of the CCC that, from 1999 to 2002, united organizations from more than 40 American states in the hope of achieving a refundable child tax credit and the restoration of food stamp eligibility

for many immigrant households. More than 1,000 grassroots organizations were involved, including low-income, women's, immigrant, and faith-based groups. They were united in the wish to bring poverty and economic inequality back onto the national agenda and forging a powerful alliance that, working together, could achieve far more than individual voices could manage. The work has been succeeded by the California Partnership, which unites more than 70 community-based organizations in that state and aims at stimulating decent job creation.

Other areas in which the CCC is active currently include community voting, education, the federal budget, welfare reform, immigration, and transportation. The Native American Project recognizes a group of people often left out of social development and aims at developing at the grassroots level leadership, organizational capability, and ability to effect social change among communities. It works with established groups such as the Affiliated Tribes of the Northwest, the American Indian Housing and Community Development Corporation, the Southern Californian Indian Center, and the Teton Coalition. The Voices for Change Project is a listenhancement program that uses modern information technology to help link together like-minded community organizations so that their voices increase in strength.

A wide range of institutional donors supports the CCC. Executive Director Deepak Bhargava calls upon several dozen specialists and community organizers. The CCC is an example of the communitarian aspect of American society, which encourages individuals to join societies and associations at the local level, and enhances the power of these to cause desirable social change regionally and nationally through enhancing their effectiveness by networking, partnership, and organizational development.

Center for Democratic Renewal

THE CENTER FOR DEMOCRATIC Renewal (CDR) is a multiracial organization that is intended to advance a vision of a democratic, diverse, and just society that is free from racism and bigotry. It was established in 1979 as the Anti-Klan Network, which united more than 60 smaller organizations in the struggle against resurgent racist violence in the United States. Its founders were the Reverend C.T. Vivian and southern rights activist Anne Braden. The CDR works closely with a wide range of civil and religious organizations in collecting data and publishing and promoting reports aimed at combating racism, bigotry, and white supremacy. Central to this effort has been When Hate Groups Come to Town: A Manual of Effective Community Responses, which documents practical steps that can be taken to resist racists. The CDR is based in Atlanta, Georgia.

Recent projects pursued by the CDR include an initiative to enable released felons to be eligible to vote and continued efforts to combat the burning of African-American churches. Inevitably, people with various types of political motivation have sought to besmirch the reputation of the CDR, claiming that its research has been falsified, is itself politically motivated, and is even a hoax. Nevertheless, the arson attacks on African-American churches continue and so too do attempts by white supremacists to instigate racial hatred. The debate as to where acceptable political beliefs shade into unacceptable bigotry is still being contested.

In the wake of the 2001 terrorist attacks, new controls have been introduced to regulate movement of people into and within the United States. This includes the National Security Entry-Exit Registration System. The CDR has opposed this scheme and argued, "This program is another in a series of moves to criminalize immigrants, particularly those from Muslim countries, and to promote a climate of fear, division, and repression during the United States' perpetual 'war on terror.' This system, used in conjunction with a soon to be broadened USA-Patriot Act, is leading to what many are calling a 'new totalitarianism.'"

In the political climate on the United States under the George W. Bush administration, this form of campaigning is maligned as unpatriotic and unacceptable. As the locus of acceptable political debate has been moved to the right, therefore, social campaigners such as the CDR have found itself recategorized in much of the mainstream media as extremists. Nevertheless the CDR continues to promote research and advocacy concerned with such issues as anti-immigrant vigilantism and the need to broaden and strengthen antihate crime legislation, and monitors far right white supremacist and neoconfederate activity.

John Walsh Shinawatra University

Center for Education Policy

THE CENTER FOR EDUCATION Policy (CEP) was founded in 1995 by John F. (Jack) Jennings; it is a national nonprofit independent organization, an advocate for public education and improving public schools. It is a division of the SRI (Stanford Research Institute) and has offices in California and Washington, D.C. CEP receives its funds predominantly from charitable foundations.

SRI's Center for Education Policy works on several projects: standards-based school reform that aims to increase student achievement through creating a set of stable expectations for what students need to know and be able to do, combined with professional development and curriculum initiatives to help the students to reach the standards; teacher development, which involves preparation, induction, and continuing support of teachers, with an emphasis on which policies lead to a guarantee of good teachers; math, science, and technology, which involves evaluations and studies on mathematics and science education since the 1980s; as well as studies on technology integration in the classrooms.

Other projects include school choice, which reflects the national debate on public versus charter schools, and literacy and lifelong learning, which stresses that the technology and the new information age create incentives for further education for all ages to acquire high-level language and literacy skills. Within that issue SRI's Center for Education Policy also explores issues of adult literacy and English for speakers of other languages.

To achieve its objective of improving public learning institutions, the center engages in research and evaluations on the design, implementation, and impact of a variety of educational programs. SRI's Center for Education Policy works closely with SRI's Center for Education and Human Services on programs that affect children and youth, as well as SRI's Center for Technology in Learning on issues related to the use of educational technology to improve educational practice.

Most of the work involves multiple methods, such as surveys, case studies, expert panel reviews, and focus groups. SRI's Center for Education Policy conducts work for federal agencies, state departments of education, local school districts, private foundations, and nonprofit groups. It serves as a link with educators and the public on the pertinent issues in education improvement, as a discussion forum for educators and policymakers, and as a think tank for policy initiatives. SRI's Center for Education Policy organizes meetings and presentations; conducts studies through surveys, panel reviews, and focus groups; and publishes reports and newsletters on a variety of topics, such as democracy and public schools, education and jobs, No Child Left Behind Act, testing, and improving public schools.

PAUL AND TANYA SLOAN INDEPENDENT SCHOLARS

Center for Law and Social Policy

THE CENTER FOR Law and Social Policy (CLASP) is a Washington, D.C.-based organization that advocates for the poor and less fortunate of American society. CLASP was founded in 1968 as a public-interest law firm by a group of attorneys with the support of the late U.S. Supreme Court Justice Arthur J. Goldberg. For its first 14 years, CLASP concentrated on a variety

of legal issues affecting such areas as the rights of women, mental health, human rights, healthcare for the disadvantaged, and the environment. CLASP also served as an incubator for organizations such as the National Women's Law Center, whose stated mission is "to protect and advance the progress of women and girls at work, in school, and in virtually every aspect of their lives," and the Bazelon Center on Mental Health Law, whose stated mission is "to protect and advance the rights of adults and children who have mental disabilities." In 1981, CLASP's board of trustees decided to focus the mission of the organization on those issues particularly pertinent to the poor and less advantaged.

CLASP is involved in public policy research on approximately 10 issues directly related to poverty and the disadvantaged. CLASP analyzes proposed legislation and regulations that may directly impact the poor, children, and others and provides testimony, legal services, and policy on these issues. For example, CLASP is one of very few organizations that deal with the issue of prisoner reentry into society. A disproportionate percentage of prison inmates are people of color, who often go to prison poor and leave prison poor, with few positive opportunities.

As a result, poverty, homelessness, and recidivism rates for ex-convicts are extremely high. CLASP, in partnership with Community Legal Services, Inc., of Philadelphia, Pennsylvania, provides information on this important issue, as well as making suggestions for policies and solutions to assist decision-makers in finding positive ways to reintegrate ex-convicts into communities and families, while providing positive opportunities to reduce poverty and recidivism.

CLASP has taken an advocacy role in proposing that state and federal laws be changed such that garnished payments are passed directly to the custodial parent for the care of the children, rather than to state coffers. Related to this is CLASP advocacy against federal budget cuts to foster-care programs, which would make it harder to place abused and neglected children in the care of relatives such as grandparents, aunts, and uncles. While the authors of such legislation may be well-meaning in their intent, removing children from the familial sphere may under some circumstances have long-term consequences.

LAWRENCE M. SALINGER, Ph.D. ARKANSAS STATE UNIVERSITY, JONESBORO

Center for the Study of Urban Poverty

PROFESSORS MELVIN OLIVER and Jim Johnson established the Center for the Study of Urban Poverty (CSUP) at the University of California in 1989. It exists to conduct research into issues relating to urban poverty and to strengthen capacity for future research and understanding by training undergraduate and graduate students, while supporting junior faculty members. Research has given rise to reports and publications and has fostered policy formulation and advocacy. The CSUP has established a reputation for creating and nurturing relationships with government agencies and other partners to create better researchers and social service providers.

The CSUP's research agenda focuses on three broad areas: poverty in Los Angeles, the working poor and transition to work, and disadvantaged low-skill workers. The location of the CSUP, in Los Angeles, means that it is placed in an environment in which large numbers of Latin American, Asian, and African immigrants first come to the United States, and the city offers numerous low-wage, low-skill jobs in both the formal and informal service sectors. As a result, Los Angeles offers an unusually interesting opportunity to study the dynamics of transitions into a large, complex, and flexible labor market. The lessons learned have wide application throughout the United States.

Research projects have included the Immigrants Organization Survey, which united the research efforts of four universities to study the creation and operation of formal and informal migrant organizations. These organizations can help new arrivals to integrate into society and, in particular, the labor market, as well as to maintain transnational links with their origin countries to provide information and resources to possible future arrivals.

The Geographic Skills Mismatch and Racial Differences in Search and Employment project considered the implications of racial housing segregation and job

decentralization in many large North American cities. These factors often lead to areas of high unemployment in low-skilled ethnically alike areas as, for example, those of African Americans whose search strategies for work may be improved.

Other projects have considered barriers, potential barriers, and perceived barriers to entry into employment. Employer Demand for Ex-Offenders in Los Angeles and Perceived Criminality, Criminal Background Checks and the Racial Hiring and Practices of Employers were both projects investigating the attitudes of employers toward various groups of people who have experienced difficulty in obtaining employment.

Publications include working papers, research reports, poverty report cards, and policy briefs. Abel Valenzuela, Jr., has headed the CSUP since July 2001. Its importance lies not just in its research and policy formulation but also in helping to educate the public about the importance and role of migrant and low-skilled workers to the economy as a whole, and the problems that these people face.

JOHN WALSH SHINAWATRA UNIVERSITY

Center on Budget and Policies Priorities

THE CENTER ON BUDGET and Policies Priorities (CBPP) is a nonpartisan research organization in the United States that was established in 1981 to identify federal budget priorities, particularly with respect to lower-income American families. The CBPP's brief has expanded considerably since that time, and its members now conduct research into a wide range of areas, at state and federal levels, as well as the interactions between the two levels of government. Research areas include pension reform, Social Security reform, Medicaid, food

stamps, low-income housing programs, and low-income tax credits. The CBPP has attracted many plaudits for the quality of its research and its preference for honest and open analysis rather than political posturing. The CBPP's board of directors and researchers are drawn from academic and nongovernmental organizations (NGOs) or research institution backgrounds and are united by their research interests. The CBPP is registered as a nonprofit-making, nonpartisan organization and is constituted as a charitable foundation.

Institutions are subject to criticism when their analysis challenges governmental policy.

Additional activities that the CBPP pursues include outreach programs and information dissemination. For example, more than 6,000 NGOs and governmental agencies participate in the center's Earned-Income Tax Credit (EITC) campaign, while the Start Healthy, Stay Healthy campaign links numerous health service providers, users, and advocacy groups in the hope of identifying more eligible recipients of free or low-cost health insurance programs. Working at both the state and the federal level, the CBPP focuses on accurate and timely analysis of specific budgeting policies and their likely outcomes. This is intended to strengthen states' abilities to create and transact prudent fiscal policies. Clearly, extensive tax cuts and excessive budget deficits are not viewed as being prudent.

Inevitably, given the polarized nature of American politics in the 21st century, all institutions are subject to criticism when their analysis challenges or contests governmental policy, especially in areas that are divisive and controversial, such as tax cuts, as well as correcting inaccuracies in analysis or reporting by other bodies. Since the center is concerned with the impact of policy changes on the poor and on issues of equity, it is widely portrayed as being a leftward-leaning organization, although the same can be (and is) also said of religious institutions that also have very conservative social agendas.

Recent CBPP policy briefs have featured, among many other issues, the failures of President George W. Bush's long-term Social Security plan, the economic problems inherent in substantial long-term budget deficits, consideration of medical insurance programs, and the need for supplementary social welfare for people in vulnerable groups. This has led its political opponents to criticize its research output and characterize the

group as a partisan lobbying organization. The center has described itself as fiscally conservative and with an interest in promoting policies to support low-income workers.

Center on Hunger and Poverty

THE CENTER ON HUNGER and Poverty (CHP) is part of the Institute on Assets and Social Policy (IASP) at the Heller School for Social Policy and Management at Brandeis University, located in Waltham, Massachusetts. The CHP developed from the Physician Task Force on Hunger in America, which, based at Harvard University under Dr. Larry J. Brown, was responsible for field trips and reporting across the country concerning the issue of hunger, which was of growing importance during the 1980s. The reports concerned not just hunger but its root causes, poverty, and economic inequality. It moved from Tufts University to its current home at Brandeis University in 2000.

The CHP has graduated from working through the Asset Development Institute and the Food Security Institute through a variety of special products. As an independent entity, it is able to employ greater focus and awareness of its aims, enabling it to compete better for research grants and attracting top-level research staff.

As part of the IASP, the CHP has focused on research in the following areas: "domestic hunger, including its dimensions, health, and nutritional consequences, and policy responses over time; hunger and food insecurity prevalence at the national, state, and local levels; promotion and expansion of the child nutrition and food stamp programs; development of nutrition education materials, specifically designed for low-income families with children; and program design and evaluation for innovative community initiatives in the hunger/nutrition field."

These objectives include a wide range of areas, from research and publication to policy formulation and advocacy, outreach, training, and development of educational materials. These activities require a wide range of skills and resources to complete satisfactorily.

Successes achieved by the CHP to date include initiating and drafting the Hunger Relief Act, preparing the National Food Security Scale and the Welfare Development Scale, being part of a network initiating and sponsoring the Mickey Leland Childhood Hunger Relief Act, conducting the "1993 Congressional Analysis: 30 Million Hungry Americans and Two Americas: Child Poverty in the U.S.," creating the Nutrition-Cognition Initiative, and being part of an initiative entitled the Medford Declaration to End Hunger in the U.S., which mobilized the leaders of more than 3,000 organizations that represent in excess of approximately 100 million members.

Special projects include Feeding Children Better, which provides resources and technical expertise to food banks across the country to improve the nutritional quality of supplies. An educational program entitled Know Hunger is designed to help students understand hunger and nutrition issues directly affecting their neighborhoods and is organized in association with the Gerda and Kurt Klein Foundation, which is a public, nonprofit organization aimed at helping young people to develop social awareness and then translate this into community service.

As one of the National Anti-Hunger Organizations, the CHP subscribes to the Blueprint to End Hunger, which recognizes that large-scale social change is necessary to end hunger in society, notwithstanding the charitable nature of many members of American society. This commitment includes the belief that "the root cause of hunger is a lack of adequate purchasing power in millions of households. When individuals and families do not have the resources to buy enough food, hunger results. As a nation we must encourage work and also assure all who work that the results of their labor will be sufficient to provide for the basic needs of their families."

In other words, the most effective method of ending hunger is to take a holistic understanding of society, which connects poverty with the responsibility of society and government to provide work for all, and work with a level of remuneration sufficient to sustain healthy and functional households.

Connell et al., "Children's Experiences of Food Insecurity Can Assist in Understanding Its Effect on Their Well-Being," *Journal of Nutrition* (v.137/7, 2005).

John Walsh Shinawatra University

Center on Urban Poverty and **Social Change**

THE CENTER ON URBAN Poverty and Social Change (CUPSC) is part of the Mandel School of Applied Social Change at Case Western Reserve University in Cleveland, Ohio. It "seeks to address the problems of persistent and concentrated urban poverty and is dedicated to understanding how social and economic changes affect low-income communities and their residents." Founded in 1988, its home city of Cleveland acts as a site for both conducting research and formulating policy, and is also a location in which community building can take place. The CUPSC focuses, that is, on action research that is designed to alter the environment it is studying.

As of 2005, two codirectors, Claudia Coulton and Sharon E. Milligan, lead a team of more than 20 staff members. Numerous partners and funding supporters have joined the CUPSC, including the Cleveland Housing Network, the Rockefeller Foundation, and the U.S. Department of Education. Activities include research and publications, education and outreach, and the CAN DO network. Funded research projects are clustered into four main areas: welfare, neighborhood change, community safety, and child and family.

Research activities focus on those in the most vulnerable categories and their experiences in the context of radical reform in the mid-1990s, as well as looking for opportunities for positive community development. Publications naturally concentrate on the CUPSC's areas of interest and are provided in a wide range of styles and formats to permit maximum appeal to a wide range of audiences. These include reports and working papers that are published to bring timely results of research findings. Methodologies and tools provide the actual survey instruments and research design plans that enable other researchers to conduct work of a sim-

ilarly high quality that may be comparative in nature. Reports specially designed to be broadly accessible to the general public include presentations and the *Briefly Stated* series.

Education and outreach activities include fellowships and assistantships, continuing education and training, and providing public speakers. Educational goals are to "prepare students for the roles as policy analysts and researchers; provide an opportunity to work directly with neighborhood residents/groups, community and political organizations in social welfare policy; have available to the center a corps of students who can undertake much of the actual data collection and data analysis (under faculty supervision); integrate the information resources and research experience of the center and its faculty into the Mandel School's curriculum whenever possible." Again, the educational function combines research with policy formulations and advocacy and action research.

CAN DO is the Cleveland Area Network on Data and Organizing. This involves the creation and maintenance of an online database of community and neighborhood statistics, including population and housing census data, economic data, crime and child maltreatment statistics, and other indicators. Neighborhood profiles are available for 36 neighborhoods in the city of Cleveland and 58 municipalities in Cuyahoga County. Researchers can use these data in their own work, and people generally can obtain up-to-date information about their home environment.

Cleveland has a high incidence of urban poverty, and this is felt particularly by women and female-headed families. More than one-quarter of all women in Cleveland live in poverty, and more than half are unmarried or have never been married, while the proportion of children born to unmarried mothers is twice the national average. Women's wages continue to lag behind men's. These factors are all interrelated in complex fashion, as researched by the CUPSC.

John Walsh Shinawatra University

Central African Republic

IN THE LOW-INCOME, SEVERELY indebted Central African Republic, subsistence agriculture and forestry dominate the economy. Poverty is widespread, with 67 percent of the population living below the poverty line and 45 percent living in absolute poverty. Some 84 percent of the population live on less than \$2 a day. Almost a quarter of children in the country suffer from a lack of adequate nourishment. Decades of civil unrest and four coups have drained resources and hampered efforts to deal with economic problems, and basic health and education services have often been interrupted by paralyzing strikes.

Over 70 percent of Central Africans live in rural areas where resources are inadequate and healthcare is limited. Inequality is a fact of life, and the lowest 10 percent of the population receive only 0.7 percent of total income, while the richest segment possesses almost half of national income. The fragile economic situation in the Central African Republic has led to a call for international attention and aid.

The Central African Republic suffers from low life expectancy (41.01 years) and a low growth rate (1.49 percent). The median age is 18.12 years, and 42.5 percent of the population are under the age of 14. Only 55.3 percent of Central Africans can expect to see their 40th birthday, and only 3.4 percent of the population have reached 65 years of age.

Central Africans lack adequate access to potable water, basic sanitation, physicians, and lifesaving drugs, and the HIV/AIDS prevalence rate of 13.5 has created a national health crisis. Some 260,000 Central Africans are living with the disease, and 23,000 have died from the disease or its complications. Very high risks of foodand waterborne diseases such as bacterial diarrhea, hepatitis A, and typhoid fever continue to further drain the country's resources, as do malaria, polio, meningococcal meningitis, and the so-called sleeping disease.

Central African children are at significant health risk, and the infant mortality rate of 115 is unacceptably high. Between 1995 and 2000, the mortality rate for children under the age of 5 rose from 158 to 194 per 1,000 live births. Child immunization rates are declining, with only 35 percent of children between birth and 23 months receiving measles vaccinations and only 40 percent receiving DPT3 immunizations. Between 1990 and 2000, immunization rates for measles, DPT, and tuberculosis declined. Only 35 percent of all children receive oral rehydration therapy when necessary. Current estimates place the number of Central African orphans

Females in many African countries are often victimized by endemic discrimination, a significant lack of resources, and a tacit acceptance of violence. Women are more than twice as likely as men to contract HIV/AIDS.

at 110,000, in great part because of the HIV/AIDS epidemic. Children have also frequently been taken hostage during the constant political upheaval that has plagued the country.

Females in the Central African Republic are often victimized by endemic discrimination, a significant lack of resources, and a tacit acceptance of violence. Women are more than twice as likely as men to contract HIV/AIDS. Central African women continue to produce children at a rate of 4.5 children per female, and only 28 percent of all women use any form of contraception. The fertility rate of 122 per 1,000 births and the maternal mortality ratio of 1,100 per 100,000 live births are indications that the country needs to pay increased attention to reproduction health and education. Less than half (44 percent) of all Central African births are attended by trained medical staff, and barely one-fourth of rural women receive obstetrical attention.

Central African education is at a critical point, and the government has begun to develop programs and allocate resources designed to improve access to and the quality of education. While literacy rates for males have risen to 63.3 percent, less than 40 percent of Central African females are literate. Between 1990 and 2002, school attendance declined from 58 percent to 49 percent. Less than one-third of children in rural areas attend school regularly. The educational crisis has affected girls disproportionately at the primary level, but girls are now more likely than boys to attend secondary schools.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Chad

IN THE CENTRAL AFRICAN nation of Chad, some 80 percent of the population live below the national poverty line. Almost one-third of the total population and some 28 percent of all children are malnourished. Annual per capita income in Chad is \$210. The United Nations Human Development Report ranks Chad among the lowest countries on quality-of-life issues, but assessment of Chadian poverty is somewhat hampered by insufficient reporting of data.

From the 1960s to the 1990s, Chad was plagued by civil unrest and was invaded by neighboring Libya. Even after democratic elections were held in 1996 and 1997, power remained concentrated in the hands of an ethnic minority. The Chadian economy is dominated by agriculture, and more than 80 percent of the population are dependent on subsistence farming and livestock. The economy is expected to improve in the near future because a consortium led by two American oil companies invested \$3.7 billion to develop Chad's oil reserves, which are estimated at one billion barrels.

Chadians have a median age of 16.02 years, with approximately half of the population under the age of 14, and 2.8 percent reaching the age of 65. Life expectancy is 47.94 years, and Chadians have a 42.9 percent chance of failing to survive until their 40th birthday.

The Chadian population lacks proper access to potable water. Additional health and environmental concerns derive from the soil and water pollution that has resulted from improper waste disposal in rural areas. Lack of access to physicians, hospitals, and lifesaving drugs further threatens the population. Chad faces a 4.8 percent prevalence rate of HIV/AIDS, with 200,000 people living with the disease and 18,000 deaths attributed to the disease and its complicating factors.

Chadians also face a very high risk of contracting food- and waterborne diseases such as bacterial and protozoal diarrhea, hepatitis A, and typhoid fever. Additional health concerns include schistosomiasis, a water contact disease, and outbreaks of malaria, cholera, and meningococcal meningitis. In conjunction with the Carter Center, Guinea worm, which is also spread through infected water, was eradicated in Chad in 1998. Chad's infant mortality rate is unacceptably high at 117 deaths per every 1,000 live births, as is the mortality rate of 200 for children under the age of 5. In 2003, 61 percent of children between the ages of 12 and 36 months were immunized against measles, and 47 percent of that group received DPT immunizations. Among Chadian infants, 61 percent were immunized against measles, and 67 percent were immunized against tuberculosis. Only 36 percent of Chadian children received oral re-hydration therapy when necessary.

The fertility rate of 6.2 children among all females of childbearing age and the fertility rate for women aged 15 to 19 pose unacceptable risks to Chadian women. Only eight percent of Chadian women use contraceptives of any sort. The maternal mortality rate of 1,100 deaths per 100,000 live births is indicative of Chad's widespread poverty and its poor healthcare system. In 2003, less than 20 percent of all Chadian births were attended by trained medical staff. Chadian girls continue to be subjected to genital mutilation despite the efforts of both government and nongovernmental organizations to stop this practice.

Many parents in Chad feel that it is unnecessary to educate their daughters, so girls lag behind boys in literacy, educational levels, and overall achievement. Just over half of the male population of Chad is literate (56 percent), and only 39.3 percent of females possess this skill. Most children in Chad receive no more than five years of basic education.

Overall, school enrollment has increased from 30.2 percent in 1993 to 55.0 percent in 2001, but girls lag behind boys in enrollment rates. From 1995 to 2000, primary enrollment rates for boys rose from 59 to 79 percent, while enrollment for girls rose from 33 to 47 percent. During that same period, completion rates rose from 21 to 29 percent for males and from eight to 12 percent for females.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Charity

CHARITY IS LOVE FOR fellow human beings, often expressed in a donation of goods and services to those in need. It is the spirit of active goodwill toward others, demonstrated in deeds to promote their welfare. The word *charity* is taken from the Latin word, *caritas*, or "love." Thomas Aquinas called charity the greatest of the virtues.

It has been said that the family is the oldest charitable and social welfare organization on earth. The family feeds, protects, and nurtures in a variety of ways all family members. One could say historically that two processes have been going on at once in the family, mutual aid and nurturance, and protection from outside forces. In early history, aid and protection gradually expanded to include other extended family members and other members of the tribe. This in turn accompanied the growth in cooperation in such areas as agriculture, hunting and fishing, and building. In time, charity became more structured and formalized.

All the major world religions developed teachings on proper conduct, including charity. These teachings became more structured over time. It is necessary to state this because most of the published works by authors in the West give considerably more attention to Judeo-Christian charity values and philosophies. There is more literature appearing of late on Islamic perspectives on charity, but little on Eastern religions (such as Buddhism, Confucianism, and Hinduism) and their perspective on charity.

One can find teachings on charity in the various sacred texts of Eastern religions, such as the various sayings about charity in the *Bhagawad Gita*. The act of giving a gift (*dana* in Sanskrit or *dan* in Hindi) is surely one of the more seminal characteristics of Hindu religiosity. It is a central component in the Law of Manu (dating from the 3rd century B.C.E.) and in the *Rig Veda* (dating back over 3,000 years).

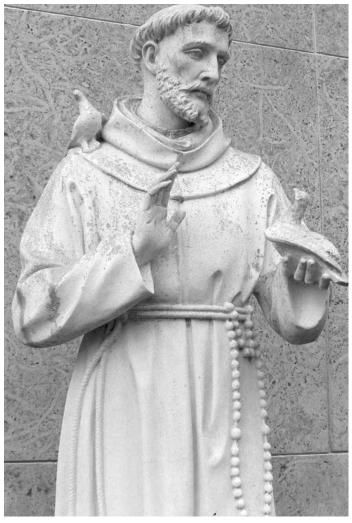

Buddhism emphasizes compassion for all living entities (humans, animals, and plants). In Buddhist thinking, charity that is done for no reward here or the hereafter is referred to as pure and unsullied, and is viewed as the best kind. The importance of compassion (metta) is a foundation stone of charity. Perhaps charity has not been structured as much in Buddhism because Buddhism has not traditionally had as strong an organizational base. Buddhists have been involved in charitable endeavors of various kinds, some of which have been modeled on Christian programs.

Confucianism treats the individual as a relational being. The person is not a detached and solitary entity, but is constantly involved in human relationships. In all relationships, both parties have obligations. For example, the father should show kindness, and provide security and education, in addition to other duties. In turn, a son should be respectful and obedient, and must show charity toward his father in old age, caring for his needs.

Jainism dates back to the 6th century B.C.E. A central teaching of Jainism is ahimsa, nonviolence to all living things. This surely influenced Mohandas Gandhi, who was not a Jain but grew up among Jains. Ahimsa can certainly be looked at in the context of a broader perspective on charity. In Jainism, charity or donation is Dana, and it should be done with compassion, with no desire for material gain, and in a spirit of self-sacrifice, and yet also should include joy in giving. Charity is of four kinds in Jainism, donation of food (Ahara-dana), donation of medicine (Ausadha-dana), donation of books or of education (Jnana-dana), and giving protection or freedom from fear (Abhaya-dana). In the Kundakunda Pancastikaya, it states that to be moved at the sight of a person in need and to offer relief to him is the "spring of virtue." In the Sutra-keit-anga, there is a similar statement that can be found in various other religious beliefs, namely, to treat all creatures in the world as one would like to be treated.

Similar statements to the above can also be found in the Bahai faith, Buddhism, Christianity, Confucianism, Hinduism, Islam, Judaism, Sikhism, Taoism, Zoroastrianism, other religious traditions, and even in Aristotle and in Greek philosophy.

One of the strongest declarations about the importance of charity can be found in Judaism. Jewish prophets like Amos, in the 8th century B.C.E., called on people to embrace charity, as did other Judaic prophets. Moses Maimonides (1135–1204) contributed notably here. The Jewish perspective on charity for ages past has emphasized justice or righteousness. In Judaism the

St. Francis of Assisi renounced wealth and founded the Franciscan order, which emphasized the love of the poor and the needy.

word *tzedakah* is employed to describe charity. *Tzedakah* does not mean love per se, but justice or righteousness. Christianity has taken the meaning of charity to be *caritas*, or love. There is an important distinction here. *Tzedakah* (which has its source in the Old Testament) turns the concept of charity into something of an entitlement. There is in Judaism a strong obligation to care for the poor. The Old Testament established rules for *tzedakah* by developing the rule of *peah*, leaving the corners of the fields unharvested, for the benefit of the poor.

Tzedakah was balanced by chesed, which is loving kindness. Charity and social welfare must ideally include both—justice on the one hand, and love on the other. St. Augustine (354–430) once stated that charity "is no substitute for justice withheld." Christianity inherited from Judaism a rich heritage of teachings in re-

spect to charity. Indeed, the very founder of Christianity was himself Jewish, Jesus of Nazareth.

Jesus called upon all to go beyond the structures of *tzedakah*, and called for a more individualized approach to caring for the poor. Catholic, Orthodox, and Protestant Christianity inherited this strong impulse to *caritas*. Thomas E. Woods, Jr., states that Catholic Christianity historically created and maintained strong social structures to ensure that charity occupied a central place. Examples abound, but a few stand out.

Medieval monasteries took their cue from St. Benedict of Nursia (480–547), the founder of the Benedictine order and the author of a monastic rule that included a strong component of charity and hospitality. St. Francis of Assisi (1181–1226) renounced wealth and founded the Franciscan order, which emphasized the love of the poor and the needy. The modern-day example of Mother Teresa (1910–97), an Albanian nun who worked among the poor and homeless in Calcutta, India, is yet another illustration of this *caritas* tradition.

She founded a religious order of nuns, the Missionaries of Charity, who are working with the poor in many parts of the world. The works of Thomas Aquinas (1225–74) and other noted figures and the papal social encyclicals provide a further backdrop. Charitable activities have been particularly in evidence with the "mainline" Protestant denominations (such as Lutheran and United Methodist). Certainly charity occupies a central place among all Christian denominations. Catholic, Orthodox, and Protestant Christianity is engaged in a vast, wide-ranging network of charitable activities worldwide.

Islam places a considerable amount of importance on the care of the poor and the needy. Zakat is a kind of alms tax, which goes to charitable activities. It is viewed more as charity by Shiite Muslims, and more as a social justice activity by the majority Sunni Muslims. In this respect, the Sunni view would come closer to the Jewish concept of tzedakah. In contrast to zakat, sadaqa is voluntary almsgiving to the needy and the poor. It is not mandatory but voluntary, and goes beyond the required zakat.

Another voluntary-sector charitable instrument in Islam is the *waqf*, a form of endowment. The Islamic concept of *umma* is important here. *Umma* means community, people, or nation, and has at times an almost ethereal quality in Islam. In this respect, *zakat* and *sadaqa* serve the needs and welfare of *umma*. Islam does not posit a "welfare state" to meet all the many needs of the poor, but assumes a strong voluntary-sector involvement, indeed an individual commitment and involve-

ment, to see this to fruition. Really, all the Abrahamic world religions (Judaism, Christianity, and Islam) would be similar in that respect.

The concept of charity has undergone considerable change over the last 150 years. The Social Gospel movement, which took root in the post-Civil War period in the United States, conjoined with Progressive-era movements to address living conditions, dislocation, and poverty. Charity was housed in a number of voluntary sector agencies like the Salvation Army throughout the early period of the 20th century. Gradually government involvement in social welfare grew, especially with the advent of the New Deal (1933–41). Increasing governmental involvement in social welfare during that period took place in a number of other countries.

The modern example of Mother Teresa is another illustration of this caritas tradition.

In some countries (such as Sweden) the involvement was so pronounced that it became known as a welfare state. Thus people who once were the recipients of charity gradually began to assume a right to social welfare benefits. The road through charity had ended up with entitlements. The view of social welfare programs as rights began to dominate over the view of social welfare as charity.

Charity is linked with the residual view of social welfare. It is not a basic, universalized, central part of the system, but is something that society does from the heart, not from the law. United Way agencies, for example, are not mandated by law to carry out charitable activities. The institutional perspective on social welfare bespeaks social welfare as more of a social right of citizens. The United States, in contrast to a number of welfare state countries, has maintained a dynamic, active, private, voluntary, nonprofit social welfare sector (many of these agencies are faith-based agencies). In that sense, it could be said that a more traditional view of charity is more in existence in the United States.

Charity Organization Society

THE CHARITY ORGANIZATION Society started in England in 1869. It was originally designed to coordinate the work of various organizations that delivered charity and aid to the poor. It came to the United States in 1877 when a British cleric working in Canada named Samuel Humphrey Gurteens crossed the border and went to Buffalo, New York, to do welfare work. Gurteens's work coincided with the increased call for public attention to the growing seriousness of social problems in the United States.

Gurteens went to Buffalo in 1875 to serve as an assistant minister in the small parish called St. Mary's. There, he witnessed the economic devastation caused by the 1876 depression. Gurteens formed an alliance with T. Guilford Smith, a moderately successful businessman who shared Gurteens's interest in the plight of the poor. They joined forces with several other young professionals and came to the decision that the British working in the charity organization held the key to solving poverty. Gurteens traveled to England where he studied these organizations and then refined their methods and changed their approach to fit the situation in Buffalo.

Gurteens traveled the city preaching his brand of poverty reform, detailing his answers in "the phases of poverty," his response to the call for a comprehensive welfare reform program. The Buffalo Charity Organization Society, which opened in 1877, copied the British model, and had almost instant success. It served as a role model for other cities such as Baltimore, Boston, Detroit, Indianapolis, Philadelphia, and New York, dealing with staggering poverty rates. Gurteens and Smith traveled the country preaching the benefits of the Charity Organization Society. Gurteens's *Phases of Charity and Handbook of Charity Organization* served as the guidebook for those who established similar societies in their cities.

The Charity Organization Society anchored its support in what it called scientific charity. They believed that they could get rid of public charity and replace it with private philanthropy by coordinating relief. The Charity Organization Society emphasized seven fundamental ideas. They included: individualization, community education, interagency cooperation, preventive philanthropy, personal service, repression of mendicancy, and adequacy of relief. Because of its reliance on cooperation, the Charity Organization Society was totally dependent on registration so that people would know who was getting aid and from where.

Of equal importance was the need to be nonsectarian so that the cooperative spirit could be maintained. The Charity Organization Society workers were under strict orders not to provide aid. Instead, the "friendly visitors" who staffed the Charity Organization Society offices would investigate, and then after consultation come up with a course of action. They relied on education to teach both the poor and wealthy as the best way to provide aid to the poor.

Poor people were to be taught abstinence and diligence, while the wealthy were to learn to give modestly of their means, but liberally of their time. Charity Organization Society staff conducted stringent investigations into each request for aid. The staff was made up of friendly visitors, and later, agents that were responsible for investigations and getting aid for the families. The friendly visitor was supposed to be a semipermanent part of the family, providing instruction in nutrition, employment, healthcare, and education. The Charity Organization Society evolved into the most popular welfare organization in the country until its decline in the 1930s.

Child Malnutrition

CHILD MALNUTRITION IS a global problem that exists in developing as well as industrialized countries. In developing countries, poor nutrition contributes to more than half of all childhood deaths. One in three children in Africa is underweight, while half of all children in south Asia are malnourished. Approximately five million children in these developing countries die each year from malnutrition.

Child malnutrition impacts countries well beyond the individual effect it has on the children. Inadequate consumption of food and necessary vitamins and minerals during the developing years can have irreversible effects on a child's physical and mental capacities that consequently contribute to decreased productivity of future generations and of the society as a whole.

Infectious disease is highly associated with malnutrition and can be the cause of this condition, or the result. Families in poverty very often do not have adequate healthcare and live in impoverished areas that lack proper sanitation and clean drinking water. These conditions contribute to malnutrition by creating environments that are conducive to infectious diseases. A lack of essential nutrients breaks down the body's ability to fight off disease. Children, with their immature immune systems, are highly susceptible to these diseases, especially if their bodies are already fragile from lack of nutrition.

While malnutrition often invokes images of underweight children, those who suffer from malnutrition may suffer from obesity. Obesity as a result of malnutrition is often seen in more developed countries such as the United States. The United States is one of the richest countries in the world; however, areas such as the Rio Grande Valley, Central Appalachia, and the Mississippi experience poverty rivaling countries in the developing world. Reliance on cheap food that is high in calories and low in nutrients precipitates malnutrition

in poor families in the United States, which can lead to obesity and diabetes in children.

Micronutrient deficiency and protein-energy malnutrition are the two basic types of malnutrition. Micronutrients are trace vitamins and minerals that are essential for health. Deficiencies in the micronutrients vitamin A, iron, and iodine are of great concern for poor people in developing countries. A deficiency of the micronutrient vitamin A can cause night blindness, a reduction in the body's resistance to disease, and growth retardation.

Iron deficiency is a principal cause of anemia and results in a decrease in the amount of red cells in the blood. For children, health consequences of iron deficiency anemia include infections, physical and cognitive development impairment, and elevated risk of premature death.

Iodine deficiency can have devastating effects on a child's health, even before he/she is born. Iodine deficiencies in the mother can result in permanent damage to her child by increasing the risk of congenital abnormalities such as cretinism, a grave, irreversible form of mental retardation.

Child malnutrition is a devastating problem that is also a concern in prosperous countries.

The second type of malnutrition, protein-energy malnutrition, is the most lethal form of malnutrition and results from inadequate consumption of calories and protein necessary to meet the physical requirements for an active and healthy life. This type of malnutrition affects every fourth child worldwide and is the type normally thought of when one discusses malnutrition. Infants and young children are the most susceptible to protein-energy malnutrition because of their high energy and protein needs.

The degree of malnutrition in children is normally determined by height, weight, and age of the child. Three indicators often used to assess malnutrition in children include stunting, wasting, and underweight. For a child to meet the international criteria for malnutrition, he or she must be two or more standard deviations below the international average for height (stunting) or weight (wasting and underweight).

Children who do not have adequate height for their age may meet the criteria for stunting. Stunting is the result of chronic malnutrition at a young age. Adequate nutrition is essential to support growth; consequently,

children who are lacking in nutrition do not have the ability to sustain growth and their height may be retarded as a result.

Wasting and underweight both refer to inadequate weight. Wasting is a condition in which the child's height is within the normal range for his age; however, the weight is below the expected weight for his height. Therefore, wasting compares the child's weight to her height. Conversely, the underweight indicator compares the child's weight to the average for her age. Children who are two or more standard deviations below the average weight for their age are said to be underweight.

Malnutrition is a devastating problem that ultimately impacts everyone. While children in developing countries are at great risk of suffering malnutrition, it is also a concern in more prosperous countries. The future of societies is rooted in their children. Strong, healthy children create strong, healthy future generations.

Child Mortality

WHILE THE TERMS child mortality and infant mortality are often used interchangeably, technically they are not the same thing. Infant mortality refers to the incidence of death among infants in their first year of life, whereas child mortality also refers to deaths of older children. Demographers define the infant mortality rate as the annual number of deaths among infants less than a year old per 1,000 births, whereas the child mortality rate usually refers to deaths prior to the fifth birthday.

It is useful to draw a distinction between the two types of rates as the likelihood of death is not nearly as high among children as it is among infants. Both of these agespecific mortality rates are widely considered among the most valuable indicators of societal development.

The risk of dying during the first few years of life has varied dramatically across societies and over time. For example, throughout most of human history, child mortality was almost universally high. Reasonable estimates indicate that about 30 percent of all births in premodern societies would have died in infancy. With the epidemiological transition of the 19th and 20th centuries, mortality declined dramatically, such that the vast majority of births in most societies now survive to adulthood. Yet there are important exceptions to this general rule, as high rates of death and disease continue to characterize the young in many parts of the world.

As an example of high child mortality, the United Nations has estimated for sub-Saharan Africa that overall, about 17 percent of all births in 2003 are not expected to survive to their fifth birthday. The situation is even worse in selected countries of equatorial Africa, as for example in Sierra Leone, where the comparable figure is about 28 percent of all births. While poverty is closely linked with high mortality, a variety of other interrelated factors are also important, including the relative success of public health initiatives, improvements in sanitation systems, water quality, the availability of modern medicines, antibiotics, vaccines, and the control of communicable diseases. The extraordinarily high child mortality that characterized Sierra Leone occurred in an already impoverished country that encountered drought, famine, and a breakdown in social order because of a violent and prolonged civil war.

Across affluent nations in the 21st century, the risk of death in infancy has plummeted to unprecedented low levels. For example, across most Western nations, the percentage of births not surviving the first year of life hovers at about one-half of a percent (slightly above or slightly below five deaths per 1,000 births). In this low mortality context, it is really the short period of time, just before or after birth that is most dangerous for infants. For this reason, there are special measures of infant death that assist in more clearly identifying the etiology of mortality. It is possible to distinguish between neonatal mortality (which refers to deaths of infants within 28 days after birth) and postneonatal mortality (which covers deaths from 28 days to one year).

When infant mortality is very low, as is true throughout most Western nations, neonatal deaths

comprise a large proportion of all infant deaths. On the other hand, postneonatal deaths are more common in poor countries, as they are more closely linked with poverty, inadequate diet, viral and bacterial risks, as well as injuries. In rich countries, most infant deaths relate to processes associated with gestation and birth, including premature birth, low birth weight, congenital anomalies, as well as obstetrical hazards associated with delivery.

Yet this is not to say that socioeconomic class and poverty are irrelevant, as neonatal mortality is higher among mothers who are economically disadvantaged. Better care for mothers and their infants before and after birth, including regular medical consultation, can reduce the risk of neonatal deaths as well as the risk of miscarriage. Other causes of low birth weight and premature birth include inadequate diet, smoking, and drug abuse by mothers, which also varies by socioeconomic class.

In demonstrating the extent to which poverty and underdevelopment are relevant in explaining infant mortality, the United Nations has estimated that just five diseases—pneumonia, diarrhea, malaria, measles, and AIDS—account for half of all deaths to children under age 5 worldwide. Many of these deaths can be avoided through relatively low-cost prevention and treatment measures. The encouragement of breastfeeding can have a major impact on infant mortality in a context whereby sanitation and water quality are problems. The availability of antibiotics and oral rehydration can have a major impact on the risk of death among infants who suffer from diarrhea and gastroenteritis.

The widespread impact of malaria could be reduced through the use of insecticide-treated mosquito nets and appropriate medicines. In addition, a large proportion of newborns born prematurely or with low birth weight in developing nations die of conditions routinely treated in the hospitals of industrialized nations.

Child Welfare League of America

THE CHILD WELFARE League of America (CWLA), headquartered in Washington, D.C., was founded in 1920 as a result of President Theodore Roosevelt's 1909 White House Conference on the Care of Dependent Children. The stated mission and vision of CWLA are "We are committed to engaging people everywhere in promoting the well-being of children, youth, and their families, and protecting every child from harm. We envision a future in which families, neighborhoods, communities, organizations, and governments ensure that all children and youth are provided with the resources they need to grow into healthy, contributing members of society."

CWLA serves as an advocate for children and their parents through a network of members including local organizations, corporate and philanthropic partners, nongovernmental organizations, state offices, and public agencies. Through this network, CWLA lobbies for policies that will best benefit children and their families, while opposing policies that it considers to be harmful to children and their families. An organization of member agencies rather than individual members, in 2004 CWLA was composed of 909 agencies. Also in 2004, CWLA held 197 conference workshops on various issues affecting children, engaged in 74 collaborations with national organizations and 11 local collaborations, and held 200 contracts worth a total of \$2.2 million.

One underlying value of the organization is that it concentrates on applying research to practice. That is, CWLA conducts research, often in partnership with public agencies or other organizations, for the purpose of applying what is learned to improving the lives of children and their families. For example, in June 2005, CWLA held a national conference in Miami Beach, Florida, on best practices for dealing with juvenile delinquency. At that conference, the opening session

dealt with a collaborative effort between CWLA and the Seattle-King County, Washington, juvenile court system to improve the outcomes for children petitioned to that court for a variety of reasons. In addition, all of the conference presentations dealt with successful child advocacy programs, such as an in-school gang delinquency prevention program in Racine, Wisconsin, and a young prostitute rescue program in Boston, Massachusetts. CWLA learns from both positive and negative program outcomes, and helps communities and agencies put the positive into practice.

Through its National Center for Program Leader-ship (NCPL), CWLA advocates in at least 20 areas important to children and their families, such as adoption, child mental health, foster care, teenaged pregnancy, HIV/AIDS, and homelessness.

ChildLine

CHILDLINE IS the United Kingdom's free, 24-hour help line for children in distress or danger. The help line provides a counseling service to comfort, advise, and protect children and young people who may feel they have nowhere else to turn. ChildLine began in 1986, shortly after a television consumer program invited individuals to respond to a survey it was conducting on child abuse

As the program raised sensitive issues, a help line was provided for 24 hours after the program was broadcast. The help line received an overwhelming number of calls from children who wished to disclose reports of abuse and mistreatment while remaining anonymous. A national, toll-free telephone number was subsequently created and staffed by volunteers. Since its launch, ChildLine has counseled well over one million children.

One of the most common reasons why children call ChildLine is abuse. Statistics show that in Britain abuse was accounted for in the following ways: physical neglect (42 percent), physical abuse (32 percent), sexual abuse (19 percent), and emotional abuse (16 percent), with some overlap, according to B. Corby. Children suffering abuse are often threatened to remain silent or made to feel ashamed and guilty. Therefore, children and young people can be afraid to disclose their abuse for fear of what may happen to them or their family. However, ChildLine offers a service that is fully confidential and can therefore be a stepping-stone for children to begin to talk about their experiences and seek the help they need. Counselors can also give children information and advice about speaking to other adults and services, and will support them through this process.

There are a variety of reasons why perpetrators abuse children. For example, such people may have experienced abuse themselves. However, research shows that the biggest risk factor in the abuse of children is poverty, as shown by C. Becket. This is a complex issue and is not an exhaustive determinant. However, many factors contribute toward this risk. The National Research Council (1993) reported that in the United States, families who received welfare support, had single mothers, had unemployed fathers, or were living in poor neighborhoods were more likely to have children placed on a child protection register. All of these issues, and more, impact a parent's physical and mental wellbeing, especially cumulative stress.

ChildLine also received 31,000 calls in 2004 from children who were experiencing bullving. Children can be bullied physically, verbally, or emotionally, and experience hurt and humiliation. Threatening text messages and e-mails add to bullying in a more indirect way. A recent survey of 2,869 18- to 24-year-olds in Britain reported that 43 percent of children and young people had previously been bullied or discriminated against at school, according to P. Cawson et al. As in other forms of abuse, children who are bullied find it hard to disclose their experience, with 30 percent suffering in silence, as studied by D.S. Hawker and M.J. Boulton. In response to an increase in calls regarding bullying, ChildLine created a working partnership with schools, called ChildLine in Partnership with Schools (CHIPS). CHIPS works to highlight and address the issues surrounding bullying.

ChildLine provides training for staff and children, allowing children and young people to be more involved in dealing with bullying, as well as providing greater communication across all levels. ChildLine is prominently made up of volunteers for all its fundraising, outreach, and counseling work.

Children and Poverty

IN ACKNOWLEDGING that every individual under the age of 18, if recognized by a country's law, has certain rights that must be protected, the United Nations Convention on the Rights of the Child sought to ensure the well-being of all children and treat them as individuals with their own privileges and freedom of expression. The convention, which was ratified by most United Nations member states (the exceptions being Somalia and the United States) and adopted into law in September 1990, asserts that children must be protected and provided with the necessary supports in order to mature into healthy adults.

Adoption of the convention has spurred a growing awareness on the part of world leaders that more concerted efforts were needed to provide children with a healthy start and protection against abuse, exploitation, and inadequate diet. To this end, the September 2005 United Nations World Summit witnessed one of the most auspicious gatherings of world dignitaries to reaffirm the Millennium Development Goals (MDG) that the United Nations declared in 2000. Among the nine stated goals that the MDG seeks to realize by 2015 is an improvement in the life chances of children by eradicating extreme poverty and hunger and reducing child mortality.

Poverty is highly contextual, which means that child poverty can take on different forms and can be accounted for by varying micro and macro conditions, depending on what region of the world they reside in. For some of the most impoverished nations in the southern hemisphere, poverty is often described in absolute terms and reflects an individual or family's ability to consume a specific caloric intake of food that is considered to be minimal to guard against starvation, dehydration, or life-threatening disease.

Even the richest nation is a long way from eradicating poverty at home.

For richer nations, where basic human needs such as food and water are provided, poverty measures often focus on income disparities or individuals' ability to purchase a range of goods and services deemed acceptable based on a country's standard of living. Poverty measures used around the world reflect these technical and conceptual distinctions about what constitutes poverty and also underscore differences in the standard of living enjoyed by nations of the northern hemisphere compared to those in the south.

A commonly cited measure of poverty in developing countries is the World Bank's Purchasing Power Parity (PPP) estimate, which sets the international poverty level for extreme poverty around \$1.08 per day or \$32.74 a month. By the end of the 1990s, the per capita income for nearly 44 percent of the population of least developed countries was at or below this extreme poverty threshold and close to 75 percent of the population were trying to survive on nearly \$2 per day.

In contrast, most western European countries have favored measuring poverty in "relative" terms, whereby thresholds are set in terms of the proportion of households with incomes less than 50 percent of the median adjusted household income for the country of residence. The United States' Federal Poverty Line (FPL), a more "absolute" approach, which was established in the mid-1960s to define a minimum level of subsistence, takes into consideration the size and composition of a household to determine its poverty status at a fixed point in time. Families are considered as being in poverty if their annual earnings fall below a designated threshold, depending on the size of the family. For a family of four in 2004, the U.S. poverty threshold was \$19,307.

Critics of an absolute measure of poverty contend that a more accurate appraisal of poverty would involve comparing some combination of a person's economic, social, and cultural resources to those of the society. Using such estimates, child poverty rates would be adjusted upward in countries like the United States where income disparities are far greater than in other developed nations in Europe and elsewhere.

Even by existing and possibly restrictive measures of poverty, rates of severe deprivation among children in the developing and industrialized world remain woefully high at the dawn of the 21st century. By 2000, babies in least developed countries were twice as likely to die at birth than infants born in richer nations. In addition, children in these countries experienced lower immunization coverage, worse healthcare services, higher rates of malnutrition, and greater gender disparities, in comparison to their better-off counterparts in the richer nations.

Wealthy nations are not above reproach. Official U.S. Census Bureau figures, using an absolute measure of poverty, report that the rate for children under 18 years of age was 17.8 percent in 2004, one of the highest among leading developed countries. Given how strongly individuals' social class during childhood predicts their economic opportunities later in life, such statistics suggest that even the richest nation is a long way from eradicating poverty at home.

CAUSES OF CHILD POVERTY

In addition to the ravages of war and a pandemic rise in the incidences of life-threatening diseases such as AIDS/HIV, which kills millions of adults and leaves countless children orphaned and impoverished, child-hood poverty in underdeveloped countries is due in part to global economic restructuring, the outmigration of low-income families from rural or agricultural-based dwellings to urban areas, demographic shifts, cultural norms, as well as an institutional framework that fails to meet the changing needs of indigenous peoples.

Though children constitute nearly 50 percent of the size of the population of least developed countries, investments in children are woefully inadequate. And, given the realities of enormous external debt, bureaucratic mismanagement, social norms, and cultural values that subjugate the rights of the child, plus a lack of a basic infrastructure upon which to build a compendium of services to support children, these countries face incredible obstacles to raising the quality of life of their youngest citizens, as noted by H. Penn.

Since children depend so much on parents' income, child poverty in both the north and south goes hand in hand with the economic prosperity of an adult caretaker. In some of the richer nations, global economic restructuring also has played a prominent role in the

marginalization and social isolation of low-income families and their children. The shift from manufacturing to a service-based economy and the increased emphasis on technology have excluded large portions of the population from the labor force in developed countries. A comparison of unemployment and child poverty rates among richer nations reveals some apparent inconsistencies. Whereas countries like the United States, United Kingdom, and Italy have low levels of unemployment but high rates of child poverty, others, like Finland and Spain, have higher rates of unemployment yet report lower levels of child poverty. What accounts for these dissimilarities is the concentration of unemployment and underemployment among adults with families, as is the case in countries like the United States, unlike Finland and other nations where young, childless adults are overrepresented on the unemployment rolls.

Literacy among mothers is also linked to child poverty rates in developing countries.

Other social demographic indicators have also been linked to poverty rates among children. In the United States, as divorce and nonmarital birth rates increase, so does the proportion of children who reside in single-parent, often female-headed families. Apart from the absence of an additional adult breadwinner, low-income female-headed households are often characterized by other socioeconomic and demographic characteristics, such as mothers' low educational attainment and early childbearing, which increase the likelihood that the children will spend some part of their formative years in poverty.

Minority status also matters since minority populations often find it harder to access employment opportunities that would afford a family a reasonable standard of living. In the United States, for example, where the legacy of slavery and racial intolerance continues to impact the life chances of black children, overt discrimination as well as the cumulative effect of prejudicial policies that prevented blacks from reaching their true potential in past decades today help to account for why black adults are more likely to be unemployed and earn less on average when they find a job.

Literacy among mothers is also linked to child poverty rates in developing countries. More educated girls are seen to delay marriage and make more informed decisions about childbearing and -rearing practices. In addition to basic literacy rates, low-income women's reproductive patterns, notably short birth spacing as well as mother's age at first birth, are strong indicators of poverty among children.

CONSEQUENCES OF POVERTY

Exposure to prolonged poverty can be especially detrimental to the health and safety of children. In instances where caregivers are either incapacitated, jobless, or have died or abandoned their offspring, children are often required to work for their own survival. Domestic and international laws have succeeded in outlawing child labor in wealthy nations around the globe. In developing countries the situation is much more complex, since poor families must often depend on the earnings of all household members, including the youngest.

Human rights groups have discovered some egregious examples of inhuman child labor conditions, and while the practice continues, such actions have increased the pressure that is brought to bear on developing countries and the companies that promote it, to abandon the practice altogether. What is not so easy to regulate and indeed continues to flourish below the radar screens of many international observers is the use of children as domestic laborers or indentured servants. Often these children endure long hours and the everpresent danger of physical or sexual abuse. Such labor is often associated with minimal or no compensation for the child and little regard for his or her personal development.

In addition to such flagrant examples of child neglect, poverty among children is also causally linked to illiteracy, short life spans, lack of access to appropriate healthcare, as well as social and economic disenfranchisement. For instance, enrollment rates in school for children were around 58 percent in least developed countries by 2000 compared to 85 percent in richer nations, according to UNICEF. These numbers only begin to elucidate the extent of the problem, since the rates are even starker if we look at disparities by gender (girls usually do worse on most measures in comparison to boys), region, birth order, caste, or ethnic origin of children in certain parts of the world. Even then, our understanding of the consequences of poverty on children in poorer countries is quite superficial apart from such fundamental measures that have been cited. This is because the south has not benefited from the wealth of investments, in terms of time and money, that have been devoted to understanding poverty's varied effects on children in the north.

In households where resources are greatly limited, girls may be the first to be denied opportunities for advancement.

North American and European studies, and growing evidence from the south, reinforce the argument that regardless of where they are born, the short- and long-term consequences of poverty on children are profound. While prolonged poverty is thought to have the most severe effects, even short exposure to extreme poverty, especially during prenatal or postnatal periods, can cause irreparable psychological, physical, or emotional harm to a child. A preponderance of evidence indicates that growing up poor increases the likelihood of cognitive deficiencies, health problems, poor academic achievement, as well as impaired behavioral and psychosocial abilities among children and earnings inequalities among adults, according to J. Brooks-Gunn and G.J. Duncan.

Mounting evidence also bolsters the argument that even among richer nations, the physical and social isolation of poor families in high-poverty neighborhoods has detrimental effects on children and youth. Communities that are characterized as being low in social organization and social control among neighbors are most often characterized as risky for children, as shown by R. Sampson et al.

GENDER DIFFERENCES

Faced with the need to support themselves or other family members who are unable to find work, boys and girls are often expected to assume the responsibility of primary provider for themselves and their families. When conventional methods of employment are unavailable, youth often resort to illegal activities. Boys are more likely to engage in property crimes, including theft or larceny, and in some instances, prostitution.

Girls are also likely to engage in pilfering when no other viable legitimate means are open to them, but all too often they are forced to sell themselves in order to earn a living. Ethnic and civil strife in some of the world's poorer nations has had an enormous impact on the number of boys who populate towns and villages. Boys are either conscripted into the armed forces or are some of the first victims of warring factions. Girls are more often the victims of sexual violence and are more likely to be exposed to sexual disease and impregnation.

Gender also confers different statuses on children, which, when coupled with the retarding effects of poverty and cultural norms, can further compound their precarious situation. In households where resources are greatly limited, girls may be the first to be denied opportunities for advancement. However, boys' preferred status does not provide them with a free ride since they are often the ones who are expected to work outside of the home to supplement meager household earnings or serve as the family's sole breadwinner.

Policies that work to ameliorate poverty are as diverse as are the conditions under which child poverty is realized and accentuated. In an effort to tackle the fundamental social inequalities that exist in many underde-

Children constitute nearly 50 percent of the population of least developed countries.

veloped countries, there is currently enormous support for loan forgiveness programs, which would help to remove some of their debt burden. Such actions, as well as increased and consistent support from donor countries, proponents of such policies argue, would allow these nations to redirect the saved monies toward much needed investments such as primary education, access to clean drinking water, and better health and nutrition services for pregnant mothers and children, according to J. Sachs.

Job training, affirmative action programs, setting minimum wage limits, and providing tax credits as well as public cash transfers and noncash benefits are just some of the approaches used by countries in the north to try to reduce poverty. Cash transfer programs seek to raise the standard of living of poor families and their children. Noncash benefits include such things as housing allowances and food stamp programs that are geared toward basic commodities that help to improve family security. Support for childcare in formal settings is also favored as an important service for low-income single mothers who must work outside the home.

However, prevailing notions of what constitutes basic entitlements are being challenged in some countries. In 1996, breaking from existing policies that supported low-income single mothers' desire to remain at home to raise a family, the U.S. federal government passed the Personal Responsibility and Work Reconciliation Act (PRWORA), which placed a limit on the amount of time low-income families can receive cash assistance and imposed strict work requirements on all able-bodied caregivers. Such approaches aim to increase the marketable skills and work readiness of low-income parents.

Other approaches in vogue currently include policies that promote marriage among unwed couples, which at their core also aim to reduce the numbers of poor children in the country. Though child poverty rates did fall in the United States during the 1990s, it remains to be seen if these gains were due to changes in national policy or a robust economy that has since fizzled.

Children's Aid Society

THE CHILDREN'S AID Society (CAS) was founded in 1853 in New York City by the Reverend Charles Loring Brace. Although it is best known as the original sponsor of "orphan trains" that carried about 150,000 dependent urban children to new homes in rural areas, the 19th century Children's Aid Society of New York was a multiservice agency. The CAS pioneered industrial schools, day schools for children with disabilities, visiting nurses, free dental clinics, and camping for poor children. In the 21st century, the CAS remains a child welfare agency offering a range of family and children's services at numerous sites in New York City. Other societies of the same name operate in large cities around the world.

The CAS of New York was founded during a period of high European immigration to the United States, accompanied by overcrowding of major cities. Poor families suffered from low wages, dangerous working conditions, high rates of morbidity and mortality, and few sources of help for the destitute. The middle of the 19th century was a period that embraced the "institutional ideal," the vision that people needing society's aid were best served in specialized hospitals, orphanages, and asylums.

Accordingly, voluntary and religious groups in most U.S. cities built orphanages for dependent children. Many of their wards were not complete orphans, but rather children who needed aid due to other family circumstances, including illness or death of a parent, desertion or family separation, acute poverty, or maltreatment. However, the existing institutions could not meet the extensive needs in large urban areas. Brace, a Protestant minister who had become aware of New

York's street children as well as those in institutions, was convinced that both groups of children could best be helped by placement with farm families in rural parts of the country. He founded the CAS of New York and began a program of placing children out of the city, the best-known service of the early CAS. Actually, the CAS helped children, young people, and their families in a variety of ways, and one study shows that only about a quarter of them fit the profile of orphaned, homeless, or abused "waifs."

Brace chronicled his work in *The Dangerous Classes* of New York and Twenty Years' Work Among Them, published in 1872, and he directed the CAS until his death in 1890. His legacy, and that of the early society, are somewhat mixed. During the years of the placing-out program, there was serious opposition from non-Protestant immigrant communities to the placement of their children in predominantly Protestant families and regions. More recently, the society's early work has been criticized for frequently disrupting poor families, and praised for including moral reform, as well as tangible assistance, in its work with poor families. Most commonly, the society is recognized as laying the groundwork for modern foster-care programs.

The CAS of New York has evolved into a complex child welfare agency, offering traditional, therapeutic, and medical foster care as well as adoption, health and dental care, school-based social services, teen pregnancy prevention, services for the homeless, community building, and camping and recreation. It has an annual budget of more than \$70 million and serves an estimated 120,000 children and families each year, including some in teen pregnancy programs and school-based services in U.S. cities outside of New York.

The Children's Aid Societies of Pennsylvania (established 1890) and Vermont (founded 1919) are examples of other large CASs that provide a range of child welfare services, while the Children's Aid Society of Utah (established 1910) operates as a traditional private adoption agency. Canadian Children's Aid Societies, such as Toronto's (established 1891), operate under public mandates to investigate allegations of child maltreatment and place children in substitute care. These nonprofit agencies receive substantial governmental funding and oversight. In Australia, the Victorian Children's Aid Society (founded 1893) merged with other voluntary children's agencies and assumed a new name, Oz Child-Children Australia, in 1992.

Children's Defense Fund

THE CHILDREN'S DEFENSE Fund (CDF) was established more than 30 years ago in 1973 with the mission to Leave No Child Behind, by giving each child a Head Start, a Fair Start, a Safe Start, and a Moral Start through caring communities and families (the phrase No Child Left Behind was later employed as the name for the 2002 Education Act, with which it has no connection).

Based in Washington, D.C., the CDF aims to represent all of America's children, no matter how disadvantaged or disempowered they may be. The 2004 Annual Report states that "CDF provides a strong, effective voice for all the children of America who cannot vote, lobby, or speak for themselves. We pay particular attention to the needs of poor and minority children and those with disabilities. CDF educates the nation about the needs of children and encourages preventive investment before they get sick or into trouble, drop out of school, or suffer family breakdown." It also notes how the invasion and occupation of Iraq and the campaigns to counter terrorism have been used to deflect and marginalize social criticism. The increase in child poverty and mortality in the United States, for example, has received very little attention.

The CDF is a nonprofit, nonpartisan organization, which is supported by donations from corporations, organizations, and individuals, as well as bequests and sale of assets and other activities. Total net assets reached \$49 million in 2004. Activities pursued by the CDF include research and publication with policy advocacy. This is credited, in part, with successful implementa-

tion of legislation relating to the treatment of children and their mental and physical well-being. Publications of the center promote children's health and development, family income, and employment prospects, while outreach programs are aimed at engaging with faith-based and other organizations to forge partnerships supportive of the overall goals.

CDF Freedom Schools is an initiative inspired by the American civil rights movement, which led to its 1993 launch of programs featuring literacy, conflict resolution, and social interaction that now serve 5,500 children annually. College-level interns and staff facilitate these educational programs, which are aimed at children aged 5 to 18 and operate in 40 cities for five- to eight-week sessions.

The CDF's Haley Farm is a center located on a 157-acre site that once belonged to the author Alex Haley. There, young people and activists are able to meet and study new methods of becoming the servant leaders who can help lead the way toward spiritual and political freedom. The Action Council provides a center for campaigning and advocacy.

The Beat the Odds Program was started in 1990 as a means of celebrating the potential of teenagers, who are so often characterized in the popular media as victims or troublemakers. It works with local and community leaders to help recognize outstanding achievements by young people, whether academic, social, or creative in nature.

Marian Wright Edelman, who has a long and successful career as a lawyer and advocate for disadvantaged Americans, founded the CDF. She was the first black woman to be admitted to the Mississippi Bar and worked with Dr. Martin Luther King, Jr.'s Poor People's Campaign, among many other achievements. The CDF has become very successful in promoting children's rights in America. An influential early employee of the organization was Hillary Rodham Clinton.

Children's Hunger Relief

THE CHILDREN'S HUNGER Relief Fund (CHRF) was established in 1975 by a group of American businessmen who were inspired by the tale of the Good Samaritan in the Bible to create a charity to assist needy children. This has led to the creation of overseas missions to open and operate orphanages and care centers in some of the poorest countries of the world, including Afghanistan, Rwanda, and the Darfur region of Sudan.

The three-part strategy used for rescuing vulnerable children entails keeping children alive, providing children with hope for the future, and breaking the cycle of poverty in children's lives. By working with local partners, CHRF claims to keep its administrative costs at less than three percent of total funds so that 97 percent of donations will directly reach those poverty-stricken populations in the Third World that are intended to receive them.

The 2003 Annual Report listed 97.2 percent of expenditures (\$33,277,047) as being spent on aid, emergency relief, and community development. The 2004 Annual Report states that this proportion increased to more than 98 percent (\$38,326,172).

Founder Colonel V. Doner was a leading member of the movement to mobilize professed Christian voters to elect President Ronald Reagan, and subsequently resigned in disappointment. After some years, he conceived of the "Samaritan strategy" as a way to spread his version of Christianity around America and the rest of the world.

The charity provides material assistance and education in American Christianity.

The part of his beliefs relating to charity states: "Do what you can for the child in front of you, and then the next child, and then the next." This results in "saving the world, one child at a time." In the Executive Message in the 2004 Annual Report, Doner writes:

"Children's Hunger Relief Fund is committed to saving children's lives and sharing God's love by helping people transform their lives and their communities so they can live productively and peacefully in a 'celebration of life.'

"To this end, we provide for people's immediate survival needs through feeding and medical programs, and also empower them for long-term transformation through education, business, vocational and leadership training."

The charity provides material assistance, therefore, as well as education in a form of American Christianity. This second aspect is resented by some critics who believe that the children concerned are very vulnerable, and should only with great care be introduced to beliefs often alien to their culture, which may cut them off from other members of their own communities.

The CHRF is now joined in the Samaritan Group by a number of like-minded organizations in many different countries, from Mexico to Uganda to Italy. Each has the same strategy of helping children on a step-bystep basis. Orphaned children's homes have been opened in Nicaragua, Mexico, Rwanda, and other locations in Africa and Asia.

Chile

THE REPUBLIC OF Chile is composed of a narrow strip of land that runs for 1,800 miles between the Andes Mountains and the Pacific Ocean in South America. Originally inhabited by Incas, the Spanish settled Chile in the mid-16th century. After winning independence from Spain in 1818, Chile was ruled by a number of military regimes. A Marxist regime was overthrown in 1973 under the leadership of Augusto Pinochet, who ruled Chile until 1990, when free elections were held. The past decades have brought steady economic growth to Chile, and the country has become a model for democratic and economic reform. Chile has also taken an active role in regional and international affairs, particularly in the promotion of human rights.

With a per capita income of \$10,700, Chile is an upper-middle-income nation with a diverse market economy that attracts a high level of foreign trade. The Chilean economy is dominated by services, which employ 63 percent of the labor force. Industries engage

23.4 percent of the workforce, and the additional 13.6 percent are involved in the agricultural sector.

Chile's economic reforms of the 1990s created an environment in which initial growth was around eight percent. Growth fell to around four percent in 1998 in response to the global financial crisis, deficit checks, and decreased export earnings within Chile. By 2002, economic recovery had begun, but a poverty rate of 20.6 percent and an unemployment rate of 8.5 percent continue to be of major concern to the Chilean government.

Over nine percent of the poorest Chileans live on less than two dollars a day. Inequality is an endemic problem in Chile, with the richest 20 percent of the population controlling 62.2 percent of available resources and the poorest 20 percent claiming only 3.3 percent. Chile is ranked 57.1 percent on the Gini Index of Human Inequality. The United Nations Human Development Report ranks Chile 43 of 177 on general quality-of-life issues.

Even though poverty levels are high, antipoverty measures, coupled with economic growth, have succeeded in reducing poverty levels from 38.6 to 20.6 between 1990 and 2000. During that period, the rate of female poverty dropped from 39.2 to 20.8 percent. In Chile, females head one in every three households. As a result, women, especially those who live in rural areas, are more likely than men to be among the ranks of the poor. The Training for Employment Program for Women on Low Incomes was established to address the issue of female poverty, and single mothers have priority. Over the past few years, 70,000 women have received benefits from the program.

In 2002, the Chilean government implemented the Comprehensive Social Protection program, designed to distribute services and support to the 225,000 poorest families in Chile. Under this program, a government grant is issued to the woman of the family, whether she is a single parent or not. In addition to the monetary assistance distributed through the program, the government gives recipients preferential access to social promotion programs, employment assistance, and social security benefits.

According to estimates for 2005, life expectancy in Chile is 76.58 years. In general, women (80.03 years) survive men (73.3 years) by seven years. The population of 15,980,912 has a median age of 30.07 years. Slightly over one-fourth of the population is under the age of 14, and eight percent have seen a 65th birthday. Except in remote areas, Chileans have access to basic necessities. Four percent of the population lack access to safe

China

drinking water, and seven percent lack access to safe sanitation. There are 115 physicians for every 100,000 residents, and 80 to 94 percent of Chileans are able to afford essential drugs.

Childhood mortality has fallen drastically in Chile over the past decades. Between 1970 and 2004, infant mortality fell from 98 to eight deaths per 1,000 live births. Among children under the age of 5, the mortality rate decreased from 98 to 12 deaths per 1,000. Chilean children tend to be healthy, and only one percent of children under 5 are malnourished. Five percent of infants are underweight at birth. Infant immunizations range from 94 to 95 percent, and the rate for children between 12 and 23 months is 99 percent.

Females bear an average of 2.02 children each, a decline from 3.6 children per woman in 1970. For females between the ages of 15 and 19, the fertility rate is 43 per 1,000. Some 56 percent of Chilean women use some method of contraception. Healthcare is readily available, and trained medical staff attend 100 percent of all births. According to modeled estimates for 2000, maternal mortality in Chile occurs at a rate of 31 deaths per 100,000 live births.

Chile has made great advances in education in the last decade. Preschool education increased from 21 to 32 percent, secondary education rose from 80 to 90 percent, and tertiary education climbed from 15 to 31 percent. Primary school completion rates reached 100 percent. These gains are the result of a constitutional amendment that made 12 years of school compulsory. Education is free for all Chileans below the age of 21.

Expanding the accessibility and quality of education has become a major priority in Chile, and particular attention has been paid to improving school enrollment rates for females and rural residents. Grants that increase with the level of education are allotted to students who live in extreme poverty. Low-income mothers of school-age children are eligible for an education completion program. The government has also implemented the High School for All program to improve enrollment rates at the secondary level. As a result of the emphasis on education, the Chilean population is highly literate. Among the population over 15, 96.4 percent of males and 96.1 percent of females can read and write.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

China

ON JANUARY 6, 2005, China officially reached a population of 1.3 billion. With this number, the country accounts for one-fifth of the world's population. The real size of the Chinese population is, however, unknown, in particular because of secret and thus unregistered births in the rural parts and questionable counting methods. Despite a number of loopholes, the one-child policy has contributed to a decline of the fertility rate from 2.29 children per woman in 1980 to 1.69 children per woman in 2004, and to 300 million fewer births in the last 30 years. The policy has helped to ease the pressure on resources and reduce poverty.

However, the policy is currently being questioned because of an increasingly aging population and a strong imbalance in the sex ratio of 118 boys to 100 girls. The population number excludes Taiwan, Hong Kong, and Macao. The average life expectancy climbed from 63.2 years in the first half of the 1970s to 71 years in the period 2000–05. Life expectancy in 2002 climbed to 68.8 years for men and 73.2 years for women. The infant mortality rate was down to 31 (per 1,000 live births) in 2002, from 85 in 1970.

The under-five mortality rate fell from 120 to 39 in the same period. Living standards have increased and the diet has improved. The official adult literacy rate of 2002 is 90.9 percent (86.5 for women, 95.1 for men); the combined gross enrollment ratio for primary, secondary, and tertiary schools is 68 percent (64 for women, 69 for men). Within a decade, the percentage of undernourished people fell from 17 percent to 11 percent, and the population with sustainable access to improved sanitation rose from 29 percent to 40 percent. Eleven percent of the under-5-year olds are underweight; 16 percent of the under-5-year olds are under-height. Be-

159

tween 80 and 94 percent of the population have sustainable access to affordable essential drugs. The annual average growth rate of Gross Domestic Product (GDP) per capita was 8.2 percent between 1975 and 2002, and 8.6 percent between 1990 and 2002. In 2004, GDP rose officially by 9.5 percent.

Unemployment is rising high; 10 million workers per year enter the urban employment market; 14 million are still laid off from state-owned enterprises; and in 2003, 110 million migrants sought work and an estimated 150 million surplus laborers could be found in the countryside. Of the population, 16.6 percent live below the income poverty line of \$1 a day, 46.7 percent below the line of \$2 per day.

POLICIES

The reform program of the "four modernizations" (si ge xiandaihua), which was declared in 1978, has produced a development gap between the industrialized coastal belt and the landlocked rural hinterland and between urban and rural areas. A third gap of intrarural and intraurban income is on the rise.

In June 1986, in order to streamline responsibilities of the various agencies and ministries involved in national and regional poverty alleviation programs, the government established a Leading Group (or Committee) for Economic Development in Poor Areas under the State Council; in 1993, it was renamed Leading Group (or Committee) for Poverty Alleviation and Development under the State Council. Beijing's immediate poverty alleviation policy focuses on providing access to adequate food and clothing for the population in the rural areas.

Although urban poverty is a growing concern, the need to concentrate poverty alleviation efforts in the countryside is still acknowledged by the government. Measured at China's national poverty line, official statistics say that in 1978 the number of the extremely rural poor with inadequate access to food and clothing was 250 million, or roughly one-third of the total rural population (the exact numbers differ from source to source between 30.7 percent and 33 percent). By 1985, the number was down to 125 million, to 80 million in 1994, and by the end of 2003, to 29 million, or 3.1 percent.

In 2003, however, the number of extremely poor Chinese, defined as living below an annual net income of 637 yuan per capita (\$77), rose by 800,000. In the same year, the national average annual income reached 2,622 yuan (\$316).

The gap between both income lines has widened since 1992, and a stop to this tendency is not within reach. In addition, natural disasters in the provinces of Henan, Anhui, Shanxi, and Heilongjiang caused an official rise in the numbers of poor Chinese by more than two million in 2003.

The Chinese way of measuring poverty in the rural areas is the household responsibility system, which was introduced in 1983 as a replacement for the people's communes, a system that was in part responsible for agricultural mismanagement and widespread famines owing to bad harvests.

The household responsibility system in practice reintroduced private land property, although by law private property is not allowed. In lockstep with the reestablishment of private markets, farmers again were given the incentive to produce on their "own" land and sell the surplus at private markets to increase their income. Township enterprises began to boom, employing rural people unable to find a job within the agriculture sector.

Ninety million people fall below the poverty line, including 75.8 million rural residents.

In the mid-1980s, however, the rural economy started to stagnate. In 1986, the poverty standard was calculated at 206 yuan per capita net income in rural areas for the year 1985. In 1994, the standard was raised to 400 yuan per capita net income for the year 1992. In 2004, the rural poverty line was adjusted to 668 yuan, from 637 yuan in 2003; the low-income line rose from 882 yuan to 924 yuan. The population living at the low-income line is said to have solved the problem of access to food and clothing.

By the end of 2004, the rural population in absolute poverty was calculated as 26.1 million or 2.8 percent of the total rural population, a decline of 2.9 million or 0.3 percentage point from 2003. The low-income population was 49.77 million at the end of 2004, a decline of 6.4 million from 2003. The proportion of the low-income population to the total rural population was 5.3 percent, down by 0.7 percent. However, even the official media criticizes this standard as distorting the real picture given the rising living expenses, and in May 2005, the government acknowledged that, under international standards, 90 million rural and urban people fall below the poverty line, including 75.8 million rural residents.

As exemplified by the bright lights of the city of Shanghai, China has pursued a capitalist economic system that has created a new wealthy class, yet China is now eager to emphasize its concerns for those losing out in the era of capitalist reform.

Under the 1994 standard, 592 counties were designated as poor. The so-called 8-7 plan (National Plan for Poverty Reduction), run from 1994 to 2000, targeted these counties with the aim of relieving them of poverty by the year 2000. The 8-7 plan was introduced to reverse the trend of growing poverty, which coincided with a stagnation of the rural economy in the mid-1980s. As a result of the stagnation, per capita net income fell from an average of 12.2 percent between 1978 and 1985 to an average of two percent between 1986 and 1993.

The failure of the 8-7 plan to channel funds directly to the poor and alleviate the incidence of poverty prompted a new plan, the New Century Rural Poverty Alleviation Plan, for the period from 2001 to 2010. Under this plan, the government has pledged to wipe out poverty by 2010. This plan not only targets counties declared as poor, but also specifically 50,000 villages, a measure that is designed to help villages in counties that are not designated as poor and hence were not included in the 8-7 plan.

The new plan recognizes village participation and multisector approaches. It places a new emphasis on sickness as contributing to poverty, and accordingly the government has started to experiment with healthcare and social security programs in rural areas. The plan also puts an emphasis on education and a reduction of obstacles to rural-urban migration in order to enable

the unemployed to leave the countryside and find work in the urban areas without the bureaucratic difficulties, which the household-registration (*hukou*) system still imposes on migrants. The government itself does not seem to be very confident about achieving the abolition of poverty by 2010. The government has announced it will abolish poverty by 2020, a target set within the framework of the United Nations Millennium Goals.

The government has set a goal to increase the income of local farmers, including professional training and development of local enterprises. It has also focused on providing adequate infrastructure, financial services, and employment, and is experimenting with the extension of social security and assistance systems from the urban to the rural areas, including those of healthcare and education. The regions principally targeted by rural poverty alleviation programs are the land-locked western regions and the industrialized northeast.

One of the programs concentrating on the west was the China Southwest Poverty Reduction Project, supported by the World Bank and carried out between 1995 and 2001 in the provinces of Guangxi, Yunnan, and Guizhou. At present, on the provincial level, the 9+2 initiative is under way.

The initiative is a program that aims at the establishment of economic cooperation between well-developed provinces and those that are less developed. The idea behind this is to use the economically vibrant Pearl River delta with Hong Kong, Macao, and Guangdong province as the core for a spillover effect into the southwestern provinces of Hainan, Guizhou, Jiangxi, Yunnan, Sichuan, Hunan, Fujian, and Guangxi. Other specialized poverty relief projects are Project Hope, which deals with schooling of poor children; the Glorious Cause, which helps private businesses in underdeveloped areas; and Project Happiness, which targets poor mothers.

Other special projects concentrate on the handicapped, bringing more girls in compulsory education, and on the self-reliance of poor rural households. On October 17, 2004, the Office of Poverty Alleviation and Development under the State Council and the All-China Federation of Industry and Commerce signed an agreement to include more private-sector initiatives in the poverty alleviation measures.

URBAN POVERTY

Urban poverty has become a matter of rising concern to the government. Increased unrest over urban living conditions are due to the structural changes in the economy since 1978. Socialist societal characteristics, such as the "iron rice bowl" (tie fanwan), which guaranteed lifetime employment including housing, food, clothing, healthcare, old-age support and other welfare services looked after and controlled by the "work unit" (gongzuo danwei), were abolished and have not yet been comprehensively replaced under the new market conditions. Urban poverty projects thus focus on re-employment measures, unemployment benefits, old-age support, health care and other social welfare systems.

In 1997, the first national urban poverty line was calculated at 1,700 yuan annual per capita income. In the same year, the State Council decreed all towns and cities would set up urban poverty relieve schemes by mid-1999. In September 1999, the State Council issued the Regulations on the Minimal Living Standard for Urban Residents. Under this scheme, laid-off SOE (state-owned enterprise) workers are trained at reemployment centers and receive a living allowance for three years. Should they be unable to find a new job, they receive unemployment benefits for two years.

China expects the middle class to expand to 45 percent of the population by 2020.

After that, some are entitled to a minimum subsistence allowance. The laid-off workers at reemployment centers do not appear in the unemployment statistics, which is why the centers are often accused of hiding unemployment. The effectiveness of their training is also doubted. The statistics show only those who are officially registered as unemployed: 4.3 percent in 2003, 4.2 percent in 2004. Also, the financial and organizational capacities of carrying out this and other programs vary across municipalities. In addition, each city has its own poverty line. Urban poverty is mostly due to redundancies at SOEs. This forces many workers previously employed by the formal state sector and for whom the "work unit" is unable to find reemployment to enter the informal nonstate sector (mainly consisting of menial work, such as street vending, rubbish collecting, knife sharpening, housekeeping, construction working, "self-employed" decorating, carpentry, and barbering), which used to be the exclusive work place of rural migrants.

This problem is enforced by the general breakdown of the rural-urban divide, as a result of which an increasing number of rural migrants leave the countryside in search of employment in the urban informal sector. In 2003, the official number of urban poor according to the national urban poverty line was 22.35 million.

In January 2005, the National Bureau of Statistics published a definition for the urban middle class based on a four-month survey of 263,584 households. The income line was defined as falling between 60,000 yuan and 500,000 yuan. The result was that the middle class turned out to be smaller than previously thought, comprising only 5.04 percent of the population. Whether real or unreal, the bureau expects a rapid expansion of the middle class to 45 percent of the population by 2020.

BACKGROUND

Deng Xiaoping's reform program laid the emphasis on prosperity rather than equality and opened the country to the capitalist economy. It put the emphasis on pragmatism and results instead of an economy guided by ideological visions. Deng argued that "whether a cat is black or white makes no difference. As long as it catches mice, it is a good cat."

As opposed to that, the Maoist development concept had paired equality with prosperity. Its aim was the complete socialization of economy and society. A successive collectivization of land was taking place since 1951 and resulted in the establishment of the People's Communes in late 1956.

The Great Leap Forward (*da yue jin*) of 1958–59 was supposed to press this aim forward, including the functions of the family. The Great Leap is perhaps the most well-known example of the failed Maoist development concept. The famine that followed the ill-conceived policy of the Great Leap Forward to industrialize the country was made worse by the so-called three bitter years of 1960–62, during which natural disasters plus the famine reduced the overall population. How many died is unknown; estimates vary between 20 and 75 million people.

The years that followed the famine saw a struggle between reformists and conservatives in the party and state hierarchy over the correct economic and social policies. The victory of the reformist wing was followed by a reassertion of the conservatives led by Mao during the Great Proletarian Cultural Revolution (wenhua dageming), which started in 1966, reached its height in June 1967, and was officially stopped in 1969, when the government felt it necessary to crush the Red Guards it had originally instigated in order to stop their violent excesses.

The repercussions of the revolution, however, were felt until 1976, the year in which Mao died. The number of victims is estimated to be three to seven million people. After Mao's death, the Gang of Four—the group of leading Marxists, which included Mao's wife—was quickly imprisoned, and Hua Guofeng had to succumb to the reformist wing gathered around Deng Xiaoping.

A prominent system that had to adjust to the modernizations since 1978 is the household registration (hukou) system. The hukou system was in place from around 1957. It was based on the separation of the economy in agricultural and industrial production—the rural-urban divide. In order to be able to manage this separation, the flow of resources between both sectors had to be controlled. Once a household was registered with an urban or agricultural hukou, it was almost impossible to change it.

Only few exceptions were made, such as sending redundant young people entering the urban economy to the countryside—a measure of economic necessity clouded in ideological pronouncements (learning from peasants through hands-on experience), especially some years later during the Cultural Revolution—and employing rural residents for menial work in the SOEs.

Apart from these adjustments to the system, only those in possession of an urban *hukou* were entitled to employment allocated by the state labor administration for the urban economy. Those with an agricultural *hukou* were employed through the collective economy of the People's Communes. This residential status was enforced, for instance, through rationed food supplies, which had to be purchased with coupons, which in turn were allocated according to the residential status shown in the *hukou* document. The rural-urban divide effectively prevented migration. Changes in residential status were only possible if both the original and the targeted "work unit" agreed. Legal migration thus happened with official consent only, and was often of a private nature (for example marriage).

At the Third Plenary Session of the 11th Central Committee of the Chinese Communist Party (CCP) in December 1978, the reformist wing of the CCP around Deng Xiaoping announced the program of "four modernizations." In its original order, industry was put first (heavy industry received priority over light industry), agriculture had second place, science and technology third, and national defense fourth.

By March 1979, the order was changed, with agriculture coming in first place, followed by light and then heavy industry. China also opened the doors to foreign

investment with the policy of reform and opening (gaige kaifang). The first Special Economic Zone (SEZ) was set up in Shenzhen in the early 1980s with tax incentives to attract foreign capital and businesses. However, the abandonment of the "iron rice bowl," the discarding of socialist principles such as egalitarian development, and hence the acceptance of uneven economic development by letting parts of the society and the country get rich earlier than others have produced a widening wealth gap.

The strict control of people's movements through the household registration system was relaxed in order to ease entrance into small towns, where unemployed rural residents could find employment in the quickly developing township enterprises. Rural enterprises thus employed rural laborers in the nonagricultural sector. In cities, migrants were welcomed because they constituted a cheap workforce for the booming coastal cities.

Moreover the establishment of free markets and a temporary *hukou* system enabled rural residents to survive in cities for some time. Reforms in the registration system, however, were also due to the increasing failure of the state to monitor movements and the necessity to succumb to reality and legalize previously illegal migration.

In 1985, the system of a temporary *hukou* was introduced. Although in recent years more migrants have managed to acquire white-collar jobs, for most of those, who are unskilled and badly educated (or not educated at all) and have no legal residence status in the city or gained only a temporary registration, the informal non-state sector remains the only employment possibility. Migration is partly enforced in order to divert unemployed rural residents to urban areas and ease the dire situation of the countryside, and partly enforced by income pressures, which make it necessary for farmers to work temporarily in towns and cities. Migrants who successfully found a job usually contribute to the income of the family in the countryside by sending money back home.

For agriculture, one decision adopted to help rural people out of poverty was a land division to the peasant household in poor areas. In 1983, this policy finally led to the "household responsibility system for agricultural production," or in short, the "household responsibility system" (bao gan dao hu, literally to contract the work to the household—hence the sometimes heard designation of the system as "contract responsibility system").

Although the word *contract* implied that the land was not in the ownership of the peasants, it effectively reintroduced the private use of land. Together with the

step-by-step introduction of this "household responsibility system," which linked the household's income to its output, the liberalization of agricultural market prices reestablished the markets for agricultural products.

The explosiveness of the unsolved social issues (developmental discrepancies, the discarding of socialist societal principles such as the "iron rice bowl" and the all-round care of the "work unit," the slow progress of abolishing widespread rural and rising urban poverty, a widening wealth gap, corruption of local cadres, and frequent unrest over working conditions, most prominent in mining areas) has alarmed the government.

The fourth leadership generation with Hu Jintao, who replaced Jiang Zemin as CCP secretary-general in November 2002, president in March 2003, and chairman of both Central Military Commissions (the CMC of the party, which is the influential one, in September 2004, and the CMC of the state in March 2005), and Wen Jiabao, who replaced Zhu Rongji as prime minister in March 2003, has changed the tone of its economic policy.

The Chinese government still finds it difficult to move against corruption.

China is now eager to emphasize its concerns for those losing out in the era of capitalist reform. A prominent phrase of Hu Jintao is yi ren wei ben—putting people first. Wen Jiabao also frequently uses the phrase. This policy implies a shift from GDP-centered to people-centered policies, which put the emphasis on a more equal, socially sustainable development. The new tone indicates the nervousness with which the government observes the frequent eruptions against unsolved social questions. According to official pronouncements, of the 48.8 billion yuan transferred to the 592 officially poor counties since 2004, 4.343 billion yuan disappeared for other purposes.

The government, however, still finds it difficult to move against corruption comprehensively and often turns a blind eye to corrupt local officials, who either divert central government funds to their own pockets or exploit the rural population through high and random fines. In imperial China, the latter measures were partly seen as additional income for local officials and can to some extent be regarded as a remnant of traditional China's policy and an inherent part of the political system.

The sincerity with which the government is regarding the disruptive nature of widespread poverty is shown by a series of articles in the *People's Daily*, the English-language version of the national daily, *Renmin Ribao*. The series mentioned the failure of abolishing poverty by 2000 and the actual rise of it, and also pointed out the problem of corruption, through which a significant amount of state subsidies goes into the pockets of local government officials, who are responsible for channeling the central government's aid to the local population.

The articles appeared especially during an international high-profile conference, Scaling Up Poverty Reduction: A Global Learning Process and Conference, which was held from May 25 to 27, 2004, in Shanghai. In addition, on May 27, 2004, a Memorandum of Understanding was signed by Chinese government agencies and the United Nations Development Program to establish an International Poverty Reduction Center in China. Also, the Poverty Eradication Awards of October 17, 2004, the International Day for the Eradication of Poverty, were publicized, a public relations measure launched in October 2003 to be awarded every two years.

Chinese Definition of Poverty

THE PEOPLE'S REPUBLIC of China has one of the fastest-growing economies in the world today. With 1.3 billion people, it also has the largest population on earth. China claims it has been very successful in reducing the number of people living in poverty. In 1978 the Chinese government reported that 250 million people lived in poverty. In 2005, the number was reportedly down to 28 million.

However, this is according to the Chinese government's definition of poverty as an income of \$.66 (66 cents) a day or \$240.90 per year. By comparison, an American teenager staffing the drive-up window at a fast-food restaurant and earning \$6.10 an hour makes more than that each week.

In the United States, poverty is defined as \$9,645 or less a year for a single person living alone. For a family of five (for example, a single mother with four children), the U.S. Census Bureau sets the poverty threshold at \$22,199 or less per year.

The causes of poverty in China are many and varied. Chief among them are adverse natural conditions and government corruption. In 1978, China introduced policies ending communist centralized agricultural planning. It returned land used for communal farms to individual families, restoring family farms. Freeing up the productive capacity of hundreds of millions has become the single largest factor in helping China's rural poor escape poverty. In the communal farm system, the emphasis had not been on production, but on advancing politically. The result was cronyism and sagging productivity.

With traditional farms restored, incentives would seem to be back for farmers to profit personally from hard work, risk-taking, and increased productivity. However, the Chinese government's claims of vast gains are not to be believed, according to a best-selling book published in China in 2003 that was abruptly pulled from bookstore shelves in 2004 after selling more than 150,000 copies in a matter of weeks. The 460-page report, A Survey of Chinese Peasants, alleges that after years of celebrated agrarian reforms and impressive claims by the Chinese government, many remote Chinese villages are still farming in primitive conditions and have again fallen into deep poverty.

The authors charge that the benefits that peasants gained from reforms largely disappeared because of corruption. In the past decade, rural tax burdens have increased four to five times, with as many as 360 different fees imposed by all levels of government. A farmer, says the book, has to pay three times more taxes than a city resident even though his annual income is only one-sixth that of an urban dweller. Sometimes the taxes are the result of a corrupt political system that gives far too much authority to a select few.

The authors tell of the death of a young villager named Ding Zuoming. In 1993, Ding uncovered corruption among village communist officials after one-third of his and other villagers' annual income was taken as taxes. When he organized the farmers to request an audit, local police beat him to death. The villagers rebelled when the local authorities tried to cover it up as an accident, and central authorities finally intervened to punish the killers. Even so, justice has not been done. When the authors visited Ding's family, all three of his children had been forced out of school because of poverty. His wife had broken an arm while working, his mother lay paralyzed in bed, and his father was too ill to work.

Meanwhile the small amount of compensation promised by the government for his death never materialized. From such a disturbing picture the authors examine the difficult and complex reform efforts in several provinces. By reconstructing the debates, decision-making process, progress, and setbacks, the report exposes the failures of the entire system.

A long chapter is devoted to how local officials led former president Jiang Zemin, former premier Zhu Rongji, and other leaders to inspect dressed-up "shining spots" where they were impressed by what they saw. They then came up with unattainable policies based on false realities.

Thus, the authors warn, measures for reducing the peasant burden or increasing rural income will not change the social structure that exploits peasants.

Therefore, some experts say encouraging reports by the Chinese government are to be viewed with skepticism.

Christian Antipoverty Campaigns

SEVERAL TIMES IN THE New Testament, offerings for the poor, especially those at Jerusalem, are mentioned. These were in part a response to the First Church Council in Jerusalem, in which Paul's ministry to the Gentiles was affirmed and he was charged to "remember the poor" (Galatians 2:10). These references show that since the beginning of the church, Christians have been aiding the poor. Today a vast number of programs are under way not only to provide relief, but to eliminate poverty altogether.

Christian antipoverty programs occur at the local church, regional, national, and international levels and in recent times at a global level. Some of the antipoverty programs are church-based and some are parachurch in nature.

The ecclesiastical antipoverty programs begin with the local church and the individual Christian. There is hardly a church that does not have some kind of fund to at least provide relief for the poor. The churches in the countries and areas where Christianity has been long established are usually wealthier. Most of these are engaged in numerous local ministries for the poor. Churches, no matter how small, give to a variety of ministries to the poor. Many aid local people who call asking for help with fuel, medicine, food, and all manner of assistance. Local programs can include food

banks and soup kitchens, adult and childcare, Meals on Wheels, Room in the Inn for Abused Women, and numerous other charitable actions.

For churches of over 100 or so members there is usually a food pantry, clothes closet, and numerous offerings for special projects to aid the poor locally or in some foreign mission. Some of these local offerings may be for something like the PATH program in Cherokee Presbytery (northwest Georgia) of the Presbyterian Church (USA). PATH is the Presbyterian Answer to Hunger. Church members save two cents for every meal each year, which is about \$23 per person per year. The change is collected about Thanksgiving time and used to feed the hungry in the region and for food supplement programs in Nicaragua or Ghana. This example could be matched by thousands of unique ways in which local churches unite to aid the poor.

The giving by individual Christians to all manner of charitable causes is rarely recognized as Christian giving because it is hidden by a general appeal. Americans giving over \$1 billion to relief for the victims of Hurricane Katrina in the summer of 2005 included a great many people of no faith, as well as all kinds of faith, including Christians.

In recent years initiatives have begun to deal with poverty beyond relief and development.

All of the mainline Protestant churches give to offerings such as the One Great Hour of Sharing, which is an interdenominational donation for helping the poor. Roman Catholics use Catholic Relief Services and other organizations. Mennonites use the Mennonite Central Committee. Both orthodox churches and Protestants have joined together in organizations such as Church World Service. Many of these programs are linked to a network of antipoverty organizations.

Charitable activities such as these have gone on for generations. These offerings have ministered not only to the local poor, but to those in the poorest countries. Missionaries have long appealed to Christians in established churches for help.

The advent of the internet has allowed information to flow from distant places where relief is needed to people in wealthier areas of the world. Christians working in the poor countries can often gain help for relief by an appeal that is acted upon by advocates in churches in North America or in Europe. For example, an e-mail from Malawi, describing the growing likelihood of star-

vation due to drought, received on a weekday can be shared so that by the next Sunday the whole congregation of a local church will be informed of the need and asked to give. A response of this kind will be much quicker than a request for foreign aid to governments. Rarely, however, is aid from any source enough to provide complete relief, not to mention ending poverty altogether.

Since World War II, ecclesiastical antipoverty programs have been paralleled by parachurch organizations. These are organizations operated by Christians that engage in relief and long-term antipoverty programs. The work that is being done is growing in scope to reach more people. They include organizations such as Bread for the World, Food for the Hungry, the Society of St. Andrew, World Vision, and many more around the world.

In recent years initiatives have begun to deal with poverty beyond relief and development. The ambitious goal of working to completely end poverty is being discussed. One such organization is CAPOR (Christian Antipoverty Online Resource), a website being used to organize and coordinate Christian ministries engaged in fighting poverty.

Another movement is the Micah Challenge, a Christian antipoverty program taking its inspiration from Micah 6:8. It is a response of the World Evangelical Alliance (WEA) to the problem of poverty. There are Micah Challenge organizations in Canada, the United States, and elsewhere, all part of the International Facilitation Group of the Global Call to Action Against Poverty (GCAP), which is a global Christian antipoverty program. These and many other groups are connected with the Developmental Gateway and have issued a Global Call for Action Against Poverty. Loosely associated, these Christian groups are also willing to work with governments and with secular or non-Christian groups in the common cause of relieving poverty.

Occurring at a rapid pace is a vast networking of ministries focused on a common goal. Jim McDonald, who is with Bread for the World, has described, in Catholics for Faithful Citizenship, the work of Christian antipoverty programs as a "rising crescendo" around the issue of global poverty. This movement engages vast numbers of Christians in patterns of ministry for the poor that unite them despite denominational or theological differences.

Perhaps the most ambitious vision for ending poverty is the developing service of Rick Warren, the pastor of the Saddleback Church and author of *The* Purpose-Driven Life (26 million copies sold). Warren's wife, Kay, feeling a call from God to do something about HIV/AIDS, especially in Africa, enlisted Rick's help. Together with Bruce Wilkinson (author of The Prayer of Jabez) and others, they made contacts with local pastors in Africa. The antipoverty vision that Warren sees is the uniting of the growing millions of local churches to put down the "global giants." The global giant of poverty is one of these. Warren envisions mobilizing Christians from the grassroots level everywhere, uniting them to deal with disease, poverty and other big issues that afflict the world. His plan is to enlist one billion individuals through local congregations to be purposedriven about dealing with global poverty.

Christians have also enlisted the entertainment world to conduct fundraisers to meet the needs of the poor. Musical groups have put together Live Aid concerts as part of their Make Poverty History campaign.

Coupled with the delivery of food or other supplies to the poor in the world is a growing association of different Christian leaders and groups for the purpose of lobbying governments to adopt policies and practices that will end poverty. This is viewed as the work of establishing the justice of God's kingdom on earth.

Christian Community Health Fellowship

THE CHRISTIAN COMMUNITY Health Fellowship (CCHF) is a faith-based healthcare organization that was started in rural Mississippi in 1978–79 as a small healthcare ministry for the underprivileged in New Hebron. As a part of the Christian community development in the Jackson area, there was a desire to include a rural healthcare ministry in New Hebron, Mississippi. H.P.

Spees was charged with the task of opening and managing the rural Christian healthcare program in this poor, primarily African-American community in rural Mississippi. Early in its development a newsletter was generated through which Christians wishing to become engaged in healthcare among the poor could share ideas. The newsletter was called *Health & Development* to emphasize that the focus was not narrowly medicine but health in all of its physical, mental, social, and spiritual dimensions. "Development" was a reflection that health was strongly influenced by the social and economic development process.

Currently it has offices in 48 states and its members are spread out all over the United States, Canada, and also 25 foreign countries. CCHF serves as a national network for over 1,600 Christian healthcare professionals and students and others concerned about the healthcare needs of the impoverished communities in the United States.

The goals of the CCHF are to: help provide quality healthcare for the poor through recruiting and empowering Christian healthcare workers for this important task; function as a forum to raise and discuss questions related to this vision; and create opportunities for healthcare professionals and students to meet and share stories for mutual education, support, and fellowship. CCHF seeks to attain these goals by providing publications, planning and supporting conferences, and offering opportunities for students to serve among the poor. The organization also provides technical assistance to healthcare centers interested in starting up, and evaluates existing programs.

Through a grant from the Bureau of Primary Health Care in 2000, the CCHF was able to establish a Best Practices program to identify and document existing best practices among the health ministries affiliated with CCHF; plan, implement, and prospectively evaluate new/young programs; and develop the infrastructure for a faith-based practice research network that will address important questions relevant to the CCHF-affiliated ministries.

Through a Compassion Capital grant from the President's Office of Faith-based and Community Initiatives, CCHF is expanding its provision of technical assistance and awards to new faith-based and community groups that are establishing comprehensive, community-oriented primary healthcare centers in needy communities. CCHF has a student program that aims to let the students enter the healthcare field in a faith-based atmosphere. There are projects targeted specifically for students, such as study materials, conferences,

preceptorship/rotation opportunities, the *Apprentice* (a student publication), and others.

PAUL AND TANYA SLOAN INDEPENDENT SCHOLARS

Christmas Seals

IN THE 19th and early 20th centuries, tuberculosis was a widespread disease with a high mortality rate, particularly among the poor. Before the use of streptomycin in the 1940s, there was no medical cure for this lung disease, but there were treatments that involved protracted stays at sanatoriums. These institutions were expensive to build and operate, and funding was often insufficient.

In 1903 Einar Holbøll (1865–1927), a future postmaster of Denmark, came up with the idea of using the volume of Christmas mail as a way of raising money for tuberculosis treatment. Holbøll, who was also a member of the precursor to the Danish Lung Association, was familiar with the effects of tuberculosis, particularly in children. Holbøll proposed that the Danish post office sell the Christmas Seals and that the proceeds go toward supporting institutions that would treat tubercular patients.

The first Christmas Seal was sold in Denmark in 1904, and received the support of King Christian IX and his wife Louise, who was featured on the first Christmas Seal. The money generated from the sale of the first Christmas Seal was used to build the Julemærkesanatoriet (Christmas Seal Sanatorium) in Jutland. The original Danish Christmas Seal Foundation continues to own and operate a number of these homes, albeit for children who suffer from diseases related to obesity.

In the United States, Christmas Seals were introduced in 1907 through the work of Emily Bissell (1861–1948), a humanitarian with a broad range of causes, including the Red Cross, which gave permission to use its emblem on the first American seal. As in Denmark, monies raised were used to build fresh-air sanatoria, but the U.S. Post Office was not directly involved in the sale of the seals. Today, Christmas Seals are a registered trademark of the American Lung Association, and the monies raised through their sale are used to fund the fight against lung diseases such as asthma and emphysema.

Since their inception in 1904, Christmas Seals have been sold in over 130 countries worldwide. Generally, in Christian countries, Christmas Seals in support of tuberculosis are recognizable by the double-barred cross of Lorraine, whereas in Muslim countries they are distinguished by a red crescent. In many developing countries, the proceeds from the sale of Christmas Seals or their equivalent continue to be used locally for community-based programs aimed at preventing and treating tuberculosis.

Interestingly, there is an avid community of philatelic societies specializing in the collection of Christmas and tuberculosis charity seals. Established in 1920, the International Union Against Tuberculosis and Lung Disease (the Union) works with 325 other organizations to prevent and treat tuberculosis around the world. At its annual conference on lung health, the union holds a Christmas Seal contest and chooses the best design among the submissions.

Each year over eight million people develop active tuberculosis, and almost two million die from this disease, almost all of them in the developing world. Worldwide, the prevalence of tuberculosis has declined 20 percent since 1990. The exceptions to this are sub-Saharan Africa, where tuberculosis, linked to HIV, is rising at a rate of three to four percent annually, and countries of the former Soviet Union. China and India together account for approximately one-third of global tuberculosis cases.

Church of England

THE CHURCH OF ENGLAND (also known as "the Anglican Communion") is a Protestant offshoot of the Catholic Church that shares most of the latter's structure, liturgy, and beliefs, though it adds some Protestant beliefs of its own. Christianity had been practiced in Britain since the 2nd century. In the 16th century, however, Pope Clement VII refused to annul King Henry VIII's marriage to Catherine of Aragon, who had not borne him any heirs.

Henry prevailed upon Parliament to "divorce" the Church of England from the Catholic Church and to make the English king the head of the new church. Other than that—and the annulment of his marriage to Catherine—Henry envisioned no changes in church belief or ritual, though some specifically Protestant reforms were introduced after his reign.

In 2002, the Church of England had approximately three million members in Great Britain. Worldwide, many churches and denominations are affiliated with the Anglican Communion, but membership numbers are not available.

The Church of England's antipoverty efforts follow the same general outlines as those of the Catholic Church, combining material aid for the poor in this world with a spiritual focus on living to prepare for the next world. Some specific areas of church antipoverty work are the Church Urban Fund, the Children's Society, the Church Board for Social Responsibility, the Make Poverty History Coalition, and the Trade Justice Movement.

The Church Urban Fund was founded in the 1980s to help direct financial and other aid to the poorest residents of British towns and cities. From its inception until 2005, it distributed £54 million (about \$90−100 million) to more than 4,000 local antipoverty organizations. The fund attempts "to be a Christian organization that makes a significant and lasting difference in the lives of individuals and communities blighted by enduring poverty." In addition to providing poor relief, the fund attempts to identify the causes of poverty and engage in poverty prevention as a long-term strategy. For example, the fund attempts to help women and children who are abuse victims, not least because they are at great risk for lifelong poverty.

The Children's Society was founded in London in 1881 as the Church of England Central Home for Waifs and Strays. In 1946, it changed its name to the Church of England Children's Society, and again in 1982 to simply The Children's Society. Through this program, the

church focuses specifically on the problems of child poverty in the United Kingdom. It provides food and shelter, education, daycare, nutritional counseling, and other social or family services as needed. In each church diocese, the program works with local groups to help identify the problems faced by poor families and find solutions. It helps runaways, abuse victims, and youthful offenders, and campaigns for legal changes to help poor children.

The Church Board for Social Responsibility is the church's organization that campaigns for social, political, and legal changes to improve the condition of the poor in Britain. It spotlights problems such as income inequality, low pay for working Britons, and unemployment. It supports solutions such as tax credits, minimum wage legislation, housing benefits, and exemption from tax for the poorest Britons. The board also focuses on the problems facing poor families, such as child poverty, and tries to find solutions.

In the Make Poverty History Coalition, the church tries to raise public and government awareness of the problems of poverty and marshal material support for the poor, and in the Trade Justice Movement, the church urges developed countries to pursue trade policies that help the poorest nations upgrade their economies and increase their productivity. The church also supports debt forgiveness for poor countries.

SCOTT PALMER, Ph.D. RGMS ECONOMICS

Church World Service

Church World Service (CWS) is the relief, development, and refugee assistance ministry of 36 Protestant, orthodox, and Anglican denominations in the United States. Partnering with indigenous organizations in 80 countries worldwide, CWS works to meet human needs and foster self-reliance. CWS is affiliated with the National Council of Churches and helps U.S. commu-

nities respond to disasters, resettles refugees, promotes fair national and international policies, provides educational resources, and sponsors CROP Walks.

CWS began in 1946 as a partnership of several Christian denominations responding to human needs in the aftermath of World War II. Its mission was biblical: feed the hungry, clothe the naked, heal the sick, comfort the aged, and shelter the homeless. In the 1950s and 1960s, CWS expanded its relief work to include Asia, Africa, and Latin America. During the 1960s emergency relief was complemented by social development addressing long-range needs.

CWS expanded its relief work to include Asia, Africa, and Latin America.

CWS's mission today is Christians working together with partners to eradicate hunger and poverty and to promote peace and justice around the world. CWS programs are guided by principles derived from experience: relief packages are not enough; long-term needs must be addressed to avert future crises; true partnering involves giving and taking, learning and teaching, listening and teaching; development priorities should come from grassroots partners rather than from donors; ending hunger requires integration of material assistance with attention to the root causes of hunger poverty and injustice; women are integral to lasting solutions to poverty and hunger; all people have fundamental human rights; need must be addressed without regard to religious affiliation or creed; and interfaith collaboration is essential.

The CWS budget exceeded \$72 million in 2004, supporting CWS programs for Immigration and Refugees (35.1 percent), Disaster Relief and Recovery (18.7 percent), Social and Economic Development (15.6 percent), Education and Advocacy (4.9 percent), and Mission Relationships and Witness (1.8 percent).

The CWS Immigration and Refugee Program (CWS/IRP) has resettled about 400,000 people and settles approximately 5,000 refugees annually in the United States. CWS/IRP is one of nine voluntary agencies that, through private and government funding, ensure that refugees are properly resettled, adjust to their new homes, and regain self-sufficiency. The agencies help refugees enroll children in school, seek medical attention, apply for work, receive language training, obtain housing and basic necessities, and receive legal services.

The CWS Emergency Response Program works in the United States and throughout the world to help vulnerable persons and communities achieve long-term physical, psychological, and spiritual recovery in the aftermath of natural and human-caused disasters. Globally, CWS responds to disaster through Action by Churches Together. In the United States, CWS coordinates its disaster response work through a network of Professional Disaster Response and Recovery Liaisons. CWS Tools of Hope (blankets, tents, fishing nets, clean water, microloans, garden tools, seeds) and Gift of the Heart Kits (soap, toothpaste, bandages, pencils, diapers, and emergency cleanup buckets) are widely distributed following disasters.

CWS fosters education, innovation, enterprise, and collaboration powered by local ingenuity and nurtured by self-respect. Through facilitation, capacity building, and financial support, CWS helps vulnerable and marginalized groups build just and sustainable communities. Programs addressing health and HIV/AIDS, water management, community-based development, education, women and children, civil society, and indigenous populations are being carried out in Africa, Asia and the Pacific, Europe, Latin America and the Caribbean, and the Middle East.

CWS aspires to raise awareness about poverty, the HIV/AIDS epidemic, human rights, and peace building, bringing the voices of partners into churches, community groups, and government. It educates the public about issues and legislation, and encourages and facilitates contacts by advocates with elected officials and the media.

The first CROP Walk was in World Food Day in 1969 in Bismarck, North Dakota. A thousand walkers raised \$25,000 to help stop hunger. CROP walkers solicit pledges of so much per mile from their backers for antihunger programs. Today, CROP Walks are held annually in about 2,000 U.S. communities and provide major funding for CWS development work throughout the world.

In the past 20 years nearly 5.5 million CROP walkers raised \$264 million for antihunger programs, providing seeds and tools, wells and water systems, technical training, and microenterprise loans—tools of hope for persons worldwide. About 25 percent of funds raised may be allocated to local antihunger programs.

