The main instruments to this end are viewed as reducing disincentives to supplying labor by reducing effective marginal tax rates on labor (including a reduction in many welfare programs) and creating higher return on capital by letting entrepreneurial efforts develop through a reduction in regulations and a reduction in marginal tax rates. On the whole, it is an optimistic philosophy of increasing wealth at all levels through the creation and protection of individual opportunity. During his presidency, Ronald Reagan frequently cited Gilder for his supply-side theories.

It has been said, "If everybody working for the government is Orwellian, then Gilderian would be nobody working for the government." Nevertheless, it is argued

that a desirable side effect of supply-side policies is that the stimulated economic growth increases the size of the tax base to such a degree that government revenues increase despite the reductions in the tax rates. In the end, while many propositions associated with supply-side economics have gained increased acceptance in the academic community over the last several decades, there is no overall consensus concerning their broad validity and applicability.

Through his study of entrepreneurship, Gilder became particularly interested in the technology sector, and he has turned his attention to this area after 1980, contributing regularly to *Forbes ASAP* and the *Gilder Technology Report*. He is a sought-after speaker on technology and the future, working out of the Discovery Institute, a conservative think tank that he cofounded in 1990.

Gini Index

THE GINI INDEX IS a summary measure of income inequality that was developed by the Italian statistician and demographer Corrado Gini (1884–1965). It is an application of his theory of dispersion in a concentration and is best illustrated using the so-called Lorenz curve, named after the American economist Max Lorenz (1880–1962). It is used to illustrate the size distribution of income. A hypothetical Lorenz curve is presented below.

In the figure, Y represents the cumulative percentage of income and X the cumulative percentage of households, and therefore the horizontal and vertical axes add up to 100 percent. The diagonal (45-degree line) in the box represents a perfectly equal distribution of income, each quintile (that is, each 20 percent) of

households receiving exactly 20 percent of total income. The Lorenz curve under the diagonal represents an actual distribution of income and tells the extent of income inequality. Low-income households (toward the origin on the X-axis) have a relatively low share in total income, whereas high-income households, for instance in the top quintile, have a higher share in total income. The more bowed out (convex) the Lorenz curve, the higher the income inequality.

The Gini Index (G) is a summary of statistics of the extent of income inequality. It is calculated simply as the area under the diagonal and above the Lorenz curve (area a) divided by the entire area under the Lorenz diagonal (area a+b):

$$G=a/(a+b)$$
 and $0 \le G \le 1$

The Gini Index is equal to 0 when income distribution is perfectly equal and 1 when income distribution is perfectly unequal. Intercountry and, over time, intracountry comparisons of the Gini coefficient are often made, even though such comparisons have statistical measurement limits and depend on the accuracy of the data. For instance, according to the U.S. Census Bureau, income inequality in the United States increased steadily from 1970 to 2000. The Gini Index in 1970 was .394 and increased to .403 by 1980, to .428 by 1990, and to .462 by 2000.

High income inequality is one of the main causes of overall poverty. The disparity in income shares indicates that low-income groups receive a disproportionately low share in total income, are unable to meet their basic needs, and hence are poverty-stricken. It is, therefore, not surprising to note that countries with a high Gini Index are also countries with high poverty rates. According to the United Nations Development Pro-

gram (UNDP), Botswana, the Central African Republic, Lesotho, Sierra Leone, and Swaziland are among the countries with the highest income inequality. Not surprisingly they are also the countries with the lowest rankings in terms of Human Development (HDI, available for 177 countries) and Human Poverty (HPI-1, available for 103 countries) Indexes. A sampling includes:

Country	Gini Index	HDI	HPI-1
Botswana	.630	131	94
Central Africa	an		
Republic	.613	171	92
Lesotho	.632	149	91
Sierra Leone	.629	176	98
Swaziland	.609	147	97

Perhaps a strategy to fight poverty should start with measures aimed at reducing income inequality.

Global Commons

GLOBAL COMMONS ARE large resource domains that do not fall within the jurisdiction of any one country. Antarctica, the oceans, the atmosphere, and space are typically considered global commons. Two commonly ascribed attributes of such resources are the difficulty of excluding others from using them (exclusion) and the degree to which one appropriator's use of the resource diminishes that consumption of the resource left for others (subtractability).

Also termed *common-property resources*, these resources can be defined by four categories of property rights, namely open access, private property, communal property, and state property. These categories differ in nature of ownership, rights, responsibilities of owners,

rules of use, and center of control. In practice, however, many resources are held in overlapping and sometimes conflicting combinations.

The global interconnectedness between the commons and their various resources is extensive. The local commons co-constitute and determine the global commons, highlighting a close and symbiotic relationship between local ecologies and large resource domains. Numerous human activities at the micro level, such as the cutting of firewood in rural areas of South America, can have causes and consequences measured at small, medium, and large spatial and temporal scales. In grazing systems, overuse of grasslands has led to increased rates of wind erosion, with local losses in soil fertility and regional to global consequences for the atmosphere.

Local activities have fundamentally and globally altered the atmosphere's composition and function. There is a widely held view that commons are inherently disaster-ridden because of overpopulation and technological innovation, allowing for an even more intensive exploitation causing the depletion and ultimate collapse of a range of common-pool resources.

There are several links that exist between poverty and the environment at the local level. For one, poor people rely heavily on natural resources for subsistence and employment. The poorest are often landless laborers who depend on soil, fish, and other natural resources for food and income. Poorer households tend to depend more on environmental resources/commons. Since poor people have limited options and alternatives, they are said to deplete resources faster—often impoverished by a declining resource base, they are in turn often forced by their circumstances to degrade the environment further. This can lead to soil erosion, land degradation, and deforestation.

Second, poor people are more likely to be exposed to polluted water and air, which cause illness and premature death. Poor people are commonly bound to reside in areas with poor environmental quality. Many poor people live close to factories that pollute the air, contaminate water, and produce hazardous and solid waste. They often live closest to the sources of pollution in urban centers and have to rely on wood and charcoal, which produce poor air quality in their own homes.

Disease (cholera, malaria) frequently removes people from the workforce for long periods. Respiratory infections and waterborne diseases (due to the low quality of the air and water supply) are two of the biggest causes of death among the poor. By far the largest cause

of disease is the lack of access to adequate water and sanitation.

Third, poor people are more vulnerable to environmental disasters and changing climate. They suffer more losses, injuries, and deaths from natural disasters than the rest of the population since they are more likely to live in unsafe housing and in areas prone to disasters such as floods, landslides, and drought. The impacts of global climate change—declining water supplies, poor harvest, and increasing spread of disease—will further affect poor people who already live in areas susceptible to disease and with limited savings, food, and other assets to help them cope in the event of fluctuating climates and extreme weather. Environmental stress can force the poorest to temporarily or permanently leave their homestead to seek survival elsewhere (environmental refugees).

Last, many poor people have ill-defined land rights. In urban areas, for example, slum dwellers, squatters, and migrants often lack tenure security over the land they inhabit. The illegal nature of settlements, combined with poor public infrastructure provisions, is seen as reducing the individual's incentive for managing local surroundings.

The poverty-environmental spiral occurs for several reasons. Some observers believe that inadequate economic growth and insecure property rights are the key causes of poverty, while others tend to focus on the role of weak government services. Some critics ascertain that it is the inequalities of the global economy that marginalize people and place them in precarious situations that often result in environmentally damaging outcomes.

According to this rationale, states and corporations are the culprits that have taken control over the global commons. These powerful actors in the global economy have managed to confiscate the property rights of the poor, ultimately forcing them onto marginal lands and into fragile existence. They also tend to emphasize excessive overconsumption in the developed world as inflicting more damage on the natural environment than is necessary.

Globalization

BROADLY SPEAKING, the term *globalization* means the integration of economies and societies through cross-country flows of information, ideas, technologies, goods, services, capital, finance, and people. The essence of globalization is connectivity. Cross-border integration can have several dimensions—cultural, social, political, and economic. The term *globalization* is used in the more limited sense of economic integration, which can happen through three channels: trade in goods and services, movement of capital, and flow of finance. There is also the channel through movement of people, or migration.

Globalization is defined as a higher stage of internationalization. It can be considered as the predominance of world-market orientation in trade, investment, and other transactions; the special and institutional integration of the markets; and the emergence of global problems, like environmental degradation and population growth, the management of which requires global cooperation.

In the forefront of the globalization process are international money capital and information flows, over which the national legislations have little or no control in the era of liberalization. In order to understand the different opportunities and conflicts claimed to be the consequences of globalization, one can find the analytical disintegration of the process into internationalization, transnationalization, and universalization, which are more relevant and scientific than the use of the globalization concept as an overall intellectual straitjacket.

The historical roots of globalization are in the internationalization process; from the perspectives of countries, internationalization developed in two main directions. The inward direction of the process has been the increase (or penetration) of the external sources of goods, capital, services, technology, and information in the domestic consumption of any given country; the outward direction of the process has been

the predominance of world-market-oriented countries and global expansion of firms in trade and investment. Internationalization, in essence, promotes economic progress. It increases the exchange of material and intellectual values and has been beneficial to contacts among peoples.

TRANSNATIONALIZATION

A very important component of the internationalization process, and one of the main sources of globalization, is transnationalization, in the framework of which the given proportions of output, consumption, exports, imports, and income distribution of a country are subordinated to the decisions of international centers, outside the frontiers of the country.

The central forces of the process are the transnational corporations, which are the results and at the same time the main actors of internationalization through foreign direct investments, global production, and outsourcing. The process of globalization of the world economy accelerated during the past decades as the diverse markets, particularly capital, technology, and goods, but also to a certain extent labor, became increasingly interconnected and integrated into the multiplier networks of international corporations.

These are the most important organizations, which are constantly creating a number of new linkages, in output, product development, design, product universalization, and marketing. These transnational economic centers of power are pushing for constant expansion of new markets and for relatively liberal and uniform values in the business environment. They are also serving as important instruments for the globalization of the markets with the spread of the information infrastructure, which increases the speed and reduces the cost of transactions.

While a certain number of transnational corporations are in the traditional commodity sector, international firms contributed to industrializing countries through the establishment of new industries, particularly car manufacturing, petrochemicals, machinery, and electronics, and to the modernization of traditional industries, like textile and food processing.

Universalization is characterized, on one hand, by the growing identity or similarity of national economic regulations, institutions, and policies across national boundaries due to multilaterally agreed patterns. This means the spread of certain values and modes of doing things, including the identical postulates of new technology and homogenization and standardization of production and consumption. The other dimension of universalization is the increasingly universal approach to human rights, or the universalization of culture by mass media. The latter is in serious conflict with the diverse cultures of the globe.

Globalization in economic terms is nothing more than integrating national markets with global markets. It has some very clear implications. Globalization puts an emphasis on consumer concerns, delivering to the consumer the very best quality in the most cost-efficient manner possible.

Globalization therefore encourages competition within or beyond the nation to earn consumer support. It is this competition that results in the continuous global search for what the consumer needs and an ongoing program seeking how to create and deliver the best products. In other words, it is based on Darwinian selection and "survival of the fittest" theory.

In the search for existence, globalization leads to partnerships and networks, ultimately leading to identifying who can do what best, thereby building on each other's strengths. Globalization therefore becomes a cooperative venture whereby organizations and people complement and supplement each other in the service of the consumer. As a result, globalization helps lead to synergies in the role of each country.

Globalization leads to quality assurance, and it is as a guarantee of their quality that manufacturers brand their products, trying continuously to upgrade quality at reduced unit costs. Globalization therefore relies on the quality of people: their vision and their commitment happen to be the very foundation of globalization, since all initiatives, innovations, and solutions ultimately rest on the outstanding quality of the people.

Proponents of globalization promote an economically borderless world where there is a free exchange of money, ideas, and expertise, fostering partnerships and alliances to serve the consumer best. Globalization means the smallest interference by the government in economic activities, so that the talents of the people can grow to fruition. In the ultimate analysis, globalization leads to consumerism.

INTERNET BIAS

The globalized economic system has an internet bias in favor of the large, the global, the competitive, the resource-extractive, and the short-term. But our challenge is to create a global system that is biased toward the small, the local, the cooperative, the resource conservation, and the long-term. The crisis of deepening poverty,

growing inequality, environmental devastation, and social disintegration in the developing and developed countries must be resolved for the world to survive. Surely, a rational system of truly free global trade can be built only upon the free and equitable use of all global natural resources, including land and minerals; the free global movement of all factors of production, including labor and capital; and the global allocation of resources and benefits by a democratic and just global authority.

There is efficiency to the market mechanism; no state exists to match the world market.

It is true that the market, national and international, is a gigantic voluntary mechanism of choice, rejection, and adjustment, another kind of democracy in which people of all strata vote with their money. But it has serious limitations and imperfections. To moderate its imperfections, to help bring about economic justice, and to regulate the market's negotiations, the polity and state need to play a regulatory role, not that of a failed monopolist and an unproductive drainer of wealth; be a promoter of infrastructures to enable the people's efficient participation in the market; be a promoter of human development in education and health, to enable more millions to enter the market as employers and employees and as consumers with a higher quality of life; and be a provider of law and order, for the people and market to grow in peace. Polity and society also need to encourage the growth of intermediate organizations between state and market for the growth of a civil society.

MARKET AND POLITY

It must be noted that in their different roles, the market and the polity have complementary roles, especially in democratic politics. Both are imperfect human institutions; only the market is more easily correctable in a functioning democracy—not state capitalization—than the state of most polities in the real world. There is the inherent efficacy and efficiency of the market mechanism. No world state exists to match the world market.

However imperfect, the market provides the world with a better-coordinated supply of a thousand goods and services than the United Nations' services to peace, international order, security, or health and culture. No government or international organization can match the systematic coordination of millions, which creates the

market, that silent, unsung institution. Indeed we cannot close our eyes to the wonders of the market. It is, however, preposterous to say that it benefits all in the economy equally and equitably and is flawless. It has its own quota of ills. What we need today is a clear perception about the roles of the two—the state and the market. This need not be mutually exclusive; their roles may in fact be complementary. We must not forget that the market benefits the "haves" alone, and hence the state must come forward to take care of the "havenots." There has been a synthesis of state control and marketization and liberalization.

The emphasis on free trade has widened to include flow of investment and finance. The world economy has become more and more structurally interdependent, so that the use of the concept "global," as distinct from "international," became acceptable and justifiable.

Technological developments in computing and telecommunications have reduced transaction costs and these costs will continue to fall further. Globalization is thus a supernational phenomenon that transcends national frontiers. It has shrunk the world through the enmeshing bonds of new technology in the context of a "global neighborhood," "global village," or "world without borders." It is not the same as the increasing degree of openness of countries witnessed earlier. It involves fast growth of trade in goods and services, much higher growth in international financial transactions, very fast growth in foreign direct investment, a deeper form of internationalization resulting from production networks of multinationals, emergence of global markets, rapid diffusion of knowledge and technology, globalized communication and transport networks, and changes in thinking and the model of operations of international institutions.

The process of globalization has continued and may intensify further. At the microlevel, there is more and more pressure on business enterprises, from both competitors and consumers, to continuously innovate and improve the quality of products. As the product life cycle has reduced, there is a need for more expenditure on research and development and searching for new markets. For increasing the core competencies, there is a need for combining expertise with others through mergers and acquisitions.

As consumers reorient their choices to superior products and services, the producers also have the capacity for continuous product and process innovation through technological and organizational improvements, especially through computer-aided manufacturing, and the link between the producers and consumers

is quickly established through electronic media, the internet, and e-commerce. At the macrolevel, more and more countries are following policies of liberalization, privatization, deregulation of markets, removing of structural distortions, and liberalizing foreign direct investment. Thus there are rapid shifts toward market-oriented policies, wherein profit motives and market mechanisms determine the allocation of scarce resources. At an international level, there is replacement of nonconditional sources of finance by portfolio investment. The International Monetary Fund, World Bank, World Trade Organization, and other international and regional organizations frame new and "level-playing-field" rules for international transactions.

This supranational phenomenon of globalization has far-reaching economic, social, political, cultural, environmental, and technological consequences. Global forces now play a much greater role in the determination of cropping patterns, investment levels and patterns, price structure, quality of production, occupational structure, and the direction of economic activities. Interest market access, reduction and removal of tariff and nontariff barriers, investment measures, and intellectual property rights have a tremendous bearing on the economies of all countries.

Globalization has the potential of raising employment levels, improving living standards, improving a consumer's product choice, expanding exchange opportunities, and raising national income levels. It is expected to involve greater international division of labor and more efficient allocation of resources, thereby making economies of scale and specialization available to the producers of the world. Consumers can enjoy a wide range of products at the cheapest rates. Globalization provides new opportunities to developing countries to derive benefits from foreign direct investment. Further, the efficiency of banking and financial sectors is expected to improve with opening of these sectors to foreign competition. Globalization is also expected to improve efficiency in domestic economies through an increase in competition and cost-consciousness.

RISKS OF GLOBALIZATION

On the other hand, there is a long history of strong hostility toward international trade effects, including unequal exchange, secular deterioration of terms of trade, and new protectionism. High volatility is a part of globalization, which is the result of a sharp increase in short-term funds and the increased use of private funds to finance external debt.

Financial globalization creates the possibility of speculation bubbles, and economies become more and more prone to exogenous financial and other disturbances. Economic shocks in any one of the five or six economies are electronically and instantaneously transmitted across the globe, and there may be devastating effects. All countries are facing structural unemployment brought by competitive pressures, new technologies, and market-oriented policies. There have been market failures in the past, and there will be new cases of market failures. The blind race of competition has created concerns regarding ozone depletion, global warming, and lack of biodiversity, which may have disastrous consequences for the world.

GLOBALIZING POVERTY

Emerging poverty and increasing unemployment and inequalities have created doubts whether this process has been instrumental in globalizing poverty. The gap between the earnings of the skilled and the unskilled workers has widened. Small-scale industries in many countries are facing closure, thereby intensifying the problem of unemployment. Economic efficiency is hardly a desirable end in itself; it has relevance only in relation to the ultimate social end, which must encompass elements of economic justice.

The dictum "Poverty anywhere is a threat to prosperity everywhere" has become relevant.

The process of globalization may be unstoppable and irreversible. All international institutions, organizations, and banks have pro-globalization policies and programs. There will be further integration of markets of commodities, services, and financial assets. Even the regional grouping may become building blocks for creating a new global architecture. Earlier, there was a dependency on the dollar as an international currency, now the euro has emerged, and tomorrow the yen or yuan zone may also emerge. No country can afford to remain isolated.

Therefore the need for effective and accountable global governance has become increasingly obvious. The dictum that "poverty anywhere is a threat to prosperity everywhere" has become all the more relevant under the globalized poverty regime. There is a need to change the situation from a "winners and losers" to "win-win" situation. The global awareness of common

issues like environmental pollution, ozone depletion, climatic changes, loss of biodiversity, infectious diseases, drug smuggling, and other such public problems that have cross-border spillover effects is increasing, which also requires global cooperation. All economic ills like poverty, unemployment, and child labor are globally owned.

Goodwill Industries

GOODWILL INDUSTRIES International is one of the largest nonprofit organizations in the world devoted to helping the poor. It provides education, training, and career services to people who are disadvantaged by physical, mental, and/or emotional challenges and by social conditions such as lack of education, or work experience, welfare dependency, and homelessness.

In 2004 Goodwill Industries provided employment and training to about three-quarters of a million people. The motivation for this work-oriented assistance arises from the belief that work has the power to transform lives because it builds self-confidence, personal independence, creativity, trust, and friendships. Belief in the creative value of work is central to the Goodwill Industries work philosophy, which is that everyone should have a chance to be gainfully employed. Goodwill Industries provides that chance for many who would otherwise probably not find employment. Its key mission is to give people the training and skills they need to become excellent workers in the American economy.

Goodwill is funded in several ways. Donations of clothing and household items are sold at over 2,000

Goodwill retail stores. In addition some items are sold through the internet site, which also functions as an online auction service. Money is paid to Goodwill as income when it helps businesses fill gaps caused by labor shortages or other factors. Also, it earns money by training workers hired by some businesses to fill labor shortages, or by filling gaps that occur in the labor needs of industry. It also helps to train contract workers who can then fill in as needed.

Over 80 percent of the income that Goodwill Industries receives is used to fund education and career services to those who seek help as workers. In this way Goodwill Industries serves as both an employment trainer and a jobs center.

Well over a quarter of a million people are helped by Goodwill with job assistance each year. Fully 100,000 are placed in competitive employment. The full Goodwill Industries program generates over \$2 billion annually. Over 50 million people give donations and many are repeat donors.

Goodwill is now international in scope. It has a public policy agenda that is concerned with the disadvantaged. Some come from low-income backgrounds. Many come with a criminal record. To serve the people who come to Goodwill seeking help who have a criminal record an ex-offender program has been developed. The goal is to reduce or eliminate recidivism and to successfully enable the reentry of the ex-offender into society as a responsible citizen and taxpayer.

Goodwill Industries International has become truly international with its network of over 200 community-based organizations in 24 countries. Its work overseas is essentially the same as in the United States. It provides job training and career services to people everywhere that it has been able to develop a center.

The socially complicated world of today is often a challenge to job seekers. They are often unable to work until issues of childcare, transportation, emotional stability, language skills, literacy, and math skills are settled. For some people, the need is to acquire life skills, such as balancing a checkbook, developing a family budget, or other need. For others the need is to get educational qualifications, such as gaining a high-school-equivalency diploma. Goodwill seeks to provide ways to handle these issues so that people can develop employability or can actually be available for work.

To further the educational needs of the people it serves Goodwill Industries is developing computerized courses that are taught online. Since 2003, Goodwill Virtual Community has developed e-learning programs to help people with employment. The courses are web-

based and free to users. Some are in English and others are in Spanish. Some involve basic computer skills and include learning proficiency in Microsoft Office programs such as Word, Excel, Access, and PowerPoint.

The Reverend Edgar James Helms, a Methodist minister founded Goodwill in 1902 in Boston. He was an early social innovator who collected household goods and clothing from the wealthy and then used the goods to train or to hire the poor to repair the used goods. These were then either sold or given to the poor. From this the Goodwill philosophy of "a hand up, not a hand out" began.

Helms viewed Goodwill as more than a social service program. It was also an industrial program to meet the new industrial age. Helms's ultimate goal was to courageously face poverty and to defeat it with prayer and service until poverty is banished.

Andrew J. Waskey Dalton State College

Grant, Ulysses (Administration)

HIRAM ULYSSES GRANT was born the son of a tanner in Ohio on April 27, 1822. He joined the military so that he could receive a free education at West Point (where he changed his name to Ulysses S. Grant). After exemplary service in the Mexican War, he resigned his commission and began several failed attempts at farming and business.

When the Civil War began, Grant received a state appointment as colonel of the 21st Illinois Infantry. His abilities quickly led to his promotion. Successes in the western theater eventually led President Abraham Lincoln to put Grant in charge of the Army of the Potomac. His successful efforts led to the surrender of

General Robert E. Lee on April 9, 1865, effectively ending the Civil War. Grant remained commander of the army after the war. He briefly served as secretary of war under President Andrew Johnson, but resigned that commission because of congressional objection to the president's firing of his predecessor.

Despite never having held elective office and having almost no political experience, Grant received the Republican nomination and was easily elected. Unfortunately, his lack of experience quickly showed. Grant was generally content to let the leaders of the Radical Republican Congress set policy. He appointed friends and financial contributors to most appointed offices.

The Grant administration is probably most remembered for its many scandals. One of the largest was the Whiskey Ring Scandal in which numerous officials skimmed federal taxes on liquor for personal benefit. Another major scandal in Congress during this time was Credit Mobilier, in which members of Congress benefited personally from railroad contracts. Other scandals involved retroactive pay raises for top officials and misuse of Native American funds for personal benefit. Grant was not directly implicated in any of the scandals, but his refusal to maintain oversight and his continued support of some of those implicated encouraged corrupt practices.

The main issue during the Grant administration was reconstruction of the former Confederacy. Initially Grant had seemed to favor the policies of Lincoln and Johnson to bring the south back into the Union quickly and try to heal old wounds. But by the time he became president, Grant had allied himself with the Radical Republicans, supporting greater military occupation and protections for the freed slaves. The Grant administration enforced the newly passed Fifteenth Amendment guaranteeing voting rights to former slaves by passing several voting rights laws. It also enacted laws designed to suppress the Ku Klux Klan and other groups hoping to suppress minority rights. Weak enforcement of those laws, however, led to most freed slaves being denied the right to vote and other basic rights.

The administration also oversaw the postwar western expansion. More railroad lines to bring people west assisted with commerce between the east and west and fueled much of the expansion. Government subsidies to railroads greatly encouraged the movement. Westward expansion also led to greater disputes with the Native Americans living in the territories. The Indian Appropriation Act of 1871 nullified treaties with many of the tribes and made natives impoverished wards of the federal government. White settlers were free to re-

ceive homestead land while natives were placed on reservations under the care of the U.S. Army in an attempt to "civilize" and ultimately integrate Native Americans into the American mainstream. Native refusal to comply led to the Indian Wars, which continued until the 1890s.

Grant also maintained a hard monetary policy. That is, money would remain backed by gold. This kept the value of the dollar high, benefiting business interests and eastern establishment banks. Farmers in the south and west suffered from this because they hoped that inflation would devalue the debts they owed. This helped to start populist movements in those areas that would grow over the next few decades. The hard-money policy also led to a shortage of capital for industrialization and western expansion. The situation became worse when several large, overextended companies were forced to declare bankruptcy, leading to the Panic of 1873. Bankruptcies and unemployment soared over the next few years.

Despite his record, Grant was easily elected to a second term in 1872. He broke with tradition to run for a third term in 1876, but the Republicans denied him the nomination. After leaving office, he became involved in several failed businesses and found himself facing poverty. He began writing his memoirs in order to provide for his family. He died on July 23, 1885, a few days after finishing them. The memoirs were published soon after his death and were a great success.

Great Society Programs

THE GREAT SOCIETY WAS a term coined by President Lyndon B. Johnson to describe his program to eradicate poverty in the United States and create a fairer

society. Described by some as a second New Deal, Johnson hoped to move the federal government to attack poverty, racism, and environmental issues. Johnson's Great Society ideas were outlined in a speech at the University of Michigan in Ann Arbor, delivered to students at a commencement on May 22, 1964.

In the speech, Johnson said the nation had an opportunity "to move not only toward the rich society and the powerful society but upward to the Great Society." He went on to say, "The Great Society ... demands an end to poverty and racial injustice. ... But that is just the beginning. The Great Society is a place where every child can find knowledge to enrich his mind and enlarge his talent ... where leisure is a welcome chance to build and reflect, not only the needs of the body and the demands of commerce but the desire for beauty and the hunger for community," and "where man can renew contact with nature."

Areas like central Appalachia continued to languish in desperate conditions.

Johnson used this speech to embark on the most ambitious domestic legislative agenda ever attempted by a president and Congress since the 1930s New Deal. The central piece of this Great Society was a War on Poverty designed to eradicate the causes of poverty within the United States. Johnson was concerned by statistics that showed that almost 25 percent of American families were living below the poverty line. He was even more concerned by the idea that entire regions of the country were almost totally oblivious to the economic growth and prosperity associated with the post-World War II era.

Areas like central Appalachia continued to languish in desperate conditions, despite the material advancement of American society. Johnson was also concerned about the changing technology associated with industry, which required advanced training and skills for existing employees.

He saw the handwriting on the wall, which pointed to the disappearance of well-paying, low-skilled jobs. He also understood the relationship between education and economic opportunity. Those whose educations failed them were the least likely to succeed in the increasingly technological society. Johnson believed that he had to act quickly to attack the causes of poverty and despair to ensure a stable and successful workforce in the future.

The first piece of legislation passed by Congress as part of this Great Society was the Economic Opportunity Act of 1964, which called for nearly \$1 billion in government spending to attack poverty. In a message to Congress, he called for a War on Poverty that would strike "at the causes and not just the consequences of poverty, one which would treat not just poor individuals but poor communities as well." On March 16, 1964, Johnson sent Congress his controversial Economic Opportunity Act, and on August 20, 1964, Johnson signed the legislation. The bill was far-reaching and future-oriented. The bill created 12 new programs designed to attack the causes of poverty. It created the Job Corps, which was modeled on Franklin Roosevelt's Civilian Conservation Corps. It provided job training to dropouts and other low-skilled people. College Work Study programs designed to help more lower- and middle-class students attend college. It created a domestic version of the Peace Corps called VISTA, Volunteers In Service To America.

This program enlisted college and high school students and housewives to perform social services for poverty-stricken Americans. Earning just \$50 a month, volunteers spent a year of their lives living in urban slums, in Appalachian valley communities, and on Native American reservations, where they taught basic reading and writing, got people jobs, helped with medical problems, started credit unions, created recreation programs, and brought the poor legal help.

HEAD START AND MEDICARE

The legislation also created Head Start, which took disadvantaged preschoolers and introduced them to education early in life with hopes of preparing them for first grade. The Head Start program was an unqualified success, raising IQ scores and reading scores and reducing dropout rates and failing rates. There was a high school dropout employment program, a Rural Loan Program, a Small Business Development Center, a Migrant Farm Workers program, a Community Action Program, a program for neighborhood health centers, Upward Bound to help minority students attend college, legal services for the poor, and a small-business incentive program designed to help minority business owners. To coordinate these programs and ensure their success, the bill created the Office of Economic Opportunity.

The second piece of legislation that was part of this Great Society program was the Medicare program. Johnson wanted to provide medical insurance for the poor and elderly. In 1964, 44 percent of people over 65

had no medical insurance. He was also concerned about the high level of poverty amongst the aged. He maneuvered around the criticisms of the American Medical Association and his Republican opponents and created a program that was revolutionary for Americans. The program called Medicare provided medical assistance to those on Social Security. The system required a deductible and low premium and in return the patients received up to 90 days' hospitalization and other medical services.

Racial tensions posed one of the greatest threats to Johnson's Great Society.

There was another small provision, which initially went unnoticed. It created a program called Medicaid, which paid the medical bills of the poor regardless of age. This was a joint state-federal program, which shared the cost of healthcare for welfare recipients. Johnson proudly stated as he signed the bill on July 30, 1965, in Independence, Missouri, in front of Harry Truman, "No longer will older Americans be denied the miracle of modern medicine."

The next part of Johnson's Great Society programming was designed to improve education. Johnson believed that one of the major causes of poverty was the poor quality of education in certain regions of the country. In 1964, there were more than eight million American adults who had not completed five years of schooling. There were an additional 20 million who had not completed eight years and almost one quarter or 54 million Americans had not completed high school.