WILLIAM H. SIMPSON WHITAKER
BOISE STATE UNIVERSITY

Civil Society

CIVIL SOCIETY IS PLACED between the individual and the state. The term is used in reference to the broad collectivity of voluntary, nonofficial, noncommercial, and more or less formally organized groups that develop in the space between the individual and the state, socializing the former and humanizing the latter.

Civil society refers to autonomous groups and associations that might cooperate but can also compete with each other. Although the associations comprising civil society have widely differing objectives, size, membership, resource levels, institutional forms, organizational cultures, and campaign tactics, they all aim at either reenforcing or altering existing rules, norms, and deeper political, economic, and social structures. Civil society refers to activities by voluntary associations to shape policies, norms, and/or deeper social structures. Civil society is therefore distinct from both official and commercial circles, though the line can become blurred at times.

The term *civil society* went through a revival in the 1990s. In 2005, it was thought of as a counterbalance to the power of the government. John Locke and others used it to separate the government from organized society, since a contract among rational men had been agreed upon in order to escape the state of nature.

Civil society describes the space of collective action and public discourse that exists between government and private citizens, and which is filled typically by citizens' movements, relief organizations, peace activists, human rights advocates, labor unions, charities, social and sports clubs, farmers' groups, environmental groups, ethnic lobbies, criminal syndicates, academia, the media, consumer protection bodies, community-based organizations, women's networks, civic clubs, citizens' initiatives, citizen action groups, nongovernmental organizations, interest groups, cultural and edu-

cational institutions, and private religious and developmental organizations. However, this term does not cover political parties, as their only reason for existence is to work to take political power. Neither is private business part of civil society, as it is private and profitoriented. Besides the understanding of civil society as "space for action," the concept is also understood to mean the society we all want to live in: trustful, tolerant, and co-operative. In the past this was a society of good manners. *Civil society* can refer to the voluntary sector as well as express an alternative vision of society.

The state should be a minimal or noninterventionist state. This type of state should be limited to looking after law and order and military defense, and it should provide space for civil society, as Adam Smith argued in his Wealth of Nations in the 18th century. For Smith, society was separate from the government, and civil society was a counterbalance to repressive government. Smith described the self-regulating economy as civil society. Protestant (Calvinist) individualism had provided the beginnings of civil society.

Smith believed that the market would give one civility, and that civil society was the result of the market, not what the government had wanted to do in the first place. In the 20th century, Antonio Gramsci in Italy emphasized culture and education, which were under threat to be used by the powerful government to impose its perspective on civil society's culture and education. Gramsci, but also before him, G.W.F. Hegel and Karl Marx in the 19th century, understood civil society as a public sphere beyond the control of the government and the family. The market needed individuals who would also play a key role in civil society.

For Hegel, this civil society, or *Buergerliche Gesell-schaft*, was the end goal of history; for Marx civil society was merely one step on the way to communism. In central and eastern Europe, at the end of the 20th century, dissidents were successful in building a "parallel society" based on active citizenship, which would lead to democracy, they hoped.

In the West, civil society promised a participatory society, which would be properly democratic to politicize the social and to deepen and radicalize democracy, as civil society does not want more welfare or economic rights. Civil society gives space to environmental, peace, feminist, and gay and lesbian groups, and leads to participation in decision-making.

These new social movements can now cooperate with each other across time and space thanks to modern telecommunications such as the internet, e-mail, and fax. As a result, there is a global opposition, and

On a global level, civil society should exist as part of the liberal state and as part of global governance.

with an increasing "NGOization" of the world, also a global civil society.

However, this global civil society needs a strong liberal state with separation of powers, checks and balances, pluralism, civil rights, and politics not as violent conflict but as an argument, in short the ability to protect this space of civil society. This might even be used to criticize the government, but at least for the time being this space might also be used to strengthen a market economy. Functions of the state in the field of welfare were taken over by civil society, not only saving the government money and leading to the reduction of the tax rate, but also smoothing the path of economic globalization. In addition, the degree of popular participation and consultation on a national and global governance level must not be exaggerated. Only a small proportion of the world's population has thus far become actively involved in civil and global civil society.

On a global level, civil society should exist as well in the same way as part of a liberal state, but now as part of global governance, sometimes also called transnational civil society or transnational advocacy networks, which have become important since the 1990s with growing interconnectedness. This global governance is part of post-Cold War arrangements—away from bipolarity to multilateralism, despite G.W. Bush's attempt at unilateralism.

Global governance is the attempt to coordinate policies on global issues, which by their very nature affect the majority of countries in the world through global warming, transnational capital flow, smuggling, and human rights. There is an increase in new centers of authority above, below, and alongside the government. U.S. citizens are today affected by decisions made by the World Trade Organization's (WTO) Arbitration Committee in Geneva, Switzerland.

Global civil society, which will become stronger, is the domain of world politics, outside the control of the state, where international nongovernmental organizations (INGOs) and other social movements pursue their specific socioeconomic and political goals. Global governance differs from world government, which is highly unlikely to exist even in the distant future, and is about establishing global rules, norms, and standards to regulate transborder conflicts such as the global drugs trade. Global governance is about civilizing, democratizing globalization, and enhancing democracy in global relations.

However, not everybody has the same resources, influence, and access to key centers of decision-making. Rupert Murdoch's News International has a greater capacity to shape the global agenda than does, for example, the Rainforest Action Network.

However, at the moment, this kind of civil society on the global level does not avoid the problems of civil society on the national level, where, after all, only a limited number of people take part in it.

Where does the ability to make decisions lie in the end, if not in the developed countries?

The first problem with global civil society, as with globalization as such, is that global civil society is not really global. Global civil society is uneven globally; it is a developed countries' (DCs or northern) civil society. The International Monetary Fund (IMF) and World Bank headquarters are in Washington, D.C.; the World Trade Organization is situated in Geneva, Switzerland; the North Atlantic Treaty Organization (NATO) is headquartered in Brussels, Belgium; and the the United Nations is in New York City.

Global civic activity has occurred disproportionately among white, northern, university-educated, computer-literate, propertied persons. On the whole, the world's underclasses have lacked the funds, language fluency (or translation facilities), and organizational capacities required for effective participation in global civil society.

Another problem is that global civil society is meant to affect multilateralism and to democratize global governance, to diffuse power away from Washington, D.C., but where does the ability to make decisions lie in the end, if not in the developed countries, or north? INGOs, and with them global governance, create norms, standards, and "soft law" with the threat of "naming and shaming." But in the last analysis, if a government thinks its national interest is more important, and if governments do not implement global standards automatically, what can be done about it? Who/what could arrest, punish, and incarcerate a government? Global governance has no enforcement power. INGOs affect multilateralism, but only if states allow them to do this. In the very end, it is the Group of Eight (G-8) of most industrialized countries, together with transnational companies and northern INGOs, that show the unequal power relations in the world, as (southern) NGOs (nongovernmental organizations) are limited.

Global civil society as the bedrock for global governance needs to be based on structural change; fairness in the world economy and global governance needs to have enforcement power. The way things are now organized, global civil society repeats the interests of strong states. The sovereign state has not come to an end, but state power has simply been reconfigured. Global civil society reproduces national civil society's hierarchy on a global level.

Wolfgang Deckers American International University, London

Class Analysis of Poverty

MOST SOCIALISTS, especially Marxists, have long maintained that one cannot properly understand, nor can one adequately address, poverty without linking it to deeper issues of class and exploitation underlying capitalist social relations. Class analysis recognizes that within capitalist societies the vast majority of people are separated from the means of producing their basic subsistence, including food, clothing, housing, and other necessities.

This majority, the working class, must survive by selling its capacity to work to those capitalists who own and control productive resources and is therefore in a precarious socioeconomic position. Thus, the material conditions enjoyed by a minority in capitalist societies are directly related to the material exclusion of the majority. Poverty is socially produced rather than resulting from characteristics of the individual.

From the perspective of class analysis, poverty is an inherent and regular feature of capitalist social relations rather than an unfortunate exception or by-product of some specific feature of capitalism, such as the unequal distribution of income or competition.

Instead poverty is understood as an integral, indeed central, feature of class exploitation within capitalist societies. Poverty, rather than an accidental outcome of specific economic policies or periods within trade cycles, is a necessary condition for capitalist productive relations and the accumulation of profit.

While more common in other parts of the world, class analyses of poverty are the least prominent approach taken by social scientists and analysts of poverty in North America. The most prominent perspectives on poverty within social sciences in North America explain poverty as resulting from opportunity structures faced by poor people.

In this view, deindustrialization, the decline of manufacturing and loss of decent-paying unskilled or semi-skilled jobs, generally related to economic globalization, has broadened and deepened experiences of poverty in the industrialized north. Poverty is thus regarded as an outcome of shifts in the economy from Fordism to post-Fordism or from the welfare state to the workfare state through neoliberalism.

For advocates of this approach the solution to poverty is through a return to policies and programs featured within previous welfare state regimes. Emphasis is often placed on training programs geared toward providing people with the skills necessary to compete more successfully in the labor market. Other proposed

solutions include the expansion of public works to provide job opportunities for people with limited skills. In either case, however, these proposals can be complementary with workfare schemes.

The underlying assumption is that poverty can be solved if powerful actors, such as corporations or the state, are convinced of the effectiveness of certain social programs to alleviate poverty, and consent to fund such programs. Nowhere is there a sense that powerful groups in society have a direct interest in the continuation of poverty.

Because of its primary elements, poverty is also produced as a feature of capitalism.

From the perspective of a class analysis of poverty, reducing poverty actually requires confrontation with, and the eventual defeat of, powerful social groups, most notably those who own and control capital. These groups cannot be converted to the cause of real poverty eradication because their social position is based on the ongoing existence of poverty. Indeed, for powerful elites, that is, members of the capitalist class, the eradication of poverty would undermine the social basis for their position as a privileged class within capitalism.

So long as productive property, or what is sometimes referred to as the means of production, is privately controlled in the hands of the few who make decisions about what will be produced, when, and by whom, leaving working people in a condition of having to sell their laboring capacity to these owners of capital, there will be poverty.

The negative features of private ownership and control are exacerbated by capitalist competition, which, in the search by individual capitalists for competitive advantage against their challengers, leads to technological innovations, or laborsaving devices, that contribute to unemployment as well as the movement of production in search of cheaper labor. Because private ownership, competition, and production for profit are primary elements of capitalism, poverty is also produced as a regular feature of capitalism.

A class analysis of poverty leads to the conclusion that social reforms cannot end poverty within the context of a capitalist economy. As a result proponents of class analysis advocate and work toward more radical and thoroughgoing, even revolutionary, transformations of capitalist society, generally in the direction of a society organized on the basis of some form of socialist

or communist social relations. In the most radical versions of class analyses of poverty the only possible way to really reduce or eliminate poverty is to abolish capitalist social relations altogether.

This does not mean, as is sometimes suggested, that proponents of a class analysis of poverty are idealists who do not support reform efforts to alleviate or reduce the impacts of poverty. Social democratic versions of socialism, as represented by some labor parties, maintain that the negative characteristics of capitalism can be moderated through policies that, without infringing upon private ownership, can still make significant gains in reducing poverty or lessen the impact of poverty on people's lives.

Still others view the launching of reforms as part of a transitional program that might meet people's needs in the present while contributing to a transformation of society toward socialism or communism. Regardless of which approach is taken, those who maintain a class analysis of poverty generally agree that addressing poverty requires a political challenge to the social power of capitalists and their government supporters and cannot be arrived at through a process of education and consensus.

Class Structure

ECONOMIC CLASS IS often seen as a function of income and wealth levels. According to this way of thinking, there are lower, middle, and upper classes, or alternatively, the poor, the middle class, and the rich. Members of these economic classes would not necessarily have any functional economic interests in common, but rather would have lifestyles and material interests in common.

The three classes differ first by the annual incomes of their members. In the United States there is an official federal government poverty level that could be used as the line between the poor and the (lower) middle class. In 2005 this level was set at \$19,500 for a family of four (U.S. Census Bureau, 2005). This means that any member of a family of four whose annual income was less than \$19,500 was living in poverty, and thus was a member of the lower class (poor). Demarcating the middle class is not so easy. Certainly, the lower income limit would be \$19,500, but what the upper limit would be is unclear. Some people would put it at \$200,000, some people at \$500,000, some even higher. Given that there is no generally accepted definition of the maximum income for the middle class, the range for the upper limit is quite large. At some income level, however, the upper class (rich) begins. As for the upper boundary for the upper class, the sky is the limit.

The second difference between the classes is net wealth, defined as the value of the total assets held by a household minus its debts. What is interesting to note about wealth is that a significant proportion (18 percent) of U.S. households have no wealth. Those with no wealth would include the poor, as well as the lower end of the middle class. The rest of the middle class would have minimal to fairly high levels of wealth, perhaps up to \$900,000. Wealth really begins to accumulate, however, with the rich (after all, they are considered wealthy). As with income, the upper boundary for wealth is fantastical; for a single family it is in the billions of dollars.

When class is viewed in this tripartite fashion, the middle class is by far the largest of the three in the contemporary United States. Those classified as poor are about 13 percent of the population, while those who are rich constitute about one percent or two percent depending on where the upper income limit for the middle class is set. That leaves about 85 percent of the population who would be considered middle-class. By this standard, the United States is quite homogeneous by class.

The relative size of the middle class varies considerably across countries by this definition. In India, for example, the middle class constitutes about 20 percent of the population, with the rest of the population living in poverty (the percentage who are wealthy is negligible). The Chinese middle class is even smaller, with only three percent to 13 percent of the population considered as such (*China Daily*). As a general rule, the more developed economies have a larger middle class, while the less developed economies have a smaller middle

class and a correspondingly larger proportion of the population living in poverty.

While the above definition of class is useful in describing certain economic characteristics of the population, it is not how economic class is viewed in political economy. Rather than relating to income or wealth, a class is defined by its ownership, or lack thereof, of the means of production. The means of production are defined as the tools, machinery, buildings, and all other nonhuman material with which labor works to produce output.

In a capitalist economic system these means of production are privately owned, that is, they are (primarily) not owned by the government. Those who own the means of production constitute the capitalist class (bourgeoisie). Through their ownership they are able to control production as well as control workers, those who do not own the means of production. This latter group, the working class (proletariat), owning nothing but its ability to work, must labor for capitalists in order to survive. Since they do not own anything with which to produce, workers must sell their ability to work to someone else—the capitalists—and subject themselves to the discipline of capitalists in the production process.

Only a small proportion of the U.S. working class would be considered poor.

There is a connection between this conception of class and our first conception, since there is a correlation between class as now defined and income and wealth levels. Capitalists will, on average, be significantly richer than workers. Certainly there are exceptions to this, with some workers being quite wealthy, and some capitalists not having all that much, but the difference between the average material standards of living of the two classes is large and noticeable.

Poverty is concentrated in the working class and those who are barely part of the economic system. For example, a worker earning the U.S. federal minimum wage of \$5.15 per hour would earn about \$10,300 per year, an income far below the U.S. poverty level. Only a small proportion of the U.S. working class would be considered poor, however, as the vast majority of them earn far more than the minimum wage.

On the other hand, in less developed countries (India, China, and the sub-Saharan African countries) the majority of the working class does live in poverty,

corresponding to their overall lower national standard of living. Another significant segment of those in poverty are people who have only a tenuous connection to the workforce. This so-called lumpenproletariat, or underclass, earns income only sporadically and would fall solidly within the ranks of the poor. The lumpenproletariat, however, does not constitute another class within capitalism, but rather could be thought of as a sort of classless segment of society, an underclass only marginally attached to the economic system living in extreme poverty. The lumpenproletariat barely exists in the developed economies, while it may be quite large in certain less developed economies.

These two classes—the working class and the bourgeoisie—are considered in political economy to be the two major classes within capitalism. Each exists only as a counterpart to the other. By defining class in relation to the ownership of the means of production, it can be seen that the two classes are fundamentally antagonistic. Capitalists will want workers to produce as much as possible as cheaply as possible. Workers, on the other hand, will resist being driven too hard and will want to be paid as much as possible. Thus there is an inherent conflict between the two classes over control of the production process and over distribution of income.

It is usually considered politically desirable when the poor move into the middle class.

In less developed countries, such as Mexico or China, there is a third group to be considered—the peasantry. Peasants, defined as those who work the land and possess their means of production, constitute a precapitalist class existing within a capitalist economic structure. Neither bourgeois nor proletariat, these workers tend to be poor, earning little from their agricultural products. While still surviving in large numbers in some countries, there is a historical tendency to push the peasantry into the ranks of the proletariat. Thus, in developed countries, such as the United States or Germany, there is virtually no existing peasantry.

We have identified only two classes in the discussion above. In advanced capitalism (such as the United States), however, there appears to be a large group between capitalists and workers. This group would include, among others, the intelligentsia, managers, teachers, entertainers, and engineers.

Some economists believe that this group constitutes a new class because they are in economic opposition to both of the other two classes. Since they are wageworkers, selling their ability to work to capitalists, this middle class would have economic interests opposed to capitalists, and since they control and manage workers, they would also have a fundamental antagonism to workers. While acknowledging the existence of this middle stratum, other economists would see this group as occupying a contradictory class position, not really a class, but sometimes aligning with workers and sometimes aligning with capitalists. Whether a separate class or not, because of its large size, this middle stratum plays a significant role in the class structure of advanced capitalist economies.

The middle class defined immediately above—according to the position occupied in the workplace—is similar to the middle class first defined by income and wealth levels. While most of the middle class defined above would fit into the income middle class, the latter would also include much of the working class, especially in developed economies. We should also note that the middle class in both definitions is often considered a stabilizing force within a political system. Thus it is usually considered politically desirable when the poor move into the middle class, defusing any revolutionary tendencies they may have.

In addition to the basic division between classes, there also exist divisions within each class. For example, within the capitalist class there may be conflicts that arise between financial institutions, which lend money, and industrial capitalists who use this borrowed money for production: the former would want to receive high interest payments while the latter would want interest payments to be low. Similarly, within the working class, interests may differ between skilled and unskilled workers, or between workers and foremen. Thus, within the overall division of society into two classes, there is a further division of the classes into various parts.

It is the essence of class that society is not seen as a collection of atomized individuals. Their group identification—in this case defined by their ownership relation to the means of production—influences and informs their interactions in society. They will differ as individuals, of course, but they will have important similarities as workers or capitalists, especially with regard to their economic relations in society.

In addition to class, other social groups can be identified. For example, individuals may be members of gender, racial, ethnic, or religious groups that are important to their identity as social beings. While these intersect with class in a complex way and may influence how class is experienced, it is important to note that they are

distinct from, and have a different economic status from, class. All of these social formations combine into a complex social structure in which individuals come together in overlapping groups, acting not as isolated economic agents but as members of various social groups.

Economic class is considered important in political economy because it is thought that economic interests primarily lie with this particular grouping. Because of this shared economic consciousness, strong political-economic bonds should be formed in opposition to the other class: class "distinguish[es] the groups whose antagonisms define the basic historical processes," according to Leszek Kolakowski.

Political economy sees economic class as one of the most important divisions within society affecting the historical development of the economy. The class structure of capitalism is both simple, consisting of only two (or three) classes, and complex, with numerous divisions within the classes interacting with each other and with the other classes, as well as with all of the other non-class societal divisions. The nature of the class struggle, along with the struggles of the other nonclass groups, will determine in large part the future of capitalist economies.

Cleveland, Grover (Administration)

NO PRESIDENT HELD TO his convictions more steadfastly than Grover Cleveland. He was born in Caldwell, New Jersey, in 1837. Cleveland practiced law in Buffalo, New York, and later became mayor of that city after some local businessmen encouraged him to

Grover Cleveland's second administration presided over the depression of 1894, which threw many Americans into poverty.

run. He earned a reputation for honesty by exposing corruption in Buffalo. This reputation helped him to become governor of New York, and as governor Cleveland fought the corruption of Tammany Hall. He gained such a reputation as an anticorruption reformer that a run for the presidency became possible.

The Democratic Party nominated Cleveland for president in the election of 1884. The Republican candidate, James G. Blaine, had strong ties with special interests on Wall Street and in the railroad industry. The contrast between the incorruptible Cleveland and Blaine was so great that many Republicans voted against their party's candidate. Cleveland won by a mere 29,000 popular votes and 37 electoral votes. In his inaugural address, he pledged himself to peace, civil service reform, fiscal austerity, and government on constitutionalist principles.

As president, Cleveland resisted special-interest politics, largely by vetoing legislation from Congress. Cleveland vetoed more legislation than any previous president in an effort to watch over the Congress's tendency to favor special interests. This earned him the nickname "the guardian president." He vetoed bills to support farmers in Texas and for false claims to veterans' benefits, and investigated railroad landholdings in the west.

Cleveland believed that paternalism "weakens the sturdiness of our national character." Toward the end of his first term, Cleveland pushed to reduce tariffs despite industrial support for protection. Big business supported Republican Benjamin Harrison and funded his campaign lavishly. He was warned that this would damage his chances for reelection, but insisted that he must stand for his principles. He won the popular vote but lost the electoral vote.

The fact that Cleveland would not bow to special interests may have cost him immediate reelection, but he would return to the White House. Cleveland won the election of 1892 but soon faced a severe depression. The unemployment rate reached 18 percent. Many businesses failed and unemployed workers endured dire economic circumstances. Cleveland's main economic policies were to repeal the Sherman Silver Purchase Act and to maintain the treasury's gold reserves.

Cleveland blamed the Sherman Antitrust Act for the depression. He also broke a railroad strike by 150,000 workers in Chicago. This action proved highly controversial. He also pressured the British to accept an agreement over the border of Venezuela, and justified his strong stance with the Monroe Doctrine. He also got involved in a dispute with Germany over Samoa. As before, he suffered a political loss for having taken strong stands. The Democratic Party nominated William Jennings Bryan instead of Cleveland in 1896.

Cleveland retired to Princeton, New Jersey, and died in 1908. Many historians have criticized Cleveland's second administration for its economic policies. Yet the depression of 1894 ended by the time he left office. Cleveland's commitment to principles, resistance to special-interest politics, and strict opposition to corruption separate him from many other politicians. His efforts to overcome corruption and machine politics did not always succeed. Yet the fact that he made such an effort at risk to his own political career is what is most commendable about his presidency.

Clinton, William (Administration)

IN 1992, GOVERNOR Bill Clinton of Arkansas came to the presidency on the strength of his personal charisma and his strategic vision for a "third way" in American politics that borrowed from both traditionally Republican and Democratic approaches to social and economic problems.

Promising voters that he was a "New Democrat," Clinton spent his two terms distancing himself from the pervasive image of Democrats as poor stewards of the economy and as soft on crime and welfare, an image whose popularization had been the work of the two previous administrations. Despite Clinton's preference for consensus building over ideological confrontation, his personal Horatio Alger story and the dream of recapturing the White House after 12 years of exile gave liberals in his party reason enough to support him.

To conservative Democrats and Republicans, Clinton's open intention to revisit some of the most precious building blocks of the 1960s welfare state, including the welfare program itself, signaled a willingness to compromise that gave them new hope for change in social policy.

BIOGRAPHY AND PHILOSOPHY

The youngest man elected to the presidency since John F. Kennedy, Clinton had achieved the office absent his hero's privileged background. Born to a widow in one of the poorest states in the country, Clinton emphasized his personal experience with deprivation and the avenue for achievement that education had afforded him (he was educated at Georgetown, Oxford, and Yale). As governor of Arkansas for five terms, Clinton made a name for himself as an innovative reformer who sought consensus between the political parties.

Seen by many as a throwback to Kennedy, Clinton's campaign in 1992 was based on a combination of in-

spiring rhetoric, personal likeability, and a coherent message that a cautiously activist government should nurture responsibility, opportunity, and community. Clinton's poverty-fighting philosophy largely reflected these themes throughout his administration.

POVERTY POLICY AND ECONOMIC AGENDA

Clinton governed during the longest period of sustained economic growth in U.S. history. High-technology innovation, falling interest rates, and low inflation all contributed to the economic boom and provided the government with many of the resources necessary to ensure that the rising tide did, indeed, lift all boats. Clinton used essentially the same combination of macroeconomic tools, including tax credits and wage increases, that his predecessor had wielded to fulfill his campaign commitment to reward personal responsibility.

In sharp contrast to the George H.W. Bush administration, however, Clinton's first budget proposed a tax increase on workers earning more than \$250,000 annually to pay for tax relief for working families, without exacerbating the national deficit. Revenue increases and some targeted spending reductions (predominantly in defense spending), coupled with the overall economic growth, combined to eliminate the budget deficit during the Clinton presidency and amass the largest budget surplus since 1951. These conditions made targeting the working poor a more palatable legislative priority.

The poverty rate among all groups fell substantially during the Clinton years.

In his first budget, Clinton requested an expansion of the Earned-Income Tax Credit (EITC). The EITC enjoyed bipartisan support and was expanded significantly in 1993, providing a family with two children a \$.40 tax break for every dollar of income earned up to \$9,500. In 1996, the president and Democratic allies in Congress managed to win an increase in the minimum wage from \$4.25 to \$5.15.

Investment in job-training programs helped ensure that workers in low-income communities would have access to some of the prosperity made available by the tightening labor market. Yet none of these proposals demonstrated the kind of commitment to large-scale employment measures that the Democratic Party had historically supported. As proof of Clinton's evolution toward an even more moderate course than that with which he entered the office, he rejected the suggestions of more liberal advisers like First Lady Hillary Rodham Clinton, Labor Secretary Robert Reich, and Health and Human Services Secretary Donna Shalala to propose a more aggressive long-term public policy approach to the ongoing inequalities in unemployment in poor minority communities. Despite his more moderate approach, the poverty rate among all groups fell substantially during the Clinton years, largely due to the robust economy, from 14.8 percent in 1992 to 11.3 percent in 2000. Child poverty fell from 25.6 percent in 1993 to 16.9 percent in 2000.

HEALTHCARE

After Congress blocked Clinton's ambitious (some would say overambitious) national healthcare program in early 1994, the administration and Democratic allies in Congress undertook a piecemeal approach to healthcare reform. In 1997, Clinton signed the Children's Health Improvement Program into law, providing \$24 billion to cover five million children whose parents made too little money to buy private health insurance, and too much to qualify for Medicaid.

Spotty enforcement in the states made for mixed results, but the program did extend coverage to a greater number of poor children. Ensuring child immunization for all children was another long-term administration goal. By 1998, child immunization rates had hovered at near 90 percent for two years. In addition, Clinton protected and expanded the improvements in Medicaid made during the early 1990s against the onslaught of an aggressively anti-entitlement conservative majority in Congress.

HOUSING AND HOMELESSNESS

Though voters did not perceive the issue of homelessness to be as urgent and terrible as they had four years earlier, Clinton did work to continue making progress on sheltering the hundreds of thousands of men and women who still lived on the streets. During his presidency, the Housing and Urban Development Department (HUD) invested almost \$5 billion in programs to help the homeless, three times the investment of the previous administration. Calling its program the Continuum of Care, HUD helped 300,000 homeless people find housing and jobs as part of the larger goal of self-sufficiency. Focusing attention on the long-term challenges to this employment objective, Clinton included

The Bill Clinton administration's most significant effort in dealing with poverty issues was welfare reform.

drug treatment, mental health assistance, domestic violence counseling, and primary care in this program.

In a policy that concurred with Clinton's "New Democrat" approach, HUD did not invest in new public housing units during the president's two terms. Instead, emphasis was placed on rehabilitating the reputation of an agency perceived by many in Congress to be overly bureaucratic and scandal-prone. Credibility and vitality were restored to the agency. Clinton's HUD initiatives included a key program advocated by the department under the Bush administration and actively promoted by Clinton during the campaign: the creation of urban Empowerment Zones.

In 1993 the administration secured \$3.5 billion in federal funding to help low-income communities in select urban and rural zones; \$2.5 billion of the appropriation was earmarked for tax incentives to lure investment into these areas, with an additional \$1 billion provided for block grants to build safe and usable public spaces. In 1999, the Empowerment Zone program was expanded with an additional \$3.8 billion in

funding for 20 more needy regions. Another Bush initiative, the controversial Moving to Opportunity (MTO) pilot program, was resuscitated by Secretary Henry Cisneros and gave vouchers to poor people to move to rental housing in suburban communities. MTO was predicated on the notion of undermining spatial segregation of poor minority people but has achieved mixed results and is still a source of debate among housing advocates.

EDUCATION

While most of the Clinton administration education proposals were geared toward making college education more affordable for middle-class families, there were a few notable efforts to target low-income communities. The two most significant of these were Clinton's increases to Title I funding, providing better educational opportunities to 11 million poor children, and his unwavering support and expansion of the Head Start program, for which funding increased by 90 percent from 1993 to 2000. In 1994, Clinton obtained funds from Congress to establish Early Head Start to improve early childhood development among poor children under three.

Other less tangible efforts to improve educational opportunities for poor children included mentoring and literacy programs that were part of Clinton's overall effort to revive 1960s-style national service programs, providing tuition assistance to young college students in exchange for their commitment to teach in impoverished school districts and provide literacy tutoring in poor schools. These and other elements of Clinton's education policy toward low-income communities echoed earlier proposals by the Bush administration, including some form of school choice. Although an opponent of private school vouchers, Clinton supported the creation of public charter schools that could serve distressed communities. By 1998, more than 1,200 public charter schools were operating in the country.

WELFARE REFORM

In his 1996 book, Between Hope and History, Clinton wrote that "for 15 years, going back to my service as governor of Arkansas, I have worked to reform welfare, to make it a second chance and not a way of life." Indeed, welfare reform is the single most significant aspect of Clinton's legacy on poverty issues and reflected his longtime emphasis as a governor on local control of federal funds.

Replacing Aid to Families with Dependent Children with the Temporary Assistance for Needy Families program, the Personal Responsibility and Work Reconciliation Act of 1996 turned a nationwide entitlement program whose funding was determined by the federal government into a block grant system through which the federal government allocated a portion of funds to states, which had to raise revenue to supplement the cost of local services. De-emphasizing cash benefits, the act included provisions to provide some services that would help recipients move into jobs, including education and job training. The administration also proposed legislation that sought to make the transition for recipients easier, including housing vouchers, food stamps, childcare, and better child support enforcement while also giving tax incentives to companies that hired recipients, working to prevent teenage pregnancy.

Although the welfare reform bill was not as instrumental in this significant drop as the growing economy, clearly the goal of lowering the number of welfare recipients had been achieved. Some 14.1 million people received welfare benefits in 1993, the majority of them children. By 1996, when the welfare reform bill was enacted, that number had dropped to 12.2 million.

In 1999 the number had plunged further, with some 6.6 million people using the program. The legislation represented a clear victory for those who believed that the welfare system itself inculcated dependency in a population of largely undeserving poor people and discouraged family cohesion and self-sufficiency. Ideologically, Clinton's support for the Personal Responsibility Act was the most obvious sign of his divergence with many of his party's historic standard-bearers. Marian Wright Edelman, the president of the Children's Defense Fund and a longtime personal Clinton friend, called the Personal Responsibility Act of 1996 the "moral blot on the Clinton Presidency," and many of the president's supporters questioned the motives of the welfare reform initiative, intimating that the president was bowing to political pressure in an election year instead of making a principled stand. In good economic times, the decision was popular with most voters, however, and Clinton became the first Democratic president elected to a second term since Harry Truman.

MAJOR EVENTS

Although Clinton did spend a significant share of his time focused on foreign affairs, including the growing threat of terrorism, the breakdown of the former Yugoslavia, the ongoing violence in the Middle East, and brokering a delicate peace in Northern Ireland, his presidency was, true to his word in the 1992 campaign, one largely geared toward domestic issues.

With a vibrant economy and a majority of voters feeling good about the direction the country was going in, there were few major events that distracted the nation from enjoying its prosperity or detracted from the president's generally strong approval ratings among voters. Among these, however, were the dramatic loss of the House and Senate for the Democrats in 1994 after controlling the Congress for 40 years; the sometimes bitter debate over free trade, which Clinton supported; the emerging realities of globalization; and Clinton's impeachment in 1998 over questions about whether he lied under oath about an inappropriate relationship with a woman.

The debates over free trade and globalization were most relevant to the issue of poverty, provoking the final turn by the American political mainstream toward neoliberal economic policies, further diminishing the already lagging manufacturing industry that, through the efforts of organized labor and its Democratic Party, had been largely responsible for providing social mobility to working-class Americans for 50 years. The "third way" Clinton espoused clearly rejected the viability of that model, with lasting repercussions for the poor in the United States and around the world.

CONCLUSION

While pledging to focus on domestic issues and act boldly, Clinton's presidency was characterized more by piecemeal efforts to fight poverty in targeted ways than by any large-scale antipoverty programs. Provoked by a desire to prevent the downward financial pressure many middle- and working-class families were experiencing because of skyrocketing healthcare costs, his effort to create a national healthcare program that would provide coverage to every single American was a notable exception.

The defeat of the Health Security Act in Congress and the retaking of congressional control by conservative Republicans in both houses in the 1994 midterm elections left Clinton with political leverage insufficient to achieve momentous change.

For the remainder of his presidency, Clinton sought to work with members on both sides of the aisle on issues that many in the Republican Party deemed sensible ways to address poverty. However, private scandal and partisan assault on his personal character brought a swift end to any meaningful bipartisan consensus developing between the president and Congress. Clinton's impeachment and subsequent confession of personal failings overshadowed any policy initiatives his administration proposed during the last two years of his presidency, although his welfare reform initiative has become the standard of government policy toward the desperately poor.

Cold War

POVERTY WAS AN important factor in the advance of the Cold War, the ideological conflict that sharply divided the world into two contrasting blocs from the end of World War II to the collapse of the Soviet Union in 1991. The Western bloc included the United States and its North Atlantic Treaty Organization (NATO) allies, and the Eastern bloc consisted of the Soviet Union and the communist regimes of central and eastern Europe.

The Cold War did not escalate into an armed conflict between the two superpowers, although both the United States and the Soviet Union were directly involved in several conflicts such as Vietnam and Afghanistan, respectively. The two countries also engaged in the largest nuclear arms race in human history. The Cold War, a term coined by American political adviser Bernard Baruch in 1947, was fought through propaganda, intelligence services, diplomatic plots, and economic pressure.

Following the Truman Doctrine, formulated by President Harry Truman, the United States decided to send aid to countries such as Greece, which, at the end of World War II, were facing civil wars that could lead to the establishment of communist regimes. Without this policy of containment, the entire region would suffer from a domino effect, bringing about a generalized acceptance of communism.

As part of this policy, growth and development became key words in the economic schemes of the Cold War. Countries associated with the United States would be able to display affluence in contrast to the austerity associated with communism. The Marshall Plan (or European Recovery Program) was the first outcome of the new policy of containment, although it was originally devised when World War II alliances were still in place.

At the end of the war, European countries were devastated. Heavy bombings had destroyed entire cities and had damaged industrial production. The agricultural sector too was destroyed, which had led to starvation in several areas of Europe. Food shortage and high unemployment were causing discontent and social unrest. An incredible sum of \$13 billion (the equivalent of today's \$100 billion) was given to those European countries that had joined the Organization for European Economic Cooperation.

The Soviet Union and the countries in eastern Europe did not join the project. Postwar poverty was proving one of the major factors in the growth of communist parties in western Europe, especially in Italy and in France, where the PCF (French Communist Party) became the single largest party in postwar elections. Yet the PCF was forced to leave the government in 1947, and a similar fate befell the Italian Communist and Socialist Parties.

The United States had also hoped that the Marshall Plan would help to break the Eastern bloc, and in July 1947, all European nations except Spain were invited to a meeting in Paris to discuss the plan. Poland and Czechoslovakia agreed to attend at first, but were prevented from doing so directly by Moscow. The Soviet leader, Joseph Stalin, obviously feared that the plan would have caused the integration of eastern European countries within the American sphere of influence. The plan initially met with strong opposition from the Republican Party in the U.S. Congress; however, it was finally passed with a strong bipartisan majority when it became apparent that the Soviet Union was trying to extend its sphere of influence over Europe.

The plan officially began in July 1948, although substantial funds had been given to anticommunist factions in Greece and Turkey as early as 1947. In 1951, the plan ended and could not be renewed because of the expenses of U.S. rearmament for the Korean War. Although most historians agree that the Marshall Plan alone cannot be credited for European recovery, American aid contributed to revive the European economies and to defeat poverty and famine. Industrial production

grew by 35 percent in the four years of the plan and the agricultural sector exceeded prewar levels. Politically, the plan reduced the influence of the Soviet Union on western Europe and encouraged the formation of NATO, the military alliance that would strongly tie western Europe and the United States during the Cold War.

In the mid-1950s, developing countries became the next frontier of the Cold War. In the second postwar period, the rise of movements for independence of colonies in Africa, Asia, and Latin America from their respective colonial powers led to the creation of independent states. These were obviously new states where American or Soviet influence could be established. The egalitarian message of communism was a source of inspiration for many anticolonial movements that saw in the doctrine an effective response to centuries of imperial rule and oppression.

The two superpowers, in effect, created very little economic or political redistribution.

So-called Third World internationalism, the ideology that emerged from these anticolonial movements, was in its original formulation a rejection of the world's division into spheres of influence and an attempt to build peace and stability. These new emerging countries were unwilling to align themselves with one bloc or the other, as they proudly confirmed at the Bandung Conference in 1955. The states emerging from the decolonization process did not want to fall prey again to a different colonizer and thus tried to establish a "creative confrontation" by playing the two superpowers against each other to their benefit.

Yet in the context of the Cold War and of the competition between the socialist and capitalist camps to gain new allies, the leaders of these movements for decolonization soon came to be seen by Western eyes as dangerous communist revolutionaries. To counter the thrust toward social revolution that was shaking many former colonies, the United States adopted a rhetoric siding with former colonies against colonial powers and emphasizing the potential these countries had for development.

In a 1961 television debate with the Indian leader Jawaharlal Nehru, U.S. Senator Adlai Stevenson stated that the United States was firm in its opposition to colonialism and supported the people's rights to selfdetermination, which should be "the objective of all peoples everywhere." The development of Third World countries, of course, could only be fully attained under a capitalist economy.

As Bangladeshi scholar Anisur Rahman pointed out, "It was the threat of Bolshevik revolution inspiring social revolutions in the Third World that was countered by a promise of 'development' to help the underdeveloped societies to catch up with the 'developed.' Development was defined exclusively as economic development, reducing the degree of progress and maturity in a society to be measured by the level of its production."

Western countries stressed that their capitalist model had functioned to create wealth and, at the same time, had ensured democratic forms of government. Yet the very concept of development adopted by the West shows a clear descent from a colonial model, since the underdeveloped new countries were dependent on developed nations just as they once were on their mother countries. In addition, when Secretary of State John Foster Dulles stated in 1951 that Russians looked "upon anybody who is not for them as against them," he was also commenting on his future foreign policy. Faced with the reluctance of many Third World nations to side with either the capitalist or the socialist bloc, Dulles declared three years later that neutrality was an "obsolete conception and, except under very exceptional circumstances, it is an immoral and short-sighted conception."

The swift change in Dulles's position was brought about by the increasing popularity of socialism in developing countries and especially by the personal success of the Chinese leaders Mao Zedong and Zhou Enlai at the Bandung Conference. The Russian leader Nikita Khrushchev had also started a campaign of financial and military aid to nations in Asia and the Middle East. As containment was replaced by *détente* in the 1970s, the Soviet Union and America continued to compete for Third World allies.

Socialism promised a redistribution of economic resources in favor of the dispossessed, while capitalism and political liberalism encouraged a wider distribution of political power in favor of marginalized groups. Yet this international split in two contrasting blocs did little to relieve Third World countries from poverty. The two superpowers, in effect, created very little economic or political redistribution. Third World countries such as Vietnam and Afghanistan were often the battlegrounds where the Cold War became a military confrontation between the blocs, although not between the two superpowers. These conflicts and the totalitarian govern-

ments that often followed augmented poverty and caused cruel massacres.

In spite of the West's image as the champion of democracy, American administrations supported totalitarian governments such as the regime in Indonesia and the dictatorship in Zaire. Through the Central Intelligence Agency (CIA), the United States also organized coups to overthrow democratically elected governments, as was the case with the military putsch that killed the Chilean socialist leader Salvador Allende. Several African countries are still suffering from the civil wars between Marxist-oriented factions and those subsidized by NATO. In Angola, for example, factions intermittently fought from the late 1970s to 2002. Ravaged by the civil war, since the cease-fire the country has not had free elections, which were scheduled for 2006.

Paradoxically, the focus on international relations and on how to win poorer countries to their respective blocs led the two superpowers to neglect poverty at home. Suddenly, at the end of the Cold War, Russia and America discovered their own poor. The dissolution of communist regimes and the transition to a free-market economy was traumatic for the Soviet Union and for many eastern European states. A large percentage of people of former communist countries now battle with poverty, and their living conditions and life expectancy have declined.

Schemes to reduce poverty in America were implemented during the Cold War, including Lyndon Johnson's ambitious War on Poverty in the 1960s. Yet these met with mixed success. Johnson's War on Poverty, for example, had a limited impact on rural areas and did not discourage migration to the already overcrowded northern cities. The large military spending of the Cold War led to the neglect of domestic social problems, particularly during the presidencies of Ronald Reagan and George Bush.

At the end of the 1980s, historian Paul Kennedy diagnosed the United States with the same "imperial overstretch" that had afflicted the United Kingdom and Spain in earlier centuries. The nation's productivity and competitiveness had to be restored and its federal debt drastically reduced if America was to avoid decline. President George H.W. Bush dismissed these gloomy forecasts, yet his neglect of domestic poverty, unemployment, and homelessness contributed to his defeat by Bill Clinton in 1992.

Colombia

AFTER SEVERAL YEARS of battling with the Spanish, troops led by Simón Bolívar won independence for a large area of South America in 1824. Bolívar united Colombia, Venezuela, Panama, and Ecuador into Gran Colombia. The union collapsed in 1830, and Colombia, Ecuador, and Venezuela emerged as separate nations.

For several decades, Colombia has faced an insurgent struggle to overthrow the government, financed in large part by funds from the drug trade. In response, a large paramilitary army has surfaced that is challenging the insurgents over territory and for control of the drug trade. While neither group has been entirely successful in its efforts to take control of the country, they do interfere with the government's ability to function in rural areas and with the right of Colombians to enjoy a basic standard of living free from violence. The political instability has also had a negative impact on the Colombian economy and on relations with neighboring countries

While the Colombian economy has become more diversified in recent years, the agricultural sector still makes up almost a third of the labor force. Colombia is subject to occasional earthquakes, droughts, hurricanes, floods, landslides, and volcanic eruptions that can devastate crops. Some 46 percent of the labor force are involved in services, and 24 percent are engaged in industry. Officially, unemployment stands at 13.6 per-

cent; but it may be as high as 20 percent by unofficial accounts.

With a per capita income of \$6,600, Colombia is an upper-middle-income nation with the potential for economic success. Natural resources include petroleum, natural gas, coal, iron ore, nickel, gold, copper, emeralds, and hydropower. While petroleum production has declined, coffee production has increased, along with the possibility of expanding into new markets. Since 2003, Colombia has made definite steps toward economic recovery. The government has instituted a program of austerity and is determined to reduce public debts and to develop export-oriented growth.

The internal strife in Colombia has resulted in the forced displacement of around three million people since 1985. In 2002, some 320,000 people moved to other parts of Colombia to avoid open warfare. Since 2003, an additional 90,000 people have been displaced. Between 2000 and 2003, approximately 100,000 Colombians fled to surrounding countries for safety.

The vast displacement in Colombia has contributed to the poverty that plagues the country. Estimates of the poverty level vary from 55 to 64 percent. It is estimated that 80 percent of all rural residents are poor and that one-fourth of the population lives in abject poverty. Almost 23 percent of Colombians live on less than \$2 a day, and 8.2 percent subsist on less than \$1 a day. While the poor are struggling to survive, the wealthiest portion of Colombia's population is supported in part through the drug-trafficking rings run by the paramilitary groups. The richest 20 percent of Colombians claim 46.5 percent of resources while the poorest 20 percent share 2.7 percent. Colombia is ranked 57.6 on the Gini Index of Human Inequality.

There are only 94 doctors for every 100,000 patients in Colombia, and six to 20 percent of the people have no access to affordable essential drugs. Nine percent of the population lack access to safe drinking water, and 14 percent lacks access to improved sanitation. Around 48 percent of Colombians have no healthcare, and Colombians face vectorborne diseases such as malaria and dengue fever as well as from communicable diseases and respiratory ailments.

In the past, Colombians have also been susceptible to river blindness, a disease spread by bites from black-flies. This disease is now under control through the efforts of the Carter Center of Emory University. The Carter Center has teamed with local officials to teach prevention and to dispense necessary medications. HIV/AIDS has also become a growing threat in Colombia, with a prevalence rate of 0.7 percent. Approxi-

mately 190,000 people are living with this disease, which has already killed 3,600 people.

Life expectancy in Colombia is 71.72 years. With a projected life span of 75.7 years, females outlive males (67.88 years) by an average of seven years. Among the population of 43,954,279, the median age is 26.04 years. Around 31 percent of the population are under the age of 14, and 5.1 percent have reached the age of 65

Between 1970 and 2005, infant mortality in Colombia dropped significantly from 69 to 20.97 deaths per 1,000 live births. Among children under the age of 5, the mortality rate fell drastically from 108 in 1970 to 21 in 2005. Seven percent of all children under the age of 5 are malnourished, but the number of children who are malnourished has fallen steadily since 1980, when 17 percent of under-5s were malnourished. About 14 percent of under-5s suffer from moderate to severe stunting. Nine percent of all infants are underweight at birth. Immunization rates for children from birth to 23 months range from 81 to 91 percent. Immunization rates have risen in recent years in response to the efforts of international organizations.

Since 2003, Colombia has made definite steps toward economic recovery.

Between 1980 and 2005, the fertility rate of Colombian women dropped from 3.9 children per woman to 2.56 children per woman. The adolescent fertility rate is 70 per 1,000 births. Sexual activity among teenagers has increased, and adolescent fertility has risen by 19 percent in urban areas and by 47 percent in rural areas. In 1980, barely half of Colombian women practiced birth control, but that number increased to 77 percent by 2005.

Trained medical staff attend 86.4 percent of births in Colombia, but attended births generally take place in urban areas. Elsewhere, access to prenatal and antenatal care is poor. Based on modeled estimates for 2000, maternal mortality occurs at the rate of 130 per 100,000 live births. Rates of illiteracy in Colombia have been reduced over the past decades. In 1980, 15.1 percent of males and 16.8 percent of females over the age of 15 could not read and write. Within 10 years, illiteracy rates had declined to 9.7 percent for males and 10 percent for females. By 2005, 92.5 percent of the relevant population were able to read and write, and differences according to gender were negligible.

Officially, most Colombian students attend school for 11 years, but it has been estimated that as many as 1,800,800 children are outside the school system in Colombia. Among those who are counted, basic education rates have improved, and the grade completion rate has rosen for both boys and girls.

By 2003, 88 percent of males and 92 percent of females were completing primary school. Over one million Colombian children between the ages of 5 and 17 are working. Large numbers of children are either commercially or sexually exploited, and a number of children have been forced to take up arms against the government or rival groups.

Human Development Index Rank: 69 Human Poverty Index Rank: 8

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Colonialism

COLONIALISM IS A FORM of imperialism based on the maintenance of complete control over an occupied entity by a ruling state. In a colonial situation the ruling party, usually represented by occupiers from a stronger state, will exercise all executive, judicial, and legislative power over the inhabitants of the occupied territory. Power is invariably extended to control over the economic activities taking place in the colony and the acquisition of resources and processed goods found and produced within the colony.

The colonial master strictly orchestrates the movements and activities of the colonial inhabitants, and their efforts are directed to benefiting the occupying state. Implicit within the concept of colonialism is the inequality of human rights.

Two major periods of global colonialism have occurred. The first period followed the European discovery and occupation of unknown lands in the western hemisphere, beginning with the voyages of Christopher Columbus in 1492. At that time in human history, Spain and Portugal were the leading maritime nations and leading contenders to reap the spoils of new territories. Protracted competition between these two countries was avoided when the Treaty of Tordesillas was signed in 1494. The treaty divided the newly found lands between Spain and Portugal. A line of longitude was drawn 1,800 kilometers west of the Cape Verde Islands. The treaty stated that Spain would receive all lands to the west of the line and Portugal all lands to the east. The great benefactor in this treaty was, of course, Spain. It received all of North America and the majority of the territory in South America. Portugal acquired only the eastern portion of South America that extends into the Atlantic Ocean. Modern-day Brazil, with its Portuguese language, is evidence of the original territorial grant in 1494.

The second wave of colonialism occurred in the last quarter of the 19th century. The activity was efficiently planned and prosecuted. The Berlin Conference was held in 1884 to decide which European country would occupy what regions of Africa. The eventual occupation and control of most of the continent of Africa brought extensive and irreversible changes to the region.

The impacts of the occupation are felt even today, decades after the eventual relinquishing of control and the end of colonialism. Enormous expanses of territory were claimed and occupied during both periods of colonialism. By the beginning of the 20th century, 90 percent of the land area on the African continent came under colonial control. In Polynesia, 99 percent of the land was colonized and in Asia, 56 percent. All of Australia was colonized and 27 percent of the Americas were under colonization at tat time. In Africa, France and Britain together colonized over 70 percent of the land. Other major colonizers during the 19th century were Belgium and the Netherlands. Germany began colonizing activities in Africa in 1914.

The primary incentive during both major periods of colonialism was economic gain for the occupying state. In Latin America, and to a lesser extent in North America, extensive landholdings were taken in the name of the occupying state and presented to individuals settling in the new lands. In addition, vast amounts

of precious metals were extracted and sent back to Europe. In the second period of colonialism, a system was established to extract raw materials and food products from the colonies and ship them to processing centers in Europe. These items were then used in the manufacturing process to create products of greater value, which were sold within the European countries and shipped back to the colonies for purchase there.

The major economic gain in this series of exchanges was realized by the occupying state while the colony derived very little if any monetary gain. This economic system came to be known as mercantilism, a process that greatly enhanced the socioeconomic status of the occupying state but added little to the wealth of the colony.

The colonial era issued in a global system of uneven economic development. The core-periphery concept of economic development developed to its fullest during this time. In this development model, the core represents the developed world and the periphery is composed of those countries, many of which were colonies, on the lowest rungs of the development ladder.

In many cases, the economic status of former colonies has not appreciably changed following independence. The continuation of the colonial status has been identified as neocolonialism, a situation in which both dependency on a developed country and inequality of economic gain persist. This model was articulated most effectively by Immanuel Wallerstein in his work on "world-system" analysis.

Wallerstein expands on the core-periphery relationship and identifies three basic features: 1) a single integrated world market operates in a capitalistic mode; 2) a multistate system exists in which no single country can dominate the system; and 3) a capitalist world system exists in which there are three regional components: the core, the periphery, and the semiperiphery.

The core is the generator of the world system and the greatest accumulator of wealth. The periphery is composed of countries in the developing world. The semiperiphery includes countries that are on the verge of breaking into the core.

The most compelling conclusion by Wallerstein is that there will always be a core and a periphery and that gains in the economic level of the periphery will always be exceeded in the core. In short, the development gap between the core and periphery not only will be maintained but will expand as time goes on. This is a dire prediction; however, in the time since Wallerstein published his world-system thesis, the development gap has increased.

By the middle of the 20th century, most of the colonial entities had received their independence. Yet their development situation was still fraught with difficulty. During the colonial period, full regional development of colonial territory was not furthered. On the contrary, the infrastructure of the colony was developed only to the degree that would ensure the production and transfer of raw materials to the occupying state. As such, the task of completing surface transportation systems, the building of suitable housing and sanitation systems, the opening of a new agricultural sector, and the development of profit-making industries were left to the newly independent former colonies, which, in most cases, did not have the capital to proceed.

May it be concluded that colonialism is directly responsible for poverty?

It is not surprising that nearly all of the former colonies have high levels of poverty. One of the frequently used indicators of poverty is the percentage of the population in a region or country living with an income below \$2 per day. World estimates for 2005 suggest that over 50 percent of world population are living in this precarious situation. It will come as no surprise to note that the measure is essentially zero for the developed world and 56 percent for the developing countries. The figure for Africa, where 90 percent of the land area was under colonialism, is 66 percent. For Africa south of the Sahara it is 75 percent.

The Latin American countries, the region subjected to colonization during the early period, do not have measures as low as those of Africa. For all of Latin America, the figure is 26 percent. May it be concluded, therefore, that colonialism is directly responsible for poverty? Certainly it was a factor, and in some cases under the regime of neocolonialism, continues to be an influence. But colonialism is not the only contributor, and in fact some previous colonies have attained developed country status (the United States, Canada, and Australia).

To the extent that colonialism and neocolonialism prohibit a newly independent country from developing its economic structure to the fullest, the answer is yes; colonialism contributes to poverty. However, when deterrents to economic development come from within the country (corruption in government, use of valuable resources that do not address the common good, and

the inability (or reluctance) to work toward the full regional development of the country), the answer is no.

The United Nations instituted a program to eradicate poverty and hunger in the developing world. One set of goals includes cutting in half, between 1990 and 2015, the proportion of people whose income is less than \$1 a day; cutting in half, in that same time frame, the proportion of people who suffer from hunger; and ensuring that, by 2015, all children everywhere will be able to complete a full course of primary schooling.

Comic Relief

COMIC RELIEF IS a United Kingdom-based charity that aims to end poverty and social injustice at home and in some of the poorest areas in the world. It was launched in 1985 from a refugee camp in Sudan in response to the African famine. Since then, Comic Relief has maintained a special focus on Africa. Comic Relief has a unique identity through its famous Red Nose Day. Every two years, Britons are encouraged to raise money while doing something silly at work, school, or home, wearing a red nose. Many places of employment and education take part. The day culminates in a live television broadcast where television, music, and sports celebrities join in the fundraising antics. The charity aims to mix comedy with serious issues.

Money raised by Comic Relief is distributed to programs through a grant scheme. Work conducted in Africa takes a variety of forms. Civilians in Africa are gravely affected by war and conflict. Communities are often completely destroyed, leaving the poor without access to housing, education, and basic health services,

as well as the means to continue their livelihood. In more arid areas of northeastern and southern Africa, pastoralists and hunter-gatherer societies have recently been forced out of the environments upon which they traditionally survived. Governments prefer to use land for more lucrative gain, such as tourism. Comic Relief helps such people to gain land rights as well as support small business and trading opportunities for those who need to supplement their income.

On the other hand, Africa also faces widespread migration from rural areas into towns and cities. Slum areas are created as a consequence. These areas can be especially hard on children, as a lack of employment within families can force children to work or live on the streets. Adults and children who are disabled also face poverty through widespread discrimination in Africa. Children can be hidden away, preventing them from receiving an education. Adults also need support to work independently or play a more active family role. One of the largest issues affecting the poor in Africa is the spread of HIV/AIDS. Over 70 percent of the world's HIV sufferers live in Africa. This disease has had a profound effect on families.

The majority of those living with HIV/AIDS are young adults. Millions of children have lost their parents. Thousands of others face trying to look after them. Women also face further economic responsibilities through the loss of male providers. Furthermore, because of abject poverty, these families are unable to afford the drugs that can stem the progress of AIDS. Comic Relief provides workers, counseling, and drugs to Africans as well as raises awareness about the often-fatal disease.

To reach those suffering from poverty or injustice in the United Kingdom, funds are aimed at different kinds of work. Programs cover local communities to combat social and economic degeneration; refugees and asylum seekers, as those fleeing war and persecution are often forced to leave all they own in their home country; domestic abuse, as this is the largest form of violent crime committed against women in the United Kingdom; fighting for justice, as individuals can face poverty and disadvantage because of the attitudes and discrimination of others—prejudices against the old, for example, can categorize them as unworthy of certain services; and supporting young people as they can be particularly vulnerable to alcohol and drug misuse, homelessness, and mental health problems. As well as fundraising, Comic Relief aims to promote social change through education and raising awareness of subjects such as fair trade and Third World debt.

Lucy Robertson, Ph.D. University of Glasgow

Communism

ESSENTIALLY COMMUNISM is a system of social organization in which property, and in particular productive assets, are held in common, that is, owned by the group or community instead of by individuals. In the broadest sense it comprises communistic anarchism, socialism, and communism in the strict sense. Anarchism calls for the abolishment of private property and any form of government. Socialism, on the other hand, implies the collective ownership and management primarily of the vital economic resources, or means of production. As such, socialism would be the first stage of communism, when the necessity for private property would cease and all the goods would be commonly owned. However, the modern use of the term socialism implies the abandonment of violence and revolutionary means to achieve an egalitarian society.

The rise of capitalism, reinforced by the Industrial Revolution, which began in the 18th century, created conditions that gave rise to modern communism. The working environment, wages, hours, and overall factory conditions for the new industrial laborers were appalling. The first comprehensive criticism came from French intellectuals. Gabriel de Mably (*Doutes proposés aux philosophes économiques*, 1768) and Morelly (*Code de la nature*, 1755), both apostate priests, relying on Plato's and Jean-Jacques Rousseau's ideas, advocated the equality and state ownership of property and industry. It was Morelly's ideas on state ownership that were embraced by the French Revolutionists. The revolution, however, fell short of fulfilling demands for economic egalitarianism.

IDEOLOGISTS

François Babeuf was chief ideologist and leader of a group of disillusioned revolutionaries who strenuously advocated economic equality—the right of all men to work and to share in the products of the economy. The form of communism desired by the conspirators referred mainly to the distribution of goods rather than to the means of production. He founded a political journal, the *Journal de la liberté de la presse* (later the *Tribun du peuple*), and formed a secret society known as the Conspiracy of the Equals that plotted to overthrow the government.

His plans included compulsory labor and public distribution of the product according to individual needs. The plot was betrayed to the government and Babeuf was guillotined. His doctrines, however, known as Babouvism, were kept alive by secret revolutionary societies and by his coconspirators.

Count Henri de Saint-Simon did not demand common ownership of all property. In that regard his ideas, as exposed in his Nouveau Christianisme (1825), are socialist rather than communist. A founder of utopian socialism, he was the first to emphasize the division of modern society into employers and workingmen. His writings contain ideas of positivism (Auguste Comte was his pupil at the time), socialism, federation of the nations of Europe, and many other modern trends. Saint Simon envisioned the role of state as the manager of industry, assuring that particular tasks are assigned according to capacity and rewards are accrued in proportion to work. In his model, the state and central government, rather than local authorities and/or voluntary associations, played the pivotal role in arranging the economic life of the society.

Charles Fourier, Saint-Simon's contemporary and author of *Traité de l'association domestique-agricole* (1822), advocated a different approach. According to Fourier the organization of economic life was carried out by local communities called phalanxes. The members were to live a common life and dwell in one large building called the phalansterie. Individual preferences played an important role in determining working assignments, although frequent changes of occupation were envisioned. A minimum wage that ensured a comfortable livelihood was guaranteed to every worker. The surplus product would be divided among labor and capital, but the least desirable work would obtain the highest compensation.

The practical experiments of Robert Owen inspired another utopian socialist, Etienne Cabet. Cabet's Voyage en Icarie (1840), modeled upon the work of Thomas More, described an ideal society in which an elected government controlled all economic activity and supervised social affairs. Goods were to be produced and dis-

tributed by the community as a whole, and there was to be complete equality among all its members. The book was extremely popular, and Cabet gained many followers. In 1848 he immigrated to America, and established the community of Icaria in Texas. In 1849, Cabet and his followers moved to the abandoned Mormon settlement of Nauvoo, Illinois, and established a temporary colony. After a bitter internal dissension arose in 1856, he left the settlement and moved to St. Louis, Missouri, where he soon died. The last Icarian settlement survived until 1898.

Louis Blanc, French socialist and historian outlined his ideal of a new social order based on the principle "from each according to his aptitudes ... to each according to his need." In his Organization du travail (1840) he advocated a system of national workshops (ateliers sociaux) controlled by workers with the support of the state. After the Revolution of 1848 the French government did introduce several national workshops, which did not last long because of the lack of genuine state support.

MARX AND ENGELS

The appearance of The Communist Manifesto of Karl Marx and Friedrich Engels in 1848 marked the radical departure from the utopian socialism to the doctrine called scientific communism, popularly known as Marxism. The Marxian theory of communism rested on the constructs of dialectical materialism and historical materialism. Dialectical materialism explained the class division of the society and ever-present forces that struggle to eliminate this dichotomy (class struggle). Historical materialism postulated the inevitability of a communist society that will emerge as a result of a class struggle. The history of our civilization, according to Marx, is a history of class struggle: a struggle between slaves and slave owners, serfs and gentry, and industrial proletariat and capitalists. The root of a class division in society is the presence of private ownership of the means of production and appropriation of economic surplus by owners of capital and land rather than by surplus creators, that is, laborers. The abolishment of private property over the means of production, and the establishment of the classless society are the ultimate destination in the Marxian concept.

According to Marx communism would emerge in the most economically developed societies and countries. In these countries, Marx contended, private property and ownership of the means of production, and the ensuing distribution of economic surplus, will become an obstacle for further socioeconomic development. The establishment of the social ownership of the factors of production would eliminate the economic base of the class division in society and eventually lead to communism. Communism, as envisioned in the original works of Marx, is an affluent society in which division of labor and distribution of goods and services are done according to the principle "from everyone according to his ability, to everyone according to his needs."

Marxian theories and programs became an impetus to formation of political organizations and parties known as socialist parties. While all of the socialist parties advocated and fought for the betterment of the working class, the dividing issue was whether that should be achieved through cooperation with capitalist governments and gradual reforms or through inevitable, proletarian revolution.

VLADIMIR LENIN

This division became obvious during World War I when the Second International, an umbrella organization of socialist parties, dissolved as the separate national parties that comprised it supported a war effort of their respective nations, rather than being faithful to the ideals of a class war.

The leading revolutionary organization was the Russian Social-Democratic Party, which under the leadership of Vladimir Lenin successfully instigated a coup d'etat in Russia, overthrowing the provisional government in November 1917 and establishing the first state of "working peoples" in the world. The establishment of a working socialist state in Russia substantially changed the political and theoretical landscape on which socialist parties operated.

Leninism represented a radical departure from original Marxian analysis. Unlike Marx, who believed that communism will emerge in the most developed countries where the working class is the strongest, Lenin advanced the thesis that communism is possible to achieve in the rural economies, where capitalism is still weak. Thus, according to Lenin, the strong working class, or proletariat, is a sufficient but not necessary condition for the revolution—it is the weak capitalist infrastructure that makes revolution possible (the "weakest link" thesis).

The success of the Russian Revolution led to the complete breakup of the Second International and formation of the Third International, or Comintern, in 1919. The central policy of the Comintern was that communist parties should be established across the

world to aid the international proletarian revolution. The Comintern initially called for the uniting of all the workers of the world for the coming world revolution, which would be followed by the establishment of a dictatorship of the proletariat and state socialism. As a result a classless society would emerge and the state would wither away.

NEW ECONOMIC POLICY

The bloody defeats of communist revolutions in Germany and Hungary and the advent of Joseph Stalin as undisputed leader of the Communist Party of the Soviet Union, the largest and strongest communist organization in the world, led to departure from the concept of a world revolution and the adoption of a new paradigm known as "socialism in one country." Leon Trotsky, another popular leader of the Russian Revolution, challenged Stalin's model by advocating a concept of "permanent revolution," and after being expelled from the Soviet Union in 1929, he founded a Fourth International in 1938 to rival Comintern. The Trotskyist International, however, split into many fractions and was unable to establish itself as a viable alternative to Comintern.

The victory of communists in Russia and the subsequent formation of the Soviet Union brought about profound changes in the political and economic sphere. Immediately after seizing power, Russian communists, known as Bolsheviks, implemented sweeping reforms. Private ownership was suspended and all the economic surpluses were quickly expropriated for the purpose of defending the revolution from "internal and foreign enemies."

Despite the success in mustering the resources necessary to win the civil war and repel the foreign intervention, the harsh methods of war communism led to growing dissatisfaction among the population, a sharp drop in industrial and agricultural production, and widespread hunger.

Disillusioned with the results of a primitive communism, Lenin launched the New Economic Policy (NEP), an economic policy that marked a radical departure from orthodox communism. The NEP reintroduced the market economy, and private ownership, and encouraged small businesses and entrepreneurship. The state remained in control of a few strategic sectors, such as heavy industry, known as commanding heights. In a very short period of time, the NEP resulted in a revival of the Soviet economy and substantial growth, especially in agricultural production.

The death of Lenin, and Stalin's victory in the ensuing power struggle, led to the abandonment of the NEP, nationalization and expropriation of privately owned businesses, and collectivization in agriculture. In a matter of years, the private ownership virtually disappeared in the Soviet Union and was replaced by state ownership of resources. In addition, the Communist Party and a few of its satellites (unions and various youth associations) became the only political organization allowed to operate in the Soviet society.

STALIN'S STATE CONTROL

Stalin's methods of tight state control over every aspect of Soviet society became a trademark of communism in the first part of the 20th century. The remarkable economic growth, industrialization of the country, elimination of illiteracy in the essentially backward peasant-dominated society, and improvement in the overall standard of living were overshadowed by Stalin's political repression, suppression of individual freedoms, coercion, and isolation. Socialism in the Soviet Union as a "first stage on the road to communism" had very little in common with brotherly society as envisioned by early communists, utopian socialists, and/or Marx.

The totalitarian tendencies in the Soviet Union and the tight control of other nations' communist parties by Moscow drove the wedge between socialists and communists. While the policy of total hostility of communists toward socialists was changed in the mid-1930s, it already facilitated the proliferation of radical rightwing political organizations, such as the Fascist Party in Italy, Nazi Party in Germany, and their various clones throughout Europe.

The Soviet Union's alliance with western democracies during World War II prompted the dissolution of Comintern in 1943. The cooperation between the Soviet Union and the west, however, deteriorated quickly following the war. The victorious march of the Soviet Red Army liberated much of eastern Europe from Nazi occupation. Stalin seized the moment and used the fight against Nazism to promulgate Soviet-style communism in a number of countries that came under Soviet influence—Albania, Poland, Czechoslovakia, Hungary, Romania, Poland, Bulgaria, the German Democratic Republic, and Yugoslavia.

The communist governments in these countries closely followed the Soviet path of political and economic development. Political life became dominated by the Communist Party, private ownership was decidedly

limited, and central planning was introduced throughout the economy.

Despite the visible totalitarian tendencies, Soviet resilience to the Western boycott and animosity following the revolution, heroic resistance in repelling the Nazi invasion, and undisputed economic growth and industrialization of the once-peasant-dominated Russian Empire became a desirable option to the colonial regime still prevalent after World War II.

Numerous countries that embarked on the process of anticolonial struggle and national liberation found in the Soviet Union a natural ally for their cause. However, Stalin's rigidity and tight controls, which he not only implemented inside the Soviet Union but expected to be mirrored in every other socialist country, prevented a number of newly liberated countries from joining the communist bloc.

CHINA

The most important deviation from the Soviet model occurred in China. The Communist Party emerged victorious in the civil war in China and by 1950 the communists came to control the most populous nation in the world.

The issues of personal rivalry between Chinese communist leadership under Mao Zedong and Stalin, who was more interested in exerting Soviet primacy than in building socialism in China, led to a split between the Soviet Union and China. Ideological differences between China and the Soviet Union became increasingly apparent in the 1960s and culminated in several border skirmishes in 1969 that brought both countries close to war.

In the early 1960s, Chinese socialism exhibited even harsher totalitarian features than the Soviet system. Mao's radical rhetoric against the West, the experiments with the Great Leap Forward, and the Cultural Revolution led to the China's isolation and serious economic challenges. Despite the successes in industrialization, the Chinese economy greatly suffered during the period of Cultural Revolution, when terrible losses occurred because of the ill-devised ideological paradigm according to which human resources were interchangeable across various economic sectors.

The death of Stalin in 1953 led to the relaxation of the Soviet model, and at the 20th party congress in 1956, Premier Nikita Khrushchev denounced the methods of Stalin and called for a return to the principles of Lenin. Khrushchev's erratic economic policies were followed by the period of Great Stagnation under Leonid Brezhnev, who was the leader of the Soviet Union for almost two decades. Brezhnev's economic policies were characterized by slow-paced reforms aimed at improving the cumbersome central planning and the efficiency of state-owned enterprises. Despite the partial reforms, the Soviet political system was unable to address issues coming from the growing demand in the consumer sector or the notorious inefficiency of the agricultural sector.

The death of Brezhnev and the advent of Mikhail Gorbachev as leader of the Soviet Union led to the introduction of deep and sweeping reform policies of glasnost (openness) and perestroika (restructuring). Reforms were aimed at democratizing both the political and economic sphere of Soviet society. As control steadily dissipated, centrifugal tendencies prevailed both within the multinational Soviet state and within the communist bloc.

One by one the countries of the Warsaw bloc, Poland, Hungary, Czechoslovakia, Bulgaria, East Germany, and Romania, abandoned communist rule by 1990. In 1991, driven by nationalistic fervor in many of the republics and a collapsing economy, the Soviet Union dissolved and Gorbachev resigned as president. Democratization of political life led to the dissolution of another socialist country—Yugoslavia, which slid in to bloody civil war in 1991. The disintegration of Yugoslavia marked an end to a self-managed socialist economy.

By the beginning of the 21st century, the traditional communist parties held power only in China, Cuba, Laos, North Korea, and Vietnam. However, with the exception of North Korea, all of these countries have reduced state control of the economy. The Chinese experience with the introduction of the market economy under the auspices of the Communist Party is particularly intriguing given the rapid economic growth and emergence of China as a world economic powerhouse.

The collapse of the Soviet Union and the communist bloc, and Chinese reforms brought about a radical departure from central planning and elimination of the state control over economic life. The introduction of market a economy and the severe reduction in state services, however, increased the poverty level in the majority of formerly communist countries. The poverty level was exceptionally high in some countries that emerged as successors of the Soviet Union and Yugoslavia.

The disappearance of the Soviet Union and the radical changes in the economic sector of the remaining

countries that nominally adhere to the communist ideal marked the beginning of a new stage in the history of communism.

The Soviet experiment, which hinged so heavily on central planning, state ownership of economic resources, exclusivity of the Communist Party as the only political organization, and tight control over almost all aspects of society, was unable to compete with the continuous democratization of Western countries. The internal contradictions present in the Soviet model of communism intensified with the elimination of poverty, the rising standard of living, and the economic emancipation of the population. The plurality of political views and forms of ownership and the continuous striving for personal freedom proved to be an insurmountable challenge for the rigid, command-driven societal structure of the Soviet model.

While Soviet economic achievements were hard to dispute, especially in eliminating urban poverty and raising the overall standard of living of the population, the initial economic successes were associated with great sacrifices, famines, forced labor, and often waste of resources.

Community-Based Antipoverty Programs

COMMUNITY-BASED antipoverty programs in the U.S. were created in the 1960s to address the growing problems of urban decay and concentrated poverty. Most programs were initiated during President Lyndon Johnson's War on Poverty. Johnson's War on Poverty programs included a wide variety of initiatives across several federal agencies. The programs lacked a coherent

policy that linked them together or an empirical base that guided their activities. One of the key innovations of the antipoverty programs of this era was the emphasis on community-based approaches to addressing poverty problems. Among the most important place-based programs were the Community Action Program (CAP), Model Cities, and the Special Impact Program (SIP).

CAP was one of the more innovative approaches to poverty alleviation. Through this program, federal funds were administered to local organizations that coordinated social services, including housing, employment, and educational programs. A critical component of CAP was that it required the "maximum feasible participation" of residents in the community in the implementation of the program. Local politicians were threatened by this program because it established a political process, and power, that went around local governments. Daniel Moynihan criticized the program for raising expectations among the poor that were unrealistic. He attributed the urban riots of the 1960s to these programs that failed to address the needs of the poor.

Model Cities was established through the Demonstration and Metropolitan Development Act of 1966. In response to criticism by local officials, the Model Cities program made grants directly to city agencies to improve housing and provide services to low-income neighborhoods. It also provided funds for building projects and gave local officials control over the planning process. In many ways it resembled the New Deal programs with its emphasis on slum clearance and redevelopment on a massive scale. Demonstration cities submitted proposals but were given the ability to control local projects. The key shift, however, was moving the control over the programs to city officials rather than nonprofit organizations.

The third program was SIP, which provided financial support to community development corporations (CDCs) for urban revitalization, especially housing. Over the years, this program has become the primary mechanism for the federal government to fund affordable housing. From the 1960s to the 1990s, CDCs and other nonprofits produced about three-quarters of a million units of federally assisted housing.

The War on Poverty stressed the participation of poor people in designing policies to provide services to their neighborhoods. Prior to the 1960s, New Deal programs emphasized federal intervention rather than local control. In addition, revitalization was considered largely a process of constructing new buildings and clearing out slums. The shift was not only from federal

to local, but also from people- to place-based programs. Rather than direct programs to individuals there was recognition that community context played a role in generating and reproducing poverty.

Many social scientists have been critical of these efforts to promote participation among the poor to implement these programs. Some have questioned the capacity of the poor to be involved in these programs. Others have criticized place-based antipoverty programs because they have moved away from organizing the poor to a focus on development. As CDCs have matured they rely increasingly on financial resources from institutions and place a higher priority on technical assistance than on mobilizing the poor. Some scholars make a more fundamental critique of the Great Society programs by suggesting that they were used to regulate the poor rather than to empower them. Welfare programs reduced the potential for social unrest.

Antipoverty programs took a different approach during the Clinton administration.

Although there is considerable criticism of the Great Society programs, they do represent important innovations in public participation. The idea that the poor should be engaged in the redevelopment of their neighborhoods is an idea that has survived the 1960s. Although this component has been de-emphasized over time, public participation is now considered a key component of community-based antipoverty programs.

EVOLUTION OF PLACE-BASED PROGRAMS

Since the 1960s there has been a partial retrenchment in community-based antipoverty programs. Although many Great Society programs were dismantled during the Richard Nixon and Ronald Reagan administrations, some were restructured into the Community Development Block Grants (CDBG). The CDBG program deemphasized public participation, but it still gave localities control over these resources to serve low- and moderate-income residents. The CDBG program is now one of the largest federal grant programs. Communities receive grants to promote economic development and to provide affordable housing opportunities.

Antipoverty programs took a different approach during the Bill Clinton administration. The primary vehicle for funneling resources to localities with high poverty rates was the Empowerment Zone/Enterprise Community (EZ/EC) initiative. The EZ/EC initiative established tax credits and financial assistance for employers locating in the identified distressed communities. Only communities with high rates of poverty are eligible to participate in this program. Initially, Empowerment Zones received \$100 million in block grants. The effectiveness of this program remains in question. Critics charge that many of these firms would have located in these communities anyway and it simply amounts to subsidies to businesses.

Community-based approaches to poverty alleviation have evolved over the years. Many of the programs began in the 1960s with a strong emphasis on public participation of the poor. Participation plays a much smaller role in these programs today. Current programs emphasize incentives to businesses rather than organizing the poor to provide services.

Critics of community-based antipoverty programs have raised several concerns with this approach to poverty alleviation. Most nonprofit or locally based organizations do not have sufficient resources to address the problems in neighborhoods with high concentrations of poverty. Even during the War on Poverty, the U.S. federal government could not marshal enough financial resources because of its commitment to the Vietnam War. Since that time, the financial commitment to poverty programs has waned and welfare reform in the 1990s represented a significantly different approach to fighting poverty.

Another line of criticism of community-based programs is that they cannot address the root causes of concentrated poverty, but tend to focus on the symptoms. Community-based programs have a limited ability in addressing issues such as racial segregation, employer discrimination, or the changing skill demands in the workforce. Similarly, the forces that have contributed to urban sprawl and the movement of the middle class to the suburbs in metropolitan areas are unaffected by these local programs. Middle-class subsidies for housing, the decline of mass transit and support for highways all have contributed to the changing urban spatial patterns over the past 50 years.

A more fundamental critique, however, concerns the ability of localities to promote economic development. It has been argued that community-based programs have been effective in providing affordable housing in poor neighborhoods, although they have not come close to satisfying the real demand for housing in these areas.

The contention is that there is little evidence that these efforts have been successful in generating jobs and investments in poor neighborhoods. Employers have moved out of the inner city for decades to areas with lower taxes, less crime, and cheaper labor. Similarly, middle-class residents have fled the inner city to avoid many of the problems in urban areas. Author Nicholas Lemann views these processes as natural and asserts that they are beyond the influence of local neighborhoods.

ASSET-BASED DEVELOPMENT AND POVERTY

Critics of community-based antipoverty programs raise some difficult issues. Many of the root causes of poverty reside outside poor neighborhoods. Federal programs, global economic changes, and regional landuse decisions shape the fate of the poor in these neighborhoods. Promoting community-based approaches to alleviate poverty is a bit like engaging in "blaming the victims." Yet, by stressing the role of these structural forces in poor neighborhoods, we ignore the assets that these neighborhoods possess, according to John Kretzman and John McKnight.

Asset-based development focuses attention on the resources that are available within the community, including individuals, organizations, and institutions. Individuals have experiences, training and education, and financial assets that are frequently overlooked. Organizations provide networks and social resources that can be mobilized for community action. Local institutions offer a variety of resources, including physical space, purchasing power, jobs, and expertise. The key to mobilizing these resources is mapping these assets and identifying strategies and programs that build on these assets rather than the problems of the community.

A few examples may help illustrate the asset-based development approach. In Boston, a neighborhood that suffered employment and population loss for decades started a planning process for the community, but was constrained by the large number of vacant properties in the region.

The Dudley Street Neighborhood Initiative considered these vacant properties as an asset that could be used to benefit the community. The community was able to persuade the city of Boston to grant it the power of eminent domain and it used the land to develop affordable housing projects in the neighborhood.

Other communities have focused on financial assets. Many poor neighborhoods suffer from disinvestment as financial institutions reinvest local assets in outside investments. The problem is not that the communities do not have financial resources but that these

resources are used for investments outside the area that may yield a higher return for investors. Community development credit institutions, however, invest local assets in opportunities in the area. Many of these institutions, such as microenterprise loan funds, focus on the financial needs of the poor. This model was adopted from programs in the Third World that have been used to allocate small amounts of credit to the poor. Rather than focusing exclusively on profits as the criterion for making investments, community development credit institutions inject a social element as well. These institutions attempt to decommoditize credit and ensure that local resources are used to benefit local residents.

Community-based antipoverty approaches will never be able to overcome all of the structural forces that are affecting poor communities. In this regard, Lemann is correct in pointing to the limits of community-driven efforts to ameliorate poverty. Yet there are meaningful things that can be done at the local level to address the needs of the poor. The asset-based development approach does not deny the importance of structural forces in generating concentrated poverty. It does point to resources available within the community that are underutilized and can be mobilized, along with structural changes outside the community, to address the conditions that generate persistent poverty.

Comoros

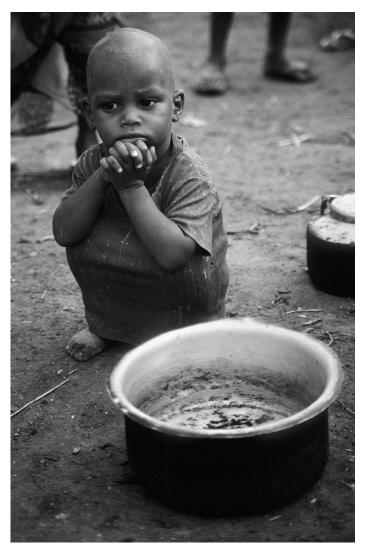

ONE OF THE POOREST nations in the world, Comoros is composed of three islands located at the northern end of the Mozambique Channel in sub-Saharan Africa. This small nation of 671,247 people has few resources to support its growing population. Many Comorans lack the education and training necessary for better-paying jobs, leaving 80 percent of the people dependent on subsistence agriculture and forcing others into the ranks of the unemployed. The Comoran economy depends on regular remittances from the 150,000 Comorans who work abroad.

Owing to a lack of arable land, Comoros is not able to produce its own food supply, including the rice that makes up the staple of the Comoran diet. This lack has created an environment in which 42 percent of all children under 5 are malnourished and in which 60 percent of the population live below the poverty line. In 2002, the Comoran government initiated community-based programs aimed at improving nutrition levels for children under 5 and pregnant and lactating women. However, most social programs tend to be of poor quality, and the poor look to their families for aid more often than to the government. Lack of data hampers a total assessment of Comoran poverty.

Much of the poverty in Comoros is derived from the instability of the government and insufficient social programs and institutions. Since the mid-1970s, 19 attempts have been made to overthrow existing governments. A military coup in 1999 paved the way for the establishment of a confederal government under a new constitution. The government pledged to upgrade education, stem population growth, and improve healthcare even as it struggles to deal with staggering debt and attempts to diversify the economy and attract foreign aid and investment.

The median age in Comoros is 18.61 years, with a life expectancy of 61.96 years. Almost 43 percent of the population are under the age of 14, and three percent are over 65. Comorans face an 18.1 percent probability of not surviving to the age of 40. General health conditions have improved somewhat, and 98 percent of the population have access to sanitation and 96 percent have access to improved water sources.

Children suffer greatly from the poverty that plagues Comoros. One-fourth of all children under 5 are moderately to severely underweight. Some 12 percent suffer from moderate to severe wasting, and 42 percent suffer from moderate to severe stunting. However, some important gains have been made in the last two

Children suffer greatly from the poverty that affects many African countries. Gains in health have been made in Comoros.

decades. Between 1990 and 2001, the infant mortality rate dropped from 88 deaths per 1,000 live births to 59 deaths per 1,000 live births. The mortality rate for children under 5 dropped during that same period. However, between 1990 and 2002, the number of infants receiving measles vaccinations decreased by 16 percent, and the number of DPT vaccinations decreased by five percent. In 2003, 63 percent of children ages 12 to 23 months received measles vaccinations and three-fourths of all children received DPT3 vaccinations. Only 22 percent of Comoran children receive oral rehydration therapy when necessary. On the positive side, the immunization rate for 1-year-olds is 90 percent for tuberculosis and 98 percent for polio.

Estimated fertility reports for Comoran women range from 4.0 to 5.09 children per woman. Estimates

place the adolescent fertility rate at 68 births out of every 1,000 women aged 15 to 19. Barely one-fourth of all Comoran women use any sort of contraception. The maternal mortality in Comoros is 480 deaths per 100,000 live births. Trained medical staff now attend 61.8 percent of all births, an increase of roughly 10 percent since 1990. The country has only seven physicians for every 1,000 people and 2.8 hospital beds for every 1,000 people. About 80 to 94 percent of Comorans have no sustainable access to affordable lifesaving drugs.

The male literacy rate is 63.6, but less than half of Comoran females over 15 possess this ability. Government emphasis on education has begun to show some success. Between 1995 and 2000, significant gains were made in the percentages of children who completed primary school. Male completion rose from 32 to 58 percent and female completion rose from 34 to 50 percent.

Comparative Research Program on Poverty

THE COMPARATIVE Research Program on Poverty (CROP) is a nonprofit international nongovernmental Organization (INGO), founded in 1992 by the International Social Science Council (ISSC) in collaboration with the United Nations' UNESCO. It is based in Norway. CROP is composed of a Secretariat and a Scientific Committee.

The Scientific Committee is the main guiding force behind CROP; its members are distinguished scholars in the field of poverty research. The funds come from multiple sources, including higher-education institutions, charitable foundations, and various United Nations agencies.

CROP is organized around an extensive international and multidisciplinary research network, which is open to all poverty researchers and others interested in a scientific approach to poverty. The General Assembly of ISSC appoints the CROP Scientific Committee to advise the program. The members of the Scientific Committee are outstanding poverty researchers representing different geographical regions and scientific disciplines worldwide.

The self-proclaimed objectives of CROP are to consider how the social sciences can better contribute to the understanding of poverty in a global context, compare the different theoretical approaches so as to understand better their links and relationships, consider how scholars working within different paradigms can develop a joint arena for multiparadigmatic poverty research, establish an international scientific network that will give impetus to a long-term research program, generate and secure high quality-data of importance for different social science approaches to the comparative study of poverty, and create a body of scientific knowledge that can be used for poverty reduction.

CROP aims to fulfill the objectives by organizing regional workshops, international conferences, and projects that serve for discussions of ideas and projects for researchers. Special emphasis is placed on projects concerning "contextual poverty," those focusing on poverty in relation to a society's cultural, economic, and political patterns; that is, those projects that focus not only on the world of the poor, the effects of poverty, and solutions to it, but also on the causes and the role of the nonpoor in creating, sustaining, and reducing poverty.

The organization publishes books, annual reports, papers, reviews, and newsletters, which are distributed globally to the CROP researchers, academic institutions, nongovernmental organizations, and governments. Topics include poverty and indigenous people, demography of poverty, social costs of poverty, law and poverty, politics and poverty reduction, poverty and water, best practices in poverty reduction, and elite perceptions of poverty and the poor. The CROP Newsletter is published and distributed four times a year, free of charge, to all members of the CROPnet. It contains articles about poverty research, reports from workshops and conferences, information about new publications, ongoing projects, future CROP workshops, as well as book announcements.

Concern

CONCERN IS THE REGISTERED name of Concern Worldwide, an Irish nonprofit company incorporated under the Irish Companies Act of 1963. It is headquartered in Dublin, Ireland. It also has offices in Belfast, London, and Glasgow and an affiliate fundraiser in New York. Concern is controlled by its members, who form the general body, maintain the Articles of Association, elect the council, appoint independent auditors, and approve annual financial statements.

The council of Concern is elected from among the membership at each annual general meeting of Concern. The council usually numbers around 35, who are rotated out of office after three years, but may be reelected later. The council meets at least quarterly. Concern is financed by donations, fundraisers, legacies, and its retail sales through Concern Charity Trading Limited, which operates in Ireland. It also provides logical and support for fundraising activities.

Concern began when people in Ireland became alarmed over the famine in Biafra in 1968, brought on by the Nigerian civil war. Starvation was affecting great numbers of people; however, thousands of Irish missionaries of the Catholic Church had served in Biafra.

A group of people in Ireland began to organize to minister to the situation. Calling themselves Africa Concern, they rallied support for relief. On June 28, 1968, Roman Catholic Bishops J.B. Whelan and G.E.C. Cockin along with Nigerian Anglican bishops of Owerri and Biafra, launched a program called the Send One Ship Appeal, or the SOS Appeal. The immediate goal of the drive was to fill one ship with relief supplies

for the people of Biafra. The people of Ireland responded with money and in-kind donations. Within three months £250,000 had been donated. The money was used to purchase the SS Columalle. It was loaded with relief supplies and sailed on September 6, 1968, for Africa. The ship was unloaded at the small west African island of São Tomé. From there the supplies were smuggled into Nigeria each night. Soon other ships were loaded with supplies and sent to São Tomé for distribution in Nigeria.

With the end of the fighting and the normalization of life the board of Africa Concern struggled with its mission. Instead of accepting congratulations for a job well done and closing its doors, the board, after much discussion, decided to set a new mission for the organization that had developed. The new mission was to work on small projects in various places, but especially in Africa. In addition it would seek to provide financial and skilled human assistance to organizations already operating on relief and development projects in the poor nations of the world.

The new mission adopted by Concern was soon redefined by events. In November 1970, a devastating cyclone struck what was then East Pakistan. The natural disaster was soon followed by a civil war between East and West Pakistan. Millions of people fled into India as refugees. In response, Concern sent a medical team to Salt Lake Camp at Calcutta. In June 1971, Concern organized the East Pakistani Famine Appeal to provide relief for the refugees.

The work in what was to become Bangladesh forced Africa Concern to change its name to simply Concern. Its mission was also changed to seek to enable the absolutely poor to achieve major changes in their material conditions and in their lifestyles in ways that are sustainable without further help from Concern. To achieve its mission, Concern works with the poor and with both local and international partners who are also working to end poverty.

The vision of Concern is the creation of just and peaceful societies where the poor can exercise their fundamental rights. In order to achieve its mission, Concern has organized itself to work with people in a caring and personal way, to deal with even the most difficult of circumstances, to work with other organizations and with governments, to use innovation to solve poverty problems, to engage in long-term development work as well as emergency relief projects, to engage in both global and civic education about poverty, and to boldly speak as advocates for the poor in situations that require either a national or a global response.

Andrew J. Waskey Dalton State College

Conflict

IT IS WELL ESTABLISHED that conflict, including war, civil war, and occupation, is linked with poverty in a number of direct and indirect ways. The primary form of conflict in the present period occurs within, rather than between, states. Thus conflict is largely over access to or control of resources and opportunities by groups within the same society. In 2003, 30 of the 53 countries in Africa were experiencing some form of intrastate conflict.

Many would argue that the strongest common denominator, indeed the root cause, of civil conflict is poverty. A study by Paul Collier of the World Bank, which examines civil wars since 1960, has found that the best predictors of conflict are low average incomes, low growth, and a high dependence on exports of primary products such as oil or diamonds. The same study found that when income per person doubles, the risk of civil war drops by one-half.

Poverty, then, not only holds negative impacts for the lives of individuals but also threatens the stability and peaceful development of entire societies. Poverty and conflict have a two-way relationship, in that poverty is both a cause and an outcome of conflict. The poverty includes not only absolute poverty but also the unequal distribution of wealth in countries that are rich in natural resources, which are controlled by governments and withheld from populations.

Countries with plentiful natural resources face additional risks, including rebellions caused by outrage when governments deny people what is deemed to be a fair share of revenues from resources such as oil or diamonds that may be located beneath a community's ancestral lands. Such has been the case in Angola, to name only one example.

Marxist theorists have long linked the instance and experiences of poverty within specific groups as being important determinants of social revolution. In classic Marxist theory, revolutionary movements are strongly linked with social processes of impoverishment among broad sections of the population.

A quick illustration of the link between poverty and conflict comes if one looks at conditions in some of the world's lowest-income countries over the last decade. In 2002, of 63 countries identified as low income, 38 are situated in sub-Saharan Africa. Of these countries, 30 had experienced some form of conflict, ranging from political violence short of war, as in the case of Mauritania, which experienced a series of coups, to large-scale international conflicts, such as the war in the Democratic Republic of Congo.

Thus there is a clear correlation between poverty and conflict in a variety of national contexts. At the same time, some analysts debate the strength of this association and have questions about the causal link between poverty and conflict. In the view of some skeptics, economic factors play a part, but not necessarily the predominant part, in the emergence of conflict.

It is sometimes argued that the link between economic concerns and ethnic conflict, for example, is quite variable and is shaped in large part by numerous noneconomic factors. Elsewhere skeptics argue that in some cases, such as Quebec and Malaysia, to cite quite different examples, economic expansion or accelerated growth failed to reduce ethnic conflicts and even showed some growth in conflict.

Some suggest that while the link between poverty and conflict is clear, there is less certainty over the conditions by which economic growth will lessen conflict or by which economic crisis will worsen conflict. According to those who question the link between poverty and conflict, poverty may lead to conflict but only in combination with other factors. For some, poverty is a necessary but not sufficient factor explaining outbreaks of conflict.

In response, those whose work draws connections between poverty and conflict reject arguments that tend to blame such factors as tribalism and social underdevelopment (meaning generally the absence of electoral democracy), which in fact have little to do with most of the world's civil wars and conflicts. The tribalism response (rather than explanation) is nothing more than an excuse for indifference and inaction from outsiders.

Any discussion of links between poverty and conflict must address broader structural issues, including the impacts of global networks and neoliberal structural adjustment programs. War-torn areas like the Congo reflect not only local issues but the internationalization of African conflicts, not only in terms of inter-

state relations but also through global business networks. Some commentators prefer to look at poverty and conflict as interlinked and intentional outcomes. A. Ismi suggests, "an unstable, war-wracked and poverty-stricken Africa amounts to a stable and prosperous West." In part, this relates to the wealthier countries' constant need for raw materials at low prices. War conditions also benefit the wealthier nations and multinational corporations by keeping supplies of minerals off the market and thereby increasing the prices gained for minerals controlled by the multinational mining firms.

The pressing need to finance the war put the Congo government in the desperate position of offering quick, undervalued deals to mining companies for exploration rights. This made resources available much more cheaply than they would have been during peacetime conditions. The structural context that has nurtured the particular regional processes in the Congo has been conditioned by neoliberal globalization, notably through the imposition of structural adjustment programs in Africa. Neoliberal globalization has encouraged the formation of often illicit, cross-border networks with multinational corporate linkages.

A couple of key points have been identified in the relationship of neoliberal approaches in Africa and the extension of Western imperialism. First among these is the extent to which "rulers of weak states who face severe internal threats and intense external pressures are the most consistent and thorough in destroying any remaining formal institutions of state," according to I. Taylor. The internal and external pressures instigated by situations like the war in Congo have the further effect of driving the privatization regimes preferred by Western corporations and governments.

Under the pressures of neoliberal structural adjustment programs and imperialist invasion and occupation, the state gives primary attention to developing and maintaining loyalty with security services. This then fuels the militarization of society as it "elevates the role and power of those with weapons and prioritises their needs over the wider needs of society, cultivating warlordism either in service to the incumbent who wears the thin mantle of sovereignty, or to his challengers," explains Taylor. This further exacerbates conditions of poverty.

JEFF SHANTZ YORK UNIVERSITY

Congo

LOCATED ALONG THE south Atlantic Ocean, the sub-Saharan low-income nation of the Republic of the Congo (Congo) was formerly known as Middle Congo. In 1990, the Congolese chose to transform their Marxist economy, and democratic elections were held in 1992. When former Marxists returned to power five years later, civil war broke out. A tenuous peace was negotiated in 2003, but the Congo is still suffering a humanitarian crisis because of the many refugees.

The Congo has great potential for further development of its large petroleum reserves. However, government resources are strained by excess mortality rates, low life expectancy, and low population and growth rates. At present, the Congo's economy combines small farming and handicrafts with a growing industrial sector. Nearly one-third of all Congolese suffer from malnutrition.

The Congolese median age is 20.7 years, and life expectancy is 48.97 years. About 37 percent of the population are under 14 years of age, and 3.7 percent are over 65. The Congolese have a 39.3 chance of not surviving until their 40th birthday.

The HIV/AIDS prevalence rate is 4.9 percent in the Congo. In 2003, it was estimated that 90,000 Congolese were living with the disease, and 9,700 deaths have resulted from the disease and its complications. The people are also at very high risk of developing food- and waterborne diseases such as bacterial diarrhea, hepatitis A, and typhoid fever, and vectorborne diseases such as malaria. In the spring of 2005, Congolese officials reported an outbreak of acute hemorrhagic fever. Approximately 49 percent of the population have no sustained access to improved water sources, and access to sanitation is sorely inadequate. General health is further threatened by limited access to physicians, hospitals, and lifesaving drugs. On the positive side, the number of undernourished Congolese dropped from 37 percent in 1990 to 32 percent in 2000.

Infant mortality is unacceptably high at 81 deaths per 1000 live births, as is the under-five mortality rate of 108. Immunization rates have declined since the 1990s. Between 1990 and 2002, infant DPT immunizations decreased from 77 to 41 percent; polio immunizations dropped from 79 to 41 percent; measles immunizations decreased from 77 to 37 percent; and tuberculosis immunizations dropped from 94 to 51 percent. In 2003, half of all children ages 12 to 23 months received measles and DPT3 immunizations. Most Congolese children who die do so from preventable diseases. About 14 percent of all children under 5 have moderate to severe malnutrition; three percent suffer from severe malnutrition; four percent have moderate to severe wasting; and 19 percent suffer from moderate to severe stunting.

The Congo's estimated fertility rate of 3.54 children per female in 2005 was a definite drop from the 6.3 children per female only two years earlier. The adolescent fertility rate, which is estimated at 143 births per 1,000 women aged 15 to 19, remains high. The Congolese maternal mortality ratio is also high at 510 deaths per 100,000 live births.

The Congo provides free and compulsory education up to age 16. After 1990, when a 90.1 percent primary school attendance was reported, a decline began that was associated with the ongoing conflict. By 2003, males were completing primary school at a rate of 59 percent and females at a rate of 56 percent. Literacy rates are relatively high for sub-Saharan Africa, and 83 percent of the population are literate, although at 78.4 percent, female literacy lags behind males at 89.6.

The Congo has established the National Plan of Action for the Advancement of Women in response to international pressure to deal with the issues of poverty and women's rights. The plan has targeted areas of concern that include violence against women, conflict resolution and peace restoration, health and environmental issues, HIV/AIDS, literacy training, human rights, and infant and maternal health.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Congo, Democratic Republic

IN THE LOW-INCOME sub-Saharan African nation of the Democratic Republic of the Congo (DRC or DROC), formerly known as Zaire, it is estimated that 75 percent of the people live in absolute poverty and 41 percent live in inhumane poverty. Even though data are often unavailable in significant areas, the extreme poverty is evident. In the late 1990s, the DRC became a hot spot for African political unrest. Three and one-half million people died in the DRC from the war and from famine and disease. Resources were severely strained by an influx of refugees from nearby Rwanda and Burundi and by the bloody civil war and ethnic strife that followed. In July 1999, under the guidance of the Carter Center and the international community, the DRC government, along with the governments of Zimbabwe, Angola, Namibia, Rwanda, and the Republic of the Congo, signed a cease-fire.

With relative stability restored after the removal of most foreign troops in 2002, the government turned its attention to improving the economic outlook for the 60,085,804 people who live within its borders. Officials faced the daunting task of coping with extreme poverty, low life expectancy, high mortality, and low growth rates. The poverty within the Democratic Republic of the Congo is somewhat remarkable because of the country's vast potential for wealth. The International Monetary Fund and the World Bank have begun working with Congolese officials to tap into these resources and to initiate much-needed economic and social reform. Reforms include diversifying the economy, which is now dominated by agriculture; improving the infrastructure; and alleviating the staggering foreign debt.

Life expectancy in the Democratic Republic of the Congo is 49.35 years. The median age is 15.8 years, with 48.1 percent of the population falling in the under-14 category and only 2.5 percent of the Congolese population living to the age of 65. The Congolese have a 47.2 percent chance of not surviving to the age of 40.

Health officials in the DRC are understandably concerned with the 4.2 percent prevalence rate of HIV/AIDS.

An estimated 1.3 million residents now live with the disease, and an estimated 100,000 deaths have occurred from the disease and its complications. Officials are also concerned about the very high risk of food- and waterborne diseases such as bacterial and protozoal diarrhea, hepatitis A, and typhoid fever, and the water-contact disease schistosomiasis. Some locations have witnessed outbreaks of malaria, plague, and sleeping sickness. Even treatable diseases pose problems for the Congolese because of the lack of physicians and hospital care and limited access to affordable lifesaving drugs. Health problems are further complicated by the fact that 55 percent of the population have no sustainable access to improved water sources and 79 percent have no sustainable access to improved sanitation.

The bloody battles have orphaned large numbers of children.

The United Nations' UNICEF estimates that hundreds of thousands of Congolese children have died from malnutrition and preventable diseases. The bloody battles have orphaned large numbers of children. Some children have been forced by rebels to engage in fighting. Infant mortality is unacceptably high in the DRC, particularly for male Congolese, and the rate has changed little from the 1980 rate of 128 per 1,000 live births. In 2000, the infant mortality rate was estimated at 129 deaths per 1,000 live births.

Out of every 1,000 live births, 101.25 male infant and 84.23 female infant deaths occur. The under-5 mortality rate is 205 per 1,000. About 31 percent of Congolese children under the age of 5 suffer from malnutrition. Nine percent of this group are severely underweight; 13 percent suffer from moderate to severe wasting; and 38 percent suffer from moderate to severe stunting. Immunization rates lag behind much of Africa.

In 2003, 54 percent of children aged 12 to 23 months were immunized against measles, and 49 percent received DPT3 immunizations. Among infants, immunization rates were 55 percent for tuberculosis and 45 percent for measles. Only 11 percent of Congolese children receive lifesaving oral rehydration therapy when necessary.

Despite the low Congolese population and growth rates, fertility is high at 6.7 children per female. That number increased from 6.5 in 1970, even though enormous advances in birth control were made during that

period. The adolescent fertility rate is 222 births out of every 1,000 women aged 15 to 19. Less than one-third of all Congolese women use any form of contraception. Maternal mortality continues to be high at an estimated 990 deaths out of 100,000 live births, an increase from the 1995 estimate of 940. Many women lack access to adequate healthcare, and trained healthcare staff are present at less than 61 percent of all births.

Attendance at primary schools is extremely low in the DRC, and the percentage of those attending school decreased during the years that political unrest was at its height. Between 1995 and 2000, male attendance at primary schools decreased from 72 to 35 percent and female attendance declined from 50 to 34 percent.

In response to international and domestic pressure to address the issue of poverty and women's rights, the DRC set up the Commission on the National Strategy for the Fight Against Poverty. The commission is made up of four female and 24 male ministers. The commission's antipoverty goals include slashing the number of the Congolese population surviving on less than \$1 a day, dealing with persistent hunger, providing free and compulsory basic education, cutting rates of illiteracy, improving HIV/AIDS education, enhancing employment and credit for women, facilitating access to healthcare, and improving reproductive health.

Congressional Hunger Center

THE CONGRESSIONAL Hunger Center (CHC) is a bipartisan, nonprofit, antihunger leadership training organization located in Washington, D.C. Republicans

and Democrats founded the CHC in 1993 in response to a 22-day fast by Democratic Representative Tony Hall from Ohio, protesting the abolition of the House Select Committee on Hunger.

The CHC follows three major strategies to fulfill its mission of fighting hunger by developing leaders. It trains leaders at the community, national, and international levels about the causes of and solutions to hunger, poverty, and humanitarian needs. It facilitates collaboration between organizations that design policy and those that develop and implement programs intended to end hunger in the United States and abroad. It increases awareness and develops strategies for the general public as well as for antihunger activists by providing skills and issues training that bridges the gap between service and public policy.

The CHC is a 501(c)(3) organization funded by grants from foundations, corporate and individual contributions, and an appropriation from Congress honoring former members of Congress Mickey Leland and Bill Emerson.

HOUSE SELECT COMMITTEE ON HUNGER

The House Select Committee on Hunger, founded in 1983 by Representatives Benjamin Gilman, Mickey Leland, and Tony Hall, sought viable solutions to domestic and global hunger and poverty. Leland, a Democrat from Texas, was a strong advocate for ending hunger and chaired the committee until his death during a 1989 humanitarian mission to the Horn of Africa. Hall then chaired the committee until the House of Representatives voted to eliminate all such select committees in 1993.

Hall's fast in protest of the House action galvanized bipartisan support for the establishment of the CHC. He and Republican Representative Bill Emerson from Missouri served as the CHC's first cochairs of a diverse board of directors representing the food industry, hunger policy experts, entertainment industry activists, and members of Congress. In 2005 U.S. Representatives Jo Ann Emerson, a Republican from Missouri, and James P. McGovern, a Democrat from Massachusetts, chaired the bipartisan CHC Board of Directors.

LEADERSHIP PROGRAMS

In 1994 CHC established a national antihunger leadership program under the auspices of Volunteers in Service to America (VISTA). In 1996 and 1997 the CHC's Beyond Food program placed 100 hunger activists in four states. Second-year Fellows were placed with policy/advocacy organizations such as Food Research and Action Center, Bread for the World, and Share Our Strength. CHC cosponsored the first National Summit on Food Recovery and Gleaning. In 1999 Congress provided funds to establish the Mickey Leland International and Bill Emerson National Hunger Fellowships. In 2004 CHC partnered with the UPS Foundation to convene the first National Hunger Forum, in Washington, D.C. By 2005 over 500 antihunger leaders had been trained in CHC programs. Program and advocacy efforts were being expanded to include close collaboration with the newly formed Senate and House Hunger Caucuses.

The Bill Emerson National Hunger Fellows Program places Fellows for six months in urban and rural community-based organizations involved in fighting hunger at the local level, followed by six months of work in national advocacy organizations, think tanks, and federal agencies.

The two-year Mickey Leland International Hunger Fellows Program provides opportunities for service while Fellows develop and refine skills useful in the global fight against hunger. The first-year field placement in a developing country allows the Fellow to research, implement, or evaluate programs or initiatives addressing issues surrounding hunger and poverty, including gender, health and nutrition, agriculture, sustainable development, and emergency relief.

Consumption-Based Measures of Poverty

CONSUMPTION-BASED measures of poverty are a class of poverty indicators that use consumption as a measure of individual welfare. A poverty measurer can

be described in terms of three main characteristics: a measure of individual welfare; a poverty line, that is, a threshold for the welfare measure below which an individual is classified as poor; and a summary statistic, for instance the proportion of the population below the poverty line (headcount ratio). Consumption and income are the most common measures of individual well-being that have been used to obtain poverty indicators.

Household surveys typically contain information on household expenditure for several product categories. However, household expenditure is a satisfactory measure of living standards only if everyone faces the same prices and everyone lives in households with the same size and composition. In most cases we observe households of different sizes living across regions or neighborhoods with different prices. Therefore, we have to make some adjustments to obtain a proper consumption-based welfare measure.

Two measures are the most commonly used to adjust for differences in prices: the money metric utility, proposed by P.A. Samuelson, and the welfare ratio, based on C. Blackorby and D. Donaldson. A. Deaton and S. Zaidi provide a discussion of the theoretical foundations and the practical implementation of these two measures.

Adjustments are necessary to get a consumption-based measure of standard of living. For instance, it is very common that rural households should invest part of their income into agricultural production inputs such as fertilizer, water, or seed. These expenditures should not be considered as household consumption but as investments. Otherwise we would overstate the actual welfare levels achieved by households. Deaton and Zaidi describe other types of adjustments for durable goods, rationing, public goods, and leisure.

CONSUMPTION VERSUS INCOME

There is a good deal of consensus on the value of using consumption as a summary measure of living standards. In recent years, researchers at the World Bank have used consumption-based measures constructed from survey data to measure poverty, to analyze changes in living standards, and to assess the distributional impacts of antipoverty policies. There are several reasons why consumption can be a better measure of welfare than income.

Consumption can provide a better picture of actual standards of living when income fluctuates significantly. In particular, consumption takes into account whether households can access credit markets or household savings at times when current income is low because of, for instance, seasonal variations. Furthermore, consumption may be better measured than income in poor economies with large informal sectors where households consume their own production or exchange it for some other goods.

VICTOR AGUIRREGABIRIA BOSTON UNIVERSITY

Contextual Poverty

TO THE CASUAL OBSERVER, it probably seems that poverty is the simple lack of material goods, and that poverty is everywhere the same. In fact poverty varies with the context in which people live. Poverty varies across communities, towns, cities, across geographic regions, and among countries.

Contextual poverty describes the differing rates of poverty that exists across communities, between communities, and between regions of the world. The differing rates of poverty can be seen between rural and urban poverty. They can also be seen between individuals who are below the poverty line and families who are impoverished.

The differing demographic factors describe differing poverty rates. Children are often poor because they are dependent upon adults. Single mothers in most cultures are poor because their husbands are not providing

support, whether through death, divorce, or inability. The aged can also be poor because they have earned income that was insufficient to provide the savings needed to support them in their less productive late years of life. Or it may be that their pension plans have been taken from them by some means (such as a company's bankruptcy). They can also be poor because they did not have children to support them. All of these and many more factors contribute to variations in poverty between individuals and groups.

Contextual studies can produce reliable research that gives a focused look at poverty.

Social scientists have conducted studies to explain the varying rates of poverty across communities. Community studies are useful for understanding community characteristics as well as community-level policies and practices. Community studies also can be used to show how policies and practices affect poverty rates.

Community studies can aid contextual studies because they take into account the variables that have been demonstrated to affect how poverty varies as a function of community demographic and economic structure. This holds true whether the community studied is urban or rural.

In rural communities the area studied in the United States or in some other Anglo-Saxon country is usually the county. The county is a basic unit of rural government that has existed for a thousand years. The other unit that has been used for measuring poverty in rural areas has been the labor market for the area.

Community studies and contextual studies of poverty differ in several ways. Typically community studies use county-level data to estimate poverty. The typical contextual study in contrast uses individual-level data on the probability that a particular household is impoverished. It does this by examining location and other factors. Usually constructing a poverty profile is much easier with a contextual study than with a community study. Some organizations working to eliminate poverty have found that contextual studies give them the basis upon which to develop poverty reduction programs. Contextual studies can produce sound and reliable research that gives a focused look at poverty in relationship to the cultural, economic, and political patterns of a society.

Another advantage of contextual studies is that they are more readily used for predicting future poverty cases. Instead of just identifying where poverty is currently located, the contextual study enables researchers to examine current social circumstances and trends that can lead to poverty-producing behaviors. Some kinds of behavior are more likely to contribute to poverty in the future.

Contextual studies of youths in certain areas have found that some may engage in behaviors that are risky for escaping poverty. Youths failing in school, skipping school, gambling, abusing alcohol or drugs, practicing unprotected sex, or doing unlawful economic activities such as smuggling are among a few of the risky behaviors that can contribute to a worsening of the conditions of poverty in the future.

Andrew J. Waskey
Dalton State College

Coolidge, Calvin (Administration)

CALVIN COOLIDGE WAS one of the most unusual and misunderstood of all American presidents. Contrary to what one would expect from a successful politician, he spoke relatively little, earning the nickname "Silent Cal." Most historians depict his administration as passive and accepting of the status quo. This is not quite the case. He came from a modest background. Coolidge was born in Plymouth, Vermont, on July 4, 1872, and went into law and politics. By 1919 he was the governor of Massachusetts.

He attracted national attention by using the state militia to suppress a police strike. In 1920 Coolidge became vice president under Warren G. Harding. Harding died on August 2, 1923. At this time Coolidge was back in Plymouth. In order to transfer power, Coolidge took the oath of office immediately. His father, who was a

Calvin Coolidge presided over a time of prosperity in the American economy, which was followed by the Great Depression.

notary public, administered the oath late that evening. Coolidge gained popularity rapidly. The economic boom of the 1920s surely helped his public image. The policies of the Coolidge administration were similar to those of his predecessor.

During this time Coolidge signed two major tax cuts into law. The 1924 Revenue Act reduced the top tax rate from 46 percent to 25 percent and the bottom rate from 1.5 percent to 1.125 percent. The 1926 Revenue Act reduced income taxes further and reduced inheritance and excise taxes. Federal revenue grew during this period, and the national debt fell. Also the percentage share of the total tax burden borne by low-income Americans fell while this burden rose for high-income Americans.