Johnson viewed this as a major cause of poverty. On April 11, 1964, Johnson signed his Elementary and Secondary Education Act, which provided for a dramatic increase in education spending. Johnson signed the bill in a one-room schoolhouse in Stonewall, Texas with Mrs. Kathryn Deadrich Loney, the teacher who had taught him to read, looking on. The bill called for more than \$1 billion in federal spending for textbooks, library materials, and special-education programs for poor children. To increase college enrollments and help poverty-stricken students who wanted to attend college, he signed the Higher Education Act, which created federal college scholarships for needy students, government-insured loans for students whose families made less than \$10,000 a year.

Racial tensions posed one of the greatest threats to Johnson's Great Society. Johnson wanted to end the racial war and open a more fair society. He believed that one could not have a great society as long as civil rights were denied to a significant proportion of the American people. He wanted to legislate away the crisis by outlawing segregation and discrimination. He saw a two-part problem: racial discrimination and a flawed immigration policy. The Immigration Act of 1965 abolished the quotas that favored European immigrants and established a system based on family relations and occupational qualifications. This allowed more immigrants from other parts of Europe and Asia.

The other problem was racial discrimination against African Americans. His answer to this problem was the Civil Rights Act of 1964. This piece of legislation would become the most far-reaching bill involving civil rights ever passed by Congress. Johnson signed it on July 2, 1964. The 1964 Civil Rights Act provided equal access to public accommodations, strengthened existing laws preventing employment discrimination by government contractors, empowered the government to file school-desegregation suits, and cut off funds wherever racial discrimination was practiced in the application of federal programs. The law was also controversial because it outlawed employment discrimination based on gender. The bill created the Equal Employment Opportunity Commission and gave it authority to investigate charges of discrimination in employment along lines of sex, race, color, religion, and national origin. Johnson understood the controversial nature of the bill predicting that the bill would cost the Democrats the south for the foreseeable future.

Johnson's Great Society programs included other pieces of legislation, which were designed to attack the root causes of poverty. He raised the minimum wage to \$1.60 an hour. Johnson signed the Clean Waters Restoration Act, which provided funds for constructing sewage treatment systems and cleaned up the nation's drinking water. This act passed overwhelmingly in both houses of Congress, providing federal standards for water quality. In 1967, Johnson signed the Air Quality Act, which virtually allowed the federal government to set national standards for industrial air pollution, which led to the unleaded gasoline movement. He also signed the Model Cities and Metropolitan Area Redevelopment Act, which rehabilitated cities and slum areas.

Other provisions included funds for urban renewal, Appalachian development, urban housing, and rent supplements for the poor. In 1965 Johnson signed the Urban Development Act, which created the Department of Housing and Urban Development. Johnson's legislations were part of his attempt to eradicate the

root causes of poverty in the United States and offer those caught in its grip an alternative.

ABEL A. BARTLEY, Ph.D. CLEMSON UNIVERSITY

Greece

LOCATED IN THE underdeveloped Balkan region of southeastern Europe, Greece is home to 10,668,354 people. About 68 percent of the labor force work in the service sector, which constitutes an increasingly large share of Greece's economy. Approximately 20 percent of Greece's labor force are in industry, the other 12 percent in agriculture. The nation's principal industry is tourism, followed by food and tobacco processing, textiles, chemicals, metal products, and petroleum. Agricultural products include wheat, corn, barley, sugar beets, olives, tomatoes, wine, tobacco, potatoes, beef, and dairy products.

Greece experienced considerable turmoil in the mid-20th century when it was occupied by Nazi Germany during World War II, and then was wracked by a brutal civil war. The democratic republic that emerged from those years was overthrown by a military dictatorship in 1967, but the military regime was itself overturned in 1974 and civilian, democratic rule was reestablished. The Socialist Party (PASOK) has ruled for most of the last quarter century, beginning with its victory in the 1981 elections. The conservatives (ND) were elected in 2004.

In 1981, Greece joined the European Economic Community and adopted the euro as its currency at the

beginning of 2002. Despite an economic downturn in the early 1990s and a burgeoning national debt since the 1980s, Greece's economy has grown fivefold over the last 20 years, and for five years at the turn of the century outperformed the average growth rate of the European Union (EU), according to World Bank statistics and G. Pagoulatos. Yet Greece's per capita income is roughly 56 percent of the EU's average, according to D. Sotiropoulos.

The Statistical Office of the European Communities (EUROSTAT) documents and reports economic statistics of EU members. In 2000 EUROSTAT reported that Greece had a poverty rate of 21 percent, second in the euro-zone only to Portugal's 22 percent. In mid-2005, EUROSTAT reported that 14 percent of Greece's population were "at persistent risk of poverty," compared to nine percent for the entire euro-zone. Greece's National Center for Social Research (EKKE) determined that 20 percent of Greece's people were in poverty, and that 7.2 percent subsist on an income of less than 10.5 euros per day.

The National Center for Social Research used Greece's official criteria for poverty. As of 2002, poverty was defined as an income of under 4,800 euros a year for one-member households, 8,640 euros for a couple with one child, and 10,080 euros for four-member families. This report also determined that 28.1 percent of Greeks over the age of 65 are poor, as are 15.7 percent of employed workers.

In September 2005 the EKKE estimated that 21 percent of the Greek population were "bordering on extreme poverty." Another report, by M. Matsaganis et al., indicated that elderly citizens were at the greatest risk, with 14.2 percent of them living in "extreme poverty." Greece also has a high level of income inequality at 6.6; as in many negative statistics, Greece ranks second in the EU behind Portugal in this regard, according to EUROSTAT. EUROSTAT explains this statistic as "the ratio of total income received by the 20 percent of the population with the highest income (top quintile) to that received by the 20 percent of the population with the lowest income (lowest quintile). Income must be understood as equivalised disposable income." Further, Greece is the only country in the EU that does not have a minimum-income guarantee, as noted by Sotiropoulos.

According to EUROSTAT, Greece had an unemployment rate of 10.2 percent in May 2005, the third highest within the euro-zone. Greece also had a very high level of unemployment among young (under 25 years of age) workers, at 26.2 percent, compared to 17.8

percent for the euro-zone as a whole. A large majority of unemployed workers receive no unemployment benefits at all. Greece has a very large underground economy, a serious and growing problem that makes it difficult to calculate with precision many economic and social statistics. Most sources estimate that the unregulated, untaxed economy is at least half as large as the officially reported economy.

The official statistics also mask the living and working conditions of Greece's substantial immigrant population. Resulting from its own economic growth as well as the collapse of nearby communist-ruled nations from 1989 to 1991, over the last two decades Greece has evolved from a source of emigration to a magnet for immigration. Today immigrants constitute approximately one-fifth of the labor force. Workers from Albania, the largest source of immigration to Greece, are concentrated in seasonal agricultural labor and other low-paying occupations and receive approximately 80 percent of the wages paid to their Greek counterparts in the same jobs, as explained by authors A.C. and C.P. Danopoulos.

Yet this spending has produced no more than a negligible effect on poverty.

The Greek state has not fared well in its efforts to confront poverty. Since 1981, which marked the election of the socialists, the Greek government has steadily increased its social spending, which today constitutes 22 percent of Gross Domestic Product (GDP), a figure consistent with the entire EU, as shown by Sotiropoulos and EUROSTAT. Greece continued to expand social spending throughout the 1990s, an era that saw many western European states undermine their commitment to the "welfare state."

Yet this spending has produced no more than a negligible effect on poverty, according to Sotiropoulos. Some economists have found that antipoverty measures introduced in the early 2000s failed to alleviate poverty because of a "very low take-up": 25.3 percent of Greece's poor decline to avail themselves of social services because of excessive bureaucracy, lack of information, and long waiting lists. Entering the second half of the 2000s, the state is constrained by an unusually large military budget—officially justified by Greece's continued tension with Turkey—and a large debt burden. Athens's 2004 Olympic Games exacerbated the debt, according to analysts; shortly after the Games' conclu-

sion, the deputy economy minister estimated that the Olympics would cost his country at least seven billion euros.

JOHN M. COX, Ph.D. UNIVERSITY OF NORTH CAROLINA, CHAPEL HILL

Greeley, Horace (1811–72)

BORN IN AMHERST, New Hampshire, Horace Greeley was known as a journalist and political leader. Like many of his day, Greeley did not receive significant schooling. However, through self-study and apprenticing for newspapers, Greeley worked to become one of the most influential political voices and literary leaders of his time.

Because he was founder and longtime editor of the *New York Tribune*, Greeley's thoughts became well-known through much of America. His tenure as editor of the *Tribune* was influenced by his conservative upbringing and strong moral beliefs. He spoke relentlessly

against various social ills, such as liquor, tobacco, gambling, prostitution, and capital punishment.

Living through the depression of the late 1830s, Greeley was profoundly influenced by his observance of urban poverty. He believed that rural life and farming would serve to resolve this poverty, and starting in 1837, through the rest of his life, he encouraged the poor to "Go west, young man." He believed populating the western territories with the poor of New York City would serve multiple purposes—it would help relieve the suffering masses of New York City, strengthen the nation by populating its midsection, and ultimately lead to economic growth and good for those who would work hard to build farms and communities in these developing lands. However, Greeley did lament that expanding the United States too far west might make it difficult to maintain democratic rule.

Greeley believed strongly in the nobility of farming as a profession. He purchased a farm in Chappaqua, New York, and experimented with various crops and technologies before exploring and explaining this work in his newspaper as a resource for the farming community. Throughout his life he was disappointed by the scarcity of farming resources, but he took advantage of the available information and reported it for his farming readership.

News reporting and newspapers, in general, were transformed through the influence and leadership of Greeley. At the *Tribune*, he established the first modern newspaper staff. He expanded news coverage into fields such as book reviews, serial novels, cultural activities, and foreign news. This expanded newspaper helped to educate the masses and expand their understanding not only of American society but of international culture as well.

It is within the *Tribune* that Greeley was able to share his strong beliefs about key issues in the United States. His outspoken opinions on occasion seem to be in contradiction. While he supported feminist issues, such as equality of education and employment, he spoke strongly against suffrage and expanding divorce laws. He vocalized support for the Free Soil movement, actively supported antislavery sentiment, and opposed secession of the south. He was a prominent promoter of the Homestead Act, signed into law in 1862.

In pursuance of his beliefs in social equality, despite various discrepancies, Greeley argued broadly for basic human rights and equality. His support for the end of slavery was complemented by his belief that impartial suffrage of men was important for reconstruction after the Civil War. While he advocated the importance of agricultural development, Greeley also understood the importance of industrialization. He understood that multiple tactics for economic growth were necessary for national economic progress and the elevation of the masses.

Throughout his life Greeley was tremendously interested in politics. He spoke loudly on behalf of various social issues, but he also sought to be actively involved in the political workings of the United States. Initially aligned with the Whig political party, he later joined the newly emerging Republican Party in 1854. He often sought political office in the House and Senate, but was seldom elected to office. He did serve a brief term in Congress (1848–49). Near the end of his life he even ran for the office of president of the United States. He overwhelmingly was defeated by Ulysses Grant. A combination of exhaustion, the death of his wife after a long illness a week before the election, and the electoral defeat resulted in Greeley collapsing, becoming demented, and dying on November 29, 1872 (before the electoral votes could even be counted).

Daniel Farr State University of New York, Albany

Grenada

WITH AN AREA OF 344 square miles and a population of less than 90,000 people, the Caribbean island of Grenada has a poverty level of 32 percent and an unemployment rate of 12.5 percent. Although Grenada is considered an upper-middle-income nation, it is severely indebted. Close to one-fourth of the labor force is involved in agriculture, mostly in tropical fruits.

However, tourism has become the dominant revenue producer for Grenada, and the addition of an international airport in 1985 substantially increased the numbers of tourists who visit the island. Grenada's diversified economy also includes construction and manufacturing and an offshore financial industry. Analyzing poverty in Grenada is made more difficult by the fact

that data on important social indicators are often not reported.

Grenada has developed its healthcare system according to guidelines established by the World Health Organization. The projected life span in Grenada has been steadily rising over the past decades, and Grenadians experience a life expectancy of 62.74 years. Women generally outlive men by four years. The median age is 21.26 years. Over one-third of Grenadians are under the age of 14, and 3.4 percent have lived to see the age of 65. About 95 percent of the population have access to safe drinking water, and 93 percent have access to proper sanitation. There are 81 physicians for every 100,000 residents, and 95 to 100 percent of Grenadians have access to affordable essential drugs.

The infant mortality rate is rapidly declining in Grenada. Out of every 1,000 live births, 14.62 infant deaths occur. Between 1990 and 2003, infant mortality dropped from 30 to 18 deaths per 1,000 live births while the mortality rate of all children under 5 decreased from 37 to 23. Nine percent of all babies are underweight at birth. Officials place strong emphasis on improving the health of the island's children, and childhood immunization rates on the island are almost universal, ranging from the mid-to high 90s.

Estimates for 2000 show that on the average, women on the island produce 2.37 children each. The fertility rate has declined since 2003 when a rate of 3 children per woman was reported. Out of every 1,000 births, 77 infants are born to females between the ages of 15 and 19. As a result, the government has developed programs to combat teenage pregnancy. Some 54 percent of Grenadian women use contraceptives to prevent pregnancy. Only one percent of all births on the island take place outside the province of trained medical staff. No data are available on maternal mortality.

Grenadians are highly literate, and only two percent of the population over the age of 15 cannot read and write. There is no gender difference in literacy rates. In 2000 the net primary school enrollment rate was 89 percent for males and 80 percent for females, as compared to 96 and 94 percent rates for the Latin American and Caribbean area as a whole.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Growth with Redistribution

GROWTH IS DEFINED AS an increase in the output of goods and services by an economy within a specified period of time, usually a year. Since output is typically measured in monetary terms, economists distinguish between growth in real and nominal terms. *Real economic growth* refers to an increase in output that has been adjusted for inflation.

Every government—local, state, and central—aspires to promote economic growth for a number of reasons. First, growth raises the living standards of the residents of an economy by enabling them to consume a larger volume of goods and services—including health and education. The Gross Domestic Product (GDP) per capita, which divides a country's total output by its population, is a measure of a country's standard of living. Second, growth enables the residents of a country to have access to essential social services like health and education.

However, experience has shown that growth does not automatically lead to higher living standards for everyone in the economy. The notion that growth leads automatically to higher living standards for everyone is called "trickle-down economics." In other words, trickle- down assumes implicitly that everyone benefits from growth—a claim that has been widely disputed by evidence. In the late 1960s, for instance, many newly independent African states achieved impressive growth rates that surpassed the targets set by the United Nations. Despite those stellar growth rates, many Africans continued to live in abject poverty, squalor, destitution, and misery. The coexistence of poverty and affluence in developed countries also casts doubts on the trickle-down effect of growth.

Rather than assuming that growth translates automatically into higher living standards for everyone, liberal economists believe that growth should be accompanied by explicit policies, programs, and actions for ensuring that the majority of the residents of an economy benefit from growth by way of more and bet-

ter jobs, rising incomes, better health, higher life expectancy, and more access to quality housing and clothing. This is what is called growth with redistribution. Growth with redistribution is said to be sustainable because it ensures that the number of people living below the absolute poverty line does not increase (a person is said to be absolutely poor if his or her income is so low that he or she cannot afford the basic necessities of food, health, shelter, and clothing); the distribution of income does not become more unequal; and the number of unemployed persons does not rise.