Data on ownership of what were then new modern conveniences indicate that consumers did quite well during the Coolidge years. During the period of 1920–30, auto ownership went from 26 percent to 60 percent, washing machines from eight percent to 24 percent, vacuum cleaners from nine percent to 30 percent, electric lighting from 35 percent to 68 percent, radios from zero to 46 percent, and flush toilets from 20 per-

cent to 51 percent. Perhaps the strongest evidence of prosperity during the Coolidge years comes from unemployment statistics. In 1923 unemployment was 3.2 percent. It went up to 5.5 percent in 1924, and then fell to four percent in 1925. Unemployment in 1926 was only 1.9 percent. At the end of his second term it was back up to 4.1 percent.

Of course this prosperity was not universal. Many farmers endured hard times during his presidency. Coolidge vetoed two farm relief acts, as he was opposed to federal intervention in such matters. Contrary to his reputation as an ardent supporter of free markets, Coolidge signed the Radio Act of 1927, which created the Federal Radio Commission (now known as the FCC). He also supported various labor-oriented policies as governor of Massachusetts. He endorsed protective tariffs and restricted immigration as a means toward the end of keeping wages and incomes high.

Some characterize Coolidge as an isolationist. While he favored "detachment from old world interests," Coolidge thought it proper for the United States to help settle contentious issues in Europe and Asia. Two examples of this principle in action were the Dawes Plan and the Pact of Paris. The Dawes Plan sought to relieve the crisis that developed out of the impossible burden that the Treaty of Versailles placed on Germany. The Pact of Paris renounced war as an instrument of national policy.

Coolidge died in January 1933. Historians have tended to denigrate his presidency. This is largely due to the dismal record of his successor. Some historians fault Coolidge for not preventing of the Great Depression. Yet the Depression began months after Coolidge left office and did not become severe until 1931. Most Americans became more prosperous during his administration. It is hard to say exactly how much of this prosperity was due to Coolidge's policies. Yet he surely deserves some credit for the prosperity that reigned during his presidency.

BIOGRAPHY. Stanley Lebergott, Pursuing Happiness: American Consumers in the 20th Century (Princeton University Press, 1993); Michael Ruckstad, Macroeconomic Decision Making (Dryden Press, 1992); Robert Sobel, Coolidge, an American Enigma (Regnery Publishing, 2000).

Corruption

CORRUPTION IS THE misuse of public power for private benefit. The process of corruption involves private and public interests or services. Corruption affects public responsibility and the private domain and usually takes place at the interface of the public and private sectors. However, the World Bank has defined the corruption as "the abuse of public office for private gain." That definition is not quite complete from a scientific point of view, as a definition of corruption depends on a country's economic and political system, development level, and traditions and customs.

Corruption's negative impact is not in doubt. It diverts resources from their planned usage, destroys economic systems, and makes a country inefficient when competing with other countries. Corruption exerts an especially hard toll on the lives of the poor by decreasing employment possibilities, causing higher prices, and demanding additional fees for government-financed public services.

Especially in developing countries, corruption makes it harder for people to meet fundamental needs such as food, health, and education. At the same time, it creates discrimination among the different groups of society. Corruption, by itself, doesn't create poverty. However, it has direct outcomes on economic and governance characteristics, intermediaries that in turn produce poverty. Finally, it can be recognized that corruption is only one form of bad governance.

The first classification of corruption is based on its distinct forms, namely bribery, embezzlement, fraud, and extortion. Bribery is usually described as obtaining money or favors by politicians or bureaucrats in return for preferential decisions or government services. Bribery acts involve two sides, mainly a representative of state and a civilian. In this transaction the representative of state misuses his or her power.

Embezzlement is associated with theft of resources by disloyal employees from their employers. There usually is no client involved during the embezzlement act. Embezzlement can derive from the impression that "everyone is doing it." Fraud is an economic crime that involves some kind of trickery, swindle, deceit, manipulation, or distortion of information, facts, or expertise. Quite often we observe that bribery directly involves fraud. On the other hand, fraud also arises when public servants take a role in organized crime like smuggling, or when contracts are given to a company whose public administrators have a conflict of interest with their responsibilities. These public servants' be-

havior is sometimes described as lawless behavior because state officials act as if there were no existing rules or regulations. Extortion means that resources are extracted by the use of coercion, violence, or threats to use force.

There are two types of corruption: petty and grand. Petty corruption involves small payments paid to low-level public servants. Usually, public servants charge a fee in addition to the amount required by law. They may threaten harassment or delay services until this payment is made. This type of corruption has a negative influence on the quality of life and the economic opportunities of poor people. The additional costs of petty corruption can be vast and severely limiting for the economic activity of the poor, as costs of bribes can reach nearly seven times the regular costs incurred.

Corruption exerts an especially hard toll on the lives of poor.

Grand corruption involves the making of large payments to people in positions of power in order to secure a right or obtain an advantage that could not be secured or obtained legitimately. This diverts substantial national resources from the public sector into the pockets of a corrupt few, and channels funds into inefficient uses by awarding contracts based on graft rather than on efficiency and social desirability. Grand corruption imposes social costs (in term of lost efficiency) in the domestic industry that focus more on relationships and side payments than on the competition in terms of efficiency and quality. Grand corruption can erode export opportunities and associated additional employment opportunities. The cost incurred by business because of bribery and lost economic opportunity can add to costs in excess of 11 percent of total gross incomes, as in the case of companies in the country of

There are major ways corruption can impact economic growth: corruption affects decisions about foreign and direct investments; corruption curtails or stops entrepreneurship with required licenses or permits that must be paid with bribes; corruption decreases the quality of public infrastructure; corruption reduces tax revenues; and corruption distorts the composition of the public expenditure.

The above statements were confirmed by World Bank corruption investigations. For example, in Bulgaria results state that one in four businesses was planned to expand, but corruption was an important indicator why the plan failed. In the case of influencing investment decisions, both types of corruption (petty and grand) have an indirect economic impact that constrains economic growth by increasing the uncertainty and unpredictability of costs to prospective investors. This point is debatable, as there are researchers who state that corruption may attract foreign direct investments (FDI) once investors belong to the inner circle of those profiting from bribery. Likely, this impact is not strong enough, as investors consider differences between petty and grand corruption.

Corruption distorts the investment climate in a country because it increases the risk of "rescuing" invested funds. Citizens of corrupt countries already recognize this risk and often send their savings out of the country. They avoid leaving their earnings near regulators, who can use funds illegitimately. So the wealthy send their investments to foreign countries, making them richer and the poor poorer.

The outcomes of corruption, which reduce tax revenue, can have a double effect.

Corruption for licenses and permissions was observed in several studies, where there are indications that small businesses tend to pay most of the bribes as a percentage of total revenue (Bosnia-Herzegovina, Ghana, Slovak Republic). Meanwhile, Polish businessmen are working in an environment that requires additional licenses, making them more prone to extortion. Payments for public administrators are made to avoid delays in services. In Russia, private investors negotiate with various public agencies (fire, police, banks, etc.), each of them requesting a bribe in exchange for speedy approval of a business license.

The outcomes of corruption, which reduce tax revenue, can have a double effect. From the state's point of view, the budget can lose funds when a household engages in corruption in an effort to ameliorate its own poverty. For example, in the case of Bangladesh, more than 30 percent of the household respondents reduced electric and/or water bills by bribing the utility meter reader.

Recognizing the problem of corruption, research respondents from Indonesia and Romania were so worried about the problem that they indicated a strong willingness to pay more taxes if corruption could be controlled.

Corruption can create weak and vulnerable national government institutions, such as a parliament, the judiciary, the civil service, and police; it can impose a limited democratic culture, decrease citizen participation in policy implementation, and have impacts on the delivery and/or quality of public services as well as on infrastructure. All these impact the poor.

CORRUPTION AND ECONOMICS

Corruption may create permanent distortions from which some groups or individuals can benefit more than others. Economists confirmed this in terms of Gross Domestic Product (GDP) linked to corruption as they found that there is a strong correlation between GDP per capita and corruption. In corrupt environments, corruption increases income inequality. At the same time, it reduces growth and thereby exacerbates poverty. For example, the children of poor parents go to publicly financed schools because their parents can't afford the bribes necessary to go to privately financed schools.

In the former Soviet Union, the change to the market system was associated with a sharp initial drop in output and significantly higher levels of poverty. Privatization of the public sector was one of the variables that created trauma for people as they became unemployed. A process that was not transparent and was usually corrupt influenced the income of the state and, in the end, the welfare of citizens. On the other hand, in other environments, corruption has not had as severe an impact. The so-called Asian tigers miracle was a perfect example of rapid economic growth (during the 1980s and 1990s) despite some corruption, where figures of people living below poverty line of \$1.25 per day decreased significantly.

Corruption impacts the delivery and quality of public services as well as infrastructure and has a direct connection with public expenditures. Different authors have confirmed that corruption lowers the quality of public infrastructure. The corrupt governments may display predatory behavior in deciding how to distribute public expenditures, for example for road construction and irrigation systems. Not surprisingly, in such situations corruption may lead to higher spending on the military. Different surveys from 1985 to 1998 confirm that corruption is highly correlated with higher military spending.

Public administration institutions with a high level of corruption tend to delivery lower-quality services in general, and corruption can be connected with the delivery of public services in such sectors as education and public health. However, some exceptions exist, as those services are directly dependent on client impressions rather than reality.

Obviously, investigations on corruption in Bosnia-Herzegovina, Indonesia, and Latvia confirm that public-sector institutions where corruption was high delivered low-quality and inefficient services. Conversely, countries with efficient public-sector institutions had lower corruption levels.

Another important fact is that corruption can lead to reduction of social spending on health and education. The starting point is that changes in costs due to corruption reduce tax incomes, increase government operating costs, and increase government spending for wages. These opposing forces create a policy dilemma, as there is no doubt about the importance of human capital investments. It may mean that in developing countries the bureaucracy tries to maximize its power by maximizing its budget. Finally, a monopoly situation comes into being, which isn't useful for the fundamental needs of citizens.

In surveys on good governance, investigators conclude that there is an association between good governance and poverty alleviation. In other recent studies on the control of corruption as one component of good governance, the analysis illustrates a strong positive causal relationship between improved governance and better development outcomes as measured by per capita incomes.

An important issue is the relationship between corruption and lack of environmental regulation of polluting the air and water. This, of course, implies both a direct effect of corruption (decreasing the effectiveness of environmental regulation) and an indirect impact through which corruption affects income.

The implications of corruption can lead to citizens' mistrust of their government. In practice, corruption destroys people's trust in government institutions. Some surveys illustrate that people with the lowest incomes don't trust some public institutions, such as healthcare providers, police, and customs, and see them as corrupt and evil. This conclusion is not without merit, as it is the poor people who cannot afford to pay bribes to unresponsive civil servants.

INITIATIVES AGAINST CORRUPTION

Global initiatives against corruption are number one on the agenda of many countries. The most well-known nongovernmental organization (NGO) that puts forth huge efforts in this matter is Transparency International, based in Berlin, Germany. This organization was established to fight corruption throughout the world and has branches in many countries. During the last 10 years Transparency International has published the Corruption Perception Index (CPI). The methodology of the CPI is improving each year and the number of the countries included is growing (the 2004 edition had 146 countries).

Additionally, there are 18 sources from 12 different institutions that report on corruption, for example Freedom House Nations, Gallup International, and the World Economic Forum. By studying the CPI between 1995 and 2004, a significant downward trend was reported in Argentina, the Czech Republic, Ecuador, Poland, and Zimbabwe. A significant upward trend was found in Bulgaria, Colombia, Estonia, Hong Kong, Mexico, and Spain.

The main reason why we must measure corruption is that many areas of human interaction and economic planning require the existence of hard, objective, and undistorted data. These data also help to set priorities for future reform and mobilize citizens to be actively involved in different processes that can help relieve poor people of the burdens of corruption.

Cost of Living

COST OF LIVING refers to the income required to maintain a certain standard of living. Many poverty statistics, such as the headcount index, rely on per capita or household income as a primary measure of wellbeing. Owing to differences in price levels, however, a certain income level will provide a different standard of living in various time periods or across differing geographical regions. Most countries have experienced inflation, that is, increasing price levels, over the past century, meaning that the income required to maintain a fixed standard of living has increased over time, resulting in a higher cost of living. Deflation, that is, decreasing price levels, is rare but has also occurred in some countries during specific time periods. Countries that are undergoing deflation experience a lower cost of living as time goes by.

The cost of living is generally measured using a price index. The most widely used price index is known as the Consumer Price Index (CPI). The CPI tracks the cost of purchasing a specific fixed basket of commonly purchased goods over time. For convenience, the CPI is scaled such that in the first year of the measurement, known as the base year, the value of the CPI is set as equal to 100.

Other ways to measure changes in the cost of living also exist. In the United States, consumer price indexes that track more specific baskets of goods such as healthcare or food are widely available. The core CPI measures changes in the overall price level, excluding two highly volatile sectors: food and energy. The Producer Price Index (PPI) estimates the cost of purchasing a fixed basket of goods commonly purchased by businesses. The PPI is known as a leading indicator for the cost of living as it is considered a good predictor of future changes in the CPI. Finally, the Gross Domestic Product (GDP) deflator tracks price levels for goods and services produced economy-wide, and is also calculated in a slightly different manner from normal price indexes. The GDP deflator and CPI generally correlate very closely with one another, and in practice they can be used interchangeably.

While measuring changes in the cost of living using the CPI is straightforward, it is not without several difficulties. First, the basket of goods used to measure the CPI represents the goods and services typically purchased by an average urban consumer. The prices of goods and services tend to be lower, particularly for housing, in rural areas. Furthermore, the cost of living for some groups may rise faster or more slowly than the

overall CPI depending on that particular group's consumption patterns. For example, the elderly spend a disproportionately high fraction of their income on healthcare, a sector that has experienced above-average inflation over the past several decades. Therefore, a cost-of-living adjustment for the elderly based upon price increases for a basket of goods purchased by an average consumer will undercompensate this group.

In addition, the Consumer Price Index suffers from three theoretical deficiencies. First, since the CPI measures a fixed basket of goods, it does not account for the ability of consumers to switch away from goods whose prices are rapidly increasing to cheaper substitutes. Second, the CPI often fails to account for increases in the quality of goods.

For example, as previously noted, while healthcare costs have been increasing rapidly in the United States, a large portion of these price increases are due to the introduction of expensive new technologies that allow for longer life expectancies and improvements in people's quality of life rather than simply higher prices for the same goods.

Third, the nature of the CPI makes it difficult to include newly introduced goods and services. A basket of goods created in the 1970s would not include goods such as personal computers, mobile phones, and MP3 or DVD players, items that are part of many persons' consumption bundles today. New items often rapidly fall in price shortly after their introduction. For these reasons, economists believe that inflation as measured by the CPI overstates the true increase in the cost of living by one percent to two percent per year.

A final challenge in measuring the cost of living is the difficulty in comparing incomes across countries. While it is appealing to simply convert incomes using prevailing exchange rates, differences in the cost of living are generally not fully reflected in this manner. Instead economists advocate comparing incomes across countries using the Purchasing Power Parity (PPP) method, which incorporates international differences in the cost of living into income measurements. The most complete group of PPP measures is the Penn World Tables.

Generally, the cost of living is lower in developing countries with lower incomes than in rich industrialized nations. For example, in 2002, by the exchange rate method, the per capita income of Japan was \$31,407 compared to just \$989 in China. Adjusted for PPP, however, Japan's annual per capita income falls to \$26,940 and China's rises to \$4,580, suggesting that the cost of living in Japan is over five times that of China.

VICTOR MATHESON, Ph.D. COLLEGE OF THE HOLY CROSS

Cost-of-Living-Based Measures of Poverty

COST-OF-LIVING MEASURES exist for two fundamental reasons. First, they are a means of comparing the relative purchasing power of income across geographical regions. For example, the amount of income it would take to maintain a certain standard of living in New York City would be different from the amount required to maintain a similar standard of living in Dallas, Texas. Second, in order for certain public policies to be consistent across states or regions, it is often necessary to use cost-of-living measures to develop equality across these areas. For example, when developing policies aimed at creating income parity among states on salaries, it is important to determine the true difference in income in order for the policy to be consistent for every state.

Because cost of living is based on the purchasing power of income, it is closely tied to rates of inflation and deflation. The U.S. government uses a cost-of-living measure prepared by the U.S. Bureau of Labor Statistics known as the Consumer Price Index (CPI) to calculate the rise and fall of prices in the economy. The CPI measures the average change in prices paid for a fixed market basket of consumer goods and services over a specified period of time.

The market basket is composed of such goods and services as food, housing, transportation, medical care, recreation, and education. The CPI is expressed as a percentage of change in the cost of a market basket from one year to another. For example, consider that the market basket price for 1980 was \$100. A market

basket price of \$160 in 2000 would suggest a 60 percent increase in the cost of living from 1980 to 2000. This percentage of change in the CPI is referred to as the inflation rate.

Disparity exists over whether the CPI is an accurate measure of cost of living.

The CPI is calculated for different geographical areas and income levels. The Consumer Price Index for All Urban Consumers (CPI-U) is based on residents of urban and metropolitan areas and represents 87 percent of the U.S. population. The Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W) is a subset of the CPI-U and represents households where more than one-half of the income is from clerical or wage occupations and one household member has worked at least 37 weeks in the previous 12 months. The CPI-W accounts for approximately 32 percent of the population.

The CPI is closely monitored by policymakers and employees whose wages vary with the economy. The practice of indexing wages to the CPI, known as Cost of Living Adjustment (COLA), was designed to offset changes in purchasing power as measured by the CPI and is built into many employee contracts.

Disparity exists over whether the CPI is an accurate measure of cost of living. Some authors suggest that because it does not measure factors that affect consumer well-being, such as crime, and that it is based on averages that do not reflect the experience of any one family, it is not an accurate measure of cost of living. These authors favor other measures, such as the social-cost-of-living index, which estimates economic demand based on the underlying welfare functions of consumers.

Costa Rica

THE REPUBLIC OF Costa Rica, which is located in Central America along the coast of the Caribbean Sea and the Pacific Ocean, is one of the most democratic countries in the region. Land is much more evenly divided than in most countries in Latin America. However, income and social inequalities have begun to increase in recent years.

The richest 20 percent of the population claim 51.5 percent of available resources while the poorest 20 percent share 4.2 percent. Costa Rica is ranked 46.5 on the Gini Index of Human Inequality. Most Costa Ricans enjoy a comfortable standard of living, and in Latin America, Costa Rica, with no military, has become a force for peace.

Originally, Costa Rica was home to some 25,000 natives who were virtually killed off by their Spanish conquerors. After achieving independence in 1821, Costa Rica was taken over for two years by the Mexican Empire. By 1848, Costa Rica had become a republic and has remained democratic from that point on except for 12 years under a military dictatorship in the late 19th century.

While agriculture, particularly coffee, banana, and beef exports, is still integral to the Costa Rican economy, the system has become more diverse in recent years. Services now employ 58 percent of the labor force, and industry engages another 22 percent. Technology and tourism have proved to be major sources of revenue for Costa Rica. The country's only natural resource is hydropower. Foreign investors are attracted to Costa Rica because of stable conditions and an educated population. With a per capita income of \$9,600, Costa Rica is an upper-middle-income nation. Despite the positive economic outlook, the Costa Rican government continues to deal with a large deficit, a substantial internal debt, and an unemployment rate of 6.6 percent.

For over a decade, Costa Rica has been steadily reducing the overall poverty rate, which is currently estimated at 22 percent, through economic growth and a strong social safety net. The sectors of the Costa Rican population that are most vulnerable to poverty are immigrants, the indigenous population, females with young children, those who live in rural areas, and elderly women. Poverty has continued to rise among certain groups. From 2001 to 2002, the number of female-headed families rose in both urban and rural areas of Costa Rica. At the same time, the number of such families living in poverty was 34.5 percent. By

2003, that number had risen to 36.2 percent. Government data also indicate that the number of households that lack basic needs increased from 28.1 percent in 2002 to 31.1 in 2003. Some 30 percent of Costa Rican children live in poverty. Six percent of the population are undernourished. Around 10 percent of the population live on less than \$2 a day, and two percent live on less than \$1 a day. The extensive social net provides financial benefits, housing assistance, healthcare, training, and education. The government is in the process of revising the Child Welfare Institute and has appointed a Minister for Children and Adolescents.

Life expectancy in Costa Rica is 76.84 years. Generally, females (79.55 years) outlive men (74.26) by more than five years. Among the population of 4,016,173, the median age is 26.03 years. Nearly 29 percent of Costa Ricans are under the age of 14, and 5.6 percent have lived to the age of 65. Generally, healthcare is readily available in Costa Rica, and there are 160 physicians for every 100,000 residents. Only five percent of the population lack access to affordable essential drugs. Five percent of Costa Ricans lack access to safe drinking water, and seven percent lack access to improved sanitation.

HEALTH STATISTICS

Between 1970 and 2005, infant mortality in Costa Rica fell from 62 to nine deaths per 1,000 live births. Among all children under the age of 5, the mortality rate during that same period plunged from 83 to 10 deaths per 1,000. Five percent of all children under the age of 5 are malnourished, and seven percent of infants are underweight at birth. Six percent of under-5s suffer from moderate to severe stunting, and two percent suffer from moderate to severe wasting. Childhood immunization rates for children from birth to 23 months have increased in recent years. Currently infant immunization rates are at 94 percent against measles, DPT, and polio and at 91 percent against tuberculosis. About 89 percent of children from 12 to 23 months have been vaccinated against measles, and 88 percent have been vaccinated against DPT3.

Between 1970 and 2005, the fertility rate in Costa Rica decreased from 4.3 children per woman to 2.28 children per woman. The adolescent fertility rate is 62 per 1,000 births. The rates of teenage pregnancies have increased steadily in recent years because teenagers have become more sexually active. Costa Rica recently passed the Responsible Paternity Law, a landmark piece of legislation that could serve as a model internation-

ally. However, there has been institutional and cultural opposition to implementing the law. Three-fourths of Costa Rican women use some method of birth control, an increase from 66 percent in 1980. Only two percent of all births in Costa Rica occur outside the presence of trained medical staff. Based on modeled estimates for 2000, maternal mortality occurs at the rate of 43 deaths per 100,000 live births.

Among the population over the age of 15, 96 percent can read and write. With a literacy rate of 96.1 percent, females are slightly more literate than males (95.9 percent). From 1999 to 2003, total primary school completion rates increased from 84 to 94 percent. During that period, female completion rates rose from 86 to 95 percent. By 2002, secondary enrollment had increased to 49.9 percent. Grade repetition and high dropout rates continue to be a problem. Out of every 10 children, three will fail to complete basic education requirements. Around 40 percent of all adolescents in Costa Rica are no longer in the school system.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Côte d'Ivoire

THE OUTBREAK OF CIVIL war in 2002 following the succession of unstable governments since 1999 has made poverty a poignant problem in Côte d'Ivoire. In 2003, an estimated 37 percent of households were living below the poverty line and in 2004, the United Na-

tions Development Program ranked Côte d'Ivoire among the lowest countries in terms of human development.

The low standard of living evidenced in Côte d'Ivoire has its origins in a gripping recession coupled with a large population increase experienced in the 1980s and 1990s, which indirectly resulted in the 1999 coup. The dust had barely settled on the new government when in 2002, a military mutiny in Abidjan led to a wave of violence throughout the nation.

Today, in the midst of a stalled peace process, many regions of the country are without access to basic social services such as education and healthcare. The transitional government that has guided Côte d'Ivoire through the peace accords has been powerless to work positively in the social sector as a result of a deadlock with dissident political parties. Moreover, the division of the country into northern and southern territories prevents any countrywide initiatives from moving forward. The persistent threat of violence in Côte d'Ivoire has also displaced a large portion of the population, especially in the western region of the country where the civil conflict has been particularly fierce. The refugee population constitutes a significant contingency of impoverished people whose itinerancy stifles their self-sustainability.

Côte d'Ivoire's poor health and education systems have at best stagnated since the conflict began. In 2002, adult literacy was below 50 percent; primary school enrollment was a mere 63 percent, and secondary school enrollment less than 25 percent. While the fertile, tropical climate of Côte d'Ivoire does not make nutritional deficiency a pervasive problem, the ravages and spoils of war have seriously upset the agricultural sector and not caused a scarcity of food but dealt a debilitating blow to the national economy.

Côte d'Ivoire is also faced with a significant lack of healthcare resources and a daunting HIV/AIDS crisis. Since the 1990s, Côte d'Ivoire has had only nine physicians per 100,000 people and 0.8 hospital bed per 1,000 people. In 2003, Côte d'Ivoire reported 570,000 cases of HIV/AIDS and lost 47,000 people to the virus. The life expectancy in Côte d'Ivoire is currently just over 40 years of age.

The instability and unaccountability of Côte d'Ivoire's recent governments have discouraged international aid and finance to Côte d'Ivoire over the last five years, with considerable dropoffs expected in 2006. These revenue sources constitute a significant proportion of the funding that subsidizes programs for public health and education, which are rapidly deteriorating if

they have not already ceased to exist. Demanding to see positive action taken in the restoration of civil governance to Côte d'Ivoire, the international community has put a moratorium on funding until that time. Elections were scheduled for October 2005, but were unlikely to take place as a result of insufficient planning. The prolongation of the peace process entails ever increasing impoverishment in Côte d'Ivoire, but the pressure of the United Nations Security Council and the international community will most likely deter a renewed outbreak of violence in 2006.

Matthew Evans Teti Northwestern University

Coughlin, Charles (1891–1979)

FATHER CHARLES E. Coughlin, a Roman Catholic priest and popular radio personality, significantly influenced American opinion during the Great Depression. A priest of the Diocese of Detroit and pastor of the Shrine of the Little Flower in Royal Oak, Michigan, Coughlin began broadcasting his sermons on the radio in 1926. His program, *The Golden Hour of the Little Flower*, on CBS radio, quickly gained a national audience.

However, Coughlin's harsh denunciations of President Herbert Hoover caused the station to discontinue his program. Not to be dissuaded, Coughlin formed his own network, which grew to more than 30 stations. Coughlin's *Golden Hour* was heard by as many as 40 million listeners throughout the 1930s and early 1940s. In addition to religious matters, Coughlin spoke frequently on economic and political issues, focusing on the Depression and the evils of modern capitalism. His

theory of economic populism consisted of a radical reform of the monetary system in America, challenging Wall Street, the gold standard, and the international banking system. He advocated a return to currency based at least partially on silver and the creation of a Bank of the United States of America to ensure democratic fairness by replacing the Federal Reserve system, which Coughlin considered dominated by bankers. He frequently ridiculed wealthy industrialists and financiers who he believed were more connected to the economic problems of the Great Depression than to their solution.

At first, Coughlin supported President Franklin D. Roosevelt's plan of reforms known as the New Deal, and Coughlin himself had been considered for a post as one of Roosevelt's economic advisors. Coughlin, however, became disenchanted with the slow pace of reforms and beginning in 1934 denounced the president's program as a grand deception. Coughlin formed his own organization, the National Union for Social Justice, in 1934 and launched an affiliated publication, Social Justice, in 1936, eventually amassing a readership of one million. In 1936 Coughlin opposed Roosevelt's reelection as president, instead helping to organize a rival political faction. The Coughlin-supported Union Party selected William Lemke as their candidate but Lemke received fewer than one million votes, hardly enough to counter Roosevelt's 27 million supporters.

Coughlin's message appealed to a broad cross section of America, including Protestants and Catholics, laborers, and small business owners in cities and farms in the American heartland. His message of reform was particularly attractive to those with little hope of material prosperity, discontented and poor first- and second-generation Americans, ethnic minorities, and the unemployed, as well as an emerging middle class that had lost its sense of economic security during the Depression.

At the high point of his influence, his listeners numbered one-third of Americans. His reforms were not as controversial as his assessment of blame for the Great Depression. Anti-Semitism tainted his message and by 1938 he routinely targeted Jews as the cause of economic hardship in America. He leveled frequent verbal attacks against Jews, Freemasons, Nazis, fascists, communists, and atheists as part of "Satan's organization" aimed at overthrowing America and Christianity.

Despite his criticism of Nazis and fascists, as his message became extreme, he spoke of his sympathy for Adolf Hitler and Benito Mussolini. His influence launched the Christian Front, a group of anarchists centered in Brooklyn, New York, and Boston, Massachusetts. Because of mounting pressure from his religious superiors and lack of financial support from listeners, Coughlin abandoned the airwaves in 1940. He ceased all public political and economic activism in 1942, the same year the U.S. Postal Service refused delivery of his publication, *Social Justice*, under the government's Espionage Act (1918). Coughlin continued his work as a parish priest in Detroit until retiring in 1966.

Credit

CREDIT AS A TERM refers to the granting of goods, services, or money in return for a promise of future payment. The future payment includes an interest or charge for the use of credit or money. Interest is usually determined as a percentage of the principal and computed annually, which makes the future payments greater than an immediate payment would have been. Credit and its opposite, debt, are operations that involve lending. Taking credit is an equivalent to going into debt.

In commercial trade, credit is used as the approval for delayed payments for goods purchased. Credit enables producers to close the gap between production and sales of goods and services, and it allows consumers to purchase goods and services at the present time and pay for those services from their future income. Companies regularly offer credit to their customers as part of the terms of a purchase agreement.

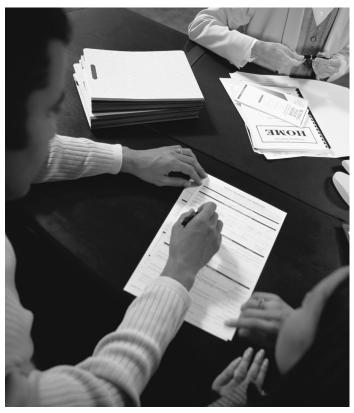

Credit extension and debt creation can be traced back to ancient times. The volume and complexity of credit transactions have grown substantially with the emergence of capitalism. Credit transaction emerges whenever capital is used and savings are required. Any movement of financial capital is dependent on credit, which in turn is founded upon the lender's confidence in the borrower and borrower's reputation or credit risk. The credit risk or default risk generally refers to the probability that the borrower will default on future payments. Data as to credit risk are supplied by agencies organized for that purpose. The chief agency in the United States is Dun and Bradstreet, formed by a merger (1933) of R.G. Dun & Company (1841) and the Bradstreet Company (1849). Often the borrower is required to provide collateral, that is, a financial instrument, as security for payment of a loan.

The most commonly used instruments of credit are the acceptance, bill of exchange, letter of credit, and promissory note. The instruments are often negotiable and traded in money markets. The purest form is the credit default swap. This is a specific type of counterparty agreement which allows the transfer of third-party credit risk from one party to the other. One party in the swap is a lender and faces credit risk from a third party, and the counterparty in the credit default swap agrees to insure this risk in exchange for regular periodic payments. If the third party defaults, the party providing insurance will have to purchase from the insured party the defaulted asset. In turn, the insurer pays the insured the remaining interest on the debt, as well as the principal.

There is a distinction between business credit and consumer credit. The principal function of business credit is the transfer of capital from those who own it to those who intend to use it. The main objective of business credit is an enlargement of capital. Consumer credit, on the other hand, allows the purchase of retail commodities without the use of cash or with the use of relatively little cash.

The principal economic function of consumer credit is to move consumers' consumption of goods and services forward in time. The main types of consumer credit are noninstallment credit and installment credit. Noninstallment credit is to be repaid in a lump sum. Installment credit, which is a prevalent form, represents all consumer credit that is scheduled to be repaid in two or more installments. It is estimated that some 90 percent of all wholesalers' and manufacturers' sales, and more than 30 percent of all retail sales, are made on a credit basis.

Another type of credit is bank credit. This type involves lending by the banking institution through bank

Consumer debt can build up to such a point that a bankruptcy must be declared, possibly pushing the consumer into poverty.

advances, overdrafts, discounting bills, or purchasing securities.

Recently a new form of credit called microcredit gained prominence. The working definition adopted at the Microcredit Summit in February 1997 characterizes microcredit as small loans extended to very poor people for self-employment projects that generate income, allowing them to care for themselves and their families. Microcredit is the extension of small loans to entrepreneurs unable to qualify for traditional bank loans. The principal aim of microcredit is poverty alleviation, enabling those without access to lending institutions to borrow at bank rates and start small businesses in their communities.

Credit plays an important role in macroeconomics, especially in money supply theory. In the aggregate models of the financial sector of an economy, credit markets and credit creation are analyzed via their relation to money markets, money creation, and price level. These models clarify the role of central bank policies in controlling money supply and price level. If more credit is granted than the community can liquidate, there is inflation; if too little is granted, there is deflation. A lack of business confidence may cause credit to dissolve,

thereby contributing to economic crises, panics, and depressions.

While credit made a contribution in the effort to alleviate poverty, especially in developing countries, credit on its own should not be viewed as a universal remedy to poverty eradication.

Crime

THE LATE 19th and 20th centuries have been characterized by the tendency to study crime as well as its causes and effects. Cesare Lombroso's Criminal Man (1876), which introduced the atavistic idea of the born criminal; Enrico Ferri's Criminal Sociology (1884); and Rafaele Garofalo's Criminology (1885) are some of the most popular early works on crime. In different time periods, a series of works have focused on crime, although not always with the same analytic tools and purposes. For instance, psychology and psychiatry focus mainly on the individual characteristics of deviants or criminals and examine the eventually problematic relationship between the criminal and the society, while sociology and criminology focus more on the social aspects of crime and on crime politics.

Edward Sutherland carried out the first important study of the relationship between crime and economic status in 1939. Sutherland described forms of nonviolent business crime that were committed by businessmen and members of the middle class in the course of their economic activity, or white-collar crime. The study

managed to show how special forms of economic criminality of the middle class (fraud, embezzlement, bribery, forgery, tax evasion) remained—contrary to blue-collar crime—unpunished. Because business-class members had the means to hide their activity and avoid arrest, they were able to minimize the chances of being punished. This study also provoked the mainstream view that criminals were usually poor or economically marginal individuals.

The increasing interest in crime and its etiology has led since 1960 to the emergence of a series of subfields, like the sociology of deviance, sociology of social control, sociology of social exclusion, and criminology. These subfields addressed a number of important issues and problems related to the analysis of crime and crime politics as well as to the understanding of the political economy of crime and its interrelation with the economic structure. A heterogeneous ensemble of critical, radical, Marxist, deconstructionist, and feminist criminologies studied the mechanisms of marginalization, stigmatization, demonization, and social exclusion of deviants.

Contrary to the biological and psychological causations of crime, researchers were interested in the social processes with which individuals were being labeled, such as deviants, delinquents, and criminals. Crime was understood as a social and legal construction using the labeling approach. Critical criminologists in Europe and the United States in the 1960s and 1970s underlined that the term *criminal* was the act that violated the penal law and considered penal law as an instrument of state power that defines which behavior is criminal or not, and decides whether and how this act will be punished.

For those criminological schools, crime, both as a human behavior and as a legal category, does not exist before penal law. At the same time, the concept of social control became very influential and increasingly important for the understanding of crime, social reaction to crime, and the official and organized responses to it, for instance through the mechanisms of penal law.

Social control was initially introduced by Edward Ross, who described it as "the moulding of the individual's feelings to suit the needs of the group." Also, for the sociological approach of social consensus by Emile Durkheim and for the structural functionalism of Talcott Parsons, social control was a social phenomenon that they considered *a priori* positive for the maintenance of social order.

According to these approaches, criminal acts violate the moral rules of an organized society, which punishes

New studies suggest that poverty is being architecturally, politically, and socially criminalized.

them in order to avoid social conflict and disorganization. The problem is not the social structures or the existing social and political norms of a society that eventually produce deviance, but the deviants who disobey the moral and penal laws of the society.

With the influence of Marxism in social sciences, social control ended up having a different meaning and representing the means of imposing power and punishing individuals and groups that it defined as deviant, dangerous, and criminal. Radical and critical criminologists defined social control as the organized ways in which the punishing power maintains order and discriminates particular social groups in the name of social cohesion. The author of *Visions of Social Control*, the sociologist Stanley Cohen, has noted that "Social control is the organized ways in which society responds to behavior and people it regards as deviant, problematic, worrying, threatening or undesirable one way or another."

In the frame of this criticism, the relationship between poverty and crime became an important topic on the criminological agenda. Especially influential was the work of Michel Foucault, especially his book *Discipline* and *Punish*: The Birth of the Prison (1975). By examining

the history of prisons in modernity, Foucault studied the mechanisms of discipline and classification of individuals as well as the social processes with which individuals were categorized as healthy or ill, as normal or abnormal, and as criminal or conform.

In the same spirit and influenced by Foucault, Dario Melossi and Massimo Pavarini attempted with their book, The Prison and the Factory: Origins of the Penitentiary System (1977), to study the relationship between crime and the economic system. Radical and critical criminologists and sociologists considered crime politics as the politics that produced social exclusion. The official punishing mechanisms of the state were seen as processes of representation and reproduction of class inequality, social divisions, and political pressure. The mechanisms of the penal system were considered to be responsible for a variety of strategies of discipline, coercion, retribution, and punishment.

It would be unthinkable for society to change its perceptions about the offender.

The basic argument of deconstructive sociology was that the state possessed the legal means to enforce control, in order to serve the needs of its dominance and exercise "the monopoly of violence." In this frame the abolishment of prisons was proposed by sociologists like Thomas Mathiesen. For Marxist criminologists like Richard Quinney and Alessandro Barratta, the penal law system was not ideologically neutral. It reflected rather the interests of the ruling classes. Poor and economically unprivileged social groups and individuals possessed, therefore, no means to influence political power.

Crime politics in the period of the Keynesian welfare state gave the discussion about poverty and crime new arguments and directions. Social control was practiced by a series of social institutions. Social workers, psychiatrists, therapists of every kind, "professionals of the soul," and multifarious specialists were all aiming at the rehabilitation and the resocialization of the offender.

On the social level, the offender was thought to be ill, abnormal, or dangerous. Society could not accept him or her and for this reason he or she had to change (it would be unthinkable for society to change its perceptions about the offender). Both models—punishment and rehabilitation—became objects of criticism during the 1960s and 1970s.

As far as state control was concerned, the criticism focused on recidivism, on the social stereotypes, social discrimination, and repression that the state produced by creating a criminogenic surrounding that was in turn reproducing the criminal population. This population was in one way or another considered as a dangerous class, the class that was at the same time economically weaker.

With regard to rehabilitation, the criticism focused on the rehabilitator's motivation: even when it was philanthropic or well intended, it was functioning under the notion that the deviant should be cured and changed. The social reaction to the criminal was not the main problem; the main issue was the deviant's problematic personality. Through rehabilitation, stigmatization, marginalization and the labeling process, the social exclusion of the deviant was administrated in a professionalized, scientific way.

The demise of the Keynesian welfare state in the late 1970s led to the abandonment of the model of rehabilitation and resocialization. The state could no longer afford the costs of rehabilitating institutions and the various experts on the criminal's treatment. The criminological theories that reduced criminal actions to the social environment and proposed that effective resocialization measurements would help to decrease crime rates gave place to a series of new theoretical approaches. Referring to and focusing on state control, the state of the 1980s seemed to play an increasingly administrative and managerial role.

Within contemporary theories in criminology, such as the routine activities theory, the opportunity theory, theories about community policing or community control, and certain victim theories, the center of analysis transferred from the state to the citizen. Citizens are now responsible for protection from crime. According to such theories, the state has no effectiveness in confronting the high rates of crime, so citizens must be self-protected. Crime, just like poverty, is considered inevitable. Social and economic inequality are uncritically seen as normal factors of neoliberal capitalism.

The deviant is still stigmatized, but there is no need to explain causally and sociologically his or her behavior. Contrary to the premises of radical and critical criminology, social and economic structures are for postmodern criminology unproblematic. Problematic are the ways of dealing with crime. Solutions like digital surveillance in public spaces and increase of private security through alarm systems are proposed.

Together with an increase in fear of crime and the need for more surveillance and security, what David Garland calls "responsibilisation strategies" have emerged. Self-protection from crime is becoming a new social need and an ethical value. The responsibility of citizens becomes a new duty. Citizens must have a special consciousness for preparing a surrounding that will hinder the efforts of other citizens to commit illegal acts. Crime is the taken opportunity to commit crime. The reduction of crime is equal to the reduction of opportunities to commit crime. The criminal, the crime, and the rehabilitative visions are of little or no interest to either criminology or the consequential policies. The interest is transferred to the damage caused by crime. Thus, what must be protected is property and what must be punished is poverty.

At the economic level, these trends reflect the demise of the welfare state and the efforts of the managerial state to reduce the costs of policies on crime prevention. The following abstract, by Brandon C. Welsh, David P. Farrington, and Lawrence W. Sherman (2001), shows the shift in research interests of modern criminology and its economization: "What are the cost savings from preventing a typical burglary, robbery, assault, or even a criminal career? Who benefits from these savings? How often do the benefits from preventing crime or criminal behavior exceed the resources spent on preventing or controlling crime? Is it more cost effective to invest in early childhood programs or juvenile boot camps to reduce criminal offending? It is important to provide answers in order to ensure that the dollars devoted to crime reduction are spent as efficiently as possible."

Following the neoliberal trend, the interests of criminology have shifted.

The emphasis lies on achieving results rather than on administrating processes. The ultimate principle is the "triple 'e': economy, efficiency and effectiveness." To this extent, cost-effective strategies in order to ensure value for money are mobilized. The interest is being transformed from inputs to outcomes. The setting of explicit targets and programs is thought to employ the new managerial aim of efficiency and effectiveness. The organizations and institutions of crime prevention ought to copy the strategies and ways with which the private sector develops.

For these purposes, models of statistical prediction of crime, comparative research, and microprogramming become more and more influential. Both the programmatic goals of the institutions of crime prevention and their results in everyday life should now be evidence-based. Effective crime prevention is now understood in terms of actuarial management. It is not being questioned in the long run, but it is related to micropolitical, technical, and managerial targets that are supposed to be nonideological and serving a common interest, the interest of safety, which again is supposed to be a nonideological and intraclass concept.

Following the neoliberal trend, the interests of criminology have shifted to more managerial and technical questions. New definitions of crime arise, for instance the one of Philip Cook, who argues that "crime is a tax on our standard living, imposing both tangible and intangible costs." The focus now is on situational crime prevention, environmental criminology, and the monetary dimensions of crime prevention policy.

At the social level, these trends reflect the transformation of social control to self-control. According to David Garland, the consolidation of the idea that citizens are potential victims if they do not manage to protect themselves or if they do not become consumers of the products of the new security markets serves very fundamental functions of the state, without the direct involvement of the state.

In this frame, a great degree of fear of crime is necessary; fear of crime is the presupposition and at the same time the result of these techniques of individualization of control.

The architecture of social and urban environments is also subjected to the new class divisions. The privatization of security is not taking place on behalf of the whole society, but on behalf of those parts that are economically and socially able to take advantage of such a privilege. A new class society emerges, a society that is constituted of those who can and those who cannot afford to pay for the new idea of security or the new security itself.

This new polarized society can be observed also in the architecture of urban surroundings and cities. Shopping centers, banks, and luxury zones are well protected from dangerous, poor, or foreigner social groups, those who cannot afford security and on whom fault and blame are concentrated. Poverty is being architecturally, politically, and socially criminalized.

Croatia

CROATIA IS THE FORMER constituent republic of the Socialist Federal Republic of Yugoslavia, which gained independence and international recognition in 1992. Croatia borders Bosnia and Herzegovina, Hungary, Serbia and Montenegro (north); Serbia and Montenegro (south); and Slovenia. Croatia is composed of the historic provinces Istria, Dalmatia, and Slavonia, with a population of 4,495,904 (2005). The ethnic composition of Croatia is 89.6 percent Croatian (77.9 percent before the end of the civil war in 1995), 4.5 percent Serbian (12.2 percent, respectively), and 5.9 percent other, including Bosniak/Muslims, Hungarians, Italians, Czech, and Roma. Croats speak the Croatian language, and the majority is Roman Catholic (87.8 percent).

With the exception of Slovenia, Croatia was the most prosperous and industrialized area among Yugoslav republics. After a recession, the Croatian economy revived in 2000, with tourism, banking, and public investments leading the way. The rate of growth was 3.7 percent in 2004, while Gross Domestic Product (GDP) per capita was 11,200 (purchasing power parity). Unemployment, however, remains high, at 13.8 percent. While absolute poverty is low in Croatia, significant poverty exists in the rural areas and certain ethnic groups (Serbs, Albanians, and Roma).

Croats, along with other South Slavs, moved into the valley of the Sava and Drava Rivers in the course of the 6th and 7th centuries. Prosperous during the reign of King Tomislav, medieval Croatia lost its independence to Hungary in 1102. Following the collapse of the Serbian empire, a large number of fleeing Serbs found a refuge in bordering regions of Croatia. The territory known as the Military Border enjoyed a considerable autonomy in the Austrian empire and became bitterly contested between Croats and Serbs. Following World War I and the collapse of the Austro-Hungarian Empire, Croatian lands became a part of the Kingdom of the Serbs, Croats, and Slovenes. During World War II, Croatian nationalists, who opposed the common state, formed a Nazi puppet Independent State of Croatia. After World War II, Croatia became a part of Yugoslavia.

Dissatisfied with the status of Croatia within the Yugoslav Federation, Croatian nationalists continued to pursue a drive toward independence, which culminated in the proclamation of independence in June 1991. This led to the outbreak of hostilities among the Serbs who lived in Croatia, the Croats, and the Yugoslav People's Army. In 1995, with tacit approval of international community, the Croatian army launched a major offensive, which resulted in expulsion of more than 200,000 Serbs from Croatia.

Today Croatia is a parliamentary democracy. The head of state is the president, who is commander in chief of the armed forces and also formally appoints the prime minister based on the parliament's recommendation.

Cuba

THE ISLAND OF CUBA, which is located south of Key West, Florida, between the Caribbean Sea and the north Atlantic Ocean, was released from the brutal con-

trol of Spain by the intervention of the United States in 1898 in the Spanish-American War. Since 1959, Cuba has been under the communist dictatorship of Fidel Castro. The economic relationship with the United States has been difficult since President John F. Kennedy placed a trade embargo on the communist neighbor in 1961. In order to escape Castro's repressive regime, many residents of the island willingly place their lives in jeopardy by sailing for the United States in boats ill-equipped for the voyage. Others attempt to enter the United States illegally with the help of smugglers or by coming into the country by airplane or along mainland routes into southwestern states.

After the dissolution of the Soviet bloc in the 1990s and the withdrawal of several billions of dollars in annual subsidies, Cuba experienced a recession from which it has yet to recover. The island has a diversified economy, with over half of the labor force involved in services. One-fourth of all workers are employed in the manufacturing sector, and 24 percent are involved in agriculture. Cuba has a per capita income of \$3,000, and unemployment is currently at 2.5 percent. The island has been faced with severe shortages of food, consumer goods, and services. As a result, the standard of living has declined. Some 11 percent of the population suffer from malnutrition. Nevertheless, Cuba has almost halved its poverty level in recent years. Unofficial reports place the current poverty level at 5.1 percent.

Cubans experience a life expectancy of 77.23 years, with women outliving men an average of five years. The median age is 35.36 years. Almost 20 percent of the population are under the age of 14, and 10.4 percent have reached the age of 65. Healthcare is free and universal in this socialist country, covering 99.2 percent of the population. HIV/AIDS prevention is a major priority in Cuba, and the country has a prevalence rate of only 0.1 percent. However, most reported incidents in Cuba are spread through sexual contact, so the country faces an ongoing threat from tourists. Approximately 91 percent of the population have access to safe drinking water, and 98 percent have access to proper sanitation. There are 596 physicians per 100,000 residents, and virtually everyone has access to essential drugs.

Infant mortality rates have declined in Cuba in response to easy access to healthcare. Between 1970 and 2005, the mortality rate dropped from 34 deaths per 1,000 live births to 6.33 per 1,000. During that same period, the mortality rate of all children under the age of 5 declined from 43 to eight per 1,000. Approximately six percent of infants are underweight at birth, and four percent of all children under the age of 5 are malnour-

ished. Five percent of under-5s suffer from moderate to severe stunting, and two percent suffer from moderate to severe wasting. Infant immunizations are almost universal, with one percent who have not been immunized against tuberculosis and DPT and two percent who have not been immunized against measles and polio. Only one percent of children between the ages of 12 and 23 months have not been immunized against measles. However, 29 percent in this group have not been immunized against DPT3.

Literacy is nearly universal in Cuba. Only 2.8 percent of males and 3.1 percent of females over the age of 15 cannot read and write. While most children attend school regularly in Cuba, the number of children completing primary school declined between 1999 and 2004. The decrease was from 104 to 94 percent for males and from 102 to 94 percent for females.

Family planning is promoted under the National Sex Education Program, and abortions are legal and free. Cuban fertility dropped from 3.5 children per woman in the 1970s to the current rate of 1.66 children per woman. The fertility of females between the ages of 15 and 19 is 67 per 1,000. Some 73 percent of all Cuban women use contraceptives of some sort. Since medical care is free in Cuba, 99.9 percent of all births take place in health centers. As a result, maternal mortality is low. Modeled estimates for 2000 place maternal mortality at 33 deaths per 100,000 live births.

In response to international pressure, the Cuban government has taken steps to improve the status of women, in part by implementing programs that fight poverty. Through the National Employment Program, the government has reduced unemployment among women to four percent. Single mothers receive economic assistance from the government along with education and skills training. Cuba has also strengthened protections for the elderly.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Cuernavaca Center

THE CUERNAVACA Center for Intercultural Dialogue on Development (CCIDD) is a school for training people to be change agents in the Liberation Theology perspective. CCIDD is at a retreat center located near Cuernavaca, Morelos, Mexico, which is about 40 miles south of Mexico City. The city of Cuernavaca lies at an elevation of about 5,000 feet where it enjoys a springlike climate year-round. In pre-Columbian times it was the resort used by the Aztec rulers. During colonial times the explorer Hernando Cortés and many other elites went to Cuernavaca to enjoy the especially restful climate.

CCIDD is an ecumenical Christian center and bases its operations on theology that is inclusive and liberational. Its mission is to give churches, groups, and individuals from Canada and the United States opportunities to encounter the presence of God in the struggle for justice in the Americas so that they will be equipped and empowered for the work of social transformation. It also has a program that is secular and appropriate for colleges and graduate programs. The CCIDD experience usually lasts from 10 to 15 days. It is presented as either a faith-based experience or a secular experience.

Either program seeks to aid the specific interests and needs of those who attend. CCIDD seeks to give to its faith-based visitors an encounter with the spirit of God as a part of the struggle for social justice in Latin America. The encounter takes place by meeting the spirit of God in direct encounters with the people of Mexico, who have experienced social, political, economic, religious, and cultural realities that deny them their divinely ordained full dignity as human beings. The Liberation Theology that CCIDD uses as part of its curriculum stresses that God has a "preferential option for the poor" and that their voices enable others to encounter prophetic dimensions of diversity in local communities of faith and hope.

CCIDD's training enables participants to be able to name and challenge practices that may be cultural, political, spiritual, or economic that support structures of inequality. The structures or systems of inequality support discrimination against people because of their gender, race, class, sexuality, or economic status, or even against the environment and the ecology of earth. Another part of CCIDD's curriculum analyzes the relationships between the northern and southern hemispheres whereby wealth abounds in the north and poverty in the south.

This disparity in wealth and the negative impact of American and Canadian foreign policies and business activities are examined as the sources of injustice between the regions. To eliminate these injustices the curriculum seeks to move beyond individualism and to promote the values of community. Those who study at CCIDD should leave empowered to work for social transformation at both the individual and collective level.

Culture of Poverty

THE SO-CALLED CULTURE of poverty refers to both a theoretical perspective and a U.S. government policy suggesting that living within the conditions of poverty leads to a series of behaviors and attitudes, a "culture" so to speak, adapted to poverty or want. The phrase was coined by the American anthropologist Oscar Lewis and developed in his book *La Vida: A Puerto Rican Family in the Culture of Poverty*.

Lewis argued that individuals growing up in an impoverished environment would share such ideas and behaviors, that parents would pass these characteristics on to their children, and that poor communities would share them. This "culture" might seem maladaptive to outsiders of higher economic status, but it would permit the poor to survive under conditions of unpredictability and want.

Focusing on individuals who acquired a worldview or culture based on their lives in poverty, Lewis argued that those who lived in a culture of poverty shared a set of values including a present-time orientation and inability to defer gratification, a seeming disinterest in planning for the future, and a kind of resignation or fatalism about their situation. Such values overlapped: one who remained focused on the immediate situation would be unlikely or unwilling to plan for the future; a desire to gratify oneself (in some way) immediately also seemed to indicate a disinterest in the future.

Values associated with poverty tended to manifest themselves in specific behaviors.

Lewis also noted that his poor subjects had little or no interest beyond their own immediate concerns, that they were often unaware of events in other parts of their city or nation and might spend their lives in a fairly small limited area, perhaps circulating among family and friends a few blocks apart. Values associated with poverty tended to manifest themselves in specific behaviors, often violence, alcoholism, child abandonment, and other socially disruptive activities, while their limited awareness of the larger world often reduced people's strategies in fighting or escaping poverty.

The ethnographic work culminating in this concept was conducted among Puerto Ricans who lived in San Juan and in the slums of New York City, but Lewis had also examined the effects of poverty in several earlier studies in rural and urban Mexico (1959, 1961). This earlier work also explored his interest in culture as a set of shared values or kind of group personality, a perspective widely popular in American anthropology at that time.

At the same time, Lewis thought that a culture of poverty represented a reasonable set of adaptive cultural strategies that arose when individuals were poor; as a set of values, families then handed these down to their children in a kind of cultural evolution. Lewis's work was influential, suggesting that poor people were not somehow cultureless but had a kind of subculture that might be understood. His focus on motivation—that is, one's values—and the role of the family appealed to U.S. policymakers who were uninterested in or hostile to structural explanations for poverty. The culture of poverty initially prompted scholars and policymakers to explore ways of aiding poor families, rather than examining the larger social and economic

factors that prompted poverty. Edward Banfield elaborated upon Lewis's work in his examination of urban deterioration, *The Unheavenly City*. Eager to explore the reasons behind urban violence in the poorest parts of urban America, Banfield drew upon his own earlier work and that of others like Lewis to suggest that urban poverty, particularly that of African Americans, was deeply ingrained, the result of psychological attitudes and beliefs, a culture if you will, of lower-class behavior that would persist in spite of opportunities to improve oneself.

Banfield's outlook was bleak and he suspected that the degree to which the poor were embedded in their impoverished values would render them essentially ungovernable and unimprovable. The poor, he argued, preferred living in their impoverished surroundings and would likely destroy the trappings of the middle class, for example libraries or parks. They would require extreme measures and Banfield was willing to suggest some, for instance the removal of poor children from their families so they could be appropriately trained in the ways of the middle class, and surveillance of poor young men in the hope that they could be drawn away from a life of crime and violence.

Banfield's perspective, focused as it was on the role of individual responsibility—in this instance, its absence among the poor—and the certain failure of government aid, made him popular in conservative circles, a popularity that persists today, some 35 years after *The Unheavenly City*'s publication.

CRITICAL PERSPECTIVES

The academy was not unanimous in its endorsement of the cultural poverty concept, however. Anthropologists in particular were quick to criticize parts of the culture of poverty. Leacock noted that Lewis was unable to sort out the sources of the culture of poverty he saw in his subjects. Was it poverty, or could it be the specific history of the people he was interviewing, for example?

Indeed, Eleanor Burke Leacock noted that the culture-of-poverty model was ahistorical, seemingly arising entirely from the family and its shared values. Charles Valentine argued that an analysis based upon a culture of poverty tended to focus policy decisions on eliminating the culture rather than poverty itself. Its most extreme interpretations argued against any sort of intervention, and perhaps the elimination of programs that might assist the poor, suggesting that they were futile given the poor family's inability to respond with the appropriate middle-class values.

Other scholars turned to field research, producing ethnographic studies that demonstrated the strength and resilience of the urban poor. In one typical example, Carol Stack found that poor African-American women used a range of kin networks to provide each other with various kinds of resources: money, childcare or other work, places to live. Stack intended her work to provide a kind of critique of culture-of-poverty arguments. For example, she drew explicit attention to poor women's interdependence and reliance upon each other, rather than pursing individual strategies more typical of the middle class.

SOCIAL POLICY

The academic debates regarding the culture of poverty occurred during a time when policy experts hoped to eliminate American poverty. President Lyndon Johnson made the elimination of poverty the centerpiece of his administration, calling for a War on Poverty, in which a range of programs and policies would be devised with the goal of eliminating poverty from the United States. Numerous programs, including Head Start, Job Corps, and Medicaid were launched as part of the War on Poverty, and some of these have been quite successful since their inception.

However, some policy officials developed arguments about the poor that paralleled those of Lewis and Banfield. The best known and most influential of these was Daniel Patrick Moynihan's policy paper, "The Negro Family: The Case for National Action," often referred to as the Moynihan Report.

Moynihan argued that the African-American family was at risk of crumbling because of its deviant social structure, and that this in turn jeopardized young African Americans who might otherwise rise out of poverty to the middle class. Moynihan marshaled a range of studies from the social sciences and history to suggest that the black family fit what he called a "matriarchal" pattern in which women had a dominant role and men a lesser one.

Such a family structure could lead to increased bitterness and hatred by men, who felt their appropriate superior role had been usurped. This might cause men to become depressed or angry, to display violence toward their families, or even to adopt a criminal lifestyle. Moynihan further noted the negative effect on children with absent fathers, including poorer school performance, delinquent behavior, and truancy. Indeed, Moynihan titled his discussion of black family structure "The Tangle of Pathology."

The Moynihan Report made no policy recommendations beyond calling for a general effort to aid the African-American family, and many scholars and policy experts were explicitly hostile to his arguments. In the 40 years since the report's publication, research has disproved some of its arguments. Family structure is known to be more flexible than Moynihan assumed, and certainly the way that women's roles are viewed is quite different. At the same time, conservative thinkers remain influenced by Moynihan's and related arguments, using updated variants to suggest the elimination of poverty programs. However, a wider range of explanations for the persistence of American poverty is accepted to some degree, and policy experts recognize that culture is only a partial explanation for understanding poverty.

Cyclical Poverty

CYCLICAL POVERTY DESCRIBES poverty that is intermittent as opposed to poverty that is long-term. Actual poverty in the United States is determined by the U.S. Office of Management and Budget and is based on the number of adults and children in the household. Some individuals spend their lives in actual poverty, while others fluctuate in and out of poverty. It is the latter who are referred to as the cyclical poor. The cyclical poor often work at jobs that are highly affected by

changes in the environment or the economy. In industrialized societies the cyclical poor are regularly referred to as the working poor. Because of their marginal poverty status, this population tends to cycle on and off public assistance, often in congruence with economic highs and lows. In contrast, the structural poor are represented by the long-term, often generational poor, and are less affected by the economy.

It is assumed that cyclical poverty exists as a result of fluctuations in the economy from periods of economic prosperity to lows that are associated with recessions and depressions. These fluctuations, referred to collectively as the business cycle, affect unemployment rates and employee wages. In prosperous economies jobs are readily available, leading to low unemployment rates. Prosperous economies also bring about increases in wages for those who are employed. Alternatively, as the economy declines, unemployment rates increase, employees are laid off, and wages are reduced. The most notable economic low in the history of the United States is the Great Depression, which lasted from 1929 until the recovery of the 1940s. At the worst point of the Depression, one in four Americans was unemployed.

The regular ups and downs of the economy can have widespread implications, especially for the marginal working poor. Because increases in unemployment are associated with increases in poverty, recessions or depressions within the business cycle result in increased poverty rates. The individuals most affected by this cycle are the millions of working poor families who earn incomes near the poverty line. During the economic downturns that occur every four to 10 years, the working poor are laid off or suffer pay cuts. Because of their precarious proximity to poverty, these economic lows can be the catalyst that plunges the marginally poor into actual poverty.

Cyclical poverty in nonindustrialized societies is often due to food shortages caused by poor agricultural planning or by natural phenomena. In nonindustrialized countries, farming is often an attempt to achieve a level of food security. Because of a lack of knowledge or lack of capital, these farmlands are often not used efficiently. With proper planning, several different crops can be grown in a season on one parcel of land without destruction of soil. However, insufficient knowledge of effective farming methods and planning and decreased income can lead to erosion of the land. Thus, farming in these areas is often unproductive.

Natural phenomena that affect crop production can also destroy the sustenance of these countries. Floods as well as droughts can wipe out vast amounts of crops, and freezes that come too late or too early can significantly impact crop production. Fluctuations of crop production in these nonindustrialized societies cause prices to rise and fall, resulting in a cyclical pattern of poverty.

Seasonal farmworkers are especially impacted by natural conditions. For many of these workers, the income they receive during the farming season is what sustains them for the entire year. A season that does not produce a profitable harvest can result in a year of poverty.

Cyclical poverty continues to be a way of life for many of the marginally poor.

In the United States, cyclical fluctuations of poverty have decreased since the mid-1980s. During the recession of the 1980s, many U.S. cities experienced economic and geographic changes that contributed to the segregation of poverty in the inner city. While the country recovered from the recession, poverty rates did not decrease as much as was expected. Unemployment rates were similar to unemployment rates experienced during the recession and were considerably higher in urban areas, despite employment availability.

During the recession the impoverished became geographically isolated in the inner cities, and researchers speculated that this isolation could have resulted from the increase in relocation of manufacturing jobs to the suburbs during this period. As jobs relocated to the suburbs, those who could afford to followed. This led to the out-migration of the middle class from the inner city, a shortage of males in the inner city who were employed and able to support a family, and a basic alteration of the family structure of the urban poor.

The result was predominantly female-headed households living in the inner city, high rates of welfare dependency, and high risk for unemployment. Furthermore, economic fluctuations did not have the same impact as prior to the recession. It appeared these people had become trapped in poverty and were unaffected by improvements in the economy.

Cyclical poverty continues to be a way of life for many of the marginally poor. These individuals experience waves of highs and lows in income based on the economy or natural conditions. Living on the edge of poverty and working a job that is affected by fluctuations in the economy or the environment increase the chance that one will experience cyclical poverty. CYNTHIA L. JUBY, PH.D. UNIVERSITY OF TEXAS, ARLINGTON

Cyprus

LOCATED IN THE Mediterranean Sea, the island of Cyprus attained its long-sought independence from Great Britain in 1960. Three years later, tensions between the Greek Cypriot majority and the Turkish Cypriot minority exploded into violence. A United Nations peacekeeping force was subsequently deployed but was unable to negotiate a lasting peace. Turkey controls the northern third of the island, which it has named the Turkish Republic of Northern Cyprus. Other governments do not recognize this area as a separate country. Repeated efforts to reunite Cyprus have been unsuccessful.

The republic of Cyprus is a high-income nation, with a per capita income of \$20,300. Over three-fourths of the labor force is engaged in services, mostly in tourism and finances. Approximately 10 percent of the labor force are involved in agriculture. The unemployment rate is 3.2 percent. Cyprus joined the European Union in 2004, and all Cypriot citizens have the rights granted to members of the Union. In Turkish Cyprus, economic indicators are less positive. The per capita income is \$7,135. Half of the labor force is involved in services, and 15.1 percent are engaged in agriculture. Agriculture is made more difficult in Cyprus because prolonged droughts may go on for several years, creating water shortages.

Data on some social indicators for Cyprus are missing, and there is no official poverty line. The govern-

ment believes it has eradicated hunger by providing a social net for those in need. Nevertheless, when compared to other Cypriots, single mothers and rural and retired women are likely to make up the poorest segment of the population. Single mothers are the only group of Cypriots who are in danger of becoming victims of long-term poverty. Benefits granted to needy individuals include pensions, public assistance, and monthly child benefit payments. Government programs offer training, employment, and social services.

Life expectancy in Cyprus is 77.65 years, with females outliving males by an average of five years. The median age is 34.68 years. Nearly 21 percent of the population are under the age of 14, and 11.4 percent have lived to see a 65th birthday. Even though water shortages are a problem, all of Cyprus has access to safe drinking water. Proper sanitation is also available to 100 percent of the population. A national health plan has been considered but has failed to garner sufficient support for passage. While healthcare is not free, it is widely available. There are 269 physicians for every 100,000 people on Cyprus. Some 95 to 100 percent of Cypriots are able to afford essential drugs.

Cypriot infant mortality is low at four deaths per 1,000 live births. This rate has drastically decreased since the 1970s when the rate was 29 deaths per 1,000 live births. Between 1970 and 2005, the mortality rate for all children under the age of 5 was slashed from 33 to five deaths per 1,000. Nine percent of all infants are underweight at birth. Immunization rates for children from birth to 23 months range from a percentage in the mid-80s to the high 90s.

Cyprus has made a concentrated effort to promote family planning. Between 1970 and 2005, the fertility rate fell from 2.5 children per woman to 1.83 children per woman. Teenage pregnancy is relatively rare at 16 per 1,000 births. Professional medical staff attend 100 percent of all births. Based on modeled estimates for 2000, maternal mortality in Cyprus occurs at a rate of 47 deaths per 100,000 live births.

Approximately 98 percent of Cypriots over the age of 15 can read and write. The increase in female literacy since 1980 is striking because the rate jumped from 84.7 to 96 percent. Male literacy increased from 96 to 97.6 percent. Most children attend school for at least 13 years. Primary school enrollment rates have dropped in recent years. Between 1990 and 2000, for instance, total enrollment dropped from 100 to 94.9 percent.

Czech Republic

THE CENTRAL EUROPEAN nation of Czechoslovakia was formed after World War I when the Czechs and the Slovaks, both of whom had been part of the Austro-Hungarian Empire, united as one nation. After losing territory in the aftermath of World War II, Czechoslovakia became a satellite of the Soviet Union. Subsequently, an attempt to liberalize communism within the country failed. Czechoslovakia achieved independence through the Velvet Revolution after the collapse of the Soviet Union. In 1993, the Czechs and Slovakians agreed to a "velvet divorce" that resulted in the formation of the Czech and Slovak Republics as separate entities. Subsequent reforms led to Czech membership in the North Atlantic Treaty Organization in 1999 and the European Union in 2004.

The posttransition economy of the Czech Republic is one of the most stable and most prosperous of all former communist countries in Europe. Despite vast improvements and a diversified economy, the Czech Republic is facing an unemployment rate of 10.6 percent. The decline in employment has forced a number of families to turn to the government for social benefits. This is particularly true in families with several children and in those headed by single parents. Some people feel that most so-called poverty in the Czech Republic is more a matter of comparative lifestyles than an absence of basic necessities.

When asked to classify themselves, 25 to 35 percent of all Czechs feel they are poor even though their incomes are above subsistence level. These views are partially a result of the fact that the poorest 20 percent of

Czechs live on 10.3 percent of available resources while the richest 20 percent claim 35.9 percent. The Czech Republic is ranked 22.4 percent on the Gini Index of Human Inequality.

The projected life span in the Czech Republic has been steadily increasing since the 1980s. The current population of 10,241,138 enjoys a life expectancy of 76.02 years. Generally, females outlive males by six or seven years. The median age is 38.97 years. Less than 15 percent of the population are under the age of 14, and over 14 percent have seen a 65th birthday. All Czechs have access to safe drinking water and improved sanitation. There are 342 physicians for every 100,000 residents, and 80 to 94 percent have access to affordable essential drugs.

Childhood mortality is extremely low in the Czech Republic, with 3.93 deaths occurring out of every 1,000 live births. Among children under the age of 5, the mortality rate is five deaths per 1,000. In the 1970s, the mortality rate of infants was 21 per 1,000 live births, and the mortality rate of under-5s was 24 deaths per 1,000. Overall, Czech children are healthy, and only one percent of children under the age of 5 are underweight. Seven percent of infants are underweight at birth. Two percent of all under-5s suffer from moderate to severe stunting and two percent suffer from moderate to severe wasting. Nearly all children in the appropriate age groups are immunized in the Czech Republic, with immunization rates in the high 90s.

Approximately 72 percent of all Czech women use contraceptives. As a result, fertility rates are low. In 2005, the estimated fertility rate was 1.2 children per woman. This rate declined from 2.2 in the 1970s. Adolescents give birth at a rate of 23 births per 1,000. Only one percent of Czech births take place outside the presence of trained medical staff. Consequently, the maternal mortality rate is low at nine deaths per 100,000 live births.

Literacy is virtually universal in the Czech Republic at 99.9 percent, and most Czech students attend school for 15 years. In 1990, 92 percent of males and 86 percent of females completed primary school. Within five years, all Czech children were completing primary school. About 34 percent of all students in colleges and universities are studying math, science, or engineering.

WORLD POVERTY

Damascus Road

DAMASCUS ROAD was founded in 1995 in Chicago, Illinois, during the Restoring Our Sight Conference. The name *Damascus Road* refers to the process of transformation that Saul experienced on the road to Damascus (Acts 9:1-31). While Damascus Road (DR) provides space for individual transformation, the entire program is designed to work toward long-term transformation of institutions, particularly churches and faith-based organizations.

The inception is credited to about 250 Mennonites and Brethren in Christ, who, during the conference, sought to address elimination of racism in the Anabaptist community. They aimed to explore the biblical basis for antiracist work, as well as the history of racism in the Anabaptist tradition, emphasizing institutionalized racism. The overarching purpose of Damascus Road was to lay the groundwork for the long-term work of dismantling racism in Mennonite and Brethren in Christ congregations, conferences, and institutions by training teams, leaders, and supporters from those organizations.

To achieve this, the organization set a goal to equip each person and team with a biblical basis, grounded in the Anabaptist tradition, for dismantling racism and a basic analytical framework for dismantling systemic racism.

Damascus Road's antiracism work is carried out primarily through workshops organized at the local level, with organizational help and trainers provided by the national organization. Workshops include: Antiracism Analysis Training, which helps articulate the biblical call to antiracist action and presents a common language for talking about racism; Introductory Workshops, which provide a customized introductory analysis; Antiracism Organizing Training, which encourages teams to continue to deepen their theological understanding of antiracism work, learn basic concepts and skills for institutional organizing, and develop a vision, goals, and strategies for their work; Antiracism Educating and Communicating Training, which covers concepts and skills for effective antiracist education; Bread for the Journey, which develops team resources and networking; and Set Free and Fire & Clay Retreats, in which participants explore issues of internalized racist oppression and superiority.

Over 60 institutional teams and 1,300 individuals had participated in Damascus Road training by 2005, which included these workshops plus conferences, networking events, consultation, and antiracism audits. The Core Organizers, composed of eight trained individuals, provide additional emphasis on broader organizing concerns, while the Core Chaplains seek to articulate the theological and spiritual foundations of antiracism.

The teams that participate in the training represent various institutions, such as congregations, church conferences/districts, denominational boards, mission agencies, colleges, high schools, and service organizations. Damascus Road's work is grounded firmly in the Anabaptist family of churches (Mennonite, Brethren in Christ, and Church of the Brethren); however, they do accept all those who are willing to participate. The organization publishes regular newsletters and provides video and print resources for antiracism work. Damascus Road is part of the Mennonite Central Committee (MCC) U.S. Peace and Justice program.

Paul and Tanya Sloan Independent Scholars

Darwinism

AS IT PERTAINS TO POVERTY, Darwinism itself is relatively neutral. In fact, although Charles Darwin (1809–82) was born into a wealthy family, he was, for the most part, socially egalitarian and sought out all kinds of people who had more advanced expertise in areas that interested him regardless of their social standing.

Darwin was inclined to the sciences early, but he had no specific interest by the time he was college-aged. After failed attempts to complete medical school at the University of Edinburgh and theology school at Cambridge University, his passion for the natural sciences was met when he was invited to participate on a five-year survey trip on the HMS *Beagle* in 1831. It was during and after this voyage, and upon reading the works of

geologist Charles Lyell, who argued that the world had been shaped not by natural catastrophes but by gradual processes, that Darwin's ideas about biological change would develop. Darwin would observe Lyell's theories of slow cumulative change over long periods of time firsthand while on board the *Beagle*, and this would eventually lead him to postulate that the same method operated in living organisms.

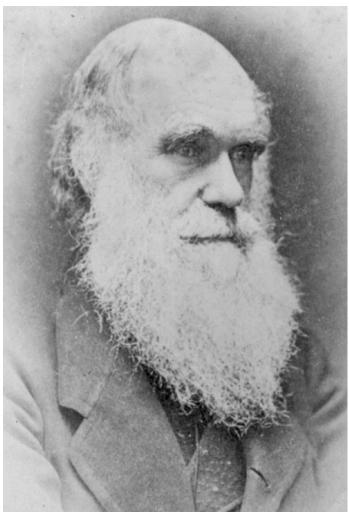

According to Harvard biologist Stephen Jay Gould, throughout his intellectual life Darwin pursued two goals: to show that species had not been separately created, and that to show natural selection had been the chief agent of species change. This latter idea would prove to be the most contentious. Darwin never applied his ideas to human cultures or social classes and never meant to have them interpreted that way.

However, two of Darwin's contemporaries in particular, Francis Galton and Herbert Spencer, would attempt to use Darwin's theory of natural selection to propagate an idea that had little, if any, scientific foundation. It is this idea that would become known as social Darwinism, which has meaning in the context of world poverty. This is because social Darwinists argued that the poor and disenfranchised were so not because of circumstances largely beyond their control, but because they simply did not try hard enough to succeed. As a result, intellectuals and public officials who were convinced that social Darwinism was valid attempted to construct and enforce policies aimed at ridding society of underachieving people rather than helping them.

Research by Martin Bernal shows that during the Victorian age, European intellectuals popularized a romanticized idea of progress. As such, many Victorian thinkers were compelled to venerate all that was modern and technologically advanced over that which had passed before it, thus creating a sense of undue superiority and racial chauvinism among many Europeans.

In essence, what was happening was that many European elites, the class from which most writers came, were attempting to rationalize and justify the European domination of Asia, the Americas, the Caribbean, and Africa in the name of the natural march of progress by applying Darwin's theory of natural selection (gradual change for the benefit of the living organism) to a theory of social change that was at its base both pernicious and bunk. Some European writers went so far as to call their domination "civilizing missions."

It is noteworthy that Darwin himself resisted any social application of evolutionary theory. In fact, throughout the first edition of *Origin of Species* (1859), Darwin never even used the term *evolution* for fear of its

Charles Darwin's work inspired others to apply evolutionary principles to social issues, including poverty.

misapplication, and in 1872 he would write, "After long reflection, I cannot avoid the conviction that no innate tendency to progressive development exists."

Francis Galton (1822–1911), Darwin's cousin, founded a school of thought called eugenics in part because he was overcome by the fear that the British elite were being outpaced in terms of population by an evergrowing underclass of "undesirables." Galton believed that behavior was genetically controlled and therefore easily manipulated. As a result, he conceived eugenics as a way to eradicate unwanted or socially harmful predilections from the gene pool by breeding out unwanted characteristics through selective mating.

He claimed, incorrectly, that social distinctions such as wealth or career reflected differences in innate endowment and that middle and upper classes tended to possess more civic worth and therefore ought to be encouraged to reproduce, while lower classes should be persuaded or even forced to limit their reproduction.

Applying Darwin's theory of natural selection to social classes, Galton assumed that ability was determined by heredity and that well-off individuals and families were so because they possessed genetic traits that were superior to those of the poor. His 1869 Hereditary Genius attempted to prove that ability was inherited in accordance with the same rules that governed physicality. Although eugenics is now discredited, Galton's work with Karl Pearson in psychometrics, especially in regression analysis, continues to be useful.

Herbert Spencer (1820–1903) grew up as an undisciplined child and was so stubborn as an adult that he would discount the opinions of those with whom he disagreed and refused to read authors whose work ran counter to his own beliefs. After the 1853 death of his uncle Thomas, his inheritance made it possible for Spencer to concentrate on writing without having to be otherwise employed. From 1862 to 1893, although afflicted with a series of mental health problems, Spencer completed A System of Synthetic Philosophy, a multivolume work describing his views in biology, sociology, ethics, and politics organized around the principles of his evolutionary theory.

Spencer believed that human life was the culmination of evolutionary processes and that human society reflected the same developmental evolutionary principles as any other biological organism. In essence, natural and social development unfolded along the same lines. To this effect then, he proposed that it was possible to know what kinds of "natural laws" promoted life and produced happiness. Further, he maintained the primacy of the individual over the aggregate and that society changed only as individuals changed. To this he added that human beings were imbued with an innate moral sense, one that provided them with the basis to make decisions about seeking pleasure for personal gain at the expense of limiting the pleasure of others. Spencer's ideas about individualism, morality, and pleasure led to his conceptualization that supporting people who were underemployed, underachieving, or underperforming was, in effect, antithetical to pursuing one's self-interest (pleasure) and counter to evolutionary principles.

It is in this context that Spencer interjected the idea of "the survival of the fittest," a phrase that he, not Darwin, coined. Here, Spencer attempted to apply the biological process of natural selection (genetic inheritance) as conceived by Darwin to acquired characteristics such as thrift and industriousness. Thus his political

philosophy asserted that industrious people who were free of commitments to existing structures such as religion and government would thrive peaceably together and toward the common good.

In contrast, people who lacked the ability to succeed on their own skill and merit would (or should) be selected out of society. Run to its logical conclusion, social Darwinism posits that there are natural inequalities among individuals resulting in a stratified social organization, which is also natural. Therefore, this self-perpetuating social structure, where only some people are morally and economically fit to procreate, is both right and good. Spencer's reasoning equated freedom from want and fear with the freedom to accumulate property and exploit others, and found justice in the unequal distribution of wealth.

Galton's and Spencer's misguided theories have continued to persist into modern times, and have found currency among social critics such as William Shockley, Arthur Jensen, Charles Murray, and Richard Herrnstein. Such theorists continue to perpetuate ideas that indicate social disparities are immutable natural differences.

PAUL T. MILLER
TEMPLE UNIVERSITY

Debt

DEBT IS AN AMOUNT of money that is owed, measured in a single snapshot of time, as a result of previous borrowing. Debt is a stock concept, as opposed to flow concepts in economics, which are expressed over

certain periods of time. Debt represents accumulation of deficits between monetary receipts and payments—flows measured monthly, quarterly, or annually. There are several different types of debt: external (foreign) debt; public (national, domestic, or government) debt; and private (corporate and household) debt.

External debt arises through accumulation of deficits between a country's receipts and payments with the rest of the world. It is usually a result of persisting trade deficits. Public debt represents accumulated budget deficits, measured as a difference between the government's tax revenues and its expenditures. It is usually a result of persisting budget deficits. The accumulated negative difference between the income and expenses of corporations and households gives rise to private debt.

Debt redistributes purchasing power between a debtor (borrower) and a creditor (lender), where the debtor is an entity that increases current consumption against consumption at future times, when the debt needs to be repaid to the creditor. The repayment of the debt includes a part of principal and an interest over the agreed-upon period of time. The interest rate is negotiated between the lender and borrower and includes the assessment of a market-free interest rate as well as risk characteristics, for example the creditworthiness of the borrower.

The ability to repay the debt, sometimes referred to as the debt burden, depends on the ability of the borrower to generate sufficient revenues in the future that would repay principal and interest without comprising too heavily already reached levels of consumption at the times of repayment. Solvency and liquidity of the debtor are instrumental in measuring the ability of repayment. Debt can be restructured or cancelled. Debt restructuring involves renegotiation between the debtor and creditor of the terms and maturity of the debt payments. Debt cancellation is the forgiveness of a certain portion or of the entire debt by the creditor.

Some analysts and economists believe that the international external debt of many developing and poor countries has become disproportional to their ability to repay. Debt restructuring and debt cancellation are at the center of initiatives to define and ease the debt burden of heavily indebted poor countries.

EXTERNAL DEBT

External debt is a debt owed by private and public entities in a domestic country to nonresidents. If the external debt is owed by the public sector, for example, by the government, it represents a portion of a country's public debt. If the external debt is owed by the private sector, it represents a portion of a country's private debt. The external debt can also be classified by the type of creditor to whom the debt is owed. The creditors of external debt include multilateral creditors, mainly the international financial institutions such as the International Monetary Fund (IMF), the World Bank, and other regional development banks; bilateral creditors, mainly foreign governments or their appropriate institutions such as the Paris Club; and private creditors, which are mainly commercial banks or bond holders.

Debt burden concerns the relative difficulty of servicing the debt. The elements for measuring the debt burden involve the nominal amount of debt owed by a country—debt stock; the annual amounts payable on debt—debt service; and the present value of debt—the amount of future debt service expressed through its costs in today's money.

The burden of external debt is measured by debt indicators, which are constructed to capture a country's ability to meet its obligations. The most frequently used debt indicators are the ratio of a country's external debt to its exports, the ratio of external debt to a country's Gross Domestic Product (GDP), and the ratio of external debt to government tax revenues. The higher the ratio, the greater the burden of servicing the debt. If the debt-to-export ratio is growing over time and the debt has already reached high levels, there is a great likelihood that debt is becoming unsustainable, forcing a country to declare a solvency or liquidity problem in meeting its monetary obligations.

DEBT CRISIS

Debt crisis is the situation where one or more countries openly declare an inability to repay the debt. For example, the Mexican government's debt moratorium in 1982 and similar debt problems in Brazil and Argentina are often referred to as the Latin American debt crisis. The debt-to-export ratio was about 400 percent for Mexico, 450 percent for Brazil, and 700 percent for Argentina at the height of the debt crisis in the mid-1980s. This means that the production and export earnings of these countries were largely insufficient to meet their debt obligations.

The roots of the debt crisis can be traced to the end of the Bretton Woods dollar standard system in 1973, followed by the two oil price shocks in the 1970s. The higher price of oil in international markets generated substantial revenues to oil-exporting producers, which

Debt is an amount of money that is owed, measured in a single snapshot of time, as a result of previous borrowing.

were, in turn, deposited into large commercial banks and subsequently used to approve additional new loans to primarily oil-importing developing countries at relatively favorable interest rates. This large-scale lending to developing countries, especially in Latin America, was often referred to as recycling of petro-dollars. The lending was justified by the promises of high growth prospects and rich national resources of the region.

At the end of the 1970s, however, international interest rates increased dramatically in response to the second oil price shock, stagflation, and tight monetary policies led by the United States. The commercial banks extended rollover credits to debtor countries at very high interest rates, which resulted in an increased burden of debt servicing and led to the outbreak of the debt crisis.

Many analysts believe that the primary cause of the debt crisis lies in inadequate economic policies, insufficient adjustment, and too much borrowing by the debtor countries. Many of the debtor countries, however, would argue that the international monetary system was ill-equipped to prevent and deal with the crisis. The creditor countries were slow to adopt debt reduction measures. Only by the end of 1980s, the Brady

bonds were created to help reduce the debt burden of Latin American countries.

In contrast to the early 1980s, when commercial banks represented the major lenders to the region, during the 1990s the institutional investors became more involved lenders, through both bond and equity markets. A substantial increase in capital inflows, economic reforms, liberalization of domestic markets, privatization of domestic enterprises, and successful renegotiation of external debt eventually played a role in reducing the debt burden of many Latin American countries by the end of 1990s.

HEAVILY INDEBTED POOR COUNTRIES (HIPC)

In contrast to the 1980s, when the debate on causes and consequences of the debt crisis focused on severely indebted lower-middle-income countries, mostly in Latin America, during the 1990s and more recently, the analysis of debt problems shifted to severely indebted low-income or poor countries, most of them in Africa.

Also, the burden of debt owed to commercial banks shifted to official or bilateral debt—owed to donor governments—and to multilateral debt—owed to international financial institutions. African countries began to experience problems with the servicing of official debt not only as a consequence of falling commodities prices, with commodities being the major source of their export revenues, but also as a result of higher interest rates and protectionism in developed countries.

Debt problems of the heavily indebted poor countries differ significantly from the problems of the lower-middle-income countries that led to the debt crisis of the 1980s. According to the classification criteria of the World Bank (Global Development Finance, 2003), the low-income economies are countries with a Gross National Income per capita of \$745 or less, while the lower-middle-income economies are those with a Gross National Income per capita of \$746–\$2,975. The criteria for the debt burden of the country are based on the corresponding debt indicators.

Thus, all low-income and middle-income countries (sometimes referred to as developing countries) in the World Bank debt reporting system are classified as either severely indebted, moderately indebted, or less indebted. Severely indebted countries are those that have a debt-to-export ratio (that is, ratio of the present values of debt service to exports of goods and services) higher than 220 percent and a debt-to-income ratio (that is, ratio of present value of debt service to Gross National

Income) higher than 80 percent. Accordingly in 2003, there were 34 severely indebted low-income countries, mostly in Africa, and 13 severely indebted lower-middle-income countries, mostly in Latin America. For example the debt-to-export ratio was reported to amount to 1,790 percent for Burundi (severely indebted low-income country) and 375 percent for Argentina (severely indebted upper-middle-income country). The debt-to income ratio was 1,090 percent for Burundi and 50 percent for Argentina.

The total debt stock is always a poor indicator of the true debt burden for the country. The total external debt in Argentina was \$136,709 million and only \$1,065 million for Burundi in 2001. Moreover, increasing external debt may not adequately reflect increasing debt servicing difficulty, especially if there is an increase in a country's export earnings and debt-servicing capacity.

For all developing countries, on average, the debt-to-income ratio amounted to 39 percent, for the lower-middle-income countries 50 percent, and for HIPC countries 90 percent. There are also important differences in the composition of long-term debt. For middle-income countries, 68 percent is private, 19 percent bilateral, and 13 percent multilateral debt. For HIPC countries, only 14 percent is private, 44 percent bilateral, and 42 percent multilateral debt.

ECONOMIC PERFORMANCE

The heavy debt burden of low-income countries has often been accompanied by their weak economic performance and slow economic reforms. The factors behind the weak economic performance encompass the adverse terms of trade developments (that is, the decline of the ratio between export and import prices) and frequent fluctuations in production and consumption due to droughts, civil wars, and other political turmoil. Persistent microeconomic distortions and inadequate macroeconomic management have contributed to perpetuate an adverse impact of external debt on economic growth. Numerous studies and countries' experiences show that the reduction of external debt can play a significant role in propelling private investment and ensuring economic growth in the future. This is because the repayment of a country's debt draws its resources away from other productive uses, especially from potentially profitable investment opportunities and important improvements in a country's infrastructure, which are essential preconditions for its future economic growth.

On the other hand, debt reduction frees the resources for potential increases in current as well as fu-

ture consumption and production. Debt overhang theory postulates that investment by domestic and potential foreign investors is discouraged because the prospective returns from investing in domestic economy are effectively taxed away by existing foreign creditors.

Accordingly, debt reduction would reduce present distortion from the implicit tax and thereby increase investment. Debt reduction would benefit both the debtor and the creditor by increasing potential investment and likelihood of debt repayment, which should encourage creditors to offer some debt assistance and reduction.

Other channels through which external debt exerts an adverse impact on economic performance include the lack of access to international financial markets as well as the general uncertainty in the economy due to the heavy debt burden. Many analysts of the aftermath of the Latin American debt crisis pointed out that the debt reduction enhanced access to financial markets, leading to increased capital flows, improved investment opportunities, and reduced debt burden.

The external debt is assumed to be sustainable if there is a strong likelihood that future output and export growth will be sufficient to reduce debt servicing difficulties over time and ensure that a country will not resort to debt rescheduling in the future. In contrast, the analysts of the IMF projected a "rule of thumb" warning sign that external debt is becoming unsustainable when the ratio of the present value of debt service to exports is on the order of 200–250 percent. These numbers are based on empirical studies and the experiences of heavily indebted developing countries.

Unfortunately most heavily indebted poor countries that presently meet the criteria for unsustainable external debt seem to experience the vicious circle of poverty and debt reduction. They need to improve their economic performance in order to reduce their debt burden, and at the same time they cannot hope to achieve better economic performance in the future unless they receive significant debt concessions or debt cancellation in the present. Many developing countries have also found that they are being implicitly punished for their efforts toward improved economic performance and better debt management by becoming less eligible to receive foreign aid and debt concessions.

PUBLIC DEBT

Public debt is money owed by government either to lenders within the country (internal debt) or to foreign lenders (external debt). The analysis of debt sustainability in low-income developing countries needs to address the fact that most of their external debt is public debt. The internal debt and bond markets in developing countries are generally small and poorly developed so that those countries rely more on foreign creditors in financing their budget deficits. The adjustment in government expenditure and taxation that is necessary to service the external debt therefore becomes an additional constraint to growth prospects of low-income countries.

Cuts in government expenditures restrict assistance to poor.

Some economic analysts believe that beyond the debt-to-export and debt-to-income ratios, the debt-to-tax ratio should be used as an additional indicator in ascertaining debt sustainability and in predicting the likelihood of debt crisis. For example, a debt-to-tax ratio above 300 percent can be used as a threshold to indicate high risk of a debt crisis and the largest negative impact on growth.

The adverse impact that a required budget restructuring can have on the welfare of a country is especially painful to the public when cuts in government expenditures restrict access to healthcare, education, or assistance to the poor and unemployed. In addition, some governments must restrict money available for protection of the environment, prevention of crime and corruption, and general enforcement of the law.

Alternatively the government can resort to increases in taxes to help service the external debt, which in turn contribute to stagnation of domestic economic growth through deterrence of consumption and investment. Thus in countries where external debt problems are largely related to their budgetary problems and not only difficulties with imports and exports, the implementation of fiscal reform must be part of the debt sustainability analysis.

The burden of public debt addresses not only the government's ability to repay the debt but also the economy's ability to absorb it. The most frequently used indicator of the public debt burden measures the publicly held debt relative to GDP. According to the indicators computed by the IMF for the sample of countries in 2001, the government debt-to-GDP ratio was 42 percent for the United States, 60 percent for Japan, and 104 percent for Italy.

Across the developing countries, the same ratio was measured at about 43 percent for South Africa, 56 percent for Brazil, 90 percent for India, and 130 percent for Jamaica. The experience of many countries indicates that the large public debt makes them more vulnerable to macroeconomic instability and susceptible to financial crisis. For example, the south Asian financial crisis of the mid-1990s had large levels of both the external and public debt as contributing factors.

Debt Relief

WHILE SCHOLARS MIGHT argue over the severity and causes of debt and the best solutions for alleviating it, most would agree that the roots of modern debt began with the European enslavement of Africans and colonization of Africa, Asia, the Caribbean, and the Americas. From the 18th century on, in a process called colonization, European countries and the United States expropriated land and exploited the people and resources throughout much of what we now call the developing world and in North America.

By the mid-1900s, many European nations and America realized that colonization was economically untenable, while politically many colonies fought for and won independence. The result was that what had been many colonies were now new countries, which were economically dependent on only a few agricultural export crops (cash crops), financially dependent on the economic generosity of Western countries, depleted of significant amounts of their natural resources, underdeveloped with respect to infrastructure, and politically unstable. As a consequence, former colonies were forced to begin nation-building with little time for planning, small national reserves, and underdeveloped industries.

Many of the initial loans went directly to the coffers of corrupt leaders.

During the 1970s, these countries, known to economists as Least Developed Countries (LDCs), took out loans from Western banks that were awash with money coming from major petroleum-producing (OPEC) nations. However, by the 1980s, Western countries reacted to the increasing power of OPEC, and the UNCTAD Group of 77, a coalition of LDCs, rallied against southern countries because they feared developing nations were banding together to demand a more equitable economic order than the one constructed by the Western powers.

With Margaret Thatcher and Ronald Reagan in power, Britain and the United States would preside over the neocolonization of the south (southeast Asia, South America and the Caribbean Basin, and Africa), using the World Bank and International Monetary Fund (IMF) to impose structural adjustment programs (SAPs) on developing countries.

SAPs consisted of loan programs that were aimed at reforming the entire economic landscape of a borrowing country. Generally, all SAPs stipulated that the borrowing countries reduce government expenditure, especially on social services such as healthcare, education, and welfare; lift restrictions on foreign investment; privatize state-owned enterprises; and cut wages while weakening labor protections.

Policy analysts have shown that many of the initial loans made by commercial banks during the 1970s went directly to the coffers of corrupt leaders in developing countries who were propped up by Western powers, such as Zaire, Indonesia, and Chile. When these loans proved too much for developing countries to handle and they threatened to default, the World Bank and IMF, at the urging of the United States Treasury Department, stepped in to provide bailouts so that Western banks would not lose the money. The World Bank and IMF then made subsequent loans in the form of SAPs (and do still) so that debtor countries could pay the interest on their debts.

At the same time, these new loans imposed "conditionalities," sometimes called austerity measures, stipulating that borrowing countries make cuts to any number of state-provided social services. The impact of SAPs was that by the early 1990s most LDCs had little state participation in the economy, trade protections for local economies were dismantled, and the economies of countries with SAPs were linked into capitalist world markets, while fewer people in these countries received necessary medical attention, education, or human services such as access to clean drinking water, sanitation services, or habitable living accommodations.

In an effort to alleviate the burden of debt facing many LDCs, a number of antidebt campaigns came together during the mid-1990s under the banner of the Jubilee Network to put pressure on Western institutions such as the IMF and World Bank to cancel the debts of developing nations. Although they won a nominal victory when, in 1996, the IMF and World Bank initiated the Heavily Indebted Poor Country initiative (HIPC) for 42 poor countries, this program has been slow to act, inefficient, and contains some of the same harmful conditionalities as did the SAPs.

Under the HIPC initiative, only 15 of the 42 countries targeted have managed to complete the HIPC process and therefore received some debt cancellation, while another 12 have reached just the first stage and therefore qualified for some relief on debt repayments. To this point, among the 52 poorest countries, only 12 percent of the original \$375 billion in debt has been forgiven, even though they have paid back more than \$375 billion in debt service and interest on these loans.

The reason that many LDCs are locked into the cycle of debt is that the interest on loans is high and the Gross Domestic Product of the countries is low. The result is that most poor countries earn only enough to pay the debt service and never manage to pay down the principal of the loan. In some instances, the aid that countries or regions receive is equal to or less than their debt payments.

For example, sub-Saharan Africa receives \$10 billion annually in aid, but pays out that much or more in debt repayment. In some LDCs, the HIPC initiative has created positive social outcomes like increased health programs in Benin, increased attendance in primary education in Tanzania, and greater access to clean drinking water in Uganda. Unfortunately, these positive outcomes prove to be the exception rather than the rule.

There is hope, however, that debt relief will finally become permanent. At their 2005 meeting in London, the G-8 finance ministers, urged by former South African president Nelson Mandela, acknowledged that the 42 developing nations targeted by HIPC need 100- percent debt relief if they are to succeed in the 21st century.

Debt Swap

A DEBT SWAP IS an arrangement that involves the conversion of overly burdensome debt obligations into new obligations. Developing countries have welcomed debt swaps as a chance to renegotiate and ease their debt burden while the creditors accepted debt swaps as an increased likelihood that they would be repaid.

By using the debt swap, the creditor and its debtor agree to exchange debt for a new asset or obligation with different repayment terms. There are different types of debt swaps: the debt-equity swap, the debt-for-development swap, the debt-for-nature swap, or another arrangement that converts debt into funding for a certain project, policy change, or economic or political reform. The common feature of all types of debt swaps is the willingness of a creditor to exchange debt for assets or obligations of lower face value but with a higher likelihood of repayment than of original debt.

Debt-equity swap occurs when the creditor sells the debt at a discount in a secondary debt market to an investor who, in turn, sells the debt to the debtor government in return for equity in a company of a debtor country. It can be used as a part of privatization programs when the debtor government agrees to exchange debt for public assets. The introduction of the debt-swap mechanism coincides with the attempts to resolve the international debt crisis of the 1980s. The first debt-

equity swap program was established in Chile in 1985 to contribute to debt reduction and stimulation of investment and growth. Since 1985, about 50 countries have used different types of debt swaps in their quest for debt resolution. For example, Argentina, Mexico, and the Philippines have used debt-equity swaps as a way of attracting foreign direct investment and stimulating interest in their privatization programs. The secondary debt market, also known as the emerging markets debt market, continued to grow substantially during the 1980s and 1990s, being dominated by debt owed by middle-income Latin American countries (Brazil, Argentina, Chile, and Mexico). On the other hand, many low-income indebted countries suffered from insufficient domestic budgetary resources to fund a debt-swap program, and relied more on pure grants, some concessional loans, or debt cancellation in their efforts toward debt resolution.

Debt-for-development swap is an arrangement where a development organization (nongovernmental organization or United Nations agency) purchases debt at a discount and then exchanges the debt with the debtor government for funding in a local currency of a certain development project. Debt-for-development swaps include debt-for-child-development, debt-for-education, and debt-for-health swaps.

For example, in the early 1990s, UNICEF carried out numerous debt-swap transactions to convert a total of \$199 million face-value debt into the funding of \$52 million in programs in support of child and maternal development in Senegal. Also, by relying on debt-for-development swaps, the United Nations' UNICEF helped to implement programs related to water, sanitation, and health in Sudan; education programs in the Philippines and Bolivia; and similar programs in Peru, Zambia, and Mexico.

In contrast to debt-equity swaps, debt-for-development swaps did not significantly contribute to debt reduction in developing countries. The first debt-for-nature swap was implemented by Conservation International in Bolivia in 1987, involving the cancellation of Bolivian external debt in exchange for funding for nature preservation and environmental protection. One of the largest environmental swaps to date was the cancellation of 50 percent of Poland's Paris Club debt in 1992 and its conversion to create the Polish EcoFund, an independent foundation.

The experience of different countries with debt swaps to date helped to highlight some of their advantages and disadvantages. Among the major advantages are debt reduction, promotion of investment and economic growth, and allocation of investment to priority areas. However, potential disadvantages of debt swaps lie in their complexity, significant transaction costs, and often adverse impact on a debtor's country government budget.

Decomposable Poverty Measures

A POVERTY MEASURE is said to be decomposable if the poverty measure of a group is a weighted average of the poverty measures of the individuals in the group. An important property of decomposable poverty measures is that a ceteris paribus reduction in the poverty measure of a subgroup always decreases poverty of the population as a whole.

Decomposable poverty measures are particularly useful in poverty studies where a population is broken down into subgroups defined along ethnic, geographical, or other lines. We can use these measures to obtain the contribution of each subgroup to total poverty, and to estimate the effect of a change in subgroup poverty on total poverty.

Standard poverty indicators like the headcount ratio and the average poverty gap ratio are decomposable. However, these poverty measures violate some basic properties or axioms proposed by A.K. Sen, like the monotonicity axiom and the transfer axiom. On the other hand, the Sen poverty index and all its variants that rely on rank-order weighting are not decomposable. In particular, the indicators in that class fail to satisfy the property that an increase in subgroup poverty must increase total poverty.

In this context, an important contribution by J. Foster, Greer, and Thorbecke was to define a class of de-

composable poverty measures that satisfy the basic axioms proposed by Sen. We describe here this class of decomposable indicators.

The Foster-Greer-Thorbecke index is a weighted sum of the poverty gap ratios of the poor. In contrast to the Sen index, the weights do not depend on the "ordering rank" of the poor, but on the poverty gap ratios themselves. In other words, the contribution of an individual to the poverty measure depends only on the distance between his income and the poverty line and not on the number of individuals who lie between him and the poverty line.

The Foster-Greer-Thorbecke index satisfies the monotonicity axiom (that is, a reduction in a poor person's income, holding other incomes constant, increases the poverty index) and the transfer axiom (that is, the index increases whenever a pure transfer is made from a poor person to someone with more income). Its decomposition shows that, in contrast to Sen-type indexes, this index satisfies the subgroup monotonicity axiom: if we change the incomes in a subgroup such that we reduce poverty in this subgroup, leaving the other subgroups the same, then total poverty in the population should decrease. Foster, Greer, and Thorbecke propose a generalization of this index.

Definitions of Poverty

IN THE UNITED STATES, the Census Bureau determines the poverty status of families based on poverty thresholds or income levels dependent on the number of family members. The poverty thresholds are adjusted each year to reflect changes in the Consumer

Price Index (CPI). The primary basis for poverty threshold determination goes back to 1955 when a U.S. Department of Agriculture (USDA) survey indicated that approximately one-third of a family's income was spent on the purchase of food. The Social Security Administration then used the least expensive food plan identified by the USDA, the Economy Food Plan, and multiplied this number by three to come up with total family income.

The 2005 poverty guidelines list a family income of \$19,350 for a family of four.

The poverty thresholds represent income levels and will vary depending on the number of family members and their ages. If total family income is less than the threshold, all members of that family are determined to be in a poverty status. Conversely, if family income is above the threshold, the family is not in poverty. Certain categories of people are not considered in the determination of a family's poverty status. These include foster children, children under age 15 and not residing with the family, people in prisons or nursing homes, family members in college dormitories, and those serving in the military.

Annual poverty guidelines are published each February in the *Federal Register* and are the official measures to be used during that year. This measure of income, also defined as absolute poverty, identifies families who do not have the necessary resources to ensure a healthy lifestyle. The guidelines appear in a two-dimensional matrix format showing the number of family members and the associated income level.

For example, the 2005 poverty guidelines list a family income of \$19,350 for a family of four residing in any of the 48 contiguous states and the District of Columbia. A family of four with an income above that amount would not be in poverty. Two additional columns in the matrix list the income levels for Alaska and Hawaii, both of which are higher. Alaska's income level for a family of four is \$24,950 and Hawaii is listed at \$22,260.

The guidelines are a simplified version of the poverty thresholds and are used primarily to determine a family's eligibility for certain federal programs. For instance, eligibility for inclusion in Head Start, the Food Stamp Program, the Low-income Home Energy Assistance Program, the National School Lunch Program, and the Children's Health Insurance Program would be

determined on the basis of the poverty guidelines. An additional adjustment to the guidelines is required when immigrant visa cases are being determined. For example, the income level for a family of four residing within the 48 contiguous states is increased by 25 percent (from \$19,350 to \$24,188) in order to comply with immigration statutes.

Another way to consider poverty is in the context of a family's marginalization within the economic system and its level of deprivation. This approach suggests a more subjective measure and is identified as relative poverty. Poor people under this measure are judged to have less access to income than others in the society. For instance, instead of using the guidelines for a family of four (see above) to determine membership in a poverty cohort, a relative measure such as the percentage of the median income for all families of four could be used for comparison. In short, a relative poverty indicator is based on a judgmental conclusion and not on a specific income measure.

Thirty-seven million people in the United States were considered as living in poverty.

In 2004, the poverty rate (also called the annual poverty rate) in the United States was 12.7 percent, which represented an increase from 12.5 percent in 2003. This meant that over 37 million people in the United States were considered as living in poverty in 2004. Disaggregated information for specific racial groups showed considerable variation: the black population had 24.7 percent living in poverty, Hispanics had 21.9 percent in poverty, and non-Hispanic whites had only 8.6 percent below the poverty line. Asians in the United States in 2004 had 9.8 percent of their people living in poverty.

Differences in poverty rates were also found in age cohorts. Nearly 18 percent of children under the age of 18 (13 million) lived in poverty while only 11.3 percent of people aged 65 and over were in that category. The child poverty rate for the United States is nothing to boast about. A 2005 UNICEF study pointed out that nearly 50 million children in wealthy countries world wide are living in poverty. The report asks why some countries in the Organization for Economic Cooperation and Development (OECD) are succeeding in keeping child poverty rates low and some are not. For example, three northern European counties, Denmark, Finland, and Norway, have child poverty rates below

three percent while the United States has one of the highest rates of any OECD country, 18 percent (2004 estimates).

The Census Bureau also uses a number of additional definitions related to poverty. Among them is a set of definitions connected to longitudinal survey data collected by the bureau. A longitudinal survey involves collecting information from the same respondents over a long period of time to determine if income situations have changed. Average monthly poverty is one of these definitions, and it determines the average percentage of poor people per month in each year of a longitudinal study.

Another is long-term poverty, which is the percentage of people in poverty every month for the full term of a three- to four-year longitudinal study. Episodic poverty is a measure of the percentage of people who were judged to be poor in two or more consecutive months within the duration of a longitudinal study. The spatial dimension of poverty is reflected in poverty area, a concept that defines census tracts or "block numbering areas" where 20 percent or more of the population are living in poverty. Poverty universe defines the population of those living in poverty.

Suggestions have been made that the current poverty guidelines are in need of revision. Because of significant socioeconomic changes in the years since the inception of the guidelines, proposals have come forward to institute changes in the way poverty is determined. In the 1960s, during the time of President Lyndon B. Johnson's historic War on Poverty, the formula for the guidelines was put in place. Advocates of change contend, for example, that the increased number of working mothers who are faced with paying for childcare signals a need for change because the current guidelines make no distinction between family members who work and those who do not work.

Another basis for suggested change is the variation in healthcare costs faced by particular groups of people. In addition, the thresholds are the same across the country, except for Alaska and Hawaii, although there are significant regional price variations, especially in the area of housing. Further, because of increased standards of living in the United States since the 1960s, it is suggested that changes in the CPI are no longer adequate for determining annual increases in the threshold levels. Concerns have been raised as well in the education field.

Since the measures of poverty are county-based, there may we well be schools whose student populations come from poorer areas of the county and therefore do not receive the added assistance needed. Further, the measure emphasizes adults and not children in data gathering. Finally, a large number of high-income retirement communities have located within otherwise poor counties and cities. The presence of these communities brings the poverty level of the community down, even though the original cohorts of poor people are still residing there.

POVERTY IN CANADA

Poverty measurement in Canada has also come under scrutiny. In recent years, the Canadian government has begun considering the implementation of a mandated poverty-line-based family income. Human Resources Development Canada (HRDC) has proposed a market basket measure of poverty.

Canada is interested in refining its approach to better understand the incidence of poverty, its depth, and the duration of poverty. These are measures that the United States has used since the 1960s, and it would appear that the Canadians will use poverty guidelines, an absolute poverty approach, to do their research determinations.

However, opinions vary in this regard and some experts are in favor of using relative poverty measures. Groups favoring the relative poverty approach contend that to be poor is to be distanced from the societal center and thus marginalized from employment opportunities and other positive aspects of life that are easily accessed by more affluent families. To be poor in a rich country, the advocates of relative poverty measures contend, implies far more for a family than simply having an income that is below a government-mandated level.

DEVELOPING WORLD

In the developing world, poverty is a supremely crucial consideration. Poverty levels are especially high in sub-Saharan Africa, where 75 percent of the population live on less than \$2 per day. The United Nations Development Program (UNDP) through its Poverty Strategies Initiative (PSI) has provided researchers and government officials with both qualitative and quantitative information on the compelling nature of poverty within this vast and fragile socioeconomic region.

UNDP publications have identified a number of conclusions about poverty in the developing world. One of their conclusions defines poverty in an absolute sense: poverty is present when private consumption

falls below a predetermined level and is defined as private consumption poverty (PCP). PCP is used to determine the total number of people below the line and the severity of the poverty problem, that is, how far below the line people have fallen.

Associated with the absolute measure of poverty in this region, considerations are also made of education levels, degrees of literacy, and life expectancy. Relative measures of poverty, such as social exclusion from opportunities within the community and being powerless to confront a governmental regime, are also used. In addition, the UNDP augments its absolute measures by accumulating information on the ability of a family to cope with health problems and physical isolation and still manage to satisfy their basic needs.

The UNDP set goals to cut in half the number of people living in extreme poverty.

The concept of vulnerability is paramount in the developing world and is closely related to poverty. Change within a society in this region can disrupt a family economically, socially, or politically. For example, the ongoing conflict in Sudan had left thousands of families homeless and in refugee camps. Environmental degradation brought on by drought in the Sahel resulted in the loss of homelands and sources of income for thousands more.

The United Nations *Human Development Report* (1997) included a Human Poverty Index (HPI) to identify and measure the degree to which people in the developing world have been denied certain basic opportunities and choices. The indicators used in the HPI are indeed basic to life itself: a measure of longevity (identified as a "short life"), lack of a basic education (here "basic" essentially means a few years at the elementary level), and access to public and private resources, such as fresh water, adequate and affordable housing, and local healthcare.

Another way of measuring poverty, the purchasing power parity (PPP) method, is described as a theoretical exchange rate derived from the perceived parity of purchasing power in one country as compared to purchasing power in another country. An extreme example would be the comparison of the costs for comparable food or clothing items in Niger and the United States. The cost in dollars would, of course, be much higher in the United States. But the fact that comparable items could be purchased in Niger for much less indicates that

direct comparisons of income, for instance, are not the best measure of what \$1 can purchase in any given place. Gross Domestic Product (GDP) data from countries are usually transformed into the PPP U.S. exchanges rate in order to derive a more reliable measure of standard of living.

The UNDP set goals to cut in half the number of people living in extreme poverty in the developing countries by 2015. This ambitious goal was named Strategy 21, and from the onset concerns were raised about the possibility of achieving the goal. In this initiative, extreme poverty identified people in the developing countries living on less than \$1 per day. The goal is to halve that number by 2015. In addition, the initiative sets out to halve the number of people identified as undernourished by 2015.

More than 40 percent live in either extreme poverty or dangerously near its edge.

Finally, the initiative hopes to improve basic education worldwide and ensure that all children of both genders are able to complete a full course in elementary schooling. Attaining these goals by 2015 will call for rapid advances in economic growth within the affected countries, an outcome that at present seems difficult at best to accomplish; massive assistance from countries in the developed world; and continued aid from the many nongovernmental organizations already working to alleviate the dire conditions in these countries. United Nations studies indicate that 20 percent of the world's population (more than one billion people) survive on less than \$1 while another 1.5 billion survive on \$1 to \$2 per day. In short, more than 40 percent of the world's population live in either extreme poverty or dangerously near its edge.

Child poverty in the developing world has been characterized by a number of severe deprivations. Perhaps the most severe of these is nutritional deprivation, which threatens the very survival of a child. Nearly 20 percent of children under 5 years of age suffer from nutritional deprivation. Water deprivation is another malady that affects 20 percent of children in developing countries. This deprivation is especially prevalent in sub-Saharan Africa, where access to fresh water sources is severely limited. Other attributes of severe deprivation seen in the developing world include shelter, sanitation, information, health, and education. It is within these crucial areas that the United Nations Develop-

ment Program hopes to realize progress by 2015 in its initiative to alleviate suffering and poverty.

Democratic Party

THE DEMOCRATIC PARTY is one of the two major political parties in the United States. It is known as a more liberal, left-of-center party, as opposed to the Republican Party. The Democratic Party, which claims Thomas Jefferson and Andrew Jackson as its founders, is the oldest continuous political party in the United States and in the world. This is rather remarkable, because many countries in the world surpass the United States in age. The origins of the Democratic Party can be traced to the conflicts between then Secretary of State Thomas Jefferson and then Secretary of the Treasury Alexander Hamilton. Both responded to their respective constituencies to a sizable extent. Jefferson advocated for rural, agrarian interests, espousing a political philosophy that was more distrustful of executive and judicial power and authority and more populist. Hamilton's political philosophy favored the urban, affluent, commercial interests, tending toward elitist, national, centralized, and Federalist approaches.

The ascendancy of Jefferson to the U.S. presidency marked the decline of the Hamilton or Federalist opposition. The Jefferson election was a landmark election in American history. The impact of Jefferson's political philosophy and ideas was to linger for years.

However, by 1824, there were divisions in the thennamed Democratic-Republican Party. Andrew Jackson emerged as a leader of a faction that became known as the Democrats, which presaged the development of the modern-day Democratic Party. It could be said that in some respects it became more populist and more democratic. The Democrats garnered the support of urban workers, Catholic immigrants, and people from the new southern and western states that had been admitted to the Union. The people attracted to the Democratic Party felt to some extent that they had been either ignored or left out of the process. This tradition or phenomenon has persisted to this day. The Democratic Party draws much of its support from segments of the population that have felt left out, oppressed, and disenfranchised.

All of this seemed to be a successful effort, for the Democrats prevailed in Congress. However, this Democratic dominance was not to last. The emerging, troublesome issue of slavery, combined with rising sectionalism (especially, of course, in the south), began to have a profound effect on the entire political process, and particularly for the Democrats.

The 1860 presidential election, surely one of the most important in American history, resulted in the election of a Republican, Abraham Lincoln. Democrats found themselves in a new and uncomfortable position of being the minority party. The next election further represented a decline in Democratic Party fortunes. However, a seminal economic event of profound magnitude altered Democratic Party fortunes in an eventful way: the Great Depression of 1929.

Republican Herbert C. Hoover was president when the Great Depression struck. Many blamed the Republicans for this cataclysmic event, and it had an untoward effect on the Republican Party for years to come. Democrat Franklin D. Roosevelt was elected president in 1932, and he successfully reinvigorated the Democratic Party and helped to restore the United States economically from the ravages of the Great Depression. The modern Democratic Party owes a great deal to President Roosevelt for a number of reasons. Roosevelt was elected president an unprecedented four times. Furthermore, Democrats were again dominant in the Congress, and were to remain so for years to come.

Roosevelt enacted a major governmental initiative: the New Deal. The passage of the historic Social Security Act in 1935 was a centerpiece of the New Deal. With the New Deal, many Democrats advanced the no-

tion that government should have an active role in advancing the common good and social welfare of citizens. Embracing the economic theories of John Maynard Keynes, many Democrats argued that government had something of an obligation to play an activist role, even for the sake of capitalism itself. The Russian Revolution (1917) and Chinese Revolution (1948), plus other Marxist and communist triumphs worldwide, made some more aware of the inadequacies of an unfettered laissez-faire capitalism and the need for government to help rectify inequalities and injustices. Some Democrats looked to middle-way alternatives in Europe, where a number of countries held on to a capitalist economic system while adopting a welfare state.

President Harry Truman followed Roosevelt in office, and continued New Deal policies. The Democrats took control of the House of Representatives in 1930 and the Senate in 1932, holding both through 1946, then recapturing the Congress along with the dramatic Truman presidential win in 1948. But fortunes changed in the 1952 election, when popular war hero Dwight D. Eisenhower was elected president.

In 1960, Democrat John F. Kennedy was elected, followed by Lyndon B. Johnson in 1963 (after Kennedy's assassination). Johnson's Great Society and War on Poverty programs in the 1960s were in some measure an invigorated extension of the New Deal (as were the Fair Deal policies of Truman and the New Frontier policies of Kennedy). Johnson's War on Poverty programs represented an assertive, spirited attempt to reduce poverty and inequality in American society. Inspired by the publication of Michael Harrington's 1962 book, The Other America, there was a felt need on the part of many Democrats that their party should break new ground in respect to poverty initiatives. There was a somewhat heady feeling at that time that government was capable of doing great things, that comprehensive government initiatives could "make a difference."

Republican Richard M. Nixon was elected president in 1968 and in 1972. The Vietnam War, which had been raging during the Johnson administration, proved to be something of an albatross for Johnson and the Democrats. Newly elected Nixon promised to do something about the Vietnam War, but it was not to end until 1975.

In 1976, Democrat Jimmy Carter assumed the presidency, only to be defeated in 1980 by conservative Republican Ronald Reagan. The conservative movement sweeping the Republican Party, and to some extent the country, had arrived, for Reagan was one of the most conservative candidates ever to occupy the Oval Office.

The path to this important 1980 election was presaged by conservative Republican Senator Barry Goldwater's 1964 presidential bid against Johnson.

Reagan was reelected in 1984, and then Republican George H.W. Bush was elected in 1988. In 1992, the Democrats came back, with the election of skilled politician Bill Clinton (who was reelected in 1996). Clinton represented the new neoliberalism of many Democrats, as did his vice president, Al Gore. George W. Bush, a Republican, was elected in 2000 and in 2004. There was criticism of War on Poverty policies, of the perceived inability of the Democrats to posit a strong defense strategy, and of the ability of Democrats to tune in to moral issues that were increasingly important to many people.

PHILOSOPHY

Philosophically, the Democratic Party rejects *laissez-faire* capitalism on the one hand and full-blown European welfare-state solutions on the other hand. Former Senator Daniel Patrick Moynihan, surely one of the most important modern influences on social policy, made an oft-quoted statement on this. He once declared that social policy issues facing America must engender specifically American solutions and not borrow European welfare-state solutions. The liberal wing of the Democratic Party would be more sympathetic to universalist, welfare-state solutions than the moderate or conservative wings of the party. The moderate and conservative wings of the Democratic Party would be more in agreement with Moynihan's statement.

It should come as no surprise that attitudes on world poverty would vary according to the particular ideological positions and values of individual Democrats. There are differences of opinion within the Democratic Party, just as there are differences of opinion within the Republican Party. Some would argue that the Vietnam War had a particularly profound effect on the Democratic Party. The foreign policy positions of the Democratic Party grew increasingly more liberal, and this surely had its effects on party fortunes. On social policy and poverty issues, the Democrats seemed to be in retreat after the 1960s.

Many conservative Democrats made an exit from the Democratic Party in 1980, becoming known as "Reagan Democrats." As a result, conservative Democrat voices on foreign policy and on a number of other issues were not listened to with as much attention as had perhaps been the case in the past. The disastrous landslide defeat to Nixon on the part of prominent liberal Democrat Senator George S. McGovern in 1972 dealt the liberal wing of the party a serious blow. Certainly, the election of conservative Republican Reagan in 1980 and in 1984 was a seminal symbol of the rise of the modern conservative movement, a movement that has impacted Democratic as well as Republican ideology since.

Neoliberalism replaced traditional liberalism as the reigning political philosophy of most Democrats by the 1980s and 1990s. Neoliberalism was more cautious about government in general, more critical of universal entitlements and indeed the welfare state, less acrimonious to big business, and more encouraging of individual initiative. The welfare proposals of neoliberalism looked more and more like conservative or neoconservative proposals. They stressed labor market participation, personal responsibility, family commitments and responsibility, and less expensive governmental budgetary commitments.

Neoliberalism represented more of a middle road in some respects, a more conservative version of traditional liberalism. The Democratic Leadership Council, founded in the 1980s, promulgated neoliberalism as a kind of antidote to the Reaganite conservatism of that era, a kind of corrective to the New Deal and Great Society traditional liberalism of pervious years.

Traditional liberalism directed attention to the environment and to structural problems in society as causes of poverty. Democrats looked less to individualist explanations and solutions and more to structural and social system change. Democrats tried to be careful not to "blame the victim." Human nature was viewed as being essentially good, not bad. Democrats looked less to original sin and more to the larger environment as the main causative agent. For Democrats, humankind might be "fallen," yet not because of original sin but because of societal exploitation, of racism, classism, sexism, and the like. Democrats looked more at "social sin" and less at "individual sin" to explain poverty and to develop policies to combat poverty.

On the issue of family planning and global poverty, the Democrats saw a link between the two. Democrats generally felt that family planning approaches were not only a good thing, but should be promoted as an important part of global social policy efforts. The importance that Democrats placed on government as the only truly universalist entity capable of launching comprehensive, universal antipoverty strategies was demonstrated again in the area of family planning.

Thus the Democratic Party would generally favor a stronger role for the United Nations, increased American government commitments to solving worldwide poverty, and in essence a "butter" over "guns" approach. They would tend to favor abortion as part of a family planning strategy, which is opposed by most Republicans.

The Democratic Party is closer to being a child of the Enlightenment and postmodernism than is the Republican Party. Democrats would aver that their religious beliefs would move them to social action on behalf of their fellow humans (particularly toward those in need) and perhaps less toward a more interior religious state, a "God and me" approach. Thus, the Social Gospel and Liberation Theology movements (both emphasizing the social action obligations of Christians) would receive a more ready hearing from Democrats than from Republicans.

Groups like Democrats for Life and others remind the Democratic Party of the need to be sensitive to the beliefs and values of people who may think differently about sensitive moral issues (like abortion) than many of the major Democratic Party leaders and elected office holders. If Democrats can accuse Republicans of "blind spots" on poverty, income inequality, and environmental issues, then Republicans can accuse Democrats of "blind spots" on moral and values issues, sensitivity to religious beliefs, and big government issues.

A continuing, lingering question for Democrats, as well as for Republicans, is how much of a role government should play in confronting poverty. It might be said that Democrats have erred in having too optimistic a perspective on the possibilities of government intervention, and Republicans have erred in having too pessimistic a perspective on the creative possibilities of government intervention.

Demographics

DEMOGRAPHY IS THE STUDY of population characteristics conducted by population experts (demographers). Demography is as old as the first counting of the males available as warriors conducted by ancient tribal leaders or kings. In modern times it has advanced greatly with the development of statistical tools for the counting and analyzing of populations.

Demography, as the study of population characteristics, includes censuses conducted by modern governments and other agencies. Depending upon the demographic features sought, a demographic study can identify and report information on the age, death rates, diseases, disease distributions, infection rates, sex, sexual orientation, fertility rates, family size, health, household size, income, occupation, spending patterns, religion, nationality, race, ethnic characteristics, and other features.

Additional aspects of population studies can include such features as access to transportation, or the mobility of people in terms of their travel time to work, or the number of vehicles available. Other features of a population can include educational attainment, home ownership, jobs—either inside or outside of the home—employing various members of the household, the social status of different groups, and family as an atomic unit or as an extended unit.

Demographic studies are conducted by numerous demographers. Governments conduct periodic cen-

suses as well as records of vital statistics such as birth, death, and other records. Sociologists use demographics to discuss social groups. In political science public opinion polls are used to measure a population's political view. In marketing research and consumer behavior research the incomes and other economic features of a population will be central.

Demographic studies not only count population characteristics but measure these over time in order to project trends in population changes. For example the growth, decline, aging, movements, rising and falling of death rates, migrations both internally in a country and externally, and life expectancy are just a few of the features of a population that can be studied dynamically. With the use of statistical techniques it is possible to use small, randomly chosen representative samples to describe the characteristics of a population. Other statistical techniques can be used to make inferences about populations.

Excessive population growth can give rise to a Malthusian economy.

Population studies can be graphed to show any number of features with a wide variety of graphs. These graphs can be used to show such things as behavior characteristics or psychographic characteristics such as mental health. The data can also be combined with maps to show the geographic distribution of population demographics.

Many countries have agencies that collect numerous statistics on populations. In the United States, the Census Bureau is in charge of conducting the constitutionally mandated decennial census. By law every person must be counted, although a small percentage of people who are unavailable, moving, or want to avoid all contact with the government are not counted.

The census in the United States also gathers data on the number of people in households, the nature of their housing, their incomes, educational levels, ethnicity, languages, and other characteristics. The results are by law kept restricted to only the Census Bureau and are published only as aggregate numbers. After a number of decades the information may be opened to the public.

In addition to the Census Bureau all of the American state governments, many localities, corporations, and nonprofit agencies collect data about people in America. The major credit agencies as well as other

marketing firms have gathered enormous bodies of information about people in the United States.

The information is put to many uses. The demographic studies that can be commissioned by states or localities can be used for locating new schools that will serve a growing area of a city or town before overcrowding in the school becomes a problem. To do otherwise could lead to an impoverishment in the educational experiences of schoolchildren because of classroom overcrowding.

Agencies working in the area of poverty, whether as researchers, funding agencies, or providers, use demographics to study poverty among people. A poverty profile is a type of demographic report on the nature, locations, kinds, and other characteristics of poverty among different groups of people across a region, country, or the globe.

In developing countries demographic data are used to plan strategies for meeting the needs of people in order to reduce or eliminate poverty. The major link between demographics and a country's poverty lies in the relationship between population size and the resource base. Overpopulation occurs when too many people are seeking to use the available resources.

Each individual is a consumer for the whole of his or her life; however, each individual is a producing contributor to the economy of a country for about 50 years, or between the ages of 15 and 65. When the consumption is greater than the productivity of the individual, then poverty ensues. On a large scale, excessive population growth can give rise to a Malthusian economy in which too many people are competing for too few goods.

In the decades since 1945, political opposition to demographic information arose in numerous former colonies after they achieved independence. When presented with a message that controlling population growth was in the best interest of the country, many leaders of former colonies denounced the demographic data as a Malthusian trick of the former colonial powers to keep the former colony enslaved.

In some former colonial countries, resources were spent on arms but not on the economy or the infrastructure, while the population continued to grow at high rates. The effect has been an enormous increase in poverty that has been statistically and demographically documented, while the work of aid groups or others seeking to eliminate poverty has failed to end it.

Dalton State College

Denmark

THE KINGDOM OF DENMARK in northern Europe is one of the most prosperous countries in the world. With a per-capita income of \$32,200, a well-developed social welfare system, political stability, and a low inequality rate, Danes are assured of a quality of life that some people consider the highest in the world. In this diversified economy, 79 percent of the labor force is engaged are services, and another 17 percent work in small-scale and corporate industry. Four percent of the labor force are involved in agriculture, mostly using high technology. As a result, Denmark is a net exporter of food. Unemployment stands at 6.2 percent.

There is little poverty in Denmark. Only 12 percent of females and 11 percent of males earn an income under 60 percent of the median income, which is how the poverty level is determined. In other nations within the pre-expansion European Union, 16 percent of females and 15 percent of males are considered poor when using this criterion. While single-parent families are somewhat more likely to be considered relatively poor, government initiatives that include higher education benefits for single parents have addressed this issue.

Denmark's social net includes pensions, unemployment compensation, cash assistance, and housing subsidies. In general, children do not receive benefits in Demark because it is assumed their parents will care for them. Only Danish nationals and long-term residents are eligible for assistance after one year.

Since Danish women do not as a rule face the barriers in education and employment that women do in most countries, there are no vast disparities in the economic standing of men and women in Denmark. In-

equalities do exist, however, among the poorest and richest segments of the population. The poorest 20 percent live off 8.3 percent of resources while the richest 20 percent share 21.3 percent of the wealth. The Gini Index of Human Inequality gives Denmark the relatively low rating of 24.7 percent.

Life expectancy in Denmark is predictably high. Among the population of 5,432,335, the projected life span is 77.62 years. With a life expectancy of 80.03 years, females outlive males by approximately five years. The median life span in Denmark is also high at 39.47 years. Nearly 19 percent of the population are under the age of 14, and over 15 percent have seen a 65th birthday. All Danes have access to safe drinking water and improved sanitation. There are 366 physicians per 100,000 residents, and 95 to 100 percent of the population can afford essential drugs.

In 2005, infant mortality in Denmark was estimated at 4.56 deaths per 1,000 live births. That rate has declined from 14 deaths per 1,000 live births in the 1970s. Between 1970 and 2003, mortality among children under the age of 5 fell from 19 deaths per 1,000 to four deaths per 1,000.

Six percent of infants are underweight at birth, but children are not malnourished in Denmark because of the extensive social net provided by the government. Childhood immunization rates are also high: 99 percent of all infants have been immunized against measles and DPT3, and 98 percent have been immunized against polio. Approximately 96 percent of all children from 12 to 23 months have been immunized against both measles and DPT3.

Birth control is highly accessible in Denmark, and 78 percent of married women of childbearing age use some method of contraception. Between 1970 and 2005, the fertility rate dropped from 2.0 to 1.74 children per woman. Teenage mothers give birth in eight out of every 1,000 births. Trained medical staff attend all births in Denmark, and both prenatal and antenatal care are widely accessible.

Literacy is universal in Denmark, and many Danish students receive 17 years of schooling. The government requires that 80 percent of all students complete secondary school with either professional competencies or the ability to pursue additional studies. As a result 50.5 percent of males and 37 percent of females choose to seek higher levels of education. Officials have also begun placing increased emphasis on sciences and are requiring science at all levels of education. Over one-fifth of all students at the tertiary level are studying math, science, and engineering.

Dependency Ratio

THE DEPENDENCY RATIO provides a rough measure of the demands facing the working-age population to take care of the dependent members of society. Increasing dependency ratios put strain on a society and risk increasing poverty, because more people must share what each member of the working population produces. Discussions of dependency ratios may refer to one of several types.

The youth dependency ratio is the number of people in the country aged 0–14 as a percentage of the number of people aged 15–64. The old-age dependency ratio shows the proportion of the population aged 65 and older to those aged 15–64. The total dependency ratio shows the total burden of dependents, as it adds the youth and old-aged and divides this by the number of people aged 15–64. A variation of this approach is the labor force dependency ratio, which adds the total number of people of any age who are not participating in the labor force, and then divides this sum by the total number of people who are participating in the labor force.

The United Nations Population Division provides an internet site, which allows users to view historical and future projections of the youth, old-age, and total dependency ratios for countries throughout the world. Worldwide trends of decreasing fertility and decreasing mortality are creating the situation in which youth dependency ratios are generally falling while old-age dependency ratios are increasing. The combination of these trends has mixed results for the total dependency ratio.

In the least developed parts of the world, as defined by the United Nations, the youth dependency ratios have historically been very high, peaking in 1980 at about 85 youths per 100 working-age people. As more young people survive to adulthood, the youth dependency ratio is falling; it is expected to be about 76 in 2005 and 45 in 2050. Meanwhile, old-age dependency ratios are increasing only slightly in the least developed parts of the world.

Since 1950, there have been about six elderly people per 100 working-age people in the least developed countries, and this ratio is only expected to increase to 10 in 2050. The combination of these trends means that total dependency ratios in the least developed parts of the world are decreasing, from 91 per 100 in 1980, to 82 per 100 in 2005, to 55 per 100 in 2050.

A similar trend holds in areas defined as less developed by the United Nations. Youth dependency ratios peaked at about 76 per 100 in 1970, and they are slowly decreasing. In 2005, the United Nations expects 48 youths per 100 working-age people. By 2050, this number is expected to fall to 32. Regarding old-age dependency ratios, the numbers are increasing from about seven in 1950, to nine in 2005, to 23 in 2050. In less developed countries, many more people are expected to survive to old age in the future. The combination of these trends will lead to relatively stable total dependency ratios, as the United Nations expects 57 dependents per 100 working-age people in 2005, and 55 dependents in 2050.

Finally, the old-aged are a relatively bigger problem for the countries defined as more developed by the United Nations, while youth dependency ratios have been much lower. By the 2030s, more developed countries are expected to have the highest total dependency ratios on account of their old-aged. By 2050, more developed countries can expected 44 elderly and 27 children per 100 working-age people.

Dependency School

ORIGINALLY DEVELOPED during the late 1960s to explore questions of development in Latin America and the Third World, the Dependency School came up with an influential theory of world capitalism and the global system. Inspired by the debates about imperialism, dependency theories focused on the processes of capital accumulation on a global scale. The critical analysis of global poverty attempted by dependency theory is based on a fundamental distinction between core and periphery, namely between economically developed countries (DCs) and least developed countries (LDCs).

The expansion of the capitalist mode of production to the LDCs causes, according to dependency theory, the exploitation of the work power in these countries, the unequal allocation of profit, the deprivation of work rights, and the general impoverishment of the local population in LDCs. Poverty in LDCs is not seen autonomously, but rather as a structural part of the globalization of economy and as the product of the economical intervention of the DCs.

One of the premises of the dependency theory is that the deregulation of the mode of production in LDCs (for instance in countries of Latin America) and the establishment of a peripheral capitalism in favor of multinational companies are not a factor of economical development of the underdeveloped or less developed countries, but rather a factor of their proletarianization.

This proletarianization caused by the expansion of world capitalism leads to the creation of a chain system of reliance between countries and economies, especially to an economic dependency of the LDCs on the DCs. As LDCs have neither the technological means nor the skill-management techniques of companies in DCs, nor the infrastructure for the development of a strong, competitive capitalism, they are forced to depend on the multinational companies of DCs.

As long as surpluses in LDCs are extracted in favor of the DCs, these surpluses cannot be used for further investment in LCDs. Because of these processes, LDCs are being economically excluded, while social and economic inequality is extended to new zones.

Despite the general agreement on the elements described above, namely that poverty in LDCs is a product of capitalist expansion regulated by DCs and that this expansion does not support the development of the LDCs, the dependency perspective is not a homogenous, concrete theory of underdevelopment and exploitation. Despite their Marxist orientations and their opposition to neoclassical economics, dependency theories differ in their interpretive approaches to (under) development and poverty.

For instance, André G. Frank attributes underdevelopment to processes of capital accumulation that colonizing metropoles imposed on their satellites/areas, while Ronald H. Chilcote focuses more on the class structure and the political processes of repression with the dependent countries. Immanuel Wallerstein introduced the macrosociological concept of the world system and adapted the view of dependency theory in order to provide an explanation of the world economy as a total system.

In terms of the dependency theory, poverty is seen as a complex set of factors.

In his historical sociology of the world system, nation-states are variables of the broader world system, which is regulated by the capitalist market economy and by the hegemony of some core states imposed on weak peripheral regions. However, according to Wallerstein, this hegemony is not stable, for the global class struggle results in a continuous (or potential) change of interests and aims.

One of the most important contributions of the Dependency School to the analysis of poverty in LDCs is that it examined poverty and underdevelopment as a structural part of world capitalism, and not simply as a problem of modernization of the economies and the social systems of LDCs. It researched the colonial history of LDCs, their economic position in the global division of labor, as well as the role of local powers and elites and their relationship with core states. It showed that poverty in LDCs is more than a problem of underdevelopment.

In terms of the dependency theory, poverty is seen as a complex set of factors, class structures in and outside the LDCs, economic interests of DCs, and their

imposition on the LDCs by the exercise of physical and nonphysical power.

Depression, Great

OF ALL THE HISTORICAL events that shaped the internal structure of America, three stand out above the rest: the War of American Independence, the Civil War, and the Great Depression. The Depression years were a time of great hardship and sweeping change. Prior to the Depression, Americans enjoyed progress and growth with only brief interruptions. There had been crises in the past, but this one was both more severe and enduring. The intensity and duration of this crisis created a desire for fundamental change.

The years leading into the Depression were good for most Americans, and outstanding for a few. Most of the rising income inequality during the 1920s came from investment income during the financial boom, rather than from labor income.

President Herbert Hoover found far less success than his two Republican predecessors. This could have been because of significant differences between his policies and those of Calvin Coolidge and Warren Harding. The Hoover administration was marked by the start of the worst economic period in U.S. history. Initially Hoover declared, "We in America today are nearer to the final triumph over poverty than ever before in the history of any land. The poorhouse is vanishing from among us." He could hardly have been more wrong in this prediction.

The economy began to slow after Hoover entered office. This was not because of his policies. The Federal Reserve Bank (Fed) fueled a boom with an easy credit

policy. In the summer of 1927, leaders of major central banks met in New York City. New York Fed Governor Benjamin Strong succeeded in pressing for a cheap money policy at this conference. By the end of the year, the Fed had lowered the discount rate from four percent to 3.5 percent and increased open-market purchases from 385 to 704 million. The stock market soared during late 1927 and 1928. This boom continued into 1929, but Fed policy began to change. In October 1928, Strong died. Illness prior to his death had left him ineffective. Strong's successor was more of a consensus builder than a leader. Concern over the stock market led to increases in the discount rate. Rates began edging up in 1928 and reached six percent before the crash. On October 24, 1929, the market began its decline. There were a few temporary rallies in stocks in the days that followed, yet the general trend was downward.

The stock market crash was a symptom rather than a cause of the Depression. Changes in monetary policy had slowed industry well before the crash. Employment in many industries peaked in early to mid-1929, and the economy slipped into recession during the summer of 1929. Yet few recognized the deterioration of economic conditions until the stock market crash on October 24, 1929.

HOOVER'S EFFORTS

There would have been a recession in 1929 no matter who was elected president. Unfortunately, Hoover unintentionally worked to convert a minor recession into a major catastrophe. Hoover's initial reaction indicated that he did not appreciate how serious the situation was. On October 25, 1929, Hoover said, "The fundamental business of the country, that is, the production and distribution of commodities, is on a very sound and prosperous basis." Hoover reacted to this crash by organizing conferences of industrial and labor leaders during November and December 1929. Hoover urged industrial leaders to avoid cutting wage rates. Many industrialists pledged to maintain wages. He thought that maintaining wages would spur economic recovery because these wages would also maintain consumer spending. His program did not deliver its intended ef-

This was a period of deflation. The Federal Reserve monetary policy ended the financial boom and worked to slow the economy. Subsequent bank failures led to a collapse of the money supply and deflation. With consumer prices falling, Hoover's program to keep wages from falling meant that real wages, adjusted for deflation, rose dramatically. Real wages in the machine tool industry rose four percent in 1930 and eight percent in 1931, and employment fell 38 percent in those two years. In the iron and steel industry real wages rose 1.5 percent in 1930 and 7.5 percent in 1931, but employment in the industry fell 68 percent. Other industries that followed Hoover's policies experienced similar results.

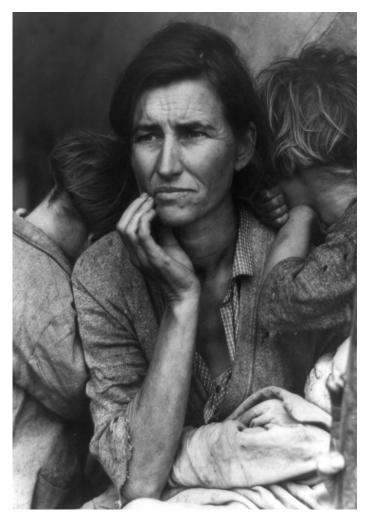

Those workers who retained full-time employment during these years of the Great Depression benefited from deflation. This increased the purchasing power of their wages. Of course, those who lost their jobs or had their hours cut endured severe poverty. The overall unemployment rate rose dramatically during these years. Gross National Product (GNP) had been \$203.6 billion in 1929, but it fell to \$183.5 billion in 1930, \$169.3 billion in 1931, and a dismal \$144.2 billion in 1932.

Per capita GNP for this period fell from \$103 to \$58. The severity of the poverty caused by this decline in average GNP is even worse when one considers that many industrial workers had increased wages incomes; others with lower wages were even worse off than per capita GNP figures indicate.

Hoover thought that by keeping worker income and federal spending high he could reverse the economic decline. Consumer and government spending would end the crisis. His high-wage policy was aimed at keeping household income and spending high. The Hoover administration increased federal spending in an effort to deal with this crisis. Federal spending on public works increased as soon as he entered office, before the onset of the Great Depression. The federal budget was \$2.9 billion in the year before he entered office. In his first year it increased to \$3.1 billion. By 1932 he had increased the federal budget to \$4.7 billion.

Much of this increased spending went into public works projects, including the Boulder, California Valley Central, and Grand Coulee Dams. His Employment Stabilization Act established the Employment Stabilization Board, which pushed for more public works. He did this during a collapse of federal tax revenue from \$4 billion to \$2 billion. This resulted in massive deficits; half of federal spending added to public debt. Coolidge had left office with a federal budget surplus of nearly \$1 billion. The federal budget ran a deficit of close to \$.5 billion in 1931 and nearly \$3 billion in 1932.

Hoover encouraged private banks to form the National Credit Corporation (NCC) as a means to support banks in financial difficulty. The NCC began operating on November 11, 1931. Federal Reserve officials pushed for a federal agency to perform this task. Con-

This famous photo by Dorothea Lange features pea-pickers in California; a 32-year-old mother of seven children. February 1936.

gress passed legislation founding the Reconstruction Finance Corporation (RFC) on January 22, 1932, and it began its operations on February 2 of that year. Congress initially funded the RFC with \$1.5 billion. The RFC paid out massive loans to banks and railroads. This generosity was later extended to industry and agribusiness. By July RFC funding expanded to \$3.8 billion. Large amounts of RFC money went to major banks, like J.P. Morgan.

When it came to poverty relief for poor families, Hoover advocated voluntary charity; however, the RFC disbursed \$300 million in loans to states for relief to poor families. Hoover also kept wheat and cotton prices high. These policies led to higher unemployment, more poverty, and idle stocks of agricultural produce. The unemployment rate was 3.2 percent in 1929, but it rose to 8.9 percent in 1930, 15.9 percent in 1931, and 23.6 percent in 1932.

Hoover claimed that his policies were a success. In fact he praised his own activism: "We could have done nothing. That would have been utter ruin. Instead, we met the situation with proposals to private business and to Congress of the most gigantic program of economic defense and counterattack ever evolved in the history of the Republic. ... For the first time in the history of depressions, dividends, profits, and the cost of living, have been reduced before wages have suffered. ... They were maintained until the cost of living had decreased and the profits had practically vanished. They are now the highest real wages in the world." Of course, real wages were very high, but at the expense of massive unemployment. Poverty and inequality increased among industrial workers, but the percentage of total disposable income received by the top five percent of households fell slightly during the Hoover years, largely because of losses in financial markets.

The Great Depression was unprecedented in both its severity and its worldwide scope.

Hoover lost his bid for reelection. Dire economic conditions caused a decline in his popularity. Also, there was an incident in which federal troops led by Douglas MacArthur drove a group of protesters out of Washington, D.C. The Democratic Party nominated Franklin D. Roosevelt (FDR). Roosevelt's personal charm made him an effective political campaigner and he defeated Hoover by seven million votes, with 472 electoral votes. Improving America's economic situation would not be as easy.

The Great Depression was unprecedented in terms of both its severity and its worldwide scope. Many European nations had experienced high and persistent unemployment starting in the 1920s. Also, some nations had even higher rates of unemployment than the United States. German unemployment had risen as high as one-third of the labor force. The European crises differed from the American Depression. Many of the European nations had experienced severe inflation, while America underwent deflation. In some countries, inflation became so severe that their currency became worthless. The hyperinflations in Germany and Hungary were particularly severe.

Dire economic conditions in Europe had fueled political extremism; World War I had already brought Marxists to power in Russia. Various Marxist and nationalist or fascist movements gained hold in Europe

during the 1920s. The emergence of persistent unemployment and industrial depression in America made it vulnerable to these influences as well. The extent of this crisis brought about intense desires for change. Some were willing to sacrifice political freedoms if it would restore economic order. While FDR did win in a land-slide, extremist candidates made alarming progress at the polls. Socialist candidate Norman Thomas got 884,000 votes. The communists got 103,000 votes. As the Depression dragged on, fascist movements like the German-American Bund gained support, too. The Roosevelt administration succeeded in preventing the growth of these extremist movements, but it used drastic measures of its own.

ROOSEVELT'S EFFORTS

The Roosevelt administration took Hoover's activism further with its economic policies. FDR extended the role of the federal government beyond what Hoover had done with the RFC. FDR formed a "Brain Trust" to design and implement a New Deal for the American people. Some of the most important figures in this trust were Harry Hopkins, Henry Morgenthau, Lewis Lowe, Averill Harriman, Cordell Hull, Harold Ickes, Frances Perkins, Sam Rosenman, Raymond Moley, and Rexford Tugwell.

FDR closed banks with the Emergency Banking Act in an effort to stem bank failures. His administration worked to pass legislation creating new federal agencies and redefined the role of the federal government in American society.

The Agricultural Adjustment Administration (AAA) came into existence to support farm prices. The Civilian Conservation Corps (CCC) aimed at employing 250,000 young men, and the Federal Emergency Relief Administration (FERA) paid \$500 million in grants to state relief projects. The Glass-Steagal Act established the Federal Deposit Insurance Corporation (FDIC). Today this agency insures bank deposits up to \$100,000. The Security and Exchange and Federal Securities Acts regulated the stock market. Additional legislation established the Tennessee Valley Authority (TVA), a public works project to produce hydroelectric power. The Rural Electrification Administration and TVA implemented federal energy policies. The National Industrial Recovery Act established detailed controls over industry. The Fair Labor Standards Act created minimum wages. FDR also intervened in private housing with the Homeowners Refinancing Act, the Resettlement Administration, and the Home Owners Loan Act. The Social Security Act established pensions for retired and disabled workers.

There were some obviously counterproductive results from these policies. Enforcement of farm prices meant that the federal government had to store or destroy excess crops and livestock. To many, the idea of wasting farm products, while some had little to eat, seemed absurd. Also, the enforcement of minimum-wage laws made it difficult for many unskilled and minority workers to find employment. One director of research estimated that FDR's minimum wages put half a million black workers out of work. The Fair Labor Standards Act threw 120,000 Puerto Rican workers out of work.

FDR faced opposition not only from fascists and socialists, but also within his own party. Louisiana Governor Huey Long claimed that FDR was beholden to business interests. Long's Share the Wealth program was supposed to "make every man a king." FDR had already promoted the idea of redistributing wealth from rich to poor. He advocated heavy progressive income taxes. Yet many of his other policies often did the opposite. Much of his New Deal was financed through excise taxes, which placed a severe burden on poor and middle-income households.

Also, his policies that kept agricultural prices high imposed hardship on unemployed and part-time industrial workers. These people could hardly afford to pay more for food, but were forced to by Roosevelt's policies. New Deal fiscal policies also redistributed income from the poorest region of the nation, the south, to other parts of the country where FDR needed more political support. Large amounts of federal money went to east and west coast electoral swing states. People in the northeast and west had incomes that were 60 percent higher than in the poverty-stricken south. Long had good reason to doubt FDR's commitment to redistribute income from rich to poor. Consequently Long's movement had considerable support. This challenge from FDR's left did not last, as Long died in 1935.

While some thought that FDR did not go far enough with his policies, others thought that he had gone too far. Many Americans became concerned with the power that FDR was concentrating in the executive branch of the federal government. Roosevelt asked Congress to allow him power "as great as the power that would be given me if we were in fact invaded by a foreign foe." The New Deal did expand the power of the executive branch beyond that of any previous president. While some merely voiced discontent about "that man in the White House," members of the Supreme

Court acted to stop New Deal policies that expanded governmental powers. The Supreme Court overturned much of the New Deal as unconstitutional. Many of the controls that FDR had established, especially with the National Industrial Recovery Act and the AAA, were undone by Supreme Court rulings.

FDR won his bid for a second term in a landslide. Frustrated with opposition to his New Deal, he attempted to "pack" the Supreme Court with his supporters. Part of his plan involved mandatory retirements of Supreme Court justices at age 75. The other part increased the size of the Court from nine to 12 justices. These moves would make it possible for FDR to appoint enough justices to guarantee support for his policies. This attempt to pack the Court galvanized opposition, so it failed. Yet the Supreme Court never challenged his programs again. FDR also opposed five senators of his own party in the 1938 mid-term elections, so as to purge opposition. All five won reelection. Had FDR succeeded in blocking opposition from the other two branches of the federal government, he would have ended, at least temporarily, the constitutional provision for separation of powers.

A slow recovery followed the final crisis of the Great Depression.

The Roosevelt administration succeeded in increasing the authority of the Federal Reserve Bank. The Gold Reserve Act of 1934 and the Banking Act of 1935 vested great powers in the Federal Open Market Committee and increased Fed control over bank reserves. In August 1936, Federal Reserve officials increased reserve requirements dramatically. The unemployment rate had fallen to 16 percent, but this increase in bank reserve requirements triggered a new crisis in the banking system.

Gross National Product bottomed out in 1933 at \$55.6 billion. It went up to \$65.1 billion in 1934, \$72.2 billion in 1935, \$82.5 billion in 1936, and peaked at \$90.4 billion in 1937. Unemployment had peaked at 24.9 percent in 1933, and fell to 21.7 percent in 1934, 20.1 percent in 1935, 16.9 percent in 1936, and 14.3 percent in 1937. The new financial crisis in 1937 reversed this slow recovery. In this new phase of the Depression, GNP fell to \$84.7 billion in 1938 and unemployment rose to 19 percent.

A slow recovery followed this final crisis of the Great Depression. Unemployment fell slowly to 17.2 percent in 1939 and to 14.6 percent and 9.9 percent in

the next two years. The economy approached full employment during World War II, not only because of the war. America was already moving back toward full employment before the war, and wartime spending did not end the Depression. Hoover and FDR both increased federal spending without solving unemployment. Industrial and labor market recovery came gradually with recovery in the banking and financial system, after the last of the financial panics.

While unemployment did fall to low levels during the war years, this did not restore prosperity. War production demanded great sacrifices. Household consumption expenditures rose somewhat during these years, but most of the increases in GNP were from military expenditures. Consumer spending skyrocketed after the war ended, but prior to this, most Americans worked hard for little in the way of increased consumption. While some think of the war years as a time of prosperity because of low unemployment rates, this is not true. The war years ended idleness, but deprivation continued.

With unemployment as high as one out of four workers during the Hoover years and in excess of 14 percent during every year of the first two terms of FDR's administration, there can be no doubt concerning poverty at this time. In some respects relative income inequality fell. The percentage of disposable income held by the top five percent fell for Democratic and Republican administrations during the Great Depression.

This decade of double-digit unemployment resulted in the impoverishment of millions. There were also many who could only find part-time work. There are many to blame for this tragic episode in American history. Hoover and Roosevelt bear responsibility. So do officials at the Federal Reserve Bank and members of Congress. The perception that Hoover was to blame and that FDR had saved the nation altered the political landscape for a generation. The Democrats controlled Congress in the decades that followed, eventually leading to the Great Society programs of Lyndon B. Johnson.

The Great Depression was undoubtedly one of the most important periods in American history. It changed what people came to expect from the public and private sectors. The federal government grew to an unprecedented size at this time. The private sector became more regulated. Some praise New Deal programs and policies, like Social Security and minimum wage laws. Some say that these measures dealt with poverty among the elderly and unskilled workers. Others see

these policies as either defective or outdated. While a consensus over the causes of the Great Depression remains elusive, the results of this event are clear. Poverty increased around the world and progress seemed to have stopped. Fortunately, this is a highly unusual historical episode.

Deprivation

DEPRIVATION REFERS TO the effects that extreme poverty has upon the poor. It creates numerous difficulties for meeting the conditions of life. Numerous synonyms refer to the deprivations experienced by the poor. Some of these synonyms are *privations*, *dispossessed*, *deprived*, and *wanting*.

These terms point to the insight that poverty is not just the lack of means to satisfy needs and wants, it also robs people physically, emotionally, mentally, spiritually, and socially. Social scientists have developed a dep-

rivation index to isolate the factors that mark a person in poverty. The factors of the deprivation index include the poverty rate, educational attainment, unemployment rates, percentage of population who are speakers of a minority language, violent crime rate, and per capita income.

In Denmark, the Copenhagen Declaration described a condition of absolute poverty as one that is characterized by severe deprivation of basic human needs. The human needs, the omission of which created the deprivation, include food, safe drinking water, sanitation facilities, healthcare, shelter, education, and access to information.

The World Bank has described deprivation as "extreme poverty." It defines this as being compelled to live on less than \$1 per day. Living on less than \$2 per day is mere "poverty." These standards of income or resources available for living show, in terms of demographic statistics and charts, that a fifth of the world's people live in extreme poverty and at least half were poor in 2004. These statistics show that deprivation, that is, living without food, safe drinking water, sanitation facilities, healthcare, shelter, education, informational resources, and more, is caused by a number of factors.

The causes of deprivation include a natural lack of resources, social disorder, and political failure. People living in the Sahara or other harsh environmental conditions are compelled to survive with few resources available for meeting needs. The lack of safe drinking water can be due to arid conditions, but it can also be due to a lack of technology or resources for digging wells or for impounding water in the wet season for use in the dry season.

Sometimes the lack of water or food or other necessities is due to social conditions. People trapped in poverty can become so physically exhausted that they lack the energy for envisioning improvements in their situation. Not only are individuals affected, but whole societies may see no way to improve life. The need to protect the few resources available may give rise to social attitudes hostile to new methods or technologies. These are perceived as very risky. If they fail, people will die rather than merely continue to subsist. In these circumstances people may be so deprived that they fear innovation.

Deprivation affects people not only physically but also socially so that the poverty endured can give rise to a culture of poverty. People in these circumstances do not have the social resources for uniting to provide water or irrigation for their crops. The lack of social resources may be due to a destructive political history. Even if the natural resources are available to the people of the country, they may be too divided ethnically or so lacking in skills that they cannot unite in the common cause of economic development. Another reason for deprivation is thievery. In addition slavery, the theft of a person's liberty and labor, has been reported as returning to Africa and the Middle East in various guises.

Deprivation Index

A DEVELOPMENT INDEX is any measure of well-being that combines a variety of quality-of-life variables into a composite statistic, while a *deprivation index* is any measure of poverty that combines a variety of indicators of social ills into a composite statistic. While per capita income is the most commonly used and most widely accepted measure of a country's economic achievement, deprivation indexes provide a broader measure of the overall level of poverty in a country by focusing on a variety of statistics beyond simply income and may, therefore, better reflect a country's true level of development.

Probably the best known deprivation index is the Human Poverty Index (HPI), which has been published at the country level by the United Nations Development Program (UNDP) since 1997. The UNDP calculates the HPI differently for developing countries and high-income nations. The Human Poverty Index for rich countries, known as the HPI-2, is the weighted average of four variables: the percentage of the population not surviving to age 60, the level of functional illiteracy among adults in the country, the percentage of people living below the income poverty line defined as 50 percent of the median adjusted disposable house-

hold income, and the rate of long-term unemployment exceeding one year in duration.

The Human Poverty Index for developing countries, HPI-1, is the weighted average of three variables: the probability of a person not surviving to age 40, the adult illiteracy rate, and the combined percentage of the population without access to safe water and the prevalence of underweight children. Both the HPI-1 and HPI-2 are weighted in such a manner as to place a greater emphasis on the components in which there is the highest level of deprivation.

The New Zealand Index of Deprivation measures poverty in regions of the country by combining the percentages of people who receive a means-tested benefit, are unemployed, have an income below a set threshold, have no access to a telephone, have no access to a car, live in a single-parent family, have no job qualifications; do not live in their own home, and live in a household below a designated bedroom occupancy threshold.

The Index of Multiple Deprivation measures poverty in the United Kingdom using multiple indicators within seven broad domains: income deprivation; employment deprivation; health deprivation and disability; education, skills, and training deprivation; barriers to housing and services; living environment deprivation; and crime.

The State University of New York Social Deprivation Index, which is calculated for most metropolitan areas in the United States, combines the poverty rate, per capita income, percentage of population aged 5 and older speaking a foreign language at home and reporting that they speak English "not well" or "not at all," unemployment rate, percentage of population 25 and older with no high school diploma, and the violent crime rate per 100,000 population.

As might be predicted, the primary criticism of any deprivation index is the choice of variables used to calculate the index as well as the weights placed on each of the variables. In addition, as with most national or regional measures of poverty, a relatively low overall deprivation index can disguise pockets of extreme poverty within certain geographical areas or ethnic groups.

VICTOR MATHESON, Ph.D. COLLEGE OF THE HOLY CROSS

Deserving Poor

ALTHOUGH THE CONCEPT of the deserving poor has deep historical roots, its modern usage stems from Victorian reforms to the Poor Laws, which reinforced existing social attitudes by creating legal distinctions between the deserving and undeserving poor. The deserving, or honest, poor were those individuals who were deemed incapable of work as the result of incapacity, illness, crippling injury, infirmity because of old age, or physical disability, such as blindness or mental deficiency.

These individuals, Victorians believed, deserved charitable aid according to the tenets of Christianity. For other individuals in need of charitable assistance, their poverty was frequently viewed to be the result of their own vice or irresponsibility. While acknowledging that the fluctuation in the economy and the labor market frequently resulted in unemployment, Victorians believed that it was the responsibility of workers to save sufficiently out of their wages to meet such contingencies.

In Britain in 1876, the Charity Organization Society detailed in its annual report the contingencies for which it believed workers could reasonably be expected to save money, including temporary unemployment, illness, or inordinately large families. The fact that many working families were unable to save such funds was seen as an indication of their personal failing rather than as an indication of the unjustly low wages within the newly developing industrial economy.

For Victorians and succeeding generations, the necessity of separating the deserving from the undeserving poor was emphasized by the belief that all charitable relief ultimately contributed to the development of permanent and often intergenerational dependency. For Victorians the solution was to establish conditions of relief that were "less eligible" than the lowest standard of living that could be obtained through paid labor in the community. In this way, only individuals who des-

perately needed aid would seek poor relief. Applicants before the Charity Organization Society who failed to meet its expectations for working-class thrift were recommended to the workhouses. The "workhouse test" further separated the "dishonest" or undeserving poor from those who truly had no other alternative, by linking poor relief to a series of humiliating and harsh requirements.

While conditions varied, the underlying purpose of the workhouse was to punish the poor and thereby discourage poverty. Families who entered the workhouse were separated, required to relinquish personal possessions, and forced to wear standardized uniforms. In exchange for a minimum of food and other necessities, inmates were required to perform a range of unskilled and often unproductive labor. While conditions at some workhouses were notably better, workers who needed only temporary relief faced a stark choice between begging and committing their entire families to the workhouse. In this manner, Victorian poor relief was divided between the "outdoor" relief provided to the deserving poor in their own homes and the "indoor" relief of the workhouse for those judged to be less deserving.

The concept of the deserving poor continues to operate in the modern context.

Although the workhouse system was eventually abandoned as ineffective, social attitudes, which differentiated between the deserving and undeserving poor, continued to influence social welfare policies in the western world throughout the 20th century. This was most evident during the Great Depression, when relief policies were frequently based on the character of the applicant. Although Western nations such as Britain, the United States, and Canada all developed institutional social security policies following World War II, the concept of the deserving poor continues to operate in the modern context through workfare programs that have increasingly tied social relief to the recipients' compliance with mandatory work or retraining schemes.

CHRISTOPHER DAVID O'SHEA UNIVERSITY OF GUELPH

de Soto, Hernando (1941-)

RECIPIENT OF THE Milton Friedman Prize for Advancing Liberty, Peruvian economist Hernando de Soto is an extraordinary individual. Returning to his native Peru in 1979 following a successful business career in Europe, de Soto began to study the question of poverty and asked why some countries are developed and affluent and others are not.

He noted that in Peru there was no lack of entrepreneurial drive among the people. In addition, the people had assets. The problem was that the people did not have government acknowledgement of what they produced and owned. In his 1986 book, *The Other Path*, de Soto argued that workers, successful as they were in the informal economy, were essentially locked out of the formal or legal economy: they may have houses but they were not officially titled, they grew crops for sale but had no deeds to the land, and they ran successful businesses but did not have the documents of incorporation that would provide legal status.

De Soto formed the Institute for Liberty and Democracy (ILD), an organization devoted to the study and analysis of inequities in the business dealings of countries in the developing world. In Peru, attempts to obtain rights of ownership for land and businesses from the national government were extremely difficult. Without formal title to their property, individuals were not able to use their assets for collateral or obtain bank loans to expand their operations. De Soto and his colleagues at the ILD call these untitled assets dead capital. The ILD estimated in 2004 that dead capital in the developing countries totaled over \$9 trillion. De Soto contends that capitalism is not inclusive of all those entrepreneurs in the developing countries whose property is untitled and therefore not usable for acquiring loans for much-needed business expansion.

De Soto and his colleagues did extensive fieldwork in the cities and rural areas of the developing world in order to determine the extent of dead capital in existence in these places. Their findings were astounding. In Egypt, for example, the assets of the poor merchants operating in the informal economy were found to be 55 times greater than all foreign investment. Despite this accumulated wealth, the merchants are not able to transform their assets into liquid capital, which would allow for the generation of new wealth through increases in production, the growth of new businesses, and the eventual alleviation of poverty. Property must be officially documented and affirmed by the national government before it can be fully incorporated into the capitalistic system.

In his article "Why Capitalism Works in the West and Not Elsewhere," de Soto points out that assets outside the West are held in "defective forms." For example, houses are built on land whose ownership records are incomplete or missing. Not being properly recorded, land of this type and the buildings on it cannot be easily sold to raise capital for other uses. In addition, without proper title the land cannot be used as collateral for loans. Without these legal representations, de Soto claims, people in the developing countries and the former communist regimes have not been able to fully embrace capitalism. As such, their economies are stalled and growth cannot be maximized.

De Soto and his colleagues in the ILD have been sought out for their advice on economics in many countries. Mexico's President Vincente Fox had de Soto working on property-rights issues in his country. De Soto has been summoned to Egypt to assist in the implementation of a property-rights program. In addition, two presidents of the Philippines, Joseph Estrada and Gloria Arroyo, have sought de Soto's help on similar issues. At one point in his advocacy career, de Soto served as an adviser to Peruvian President Alberto Fujimori.

Prior to de Soto's initiatives on property rights, Peru and other countries held strong control over the ways business was done, and the withholding of property rights held the poor in check. It is not surprising that the Shining Path organization, a terrorist group in Peru, did not take kindly to de Soto's findings and the demands of the ILD. In fact, de Soto's life was threatened on more than one occasion because of his stance on property rights and demands for change.

De Soto's challenge is to break the hold that lessthan-progressive governments have on their workers and to bring an era of legal property rights to them. To do so will open these countries to economic growth and expansion. SEE ALSO: Antipoverty Programs; Capitalism; Exclusion; Exploitation; Microcredit; Peru; Privatization; Pro-Poor Growth.

Destitution

DESTITUTION IS A FORM of poverty in which people are so lacking in material goods that they have nothing. The devastation may be caused by cataclysmic natural disasters or due to human-caused disasters such as war. Many scholars who write about poverty consider destitution to be synonymous with extreme poverty or extreme want. Similar terms that are not as extreme but do describe extreme conditions of want are indigence, pauperism, beggary, and utter want.

There are many reasons why people may be destitute. The devastation caused by natural disasters can destroy all resources. Throughout history whole cities or regions have been ravaged by fires, floods, earthquakes, tsunamis, hurricanes, plagues, famines, severe winters, or other disasters.

From time to time people who had little to begin with were rendered destitute when floodwaters not only destroyed what they had but brought silt or fill that destroyed farmland, rendering the land useless for agriculture. In Central America, Hurricane Mitch (October 22 to November 4, 1998), a category 5 hurricane, brought terrible flooding to Honduras, Nicaragua, and elsewhere in the region. The floods not only killed hundreds of people, but livestock and other farm animals were also wiped out. The resulting devastation made many poor people destitute; their only recourse became the aid supplied by international relief efforts.

Other examples of natural disasters causing destitution can be found in the areas that are prone to severe earthquakes. People may be killed in great numbers by the earthquakes because they are in buildings that were not built to withstand severe shocks. The impact may render whole areas destitute, because those who survive

have lost their businesses, homes, and families and are left with only a pile of rubble.

Famine can also be a result of destitution. In the 1840s Ireland was hit with a potato virus that killed potato plants, a staple of the Irish diet. The Irish population had grown to a great extent because of the extra food supply provided by potatoes. Lacking money, especially enough to buy food, a great many of the Irish, perhaps as many as one million, starved to death. With money, food would have flowed to a market, but lacking money or resources that could be converted into money, the destitute were left to starve.

Other natural disasters include drought and bad harvests. The Sahel in Africa, the semiarid belt that stretches across Africa, is a transition zone between the Sahara Desert and the broad savannahs of Africa. In the last part of the 20th century the Sahel was affected severely by drought. Many of the people, and especially the nomadic people of the area, lost their livestock. Without sheep, goats, or especially camels they were rendered destitute.

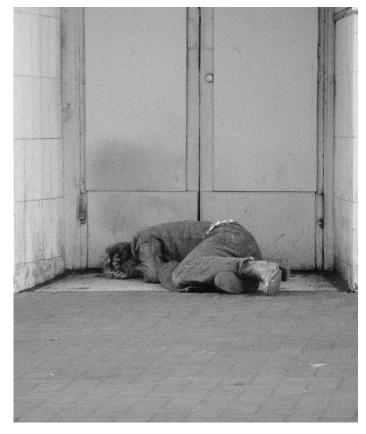

In other areas farmers in Asia have been affected by bad harvests enough that they were forced to choose between losing their land and total destitution and selling one or more of their children. Boys were usually kept, but girls sold, often into prostitution. There have also been men who joined armies or women who entered into prostitution to escape their destitute condition. The other practical choice was to die of starvation or turn to theft or banditry.

High population growth, along with the exhaustion of the soil in Ethiopia and other places in east Africa, has caused the poor to become even more destitute. The neighboring country of Somalia has been racked by clan warfare, with great numbers of people left so destitute that they starve.

Destitution can also be caused by human actions. Bad economic decisions or severe changes in economic conditions can cause people to lose all that they have. The Great Depression of the 1930s was global in scope. In the United States over a quarter of the people in the country were reduced to surviving with little more than the clothes on their backs. Millions were regularly fed at soup kitchens by charitable groups.

Homeless people in the United States, Europe, or elsewhere are usually destitute as well. What little they have would be insufficient to do more than purchase a meal or two, if that much.

Wars have often reduced people to destitution. Whole countries have been reduced to starvation with little in the way of resources remaining. Much of the

Homeless people are considered destitute or in a condition of extreme poverty, having practically nothing.

population may be left dead at the end of the war. This kind of destitution may leave the living with little for rebuilding the country or their lives. Others may become refugees who inundate another country looking for help for survival. The effect may be very damaging on the places to which they go.

Modern industrial societies have adopted policies that organize the economy, tax laws, spending programs, and more into social security safety nets. These programs include various forms of health insurance, Social Security, unemployment compensation, workmen's compensation, and others. The goal is to put a floor on the economic depths to which people can sink. Rather than allowing people to become destitute, a social safety net is provided. The safety net sets a level of income for people to receive that will keep them from becoming totally destitute.

Development Gateway

DEVELOPMENT GATEWAY IS a nonprofit organization started in 2001 by the World Bank. Former World Bank President James Wolfensohn promoted its formation. A board of directors governs Development Gateway. The board's members come from 12 countries (Australia, China, Germany, India, Italy, Japan, Korea, Luxembourg, Mali, Mozambique, Pakistan, and Rwanda). In addition, other members are from a private company (MphasiS) and from the United Nations and the World Bank.

The Development Gateway Foundation is a promoter of development. Its primary goal is empowering people in developing countries so that they can live more wholesome lives. The method of development used by the foundation is to build partnerships, especially through internet information systems. These networks provide access to the knowledge and information necessary for sound and permanent development. The foundation seeks to serve the needs of development practitioners, civil society, private sectors, the official donor community, and many others.

The spread of the internet has allowed Development Gateway to utilize the new cheaper information and communication technologies that are currently available. These allow people to increase their knowledge by sharing information to enhance development effectiveness, to improve public-sector transparency, and to empower communities so that they can build a new, more prosperous life. Development Gateway uses internet portals to assemble people, information, and resources interactively so that a community of those dealing with poverty is created. Internet portals allow for greater communications not only between individuals but also between organizations and communities.

The end result is that communities can share information much more effectively than ever before.

The sharing of information not only pools development understanding and information, it also creates new communities as people share experiences. Development Gateway is using e-purchasing for public agencies to serve the poor (dgMarket). The dgMarket is an online service that provides access to government contracting for purchases of supplies around the world. The goals are to foster government transparency and efficiency. The dgMarket seeks to promote business opportunities for suppliers so that the market is more efficient and cost benefits go to the poor.

The information gathered is available as major development topics (called Topic Pages) and as local information service providers (Country Gateways). The Topic Pages are e-communities led by experts in the development field. The Topic Pages allow people to connect with partners, members, organizations, and other stakeholders. The connections create opportunities for exchanging knowledge, know-how, and opinions. The Topic Pages allow people who are development specialists to "virtually" meet and to exchange information on development. There are 26 critical areas in which experts are used as guides and global topic advisers to arrange information into forms that can be used to promote development.

Another feature of Development Gateway is AiDA (Accessible Information on Development Activities). AiDA is an online directory of the development activities of organizations around the globe and is the largest online source of information on development projects in the world. It allows access to records on planned, current, and completed activities and programs from international organizations by country, region, sector, or thematic area.

Gateway has a monthly newsletter, *Development Gateway Newsletter*, that seeks to promote development. The newsletter provides news about conferences, development projects, and development resource links.

Direct and Indirect Measures of Poverty

POVERTY CAN BE considered a special case of the measurement of well-being. The Concise Oxford Dictionary explains the adjective poor as a state of "lacking money or means to live comfortably," and the noun poverty is defined as the state of being poor and as "want of the necessities of life." Consequently, poverty and the poor had to be analyzed within the state of want, with deprivation that is related to the necessities of life. In general, poverty also can be defined as living below some threshold of the distribution of welfare. This, on the other hand, brings poverty close to the concept of inequality. The inequality implies that at the bottom of the welfare distribution a certain level of deprivation exists. That particular level of welfare is referred to as the poverty threshold in the literature, and has a central place in definitions and measurement of poverty.

There are two principal issues surrounding the measurement of poverty. First, we need to establish what kind of poverty we are attempting to measure, and second, we need to choose what kind of measures of poverty we are going to use.

Similarly there are at least two rivaling approaches in poverty research: absolute poverty and relative poverty. Arguably, these unidimensional approaches reflect the stages in historical development of poverty measurement. Recently, three additional approaches emerged in the literature on poverty: relative deprivation, multidimensional, and dynamic approaches.

The measurement of poverty started in the early 20th century with the use of an absolute-income threshold for buying food of minimum nutrition. In his pioneering study (Poverty: A Study in Town Life) in the city of York, England, Seebohm Rowntree, by conceptualizing poverty as the minimum physiological capability to function, laid the foundation for the absolute poverty approach. Within this approach poverty is perceived as living under the minimum below which physical efficiency could not be maintained, and it is that minimum rather than the way of living that separates the poor from the nonpoor. In his Poverty and Famines, Amartya Sen elaborated the very basics of the absolute concept of poverty. According to Sen, there is a core of absolute deprivation that results in starvation, malnutrition, and visible hardship.

The U.S. Bureau of the Census poverty threshold is considered an absolute threshold. The dollar amount

threshold was originally estimated from the cost of a minimum food basket multiplied by three (since it was estimated that an average family spends a third of its income on food).

In 1992 the Census Bureau defined the poverty line as \$6,932 for a single-person household and as \$13,924 for a four-person household. The U.S. poverty threshold has been criticized for neglecting the rise in the general standard of living, regional differences, noncash benefits, and other factors. Nevertheless, the Census Bureau threshold remains the single poverty measurement in the United States.

In Europe, in contrast to the United States, poverty has been increasingly conceptualized in relative terms. Peter Townsend, the principal advocate of the relative concept of poverty, emphasizes the fact that necessities of life are not fixed; rather these are continuously adopted and augmented and socially and historically determined (*Poverty in the United Kingdom*). Consequently, attention has been shifted from an absolute threshold to examining the situation when resources fall far below an average level of income. This approach implies that poverty is more a function of income.

Stein Ringen argued that a lack of material resources is neither necessary nor a sufficient condition for poverty. While a supporter of the relative definition of poverty, he insisted that poverty should be measured directly as deprivation and not indirectly as the lack of resources. This is the third approach to poverty, known as the relative deprivation approach.

The intensive research on poverty in the 1980s led to the formation of the multidimensional approach. This point of view asserts that poverty is a complex phenomenon and should be measured with a set of several indicators, including direct, indirect, and subjective measures. Finally, the dynamic approach to poverty attempts to address the questions of poverty persistency, intergenerational aspects of poverty, and other factors.

However, regardless of what concept of poverty is adopted, the technical problem of measurement remains. In general, the measurement indicators can be divided into subjective and objective. The subjective type of poverty measurement uses the informant's subjective perception on her financial/material situation as the indicator of poverty.

Objective measures can be either direct or indirect. Direct measurement of poverty, the poor living conditions or unsatisfied basic needs method is based on direct observation of the specific, factual satisfaction of needs. The observed condition level is then compared with its normative threshold. Several deprivation in-

dexes have been developed for directly measuring poor living conditions to identify the poor. Most of these indexes are simple sum variables, calculated from a set of dummy variables, in which each variable indicates the lack of some essential consumer durable, problems with accommodation, and others.

Alternatively, one can measure resources that are at the disposal of the household, and compare the magnitude and composition of these resources with the resource requirement necessary to meet the basic needs. These methods that use low resources are known as indirect measures of poverty. *Indirect* refers to the fact that these indicators measure poverty indirectly, that is, they measure the lack of resources that is assumed to cause deprivation. In the indirect approach, the focus is on the identification of the potential satisfaction of human needs.

The principal indirect method that has been applied empirically is referred to as a poverty line. By this method identified resources are reduced to the current disposable income or consumption expenditures (poverty line) and then compared with actual household disposable income or consumption expenditures and expressed as a quantity of money per unit of time.

Indirect poverty indicators that use the distribution of income to identify the poor are also known as financial poverty indicators, since measuring poverty as low expenditures (or low consumption) is technically similar to measuring financial poverty. One of the main advantages in using low consumption to indirectly measure poverty is that there are substantial variations in housing costs between regions and countries. On the other hand, the lack of reliable data on household expenditures, especially when compared with data on household incomes, presents a serious obstacle in the use of low expenditures as the indirect measurement of poverty.

Because of the imperfection of a single poverty measurement indicator, and especially given the fact that different indicators provide different poverty assessments, all three types of indicators are often used side by side. By using more than indicator, a more comprehensive and reliable analysis of poverty is achieved.

Disability Insurance

ONE OF THE CAUSES OF poverty is the loss of income because of illness or injury. To prevent this, disability insurance coverage by either the government or private companies has been developed. The idea of individual disability insurance is a simple concept. Insurance companies have designed insurance policies so that for a relatively small monthly payment a wage earner can purchase a policy that replaces much of his gross income. The amount replaced varies with the policy and also varies accordingly in cost.

In the United States "income from whatever source derived" (Sixteenth Amendment to the Constitution) is liable for income tax. The federal government in the United States has adopted legislation that excludes benefits from a disability policy as part of the gross income of an individual that would be liable for taxation. The exclusion of disability insurance benefit payments from income taxes has two desirable advantages. First, it reduces the cost of the insurance to individuals. Otherwise, in order to replace the income that would be lost if injury or illness caused permanent loss of the ability to earn a living by working, the cost of the needed insurance would be much higher.

An additional advantage is that a greater number of people who participate in purchasing disability insurance policies increases the pool of people who are contributing to the unfortunate few who will experience permanent disability. It also provides the insurance company with funds for investment, which not only attracts stockholder investors but also further reduces the cost of developing the reserves needed to pay disability benefits when necessary.

In the United States, the large number of insurance companies offering disability insurance policies gives consumers many competitive choices. However, as in all market situations, the quality of products varies along with the price. One danger to a person who purchases a

disability policy is that the insurance company may have drafted the policy so that it will seek to evade payment responsibility under the terms of the policy. Another danger is that the company may not succeed financially and therefore go bankrupt. If bankruptcy occurs, then the insured whom is owed financial support under the terms of the disability policy may lose the income and receive nothing. The financial impact for a family in that circumstance could be devastating.

Insurance companies are regulated in all the American states by a state insurance commission or commissioner. The exact title varies from state to state, but the functions are performed regardless of the title. The mandates for each insurance commissioner in every state are to see that the insurance companies operate on the basis of sound principles and to promulgate regulations that encourage insurance companies to operate in the state.

Other forms of disability insurance are those provided by governments. The Social Security system in the United States provides a limited amount of supplemental income for those who suffer permanent disability before their retirement. It pays for permanent complete disability as a percentage of the income the person was making. However, unlike some private policies, it will not pay for partial disability. In addition, if the person who is disabled has a private policy, a windfall elimination formula reduces the amount paid. European countries have similar systems, but in those countries the benefits are much more generous.

Disease and Poverty

THERE IS A direct correlation between poverty and disease. Poverty creates a cyclical relationship with dis-

ease for vulnerable groups and countries in that it causes people and countries to be hopeless, unaccountable, and irresponsible, which in turn creates the conditions for disease to fester and spread. Thus, from a human behavior perspective, many of the diseases that are causing so much suffering in our world today could be prevented if individuals and governments would be responsible in their behavior.

The deadliest diseases are mainly found in the poorest regions of the world.

While this may come as a harsh indictment, an analysis of the causes and spread of some of the deadliest diseases will reveal that they could be contained if governments and individuals acted in ways that would minimize their outbreak and spread. However, governments and people in poor countries have not acted to curb diseases because they do not have the resources with which to act in the first place. Therein lie the dilemma and hopelessness of disease control in poor countries.

The deadliest diseases are found predominantly in the poorest regions of the world. The poorest people in these places are the most vulnerable as well. Sub-Saharan Africa and southeast Asia are the two regions in the world where the human cost of disease is greatest and poverty levels are highest. Indeed, sub-Saharan Africa is the only region in the world now where poverty levels keep rising and more people are afflicted with killer diseases every year.

In a feature article in *Time* in March 2005, Jeffrey Sachs drew attention to the persistence of poverty in Africa by stating that "while the economic boom in East Asia has helped reduce the proportion of the extreme poor in that region from 58 percent in 1981 to 15 percent in 2001, and in south Asia from 52 percent to 31 percent, the situation is deeply entrenched in Africa, where almost half of the continent's population lives in extreme poverty—a proportion that has actually grown worse over the past two decades as the rest of the world has grown more prosperous."

The magnitude of poverty in Africa can be appreciated from the Live 8 Concerts that Bob Geldof, in association with other activist musicians, organized in different cities across the globe to draw the attention of G-8 leaders meeting in Scotland in July 2005 to poverty in Africa. Geldof organized a similar concert in 1985 to raise money to fight African poverty in Ethiopia.

Twenty years later, the situation appears to have worsened. One of the clearest expressions of the links between disease and poverty is the HIV/AIDS pandemic.

HIV/AIDS PANDEMIC

In the 1980s, when doctors and scientists were grappling with the cause and mode of spread of AIDS, a staff writer for *Time* magazine wrote that more than two million Africans were infected with the HIV virus. Less than 20 years later, in 2002, the World Health Organization (WHO) estimated that there were 29.4 million Africans living with HIV. In 2005 there were an estimated 35 million people worldwide living with HIV/AIDS and the greatest number lived in sub-Saharan Africa.

Sue Sprenkle of the Southern Baptist Convention International Mission Board wrote in 2001 that "only 10 percent of the world's people live in Africa, yet it is home to 70 percent of the world's HIV-infected people." Countries in southern Africa are the worst hit. According to estimates, one in every four people in Botswana is HIV-positive; it is one-in-three in Zimbabwe. South Africa is perhaps the worst case in the world. In 1986 HIV prevalence in adults in that country accounted for only about one percent; by the end of 2001 it had risen to about 39 percent.

Not surprisingly, of the 3.1 million people worldwide who died of AIDS in 2002, 2.4 million were living in sub-Saharan Africa. For South Africa alone, WHO has estimated that for the age group 15–34 years living with AIDS, 1.3 million would die between 2000 and 2005, and a further 1.7 million in the next five years. The United Nations projects that there will be 40 million AIDS orphans in Africa by 2010. Some of these orphans would be carriers of the AIDS virus. The problem of HIV/AIDS in Africa thus reflects the deepest levels of misery and hopelessness.

When we contrast the prevalence of HIV/AIDS in the world's poorest regions with that in developed countries, an interesting scenario emerges. In First World countries, the incidence of AIDS is greatest among Third World communities, that is, communities in developed countries that mimic conditions of life in Third World countries.

In the United States, for example, a Centers for Disease Control and Prevention (CDC) report that appeared in June 2005 estimated that more than one million Americans were living with the HIV/AIDS virus, up from between 850,000 and 950,000 in 2002. The report explained that the increase is due to the fact

that people suffering from AIDS are living longer because of the availability of powerful drugs. Importantly, the report indicated that African Americans make up 47 percent and gay and bisexual men represent 45 percent of HIV/AIDS cases in the United States.

The categories "black," "gay," and "bisexual" represent marginalized and underresourced groups in the United States; however, they do not give a good measure of comparability. The demographics for 2003 are rather revealing. For every 100,000 people in given populations, the rates of HIV/AIDS infection were as follows: 58 for blacks, 10 for Hispanics, eight for American Indian/Alaskan, six for whites, and four for Asian/Pacific Islanders. The rates for all other groups combined are less than half of the rate among the black population. One wonders whether this is coincidence or an accident; it would suggest that black people everywhere have been especially marked for the disease.

OTHER DEADLY DISEASES

In addition to AIDS there are other deadly diseases that afflict millions of poor people worldwide. A WHO report in April 2005 stated that outbreaks such as Ebola and Marburg in Africa and SARS in Asia may arouse genuine fears in people, but they are not the biggest killers. Diseases such as malaria, diarrhea, tuberculosis, measles, meningitis, tetanus, and syphilis continue to kill millions in nations in Africa and southeast Asia, although in absolute terms the rate of death is greatest in Africa than anywhere else.

According to the report, malaria kills between one and five million people around the world every year, and 90 percent of the deaths occur in Africa where a child dies of malaria every 30 seconds. A CNN news report in April 2005 stated that malaria costs Africa \$12 billion a year. In southeast Asia, a similar trend can be observed. The WHO director for the region, Dr. Uton Muchtar Rafei, told a conference on tuberculosis (TB) and malaria in Dhaka, Bangladesh, in November 2000 that about 25 million people suffered from malaria and over 1.25 billion people were at risk of infection in the region. With reference to TB, Rafei said that about 40 percent of the people in southeast Asia were infected and more than 1.5 million died in 1999 alone. He said that 95 percent of TB cases worldwide occur in poor countries and that in these countries, poor people are the most vulnerable.

In addition, in southeast Asia, a joint mission of international donors visiting Afghanistan in April 2002 drew attention to the appalling state of health delivery

Rampant disease and dire poverty seem to go hand in hand in Africa. Above, a woman and her child await medical treatment in the tuberculosis tent in a refugee camp along the Ethiopia-Somalia border.

in the war-ravaged country, especially in rural areas where the doctor-patient ratio is one to 100,000. The mission reported that only 65 percent of Afghans had access to health facilities, while only 32 percent of children were immunized against childhood diseases. The mission recommended that donors invest \$200 million in healthcare to enable Afghans to move beyond the cycle of disease and deprivation.

HOW DISEASE OCCURS

Given the spread of diseases in poor countries, it is necessary to examine how they occur. HIV/AIDS is a good example. Some people, mostly a few evangelical Christians, have suggested that HIV/AIDS is divine punishment to curb promiscuity and homosexuality. There is even an apocalyptic ring to that suggestion, and it says

that in the last days incurable diseases will afflict humanity. To some Christians, then, HIV/AIDS and other deadly diseases point to the end of the world. To the extent that the medical and scientific community has not yet developed a cure for HIV/AIDS, these Christians may continue to hold their unique perspective on the disease.

Indeed HIV/AIDS is largely a sexually transmitted disease; however, it is not solely the disease of the sexually promiscuous, although such people stand a greater risk of infection. Millions of children have been born with the disease through no fault of their own, while others have contracted the virus through blood transfusion or intravenous needle-sharing with infected persons. What is evident is that HIV/AIDS has emerged as the disease of the poor both in developed and developing nations.

One important factor regarding the spread of AIDS is government intervention and public responsibility. In rich countries, governments spend millions of dollars educating people and funding research to find a cure for the deadly disease. An MSNBC news report of July 5, 2005, states that the U.S. government passed a law that required all expectant mothers to undergo an HIV/AIDS test. The purpose was to protect unborn babies from contracting the virus from mothers who may be infected.

This was a great preventative measure that served as the first line of defense against the disease in children. The government could pass this act because it had the resources to carry out the tests. But it is one thing to diagnose a disease and another thing to offer a cure to the afflicted. About 39 million Americans do not have health insurance, meaning that they do not have access to quality healthcare. If any of them contracts the HIV/AIDS virus, he would not know that he is a carrier and would unknowingly pass it on to partners. Thus even in the richest country in the world, the danger of AIDS is a factor of poverty.

Some attributed infection to witchcraft or action by angry ancestors.

The situation is worse in poor countries, where governments cannot fund research or import retroviral drugs to curb the spread of HIV/AIDS. In terms of educating the public about safe sex, governments in these countries face an uphill battle because of illiteracy, ignorance, and poverty. Radio and television advertisements have not been effective because the target group does not have access to such technology. Myths about the causes of the disease and traditional ideas about sex have inhibited efforts to curb the spread of the disease.

In a February 2001 edition of *Time* magazine, Johanna McGreary offered insights into how myths fed the spread of the disease in Africa. Some attributed infection to witchcraft, action by angry ancestors, or, in the case of South Africa, a ploy by whites to control the black population when apartheid finally ended. These beliefs could hardly help the people to understand the enormity of the danger with which they were confronted.

And when they finally understood what they were up against, the stigma attached to the disease (because it is sexually transmitted) led infected persons to keep quiet about their condition.

In the United States and Canada, people testing positive for the virus are required by law to inform their spouses if they are married. In Africa there is a "don't tell" culture surrounding the disease. Even doctors do not indicate on death certificates that patients died of HIV/AIDS, in accordance with local practices. In the majority of cases, infected people did not know that they carried the virus and attributed its manifestation to malaria, TB, diarrhea, or any other disease that would crumble their already compromised immune system. These carriers would unknowingly spread the disease until they were too weak to engage in sex.

By then their partners might have carried it on to others, creating a ripple effect that is difficult to arrest. Once people have contracted the virus, they wait to die. In rural areas where patients may not have access to clinics, these people are treated as outcasts, condemned, and neglected because of their particular type of disease. Those who end up in hospitals may live a little longer because of the rudimentary treatments that they receive. Governments are now struggling to increase the importation of generic drugs to prolong the lives of people carrying the HIV virus.

When we move beyond AIDS and consider diseases such as malaria, cholera, and TB, we see how poverty couples with ignorance to make people irresponsible. Malaria is spread by mosquitoes, and mosquitoes breed in stagnant water, dead weeds, and damp and dirty surroundings. The hot and humid climate in Africa and parts of Asia is ideal for mosquitoes to thrive; incidentally, these are places where drainage systems are poor and sanitation is worse. People dispose of garbage and human waste in utter disregard of the health consequences.

Huge garbage dumps spring up in residential areas where mosquitoes breed in large numbers. The majority of people sleep without treated mosquito nets, thus becoming vulnerable to mosquito bites. Governments do not have enough resources to spray the mosquitoes or import medicines. And so as with HIV/AIDS, people suffering from malaria only hope that they will be lucky. If not, they die. That is the sad reality of the impact of poverty on human health.

In rural areas in western Africa, for example, villagers dig pits as places of convenience. These open pits attract flies that may settle on food. When it rains, feces washes into streams that may also serve as sources of drinking water for other rural populations. In towns, human-waste management is left in the hands of "night soil men" (men who clear panloads of feces every night) who dig bigger pits where they dump the waste. The

problems associated with human waste in rural areas occur in towns on a larger scale.

Although city populations have potable water, they still live with the stench and flies that have feasted on the feces. Even houses and facilities that have water closets are not entirely free from the problem of human waste. Cesspools are poorly constructed and easily spill over, leaving dark streams of toxic human waste that pollute the atmosphere.

As the world waits for G-8 leaders to take action on world poverty, a British government official has said that people expecting total eradication of poverty will be disappointed. Some may see the comment as bad for its timing, but sadly, it is true. Even if rich nations create clean financial slates for poor African countries, they would have to find strategies to deal with disease on the continent. McGreary summed it up best when she said that "here [Africa] the disease [HIV/AIDS] has bred a Darwinian perversion. Society's fittest, not the frailest, are the ones who die." When the generation of working people is dying out because of disease, there is no amount of debt relief that can salvage Sub-Saharan Africa from despair and demise unless disease has been brought under control.

Distribution

THE ACT OF SPREADING or apportioning of goods and services to those with a demand or need for them is referred to as *distribution*. This includes the commercial activity of transporting and selling goods from a pro-

ducer to a consumer. The pattern of need for distribution is determined in part by the demographic characteristics, or spatial property, of the need, which is scattered about over a geographic area, population density, or volume. In epidemiological terms, the frequency and pattern of health-related characteristics and events in a population may also be referred to as distribution. With respect to the statistical or mathematical distribution of attributes of a population, a distribution may be thought of as an arrangement of values of a variable showing their observed or theoretical frequency of occurrence.

Economically, trades that are specialized in distribution make up a large portion of social and financial activity within a society. Distribution is central to, and an essential part of, a population's economic activity directed toward self-sustenance and survival. Consistent distribution via logistics and transportation of goods and services is directly related to the capacity of a society to maintain employment opportunities for members and the capacity to distribute income and shared prosperity among members.

The availability of goods and services and social conventions observed by vendors and consumers at the local level is heavily influenced by the patterns of distribution frequently determined by manufacturers and suppliers at distant locations. Distribution statistics are maintained by both governments and suppliers to provide predictive information for determining rates of consumption and need among existing and projected populations. These include pricing information for the manufacture and distribution of goods and services and rates of consumption.

Distribution and associated administrative and direct costs of distribution are directly related to the capacity to provide relief to a population during times of disaster and to the capacity of a society to prosper and reduce poverty and need among members. Distribution effectiveness is in part related to the reliability of current or recent census data and shifts in population need, the capacity to transport materials over the terrain of a geographic area, the availability of labor to provide transportation, the political and environmental barriers to distribution, and trends in consumer behaviors.

Infrastructure, available energy, and reliable communicative technology are also directly related to the effectiveness of distribution efforts. Theoretically, during periods of increased global equity in trade and distribution efforts, poverty rates and global income inequity diminish. The equitable distribution of income and opportunities to obtain income within a population are di-

rectly related to the rates of, and emergence of, poverty within a population or geographic area.

CHARACTERISTICS OF DISTRIBUTION

Income inequality, disparities in the level of development of nations, employment and educational opportunity, access to healthcare and preventive care, nutritional supports inequities, and relative security and stability from conflict are associated with deficits in the distribution of services and goods to specific populations. Social and economic instability and inadequate resources are directly linked to the emergence of poverty.

These precursors to poverty occur in response to political or military conflict or natural disaster. Distribution efforts with respect to recovery from social and economic instability are directly dependent on the availability of adequate information, or available data, on the problems and needs of affected populations to determine the scope and direction of effort, goods, and services supplied or expended by informed decisionmakers. Responses to health-related crises by way of distributed health-service providers and medicines are also dependent on the origins and development patterns of epidemics or outbreaks. In recent decades, advances in technologies, such as computer models of distribution and graphing and imaging programs, have served to represent the distribution of goods or services needed and to provide faster relief.

For example, reliance on these information services was considered crucial, along with logistical technologies (transportation and shipping), in responding to the Asian tsunami of 2005, which required global mobilization for effective distribution of relief efforts.

EFFECTS OF DISTRIBUTION

World distribution mechanisms and world trade markets tend to generate price changes and variation for commodity exports from differing parts of the world, based on available supply and marketable demand. International variations of production, delivery, and price affect the markets of developed countries sufficiently to incur additional costs with respect to distribution efforts to impoverished or less developed regions of the world.

Sustainable development efforts, though more difficult to achieve at times, generally include effective distribution strategies that have beneficial effects over time on the economic inequities experienced in the less developed areas of the world. Where administrative costs are sufficiently controlled through effective information technology, data-driven decision support, and collective-purchasing power, efforts are often sufficient to provide for sustained distribution of goods and services including income opportunities that may bestow long-term benefits. These include increased self-sufficiency, increased standards of living, and improved health and longevity for affected populations.

Resource distribution serves to reduce the determinants of poverty.

Poorly distributed resources, or assets, create differences in consumption and other socially based behaviors that can serve to further deteriorate social capital and social cohesion. This can lead to a change in the distribution of family and individual earnings, female labor supply decisions, family composition, birthrate, and living arrangements, so that changed political or social progress serves to further conditions of inequality within affected populations.

Furthermore, poor or uneven income distribution and taxation distributions tend to negatively affect the well-being of families and of children by diminishing rates of completed education, increasing teen pregnancies, increasing dependency for economic supports and reducing self-sufficiency, and subsequently transmitting continuing family, personal, and intergenerational forms of poverty.

Income or asset redistribution, along with opportunities for education, employment, health services, preventive care, residential stability, and the availability of essential goods such as nutritional supports, medicines, and supportive services, serves to attenuate the effects of family, personal, and intergenerational forms of poverty. Increasingly, the digital divide, or distribution of available access to information and communication technologies is also a determinant in the capacity of a population to identify opportunities and avenues of resource distribution that would serve to reduce the determinants of poverty.

Recent efforts of globalization, or international and worldwide redistribution of income, employment opportunities, and asset and service reallocation, though controversial, have begun to show a reduction in previously projected rates of international poverty and increases in regional economic integration, as well as increasing emphasis on laws that improve overall human

rights. Conditions of absolute poverty or unrecoverable poverty are diminished, individual ownership and economic power are increased, inequality conditions are decreased, economic fairness is improved, and the size and quality of labor force are increased. The main effect of distribution, then, at the level of globalization, is to attempt to reduce suffering because of economic or social inequality, political conflict or instability, asset and resource inequities, and naturally occurring catastrophes. Distribution at the level of globalization brings numerous ethical dilemmas in terms of job and opportunity loss, income loss, and loss of resources and services for populations that are considered more developed in an attempt to raise the relative security of the most disenfranchised. There are also increased expenditures in the administration and implementation, or asset loss, within the distribution effort that further diminish the resources available to serve the interests and needs of either developed or underdeveloped populations.

A key concern of decision-makers in having the maximum beneficial effect for distribution effort, though, is to control administrative costs associated with the delivering of goods and services where possible. Multilevel and technically oriented evaluation of methods of the distribution effort based on reliable sources of data and information concerning matching of resources to need is utilized to manage these costs and ensure the optimum effect possible for the distribution effort. Determining the effectiveness of distribution, then, requires the maintaining of global and regional, multivaried informational databases that capture the demographics of population and need for the period of time the distribution effort is desired.

DISTRIBUTION AND WORLD POVERTY

Poverty and income distribution depend in part on other distributions of attributes of need throughout a population. For example, populations of need may experience larger family or household size as a response to insecurity and increased mortality within families where living conditions are harsh. Developing regions of the world with poor transportation, communication, and information infrastructures have lesser opportunities for employment, employment experience, and educational or training opportunities. They experience a much higher cost of living relative to the available income.

Poorly distributed and utilized resources worldwide are associated with numerous forms of poverty in lesser developed regions of the world, such as social capital poverty, energy poverty, natural-resource poverty, nutritional poverty, healthcare-access poverty, education-access poverty, habitable-shelter poverty, aging-security poverty, income poverty, global- and political-security poverty, human-rights poverty, and numerous others. The real effect of distribution efforts, including income distribution from the wealthiest and most secure to the neediest and most insecure, is in part dependent on prevailing regional definitions of what constitutes poverty or a poverty line for income and available-resource access. One reasonably reliable estimator of need across poverty definitions in different regions includes prevalence of disease, longevity rates, and mortality rates (per capita) for impoverished populations. Poverty and poverty measures, including factors associated with disease and mortality, may be found in the most developed and in rapidly emerging nations, as well as the most poor of nations.

RANDALL E. BASHAM, Ph.D. UNIVERSITY OF TEXAS, ARLINGTON

Djibouti

THE SMALL EAST African nation of Djibouti, which borders the Gulf of Aden and the Red Sea, was formed in 1977 from the French territory of the Afars and the Issas. Djibouti continues to maintain close ties with France. In the 1990s, the Afars minority instigated a civil war, which ended in 2001. Djibouti is home to the

only American military base in sub-Saharan Africa and is integral to the war on global terrorism. Half of Djibouti's adult population is unemployed, and almost three-fourths of the 476,703 people live in relative poverty on less than \$3 per day. Because of prolonged droughts, the World Health Organization estimates that 28,650 Djiboutians are suffering from severe food and water shortages.

As a significant transshipment area for the African highlands, Djibouti's economy is heavily tied to shipping and trading, and two-thirds of the population lives in the capital city of Djibouti. A small number of Djiboutians are nomadic herders. Agriculture is limited because of frequent droughts and the lack of arable land, and most food is imported. The poorest people are dependent on food aid from the government. Many resources of this lower-middle-income nation go toward paying foreign debts.

Women are more likely to suffer from extreme poverty than are men.

Djiboutians have a life expectancy of 43.1 years, and the median age are 18.23 years. Approximately 43.3 percent of the population is under the age of 14, and 3.2 percent are over the age of 65. Djiboutians face a 42.9 percent probability of not living to the age of 40.

Health problems in Djibouti include an HIV/AIDS prevalence rate of 2.9 percent. By 2003 estimates, some 9,100 Djiboutians have the disease, and approximately 690 have died from the disease and its complications. Djiboutians suffer from a high risk of food- and waterborne diseases such as bacterial and protozoan diarrhea, hepatitis A and E, and typhoid. Common health hazards have been exacerbated in Djibouti because of prolonged droughts that led to outbreaks of cholera, dysentery, malaria, and respiratory conditions. Some Djiboutians, particularly those in rural areas, lack access to proper medical attention and lifesaving drugs. As a result of the droughts, thousands of Djiboutians also lack access to potable water.

The high infant mortality rate of 104.13 deaths for every 1,000 live births is indicative of the problems facing Djiboutian officials. Estimates for 2003 place the under-5 mortality rate at 138 per 1,000. About 18 percent of Djibouti's children under the age of 5 are malnourished, and six percent are severely underweight. Approximately 13 percent suffer from moderate to severe wasting, and 26 percent suffer from moderate to severe

vere stunting. In 2003, 66 and 68 percent of children aged 12 to 23 months received measles and DPT3 immunizations, respectively. Infant immunization rates are now rising again after a drop between 1990 and 2002, during which time both DPT and measles immunizations dropped from 85 to 62 percent.

Women are more likely to suffer from extreme poverty than are men, making females more vulnerable to health risks. In 2005, the fertility rate of Djiboutian women was estimated at 5.4 children per female, and the adolescent fertility rate was estimated at 32 per 1,000 women aged 15 to 19. Statistics on the use of contraceptives are unavailable. Estimates for 2000 place maternal mortality at 730 per 100,000 live births, and poor women are more likely to die in childbirth than are the more affluent. The high maternal mortality rate is due to a number of factors, which include a lack of obstetrical care and cultural traditions such as excision and infibulation. Trained medical staff now attend over 60 percent of births.

Only one-third of Djiboutian males are classified as illiterate, but over half of Djiboutian females over the age of 15 are illiterate. The highest rates of illiteracy are found in married women between the ages of 14 and 49. According to government survey estimates, 71 percent of nonsingle urban women and 97.5 percent of nonsingle rural women in that age group are illiterate. Rates of both male and female literacy have declined since 1980, but the decline in women has been more striking. The literacy rate among women dropped from 74.4 in 1980 to current levels. From 1999 to 2003, the male primary school completion rate rose from 31 to 35 percent and the female completion rate rose from 27 to 32 percent. Most Djiboutian children receive no more than four years of schooling.

In August 2000, officials adopted the Poverty Reduction Strategy Paper (PRSP), which articulated the following goals for the 21st century: growing the economy, expediting human resource development, reducing poverty, and strengthening governmental planning and capacities.

Djibouti also passed a series of laws intended to address the problem of sex discrimination, including raising the marriage age for women to 18, establishing criminal penalties for female genital mutilation, enhancing education and economic opportunities, and initiating new health policy guidelines with an emphasis on reproductive health.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Dominica

THE ISLAND OF Dominica, which is situated between the Caribbean Sea and the north Atlantic Ocean, achieved its independence from Great Britain in 1978. With a per capita income of \$5,500, Dominica is considered upper-middle-income, but the country is severely indebted. Approximately 40 percent of the labor force are involved in agriculture, mostly in growing bananas. This crop is highly vulnerable to weather conditions, and Dominica is subject to hurricanes and floods. Economic reforms were instituted in 2003, resulting in increased privatization and the removal of price controls.

The government has promoted the tourist industry in recent years, but efforts have been hampered by inadequate travel facilities and the lack of beaches. Efforts are underway to develop an offshore financial sector and to construct an oil refinery.

While attempting to grow the economy, Dominican officials must also cope with an unemployment rate of 23 percent. In 2003, a government report identified a poverty level of 40 percent, affecting 29 percent of all Dominican households. Some 39 percent of the poor lived in households headed by single mothers. In response, the government provided for aid under the Social Protection Program, the Basic Needs Trust Fund, and the Public Investment Fund.

Life expectancy among the Dominica population of 69,029 is 74.65 years, a decrease from 77 years in 2003. The median age is 29.59 years. On the average, women outlive men by six years. Around 27 percent of Dominicans are under the age of 14, and 7.9 percent are at

least 65. Only three percent of Dominicans lack access to safe water, while 17 percent lack access to proper sanitation. There are 49 physicians for every 100,000 residents, and from 80 to 94 percent of the population have access to affordable essential drugs.

In 2005, infant mortality was recorded at 14.15 deaths per 1,000 live births, a reduction from 19 deaths per thousand in 1990. At 9.38 deaths per 1,000, female infants have a significantly better chance of surviving than do male infants at 18.68 deaths per 1,000. The mortality rate for all children under the age of 5 is 14 deaths per 1,000, a decrease from 23 deaths per 1,000 in 1990.

Five percent of Dominican children are malnourished, and 10 percent of babies are underweight at birth. Six percent of children under 5 suffer moderate to severe stunting, and two percent experience moderate to severe wasting. Childhood immunizations are virtually universal in Dominica, with only one percent of children between birth and 23 months failing to receive the proper vaccinations.

Fertility is low on the island, and women produce an average of 1.96 children each. This is a significant decrease from the 3.9 children per woman recorded in 1980. The fertility rate of females aged 15 to 19 is 46 per 1000. Half of all women use contraceptives of some sort. All births in Dominica take place in health centers or hospitals. Between 1985 and 2003, maternal mortality was estimated at 67 deaths per 100,000 live births.

Dominica defines literacy as ever having attended school. Based on this definition, 94 percent of both males and females are literate.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Dominican Republic

LOCATED BETWEEN THE Caribbean Sea and the north Atlantic Ocean, the Dominican Republic comprises the eastern two-thirds of the island of Hispaniola, while Haiti covers the western third of the island. For most of the latter half of the 20th century, the Dominican Republic was under the authoritarian rule of Joaquin Balaguer. After Balaguer was forced out of office, a representative democracy was instated.

Historically, the Dominican economy has been tied to the export of sugar, coffee, and tobacco, but only 17 percent of the labor force is now involved in agriculture. The Dominican Republic suffers from water shortages caused by periodic droughts. In response to increasing tourism and free trade, some 59 percent of Dominicans work in service and government jobs. In the last two years of the 20th century, the Dominican Republic became one of the fastest-growing economies in the western hemisphere. The economy has since slowed.

One-fourth of the population is poor in this lower-middle-income nation, and 27 percent of the people are malnourished. There is a 17 percent unemployment rate. Vast inequality exists in the Dominican Republic, and the poorest 20 percent of Dominicans subsist on 5.1 percent of the country's resources while the richest 20 percent claim 53.3 percent. The Dominican Republic is ranked 47.4 on the Gini Index of Human Inequality.

The Dominican population of 8,950,034 experiences a projected life span of 67.26 years, with women living an average of three years longer. The median age is 23.88 years. Almost one-third of the population is under the age of 14, and 5.4 percent have reached the age of 65. The HIV/AIDS epidemic is becoming a threat to the Dominican Republic, with a prevalence rate of 1.7 percent. Some 88,000 people are living with the disease, and 7,900 have died. About 14 percent of Dominicans lack access to safe water, and one-third of the population lacks access to proper sanitation. There are 190 physicians for every 100,000 residents, and 50 to 79 percent can afford essential drugs.

Childhood mortality has declined drastically in the Dominican Republic since the 1970s, when 91 deaths occurred out of every 1,000 live births. That number has been reduced to 32.38 per 1,000. In 1970, the mortality rate of children under the age of 5 was 128 per 1,000. It is currently 35 per 1,000. Five percent of all children under the age of 5 are malnourished, and 14 percent of babies are underweight at birth. Nine percent of children under the age of 5 suffer from moder-

ate to severe stunting and two percent experience moderate to severe wasting. Infant immunizations against measles and tuberculosis are in the 90 percent range, but rates for immunizations against polio and DPT are reported at 73 and 72 percent respectively. In 2003, immunization rates for children between the ages of 12 and 23 months were recorded at 79 percent against measles and 65 percent against DPT.

On the average, Dominican women have 2.86 children each. Total fertility has declined steadily since 1970 when 5.6 children per woman was the average. Among adolescents, the fertility rate is 81 per 1,000 births. Data collected by the Population and Health Census in the Dominican Republic indicate that 23.3 percent of all adolescent girls have conceived at some point.

To stem the rate of teenage pregnancy, the government has launched a sex education program. Some 70 percent of Dominican women use contraceptive methods to prevent pregnancy. Approximately 98 percent of all births take place with trained medical staff in attendance. Modeled estimates for 2000 place Dominican Republic maternal mortality at 150 deaths per 100,000 live births.

Approximately 85 percent of all Dominicans over the age of 15 can read and write, and there is no significant gender difference in this ability. Education is universally available, and most students attend school for 13 years. From 1999 to 2002, primary school completion rates rose from 80 to 93 percent for males and from 85 to 97 for females. One-fourth of all students attending colleges and universities study math, science, and engineering.

Donnelly, Ignatius (1831–1901)

IN THE LAST HALF OF the 19th century, the twin processes of industrialization and urbanization, while offering new opportunities, also undermined the traditional position of skilled workers, who saw their socioeconomic power steadily eroded by the growing concentration of industrial capitalism and the automation of manufacturing processes.

While craft unions struggled to protect the status and rights of their membership, unskilled workers, who were often disenfranchised by the political process, were forced into ghettos as an industrial proletariat, which lacked both the economic and social benefits of modernization. As these workers turned increasingly to the radical solutions offered by syndicalism or Marxism, middle-class social reformers also sought social and political reforms that would ameliorate the poverty of working-class families.

The political career of Ignatius Donnelly reflected this growing concern with social and political reform in late 19th-century America. In the factional atmosphere of America's Gilded Age, Donnelly moved from his early success with mainstream politics toward more radical agrarian and populist politics in his search for social reform.

Donnelly was born and educated in Philadelphia, Pennsylvania, where he studied law and was admitted to the bar in 1852. After a short legal practice, he moved to Minnesota where he became quickly involved in state politics. After serving as lieutenant governor of Minnesota (1859-63), he was elected as a Republican representative to Congress (1863–69). While in Congress, Donnelly actively supported government land grants for railway expansion, arguing that railroad development was vital for the economy of the western states. Following a series of electoral defeats as a congressional candidate resulting from his quarrels with the Republican leadership in Minnesota, he allied with the Democrats and returned to state politics, serving in the Minnesota Senate (1874–78). Another defeat as a congressional candidate in 1878 brought Donnelly's political career to a hiatus, but he returned to serve various terms in the Minnesota legislature (1887, 1891–93, 1897).

During the 1870s, Donnelly became increasingly involved with agrarian and popular politics, establishing his own weekly reform journal, the *Anti-Monopolist*, in 1874. In 1886 he drafted the program for the Minnesota Farmers' Alliance, and in 1892 he was nominated by the People's Party for vice president. This political transi-

tion reflected Donnelly's increasing disillusionment with the ability of mainstream politics to achieve social reform. While Donnelly was the central figure behind a number of socioeconomic reforms, from restructured interstate commerce laws to liability legislation to force improvements in workplace safety, he ultimately perceived American politics as becoming increasingly corrupt, as business interests gained heightened control of the political system. In particular, Donnelly reversed his earlier beliefs by targeting railroads and trusts that he argued used their economic power to force politicians to enact laws that favored their interests above those of farmers and workingmen. Ultimately, Donnelly viewed 19th-century America as a society where greed, corruption, and selfishness were triumphing over generosity, honesty, and self-sacrifice.

Brutal poverty endured by the working classes would spark a bloody revolution.

While Donnelly was recognized for his quasi-scientific work on Atlantis and for his attempt to establish Francis Bacon as the true author of Shakespeare's plays, he also used his literary talents to give voice to his political and social vision. This was most evident in *Caesar's Column: A Story of the Twentieth Century* (1890), which he wrote under a pseudonym following his electoral defeat in 1889. Published in the wake of the fantastic success of Edward Bellamy's *Looking Backward* (1888), Donnelly's novel also saw considerable success, selling 60,000 copies in the United States in nine months and almost three-quarters of a million copies in Europe and North America by the close of the century.

Whereas Bellamy presented a technological utopia in which social revolution had saved society, Donnelly presented a brutal dystopia in which a totalitarian oligarchy, strengthened by scientific and technological advancement, had crushed all attempts at social reform. Donnelly presented this as the inevitable outcome of the political corruption and harsh industrial conditions that he perceived in contemporary American and European society.

In Donnelly's vision, the brutal poverty endured by the working classes would ultimately spark a bloody revolution focused on revenge rather than reform. While Donnelly intended this work as a warning to support the necessity of social reform, it was initially rejected by a series of mainstream publishers as an incendiary call for revolution. Drought

DICTIONARY DEFINITIONS of *drought* are very straightforward and brief: drought is a long period without rainfall. There have been many periods of this type, and the impact of a severe drought on people and animals within the affected region has been devastating. There are many examples of the impact of severe drought.

The Dust Bowl in the 1930s forced many thousands of people to abandon their land in the midwest of the United States. Drought in the Sahel region of Africa from 1968 to 1974 took the lives of hundreds of thousands of people and millions of farm animals. In the first few years of the 21st century, the threat of drought is widespread. Large areas in sub-Saharan Africa continue to suffer from lack of rainfall. In southern Africa, estimates suggest that more than 15 million people are at risk of starvation. Ethiopia is another African country in danger of losing millions of people because of drought and ensuing famine. Experts speculate that the loss of life in the current crisis could exceed the 1984 to 1985 drought occurrence when over one million people perished. The Sahel, the semidesert region adjacent to the southern edge of the Sahara, is having food shortages because of low agricultural production during periods of persistent drought. Other regions in the world are also having drought conditions more frequently than in the past. All indications are that this situation will continue in the most susceptible regions.

The explanation for drought is complex. Both natural occurrences and the actions of humans contribute to drought formation. The areas most prone to drought are the semideserts that lie adjacent to the great deserts

of the world. Deserts originally formed beneath the naturally occurring high-pressure systems centered at approximately 30 degrees north and south of the equator. These regions are under the influence of dry air descending from the high-pressure systems. The deserts are essentially devoid of vegetation and receive low levels of precipitation. The Atacama Desert in South America is extremely dry: no rainfall has ever been recorded in large parts of this desert.

DESERTIFICATION AND LAND DEGRADATION

The largest of the world's great deserts is the Sahara in north Africa. Deserts are found on every major continent, and evidence indicates that the deserts are in fact expanding. In 1977 a United Nations study pointed out that the areas on the margins of the great deserts are becoming drier. In some cases, especially in the Sahel, the Sahara is continually moving south and replacing the semidesert. In a transformation of this type, the vegetative complement of the semidesert, the attribute that identifies it as a distinct climatic type, disappears and the area becomes desert. The term given to the process of increased aridity and the transformation of the semidesert is *desertification*, and its origins and anticipated expanse are the topic of discussion by development experts worldwide.

There is little doubt that desertification is due in part to climatic change, a process that has been under way on earth for millennia. But climate change is only one of the contributing factors. There is also the strong argument that desertification is to a great extent humaninduced. In order for agriculture to take place, the land must be cleared and opened for planting. If sufficient rainfall is present at the right times during the growing season, the system operates in good order. However, exceptionally dry conditions can negatively impact agricultural activity in a number of ways. If it is especially dry at the beginning of the season, planting may have to be delayed. If this is the case, winds can blow away the fertile topsoil and the new seeds if they have been planted. Drought conditions can negatively impact a crop later in the growth cycle; for example, if corn does not receive sufficient rainfall during the last stages of plant maturity, an entire crop can be decimated. Overgrazing can reduce the plant cover in semiarid regions, reducing the amount of plant growth in the following

Land degradation can also occur from overuse of the land. Agricultural land will retain its fertility and potential for productivity many years longer if it is left to fallow every few years. If this does not occur and the land is under crops uninterruptedly, its fertility will diminish. Land degradation, whether human-induced or through climate change, greatly affects the occupants of regions where subsistence farming is the primary economic activity.

The United Nations estimates that land degradation through climate change and human-induced activities has taken over six million hectares of proactive land out of operation every year since 1990. People in sub-Saharan Africa, the Sahel, and other regions of Africa have been the hardest hit. The United Nations also estimates that 135 million people are at risk of being displaced by land degradation. Sixty million people are expected to leave the degraded land of sub-Saharan Africa by 2020. Similar situations are reported in the degraded land areas of Peru and Mexico.

In Mexico, nearly half the land is affected by desertification and millions of Mexicans have been forced to move to other regions of the country. Land degradation in Mexico causes, in part, the massive influx on Mexicans into the United States.

The link between land degradation and poverty is clear. The *United Nations Human Development Report* (2005) pointed out that millions of poor people in the developing world live on farms where soil productivity has been severely eroded because of land degradation. Farmers in these areas are caught in a vicious cycle; they must continue to use soil that is losing its fertility from year to year. Consequently, their crop yield diminishes each year and less food is available. Under these conditions, it becomes necessary for them to abandon their land and move to more productive regions. This is not an easy task for poor families with no certainty that a new home can be found.

Worldwide observances took place on June 17, 2005, to mark the 11th anniversary of the UN Convention to Combat Desertification (UNCCD). The commemoration is part of an international campaign to increase public awareness of land degradation and its impact on millions of people, most of them living in poverty.

In 1995, the UN Commission of Sustainable Development (UNCSD) noted that one billion people live in the rural areas of the world's dry lands. The report went on to suggest that these people were at risk of losing their homes due to the ravages of land degradation. The economic losses associated with this situation were estimated then to be nearly \$50 billion per year. The UNCSD report went on to state that desertification and drought are closely interlinked with climate change, de-

Satellite imagery reveals Africa's growing desertification—the spread of the Sahara Desert from the north toward the south.

forestation, the diminishment of water resources, population growth, and poverty. The UNCSD then urged governments to put in place an integrated approach to combating land degradation and to take into account the link with poverty.

The UNCSD report stressed the need for governments to identify and access necessary financial resources to assist those in need, especially people in sub-Saharan Africa. In the decade since the pronouncements of the UNCSD and the UNCCD, gains have been made, but the deleterious impacts of land degradation and poverty remain.

In 2005, more than 75 percent of the people in sub-Saharan Africa lived on less than \$2 per day. In addition, less than half the rural dwellers in this region had access to improved water sources. Also, life expectancy at birth in sub-Saharan Africa is 47 years, two-thirds the world figure (67 years) and three years lower than its peak in 1990 (50 years). Finally, the United Nations Human Development Index (HDI), which measures the three dimensions of human welfare (income, education, and health), has risen since 1975 for every major region in the world except sub-Saharan Africa. The HDI reached its high point in 1990 and has stayed the same

since that time. In 1986, sub-Saharan Africa's HDI was on a par with that of south Asia. In 2005, sub-Saharan Africa ranked lowest in the world. There is little likelihood that poverty in sub-Saharan Africa will be alleviated without massive infusions of monetary and technological aid over many decades.

Duration of Poverty

DO THE POOR REMAIN so their entire lives? This is often the case in developing nations where little opportunity is offered to the poor to prosper economically. There, long-term and multigenerational poverty is a reality. But in the industrialized world, particularly in nations with a large number of citizens existing in an economic middle class, studies show considerable mobility across the poverty threshold—with large percentages of the poor moving out of that condition and middle-class households that fall below the poverty threshold remaining there only briefly.

A way to measure the duration of poverty is by identifying "poverty spells," or periods of time spent in poverty. To be considered as in such a spell, a person or household must live below poverty levels for at least 60 days. According to one study of Americans, 51.1 percent of the spells experienced by persons being tracked lasted four months or less. About 79.6 percent of such spells were over within a year.

Another study showed that among Americans living in poverty for the entire year of 1996, 65.1 percent remained in poverty in 1997, 55.5 percent remained throughout 1998, and 50.5 percent in 1999—with in-

creasing numbers leaving poverty each year. In contrast, of Americans not in poverty in 1996, 2.9 percent fell below the poverty level in 1997, 3.3 percent for 1998, and 3.5 percent during 1999.

Thus, the poor in America are an ever-changing population, contrary to any perception that the destitute remain so for their entire lives, according to a number of studies, including the Panel Study of Income Dynamics (PSID), the National Longitudinal Survey of Youth, and the Survey of Income and Program Participation. Each found that most spells of poverty are fairly brief. The typical pattern in the United States was that households below the poverty line for several years often managed to rise above it. However, because they do not manage to rise very high, events such as loss of a job, breakup of a marriage, or disaster resulting in financial loss can throw such a family back into poverty very quickly.

Relatively few American households suffer from chronic poverty year after year. One study showed that between 1979 and 1991, one-third of all Americans experienced a spell of poverty. Of those who dropped below the poverty threshold about half were poor for three years or less; one-third remained so for four to nine years; 14.6 percent stayed there for 10 of 13 years; and only 4.5 percent remained poor all 13 years.

Is race a factor? This same study showed two-thirds of black Americans experienced poverty at some point during that 13-year period, compared to one-fourth of white Americans. Furthermore, 67 percent of white Americans who experienced poverty were poor for three years or less, whereas the figure for blacks remaining poor for only three years or less was 30 percent. Consequently, black Americans already touched by poverty were more likely to fall into it for substantially longer periods.

Another study showed that between 1969 and 1987, 38.1 percent of all Americans experienced a spell of poverty, but that only 1.1 percent were poor throughout the entire 19 years.

Do these findings hold up elsewhere in the industrialized world? Yes, according to a study that compared the poor in the United States with those in the United Kingdom, Germany, Sweden, Canada, and the Netherlands. Between 12 and 40 percent of the population across the six countries were touched by poverty over a six-year period, with the majority experiencing only short spells in poverty. As the duration of poverty lengthened for a household, in all six countries the probability of rising above the poverty level fell—with a small group of the population remaining in poverty

for long periods of time with little chance of exit. In all six countries, the probability of breaking above the poverty threshold fell based on previous experiences in poverty. In other words, those who had lived in poverty before were more likely to do so again, but those who had not but fell below poverty level, then rose above it, were not as likely to return. Thus, for the longer-term poor, there was a low probability of exit and a high probability of return. In all six countries, households with six or more years in poverty typically made up two to six percent of the population.

These statistics do not compare to Third World or developing nations, where poverty is far more rampant and fewer live in the middle-class levels spanning destitution and opulence. There, the duration of poverty is much longer and the likelihood of rising out of it much lower.

WORLD POVERTY

Earned-Income Tax Credit

THE EARNED-INCOME Tax Credit (EITC) has grown from its inception in 1975 to become the largest federally funded means-tested cash assistance program in the United States. To receive the credit, low-income taxpayers file their regular tax returns and fill out the six-line Schedule EIC. The program's political popularity seems to come from the fact that, unlike traditional welfare programs, payments go only to those who work. The highest payments go to those with annual earnings at the level of a full-time worker earning the minimum wage.

In 1966, the Office of Economic Opportunity, the federal agency charged with conducting the War on Poverty, proposed a negative income tax (NIT), which would have guaranteed a minimum annual income to everyone. In 1969, President Richard Nixon backed a similar NIT called the Family Assistance Plan, which would have replaced the traditional federal welfare program, Aid to Families with Dependent Children (AFDC). However, this NIT was attacked by liberals as being too stingy and by conservatives as undermining the incentive to work and being overly expensive. Senate Finance Committee Chair Russell Long instead pro-

posed a work bonus plan, designed primarily to have the federal government offset the burden of rising payroll taxes on poor workers. The bill was finally adopted as the EITC in 1975, adding a 10 percent supplement to wages up to \$4,000 for taxpayers with children, with the wage supplement phased out over the \$4,000 to \$8,000 range.

The EITC modestly boosts the labor force participation of single women with children.

This temporary provision of the tax code was made permanent in 1978, but its value to the working poor fell because of the era's high inflation rate. As bipartisan support for the program grew, the Tax Reform Act of 1986 boosted payments back to their initial level in inflation-adjusted terms and indexed the credit so that it would subsequently rise at the inflation rate.

In 1990, EITC payments were boosted for families with more than one child, and in 1993, payments were increased substantially so that full-time work at the minimum wage plus the EITC would push most families' incomes above the official poverty line. In 1994, a

small credit was made available to childless taxpayers for the first time. The number of claimants and amount of inflation-adjusted EITC expenditures (2003 dollars) are shown in the table below.

Year	EITC Expenditures	Number of Claimants
	(billions of \$, 2003)	(millions)
1975	\$ 4.30	6.22
1980	\$ 4.46	6.95
1985	\$ 3.59	7.43
1990	\$10.67	12.54
1995	\$31.50	19.33
1999	\$35.42	19.54
2003	\$37.49	20.81

The second table gives representative EITC benefits for the 2004 tax year for married households (benefits are the same or slightly lower for nonmarried households). The payment to households with no children plateaus at \$390 for those earning between \$5,500 and \$7,000—and falls to zero for those earning \$12,500. The payment for one-child households plateaus at \$2,604 for those earning between \$8,000 and \$15,000—and falls to zero at \$32,000. The payment for households with more than one child plateaus at \$4,300 for those earning between \$11,000 and \$15,000—and falls to zero at \$35,000. The inflation-adjusted amounts given below have held since 1993.

	EITC I	Payment (2004)
Income	No Children	One Child	Two or More
\$ 1,000	\$ 78	\$ 349	\$ 410
\$ 5,000	\$383	\$1,709	\$2,010
\$10,000	\$191	\$2,604	\$4,010
\$15,000	\$ 0	\$2,604	\$4,300
\$20,000	\$ 0	\$1,813	\$3,262
\$25,000	\$ 0	\$1,014	\$2,209
\$30,000	\$ 0	\$ 215	\$1,156

In the range between \$0 and the maximum payment, households with more than one child receive a subsidy equaling an impressive 40 percent of their labor earnings. The subsidy rate is 34 percent for one-child households and 7.65 percent for childless households. Only those with nonlabor income below a certain level (\$2,650 in 2005) are eligible for the EITC. In addition, 14 states (and Washington, D.C.) have smaller-scale EITC programs as part of their state income tax codes.