Policies that promote growth with redistribution include:

- 1) Fiscal policy. Governments could place a higher tax burden on those who benefit disproportionately from growth, and use the proceeds to finance government expenditures that benefit the poor.
- 2) Subsidies. Governments could also subsidize the goods and services that are typically consumed by the poor. These include education, health, housing, and nutrition.
- 3) Price controls. Some governments place binding price ceilings on goods and services that are essential for the livelihood of the poor.
- 4) State ownership of key economic resources. To ensure equity, governments may own or control some of the key economic resources in a country. These include power and water supply, transportation, health, and some manufacturing activities. This is common in socialist economies, and is still practiced to some extent in welfare states such as the Scandinavian countries—Denmark, Norway, and Sweden. In these countries, the state imposes higher taxes and uses the proceeds to provide social services to its residents.
- 5) Charitable organizations. Some countries use charitable organizations to ensure that the poor benefit from growth. They encourage the rich to make tax-deductible contributions to charitable organizations that provide social services to the poor. These countries believe that this approach is more efficient than one in which the state intervenes directly in redistributing wealth. The opponents of state intervention contend that socialism or central planning reduces the size of the economic pie available for redistribution.

OBJECTIONS

Neoclassical or conservative economists object to the notion of growth with redistribution because it serves as a disincentive for people to work hard. The concept has come to be seen, rightly or wrongly, as a way of transferring income from the rich to the poor. The rich are thus discouraged from generating more income, while the poor, expecting largesse from the government, have no incentive to work at all. The result is a lower output in the economy and a smaller economic pie to be redistributed. This is why some analysts euphemistically refer to growth with redistribution as the redistribution of poverty.

STEVE ONYEIWU ALLEGHENY COLLEGE

Guaranteed Assistance

GUARANTEED ASSISTANCE programs seek to assure aid to the impoverished. Guaranteed assistance programs can take various forms as they seek to remedy poverty in diverse manners, ranging from guaranteed minimum income, guaranteed healthcare, guaranteed education to conception of a guarantee of minimum nutrition and so forth.

Most of these programs approach remedying various social problems affiliated with poverty by ensuring a minimum attainment level. The basis for these types of policies is an assertion of basic human rights and needs—that there should be minimum standards that all persons should be able to meet.

A guaranteed income is a type of policy that would ensure all citizens have an income above a set standard. This type of policy can be constructed as a basic income, wherein the government would pay a standard minimum income for the year to each citizen. This income would be substantially larger for adults than for children and this type of income would be supported by a high tax base, but a significant proportion of one's tax could be returned in the basic income, contingent upon a person's income from work. C. Clark (1997) suggested that a 36-percent flat-tax in the United States could support a system with a basic income of \$8,000

per adult and \$2,000 per child. Tied to the concept of a guaranteed income are the minimum-wage policies that exist in many countries around the world, particularly in developed nations. A minimum-wage policy differs from a minimum income in that it is often structured around a minimum value or wage paid per hour of work. While variations exist, minimum wage may not allow an individual to live above an established poverty line.

Guaranteed assistance programs are often thought of in purely economic terms. However, this concept can be expanded to be inclusive of policies that seek to ensure educational attainment, childcare, healthcare, adequate food resources, housing, and other essential needs. A guaranteed minimum income for a family does not ensure that all basic needs will be met. Guaranteeing education, or education loans perhaps, can enable individuals to attain higher-paying jobs and move out of poverty more readily than a minimum income.

When contrasting the policies in developed nations with those of lesser-developed nations, a stark contrast may be seen. In developed nations, such as in Europe and the United States, there are more policies that will guarantee education and healthcare. In lesser-developed nations, the basic needs of the people may indicate a more substantial need for a guarantee of nutrition. Clearly, developed nations are likely to ensure basic adequate nutrition, but in the impoverished cultures of south Asia and Africa where famines may be occurring, the need for education is less essential.

Guaranteed assistance programs in their various incarnations are essentially ensuring that all people of a society can reach a minimum standard of living. These programs have visible short-term effects, as they improve citizen lifestyle, but also have long-term effects, as people are able to maintain better health and nutrition and attain better education and healthcare, and they enable a society to reach for the ultimate goal of eradicating the most severe forms of poverty.

Guatemala

HISTORICALLY, THE REPUBLIC of Guatemala was part of the Mayan civilization during the first millennium. In 1821, Guatemala won independence from Spain after nearly three centuries of harsh repression. The dissolution of the United Provinces of Central America in 1839 led to the formation of the republic. During the latter half of the 20th century, political power in Guatemala changed hands frequently among various military and civilian governments. A guerrilla war that lasted for three and one-half decades ended in 1996 after more than 100,000 people had died and a million more had become displaced.

Within Central America, Guatemala is the largest and most populous country. However, its per capita income of \$4,200 is around half that of Brazil, Argentina, and Chile. Approximately 50 percent of the labor force are involved in the agricultural sector, chiefly in coffee, sugar, and bananas. Agriculture accounts for about a fourth of the Gross Domestic Product. Services employ 35 percent of the labor force, and the remaining 15 percent are engaged by various industries. Current employment stands at 7.5 percent.

The Guatemalan government has begun wooing foreign investors who ignored the country during the years of political strife. However, widespread government corruption and excessive criminal activity, including drug trafficking and gang violence, present major obstacles to economic prosperity. The weather also plays a role in Guatemala's economic health because of its vulnerability to volcanic activity, occasional violent earthquakes, and hurricanes.

Income is unequally distributed in Guatemala. The richest 20 percent of the population hold 64.1 percent of resources while the poorest 20 percent share 2.6 percent. Guatemala is ranked 48.3 percent on the Gini Index of Human Inequality. Three-fourths of the population lives in poverty; 24 percent live in extreme poverty. Some 37.4 percent of Guatemalans live on less than \$2 a day, and 16 percent on less than \$1 a day. The poorest segments of the population are women, chil-

dren, rural residents, and members of the indigenous population. Within this group, 54.3 percent are poor and 22.8 percent are extremely poor. It is estimated that 75,000 children in Guatemala are malnourished, and 67 percent of them are of indigenous ancestry. Elderly women are also particularly vulnerable to poverty in Guatemala because 84.1 percent of them have no social security coverage.

In 2001 the Guatemalan government passed a value-added-tax bill and earmarked five percent of the revenue for food security programs. The National Food Security and Nutrition Council was created to oversee the distribution of food, giving priority to children and pregnant and nursing mothers.

Guatemala has a relatively young population and a life expectancy of 65.14 years. The projected life span has increased considerably since 1980, when life expectancy was 55 years for males and 59 years for females. Among the population of 14,655,189, the median age is 18.47 years. Over 42 percent of the population are under the age of 14, and 3.2 percent have reached the age of 65.

The medical system is in crisis in Guatemala because hospitals do not have necessary medicines and social security does not function. Some 2.4 million people have no access to the healthcare system at all. There are only 109 physicians for every 100,000 residents, and from 20 to 50 percent do not have access to affordable essential drugs. With a prevalence rate of 1.1 percent, HIV/AIDS is raising concern in Guatemala.

In 2003, 78,000 people were living with this disease, which had caused the deaths of 5,800 people. Around eight percent of the population lack access to safe drinking water, and 19 percent lack access to improved sanitation. Because two oceans border Guatemala, the country is a breeding ground for the blackflies that cause river blindness. Guatemalans in 518 communities receive biannual treatments for this disease through the efforts of the Carter Center of Emory University, founded by former president Jimmy Carter.

Infant mortality rates are high in Guatemala, particularly among the indigenous population, where 46 deaths occur out of every 1,000 births. In the most isolated areas, mortality may be as high as 92 deaths per 1,000 live births. Overall mortality rates have declined over the past decades. Between 1970 and 2005, infant mortality fell from 115 to 35.93 deaths per 100,000 live births. During that same period, the mortality rate among all children under the age of 5 plummeted from 168 to 49 deaths per 1,000. Nearly a fourth of all children under the age of 5 are malnourished, four percent

severely so. About 13 percent of infants are underweight at birth. Almost half of all children under 5 suffer from moderate to severe stunting. Childhood immunization rates range from 84 to 96 percent among children from birth to 23 months.

Fertility is also high in Guatemala, and women bear an average of 4.53 children each. That rate has decreased from 6.3 children per woman in 1980. Among teenage mothers, the birth rate is 97 per 1,000 births. Around 40 percent of Guatemalan women use some method of contraception. Approximately 59 percent of all births in Guatemala take place outside the presence of trained medical staff. As a result, maternal mortality is also unusually high for the region, occurring at a rate of 240 deaths per 100,000 live births. Rates are higher in predominantly indigenous regions.

Among Guatemalans over the age of 15, 70.6 percent can read and write. With a literacy rate of 78 percent, males have a distinct advantage over females (63.3 percent). Progress has been made in this area. In 1980, 39 percent of males and 55.1 percent of females were illiterate. Most Guatemalan students attend school for at least nine years. Primary school completion rates have increased significantly in the last few decades. Between 1980 and 2003, rates for males increased from 52 to 66 percent and from 47 to 63 for females.

Guinea

LOCATED IN SUB-SAHARAN Africa and bordering the Atlantic Ocean, Guinea is one of the poorest na-

tions in the world. Guineans survive on an annual income of approximately \$410. Some 40 percent live below the national poverty line, and nearly a quarter of all children under the age of 5 are malnourished. In rural Guinea, 35 percent of all households lack access to safe water, as do 28 percent in urban areas. Some 58 percent of Guineans lack access to adequate sanitation.

With a life expectancy of 49.86 years, the median age of Guinea's population is 17.67.

Even though only 3.63 percent of Guinea's land is arable, 80 percent of the labor force are engaged in the agricultural sector. Approximately 80 percent of all agricultural workers are unpaid female workers. International efforts are now being directed toward increasing rice production in Guinea. Teams from the Japanese government and from Emory University's Carter Center are working with Guineans to enhance agricultural knowledge and technology to increase food production.

Some three-fourths of all Guinean exports derive from the mining sector. Guinea is the second largest producer of bauxite in the world but has been unable to adequately develop a substantial potential for mineral and hydropower resources. Electing only two presidents since 1958, Guinea has traditionally enjoyed political stability, but the addition of approximately one million refugees from four bordering countries has threatened this stability and added to the ranks of those who rely on the government's social net for survival. In 2003, the International Monetary Fund and the World Bank cut off all assistance to Guinea.

With a life expectancy of 49.86 years, the median age of Guinea's population of 9,467,866 is 17.67. Some 44.4 percent are under the age of 14, and 3.2 percent are over the age of 65. Guineans have a 35.9 percent chance of seeing a 40th birthday.

Guinea suffers what the World Health Organization calls a "galloping" HIV/AIDS rate of 3.2 percent. Estimates for 2003 place the number of current HIV/AIDS cases at 140,000, and 9,000 Guineans have died from the disease and its complications. Guineans have a very high risk of contracting food- and waterborne diseases such as bacterial and protozoal diarrhea, hepatitis A, and typhoid fever. In certain areas, the risk of contracting malaria and yellow fever is also high.

Other common diseases that affect Guineans are meningococcal meningitis, a respiratory disease; schistosomiasis, a disease spread through contact with infected water; and Lassa fever, which is contracted through exposure to infected aerosolized dust or soil. About 23 percent of all children under 5 are moderately to severely malnourished. Some 26 percent of these children suffer from moderate to severe stunting, and nine percent suffer from moderate to severe wasting. Guinea's infant mortality rate is high at 90.37 deaths for every 1,000 live births, but female infants are somewhat hardier than male infants (84.76 to 96.82).

Childhood mortality for children under 5 is declining, but high incidences of diarrhea, malaria, and acute respiratory infections contribute to the 160 out of 1,000 mortality rate. Through the National Safe Motherhood Program, the Guinean government has pledged to reduce neonatal mortality by 50 percent by 2010. Since the creation of the Expanded Program on Immunization, Primary Health Care and Essential Medicines, Guinea has been able to provide basic healthcare to 60 percent of the population, and to increase the number of childhood vaccinations to 69 percent.

Guinean women bear an average of 5.83 children each. Estimates in 2003 placed the fertility rate of women aged 15 to 19 at 149 per 1000 births. Less than 10 percent of all women use contraceptive measures. Educating Guineans about family planning is essential to controlling poverty in Guinea, and the government has pledged to reach at least 80 percent of all women in the 21st century.

Guinea's maternal mortality rate of 1,600 deaths per 100,000 live births is one of the highest in the world. Trained medical staff attend only 25 percent of births in Guinea, but new initiatives have led to a monitoring program that reaches 65 percent of Guinean women. Much attention has been paid to eradicating genital mutilation. In 2001 the government launched a plan to encourage practitioners to surrender excision knives in exchange for retraining for new jobs.

Literacy rates in Guinea remain low. While nearly half of male Guineans over 15 can read and write, only 21.9 percent of women in this group can do so. Efforts to address this inequality led to the creation of a literacy program for training 2,000 literacy workers. Only 54 percent of Guinean children attend primary school regularly, and females lag behind males in attendance rates. In 2001 a new emphasis on female education led to the institution of the Education for All program, which improved access to education for girls by building new classrooms, creating multigrade classrooms, reducing costs, furnishing free books and supplies, rewarding academic excellence, and developing female-centered curricula. The success of the program was ev-

ident in the fact that female school attendance rose from 31.5 percent in 1995 to 63 percent in 2002.

Guinea-Bissau

THE LOW-INCOME, severely indebted, sub-Saharan nation of Guinea-Bissau is ranked as one of the 10 poorest countries in the world. Just under half of the population lives below the national poverty line. At least 26.2 percent live in extreme poverty, and 22.5 percent are considered moderately poor. Poverty is more prevalent in rural areas, with 84 percent of the poor living in the three poorest regions.

Education is crucial to breaking the Guinean poverty barrier given the fact that 84 percent of those who are poor have no formal education. Some 44 percent of Guineans have no sustainable access to improved water and sanitation sources. A severe lack of adequate healthcare continues to create an environment in which diseases flourish. There are only 17 physicians for every 100,000 Guineans, and half of the population lacks access to lifesaving drugs.

Guineans suffer greatly from an extensively unequal distribution of income. The poorest 20 percent of the population share 5.2 percent of all income while the richest 20 percent share 53.4 percent. The country ranks 47.0 on the Gini Index of Human Inequality.

Decades of civil war have strained Guinea-Bissau's economy to the limit. Although the country has not completely recovered from the damage to its infrastructure, the economic outlook has improved to some ex-

tent since 1999. Some 82 percent of Guinea-Bissau's labor force are involved in agriculture and fishing. Ranking sixth in the world in the production of cashews, the country also exports fish and seafood, peanuts, palm kernels, and timber. Although undeveloped, Guinea-Bissau has the potential to profit in the future from its offshore oil reserves. In 2004 the International Monetary Fund and the World Bank granted Guinea-Bissau \$107 million in emergency budgetary support. Current levels of foreign aid are not enough, however, to end the country's abject poverty.

Like most African nations, Guinea-Bissau's population is young, with a median age of 18.97 and a life expectancy of 46.97 years. Between 1980 and 2005, male life expectancy increased from 37 to 45.09 years, while female life expectancy rose from 40 to 48.92 years. Some 41.5 percent of the population are under the age of 14, and only three percent are over the age of 65. Guineans have a 41.3 percent of not living to see their 40th birthdays.

The 10 percent HIV/AIDS prevalence rate for Guinea-Bissau is extremely high, even by African standards. Some 17,000 Guineans live with the disease, which has caused at least 1,200 deaths. The people of Guinea-Bissau are stricken with many of the same infectious diseases that plague other poor African countries. Risks of contracting food- and waterborne diseases such as bacterial and protozoal diarrhea, hepatitis A, and typhoid fever are very high. Guineans are also vulnerable to infectious diseases such as malaria, yellow fever, schistosomiasis, and meningococcal meningitis.