One notable advantage of the EITC, in comparison to traditional welfare programs, is that it is inexpensive to administer, adding only slightly to the costs of running the Internal Revenue System. However, because there is little investigation of recipients' eligibility, the EITC is open to abuse. A poor household earning little or nothing could inflate its earnings to gain a higher EITC payment or could claim a child who isn't a dependent under the rules of the program.

A study of noncompliance for returns filed in 1995 estimated that overpayments increased total EITC expenditures by 34 percent. Another possibility is the failure of those eligible to file for their payments. A study using 1990 data estimated that only 80 to 86 percent of those eligible received EITC payments. In the program's early years the IRS intervened and awarded payments to filers who appeared to be eligible, but this practice was discontinued in the early 1990s.

In the late 1990s, over 60 percent of EITC payment went to taxpayers with pre-EITC incomes below the official poverty line. Roughly two-thirds of payments went to taxpayers with wages in the bottom quarter of all workers with children. In 1990, 75 percent of recipients worked at least 1,000 hours and 60 percent worked more than 1,500 hours, but some eligible recipients worked only a few hours at relatively high earnings.

Labor economists have found the work incentive of the EITC to be fairly complex. Approximately 77 percent of recipients have earnings that fall in the flat or phase-out range. The EITC payment will reduce their propensity to work somewhat, while it strongly increases the incentive to work for those with lower incomes.

Empirical evidence suggests that the EITC modestly boosts the labor force participation of single women with children (by about 2.8 percentage points), while it simultaneously slightly reduces the labor force participation of married women (by about 1.2 percentage points). In addition, research suggests that the tax credit is associated with a small reduction in hours worked among recipients, but that it boosts aggregate hours slightly because of the small rise in labor force participation. Finally, the EITC also increases the tax code's marriage penalty and it encourages births to a small degree, although there is no direct empirical evidence of whether its fertility incentives have actually influenced behavior.

East Timor

THE ISLANDS THAT MAKE up the Democratic Republic of Timor-Leste, popularly known as East Timor, are located in southeastern Asia at the eastern end of the Indonesian archipelago. East Timor has had a turbulent history, beginning in the early 1500s with battles with the Dutch and ending with hard-won independence from Indonesia in 2002. Estimates of lives lost during the Indonesian conflict vary from 100,000 to 250,000. An additional 300,000 Timorese were forced into exile in West Timor during a scorched-earth campaign. Independence was ultimately achieved with the assistance of a delegation of United Nations peacekeeping forces, which ranged from 5,000 to 8,000 members.

The brutal years of battle virtually destroyed East Timor's infrastructure and left the country with a housing shortage, inadequate water and irrigation systems, and almost no electricity. Schools, hospitals, and businesses were also demolished. With help from the international community, East Timor has rebuilt its infrastructure, and 250,000 exiles have returned. Economic prospects recently brightened with the discovery of offshore oil deposits. East Timor's other natural resources include gold, petroleum, manganese, and marble; but they are largely undeveloped. The country is geographically vulnerable to frequent floods and land-slides and periodic earthquakes, tsunamis, and tropical cyclones.

Because of the massive destruction of property in East Timor, data on social indicators are not always available, and comparisons across time are difficult since the country was only officially recognized in 2002 when it became the first new nation of the 21st century. Available information does show that at \$400, East Timor has the lowest per capita income in the world.

Officials are coping with a poverty rate of 42 percent and an unemployment rate of 50 percent. Estimates of East Timor's population vary from 800,000 to 1,040,880. Life expectancy is 65.9 years, and the median

age is 20.41 years. Some 37.1 percent of the population are under the age of 14, and three percent have reached the age of 65. The Timorese have a 67 percent chance of seeing the age of 40.

While health services have been partially restored, they are sorely inadequate to meet the needs of a population recovering from years of turmoil and conflict. UNICEF, the United Nations' organization for children, estimates that in rural areas, 80 percent of the population lack access to safe water and 90 percent lack access to proper sanitation.

Reports for 2003 indicate that infant mortality in East Timor is high at 87 deaths per 1,000 live births. Mortality for children under the age of 5 is exceptionally high, although the rate dropped from 160 in 1990 to 124 in 2003. The 43 percent prevalence of malnutrition and the 13 percent rate of severe malnutrition among children under 5 play a significant role in the excessive child mortality. Some 47 percent of children suffer from moderate to severe stunting, and 12 percent suffer from moderate to severe wasting. Timorese children are vulnerable to infectious and parasitic diseases, and many have vitamin A and iron deficiencies.

Childhood immunization rates remain low in East Timor because the health system is still recovering and there is a general lack of knowledge about the benefits of immunizations. Rates range from 47 percent against polio to 83 percent against tuberculosis. Only seven percent of Timorese children receive essential oral rehydration therapy when it is needed.

Most schools in East Timor were destroyed by the conflict with Indonesia, and the education system is still in the process of recovering. By 2002 estimates, only 58.6 percent of the population over the age of 15 can read and write. Timorese children are expected to attend school for at least 11 years, but this is not always possible under current circumstances.

Fertility is high among Timorese women. In 2003, total fertility was reported at 7.6 children per woman, and adolescent fertility was recorded at 7.3. Estimates for the period covering 2000 to 2005 suggest that overall fertility has declined to 3.8 children per woman. Only eight percent of Timorese women use contraceptives of any sort. Modeled estimates suggest that maternal mortality is extremely high at 660 deaths per 100,000 live births, although that number has decreased significantly from the 1995 modeled estimate of 850 per 100,000.

Because of malnutrition, many Timorese women suffer from anemia and are subject to hemorrhage during delivery. The number of home deliveries is estimated at over 80 percent. Trained medical staff attend less than one-fourth of all births, and birth attendants are often poorly trained and unable to react properly in emergency situations.

Easter Seals

THE NATIONAL SOCIETY FOR Crippled Children and the International Society for Crippled Children are the precursors to the Easter Seals organization. The impetus behind these was the International Association of Rotary Clubs, later known as Rotary International (RI), a worldwide nonprofit organization of professionals that provides humanitarian services across the globe.

Among its earliest causes, the newly founded RI encouraged local clubs to take on support for the needs of crippled children. Much of the groundwork for this particular crusade can be attributed to the work of Paul Harris, the founder of RI, and especially Ohio Rotarian Edgar Fiske Allen. "Daddy" Allen is considered the founder and visionary of today's Easter Seals organization and is among a handful of Americans honored by the Points of Light Foundation for his outstanding achievements in volunteer work.

In 1907 one of Allen's sons died of injuries sustained by a streetcar accident. Lack of appropriate and immediate medical care for his son eventually led Allen to advocacy for the care of crippled children and culminated in the creation of the Gates Hospital for Crippled Children in 1915 and the Ohio Society for Crippled

Children in 1919. In 1921 the National Society for Crippled Children was formed, and the following year the International Society for Crippled Children was also created. Harris and Allen also coauthored the Crippled Children's Bill of Rights, which was adopted in 1930.

The first American Easter Seals campaign was launched in 1934, and was known as the penny seal. In 1952, the lily was incorporated into its design and became synonymous with the cause of Easter Seals. Easter Seals gained popularity when personalities such as President Dwight Eisenhower and actress Lucille Ball showed their support for the cause. With the growing familiarity of the annual Easter Seals stamp campaign, the National Society for Crippled Children adopted Easter Seals as its organization name in 1967. The Easter Seals lily logo is a registered trademark of the American society.

Today, Easter Seals is a successful nonprofit, nondenominational, community-based grassroots organization that works on a local level for the well-being of physically and mentally disabled children and adults. Easter Seals provides assistance for children as well as adults who are disabled either at birth or as a result of illness, accident, or aging. It also provides support for their families.

Operating in communities in the United States, Puerto Rico, and Canada, Easter Seals provides a wide range of services to the disabled and is considered an expert in disability and special needs. Services include occupational, physical, and speech therapy; job training; transportation; childcare; and adult care. Easter Seals also offers accessible camping and recreational facilities. In the United States, the Easter Seals, Inc., national headquarters is in Chicago and there are more than 550 Easter Seals service sites.

Easter Seals employs professional and managerial staff, and provides specialized training to physicians and other healthcare personnel. The goal of these services is to help the disabled live their lives more independently. In the period 2002–03, Easter Seals provided services to almost 1.335 million children and adults and their families in America.

As a nonprofit organization, Easter Seals is synonymous with responsible spending, with 94 percent of its program dollars spent on client services. Overall public support and revenue for the period 2002–03 was just under \$700 million. In 2004, the sale of Easter Seals in the United States raised approximately \$14 million. Money is also raised through local telethons, walkathons, and other pledge vehicles. Funding is also received from corporations, government, and private

insurers. Included in the Easter Seals services are 100 Easter Seals recreational and residential camps for both children and adults. Every year, each jurisdiction selects at least one Easter Seals ambassador who is involved in awareness- and fundraising. Easter Seals organizations are active in their respective jurisdictions in advocating for the passage of legislation in support of people with disabilities.

Economic Definitions of Poverty

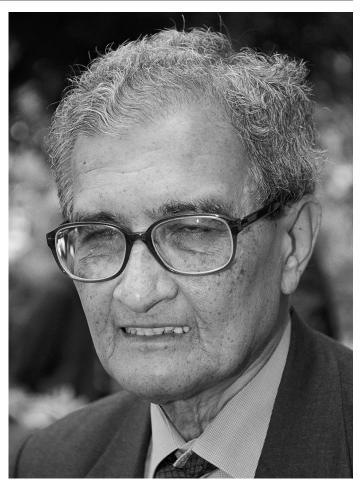

TWO DEFINITIONS OF *poverty* are the most common. The narrow definition focuses on the lack of material goods. The broader definition, on the other hand, incorporates numerous other factors such as living conditions, health, transportation, and community life.

In the current poverty debate, one distinguishes among three poverty concepts: when the available income is too small to physically survive (absolute poverty), when the available income does not suffice in order to lead to life that society considers acceptable (relative poverty), and when available income does not meet the subjective needs of an individual (subjective poverty).

The simplest and most widely used poverty measure in the literature is the headcount ratio, or poverty rate. It measures the percentage of poor in the population. The poverty rate merely divides the population into two groups, the poor and the nonpoor, neglecting how far below a specified poverty line a poor person's resources are. This problem, associated with the poverty line, is overcome with the so-called poverty gap. The poverty gap measures the mean shortfall of the poor's resources from the specified poverty line.

According to A.K. Sen, poverty measures should fulfill three axioms:

1) Focus Axiom. The poverty measure should be independent from the income of the rich.

According to Amartya K. Sen, poverty measures should fulfill three axioms: focus, monotonicity, and transfer.

- 2) Monotonicity Axiom. A reduction in income of a person below the poverty line must increase the poverty measure.
- 3) Transfer Axiom. A pure transformation of income from a person below the poverty line to anyone who is richer must increase the poverty measure.

Based on an axiomatic approach, Sen suggests a very sensible measure of poverty, which takes into account not only the headcount ratio and income ratio but also the income inequality (relative deprivation) among the poor.

Various approaches have been used in the past to construct a monetary poverty line, such that all those with incomes less than that are called poor. One is the calorie expenditure approach popularized by V.M. Dandekar and N. Rath, who use a minimum norm of 2,250 calories per capita per day as a basis of determining the monetary poverty line. According to this approach, one has to first find out the calorie intakes in different per capita expenditure classes, and then the mean of the ex-

penditure class with calorie intake nearest to the norm is taken as the poverty line.

Economic Dependence

DEPENDENCE, IN GENERAL, is defined as being in a state of support and/or subordination to someone or something needed or greatly desired. From the macro perspective, one can speak of one country's dependence on a specific raw material or commodity, such as oil, or more broadly it can refer to economic dependence, as when one country's economy is subordinated to the development of another country's economy.

The anticolonial struggle after the end of World War II was accompanied by the effort to improve the living conditions in the newly liberated colonies and developing countries. The initial measures, such as the assignments of international experts, the expansion of the Western-style education, and the building of infrastructure followed the developmental path of the industrial countries. However, the gap between developing countries and developed economies steadily widened, putting these developmental strategies in question.

In the early days of the Cold War the historical causes and the real nature of *underdevelopment*, a term that became widespread in the literature on economic development, were neglected, and the development paths of particular countries were assessed from the standpoint of the needs of their Western or socialist supporters, and not from the perspective of intrinsic developmental needs of the respective countries. In other words, the economies of developing countries be-

came subordinated to the development of the industrialized countries, that is, they became economically dependent on the developed countries.

There are a great number of explanations for economic dependence and underdevelopment. The best known approaches are combined under the heading "dependencia theories." These theories further develop the concept of imperialism, and assert that the state of economic dependence is directly responsible for the exploitation of developing countries. The theories emphasize that external dependencies are primary causes of internal structural deformations, a process that perpetuates the external dependency.

The external economic dependence is rooted in the political and military colonial domination that destroyed the indigenous lifestyle and culture, while the postcolonial development schemes forced integration into the international division of labor. The forced integration caused deep structural changes in the peripheral societies, and created an economy oriented toward the requirements and demand conditions of the industrial countries. The most propulsive sector of the economy of the developing countries, the export-oriented sector, was heavily sensitive to the economic conditions in the developed economies. Thus, the long-term development goals of the developing countries were ultimately dependent on cyclical movements in economies of the industrial countries.

In addition, the modern sector in developing countries mirrored that of industrialized countries, thus leading to further polarization within society. The economic growth did not lead to the reduction of poverty, but to the widening of the gap between the elite, which accepted the norms and values of the industrialized countries, and marginalized masses. The external dependence reproduced itself within developing countries. The economic sectors that served internal needs became dependent on the modern sector, which, in turn, was subordinated to the economic conditions in the industrialized countries.

Economic dependence, according to dependencia theories, is a direct consequence of capitalism. Dependencia theories, however, do not concentrate on strategies for development beyond the demand for structural changes, independence, and participation. The only way to avoid the vicious circle of underdevelopment and poverty is to embrace self-reliance and embark on a path of internal economic development.

Economic Distance

ECONOMIC DISTANCE HAS two distinct yet interrelated definitions. One is a relative measure of household well-being based on a percentage of median income, or an absolute difference in per capita income between social groups. For example, economic distance can be measured as the percentage of families with household income that is less than 50 percent of median income, or as the ratio of income for higher-income households versus lower-income households.

A more common usage refers to the spatial or social distance to centers of economic activity and power, or as the costs of reaching markets, including the probability of losses in product quality. The concept has two major aspects: spatial and often social distance between sparsely populated rural areas and urban growth centers; and social and to a lesser extent spatial distance between disadvantaged urban communities and areas of economic opportunity in urban areas. Reducing economic distance is often advocated as a way to reduce rural poverty based on the assertion that a lack of market access limits economic growth and opportunity, and hence plays a key role in the creation of poverty pockets (lagging geographic regions with high rates of poverty and social dislocation).

Examples of such regions include the hinterlands in much of Latin America and the Appalachian and Mississippi delta regions in the United States. J. Jalan and M. Ravallion also provide strong evidence for poverty pockets in their examination of household data from four rural Chinese provinces in 1984 through 1990. Their research concludes that holding initial endowments constant, households within relatively wealthy areas were more likely to escape poverty than their counterparts in poorer regions.

Investment in infrastructure, especially roads and telecommunications, is usually seen as a way to reduce economic distance, thereby engendering economic growth and reducing poverty. For example, a recent publication by the World Bank touts development of the transportation systems as the means for generating employment and reducing poverty in the Balkans. However, Jalan and Ravallion point to growth in agriculture and investments in healthcare as key explanations for the effects of economic distance they observed in China rather than the lack of adequate road systems.

More generally, reductions of economic distance can be a two-edged sword by facilitating out-migration and loss of internal markets to outside competitors. In fact, the controversial phenomenon of globalization is the outgrowth of continuing reductions in economic distance between often distant countries. It is conceivable that reductions in economic distance could in some cases create rather than help eliminate poverty pockets, if the fruits of the resulting gains in efficiency from increased trade are not equitably distributed.

T. Conley and G. Topa found a strong pattern of differences in unemployment rates (and by our extension poverty levels) across Chicago, Illinois, neighborhoods based on geographical differences. This result implies that economic distance also matters in urban settings. However, the pattern was explained by racial or ethnic and occupational distance, that is, by social and educational or class differences between neighborhoods. Their work reveals an overlap in the two definitions of economic distance, in that differences in income level or class distinction correlate with differences in physical location. They suggest unobserved differences in human capital and skill sets, informal networks, and discrimination in labor markets as possible explanations. There is further analysis within the context of physical distance in explaining poverty levels and the lack of economic opportunity.

Economic Growth

ECONOMIC GROWTH REFERS to the rate of increase in a state's prosperity over the course of time. It is more commonly used to consider long-term growth. The single percentage annual measure of economic growth has come to be considered perhaps the most important test of national and governmental economic progress and, especially in the developing world, carries with it a measure of prestige. Growth rates in east Asian states in particular have reached levels that are unprecedented, since modern growth is hugely more rapid than it has ever been.

Three aspects of the economy can cause growth: capital accumulation, which includes investment in all factors of production (such as land, people, and machinery); labor market growth; and technological progress. Total factor productivity (TFP) is a combination measure, which summarizes changes in each of these three areas. However, there is considerable and continued controversy concerning exactly what sorts of changes are most effective in promoting overall growth and how they can be managed. The Austrian economist Joseph Schumpeter added to the debate by pointing out the importance of entrepreneurs in stimulating growth.

The economist W.W. Rostow argued that the action of economic growth was to cause societies to move from a traditional stage to a transitional one in which the conditions are secured for the change to a mature society capable of much higher levels of growth. Colin Clark subsequently described this process as moving from agriculture to manufacturing to services. Subsequently, much discussion has centered on the move to a fourth stage, which is that of the information or knowledge economy.

In any case, it is clear that economic growth leads to and is caused by transformation of the existing nature of the economy. Nobel Prize winner Simon Kuznets wrote that six factors characterize growth in modern economies: high rates of growth in population and per capita output, high rates of change of TFP, rapid structural economic transformation, rapid social and ideological transformation, market and resource-seeking activity by developed country firms, and limited spread of growth internationally. The desire for greater equity in global economic development has led many to try to change the last of these factors.

Greater attention to the reasons for economic growth has further stimulated the concept of endogenous growth theory—the idea that economic growth can arise from within a nation and need not be caused solely by inputs from external sources. Causes of growth according to this theory include new and more efficient uses of machinery and technology, greater levels of education and productivity in the local workforce, and government policies.

There are many ideological and political implications to this approach since it contradicts to some extent the structural adjustment approach of the International Monetary Fund, which has paid no heed to local conditions or to the ability of domestic markets to transform them. The examples of South Korea, Taiwan, Singapore, and China, among others, demonstrate the extent to which economic growth can be stimulated through government policies, particularly with respect to encouraging education and discouraging imports.

Economic Growth and Poverty Reduction Strategy

WORLD POVERTY REDUCTION is a central issue in today's growing global economy. However, the best

approach to raising income levels of the poor on a sustainable basis is open to debate. Poverty reduction may come about through income growth, redistribution, or both. Changes in poverty are monitored by examining the relationship between growth in a country's per capita income and how the income share of the bottom 20 percent of the income distribution changes (that is, the Lorenz Curve). Advocates of reducing poverty through economic growth and development argue that economic growth—an increase in an economy's ability to produce goods and services resulting in growth of per capita income and a rise in the standard of living—must play a role in achieving sustained poverty reduction in developing countries.

Research shows that economic growth is associated with reductions in poverty, and most economists believe such growth benefits nearly all citizens of a country, even if not equally. The poverty impact of growth can differ substantially among countries. The extent to which these benefits are realized by various groups is reflected as change (or lack of change) in the distribution of income. If economic growth raises the income of everyone in society in equal proportion, then the distribution of income will not change. An increase in mean income in a society, at an unchanged distribution, must necessarily lead to a reduction in poverty.

For growth to occur without a reduction in poverty, income distribution must become more unequal. Growth in household incomes is essential to poverty reduction. However, if growth is skewed in favor of richer households, economic growth may have little impact on poverty reduction. In fact, much of the controversy in pursuing economic growth approaches to poverty reduction involves the relationship between inequality and growth.

Pursuit of economic growth may lead to increasing inequality in the distribution of income. However, sustained growth, even if associated with increasing inequality, can nevertheless bring about poverty reduction, albeit at a lower rate. For a given rate of economic growth, a neutral distributional or pro-poor pattern is preferable in terms of its impact on poverty.

The growth impact on poverty varies according to several factors. The positive relationship between growth and inequality is most pronounced where development takes place within an urban-based setting, that is industrialization, with little or no emphasis on rural development. In developing countries in which agricultural communities account for the majority of those living in poverty, urban industrial growth generates little employment and thus little income gain among the

poor. The accrued increase in income based on urban economic growth accrues only to a very small number of households. There also appears to be a relationship between a country's initial distribution of income and the rate of poverty reduction for a given rate of growth. With low initial inequality, economic growth translates into greater poverty reduction, and alternatively with greater initial inequality, economic growth translates into lower rates of poverty reduction. Thus, in countries where inequality is initially high, the poor benefit less from growth. Stated simply, income growth among the poorest groups of people is slower in well-endowed economies.

In countries with largely rural economies, substantial portions of the population tend to be poor and rely on agricultural employment or subsistence farming. When such a country grows through agricultural exports, or when manufacturing growth increases the demand for food and materials supplied by the rural sector, benefits accrue to both poor farmers and their poorer laborers.

The poor may benefit even in the presence of adverse changes in income distribution.

Therefore, in many developing countries it is not surprising to find that growth in agriculture has a more substantial impact on poverty than growth in other sectors, because most of the poor live and work in rural agricultural sectors. Since the manufacturing sector is relatively small, in terms of numbers of people employed, its growth is likely to have a much smaller impact on the number of poor people in rural areas, although a small number will migrate.

Several approaches to growth can be pursued through economic policy and investment. Policy promoting a neutral distributional or pro-poor growth strategy is likely to support labor-intensive rather than capital-intensive markets and to place emphasis on raising education and skill levels among the poor. The trade-off in pursuing a more neutral distributional pattern of growth is the possibility of compromising the overall rate of growth. The issue raised by this trade-off is whether or not a more inequitable, though faster, rate of growth may achieve more poverty reduction than a more equitable, but slower, growth pattern.

The poor may benefit from growth even in the presence of adverse changes in income distribution. In most cases, economic growth does promote at least some

poverty reduction. Some would argue that income distribution tends to change slowly and policy that aims at redistributing income at the expense of economic growth may have slower payoffs in terms of poverty reduction. Others would disagree.

While countries vary in poverty outcomes with regard to development strategies, there are several strategies that appear to be promising in reducing poverty among developing countries. Chief among these strategies are social and economic development approaches with an outward-oriented strategy of export-led growth—open economies tend to grow faster than closed economies; agricultural and rural development at an early stage, with encouragement of new technologies; investment in physical infrastructure and human capital; efficient institutions that provide the right set of incentives to farmers and entrepreneurs; improved access to capital through better functioning credit markets, and a more equal distribution of assets; and social policies to promote health, education, and social capital, as well as safety nets to protect the poor.

CYNTHIA K. SANDERS, Ph.D. BOISE STATE UNIVERSITY

Economic Inequality

ECONOMIC INEQUALITY most commonly refers to an analysis of the degree of disparity (inequality) within an economy. This study is accomplished by measuring, for instance, the amount of income, wealth, or expenditure distributed among a chosen population and geographic area. In writings about economic inequality, income is most commonly measured using objective and normative methods. An objective measure of income applies statistical procedures such as the Gini coefficient of the Lorenz Curve. This curve has a "0 to 1" range, indicating the extent of income inequality that can increase or decrease in value. "0" represents a completely equal division of income, and "1" represents a completely unequal division of income. A normative measure pays attention to social issues affecting patterns of income: these might include gender, ethnicity, race, age, rate of infant mortality, social structure, literacy, diversity of employment opportunities, rates of consumption, life expectancy, control over resources, and access to basic needs or social services (education, medical care).

The measurement of economic inequality describes the well-being of a society. For instance, governments might identify financial differences between income groups experiencing wealth and those experiencing poverty. Outcomes might reveal the extent of imbalance over time; show where in the group poverty or wealth is occurring; and help determine descriptions and prescriptions of wealth and poverty in any given social context.

On the global level, economic disparities among nations might be studied to determine national living standards or quality of life. At the local level, investigations of economic inequality aid the assessment of mean incomes, levels of poverty occurrence, and income thresholds of deprivation, which allows policymakers and political theorists to create guidelines for minimum wage laws, taxes, tax breaks, social assistance and benefit programs, financial aid, unemployment insurance, and pension programs.

What critics often find misleading in such calculations, however, is the extent to which they can hide true economic realities, that is, actual consumption patterns, inadequately measured basket-goods, the impact of inflation, real wage values, fluctuating interest rates, and other factors sometimes overlooked or ignored in numbers-based studies.

The knowledge brought forth by studies of economic inequality has created genuine movements appalled by the devastation inequality has had on the universal common good. Patterns exposing declining wages and job security affecting millions of workers hint at the unrelenting local and global problems accompanying the rise of capitalism, the globalization of the economy, and the rise of wealthy multinational megacorporate enterprises, technology, rapid transportation, and mass consumption. Highly accumulated

amounts of income and wealth—among the powerful few who can truly influence economic outcomes—have aggravated and multiplied the poverty of the many, as indicated by recent United Nations Development Report updates. Such patterns have shaped the political sphere of moral debate in the new millennium, raising three important questions: Whose responsibility is it to balance the inequities between rich and poor? What strategies might be used to ensure that equality can be reached without a considerable decrease in income or wealth of those unwilling to forfeit it? Is the current economic system conducive to economic equality?

As the control of resources, income, and wealth by the dominant few has become common to general knowledge, complex ethical discussions contemplate possibilities for economic fairness, human rights, and social justice. Whatever the outcome, the search for transformative solutions—especially where conditions of extreme economic inequality have crippled communities and societies with extreme hunger and thirst, sickness, lack of education, lack of basic needs, and debt—has become a social priority in need of significant progress.

Economic Insecurity

ECONOMIC INSECURITY IS a condition in which an individual's or household's economic well-being and

stability are compromised. Households living in poverty are by definition economically insecure as they struggle on a daily basis to make ends meet and fulfill their basic needs. However, living in poverty is not a prerequisite for experiencing economic insecurity.

Many individuals and households exist on marginal incomes just above the poverty line or rely on unstable sources of income. Many who experience economic insecurity work full-time and do not receive public assistance or income maintenance benefits of any kind. Such households often live in constant awareness that even a slight change in their economic condition could push them into dire economic circumstances in which they are unable to meet basic needs such as food, clothing, shelter, and medical care. These marginal-income groups are often referred to in the United States as the working poor. Although many economically insecure individuals may never slip into short-term poverty, they are not far from its income boundaries.

Economic insecurity is more highly associated with certain individual and household characteristics, including household structure, race, age, gender, and geography. Single-parent households, especially female-headed households, nonwhites, children, the elderly, women, and those living in central cities or rural areas are at a higher risk of living in a state of economic insecurity. Additionally, those employed in the secondary labor market, transitional jobs, or seasonal work are more likely to be economically insecure.

Economic insecurity is not reserved for only boor or marginal-income households.

National economic trends and events also play a role in the economic security of individuals and households. These include economic downturns, higher unemployment rates, recessions, business closures, and an overall lack of economic growth or decreases in per capita income. Adverse life events, such as the loss of a spouse, changes in family composition, involuntary job loss, illness, disability, and involuntary residential moves such as eviction or home foreclosure, all impact economic security negatively.

Economic insecurity is not reserved for only poor or marginal-income households. Many Western economies have seen rising levels of economic insecurity among upper-income working people. Corporate downsizing, job outsourcing, and growing globalization of the economy have wiped away a sense of career-long employment confidence for many. Policies aimed at globalizing production and distribution, and structural adjustment policies, while increasing labor market flexibility, have often resulted in an increased probability of losing one's job.

Economic insecurity resulting from the loss of a job may also result in other adverse outcomes, including threats to retirement benefits and lack of healthcare coverage. Additionally, job changes compromise one's ability to build social capital through the establishment of relationships with coworkers or neighbors in the event of disruption of residential stability. Economic insecurity may also result in individual behavior changes.

Threats of unemployment may convince workers to change jobs, which may result in a loss of seniority protection a current job may provide and future loss in upward job mobility. Individual actions and safeguards to reduce the risk of economic insecurity include such things as increased savings and asset development, decreased consumption, and development of human capital and a comparative advantage in the labor market.

Governments have spent substantial resources in attempts to reduce economic insecurity in society. Safeguards against economic misfortune and creation of national systems of social insurance, such as the United States Social Security Act of 1935, partially insulate the population, in this case the elderly, from the risk of economic hardship. Restorative, preventive, and social maintenance services all help to prevent economic insecurity or restore security.

Public health insurance and cash transfer programs, including old-age pension programs, workers' compensation, and unemployment insurance. all pay benefits to help insure against economic insecurity in the event of becoming aged, unemployed, disabled, or sick. Public benefits ease the gap through food supplement, shelter, and childcare subsidies. Cuts in government spending for programs that provide economic stability month to month quickly result in adverse economic outcomes.

There has been an international trend to reduce social protections of the welfare state. Development of the welfare state was largely motivated by a desire to decrease economic insecurity. The combination of an increased rate of labor market change and decreased protections from the adverse consequences of change through social welfare programs has inevitably produced greater economic insecurity.

CYNTHIA K. SANDERS, Ph.D. BOISE STATE UNIVERSITY

Economic Insufficiency

FOR AN INDIVIDUAL or a household, economic sufficiency means maintaining a decent standard of living and not having to choose between basic necessities such as medical care and food. An economically self-sufficient household is able to meet basic needs without relying on the help of government transfers or private assistance.

Economic insufficiency implies just the opposite. Many struggle with economic insufficiency largely because of inadequate incomes. Working full-time all year does not necessarily translate into economic sufficiency. Those who live in a state of economic insufficiency typically also live in a state of material deprivation with inadequate consumption of particular goods and services such as food, clothing, housing, medical care, and childcare. Absolute-income measures of poverty do not identify many who experience economic insufficiency.

Indicators of annual income may misrepresent actual household economic and material resources. Additionally, households face different demands on their economic resources. For example, the need for out-of-pocket healthcare and childcare expenditures varies across households. Some might suggest that a state of economic insufficiency is caused by preferences in spending and/or financial management. However, research shows that generally households that lack non-necessities generally lack necessities as well.

One alternative measure in the United States that seeks to capture a household's level of economic self-sufficiency is the Standard for Self-Sufficiency (SSS). The standard takes into account differing costs associated with family size and regional variations in standard-of-living costs. The SSS takes into account actual housing costs in the area, food, estimated care costs, transportation, childcare, and miscellaneous essential

items. The result is an income figure that exceeds absolute-income measures of poverty and an income figure adequate to meet basic needs without relying on public or private assistance.

Economic insufficiency is not just a matter of meeting basic needs. It also impacts longer-term economic sufficiency by interfering with an individual's potential social and economic development. Being well nourished, adequately sheltered, and in good health enables an individual to be productive in the broader sense. For example, well-nourished, healthy, and adequately sheltered adults are likely to have more regular employment, to be more effective parents, and to participate more actively in their communities.

Central to building economic sufficiency are access to education and training and access to jobs that provide real potential for skill development and career advancement over the long term. Although training and education do not have the same urgency as basic needs, true long-term economic sufficiency increasingly necessitates investments that enhance job skills and adaptability.

Economic insufficiency is also a community-level issue. Within a community, economic self-sufficiency is a level of social and economic development in which that community can control and internally generate resources to provide for the needs of its members and meet its own economic and social goals. Community and institutional supports enable the availability of affordable housing, public transportation, neighborhood safety, and accessible jobs. Social and economic underdevelopment is the paramount obstacle to economic sufficiency.

While provision of government services helps to reduce economic insufficiency, a more sustainable focus involves increasing community and individual productivity through community development within low-income and poor communities that lack the infrastructure and jobs needed to support movement from economic insufficiency to economic sufficiency.

Promoting economic sufficiency within any given community might include promoting local leadership to exercise control and decision-making over local resources and fostering the development of stable, diversified local economies and economic activities that will provide jobs, promote economic well-being, and reduce dependency on public funds and social services.

Economic Liberalization

ECONOMIC LIBERALIZATION refers to the removal of both price and nonprice barriers to the functioning of markets in the economy. In a liberalized economy, decisions are made in and by the markets, as dictated by free market forces, that is, supply and demand conditions. The idea behind support of economic liberalization is that in an economy where all the markets (output, input, financial, and external) are liberalized, prices set by supply and demand reflect the true resource and opportunity costs of factors of production and allocate resources in the most efficient way, providing the most effective and efficient solution to the problem of scarcity.

The emphasis on free-market reforms in industrial and developing countries over the last few decades is a response to the protected and regulated markets of the 1960s and 1970s that resulted from Keynesian macroeconomic policies in industrial and import-substitution-industrialization (ISI) policies in some developing countries. The two oil shocks in the 1970s and the world debt crisis in the mid-1980s aggravated the ills of the world economy, raising questions about the wisdom of regulation and protection. Economic liberalization and deregulation, it was argued, would reallocate resources more efficiently, contributing to increases in competition, productivity, and growth.

Economic liberalization became part of the official development strategy of international economic organizations: the International Monetary Fund (IMF), World Bank (WB), World Trade Organization (WTO), and Organization of Economic Cooperation and Development (OECD). Especially in developing countries—plagued with market rigidities and financial bottlenecks in markets—economic liberalization, coupled with the appropriate macroeconomic stabilization policies, is

typically seen as the only way to access the world financial markets and secure development loans. Economic liberalization, it is argued, reduces overall market risk and uncertainty by allowing market forces to interact freely, and secures allocative efficiency.

Distributive issues, that is, which groups benefit from the process of resource reallocation and growth, are not a concern since in theory everybody becomes better off in the long run. The IMF has an extensive list of documents supporting economic liberalization. In the short run, however, the economy goes through an adjustment period. Within this period, some industries shrink, some expand. The shrinking industries lay off labor and the expanding industries hire new labor. If the expanding industries fail to absorb the unemployed labor, overall unemployment rises.

The overall effects of economic liberalization on poverty are ambiguous.

In developing countries, the lack of social safety nets and economic institutions that would otherwise support the unemployed deepens poverty. In addition, economic liberalization has historically targeted labor market institutions and dismantled them (as reflected by the all-time-low unionization rates), weakened job safety, and reduced wages and benefits as increased global competition threatened corporate profitability. The advocates of economic liberalization, however, see these adverse developments as temporary phenomena and refer to them as short-run adjustment costs. Once the adjustment to free markets is completed, the argument is that the rising economic tide will lift all boats and eventually eradicate unemployment and poverty.

Trade and capital-market liberalization have been the two most controversial aspects of overall economic liberalization in terms of their effects on poverty. Trade liberalization is assumed to reallocate resources into areas where the economy has a comparative advantage, and therefore to stimulate specialization in the production of exportable goods and services.

Assuming a foreign-exchange system that is supportive of the free-trade regime, all trading partners benefit from trade, enjoying higher real incomes and growth. Adjustment costs still exist, but the overall net long-run effect of free trade is that everyone wins, both rich and poor. International economic organizations, especially the World Bank and the IMF, have been relentlessly pushing for trade liberalization in developing

countries, thereby opening up new markets. Ironically, industrial countries have been lagging behind in liberalizing their agricultural sectors, instead subsidizing and protecting them.

As a result, developing countries with a comparative advantage in agricultural exports (especially Africa) fail to export their goods to rich industrial countries, and cannot enjoy the potential benefits of free trade. It is therefore not very surprising that proponents of free trade have been arguing recently for industrial countries to liberalize their agricultural sector.

Even though agricultural protection in industrial countries has resulted in deepening poverty in Africa, economic liberalization has helped reduce poverty in Asia. As a result of the global shift in industrial production to Asian countries, real incomes in Asia have increased. Even so, there are some who argue that Asian economic gains were matched by the deteriorating economic status of unskilled labor in industrial countries. A vocal proponent of this view in the United States is P. Buchanan.

Less research has been done on the interrelationship between financial liberalization and poverty. Mainstream economic theory argues that financial liberalization stimulates savings and investment, both domestic and foreign, and hence contributes to economic growth. Again the rising economic tide lifts all boats, reducing poverty. In practice, financial liberalization has had mixed results. P. Arestis and A. Caner argue that financial crises resulting from speculative capital flows raise macroeconomic volatility and worsen the economic status of the poor by lowering their incomes and changing the distribution of income against the poor. Furthermore, as incomes drop, so do tax revenues, restricting the financing of antipoverty programs. A. Charlton and J. Stiglitz add to this list the fact that financial integration lowered the bargaining power of low-wage workers and lowered the credit availability to the poor, aggravating their economic problems.

The overall effects of economic liberalization on poverty are ambiguous. The rising tide has not lifted all boats equally. Capital owners, especially financial capital owners, seem to have benefited disproportionately more relative to low-wage unskilled labor.

Ecuador

THE REPUBLIC OF ECUADOR traces its roots to the Kingdom of Quito formed by natives on the northern highlands in western South America. Later, Ecuador became part of the Inca tribe through conquest and marriage. In 1532, Francisco Pizarro claimed the land for Spain, and two centuries of exploitation of the land and the people followed. After revolting against Spain in 1819, Ecuador, Venezuela, Colombia, and Panama formed the Gran Colombia. When the confederation collapsed in 1830, Ecuador, Colombia, and Venezuela emerged as independent nations. Since the late 1970s, Ecuador has been under civilian rule, characterized by political instability and a rapid succession of presidents.

Petroleum is Ecuador's most valuable resource, generating 40 percent of export earnings and one-fourth of budget revenues. However, the market is dependent on global petroleum prices and on international events. Other Ecuadorian resources include fish, timber, and hydropower. Services dominate the economy, employing 68 percent of the labor force. Almost a fourth of the workforce is engaged in industry, and 10 percent are involved in agriculture. Unemployment stands at 11.1 percent, and 47 percent of the labor force are underemployed. Because of this, around eight percent of the population have migrated, mostly to Spain, Italy, and the United States.

Ecuador is subject to frequent earthquakes, landslides, volcanic activity, floods, and periodic droughts. In 1998 in the aftermath of El Niño, which caused \$3 billion in damage, Ecuador suffered an economic collapse that resulted in bank failures, an inflation rate of 43 percent, and loan defaults on external debt. The poverty rate soared to 70 percent. After a coup in 2000, the vice president assumed power and began working with the Ecuadorian Congress to implement structural reforms designed to stabilize the economy. He was subsequently replaced.

Despite some growth, the economy has not completely recovered, in large part because chronic corruption serves as an obstacle to true progress and stymies efforts to improve the quality of life in Ecuador. Vast inequalities also negatively affect the standard of living. The richest 20 percent of the population claim 58 percent of the nation's wealth while the poorest 20 percent survive on only 3.3 percent. Ecuador is ranked 43.7 percent on the Gini Index of Human Inequality.

Ecuador is a lower-middle-income country with a per capita income of \$3,700. While the poverty rate has declined from the 70 percent of the late 1980s, 45 percent of Ecuadorians currently live below the poverty line. Some 40.8 percent live on less than two dollars a day, and 17.7 percent live on less than one dollar a day. Over half of the Ecuadorian population is unable to meet basic needs, and 57.8 percent of this group live in rural areas.

Women and children are more susceptible to poverty than other groups, and poverty is worst in rural areas. The United Nations has estimated that 70 percent of children in Ecuador are poor. That number rises to 90 percent among the indigenous and Afro-Ecuadorian population. Cultural barriers continue to prevent efforts to end gender discrimination in Ecuador. As a result, women are more likely to be unemployed, and those who do work earn lower salaries.

Housing conditions are poor. Some 15 percent of Ecuadorians lack access to safe drinking water, and 14 percent lack access to basic sanitation. As a result, diseases such as river blindness spread, affecting more than 20,000 Ecuadorians in 119 communities. The Ecuadorian government recently pledged to halve the extreme poverty rate of 26 percent recorded in 1990 to 13 percent by 2015.

Government data recently revealed that 76.2 percent of women and 69 percent of all employed Ecuadorians have no kind of health insurance. Access to affordable healthcare is not always available as a result. There are 145 physicians for every 100,000 residents in Ecuador, and over half of the population is unable to afford essential drugs. Life expectancy in Ecuador is 76.21 years. On the average, females (79.22 years) outlive males (73.85) by five years. Among the population of 13,363,593, the median age is 23.27 years. Over a

After the effects of massive storms from El Niño in 1998 in Ecuador, the poverty rate soared to 70 percent.

third of the population is under the age of 14, and almost five percent have reached the age of 65. HIV/AIDS is becoming a serious threat in Ecuador, with a prevalence rate of 0.3 percent. In 2003, 21,000 Ecuadorians were living with this disease, and another 1,700 had died.

Children have access to free healthcare through the Maternity and Child Care Act, but minority children may not receive the proper care. Consequently, Ecuadorian infant mortality rates are highest among minority children. Officials believe that half of all infant deaths are preventable. Mortality rates have declined significantly over the past decades. From 1970 to 2003, infant mortality fell from 87 to 24 deaths per 1,000 live births. During that same period, the mortality rate of children under the age of 5 was slashed from 140 to 27 deaths per 1,000.

Approximately 14 percent of all children under 5 are malnourished, and 16 percent of infants are underweight at birth. Six out of 10 children under 1 year of age are anemic. Some 26 percent of under-5s suffer from moderate to severe stunting. Childhood immunizations have increased in recent years for children from birth to 23 months, ranging from 80 to 99 percent.

Between 1970 and 2005, the Ecuadorian fertility rate dropped from 6.0 children to 2.72 children per woman. Among adolescent mothers, the birthrate is 62 per 1,000. Teenage pregnancy continues to rise in Ecuador, particularly in rural areas. Studies show that 92.6 percent of women of childbearing age understand the concept of birth control, but only 35.3 percent of all women use contraception on a regular basis. Among

married women, 56 percent practice some method of birth control. Trained medical staff attends 91.3 percent of all births in Ecuador, but only 20 percent actually occur in hospitals or clinics.

Healthcare is provided for women and children through the Maternity and Child Care Act. For women this means that they have access to sexual and reproductive healthcare throughout their lives. Nevertheless, maternal mortality continues to be high, and rates are highest among rural and minority women. According to modeled estimates for 2000, 130 maternal deaths occur out of 100,000 live births. Many of these deaths occur because 60 percent of pregnant women in Ecuador are anemic, making them more susceptible to excessive bleeding during delivery.

Literacy rates are high, and 92.5 percent of the Ecuadorian population over the age of 15 can read and write. Officially, 100 percent of Ecuadorian children now complete primary school, and more than half are enrolled in secondary school. In reality, only 39 percent of indigenous and Afro-Ecuadorian children attend primary school. One reason for this rate of attendance is that around 430,000 children between the ages of 5 and 17 are working.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Education

GLOBAL LEVELS OF educational attainment vary greatly. Adult illiteracy rates in the developed countries

hover near or precisely at zero percent. This figure is a direct reflection not only of the success of the educational systems in these countries but also of the high status held in the society for education. In these countries it is a given that education is a privilege and something that is highly prized. It is true as well that highly developed countries have the economic means to ensure that all children have the opportunity to achieve their potential within a quality education system. In most developed countries, attendance in school is mandatory through at least the mid-teen years. The compelling desire is that all young people will complete high school and that many will continue their studies in either an institution of higher learning or a quality vocational field.

NO CHILD LEFT BEHIND

Public education in the United States is not without its problems. Since the abolishment in the 1950s of the "separate but equal" concept of schooling, attempts have been made to provide adequate instruction to all students regardless of socioeconomic status or geographical location.

However, recent evidence from national testing clearly indicates that all groups do not score equally. White students and Asian Americans invariably score higher than African Americans, Hispanics, and Native Americans at all grade levels and in all subjects. Students from families in a low-income or poverty situation also score lower than the leaders. The current effort in American education is directed at closing the achievement gaps that separate these groups.

The federally mandated No Child Left Behind Act of 2001 (NCLB), demands that all students in all grades and in all subjects be proficient by the close of school year 2013–14. This is a tall order, and many groups in the United States are voicing objections not only to the seemingly impossible goals set in this legislation but to other aspects of the legislation.

Regardless of the shortcomings of NCLB, whether real or imagined, the education system in the United States needs attention. One example will make this clear: since 1990 the percentage of students graduating from high school has actually dropped. After climbing steadily in previous decades to a high near 90 percent, there has been a slow but steady decline of a few percent each year since 1990. Couple this outcome with a general slippage in the rank of schools in the United States in international comparisons and the task set out for the educational community is well understood.

DEVELOPING WORLD

The education picture in countries of the developing world is radically different. Considering literacy rates again, there are a number of countries in sub-Saharan Africa where over half of the adult population is illiterate. The worst-case situation is Niger, a poor country in west Africa, where the illiteracy rate in 2001 was estimated to be 83.5 percent. The United Nations Human Development Report for 2003 also indicates that the probability at birth of not surviving to age 40 in Niger is 38.7 percent. This says that on average nearly four of every 10 newborns will not live to their 40th year. Several other African countries have even higher percentages in this category.

A large percentage of children in Niger are also underweight for their age. Of those under 5 years of age, 40 percent are underweight due to malnutrition and the ravages of poverty. Further, 85.3 percent of the population of Niger live on an income below \$2 per day; and 1.4 percent live on less than \$1 per day. It should come as no surprise to learn that educational levels in Niger and dozens of other poor countries are miserably low. There may be the desire to learn but the economic system and, in many cases, the cultural attitudes within the country argue against emphasizing education. This is especially true for young girls in the developing countries. Their school attainment is generally far below that of the boys.

What is so astounding about these goals is that they are giant leaps.

The United Nations created a set of goals for the eradication of poverty and hunger and the improvement of education in the developing world. The organization's Millennium Development Goals (MDG) program set out targets of attainment to be reached by 2015. The three major goals were to 1) cut in half between 1990 and 2015 the proportion of people whose income is below \$1 per day, 2) cut in half between 1990 and 2015 the proportion of people who suffer from hunger, and 3) ensure that by 2015 children everywhere, both boys and girls, will be able to complete a full course of primary schooling.

What is so astounding about these goals is that, from the perspective of the developing world, these are giant leaps. But from the perspective of virtually anyone in the developed world it is essentially unthinkable that

such conditions exist in the first place and that it should take 25 years to attain the stated goals.

The MDG directed at relieving hunger does not seem to be making a great deal of headway in sub-Saharan Africa. By the year 2000 many of these countries had between 25 and 55 percent of their people categorized as undernourished. In addition, the MDG goal of improving access to primary education will be missed and it is estimated that nearly 50 million children in the developing world will still be out of school in 2015. Despite the lack of hoped-for progress in attaining the MDG many experts still believe that with the concerted efforts of governments worldwide and the commitment of the necessary resources and technological help to the poor countries, the goals can be reached. To not do so means the inevitable and certain loss of millions of lives unnecessarily, and most of the lives lost will be those of young children.

The United Nations Educational, Scientific and Cultural Organization (UNESCO) has launched a number of initiatives to combat the insidious combination of poverty, hunger, and illiteracy. Roundtable sessions have been held by UNESCO with other world organizations to discuss the role of education in poverty. A United Nations publication, Education and Poverty Eradication: Organization for Action, was printed and widely disseminated in 2001. A framework for action was prepared in cooperation with the Comparative Research Program on Poverty (CROP), a Norwegian nongovernmental organization.

In addition, UNESCO undertook a five-country study on education and poverty alleviation. There is a clear understanding that little can be done to alleviate poverty or to reduce hunger without enhancing education. With the onset of increased acts of terrorism globally, researchers have conjectured on the possibility of a link among poverty, levels of education, and terrorism. Studies on this subject seem to indicate that a clear connection with terrorism cannot be unequivocally made. Researchers have concluded that there is little basis to believe that lowering poverty or enhancing education would necessarily help to lower the incidence of terrorism.

The link between poverty and education is abundantly clear in the United States as well. Although the United States is a leader in the developed world and has accumulated extraordinary wealth, there are still many people in the country living below the poverty line. Children in low-income families and those living below the poverty line perennially score lower on both federal and state standardized tests than do other children.

For these reasons, educators are now addressing the notion of the "whole child," a posture that considers not only educational attainment but the physical and mental health of the child. The concept of the whole child is one of a number of more holistic approaches to education under development in the United States and other First World countries. Articles and books are beginning to appear that stress the importance of schools connecting more closely to the communities in which they are found. In like manner, all sectors of the community are being approached to include the schools in a more intimate manner.

The notion of holistic community revitalization, with the schools in the community playing a key role, is an approach that has been developed and in place for years in Australia and New Zealand. The approach appears to have great merit especially in smaller communities in rural areas, where for years the school has been the center of activities. The idea is now being suggested for urban centers as well. One of the approaches for community revitalization within the urban area is called school-community organizing. Success in this endeavor could see a return to viable and closely knit neighborhoods, an attribute of American towns and cities before the era of suburbanization and the busing of students away from their home turf.

There may be a great deal of merit in these suggestions for improving education.

Some writers are taking the community-school concept even further. There is the belief among some researchers that the American school has reached its maximum level of efficiency and capability for educating students in its present configuration. If this is true, the argument continues, it is time to direct resources away from the schools and into the communities. In short, solve the problems of the communities (population decline, shortage of employment opportunities, and poverty). If this can be accomplished, the schools within those communities will improve as well. There may be a great deal of merit to these suggestions.

For years it has been clear that the Department of Defense (DOD) schools in the United States and those serving families in overseas locations have operated in the tight community-school manner. These schools have achieved the highest scores on federal tests and they exhibit the strong association with community identified by these researchers. Generally, the DOD

schools have much higher parental involvement, a more enthusiastic and goal-oriented student body, and the full support of the community, which in this context is the military base.

Schools in small communities are doubly challenged. It is difficult to attract good teachers to these small places, and students by and large indicate early in their education career that they will leave the community as soon as they graduate. If the community revitalization approach is to have any success at all, ways must be found to keep students in those places following graduation. This, of course, argues for directing more resources into the communities.

Along with community development, some educators are stressing the need for more "place-based" education in the schools. The place-based approach directs students to conduct research projects within their home community, seek out longtime residents of the place and learn about the place from them, and write reports about their community. By engaging in these activities the hope is that students will generate a greater appreciation for the place and consider staying there instead of heading for the nearest big city. This approach has worked well in Australia and New Zealand and could work just as effectively in the United States.

Another movement within education is changing the emphasis in schools from a teacher-centered focus to one that emphasizes learning. It has long been known that overuse of the disseminating method of teaching and emphasis on lecture does not enhance learning. Nor do these delivery methods enable the student to learn how to learn, an outcome that educators insist is essential. Nor do they develop in students the belief that they are responsible for their own learning, an outcome that ideally should happen early in the student's education career. Changes such as these in the realm of education will not come easily. Most teachers in the schools learned their craft primarily through lecture classes in colleges of education.

It is a truism that teachers will teach as they were taught. In that sense, it is estimated that over 90 percent of the delivery approaches in higher education are through simple dissemination of information or lecture, neither of which can enhance high-order thinking skills so necessary in our complex world.

GERALD R. PITZL NEW MEXICO PUBLIC EDUCATION DEPARTMENT

Educational Vouchers

THE CRITICAL IMPORTANCE of education in the life of an individual, family, and nation is widely understood. Education, at least school education, is commonly considered the basic social infrastructure. In order to guarantee education to all, governments around the world run or finance schools. However, the quality of government education in poor communities and nations is generally found to be low. This means that the poor who cannot afford private schools and can only attend government schools get a lower-quality education, which limits their chances of having a better future. How do we then assure better quality education to the poor?

The idea of education vouchers is conceived as a means to empower poor students so that they can attend a school of their choice. The poor would have the same choice as the rich and schools would compete for all students. The same student who goes to a government school today can take the voucher from the government and go to any school of his or her choice. That choice in turn creates competition among schools to attract and retain students. Choice and competition work together to provide universal access to and higher quality of education to all.

Basically the idea behind education vouchers is that the money that governments spend on government schools is converted into education vouchers and given directly to poor students. Instead of funding schools, governments fund students. The education voucher is a coupon offered by the government that covers the full or partial cost of education at the school of the student's choice. The schools collect vouchers from students and present them to government for the amount of money specified on the voucher. The education voucher combines core competencies of the private and public sectors: efficiency and accountability of the private sector and equity and independent supervision of the public sector.

In the present system in the United States, the schools are accountable to the state governments and communities. The voucher system makes schools accountable directly to students since they pay for the education through vouchers. If the student does not like the school, he or she can take the voucher to another school. Under the voucher system, money follows the student rather than the school, as in the present system.

BENEFITS OF EDUCATIONAL VOUCHERS

Today a poor student may not be able to obtain a good education because he or she cannot afford to go to school at all or may be stuck in a poor-performing school. The voucher gives the student the money, and thereby the mobility to go to any school that he or she feels would provide a good education. This scheme satisfies the basic human right that all children be treated equally and equal educational opportunity be provided to all, irrespective of cash, class, or creed.

The revenue of a school would depend on the number of students it has—both those who pay directly and those who pay through vouchers. Each school would actively solicit students, including the poor (voucher) students. The resultant competition among schools would improve the quality of learning, of infrastructure, and of extracurricular activities.

To attract and retain students, schools would offer a variety of services that students and parents value—meals, transportation, supplementary tutorials, afterschool care. The schools would provide these extra services not because they are mandated but because that is the way to keep their students (customers). More importantly each school would have the incentive to figure out the service that is most valuable to its students.

Concerns about corruption and leakage in any public system are warranted. However, a well-designed voucher system would have less leakage than the present system as it puts the money directly in the hands of those who will pay and benefit from it.

Voucher programs have been implemented in different forms in countries as diverse as Sweden, Chile, Columbia, the Netherlands, some areas of the United States, the United Kingdom, New Zealand, Bangladesh, the Czech Republic, and Côte d'Ivoire.

RISKS OF EDUCATIONAL VOUCHERS

According to Independent School Management's Ideas and Perspective magazine, there are also risks associated with educational vouchers, at least for the U.S. public. Some of these risks include "Vouchers will come with strings attached: government intervention and controls are sure to follow. Legislators must establish accountability for the expenditure of public funds. Any private schools receiving vouchers could be subject to licensing, increased certification, and new accreditation standards; vouchers could further weaken the public school system by siphoning off revenues and skimming off the most motivated students and parents; a two-tiered educational caste system, consisting of premier and pauper schools, could result; private schools could be placed in adversarial relationships with public schools, lobbying for larger portions of the voucher pie; vouchers could encourage private schools to raise tuitions by the amount of the credit available. Impoverished students would be trapped once again in poor public school systems, while wealthy parents receive subsidies to send their children to elite schools."

Vouchers can be tailored to suit specific needs of a country or locality.

Vouchers work very well when the following conditions are fulfilled: there is a well-targeted population, including a clear identification of voucher beneficiaries; schools have the autonomy to respond to student demands, that is, schools should have the necessary regulatory freedom in terms of admitting students, expanding classes, or recruiting teachers; choice of schools in the neighborhood, for example, the field area should have an adequate number of schools so that students have a variety of options; and there are informed choices by parents, that is, there should be multiple sources of information like media reports of schools, performance reports by a director of education, and word-of-mouth sharing of information to enable an informed school choice.

Vouchers can be tailored to suit specific needs of a country or locality. Vouchers could be allowed to be used only across public schools, or public and private schools. They could be universal (given to all students of school age, as in Chile) or given to some on the basis of family income, minority status, or gender of the student. The voucher would cover only the direct educa-

tion cost (tuition fees) or also could provide extra money for the indirect opportunity cost of education (uniforms, textbooks, travel).

PARTH J. SHAH
CENTRE FOR CIVIL SOCIETY

Egypt

SINCE ITS INDEPENDENCE in 1952, several presidents have ruled Egypt. Each of them had his vision of national development and thus different perspectives of solving economic problems, especially poverty. During Gamal Abdel Nasser's era (1953–70), a policy of nationalization was implemented. This was based on redistributing wealth in Egypt to emphasize a balance between the rich and poor people. The policy helped in poverty eradication in parallel with the industrialization plan that was set in motion early in the 1960s.

During the era of Anwar Sadat, the third Egyptian president (1970–81), Egypt began to liberalize its trade policies in 1975 and witnessed a growth spurt of 7.1 percent per year for the following 10 years. Capitalist restructuring and attendant poverty did not originate in the 1990s; nascent forms of capitalist restructuring were started in the mid-1970s with the proclamation of an "open-door" policy.

An incessant growth of poverty can be documented over the last 20 years. But the root causes of the growth of poverty should perhaps be dated earlier. During Hosni Mubarak's rule (1981 to present), the Egyptian government continued development plans, but with a drop in Gross National Product of 1.4 percent in 1992, the government responded with a significant economic reform package. It tightened fiscal policy, decreased social subsidies, decontrolled interest rates, liberalized capital, and undertook reforms to enable privatization of the Egyptian economy.

Although poverty is always one of the main items of any development plan in Egypt, either short- or long-term, one of the aspects of enduring poverty is that percentages of poor women are slightly higher than those of males. Poverty rates include 21.85 percent of the population for females, compared to 20.98 percent for males, in rural areas. The corresponding figures in urban areas are 18.7 percent and 18.2 percent, respectively. Simulation analysis showed that being a female increases the probability of being poor by 2.3 percentage points in urban areas and by 4.79 percentage points in rural areas. About 36 percent of both men and women in northern urban areas in Egypt are poor and 67 percent are moderately poor.

The key elements of attacking poverty in Egypt are through building and enhancing all types of assets. Promoting economic assets, especially labor, credit, and land, and access to health and education services are only some parts of the multidimensional strategy to diminish poverty. Increasing social and political assets of the poor, through solidarity and groups of actions, are also important to help the poor fight poverty themselves.

Egypt is undergoing a structural adjustment process guided by the international financial institutions, including the World Bank and the International Monetary Fund. The Egyptian economy is widely acclaimed to have successfully completed the prescribed stabilization phase and is, by some accounts, poised to embark on a fast-growth trajectory. However, this transformation has resulted in a changing economic structure, with far-reaching implications for poverty in the country. Poverty has been on the rise in the midst of affluence for a few.

NILLY KAMAL EL-AMIR
CAIRO UNIVERSITY

Eisenhower, Dwight (Administration)

DWIGHT DAVID EISENHOWER (1890-1969) was the first Republican to win the presidency since Herbert Hoover's election in 1928. Because of Eisenhower's enormous popularity, resulting from his successful leadership in World War II as supreme allied commander in Europe and an engaging personality, most were convinced that "Ike," as he was affectionately called, could have secured the Republican or Democratic presidential nominations in 1952. Yet, despite President Harry Truman's efforts to convince him to run as a Democrat, Eisenhower ran as a Republican because his views were more in keeping with those of the Republican Party, and he felt that running as a Republican would reinvigorate the two-party system, which it did. In the 1952 election, he easily defeated Democrat Adlai Stevenson, as he would a second time in 1956.

When Eisenhower entered the White House in 1953, many Democrats were concerned that he would attempt to dismantle the New Deal and its antipoverty programs. He was truly conservative and fearful of a runaway welfare state. Accordingly, he called for a reduction in the federal bureaucracy, spending cuts, and returning power to states and local governments, and warned of "creeping socialism."

Nevertheless, he generally accepted the New Deal apparatus, especially Social Security; did not move to roll back economic regulation and social programs; and mainly sought to instill businesslike management and efficiencies into existing programs. His moderate stance on domestic policies was called Modern Republicanism, Dynamic Conservatism, and eventually Progressive Moderation.

Eisenhower did not simply accommodate the expanded role of the federal government. He established the Department of Health, Education, and Welfare in 1953 and in 1954 approved of the expansion of Social Security to cover an additional 10 million Americans,

Dwight Eisenhower mainly sought to instill businesslike management and efficiencies into existing social programs.

including farmers and professionals. Also during the Eisenhower administration, unemployment insurance was expanded, a higher minimum wage was enacted, and funding was increased for public housing for the poor, but the president's devotion to balanced budgets led him to veto two public housing bills.

Eisenhower proposed a limited public-health insurance program designed to help the half of all Americans, mostly the poor and elderly, who did not have insurance. His plan would have sought to encourage private and nonprofit health insurance companies to provide broader insurance protection to more families by creating a federal reinsurance service. Under his proposal, the federal government would have reinsured the special or substandard additional risk incurred from broadening coverage. The program required a startup appropriation of \$25 million to be recouped by reinsurance fees. The measure also would have increased funding for vocational rehabilitation services and hospital construction.

Like Franklin Roosevelt, Eisenhower believed in stimulating the economy during cyclical downturns. Yet he generally professed opposition to using government programs as a stimulus, for he saw such endeavors as inevitably increasing the federal bureaucracy and government involvement, which he disliked. Therefore, he vetoed two public works projects designed to fight recession. During the recession of 1958, however, he ordered his postmaster general to ask Congress for \$2 billion for modernization of postal buildings and equipment, believing that the program would swiftly put many of the jobless to work in the cities where unemployment was concentrated.

Despite the mild recessions of 1954 and 1958, Eisenhower's eight years in the White House were a time of real prosperity. Personal incomes, the Gross National Product, home buying, automobile purchases, capital investment, and road construction were at the highest levels of the century. His frugal fiscal policies, determination not to cut taxes, refusal to increase defense expenditures, and budget balancing skills are believed to have played a role in this economic upturn.

One of Eisenhower's greatest domestic achievements was the construction of the Interstate Highway System (now officially named the Dwight D. Eisenhower National System of Interstate and Defense Highways) that he originally envisioned and personally pushed through Congress as the Federal Aid Highway Act of 1956. The face of America was forever changed by the world's greatest network of highways. This had an enormous impact not only on transportation, commerce, communication, and national defense, but also on rural poverty. These high-speed federal freeways opened isolated and underdeveloped regions and brought permanent jobs through all sorts of business projects, thereby dramatically improving the quality of life for millions of Americans, especially the rural poor.

Although critics accused Eisenhower of being uninvolved in the details of governance, the publication of his diary and the release of other private papers demonstrate that he was intensely involved in the operation of his administration and the formulation of domestic policy. Fostering the misconception of a detached leadership was his easygoing manner, inclination to give credit to others, publicized golf outings, and secret delight in deliberately giving reporters mind-boggling responses to questions at press conferences. After leaving office in 1961, Eisenhower lived to see his worst fears of a massive expansion of the welfare system with the advent of Lyndon Johnson's Great Society programs.

El Salvador

THE REPUBLIC OF EL SALVADOR is the smallest country in Central America and the only country in the region that has no Atlantic coastline. Along with other Central American countries, El Salvador won independence from Spain in 1821. El Salvador declared independence from the Central American Federation 18 years later. Decades of battles with other Central American nations followed. Between 1931 and 1979, military dictators ruled El Salvador. Subsequently, civil war broke out, and throughout the 1980s, the country was involved in prolonged conflict at a cost of 75,000 lives. In 1992, leftist rebels signed a treaty that paved the way for military and political reforms.

El Salvador is known as the Land of Volcanoes because of frequent and destructive earthquakes and volcanic activity. Hurricanes are also common and can be devastating, as was the case with Hurricane Mitch in 1998, with 200 lives lost and the destruction of over 30,000 homes. In the winter of 2001, a major earthquake damaged 20 percent of Salvadoran homes. The following summer, a severe drought destroyed 80 percent of crops and left famine in its wake.

Just over 17 percent of the Salvadoran labor force are employed in agriculture. Services dominate the economy, providing employment for 65.8 percent of the labor force. Various industries engage an additional 17.1 percent of the labor force. El Salvador has a current unemployment rate of 6.3 percent and vast underemployment.

Among those people who are employed, 30 percent do not have steady jobs, earning only subsistence incomes. Attempts to open new export markets and promote foreign investment, while overhauling the tax system and modernizing the healthcare system, have been hampered by the sluggish economy. The Salvado-

ran government depends on foreign aid and regular remittances from citizens who live abroad for economic survival.

The per capita income of \$4,900 is only half that of Brazil, Argentina, and Chile. Income is unequally distributed in El Salvador, with the richest 20 percent claiming 57.1 percent of available resources while the poorest 20 percent share only 2.7 percent. El Salvador is ranked 53.2 percent on the Gini Index of Human Inequality. Approximately 48 percent of Salvadorans live below the poverty line. About 19 percent live in absolute poverty, unable to support their basic needs. In rural areas, 55.8 percent of the population are poor, and 29.1 percent live in absolute poverty.

Women head over a third of poor households. Approximately 58 percent of the population live on less than two dollars a day, and 31.1 percent subsist on less than \$1 a day. Around 12 percent of the population is undernourished. All indications are that poverty are steadily increasing in El Salvador.

About 19 percent live in absolute poverty, unable to support their basic needs.

Almost one-fourth of Salvadorans lack access to safe drinking water, and 12 percent do not have access to improved sanitation. Healthcare is beyond the reach of many people. There are 126 physicians for every 100,000 residents. From six to 20 percent of the population are unable to afford essential drugs. Life expectancy in El Salvador is 71.22 years.

Among the population of 6,704,932, the median age is 21.57. Approximately 37 percent of the population are under the age of 14, and 5.1 percent are at least 65 years old. With a prevalence rate of 0.7 percent, HIV/AIDS is rapidly becoming a major threat in El Salvador. In 2003, 29,000 people were living with the disease, and 2,200 had died from the disease or its complications.

Between 1970 and 2003, infant mortality rates in El Salvador fell from 111 to 32 deaths per 1,000 live births. During that same period, the mortality rates for all children under the age of 5 dropped dramatically from 162 to 36. About 10 percent of all children under 5 are malnourished, and 13 percent of infants are underweight at birth. Approximately 19 percent of children under the age of 5 suffer from moderate to severe stunting. Immunization rates for children from 12 to 23 months have increased, currently ranging from 81 to 93 percent.

Between 1970 and 2003, the fertility rate in El Salvador declined from 6.1 to 3.1 children per woman. Fertility among adolescents occurred at a rate of 82 per 1,000 births. Contraceptive use increased from 59.7 percent in 1998 to 67 percent in 2000. The number of women receiving prenatal checkups rose from 46 to 71.2 percent between 1995 and 2002. As a result, from 1992 to 1995, maternal mortality rates dropped from 109 deaths per 100,000 live births to 51 deaths per 100,000 live births. Trained medical staff attend over half of all Salvadoran births.

Among the Salvadoran population over the age of 10, 80.2 percent are able to read and write, and literacy rates have changed little over the last 25 years. Female literacy (77.7 percent) lags behind male literacy (82.8 percent). Primary school completion rates have also been stagnant during that period. About 89 percent of males and 86 percent of females complete primary school. Less than half of El Salvadoran students are enrolled in secondary schools.

Human Development Index Rank: 104 Human Poverty Index Rank: 34

Employment

EMPLOYMENT CAN BE categorized in many ways: blue-collar versus white-collar, full-time versus part-time, year-round versus seasonal, permanent versus migrant, skilled versus semiskilled or unskilled, unionized versus nonunionized, experienced versus apprentice. Classifications by type of work can be reduced to four

basic categories: professional, service, industrial, and agricultural. (Jobs related to transportation and communications might be placed in each of the four categories, while those related to mining, logging, and the exploitation of other natural resources might be categorized as either industrial or agricultural. Government employment would fall largely under service.)

In general, the number of jobs in the professional and service categories increases as an economy develops from an industrial to a postindustrial model. In contrast, if an economy is characterized primarily by employment in the agricultural sector, it has remained, in essence, preindustrial.

At the beginning of the 21st century, the most affluent societies are the postindustrial. Those characterized primarily by industrial employment may be either developing or economically stagnant, with the direction of the economy reflected in a rising or eroding standard of living. Economies characterized primarily by employment in agriculture are generally undeveloped or underdeveloped—and impoverished.

Indeed, in any given economy, the affluence of individual workers can similarly be gauged by the type of work they are engaged in, with professionals being the most highly compensated and agricultural workers being the least compensated. The salaries for the best-paying service jobs typically exceed those for the best-paying industrial jobs, but wages for those employed in the highly unionized heavy industries greatly exceed the wages earned by those in entry-level service jobs that require minimal training or formal skills.

The United States is the world's largest and arguably the most advanced economy. In 2004, services accounted for 79.4 percent of the \$11.75 trillion Gross Domestic Product (GDP); industrial production, 19.7 percent; and agriculture, 0.9 percent. The professional and service sectors employed 76.7 percent of the labor force of 147.4 million workers; manufacturing employed 22.7 percent; and agriculture, 0.7 percent.

Similar percentages are found in other advanced economies. In Japan, services accounted for 74.1 percent of the \$3.745 trillion GDP; industrial production, 24.7 percent; and agriculture, 1.3 percent. Of the labor force of 66.97 million, 74.1 percent were employed in the service sector, 24.7 percent in industry, and 1.3 percent in agriculture. In Germany, services accounted for 68 percent of the \$2.362 trillion GDP; industrial production, 31 percent; and agriculture, 1 percent. Of the workforce of 42.63 million, 63.8 percent were employed in the service sector, 33.4 percent in industry, and 2.8 percent in agriculture. And in the United King-

dom, services accounted for 72.7 percent of the \$1.782 trillion GDP; industrial production, 26.3 percent; and agriculture, one percent. The service sector employed 79.5 percent of the workforce of 29.78 million; industry, 19.1 percent; and agriculture, one percent.

The employment ratios among the sectors of developing economies are much flatter and show a much greater dependence on the agricultural sector. In the People's Republic of China, industrial production and construction accounted for 52.9 percent of the \$7.262 trillion GDP; services, 33 percent; and agriculture, 13.8 percent. Of the 760.8 million people in the workforce, 49 percent were employed in agriculture, 29 percent in services, and 22 percent in industry.

A flattening of the ratios of employment by sector occurs in stagnant industrial economies.

In India, the service sector accounted for 48 percent of the \$3.319 trillion GDP; industrial production, 28.4 percent; and agriculture, 23.6 percent. Of the 482.2 million workforce, 60 percent were employed in agriculture, 23 percent in services, and 17 percent in industry. In Brazil, services accounted for 51.3 percent of the \$1.492 trillion GDP; industry, 38.6 percent; and agriculture, 10.1 percent. Of the 89-million labor force, 66 percent were employed in the service sector, 20 percent in agriculture, and 14 percent in industry. In Nigeria, agriculture accounted for 36.3 percent of the \$125.7 billion GDP; services, 33.3 percent; and industry, 30.5 percent. Of the 55.67-million workforce, 70 percent were employed in agriculture, 20 percent in services, and 10 percent in industry.

A similar flattening of the ratios of employment by sector occurs in stagnant industrial economies, though it might not be immediately apparent in the numbers. In Russia, the service sector accounted for 61.2 percent of the \$1.408 trillion GDP; industry, 33.9 percent; and agriculture, just 4.9 percent. Of the workforce of 78.83 million, 65 percent were employed in the service sector, 22.7 percent in industry, and 12.3 percent in agriculture. But the official unemployment of 8.3 percent does not include the two to three times that number who are underemployed. In addition, in 2003, it was estimated that 25 percent of the Russian population were living below the poverty line.

In much of the Third World, such statistics would represent improved economic conditions. In the early 1990s, Algeria's labor force was estimated at 3.7 million

of the population of more than 26 million. Bolivia's labor force was estimated at 1.7 million out of a total population of over 7 million. The unemployment rate in the Bahamas and in Bangladesh has remained at about 30 percent since the early 1980s, when it represented an improvement over previous levels.

Botswana's unemployment rate was 25 percent. Jamaica's unemployment rate has chronically been 25 percent, and it has been much higher in the cities, which like many in the Third World, are surrounded by vast slums.

Rapid urbanization has exacerbated the already dire economic problems facing Third World nations. Approximately one in six of Mexico's 90 million people live in its five largest cities. In 1990, Mexico City had a population of almost nine million, and by the year 2020, it is expected to be the largest metropolitan area in the world, with about 25 million people. One-sixth of Brazil's population of 155 million now lives in its five largest cities—almost 11 million in São Paulo and over six million in Rio de Janeiro.

In Côte d'Ivoire, foreign investment and the expansion of industry led to radio and newspaper advertisements touting the benefits of working in the cities. As a result, there was a mass exodus from the countryside. In the cities, fashionable districts complete with skyscrapers, luxurious apartment buildings, and chic nightclubs were suddenly surrounded by crowded districts populated by masses of working poor. Migrant workers from neighboring countries were encouraged to fill the need for laborers in the countryside, but they, too, began to migrate to the cities, creating serious tensions between them and native workers already hard-pressed to secure factory jobs.

Despite the problems created by rapid urbanization, large portions of the workforces in Third World nations are still engaged in subsistence agriculture. In Afghanistan, 68 percent of the population are engaged in subsistence agriculture and raising livestock. In Bangladesh, 74 percent of the population are engaged in subsistence agriculture. In the Himalayan nation of Bhutan, 95 percent of the population are employed in agriculture, even though only 2 percent of the land is arable. Similarly, 82 percent of the population of Burkina Faso are engaged in agriculture, though only 10 percent of the land is arable, and 85 percent of the population of Chad are engaged in agriculture, though only two percent of the land is arable.

More than 85 percent of the export earnings of the central African nation of Burundi continue to derive from coffee. Despite a stable democratic government,

Costa Rica experienced up to 25 percent annual inflation rates in the 1980s and 1990s because of a dependence on coffee, bananas, and sugar for export earnings.

The production of these crops has long been controlled by foreign conglomerates, particularly United Brands (formerly the United Fruit Company), which has dominated the production of cash crops throughout Central America for the past century or more. In 1989, the annual inflation rate in Argentina was 3,000 percent and the nation's foreign debt reached \$58 billion, or 70.13 percent of its Gross National Product (GNP).

Many Third World economies are also heavily dependent on raw material exports for their foreign exchange income. In the mid-1990s, 98 percent of Algeria's export income was being earned from oil and natural gas. In the same period, 77 percent of Bolivia's reported export earnings were earned from metals (primarily tin) and natural gas. Although per capita annual income in the small island nation of Brunei was \$9,600, 99 percent of the sultanate's export income was earned from petroleum and liquefied natural gas.

In many instances, the main export of Third World nations has been human labor.

Palm oil has long been the major export of Benin, with almost 50 percent of the workforce involved in its production. Despite a sound agricultural base, 60 percent of Cameroon's export earnings are derived from petroleum. The emphasis on petroleum production has caused severe dislocations of population, with almost 20 percent of the population of over 11 million now living in the two largest cities, Douala and Yaounde.

Most of the new arrivals have difficulty finding work, and cement-block shantytowns stretch for miles around the outskirts of the cities. In the mid-1970s, Mexico sought a rapid expansion of its industrial base and attracted substantial foreign investments on the basis of its high oil revenues. When the price of oil dropped precipitously in the mid-1980s, the nation's foreign debt ballooned and up to 20 percent of the labor force became unemployed.

Some Third World nations have sought to achieve economic independence and to increase prosperity by nationalizing their natural resources, but these efforts have usually had, at best, mixed results. Gamal Abdel Nasser's nationalization of the Suez Canal is often heralded as the signal event in such attempts. But because

of the withdrawal of British, French, and American financial investments, it eventually led to increased dependence on Soviet foreign aid and economic stagnation in Egypt.

From 1971 to 1973, the Chilean government of Salvador Allende nationalized the entirely foreign-owned copper industry, as well as the coal and steel industries and 60 percent of the banking institutions in the country. An international embargo against Chilean copper led to economic disaster, since almost half of its export earnings were derived from the metal. Allende was subsequently assassinated in a military coup, allegedly encouraged by the U.S. Central Intelligence Agency and financed by such international conglomerates as ITT.

In 1972, Iraq moved to nationalize its oil industry and within three years the government controlled 90 percent of the production. But, again, nationalization discouraged foreign investment and made Iraq dependent on Soviet technical assistance—which did not generate a broad-based expansion of the Iraqi economy. (Nonetheless, a recent study included the interesting fact that if Iraq's oil-export income since nationalization had been reinvested in the nation's economic development and industry, instead of being spent on military expansion and Saddam Hussein's self-indulgent projects, Iraq might now have a GDP comparable to France's. Instead, the average monthly income has not yet reached three figures.)

Until the late 1960s, three conglomerates—Cerro, International Petroleum, and W.R. Grace—controlled the major industries in Peru, in conjunction with the "40 families," an elite group of Peruvians. Alarmed at the increasing popularity of the Shining Path guerrillas, the military staged a coup, nationalized the major industries, and instituted agrarian reforms. But the nationalization of industries and the social reforms discouraged foreign investment while raising the expectations of the populace.

Extremely high inflation and foreign debt caused the military to move sharply to the right by the late 1970s. The resulting political repression, in combination with the economic instability, only increased the appeal of the Shining Path. The situation deteriorated steadily from there, until in 1992, President Alberto Fujimori felt compelled to impose martial law.

In many instances, the main export of Third World nations has been human labor. Bangladesh has provided much of the unskilled labor force in Saudi Arabia, the United Arab Emirates, Oman, and Kuwait. Over 25 percent of Botswana's formal-sector employees have spent six to nine months working in South Africa.

In some instances, the endemic impoverishment in Third World nations has led to desperate sorts of solutions. In the mid-1990s, cacao exports from Colombia were estimated at \$1.5 billion annually; the total reported GDP at that time was \$4.85 billion. Marijuana has become Jamaica's third largest export, after bauxite and bananas—with earnings from the three accounting for over a quarter of the island's total GDP.

Until the HIV/AIDS epidemic, Haiti, one of the poorest countries in the world, was the world's largest exporter of blood plasma. For a pint of plasma, the donor received \$4 and a bottle of soda pop.

Employment Policies Institute

THE EMPLOYMENT POLICIES Institute (EPI), head-quartered in Washington, D.C., is a nonprofit research organization devoted to studying public policy issues surrounding employment growth. Founded in 1991, it rapidly became one of the most active forces combating attempts to increase minimum wages in the United States—disseminating its findings in the national media and congressional testimony.

In 1994 two Princeton University economists, David Card and Alan Krueger, published "Minimum Wages and Employment: A Case Study of the Fast-Food Industry in New Jersey and Pennsylvania," in the American Economic Review, with the novel finding that increasing the state-level minimum wage seemed to generate higher employment growth at New Jersey's fast food restaurants.

The EPI played a high-profile role in questioning this widely discussed study. It sponsored research, partly based on a newly collected payroll data set covering approximately the same labor market, which overturned Card and Krueger's findings and supported the more traditional conclusion that increasing the minimum wage causes employment to drop by a modest amount.

The unifying theme of the EPI's research is that low-paid, less skilled workers are often harmed by legislation that is putatively designed to help them. It argues that employment of the most vulnerable workers will be jeopardized if government mandates make it more costly to hire them, that poverty can best be fought by maximizing the incentives to hire and to work. Its research focuses on the downside of living-wage laws, mandatory health insurance coverage, and unemployment insurance, for example, although it is a supporter of the Earned-Income Tax Credit, which pays a wage subsidy to low-earning workers.

The EPI's left-of-center critics regard it as a front group lobbying for policies that benefit the restaurant and hotel industries—its primary source of funding. Critics such as SourceWatch accuse it of issuing reports that "help put a bright face on the miserable job scene," claiming that "its standard tactic is to trot out a study using contrived statistics designed to show that hundreds of thousands of jobs will be lost if the wage is raised" and that it issues "tendentious sound bites whenever attempts are made to establish healthcare or better wages for workers." Despite these criticisms, the EPI has continued to work with a range of respected university-affiliated labor economists.

Ironically, an increase in the national minimum wage would generally increase the costs of all the competitors in the low-wage restaurant and hotel industries. Thus, if lobbying by the EPI has held down the minimum wage, the biggest winners are probably consumers who pay less for the goods and services produced by these workers, because competition forces employers to pass along their lower costs to buyers.

WAKE FOREST UNIVERSITY

Employment Theory

THE GREAT DEPRESSION of the 1930s in the United States and Europe presented an economic dilemma: classical economic theory, which held that employment levels would be maintained if supply matched demand, did not prove to be true. Unemployment was rampant and persisted through several years of that decade. It became abundantly clear that the classical economic theory was in need of close scrutiny. The eminent economist John Maynard Keynes provided the new perspective needed in his seminal work, The General Theory of Employment, Interest, and Money, published during the height of the Depression in 1936. Keynes rightly predicted that the publication of his book would cause a revolution in the way economists would deal with questions regarding the aggregate economy.

Keynes correctly concluded that the operation of the economy and the maintenance of healthy levels of employment depended on the intervention of the government in the creation of public works and the use of deficit spending to create more jobs and increase purchasing power. Keynes argued that the knowledge of government in economic matters was superior to that of the market. This was especially true, Keynes suggested, because of the uncertainty that existed in the aggregate market. He concluded that the classical economic explanation of employment couched in a balance between supply and demand was simplistic at best.

The experience of the Depression years proved the classical theory to be wrong. Despite the frequent existence of a balance between supply and demand during the Depression period, employment levels remained excessively low. Keynes concluded that low levels of employment resulted from discrepancies in the factors of savings and investments, which in turn result in economic instability.

Keynes proposed that any shortfall in private investment (caused by higher-than-average rates of saving) could be countered by governmental financing through deficit spending. Keynes introduced "standardized national income accounting," a concept that eventually led to the introduction of the Gross National Product, a standard measure in economics today. Following World War II, Keynes was instrumental in the creation of a new currency system and was one of the founders of Bretton Woods accord, an institutional predecessor to the World Bank and the International Monetary Fund (the primary institutions in the relief of poverty around the world today).

Keynes pointed out that a firm that was unable to increase investment due to low product demand could be assisted by government spending to stimulate demand for the product, which would alleviate the economic disequilibrium and expand the economy. Demand in the private sector could be increased, according to Keynes, by either government financial intervention or the lowering of taxes. Keynes insisted that fiscal policy would be the most effective approach to flagging economic demand. The term managed capitalism has been used to characterize the Keynesian theory, as evidenced by the expanded role of government in stabilizing the economy, but not taking full, literal control of it.

The work of Keynes laid the foundation for the field of macroeconomics, the subdiscipline that deals with overall economic questions and governmental use of fiscal policy (spending, taxes, and deficits). The government becomes a key player in striving toward maximizing employment. In times of faltering economic conditions, the government could move to reduce taxes, increase spending, create public works programs, or some combination of these approaches, in order to increase purchasing power and stimulate economic demand.

On the other hand, during times of economic recovery and expansion, the government would cut back on spending. If an economic expansion is judged to be expanding too fast, the government can choose to raise interest rates in order to slow the economy. A competing theory to the Keynesian focus on income and employment has been put forth in recent years, and is attributed primarily to economist Milton Friedman. This monetarist approach holds that the quantity of money in the economic system is the key factor in the maintenance of healthy growth. Friedman and others contend that sound monetary policy is the most effective governmental approach.

Empowerment of the Poor

ONE OF THE KEY STEPS toward the empowerment of the poor is to understand not just the concept of value, but also the concept of virtue. Once we expand our understanding of value to include the idea of virtue, we can reassess the real conditions that create wealth and poverty.

The first real definition of value as we understand it today is found in the Middle Ages, as seen in the work of Peter John Olivi, but Aristotle is the first to have defined the concept. Aristotle defines value as that which is commensurable, and therefore exchangeable. To make things commensurable, that is, capable of comparison, and therefore exchangeable, we need to abstract from their differences and find a common term: a house is equivalent to five beds means that the house can be exchanged for five beds.

Society is based on this exchange: the architect exchanges the product of his work (the house) with the product of the work of the craftsman (bed), as described by Aristotle in his *Nicomachean Ethics*. Value expresses the relation of comparison between the house and the five beds. But this expression of comparison hides the fact that it can occur only if it abstracts from the difference between the house and the bed; that is, it can occur only by creating a third term, money,

which levels these differences and expresses the quantity of the relation (one house equals five beds). The operation is there is a material thing (the production of house and bed), from which one abstracts (one house equals five beds) in order to be able to put the two products into relation.

Virtue is defined, according to pre-Socratic philosophy, as the knowledge of oneself, with the goal of achieving happiness. For Socrates, virtue is a force, inseparable from the good that leads to the self-actualization of the individual subject. Virtue produces both material and spiritual richness, and poverty. Virtue can also reverse one into the other; the real richness is happiness.

Later, for Aristotle, virtuous activity is the means by which individuals find real happiness. According to Aristotle, virtue is the source of beauty and pleasure, knowledge and practical realization of desire. The virtuous activity is bound to autarchy, the principle of self-sufficiency. Individuals acquire autonomy, independence, and freedom only when they find everything necessary to their happiness within themselves.

By reexamining value in regard to virtue, we reconstruct the relations that compose society. For example, the exchange value of a t-shirt in Paris, France, is \$5. However, we need to take into account the fact that a child labored a certain amount of hours with substandard pay to produce it. Taking this quality of life or "virtue" factor into account changes the value of the t-shirt. It costs \$5 and 10 child-hours. To empower the poor one must know that the cost of an hour in the life of a child is incommensurable, and that purchasing the t-shirt for \$5 supports that child's labor.

Endemic Poverty

ENDEMIC, AS A TERM, suggests nativity to a particular place or people. Endemic poverty is persistent long-term poverty of a particular people or region that may span not just many years but may extend over generations. This type of poverty may not be a consistent impoverishment, but may be characterized by periodic poverty and famine.

Long-term poverty affecting large populations has been a particular issue found in many developing and underdeveloped nations. Endemic poverty is particularly a concern, and is being addressed in various manners in many south Asian countries and in some parts of Africa.

The way poverty is measured is problematic, but caloric intake and undernutrition are good measures when examining endemic poverty. In particular, endemic poverty may be noted by cyclic periods of famine. The long-term impacts of undernutrition are particularly impactful for the young (including developing fetuses). Those who experience famine in their youth are more likely to have developmental problems, increased likelihood of disease throughout life, and increased likelihood of childhood mortality and shorter life spans.

Examinations of household income and other economic factors do not adequately examine the issues affiliated with long-term or regular periods of famine. Measures of economic conditions are especially problematic because the social infrastructure may strongly impact the lived experience of poverty, even in low-income regions. Some nations may be able to shift populations out of endemic poverty with less money than others depending upon the means in place to disperse food resources.

Many experts link endemic poverty to issues of fertility. In the short term, famine does result in decreased fertility; however, as food becomes more readily available there is often a rebound effect resulting in increased overall fertility. When examining cultures that have overcome the existence of endemic poverty, there has ultimately been a declining fertility rate that may have influenced the greater likelihood of amassing economic productivity. Endemic poverty, with its periodic famines, makes it difficult for societies to shift beyond this structure as improved food production and availability serve to feed those living in famine, who in turn may experience increased fertility, ultimately negating the increased food productivity resulting in cyclic famine.

Examined cross-culturally, there is tremendous diversity in the presence and experience of endemic poverty. Today in India estimates suggest that between 20 and 30 percent of rural households are experiencing endemic poverty. Endemic poverty is virtually nonexistent in most developed nations, such as in western Europe and the United States.

Engel Coefficient

THE ENGEL COEFFICIENT is the proportion of family income that is spent on food. It received its name in honor of German statistician Ernst Engel (1821–96).

In a famous study using the budget data of 153 Belgian families, Engel found that the lower a family's income, the greater is the proportion of it spent on food. Later studies have confirmed this empirical regularity, which has been called Engel's Law. According to H.S. Houthakker (1957), "of all the empirical regularities observed in economic data, Engel's Law is probably the best established."

Engel's Law is a *ceteris paribus* relationship. That is, it holds when prices and preferences are kept constant. An alternative way to enunciate Engel's Law is by saying that the income elasticity of the demand of food is smaller than one.

The Engel coefficient plays an important role in several methods for the estimation of the poverty line. Since the seminal study by B. Seebohm Rowntree, the Cost of Basic Needs (CBN) approach has been one of the most commonly used methods to estimate poverty lines. According to this methodology, poverty is the lack of some basic consumption needs, and the poverty

line is the cost of these needs. To implement this method, we should stipulate a basic consumption bundle and then calculate its cost using information on prices. The implementation of this method poses some practical problems. In particular, the choice of the basic needs bundle is quite arbitrary, especially for nonfood products.

However, objective nutritional requirements can provide a defensible anchor to define a bundle of basic food products. For instance, the food poverty line could be the cost of buying 2,000 calories per person per day. However, we are typically interested in a poverty line for total consumption or income, and not just in a food poverty line.

An approach that has been used in many poverty studies, for example by G.M. Fisher, is to estimate the poverty line as is the average Engel coefficient for the group of households with income below percentile p, where p is typically between 25 percent and 50 percent. As argued by M. Ravallion and B. Bidani, this approach can provide biased estimates of the poverty line. Ravallion and Bidani propose to use household-level data to estimate an Engel curve for food consumption and use the estimated curve to calculate the poverty line.

VICTOR AGUIRREGABIRIA BOSTON UNIVERSITY

Engels, Friedrich (1820-95)

FRIEDRICH ENGELS WAS BORN into a wealthy family of a textile manufacturer in Barmen, Germany. He left grammar school early to attend commercial training as an apprentice in Bremen. To gain foreign experience in commerce he was sent to Manchester, England. There he made the acquaintance of Robert Owen,

a leading figure of the utopian socialist movement of the first half of the 19th century. During a stay in Paris, France, in 1844, Engels met Karl Marx, a meeting that changed his life (and history) forever, as he became the close associate, collaborator, and financial sponsor of Marx.

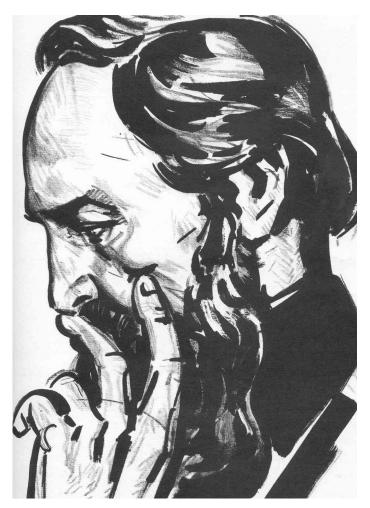

In 1845 Engels published his famous report about the social condition of the working class in England, whereby he analyzed the empirical findings of his personal experience in Manchester from 1842 to 1844. England, at that point, had experienced the Industrial Revolution for nearly a century, whereas the eventually heavily industrialized Ruhr area, where Engels was born, was still at the very beginning of industrialization. The account of Engels's England drew much of its insights from the comparison of the ongoing industrialization in Britain and the takeoff of industrialization in Germany.

Engels's focus was the interaction between the emerging industrial techniques and the social transformations linked to the new necessities of production. He outlined that even the preindustrial mechanization in the late 17th and 18th centuries not only had formed an industrial proletariat within the cities, but also led to a proletarization of the agricultural workforce. Engels was most concerned with the industrial proletariat, which in his opinion was an exploited workforce that was forced to unite in organizations like trade unions and political parties. He surmised that the history of those movements had by then been a history of many defeats and a very small number of victories.

In England he had witnessed many disputes in the workplace, sometimes even strikes, which in his opinion were the future for any society in the process of industrialization. He showed that the bourgeois democracy, still established in Britain and France, tried to limit the political influence of the working class by fiscal and other restrictions. Within the working class, Engels identified the most skilled workers as the leading figures in the emerging movement.

For the German and European (non-British) public, probably the most important lesson from Engels's analytic description of the social status of the working class in England was that the rural pauperism was transformed into the "Social Question" during the process of industrialization.

Pauperism was caused by an explosion in the rise of population whereby the traditional economy did not provide enough working possibilities for this increased population. What Engels witnessed during his stay in Manchester was a new phenomenon: there was a large

Friedrich Engels worked with Karl Marx to study the plight of the working class during the rise of the Industrial Revolution.

increase in jobs within the emerging industries, but despite the work possibilities, most workers did not earn enough money to live a decent life from their work. That led Engels and Marx in 1848 to write the *Manifesto of the Communist Party*. In that manifesto, they identified the exploiting modus of the capitalist society, as robbing the worker of a large part of his earnings ("Mehrwert") for the benefit of the owner of the means of production.

According to Marx and Engels this was not (only) because of an evilness of the individual exploiter (that is, the owner of the means of production), but was the inner logic of the capitalist way of production. The *Communist Manifesto* therefore described the not only necessary but historically unavoidable overthrow of the capitalist society and its replacement with a communist society.

Engels was in the shadow of Marx in his analytical capability, but the close collaboration and friendship be-

tween them linked their works as inseparable. After the death of Marx in 1883, Engels became the executor of the Marxist legacy regarding the emerging labor movement (especially in Germany with the SPD, or Social Democratic Party of Germany).

After the collapse of the Soviet Union in 1991, a new look at the analytical possibilities and deficiencies of both Marx and Engels was appropriate, as it demonstrated their important role in the emergence of social sciences as a scientific discipline during the 19th century. Especially important was the broader implications for society of the change from pauperism to a Social Question in the course of industrialization, which was lucidly described by the two thinkers; the writings of Engels on the working class's condition in England provided groundbreaking empirical insights.

Engineers Without Borders

ENGINEERS WITHOUT Borders Canada (EWB, or Ingénieurs Sans Frontières Canada) was formed in 2000 as part of the Millennium Development Goals aimed at halving world poverty by 2015. EWB began with the idea that the engineering profession could contribute to development.

Within two years the "EWB core" was developed, made up of volunteers dedicated to building the organizational capacity to have a significant and lasting impact in developing communities. EWB is a nonprofit, charitable, volunteer-based nongovernmental organization with over 10,000 members in Canada alone; its mission is to promote human development through access to technology.

The goal of EWB is to ensure that people in developing communities have access to the technology they need to improve their lives. To achieve that goal, EWB works with partners overseas to build capacity in the rural technical sector in areas such as water and sanitation, food production and processing, and energy. Volunteers who donate time to the EWB do most of the work abroad in over 20 countries, such as East Timor, Madagascar, India, Haiti, Uganda, the Philippines, Uzbekistan, and others.

EWB also works in Canada to help make it a role model in development among Western nations. Depending on the budget, each of the existing 24 chapters sends volunteers overseas to work from short terms such as four months for up to three years. The McConnel Family Foundation granted funding in 2003 that allowed for additional paid staff and the opportunity to establish a funding base within the professional engineering community. EWB's budget in 2004 was roughly \$1 million, the funds donated by individuals, corporations, and charitable foundations.

EWB is guided by six principles, written into its charter: "1) we use people-first approach; 2) we focus on finding sustainable solutions to root-cause problems; 3) we maximize social returns by running an effective and efficient organization; 4) we seek to partner with existing organizations wherever possible; 5) we operate transparently and openly address lessons learned; and 6) we maintain our commitment to underdeveloped communities."

EWB is governed by a board of directors, which consists of elected and appointed individuals. The board meets with the management team to review operations, provide financial oversight, set strategy, and offer support. One goal of the organization is to develop a cadre of alumni who will be found in leadership positions around the world—in development, business, government, academia, and elsewhere. Individuals and programs associated with EWB Canada have been selected for a number of international, national, and regional awards dealing with humanitarian efforts.

There are numerous ways to get involved with the EWB. Volunteers come not solely with engineering backgrounds; EWB seeks help from individuals from a variety of fields, such as communications, marketing, and business building, and those who have a passion for development with a dedicated and professional approach.

PAUL AND TANYA SLOAN INDEPENDENT SCHOLARS

Entitlement

ENTITLEMENT REPRESENTS the monies, goods, or services due to an individual, based on the ability of the individual to meet established criteria. The status of the individual receiving the social benefits could include age, disability, need, or other criteria. Examples include Medicare, Social Security, and others. In the United States, the federal government established the first entitlement program with the passage of the historic Social Security Act of 1935.

Entitlement programs are controversial and much discussed. Conservatives argue that entitlement programs, if left unchecked, could end up bankrupting the government (and society). Besides, they argue that it is not and should not be the role of government to provide a "cradle to grave security," and that government cannot do so financially, even if it wanted to. Liberals aver that citizens are entitled to these programs, first because in many cases the government made promises to people that these services were forthcoming, and second that government (in their view) has a moral obligation to provide these services to its citizenry. One could say that one's attitude toward entitlements would largely depend on one's political philosophy and beliefs and one's view of the role of government.

BRIEF HISTORY OF ENTITLEMENT

The history of entitlement has to be understood in the context of political and social theory, the history of philosophy and religious belief, and indeed the evolving and changing conception of the common good and the role of government over time.

Aristotle viewed politics as a branch of ethics, the application of practical wisdom to societal concerns. Both Aristotle and Thomas Aquinas thought that government did have a responsibility to its citizens, indeed a responsibility for shaping the moral character of its

citizens. Aquinas argued for a balance of governmental authority, neither total governmental control nor for the opposite extreme, a total *laissez-faire* approach.

The teachings of the world religions on the obligations that people have toward others, on charity, on rights, and on the dignity of the human person paved the way for modern social welfare and for our understanding of entitlement and what it might entail. Certainly one of the strongest, clearest declarations about the importance of caring for one's fellow humans can be found in Judaism.

The great Jewish prophets such as Amos, Isaiah and others called for social justice and for people to fulfill their obligations to those in need. The work of Maimonides stressed these obligations to the needy. Tzedakah is a Jewish word that describes charity, or righteousness. In Judaism, charity and obligations to the needy are placed under the banner of justice. Tzedakah might be seen as a prelude to entitlement. Tzedakah was balanced by chesed, which is loving kindness. Jewish social service agencies provide many services to the needy.

The role of government has been debated and discussed throughout human history.

For Christianity, *caritas* (love) played an important role. For Aquinas, charity was the greatest of the virtues. Augustine averred that "charity is no substitute for justice withheld." Charity and justice must go together. For many government-run entitlement programs, loving kindness sometimes gets swallowed up in the bureaucratic rules and regulations and implementation of the programs themselves.

Islam emphasizes charity and care for the needy, through *zakat* and other means. Other world religions such as Buddhism, Hinduism, Jainism, and Confucianism, incorporate social teachings that call on members to reach out to meet the needs of people.

Catholic, Orthodox, and Protestant Christianity stressed the importance of service to those in need. St. Benedict of Nursia, the founder of the Benedictine order, authored a monastic rule that incorporated a pronounced commitment to charity and hospitality. Faithbased initiatives would not be possible without the many charitable activities of Catholic, Orthodox, and Protestant Christian churches. The Salvation Army alone has a large system of social service agencies providing a considerable amount of relief to needy people every day. Mother Teresa was a nun who worked among

the poor and homeless in Calcutta, India, and exemplified caritas.

The role of government has been debated and discussed throughout human history, through Aristotle, Plato, ancient Greek philosophy, Cicero, St. Augustine, Aquinas, Jean-Jacques Rousseau, Thomas Hobbes, John Locke, Jeremy Bentham, Adam Smith, Karl Marx, Hannah Arendt, Jacques Maritain, and the papal encyclicals from Pope Leo XIII through Pius XI, John XXIII, John Paul II, and a great many more philosophers and social commentators. Some theorists argued for a greater government role, some for less of a role. Certainly the rise of Marxism-Leninism in the 20th century marked the ascendance of a significantly large role of government in almost every aspect of life.

The rise of the modern welfare state, which implies that government and society assume a sizable role for the welfare of the citizenry, is another example of a large government role being played out. The Scandinavian countries could be looked at as prime examples of this. Some conservative critics have at times referred to the Scandanavian welfare state as "cradle to grave security." In the welfare state, entitlement reaches new heights, and welfare benefits become rights, not privileges.

In the United States, the Great Depression left such a large amount of economic and social tumult and fear that the New Deal of President Franklin D. Roosevelt was largely welcomed by most citizens. New Deal social programs like Social Security (and its many amendments) and others brought an increased expectation that government would provide for its citizens. Roosevelt himself warned in 1935 against government welfare benefits as a "subtle destroyer of the human spirit." He also indicated that Social Security was not meant to be a total support system in old age.

Interestingly, while the 1935 Social Security legislation was relatively moderate or conservative by modern welfare state standards, the 1939 amendments added benefits for the spouses and children of deceased workers and increased the number of workers covered by old-age insurance. The formula for calculating benefits was adjusted, with the net result being that the benefit structure became more redistributive.

A typical scenario unfolded with the New Deal. Programs were established, then liberalized, expanded, and grew in size and cost over time. This seemed to be characteristic of the early stages of welfare growth everywhere, and particularly in western Europe and in the United Kingdom. The National Health Service in the United Kingdom is an example of a government-

funded national health program. The United States, in contrast, never developed a national, government-sponsored health program. Some have referred to the United States as something of a "reluctant" welfare state. Indeed, it could be stated that national healthcare is such a central component of any welfare state or social welfare system that it could be argued that America is in some ways not a full-blown welfare state at all (certainly when compared to western European standards). The United States has a much more developed private social welfare sector (voluntary, nonprofit, and the rapidly emergent for-profit sector). Because of all this, it might be said that the United States may not have as strong an entitlement ethos as may exist in many western European countries.

A "rights" orientation was more characteristic of the development of entitlement programs in the United States. This is well exemplified in respect to the disabled (persons with disabilities). Before the 1970s, most social legislation that pertained to persons with disabilities, such as public assistance or Social Security programs and services, provided limited support. Persons with disabilities went to court and to the legislature, which resulted in important legislation and court decisions from the 1970s through the 1990s (and on to the present) affecting their lives. The focus here was on the rights of persons with disabilities to the same protection under the law enjoyed by the rest of the U.S. population.

The challenges for entitlement programs are significant indeed.

The historic Americans with Disabilities Act (1990), a culmination of these efforts, prohibited discrimination against persons with mental or physical disabilities in employment, public accommodations, transportation, and other areas. With affirmative action and other programs, one sees as well a "rights" orientation.

Peter G. Peterson, among others, has argued that the United States must do something about its entitlement programs and its national debt. A huge amount of government budgets goes to entitlements. With a rapidly aging population, advances in medical technology, and other developments, entitlement commitments will only continue to grow. A parallel, troubling development is that the dependency ratio (the number of workers required to pay into the Social Security system to support one retired worker receiving Social Security) is

significantly worsening. In 1960, the worker/beneficiary ratio was 5 to 1. In 2001 it had dropped to 3.4 to 1, and by 2030 it is expected to be approximately 2.2 to 1. Population growth must occur in order for the dependency ratio to remain at an acceptable level. Otherwise the burdens for workers will be enormous.

American society is witnessing the fastest-growing aged population ever. The challenges for entitlement programs are significant indeed. President George W. Bush proposed an "ownership society," whereby the individual citizen takes over more responsibility for his or her welfare. An example here would be individual health savings accounts. These proposals are being made in light of the increasing inability of the welfare state to support growing numbers of people needing such support and to fund the expensive medical technology that is increasing societal longevity. One thing is certain: to continue entitlements of any kind in the future will demand the utmost creativity on the part of government and society. Indeed, we have to look beyond government to solve entitlement challenges.

Government simply cannot do what everyone might want it to do, in light of such increased demands on it. All social welfare sectors must play a role in the future—the government sector, the voluntary, non-profit sector, the for-profit sector—along with, of course, the individual. We will be seeing a mixed welfare economy, rather than an exclusive government hegemony, as has been largely the case with the traditional, government-supported welfare states of the past.

THOMAS D. WATTS UNIVERSITY OF TEXAS, ARLINGTON

Environmental Degradation

"WHAT IS COMMON to many is taken least care of, for all men have greater regard for what is their own than what they possess in common with others." "The tragedy of the commons" is a modern statement of the insight captured by Aristotle. Any arrangement whereby benefits accrue to one group of people but the costs are borne by another group is a recipe for disaster. Many experts would argue that is exactly what has happened with our environmental resources.

Garret Hardin, who coined the phrase the tragedy of the commons, used the example of a common village pasture for illustration. He reasoned that each cattle owner in the village has incentive to allow his cattle to overgraze since the benefits of overgrazing accrue to him while the costs are borne by all cattle owners in the village. Each one thinks that if he limits grazing of his cattle, there is no assurance that others will also do so. This cost-benefit calculus leads to a situation whereby all cattle overgraze the common pasture, the grass runs out before the next rains, and many cattle die—the tragedy of the commons.

However, before the advent of modern governments, most of the natural resources were managed by local communities. Access to a common resource—village pastures for cattle grazing, forests for fruits and fuel wood, wild animals for hunting, river water for agricultural use—was controlled by norms and customs, either articulate or inarticulate.

Ever-increasing demand for these resources due to growing population, accelerating economic development, and improving technologies began to put pressure on the informal norms and customs that managed the use of these resources. Unfortunately, instead of building on the informal arrangements that had worked well, a completely new method was adopted. The state took over the ownership and management of common resources. The commons were nationalized.

By all accounts, state ownership and management, commonly referred to as the command-and-control approach, has singularly failed in managing the use or the preservation of natural resources. Instances of government failures in management of natural resources abound: in a famous study of grassland degradation in central Asia, satellite images showed marked degradation in the grasslands of southern Siberia, where the former Soviet Union had imposed state-owned agricultural collectives, while grasslands in Mongolia, which had allowed pastoralists to continue their traditional, self-organized group property regime, were in much better condition.

The reason for this state failure is precisely the one that Hardin gave for the tragedy of the commons. The benefits of the resource accrue largely to the functionaries of the state but the costs are borne by all citizens. The nationalization solution had assumed that the interests of government officers and those of the people are the same; that government officers would behave as if the costs and benefits were borne equally by all citizens, including themselves; and that the forest guard would protect tigers as if they were his. Alas, that is not the case—all men have greater regard for what is their own than for what they possess in common.

The facts of successful community management of the commons and of the failure of state ownership suggest that the famous phrase of Hardin be revised—from the "tragedy of the commons" to the "tragedy of the collective." It is indeed the tragedy of collective ownership, a situation where resources belong to everyone but are cared for by none or a few. In this situation, the accountability structure, the cost-benefit calculus, fails to reconcile the interests of state functionaries with those of the people. The interests of the managers and owners are not harmonized.

A similar principal-agent problem occurs in the management of a corporation. The interests of the managers would not always mesh with those of the stockholders. Various market mechanisms exist, the threat of takeovers and mergers being one, to ensure that managers do not stray too far away from maximizing shareholder value. On the other hand, flourishing commons have existed in the past and also exist today. It is in fact the tragedy of the "collective" and not of the "commons."

REMEDY FOR THE TRAGEDY

Fundamentally there are two ways to deal with this tragedy: change attitudes or change incentives. The

Green movement aims at changing the attitude of humanity to preserve the environment. An alternative is called a "terra-cotta" approach that focuses on changing incentives to manage the environment. *Terra-cotta* means "burnt earth" and refers to earthenware made from this material. Terra-cotta symbolizes the philosophy that values nature not for its mere existence, even untouched nature, but in its relation to human beings.

When industrialists pollute, poachers kill endangered species, fishermen grab the smallest fish, forest officers allow illegal felling; when one showers instead of bathing with a bucket, the Greens suggest that the only sustainable solution is to change the attitude of industrialists, poachers, fishermen, forest officers, and the public. How does one change attitude? Increase awareness, raise consciousness, educate, cajole, and ostracize. But humans are stubborn. A stick must go with the carrot: regulate, proscribe, prosecute, and penalize. The battle to save the environment has to be perpetual because the enemy is us. It must continue until we change our attitude or our nature, or cease to exist.

The enemy is indeed us. Not because our nature is to pollute, poach, grab, consume, and overuse, but because the incentives are perverse. Change the incentives and the outcomes will change. How does one change incentives? Reconfigure the structure of accountability—institutions and rules—so that those who benefit also pay the costs. The primary means of injecting accountability is to revise the pattern of ownership of natural resources. When that is not feasible, design use-rules so that users pay the price for the use of the resource.

RESTRUCTURING RESOURCE OWNERSHIP

One of the most effective ways to right the incentives is to change the structure of resource ownership. Three basic structures of resource ownership exist: individual or family, community, and collective (national or international); in short, individual, community, and collective ownership. The basic direction of this change should be away from collective ownership toward individual and community ownership. Privatization describes the shift toward individual or family ownership, and communitization the correction toward community ownership.

Land exemplifies the gradual evolution from collective, to community, and finally to individual ownership. Land as land, not as forests or mountains, is largely privately owned. And our experience of generally superior private management of land suggests that the change of ownership structure has been beneficial.

In the case of forests and water, however, the shift has been in the opposite direction—from community to collective ownership. The almost universal nationalization of these resources has led to the tragedy of the collective. Some people predict that water will be the cause of the next world war. The best way to avoid such tragedies is to put forests and water back in the hands of communities.

The rural and tribal communities, whose historical claim on these resources has been expropriated through nationalization, have also lost the most remunerative resources for their livelihood. In every country, they are the poorest communities. Governments, national and international, are doing everything to help them except to give them back their water and forests.

As the CAMPFIRE program of Zimbabwe and Nepal's Community Forestry experiment indicate, community ownership solves two problems simultaneously: better management of natural resources and wildlife and provision of dignified livelihood to the poorest communities. With the ownership of natural resources, tribal people are able to build their own future according to their values, customs, and traditions.

So the problem is not population but systems of economic and political freedom.

According to this point of view, experiences the world over have made it amply clear that resources in the hands of private parties—be they of individuals, communities, or corporations—are better managed than they are in the hands of governments. Who should be entrusted with these resources depends upon the types of resources, circumstances, and local customs and traditions.

For resources that have generally been in the commons, like water and forests, the best stewards are the local communities who have been managing those commons historically. Entrusting these resources to any other entity would mean keeping the communities out forcefully—by guns and guards. Whether these guns and guards are employed by governments or by private corporations, they would not be able to withstand the battles for survival by the communities. Neither corporatization nor collectivization is a solution.

In addition to all the utilitarian or efficiency arguments, it must be remembered that local communities have a prior claim—a moral claim—on these resources. They have been using the resources for generations and

centuries. It is on the premise of prior use that all resource ownership has been settled in any civilized society. Privately owned land today was at some point in time a forest. Settlers cleared the forests for agricultural, residential, or commercial land and received a property title from the government. Some people, however, did not clear but lived in the forests. These forest dwellers are now refused the same process of land titling that settlers enjoyed. The people who kept the forests intact are being penalized for not clear-cutting them in the past. The most efficient as well as moral resolution is to take forests from government forest departments and put them in the hands of forest dwellers.

For these new ownership arrangements to work properly—for them to be incentive-compatible—reliance on the common law of torts and negligence and an efficient judiciary is inescapable. State regulators simply cannot foresee all contingencies and craft regulations to deal with them. The common law of torts is better suited to accommodate the uncertainties of life.

THE THIRD LAW OF ECOLOGY

The Green credo has been formalized into a mathematical identity, which Hardin has called the third law of ecology: the IPAT equation. I = P*A*T, where I denotes man's impact on the environment, P is population, A is affluence, and T is technology. All else being equal, any increase in population, or production/consumption, or improvement in technology, the law suggests, must result in greater environmental degradation and greater pressure on finite natural resources. Sustainability, therefore, requires that all three factors, population, economic growth, and technological change, either be slowed down or altogether halted.

However, the Green credo notwithstanding, as Professor Julian Simon has demonstrated, population is the "ultimate resource." Each child is born with a stomach that needs to be fed, but the same child has two hands and most importantly a mind. If the economic and political system allows the child to use them fully, she will produce more than her needs. So the problem is not population but systems of economic and political freedom.

Simon shows that energy and resources are infinite—the only limit is our imagination and ingenuity. As we face a shortage of a resource, the price of the resource rises, and this signals to all entrepreneurs that profit awaits those who discover a substitute or a better method of production. During the Industrial Revolution, charcoal was the main source of energy. The

forests of England were clear-cut and burnt for charcoal. As fewer and fewer trees were left, the price of charcoal rose. Greedy businessmen began the search and found coal under the ground. The coal replaced charcoal; the forests of England came back up. There is a lot of coal left in England but no one mines it since petroleum is even better. Fuel cells are being developed, which run on hydrogen that comes from water. It is possible that the leaders of the Middle East will one day be sitting on oil that no one wants.

Put the (inflation-adjusted, real) price of natural resources against time for the last 200 years or so for which we have the data, and the unmistakable trend is downward. Despite a Malthusian geometric increase in population and Galbraithian "conspicuous consumption," prices of natural resources are falling. The price that has been continuously rising is that of human labor. Human labor is scarcer than any other natural resource. Our numbers are still not large enough to result in excess supply.

Human ingenuity is exercised through technology. Despite this consistent historical track record, Greens view technology as an accident with resulting calamity as a certainty. No one can guarantee that we would not face any resource problems in the future, but all the historical evidence suggests optimism.

Growth in population has not increased the scarcity of natural resources and technology's track record leads to optimism about the future, even if one wants to be cautious. The third variable in the IPAT equation, affluence, can be measured by Gross Domestic Product or even better by the Human Development Index of the United Nations. By any account, an average person in the world today lives longer and is better fed, clothed, and sheltered than at any other time in human history.

Not surprisingly, the terra-cotta vision is exactly the opposite. In the incentive-restructure approach, as opposed to the attitude-reform approach, the impact on the environment comes from the institutions and rules about ownership and use of resources that create the tragedy of the collective.

The new third law of ecology is $I = C^*P^*A^*T$. The impact depends on the proportion of resources that are collectively owned and managed (C), the proportion of resources whose use is not priced (P), the level of antiscience, antitechnology attitude (A), and the extent to which tort laws are underutilized to determine liability and negligence (T).

Consider a national park, which is collectively owned (C=1). The tribal people living there engage in illegal tree felling and poaching. Absence of ownership

removes the sense of responsibility. However, transfer of ownership to the communities (C<1) makes the user accountable for the maintenance of the forest and reduces the negative impact.

The antireason attitude fails to appreciate the power of human imagination and ingenuity. Tort law makes the polluter pay. It allows the use of a resource only up to a point where benefits outweigh the costs. Unlike Hardin's third law of ecology, the terra-cotta approach sees human population, affluence, and technology as saviors of humans as well as the environment.

PARTH J. SHAH
CENTRE FOR CIVIL SOCIETY

Equality

EQUALITY IN ANTIQUITY and premodern society usually meant the equal distribution of the means of production, that is, in an agrarian society, the equal distribution of farmland. This pattern reemerged in the writings of the French Enlightenment philosopher Jean-Jacques Rousseau, who was already confronted with the emergence of private ownership of the means of pro-

duction other than farmland. Although private property could, in Rousseau's mind, not be abolished, it had to be subordinated to the interests of society.

The modern debate came with the French Revolution in 1789, whereby equality had a prominent place in the revolutionary motto "Liberté, Egalité, Fraternité" (Liberty, Equality, Fraternity). The appearance of the two words equality and fraternity shows that equality in this motto was not primarily a social promise, but a solidarity as part of or an addendum to equality; it was symbolized with the third term, fraternity. It can be shown that some models of the revolutionary motto contained only the two terms liberty and equality and did not refer to fraternity. Equality in this revolutionary motto therefore stood only for equality for citizens among themselves and in the eyes of the law.

The denial of the equality of all human beings led to the Holocaust.

In the 19th century, voting even for men was not yet generally granted in Europe. The equality in the revolutionary motto was an ideal not yet reached universally. Nevertheless, the debate on the term *equality* soon became an issue in the context of the emerging social question in the age of industrialization.

Whereas the bourgeois revolutionaries of 1789 in their majority only meant equality of participation in state affairs by voting and equality of treatment in the courtroom, in the 19th century the equal distribution of wealth became a topic on the agenda. Equality in the social sense could be seen as equality in the distribution of means of production or at least in the distribution of prospects. Whereas liberalism tended to hope for equality of individual prospects through a free-market economy, socialism saw the redistribution of means of production as a necessary prerequisite for equality. This divide still characterizes the debate on the topic of (social) equality today.

At the end of the 19th century, the term *equality* was transferred to another field, when racism in the form of crude social Darwinism tried to postulate the inequality of human beings according to their race. This denial of the equality of all human beings led to the Holocaust against the Jews and to many hate crimes committed by racists.

This attitude influenced U.S. history up to the second half of the 20th century: the discrimination against African Americans was caused by the feeling of white

Americans that nonwhite Americans were unequal. The notion "equal but different" was used to give discrimination a legalistic approach. Only when this notion was declared unconstitutional (especially in the education system), at least formal equality for all U.S. citizens was reached. Discrimination against blacks has still ongoing effects for the prospects of different groups of U.S. citizens, as unequal treatment up to the 1950s and 1960s still has an impact on the social condition of groups of different ethnic origins within the United States. It has to be emphasized that slavery at the beginning of the African-American experience in the United States was the ultimate form of inequality. Another was the apartheid regime in South Africa.

Within the context of poverty, it is the overall lack of equality that lies at the root of many forms of poverty: lack of equality of access to resources, lack of equal treatment of citizens by their governments, and lack of equality between not only individuals but countries as well.

Equality has become a topic in the relation between the two sexes, too. As with African Americans, women did not have the same, that is, equal access to education and jobs in most countries of the world. Though voting rights for women were reached in many Western countries within the first half of the 20th century, equal prospects in professional life did not come until the 1980s. Inequality of women is still an important topic in many countries, most blatantly in the Islamic world. As always, legal inequality leads to social inequality, as for example, the prohibition against women conducting their own affairs (like driving a car in Saudi Arabia) leads to a de facto exclusion of women from many fields of the economy.

Any modern approach to the term *equality* has to embrace both the legalistic approach (citizenship, equality in the eyes of the law) and the social aspect (at least concerning the equality of prospects).

Equatorial Guinea

THE REPUBLIC OF EQUATORIAL Guinea is a small country in western Africa with substantial poverty, despite significant deposits of oil and natural gas. Most analysts blame the poor social conditions on the corrupt leadership of President Teodoro Obiang Nguema Mbasogo, who gained control of the country in a 1979 military coup d'etat, which overthrew, tried, and executed his uncle, President Francisco Macas Nguema.

Francisco Nguema had ruled Equatorial Guinea since it gained independence from Spain in 1968. Widespread human rights abuses throughout the 1970s caused a third of the country's population to flee. Amnesty International and other organizations claim that human rights abuses and suppression of political opposition continue under the current leader.

Equatorial Guinea is composed of a small area on the western coast of Africa between Cameroon and Gabon, and five inhabited islands. The largest island, Bioko, contains the Equatorial Guinean capital, Malabo. Equatorial Guinea officially has been a constitutional democracy since 1991. Subsequent legislative and presidential elections are widely regarded as fraudulent, however.

Traditional sources of income in Equatorial Guinea are farming, fishing, and forestry. The economic prospects of Equatorial Guinea improved dramatically in 1996 when large oil reserves were found off Bioko's coast. The outlook improved further in 2001 when sizable natural gas reserves were discovered. Equatorial Guinea is now the third largest African oil producer after Nigeria and Angola. In spite of dramatic increases in economic growth and per capita Gross Domestic Product, very few Equatorial Guineans have benefited from the improved economy. Subsistence farming remains the predominant economic activity. Approximately 90 percent of Equatorial Guinea's population continue to live in abject poverty.

A 2004 report by the U.S. Senate Permanent Sub-committee on Investigations revealed that hundreds of millions of dollars of oil industry revenues were deposited into American bank accounts controlled by President Obiang Nguema Mbasogo or his relatives and friends. According to the report, between 1995 and 2004, Riggs Bank, based in Washington, D.C., oversaw about 60 government and private Equatorial Guinean accounts worth \$700 million.

Riggs Bank officials allegedly assisted in channeling much of this money into offshore tax shelters for President Obiang Nguema Mbasogo, other government of-

Though offshore oil has improved prospects, very few Equatorial Guineans have benefited from the improved economy.

ficials, and their families. Riggs Bank was fined a record \$25 million in 2004 for failing to report the suspicious activity. President Obiang Nguema Mbasogo claims that oil revenues are a state secret and has refused repeated requests for financial transparency in its oil industry. He denies any wrongdoing.

The United Nations claims 80 percent of the wealth in Equatorial Guinea is controlled by five percent of the country's population. Thus, approximately 25,000 people control the wealth for a country of more than 500,000 people. A significant part of the explanation is that most of the country's businesses are owned and controlled by government officials and members of their families.

Reports suggest that very little of Equatorial Guinea's newfound wealth has been spent on social programs or economic development. Schools and hospitals are generally underfunded or nonexistent. Corruption and mismanagement by Equatorial Guinean leaders have led to the elimination of many interna-

tional aid programs. The country's large oil revenues also have made it ineligible for World Bank and International Monetary Fund (IMF) financing and debt reduction programs.

Equity and Efficiency Trade-Off

EQUITY AND EFFICIENCY trade-off refers to the idea that while free markets perform quite well in producing economic efficiency, the market mechanism does not necessarily produce outcomes that a society would judge to be equitable. If a society values equity, it may be willing to sacrifice some efficiency in order to gain additional equity. A society can become more equal through a redistribution of income that removes some of the incentives to work and produce, which results in a smaller overall size of the economic pie to be shared. This is the essence of the trade-off.

To obtain a more clear idea of this trade-off, it is important to understand what economists mean by *efficiency* and *equity*. *Efficiency* refers to Pareto-efficiency, which is a condition in which no one in the society can see his situation improved, in terms of having a larger amount of resources available for consumption, without someone else being made worse off.

If someone can be made better off without anyone being worse off, then the economy is not working efficiently, because there is a chance to improve the situation for some members of the society at a cost to no one. Such efficiency works along with the compensation principle, meaning that a change to the economy may make one person better off and another person worse off, but it is still possible to improve the efficiency of the economy if the winner can compensate the loser and still have something left. This meets the criterion that no one is made worse off by the change.

In a free-market economy with perfect competition, where no one consumer or business is large enough to influence prices, and where a market exists for all goods, the first fundamental theorem of welfare economics indicates that the "invisible hand" of the market will guide its participants to a Pareto-efficient outcome.

Indeed, the market mechanism has not met a match in producing goods efficiently. However, the market mechanism does not provide any feature to necessarily ensure that the efficient outcome it produces will be considered equitable by society. An economic outcome that results in some extremely rich people and some extremely poor people can be considered efficient, if it is the case that the only way to improve the situation of the poor is to take some of the resources of the rich. This is the implication of the Pareto-efficient criteria. A society that also has concerns for fairness in the distribution of resources may seek to strike a balance between efficiency and equity.

Equity refers to how the resources and production of an economy are distributed among its members. A society's views of equity can be reflected through the social welfare function. Such a function shows how the utility or welfare of each member of the society should be weighed to determine the overall welfare of the society. A utilitarian social welfare function attempts to maximize the combined utility of each individual in the society to achieve the largest total utility.

On the other hand, a Rawlsian social welfare function only seeks to maximize the utility of the worse-off person in society. Though utility is not a measurable concept, incomes are often used to replace utility in practical social welfare functions. Questions of equity can then be considered through examination of the income distribution.

The nature of the trade-off between efficiency and equity is that given human nature, often the only way to achieve greater equity is to reduce economic efficiency. People will have fewer incentives to work hard and to save if they know that their extra work will be taxed at high rates and redistributed to those who have less. As such, economic policymakers must confront the trade-off between efficiency and equity in order to strike an appropriate balance. Princeton University Professor Alan Blinder refers to this as a need to develop eco-

nomic policy with both a "hard head" and a "soft heart." Any government action that improves efficiency and increases equity has a strong case to support it. Meanwhile, programs that reduce efficiency and equity should clearly be rejected in most cases. But the question is harder when only one factor is improved at the expense of the other. This requires a careful judgment of the benefits and the costs, as well as an evaluation of how society views the trade-off between efficiency and equity.

Equivalence Scales

CAN THE NUMBER OF U.S. dollars that a family receives on a regular basis accurately measure its standard of living? What if it is a single parent and one child? Or 14 children living with a grandmother, three adult sisters, and an elderly great-uncle? What if one of these families lives in Paris and the other on a family farm in Indonesia? Or Hawaii? Are their human needs the same? An equivalence scale is a tool to consider these variables.

On the surface, counting the poor would seem to be a rather simple procedure. First, a calculation of the household's needs is made. The resources are entered to see if they are sufficient to meet these needs. If they do not, it would seem logical to assert that the household is poor. But how can the household's resources be objectively observed and enumerated? The Hawaiian family is sitting on a \$2.6 million property. How is that factored into the equation?

Policymakers utilize equivalence scales to establish a scientific approach to compute such matters. The methodology by which families and individuals in a variety of conditions theoretically can be quantified may assume that individuals (or families) seek to maximize their well-being (denoted as utility, U) by making purchases that are feasible given the household's income and market prices that they face. The welfare-maximizing purchases of local market goods are a function of the prices of all goods, signified by (p). Total expenditures are (I), and are denoted by the scientists using them as demand functions for each of the n goods, xn = xn(p, I).

Additional factors are inserted, but in short, equivalence scales are attempts to come up with indexes or scores that can be cited to measure the level of poverty in different environments and highly varied situations. This is not an exact science. However, it is being increasingly refined and redefined because of demands for uniformly comparable numbers. Social workers need tools to gauge the level of need in widely diverse scenarios, as well as to measure program outcomes and effectiveness of remediation efforts. Policymakers, welfare analysts, statisticians, researchers, and the news media constantly use poverty data in various ways. U.S. government programs that use income criteria range from food stamps to Head Start, from legal services to Medicaid.

In the face of such a need, a respected authority, David M. Betson at the University of Notre Dame, has stated, "In the final judgment, the setting of poverty thresholds represents a subjective conjecture only bounded by our intuition and common sense."

ROB KERBY
INDEPENDENT SCHOLAR

Eritrea

THE STATE OF ERITREA was formed in 1993 after 30 years of fighting and then defeating Ethiopia. The United Nations-organized federation of 1952 had collapsed as predicted by Eritreans who always wanted in-

dependence: from Italian colonization after 1885, and from British military administration after 1945. Independence in 1993, however, did not bring peace, prosperity, or unity. President Isaias Afwerki's reputation as a reformer had been tarnished since the new war with Ethiopia in 1999–2000.

On both sides, more than 125,000 people died, with Ethiopia and its superior economic and population size trying to smother its enemy. The decades of occupation and fighting are still working through to today's political agenda. A constitution has still not been implemented in Eritrea; general elections have been postponed, opposition parties repressed, dissidents arrested, human rights violated, people expelled, and the media censored. Eritrea is still a one-party state, the judiciary is weak, and terrorism has raised its ugly head.

The Organization of African States, later succeeded by the African Union, is trying to realize its Framework Agreement, and other outside forces, such as the United Nations, United States, and European Union, are trying to end the conflict between Eritrea and Ethiopia.

The International Court of Justice's Boundary Commission's demarcation between the two countries has not been accepted by Ethiopia. It is not clear if Ethiopia will ever accept Eritrean sovereignty. Although Eritrea maintains the second largest army in Africa, instability in the Horn of Africa may well continue.

With the implementation of a peace agreement between the Sudanese People's Liberation Army (SPLA) and the central government in Sudan, relations between Eritrea and Sudan may become less tense. However, the ruling National Islamic Front (NIF) is bent on supporting the spread of Islamic fundamentalism into Eritrea, where half the population believes in Islam. Some, however, believe that the Sudanese policy of supporting the Eritrean Islamic Jihad (EIJ) was simply to weaken Eritrean support for the Sudanese opposition.

Politically, and in foreign policy terms, Eritrea is very volatile. Economically it does not look much better. With a GDP (Gross Domestic Product) income of around \$130 per person (which means around \$700 in Purchasing Power Parity), Eritrea ranks among the highest on the United Nations Human Development Index. This index is based on longevity, knowledge, and education of the population going beyond classic indicators of economics and finance (the higher the rank, the lower the quality of life).

After the war with Ethiopia, as GDP grew, droughts happened regularly; inflation and unemployment were and remain high. External debt is currently 60 percent

higher than what the whole country earns with exports in one year. The debt cannot be sustained, and military spending, which is still around 17.5 percent of GDP, must be reduced. There is only very limited interest in Foreign Direct Investment (FDI), even though the International Monetary Fund encourages policies to welcome FDI proposals, which are meant to lead to an outward-looking market economy. However, centrally planned economy management is usually implemented.

The majority of the population lives in the country-side, living off agriculture and livestock husbandry, even though only five percent of land in Eritrea is arable. Half the population will need food aid for years to come. Close to half the population is under 15 years old. More than half the population lives on \$1 a day. The population will increasingly pressure the government for housing, clothing, and food. It is one of the poorest countries in the world and tourism will not bring money into the economy: it is still in its infancy.

Recovery from decades of war, repatriation of displaced persons, a difficult climate, domestic political and economic problems, and tense foreign relations all guarantee that Eritrea will remain volatile for years to come, not to mention the legacy of colonialism and the destructive games of the Cold War.

However, there is a chance that because of previous Italian and British methods of governance and political life and the political consciousness gained in the struggle for independence, the 4.5 million Eritreans might industrialize earlier than many of their neighbors. One thing remains certain: despite its small population and geographical size and because of its strategic geopolitical position along the world's busiest shipping lanes bordering the Red Sea, Eritrea will remain in conflict.

Estonia

FOR MUCH OF ITS history, other countries have dominated Estonia. With the collapse of the Soviet Union in 1991, the Republic of Estonia was able to establish its right to independence. Unfortunately, the transition from a state to a market economy signaled bitter divisions among the Estonian majority and Russians, who make up one-third of the population. The conflict resolution team from the Carter Center of Emory University, founded by former president Jimmy Carter, was called in to help Estonians and Russians establish new ways of building trust and communication and pave the way for political and economic reforms.

As an upper-middle-income nation with a per capita income of \$14,300, Estonia has developed strong economic ties to Western nations. In 2004, Estonia joined both the North Atlantic Treaty Organization and the European Union. Almost 70 percent of the Estonian labor force are engaged in services, and 20 percent are involved in industries. Only 11 percent of the labor force work in agriculture. The Estonian economy has received a huge boost from the electronics and telecommunications sectors.

In 2003, the government announced a budget surplus of \$130 million. Nevertheless, Estonia has a poverty rate of 18.9 percent and an unemployment rate of 9.6 percent. Approximately 18 percent of Estonians live on less than \$4 a day, and four percent of the people are malnourished. Resources are not distributed evenly in posttransition Estonia. The poorest 20 percent of the population live on 20.62 percent of resources while the richest 20 percent share 44 percent. Estonia is ranked 37.2 percent on the Gini Index of Human Inequality.

The population of 1,332,893 experiences a life expectancy of 71.77 years. At 77.6 years, females survive an average of 11 years longer than Estonian males at 66.28 years. The median age in Estonia is 39.06 years. Some 15.5 percent of the population are under the age of 14, and nearly 17 percent are at least 65 years old. All Estonians have access to safe drinking water and improved sanitation. There are 313 physicians for every 100,000 residents, and only five percent of Estonians are unable to afford essential drugs.

According to estimates for 2005, the infant mortality rate is 7.87 deaths per 1,000 live births. At 9.06 deaths per 1,000 live births, male infants are less likely to survive than female infants at 6.67 deaths per 1,000 live births. Infant mortality has been more than halved since the 1970s. The mortality rate of children under

the age of 5 is nine deaths per 1,000. That rate has been slashed by more than half since 1970. Six percent of all infants are underweight at birth. Childhood immunization rates are in the mid- to high 90s for all children from birth to 23 months.

Between 1970 and 2005, the total fertility rate in Estonia fell from 2.2 children per woman to 1.39 children per woman. The adolescent fertility rate is 28 per 1,000 births. About 70 percent of all Estonian women use some method of contraception, and trained medical staff attend all births. Modeled estimates for 2000 place maternal mortality at 63 deaths per 100,000 live births.

Only 0.2 percent of Estonians over the age of 15 cannot read and write, and most students attend school for 16 years. There is no gender difference in literacy rates. In 1990, 95 percent of males and 91 percent of females completed school at the primary level. By 2000, all males were completing primary school, and 98 percent of females were achieving a basic level of education.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Ethiopia

AS ONE OF THE POOREST countries in the world, the east African nation of Ethiopia is a land with a long history of bloody coups and civil uprisings. In addition to prolonged fighting, Ethiopia suffers from frequent droughts that threaten the very survival of its population, which is the third highest in Africa. The 133,000 refugees from neighboring countries further drain

Women and children make up the majority of refugees along the Ethiopia-Somalia border, greatly taxing Ethiopia's fragile resources. Five million people per year in Ethiopia depend on food aid to survive.

Ethiopia's fragile resources, leading to even deeper levels of poverty. With an average annual income of approximately \$100 per person, half of the population lives below the national poverty line. Over 80 percent of Ethiopians subsist on less than \$2 a day, while 26.3 survive on less than \$1 a day. Almost half of the country's children under 5 are malnourished. Five million people a year depend on food aid to survive. Over four million Ethiopians suffer from an acute lack of potable water, and only eight percent of the population have sustainable access to adequate sanitation. Studies reveal that despite international attention to Ethiopia's problems, little progress has been made in quality-of-life issues for several decades.

Ethiopia has the highest rate of blindness in the entire world. Officials also cope with high mortality and HIV/AIDS rates and a high population growth rate that the country is unable to sustain. Both unemployment and underemployment are prevalent. The Ethiopian economy is based on subsistence agriculture, and 80

percent of the labor force are concentrated in the agricultural and animal husbandry fields. In addition to frequent droughts, Ethiopian farmers are faced with a scarcity of arable land and the aftereffects of poor farming methods and management, which have resulted in overgrazing, soil erosion, and desertification.

In 2001, Ethiopia qualified for assistance from the Highly Indebted Poor Countries (HIPC) program, which may offer some relief from its foreign debts. In 2005, further debt relief was proposed by the Group of 8, which outlined plans for establishing funds to offset debt and increase social spending in 18 of the world's poorest nations.

Ethiopians have a life expectancy of 48.83 years, and the median age is 17.75 years. Approximately 43.9 percent of the population are under the age of 14, and only 2.7 percent are over the age of 65. There is a 43.3 percent likelihood that an Ethiopian will not live to see a 40th birthday, and nearly a fourth of Ethiopian children never see the age of 5.

With an HIV/AIDS prevalence rate of 7.3 percent, Ethiopia has reached a crisis level in this epidemic. Approximately 2.2 million people are living with HIV/ AIDS, and at least 200,000 of these are children. Some 120,000 have died from the disease and its complications. Ethiopians also face a very high risk of food- and waterborne diseases, which include bacterial and protozoal diarrhea, hepatitis A and E, and typhoid fever. In some areas, Ethiopians are also vulnerable to malaria and cutaneous leishmaniasis. Other common diseases include meningococcal meningitis, rabies, and schistosomiasis, a water-contact disease. Incidences of tuberculosis are also on the rise. Ethiopia has the highest rate of blindness in the world, with some 960,000 people considered legally blind, and six million others with low vision. At least 10 million Ethiopians have trachoma, a bacterial conjunctivitis that is endemic in poor rural communities but which is entirely preventable.

Trachoma is believed to be responsible for one-third of all incidences of Ethiopian blindness. A 2000 study revealed that 88 percent of Ethiopian children between the ages of 1 and 10 were infected with trachoma, as were 20 percent of adult women under the age of 40. Trachoma is generally treated with antibiotics, although more severe cases may require surgery.

In the late 1990s, it was discovered that river blindness (onchocerciasis), a disease spread by contact with blackflies that frequent fast-flowing rivers, had infected more than three million Ethiopians and that an additional 7.3 million were at risk for contracting the disease. The incidence of Guinea worm disease, which was prevalent in Ethiopia, has decreased by 99 percent since 1990 through educating local communities about protecting themselves from infected water.

Because of the prevalence of disease in Ethiopia and because half of all Ethiopians lack access to health-care and lifesaving drugs, the Carter Center, led by former president Jimmy Carter, joined with the Ethiopian ministers of health and education and several Ethiopian colleges and universities to form the Ethiopian Public Health Training Initiative, which trains workers to provide medical care to local health centers that service 90 percent of the population. Workers also educate Ethiopians about preventive measures that stem the spread of disease.

Ethiopian children are among the most vulnerable in the world, and almost one-fourth of all children will die before the age of 5. In 2005, the infant mortality rate was 95.32 per 1,000 live births, with a rate of male infant mortality of 105.3 and a female rate of 85.05. In 2003, infant mortality was recorded at 112 per 1,000

live births, and the mortality rate for children under age 5 was 169 per 1,000. Approximately 47 percent of Ethiopian children under 5 are malnourished, and 16 percent are severely underweight. About 11 percent of Ethiopians under 5 suffer from moderate to severe wasting, and 52 percent suffer from moderate to severe stunting.

In 2003, immunization rates for measles and DPT3 among children aged 12 to 23 months were recorded at 52 and 56 percent respectively. Between 1990 and 2002, measles immunizations for infants increased from 38 to 52 percent; DPT immunizations rose from 49 to 56 percent; polio immunizations advanced from 36 to 57; and tuberculosis immunizations jumped from 50 to 76 percent.

According to 2005 estimates, Ethiopian women have a fertility rate of 5.33 children. The fertility rate for women aged 15 to 19 is 133 per 1,000 births. Only 8.1 percent of all women use contraceptive measures. The maternal mortality ratio is high at 850 deaths per

Women have not been treated well by Ethiopian society, and they are more vulnerable than men to the effects of poverty.

100,000 live births. This is partially because of the prevailing HIV/AIDS epidemic. Trained medical staff attend only 5.6 percent of all births in Ethiopia. Women have not been treated well by Ethiopian society, and women are more vulnerable than males to the effects of poverty. While efforts have been made to address disparities, women lag behind men on most social indicators.

While 50 percent of Ethiopian males over the age of 15 can read and write, only 35.1 of the comparable female population can do so. Literacy rates have decreased since 1980 when rates for males and females were 71.8 and 88.3 respectively. Primary school completion rates for males dropped from 22 percent in 1995 to 19 percent in 2000 at the same time that female completion rates decreased from 13 to 11 percent.

European Relative-Income Standard of Poverty

THERE ARE TWO BASIC methods by which poverty lines are set in countries: the food or consumption basket standard, which is used by the United States and many developing nations, and the relative-income standard, which is used by the European Union, among

other countries and organizations. Under the standard food basket variant, or consumption basket variant, the poverty line is defined based on the amount of income required to purchase certain basic needs. In the United States, for example, the poverty line is defined by estimating the lowest possible income required to purchase a nutritionally complete diet and then multiplying this figure by three. Food or consumption basket methods of defining the poverty line provide absolute measures of poverty.

Relative-income standards set the poverty line as some fraction of the average income of a country or region. For example, in calculating the Human Poverty Index, the United Nations Development Program (UNDP) defines a country's poverty line as 50 percent of the median income level for that country. Similarly, the European Union defines poverty in its member countries as 60 percent of national median income. By the European Relative-Income Standard of Poverty, in 2003, the poverty rates in the European Union ranged from 21 percent in Ireland and Greece to 10 percent in Luxembourg and Norway and eight percent in the Czech Republic.

The use of a relative poverty line is appealing because it accounts for improvements in society's general welfare levels. As society grows wealthier and the general population gains access to new and improved goods and services, it can be argued that the poverty line should rise as well to allow those who cannot afford these new products to be counted as poor. For example, in the 1950s, few households, regardless of income status, had automatic dishwashers, washing machines, or television sets.

Therefore, there would have been no reason to count those persons without the means to acquire these items as among the poor. As ownership of these products has become widespread, however, in a general sense those who do without these modern conveniences might be considered as in poverty. The famous economist Thorstein Veblen noted in 1899 that a person who could not afford shoes would be considered quite ordinary in many poor countries, but the same person in an industrialized nation would suffer from a severe social stigma.

Of course, there are many criticisms of using a relative-income standard to measure poverty. First, any choice of relative income, such as the 60 percent of median income used under the European Relative-Income Standard, is largely an arbitrary decision. Of more concern is the fact that the use of a relative standard makes it virtually impossible to compare poverty rates across

time or among countries in any meaningful sense, as the definition of what it means to be poor varies. For example, based on the UNDP's 50 percent of median-income standard, 17 percent of the population in the United States lived in poverty in the 1990s, while the poverty rate for Poland was only 8.6 percent. The average income in the United States was nearly three and a half times that of Poland, however, meaning the income level that defined the poverty line in the United States exceeded the average income for Poland.

Indeed, as the European Union has expanded to admit former Eastern bloc countries with significantly lower average incomes than those of western Europe, many experts have begun to question the use of a relative-income standard to measure poverty.

VICTOR MATHESON, Ph.D. COLLEGE OF THE HOLY CROSS

European Union Definition of Poverty

UNLIKE THE UNITED States, which defines poverty based on the cost of a food basket with the Bureau of Labor Statistics Family-Budget-Based Measure of Poverty, the European Union (EU) defines poverty in terms of both people's material well-being and ability to participate in their societies.

In official documents from the EU and its member nations, poverty is almost always mentioned together with social inclusion. Families or individuals with incomes below 50 percent of the EU's median income are considered poor. The EU's approach to poverty results from a long evolution that started with indifference to the plight of the poor and has culminated in a humane

policy of concern with people's material and spiritual well-being.

In 1771, the English author Arthur Young expressed a view that was popular among the European upper classes in his *Farmer's Tour Through the East of England*: "Everyone but an idiot knows that the lower classes must be kept poor or they will never be industrious ... they must (like all mankind) be in poverty or they will not work."

Supporters argued that a country-by-country boverty line would be more accurate.

At the same time, however, other voices expressed a more humane concern for the well-being of the poor. Adam Smith, often considered the father of free-market capitalism, worried about the high personal costs imposed on poor laborers and their families in *The Wealth of Nations*: "The man whose life is spent in performing a few simple operations has no occasion to exert his understanding. ... The torpor of his mind renders him, not only incapable of relishing or bearing a part in any rational conversation, but of conceiving any generous, noble, or tender sentiment. Of the great and extensive interests of his country, he is altogether incapable of judging."

By the 20th century, European nations generally had been won over by the arguments of those who wished to alleviate poverty rather than to punish people for suffering it. The Council of Europe adopted the first pan-European definition of poverty in 1975. It declared as living in poverty "individuals or families whose resources are so small as to exclude them from a minimum acceptable way of life in the member state in which they live." In 1984, the European Commission (predecessor of the EU) added more detail about social inclusion: "The poor shall be taken to mean persons, families, and groups of persons whose resources (material, cultural, and social) are so limited as to exclude them from the minimum acceptable way of life in the member state in which they live."

In the early 2000s, the main debate in the European Union was over whether the poverty line (at 50 percent of median income) should be set separately for each member nation or as one standard for all the countries of the EU. Because the median-income level varied widely among member nations, supporters of separate national poverty lines argued that a country-by-country poverty line would be more accurate.

Evangelicals for Social Action

EVANGELICALS FOR SOCIAL ACTION was published in 1972 by sociologist David Moberg, who argued that traditional evangelicalism was noted for its social involvement. Early evangelicals established welfare societies such as the Salvation Army, schools for immigrants, homes for unwed mothers, city missions, and agencies to help the poor, sick, and prisoners. The church supported legislation to bring about social justice.

In the 20th century, as evangelicals began to prosper in America, a "modernist" movement in theology came to emphasize social action. The social gospel became linked with liberal theology, and evangelicals, anxious to distance themselves from this group, separated themselves from social action in order to get "back to first principles."

Moberg called upon evangelicals to recognize that welfare—helping the victims of social problems and corporate evil—is not the same as eliminating the source of the misery. Biblical principles call the church to evangelism, plus welfare, plus working toward social justice.

Evangelicals for Social Action (ESA) was formed as a result of the reasoning presented by Moberg. It is a nondenominational community organization network whose stand regularly cuts across ideological lines. Its roots trace back to the first Calvin College conference on politics, which Paul Henry organized in the spring of 1973, where a workshop was scheduled to be held over Thanksgiving 1973, where the now-famous Chicago Declaration of Evangelical Social Concern was written, the founding document of the ESA. ESA's proclaimed mission is to challenge and equip the church to be agents of

God's redemption and transformation in the world. That mission the ESA pursues through: reflection on church and society from a biblical perspective, training in holistic ministry, and linking people together for mutual learning and action.

ESA leads a network of 16 organizations committed to a goal of combining the evangelical tradition and concern over issues of social justice. ESA also offers a monograph series entitled the Crossroads Monograph Series on Faith and Public Policy. The monographs are completed by graduate students (awarded fellowships), policy analysts, and other established scholars. Many of the monographs are available through the ESA website. Crossroads subjects include poverty, hunger, economic justice, and biblical feminism. The Crossroads are supported by grants from charitable foundations and trusts. The ESA also publishes a magazine on biblical social concern, Prism, and Creation Care, dealing with environmental issues.

The ESA has four core goals: promoting holistic ministry that combines evangelism and social action through the Network 9:35, nurturing costly discipleship across a broad front in *Prism* and the biweekly *E-pistle*, nurturing a biblically balanced evangelical political engagement, and continuing the work of the Evangelical Environmental Network until it is ready to become its own independent organization.

Evans, George Henry (1805-55)

GEORGE HENRY EVANS was an American social activist and labor and agrarian reformer. He attempted to

improve the conditions of working-class Americans during the early and mid-1800s. Evans was born in Bromyard, Herefordshire, England, on March 25, 1805. He immigrated to New York City in 1820 with his father and brother. He died in Granville, New Jersey, on February 2, 1855. Early in life he became an apprentice in the printing trades, which has often been an occupation of social reformers.

Evans became radicalized in his social and political beliefs primarily as a result of the intense upheaval experienced in the depression of 1819 and the years of economic hardship that followed. Indeed others were radicalized as well. In the 1820s, for the first time in American history, working people began to organize into separate political parties that expressed their own beliefs. Evans led a number of working-class parties from 1827 to 1837. In 1826, Evans edited a newspaper that was sympathetic to the Owenite communities.

Evans can be viewed as one of the notable social reformers in American history.

Evans became involved in a movement in 1829 that resulted in the founding of the Workingmen's Party. Evans established in 1829 a newspaper, the Workingman's Advocate, which served as an organ of the Workingmen's Party (and was the first labor newspaper in the United States). He was to edit several other social reformist publications in his career: the Daily Sentinel, The Man, Radical, and others. For Evans his publishing activities were a means to an end, that end being social change and the development of a new society, one that was more egalitarian and more respectful of the rights of all citizens in society, no matter their race, social class, or status.

Evans advocated many reforms, including the abolition of slavery, chattel, or wage; landownership limitations; the free-soil movement; the homestead movement; labor rights; and a host of others. He organized the Agrarian League toward the goal of land reform. He was a longtime advocate of Native American rights. He traveled widely to promote the new Republican Party. On one of these trips, he was caught in a snowstorm and died of pneumonia.

Evans can be viewed as one of the notable social reformers in American history in his attempts to mitigate the harshness of the effects of the Industrial Revolution and *laissez-faire* capitalism. While not being completely successful in his pursuit of social reform in his

lifetime, several developments occurred after his death that would have pleased him: the elimination of slavery and the advance of Native American rights, to name but two.

He was a man of strong beliefs, so strong that he spent most of his life trying to achieve or put into practice those beliefs toward a more just, egalitarian, and humane society.

Exclusion

EXCLUSION IS a concept, state of being, and process that operates on a variety of levels. Individuals and groups can face exclusion from participating in local or worldwide activities. Social exclusion is generally considered relative to a geographic location and invokes the rights of citizenship. A broad definition of *exclusion* is the nonparticipation in the normal activities of citizens in a society, according to T. Burchardt et al. Thus exclusion is a dynamic concept that highlights that a range of people are forced to the edges of society and retrained in their position to take part as others can.

Exclusion has a strong material basis. Low-income employment or long-term unemployment can be a precursor or symptom of exclusion. For example, child poverty has been increasing in Britain for the last 30 years. A rise in child poverty is particularly worrisome because of the long-term impacts on a child's future, and hence the future generation. Research shows that children born into poverty are more likely to experience unemployment than children in higher-income families. Also, such children who do obtain work as

adults are significantly more likely to be in a low-paid job. Combined with the fact that the number of low-paid workers living in poverty is increasing, then inequality and exclusion are likely to perpetuate across generations, as discussed by A. McKnight.

A common link between economic exclusion and its endurance is education. Young people who leave school with a low level of attainment, or few qualifications, are much more likely to face exclusion in their adult life. Again, individuals will be more likely to face unemployment or low-paid work. Exclusion can be experienced through education in a range of ways. The effects can have economic and social impacts. J. Sparkes and H. Glennester report that low attainment impacts the likelihood of owning one's own home, voting in elections, and impacts one's health, particularly depression. Girls who leave school with poor attainment are also more likely to have early pregnancies.

Aiming policies at the excluded alone will not change the system.

While low-performing individuals face greater exclusion than their counterparts, dimensions of social exclusion also predict performance and access at school. Growing up in families receiving income support, low parental academic achievement, poor housing conditions, experience of local authority residential care, and a negative neighborhood environment are all factors that increase the probability of low school performance. Risks are even greater if multiple indicators are experienced.

One of the advantages of the concept of exclusion is that it does recognize inequality in noneconomic factors. Exclusion can also be cultural and political. For example, individuals can be excluded on the basis of age, gender, disability, sexuality, race, religion, or location. Yet often these elements can go on to have an economic influence. S.M. Mahapa and M. Mashiri's study on women in rural South Africa shows that low-cost transport and a lack of accessibility to other areas have a direct impact on the social and economic lives of these women. Isolated in local communities, women are restricted from buying items in cheaper markets or selling their own produce. Women are then less able to save money that could allow them to travel and take a greater part in activities.

Urban areas are also subject to exclusionary effects. Residential areas segregated through ethnicity can have profound consequences. This is most visible in the United States. African Americans have been spatially segregated to such an extent that ghetto areas have become accepted as part of the order of society. The creation of segregation over a period of time has created environments where poverty is the norm, low educational achievement is expected, and a deteriorating environment is accepted, per D. Massey and N.A. Denton.

A shift in language from *inequality* and *poverty* to *exclusion* has also created a new wave of social policy formulation. This is most prominent in the United Kingdom. The New Labour Party has promoted social exclusion discourse and created its own Social Exclusion Unit as a crosscutting resource. The change in rhetoric and focus on exclusion are also a political shift. Previous concepts of those who are poor or lacking sufficient means highlight the vertical system of inequality. The poor are placed in a subordinated position that is in direct contrast, but inextricably linked, to the more rich and powerful.

Yet a concept that is based on a state of marginalization implies a horizontal model where the wealthy are invisible and subsumed under the normal, as described by H. Steinert and A. Pilgrim. In this argument, the effects of economic relations become hidden among the debate on participating in what is normal. A similar point is made on the term *globalization*. The concept constructs globalization as an evolving stimulus, something that can be defined and debated in many ways. Therefore, globalization is seen as an abstract challenge instead of a phenomenon based on a worldwide capitalist system, as shown by J. Mulderrig.

As exclusion is built on inequality and sustained through capitalism in a globalizing social order, D. Byrne argues that a new way of redistribution is the only avenue for inclusion. Economic redistribution will provide greater stability for workers. Aiming policies at the excluded alone will not change the system. Inclusion and empowerment need greater solidarity and political organization across classes.

In this way, a new political culture developed through local coalitions can provide the social forces needed to provide sustainable worldwide development, with greater rights for workers.

Lucy Robertson, Ph.D. University of Glasgow

Exploitation

MARXISTS TRADITIONALLY DEFINE exploitation as the condition where the value of labor a worker can purchase with the income received for his labor is less than the value of labor performed. This concept rests on the labor theory of value, which states that a good's value is determined by the amount of labor used to create the good. Thus, there are two forms of labor: labor contained within the worker (potential labor) and labor contained within goods (embodied labor). Individuals who exert more labor than they can purchase with their wage income are exploited. Those who can purchase more labor with their income than they expend are exploiters. These two groups are typically referred to as laborers and capitalists, respectively. Thus, the concept of exploitation provides the basis for class analysis and class struggle in the Marxian literature.

Arthur Pigou provided a definition of exploitation that is more commonly used in mainstream economic analysis. In his definition, the degree of exploitation is measured by the percentage deviation of a worker's marginal revenue product from his wage. A worker's marginal revenue product is the value (in terms of revenue) of the increased output produced when that worker is added to the production process. In a perfectly competitive labor market, the wage is equal to the marginal revenue product. This condition arises because the firm takes the wage as given; the market sets it. The firm then employs labor until the marginal revenue

product of the last hour worked is equal to the market wage. Thus, there is no exploitation in competitive labor markets. Exploitation arises when the firm exerts market power in the labor market. This type of firm is said to possess monopsony power (the term *monopsony* comes from the Greek, meaning "single buyer"). There are several potential sources of monopsony power; however, the classical example is the company town. This case arises when a single firm is the major employer in an isolated town or region.

ALTERNATIVE MARXIAN DEFINITIONS

Marxist scholars have attempted to define a new concept of exploitation that does not rely on the labor theory of value. Exploitation still serves as the cornerstone for class analysis in the Marxian tradition. However, mounting criticism of the labor theory of value and the relevance of exploitation in its traditional Marxian definition has pressed these scholars to search for a new definition of exploitation.

Aage Sørensen has proposed that exploitation be defined in terms of inequality that arises from the ownership of rent-producing assets. Economic rents are returns on an asset greater than the return required to bring about use of the asset. For example, economic profits are a type of rent that arises because a firm sells its output at a price greater than the average economic cost of supplying the product. In many cases, workers are able to unionize and capture a share of these profits/rents. In this case, under Sørensen's definition, the unionized workers would be exploiters.

In another alternative definition, Erik Olin Wright defines exploitation as "the process through which certain inequalities in incomes are generated by inequalities in rights and powers over productive resources." This definition basically re-creates the original sense of exploitation; however, it does not rely on the labor theory of value.

WELFARE AND ETHICAL IMPLICATIONS

The Marxian definition of exploitation carries strong ethical implications. In the traditional Marxian sense, exploitation provides an explanation for antagonism between workers (the exploited) and capitalists (the exploiters) since the latter gain at the expense of the former. However, being exploited does not mean the worker is worse off than if he was not being exploited. In developed economies, workers voluntarily supply their labor to employers. Thus, if a worker supplies his

labor to an employer, that worker must believe he is at least as well off working for the employer as he is working for himself. Of course, the worker may be better off if he owned "productive resources," that is, capital. According to the theory, if the factors of production (capital, land, and other natural resources) are equally distributed amongst all workers, then no one would be exploited, at least initially. Since it is the unequal distribution of resources that leads to exploitation, Marxists often view this inequality as unethical. Even with equal distribution initially, differences in ability will allow some workers to build more capital and eventually become capitalists. Thus, preventing exploitation requires a constant reallocation of resources.

The Pigouvian measure of exploitation does not carry the same moralistic implications. Neither does it provide a direct measure of welfare. Certainly, as a firm's monopsony power increases, it is capable of suppressing wages further below the competitive level. Thus a worker is better off in a competitive than in a monopsonistic labor market. In this sense, greater exploitation can be viewed as an indirect measure of welfare relative to the competitive equilibrium.

As an empirical matter, several studies have attempted to estimate the degree to which certain workers are exploited using Pigou's measure. These studies are prevalent in the sports economics literature, where it is argued that athletes receive salaries far below their marginal revenue product. Similar studies and techniques have been applied to the labor markets for schoolteachers and nurses.

Both definitions of exploitation are static concepts; they look at wages and labor at a single point in time. Therefore they do not provide many useful insights for the relationship between exploitation and long-term welfare effects. However, Marxist scholars recognize exploitation as the driving force behind capitalist accumulation. Therefore, if exploitation leads to economic development, workers may find that being exploited works to their benefit over the long run.

VASILIOS D. KOSTEAS CLEVELAND STATE UNIVERSITY

Extreme Poverty

EXTREME POVERTY IS also called absolute poverty. It is the condition of living in such deprivation that in terms of American dollars a person is living on less than \$1 a day. It is estimated that there are over one billion people in the world living in extreme poverty. In addition it is estimated that at least eight million people die from the effects of extreme poverty each year.

Most of the people in the world living in extreme poverty are living in rural areas of developing nations. Most are living on marginal land or are dependent on marginal land, where they are forced to extract a subsistence living from poor resources.

Extreme poverty is the result of several factors. Perhaps the most important is the very poor natural conditions in which millions live. The land or the economic resources are extremely limited. This means that even if the capital or assets were equally distributed, most people would still be very poor. In addition traditional techniques for farming, extraction, herding, or other means of producing food have a low yield. The productivity from traditional methods is insufficient to support current population levels.

Making the problem of extreme poverty worse is the fact that the number of people living in conditions of absolute poverty are increasing in many areas. At least 80 percent of the world's poor live in rural areas away from the resources that cities provide. Poor health decreases the productivity of those living in extreme poverty as well. At least 400 million people suffer from chronic diseases such as tuberculosis, malaria, other insect-borne diseases, and worms from polluted waters. The growing spread of HIV/AIDS has only worsened the problem. Adding to the poor health of those living in extreme poverty is their reduced caloric intake. At least 600 million people receive less than the needed calories for good health.

The conditions of rural life for those in extreme poverty have led millions to transfer the problem to urban centers around the world. A great number of the cities of the world now have shantytowns or other areas

Extreme poverty, also known as absolute poverty, has been defined by the United Nations as a poverty line of living on less than \$1 a day. As shown above, extreme poverty is not restricted to urban areas, but occurs mostly in rural settings all over the world.

filled with the rural poor who, by moving, have become the urban poor. The mass migration of the rural poor living in extreme poverty has fueled the massive illegal immigration into the industrialized countries in Europe and in North America.

The problem of extreme poverty is mixed. In some places extreme poverty is decreasing. In other areas it is increasing. In the former Soviet Union, Africa, and in much of Latin America it is increasing. However, in Mexico, China, India, and other countries it is decreasing. In Mexico the continued flow of remittances sent by Mexican Americans back to Mexico, along with the absence of large numbers of Mexicans in Mexico, has transferred part of the problem to the United States, while transferring solutions back to Mexico in the form of dollars amounting to many billions each year. The long-term effect is that Mexico is being transformed economically.

A similar effect is occurring in both China and India. As their growing populations of educated people are able to earn more by cheaply manufacturing enormous amounts of goods and services, the more poverty is reduced. Some of the reduction is due to globalization that permits intellectual work and services to be done in China or India at lower costs but for locally high rewards. The economic impact is to spread wealth that eventually reaches some of those in extreme poverty.

In contrast is sub-Saharan Africa, where the number of people living in extreme poverty has doubled in the last 20 years to over 400 million from 165 million in 1981. The reasons for the great increase include high birthrates, drought, and other environmental conditions contributing to poor harvests.

Solutions for dealing with extreme poverty have been formalized into the Millennium Development

Victims of extreme or absolute poverty can be found in the crowded cities of developed nations.

Goals adopted by the United Nations. The overall goal is to reduce extreme poverty in the world by half by the year 2010. Others have adopted the goal of reducing extreme poverty by the year 2015. To the goal of reduction is added the target of economic development that has environmental integrity, so that economic development can be sustainable.

In the last quarter of the 20th century, ideas about poverty developed rapidly, as did proposals for solutions. The major definition of extreme poverty has developed along the lines of a monetary definition. The problem with this definition is that many millions of those living in extreme poverty are in barter economies where money is scarce.

Measuring poverty for a particular country is difficult and not easily defined. A poverty line sets a level of consumption below which an individual, family, or a household is considered impoverished. The setting of such a line is somewhat arbitrary. How does one measure enough income to feed a family? It may be that the family members are all of small stature and have excellent metabolisms. The amount of food they need for sedentary work is not the same as that of a family whose members are all over six feet tall or are engaged in vigorous physical labor; they will need much more caloric intake.

Poverty lines are scientific constructions by social scientists and were originally set as food minimums, or "baskets." However, the price of food varies, the work to get the price of a meal varies, and other factors come into play. Despite their inherent difficulties, the use of poverty lines has remained the standard for the lack of an alternative. Poverty lines are useful to bureaucrats, policymakers, and other administrators of poverty-relief programs. They are also politically and economically useful.

Setting poverty lines is actually the work of politicians. However, to accurately measure poverty there is a need to shield those who gather the data on poverty rates and calculate the degree of poverty from negative political interference. The United Nations is the official bureaucracy that has set the income line or poverty line for extreme poverty at living on less than \$1 a day. This definition of extreme poverty is clear and has rhetorical value in the United States and elsewhere in the world. It is also actually close to the poverty minimum used by the poorest countries.

The use of the extreme poverty limit of less than \$1 a day also allows the World Bank, nongovernmental organizations (NGOs), governments, aid agencies, and other groups to easily convert the amount of money needed for describing extreme poverty in a country into local currency.

An alternative is to use purchasing indexes; however, these statistics are not available in many countries. In addition, using a market basket concept has the problem that the basket of goods varies widely across the planet.

An additional problem with achieving the goal of reducing extreme poverty is the fact that China and India accounted in 1990 for 60 percent of the people in extreme poverty. Cutting this figure for these two growing economic countries is achievable. However, in Latin America, Africa, and elsewhere there is little that is being accomplished in halving the presence of extreme poverty. It is also the case that most of the world population living in extreme poverty is surviving well enough to reproduce, thus increasing their numbers to add even more to the problem.

Politically there are numerous forces working to meet the goal of halving extreme poverty. In the United States a number of states and cities have joined the campaign to Make Poverty History, a United Kingdombased umbrella organization dedicated to fighting extreme poverty.

According to the Make Poverty History organization, "Every single day, 30,000 children are dying as a result of extreme poverty. The gap between the world's rich and poor has never been wider. Malnutrition, AIDS, conflict and illiteracy are a daily reality for millions. But it isn't chance or bad luck that keeps people trapped in bitter, unrelenting poverty. It is man-made factors like a glaringly unjust global trade system, a debt burden so great that it suffocates any chance of recovery, and insufficient and ineffective aid." Make Poverty History has set out to eradicate these problems.

WORLD Poverty

Fabian Society

WHILE WORKING-CLASS organizations in western Europe, Great Britain, and North America increasingly turned to Marxism in response to growing poverty caused by urbanization and industrialization in the late 19th and early 20th centuries, middle-class reformers focused on legislation to achieve social reform. This was most evident in the establishment of the Fabian Society as a non-Marxist strand of British socialism.

Emphasizing "gradualism" and state-sponsored reform, Fabianism reflected the social values of the predominantly middle-class intelligentsia that had been instrumental in its founding. Established in 1884, the Fabian Society included prominent Victorian writers and intellectuals such as George Bernard Shaw, Annie Besant, Edward Carpenter, Sidney and Beatrice Webb, and H.G. Wells, along with rising political figures such as Ramsay MacDonald.

With its initial meetings held in the drawing rooms of its affluent members, the Fabian Society would struggle to overcome its characterization as an "intellectual debating club." Although not entirely successful in their efforts to reach the working class, the Fabians had a significant influence on the development of reformist

socialism throughout the English-speaking world through their publication of pamphlets, essays, and books on socialism. The Fabians reached out to the working class and urban poor through the publication of penny tracts such as Why Are the Many Poor? (1884) which argued that capitalism lay at the root of industrial poverty without providing a concrete agenda for social reform. Two years later What Socialism Is (1886), the fourth Fabian penny tract, was presented as a debate between anarchist and collectivist socialist ideals.

While this failure to present a coherent political and social vision reflected the ongoing intellectual debate within the Fabian Society, this vacillation also contributed to the Fabians' difficulty in building a broad-based organization. Throughout the late 19th century, Fabians called for the same broad reforms that were advocated by other middle-class reformers. These included the provision of compulsory free education, the redistribution of unused land to the urban poor, tax reforms that targeted "unearned incomes," the nationalization (with financial compensation) of key industries in transportation and the resource sector, and the municipalization of essential services such as water supply, gas, and public transportation. This focus on "municipal socialism" was advanced in Fabian pamphlets

such as *Socialism in England* (1890) and it became a mainstay of socialist reform throughout the Western world. Perhaps the most significant of these early works was Sidney Webb's *Fabian Essays in Socialism* (1889), which facilitated the expansion of Fabianism into an international movement with the establishment of Fabian Societies in North America, India, Australia, and New Zealand.

Fabians believed that state-sponsored reform was necessary for the creation of a just society and, as with other Victorian reformers, they perceived this transition not as the result of revolution but as the logical result of continued social advancement. Specifically, Fabians saw this change as occurring through the expansion of existing state functions and the gradual adoption by government of an increasingly influential role in regulation and the provision of social services.

In this sense, the Fabian vision of the future closely paralleled the utopian vision advanced by Edward Bellamy in Looking Backward (1888), and this convergence undoubtedly contributed to the growing popularity of Fabian socialism into the 1890s. Into the 20th century Fabian support was also encouraged through the efforts of popular novelist H.G. Wells, whose *The Misery of Boots* was published as a Fabian tract in 1905. Gauging their popularity is difficult as local clubs were formed autonomously and full membership rolls are lacking; however, the true influence of Fabianism should not be judged according to membership but through the wider political and social influence of their ideas.

Advancing the concept of a "national minimum," which had become a key Fabian slogan by the mid-1890s, Sidney and Beatrice Webb's *Industrial Democracy* (1897) helped lay the foundation of the modern welfare state by arguing that the state had a duty to enforce a minimum set of socioeconomic standards for all individuals. Into the early 20th century, Fabians increasingly joined with established labor parties to pursue direct political reform, and their direct social and political influence declined rapidly after World War I as established political parties increasingly adopted social reform policies.

Faith-Based Antipoverty Programs

MOST RELIGIOUS GROUPS are motivated to improve the human condition and routinely engage in social action programs to lift others out of direcircumstances. Indeed, a central mission of many religious groups is to show charity to the less fortunate, and faith-based organizations (FBOs) have engaged in social service efforts long before modern governments became involved in antipoverty activities.

One interfaith group, Call to Renewal, has pledged a Covenant to Overcome Poverty based on the belief that all of humanity is responsible for caring for the vulnerable because all belong to God. It is estimated that millions of individuals across the world are served each year by religious organizations and groups. Moreover, there is strong evidence that faith-based organizations are effective in fighting poverty through the variety of services and activities they offer.

Although faith-based organizations have a long history of providing humanitarian services to the disenfranchised, the popular attention and recognition they have received for doing this type of work have increased only recently. In addition to the increased attention, it appears as though there was an upsurge in antipoverty efforts by these groups during the 1990s.

In a departure from previous administrations and public policy, the official role of FBOs in providing social services was actively promoted by President George W. Bush, who championed the philosophy that FBOs could be compensated for delivering social services. This recent interest in utilizing faith-based organizations to find solutions to problems of humanity, including poverty, is contrasted to previous years when the role of religious groups was dismissed or shunned because it was seen to violate the separation of state and church. It should be noted, however, that recent interest in the role of FBOs is not limited to members of the Republican Party. Other groups, such as Harvard's Kennedy School of Government, have actively investigated how FBOs can address social problems.

A single definition of what constitutes a faith-based organization does not exist, especially when considering the role of faith and religion from an international or global perspective. That said, an FBO is defined as an organization founded on or motivated by religious conviction and includes "local churches, synagogues, temples, and mosques" of varying sizes and scope, according to J.L. Saxon.

FBOs can have a global organization or faith following (for example, Catholic Charities, Lutheran Social Services, Salvation Army, Jewish Family Services, and Nation of Islam) or a rather small local following. Additionally, many faith-based coalitions or partnerships exist that center on antipoverty efforts of diverse denominations and belief systems. That is, faith groups from varied backgrounds are brought together by an organization dedicated to fighting poverty (such as Call to Renewal). Ram A. Cnaan and other authors organized FBOs that provide social services into six categories: local congregations, interfaith agencies and ecumenical coalitions, regionwide groups, national projects, paradenominational relief organizations, and international faith organizations.

FIGHTING POVERTY

FBOs combat poverty through a range of activities or methods that can be grouped into direct and indirect services. Direct services may include identifying individuals in need and providing them with goods or services designed to meet short- and long-term needs. For example, individuals may be provided with food, shelter, clothing, or medical care to meet short-term needs. Some FBOs maintain or provide ongoing support to homeless shelters or soup kitchens, others provide rent or utility assistance. Other direct services may include skills training and education to meet long-term needs, such as language classes, high school equivalency courses, or job-skill enhancement. Services such as childcare, transportation, and legal assistance are also seen as vehicles to fight poverty and are routinely provided by FBOs.

Direct antipoverty activities include both local and international efforts. Locally delivered direct services tend not to garner the media coverage that accompanies large-scale relief efforts to major crises (such as a tsunami, hurricane, or war) or individual trauma (such as a house fire). Critics argue that FBOs, compared to secular social services, tend to focus on relieving immediate needs at the expense of skills development, which may be more effective over the long term. Yet this criti-

cism is not fully supported, as many FBOs center massive efforts on empowering individuals to become self-sufficient and rewarding self-sufficiency.

In addition to easing the burdens of the poor or providing them with opportunities to respond to life's challenges, FBOs engage in indirect services to combat poverty. For example, many FBOs are politically involved and attempt to change legislation believed to support poverty or limit individuals' ability to become more self-sufficient (such as Call to Renewal). They may be involved in sponsoring or supporting media campaigns designed to build awareness of poverty, rallying support for reducing poverty, or supporting political candidates believed to share similar values and views on how to ameliorate poverty (like the Catholic Campaign for Human Development).

Social capital indirectly fights poverty because it provides connections to opportunities.

The efforts of one faith-based coalition, Call to Renewal, identify and support seven principles believed to fight poverty: full participation by people of all races in society; a living family income for all who responsibly work; affordable, quality healthcare for all regardless of income; effective schools; safe and affordable housing; safe and secure neighborhoods; and family-friendly policies and programs in every sector of society.

FBOs also promote social capital, which refers to the building of social ties within a faith group, according to W.H. Lockhart. The creation of social capital indirectly fights poverty because it provides individuals with connections to opportunities; as the adage states, "It's not what you know, but who you know."

EXAMPLES OF FAITH-BASED ORGANIZATIONS

Some examples of prominent FBOs that provide antipoverty services are the Salvation Army, Catholic Charities USA, Lutheran Social Services, Church of Jesus Christ of Latter-day Saints, Jewish Family Services, and other nondenominational organizations such as Feed the Children and World Vision. Several of these and other FBOs are briefly described below.

The Salvation Army operates a Community Development program that seeks to partner with individuals and communities in poverty alleviation. Program initiatives include education, literacy, housing, horticultural training, feeding programs, and the innovative online

conference, "The Salvation Army and the Poor: Voices of Our Global Family." Examples of these initiatives in action include haircutting classes in Rustavi, Georgia, Operation Dagsverk for Ghana, and a new food and nutrition program in the Democratic People's Republic of Korea. The haircutting project gave young people the chance to learn a trade in a community where unemployment is high.

The program also provides many needy people with free haircuts. Operation Dagsverk (Day of Work), a project of the Swedish Student Organization, gave students an opportunity to help provide better educational facilities for their counterparts in Ghana. The project raised more than \$700,000, which the Salvation Army in Ghana will use over several years to improve and expand the country's public schools. The food and nutrition project in the Democratic People's Republic of Korea provides equipment and training to establish a yogurt processing and packaging plant in the country's South Hwanghae Province.

Controversy surrounds giving government funds to FBOs to provide social services.

In addition to providing for local humanitarian efforts, the Church of Jesus Christ of Latter-day Saints (LDS), through the Latter-day Saint Charities, has engaged in international efforts to provide clean water for those who do not have it, wheelchair distribution, vision treatment, and financial assistance. Moreover, the Church of Jesus Christ of Latter-day Saints has developed the Perpetual Education Fund, which pays for the education of members in underdeveloped countries with the expectation that these members will then repay the fund so that others can receive similar opportunities.

On a more local basis, the LDS Church offers employment services that include skills-building and jobsearching components in addition to a program called Deseret Industries that provides jobs for individuals who are temporarily unemployed or difficult to employ because of disability or other social or economic challenges. This program is also used by church leaders to provide clothing and other necessities to individuals in need.

Catholic Charities USA provides a number of direct services that are designed to aid those living in impoverished circumstances. One of these programs is the HUD Housing Counseling Program. Through this pro-

gram, housing counselors are trained to provide homebuyer education, mortgage delinquency and reverse mortgage counseling, relocation counseling, and other services. Catholic Charities USA also advocates for the poor at the policymaking level. For example, this FBO has recently been working to preserve the Social Security program through a vigorous lobbying and educational campaign.

Jewish Family Services has been serving people living in poverty since the late 19th century. In the beginning, this FBO distributed milk and coal to poor families and immigrants. Today the organization offers a broad array of direct services such as help for older adults, programs for adults with developmental disabilities, and food assistance.

Lutheran Services in America is an alliance of the Evangelical Lutheran Church in America, the Lutheran Church-Missouri Synod, and their related social ministry organizations. This FBO has affiliated with it nearly 300 health and human service organizations that provide care in thousands of communities in the United States and the Caribbean. Among the many initiatives supported by this organization are services for the elderly, like the Affordable Housing program offered by Lutheran Senior Services in St. Louis, Missouri, and the Food Service program administered by Lutheran Social Services of Alaska, which provides emergency food assistance to individuals and families in the Anchorage area.

The Friends Committee on National Legislation is a public-interest group founded in 1943 by the Quakers that seeks to influence legislation by directing messages of social justice, peace, and equality to policymakers. Examples of the work this organization is involved in include working to alleviate poverty and other social and economic problems in Haiti by advocating for international intervention and urging U.S. policymakers to increase resources in Native American communities where the poverty rate is extremely high.

In 1964, members of the Nation of Islam formed the Three Year Economic Savings Program, which was designed to help fight poverty, unemployment, hunger, and housing problems. While this program was designed to last only three years, it continues to operate as a means of supporting economic opportunities for African Americans in the United States. Through the Three Year Economic Savings Program, this FBO has purchased 1,500 acres in southwest Georgia for farming. This initiative, known as Muhammad Farms, produces a variety of fruits, vegetables, and grains that are used to feed the needy.

Feed the Children is a Christian, international, non-profit relief organization with headquarters in Oklahoma City, Oklahoma, that delivers food, medicine, clothing, and other necessities to individuals, children, and families who lack these essentials because of famine, war, poverty, or natural disaster. Established 25 years ago, Feed the Children has created and developed one of the world's largest private organizations dedicated to feeding hungry people.

In 2004, Feed the Children shipped 146 million pounds of food and other essentials to children and families in all 50 states and in 57 foreign countries and supplemented 1,040,710 meals a day worldwide. A key goal of this program is to help needy families move past needing help and into becoming self-sufficient members of their community. Through long-term, self-help development programs funded by grants and donors, Feed the Children reports that tens of thousands of families in countries around the world have increased their ability to be self-sufficient by learning and applying new, marketable skills.

Similar to Feed the Children, World Vision is a Christian relief and development organization dedicated to helping children and their communities worldwide reach their full potential by tackling the causes of poverty. To this end, World Vision seeks to help people discover and use their own vision, skills, and resources to move from abject poverty to abundant living by partnering with churches, governments, local organizations, and international agencies.

In Mississippi's Golden Triangle region, religious communities have offered a variety of services to vulnerable populations. Coordinated efforts have produced a system whereby donations from different congregations and organizations are centered in a type of "one-stop-shop" that is staffed by volunteers. To the most vulnerable individuals, disbursements of goods and services are continuous whereas disbursements to those with short-term needs are intermittent.

POLITICAL FACTORS

Poverty programs are being outsourced by the U.S. government to profit-oriented and nonprofit groups, according to Lockhart. One such initiative was legislation known as the Charitable Choice provision, which promoted the opportunity for faith-based organizations to secure federal funds to support the social and humanitarian services they provide.

Controversy surrounds giving government funds to FBOs to provide social services, however. Critics argue

that the practice breaches the constitutionally mandated separation between church and state. On the other hand, the White House contends that this legislation ensures that religious organizations are able to "compete on an equal footing for funds without impairing the religious character of such organizations and without diminishing the religious freedom of the recipients."

Although the Charitable Choice legislation has brought increased attention to this debate, partnerships between secular/state antipoverty groups and FBOs are not new. For example, the U.S. Agency for International Development (USAID), the federal agency charged with helping people overseas struggling to recover from a disaster or striving to live in a free and democratic country, has collaborated with FBOs to fight poverty for more than 20 years.

CONCLUSION

Faith-based organizations have directly and indirectly engaged in antipoverty activities for centuries. Such activities vary from providing immediate support or relief from poverty or suffering to activities that support individuals' long-term self-sufficiency. On an individual level, millions are helped through local FBOs and congregations. On a group or community level, FBOs are addressing large problems within and across nations and also serve millions. While some FBOs have been criticized for using antipoverty efforts as a means to proselytize, many separate their humanitarian services from preaching.

In the United States, political controversy exists about whether FBOs should be able to compete for federal funding to deliver antipoverty services. Long after this controversy has ended, and regardless of the outcome, FBOs will continue to fight poverty in our backyards and across the world.

Family Budgets

THE FAMILY BUDGET COULD best be described as the bundle or basket of resources that the family uses in its day-to-day activities. For most of the industrialized world, this basket takes the form of money; elsewhere the budget might be thought of as stored foods, available time for labor, and other nonfinancial resources. In the United States, the family budget is typically allocated to a range of family needs, including shelter, food, clothing, transportation, and other obligations like medical care or taxes.

The government statistician Mollie Orshansky devised the original concept of the poverty level by determining the various items a family would require to meet its needs, and then applying the costs of these to a family's net, or after-tax, income. Orshansky drew on the U.S. Department of Agriculture's model of a minimum budget (called the "economy food plan") and determined that a family of three would spend approximately a third of its income to meet its basic food needs, and then calculated similar poverty-level budgets for families of differing sizes.

This basic formula remains the marker of poverty today, and is updated yearly by the U.S. Census Bureau so as to account for changes in income, population, and other economic factors. But the poverty level in U.S. families has been distorted by some of the earlier as-

The "shrinking dollar" is a symbol of the family budget among the working poor whose paychecks don't cover basic necessities.

sumptions of the model. During the formulation of what constitutes such a level, most people believed that families could survive on approximately 1.4 times the poverty-level income, while in the contemporary era, citizens think that the poverty-level income is nearly double what families living in poverty actually live on. Households must meet a range of household needs that were rare in the past, including childcare and increased medical, housing, and transportation costs. In fact, food costs are higher than in the original calculation.

Thus family budget in relationship to poverty has several meanings. It obviously means the specific, often government-defined minimum household income necessary to provide some theoretical combination of basic needs. It also means the stream of resources, not all economic, that a family uses to meet its needs. Thus labor, both paid and unpaid, contribute to the family budget, and so do a range of strategies that similarly achieve those needs without affecting the budget (a child's school lunch program, for example). The term becomes even more awkward when applied to poor families in developing countries, who may rely little on

money and much on their own subsistence, labor, and exchanges with family and friends.

Social structure within the family itself plays a role in shaping family budgets. As a family works to stretch meager income, children may contribute to the budget or take over providing for their own needs, a practice common among poor families in the developing world. However, some evidence suggests that this practice also occurs among the poor in the United States. Family members sometimes also keep a small fund for themselves, rather than contributing to the needs of the family as a whole, a pattern that appears particularly common among male family members.

Women are more likely to dedicate their own funds to family rather than personal needs. Poor families also alter their budgets as other families do, working longer hours to increase their income. Barbara Ehrenreich has noted that many of the working poor hold two or even three poorly paying jobs to maintain a degree of economic stability. The budget may also include income acquired from either unreported (informal) or illegal activities, for example unreported vending or babysitting, or sales of illegal goods or services.

Eliminating some things, even things as basic as food, also stretches the family budget. Poor families report skipping meals regularly, particularly during periods when income is scarce, for example the week prior to receiving a monthly assistance check, or during the periods of reduced hours seen in many service occupations. Utilities may be turned on and off and on again; the bus may be forgone in place of a lengthy walk home. The poor change their use of time as well. If no income makes a two-hour walk somehow economically rational, the promise of income and the fear of its loss prompt some to work constantly—to work multiple jobs during multiple hours, reducing sleep, and counting on other family members for work done in the home.

The family budget in the developing world can take a variety of forms, though families will also pursue similar strategies when in need. Rural families will necessarily have far smaller cash budgets, while they can rely somewhat more on their own production, for example what they grow, and upon their own labor. Still, such families are often reduced to borrowing from relatives, trading their own goods for the goods and services of others, participating in available informal economic activities, and skipping basic needs, including food.

Government-mandated family budgets affect policy decisions both in the United States and elsewhere, but they are a fairly static measure of a family's poverty. In the United States, especially, the family budget is woefully outdated, based as it is on historical calculations of family financial obligations that have changed dramatically over the last 40 years. As poverty in the United States rises, a more reasonable measure of the family budget should be devised to create a more effective and successful family policy.

Family Desertion

DESERTION IS A LEGAL term that describes an aspect of family law. In some states, it is called abandonment. Specifically it describes a violation of domestic relations. It is the abandonment or renunciation of marital relations and obligations without cause or legal justification with no intention to return (animus revertendi).

Desertion can be an act by either spouse. It is an act of abandonment without any intention to resume relations. The party deserting does so without the consent of the other party to the marriage. The desertion constitutes wrongful conduct on the part of the party deserting his or her spouse. Unintentional desertion is not grounds for a divorce. Military personnel captured and held prisoner are not viewed as having willingly engaged in desertion. Marriage is usually viewed by the state as a contract. Desertion violates the marriage contract.

In the context of poverty, family desertion and the reulting loss of income can move a family that might have been on the edge of being poor over the line into outright poverty. The law of desertion varies among the states in the United States and around the world. In

some jurisdictions a year's absence is sufficient to establish grounds for divorce. The aggrieved spouse usually shows an absence of more than a year and a day. In other jurisdictions it takes up to five years.

Desertion requires that the desertion party willfully choose to be absent from the marital relationship for at least a year. In a divorce that follows desertion, the aggrieved party may be required to show that the desertion was not caused or provoked by the party left behind. Desertion is one of a number of grounds for divorce. Normally it is not a criminal act, but a civil harm that permits the aggrieved spouse to have grounds for divorce. However, desertion can be criminal if the abandonment occurred as a willful failure to provide for a spouse who was gravely ill or in very necessitous circumstances. Creation of legal grounds for divorce does not address the emotional trauma that is so commonly experienced. Nor does it address the financial difficulties that may be incurred.

Desertion can also occur legally even if the person deserting continues to send financial support. Moreover desertion cannot be established if the party who left was thrown out of the home. Desertion does not occur if the deserting spouse flees the marital relationship because of the other spouse's behavior. However, constructive desertion occurs when one spouse makes life intolerable for the other so that there is no real choice but to leave.

If, for example, a husband is sexually abusive or a wife is frequently so drunk that there is a danger to family members, whether children, the innocent spouse, or others, such that for safety's sake a party flees—this does not constitute desertion. The law will not allow the wrongdoer-spouse who drove the innocent spouse out of the house or the relationship to claim the status of victim in this form of involuntary abandonment.

What may happen is that there is more than one ground for divorce, so the parties involved may settle for irreconcilable differences as the reason for divorce. This means that desertion is not used as a ground for divorce since irreconcilable differences are a more neutral ground. Since more than one ground for divorce may fit a given case, the parties and their attorneys will most likely opt to use irreconcilable differences as a ground for divorce rather than desertion, as the former implies no guilt or wrongdoing on the part of either party. The exercise of this option normally occurs after settlement has been reached.

Desertion is a marital problem that has existed for millennia. However, in the modern world, social trends and pressures have threatened family relations in a destructive way. Among these trends is the breakdown of economic cooperation amidst the growing deinstitutionalization of marriage.

Deinstitutionalization manifests itself in high divorce rates, temporary cohabitation, children born out of wedlock, and marital abuse. By centering attention and authority on the nuclear family rather than on the extended family, marriage relations have been weakened. With marital weakening has come the growth in desertion and divorce. Family desertion is a cause that contributes to increasing poverty rates because it is often coupled with nonsupport.

Family Size and Structure

THE RELATIONSHIP BETWEEN family size and structure and poverty is one fraught with methodological considerations, cultural difference, and moral heat. Methodologically, problems arise in establishing a framework for family size given that understanding of the limits and boundaries of family changes over time and place.

In developed societies the trend over the modern and postmodern period has been toward smaller units defined on the basis of consanguinity and residence. During the mid-20th century, the societal norm (though whether it was the statistical norm may have been another matter) in Europe and the United States focused on the nuclear family, which was seen as the most rational unit for these societies. In its purest form, this was constituted by two spouses in a heterosexual relationship sharing a residence with a small number of biological children.

Despite the attempts of some scholars to show that the nuclear family was a universal feature of human societies, it is now widely regarded as a historically and culturally specific formulation connected to the parameters of the wider economy. The move away from a society based upon agrarian production and an increase in urban living meant that the preceding form of extended family no longer provided economic benefit.

In rural societies in the southern hemisphere, family structure is based on the needs of agrarian production and care for the elderly. In countries with high rates of infant mortality there has traditionally been pressure on families to have more children who contribute economically to the family unit, which allows the extended family to provide care for economically inactive older adults. This is also structured by the absence of formally organized care for the elderly provided by the state or market economy. This makes larger families a prerequisite for a more comfortable life.

Research by C. Portner has interpreted this within the framework of risk management, whereby children can act as a form of insurance from disasters that require labor power. This research supports the theory that family size and structure respond to material circumstances inversely by showing that the less a family in a developed country expects material hardship, the lower the number of births.

Returning to developed nations, family size has continued to fall over the last 30 years. However, by far the most significant trend has been in the parental structure of households, with increases in wealthier nations of households containing only one parent (most often the mother). The precise relationship between parental structure and poverty has been subject to moral debate in these societies.

These debates stem from the observed relationship between single-parent households and a range of outcomes for children, such as decreased educational attainment, increased delinquency, and involvement in sexual activity that are more likely to reduce the labor market position of these children when adults. However, many researchers have argued that it is not family structure per se that influences such outcomes but the circumstances leading to separation or the experience of lone parenting (including reduced access to resources and discrimination against such families). Poverty may be associated with family disruption, but there is still debate over the direction of the relationship and that the nature of family disruption may be more important than the resultant family structure in causality, according to A. Acock and D. Demo.

Some responses have interpreted the single-parent family as a symptom of social exclusion, in which barriers to employment and resources make it the most rational choice for mothers in the absence of potential employed partners. The availability and reliance on state benefits have also been implicated as a disincentive to shared residence of the biological parents. Such an approach, known as the "underclass thesis," is expounded famously by C. Murray, who sees the absence of male employment opportunities and the growth of single-parent households on deprived housing estates as connected phenomena.

Negative consequences for young people raised in such families are implicated; however, the efficacy of community as the path through which disadvantage is passed on is introduced through issues such as cultures of crime and the absence of positive, working role models. However, as the trend for diversity away from the traditional nuclear family becomes more common across the class structure, the associations with negative outcomes should subside.

Family Violence Prevention Fund

THE FAMILY VIOLENCE Prevention Fund (FVPF) began its work in 1980 with a focus on domestic violence education, prevention, and policy reform. The FVPF also helps women and children whose lives are thrown into poverty and wrecked by abuse, because it holds that "every person has a right to live in a home free of violence."

The FVPF works with policymakers to challenge them to take domestic violence seriously, judges to protect the victims of abuse, and the police to train and educate on how to respond in appropriate ways when confronted with domestic violence cases. The FVPF also educates healthcare providers and employers on how to identify victims of abuse and what to do in such cases. Among its accomplishments are establishing one of the first medical service units for domestic violence,

developing a national media campaign on domestic violence, and preparing a national educational curriculum for judges. In 2004, the FVPF organized the national Conference on Health Care and Domestic Violence, Health Consequences over the Lifespan. the FVPF has received awards for its work; it was listed among America's 100 Best Charities in 2002 and 2003, selected for this list by *Worth* magazine based on an analysis of skill, innovation, effectiveness, and strategic insight.

The FVPF works toward setting stricter and longer punishment for those guilty of domestic abuse and violence, and lobbied hard to pass the 1994 Violence Against Women Act, which signaled that progress was being made in the areas of law enforcement, victim assistance, prosecution, and crime prevention. The act made it a crime to cross state lines to continue to abuse a spouse or partner, created tough new penalties for sex offenders, and prohibited anyone facing a restraining order for domestic abuse from possession of a firearm.

In addition, the Violence Against Women Act provided more than \$1.6 billion of federal funds over six years—for police, prosecutors, and prevention service initiatives in cases involving sexual violence or domestic abuse. The FVPF regularly monitors federal legislative activity, provides technical assistance to congressional offices, and works closely with antiviolence and other social justice organizations to educate Congress, the presidential administration, and federal agencies.

The FVPF has international programs as well. CONNECT, a magazine for parents, gives parents and caregivers practical advice on how to talk to kids about respecting women and girls and cultivating healthy relationships. It offers regular features, including a "Parent2Parent" advice column, articles on hot topics such as violent video games, questions and answers with authors and experts, and interviews with parents, teens, and women who grew up in violent homes. A new publication from the Family Violence Prevention Fund, with support from the Avon Foundation and the Wireless Foundation, CONNECT is available online in English and Spanish.

The FVPF is a nonprofit organization with a budget of about \$2.2 million a year, provided mostly by federal and state grants, funds from private foundations and corporations, and through fundraising.

Famine

FAMINE REFERS TO AN extreme and protracted shortage of food, which results in widespread and persistent hunger, emaciation of the affected population, and a substantial increase in the death rates, according to the *Encyclopedia Britannica*. The key defining factor therefore relates to the problem of food scarcity. Thus to understand what constitutes a famine, to analyze its consequences, and to find ways in which its devastation can be minimized, or eliminated altogether, requires the researcher to probe into the question of food scarcity and all that bears upon this issue.

At the simplest level, food scarcity may be seen as the result of an imbalance between the forces of demand and supply within the market for food. Famine, seen as an imbalance between such forces, appears to have a straightforward solution: correct the imbalance—through policy interventions—and the problem is resolved. Unfortunately this simplistic approach does not always work, as the sources of most experiences of famine are only partly economic and substantially political.

Another approach by A.K. Ghose views famine not so much as shortages of food but in terms of a decline in food availability affecting a particular group or groups. This fine distinction makes sense only under some special conditions as the following quotation illustrates:

In a society with a given pattern of distribution of food among the population, a certain level of food supply is required to ensure that even the most disadvantaged sections do not starve. If the food supply falls below this level, the poorest must starve unless the decline in the food supply itself leads to a reduction in the inequality of food distribution. Since it can be plausibly argued that a decline in food supply typically leads to a worsening of food distribution, reductions in food supply can clearly cause famine.

But, firstly, it still can not be argued that famines are necessarily caused by reductions in food supply. Secondly, since changes in food distribution in consequence of reductions in food supply are of crucial importance in determining the overall effects, reductions in food supply in themselves do not have much predictive power. A 10 percent decline in food supply may lead to a major famine in one situation but to only a minor squeeze on some people's food consumption in another.

For Ghose the relevant distinction is between levels of food availability across a given population.

Less enlightened interpretations of the causes of famine attribute its principal origins to climatic and environmental changes. These arguments regard drought, unusually heavy rains—leading to flooding—and crop disease as the key forces behind food scarcity.

AGRICULTURAL PRODUCTION

Ideas such as these are generally based on either the Malthusian principle of man's inability to feed evergrowing populations or the use of inappropriate policies with unwelcome side effects such as those prompted by ecological dysfunction. The work of Professor Paul Ehrlich is well-known for covering both the Malthusian and the ecological disaster strands of thinking on this topic. His early 1970s contribution, *The Population Bomb*, is well-known for arguing against aid disbursements to countries such as China and India on the grounds that such assistance will only prolong the suffering of those in need.

Overall, it seems fair to suggest that the scientific basis of these assertions has weakened considerably with the passage of time. This evidence is perhaps at its strongest when considering the substantial improvements seen in agricultural productivity throughout the past 100 years or so. In the developed world, the improvements have been occasioned through increased use of more effective mechanized equipment as well as better use of seed technology and fertilizers.

In the United States for example, agricultural productivity improved by a factor of 30 or so during the 1900–70 period alone. Much of western Europe has experienced similar levels of growth. With the so-called

Green revolution there have been impressive experiences in a number of developing countries as well. With such overall macrolevel successes the more localized and microlevel—though calamitous all the same—issues of famine appear as being man-made.

Modern-day economic analysis suggests that climatic and environmental challenges, whether occasioned by a growing population or by some other cause, cannot be held solely responsible for food scarcity-induced experiences of famine. Mainstream economists' interest in analyzing famines was sparked by the work of A.K. Sen. Economists and demographers, for example S. Preston and J. Simon, have argued that a protracted experience of food scarcity is largely unconnected to changes in population or environmental problems. Common thinking among these groups is that while rapid population change and environmental degradation may exacerbate food scarcity, they will not act as its main motivators.

ECONOMIC INCENTIVES

In any event, the economic dimension of the experience of famine may be addressed through introducing appropriate economic incentives. If the incentives fail to deliver on solutions, one may attempt to fine-tune the policy (and the incentives) over time so as to get closer to the desired outcome. In reality this process may, of course, require many rounds of planning and negotiations with different stakeholders before it has any chance of success.

The political dimension of famine is much tougher to address successfully.

And confidence in the workability of this approach is only likely to be high if there is a fundamental belief in the sanctity of market forces and the economic incentive systems they support. An alternative view holds that public action can be a powerful force in addressing many of the economic and other challenges posed by the threat of famine. J. Drèze notes that very often famines originate in a crisis of rural livelihoods, which may or may not be linked to crop and other failures. A powerful solution to this can be found in policies that are designed to reinvigorate income-earning opportunities across a spectrum of activities, including food production. But in addition to food production these activities may include pastoralism and rural crafts.

The political dimension of the experience of famine is generally much tougher to address successfully; seminal work in this area includes the work of Sen, Drèze, and Ghose. This assertion is based on a widespread belief that the key drivers are vested interests that are usually embedded in individual, tribal, or national movements. What unites these overlapping groups is their allegiance to a common religion, language, history, culture, or ethnic origin. These ties are often intermeshed with wider issues involving access to resources such as land and water, as well as broader considerations over sovereignty, legitimacy of rule, and the political system.

It is the bonding effects associated with the strength of such allegiances, not to mention the prospect of personal and/or group gain, that regularly lead to conflict. In the line of thinking promoted through the writings of Drèze and Sen, it is conflict—or rather the desire to move away from conflict areas—that drives people away from their homes and livelihoods. It is this displacement that diminishes capabilities and, through that, loss of access to previously established systems of property rights, and finally loss of access to food and the sources of food. The historical records on this are quite revealing, as the table below illustrates:

Period	Region	Main Explanation
1899–1900	India	Drought
1920–21	North China	Drought
1921–22	Soviet Union	Drought
1928–29	China	Drought
1932-34	Soviet Union	Collectivization
1941-42	Poland	War
1941–43	Greece	War
1941–44	Soviet Union	War
1943-44	India	Speculation
1947	Soviet Union	Collectivization
1960-61	Congo	War
1965	India	Drought
1967–69	Nigeria	War
1968-74	Sahel	Drought
1973	Ethiopia	Drought
1974	Bangladesh	Floods
1974	Somalia	Drought
1975–79	Cambodia	War

Of the 18 or so major cases of food scarcity outlined above (among others), nine appear to have been caused by natural disasters (such as extreme drought or flooding), six relate to either international or civil war, and the rest appear to be largely due to other man-made phenomena such as speculative activity (Bengal famine of 1943), or poor policy choices by the state (such as the collectivization programs of the early 1930s in the Soviet Union).

Adding to these are the mid-1990s famines in southern and central Africa (in particular Rwanda), in the former Yugoslav republics, and within North Korea in the mid- to late 1990s. The first of these two cases coincided with the experience of genocide and war. The last example—insofar as may be clear from the outside—was the result of failing economic policies, a subject taken up by M. Woo-Cummings.

POLITICS AND FAMINE

But, as well as many of the issues just mentioned, Sen has raised a far more subtle point. He argues that non-democratic political systems have little incentive to deliver on political pledges, except perhaps for those made to their most immediate band of supporters. Being basically unaccountable to the wider electorate means that nondemocratically appointed rulers do not fear the wrath of the population should their policies fail. Thus poor policy choices may result in the development of a whole host of problems, including those relating to food scarcity.

Those societies following the principles of representative rule (based on the doctrine of democracy), on the other hand, are more likely to end up with politicians who are more careful about the decisions they make. A poor decision leading to problems such as food scarcity is certain to result in voter disapproval at the ballot box. As such, perhaps the most effective approach to preventing a famine—according to Sen—is for the political system to be democratically instituted. Democracies typically enjoy a free press that, as a whole, will feel unencumbered by allegiance to one particular political dogma or another. Motivated by their desire to "sell" news, members of the press will champion the rights of citizens and provide exposés of those politicians who regularly fail to meet their expectation in the delivery of good service.

A good example of this is cited in an article on famine appearing in the Oxford Companion to Politics of the World. There it is noted that during Mao Zedong's Great Leap Forward, the People's Republic of China experienced a substantial famine. It is further noted that in excess of 15 million deaths occurred there owing to "disrupted production and excessive state procurements from the countryside." Scholars such as Sen have argued that the severity of the famine was exacerbated

through the absence of a free press. Sen has contrasted the Chinese experience with what India went through in the mid-1960s. During 1965–66 the monsoon rains failed for two consecutive years, yet India did not suffer a famine. Sen has attributed this to India's freedom of press.

In connection with this, Sen also notes that democratic systems provide greater opportunities for economic growth and increases in overall prosperity levels amongst the population. Such "dividends" associated with open systems of government provide the best guarantees against the recurring nightmare of famines.

FOOD SECURITY

A different approach to the discussion of famine would be to describe it in terms that would include aspects of food sovereignty, and by extension human security. This alternative approach will of course embrace discussions of food availability, shortage, and distribution. But the main focus will be one in which broader institutional issues are discussed and reviewed. Under such an approach the myriad complex challenges facing a developing economy undergoing political and other forms of transition can be argued as giving rise to famine situations.

Achieving food security means ensuring that sufficient food is available.

In this context S. Wright reminds us of the United Nations' Food and Agricultural Organization's position by reporting that food security is attained when "all people, at all times, have physical and economic access to sufficient, safe and nutritious food to meet their dietary needs and food preferences for an active and healthy life. Achieving food security means ensuring that sufficient food is available, that supplies are relatively stable and that those in need of food can obtain it."

Drèze gives a clear articulation of the challenges faced on food security through his identification of short-term and long-term tasks. Drèze calls for public action, which, he maintains, assists in the following manner. First, this kind of involvement helps by reducing the likelihood of the threat to the livelihoods of vulnerable groups. Second, public action can provide short-term relief to any of the affected groups once the threat of famine actually materializes.

The whole debate on food security has prompted a number of governmental and nongovernmental agencies to pursue well-meaning initiatives such as those involving the setting up and monitoring of "early warning systems." One such organization—which has the backing of the United States Agency for International Development—is the Famine Early Warning Systems network (or FEWS), focusing on 20 African countries as well as Afghanistan and Haiti. The African states included in the program are Angola, Burkina Faso, Chad, Djibouti, Eritrea, Ethiopia, Kenya, Malawi, Mali, Mauritania, Mozambique, Niger, Rwanda, Senegal, Somalia, Sudan, Tanzania, Uganda, Zambia, and Zimbabwe. Other agencies, such as Meso-American Famine Early Warning System (MFEWS), focus on other parts of the world.

FEWS relies on a series of innovative measures and approaches in order to monitor food security for the areas mentioned. For example, the agency relies on a combination of livelihood zone maps, baseline reports (a detailed description and analysis of livelihoods and livelihood zones), livelihood profiles (summary descriptions of livelihood zones), and needs assessment reports (analysis of recent conditions and needs).

The reliability of these instruments is based on the fact that much of the data-gathering exercise occurs at the village level, relying on first-hand accounts of how people obtain their vital resources. This data-gathering exercise is supported by the work of staff from government and nongovernment agencies, and market participants such as stallholders.

Other information sources (of a secondary type) rely on research papers and environmental statistics. Faced with a real emergency, agencies such as FEWS rely on livelihood analysis extensively, as it provides a useful framework for reading and understanding early-warning information about an upcoming crisis, whatever its origins. These livelihood analyses form the basis of many of the "alerts" issued by such agencies.

NATIONAL GOVERNMENTS

Useful as the work of relief and monitoring agencies is to the overall work required to identify and prevent famines, their contribution cannot flourish without the active cooperation and participation of national governments.

As Drèze has noted, "while the participation of international relief agencies as well as local communities can be important, neither have the opportunity to draw on the extensive informational, administrative and logistic resources that are readily available to national governments."

Drèze also notes that national governments are not always eager to respond to a famine emergency and have been known to precipitate this in the first place. This is when early-warning systems such as those mentioned above can prove their worth by providing the necessary alerts to the right agencies and groups. However, and another significant point made by Drèze is that in practice the viability of an early-warning system is often predicated on the political motivation, the incentives, and the kinds of pressure felt by the concerned governments rather than on the sophistication of the early-warning systems in place. In a point not too dissimilar to Sen's, he maintains that it is the strength of public institutions, and people's engagement with them, that must act as the best guarantor against the threat of famine. Without this participative approach famines will continue to wreak havoc on vulnerable people's lives.

The obligation to meet the challenges posed by current crises, and avoid continuing catastrophes in the future is both a moral and an ethical obligation tat growing numbers of rich country residents and governments appreciate. An important immediate objective has to be addressing the question of how to galvanize this support into creating stronger representative national bodies whose mission and resources are appropriately focused on the challenge of famine identification and prevention.

Federal Targeted Training

THE GOVERNMENT OF THE United States spends tremendous sums of money each year to train people for jobs in the federal government or for employment in the general economy. Some of the training seeks to help people get a job. Other training seeks to improve the capacity of workers to perform at higher levels in their jobs. Both types of training are aimed at preventing poverty or at lifting people out of poverty.

In order to be more effective in the use of the money spent on training, the federal government "targets" training so that people who need training get it. Moreover, geographical regions that are lacking sufficient workers are promoted as areas that job seekers should go to for training, in order to qualify for those available jobs.

The federal government recognizes that the way in which work must be organized into employment today is a dynamic challenge. Technology alone is forcing people to do new jobs. Old jobs in both governmental and private sectors of the national economy have disappeared. This means that many young people may come to the job market without the skills needed for getting a job. Or older workers may need to be retrained if they are to continue to be useful producers.

It is the philosophy of the federal government that human capital has a supreme value. Accordingly it is the duty of all federal agencies to seek ways to respond to the challenges of the changing employment needs.

In order to implement its philosophy of the supreme value of human capital, the federal government as a matter of policy uses the concept of targeted training in order to be more efficient in the use of the great sums it spends on training. For example the Workforce Investment Act of 1998 (Public Law 105-220) was adopted by the 105th Congress on August 7, 1998. The act's preamble states the purpose of the act is to "consolidate, coordinate, and improve employment, training, literacy, and vocational rehabilitation programs in the United States, and for other purposes." In order to achieve these general goals, the act provides for "the establishment and implementation of programs

targeted to empowerment zones and enterprise communities."

Among the many topics associated with the numerous provisions relevant to targeted training that are spread across the United States Code and the Federal Code of Regulations are such things as "equal opportunity and civil rights," "desktop computer skills," "information technology," and many others. These and other elements of civil rights are part of the targeted training used by the federal government for training the unskilled into employable workers.

According to Anthony P. Carnevale, chairman of the National Commission for Employment Policy, federal targeted job training is explained as: "Congress, the administration, and other interest groups recently have focused much attention on federal job training programs and their ability to adequately prepare American workers for the labor market. Employers require skilled, flexible, and responsive workers. Yet millions of Americans lack the capacity to get and keep jobs in an increasingly sophisticated economy. This is even more true given that our economy is undergoing a period of structural change. The resulting discrepancy between skill level and available jobs is not only detrimental to individuals, it curtails overall economic growth.

"To reduce this disparity between skills and need, the federal government funds programs to educate, train, and place people in permanent, unsubsidized jobs. Job training supplements general education which aims to supply the broad basis of knowledge and understanding needed to function in society as well as in the labor market. However, successful job training is more comprehensive than a simple course of instruction. Individuals must be assessed to determine what training is appropriate to their needs and interests, they must receive supportive services while they are program participants, and be provided with job search assistance when they have completed training. Thus, the term job training often applies not only to instruction itself but to the counseling, assessment, and placement services necessary to successfully link instruction to employment."

Feinstein Foundation

THE FEINSTEIN FOUNDATION was created in 1991 in Rhode Island by Alan Shawn Feinstein, a nationally known philanthropist and humanitarian. The foundation is dedicated to charitable causes, specifically, alleviation of hunger, community service and education, and the values of caring, compassion, and brotherhood.

The foundation is very active, raising money each year to fight hunger and support education. The Feinstein Foundation provided the seed money for the World Hunger Program at Brown University, the first university center to study and try to end the causes of hunger; the World Hunger Brigade, a program that encourages middle school students to study hunger and design programs to fight it; the Feinstein International Famine Center at Tufts University, which carries out projects designed to help reduce hunger in countries around the world; and the Center for Hunger Free America at the University of Rhode Island.

In 1994, Providence College, through a grant of \$5 million from the foundation, established the Feinstein Institute for Public Service and a bachelor's degree program in public/community service studies, the first major of its kind in the nation. The program provides the opportunity for students to select either a major or minor in public/community service. In addition, the institute will develop a Community Service Clearing House and Resource Center. An additional grant of \$1 million has been provided to the college to establish an endowment fund for scholarships for students electing to major in community/public service.

The Feinstein Foundation supports several other educational programs, such as the Middle School Youth Hunger Brigade, where students learn about the causes and effects of hunger and take action to address the problem in their communities. A resource guide is provided to all participating schools.

Schools are given cash awards for outstanding reporting on their help to agencies aiding the needy in their communities. This program is now being disseminated nationally. Another program is the I Can Make a Difference elementary school program, in which over

100,000 children have participated. Students are provided with journals in which they record their good deeds and other acts of kindness that make a positive difference in the lives of others. Teachers are provided with instructional guidance and other incentives, including grants, for projects they undertake with their classes to help better their communities. Community Service Learning Programs, or grants, are awarded to high schools to establish programs that support and promote community involvement, and the Enriching America Program awards grants to higher education institutions to establish such programs at their institutions.

The foundation established a magnet high school for Community and Public Service, first in Rhode Island, to have service written into the curriculum. The foundation also sponsors several service-based scholarships. A Feinstein grant of \$500,000 was given to initiate a joint doctoral program at the University of Rhode Island and Rhode Island College, where community service is an integral part of the curriculum. All graduates of this program are known as Feinstein Fellows.

Feminist Approaches to Poverty

THOUGH IT IS NOT PUBLICLY well-known, feminism has historically had a relationship with poverty alleviation. During the rise of second-wave feminism in the 1960s and 1970s, feminists were active in the welfare rights movement and in understanding the impact of divorce on reducing women's income. This was a development that led to the displaced homemakers' movement and an understanding of how women in developing countries seemed to be more often poor

than their male counterparts. This last category led to the feminist critique of modernization theory and greater awareness of incorporating a feminist perspective into development. Feminist approaches have also incorporated poor women's (and men's) own understandings of their experience, suggesting that solutions to poverty are best understood by the poor themselves. Thus feminist approaches often incorporate some degree of self-help or participation by the poor with a feminist philosophy underpinning the project.

Feminist approaches are generally critical of traditional assumptions about poverty and its alleviation. Such approaches are diverse, ranging from those that may assist a small group of women and their children to larger-scale projects that aim to aid a community or other large group. Further, feminist scholars with an interest in poverty and its alleviation have produced innumerable papers, articles, and books about poverty and women, an outcome that is likely to continue. Feminism has ideally combined theory and praxis, and some succeed at this, providing both applicable experience and its theoretical understanding, though in practice these two streams are often separate but interrelated.

HISTORY

Feminism came of age in the 1960s, and its rise is often attributed to the popularity of Betty Friedan's *The Feminine Mystique*. While this certainly played a part in some women's growing awareness of their subordinate status, for others participation in the social justice movements of the 1960s was more important. Collegeage women participated in many of the early civil rights groups and were active during the Freedom Summer of 1964.

These experiences changed many participants, who became active in such groups as the National Welfare Rights Organization and other organizations with a special focus on poor mothers. Such participation led feminists to question assumptions made about poor women, particularly those receiving welfare. Welfare or Aid to Dependent Children (AFDC), as it was then known, had historically been a state-provided widow's pension that preceded Social Security.

In its early years, single mothers and women of color generally were barred from receiving benefits. However, over time, its composition changed. Widows received Social Security survivors' benefits and left the welfare system. Pressure to allow African Americans to receive benefits rose. And African Americans began migrating north for industrial jobs, sometimes applying

for benefits to tide them over or to support a family that had been displaced.

In some sense, the system had shifted from what most Americans considered the deserving poor, white mothers who had lost their husbands owing to death, to those who were undeserving, black mothers who were regarded with suspicion because of an unreflective racism that defined blacks as inherently lazy and immoral. The feminist critique added the dimension of gender, asking why women were shouldering the complete child-rearing burden. Feminists also asked why women were subjected to demeaning inquiries about their sexual behavior, why their homes were raided to search for the presence of men (men were assumed to provide women with money beyond their welfare payments), and why women were tracked into poorly paid but gender-appropriate jobs.

FAMILY AND FEMINIZATION OF POVERTY

There were also growing concerns about the feminization of poverty. The complicated relationship among welfare, race, and gender suggested that women carried a greater burden. First, women nearly always contributed the majority of labor in childcare. This included not just the act of caring for a child, but also meant a woman pursued any job she might have around a schedule dictated by childcare. She thought more often about what needs a child might have. It was more often her time and perhaps her money that were taken up when a child fell ill or a parent needed to visit school.

Second, women's jobs were concentrated in a "ghetto" of low-paying work. The most prestigious, though still low-paying, replicated women's caregiving role: teachers, nurses, social workers, and even secretaries placed women in jobs where they performed for pay some services they also performed at home. Other jobs might incorporate the caregiver role: babysitter, maid or domestic, hairdresser, waitress.

A third category included the sorts of poorly paid service and industrial work that fell to women: retail sales, some food service work, and assembly-line work. Many such jobs, poorly paid and inflexible, did not provide a wage sufficient for a woman to support herself and her children. Practically speaking, women were dependent upon a breadwinner husband to support the family even if they too worked.

During this period, other social changes were occurring as well, including changes in divorce law. These changes provided a clear picture of women's limited fi-

nancial options. For those women whose work-history had been exclusively in the home, their sudden reliance upon their own income led to a dramatic drop in living standards. With little work experience, they were thrust into poorly paying jobs requiring little experience or into entry positions with low salaries. These so-called displaced homemakers became activists when they began to organize with feminists to provide help for such women, including helping to sponsor, eventually, state and federal legislation.

Development projects tended to diminish or eliminate women's productive activities.

Because women are nearly always integrally involved in family life, female poverty and the family intersect in complex ways. Women's work within the home carries no economic value in most policy decisions; when women enter the workforce they may need to pay for childcare or ask children to take care of themselves.

In the United States, where social welfare benefits are limited, mothers in general juggle a range of household demands and activities that require both their time and their money. For poor women these demands are greater. For a poor woman working several jobs, household work is shifted to children, friends, or relatives. The feminist critique asks why women's work, so vital, is so undervalued. The interest on the part of feminism in childcare and in a variety of family arrangements is in part based on this question, that is, how is all work distributed so that families may survive with a degree of security?

WOMEN AND DEVELOPMENT

Some success with all these ideas has come about in the inquiry about the impact of economic development upon women in the developing world. Economic assistance to poor countries had increased after World War II, at least in part as a means to revitalize and stabilize Germany, Italy, and Japan after their defeat by Allied forces.

Development officials hoped that dynamic, economically stable nations would be more apt to develop and maintain democracies and to increase their trade relations with other democratic countries. Postwar economic development accepted and promoted Euro-American ideas: democracy, free and open markets, and

the sort of disconnected nuclear-family structure that Americans tended to take for granted. This set of assumptions, codified as modernization theory, drove much development throughout Europe and the developing world. However, development appeared to affect men and women differently, and this fact led to a debate among feminist development scholars about its effectiveness.

Ester Boserup notes that in those places where women were active in production, the introduction of development projects tended to diminish or eliminate women's productive activities. In parts of Africa, for example, women were the primary farmers in a family; when development projects targeted men for agricultural assistance, women's control of farming and their family status both declined. The traditional development paradigm assumed that overall development would improve women along with others, but in fact the opposite appeared to be true.

Credit or microcredit banks are popular and fairly successful among poor women.

Others, writing from the socialist perspective, argued that Boserup did not go far enough in exploring the impact of development. Such schemes tended to benefit those at the top of social and economic hierarchies, which usually meant men and individuals with higher rank and social capital. While women had some bargaining power in their traditional subsistence roles, this declined with development, and inequalities between men and women increased. Such inequalities tended to hit women harder as men became less likely to share income and to provide for children, especially daughters.

Development projects and strategies that aim at improving women's lives are likely then to work with women, providing them some avenue of support in both their domestic and public lives. Such projects will also aim at giving women some control over their activities and participation in the organization, the goal being to empower those who participate in the project. Projects involving the lending of credit or so-called microcredit banks are both popular and fairly successful among poor women around the world.

Some such banks may make loans only to women (the Grameen Bank of Bangladesh is one such example) while others may loan to any poor applicant. Loans are very small, and are usually used to set up a small homebased business that will permit a woman to earn a living and support a family. Such banks have a strong record of repayment and involve women in the administration and collection of loans.

Other projects include cooperatives that produce a range of commodities and invest the income or distribute it in some form to members. Some development projects involve women in self-help literacy and family health groups. Women transmit what they learn to other members of their families, creating a ripple effect through a given community. Small-scale projects that improve domestic labor are also common. Such projects might alter a common technology, for example a cooking method that allows women to redirect their time both from cooking itself and from its related activities, for example, gathering firewood. By being aware of the range of activities that women perform and how these affect the family and community, feminist approaches to development affect women directly and their families as well.

Feminization of Poverty

THE NOTION OF the feminization of poverty indicates the growth in the number of women in poverty and the vulnerability of women to economic, social, cultural, legal, and political conditions. The factors associated with this growth vary from one region to another according to social, demographic, and economic settings. The feminization of poverty is linked to un-

equal access to and distribution of resources, a lack of control over productive resources, and limited participation in political and economic institutions. Among the most important factors are cultural norms, social perceptions, interpersonal behavior, civil strife, family structure, and public policies.

In its 1995 report on poverty, UNDP stated that poverty had a woman's face.

It is believed that the term feminization of poverty originated in the late 1970s in the United States during debates on the welfare system and single mothers. Critics were arguing that the welfare system in the United States not only did not free the poor from the grasp of poverty but also, in fact, increased the number of women depending on the welfare system and living in poverty. The data gathered from regions as diverse as Africa, Europe, and Asia have demonstrated that women around the globe tend to constitute the majority of people living in poverty.

The United Nations Development Program (UNDP) also supports this claim. In its 1995 report on poverty, UNDP stated that poverty has a woman's face: of 1.3 billion people living in poverty, 70 percent are women. It is estimated that nearly 900 million women in the world have incomes of less than \$1 a day.

However, there are conflicting views on the subject. Some scholars argue that, indeed, there was a substantial increase in the percentage of poor women, but it occurred in the 1960s, not in the 1970s or 1980s as is often said. Nevertheless these scholars admit that the trend in feminization was more severe for black women than for white, with the percent are of black poor who were women continuing to increase in the 1970s, albeit not as rapidly as in the 1960s.

Scholars, however, agree that the feminization of poverty among women results from a number of social and economic factors, including dramatic changes in family structure, as well as gender inequality, class division, economic restructuring, changing demographics, and shifts in government policies. Interest in poverty and gender inequality sparked a new wave of discussions of the feminization-of-poverty phenomenon in academia, among politicians, and in the media.

Moreover, the concept of the feminization of poverty not only was widely discussed by academia, politicians, and the media, but also it was a central point in the debates at international forums. Several United Nations bodies at international conferences analyzed the global situation of women and refined and incorporated the concept into documents, laws, and regulations.

The discussions center on issues concerning gender disparities and the ways of measuring gender biases in poverty, endowment, cultural norms, institutional structures, interpersonal behavior, economic restructuring, democratization, and public policies. Nevertheless, the concept of the feminization of poverty has been clouded by a number of criticisms, questioning for instance the process of women falling into poverty, or the usage of gender trends to explain women's poverty, or the classification of women based on class, age, or race.

Despite the critical assessment of the concept of the feminization of poverty, it is still used to understand and explain current trends in the state of women in poverty and the reasons behind it. The main perspectives include gender, rights and entitlements, cultural norms, demographics, and public policy.

GENDER PARADIGM

Many studies on the subject believe that gender is the key driver in power relationships in social life at the household, community, and society levels. Gender affects not only labor division, apportionment of employment, income, capital, education, goods, and public services, but also the distribution of power and access to decision-making. This, in turn, results in gender biases in national legislation and international laws.

Moreover, it is believed that women are more vulnerable to chronic poverty because of gender inequalities, which come in the form of income distribution and access to credit. A positive example of the Grameen Model of microfinance exists in Bangladesh that has caused a shift in values and expectations that affect women's roles in society and where poor women have the best credit ratings, and credit extended to women has a much greater impact on household consumption and quality of life of children. But still other evidence shows that microfinance institutions were not able to make women become more socially, politically, and personally empowered and gain sustainable economic strength through financial self-sustainability.

Women in general do not have control of property and income earned through work. They have limited access to resources and the labor market. As empirical studies show, the status of women in the labor market is significantly lower than that of men in terms of the nature, conditions, and quality of the jobs available to them.

According to the U.S. Census Bureau and data from the Survey of Income and Program Participants (SPP), roughly 43.1 percent of women ages 25 to 54 who experienced job accessions, entered the low-paying service-producing industries. The majority of these women (82.9 percent) were paid by the hour at an average rate of pay of \$4.84.

The remaining women were paid weekly and had an average weekly pay of \$196. In contrast, only 28.8 percent of men ages 25 to 54 who experienced job accessions entered the low-paying service-producing industries. Most of these men (64.7 percent) were paid hourly, with an average wage rate of \$6.62. The men who were paid weekly had an average salary of \$374, significantly more than the women entering the same industry.

When factories, plants, or businesses close and/or employees are laid off, women usually experience unemployment much longer than men and have lower wages when entering a new job or get unequal compensation for the same work. The decline in real wages greatly affects families where women are primary breadwinners. With the drop in wages and income coupled with the discrimination and inequalities, women's poverty rates increase at a rate much faster than men's.

Women often have inadequate rights to land, labor, housing, or any other property.

The domestic activities of child-rearing and managing the home are not valued, although this labor often subsidizes men, enabling them to work and employers to profit. Moreover, caring for and teaching children, nursing the sick, preparing food, cleaning, serving others, and managing a household, which are considered women's work, evolved into the public sphere and gave rise to female-dominated sectors—healthcare, teaching, clerical work, and sales and service jobs—that have very low wages.

Some researchers have found that in many societies, in order to get higher incomes, women have to work more hours than men and they have lower education and limited access to knowledge. Without access to knowledge and education, women's and girls' opportunities to reach economic independence and self-determination through participation in economic activities, such as employment or business development, are more

difficult and options and choices are very much limited. They also suffer gender-based obstacles in the trade arena that make it difficult to undertake trading activities with the same ease and grip as their male counterparts.

Because of such gender inequalities, women in search of higher wages and incomes often are pushed out of their countries of origin and join a stream of migrants. Although they might remit significant money to their families back home, they frequently face all the challenges of migration, including unequal treatment, harassment, and abuse.

Gender differentiation in the social, economic, and political fields results in unequal distribution of resources, leading to women experiencing a greater severity of poverty than men. Even on a microlevel in the household, the gender disparities result in different access to income, resources, and services. Because of these reasons, women have fewer options to rise out of poverty. Improving the political, legal, cultural, economic, and social status of women is thus pivotal to escaping the poverty trap.

HUMAN RIGHTS AND ENTITLEMENTS

To explain the causes of feminine poverty, it might be useful to look into gender-specific rights and entitlements. These rights may be of economic, social, or cultural character and are of great significance, as they have an effect on poverty and the social and cultural marginalization of women. The marginalization of women negatively affects women's social, economic, and political power. Gendered social constraints determine women's poverty through restricting women's rights both to entitlements and to the enhancement and free exercise of their capabilities.

Women often have inadequate rights to land, labor, housing, or any other property, which are essential for life, survival, and economic security. Moreover, the lack of these rights affects access to credit and the possibility of increasing economic opportunities. Substantial evidence has shown that the lack of the right to control land has extremely harmful effects on women who grow crops for a living, for instance, in some Asian (India, Bangladesh, Sri Lanka, Cambodia) and African countries.

Women often have lower status in their households, communities, and global civil society. There is evidence to demonstrate that because of the weaker and conditional basis of their entitlements, women are generally more vulnerable to poverty. Even in cases where women

The percentage of poor single-parent families is 18 percent in Great Britain, 19 percent in Germany, 20 percent in Italy, 21 percent in Norway, 22 percent in France, 25 percent in Switzerland, 40 percent in Ireland, 52 percent in Canada, and 63 percent in the United States.

own the land or means of production, they are still able to produce lesser amounts of goods and profitably sell them, as they have limited access to markets, services, credits, information, and training. Lower productivity and higher transaction costs often result in business failures.