Poverty affects Guinean children disproportionately. While infant mortality rates have begun to drop, they remain high. Between 1990 and 2000, rates decreased from 153 to 130 deaths per 1,000 live births, followed by a decline to 107.17 in 2005. The mortality for children under the age of 5 likewise decreased. Between 1990 and 2003, that rate declined from 253 to 204 per 1,000 live births.

Fully a quarter of all Guinean children under the age of 5 are malnourished, and seven percent are considered severely underweight. About 10 percent of under-5s suffer from moderate to severe wasting, and 30 percent suffer from moderate to severe stunting. Immunizations against measles for children from birth to 23 months reached 61 percent in 2003, and DPT3 immunizations rose to 77 percent. Approximately 75 percent of infants were immunized against polio, and 84 percent received tuberculosis immunizations. Less than a quarter of Guinean children who are ill receive lifesaving rehydration therapy. A scant seven percent of children

under 5 sleep under treated bed nets to protect them from insects, and only 58 percent receive antimalarial drugs when necessary.

Among all women of childbearing age, the fertility rate was 4.93 per woman by 2005 estimates. In 2003, fertility rates were even higher at 6.6 children per woman, with a rate of 210 per 1,000 for women between the ages of 15 and 19. Less than 10 percent of Guinean women use contraceptives of any kind. Maternal mortality rates are abnormally high in Guinea-Bissau. In 1995, maternal mortality was estimated at 910 deaths per 100,000 live births. By 2000, that number increased to 1,100. Access to healthcare continues to be limited, and trained medical staff attend only 34.7 percent of Guinean births.

The majority of Guinean children receive no more than six years of schooling, but illiteracy rates have declined through efforts to promote education and literacy. However, in 2003 the 27.3 percent literacy rate for Guinean females lagged far behind the 58.1 percent rate for males. Between 1980 and 2000, primary school enrollment dropped from 63 percent to 53 percent for males, but the percentage of females enrolled in primary school increased from 31 to 38 percent.

Guyana

THE COOPERATIVE REPUBLIC of Guyana was originally home to Dutch, English, and French colonies.

The Dutch obtained possession of most of Guyana by the early 17th century. During the Napoleonic Wars, Great Britain gained possession of three Dutch colonies and established British Guiana in 1831. As a result, Guyana is the only English-speaking country in South America.

After slavery was abolished in 1834, Guyana experienced a period of black urbanization. Indentured servants from east India were brought into the country to work the vast sugar plantations. Guyana's population still mirrors the ethnic diversity of its history, and ethnicity plays a major role in political strife. Half the people are east Indian, 36 percent are black, seven percent are Amerindian, and the rest are white, Chinese, and other mixtures.

The government has done a great deal to reduce poverty since 1988.

After winning independence from Great Britain in 1966, the name of the country was changed back to its original form, Guyana. The nation was subsequently ruled by a succession of socialist-oriented governments. In 1992 the first democratic elections in 28 years were held. Since 2000, Guyana has been involved in disputes with Venezuela and Suriname over contested territory. The outcome of the dispute with Suriname could have a significant impact of the economy on both countries because the land in dispute is coastal land with huge oil reserves.

Guyana has experienced moderate economic growth in the 21st century by expanding agricultural and mining sectors, attracting foreign investors, and enacting a more realistic exchange rate than in the past. Further economic growth has been hampered by a shortage of skilled labor and an infrastructure in need of restructuring. Prospects for a more prosperous economy are dependent on continued privatization, expanded public investment, and the exploitation of bauxite deposits.

Guyana's other resources include gold, diamonds, hardwood timber, shrimp, and fish. The agricultural sector generates 38.3 percent of revenue for Guyana. Industry accounts for almost a fifth of the Gross Domestic Product, and services produce the remaining 41.8 percent. While the unemployment rate is officially 9.1 percent, it is widely believed that this figure is under-representative of the extent of unemployment in Guyana.

Despite great potential for economic growth, Guyana's per capita income of \$3,800 is one of the lowest in the western hemisphere. Payments on substantial external debts drain the country of resources needed to deal with domestic issues. Currently, poverty in Guyana is estimated at 35 percent. However, the government has done a great deal to reduce poverty since 1988, when the poverty rate rose to 65 percent. Within four years, the number of people living in poverty had been reduced to 43 percent.

Guyana's antipoverty program is based on World Bank guidelines and is geared toward social inclusion and economic growth. There are no current data on particular aspects of poverty in Guyana, but a Household Income and Expenditure Survey that is under way will improve poverty assessments. Data from other sources reveal that 61 percent of Guyanese live on less than \$2 a day, and 14 percent of the general population are undernourished. Inequality of resources is prevalent in Guyana. The richest 20 percent claim 49.7 percent of resources while the poorest 20 percent share only 4.5 percent. Guyana is ranked 43.2 percent on the Gini Index of Human Inequality.

Access to healthcare is limited in Guyana, particularly in rural areas. There are only 26 physicians for every 100,000 residents. Hospitals do not always receive drugs, and most of the population lacks access to affordable essential drugs. Six percent of Guyanese lack access to safe drinking water, and 13 percent lack access to improved sanitation. Among Guyana's current population of 765,283, life expectancy is 65.5 years. With a projected life span of 68.28 years, females outlive males (62.86 years) by more than five years. The median age is 26.91 years. Over 26 percent of the population is under the age of 14, and 5.1 percent have reached the age of 65. Guyana is facing a growing HIV/AIDS epidemic, with a current prevalence rate of 2.5 percent. Around 11,000 people are living with this disease, and 1,100 others have died.

Infant mortality in Guyana is unacceptably high, but incidences have been reduced significantly in the last several decades. Between 1970 and 2003, the Guyanese infant mortality rate fell from 81 to 52 deaths per 1,000 live births. The mortality rate of all children under the age of 5 dropped from 101 to 69 deaths per 1,000 during that period.

About 14 percent of all children under the age of 5 are malnourished, and 12 percent of infants are underweight at birth. Approximately 11 percent of the under5 population suffer from moderate to severe wasting and/or stunting. Immunization rates for children be-

tween the ages of 12 and 23 months range from 89 to 95 percent.

According to estimates for 2005, Guyanese women bear an average of 2.05 children each, a decline from 4.9 children per woman in the 1970s. The fertility rate for adolescents is 58 per 1,000 births. Only 37 percent of Guyanese women use contraceptive measures. The number of births attended by trained medical staff declined from 95 percent in 1995 to 86 percent in 2005. Based on modeled estimates for 2000, maternal mortality occurs at a rate of 170 deaths per 100,000 live births.

The Guyanese population is highly literate, and 98.8 percent of the population over the age of 15 have attended school at some point in their lives. Illiteracy has decreased steadily in Guyana since 1980, when 3.7 of males and 6.4 percent of females were illiterate. Only two percent of children are not enrolled in primary school, but dropout rates are high. Three-fourths of the relevant age group attends secondary school, but many fail to complete the program.

Habitat for Humanity

HABITAT FOR HUMANITY International is a nonprofit organization devoted to building housing for those living in substandard shelter. Its professed goal is "to eliminate poverty housing and homelessness from the world, and to make decent shelter a matter of conscience and action."

The actual operation of Habitat for Humanity is somewhat unusual for a private charitable organization. Rather than simply giving housing to those in need, Habitat requires a down payment and monthly mortgage payments from the recipient families, who must also participate in the building of their own home. Homes are built with volunteer labor and donations of money and materials, and then are sold to the recipient families at no profit, financed with no-interest loans. Habitat is a strictly private organization that accepts no government funds for its operations, relying instead on private donations and volunteer labor.

Millard and Linda Fuller founded Habitat in 1976. Since then they have built and rehabilitated more than 175,000 houses and are currently active in 100 countries, including all 50 states of the United States. The profile and work of Habitat received a large boost in

1984, when former President Jimmy Carter became publicly and actively involved in its operations. At that time he personally helped renovate a building in New York City in order to provide adequate shelter for 19 families. Since then he has volunteered his construction skills and time on a regular basis, helping to build housing for those in need, while also lending his very well-known name to Habitat's efforts. The Jimmy Carter Work Project has subsequently become an annual event, with up to 1,000 homes being constructed in a single week.

Habitat considers itself to be an ecumenical Christian nonprofit organization. As such, they see the work that they do as exemplifying "the economics of Jesus." This is centered on what Millard Fuller calls "biblical economics": no earned profits and no interest charged on loans. Those involved in Habitat give what they have in response to human need, rather than following the profit motive (the compelling economic force in capitalism).

They see Habitat as a Christian ministry that welcomes people of all faiths, seeing that "everyone can use the hammer as an instrument to manifest God's love," what Fuller calls "the theology of the hammer." This explanation for their work seems to recognize the fail-

ure (and even the impossibility) of capitalism to provide adequate housing for everyone.

It may seem reasonable to think of decent housing as an economic right, something to which everyone is entitled. This, however, is not the case under capitalist ideology. Adequate housing is simply one result of the economic process, and as such, is not guaranteed. No results, that is, goods or services, are specified under capitalism. What is specified (at least in a well-functioning capitalist economy) is that the economic process follows the rules of the capitalist game. It is the process that is guaranteed, not any particular result. Thus adequate housing, distributed according to the profit motive, will not be available to everyone, with the poor suffering the most.

In every country in the world, a certain portion of the population necessarily lives in poverty. This proportion ranges from about 12 percent in a rich country like the United States to virtually the majority of the population in the poorest countries in sub-Saharan Africa. The consequences of this poverty are devastating: life becomes a dreary existence, with all efforts focused on mere survival.

One of the most obvious expressions of this poverty is the lack of adequate housing. It is estimated that over one billion of the world's city residents live in substandard housing, primarily in the slums and squatter settlements in developing countries. It is also estimated that 20–40 million urban households are homeless. The total number of people worldwide living in inadequate housing may be as high as 1.3 billion—or about 20 percent of the total world population. In the United States the poverty housing situation is getting worse. The shortfall in affordable and available low-cost rentals is getting larger, with the percentage of households who pay more than 50 percent of outlays for housing increasing. There is much room for programs, public and private, to try to address this problem.

Governments could step in to try to alleviate this suffering of the poor. This failure of markets to provide adequate housing for everyone would seem to be a perfect opportunity for the state to serve its most needy citizens. And, in fact, many governments around the world do have programs helping poor families secure decent housing. As documented above, however, these programs are woefully inadequate, particularly in the poorest nations, where help is most needed. The need for private programs, such as Habitat for Humanity, is obvious.

It is interesting to note that the philosophical basis for Habitat is explicitly noncapitalist. Although founded

in a capitalist country—the United States—Habitat's philosophy is based in the Bible, in direct opposition to capitalist ethics. Habitat argues that people should receive according to their needs rather than according to the profit motive, that is, adequate housing is an economic right. This can be accomplished either through government action or through private efforts. Since government programs are clearly insufficient, Habitat has stepped into the breach.

Habitat for Humanity is a significant effort on the part of private citizens to provide decent housing for the poor. It does this, not through simple handouts, but rather through requiring recipient families to invest their "sweat equity" and money into their own home. This policy has been quite successful over the past 30 years, providing decent, affordable housing for hundreds of thousands of families throughout the world.

Haig Fund

FIELD MARSHAL Earl Haig, the British commanderin-chief, founded the Earl Haig Fund in Scotland in 1921. It is a registered charity in Great Britain that has the aim of providing help in time of need to any man or woman (or their dependents) who served in the armed forces of the United Kingdom.

The Haig Fund Scotland raises money through the sale of Scottish poppy flowers. The use of poppies was inspired by the poem "In Flanders Fields the poppies blow between the crosses, row on row" by Lieutenant Colonel John McCrae, one of the "trench poets" who was killed in World War I. The Scottish Poppy Appeal takes place every November during the week leading up to Remembrance Sunday, when tribute is paid to those who fell in battle. Since World War I ended on November 11, the Scottish Poppy Appeal takes place at that

time. The week leading to Remembrance Sunday is a time for services at war memorials. It is also a time in which an army of volunteers takes to the streets with collection containers to raise money from the public. Approximately 1,000 leaders organize the appeal. They supervise 10,000 volunteers who each place seven collection containers in places where the public can donate. In 2004 the Scottish Poppy Appeal raised over £1.4 million with collection containers handled in the streets or placed in churches.

In addition to the Poppy Appeal, the Haig Fund also accepts donations, legacies that the fund is allowed to inherit, and Gift Aid, which is a provision of the law that allows the fund to receive an additional 28 pence from the Inland Revenue for each pound sterling that is donated. It is a matching grant in which income taxes are used to match donations.

The monies raised through the Scottish Poppy Appeal are used to provide financial assistance to former servicepeople or their dependents in Scotland. The fund meets financial difficulties by helping with needs such as food, utility bills, wheelchairs, or even debts. Over half of the sums expended go to the wives, widows, or orphans of those who served.

The fund also provides sheltering employment for ex-servicepeople. The Lady Haig's Poppy Factory, founded by Lady Haig, is located in Edinburgh. It employs 24 disabled ex-servicepeople who assemble the Scottish poppies and wreaths used during the Scottish Poppy Appeal.

The Haig Fund has supported a retirement home for ex-servicepeople for 50 years, the Flanders House in Glasgow. The home was closed at the end of September 2005 because it no longer met the standards for serving the handicapped. To provide a new retirement home, the Board of the Haig Fund joined with Erskine, which is a Scottish charity that provides specialist care for exservice personnel, to build a new retirement home that will be located on Dorchester Avenue in Glasgow. Earl Haig also established Haig Homes, a separate organization that provides homes for veterans. The Royal British Legion Scotland Pensions Department is entirely funded by the Earl Haig Fund Scotland. It helps ex-servicepeople apply for pensions and other benefits, especially for service-related injury or sickness.

Haiti

THE REPUBLIC OF HAITI occupies the western third of the island of Hispaniola, while the Dominican Republic covers the remaining area. Haiti has a long history of repression and political violence that began in the late 15th century. In the early 17th century, the sugar and forestry industries flourished through the work of African slaves. Haitian slaves eventually revolted against the French who had taken over the island from the Spanish. In 1804, Haiti became the first black republic to declare its independence.

However, independence did not put an end to the political instability. Authoritarian regimes, corruption, and drug trafficking have all taken a heavy toll on Haiti, and the infrastructure and social systems are virtually unworkable. In addition to government mismanagement and political strife, the weather plays a major role in Haiti's economic problems. The country is subject to hurricanes, earthquakes, and periodic droughts.

Haiti is the poorest country in the western hemisphere, with an abject poverty level of 80 percent. Within the Americas, Haiti has the worst record of health indicators and the highest infant and maternal mortality rates. Nearly half of the population suffers from malnutrition. Some 60 percent of all rural households suffer from chronic food insecurity. Approximately two-thirds of the population has no formal jobs, even though there is a shortage of skilled labor. Underemployment is also common. Approximately 66 percent of the labor force are involved in subsistence agriculture.

The World Health Organization estimates that Haiti's health services reach from 40 to 60 percent of the population, leaving the rest to their own resources. General health is further threatened by the fact that over half of Haiti's population lacks access to safe water and proper sanitation. There are only 25 physicians for every 100,000 residents and affordable essential drugs are available to less than half the people. Haitians have a total expected life span of 52.92 years. The median age is 18.03 years. Nearly 43 percent of the population are under the age of 14, and 3.4 percent

have reached the age of 65. With an HIV/AIDS prevalence rate of 5.02 percent, Haiti has the highest incidence of this disease in the Americas. According to 2003 estimates, there are 280,000 people living with the disease, which has caused 24,000 deaths.