Despite a great number of international human rights standards, including the Universal Declaration of Human Rights, the Vienna Declaration and Platform of Action, the Convention on the Elimination of All Forms of Discrimination Against Women, and the International Covenant on Economic, Social, and Cultural Rights, the violation of women's rights still remains very real.

Some scholars believe that social and cultural norms have a significant impact on the feminization of poverty. The social and cultural norms and practices that govern the relationships between men and women in a particular society, historical context, or space vary through time and societies. Nevertheless, these norms and practices based on gender, which produce and reproduce views and realities that keep women in situations of subordination, exclusion, and greater poverty, can be found in all societies.

There is substantial evidence to support the claim that gender biases in human rights are deeply planted in cultural norms, customs, traditions, and religious attitudes within households, communities, and societies. These cultural norms, institutional structures, and interpersonal behaviors that reinforce male dominance are based upon a social construct that has been summed up by the word *patriarchy*. Thus, based on patriarchal practices and structures, women are limited in rights and entitlements. This leads to a situation in which

women remain powerless and dependent on men. The unequal power relations diminish women's self-determination and limit their economic opportunities.

Although a number of international laws and regulations stress that women's human rights cannot be violated on the grounds of cultural or religious norms, gender inequalities that are entrenched in cultural norms beliefs, and ideologies trap women in poverty from one generation to the next. The legacy of patriarchy in all societies remains to this day in cultural norms, and institutional and family structures. Its persistence influences all forms of social interaction, including poverty reduction strategies.

DEMOGRAPHICS

Studies have demonstrated that although historically class and race had been the principal structural determinants of poverty, the increasing tendency of women to seek jobs or to maintain households alone has introduced a new variable into the equation: demography. Demographic factors contributing to the increase in female-headed households around the world include changes in mortality and life expectancy, marriage rates, divorce, widowhood and separations, and out-of-wed-lock births. Demographic changes mean that the number of families where women are the principal breadwinners is increasing.

Recent observations indicate that households headed by women are more likely to be poor than households headed by men. For example, according to one study, the percentage of poor single-parent families is 18 percent in Great Britain, 19 percent in Germany, 20 percent in Italy, 21 percent in Norway, 22 percent in France, 25 percent in Switzerland, 40 percent in Ireland, 52 percent in Canada, and 63 percent in the United States. And women who suffer with a minimum level of income transmit the poverty to their children. This is particularly true for the daughters, who are often obliged to quit school to take care of their brothers and sisters while their mothers work.

Moreover, some studies have demonstrated that poor young women, particularly minority women, are more likely to become single mothers. In addition, women who are ethnic minorities, refugees, disabled, or elderly are much more prone to fall into poverty than others, as they are more excluded from societal institutions.

In 1984, for instance, the median income of women 65 years and over was \$6,020, compared with \$10,450 for men in the same age category, and 15 percent of all

women age 65 and older had incomes below the official poverty line.

DEMOCRATIZATION

Some scholars are claiming that in democratic societies feminization of poverty has lesser intensity than in other societies. They believe that democratization creates the space for women to improve their representation in government, to gain rights and full citizenship, and to redistribute resources in ways that promote gender equality.

These scholars, however, stress that the realization of gender equality and women's empowerment depends on the ability of women and men to organize, occupy, and heighten the democratic space. Women's participation in decision-making processes, whether at home, at work, or in public life, in turn impacts the democratization process.

POLICIES

The feminization of poverty is closely linked to the economic, social, and policy regimes of any given society. In the United States, for instance, public policies for reducing poverty and welfare dependency since the 1960s have focused primarily on encouraging poor mothers to work. They basically hindered the initiatives of women and failed to consider the differential impact of various factors on women and men. In addition, many of the recent efforts to reform welfare and to assist lowincome families have mainly concentrated on capacity building of low-income mothers through education, job training, increased childcare subsidies, and incentives aimed at motivating individuals to leave the welfare system. While these reform initiatives are important components for improving the economic future of single mothers, they are only part of a more comprehensive structure.

Many analysts claim that these public policies support mothers neither at home nor at work. If single mothers are expected to work toward welfare independence and eventual economic self-sufficiency, there is a strong need for the federal government to adopt public policies that offset the effects of unfavorable macroeconomic circumstances. No individual policy response will alleviate poverty among women. Rather, a multifaceted policy response that recognizes the wide diversity of their situations is necessary. The application of gender analysis to a wide range of policies and programs is therefore critical to poverty reduction strate-

gies. By ignoring the diversity of the poor female population, policymakers will fail to develop policies that address the needs of poor women in all categories.

Feudalism

THE LONG-HELD definition of *feudalism* as a European political and economic system in place from the 9th to the 15th centuries, in which a small elite cadre of lords with military support commanded the work of peasant farmers and held them in servitude, has recently come under scrutiny by medieval historians and has been rejected by many.

For some scholars the term has taken another meaning: a system of personal relationships among members

of the military leaders of the time, which led eventually to the formation of formal government and Western democracy. For some contemporary medieval historians, the terms *lord* and *peasant* have been included within the manorial concept, the manor being the district over which the lord had domain.

The first definition, identifying a European political and economic system, has been the one most widely used to describe that period in history. In that sense, feudalism refers to a social organization in which peasant agriculture is the primary economic activity within the domain of a lord and the peasants are bound to the land and to the lord on condition of service and homage. Many social scientists signal the beginning of what has come to be known as the "cycle of poverty" with feudalism. The cycle of poverty identifies a condition in which people living in poverty tend to remain in that social status simply because there is no opportunity to significantly change the prevailing social and economic conditions.

The peasant farmer was relegated to poverty and a life that came close to sheer survival.

Certainly there is a case to be made that poverty existed in human societies before the Middle Ages. There have always been poor people on the surface of the earth. However, the relatively formal structure of feudalism clearly documented the plight of the peasant in that social setting. The peasant farmer who worked the land paid most of the resulting crop to the lord as rent and taxes, keeping only enough to manage a subsistence lifestyle. With little or no opportunity to acquire savings or gain a reasonable income or property rights to the land, the peasant farmer was relegated to the rigors of poverty and a life that came close to sheer survival. Feudalism kept peasant families in this socioeconomic status for generations.

Feudalism gained prominence in Europe during the 9th century primarily through the absence of strong central governments. Without the guidance and leadership of a central authority, local centers of power will come into play. Europe in that period made no effort to restore the Roman forms of government and opted instead for expedient measures, resulting in the rise of microregional centers of power. In some sense, these centers were relatively isolated because of poor or non-existent transportation corridors and communications systems across Europe, and the continued threat of at-

The social system of feudalism, in which serfs' lives were controlled by lords, often centered on the lord's castle. In return for their fealty, serfs would be protected from outside invaders by the lord, with the serfs taking refuge within the castle walls.

tack by marauding groups from outside the region. In these situations, defense of the society fell to the lord and his military associates, and for this service the peasantry was obliged to serve at the will of the lord.

The regional enclaves were ruled by lords, who received their lands through grants and were expected to govern the area, develop an agricultural economy, and defend the terrain against outside raiders. The feudal leaders began to consider the territory they governed as their private property, which they could pass on to their heirs.

Since money had essentially disappeared from use, Europe had developed a barter system to meet the need for necessities. The fiscal relationship, then, between the lord and peasant was in the form of service to the lord through the growing of agricultural products; payment of crops was made to the lord to satisfy rent and taxes and to get protection of the community by the lord through his military arm.

Control of all aspects of a community's activities was completely in the hands of the lord. Ownership of the fields and forests and all economically viable attributes of the place fell to the lord. The arrangement between the lord and peasants was called homage, or being a servant to the lord, and fealty, being faithful to the lord. This arrangement served as a kind of contract between the lord and the peasant. This social system lasted until the 14th century, when kings sought alternative arrangements to their relationships with regional lords. By the 13th century the economy had moved from an almost exclusively agrarian system to a mixed base. In addition, allegiance to a king at a distance became more possible. By the end of the Middle Ages mechanisms were in place that led to strong monarchies and the emergence of the nation-state system in the 16th century.

Current thinking among medieval historians varies greatly on the use of the term feudalism. Some argue

that the term should not be used at all because the historical record does not support the basic premises of the concept. Others argue that the term should be used in a limited manner and only to address the relationship between the lord and his peasant workers. Despite this controversy, there is no doubt that some measure of poverty existed within these social settings. The peasant workers did not have property rights; they were required to pay taxes to their lords in the form of agricultural products; and they had no opportunity to accumulate savings of any type. Although there are no formal measures of poverty in that era, there is no doubt that socioeconomic conditions in the era of feudalism warrant the use of the term *poverty* to describe the socioeconomic situation.

Fiji

LOCATED IN THE SOUTH Pacific Ocean, the island of Fiji achieved independence from Great Britain in 1970. Two military coups in 1987 were the result of accelerating tensions between native Melanesians and Indians, the descendants of laborers brought to Fiji by the British. A new constitution guaranteed Melanesian control but led to a large exodus of Indians, which in turn created economic problems for the island. Subsequent amendments attempted to restore equity, and free elections were held in 1999. The following year, a coup plunged Fiji into renewed turmoil, but democracy was again restored in August 2001.

Fiji's economy is one of the best developed in the entire Pacific region, in large part because forests, min-

erals, and fishing are abundant. Approximately 70 percent of Fiji's labor force are engaged in agriculture, and much of it is at the subsistence level. Sugar is the leading export crop and most industry is focused on sugar processing. Government revenues profit greatly from the tourist industry, which services between 300,000 and 400,000 visitors a year. The economy is also dependent on regular remittances from Fijians who work in Iraq and Kuwait. The unemployment level stands at 7.6 percent. Other immediate economic concerns revolve around low investment, uncertain landownership, and budgetary shortfalls.

Fiji was experiencing a poverty level of 25.5 percent in 2005. Poverty on the island is determined by an inability to meet basic needs of food, water, shelter, clothing, education, and healthcare. Government data reveal that in addition to those who are already classified as poor, numerous others are in immediate danger of joining their ranks. The majority of those below the poverty line have at least one family member who is employed. The government has created the Ministry of Women, Social Welfare, and Poverty Alleviation to oversee efforts to combat poverty.

Over half of Fijians do not have access to safe drinking water or improved sanitation, and there are only 34 physicians for every 100,000 residents. However, 95 percent of the population have access to affordable essential drugs. Since 1980, life expectancy has been steadily rising. In 2005, the projected life span for Fiji's population of 893,354 was 69.53 years. The median age is 24.28 years. Over 31 percent of the population is under the age of 14, and 4.1 percent has reached the age of 65.

Between 1980 and 2005, Fijian infant mortality fell from 50 to 17 deaths per 1,000 live births. Among all children under the age of 5, the decline during that period was from 61 to 21 per 1,000. Eight percent of Fijian children under the age of 5 are underweight, and 10 percent of infants are underweight at birth. Childhood immunization rates vary from the high 80s to 99 percent among infants and toddlers.

On the average, Fijian women bear 2.75 children each. That number has decreased from 4.2 children per woman in 1980. The adolescent fertility rate is 46 per 1,000 births. Some 44 percent of Fijian women use contraceptives. All births in Fiji occur in the presence of trained medical staff. As a result, the maternal mortality rate has declined. According to modeled estimates for 2000, 75 deaths occur out of every 100,000 live births.

Approximately 94 percent of the population over the age of 15 can read and write. Males are more literate than females, with a rate of 95.5 percent as compared to 91.9 percent. In 1980, reports placed male literacy at 86.7 percent and female literacy at 77.9 percent.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Fillmore, Millard (Administration)

MILLARD FILLMORE BEGAN his political career in New York, and was a founding member of the Anti-Masonic Party and later a Whig. In Congress, Fillmore supported strong protectionist legislation, including the Whig Tariff of 1842. He also supported the antislavery faction of the Whig Party but tended to take moderate positions. He believed that while slavery was evil, its existence in the south was guaranteed by the Constitution.

In 1848, Fillmore received the party's nomination for vice president. His nomination counterbalanced the presidential nomination of the southern slaveowner Zachary Taylor. His vice presidency was mostly notable for his fights over patronage jobs in New York. At the time, almost no one believed that government should play any direct role in alleviating poverty. Rather, the major debate was over the government's role in trying to limit or restrict the expansion of slavery.

Taylor died suddenly in 1850 in the middle of a particular crisis on the issue of slavery. For the previous 30 years, the Missouri Compromise had kept an uneasy peace by limiting expansion of slavery to southern territories and keeping a balance between free and slave states. However, the acquisition of new southern territories threatened to upset that balance. Taylor had pro-

During President Millard Fillmore's time (the early 1850s), the primary antipoverty programs were poorhouses or almshouses.

posed admitting California and New Mexico as free states. This outraged southerners, who saw that they would soon be a minority in Congress if these free states entered the Union.

Fillmore believed in a weak presidency. He felt that Congress better represented the diversity of views in the nation and that the president should not oppose any Constitutional laws passed by Congress. To do otherwise, he believed, could lead to crisis and possibly civil war.

As a result, he reluctantly supported what came to be called the Compromise of 1850 to resolve the crisis. California was admitted as a free state and the status of the new southwestern territories of Utah, New Mexico, Arizona, and Nevada would be organized with the slavery question left up to the new settlers. The agreement also abolished slavery in Washington, D.C.

To assuage southern concerns about changing the balance of free and slave states by admitting California, Congress passed the infamous Fugitive Slave Act, which required northern states to assist in the recapture of escaped slaves and their return to the south. This inflamed northern hostility to slavery, as their African-American neighbors were frequently captured and returned to

slavery in the south. Although a supporter of high tariffs, Fillmore also supported foreign trade. He sent Commodore Matthew Perry to open trade relations with Japan and signed commercial treaties with many other countries. Fillmore supported a failed effort to build a canal connecting the Atlantic and Pacific through Nicaragua.

Poorhouses lost the support of the public and survived as miserable warnings.

Fillmore supported infrastructure as ongoing internal improvements, such as canals and railroads. He was the first president to provide federal support for railroads. The resulting reduced transportation costs allowed for a significant reduction in postal rates. During his three years in office, the federal budget remained under \$50 million, with budget surpluses of about \$4 million each year.

Fillmore's administration did little to alleviate poverty in America during the early 1850s. According to Harvard sociologist Theda Skocpol and Smart Library, poorhouses were the main antipoverty program. "Providing shelter for the poorest of people, they were intended to cut the expense of poor relief, deter potential paupers, lessen the harshness of contemporary poor relief, and improve the character and behavior of the poor. Work was mandatory for able-bodied men, alcohol was prohibited, and begging forbidden. Yet, by the 1850s it was evident that poorhouses were not working as intended.

Skocpol says that "a preoccupation with order, routine, and cost replaced the founders' concern for behavioral and social reform. They were inadequately funded, failed to help needy inmates, and fell prey to corrupt managers. Work was not provided for able-bodied paupers, while the very young, old, and insane were shut up and exploited." Poorhouses soon lost the support of reformers and the public, and survived, says Skocpol, "mainly as miserable warnings to working people to avoid dependency at all costs.""

Fillmore's support for the Compromise of 1850 so outraged abolitionists that the party's antislavery faction withheld its support at the 1852 convention, costing him the nomination. Four years later, Fillmore accepted the presidential nomination of the American Party (the "Know-Nothings"), a strong anti-Catholic, antiforeigner party. Fillmore, however, focused on the need for national unity. He lost overwhelmingly.

During the Civil War, Fillmore remained loyal to the Union, but strongly opposed many of President Abraham Lincoln's wartime policies, including emancipation of the slaves. After the war, Fillmore supported President Andrew Johnson's conciliatory approach to Reconstruction and tended to support Democratic Party policies. He died in 1874.

Financial Markets

FINANCIAL MARKETS, in terms of stock exchanges, are devoted to the buying and selling of financial tools called securities. Merchants first created joint-stock companies during the Middle Ages and the Renaissance to spread the risks of sea voyages and explorations carried out to establish trade with foreign markets. Stock exchanges are as old as the capitalist mode of economic production, and, with the advent of the Industrial Revolution, stocks were used to finance the infrastructures of industrial civilization.

Today the growth of capitalist societies is funded through the trading of the securities offered by companies, governments, and other institutions. Securities include stocks, bonds, futures, and options. Stocks are still the main form of securities traded in stock markets. Stocks are shares of ownership in companies owned by the stockholders.

Stockholders receive portions of the company's profit margin (dividends) and usually benefit by trading company stocks, buying them when they are at a lower price and selling them when they reach a higher price. However, if the company does not make profits, divi-

The fear that volatile stock markets may trigger another economic depression is firmly rooted in our contemporary society.

dends are usually suspended and stocks' value may decline below the original purchase price. The stockholder may then have to sell at a lower price, losing rather than gaining money.

Global capitalism relies on financial markets to develop. Stocks and other securities traded in financial markets around the world create the necessary surplus capital to create, in turn, the surplus production that is one of the core principles of capitalism. Therefore, drops in financial markets can seriously affect national economies, leading to an increase in the level of poverty.

With the emergence of globalization, financial markets are becoming increasingly interdependent and can easily influence each other. Fluctuations in the American stock market can soon have an impact on European and Asian markets and vice versa. The crises of financial markets are preceded by the creation of a stock market bubble, caused by the development of public enthusiasm for a particular stock into herd behavior. This creates an exaggerated bull market, a type of market where prices of a given stock rise dramatically, making them significantly overvalued.

Noneconomic events can influence stock values and the volume of trading as much as the economic situation. For example, the New York Stock Exchange (NYSE), mostly known by the name of its location, Wall Street, went through cycles of growth and loss since the 1970s, when the scandals of the Richard Nixon presidency and the setbacks of the Vietnam War had a negative impact on the market. As the American status of superpower remained increasingly undisputed through the 1980s and the 1990s.

Yet, in both decades, the Dow Jones suddenly dropped, establishing negative historical records. In 1987, it dropped by 508 points, while 10 years later it slumped by 554 points. After the September 11, 2001, terrorist attacks against the World Trade Center, the stock exchange remained closed for four days. The continued threats of terrorist attacks have led to a general decline in the American financial market since 2001. This state of anxiety has had a negative impact on international markets as well.

GREAT DEPRESSION AND ASIAN CRISES

Because of the strong links between drops in financial markets and the increase of poverty levels, whenever stock markets around the world plunge sharply, people speculate on the likely advent of another Great Depression. This worldwide economic collapse, beginning in 1929 with the New York stock market crash and ending after the outbreak of World War II, is the most famous example of how drops in financial markets can suddenly produce more poverty. It is perhaps owing to our own unstable economic prospects if the Great Depression continues to stimulate interest and debates.

The stock market, once a symbol of national prosperity, was now a symbol of poverty.

The fear that the increasingly volatile financial markets may be the starting point of another economic depression is firmly rooted in our contemporary society. The 1929 stock market crash came unpredictably after a period of sustained growth as the Gross National Product had risen by 22 percent between 1922 and 1929. From 1928 to the middle of 1929 the economy grew extremely fast, thus increasing the faith many investors had in the market.

The market peaked in September 1929, but then started to decline in October, leading to a sharp fall of stock prices on the 23rd. Prices reached the same level of 10 months earlier. The following day, known as Black Thursday, widespread panic caused stockholders to sell

and a massive number, 12.9 million shares, were traded. The following week, on Black Tuesday, another negative record was reached, with 16.4 million securities being traded. The market was completely in the grip of fear and confusion. In spite of optimistic statements from leading financiers, the market continued to decline for three entire weeks.

The crash, coming so unexpectedly in the popular mind after the peak of economic activity, significantly reduced the wealth of investors, who became increasingly less willing to purchase goods and services. The stock market, once a symbol of national prosperity, was now a symbol of national poverty. After a brief period of renewed confidence, financial markets continued to decline. The crisis soon became international with the devaluation of sterling in 1931.

As a result of the reduction of wealth, goods that were not considered essential, such as automobiles, experienced a sharp decrease in sales. As many firms experienced financial losses, they made their workers redundant, which obviously increased the levels of unemployment at an alarming rate. The American economy mirrored the decline of Wall Street.

The Great Depression is the most famous example of how financial crises can affect the general economy and increase the number of poor in a given country. Yet it is not the only example. Since the 1990s, financial crises have become more frequent both in developed and emerging countries.

In the case of emerging countries, these crises have dramatic effects on the nations' already weaker economies. The financial crises that struck Asian countries in 1997 significantly reduced the rate of growth of the Gross Domestic Product by 10 percent. Similar negative effects were recorded because of the 1998 financial crisis in Russia and the 1999 event in Ecuador, which also led to political instability.

Financial crises in emerging markets are often set in motion by a recent process of liberalization. This can cause an uncontrolled rise of lending, also owing to inflows of foreign capitals. The uncontrolled expansion of loans soon results in excessive risk-taking and thus in an increase in nonperforming loans.

In the case of the Asian financial crisis of 1997, foreign capital was actively sought by banks and other financial institutions that were willing to pay high interest to fund their lending. These investments were considered as protected by a government safety net, either by the government of the emerging country or by international financial institutions such as the International Monetary Fund. When it became clear that these loans would remain insolvent, foreign capitals started to be withdrawn, causing a serious decline in the economy. A cursory look at statistics can give a better idea of the exponential inflow of foreign capital and the consequent rise in lending. In Thailand, net external portfolio investment rose from \$2.5 billion in 1994 to \$4.1 billion in 1995, and short-term debt from \$29.2 billion to \$41.4 billion, despite warning signs of a coming deflation of the property-sector bubble and the overexposition of the banking system.

In Thailand and South Korea, the crises and the uncertainty of stock markets were instrumental in precipitating the economic recession, with stock prices in Thailand falling by 40 percent in 1996. In Malaysia, Indonesia and the Philippines, stock market crashes coincided with the beginning of the recession. Because of the increasing interdependence of international markets, economists consider the southeast Asia crisis as the cause of the Russian and Brazilian crises of the following year, because after the Asian crisis, banks were reluctant to lend to emerging countries.

Thirty million urban workers lost their jobs; 160 million rural workers became superfluous.

The Asian crisis affected dozens of countries and led to massive unemployment, currency devaluing, and bankruptcy for several important corporations, such as KIA Motors in South Korea. Even countries that were relatively unaffected by the crisis, such as the People's Republic of China, still had to restructure their economies. China's state industries proceeded to massive firings. It is estimated that, as a result of the crisis, 30 million urban workers lost their jobs, while 160 million rural workers became superfluous. The state was forced to increase to several billion dollars the public spending devoted to make its economic growth competitive once again. In countries where the crisis struck harder, as in Thailand and Indonesia, its consequences led to the closure of hundreds of factories. The crisis also challenged the social bases and the institutional mechanisms of economic activity.

Millions of people were again reduced to poverty. The crisis upset the fragile social balance in many urban areas, which were already plagued by massive environmental problems and lack of basic services such as housing, sanitation, and clean water. In the years preceding the crisis, these urban areas were densely repop-

ulated with unqualified industrial workers in search of the economic profits promised by the city.

While in the rural areas these people could count on family support systems, this new class of urban proletariat was the main target of economic regression, left as it was without social support systems. After a constant rising trend, wages fell sharply while prices rose because of currency devaluations. In just over a year, prices were up 7 percent in Thailand, severely endangering the incomes of the urban poor and the rising middle classes. Ethnic and religious tensions were also consequences of the halted growth. The inability to pursue the reduction of poverty considerably lessened the consensus of governments in the region.

As globalization increases, financial crises are not simply experienced locally but tend to spread internationally. The costs of financial globalization are paid by the people on the margins of our capitalist societies. When a financial market crashes, sophisticated traders always profit as they exploit the bubble they have helped to create. Yet for small investors, the so-called dumb money, a crash in a financial market can lead to major losses. More serious still is the impact on those who are already struggling with insecure jobs and meager salaries. These are the first to lose their jobs and can easily fall below the poverty line. Thus the claim that the globalization of financial markets has brought increased opportunities for growth in developing countries does not take into account the increased risks for misery and recession that it entails.

Finland

FINLAND IS A SMALL Nordic country that has adopted a development policy for aiding poor countries around the world. In February 2004, the government of Finland made the eradication of extreme poverty globally the main goal of its development policy program. Like all nation-states Finland has a foreign policy that serves its interests in its relationships with other countries. Its foreign policy seeks to achieve coherence in all areas of international cooperation. Finland is attempting to coordinate both domestic policies and foreign policies in the positions that it takes in relations with developing countries. This coordination includes the policy areas of agriculture, environment, forestry, health, human rights, immigration, information society policies, security issues, social issues, and trade.

For Finland, development cooperation is an important instrument of its development policy. It uses this instrument to strengthen its ability to promote development in the world's poorest countries. It does this also by seeking to strengthen the private sector, by increasing investment and trade opportunities, and by supporting economic growth in the world's poorest countries. By aiding the development of poor countries, it is aiding the development of their purchasing power and thereby the opportunities for marketing Finnish goods and services. Finland's development policy takes human rights as its starting point. Human rights are those individual rights agreed upon in the various international human rights agreements that it has signed with other nations.

The basic objectives of Finland's development policy include commitment to the values and goals of the United Nations Millennium Development Goals; commitment nationally to a broad, unified, and coherent agreement in all policy sectors; and commitment to a rights-based approach. The commitment Finland has made includes the principles of sustainable development, a broad view of development financing, a partnership approach to development rather than a paternalistic approach, and respect for the right of self-determination for all people. The objectives represent a long-term commitment that is transparent, open, and predictable so that the actions that Finland engages in do not mask a hidden agenda.

The driving motivation behind Finland's development policy is the eradication of extreme (absolute) poverty, which has been defined as having resources such that a person must live on less than one dollar per day. By adopting this goal Finland is also acting in accor-

dance with the United Nations Millennium Declaration, which has set as a global goal the reduction of extreme poverty in the world from one billion people to only half that number by the year 2015.

The Millennium Development Goals, which Finland accepts, were adopted in light of the belief that achieving the goal of eradicating extreme poverty would also reduce global environmental problems, promote equality throughout the world, and strengthen respect for human rights. The policy that Finland has adopted is a development of its foreign relations since the 1990s.

Finnish policy reflects the belief that poverty reduction is a public good. Public goods, such as clean air and clean water, have costs that must be shared by all. However, it also recognizes that "free riders" that seek to gain some part of public goods while externalizing the cost to others are naturally attracted to arenas of public goods. Finland, the Finnish people, and the Finnish leadership do not want free riders that exploit public goods that they believe are not really marketable.

On the domestic front, Finland is a highly industrialized free-market economy with domestic production comparable to that of its European counterparts. Gross Domestic Product (GDP) per capita is \$29,000, with only 5.4 percent of the population living below the poverty line. However, unemployment remains a problem at 8.9 percent of the 2.66-million labor force. Thirty-two percent of the labor force is made up of service industries, surpassing regular industry as the second largest part of the labor force in Finland at 22 percent. Illiteracy is a concern, with 10.4 percent of Finland's population between the ages of 16 and 65 considered to have substandard reading and writing capabilities. The infant mortality rate in Finland is 3.57 out of every 1,000 births, and the life expectancy is 78.35 years. The median age of Finns is 40.97 years, with 15.9 percent of the population over the age of 65. Two-fifths of Finland's GDP comes from exports, including cutting-edge technology like mobile phones. Finland is mainly dependent on importing most of its natural resources, except for timber.

First8

FIRST8 IS A DUTCH (Netherlands) campaign to raise people's awareness of the Millennial Eight goals. It seeks to inform people of their duty to participate in the campaigns to end poverty. The First8 campaign was unique because it was a photography campaign against poverty. Photographs were allowed to speak a thousand words each.

The photographs were put on a website with video and music combined to display the Millennium Development Goals (MDGs). The First8 campaign was launched in September 2004 with the aid of numerous groups, including the Maak Het Waar Campaign of the Global Call to Action Against Poverty.

Creating First8 involved using a broad coalition of organizations and agencies from Dutch civil society. The antipoverty campaign was led by the Nederlands Platform Millienniumdoelen, which united several organizations to bring greater numbers of people into support the MDGs. By networking together, the goal was to reach a vast number of people in a unified way. The campaign has turned to popular culture centers in order to get its message out to young people. For example, it put campaign clips on MTV and on other music channels.

First8 sent out a booklet of photographs about extreme poverty to over 1.6 million people in Holland. In addition, it sent the same booklet to over 25,000 influential leaders around the world, and to those attending the opening session of the 2004 United Nations General Assembly. The campaign's ultimate goal is to eliminate extreme poverty, which has been defined as trying to live on less than \$1 per day. The First8 campaign created a powerful interactive website to aid the campaign. It featured powerful images and links to antipoverty agencies such as CARE or OXFAM.

These links provided powerful images and information for people interacting with the website and also provided a tool for calculating where a person with an income of any number of dollars or euros stands in the world. By October 14, 2004, 1,000 copies of the photo book had been distributed at the United Nations, and all 56 photographs were on display at the Capitol building in Washington, D.C., as an exhibit to promote both extreme poverty and MDG awareness among congressional leaders and staff. In November 2004, electronic record keeping on the First8 website showed hits and responses from around the world. The Dutch campaign also gained international recognition on December 2, 2004, when it won the prestigious EPICA award. An international jury composed of members from 41 countries gave the award. First8 won over 4,755 other entries.

Later in December, Secretary General of the United Nations Kofi Annan aided the campaign when he was photographed holding the First8 book. The First8 photo book of those living in extreme poverty was published in black and white and anonymously, but investigative reporters eventually uncovered Sanders Veenman, a Dutch photographer, as the source of the photographs used in the First8 campaign. The immediate inspiration had come to him while dealing with AIDS patients in Zambia.

Fiscal Policy

FISCAL POLICY REFERS to the use of government measures to influence economic activity. It is the management of the economy through the employment of tax, spending, and transfer policy. Usually it is separate from monetary policy, which is the use of money supply in influencing economic activity.

Fiscal policy first gained importance after the publication of John Maynard Keynes's General Theory of Employment, Interest and Money in 1936. Before the advent of Keynesian economics, governments and economists did not consider management of the economy through

fiscal policy. When the 1932 presidential campaign was under way in the midst of a worsening depression, both candidates spoke of balancing the budget. It took Keynes's analysis to awaken economists and later policymakers to use fiscal policy to manage the economy.

Fiscal policy, since it first gained currency with Keynes, has been a matter of significant controversy. Any quantity of fiscal policy means greater government involvement in the economy and in the lives of individuals. Many free-market advocates oppose fiscal policy because of this. Demand management has been opposed by monetarists and supply-siders styled in the form of so-called Reaganomics.

The disagreement is not really whether government budget management is necessary with built-in automatic stabilizers but whether the government ought to use discretionary means to manipulate the economy. There is an important questions at stake: whether the government ought to be involved in the management of the economy?

THE BUDGET

The fiscal policy of the government is encapsulated in the budget, and if one wishes to view a snapshot of it, it can be seen as the government budget deficit—which is a summary position of the expenditures and revenue of the government. Whether the government activity seeks to use the budget as a tool in influencing the economy, any budgetary changes will mean an effect on the economic status of the economy.

The government can engage in expansionary or contractionary fiscal policy. If there are unemployed resources in the economy, the government can spend more while leaving taxes unchanged—or even reducing them—or it can reduce taxes and leave spending unchanged. This is an expansionary measure. If the government perceives growing inflation or an economy growing too rapidly, then it can take contractionary measures, that is, lower spending, raising taxes, or both.

Aggregate demand is the target of fiscal policy, whether it be of a stimulating or dampening effect. By spending more and/or taxing less, the government ultimately increases aggregate demand. But if it chooses to stimulate aggregate demand by spending more, the effects are direct. If it chooses to lower taxes, it works indirectly through household spending. A tax cut is then at the discretion of household spending and saving choices.

Consider an expansionary fiscal policy through an increase in spending. Whenever the government in-

creases aggregate demand, there are two possible effects, and the extent of each depends on how close the economy is to full employment. The first is to increase output or income, the desired effect. The second is to compete with the independent sectors for available resources, the crowding-out effect, in other words. With an upward-sloping aggregate supply curve, the government's increase in spending increases not only output but prices.

Crowding-out may also take place by shrinking private investment through the interest rate increase that accompanies an increase in spending. If the government raises the deficit, it will meet part of the increased expenditures by financing it through the issue of new debt. This will consequently increase the rate of interest. Moreover, whenever the government raises incomes by increased spending, it will induce households to enhance their liquid assets. This means an increase in the demand for money. Without an expansionary monetary policy, this increase in money demand means an increase in the interest rate. So even if the government finances its increased spending by past surpluses, it will raise the rate of interest and thereby crowd out private investment.

When the government increases its spending, there is a multiplier effect throughout the economy. Increased spending gives households additional income, which increases their purchasing power. Out of this additional income, consumers will normally save part and spend part. This then gives another round of income to households, which in turn increase their spending by part. This is the multiplier process by which a certain additional sum will augment income or output by a multiple. The increase in prices that results from the increase in aggregate demand, however, dampens the multiplier effect.

Fiscal policy can be active or discretionary in nature, or may be automatic. When the government consciously implements a fiscal policy, it changes taxes and/or spending largely to counteract the business cycle. But even if the government did not do this, there are automatic stabilizers built into the revenue/expenditure structure of government. Unemployment insurance, for example, increases in downturns. And since there are proportional income taxes—which may be progressive—tax revenue declines in downturns and increases in upswings. Add to this other government transfers that increase in recessions and there are a number of automatic stabilizers.

The central point of contention between those who favor fiscal policy and those who oppose it is not its

ability to act as an automatic stabilizer but in its discretionary role. Should the government play an active role in the management of the economy? And if so, what is the proper manner of doing so? Given that the government should take an active part in stabilizing the economy, it must first tackle the problem of how best to accomplish its objective of maintaining full employment and low inflation.

There will always be some lag between the time the government recognizes the problem and its final implementation of its policy. Moreover, often by the time the government actually recognizes the problem, it is well under way and perhaps even the automatic mechanisms in the economy are bringing about a correction. Discretionary fiscal policy is either then unnecessary or maybe, indeed, harmful. Even if one believes in the theoretical possibility of government involvement, there is always the practicality of implementing its policy.

Increased taxes mean a smaller incentive to work and this affects employment.

The mode the government chooses is also important. If the government chooses to use tax changes, that is tax cuts, as its main thrust in its policy, then it is at the discretion of households, that is, taxpayers, to spend out their additional earnings. If households perceive these tax cuts as temporary, then they may choose to save most of it. This additional saving must then be channeled into additional investment to actually get the multiplier process going. Even if it is a permanent tax cut, households may perceive a higher level of taxes some time in the future because the government will ultimately have to repay its increased indebtedness and the households will begin to save now. This is the proposition known as Ricardian Equivalence.

Output has a natural tendency to return to its full employment level, and unemployment to its natural rate. It is largely a matter of time and whether this process is long or short relative to what the government can do through its fiscal policy. If unemployment is near or at its natural rate, then fiscal policy ultimately will largely result in higher prices and crowding-out. It becomes an important matter to know full employment output and the natural rate of unemployment, and these are often points of contention among economists.

When used in conjunction with monetary policy, fiscal policy is most efficacious. This is because fiscal policy will often affect the rate of interest through its

increased borrowing, and therefore affect the demand for money. If it increases the rate of interest, then the central bank can undertake expansionary monetary policy. Coordination is crucial to this process and in the United States involves the cooperation of the Federal Reserve with the fiscal policy of the federal government. But this combination is also powerful, and when the economy is near full employment will lead only to escalating inflation.

The government also has to consider its effects on the rest of the world, for fiscal policy will change the exchange rate and the balance of payments. If interest rates rise, then this will encourage funds from abroad to flow to the home nation, thus increasing the demand for the home currency. This means an appreciation in the home currency and will discourage exports and encourage imports. Thus the nation will run a trade deficit. The budget deficit of the government is thus linked to the trade deficit. The twin deficits are significant in the United States.

Perhaps the greatest issue is whether the government ought to actually ever be involved with the management of the economy. By using spending as a tool, the government will change the composition of output. By using taxes as a tool, it will give people less discretionary income and therefore less choice. Some are opposed to a greater government presence in the economy on an ideological basis. It means simply less for the free market to do. And it also alters work incentives. Supply-side economists are wont to point this out. Increased taxes mean simply a smaller incentive to work, and this affects the full employment level of output.

If the government wishes to use fiscal policy as an effective tool, it has to consider the long-term as well as the short-term effects. There will always be those who are opposed to greater government involvement in the economy, and if this is not the goal of fiscal policy then the government has an obligation to also make the budgetary process elastic. It has to return to its pre-policy levels after it has achieved desired goals. But this is all too often impossible after the policy measures have come into place. Politicians will naturally resist spending cuts if they affect their constituents.

Food First

FOOD FIRST IS THE popular name of the Institute for Food and Development Policy, a nonprofit grassroots think tank and activist education center. Food First was founded in 1975 by Frances Moore Lappé and Joseph Collins as a means to continue and extend the research and advocacy begun in their widely read book *Diet for a Small Planet*. Through the production and dissemination of research reports, books, and videos Food First has provided a wide range of accessible resources for popular movements in the struggle to reform the global food system.

In addition, Food First provides speakers to discuss issues of hunger, trade policy, and genetically modified crops within mainstream media. Food First advocates people's basic economic right to food and to food-producing resources while providing research that both addresses the root causes of hunger and poverty globally, and offers possible solutions for hunger and poverty.

Food First argues against neo-Malthusian and neoliberal positions on hunger, as expressed within agribusinesses, biotech companies, the World Bank, and the U.S. government, which suggest that population growth outstrips the capacity to grow food. Such perspectives have accompanied the expansion of free trade regimes and capitalist globalization, providing an intellectual cover for trade and investment policies that actually contribute to the spread of poverty and hunger. Food First argues that such misconceptions obscure the causes of and solutions to hunger while dismissing practical alternatives and encouraging a sense of fatalism about the prospects for ending hunger globally.

In popular books such as *Food First* and *World Hunger: Twelve Myths*, Food First has clearly shown that the problem of hunger is one of food distribution rather than food production. Food First notes that globally 80 percent of people who suffer hunger make their living off the land, while 50 percent are actually small-scale farmers. In the world's wealthiest countries, such as the United States, poor people cannot gain access to affordable and nutritious food even as family farmers

receive low prices for their crops. Neoliberal governments respond with insufficient ad hoc appeals to charities such as food banks, which are not able to meet people's needs. Food First argues that the current global systems of industrial food production and transport are unsustainable, both socially and ecologically.

Among the problems addressed by Food First are the massive subsidization of industrial farmers and agribusinesses by the U.S. government, as well as the dumping of cheap surplus grain stocks domestically as consumer snacks and internationally as so-called food aid. More recently, Food First has offered critical analyses of the crop biotech industry. Against the claims of biotech advocates, research undertaken by Food First illustrates the extent to which the biotech industry has served primarily to increase corporate profits while doing little to help poor farmers or make food available.

Food First argues that ending hunger requires an investigation into the structural roots of poverty. This means confronting the growing inequality characterizing neoliberal capitalist globalization, as well as implementing structural changes related to access to food, jobs with living wages, and access to land and food productive resources for poor people.

Food First's programs are driven by notions of food sovereignty, food production autonomous from corporate control, and the development of alternative trade structures that can benefit the majority of the world's farmers rather than agricultural companies. Land reform and access to productive land for poor people are key parts of developing more equitable and sustainable economies locally and globally. They support the call for "land to those who work it" as a means to increase the ability of families to feed themselves, while also protecting wildlands from ecological harm. Additionally, Food First supports independent efforts to develop ecologically and socially just farming systems, including organic agriculture.

More than just a typical think tank, Food First maintains that securing the social changes necessary to end hunger requires mass mobilization and the actions of broadly based social movements. Food First has formed alliances with numerous grassroots poor people's movements and networks of farmers and peasant leaders, including the Landless Workers Movement (MST) of Brazil, Via Campesina in Honduras, Focus on the Global South in Thailand, and the Coalition of Immokalee Workers in the United States.

Food for the Hungry

FOOD FOR THE HUNGRY International (FHI) is a worldwide ministry motivated by Christians that seeks to meet the physical and spiritual hunger of the poor. The goal of FHI's ministry is met by telling people about physical and spiritual hunger, by sending people to share their love of Christ with others, and by providing both emergency relief and sustainable development. Its statement of faith is adopted from the National Association of Evangelicals.

Dr. Larry Ward founded Food for the Hungry in 1971 in order to help some of the world's poorest people. He retired in 1984 and was replaced by Dr. Ted Yamamori, who but for the kindness of strangers in Japan during World War II would have starved to death. Dr. Yamamori retired in 2001. He was replaced by Benjamin K. Homan as the head of FHI in the United States. Food for the Hungry International is incorporated in Geneva, Switzerland. Its staff numbers over 1,700 people and over 30 nationalities. Nearly all staff members work in their home country. These number 37 countries on four continents.

Food for the Hungry defines success with three marks. The first mark of success occurs when FHI's sharing of the hunger needs of the world with churches results in an increase in church giving. The second mark is defined as the increased involvement of leaders in a community in solving community problems because they have been influenced by FHI. The third mark is known as when families increase the sharing that they do with one another to meet needs.

Food for the Hungry is financed by contributions to its autonomous organizations in Canada, Japan, Korea, Norway, Sweden, Switzerland, the United Kingdom, and the United States. FHI encourages its donors not only to give but also to pray for its ministry and for the poor. The current budget of FHI is over \$70 million. Almost all of the income, commodities, and other resources that it receives every year go to serve the peo-

ple in its mission fields. This efficiency is the result of three factors. First is a sense of responsibility before God as stewards. The second factor is a strong policy and practice of accountability to its donors. And the third factor is the willingness to cooperate with other organizations in order to achieve efficiencies by pooling resources.

For example, containers used by FHI can be filled more quickly and shipped sooner to people in the field on container ships if it cooperates with other organizations. The Americans who have united to form Food for the Hungry in the United States have on many occasions been awarded recognition for their efficiency as a charitable organization. Food for the Hungry also cooperates with governments and corporations. From them it receives both supplies and matching grants.

Food for the Hungry has had emergency relief projects and long-term programs in Africa, Asia, and Latin America. Since the end of the Soviet Union, it has had ministries in eastern Europe. It has done this with education, child development programs, farming improvement programs, clean-water projects, and various kinds of food programs for improving health and nutrition. FHI has also promoted microenterprise loans for tools such as sewing machines. The loans finance capital purchases that can be used to earn enough to repay the loan and to advance the income and financial resources of the poor.

Food-Ratio Poverty Line

A PRIVATE CONSUMPTION-BASED method of determining poverty, food-ratio lines draw from the proportion of a household's money that is spent on food to calculate official poverty levels. It is a method,

though alternately used by various nations, to distinguish between the poor and nonpoor on an estimated basis of what ratio of a household's income is spent maintaining a sustainable diet. Like other measurements used in calculating poverty, it has been the center of much dialogue concerning its applicability in the wake of recent changes in economic and social conditions that have occurred worldwide over the course of the last two decades.

Advocates for new measures of poverty suggest that food-ratio lines are antiquated.

Poverty statistics for use in all executive departments in the United States are based on Mollie Orshansky's definition of poverty thresholds, first developed in 1964, and slightly revised by committees in 1969 and 1981. Orshansky, an economist with the Social Security Administration, drew from a 1955 study that found that families with at least three members generally spent approximately one-third of their net income on food, and she used these findings in conjunction with four nutritionally adequate food plans designed by the Department of Agriculture to determine poverty thresholds.

The least costly or economy plan was taken and multiplied by three in order to calculate poverty thresholds for families throughout the country. For smaller families, such as two-person units, the cost of the food plan was multiplied by 3.7. Annual updates of the Social Security Administration poverty thresholds were based on changes in the prices of items on the economy food plan.

Calculating official poverty thresholds on the basis of the percentage that a household spends on food has been rather widely criticized by a number of individuals and organizations in the United States. Advocates for new measures of poverty suggest that food-ratio lines are antiquated and do not speak to economic trends that have followed in the wake of the 1960s, when this method of determining poverty was originally devised. They point to the increase in healthcare and transportation costs, the slow rise of minimum wages, and the impact of geographical housing markets as significant factors that are too often disregarded in current poverty calculations.

Though food too is impacted by inflation, there has been growing concern that it does not constitute the percentage of a family's income that it did in previous years, nor that it rises in response to inflation at the same rate as do these other costs. As a result, it is feared that families lacking basic necessities of food, clothing, shelter, and adequate healthcare are growing in number throughout the country, even as they are officially considered to be above poverty thresholds. Thus, many individuals are looking toward renewed forms of poverty measures that take account of income levels and the costs of affording basic needs that are not primarily based on food costs.

In Thailand, for example, the official poverty line is also consumption based, and is calculated from an estimated cost of basic needs that includes both food and non-food items. According to the National Development and Social Development Board, the food poverty line is derived from estimating the cost of food baskets. Per capita household caloric requirements are determined by adding up the required calories per day of each household member with respect to age and sex.

The household calorie requirement then gets converted into money metric terms in order to establish the number of calories that can be purchased with a single baht (four). The poverty lines in 2002 averaged 922 bahts per person per month, representing a decline of approximately 20 percent in poverty from 1988. Nonetheless, criticisms of Thailand's food poverty line have been levied on the basis that the year used for calculating the cost of food baskets should be changed from 1992 to more adequately reflect social, economic, and governmental changes since that time. Suggestions have also been made to adjust the ratio of food consumption from 60 percent of a household's total expenditures, to the actual percentage of money spent on food, in hopes that will yield a more accurate poverty measurement.

Food Research and Action Center

THE FOOD RESEARCH and Action Center (FRAC) is a leading national organization working to improve public policies to eradicate hunger and undernutrition in the United States. Founded in 1970 as a public interest law firm, FRAC is a nonprofit and nonpartisan research and public policy center that serves as the hub of a network of antihunger advocates throughout the United States.

Believing that hunger reduces children's ability to learn, decreases workers' productive energy, and weakens elderly persons' resistance to disease, FRAC works to achieve the full productive potential of the United States by harnessing national resources on behalf of those least able to provide for themselves. FRAC conducts research; monitors legislation and regulations affecting the poor; provides program support to antihunger advocates; collaborates with national and local antihunger organizations; partners with associations of educators, nutritionists, physicians, and labor and business leaders to enhance antihunger advocacy; and develops media and public information campaigns to promote changes in public attitudes and policies toward hunger and poverty.

FRAC conducts research on the extent of hunger and hunger's impact on low-income families with children. Its 1991–95 Community Childhood Hunger Identification Project (CCHIP) documented the seriousness of hunger and food insecurity in the United States. The study's methodology has been adopted by the U.S. Census Bureau and the Department of Agriculture as the basis for annual reports on hunger in the United States.

FRAC reviews and analyzes major developments in legislation, regulations and policy proposals at the national level that affect food assistance programs. It works closely with a national antihunger network of advocates, food banks, program administrators and participants, and policymakers, providing them with program information and analyses. FRAC focuses especially on programs that help children grow and learn—Food Stamps, the School Breakfast Program, the Summer Food Service Program for Children, the Special Supplemental Nutrition Program for Women, Infants and Children (WIC), and programs that provide meals and snacks to children in daycare and before- and afterschool programs.

FRAC develops media and public information campaigns to help promote changes in public attitudes and policies. Campaigns have included the National School Breakfast Expansion Campaign (1987), the Campaign to

End Childhood Hunger (1991–present), the Mickey Leland Childhood Hunger Relief Act (1993), the Building Blocks Project (1994–present), Save Our Nation's Nutrition Programs (1996), the Hunger Has a Cure Campaign (1997), and the National Nutrition Summit (2000). FRAC has been a leader in national efforts to protect and expand food stamps, the program that, after employment, is the nation's defense against hunger.

CHILDHOOD HUNGER CAMPAIGN

The Campaign to End Childhood Hunger is a movement of people from all walks of life whose common mission is ending hunger among children. The campaign's National Advisory Council includes corporate executives, labor union presidents, bipartisan leadership in the U.S. Congress, religious leaders, creative artists, and experts in hunger and poverty. The campaign is endorsed by more than 100 national organization, representing millions of Americans. Endorsing organizations include the U.S. Conference of Mayors, America's Second Harvest, the National Urban League, the AFL-CIO, the League of Women Voters, the Children's Defense Fund, and Catholic Charities USA.

Working with key antihunger groups in every state, the campaign educates the public on the extent of, causes of, and solutions to hunger; promotes increased government and private-sector response to hunger; uses the media to inform and educate; engages in research on childhood hunger and poverty; conducts conferences and skill-building sessions; strengthens local coalitions; and produces and distributes educational materials.

FRAC's Building Blocks Project seeks to maximize participation in federal nutrition programs by child development programs. Recognizing that learning is affected negatively when children are hungry, FRAC helps Building Blocks partners access federal nutrition benefits by offering information, technical assistance, and support.

Food Shortages

FOOD SHORTAGES ARE production shortfalls on a regional level. Hunger is produced when need is greater than food availability. A food shortage occurs when food supplies within a given region are lower than the amount needed by that region's population. Food shortages are not the same thing as food poverty or food deprivation.

Food deprivation is the situation in which the nutrients consumed by an individual are fewer than he or she needs. Food poverty, or food insecurity, operates at the household level and is the result of a household being unable to obtain enough food to meet the needs of its members. Food shortages can certainly lead to household food poverty, which in turn can contribute to food deprivation. However, multiple causes contribute to all three levels of hunger.

Food shortages can be thought of as a production problem, but often food shortages occur as a result of political interventions that affect rules about importation of food. Even when food shortages occur because of a production problem, there is usually a connection to environmental reasons such as drought and a connection to political intervention such as prevailing economic policies.

Choice of diet has much to do with the occurrence of food shortages. Estimates indicate that if the world were to subsist on a vegetarian diet, there would be more than enough food to sustain the world's population. However, the growing Western trend toward a preference for animal foods has had a contributing factor in food shortages. Currently, global preferences are for a diet that is derived, in part, from animal products. Following this type of diet is more likely to lead to food shortages.

Shortfalls in the global food systems have been addressed in a variety of efforts in both developed and developing countries. Meat products are being discouraged in more developed countries. In the interest of equity, "food first" advocates have urged citizens to eat lower on the food chain in order to make more food available for global food needs. In developing countries, consuming meat products is associated with higher status. Thus, it is challenging to introduce dietary change.

Global food shortages are different from regional food shortages. This is because an analysis of available evidence points toward the fact that a global food shortage does not exist. Regional food shortages, in contrast, have occurred in some developing regions, partly from rapidly increasing population growth. Sub-Saharan

Africa and southern Asia have been identified as regions where dietary energy supplies fall below basic average requirements. Higher fertility rates along with underdeveloped agricultural technology, natural disasters, and political unrest are cited as causes. However, birthrates have slowed and agricultural production has increased in south Asia, yet this region still lacks enough food. Experts suggest that the cause of food shortages cannot simply be seen as a product of overpopulation, and food importation is not always the solution.

More important is the role of political violence in causing food deprivation.

The causes of food shortages are complex. Food production is certainly an issue but not the only issue. Production is affected by the climate of the region, with temperature and rainfall being important determinants of how many harvests can occur in a single year. Droughts are likely to interrupt crops, but should not immediately be linked with hunger, as seasonal variations in water supply could potentially be offset with stored foods. Natural disasters can also be a factor in diminishing food production, but often the severity is dependent on effective governmental response to the crisis.

Production is not the only determinant of food shortages. Sociocultural factors, which include the organization of land, labor use, as well as dietary preferences, are also important. Land and water control are important dimensions of how the organization of land can greatly influence food shortages. Inequality in landholding is a marker of social inequality.

Higher aggregate landholding is an important marker of household poverty or wealth and a predictor of household agricultural and food self-sufficiency. One of the key ways landholding affects food supply is by crop selection. Being compelled to choose cash crops over food crops places local residents at an economic disadvantage. Maybe more important is the role of political violence that permeates the cycle of internal conflict in causing significant food deprivation.

To counteract food shortages and prevent famine deaths, the international community has maintained famine early-warning systems and food reserves since the 1970s. Where information systems identify impending or actual acute food shortages, the United Nations and nongovernmental organizations (NGOs) ordinarily

move food and other emergency care into affected zones to prevent suffering. Such interventions also are meant to slow involuntary migrations by those potentially affected. By the 1980s, early warning and response had been associated with success in preventing famine, except in war zones.

Transporting and guarding emergency food supplies in conflict situations also become a source of livelihood for would-be combatants. Such possibilities have led to concern that food aid might prolong conflicts. It remains a challenge for donors to deliver food and other essential aid in ways that can relieve food shortages and renew productive capacities, without problematic unintended consequences.

Food shortages related to conflicts also can be characterized as entitlement failures where political power-lessness prevents communities from getting access to available food. After being deprived of essential assets or using them for food to meet immediate nutritional needs, people find themselves without further resources. Conflict-related destitution thus creates conditions of chronic food insecurity and shortage for households that otherwise may have been temporarily or seasonally short of food. Further research is needed to more fully understand the dynamics of why food shortages occur and how to prevent them more effectively.

Food Stamps

PRIOR TO THE 1930s, hunger in the United States was primarily the responsibility of individuals and families. Because of widespread suffering during the Great Depression, coupled with the struggle of farmers to

earn income, the federal government began buying excess farm yields for redistribution. However, this effort was marked by inefficiency because distribution was sporadic. Further, inability to process perishable foods meant distributed commodities did not match nutritional needs of recipients. Poorly planned means of distribution from centralized locations caused long lines of recipients waiting for meager provisions, with stigmatizing results.

In 1939, the federal government experimented with food stamps, whereby participants could purchase orange stamps equal to their monthly food expenditures. For every dollar's worth of orange stamps, 50 cents of blue stamps were given to participants. Orange stamps could be used for purchase of food, whereas blue stamps could be used only for surplus commodities set aside by the government. Over the next four years, nearly 20 million Americans residing in more than half the counties in the country participated at some point.

However, from the onset, the program was decried because of inappropriate use of stamps for purchase of unauthorized goods, lack of ability to deliver food to many needy families, and the high cost of food stamps. By the onset of World War II, when demand for farm products rapidly increased, coupled with limited ability of the program to reduce hunger and malnutrition, food stamps were abandoned. The government returned to direct distribution of commodities.

It was not until the early 1960s that the federal government began to experiment again with food stamps for food redistribution. In the pilot programs, food stamps could be used to purchase an array of foods. With success, meaning increased nutritional levels and sales of farm goods in the public market, the program was expanded. By 1964, 40 counties and three urban areas in 22 states had a food stamp program funded by the federal government.

In 1964, the Food Stamp Act established the program still in use today. By the mid-1970s, almost all communities relying on federal funding for food redistribution were mandated to use food stamps. Several important legislative changes occurred during the 1970s. National uniform eligibility regulations were established. Allotments of food stamps were set at 30 percent of household income (a general rule of the economic market in the United States was that food costs a household one-third of its income). The program was eventually expanded by federal mandate to every community in the nation. Under the Food Stamp Act of 1977, the purchase requirement for food stamps was eliminated.

During the 1990s, major changes to the food stamp program were instituted under the Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA). Because of a public backlash against welfare participants, the government sought to reduce the amount of benefits provided to low-income families. Under the PRWORA, work requirements are mandated for eligible adults. Those without children receive only three months of food stamps in a 36-month period if they do not work at least 20 hours per week. Disqualification of applicants is tied to disqualification for other federal aid programs.

Households are allowed \$2,000 in cash or convertible wealth. The value of the home is not counted in wealth calculations. Each adult in the household is able to own a vehicle the value of which does not exceed \$4,650. Any value above that is counted as disposable income for the means test. If all members of the household receive cash aid from the Temporary Assistance to Needy Families program or Social Security Insurance program, the household is automatically eligible for food stamps.

Despite nearly 25,500,000 people receiving benefits, the food stamp program falls short.

Otherwise, the household net income must be lower than federal guidelines for participation (a four-person household must make less than \$1,571 per month). The household may deduct certain work-related expenditures from monthly income, such as child-care, some medical expenses, and some household expenses if such expenses, coupled with cost of housing, exceed 50 percent of monthly income.

Allotments are based on a formula that multiplies the household income by 30 percent, which is then deducted from the federal allotment guideline. For instance, if the household earns \$566 per month, it would have to deduct \$169 from its allocation, which for a family of four is \$499. The household would thus receive \$330 in food stamps per month.

Despite nearly 25,500,000 people receiving benefits, the food stamp program falls short in serving all eligible people. Some reasons why people don't participate include stigma of participation, lack of awareness of eligibility, lack of access to program offices because of inappropriate location and limited hours, the complicated application process, and other challenges. This is a concern since, despite the wealth of the United States,

more than 11 percent of households struggle with food insecurity.

WILLIAM RAINFORD BOISE STATE UNIVERSITY

Foods Resource Bank

The Foods Resource Bank is a Christian, humanitarian, nongovernmental organization. It is modeled after the successful Canadian Foodgrains Bank. Foods Resource Bank's goal is to engage the grassroots agricultural community, along with individuals, churches, and urban communities, to grow solutions to hunger problems in the world by working to establish food security through sustainable development activities. Food security is achieved "when all persons at all times have the physical and economic access to enough food to provide the nutrients they need for productive, active, and healthy lives."

The Foods Resource Bank fulfills its mission by forming coalitions with farmers and agricultural establishments and creating plans to produce and provide an effective supply of new resources, by coordinating groups of church and community groups and local farmers to raise crops and money that will be donated for food aid and community development projects, and by establishing indigenous partners in the developing countries to work and implement various programs.

A typical project involves a group of people getting together to farm a common plot of land. Once harvested, the crop is converted to cash that is donated to the Foods Resource Bank to supply seeds, tools, drip irrigation, animals, and instruction to local villagers who work to create community gardens, wells, herds, etc., that will sustain them long-term. The implementing members and Foods Resource Bank carefully monitor

all funds. They are distributed through reputable and known agencies. These in-country partners have a proven track record of sustainable food security programming and work with the villagers to help them feed themselves and their families, with extra to share, barter, or sell. The program places a heavy emphasis on food security, that is, helping people feed themselves. Approximately 75 percent of their effort is devoted to food security, with 25 percent directed to hunger relief.

The Foods Resource Bank's funds come from various sources, but mostly they are received through the selling of crops resulting from community growing projects that involve landowners, farmers, agribusinesses, and churches that donate the annual use of land, farm equipment, and farm management. Agribusiness contributes seed, fertilizer, and chemicals.

The implementing members of the Foods Resource Bank are Christian denominations, Christian church agencies, and Christian-based hunger organizations. They participate in established programs with stable partners in international locations and address the issues of food security, nutrition, and food relief. The supporting members of the Foods Resource Bank are individuals, businesses, Christian-based organizations, and other charities. Those members provide advocacy assistance and financial and material resources for hunger relief and food security.

PAUL AND TANYA SLOAN INDEPENDENT SCHOLARS

Ford, Gerald (Administration)

THE 895-DAY PRESIDENCY of Gerald Rudolph Ford (1913–) stands out because Ford was the first official in American history to become vice president and subse-

quently 38th president of the United States without winning a popular election. Gerry Ford, a prominent Republican congressman from Michigan who had served in the House since 1948, was appointed to the vice presidency on October 10, 1973, when Spiro Agnew resigned after a tax evasion charge. He succeeded President Richard M. Nixon on August 9, 1974, who resigned amidst the Watergate scandal. The resignations and the social and political turmoil of the Vietnam War acutely weakened the "imperial presidency," which had undermined constitutionality during Nixon's tenure. Ford's goal was to restore public confidence in the national government and the institution of presidency that was placed in a comparatively inferior position relative to Congress because of the scandals.

Ford continued the social policies followed by the moderates since World War II.

The Ford administration did not have a specific agenda because there was no transition period to think of one. Lacking vision and imagination, and without a broad political base and clearly defined mandate, throughout the three-year presidency Ford tried to "clean up" the Vietnam and Watergate legacy and to revive the faltering economy that was seriously weakened because of the quadrupling of oil prices. Nevertheless, in 1977 a \$2 billion Child Nutrition Reform program went into effect that aimed to facilitate the nutritional needs of poor children. In addition, the Comprehensive Employment and Training Act of 1977 targeted the unemployed and the economically disadvantaged and provided them with training and employment opportuities.

Ford largely continued the policies that had been followed by the moderates since World War II by pursuing a conservative approach to economic and social policies and a cautiously internationalist approach to foreign policy. The country's ongoing problem with galloping inflation and a recession (stagflation), and high unemployment were some of the most important issues on Ford's domestic agenda. Neither Ford, who reduced federal budget spending but vetoed over 50 pieces of legislation while in the office, nor Congress was able to quickly remedy the difficult economic situation.

Ford's most controversial act as president was to pardon Richard M. Nixon for all wrongdoings that he "committed or may have committed or taken part in" while in office. Ford granted an unconditional pardon on September 8, 1974, only after a month in the office, arguing that he was bringing closure to the Watergate affair. This act backfired badly and the public was enraged because Ford pardoned a president who apparently violated the law and was facing criminal prosecution.

Moreover, just a week before he pardoned Nixon, Ford granted only a partial pardon to the resisters of the Vietnam War, draft dodgers, and military deserters. Unlike Nixon's unlimited pardon, this pardon required individuals seeking clemency to earn it by performing up to two years of community service. Both the opponents of any leniency and the proponents of the total amnesty were dissatisfied with this limited measure in the light of Nixon's unconditional pardon. To appease the critics and to defend his position on pardoning Nixon, Ford testified before the House Judiciary Committee where he stated that no deals were made in connection with the pardon, which saved Nixon from public humiliation.

Ford established a presidential commission to investigate intelligence gathering and to propose implementation of major reforms of the activities of the Central Intelligence Agency (CIA), Federal Bureau of Investigation (FBI), and other agencies. The intelligence dealings had come under public scrutiny when it was discovered that many American citizens, especially those opposing the Vietnam War and the Nixon-Kissinger policies, had been under surveillance. The revelation that the CIA had engaged in assassination plots against foreign leaders further deepened the controversy.

The Ford administration's foreign policy continued to revolve around the concept of détente with the Soviet Union and around the regions of southeast Asia and the Middle East. Following the end of the Vietnam War in 1975, President Ford ordered the dramatic and controversial evacuation of the remaining Americans and some Vietnamese that brought more than 100,000 Vietnamese refugees into the United States. The evacuation coincided with the recovery of the U.S. merchant ship SS Mayaguez, which was seized by the Cambodian navy on May 12, 1975. Although 41 Americans lost their lives in the recovery of 39 members of the Mayaguez crew, Ford received approval for this action, which critics considered to be a disproportionate and heavy-handed approach to solving a minor crisis.

Ford won the nomination of the Republican Party for president in 1976 by defeating opponents like Ronald Reagan. Yet he lost the election to the obscure former governor of Georgia, Jimmy Carter, by one of the most slender electoral margins in history because Carter managed to exploit Ford's many mistakes. Though the Ford administration lacked a vision for the future, it will be remembered for providing a renewed faith in the basic honesty of the president and for making the nation feel better about itself by healing the breach of faith between the president and the American people.

Foreign Aid

Foreign aid is the flow of financial and other resources from richer countries to poorer ones. Foreign aid is also known as development assistance, development aid, or development cooperation. Financial aid can take many different forms such as gifts in kind, grants, and cheap loans. Transfer of resources can also take the form of expertise and equipment to needy countries. Aid may be given for a variety of reasons, including humanitarian objectives (for example, to help victims of natural or man-made disasters), promotion of economic development, or political and strategic reasons.

Aid may be bilateral, that is, disbursed from one country to another, or multilateral, which is given through an international organization such as the World Bank or United Nations agencies. Multilateral aid may also be given by regional entities such as the European Union or consortiums like the Organization for Petroleum Exporting Countries, comprising shared efforts on the part of several nations.

As well as publicly funded aid, nongovernmental organizations, which include emergency relief organizations and private and volunteer aid agencies (for example, OXFAM, CARE, Doctors Without Borders, and

organizations operating under the auspices of religious bodies), provide assistance to poorer countries worldwide. Since poverty encompasses different dimensions of human deprivation (including nutrition, shelter, health, education, and security), foreign aid from various sources, and in its many different forms, plays a significant role in mitigating the effects of poverty around the globe.

Most industrialized countries coordinate their aid efforts through the Development Assistance Committee (DAC) of the Organization for Economic Co-operation and Development (OECD), created in 1961 to improve the effectiveness of its members' aid endeavors. The DAC annual report entitled "Development Co-operation" and the DAC website present a comprehensive overview of the aid flows. (The annual publication The Reality of Aid conducts an independent critical assessment of the DAC report.) Albeit far less significant, other bilateral aid donors include non-DAC countries such as the Czech Republic, Hungary, Iceland, Poland, and rich Arab states like Kuwait and Saudi Arabia. In addition, a few countries, like China and Israel, are in the curious position of being both donors and recipients of aid.

TIED AND UNTIED AID

Aid flows may be tied, untied, or partially untied. Tied aid signifies that the recipient is in some way restricted in the use or expenditure of the resources it receives. For instance, assistance may be linked to specific development projects or to the procurement of goods and services from the donor country.

Many experts have long argued that aid tying not only limits choice to impoverished recipient countries, but also undermines aid effectiveness since aid may be aimed to serve first and foremost donors' commercial interests, rather than supporting recipients' development. Catrinas Jepma has estimated that tied aid raises the cost of many goods and services to the recipient between 15 and 30 percent. Untied aid, on the other hand, signifies no restriction or formal obligation on the part of a recipient and is thought to be most desirable from the recipient's point of view.

It had been traditionally thought that untied aid provided significantly less benefit to the donor compared with tied aid. This idea has been challenged in recent years by some economists, demonstrating that untied aid generates a stock of goodwill for the donor in a recipient country, with long-term positive consequences for donor exports to these countries. More generally, whatever the form of aid, it is reasonable to assume that the recipient extends to the donor various political and economic favors as an expression of gratitude, as discussed by S. Schönherr and K. Vogler-Ludwig.

Historically, Scandinavian countries and the Netherlands have been in the group of leading untied aid donors. On the other hand, some large aid donors (notably the United States) have provided most of their assistance in a tied form. Statistics suggest that a small gradual reduction in tying of aid has taken place over the years. Indeed, a high-level DAC meeting in April 2001 reached an agreement to untie all aid to least developed countries except for food aid. Since then, some donors have committed themselves to reducing or eliminating tied aid to all countries in the long run.

HISTORY AND TRENDS IN AID

Aid has its roots in the Marshall Plan (1948–51), under which the United States poured assistance totaling \$13.3 billion (about \$100 billion in today's dollars) to help Europe recover from the devastation of World War II. The success of that enterprise (officially called the European Recovery Program) later prompted the industrialized countries to provide aid to poorer nations, especially to many of the former European colonies that had gained independence. The creation of the International Bank for Reconstruction and Development (better known as the World Bank) in 1944 and the United Nations in 1945 was also part of the international cooperation solution to assist the development of economies around the globe.

In 1969 the Pearson Commission recommended that richer countries set aside 0.7 percent of their Gross National Product for foreign aid. Adopted by the United Nations in 1970, and repeatedly pledged by donor countries, most recently in the 2002 Monterrey Consensus promising "concrete efforts" toward that goal, this target has been met by very few countries. For instance, despite being the world's largest donor in volume terms and recent increases, the United States still spends under 0.2 percent of its income on aid—less than any other industrialized country.

At the other end of the spectrum, Denmark, Norway, Sweden, the Netherlands, and Luxembourg consistently meet or exceed the United Nations target—contributing, on average, over 0.8 percent of their income to aid in 2003. Furthermore, Sweden, Norway, and Luxembourg have indicated their plans to achieve one percent in the long term. Four other countries (Bel-

gium, Finland, France, and Ireland) have given firm dates to achieve the 0.7 percent target over the next few years. In general, public consciousness about development issues appears to play a role in the volume of aid disbursed. Countries such as the Netherlands and the Nordic nations, where there is a higher level of public awareness about development problems, including global poverty, evidently give more aid.

Aid from DAC countries totaled \$69 billion in 2003, with approximately two-thirds given bilaterally. Although this figure is the highest ever, both in nominal and real terms, the growth in aid has not matched nearly all richer countries' economic growth in recent decades. Thus, overall, aid continues to be less significant when measured as a share of DAC countries' combined income. Aid as a percentage of DAC countries' combined income stood at 0.25 percent in 2003, well short of the average of 0.33 percent achieved in the years 1980 to 1992. The decline in aid-to-income ratios in recent decades has often been attributed to aid weariness among citizens of donor countries and controversy over how well aid has worked. Despite this, many donor countries continue to affirm their commitments to supply as well as increase future aid.

AID EFFECTIVENESS

One of the most influential early papers on the impact of aid is by H. Chenery and A. Strout, whose theoretical model of aid and growth underpinned much of the subsequent analysis. The basis of the model is that aid augments domestic savings and investment as well as a country's foreign exchange earnings. Through these, aid raises a recipient economy's growth rate, which in turn raises its income and generates a further increase in savings and investment. Hence, the initial "big push" sets a country on a path of self-sustaining growth.

This model has been controversial, with many observers questioning aid's effectiveness in promoting developing countries' economic growth on various theoretical grounds. Empirical studies have not been conclusive either. For instance, P. Mosley finds that the net impact of aid is neutral overall. On the other hand, J. Svensson claims that aid contributes to economic growth in more democratic countries, while R. Lensink and H. White find that aid, above a certain level, has a deleterious impact on the growth rate of a receiving country.

An influential 1998 book by the World Bank entitled Assessing Aid: What Works, What Doesn't, and Why provoked particular interest in the question of aid ef-

fectiveness. A key finding of this book as well as subsequent analysis by many World Bank economists is that aid has a positive impact on the economic growth of only those developing countries with good fiscal, monetary, and trade policies—with little effect in countries with poor policies. Since that publication, some prominent economists such as J. Sachs have argued that good governance should be defined relative to income (that is, one should control for income levels), since without such qualification there would be no "good governments" in places like Africa.

Another problem appears to be the different perceptions of good governance across cultures. A recipient's view of good governance does not necessarily accord with donors' norms. In any case, disbursement of aid may also be tied to a recipient's efforts in establishing good governance, as well as to one's already established good governance.

Over recent years, much of the aid literature has focused on testing the robustness of the results of Assessing Aid. The results, however, have been mixed, as shown by W. Easterley et al. Many economists would agree with the sentiments expressed by Easterley, who maintains that since developing countries include a variety of institutions, cultures, and histories, no generalizations should be made about the impact of aid on economic growth.

There is no doubt that the views expressed in Assessing Aid have shaped opinion and influenced practice in the donor community. One consequence of this has been an increase in the practice of allocating aid not just on the basis of poverty, but also on good economic management on the part of developing countries. Indeed, the United Nations conference in Monterrey in 2002 put in place a framework under which poorer countries' commitments to good governance and their respect for human rights would be matched by donor commitments toward policy coherence, support for good performers, as well as mobilization of additional resources for reducing poverty.

DONOR INTEREST AND RECIPIENT MOTIVES

Much of the discussion above focuses on the recipient need (RN) motives for giving aid, where the aim is to accelerate the economic growth of developing countries or to alleviate poverty among them. However, there are other grounds for the disbursement of aid, which include geopolitical or mercantile imperatives. Some observers maintain that aid is too often used as a trade creation device facilitating formation of foreign markets

Critics of tied U.S. foreign aid accuse the United States of trying to create a hegemony over its poorer neighbors in Latin America.

for the donor's products, or linked to donor's colonial past and political alliances or achievement of specific foreign policy objectives. Indeed, DAC figures show that among the top aid recipients are many middle-income economies. Even some high-income countries such as Israel receive substantial aid, especially from the United States. Nonetheless, at the same time, some aid-dependent countries in sub-Saharan Africa receive aid amounting to a significant portion of their national income (remarkably, some, like Guinea-Bissau, had an aid-to-income ratio as high as 63.5 percent in 2003).

The donor interest (DI) models use variables such as the number of years a recipient country has been a colony of the donor, the geographical distance between the donor and the recipient, exports from the donor as a share of total imports by the recipient, voting patterns at the United Nations by the recipient, and cultural and religious similarities between the two parties to measure the extent of donor interest. Likewise, RN models use variables such as the Gross Domestic Product per capita, the infant mortality rate, the life expectancy, the level of undernourishment, and the primary school enrollment rate to measure need in a recipient country.

Early DI and RN models were empirically tested for a number of donor countries. These studies broadly concluded that aid flows primarily reflect donors' interests. However, many of these studies have been criticized on econometric grounds. More recent studies, such as one by A. Alesina and D. Dollar, report that the direction of foreign aid reflects economic needs of the recipients as well as both political and strategic reasons. Studies in this literature also generally conclude that multilateral aid is more sensitive to RN as compared to bilateral aid. Most economists and political scientists today would agree that the allocation of aid among countries often reflects multiple objectives on the part of a donor.

Regardless of different emphases placed by various donors on DI versus RN, it is clear that the issue of disbursement of aid involves not only the question of who gets aid, but how much. For many donors giving aid involves a two-stage process. In the first (gatekeeping) stage, eligible countries are selected. In the second stage, it is determined how much each of these eligible countries should get.

AID AND GLOBAL POVERTY REDUCTION

Despite over \$1 trillion worth of economic assistance to developing countries over the past half-century, some 2.8 billion people (nearly half the world's population) lived in poverty (on less than \$2 a day) in 2003–04. There is an assertion in some circles that aid has therefore failed. Some stakeholders blame the donors for misdirecting their aid, while others accuse receiving countries of poor management and governance. Whatever the reason for the past shortcomings of aid, one's expectations of the likely contributions of aid must be forward-looking.

Today, the development progress in the Third World and other rapidly changing international challenges remain a shared responsibility. Many developing countries (particularly those in Africa, with its harsh climate and other adverse factors such as disease and isolation) cannot lift themselves out of poverty without a significant increase in aid. It is therefore hardly surprising that poverty reduction remains the most frequently stated goal of the foreign aid programs of donor countries. Efforts to eliminate poverty have indeed been the focus of the United Nations Millennium

Development Goals—an initiative that, among other things, aims to eradicate extreme poverty and hunger, as well as achieve universal primary education and significantly reduce child mortality by 2015—as set out in the Millennium Declaration signed by all 191 United Nations member states in September 2000.

However, many observers, including the United Nations in its 2003 Human Development Report, are skeptical whether the commitments made by the wealthy nations to meet these goals are being met.

Poverty reduction and economic growth are often highly correlated.

As stated earlier, besides poverty reduction, another oft-stated goal of most aid programs is the promotion of economic growth. Of course, poverty reduction and economic growth are often highly correlated, but it is still possible for aid to reduce poverty without having a positive effect on growth—just as aid has the potential to stimulate growth without lessening poverty.

Studies on the relationship between foreign aid and poverty enquire whether aid can lead to poverty reduction after controlling for other explanatory variables and institutional settings. For instance, P. Collier and D. Dollar find that aid can reduce absolute poverty and accelerate poverty reduction in developing countries with good policy and institutional environments. Analogously, C. Burnside and D. Dollar find that aid is effective in reducing the infant mortality rate (used as a proxy for poverty), but only in countries with good policy environments.

Most studies in this area probe for the existence of a statistical correlation between donor aid and poverty reduction in recipient countries. Investigating the linkage between aid and poverty, however, cannot identify the existence of causation between the two, since two variables may be highly correlated, but not necessarily causally linked. In order to address this problem, B. Arvin and F. Barillas check for the existence of a causal linkage between aid and poverty.

That is, they conduct an empirical test to ascertain whether infusions of aid influence poverty, whether poverty impacts the aid flows, or whether causality proceeds in both directions simultaneously—suggesting the existence of a self-perpetuating circular flow between aid and poverty. While their results identify no causal associations in some of their samples, they point

to the existence of a number of relationships across others.

CONCLUSION

Increasing fiscal constraints and aid fatigue among donor nations over the years have led many to emphasize the need for accountability of their aid dollars and gradual self-reliance of the recipients. As a result, most donor countries now demand that higher aid levels be accompanied by more efficient use of the funds available—thus rewarding states with proven records of good economic management and internal political stability.

The demise of most military aid programs, the rise of democratic governments in a growing number of countries, and reduced demand for aid from a number of large and medium-sized Asian countries (most notably China, India, and Thailand) bring hope that the limited aid funds will be used more effectively in development projects and for poverty reduction in needy countries. In the end, long-term inability to root out poverty and other social ills associated with poverty (disease, illegal drugs, conflicts, refugees, child labor, crime, terrorism, and environmental degradation) will haunt the developed nations, crossing their borders in one form or another.

Finally, it is worth noting that the granting of aid is only one policy that can spur economic development and alleviate poverty around the globe. Other measures that can be used in conjunction with development aid include debt forgiveness, removal of subsidies to domestic producers, and general opening of markets, especially by donors like the United States and the European Union. High levels of subsidies depress prices and effectively shut out producers from developing nations. A case in point is the subsidized crops from richer countries, with which many farmers in the Third World are unable to compete. Removing such subsidies and opening markets, which would increase the volume of exports by developing countries, side by side with debt forgiveness and development aid, is likely to create a better environment to eradicate world hunger and poverty in the long run.

Foreign Direct Investment

FOREIGN DIRECT INVESTMENT (FDI) allows international corporations to invest directly in foreign countries by buying into local firms. In particular, FDI defines the process through which a firm located in a country, known as the home country, buys 10 percent or more of the stock of a firm in a foreign country (the host country, generally a developing country). Usually, corporations involved in FDI buy the necessary amount of stock to give them full or partial control over the firms in the host country, which thus become their affiliates or their branches.

This type of FDI is called acquisition. When a new legal entity is created by the inflow of foreign capital, the operation is described as a merger. In other cases, FDI takes the form of a Greenfield investment, whereby

a completely new plant is set up. Foreign direct investment has acquired a global dimension, with FDI stocks representing 20 percent of global Gross Domestic Product (GDP). Economists, social activists, and historians have widely debated whether foreign direct investment brings considerable poverty relief in developing countries or whether it is just another way to exploit their resources and their less strict labor and environment legislations. The heart of the matter is whether foreign direct investment is able to generate spillovers for host economies and if it raises the productivity of domestic enterprises. In addition, do transnational corporations share their profits with the workers and the citizens of the host country? Or do all returns simply increase the gains of the multinational shareholders?

The growth of foreign direct investment has stimulated a debate on its complex nature.

Indebted and poor countries are still dependent on foreign aid for their development strategies. Since the 1990s, foreign direct investment has become the largest source of foreign private capital reaching developing countries. Developing countries have established a series of economic bonuses to attract foreign investment. For example, as Gordon H. Hanson has shown, Brazil became the focus of the automobile industry in the late 1990s.

Both General Motors and Ford established new plants in the country. GM agreed to build a plant in the scarcely industrialized area of Rio Grande do Sul, receiving in exchange several subsidies that partially covered the costs of building roads, ports, and other infrastructures related to the plant; temporary exemption from VAT; and a reduction of import duties on material used to build the plant. The same package of subsidies was received by Ford for the construction of its plant in the poor northeastern state of Bahia.

Both in Rio Grande and Bahia, compensation for automobile workers is lower than in other regions of the country. Both GM and Ford mainly use foreign suppliers. These two examples should make it apparent why the growth of FDI has stimulated a debate on its complex nature and on its possible negative impacts on the economies of the least developed countries. The focus of this debate has been how to use foreign direct investment to fund more sustainable forms of development. The assumption that greater inflows of FDI will automatically act as a benefit for the host country's

economy and its general level of wealth has proved inaccurate.

For example, in spite of constantly increasing FDI, current accounts in most Latin American countries remain in deficit. In Africa, problems of corruption and lack of transparent regulations have limited the impact of foreign direct investment. The link between FDI and the gross domestic product has been challenged by studies on central and eastern European countries. In this area, foreign direct investment has grown steadily since 1990, yet GDP has dropped. Therefore, the benefits of foreign direct investment are not merely proportionate to the host country's ability to attract foreign capital. The impact of FDI largely depends on the levels of domestic investment and savings of the host economy, the mode of entry of FDI (merger/acquisition or Greenfield investments), and the sector that receives the investment.

Stability of FDI is crucial for the reduction of poverty in developing countries. The economies of host countries will benefit by a stable inflow of foreign investments, as these can encourage product diversification, thus reducing market dependence on a restricted number of sectors and products. However, the stability of FDI is seriously jeopardized by global trends. If international flows of trade and investment drop for long periods, foreign companies are less willing to employ their capitals in FDIs.

It is obviously more difficult to deinvest the capital put in a foreign affiliate than it is in a portfolio investment (where there is no direct management of the firm invested in). Studies on stability of FDI during crises supply ambiguous data. During the 1996–97 Asian crisis, for example, countries such as Korea and Thailand continued to receive FDI, while its amount dropped in other countries like Indonesia. During the Latin American crisis of the 1980s, however, FDI slumped sharply.

The social benefits of FDI can include the reduction of unemployment, the enhancement of training programs for workers, and the rise of wages. Yet only a small portion of the population usually takes advantage of foreign investments. Employment and training tend to be given to the already educated, wealthy urban elites.

Rather than funding the production of food or other subsistence products, foreign capital often goes into the production of sophisticated goods, thus stimulating a culture of consumerism. Traditional and rural businesses show less capacity to attract foreign direct investment and, as a result, they may be forced out of business or required to seek other funding.

Together with training programs, parent companies can also support their foreign affiliates with Greenfield investments, which can develop new infrastructures and technologies in the host country. However, this importation of foreign technology can also have negative effects, as small local businesses become unable to sustain enhanced production and competition.

The effects of FDI can lead to both "crowding in" and "crowding out." The former occurs when foreign companies produce a generalized growth in the host economy. The latter is marked by the domination of foreign companies over local markets, with the consequent reduction of local competition. If labor and environment standards are kept low to attract foreign investments, this may result in crowding out phenomena as governments will find it increasingly difficult to absorb the impact of industrial growth on their societies and the environment.

As economic globalization is more and more under critical scrutiny, it is becoming evident that mere privatization and market deregulation are not the solution to the problems of developing countries. They are certainly central means of attracting FDI, but favor market speculations in poor and indebted countries. To be effective, FDI needs to be channeled and controlled. National legislation should make sure that local markets receive the due support, otherwise the economies of developing countries will not be able to adapt to the influx of FDI.

Countries should be skeptical that promoting FDI will increase their wealth.

In addition, guidelines and regulations should stimulate ethical and socially responsible FDI and prioritize the reduction of poverty and gender imbalances (it is estimated that 70 percent of the world's poorest citizens are women). Although it is difficult to assess the environmental impact of foreign direct investment, firms should adopt Environmental Management Systems (EMS) to work out the likely environmental consequences of FDI inflows. These include ISO 4001, which prescribes investments in inspections and monitoring of environmental effects. This area is often neglected in developing countries and international support is of fundamental necessity. Parent governments and firms should also make scrupulous checks that they are providing the host country with environmentally sustainable technology.

If foreign direct investment is to become a source of development for poor countries, governments, NGOs, civil society groups, corporations, labor unions, and local authorities will all have to work together. Otherwise, FDI is in danger of becoming yet another way of making profits in developing countries. In his paper "Should Countries Promote Foreign Direct Investment" for the United Nations Conference on Trade and Development, Hanson has concluded his analysis by stating that "countries should be skeptical about claims that promoting FDI will increase their wealth." Hanson explains that although host governments continue to give multinationals incentives, the benefits they receive in return are far from justifying them. Yet "governments feel compelled to offer concessions given that multinationals subject their locations decision to bidding by potential host-country governments."

Hanson calls for cooperation among governments to prevent multinationals from exploiting their expansion in developing countries to make profitable gains. As we hear more and more about the charitable donations of multimillionaires such as Bill Gates to noble causes, we should wonder why such donations are needed in the first place. These very acts point to the unsustainable dimension of our global economy for developing countries.

As Brendan Martin writes, "It is all very well for Bill Gates to charitably donate \$750 million to pay for immunization programs for certain diseases, as he recently announced he would do, and for James Wolfensohn to urge transnational companies setting up in poor countries to contribute financially directly to local education services. Societies which depend on such largess to meet their basic health and education needs are neither sustainable, democratic nor equitable—yet new dimensions of power are ceded to large companies."

Foster, Greer and Thorbecke Index

THE FOSTER, GREER and Thorbecke (FGT) Index is a poverty measure developed by Eric Thorbecke and Joel Greer of Cornell University and James Foster, a professor of economics at Vanderbilt University. The formula is used by economists to measure how income is distributed below the poverty line. What it does, explains Foster, is to help measure how really poor the poor are. It accomplishes this by taking into consideration a variety of factors.

Poverty can be difficult to measure. For example, a family earning \$6 a week in Guatemala is at a different poverty level than a family earning \$6 in Tahiti or Tennessee. The index was first published in 1984 in Econometrica, the journal of the Econometric Society at Northwestern University in Evanston, Illinois, in an article titled "A Class of Decomposable Poverty Measures." Since its publication, the FGT measure, as it is now called, has been adopted as the standard poverty measure by the World Bank and the Inter-American Development Bank. Most recently, it became part of Chapter V, Article 34, of the Mexican Constitution.

"I was extremely surprised when a colleague in Mexico mentioned to me, 'Did you know that your measure is now the basis of the poverty program in Mexico?" Foster said. He has since traveled to Mexico and visited with the Mexican vice minister of finance, who explained how the government uses the FGT measure in a poverty-reduction program called Progresa (Programa de Educación, Salud y Alimentación, or the Program for Education, Health and Nourishment).

"First they have a 14-billion peso fund that is gathered by taxation," said Foster, "and is redistributed through education programs, through health programs

and through other welfare programs to the poor. It's allocated among the states in proportion to what my measure says. So, if there's a state in Mexico with twice the poverty, it gets twice the funds, on a per capita basis. Secondly, within the states, it's allocated across regions." Thus, the index determines the allocation of approximately \$1.6 billion in funding.

Foster, who is a member of the MacArthur Foundation-funded Network on Inequality and Poverty and Broader Perspective, says he became interested in measures of poverty and inequality while an undergraduate student. He has recently completed a book with his mentor, Nobel laureate Amartya Sen, a pioneer in measuring poverty currently at Trinity College at Cambridge. Foster also has completed papers on measuring inequality and measuring literacy. He's currently working on measuring health inequality. A subtext of much of his work is "let's go beyond income in measuring the well-being of our society," he said.

Foster's poverty measure, however, has not been adopted widely in the United States. "Here in the United States, the way we measure poverty is by counting people who are poor and expressing that figure as a percentage of the total population. One problem with that is if you have a lot of really poor people, it doesn't show up in the data," he said. According to Foster, the relative strength of the FGT is that it allows researchers to discover how many poor are falling far below the poverty line and how many are hovering close to it.

ROB KERBY
INDEPENDENT SCHOLAR

Foucault, Michel (1926-84)

THE FRENCH PHILOSOPHER Michel Foucault was one of the leading intellectuals of the 20th century,

whose investigations on the mechanics of power and the history of sexuality have shown how discourse shapes perception. Throughout his studies, Foucault focused on those people and practices that are considered marginal in Western societies. In them, he found keys to understanding how the upper classes, the scientific community, and the social elites exercise their power. His thought has thus challenged the very concept of what is "normal" and pointed to the constraining force of historical contexts to limit human freedom.

While Foucault's legacy is primarily relevant for gay and lesbian studies, his focus on marginality obviously touches on the issue of poverty and challenges the conventional ways in which it has been conceived and represented. His studies on the mechanisms of power have illustrated how the ruling classes dominate and police the poor and other "deviants." Works such as *Madness and Civilization* and *Discipline and Punish* had an important impact on the social sciences, as Foucault critiqued the origins of institutions such as prisons, hospitals, and asylums.

The life of the French philosopher has attracted as much attention as his works. Some biographers have located in Foucault's own consciousness of being a marginal subject the inspiration for his most fascinating insights. Foucault was born into that traditional French bourgeoisie that he would later target in his works. Born in Poitiers in 1926, the young Michel received a superb education thanks to his family's financial wealth (his father was a successful surgeon as was his grandfather). He attended the Jesuit college Saint Stanislaus in Poitiers and then entered the celebrated Ecole Normale Supérieure in Paris in 1946. There he became a favorite student of Jean Hyppolite, an important existentialist.

Existentialism was a clear influence on Foucault, stimulating him to challenge the way we apprehend and know things. Yet Foucault was later associated with intellectuals such as Claude Lévi-Strauss, Roland Barthes, and Jacques Lacan, who reacted against Jean-Paul Sartre's existentialism. Foucault's university years were also marked by a severe nervous breakdown and a suicide attempt, which some biographers link to his guilt for his growing awareness of his homosexuality.

In the early 1950s, Foucault was also briefly a member of the Communist Party, which he left for his concerns over Stalinist purges. After graduating in 1952, Foucault started a career characterized by constant movement and prolonged periods of time spent abroad. He taught at the University of Lille and was then cultural attaché in Sweden, Poland, and Germany. He returned to France in the 1960s to teach at the University of Lille and was

versity of Clermont-Ferrand, where he met his life partner, Daniel Defert. While at Clermont-Ferrand, Foucault wrote his early monographs, including Folie et déraison: Histoire de la folie à l'âge classique (1961, Madness and Civilization). However, it was not until the publication of Les mots et les choses (1966, The Order of Things) that Foucault started to attract wide international attention. After two years spent at the University of Tunis, Foucault returned to Paris, first as director of the philosophy department at the University of Paris, Vincennes, and then as chair of The History of Systems of Thought at the Collège de France, one of the country's most prestigious cultural institutions.

From the 1970s until his death from AIDS-related septicaemia, Foucault wrote extensively and traveled widely to foreign universities, spending several years as visiting professor at the University of California at Berkeley. His later publications include the celebrated Surveiller et punir: Naissance de la prison (1975; Discipline and Punish: The Birth of the Prison) and three volumes on the history of Western sexuality.

In Madness and Civilization and Discipline and Punish, Foucault explained the rise of institutions such as prisons, asylums, and hospitals as the effort of society to exclude those whose social, sexual, and psychological status did not conform to the norm. These places of coercion had their origins in the belief of the 18th century that human behavior could be controlled and reformed.

According to Foucault, the regulation of social conduct in modern society is represented by the Panopticon. Devised by the reformer Jeremy Bentham in 1787, this type of circular prison made all the convicts the subject of scrutiny from a central tower. A single guard could watch over several inmates while remaining hidden from them. The development of the penal system was clearly informed by the middle-class effort of forcing onto general society its concept of normality. The Panopticon was not limited to the individuals it inspected, but is the image of the surveillance of entire social groups.

In Foucault's thought, power and knowledge are always closely linked, as his phrase "power-knowledge" (pouvoir-savoir) makes clear. The mechanisms of power aim at the creation of social homogeneity. Although the Panopticon has been replaced, Foucault argues that contemporary society is still dominated by surveillance of some subjects by others, such as teachers, social workers, and policemen.

Fourth World

THE MAIN ARGUMENT of the advocates of the "End of the Third World" relates to the uneven development within the Third World. Geographical size and population size were extremely different; some countries were rich in raw materials, others resource-poor. Giant India was part of the less developed countries (LDCs) as were microstates, which had fewer inhabitants than a suburb of Delhi.

In the 1970s, the newly industrializing economies (NIEs) (South Korea, Singapore, Hong Kong, and Taiwan) were on the threshold of joining industrialized country status. Oil-exporting Saudi Arabia and manufactured-goods exporting Brazil often have more in common with industrialized countries. At the same time, the income gap of the LDCs to the least developed countries (LLDCs), also called the Fourth World, increased year by year. Fourth-World countries (or LLDCs) are even less-developed than LDCs.

At the First United Nations Conference on Trade and Development (UNCTAD) in 1964, there was a discussion about least developed countries and how to identify them. In 1971, the United Nations (UN) General Assembly recognized this category of countries characterized by severe economic and social problems, notably the profound poverty of their people and the weakness of their economic, institutional, and human resources.

The UN's criteria for LLDC status include income per capita per year of up to \$750; ranking on the Augmented Physical Quality of Life Index (APQLI, which consists of life expectancy at birth and very limited health services, safe drinking water, calorie intake per day, attendance at primary and secondary schools, and literacy rate); an Economic Diversification Index (EDI) rank, also called Economic Vulnerability Index (EVI, with figures for the most part into manufacturing and services that play in a country's Gross Domestic Product, including consumption of electricity, structure of

exports, the instability of agriculture, the economic importance of traditional activities, and the percentage of people displaced by natural disasters); and an upper limit of population of not more than 75 million.

Of the less developed countries, around 40 became part of the Fourth World. These countries were extremely poor; had minimal industrialization; suffered from malnutrition, ignorance, and disease; and their labor force was not very skilled. To be counted as an LLDC, all these indicators have to fit. The rationale behind these indicators is to quantify poverty in a simple and straightforward manner. The least developed countries or Fourth World shares absolute poverty and economic weaknesses, which make it very difficult to develop. The list of Fourth World countries is now around 50 strong, with a combined population of over 600 million people, and of those countries two-thirds are in Africa. The economic relationship of these countries to the rest of the world is minimal. Other characteristics for these countries are very low economic growth rates and of course very low savings and investment rates, but very high birthrates. Most people work in subsistence agriculture in the countryside, which is not self-sufficient and needs food imports. Transport links are very limited.

A place on this list of LLDCs has some advantages, as bi- or multilateral development agencies offer special conditions (grants instead of aid, which had to be repaid with interest or at least concessional aid) to the poorest of the poor countries. However, more aid will not end the increasing wealth gap among the less developed countries, and some countries see inclusion on this list as demeaning in general as it might also deter foreign investment. Special provisions in regional integration organizations, in commodity agreements when they exist, for oil purchases, for fair trade in general, and for a no-arms-sale policy might be more constructive for the Fourth World together with their governments' acceptance of responsibility for development.

LIST OF FOURTH WORLD COUNTRIES

Asia (10 countries): Afghanistan, Bhutan, Bangladesh, Cambodia, Lao People's Democratic Republic, Maldives, Myanmar, Nepal, Timor Leste, Yemen

Africa (34 countries): Angola, Benin, Burkina Faso, Burundi, Cape Verde, Central African Republic, Chad, Comoros, Democratic Republic of Congo, Djibouti, Equatorial Guinea, Eritrea, Ethiopia, Gambia, Guinea, Guinea Bissau, Lesotho, Liberia, Madagascar, Malawi, Mali, Mauritania, Mozambique, Niger, Rwanda, São

Tome and Principé, Senegal, Sierra Leone, Somalia, Sudan, Togo, Uganda, United Republic of Tanzania, Zambia.

Oceania (five countries): Kiribati, Samoa, Solomon Islands, Tuvalu, Vanuatu.

Caribbean (one country): Haiti.

France

THE FRENCH REPUBLIC is one of the most advanced countries in the world and is a leader in the European Union (EU). France borders Spain in the south and Belgium, Luxembourg, Germany, Switzerland, and Italy on the north and east. The country has coastline on both the Atlantic Ocean and the Mediterranean Sea. France claims a 200-nautical-mile Exclusive Economic Zone only on the Atlantic Ocean. The Pyrenees and Alps provide a physiographic frame for the extensive plains and rolling hills that mark the French landscape. The presence of the Atlantic Ocean and the Gulf Stream provides a tempering effect on the climate of France. Rainfall occurs mainly during the winter months and the summers are warm and drier.

Historically, France was ruled by a series of absolutist and despotic monarchs. The first of these was Charlemagne, crowned in 800, and ruler of an empire extending throughout modern-day Europe. The monarchical system ended in the 1870s and was replaced by a series of republics, which continues into the 21st century. Of greatest significance to current economic development in France was a series of events during the presidency of Charles de Gaulle, considered by many people in France as the greatest leader in their history.

One of the major points in the Evian Accords enacted in the 1950s was the termination of colonialism and French imperialism. De Gaulle was also instrumental in bringing about the independence of Algeria, a long-time colony of France. In addition, De Gaulle was instrumental in redirecting the French economy toward the development of manufacturing and industrial sectors.

France's rapprochement with Germany soon after the end of World War II also paved the way for future economic development not only in France but also throughout Europe. The Treaty of Paris in 1951 created the European Coal and Steel Community (ECSC) for the sharing of coal and steel resources in France and Germany. Other European countries also became part of the ECSC because of its success and the prospect of further economic integration within the region. Two other European communities were formed in 1957: the European Economic Community (EEC), which became known as the Common Market, and the European Atomic Energy Community (Eurotom). In the 1960s, the three communities were merged and took the name European Community. Finally, in 1992 the Maastricht Treaty gave the group its current name, the European Union.

Currently, France's Gross Domestic Product (GDP), a measure of the value of all goods and services, ranks fifth in the world. This economic achievement is attributed to a widely diversified economy, a wide array of natural resources, and a well-trained and efficient workforce. Natural resources within France include coal, iron ore, bauxite and other minerals, uranium, timber, and fish. Arable land in France accounts for 34 percent of the total land area. Agricultural products include wheat and other grains, sugar beets, potatoes, and grapes for wine. The latter is, of course, a commodity for which France is world-famous.

In addition, France produces beef, dairy products, and fish. The industrial sector is equally diverse. The production of machinery and other metal goods, automobiles, automobiles, aircraft, textiles, and electronics clearly identifies a robust and modern industrial sector. Economic activities of the scope seen in France are reliant on massive amounts of energy. In this area, France is a net importer. Although France produces some of its needed oil and natural gas, most of its needs are satisfied by importation.

France is one of several western European countries that receive natural gas from the gas fields in the northern reaches of the western Siberian lowland. In the 1970s, countries in western Europe engaged in a

France ranks 10th on the Human Poverty Index. Its capital, Paris, is the government headquarters as well as the center of higher learning and the arts, and has the majority of French companies, financial centers, and manufacturing.

unique cooperative venture with the Soviet Union to access the natural gas. France and other western European countries provided the technology for the building of the pipelines from the Russian north across the European littoral and into western Europe. In exchange for this service, the Soviet Union agreed to supply natural gas on demand until the agreement value received equaled the cost of pipeline installation.

The plan to build the pipeline initially met strong opposition from the United States, which claimed that the Europeans were making deals with an avowed enemy and that engaging in an economic arrangement of this scale would certainly strengthen them to the disadvantage of the West.

The western European countries considered the concerns of the United States, but the pipeline was built and natural gas delivered. This event suggests the power of sound economic arrangements and how borders between adversaries can be circumvented when the economic need is great enough.

The labor force in France reflects its economic diversity. Agriculture employs about five percent of the workforce, a figure that is considerably higher than in other advanced countries such as the United States, which has less than two percent of its workforce in agriculture. This is explained in part by the strong emotional attachment the French have to the land, and which continued into the industrial era. In addition, French farmers' organizations remain well organized and not hesitant to make their demands known to the government when it is deemed necessary. French exports include transportation equipment, plastics and chemicals, iron and steel, pharmaceuticals, and beverages. The country's major trading partners for both exports and imports include Germany, Spain, the United Kingdom, Italy, Belgium, and the United States. The industrial sector accounts for 24 percent of the workforce and the service sector has 71 percent.

The total population of France is 60.7 million (2005). Over 40 percent of the population live within

the four major metropolitan centers and their contiguous regions. These include Paris, Lyon, Marseilles/Aixen-Provence, and Lille. More than half of the total economic activity in France is found within these four urban regions.

Paris is the leading center, with its government headquarters, universities, and other centers of higher learning and the arts; the headquarters of a majority of French companies; financial centers; and a variety of manufacturing centers. Lyon has heavy industry and textile manufacturing. At one time Lyon was the leading center for silk making. When synthetic materials became prominent in the post-World War II period the silk industry in Lyon suffered for a short period of time. However, the city regained its prominence in textile manufacturing, this time using primarily the synthetic products, owing in large part to its highly trained and efficient workforce. The transition from silk to synthetics was a relatively painless one for the textile manufacturers in Lyon. The urban centers around Lille and Marseilles gained prominence because of their strategic geographical locations, one on the Mediterranean Sea and the other with proximity to the countries of northern Europe.

DEMOGRAPHICS

The demographic measures in France identify a country that has completed the demographic transition and, like many other western European countries, it has a population that is aging. The rate of natural increase (RNI) in France for 2005 is estimated to be 0.4 percent, a figure well below the world average of 1.2 percent but higher than the western European average of 0.1 percent. With its low RNI, France's projected population in 2025 is 63.4 million and in 2050, 64.0 million. France has essentially reached zero population growth (ZPG), an attainment that is shared primarily with some, but not all, countries in the developed world. The total fertility rate (TFR) in France is 1.9, which is the average number of children born to a woman between the childbearing years of 15 and 49. This figure is lower than the world average of 2.7. A TFR higher than 21, considered the population "replacement rate," indicates a region or country that is increasing in population. All of the countries of Europe have a TFR lower than 2.1.

France has one of the highest life expectancy measures in the world. Average life expectancy at birth is 80 years. For men the number of years is 77 and for women, 84 years. France is surpassed in this demographic category by only Japan (82 years), Iceland (81

years), and Sweden (81 years), and is tied with six other countries, all of which are in Europe with the exception of Canada. The economic success of France is seen in its Gross National Income (GNI) per capita, which was \$29,320 (2004). This figure is slightly below the western European average of \$29,410 and over three times the world average (\$8,540). The country has an excellent education system. This is reflected in the adult literacy rate, which stands at 99 percent.

France has work to do to maintain and improve its socioeconomic levels.

The poverty rate for France is variously reported as between 6.5 and 10 percent. Also, the unemployment rate is reported to be approximately 10 percent. Both of these measures seem to contradict the success of the economic sector in the country. Part of the explanation may lie in the government-sponsored program that provides a "minimum revenue insertion" to people who are on welfare or are unemployed. People receiving the benefit are not likely to seek employment or get off welfare because the potential for earnings in a job is frequently equal to or even lower than what is received through the insertion program.

Critics of the minimum revenue insertion program insist that it creates both unemployment and poverty. They contend that many low-paying jobs remain vacant because the wages are lower than the amounts received in the insertion program. Poverty is created, the critics suggest, because the insertion program, originally set up to provide temporary assistance, has become permanent. Couple the poverty problems and relatively high unemployment with a sluggish economy in the first years of the 21st century and it is clear that France has work to do to maintain and improve the socioeconomic levels attained during the Fifth Republic.

In recent years, the government has relinquished control over a number of economic entities. However, healthcare, education, and energy are still run by the government. The gas and electricity organizations, Electricité de France (EDF) and Gaz de France, remain under government ownership. In addition the government is the majority owner of the leading telecommunications provider, France Telecom, and the government operates the railroads.

Francis of Assisi (c. 1181-1226)

BORN INTO A WEALTHY merchant family of Assisi, Italy, St. Francis was an inspirational leader of the movement of Evangelical poverty in the early 13th century. A direct outcome of Francis's emphasis on voluntary poverty was the foundation of the Franciscan orders of the Friars Minor (Ordo Fratrum Minorum), the woman's Order of St. Clare (or Poor Clares), and the lay Third Order.

Francis considered voluntary poverty the first step toward a regeneration that could lead to the salvation of wealthy Christians like himself. Through his charisma, Francis succeeded in gaining a large following and became one of the most important figures in medieval spirituality. His devotion to poverty earned him the nickname *il Poverello* (the poor little man) and, through his lasting influence, played a fundamental part in Catholic history. Yet recent scholarship has also pointed out the limitations and lacunae in Francis's thought and, in particular, in his conception of voluntary poverty.

Francis was the son of Pietro di Bernardone, a cloth merchant, and Lady Pica, who was probably a noblewoman of French origins. The infant was originally named Giovanni, but his father later changed his name to Francesco. In his youth, Francis received instruction in Latin and French, and particularly liked the literature of the troubadours. He was a lively and enthusiastic person who quickly became a well-known personality

among the youth of Assisi. In 1202, Francis was taken prisoner while fighting in the war between Assisi and Perugia, and, after his release, he fell seriously ill. Upon his recovery, he tried to pursue his military career in the papal army led by Count Gentile against the emperor Frederick II. Yet, while en route to join the army, he had a vision that ordered his return to Assisi where a nobler knighthood awaited him.

After his return to Assisi, he devoted himself to solitary prayers and meditations. It was during this period of his life that Francis experienced several episodes that fundamentally contributed to his conversion: a vision of Christ while he was praying, a pilgrimage to Rome where he begged for alms in front of St. Peter's Basilica, a meeting with a leper, and, above all, hearing the crucifix in the ruined San Damiano Basilica in Assisi tell him: "Go, Francis, and repair my house which, as you see, is well-nigh in ruins."

As a result of this last event, Francis sold several of his father's finest cloths and tried to give the money to the priest in San Damiano, who, however, refused. Disapproving of Francis's actions, his father summoned him in front of the bishop of Assisi. This was the turning point in Francis's life. Before his father could speak, Francis gave all his clothes back to his father and, taking a cloak offered by the bishop, went to the woods surrounding Assisi.

Francis gave up family ties to embrace a life of poverty and, after hearing mass on the feast of St. Matthias, February 24, 1208, he started preaching. He attracted many followers and, two years later, he led a group of 12 disciples to Rome to seek papal authorization for his Franciscan order. Pope Innocent III finally agreed to the establishment of the order on April 16, 1210. Members of the order did not have possessions, and their main occupation was preaching. Starting from the region of Umbria where Assisi is located, the preachers soon spread throughout Italy as their number rapidly grew.

Francis even ventured outside Italy on several occasions and, in 1219, he arrived as far as Egypt to preach to the Muslims besieged by the Crusaders. The rapid expansion of the order, however, soon provoked internal disagreements that resulted in the full inclusion of the order into the strict supervision of the Catholic Church. In the last years of his life, Francis increasingly retired from active direction of the order, which, he feared, was changing its fundamental character. Before his death, Francis received the *stigmata* (Christ's wounds), the evidence of his longing for a complete union with Christ. He was canonized in 1228, only two

years after his death. Francis wanted to embody what he thought was the fundamental message of Christ: the rejection of earthly wealth and the embracement of poverty.

Poverty is so firmly at the core of Francis's preaching that his contemporaries defined it as his lady or his bride. In his last writing, the *Testament*, Francis defined absolute personal and spiritual poverty as the essential lifestyle of his order. Medieval representations of Francis, such as the pictorial ones made by Giotto, stress the centrality of poverty in the saint's life as he is often clothed with a simple tunic and is barefoot. The figure of Francis has attained such a legendary status that it is difficult to gain critical distance. Throughout the centuries, the persona of the saint has been immune to criticism.

However, Kenneth Baxter Wolf has pointed out how Francis's stress on voluntary poverty did not take into account the idea that the poor could use their own involuntary poverty as a path to heaven. In marked contrast to Francis's poverty, contemporaries were likely to react to involuntary poverty as a symptom of moral deviance. Moreover, Wolf argues that Francis's experiment in poverty had a potentially harmful effect on the level of almsgiving directed toward the involuntary poor. The Franciscan loathing of money prevented the friars from taking a leading role in alleviating urban poverty, but their own mendicant lifestyle also put them in direct competition with other beggars for the charitable donations of the urban elite.

Franciscan Order

FRANCISCANS ARE members of a Roman Catholic religious order that requires poverty of its members.

The men's or First Order was founded by Giovanni Francesco Bernardone, an Italian mystic and preacher, known as St. Francis of Assisi. The women's or Second Order was first led by Francis's disciple, Clare Offreduccio, who became known as St. Clare of Assisi.

The brothers shall not acquire anything as their own.

The Franciscans were one of four 13th-century orders of mendicant or begging friars, the Franciscans, Dominicans, Carmelites, and Augustinians. Unlike earlier monastic orders, which lived in the solitude of monasteries, Franciscans served active lives within the world, ministering to the needy. Their early ministry, dwelling places, and clothing were those of the poorest and most despised of their day: lepers. Francis wrote several Rules of Life that set out how his followers were to live out their vows. These included:

Earlier Rule VII: "None of the brothers should be administrators or managers in whatever places they are staying among others to serve or to work, nor should they be supervisors in the houses in which they serve. Instead, they should be the lesser ones and subject to all who are in the same house. And they may receive for their work everything necessary except money."

Earlier Rule VIII: "None of the brothers should in any way carry, receive, or have received either money or coins, whether of clothing or books or payment for any work. If by chance some brother has collected or is hoarding money or coins all the brothers are to consider him as a false brother and an apostate and a thief and a robber."

Later Rule VI: "The brothers shall not acquire anything as their own, neither a house nor a place or anything at all."

After five Franciscan missionaries were put to death by the Sultan of Morocco on January 16, 1220, Francis counseled the friars to go gently and humbly into mission lands. Earlier Rule XVI instructed: "One way to conduct oneself in mission lands is to not engage in arguments or disputes, but to be subject to every human creature for God's sake and to acknowledge that they are Christians."

Franciscans were to identify themselves with the marginalized of society by being vulnerable and powerless. Shortly before his death, Francis dictated a *Testament* summarizing the religious ideals he wished to bequeath to his followers: "And those who came to re-

ceive life gave to the poor everything which they were capable of possessing and they were content with one tunic, patched inside and out, with a cord and short trousers. And we had no desire for anything more. And we were simple and subject to all."

As a young man, Francis had led a worldly, carefree life. As a prisoner of war in 1204, he suffered a severe illness during which he renewed his faith. Upon his release, he began performing charities among the lepers and worked on the restoration of dilapidated churches. Francis's change of character and his expenditures for charity angered his father.

He devoted himself to the care of outcasts in the woods of Mount Subasio. In 1208, while restoring the ruined chapel of Santa Maria degli Angeli, he felt a divine call to go out into the world and to follow Christ's instructions in Matthew 10:5-14 to possess nothing but to preach the Gospel through word and deed. Clad in his customary rough garment, barefoot and without a staff or money, he began to preach repentance. He was joined by a prominent fellow townsman, Bernardo di Quintavalle, who sold all that he had, gave it to the poor, then followed. Soon 11 others had joined the group and lived in a deserted lepers' hut.

Innocent III sent Francis off to the pigpen and was impressed by his willingness to obey.

They spent much of their time traveling through the mountainous districts of Umbria, Italy, cheerful and singing, making a deep impression on their listeners by their earnest exhortations and a willingness to work. What seems to have impressed first the Bishop of Assisi, Guido, then Cardinal John of St. Paul and finally Pope Innocent III himself, was their loyalty, and willingness to toil without pay at the worst tasks.

There are a variety of stories concerning the first audience of Francis with the Pope. One holds that Innocent III sent the ragged Francis off to tend the pigpen and was impressed by his ready willingness to obey. At the Pope's instructions, the group elected a leader; not surprisingly, it was Francis. Their growing number came to be known as the First Order. In 1212, Clare was given permission to establish the Order of the Poor Ladies, also known as the Poor Clares, later formalized as the Second Order of Franciscans. In later years, Francis and Clare founded the Third Order, which did not require its members to be celibate priests or nuns, but still required the married couples or widowed to live a

lifestyle of austerity, hard work, poverty, and dependence on charity.

By the time Francis died, the First Order had spread from Italy to England, the Holy Land, and all of Europe. Members were known as the people's preachers. They wore a gray tunic with a white cord at the waist and became known as Grey Friars.

Friar Tuck, the fictional monk who legend says was part of Robin Hood's Merry Men, is usually portrayed as a Franciscan. English philosopher and scientist Roger Bacon was a Franciscan, as were the philosopher-theologians Duns Scotus and William of Occam. Other famous Franciscans include St. Anthony of Padua; Popes Sixtus IV and Sixtus V; Junipero Serra, the founder of the California missions; and Giovanni di Fidanza, later known as St. Bonaventure.

ROB KERBY
INDEPENDENT SCHOLAR

Frank, Andre Gunder (1929–2005)

ANDRE GUNDER Frank was a German economist, historian, and polymath with wide-ranging interests and ideas. He lived and taught at universities across Europe and America, having become used to migration as a way of life when his family fled Germany upon Adolf Hitler's rise to power. His intellectual imagination was characterized by the same desire to cross borders and find new connections that had eluded previous observers. His principal contributions were in the fields of structural dependency and world systems theory.

In Capitalism and Underdevelopment in Latin America, Frank contributed to the emergence of structural dependency theory, which was also exciting economists such as Raul Presbisch. He too pondered the issue of

why some countries were able to dominate the economic activities of others and answered the question by proposing that for a variety of power and politically related reasons, central countries were able to control peripheral ones and ensure that their commodity trade was always conducted on unfavorable terms with the manufactured goods produced in the center. Hence, through accumulation of resources as prescribed by capitalism, the periphery remained perpetually underdeveloped.

In The World System: Five Hundred Years or Five Thousand? Frank was part of the attempt to relocate the center of world history away from the West and to question the extent to which large-scale, extremely long-run core-periphery structures could be discerned in global history. In ReOrient: Global Economy in the Asian Age, Frank argued that the focus on European and Western history was misplaced ethnocentrism. Instead, it should be recognized that until the fortuitous discovery of American silver and the Atlantic slave trade, Western nations were peripheral to the international trading system, which had for centuries been centered on China.

As a result, all existing Western views of development must be incorrect and reinvented. His views were always in the minority in academic articles and his opinions were often dismissed out of hand by some of those whom he considered to be old-fashioned ethnocentrists. In any case, the type of macroanalytical multivariate global history with which Frank was concerned is always vulnerable to charges on methodological bases, since so many variables could be considered and because data are so frequently incomplete. Nevertheless, a number of his previous collaborators and friends rushed into print with highly critical reviews, which he also sought to rebut with some relish.

In one of his last important publications, Frank wrote a two-part article in the *Asia Times* entitled "The Naked Hegemon," in which he argued that the economic policies of the neoconservative George W. Bush administration were so ruinous for the American economy that they would inevitably undermine the grandiose foreign policy it was simultaneously transacting and of which Frank also disapproved. These were just part of a voluminous research and writing output of hundreds of articles, book chapters, reviews, essays, and other scholarly letters. His enormous output was, according to those who knew him, matched by his appetite for life, friendship, and debate. He was married to the social activist and author Marta Fuentes, who died in 1993.

Franklin, Benjamin (1706-90)

YOUNGEST OF 17 CHILDREN, four of whom died at birth, Benjamin Franklin described his childhood as one of poverty and obscurity. His father worked as a candlemaker and was unable to amass any degree of wealth. At age 10 Franklin was taken out of school to assist his father in the candlemaking craft, an occupation that he disliked. When he was 12, Franklin went to work for his brother, who owned a printing business. Within a few years, unable to tolerate this position, he moved to Philadelphia and found work in the printing business. Following a brief junket to London and work as a typesetter, Franklin was brought back to Philadelphia by a wealthy merchant to work as his personal assistant.

In this position, Franklin made the acquaintance of many influential Philadelphians and in time established his own publishing business. One of the ongoing publications in this business was *The Pennsylvania Gazette*, a newspaper to which he contributed articles and essays.

In 1732, Franklin began one of his most famous publications, *Poor Richard's Almanac*, a series of essays complete with clipped sayings intended to guide people in their daily lives. Franklin continued to publish the *Almanac* for the next 25 years, which brought him recognition and fame throughout the colonies and Europe. The *Almanac* contained innumerable references to the woes of poverty and anecdotes on how to achieve the better life. For example, the 1733 edition includes a saying describing one aspect of poverty, "Light purse,

Benjamin Franklin grew up in poverty and had sage advice for his fellow countrymen on the perils of laziness and lack of ambition.

heavy heart," and another one suggestive of the mindset of someone without food, "Hunger never saw bad bread." Franklin cautions the laggard that "laziness travels so slowly, that poverty soon overtakes him."

In the same vein, Franklin contends that "at the working man's house hunger looks in, but dares not enter," a good example of his basic premise that the industrious individual will succeed. But be aware of the proper attitude, Franklin instructed, and that is clear in this statement: "Pride breakfasted with plenty, dined with poverty, and supped with infamy." Franklin insisted that people choose for themselves their own direction in life and emphasized self-determination in this process. However, he cautions the reader that a proper self-image is essential: "A man wrapped up in himself makes a very small bundle."

Perhaps this saying from the *Almanac* speaks most to Franklin's own experiences in life: "Having been poor is no shame, but being ashamed of it, is." From his

humble beginnings, Franklin achieved stature as a writer, scientist, politician, and successful businessman. His scientific discoveries gained him recognition among the leading scientists in Europe. He founded the American Philosophical Society and a school he started eventually became the University of Pennsylvania. Franklin was instrumental in reforming the domestic postal system and he represented the colonies in dealings with England. He was an outspoken opponent of the British Stamp Act and worked to have it repealed. Franklin traveled widely in France from 1767 to 1775, during which he made important contacts with influential business and governmental leaders. His fame and stature were instrumental in gathering financial and military support from the French in the colonies' struggle against the British.

Franklin gained further insights into poverty during his visits to England. Whereas the colonies were thriving economically, poverty and unemployment were rampant in England. The explanation for the high degree of hunger and poverty in England was attributed to having an overabundance of workers who could not be employed. When asked how the colonies avoided the ravages of poverty, Franklin explained that paper money was issued to the colonists in "proper proportion to make the goods and pass easily from the producers to the consumers." The paper money was known as Colonial Scrip, and in creating it, Franklin stated, "we control its purchasing power and we have no interest to pay to no one."

When the colonial monetary policy was brought to the attention of the British Parliament, that body passed a law in 1751 prohibiting the colonies from using the scrip and to use only the money provided them by the English. An even more powerful law was passed in 1763. As a result of this legislation, unemployment and the beginnings of poverty became apparent in the colonies because the amount of money provided by the British was insufficient to cover the costs of production and consumption.

In response to this legislation and the problems it caused, Franklin wrote that the colonies would have gladly paid a minimal tax on tea and other items had it not been for the poverty caused by the English laws that prohibited the use of Colonial Scrip. In Franklin's view, this was the strongest reason for colonial resentment of England and the ultimate actions resulting in the Revolutionary War.

Fraud

FRAUD IS A FORM OF THEFT in which dishonesty is calculated for advantage. It is theft that occurs when a thief has been able to successfully misrepresent some material fact(s). It involves the distortion or changing of the facts, or the truths connected with a business transaction, or a government transaction, so that the performance of a contract is actually a form of theft.

Fraud can also involve the wrongdoer in an act of masquerading his or her identity, so that the victim is fooled into a financial act that would not be performed if all of the facts were truly known. The result is that the victim of fraud is hurt by the terms of a contract that is misrepresented. In cases of fraud, the thief uses the confidence that has been placed in the thief by the person defrauded. The confidence is gained by the deliberate and intentional inducing of reliance upon representation of the material facts in the situation that allowed for the fraud to take place. Every year many millions of dollars are lost to fraud. The usual loss is money or property. Some victims of fraud are thrown into poverty as a result of the activity.

Fraud can occur in all kinds of businesses and industries, whether for-profit corporations, governmental agencies, or nonprofit organizations. It can also victimize consumers or individuals. There are numerous forms of fraud, some of which are not called fraud, but seduction, or other forms of injury to the innocent party that are the result of lies or misrepresentation presented by the thief.

The concept of fraud began in English common law. Some of the common types of fraud are lying on a contract, forgery, check fraud, counterfeiting, misuse of credit cards, falsifying of information, and personal misrepresentation. In addition fraud often occurs in sales transactions of goods, of securities, or of conveyances (transfers). It also occurs in the writing of wills, the abuse of trademarks and copyrights, the liabil-

ity alleged in products, and even in obtaining consent for marriage. There have been cases where employers have been held liable for fraudulent action on the part of their employees. This rule may also be applied in cases of an agent who violates a trust even if the one who authorized him to act as a trustee was ignorant of his actions. Fraud can also occur because of a failure to speak. Instead of misrepresenting a material fact, the wrongdoer allows a misconception to go uncorrected. There have been cases where people are gullible, superstitious, or ignorant and become the victims of fraud. The courts have allowed them to recover damages even though the claims made by the wrongdoer were patently absurd and contrary to common public knowledge.

Fraud can have both civil and criminal consequences. In civil law fraud is the basis of the tort of misrepresentation. This form of tort is a civil action called deceit. The victim of fraud is entitled to recover not only losses but compensatory damages. It is usually based on one of three measures.

To prove fraud a prosecutor or the attorney for a plaintiff in a civil suit will have to prove that the fraud was deliberately intended and the plaintiff actually believed the misrepresentation. In addition the accused must have benefited from the fraud, and if there was harm done, it must be directly related to the fraud.

The first form of compensatory damage is the "out-of-pocket" measure. This measure is the difference between the price that was paid for an item or a service and the actual value of the item received. For example, if a victim bought an item such as a refrigerator and paid \$1,000 for it, but found that on delivery it was an "equivalent" model that sells for \$800, then the difference, if kept by the seller, was fraudulently obtained money.

A second form of compensatory damage is the "benefit-of-the-bargain" measure. In this case the difference that can be defrauded is the difference between the value of the item as it was represented to be and its actual value. For example if a person bought a diamond ring for \$1,000 and then found that the diamond had been misrepresented in value and that its market value was only \$500, then the victim can sue for the difference that was misrepresented.

A third form of compensatory damage is the cost of doing something, or "make-good" damages. This measure can be used when the misrepresentation costs someone and the extra costs are the result of misrepresentation. For example, if a package vacation to a resort misrepresented the nature of the resort, the meals, facil-

ities, or other features, then the costs incurred could be actionable for recovery. Suppose that the hotel at the resort was so dilapidated or otherwise unacceptable that the vacationer had felt compelled for reasons of safety, sanitation, or sanity to move to another hotel, then the costs could be actionable by law.

Because fraud is a tort that is an intentional wrongdoing it can be punished with punitive damages. The misrepresentation or fraud has to be intentional. Mere recklessness may not be recoverable as a punitive action.

An example of grand fraud was the savings and loan frauds of the 1980s.

Besides the law of torts, fraud usually involves the violation of a contract either implicitly or explicitly. Fraud will change the relationship formed by a contract, so it could lead to rescinding the contract. Rescinding a contract "undoes" or nullifies it. If one party to a contract was deliberately duped by the fraud of the other party to the contract, then the judge in a case can rule that the contract is rescinded and thereby declare it unenforceable.

Fraud may also be the grounds for gaining judicial relief by forcing the restitution of what was lost because of the fraud. Courts can order restitution or restoration of property that was transferred by a victim of fraud to another party. And it may also be grounds for reforming the terms of the contract. This would mean that the terms of the contract could be rewritten to conform to the representations that were made when the contract was originally negotiated. Reformation in the execution of a contract comes from equity law. Reformation is an equitable remedy that allows the court to literally rewrite the contract. The court will then put the contract into wording that does faithfully state what was originally represented.

WILLS OR TRUSTS

Fraud can occur in the writing of wills or of trust agreements. In the latter case, frauds that violate trusts can be embezzlement, which is the unlawful taking of property that the wrongdoer has in his or her possession. It is the fraudulent taking of property that has been given into the care of someone who has been trusted to care for the property. Since fraud is a form of theft, it can be the reason for prosecution in either or both the state and

federal courts. It is a violation of federal law, and all states also prosecute cases of fraud. The crime of fraud occurs when the perpetrator takes title to property under false pretenses. Usually, but not always money is involved.

Another form of fraudulent behavior that is subject to criminal prosecution is called larceny by trick. In this type of case, the offender persuades the victim to transfer possession of property with the intention of stealing it. The victim is tricked into giving away possession of the valuables or property.

The crime of false pretenses is committed by a wrongdoer when title to property is acquired through deceptive persuasion that intentionally defrauds the victim. Often the wrongdoer is a confidence artist who is targeting a victim such as an elderly homeowner. The elderly person will be "sold" a story that her home needs some kind of work done on it, but the work will be shoddy or simply not done, and the victim will be required to pay a large amount for the "work." Crimes of fraud are often ranked by degrees of severity. The punishment will be graduated in severity depending upon the value of the property that was swindled.

There are a significant number of federal laws that punish fraudulent conduct. Among the federal statutes covering acts of fraud are the False Claims Act, the Mail Fraud Act, and statutes that seek to protect the public from securities fraud. The Federal Trade Commission (FTC) has jurisdiction over investigations into consumer fraud. It has the authority to promulgate rules and regulations that define and prosecute consumer fraud. Many states have their own "little FTC acts" that allow for the prosecution of fraudulent business practices. These statutes often allow for treble damages if a conviction is won.

STOCK FRAUD

The various stock exchanges in the United States have existed in some form for almost the entire life of the republic. From time to time the exchanges have been wracked with scandals caused by fraudulent behavior by traders or others involved with the exchange's market. On the other hand there have been corporations, banks, or other institutions that have been looted or victimized by fraudulent activities by managers or corporate raiders.

The high-flying stock sales of the days prior to the Great Depression gave rise to laws against "blue stock" sales. These were shares of stock that were backed with nothing significant in terms of assets, were sold with the

promise that they would rise to reach the sky, but were in reality worth only the value of the "blue sky."

Other grand fraud schemes have been pyramid sales. Charles Ponzi, in 1920, promised that people could double their money in 90 days. In effect his financial plan was a great pyramid scheme, with those in and out early making money, but with the last to come into the scheme becoming the losers.

An example of grand fraud was the savings and loan institutions frauds of the 1980s. Charles Keating, the head of Lincoln Savings and Loan, was one of a number of bankers tried, and in a number of cases, convicted of fraud.

Perhaps the most expensive fraud cases involving American business were those associated with the collapse of the communications company MCI, the energy company Enron, and other global companies. In the Enron case, its accounting firm, Arthur Andersen, went bankrupt as well. The outcome of these cases has been very strict controls. The Sarbanes-Oxley Act instituted very strict measures that require internal controls that will probably prevent fraud by lower levels of management, and negate the claim that upper management was ignorant of their actions. The intention of the provisions of the Sarbanes-Oxley Act is to have controls in place what will detect fraudulent actions early. This form of accounting is called forensic accounting.

Fraud by corporate chieftains has cost billions of dollars and financially injured thousands of employees and citizens. In addition it has destroyed the retirement savings or healthcare packages of many others, especially retirees. In terms of the losses and injuries to the average citizen, the scope has been much greater than cases of welfare fraud. However, critics of welfare often engage in political crusades against social programs in order to end welfare fraud.

WELFARE FRAUD

Welfare is money or in-kind payments made through public assistance programs and includes benefits, food stamps, and policies that help the temporarily needy. Welfare fraud may include obtaining cash assistance, medical assistance, and/or food assistance by misrepresentation of the need.

One notorious case was that of the alleged "welfare queen" who collected welfare checks in her Cadillac automobile. The image of the public being robbed by an African-American woman who was too lazy to work and who was able to easily steal the system blind was determined to be false. She simply never existed. On the

other hand, there have been plenty of cases of people illegitimately collecting welfare payments.

There are organizations dedicated to fighting welfare fraud. These include the United Council on Welfare Fraud (UCOWF). The organization is composed of investigators, prosecutors, administrators, claims writers, and eligibility workers in local, state, or provincial agencies in Canada and the United States. Their goal is to fight fraud, wastes, and abuse in social service programs by detecting and recovering money lost to fraud, and to seeing that those who engage in welfare fraud are prosecuted. Some of these cases will be due to the misrepresentation of the amount of income that a family has. In other cases the time limits for being on welfare are violated.

Among the frauds committed by the poor on welfare is to falsely report that a parent is absent from the household. Or they may intentionally fail to report a change in the household composition, such as a parent being claimed as a resident who is actually not there. Or they may not report real earnings in their statement of income that would affect the eligibility for benefits. If they intentionally fail to report any change in circumstances that would affect their benefits, or if they intentionally receive benefits from two or more states at the same time, fraud has been committed.

Another form of welfare fraud is theft by the people who work in the system.

There have been cases of Social Security fraud where an elderly person's death was not reported and the Social Security Administration continued to pay the benefits, which were used illegally by a relative or a friend. This form of fraud has occurred with the payment of other benefits as well.

Welfare fraud is committed, like all forms of fraud, by only a few people. While all states have some office that is dedicated to the investigation of welfare fraud, it involves only a small fraction of criminal cases. One reason for the emphasis on detecting welfare fraud is to assure the public that the poor on welfare are the "deserving poor" and not indolent exploiters of the system.

Another form of welfare fraud is theft by the people who work in the system. In these cases the public trust is violated. The advent of computers has made it easier at times for welfare workers to manipulate the system by faking a file that does not have supporting documents. One way this is done is to add a fictitious person or child to a welfare unit, but designate the payment to another recipient. The fraud can be committed by the caseworkers by using a loophole in the welfare system. Specifically those who receive welfare through Aid to Families with Dependent Children (AFDC) can designate another person to receive their payments. The phony case files can then take advantage of a bureaucratic glitch to enrich the caseworker. Those convicted can have their assets seized.

Not only are government agencies defrauded by the occasional welfare cheat but so are private agencies. There are numerous charitable and religious institutions that have been lied to by petitioners asking for help. Most pastors of churches have numerous stories about those who came seeking help and who were really not in need but were scamming "the system."

Other victims of fraud may be the elderly on Medicare or Medicaid. There have been numerous cases of overcharging patients, and some convictions of medical providers or insurance companies. This kind of fraud can occur by ordering unneeded medical exams or by charging for tests never done.

FOOLING THE POOR

Other victims of fraud among the poor are the elderly, who are often preyed upon by confidence men. The confidence trickster or "con" attempts to fool the "mark" with a confidence game. The con artist is usually in league with accomplices ("shills"). The game is to encourage the marks to believe that by helping they can be rewarded with money that is dishonestly obtained. Often the game appeals to greed or to the belief in getrich-quick schemes. More than one elderly person with a limited income has lost his savings to a confidence game such as the "pigeon drop."

In the pigeon drop, the pigeon is the mark and is often an elderly person who is enticed to match a sum of money to be held until its owner can be found. However, the pigeon will soon find that her money has been switched for paper and that the "nice people" are gone with the real money.

Free Trade Agreement of the Americas

THE FREE TRADE Agreement of the Americas (FTAA) aims to be a free-trade area among the economies of the Americas. Countries involved in such a free trade agreement will have removed all barriers to international trade and investment among the member nations. The goal is to increase trade and investment flows amongst the member countries. The process of creating the FTAA began when representatives from 34 nations met at the Summit of the Americas in December 1994 in Miami, Florida. Formal negotiations began at the Second Summit of the Americas in April 1998 in Santiago, Chile. At the third Summit of the Americas in Quebec City, Canada, in 2001, the participating nations agreed to conclude negotiations by January 2005 and implement the agreement by December 2005.

The FTAA conducts its negotiations along many different categories: market access, agriculture, government procurement, investment, competition policy, intellectual property rights, services, dispute settlement and subsidies, antidumping, and countervailing duties. The Trade Negotiating Committee (TNC) oversees the groups' negotiations and is responsible for the final agreement. Brazil and the United States cochair the TNC.

For the most part, the effects of regional trade agreements like the FTAA are the same as global trade and investment liberalization. Trade liberalization, whether global or regional, causes shifts in domestic production and employment, possibly affecting wages for some groups of workers. A unique aspect of regional trade agreements is the distinction between trade creation and trade diversion. When a country lowers its trade barriers with respect to all other countries, the general level of trade will increase. This is called the trade creation effect.

In addition to increasing overall trade, regional agreements might also divert trade from countries excluded from the agreement to members in the group. For example, after forming the FTAA, the United States may begin to import more wine from Chile at the expense of French wine. This occurs because French wine prices (including tariffs) are initially lower than Chilean prices (for the same-quality wine); however, the Chilean wine becomes cheaper once tariffs on Chilean wine are removed.

Trade diversion imposes a welfare loss on the importing nation, since it is no longer buying its goods from the lowest-cost producers. Thus, according to traditional trade theory, whether regional agreements increase economic welfare depends on the extent of trade creation relative to trade diversion. The standard theory also makes some predictions about the relative size of these effects. The trade diversion effect is smaller when the member countries' production costs are closer to the price from the original exporting country (that is, when Chilean wine prices are close to French wine prices). Trade creation is greater when the demand for imports is highly responsive to price changes. Given the wide range in levels of development among the member nations of the FTAA, we may expect trade creation to outweigh trade diversion.

Other potential effects of the agreement include the potential employment and industrial shifts generally associated with trade liberalization. In the United States, critics of the FTAA may argue that the agreement will lead to a loss of jobs and a general decline in wages for less educated members of the workforce. Similar arguments were made prior to ratification and implementation of the North American Free Trade Agreement (NAFTA). The empirical research, however, has not found significant impacts along these lines. The FTAA may have a greater impact given the combined size of the South American economies relative to the Mexican economy. On the other side, the trade agreement should lead to an expansion of high-tech sectors in the United

States. Many critics of both the NAFTA and the FTAA believe these agreements will lead to a lowering of environmental and labor standards and ensuing environmental degradation.

Member countries include Antigua and Barbuda, Argentina, Bahamas, Barbados, Belize, Bolivia, Brazil, Canada, Chile, Colombia, Costa Rica, Dominica, Dominican Republic, Ecuador, El Salvador, Grenada, Guatemala, Guyana, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Panama, Paraguay, Peru, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Suriname, Trinidad and Tobago, the United States, Uruguay, and Venezuela.

Freedom from Hunger

FREEDOM FROM HUNGER is a private organization registered as a charity in the United States. The focus of Freedom from Hunger has been on helping people to access resources necessary for overcoming hunger through their own efforts.

Freedom from Hunger was founded in 1946 as Meals for Millions by businessman Clifford Clinton and Dr. Henry Boorsook, who, at Clinton's urging, was responsible for developing Multi-Purpose Food (MPF), a high-protein powdered food supplement still used in global relief efforts. Meals for Millions was initially founded as a means for distributing MPF in the face of difficulties to persuade government agencies and relief organizations to distribute the food supplement. Over the next decade, Meals for Millions arranged for the distribution of almost seven million pounds of MPF to relief agencies in 129 countries. Beginning in the mid-1950s the organization shifted its focus away from relief

programs and toward the prevention of chronic hunger. While food relief was viewed as a necessary short-term measure against imminent starvation, preventing chronic hunger and malnutrition, which affects many more people, requires a longer-term approach. Meals for Millions came to recognize that central to such a relief approach is the activity of hungry people themselves.

In the early 1970s, Meals for Millions directed its efforts toward implementing Applied Nutrition Programs, which prioritized the health and nutrition of mothers and children. In 1979 Meals for Millions merged with the American Freedom from Hunger Foundation. An initiative of the John F. Kennedy government designed to provide popular education about issues related to hunger and to encourage public participation, the foundation had previously raised funds for Meals for Millions.

The newly structured organization focused on addressing the needs of poor people in rural areas where the extent of poverty is often greatest and resources are lacking. In 1987 the name *Freedom from Hunger* replaced *Meals for Millions* as an expression of the organization's focus on poverty globally and in recognition of the need to reach more than millions, given the growth of poverty since the 1970s.

In 1988 Freedom from Hunger developed the pioneering Credit with Education program, an integrated program combining microcredit financing with health and nutrition education. This program is based on the principle that people want to be active participants in change rather than recipients of charity. Credit with Education is intended to provide information to help people improve their situations while also providing some of the resources to do so.

Freedom from Hunger helps small groups of women gain small loans of approximately \$75 per woman and provides a place in which the money can be safely saved. Under the program women are encouraged to use the money to start small businesses such as food or craft production for sale. Credit with Education runs weekly meetings at which the women are provided with information about health, nutrition, and family planning, as well as business advice.

The Credit with Education program is provided to more than 309,000 poor families. More than 20 local organizations have been trained by Freedom from Hunger to establish services for poor rural communities. Freedom from Hunger has worked to develop Credit with Education partnerships in at least 16 countries, including Benin, Bolivia, Burkina Faso, Ecuador,

Ghana, Guatemala, Haiti, Honduras, Indonesia, India, Madagascar, Mali, Peru, the Philippines, Togo, and Uganda.

Critics of such microcredit and microbusinesses argue that these programs do little to impact systemic inequality and poverty, relying on a business model that focuses on hunger "one family at a time," as Freedom from Hunger suggests. There are also concerns about the fact that women are required to repay their loans with interest and that education programs begin after loan repayments begin. Additionally, there are questions about the impact of business competition and the pressures of loan repayment on already deprived communities and local social relations.

French Revolution

The French Revolution of 1789 is one of the most important events of the modern world. Inequality in French society was a major factor behind the revolution. The popular aphorism that "nobles were to prey, clergy were to pray, and people were to pay" sums up the condition of the people in general on the eve of the French Revolution. Class division was endemic in the contemporary societies of Europe, but in France the gap between the rich and the poor was increasing day by day. A decadent feudal order was clinging to its privileges, while the cry of the *philosophes* (philosophers) was "equality, liberty, and fraternity."

Nobility and clergy formed the two higher echelons of the society, and the rest were commoners, a heterogeneous group consisting of artisans, the bourgeoisie, urban poor, laborers, lawyers, intellectuals, and shop-keepers. Even among the aristocracy, there was division over power and wealth, and when the revolution occurred, the "unprivileged" elite like the lower clergy

joined the mainstream. The *ancien régime* (ancient regime) could not check the spontaneous outburst of anger against poverty and oppression. The term *sansculottes* (without knee-breeches) was applied to the poorer sections of rural and urban areas.

On the whole, the commoners constituted about 95 to 97 percent of the population and the peasants formed the majority of this group. The proportion of the whole population engaged in agriculture in France in the 1750s was about 60 percent. They indulged in cultivation or work on vines after getting land either on rent or lease from the higher section of the society. The *métayers* (sharecroppers) shared with the landlord half the produce. It was this bulk of people who were reeling under poverty in France because of atrocious taxes, a nonchalant royalty, and rising prices.

The corvée, a kind of unpaid labor for making the roads or alternatively making payments, was in existence. There were also the taille (direct tax on personal income), gabelle (salt tax), aides (excise duty on wines), and vingtième (a tax levied on income, "twentieth" tax) on the commoners. The higher two classes were exempted from the tax burden, which was paid by cultivators, wage earners, shopkeepers, artisans, and the professional classes.

An array of taxes like charges for bridges, roads, markets, and transfers of land also was prevalent. These dues made life miserable for the general masses, who were paying higher prices for the cost of goods purchased. Grain prices had increased by about 60 percent. For the common people, escalation of prices by 65 percent, along with wage increases of 22 percent between 1785 and 1789, worsened the economic condition. A cultivator could keep only 18 francs for himself out of the total earning of 100 francs. The land was producing less and the portion cultivated grew less. The diet of an ordinary peasant in the country consisted of black bread and roots. The métayers had to sell household goods out of poverty. Many burned the bedsteads for protection from the cold. The gradual transformation of society from agricultural to industrial resulted in a loss of jobs. Cities like Paris were getting overcrowded with the hungry because of migration from rural areas as a result of poverty. But they could not get any work. The scarcity of food, bad harvests, and the increase in the price of bread were making people's lives miserable. The poor artisans of Paris became the politicized group because of a high literacy rate.

The artisans and workmen, who were at the mercy of rich businessmen controlling commerce, lived on a bare subsistence level, eating buckwheat and drinking water. Many died of cold and became sick because of the lack of a proper diet. In the 1770s, about one million people were classified as beggars.

In 1789, the wave of discontent became aggravated because of bad harvests resulting in the soaring price of bread, the staple diet. There were frequent food riots, with bakeries and grain convoys as the target of attacks. Industry was hit by rising unemployment in the textile centers of France. The cultivators, artisans, and workers were directing their anger at the vestiges of the ancient regime, and the common bond among them was poverty.

In the 1770s in France, about one million people were classified as beggars.

Poverty also goaded women to raise their voices. The women of Paris seized shops, distributing goods to the people at *le prix juste* (fair price). In the *cahiers des doléances* (list of grievances) of 1788, the market women had registered their protest against social injustice and demanded improved work conditions.

On October 5 and 6, 1789, about 6,000 women marched to the palace of the French king, Louis XVI (reign period 1774–92) at Versailles to demand bread. The family of the king became virtual prisoners in the palace, and the procession to Paris of "the baker, the baker's wife, and the baker's boy" aptly reflected the anger of the masses affected by poverty.

The National Assembly (June 17, 1789–September 30, 1791) abolished feudalism and ended the privileges of the nobility and clergy on August 4, 1789, and the Civil Constitution of the Clergy of July 12, 1790, ended the dominant position of the church. The French Revolution not only had been against despotism, but also was directed against the inequality of society.

Friedman, Milton (1912-)

"FOR HIS ACHIEVEMENTS in the fields of consumption analysis, monetary history and theory, and for his demonstration of the complexity of stabilization policy" Milton Friedman of the University of Chicago received the Nobel Prize in Economics in 1976. Friedman's name is chiefly associated with the renaissance of the role of money in inflation and the consequent renewed understanding of the instrument of monetary policy. This strong emphasis on the role of money should be seen in the light of how economists—usually advocates of a narrow interpretation of Keynesian theory—had almost entirely ignored the significance of monetary policy when analyzing business cycles and inflation.

As far back as the 1950s, Friedman was a pioneer in the well-founded reaction to the earlier post-Keynesian one-sidedness. And he succeeded—mainly thanks to his independence in initiating a very lively and fruitful scientific debate that has been going on for more than a decade. In fact, the macroeconometric models of today differ greatly from those of a couple of decades ago as far as the monetary factors go, and this is very much thanks to Friedman. The widespread debate on Friedman's theories also led to a review of monetary policies pursued by central banks in the United States. It is very rare for an economist to wield such influence, directly and indirectly, not only on the direction of scientific research but also on actual policies.

Friedman has carried out a number of studies, which, scientifically speaking, are both original and weighty in support of his analysis of the role of money. His empirical studies of the relationship between increase in the supply of money and the consequent changes in incomes and prices thus were founded on a new formulation of the theory of demand for money or liquid resources. His findings on the comparatively great relevance of the quantity theory in explaining developments are, in fact, built on the premise that the demand for money is very stable.

From a purely scientific point of view, Friedman's other achievements are of great interest. Of primary

importance here is his refashioning of the theory of consumption based on the hypothesis that "permanent income," and not year-to-year income, is the determining factor when assessing total consumption outlay. He makes the extremely valuable distinction between the temporary and more permanent incomes of households; Friedman has demonstrated that a much greater proportion of the former type of income is saved than the latter.

Friedman was the first to demonstrate that the accepted assumption of a simple trade-off between unemployment and the rate of inflation was only a temporary phenomenon; on the longer term (more than five years), no such trade-off exists. Unemployment below a structural level of balance thus leads, according to Friedman's theory, to a cumulative increase in prices and wages mainly on account of the destabilizing influence exerted by expectations.

Friedman has demonstrated how both prolonged "effect-lags" and those of varying lengths—of changes in the supply of money, for example—can have a destabilizing effect. The conclusion he draws for economic policy from these findings has been the subject of lively debate. To put it briefly, it is that monetary policy should be simplified and that its goal should be to ensure a long-run stable growth rate of the supply of money. Friedman was among those who first realized—and could explain—why the Bretton Woods system, with relatively fixed rates of exchange, was due to break down sooner or later.

Fuel Poverty

IN ENGLAND *fuel poverty* is a term used to define a poverty condition in which the economic resources are not available to purchase enough fuel to keep a household warm. The term is also used on the continent of

Europe. The idea of fuel poverty is present in North America, but it is not a widely used term. A household in England is considered to be fuel-poor when it has to spend more than 10 percent of its income on fuel. This includes not only fuel for heating, but also for heating water, cooking, lighting, and using electrical appliances. In addition the money spent on heating must be enough to reach a temperature of 21 degrees Centigrade (or 69.8 degrees Fahrenheit) in the living room, and 18 degrees Centigrade (64.4 degrees Fahrenheit) in other rooms. If a household has to spend more than 20 percent of its income on fuel, then it is considered to be an example of severe fuel poverty.

Income for a household is calculated as the amount that is necessary to both rent (or pay a mortgage) and heat the dwelling. The National Right to Fuel Campaign in England has proposed that disposable income available after meeting housing costs should be the income used for considering the financial conditions in a household for defining fuel poverty.

The consequences for a household that is experiencing fuel poverty can be very serious. It damages the health of those in the household, where there is not enough fuel available for properly warming living spaces. The quality of life can be so severely affected that the weak—children, the disabled, the chronically ill, and the aged—are made vulnerable to illness and death.

Fuel poverty is an important contributor to death in England and in Europe. In England more people die each winter of fuel poverty than perish from the condition in the rest of Europe.

In 1996 and again in 2001 the English House Conditions Survey was conducted in order to assess the problem of fuel poverty. It found that there were 4.3 million fuel-poor households, with all housing costs included as income. In addition there were 6.8 million fuel-poor households using the disposable-income method, with the housing costs excluded.

In 2004, improvements had reduced the number of households experiencing fuel poverty. In England alone there were 1.4 million households defined as fuel-poor. In the remainder of the United Kingdom (Wales, Scotland, and Northern Ireland), there were an estimated three million fuel-poor households. However, floating fuel prices can rapidly change the situation.

Several factors contribute to fuel poverty. These include a simple lack of money for buying fuel to heat a home or residence, rapid rises in the price of fuels, poor energy efficiency of the heating equipment, and inade-

quate weather-proofing in a home or apartment may be such that much of the heat is lost.

Low incomes are a major cause of fuel poverty. The fluctuations in employment conditions may cause some people to become unemployed, and without income from their former job they lack the money for fuel. People in many places in England simply lack the money needed to buy fuel. There is the additional problem that even with the most prudent management of household resources, funds for fuel may not be available. Fuel-price instability can also severely impact households. Rising fuel prices (such as was the case in the fall and winter of 2005), whether electricity, coal, natural gas, or heating oil, can easily destroy a family budget no matter how careful financial planning may be.

In England alone there were 1.4 million households defined as fuel-poor.

A major cause of fuel poverty is the inefficiency of the heat exchange in homes. All dwellings "breathe" or exchange the air inside with the air outside. Usually there is a complete exchange every hour or so. The exchanges cleanse the air in the dwelling. However, the rates of exchange can be too high, leading to significant heat loss. In the winter, housing materials usually contract, so that the fit of its various parts is looser than during the summer. This allows greater amounts of air to be exchanged between the inside and outside of the dwelling; this means that heat escapes.

If a photograph were taken of a dwelling with infrared film it would show the hot spots where the heat is escaping. These would be the places where additional insulation or weather-stripping is needed in order to prevent heat loss. In order to save energy all dwellings need to be thoroughly insulated.

The cracks in floors, around doors and windows, and through the roof allow air to enter, while heat escapes. The energy efficiency of an apartment or home can be greatly improved at a relatively low cost. Windows and doors can be caulked and weather-stripped to reduce the flow of cold air. Storm doors and storm windows can be used to seal openings, by creating a deadair space between the inside windows and the outside storm windows. Storm windows and doors can also reduce condensation, reduce ultraviolet (UV) light in the summer, and increase the heat in winter and significantly cut energy costs. Since windows can account for 25 percent of the heating loss in a home, good insula-

tion of windows is an important way to reduce the threat of fuel poverty.

Insulation in attics can be of several kinds. Blown insulation is usually cellulose, fiberglass, or rockwool. It is blown into the attic with a blower so that it creates a thick blanket of dead-air spaces that provide insulation. Blowing in the insulation increases the probability that all of the cavities will be filled. Insulation in thick matted rolls is also readily available. This material can usually be installed by the homeowner. Good insulation and weatherization of a dwelling cost money, but it yields very significant reductions in heating costs.

In the United States there have been, since the Arab oil crisis following the 1973 Arab-Israeli War, numerous weatherization programs. Some of these have been sponsored by the federal government as subsidy programs for the poor. Others have been sponsored by state governments or by the power utilities themselves.

Elsewhere in Europe fuel poverty is addressed less actively than it is in England.

Since the 1970s the cost of a furnace has remained about the same in terms of the number of dollars it takes to buy a furnace. However, the furnaces available in the first decade of the 2000s are much more efficient. Their greatly increased efficiency means that the cost of heating has not risen as sharply as it would have otherwise, because it takes less fuel to produce the same amount of home heat. Programs to replace old furnaces exist in some locales.

Among the programs are subsidies for fuel costs to the poor. In addition most utilities have a voluntary giving program that allows more prosperous homeowners to donate to a fund for helping people experiencing fuel poverty. These programs are usually well advertised by the power companies in order to encourage donations.

Most power companies have promoted weatherization programs to reduce the cost of fuel consumption. Access to these programs is usually readily available to the poor. Groups like the American Association of Retired Persons (AARP) have promoted energy efficiency in furnaces and heaters, as well as programs for advancing weatherization. As the major voluntary association advancing the interests of retirees, AARP provides information on weatherization programs sponsored by both the federal and state governments.

The American approach is in keeping with American traditions of self-help and volunteerism. In con-

trast, meeting the problems of fuel poverty in England and Europe is usually approached as a public policy initiative.

The English National Right to Fuel Campaign was launched in 1975. Since then the government and numerous groups have worked to define, identify, and seek solutions to the problem of fuel poverty. Defra (the Department for Environment, Food and Rural Affairs) is a government agency that works to balance the essentials of life—food, air, land, water, people, animals, and plants. Fuel poverty is one of its concerns.

In 2003 the British government issued an "Energy White Paper" in which it presented its key energy policy goals and the strategy to achieve them. The central commitment of the government is to ensure "that every home is adequately and affordably heated" by the years 2016–18. The goal is not a moral promise, but rather is a practical goal to be achieved as soon as possible. The British government's various agencies have developed policies and programs for meeting the targets. Among these policies is the Decent Homes Standard. All homes controlled or regulated by the government are mandated to meet the target of being adequately heated by 2010.

The English medical system has alerted physicians to identify patients who seem to be ill because of poor household heating conditions. Once identified, their condition of fuel poverty will be addressed. The government also has a program, Warm Front, for reducing fuel poverty in the private sector of England. The name of the program was changed in June 2000 to the Home Energy Efficiency Scheme. The program provides insulation and heating measures necessary for meeting the needs of poor households. The work on eliminating fuel poverty in England has also required the use of innovations to create sustainable energy supplies and at the same time to reduce pollution.

Elsewhere in Europe fuel poverty is addressed less actively than it is in England. In Ireland it is estimated that 10 percent of the households are affected by fuel poverty. Fuel poverty is mostly found in Ireland in households where there is a single parent or the adults are unemployed. It is estimated that there are annually 2,000 deaths each winter in Ireland because of fuel poverty.

In some southern European countries, notably Greece, Spain, and Portugal, little has been done to deal with the problem of fuel poverty. Activists have argued that there needs to be a massive program of subsidized investment made in the heating equipment of the poor. If the old stoves or furnaces of the poor in these coun-

tries were retrofitted, there would be an enormous savings in fuel costs. Also the negative health consequences of fuel poverty would be greatly reduced.

WORLD POVERTY

G-8

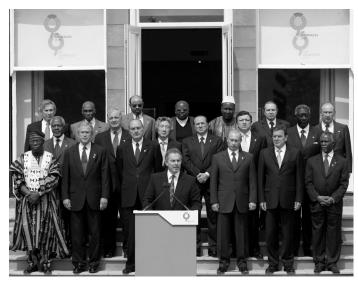

G-8 SUMMITS ARE THE annual meetings of the government leaders of the major industrial countries. The G-8, which was known as G-7 before Russia joined it as the eighth country, functions as a forum where heads of state can discuss economic, political, and financial issues of mutual interest and attempt common strategies.

Yet, with the rise of the antiglobalization movement in the 1990s, these summits have been widely contested. They have become the symbol of economic injustice and of those free-market policies that antiglobalization militants fault for reinforcing world poverty. Opposition groups to the G-8 have voiced their hostility to what they consider undemocratic meetings controlled by big corporations, demonstrating in large parades that have sometimes caused urban riots and violent clashes with police forces.

G-8 meetings have come to represent the central discrepancy of global economy: the huge decentralization of production processes, often moving to developing countries where manpower is cheaper, child labor can be exploited, and workers' rights are nonexistent is implemented through a simultaneous centralization of command and control processes in rich economies.

The G-7 was originally formed in 1976 when the leaders of the United Kingdom, France, Germany, Italy, Japan, the United States, and Canada met in Puerto Rico to discuss the efficacy of their economic and financial policies. The following year, the European Community (now European Union) was invited to take part in the meetings. Russia was first asked to participate in political discussions in 1994 and became a full member four years later, thus turning the G-7 into the G-8. The annual meetings of the G-8 take place in the home country of its chair, which is assigned on a rotating basis among the member states. The summits were originally intended to support economic growth and retain stability in the international financial markets. Yet, with the rise of globalization, the meetings have stressed the increased interdependence of markets and economies, with their goals shifting to the improvement of the cooperation among the G-8 member countries. Enhanced cooperation was soon perceived as the only way to ensure the efficient functioning of the different national economies.

In the late 1980s, such dramatic events as the Iran-Iraq war, the Chernobyl nuclear disaster, the Tiananmen Square massacre in China, the Gulf War, and the fall of communist regimes in eastern and central Eu-

The 2005 G-8 Summit, with the eight leaders and accompanying dignitaries behind British Prime Minister Tony Blair.

rope have made political issues just as central to G-8 summits as economic ones. The scope of G-8 meetings has expanded even more in recent years to include international political and social issues such as debt-relief to developing countries, the threats of terrorism worldwide, and organized crime, environmental, and health-care problems.

Poverty in developing countries has become an increasingly central issue in G-8 summits since 1996. The G-8 meeting in Lyon, France, that year witnessed the creation of the New Partnership for Africa's Development (NEPAD), which stated that industrial countries should support developing countries in their industrial development and in the transition to a global market economy.

In 1999, the discussion on debt relief led to the Cologne Debt Initiative to relieve heavily indebted poor countries (HIPCs) from unsustainable debt. The strategies of the Cologne agreement were twofold. G-8 members decided to increase the official development assistance (ODA) to indebted countries while, at the same time, endorsing attempts for economic and political democratization. In 2002, the G-8 devised the Africa Action Plan, which commits the eight members to apply NEPAD provisions.

According to the Africa Action Plan, G-8 members should provide considerable financial aid to those African countries that have implemented institutional and structural reforms to strengthen democracy and a free-market economy. These plans to reduce poverty are always accompanied by suggestions that developing

countries liberalize large sectors of their economies and encourage private investments.

Since the 1990s, G-8 summits have been widely contested by the antiglobalization movement, which includes a diverse coalition of environmental groups, church and labor organizations, left-wing parties, and nongovernmental organizations (NGOs).

Antiglobalization activists point out the antidemocratic composition of G-8 summits, whose delegations are not elected by the people, and represent only a small number of countries. A few heads of state, critics claim, make decisions that will affect the entire world. In addition, the G-8 has become a symbol of the free-market economy. Thus, to many, in spite of its plans to fight poverty, it represents all those policies that have led to the heavy indebtedness of developing countries. The critics of economic globalization argue that the G-8 embodies such a process, one that has left out many disadvantaged groups and entire nations, reinforcing poverty and economic inequalities. To antiglobalization organizations, G-8 meetings are instrumental to big corporations to keep their hold on the global economy and use international financial institutions such as the International Monetary Fund and the World Trade Organization (WTO) to support their neoliberal policies.

G-8 plans against poverty have been described as timid and ineffectual. Corporations opening industries in developing countries often exploit the cheap labor force in those nations. While until the mid-1990s, Western investments in the Third World were considered as a first step to fight poverty, antiglobal activists are now seeking to show consumers how the alliance between corporate investment and many governments in the developing world is predicated on a mutual human rights violation.

The underlying assumption that increased foreign investment would lead to increased democracy in developing countries is exposed as an apparent lie, according to critics. On the contrary, big business frequently relies on local police and armed forces to quench any sort of peaceful demonstration and to evict peasants from lands needed by foreign conglomerates. The perceived alliance between the G-8 and corporate power has provoked anger against the annual summits. Since the 1999 protests against the WTO in Seattle, Washington, mass demonstrations have characterized the meetings not only of the G-8, but also of the International Monetary Fund, the World Economic Forum, and the World Bank.

These protests have sometimes degenerated into veritable urban riots, raising controversial debates

about police and protester violence. In the activists' eyes, the closure of areas in the vicinity of certain summits represents the Western impulse to fence itself off from poor countries. In the case of the riots that exploded in Genoa, Italy, in 2001, evidence suggests that the police fomented violence, infiltrating armed criminals within the demonstrators.

To counter the accusations of limited democracy, the 2005 G-8 Summit at Gleneagles, Scotland, tried to present a more inclusive image by inviting leaders from African nations as well as Latin American ones. It also coincided with Bob Geldof's next edition of Live Aid, Live 8, a series of rock concerts throughout the globe to raise popular awareness of world poverty. It still remains to be proven how effective G-8 measures are in countering world poverty.

G-8 Africa Action Plan

IN 2002, AT THE G-8 SUMMIT held in Alberta, Canada, leaders of the G-8 countries (France, Germany, Italy, Japan, the United Kingdom, the United States, Canada, and Russia) adopted an Africa Action Plan (AAP). The plan was devised to enable G-8 nations to provide support for the New Partnership for Africa's Development (NEPAD), a newly launched program initiated by leaders of five African nations (Algeria, Egypt, Nigeria, Senegal, and South Africa).

The Africa Action Plan establishes out how each of the G-8 partners, together or individually, will enhance its engagement with African countries in support of NEPAD's fundamental objectives. The G-8 Africa Action Plan includes over 100 specific commitments, which mirror the priority areas identified by NEPAD as the means to attain sustainable growth and eliminate poverty in Africa.

In the Africa Action Plan, G-8 partners reaffirm the need for broad partnerships with countries throughout Africa to address core issues of human dignity and development. The fundamental premise is to enter into enhanced partnerships with African countries whose performance reflects the NEPAD commitments, including a political and financial commitment to good governance and the rule of law, investing in people to help build human capacity, and pursuing policies that spur economic growth and alleviate poverty.

MAIN POINTS OF THE AFRICA ACTION PLAN

- 1) An agreement to develop a plan for peacekeeping in Africa, since security is essential for community development. Greater security will likewise enable national development and greater foreign investment. The goal is to ensure that by 2010, African regional and subregional organizations are able to prevent or resolve violent conflicts on the continent effectively. The AAP calls for African governments to develop frameworks for regulating and making transparent the activities of international arms brokers and traffickers, to take active engagement to eliminate the flow of illicit weapons to Africa, and to broker peace countries are to develop measures to ensure greater accountability and transparency with respect to the import or export of Africa's natural resources from areas of conflict.
- 2) The expansion of capacity-building programs related to political governance in Africa, including support for African efforts to ensure that electoral processes are reliable and transparent and that elections are conducted in a manner that is free and fair in accordance with NEPAD's commitment to uphold and respect "global standards of democracy." There is a call to intensify international efforts to facilitate the freezing of illicitly acquired financial assets and for the return of previously illegally expropriated resources to the affected nation. The plan calls for development of programs to assist African countries in their efforts to combat money laundering and the financing of terrorist groups with unlawfully obtained monies.
- 3) A commitment to improve global market access for African exports by tackling trade barriers and farm subsidies that hinder Africa's competitiveness in the world market. The idea is to work toward the objective of duty-free and quota-free market access for all products originating from the Least Developed Countries

(LDCs), including African LDCs. The AAP calls for work toward enhancing market access—consistent with WTO requirements—for trade within African free-trade areas or customs unions and work to help African nations increase and stabilize agricultural productivity and develop water resource management systems.

4) The goal of spending half or more of the G-8 share of the \$12 billion per year in increased Official Development Assistance (ODA), which means at least \$6 billion per year in new resources will go to Africa. The plan calls for increasing the use of grants rather than loans for the poorest debt-vulnerable countries, and providing up to an additional \$1 billion to meet the projected shortfall in the highly indebted poor countries (HIPCs) initiative.

5) Significantly increase the support provided by bilateral aid agencies to basic education for African countries with a strong policy and financial commitment to education and improved information and communication technology. The idea is to provide scholarships and other educational support for African girls and women, work with the pharmaceutical industry to make lifesaving drugs more affordable in Africa, and act with African countries and other stakeholders to ensure effective distribution of antiretroviral (ARV) drugs—especially with respect to HIV/AIDS and other communicable diseases. Plans for other medical interventions call for help in providing the resources needed to eliminate polio by 2005; continue funding and support for the Global Fund to Fight AIDS, Tuberculosis and Malaria; and helping Africa enhance its capacity to participate in and benefit from the Fund.

The key priority of NEPAD is to attract Foreign Direct Investment (FDI) in energy, agriculture, communications, and human resources. NEPAD's supporters hope that with an annual \$64 billion in public and private investment, a Gross Domestic Product growth rate of seven percent could be secured in participating countries. Under the terms of NEPAD, African countries guarantee good governance in return for financial aid. To guard against corruption, a system of peer review is proposed to monitor African countries' deployment of funds and progress toward good governance. The limitations of G-8 support are that the pledges of aid fall far short of Africa's financing needs, and they do not compensate for the steady decline in aid to Africa since the mid-1990s. The new monies are highly conditional and are restricted to those countries that meet the G-8's political and economic criteria.

The responses of African nongovernmental organizations (NGOs), unions, and intellectuals to NEPAD

largely criticize its neoliberal paradigm for being very much the language of the industrialized countries, particularly the G-8. NEPAD follows the same neoliberal principles that have come under heavy criticism by civil society worldwide, policies that are responsible for increasing gaps between the rich and the poor and that have resulted in economic disasters. Despite the recognition of the central role of the African people, civil society has not played any role in the conception, design, and formulation of NEPAD. A few African leaders, in consultation with G-8 leaders, developed NEPAD. Critics contend that NEPAD adopts social and economic measures that contribute to the marginalization of women and the poor and does not question the global economic system that plays a major role in Africa's continued marginalization.

With respect to Africa's external debt, NEPAD's proposal for debt relief represents a significant step backward from what the Jubilee movement in Africa continues to demand: 100 percent cancellation of low-income country debts without structural adjustment conditions, plus the assessment and cancellation of illegitimate debts that have their origin in apartheid and military dictatorships.

Many NGOs conclude that NEPAD is rather a continuation of the highly questionable Structural Adjustment Programs (SAP), now including privatization of public services such as water and electricity supply or health services.

LORNA LUEKER ZUKAS NATIONAL UNIVERSITY

Gabon

THE GABONESE REPUBLIC is a country in western Africa with significant poverty, despite abundant oil and mineral reserves. Gabon's small population and oil revenues contribute to one of the highest per capita incomes in the region. Its Gross Domestic Product (GDP)

in 2004 was \$5,900 per person, which is four times that of most sub-Saharan African countries. There is a widening gap between the rich and poor, however. Approximately 80 percent of Gabon's population are classified as poor by Gabon's Department of Statistics.

Traditional sources of income in Gabon are timber and manganese production. The discovery of oil off the Gabon coast in the early 1970s led to a significant increase in the country's national income. Poverty remained widespread despite reductions in its severity. Oil revenues reduced extreme poverty from more than half of Gabon's population in 1968 to 11 percent in the early 1990s. Most of Gabon's population remains below the poverty line and people in rural areas have extremely limited access to basic social services. In spite of Gabon's abundance of natural resources, burdensome foreign debt and questionable leadership have hindered its economy. Gabon's foreign debt has made it difficult to devote significant financial resources to poverty reduction programs and economic development.

In October 2000, the IMF granted Gabon \$119 million of standby credit.

Developed nations and international organizations have worked with Gabon to reduce its poverty and improve the economy. Most of this aid has been conditional on improved fiscal discipline by the Gabonese government and agreements to privatize much of the publicly owned businesses. In 1994-95, the International Monetary Fund (IMF) provided a one-year standby arrangement. In late 1995, the IMF began a three-year Enhanced Financing Facility (EFF) at nearcommercial rates. France provided Gabon with significant financial support in January 1997 after Gabonese leaders met IMF-mandated economic targets for mid-1996. Later in 1997, the IMF criticized the Gabonese government for overspending on off-budget items, borrowing too much from the country's central bank, and failure to keep the schedules for privatization and administrative reform. In October 2000, the IMF granted Gabon \$119 million of standby credit.

Gabon rescheduled the payment of its official debt by signing an agreement with the Paris Club in December 2000. The Paris Club is an informal group of creditor countries that work to find sustainable solutions to the debt repayment difficulties of debtor nations. Gabon signed an additional debt repayment agreement with the United States in December 2001. Further IMF standby arrangements and Paris Club debt rescheduling occurred in 2004 and 2005.

The Gabonese government began a \$2.9 million antipoverty program in January 2002. This included laws to fight corruption and the embezzlement of public funds. Fiscal mismanagement remains a problem in Gabon. In spite of official priorities to reduce poverty and reinforce state institutions, Gabon's 2003 budget included the construction of a senate building, presidential palace renovation, and vehicle purchases for members of the government. Critics claim the Gabonese government needs to introduce new technologies, improve the country's infrastructure, and train female farmers in order to effectively combat the nation's poverty.

John B. Buck Jacksonville University

Galbraith, John Kenneth (1908-)

JOHN KENNETH GALBRAITH was born in Ontario, Canada, and studied at the University of Toronto, the University of California, and Cambridge University. He immigrated to the United States in 1931 and became an assistant professor of economics at Princeton University in 1939. After holding a number of administrative positions, he became Paul W. Warburg Professor of Economics at Harvard University, a chair he held from 1949 to 1975. A politically active liberal Democrat, Galbraith became an adviser to Adlai Stevenson and Presi-

dent John F. Kennedy. Kennedy appointed him U.S. ambassador to India (1961–63) during the Chinese-Indian border conflict.

Galbraith has written many books in economics, and has also published works of fiction and nonfiction in other fields. His best known works are American Capitalism (1952); The Great Crash (1955); The Affluent Society (1958); The Liberal Hour (1960); Made to Last (1964); The New Industrial State (1967); The Triumph (1968); Ambassador's Journal (1969); Economics, Peace and Laughter (1972); "Power and the Useful Economist," American Economic Review (1973); Money (1975); The Age of Uncertainty (1979); Annals of an Abiding Liberal (1979); A Life of Our Time (1981); The Tenured Professor (1990); A Journey Through Economic Times (1994); and The Good Society: The Human Agenda (1996).

Some critics of the Kennedy and Lyndon Johnson administrations say Affluent Society most likely contributed to the War on Poverty being a disastrous government spending policy first brought on by Kennedy and Johnson. The main content of the book was not really the affluence of society. A major theme was the alleged contrast between private affluence and public squalor. Although the thesis was not astoundingly new, having long been argued by others, Galbraith's attack on the myth of "consumer sovereignty" went against the cornerstone of economics and, in many ways, the culturally hegemonic "American way of life."

The New Industrial State expanded on Galbraith's theory of the firm, arguing that the orthodox theories of the perfectly competitive firm fell far short in analytical power. Companies, Galbraith claimed, were oligopolistic, autonomous institutions vying for market shares (and not profit maximization), which wrested power away from owners (entrepreneurs/shareholders), regulators, and consumers via conventional means (such as vertical integration, advertising, and product differentiation) and unconventional ones (such as bureaucratization and capture of political favor).

Naturally, these were themes already well espoused in the old American institutionalist literature, but in the 1960s, they were apparently forgotten in economics. The issue of political capture by firms was expanded upon in his book *Economics and the Public Purpose*, published in 1973. But new themes were added, notably public education, the political process, and stressing the provision of public goods.

Galbraith is more or less influenced by the economist John Maynard Keynes for the relevance of government intervention to correct market failure when it is needed. There is an inbuilt public choice approach in

Galbraith's analysis of economics, like J.M. Buchanan's and others'.

Gambia

GAMBIAN POVERTY HAS BEEN on the rise since 1993, coinciding almost exactly with the rise to power of Yahya Jammeh, who has been president of the country since 1994. Today over 60 percent of the Gambian population live below the national poverty line. Poverty is largely concentrated in rural regions and the eastern half of Gambia. It is also markedly higher amongst women as a result of low income and marginal access to property.

The 1994 coup in which Jammeh proclaimed himself president of Gambia was accompanied by economic turmoil, which was precipitated by Gambian political instability. The country's Gross Domestic Product (GDP) growth plummeted in the 1980s and 1990s to below two percent, and the coup constricted aid flows and tourism, which alone accounts for about half of the GDP. During the period 1983-93, Gambia's population grew by 4.2 percent, creating a substantial increase in the competition for resources. During the last 25 years, migration to urban areas because of poor agricultural performance and scarce economic opportunities has left rural areas underpopulated, while urban dwellers have experienced a shortage of social services owing to crowding. Although favorable climatic conditions have recently yielded an agricultural renewal and the GDP returned to eight percent in 2004 as a result of broad-based structural reforms, poverty is a persistent problem in Gambia.

One of the most significant problems affecting poverty levels in Gambia is the high unemployment

rate, which in 2002 reached over 50 percent. The majority of Gambian unemployment and poverty is faced by the agricultural sector. Most of the impoverished farmers harvest groundnuts at the subsistence level, and these individuals constitute the majority of the poor in Gambia. The groundnut market value dropped 15 percent from 1991 to 1999, accounting for not only the endemic poverty faced locally by agriculturalists, but also a substantial decline in the GDP. On top of this, harvests diminished during the late 1990s because of poor weather, a depleted workforce, and insufficient facilities, while government subsidies failed to effect positive results.

The other most dramatic factor of Gambian poverty is the country's extremely poor health indicators. There are only three hospitals for a population of approximately 1.5 million people and four physicians for every 100,000 people. Communicable diseases are rampant in Gambia, and particularly prevalent in poor, rural areas. Malaria alone kills 350,000 people per year in Gambia. However, the spread of HIV/AIDS has been regulated to a one to two percent incidence rate in Gambia, which is remarkably low for the region. Approximately 38 percent of the population do not have access to clean water and 63 percent of the population are without sanitation services.

Beneficial child healthcare measures have been implemented in recent years, including an immunization program, which has infant immunization against tuberculosis and measles both in the 90th percentile and infant mortality down to 7.5 percent. However, public health programs have been economically biased, providing weaker health services to the already impoverished parts of the country. For instance, the maternal mortality rate in rural areas is twice that in urban areas.

Universal access to education is increasing in Gambia as a result of relief from the International Monetary Fund and the World Bank, and 73 percent of children now enter primary school. However, only a third of these children continue on to secondary school, and the adult literacy rate is an extremely low 34 percent. High dropout rates are a symptom of waning quality and relevance of the curriculum at the more advanced educational stages, as well as insufficient government funding for secondary education.

MATTHEW EVANS TETI NORTHWESTERN UNIVERSITY

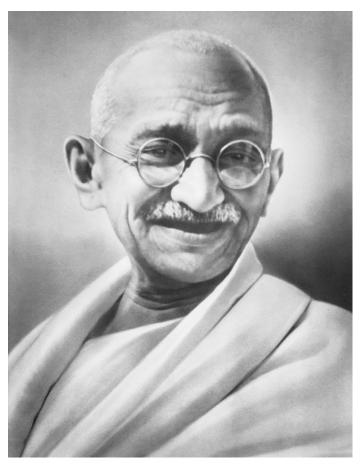

Gandhi, Mohandas (1869-1948)

MOHANDAS KARAMCHAND Gandhi was born in Porbondar in Gujarat, India. After getting his legal education in Britain, he went to South Africa to practice law. Imbued with a high sense of justice, he was revolted by the injustice, discrimination, and degradation to which Indians had to submit in the South African colonies. Gandhi returned to India in 1915 at the age of 46. In 1916 he founded the Sabarmati Ashram at Ahmedabad where his friends and followers were to learn and practice the ideals of truth and nonviolence.

Gandhi took command of the nationalist movement to free India from British rule and died a martyr to the cause of unity on January 30, 1948. He is known as father of the nation of India, and popularly respected as Mahatma Gandhi.

Gandhi was neither an economist nor a politician. His was a socialist plan, based on nonviolence, truth, love, and sympathy. Gandhi wanted to have an ideal society of his own imagination. His ideas on economics are part and parcel of his philosophical, political, and sociological ideals. Gandhi was essentially concerned with the free growth of human beings and emancipation of the downtrodden and exploited masses. The economic ideas of Gandhi are scattered in his various writings.

Gandhi was in favor of maximization of social welfare, not in the material sense of the term, but in its more spiritual nature. His concept of welfare is based on the growth of the totality of human personality. Gandhi wanted reduction in inequalities and the free growth of human beings. To Gandhi wealth did not mean welfare. Gandhi was in favor of the satisfaction of basic human wants like food, clothing, and shelter. He was against the concentration and acquisition of wealth beyond the point of necessity. He was dreaming of a socialist type of society where the basic demands of the

Mohandas K. Gandhi was a utopian socialist who believed that voluntary poverty offered a better material and spiritual life.

people would be met. Gandhi was against the concentration and misuse of wealth. According to him, the capitalists should act as only the trustees of accumulated wealth. The poor workers, under trusteeship, should consider the capitalists as their benefactors and place every faith in their good actions. In this way, labor welfare can be maximized. Rich people should not use their wealth arbitrarily, but for the benefit of others. Trusteeship is a means of transforming the capitalist order of society into a socialist one. Trusteeship eliminates economic inequalities between the rich and the poor.

Gandhi was in favor of self-sufficient villages. He wanted to use a technique of cultivation that would not deplete the soil. Gandhi was against the individual ownership of land, and evolved the system of a village Sarvodaya. He proclaimed that the problems of villages must be solved properly so that poverty is eradicated and people can be happy and self-reliant.

Gandhi wanted a decentralized pattern of development because such a pattern is better normally and spiritually. Decentralized industries can play a crucial role in the development of a country. Village industries are highly democratic and also conducive to the growth of happiness between labor and capital.

Gandhi did not find any necessity for industrialization in any country, and seemed to be opposed to machinery, because machines establish "their own mastery over man and make him their slave." He was reasonable enough to say that machinery is permissible if it does not deprive the masses of the opportunity of labor, increases humanity's efficiency, and does not make people slaves. He welcomed the type of machinery that helped the workers and which worked as servants. He was influenced by the labor-absorptive power of cottage and village industries.

Gandhi considered *Khadi* industry as the symbol of unity, freedom, and equality. *Khadi* implies the decentralization of production and distribution of the necessary products. Gandhi expressed the idea that every man must earn his daily bread by his own labor. This is applicable to all types of labor. He condemned idle labor.

Gandhi favored the formation of trade unions in different production places, but the actions of the trade union should be based on nonviolence, arbitration, and truth. Trade unions should safeguard the rights and interests of their members. He advocated the participation of labor in management and equal pay for equal work. He wanted cooperation between labor and capital; capital should be the servant of labor, not its master. Gandhi understood the importance of the dignity of labor.

Gandhi is regarded as a utopian socialist. He was not a theoretical economist. To some extent, Gandhian economics seems to be relevant for the developing countries and also for those economies that are fed up with the excess of materialism and lack of human values and relations. The spirit of Gandhian economics seems to be still alive today in the form of a low-aspiration model of development.

In fact, Gandhi was the first Indian nationalist leader who identified his life and his manner of living with the life of the common people. In time he became the symbol of poor India, nationalist India, and rebellious India.

Garfield, James (Administration)

JAMES GARFIELD WAS FIRST elected to Congress from Ohio while serving as a Union general in the Civil War. After the war, he allied himself with the Radical Republicans. He supported strong protections for the freedmen and tough military measures to suppress the former rebels. He was one of the House leaders who impeached President Andrew Johnson in 1868.

Although no one believed government should be involved directly in resolving issues of poverty, government monetary policy could have a real impact. Hard money supporters believed gold and silver should back up U.S. currency so money would retain its value. This primarily benefited banks and the interests of merchants who had money. Others thought government should allow inflation to devalue currency so that people in debt, primarily farmers in the west, could escape the debts that made their life harder.

Garfield, although a westerner, strongly believed in a hard money policy. He viewed it as a moral issue, arguing that inflation was a form of legalized theft. He was also considered a moderate supporter of tariffs and civil service reform.

In 1872, Garfield was one of many congressmen embarrassed by involvement in the Credit Mobilier scandal. Congressmen received stock and generous dividends from a railroad company that had been given munificent government contracts. Although the scandal ended many political careers, Garfield's involvement was relatively minor and ultimately left him unscathed. He had also received other payments from government contractors while serving in the House, which, although legal at that time, seemed ethically questionable to many reformers. Garfield sat on the election commission in 1876 that controversially awarded the presidency to Republican Rutherford B. Hayes.

In a special election in January 1880, Garfield was elected to the U.S. Senate. But before he could take his seat, he went to the Republican Convention, where he nominated John Sherman for president. The convention became deadlocked. In order to block an attempt by supporters of former President Ulysses Grant to

take the nomination, the other major candidates compromised by nominating a surprised Garfield on the 36th ballot.

After the election, there was an unusually large flurry of demands for patronage government jobs. Garfield had spoken out generally in favor of civil service reform, though he was not considered a particularly strong advocate. He spent much of his first months dealing with job controversies, particularly a fight over jobs at the Port of New York. When Garfield proposed replacing a reformer with someone who had helped on his campaign, senators complained of the patronage appointment. When the Senate refused to confirm his appointment, he ceased making any further appointments until the Senate acted, resulting in a lengthy showdown. Eventually the Senate confirmed his nominee.

There was also a minor scandal involving kickbacks in government contracts for private postal routes out west. The president, however, was not directly implicated. Outside of the patronage controversies, the Garfield administration had little time to address any major domestic issues. One minor initiative recalled government bonds paying six percent interest and refinanced them at 3.5 percent, which saved \$10 million annually, about four percent of the budget at that time.

Given his short tenure, Garfield had little foreign policy. He proposed a conference of all American republics in 1882. However, it never took place. In July 1881, a disgruntled (and probably insane) office seeker named Charles Guiteau shot the president in the back. Garfield lingered for months before dying on September 19, 1881. Many experts attribute his death to infections caused by medical probes trying to remove the bullet. Outrage over the assassination resulted in the passage of the Pendleton Act in 1883. This was one of the first legislative acts aimed at civil service reform.

Gender Discrimination

WHILE POVERTY FAILS to discriminate on certain levels of human existence, its deleterious effects upon women over time and across the globe have been severely disproportionate as compared to men, especially in developing countries. This phenomenon, known as the feminization of poverty, is extremely significant in countries with transitional economies, as a result of the process of social and political transformation.

During the first decade of the 21st century, the United Nations estimated that a significant majority of the 1.5 billion persons who survive on \$1 a day or less are women. Poverty's discrimination against women is not limited, however, to a lack of income and other concerns that are strictly economic. Other manifestations of poverty that affect women excessively include the areas of illness, hunger and malnutrition, inadequate housing, violence, limited or lack of access to education, and the inability to participate in basic aspects of civil, social, and cultural life.

Researchers suggest that the reasons for gender discrimination in the area of poverty are related to issues of power and dominance that often stem from traditional and rigid gender-specific rights, roles, and privileges that are assigned at birth. Such gender stereotypes often restrict women's access to education and resources that would allow them to enjoy a just standard of living. These disadvantages stem from centuries of deeply embedded patriarchy, or male advantage exercised as oppressive power over women and disadvantaged males. Feminism seeks to deconstruct the horrors of patriarchy to liberate women from the destructive cycle of poverty and violence.

In addition to providing adequate training and means for women to liberate themselves from poverty, feminism addresses some of the structural issues related to gender discrimination in this area. Most recently, feminists have noted that the inability to provide a gender perspective in national and international economic planning and analysis will result in the continued victimization of women.

Despite feminism's exposure of the disproportionate feminization of poverty, women continue to be among the poorest of the poor across the globe. Although historically women are at the highest level of participation in the global workforce, their wages still are significantly lower than their male counterparts'. This injustice is intensified by the fact that women bear the majority of the burden of family responsibilities, which often is intensified by lack of access to family

planning and adequate childcare. Women work twice as many hours as men; however, they receive only one-tenth of the world's income, and own less than a hundredth of the world's property. In some countries, the loss of a husband results in a widow's loss of her land and possessions, since there are legal statutes that transfer inheritance to the deceased extended family, leaving his widow and children destitute.

Many other manifestations of poverty affect women disproportionately. In Africa, 55 percent of HIV-positive patients are women. In many developing countries, women who are pregnant, mothers who are nursing, and their children are at the greatest risk of undernourishment. In the United States, approximately one-half of homeless women are fleeing domestic violence. In Turkey, 58 percent of women are victims of violence. Of the approximately 875 million people worldwide who are illiterate, just over two-thirds are women. In terms of civil service, women hold less than 30 percent of the world's political, diplomatic, and bureaucratic posts.

In the United States, one-half of homeless women are fleeing domestic violence.

The United Nations has played a key role in the modern attempt to end gender discrimination with regard to poverty and other issues intrinsically linked to it. In 1975, Mexico hosted the United Nations' First World Conference on Women (UNWCW), a gathering that resulted in a Plan of Action setting minimum targets to be met by 1980, which focused on securing equal access for women to resources such as education, employment opportunities, political participation, health services, housing, nutrition, and family planning.

Copenhagen, Denmark, was the location for the second UNWCW in 1980, noting significant achievements in the status of women since the 1975 conference. By the same token, the conference declared that significant changes had to occur in the areas of equal access to education, employment opportunities, and adequate healthcare services in order to achieve a true end to the disparity between the socioeconomic status of men and women.

The third UNWCW occurred in Nairobi, Kenya, in 1985, continuing the agenda of the first two conferences and expanding its economic agenda to identify the genuine power and autonomy held by women, and promoting the value of women's unpaid domestic

work. The fourth UNWCW, convened in Beijing, China, in 1995, produced the Beijing Platform for Action, which is considered to be the most thorough document ever produced by a United Nations conference on the subject of women's rights. It stressed 12 central concerns, including the elimination of discrimination against women, the eradication of poverty, and the establishment of means of placing women in key governmental positions. In 2000, the United Nations held a follow-up session entitled "Beijing +5" to evaluate the resolutions of the 1995 conference. The final report resulted in a failing grade for advances in the area of women and poverty. Accordingly, it recommended a fourfold action plan that would research the feminization of poverty and provide concrete political and legal means to ensure women's equal access to economic resources.

In the spring of 2005, the United Nations sponsored a second review session entitled "Beijing +10," acknowledged both the successes and failures with regard to the feminization of poverty, and proposed 20 resolutions to end women's disproportionate struggle with poverty worldwide.

Gender Division of Labor

IN TODAY'S SOCIETY and in many countries, concepts of work and labor pools have undergone changes, with more women working outside the home than in past centuries. While "women invest significantly more hours in household labor than do men, despite the narrowing of gender differences," according to S.M. Bianchi et al., women now work part-time or full-time in jobs or careers as well.

As anthropologist Gary Ferraro states, "the household may be made up of a nuclear family (husband, wife, and children) or a more elaborate family structure containing married siblings, multiple wives, and more than two generations," suggesting that all members of the household participate in household labor. Therefore, it is hard to believe that one aspect of the family has evolved very little over the course of history: the gender division of labor, wherein women and men are seen as responsible for different activities, is as strong today as it was decades ago.

This article will provide definitions of and examine how the gender division of labor has remained relatively unchanged over the years. In addition, it will examine the history of the gender division of labor in the workforce and in the family from a global perspective, as well as a Western culture perspective, and explore the modern challenges for women and men in the context of the gender division of labor.

DEFINITIONS

According to Ferraro, "the process of production is the allocation of tasks to be performed—that is, deciding which types of people will perform which categories of work." In all societies, work to provide for family must be completed, whether the work is to hunt and gather, or cook and clean, or participate in wage employment. Societies have made distinctions for the production of work on the basis of gender and age. L.P. Cooke easily defines the division of labor as when a woman devotes all of her time to unpaid labor while her husband devotes all of his time to paid labor. Jackson states, "gender divisions of labour have been broadly thought of ... as the process by which men and women come to perform distinctive activities and roles, beyond the biological imperatives of biological reproduction."

Historically in Eurocentric terms, men have been known as "breadwinners" or providers for the family, while women are the reproducers and perform domestic tasks. Thus "the roles of wife and mother are intimately tied to expectations for doing housework ... and displayed through outcomes such as a clean house," as noted by Bianchi et al. Throughout history, however, women have eased into the public and paid work arena. As a result, the concrete definition of household gender division of labor has become more one of degrees.

GENDER DIVISIONS IN THE WORKFORCE

Women have entered the workforce, defined here as paid labor outside the household setting, throughout history for different reasons. K.B. Graubart explains

that the textile industry was one of the first trades for women entering into wage labor. In 16th-century Peru, women and men worked alongside one another as cumbicamayos ("makers of cumbi") weaving cloth for textile production. It was not until European colonizers arrived that a division of labor began to develop. According to M.J. Maynes, "one of the most significant and controversial aspects of globalization from a feminist point of view has been its disruption of local gender divisions of labor and its impact on women's wage labor." Before the European colonizers arrived, both men and women completed weaving; after Spanish colonization, weaving was considered a female activity or job. Widows and single women were put to work making clothing, while "men were assumed to be busy on mitas, in wage labor, fishing or working their plots of lands."

Centuries later, gender divisions of labor among working-class women still exist.

After Spanish colonizers introduced gender division of labor practices to Peru, 18th-century European spinsters felt the impact as well. In Ireland, "women soon gained a reputation as expert flax spinners, although much of the weaving initially was done by men," explains Maynes. In 19th-century Europe, most spinners were unmarried or widowed women.

According to Maynes, when women did marry, they were still allowed to work; however, married women were not allowed to make as much money as their unmarried counterparts: "while older women were no doubt the most skilled spinsters, once they married, they devoted less time to spinning, which decreased their daily productivity and earnings." Once married, women were expected to devote more time to families and less time to work outside the home for pay. Thus paid work to provision a family was a man's responsibility.

Centuries later, gender divisions of labor among working-class women still exist. Even in small businesses, a gender gap remains. Women in modern businesses tend to work in the administrative realm. Even those who partner with their husbands in small business have their work centered on the clerical aspects of paid work, according to S. Baines and J. Wheelock. Although married couples share work responsibilities, the burden of housework still falls on the shoulders of the wife. As noted by Bianchi et al., "research has shown

that wives spend considerably more time in housework compared with husbands, even when they are working in the paid labor force."

When combining family and work, women are generally the ones responsible for balancing all family duties, household work, and paid work, and typically sacrifice work for family. Thus according to one British study, given traditional divisions of labor, women are still universally responsible for the bulk of unpaid reproductive labor in the household and the wider community.

GENDER DIVISIONS IN THE FAMILY

The gender division of labor not only exists in the workplace, but within the family as well. The family, as defined anthropologically by Ferraro, is the basic social unit and can include people who are related by marriage (legal and/or common law) or blood. Despite a narrowing gender gap, the responsibility of "unpaid labor," or housework and child rearing, still falls on the shoulders of the wife/mother.

Therefore, according to Bianchi et al., "research has shown wives spend considerably more time in housework compared with husbands, even when they are working in the paid labor force." According to current data, "estimates are that men do between 20 percent and 35 percent of the housework." Women, then, are contributing between 65 percent and 80 percent of the household labor to ensure that a family's needs are meet. This holds true even when a woman has more education or a better job and has the role of the breadwinner.

The traditional definition of gender divisions of labor define women's work as unpaid, domestic labor, while men's work is described as paid labor, inferring that the male figure is normally the breadwinner of the family. Therefore, it is an interesting phenomenon that when the tables are turned and the woman becomes the breadwinner for the family, the unpaid labor does not fall on the shoulders of the husband/father in the unpaid or lesser labor position. Rather, the opposite is the case: "housework contributions do not follow 'logical' rules of economic exchange. Rather, the more a husband is dependent on his wife economically, the less housework he does, most likely as a way to reassert his masculinity," as noted by Bianchi et al. Others elaborate by stating that some unemployed men with employed wives may refuse domestic labor in order to secure at least one arena where their masculinity is not under question.

According to experts, the masculine gender role is based, much as the feminine gender role is, on a set of behaviors, attitudes, and conditions that are generally found in men of an identifiable group. This concept is not to be confused with masculine stereotypes and/or ideals, which are based on general ideas or widespread notions about how society believes men should act. Although there are a variety of masculinities seen throughout the world and in different men's contexts, heterosexual, middle-class masculinity is the one most often cited when discussing gender divisions of labor with the male seen as the breadwinner and public provider for his family.

Bianchi et al. conducted a study in the United States from 1965 to 1995. They theorized three perspectives on the process of domestic labor allocation: "1) the time availability perspective, 2) the relative resources perspective, and 3) the gender perspective." They describe the time availability aspect as dividing the gender division of labor according to "availability of household personnel in relation to the amount of housework to be done." Since men participate in the paid labor force, women have more time at home for household chores. As women entered the paid labor force, their time spent on housework hours decreased; however, technological advancements allowed women to maintain housework standards and men were not seen as needed to aid in household activities.

Time plays another interesting role in gender divisions of labor when comparing women's domestic work hours to those of men. The question arises if men and women's domestic tasks should be compared by time spent and level of excursion. For instance, do men's tasks, such as lawn mowing or chopping wood, equal a woman's time and labor in cleaning the kitchen and helping the children with homework?

Some analysts state that hours of work covering diverse levels of effort cannot easily be compared as a basis of establishing equity in divisions of labor, and time input studies as a basis for evaluating equity contribution may be systematically biased against recognition of male effort where hours worked are fewer than those worked by women but physical intensity is higher.

The relative resources perspective, described by Bianchi et al., suggests that "the allocation of housework reflects power relations between men and women" and that "higher levels of education and income relative to one's spouse ... are expected to translate to more power." They go on to cite Becker's microeconomic theory "in which households divide labor in ways that maximize efficiency and output spe-

cialization of partners." Therefore, since men have an advantage in wage earnings, they participate in market work, while women's roles as mothers result in their advantage to nonmarket work. Both men and women seemed to be motivated to reduce their share of housework.

The third theory, the gender perspective, is described by Bianchi et al. as a "combined gender ideology with the theoretical construct of 'doing gender." They describe the gender perspective as disadvantaging to women because women's household tasks are typically socially defined as the least attractive, such as meal preparation and laundry. Bianchi et al. also suggest that women hold a higher expectation of cleanliness than men, and that "housework is a reflection of a woman's competence as 'wife and mother'—but not men's competence as a 'husband and father."

IMPLICATIONS

As more women are entering the labor force and continuing to perform domestic tasks, implications surrounding women in a variety of areas, for example women's health, should be explored. More information is needed about linking women's work habits to such diseases as cancer, heart disease, and depression. There is little research concerning this aspect of the gender division of labor. One study from Germany, however, has explored whether or not the gender division of labor practices has an implication for second births and divorce rates.

Modern women still perform the largest quantity of domestic labor.

Cooke's article explores the possible connection between gender division of labor and second births and divorce rates in German households. While there is no significant connection between gender divisions of labor and divorce rates, Cooke did find data related to second births tied to the amount of time men spent on household chores. German women are no different from other women—they tend to do more housework than their male counterparts. Thus as many authors note, "in industrialized countries, husbands' average domestic participation is about one third of the time contribution of wives." Cooke credits a woman's wage earnings as the indicator for second births. The study indicates that for each hour a woman is employed, the

odds of a second birth decrease by three percent—"her greater wages are expected to decrease the likelihood of second births because they increase the cost of children." Consequently, "male breadwinner families in which women are out of the labor force are significantly more likely to have second children."

CONCLUSIONS

The process of household production governs all societies by distributing tasks among people. Task distribution has linked women, men, and children to certain gender-defined tasks and activities. However, as women have crossed over into the public sphere of wage labor, the easily defined gender distribution of men performing wage labor and women performing domestic tasks has become more complicated. Both women and men are working in wage labor, and men are doing more housework; however, modern women still perform the largest quantity of domestic labor. More studies need to be done to discuss the implications for women's health in connection to the added workload women experience working outside the home, as well as continuing to perform the largest portion of domestic activities.

Genetic Explanations of Poverty

GENETIC EXPLANATIONS OF poverty focus mainly on differences in intellectual ability as measured by intelligence quotient (IQ). According to this view, an important cause of poverty is that on average, people with low incomes are less intelligent than people with higher incomes. If true, this view means that some people are poor because of inherent personal limitations that might be impossible to remedy by education or job training. It thus has implications for what societies can—and cannot—do to combat poverty.

ARGUMENT FOR GENETIC BASIS OF POVERTY

The argument proceeds in three main steps. First, it contends that intelligence is largely genetic and cannot be significantly improved by environmental factors such as better education or nutrition. The Bell Curve, written by R.J. Herrnstein and C. Murray in 1994, gives the canonical statement of this view and stimulated much of the later debate about genetic explanations of poverty. The authors argue that "a half-century of IQ data [indicate] that differences in intelligence are intractable and significantly heritable and that the average IQ of various socioeconomic and ethnic groups differs."

Second, it contends that IQ accurately measures intelligence and that intelligence itself is a useful concept. Herrnstein and Murray review the history of intelligence testing from the late 19th to the late 20th centuries and conclude that IQ tests indeed measure what we would normally call intelligence: that is, the "ability to reason, draw analogies, and identify patterns ... [and] a general capacity for inferring and applying relationships drawn from experience."

Third, the argument employs statistical methods in an attempt to show that income is strongly correlated with intelligence. Herrnstein and Murray found that as intelligence decreased, the likelihood of poverty increased. Only two percent of individuals with IQs in the top five percent of the population had incomes below the poverty line; for those with IQs in the 20 percent below that, three percent were in poverty; for IQs in the 50 percent below that, six percent were in poverty; for IQs in the 20 percent below that, 16 percent were in poverty; and for IQs in the bottom five percent, 30 percent were in poverty. The authors also found that parental IQs were a better predictor of their grown children's poverty than the family's socioeconomic status.

In 2002, another controversial book applied the same type of argument to countries that *The Bell Curve* had applied to IQ groups within countries. *IQ and the Wealth of Nations*, by R. Lynn and T. Vanhaven, uses statistical methods to correlate countries' average IQs with their real Gross Domestic Product (GDP) per capita. The authors found a strong correlation (0.675 in 1998) between national average IQ and per capita GDP. They conclude, "Differences in national intelligence provide the most powerful and fundamental explanation for the gap between rich and poor countries."

CRITICISMS OF THE THEORY

All three steps in the genetic argument have been hotly disputed. The late Stephen Jay Gould, a professor of biology at Harvard, argues that a correlation between the IQs of parents and children does not prove that IQ is mainly genetic. "Suppose that I measure the heights of adult males in a poor Indian village beset with nutritional deprivation, and suppose the average height of adult males is five feet six inches," Gould writes. "Heritability within the village is high, which is to say that tall fathers (they may average five feet eight inches) tend to have tall sons, while short fathers (five feet four inches on average) tend to have short sons. But this high heritability within the village does not mean that better nutrition might not raise average height to five feet ten inches in a few generations." Likewise, Gould argues, education and social programs could raise the average IQs of disadvantaged groups in society.

In addition, various studies have disputed the soundness of the statistical arguments for the genetic explanation of poverty. One study at the University of California at Berkeley used the same data as The Bell Curve, but weighted the variables differently and got far different results. Michael Hout, one of the Berkeley statisticians, notes that "socioeconomic background affects poverty far more than Herrnstein and Murray claimed. Our estimate of the effect of socioeconomic background on whites' risk of being in poverty in 1990 is 66 per cent higher than theirs; our estimate for African Americans is 53 per cent higher than theirs," as quoted from an article by N. Lemann. Apart from the merits or demerits of the genetic theory of poverty, many critics are no doubt spurred by fears that the theory could be used to justify heartless or racist policies.

It is important not to caricature *The Bell Curve* or genetic explanations of poverty. At one point, Herrnstein and Murray estimate that the genetic contribution to intelligence is "between 40 and 80 percent," which

concedes, conversely, that the contribution of environment is 20 to 60 percent. This amounts to a retreat from their earlier claim that IQ differences are "intractable." They also concede that "the IQ score of an individual might have been higher if he had been raised in more fortunate circumstances," which comes close to admitting that education and social programs can, after all, have some effect in reducing poverty. In addition, they warn against overestimating the importance of intelligence: "Cognitive ability accounts for only small to middling proportions of the variation among people. The identification of IQ with attractive human qualities in general is unfortunate and wrong."

Based on the evidence, it seems clear that intelligence has at least some influence on the likelihood of poverty. Less clear, however, are the extent of that influence, the extent to which intelligence is genetically determined, and the extent to which IQ and economic well-being can be improved by education, social programs, and nutrition.

SCOTT PALMER, Ph.D. RGMS ECONOMICS

George, Henry (1839-97)

HENRY GEORGE WAS BORN in Philadelphia, Pennsylvania. Dropping out of school in seventh grade, he worked as a cabin boy and sailed around the world. Halfway through his second trip, he settled in San Francisco, California, and became a journeyman printer. The city was transforming from a tent encampment to an emerging metropolis before his eyes. But in the midst of the city's wealth and beauty, George also saw poverty and misery. In his leisure hours he wrote an essay that eventually became the book for which he is best remembered: *Progress and Poverty*, his attempt to explain the simultaneous emergence of wealth and pauperism in

modern industrial society. Because he was unknown, George had to typeset and print the book, with the help of sympathetic friends. This original edition was eventually "discovered" and published by D. Appleton & Company in New York. An edition in England created a sensation in literate circles.

The English scientist and writer Alfred Russel Wallace declared it "the most remarkable and important book of the present century." George was soon an international figure. Leo Tolstoy, John Dewey, and Bernard Shaw were among the multitude of George's admirers. Said Dewey, "Henry George is one of a small number of definitely original social philosophers that the world has produced. It would require less than the fingers of the two hands to enumerate those who, from Plato down, rank with Henry George among the world's social philosophers."

After meeting Irish radical Michael Davitt in New York in 1879, and hearing of widespread peasant evictions in Ireland, George applied his theories to the Emerald Isle. Shortly thereafter he began lecturing on behalf of the Irish Land League in New England and Canada, and ultimately visited Ireland to wide acclaim. George made six lecture tours of Europe, where his ideas were more enthusiastically embraced than in the United States. In 1886 George honored the appeal of numerous labor groups and ran, unsuccessfully, for mayor of New York City. He spent the rest of his life arguing for social reform.

Labor, George argued, was the only real source of wealth in the world. With the wild land speculation in the American west, however, landowners reaped huge profits simply by holding on to land as the populations around them increased. Meanwhile, those who owned no land saw almost all their living expenses rise as a result. To combat this unhealthy social and economic bifurcation, George proposed a property tax that would confiscate the landowners' "unearned increment"—any increase in value that did not arise from improvements made directly by the owner.

Since the value of the land was created by society and not by the landowner, society should reap the benefit. This 100 percent tax on the increased value of land, which George's followers began to call the "single tax," would bring in so much capital, he argued, that all other taxes would be unnecessary.

The collected fees could be used to equalize wealth, raise revenue to aid the poor, and stabilize society through the creation of excellent schools, museums, theaters, and other social and cultural institutions. "Ignorance and vice, the recklessness and immorality en-

gendered by the inequality in the distribution of wealth," would be replaced by an "increase in wages, and the opening of new avenues of employment which would result from the appropriation of rent to public purposes," as phrased in Progress and Poverty. As Fred Nicklason has ably demonstrated, George's vision was not simply economic but also religious in nature. George fiercely believed that "man's errors, not God's providence, caused poverty." The right to tax land, he believed, was "natural and cannot be alienated. It is the free gift of his Creator to every man who comes into the world—a right as sacred, as indefeasible as his right to life itself." Though the single tax was never adopted by any government, it influenced progressive tax policy in the United States, the United Kingdom, and New Zealand; inspired a large number of local and state politicians; and influenced a generation of investigative reporters, including Benjamin Flower, Ida Tarbell, Charles Edward Russell, Lincoln Steffens, and Upton Sinclair.

PAUL HILLMER CONCORDIA UNIVERSITY

Georgia

GEORGIA IS A POVERTY-stricken country in south-western Asia that borders the Black Sea between Russia and Turkey. The region of present-day Georgia was formerly part of the kingdoms of Colchis and Kartli-Iberia; the Roman, Ottoman, Persian, and Russian Empires; and the Union of Soviet Socialist Republics (USSR). The current republic gained its independence from the Soviet Union on April 9, 1991. Since then, Georgia has progressed with market and democratic reforms despite significant poverty, civil strife, and other social problems.

In 1994, 80 percent of the Georgian population were considered poor. This poverty rate fell to 60 per-

cent in 1995, and 46 percent in 1997. As of 2001, 54 percent of Georgia's population lived below the poverty line. In recent years, the poverty rate has stabilized at around 51–52 percent. In 2002, 15 percent of the population were considered extremely poor. This was a reduction from previous years.

Primary causes of poverty in Georgia are unemployment, insufficient education, lack of infrastructure and social services, and external shocks such as droughts. Unemployment is a significant factor in defining who is poor. As of 2001, 17 percent of Georgia's labor force was unemployed. One-third of Georgia's extremely impoverished households have no employed members. Insufficient education is another important influence on poverty. One-third of Georgia's extremely impoverished households have average or lower education levels. External shocks, such as the Russian financial crisis of 1998 and the droughts in 1998 and 2000, increased Georgian poverty. The low quality of roads and the lack of sufficient energy, education, and healthcare also contribute to poverty in Georgia.

Accessibility to education and healthcare services is better in urban areas, which improves the prospects of employment. Yet urban poverty in Georgia is deeper and more severe than rural poverty. In urban areas, poverty is related to an insufficient food supply. In rural areas, households consume whatever food they produce. The primary poverty issue for rural families is a lack of financial resources and insufficient infrastructure, such as roads, which would improve their access to social services. Because rural Georgians have the capacity to grow food and raise livestock and poultry, the poverty level for rural Georgians is lower than that for city-dwellers. The level of rural poverty fluctuates with the climate, however. The droughts in 1998 and 2000 increased rural poverty in Georgia.

Despite damage to the economy caused by civil strife, Georgia has made significant economic gains since 1995, such as achieving positive growth of its Gross Domestic Product (GDP) and the reduction of inflation. This turnaround has been achieved with assistance from international organizations, such as the World Bank and the International Monetary Fund (IMF).

Georgia has made limited progress in fighting poverty because of insufficient financial resources. This is in large part because of its chronic failure to collect tax revenues and other government fees. Poverty reduction efforts focus on reforming the country's tax code, enforcing tax levies, and reducing corruption. In an effort to reduce energy shortages, Georgia privatized the Tbilisi electricity distribution network in 1998. The resulting private company suffers from continued low rates of payment collection, however. Current plans for economic development focus on the construction of oil and gas pipelines to transport the energy resources of neighboring countries.

JOHN B. BUCK JACKSONVILLE UNIVERSITY

Germany

THE ECONOMY OF contemporary Germany, Europe's most populous nation at around 83 million inhabitants, is the largest in Europe and ranks fifth largest in the world. In the early modern period, from around 1500 to 1800, Germany was a relatively backward country when compared to the other developed nations of the Western world. But as a result of economic modernization and unification in the latter half of the 19th century, Germany leapfrogged into third place as an industrial giant, ranking just behind the United States and Great Britain by the start of World War I. The devastation caused by the two world wars set Germany back.

Its eastern half, under Soviet control, languished with the rest of the communist command economies from 1949 to 1989. West Germany rose from the ashes of war to be a leading economic, though not military, power from the late 1950s onward. West Germany

adapted competitive capitalism with government-targeted support to key industries. The government created large social programs that provided an economic safety net for most of its citizens.

The two Germanys were united in 1990. The new federal republic has had to invest billions of dollars per year to modernize the outdated infrastructure of the east, create jobs and protect its citizens from social dislocation (the average annual transfer is currently about 70 billion euros). As a result, the 1990s were turbulent times in the economic life of Germany, with persistent high unemployment and low growth. The government has had to cut back on some of the generous welfare benefits that were common under the old federal republic.

It was not until the 1800s that the European states became involved in poor relief.

As a result, the number of people who have fallen below the poverty line has risen. When speaking about poverty in a rich, advanced nation, however, one must frame the issue in comparative, not static, terms. Germany is still a very wealthy country, but one that is struggling with problems left over from unification and because of birth pains related to the new, enlarged European Economic Union.

Poverty should always be defined in relative terms. In so-called underdeveloped countries (for example in Asia and sub-Saharan Africa), poverty might mean lacking in livestock or farm equipment to grow food, adequate housing, access to medical care, or having to make children work, or even selling them to make ends meet. Poverty in this context can translate into conditions of chronic poor health, disease, and even death. By this definition, virtually nobody in Germany could be considered poor.

In a rich nation, by contrast, economists try to define a poverty line, which means an annual income below which a family has a lower standard of living relative to the majority in the society. This means worse food, housing, medical care, and enjoyment of life than others, but does not mean poverty in the life-threatening sense that citizens of underdeveloped nations may experience.

Even inside advanced economies, absolute and relative poverty must be distinguished. Economists refer to absolute measures of poverty as a comparison between household income and the cost of a basket of specific

goods and services, while relative poverty measures compare the spending patterns of households or individuals with the spending patterns of the general population.

By the absolute measure, the percentage of absolute poor in Germany is very high at 30 percent, but the relative percentage of poor is only six percent. The large discrepancy can be explained by taking into account government assistance that helps the poor by providing rent subsidies, food vouchers, and child support. One area that has been well studied in this regard is child poverty.

THE TWO GERMANYS

In 2001, the number of children living in poverty in western Germany was almost 17 percent before government transfers (welfare assistance), but only 9.8 percent after transfers. In the east, the difference was even more substantial, almost 27 percent before and 12.6 percent after. Social scientists are almost all in agreement that the continental European welfare state substantially reduces poverty rates, even though welfare creates dependency on the state and contributes to chronic unemployment and an inflexible job market. By contrast, the United States has less unemployment and a dynamic job sector, but a larger number of citizens living in relative poverty, around 18 percent.

The role of the state in reducing poverty is relatively recent. In the Middle Ages and early modern period, the church was primarily responsible for aiding the poor. The rich gave alms and the ecclesiastical authorities distributed food and small amounts of money to the wretchedly poor who gathered outside the church. Many of these poor were debilitated by disease, old age, or other afflictions. Most of the population was made up of peasants, who were poor by any definition, living in unsanitary conditions and eating primarily bread and root vegetables like turnips and potatoes. The price of rye and potatoes (after its introduction from the New World) determined poverty levels. But the peasants in Germany, especially in the eastern lands, were bound to the land and dependent on their lords rather than the state for survival in periods of economic crisis.

It was not until the 19th century that the European states became involved in the issue of poor relief, or the "Social Question," as it was then called. The chancellor of Germany, Otto von Bismarck, decided in the 1880s to strongly oppose the burgeoning Social Democratic Party, whose leaders wished to radically alter capitalism

and the face of industrial society. Bismarck wooed the workers by introducing government programs that first provided health and disability insurance (1883, 1884) and then insurance for old age and invalidity (1889). These programs initially covered only the top segment of the blue-collar workers, so while they did little to alleviate poverty, many workers' lives were cushioned from economic hardship.

These initiatives also created precedents for the modern welfare state that came into existence in Germany after World War I. During the Weimar Republic (1918–33), welfare programs were expanded to include war victims' benefits to aid the hundreds of thousands of returning soldiers from the front. Germany paved the way to reducing child poverty with the Youth Welfare Act, passed in 1922, which still serves as a model for youth-related welfare programs all over Europe. During the Weimar period the various forms of unemployment and poor relief were consolidated into one program, paid for equally by employers and employees.

These initiatives worked well to provide all needy citizens with basic assistance in times of need, but with the arrival of the Great Depression in the early 1930s, the government found itself unable to afford the high costs of the program. In fact, angry voters, who much resented the austerity programs introduced by various German governments from 1930 to 1933, helped catapult Adolf Hitler into power.

NATIONAL SOCIALISM

The National Socialists promised full employment and a reconstitution and expansion of many of the welfare programs introduced during the Weimar period. They were able to do this by deficit spending and centralization of all the social insurance programs. By 1942 all wage earners, as long as they were "Aryan," were covered by accident and health insurance, women were guaranteed 12 weeks of paid maternity leave, and the poor received housing and food assistance. These programs were progressive, and popular, but they came at a high cost. German citizens traded their freedom and autonomy and gave the government a blank check to impose a genocidal dictatorship and ultimately lead the nation into a catastrophic war.

After World War II, two German states came into existence; the one in the west had a free-market economy, the one in the east had a communist, centrally controlled command economy. In the latter, the German Democratic Republic, the state had a monopoly on all the welfare programs. The system was extremely hi-

erarchical and highly subsidized. The state guaranteed full employment by paying workers in inefficient or unnecessary industries. Food and housing were heavily subsidized for all citizens so that despite extreme shortages, all basic needs were met. The standard of living was much lower than in West Germany, but so was inequality. Except for a small stratum of privileged Communist Party members, everyone was equally poor. Even the luxuries enjoyed by the elite were very modest when contrasted with the living standards enjoyed by average Europeans in the capitalist West.

After 1950, the West Germans decentralized the administration of welfare programs and returned to the Weimar system, in which social insurance and public assistance were administered differently in the various German states. Some states means-tested social insurance and public assistance programs, some did not. Some occupation groups, like civil servants, had better insurance than other public-sector workers. In the 1970s an attempt was made to standardize social compensation and welfare programs at a federal level, but inequities remained.

When the two Germanys were reunited in 1990, these inequities only increased. Both the conservative Christian Democrats and the liberal Social Democrats today wish to placate voters and retain the overall structure of the welfare state, which has guaranteed a social safety net ever since the days of Bismarck. The programs are very popular, and a national consensus exists that Germans do not wish to have an "American system," where the poor are allowed to fall through the cracks. But paying for these programs has put extreme pressure on the government, which is running at everincreasing deficits. Painful reforms will be necessary if Germany is going to be able to both afford both its extensive welfare state and continue to succeed in a very competitive global economy.

Ghana

GHANA PRESENTS interesting scenarios for understanding the complexity and difficulty of analyzing poverty in Africa. Ghana is one of the least-developed countries in the world, according to standards set by the United Nations. To put it into perspective, the poverty rate was 46 percent in 1994 and decreased to 39 percent in 2000; it was 40 percent at the end of 2004. It should be noted that the population in 1994 was about 18 million and in 2004 it was 20 million. The type of economy in Ghana will partly explain the level of poverty.

The economy is heavily dependent on subsistence agriculture that is carried on by mostly illiterate rural folks. According to 1999 estimates, 60 percent of the workforce were employed in agriculture and contributed about 60 percent of the Gross Domestic Product (GDP). In contrast, industry accounted for 15 percent of GDP, and services 25 percent. Unemployment has always been high, standing at 20 percent in 1997. High unemployment rates have coupled with an inflationary rate of 13 percent.

The result has been that many Ghanaians depend on remittances by those living abroad, reflected in the fact that in 2004 alone, Ghanaians working in other countries made remittances totaling \$1.5 billion. This is money in individuals' pockets that increases their purchasing power, hence the unusually high GDP per capita of \$1,305, although in essence people who live this way live precariously.

Other manifestations of poverty in Ghana include the high level of illiteracy and inadequate healthcare facilities, especially in rural areas. Nationally, the literacy rate stands at 73 percent. Government expenditure on education is only 2.8 percent of GDP, in spite of high-sounding rhetoric of reform of the education sector enunciated in Vision 2020. Similarly, patient-to-doctor ratios are disappointingly low, even in urban areas, while people in rural areas do not see actual doctors where there are clinics. Health superintendents who do not have the expertise to diagnose complex health problems

man rural healthcare centers. Government allocates two percent of GDP to the health sector. Understandably, life expectancy is low. According to World Health Organization figures for 2002, life expectancy at birth is 57 and 60 years for males and females respectively, while infant mortality per 1,000 births is 352 for boys and 295 for girls.

In spite of this appalling picture, the international donor community holds Ghana up as a model of growth and stability in sub-Saharan Africa. Shortly after passing the African Growth and Opportunity Act (AGOA) in 2000, the U.S. government declared Ghana eligible. Similarly, Ghana has since 2001 been admitted to the World Bank's Highly Indebted Poor Countries (HIPC) initiative. Thus we are left with an obvious conundrum. The country with nearly half the population living in poverty is also held up as a model of growth and hope.

There are two ways to understand the situation. The first relates to Ghana's former colonial status and what that has meant for its place in the global political economy. An erudite Ghanaian put it best when he said that Ghanaians under colonial rule were encouraged to "produce what they do not consume and consume what they do not produce." Ghana is endowed with natural and human resources, two of three essential elements needed to start a process of industrialization.

But instead of starting the country on that path (as they themselves had done in a previous era), the British colonialists encouraged Ghanaians to engage in primary production in order to keep the country as a market for British manufactured goods. Bereft of an industrial base, Ghanaians developed consumption of foreign manufactured goods that created a dependency syndrome that carried into the postindependence period.

With the increasing pace of globalization, Ghana is caught in yet another level of difficulty. Donor countries and institutions argue that globalization will help poor countries like Ghana if they embark on democracy and good governance. Democracy leads to freedom of choice, but it does not create equitable relations between poor and rich countries, especially when the former are restricted by tied aid that requires a percentage of goods to be channeled between donor and recipient countries. Critics charge that tied aid undermines the very concept of democracy and trade liberalization. And when a country does not price its produce on the international market, it cannot engage in mutually beneficial trade regardless of the type of government.

However, the problem of poverty in Ghana is not entirely foreign-generated. There is so much corruption

in Ghana that it will require a complete overhaul of the social, economic, and political systems to rid the country of poverty. The deputy chairperson of the National Commission for Civic Education did not mince words when she said that "corruption is the bane of development; we all recognize it yet we pretend it does not exist." Government policy of "zero tolerance" has not worked, and some have alleged that government officials themselves are deeply implicated in corrupt practices. A professor has suggested that electronic surveillance and hidden camera operations should be adopted to curtail corrupt practice. At the individual level, people generally do not feel a sense of accountability or responsibility when they work for the government, or for someone else. Thus the international donor community may forgive Ghana's debts, but until Ghanaians themselves change their attitudes, the alleviation of poverty might remain only a wish.

Martha Donkor Edinboro University of Pennsylvania

Giddens, Anthony (1938-)

AS AUTHOR OR EDITOR of 30 books, and as director of the London School of Economics and Political Science, Anthony Giddens's interests and influence have been broad. Two features of his work are most pertinent here. First, there is his effort to rethink the theory of social sciences, what he terms *structuration* theory, and second, his efforts as the prominent theorist of the so-called Third Way.

Structuration theory is an extended gloss on the famous remark of Karl Marx that we make history, but not with materials of our own choosing. It attempts to overcome all the troublesome dualisms in social theory, but prominently agency/structure, micro/macro, and

subjective/objective. Giddens argues that social structure presupposes action and vice versa. Social structure is both "enabling and constraining," and has but "virtual reality" as both medium and concrete product of action. When we speak we use language and reproduce it, and it "exists" only insofar as it is spoken or written. One can buy a hot dog with a \$5 bill only because people have beliefs about what it is and what it can do. These are "objective" facts even if unlike (say) salt's solubility, they are facts only because of what we believe and do. And this is true of all our actions.

In contrast to Durkheimian accounts of structure as causal, persons working with materials at hand are the causal agents of society and history. Other consequences follow: ethnography will be an essential first step, followed by an effort to understand why members believe what they do, and indeed, whether what they believe about their "world" is true. As with Marx, a good deal of social life is sustained only because members have false beliefs, uncritically taken for granted.

Consider poverty. One side holds that it is explained by the culture of poverty: beliefs held by poor people, which cause their poverty. In this view, society needs to change the poor's beliefs. The other side argues that it is explained by objective circumstances of the social position the poor find themselves in, their lack of resources given the objective conditions of the labor market. But this bifurcates structure and culture. Of course, the poor act on their beliefs, but the alternatives available to them depend upon features of the world that require human institutions for their reality. Of course, those lacking skills encounter external constraints on action. There is inequality of opportunity and there are no jobs. But these facts are not external to the activities of persons; they are a consequence of the actions of capitalists, government actors, consumers, etc., each of whom are acting with materials at hand.

An essay in *The New Yorker*, "The Two Tonys," identified Giddens's close association with Tony Blair's Third Way politics. But this Third Way is certainly not the traditional social democratic way between communism and liberal capitalism. Indeed, it is not easy to characterize it, except perhaps to say that it seeks to join the values of social democracy with market liberalism. This can be illustrated by considering poverty.

Giddens offers that the key element in Third Way welfare reform is a focus on *social exclusion*. The term "directs our attention to the social mechanisms that produce or sustain deprivation," Giddens says. This would seem promising, but Giddens also argues that since "it refers to circumstances that affect more or less

the entire life of an individual, exclusion contrasts with being 'poor,' 'deprived' or 'on a low income.'" Exclusion would seem to refer to a small subset of the poor and, accordingly, would take us a long way from concerns about jobs or income inequality.

Similarly, "countering mechanisms of social exclusion ... meshes closely with other themes in third way politics, including that of personal responsibility. But, presumably, the well-worn catchphrase that 'welfare should offer a hand-up not a handout' takes on flesh in the emphasis placed upon labor-market reform and job creation."

Again, this seems encouraging except that, writing in 2000, Giddens strongly endorsed Bill Clinton's 1996 effort to "end welfare as we know it." Of course, the proportion of people receiving benefits went down, but the evidence also suggests that in the absence of any effort to create decent jobs, like so many of the world's poor who lack benefits, the poor in the United States are also adept at survivalist strategies, including their unidentified efforts in the informal economy.

Giffen Goods

ONE OF THE BUILDING blocks of economics is the law of demand. If the price of a good goes up, quantity demanded goes down (hence the so-called demand curve is downward-sloping). Yet, there is allegedly a situation when this does not hold, as there are some goods that are demanded more with their higher price.

Alfred Marshall, in his famous 1895 Principles of Economics, attributes this finding to a British statistician and economist, Sir Robert Giffen (1837–1910), after whom such goods are named (though as George Stigler points out, it seems that Giffen himself was unwilling to accept the existence of Giffen goods and we should rather refer to these goods as Marshall goods). Giffen behavior seems to emerge under these particular cir-

cumstances: a good is an inferior good (that is, a good for which demand decreases when income rises), lacks close substitutes, and constitutes such a substantial portion of the buyer's budget that one may become so impoverished by an increase in the price of such a crucial good that one cannot afford to buy other goods and has to buy more of this basic good. Hence a quantity demanded for the Giffen good goes up. Potato, grain, and rice in underdeveloped economies are often mentioned as potential candidates of such a good.

Attempts were made to identify Giffen behavior among poor Chinese families.

Though theoretically possible for some very poor households who consume only a few basic goods, economists were not able to find examples of such behavior. The potato example, during the Irish famine of 1845–49, has sometimes been used, but has not survived historical scrutiny. Recently some attempts were made to identify Giffen behavior in the case of rice and noodles among poor Chinese families, but the findings are still only preliminary.

Regardless, even if some goods of this kind can be identified, their existence does not disprove the law of demand or the overall economic theory. They should only remind us that standard supply-and-demand schedules are derived under the assumption of *ceteris paribus*, that is, no other changes than changes in price of a good in question are allowed.

In "normal" analysis, however, economists do not stick to a strict interpretation of the ceteris paribus assumption. They allow for negligible changes throughout other markets. When these changes become nonnegligible, though, such as if the real income is substantially affected by the rise in the price of one good (or, for example, if a decline in the price of a good causes the good to lose its prestigious status and hence is demanded less rather than more), we see the inherent limits that lie within the particular use of an analytical apparatus, not within the law of demand or economics as such.

Gilder, George (1939-)

GEORGE GILDER IS A libertarian social philosopher and futurologist. After attending Exeter Academy, he graduated from Harvard University in 1962. After a brief stint in Washington D.C., he returned to Harvard's Kennedy Institute of Politics as a research fellow and became the editor of the *Ripon Forum*, a magazine informally affiliated with the Republican Party. During this time, several prominent public figures, including Nelson Rockefeller, George Romney, and President Richard Nixon, employed him as a speechwriter.

In the 1970s Gilder's research into society and poverty resulted in a string of influential books. In his 1972 book *Men and Marriage* he reaffirms the traditional gender roles as a critical underpinning for the stability and advancement of society (as it was seen as one of the first serious intellectual attacks on the modern feminist movement, Gilder was awarded the "Male Chauvinist Pig of the Year" award in 1974 by the National Organization for Women).

This was followed in 1978 by Visible Man: A True Story of Post-Racist America, titled in contrast to Ellison's Invisible Man. Following the story of a young African American falsely accused of rape, Gilder makes the case that much of his plight, like that of others in the lower socioeconomic classes, can be traced back to perverse antisocial incentives and designs of policies of the welfare system. Thus Gilder claims that liberalism, rather than alleviating social ills, perpetuates them. Many themes from both of these earlier works are found again in Gilder's 1981 best-seller Wealth and Poverty, a book closely associated with the advent of supply-side economics and sometimes referred to as "the bible of the Reagan revolution."

Indeed Gilder's association with pioneering supplyside economics was furthered by his involvement in several public forums, such as the Lehrman Institute's Economics Roundtable, the Manhattan Institute, A.B. Laffer's economic reports, and contributions to the

George Gilder's research into society and poverty resulted in a string of influential books on supply-side economics.

Wall Street Journal's editorial pages. The term supply-side economics is in contrast to Keynesian economics with its emphasis on fostering economic growth by stimulating demand, often with the use of government spending programs. Thus, supply-siders view creating individual incentives to encourage the supply of labor and capital as key to securing economic growth and alleviating poverty.