Infant mortality in Haiti is high at 73.45 deaths per 1,000 live births. Female infants are much hardier, with a mortality rate of 66.79 per 1,000 as compared to 79.92 deaths per 1,000 for males. There has been a marked improvement in infant mortality since 1970, when 140 infants died out of every 1,000 live births. However, between 1996 and 2000, infant mortality increased from 73.8 to 80.3 deaths per 100,000 live births in response to increasing poverty, poor access to healthcare, and the rising HIV/AIDS epidemic. The mortality rate for children under the age of 5 dropped dramatically from 221 to 123 deaths per 1,000 between 1970 and 2002 but continues to be high for the same reasons that infant mortality is excessive in Haiti.

Haiti is the poorest country in the western hemisphere, with an 80 percent poverty level.

A major component for reducing childhood mortality in Haiti is continuing to cut down on the number of children who are malnourished and increasing childhood immunization rates. Between 1980 and 2000, the number of children under the age of 5 who were malnourished was more than halved, from 37 to 17 percent. Even so, four percent of all children under 5 years of age are severely underweight, and 28 percent of all babies are underweight at birth. Some 23 percent of under-5s suffer from moderate to severe stunting, and five percent experience moderate to severe wasting. Haiti's rate of childhood immunizations continues to be abysmal. While 71 percent of infants are immunized against tuberculosis, only 53 percent receive measles immunizations, and 43 percent receive DPT and polio immunizations. Among children between the ages of 12 and 23 months, only 53 percent have been immunized against measles and 43 percent have received immunization against DPT3.

While fertility rates have decreased in Haiti over the past decades, fertility continues to be higher than the economic structure can support. Total fertility decreased from 5.8 children per woman in the 1970s to 4 children in 2004. Among adolescents, the current birth rate is 69 out of 1,000. However, officials have made some gains in promoting family planning.

Between 1990 and 2003, the number of women using contraceptives rose significantly from 11 to 28.1 percent. Professional medical staff now attend 23.8 percent of all births, but that number has changed little in recent years. Between 1995 and 2000, maternal mortality rose 15 percent. By modeled estimates for 2000, the current rate of maternal mortality is 680 deaths per 100,000 live births. Many Haitians are not literate. Only 54.8 percent of males and 51.2 percent of females over the age of 15 can read and write. Haiti has made significant progress in primary school completion rates since 1980 when only 29 percent of males and 27 percent of females completed this level of education. In 2000, 69 percent of all males and 70 percent of females completed primary school.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Harding, Warren (Administration)

MANY HOLD A DIM view of the Warren Harding administration. Some historians rank his administration as the worst in U.S. history. Yet this was not always the case, and others dispute the opinions of his critics. Harding was popular during the early part of his presidency, but his standing fell by the end of his administration and declined further with the passage of time. This was mostly because of scandals involving top members of his administration.

Warren Harding came from a modest background in Blooming Grove, Ohio, yet ultimately rose to the presidency. He attended Ohio Central College and undertook a brief and unsuccessful venture into the insurance business. He then bought a small newspaper—the *Marion Star*—and made it into a success. This led to rapid political success. Harding was elected state senator in 1899, lieutenant governor in 1902, and a U.S. senator in 1914.

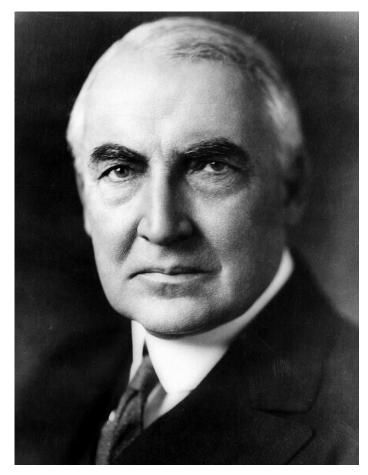

Harding won the election of 1920 in a landslide. In his inaugural address he pledged himself to fiscal austerity and low taxes. By the time Harding took the oath of office in January 1921, the wartime economic boom had given way to depression. Unemployment had been 1.4 percent in 1919. In 1920 it rose to over five percent. In 1921 unemployment peaked at 11.7 percent and industrial production slowed. Heavy industry suffered the worst losses. Employment in the iron and steel industries was cut in half. Other heavy industries suffered similar employment losses. Prices and wages fell during this period of deflation. The poverty resulting from this depression was severe but temporary.

The Harding administration acted to reduce government involvement in the economy during the 1920–21 crises. This administration and Congress cut federal spending massively, reduced tax rates, and ended many wartime controls on industry. In 1920 federal spending was \$6.357 billion. It fell to \$5.061 billion in 1921, 3.389 billion in 1922, and \$3.140 billion in 1923. Harding vetoed a soldier's bonus bill sponsored by the American Legion. In November 1921 marginal income tax rates were cut by 13.8 percent. Tax revenue fell, but not as much as spending, so the budget surplus rose and total public debt fell from \$24.299 billion in 1920 to \$22.349 billion in 1923.

One exception to Harding's *laissez faire* policies was his support of the Fordney-McCumber tariff act of 1922. This was a highly protectionist tariff. Harding also increased the power of the presidency relative to Congress with the creation of the Bureau of the Budget.

The economy began to recover in the second year of the Harding administration. The end of the depression of 1920 meant renewed growth, low unemployment, and growing prosperity. Unemployment fell to 6.7 percent in 1922 and 2.4 percent in 1923. Of course, the prosperity of the early 1920s was not uniform. Many farmers endured hard times during the 1920s. There was also an increase in income inequality. Harding opposed measures to redistribute income through progressive income taxation.

The fact of the matter was that most increased inequality of this time resulted from investment income in financial markets, especially from the stock market boom. Labor income was not the source of rising inequality, so it made no sense, even for those who

Warren Harding's administration oversaw economic crises in 1920 and 1921, when unemployment rose to 11.7 percent.

wanted to reduce inequality, to redistribute through income tax rates.

Harding avoided U.S. involvement in the League of Nations and limited immigration from Europe. His remarks on league membership during his campaign were vague, but his actions to keep the United States out of this organization were unmistakable. These moves and his protectionism might seem to indicate isolationism. However, Harding succeeded in slowing the naval arms race among industrialized nations. Nine world powers attended a conference run by Secretary of State Charles Evan Hughes. They signed an important treaty on naval armaments that reduced political tensions in the Pacific and far east. He also reduced Germany's war debt through the Dawes Plan. This reduced German reparations to 2.5 billion marks over the coming half century, thus relieving some of the problems that were plaguing the German economy.

Harding did much for civil rights in the 1920s. He reversed the racial segregation of federal offices insti-

tuted by President Woodrow Wilson. He also supported antilynching legislation and advocated political, economic, and educational equality among races in a speech he gave in Birmingham, Alabama. This was certainly a bold move. Harding also ended the harassment of pacifists and left-wing radicals perpetrated by Wilson and pardoned his former opponent, socialist presidential candidate Eugene V. Debs.

Several members of the Harding administration marred its reputation with their involvement in scandals. Secretary of the Interior Albert Fall and Secretary of the Navy Edwin Denby were forced to resign for their involvement in the Teapot Dome scandal. Secretary Fall went to jail for accepting bribes. Charles Forbes of the Veterans Administration went to jail for misappropriating millions of dollars. Attorney General Harry Daugherty nearly went to jail.

Harding died of a heart attack while in San Francisco, California. Vice President Calvin Coolidge succeeded him. In the decades following his death, many disparaged his reputation as president. This is partly because of the scandals of his administration and partly because of the decline of the Republican Party during and after the Herbert Hoover administration. Harding was not involved in either the scandals of his administration or the economic disasters of the Hoover administration. Consequently, a few historians now question the critical view that some took of his presidency.

Harrington, Michael (1928-89)

MICHAEL HARRINGTON'S *The Other America* (1962) is credited with the "discovery" of poverty in "affluent" America and as being the stimulus for the so-called War on Poverty. But just as the war in Vietnam

buried even a chance of fighting a war on poverty, it buried Lyndon Johnson, and it confounded Harrington's hopes for a "left-wing of the possible." In the tradition of Eugene Debs and Norman Thomas, Michael Harrington was America's foremost socialist, consistently Marxist in his analysis of capitalist society and consistent in his belief that socialism could be achieved only democratically.

Harrington was raised in a middle-class family in St. Louis, Missouri. He went exclusively to Catholic schools and then to Holy Cross University. After a year at Yale law school and a year at the University of Chicago, he joined Dorothy Day's Catholic Worker movement, going "as far left as you could go within the Church." A 1952 essay, "Poverty—U.S.A.," attracted little attention, but its conclusion suggested what his approach would be: "It goes without saying that the incomes structure must be changed."

Putting his commitments to the church behind him—in later years he identified himself as "an Ethnic Catholic"—he joined, in 1953, the Young People's Socialist League. This began for Harrington a lifelong struggle with sectarian radical politics, first with the Socialist Party; second, over the politics of the Korean war, with the Young Socialists League; third, with the Independent Socialist League and their anticommunist "drift to the right"; and fourth with Students for a Democratic Society (SDS) over what a sound antiwar policy should be. To put the matter as briefly as possible, Harrington found himself caught between an "Old Left" that had become neoconservative and a revolutionary "New Left" that had little sympathy with his lifelong commitment to the Democratic Party, with a strong labor movement at the center. (His 1973 Socialism is an excellent introduction to the issues as he saw them.)

In 1962, President John Kennedy, who had read Dwight Macdonald's long review of *The Other America*, asked Walter Heller to look at the poverty problem. After Kennedy was assassinated, Johnson proclaimed that his administration "today, here and now, declares unconditional war on poverty in America." Harrington and Paul Jacobs joined the President's Task Force. They ended their memos, "Of course, there is no real solution to the problem of poverty until we abolish the capitalist system."

But a memo to Sargent Shriver that was not utopian put the matter squarely: "if there is any single dominant problem of poverty in the United States, it is that of unemployment." Secretary of Labor Wirtz agreed, but when he raised this idea at a cabinet meeting, Johnson ignored him. How could he offer tax cuts, reduce government spending, fight a war, and create jobs? Instead the poor would get job training, which they could use in the hoped-for expanding economy.

Harrington has been wrongly remembered as being identified with the idea of a "culture of poverty." As his biographer writes, "throughout the book, 'culture of poverty' is used interchangeably with another term, 'vicious circle." Harrington's point was that the structure of institutions, labor markets, slums, and schools made it quite impossible for the poor to get a good job and to find good housing where schools were good.

Within a decade, neoconservatives like Edward Banfield would explain that the typical "other American" does not care where he lives or whether the schools are good: "indeed, where such things exist he destroys them by acts of vandalism if he can." Nathan Glazer added that liberal policies had created a culture of "welfare dependency." It was a straight line to Bill Clinton's program "to end welfare as we know it."

Harrington could not have anticipated this, but he did argue, in 1964, that Johnson had chosen the correct terrain to fight for approval of the Economic Opportunity Act: "If, for example, Johnson had approached democratic America in terms of the trade union vocabulary—full employment, minimum wage, shorter work week—that would have set off all kinds of class antagonisms, real and imagined, on the part of business. ... But the American pattern of speech does not allow the same fury against the 'poor' who are traditionally seen as victimized, unorganized and not menacing." Sadly, it allows for considerable fury, especially when racism is part of the picture. Harrington was correct that no socialist revolution was on the agenda in the United States. And he was not alone in suffering from the deep difficulty of reconciling a radical vision with the means available in American electoral politics.

Peter T. Manicas University of Hawai'i, Manoa

Harrison, Benjamin (Administration)

BENJAMIN HARRISON WAS born on Tuesday, August 20, 1833, in North Bend, Hamilton County, Ohio. His father, John Scott Harrison, was a congressman from Ohio and his mother, Elizabeth Ramsey, was a homemaker. Harrison attended Miami University in Oxford, Ohio, graduating in 1852. He then moved to Cincinnati where he studied law for two years before moving to Indianapolis, Indiana, where he was admitted to the bar and then got a job as a recorder of decisions for the state supreme court.

While in Indianapolis, Harrison worked with the Republican Party trying to get candidates elected. He also gained a reputation as a very good lawyer. During the Civil War, Harrison served in the Union Army, briefly reaching the rank of brigadier general. In 1864, while serving in the army, he was reelected recorder of the state supreme court.

In 1876 Harrison ran unsuccessfully for governor of Indiana. In 1879 he was appointed to the Mississippi River Commission before being elected to the U.S. Senate on March 4, 1881. He served in the Senate until March 4, 1887, as chairman of the U.S. Senate Committee on Transportation Routes to the Seaboard and the U.S. Senate Committee on Territories. In 1888 Harrison was nominated by the Republican Party as its candidate for president. Harrison's handlers limited his campaigning, organizing the first truly front-porch campaigns. Harrison's campaigning consisted of short direct speeches delivered to delegates who came to visit him at his home.

The Democrats viciously attacked Harrison, referring to him as "Little Ben," an obvious reference to his short 5-foot-6-inch stature. Harrison retorted by arguing that he was big enough to wear the hat of his grandfather, "Old Tippercanoe," who held the president's office in 1840. Even though Harrison received more than 100,000 fewer votes than Grover Cleveland, his Democratic opponent, he won the election by winning the electoral college 233 to 168. Harrison served from March 4, 1889, to March 9, 1893.

Called the "centennial president" because he was inaugurated on the 100th anniversary of George Washington's inauguration Harrison spent much of his time on foreign affairs, setting in place the mechanism for creating the Pan American Union. He negotiated a treaty to annex Hawaii, even though Cleveland backed out of the treaty. Also, American soldiers, stationed in the west, massacred 153 Lakota Indians at Wounded Knee, South Dakota, on December 29, 1890.

Domestically, Harrison had a rough start, as Democrats utilized congressional rules to implement the "disappearing quorum," which allowed congressmen to debate an issue and then not answer the roll-call vote, stalling legislation for nearly two years. Nevertheless, Harrison was credited with several congressional victories including providing funds for internal improvements, expansion, and modernization of the navy, and subsidies for steamship lines.

Possibly his most controversial piece of legislation was his Dependent Pension Act, which provided a pension to dependents of Civil War veterans. This legislation provided \$6 to \$12 monthly pensions. By 1893, with more than one million people getting pensions, this cost the government nearly \$160 million.

Harrison was also noted for signing the Sherman Antitrust Act, protecting the country from monopolies and trusts. It made all contracts, combinations in the form of trusts, and conspiracy in restraint of trade or commerce illegal. This was the first federal attempt to regulate trusts. The Sherman Silver Purchase Act, passed in 1890, forced the Treasury to purchase 4.5 million ounces of silver each month while issuing legal tender in the form of treasury notes that could be used to buy gold or silver.

The major domestic issue that confronted Harrison was the protective tariff. He was caught between two extremes on this issue. His party wanted him to keep the tariff high because it created unprecedented wealth in the Treasury. Those who opposed the tariff argued that the surpluses were hurting business. Representative William McKinley and Nelson Aldrich wrote legislation raising the tariff even higher. Even though Harrison was concerned, he chose not to challenge his party and instead chose to write in reciprocity measures to blunt the effect, and removed the tax on raw sugar. Domestic sugar growers were given a two-cent-per-pound bounty.

Because of his lavish spending Harrison had depleted the Treasury by the midterm elections of 1890. In response voters overwhelming voted for the Democrats. In 1892 the Republicans again nominated Harrison as their candidate but he suffered a humiliating defeat to Grover Cleveland, the man he had defeated four years earlier.

ABEL A. BARTLEY
CLEMSON UNIVERSITY

Harrison, William (Administration)

WILLIAM HENRY HARRISON was born in Virginia in 1773. His father served in the Continental Congress and was governor of Virginia. Harrison fought as an officer in the Indian Wars of the Northwest Territories (present-day Ohio, Indiana, Michigan, Illinois, and Wisconsin). In 1800 President John Adams appointed him territorial governor. During the War of 1812, Harrison commanded U.S. forces in the Northwest Territories. Later Harrison served in the U.S. House and Senate from Ohio and as ambassador to Colombia under President John Quincy Adams.

Although Democrats had dominated the White House, a poor economy made the Whigs' chances much more likely in 1840. President Andrew Jackson and the Democrats refused to renew the charter for the Second Bank of the United States, resulting in its termination in 1836. State banks filled the demand for credit and currency, but this was dependent on the financial soundness of whatever institution issued the notes. If people lost faith in a bank, there would be a "run" on the bank to cash in their notes for specie (gold or silver). Those left holding notes when a bank ran out and suspended specie payments were left with worthless notes.

During the westward expansion of the 1830s, speculators borrowed money to buy land that they hoped to resell to pioneers moving west. In 1836 the federal government began requiring gold or silver as payment. This caused the contraction of credit as people scrambled for gold and silver to make their land payments. Banks quickly ran out of specie and had to suspend payments. At the same time a collapse in the price of cotton crippled the south, where many farmers were unable to make mortgage payments. This led to a severe recession that lasted well into the 1840s, causing widespread poverty especially in rural areas.

The Whig Party expected to take advantage of this recession to regain the White House. Henry Clay was the favorite, but his Masonic membership caused opposition from the anti-Masonic wing of the party. Harrison was nominated because he was a man of the people and a war hero, two images that called to mind the pop-

ular former President Andrew Jackson. Harrison used the nickname "Tippecanoe," a reference to his military victory against the Indians in 1811, and spoke of being born in a log cabin.

The main substantive issue, however, was the economy, although neither party saw any direct government role in the alleviation of poverty. The Whigs supported a higher tariff, which appealed to northern manufacturers. Democrats supported lower tariffs, which meant lower prices for consumers. The tariff and a stable financial system were key issues of the campaign.

Martin Van Buren was closely tied to Jackson's policies, which many blamed for the recession. Van Buren also lacked Jackson's charisma and personal appeal to the common man. While Harrison received only 53 percent of the popular vote, he carried 80 percent of all electoral votes, doing well in all regions of the country.

As was the tradition of the time, Harrison himself said little during the elections. He allowed others to speak for him and encourage his election. Once elected, he decided to spell out his views during his inaugural address, the longest on record at almost two hours. Harrison called for a limited presidency, saying he would serve only one term. He also vowed to defer to Congress in setting policy and would not veto any laws as long as they were constitutional.

Harrison, a slave owner, also expressed support for slavery as a state matter. He argued that allowing people in some states to decide the policy for people in other states would only lead to distrust, jealousy, and eventually civil war. Not just in slavery, but in all things, the federal government should play a limited role, allowing greater freedom to the states to create their own policies. While Harrison made clear that he would leave setting monetary policy to Congress, he did criticize having an "exclusive metallic" currency, in other words one based only on gold or silver. Such policies, he argued, would only help the rich get richer and the poor get poorer. That was unacceptable in a free republic such as the United States.

Harrison contracted pneumonia after giving the inaugural address in freezing weather without wearing a coat. He spent virtually his entire presidency in his sickbed, dying 30 days later on April 4, 1841.

THOMAS D. JEITSCHKO, PH.D.
MICHIGAN STATE UNIVERSITY
MICHAEL J. TROY, J.D.
INDEPENDENT SCHOLAR

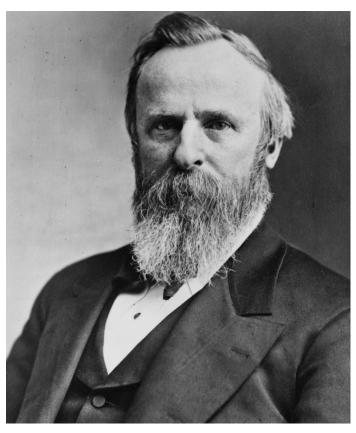

Hayes, Rutherford (Administration)

RUTHERFORD B. HAYES (1822–93), a Harvard Law School graduate, talented courtroom lawyer, and wounded Civil War general, began his Republican administration in March 1877 under the cloud of the divisive presidential election of 1876, yet he freed his presidency from many partisan considerations by announcing that he would serve only one term. And because of his independence, integrity, and idealism, his popularity steadily rose throughout his four years in the White House. In the wake of the electoral dispute, Reconstruction, and the scandals of his predecessor's administration, Hayes's mission was national unity, which he pursued through his policies, pronouncements, and appointments.

As part of the arrangements ending the turmoil over the election of 1876, Hayes readily agreed to remove the remaining federal troops from the south and thus end Reconstruction. He believed force would never succeed and idealistically felt that social harmony could be restored through the restoration of civil governments and reasoned appeals to southerners. He mistakenly thought that such a policy would attract whites to the Republican Party, and that through mutual respect and cooperation blacks could better and more permanently secure their rights as citizens and participants in the political and economic order.

Yet Hayes was soon disappointed when southern leaders failed to keep promises to guarantee the rights of African Americans. Hayes also sought national unity by appointing a southern Democrat to his cabinet and selecting William Woods of Georgia as associate justice of the Supreme Court, the first justice to be appointed from the south since the Civil War. Hayes also appointed John Marshall Harlan of Kentucky, "the Great Dissenter," who would condemn racial segregation.

Long before his presidency, Hayes was known as a social reformer. Before the war, he had volunteered his

Rutherford Hayes focused his efforts on improving the poverty situation among Native Americans in the late 1800s.

legal services on behalf of fugitive slaves to secure their freedom. As governor of Ohio (1868–72, 1876–77) he championed universal manhood suffrage, equal rights for African Americans, educational and prison reform, improved and new institutions for the insane and orphans, and greater aid and respect for the poor. He also hired state employees based on merit and instituted sound fiscal policies and significant debt reduction. Accordingly, Republican reformers supported Hayes in 1876, and, once in office, he pursued a reform agenda.

As president, Hayes, with the skillful management of his Secretary of the Interior Carl Schurz, inaugurated a radically new policy concerning Native Americans. Hayes emphasized conciliation with natives and the improvement of conditions on reservations through direct government assistance and federally funded education for native children. Instead of relying on the military, carefully selected and trained civilians handled Native American affairs, with strict controls of federal "Indian agents" designed to root out dishonesty and ensure respect and fair dealings. Native American police forces were established to maintain law and order on reservations.

Hayes channeled financial aid to the heads of families rather than to tribal leaders, and adopted policies to encourage private landownership as a means to combat the poverty of the reservations. The president stated that his goals were the achievement of opportunity, equality, and full citizenship for all Native Americans. After leaving office, Hayes would look upon his enlightened policy as one of his greatest achievements. Hayes was also proud of his veto of a bill that would have restricted Chinese immigration as being unfair and unconstitutional.

Hayes believed that his hard-money policies and return to specie payments were responsible for the strong economic recovery following five years of depression. But despite the upturn, Hayes was concerned for workers and the poor and spoke forcefully against the abuses of big business, corporate avarice, and the dangers occasioned by the concentration of wealth and power in the hands of a few. He stood firm against railroad abuses, yet was decisive in using federal troops to protect railroad property endangered by an increasingly violent national strike.

He became the first president to confront wide-spread labor unrest in an increasingly nationalized and industrialized economy. He was also early to recognize the dangers to the environment caused by industrialization. As for political corruption, Hayes cleaned up the notoriously corrupt New York Customhouse, headed by Chester A. Arthur, and ordered that federal employees not engage in political activity. However, Congress refused to heed his call for more expansive civil service reform and the creation of a civil service commission.

After leaving the White House in 1881, Hayes actively opposed the death penalty and promoted prison reform. He also worked with organizations raising private donations and calling for federal funding for the education of indigent black and white children and adults in the south, from grade school through graduate studies, as a means to overcome social ills and poverty.

Head of the Household

DEFINING HEAD OF THE HOUSEHOLD is crucial not only because it denotes legal and tax categories for individuals living in a household, but also because it shows the relative status given to males and females in a variety of social arenas. Head of the household is related to the concept of family, which is the "basic social group" for all humans, according to G. Ferraro. Although family is a universal concept, most laypeople do not consider that a family is "a social unit characterized by economic cooperation, the management of reproduction and child rearing, and common residence," as phrased by Ferraro.

In addition, marriage, while not necessarily a universal concept, is defined by Ferraro as "a series of customs formalizing the relationship between male and female adults within a family." These concepts are useful components when considering current global definitions, and implications for head of the household.

TERMS AND DEFINITIONS

Information from the United Nations statistics division shows that it is important to understand the definition of household before one can clearly understand head of the household as a concept. A household can be thought of as either (a) "a one-person household ... in which one person makes provision for his or her own food or other essentials for living" or (b) "a multi-person household, defined as a group of two or more persons living together who make common provision for food or other essentials for living," as shown by the United Nations and S. Chant. In a multiperson household, the individuals may or may not be related by blood or marriage; it is the making of common provisions that is the key element for defining a household.

From these definitions, the United Nations has developed a definition for head of the household or reference member of household. It states that a head of the household is the "person in the household who is acknowledged as such by the other members." The implication of this definition is that the head of the household will be that person who "is used to determine relationships between household members."

However, when there is joint headship, or when spouses are considered equally heads of household, then the definitions should shift accordingly. This shift only occurs when the headship means that individuals provide equal economic provisions and have equal authority and responsibility for the household and other members living therein. This definition emphasizes people's relationships to one another.

In using the U.S. Census Bureau's definition of household, we find that there is an emphasis on the actual physical-dwelling component of household. A household defined in the United States "includes all persons who occupy a housing unit. A housing unit is a house, an apartment, a mobile home, a group of rooms, or a single room that is occupied as separate living quarters. ... The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or unrelated persons who share living arrangements." In other words, it is the residence that denotes household and the individuals living there are separate. This definition may have more to do with definitions of property than do other definitions.

Another definition relating to the United States notes that "a household is defined as one or more people living in a residence" while "the head of household is one of the people who owns or rents the residence and was indicated first on the U.S. Census surveys," as described on CensusScope. This promotes a Eurocentric view with the male as head of the household, according to Chant. This definition is problematic because it does not state how the head of the household was determined in the first place. The information from CensusScope indicates that in the United States in 2000, 52 percent of all households were married couples; 12 percent were "female householder" with no spouse; four percent were "male householders" with no spouse; and the final 32 percent were "nonfamily households."

Women are more often the reference person than men—a shift from previous decades.

According to the National Statistics Bureau in Britain, there has been a move to replace the term head of the household with household reference person. This term seems to more accurately delineate the "characteristics of the household more generally"; it accounts for income levels and age and is not based on sex alone. In Britain, household reference person can be defined in terms of (a) a person who is the sole person in a rented or an owned accommodation or (b) joint householders or people living together.

If the person lives alone, he/she is the household reference person. If there are joint householders, then the person with the "highest income" is taken as the household reference person; however, when the income levels are the same, then the older person is the household reference person. In Britain, by classifying household reference persons, women are more often the reference person than men—a shift from previous decades of classification.

Finally, according to the United Nations Food and Agricultural Organization (FAO), the head of the household "is the person in the household acknowledged as head by the other members. The head has primary authority and responsibility for household affairs. However, in cases where such authority and responsibility are not vested in one person, special rules may be needed to identify the head of household." The interesting point for the FAO is that it also defines the relationship of other individuals to the head of the holder's household, such as spouse, child, spouse of child, grandchild or great-grandchild, other relative, or other persons not related to the head, including domestic employees, as all members of the household based on their dependent status.

A definition using oldest male has led to a clear bias toward men as decision-makers.

In the past, head of the household was used to mean the oldest male in the group living in the household, that is, in Hungary the household reference person is "oldest active male" and in the Czech and Slovak Republics, the household reference person is defined "as male if complete family." As the FAO notes, the definitions used to identify the head of the household are subject to a certain ambiguity and in some cases tend to exclude women.

Precise criteria should be set to avoid arbitrary interpretation on the part of the enumerators and subjective perception on the part of the interviewees. In those countries where male migration is relevant, the absence of the head of the household (at the time of the enumeration or within a specified period of time) should also be considered, according to the FAO and S. Cantillon and B. Nolan. Thus in many instances, a definition using oldest male has led to a clear bias toward men as decision-makers and economic provisioners to the exclusion of women's authority and economic contributions, as shown by Cantillon and Nolan.

Women's household work is connected to childbearing and child-rearing responsibilities, and often is not thought of as adding economically to the household, as related by Chant. Classifying individuals as household reference persons, as is done in Britain, would work well for households in industrialized countries and for individuals in middle and upper socioeconomic strata. But for couples in other countries and in lower-income strata, this definition may still lead to a gender-biased frame of reference.

REGIONAL DIFFERENCES

Part of the need to understand how groups define head of the household is to gain a more comprehensive perspective about who comprises a household and the impact of that composition on all household members. Depending on the definition used, it may be difficult to determine how resources are divided up among household members because the head of the household is often defined as a male, as evinced by J.A. Lampietti and L. Stalker.

Along with this, current research indicates that female-headed households are far more likely to live in poverty in industrialized countries; however, the research may not extend to the developing world. According to P. Gregg et al., in the United States, "two-thirds of children with lone parents are poor, compared with one-quarter of children with two parents." Thus poverty is the main concern for children living in a household where there is a single parent as head, and this is especially noteworthy since estimates provided by Chant indicate that "one-third of households worldwide" are female-headed.

According to Cantillon and Nolan, "conventional methods analyzing poverty and income inequality take the household as the income recipient unit, and assume resources are shared so that each individual in a given household has the same standard of living." Therefore head of the household definitions imply that all members of the household are provided for equally, when in fact this is not the case. Traditionally, in European and Western countries, women are responsible for the caregiving activities within the family, as shown by M. Corsi and K. Orsini.

These activities often limit women's ability to obtain paid work outside the home. According to Chant, as there have been global changes in women's activities, defining a household as having a "female head," we are in fact saying that this type of household is unusual and that males should be defined as the "actual" headship in normal settings. G. St. Bernard points out that these issues are important when considering head of the household from a global perspective and the changes going on

as a result of increased divorce and/or household dissolution, as well as the impact of disease on household structure.

Throughout east, west, and southern Africa, civil wars and HIV/AIDS have significantly changed how families are structured. In terms of civil disruptions, it is unclear how much of an impact these have had on increasing the number of female-headed households, as discussed by NewsfromAfrica and the International Foundation of Agricultural Development (IFAD). As a human rights concern and because of the value placed on male-headed households, women who were heads of their household in the past have been housed with former combatants who have been known for violence against women, according to NewsfromAfrica. This act is of particular concern in terms of women's safety and well-being and those of their children.

A second disrupter of family structure and households is disease. For instance, in many African countries, the caregivers for family members with HIV/AIDS are women and girls, as estimated by the United Nations. This caregiving becomes problematic because 90 percent of it is provided in the home. Over two-thirds of the caregivers in households with HIV/AIDS are women and one-quarter of these women are over the age of 60 years, as shown by the United Nations and T.S. Jayne.

In other areas, a whole generation of men and women are dead from AIDS and so the head of the household may be a youth (girl or boy) who is responsible for other children, the other ill household members, and obtaining household goods for the family, which has been studied by the United Nations and E. Guest. According to IFAD, female-headed households may be "disadvantaged" because their landholdings are smaller than those of male-headed households, and they have fewer assets and more dependents than do male-headed householders.

However, in some countries, such as Ghana and Nigeria, female-headed households are less likely to live in poverty when compared to male-headed households. This difference is most likely because female-headed households in these areas are receiving "remittance incomes" and they are not composed of individuals in the same way that male-headed households are.

DIFFERENT COHORTS OF WOMEN

Research by R. Soong indicates that women who are heads of household in Latin America and the Caribbean tend to be unmarried, members of the lowest socioeconomic strata, and older. They are less likely to be employed full-time. Interestingly, there may be different cohorts of women who are headships.

First there are "younger single women" who are students. Second there are "divorced/separated/widowed older women (45 years or older), especially retirees." And third there are "single parents who are unemployed or only work part-time." Each of these cohorts represents different household structures and family needs. In addition, it appears that Venezuela and Argentina have higher percentages of households headed by females.

In the 1960s, there was a major shift in family structure and work opportunities.

Part of this information should be considered in the context of women as food producers for their families, according to the FAO. Overall, in the regions of the world, 49 percent of rural people and 43 percent of rural households live in poverty. However, rural women in Latin American and the Caribbean are more likely to live in poverty. According to the FAO, when comparing poverty levels for female- and male-headed households in select countries, we find that in all countries except Mexico, the percentage of female-headed households in poverty is far higher than male-headed households in poverty. These women's "fundamental roles" are to ensure that there is enough food for their families, and they "assume economic roles related to survival, as unpaid workers on smallholdings or as temporary or permanent workers in production units geared toward domestic consumption or export."

In other words, these women work for little pay to ensure the survival of their families and themselves. As noted by the FAO, "the assumption is that a woman is, and should remain, limited to her role as housewife, in the performance of domestic, reproductive and related activities, and that by catering to the head of household [males] in the principal productive activities of the farm [or business] the results achieved will extend to the entire family unit." The benefit may not trickle down and/or may not be a possibility when a woman is a headship. Nor does such a view account for the amount of goods women produce for the market, such as 40 percent of agricultural goods, "77 percent of dried beans," or "51 percent of maize."

In the 1960s, there was a major shift in family structure and work opportunities for women in the United

States. At that time, there was an increase in divorce and decrease in two-parent families. Along with these changes, there was an increase in number of welfare recipients, according to D. Lindsey. As a consequence, the number of children living in two-parent households declined and the number of children living in single-parent households increased to 30 percent of the child population by the year 2000. The A.E. Casey Foundation reported that 22 million children in the United States (out of 73 million) resided in a single-parent household in 2003.

At the same time, more women began to work outside the home because of the social and economic stresses families were experiencing, according to Lindsey. However, women's work outside the home is usually in secondary labor markets wherein women are temporary workers and are "ineligible for unemployment and health insurance benefits by virtue of their low wages and part-time work."

Thus children living under single-female headships are more likely to be poor than other children in the United States. As a remedy to this problem, a new public welfare act called the Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA) went into effect in 1996 and instituted a program called Temporary Aid for Needy Families (TANF), as recounted by B.B. Blum and J.F. Francis.

The goals for TANF are to "provide assistance for needy families to care for their children" and "end welfare dependence by promoting job preparation, work, and marriage" among other items, as related by S. Vandivere et al. Interestingly, this new public welfare policy and program have placed the value of maintaining a two-parent household in the forefront. Finally, the new policy implies that men should be the normative head of the household, which emphasizes the Eurocentric views of women's roles and family structure.

In summary, definitions of head of the household portray much about a country's worldview and value system. As noted at the beginning of the article, the United Nations and Britain have begun to use the term household reference person, which is based on income level and age rather than on sex, when examining household composition.

The implication for defining types of households is that we can then further delineate the impact of poverty on these different family structures, giving a more comprehensive picture of what it means to live in these households and how we can focus policies to provide help for all members of households, no matter the structure. UNIVERSITY OF UTAH

Head Start

HEAD START IS A FEDERALLY funded U.S. preschool education program, one of the War on Poverty

social programs enacted during the presidential term of Lyndon Johnson. Its key goal is to improve the school-readiness of low-income or otherwise eligible at-risk children by providing early educational experiences, parental education and involvement, and healthcare and screening. Head Start began in 1965 as an eightweek summer program for children ages 3 through 6 offered with funding from the Office of Economic Opportunity (OEO).

Head Start has expanded into a comprehensive child development program for eligible families with children under age 6, including women who are expecting a child. Local agencies receive federal funding to provide services in early childhood education and development, augmented with medical, nutritional, dental, mental health, and parental education programs. In addition to providing funding, the federal government monitors local programs using the Head Start Program Performance Standards, which are designed to ensure that enrolled children receive services of uniform quality that are consistent with Head Start goals and objectives.

Head Start is now administered by the Administration on Children, Youth and Families (ACYF) within the U.S. Department of Health and Human Services. In addition to locations in all 50 U.S. states and Washington, D.C., Head Start centers are found in Puerto Rico and the U.S. territories, and altogether have an annual budget of more than \$6.5 billion.

Support activities such as training, research, and monitoring add more than \$230 million to the total cost of the Head Start program. In fiscal year 2004, the average cost per child was \$7,222, and more than 900,000 children received services. Most children are served in classroom settings in the more than 20,000 Head Start centers, although about five percent received homebased services.

During much of its history, Head Start has enjoyed considerable public and political support in the U.S., and it has served as a model for preschool programs in other countries. Enrollment in the mid-1960s began in the neighborhood of 700,000, and then fell almost by half during most of the 1970s. The number of children served rose each year from 1988 to 2002, and then fell slightly, while the program's budget has increased each year since 1986.

In 1994, a new program for children less than 3 years old, Early Head Start, was added. Overall program growth since 1990 has increased the number of children served by about 70 percent and the budget by more than 400 percent. Despite its growth in enroll-

ment and funding, Head Start has never had the resources to serve all eligible children or to ensure the highest-quality preschool education in every jurisdiction.

Almost since its inception, Head Start has been the focus of research and evaluation studies to try to assess whether and how well it accomplishes its goals. Numerous studies, some funded by the federal government as part of the overall Head Start program, have sought to measure the short-term and long-term effects of participation in Head Start programs. In general, short-term studies assess participants' initial adjustment to and performance in school, usually up to about the third grade. Long-term studies have examined outcomes including high school graduation rates, arrest and incarceration rates, and women's age at first child-bearing. Conclusions based on numerous research studies suggest mixed results for Head Start.

Studies show lower rates of repeating grades or placement in special education.

Interpretation of these findings is complicated by the shortcomings of research designs that rarely use random assignment and sometimes lack comparison groups or large sample sizes. While some researchers and reviewers of research conclude that cognitive and behavioral gains made by Head Start participants disappear within a few years of beginning school, others suggest that early gains persist, though they may lessen with time. Longer-term studies show lower rates of repeating grades, of placement in special education, or of arrest, and some report higher rates of high school graduation, though there is some indication that results may vary by race or ethnicity.

Since expanding eligibility to children from birth to age 3, Head Start has begun other initiatives, including a project to encourage the involvement of fathers with their children and one to promote early literacy skills. Most recently, both the administration of G.W. Bush and members of Congress have moved to make Head Start a state-administered program. Legislation was recently passed to designate eight states for demonstration projects, which could lead to dramatic changes in the structure, content, and administration of the core Head Start programs.

Headcount Index

THE HEADCOUNT INDEX is the simplest measure of the prevalence of poverty in a particular area. The Headcount Index is calculated by taking the total number of people in a country who fall below a predetermined income level and dividing this figure by the total population. In other words, the Headcount Index is simply the percentage of the population that falls below the official poverty line. The Headcount Index is also commonly referred to as the poverty rate.

While the appeal of the Headcount Index as a measure of poverty lies in its simplicity, several characteristics of the index limit its usefulness in practice. First, official definitions of what constitutes poverty vary from region to region so that the Headcount Index is generally not comparable across countries. For example, in the United States in 2003, 12.5 percent of all Americans lived below the poverty line as defined by U.S. government officials. The poverty line for a single American individual in that year was an annual income of roughly \$9,400, a figure that exceeds the average income for populations in over 125 countries around the world.

By comparison the most recent Headcount Index for Mexico revealed only 10.1 percent of the population lived below the country's official poverty line of roughly \$400. While a direct comparison of the Headcount Indexes of the United States and Mexico would suggest that Mexico has a lower incidence of poverty than the United States, a person defined as poor in the United States might earn over 20 times that of a typical poor person in Mexico, even after considering differences in the cost of living.

International agencies have attempted to correct for this deficiency in the Headcount Index by standardizing definitions of what constitutes poverty. The most commonly used standardized measure of poverty is the \$1-a-day level, which corresponds to an annual income of \$365 adjusted for inflation and international differences in costs of living (also known as purchasing power parity, or PPP).

By the \$1-a-day threshold, the Headcount Index for the developing world was 20.6 percent in 2001, corresponding to just under one billion persons in poverty. These figures represent significant decreases from past numbers largely because of declining poverty rates in India and China. In 1981 and 1990, the Headcount Indices for the developing world were 40.7 and 27.9 percent, respectively; however, through population growth, the total number of persons below the \$1-a-day threshold has declined much less rapidly, falling from 1.40 billion in 1981 to 1.14 billion in 1990.

The second shortcoming of the Headcount Index is the fact that all persons who fall below the poverty line are counted in the index regardless of how far below the line they fall. Thus an utterly destitute person with no income is treated identically in the Headcount Index as someone just below the poverty line cutoff.

A country that wishes to reduce its Headcount Index might be tempted to direct poverty assistance to those least in need of aid since relatively well-off poor persons will require the least money to bring them above the poverty line. The difference between a person's actual income and the poverty line is known as the poverty gap, and the Poverty Gap Index accounts for both the proportion of the population that is poor and how far below the poverty line the typical poor person lies.

A final concern of the Headcount Index is that it focuses solely on income without taking into consideration other factors that may contribute to well-being. While per capita income is closely correlated with many other statistics, such as infant mortality, caloric intake, and access to safe drinking water, a statistic based on income alone may not truly represent a person's welfare. The Human Poverty Index and a variety of deprivation indexes attempt to include multiple measures of well-being besides income in their calculation. In addition, the Headcount Index may fail to account for non-cash benefits such as public healthcare or subsidized housing in total income.

VICTOR MATHESON, Ph.D. COLLEGE OF THE HOLY CROSS

Healthcare

"THE BIGGEST ENEMY of health in the developing world is poverty," stated United Nations (UN) Secretary General Kofi Annan in 2001. Indeed at the beginning of the 21st century, 1.1 billion people (21 percent of the global population) worldwide were earning less than \$1.08 per day in 1993 purchasing power parity (PPP) dollars, thereby satisfying the UN's measure of "extreme poverty." Because of their extreme poverty, in 2005 more than 20,000 such people per day died otherwise preventable deaths.

The World Health Organization (WHO) defines health as "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity." Health is essential to a normal functioning life for every person. However, poverty and health are complexly intertwined. Poor health status can cause a person to fall into poverty. Poor health can compromise a person's earning capacity, impose catastrophic costs on individuals and households from expenses and lost wages, and reduce children's ability to learn.

Poor health restrains individual opportunity. Likewise, poverty can cause poor health, both directly and indirectly. Often poverty leads to poor nutrition, inadequate housing and sanitation, and diminished access to safe drinking water and medical care. These correlates of poverty directly threaten poor people's health. Poverty also affects health status indirectly, because it is associated with lower educational attainment, particularly for females. Inadequate education is known to impair relative health status, particularly for children whose mothers are illiterate. Because poor health status is both a cause and an effect of poverty, a decline in health can become a poverty trap from which individuals are not likely to escape on their own.

Poverty, both generalized (as in countries with low per capita incomes) and relative (as in countries with high income inequality), is bad for health. Citizens of wealthier nations generally live longer, healthier lives than citizens of poorer nations. In 2002, the mean Gross Domestic Product (GDP) per capita in high-income nations was \$28,741, and the average life expectancy at birth in those nations was 77.4 years. In low-income nations, in contrast, in 2002 the average per capita GDP was just \$2,149, while average life expectancy at birth was 59.1 years.

The World Bank reports that in 1994 about nine percent of global GDP, or \$2.33 trillion, was spent on healthcare worldwide. Although 84 percent of the world's population reside in low- and middle-income countries, only about 11 percent of global expenditures on healthcare took place in those countries. Accordingly, relative to residents of wealthy nations, people living in low- and middle-income countries enjoyed more limited access to healthcare resources such as hospitals, medicine, and the services of trained nurses and physicians.

In nations where poverty is widespread, the greatest and most widespread gains in health status ordinarily are achieved by the implementation of mass public health measures that mitigate the effects of poverty. In particular, health status in poor nations generally improves dramatically in response to improvements in sanitation, safe drinking water, family planning, and vaccinations. These basic public health requirements appear to be fulfilled in most nations where per capita GDP exceeds \$8,500 (at 2002 U.S. PPP). Accordingly, by 2002 a person born in a nation whose annual GDP per capita exceeded \$8,500 (at 2002 U.S. PPP) (other than South Africa) could expect to live, on average, for 70 years.

After nations achieve per capita GDP above \$8,500, additional gains in national health status typically are made at the margins. Usually such additional marginal gains are achieved through medical treatments and interventions for specific illness and injuries of individuals, rather than the population-based public health measures. As national wealth becomes high, large gains in average life expectancy become less likely, though improvements among specific groups can be achieved. In 1998, for example, average life expectancy for white women in the United States was 79.9 years whereas for black males it was 67.8 years, according to the Centers for Disease Control (CDC). A life expectancy of 67.8 years compares unfavorably with that achieved by many countries less wealthy than the United States.

Even in wealthy countries where satisfactory public health measures have been implemented, poor people often experience relatively poor health status. The health effects of domestic income inequality are especially pronounced in high-income countries, including the United States, in which healthcare coverage is not

In the United States, the government provides healthcare coverage to children and the impoverished primarily through Medicaid

guaranteed to all residents. Canada, for example, which provides national health insurance to all residents, enjoys both greater income equality and lower mortality rates than the United States, as shown by N.A. Ross et al. This result holds true in both rural and metropolitan areas, as compared to corresponding U.S. rural and metropolitan areas. In the United States, the federal government provides healthcare coverage to the elderly through Medicare, and to children and the impoverished primarily through Medicaid.

Because the U.S. government does not guarantee health insurance coverage to working poor people, however, such persons often remain uninsured and are particularly vulnerable to adverse health incidents. Indeed, health disparities between rich and poor citizens are most pronounced among the working-age population, perhaps suggesting that Medicare, the U.S. national health insurance program for the elderly, can mitigate some of the adverse health effects associated with low income among its target population.

Although most adults in the United States obtain healthcare coverage from private insurers, the private sector has never provided health insurance to all working adults in the United States. This fact may indicate that private-sector provision of health insurance is subject to market failures that could be mitigated if health insurance or healthcare services were provided to some or all citizens directly by the government. Specifically, in competitive markets, private health insurers have profit incentives to seek to insure only low-cost healthy individuals and to contain expenditures by implementing high copayments and coverage exclusions. These measures tend to mitigate the cost-socializing aspects of insurance, and thereby limit the availability of protection against the impoverishing aspects of illness and treatment.

EARLY EFFORTS

"The goal of public health and medicine is to keep people as close to the idealization of normal functioning as possible under reasonable resource constraints," according to N. Daniels et al. That health is essential to a normal functioning life for any individual has long been recognized.

Historically, healthcare was not limited to market transactions. Two distinct sources of care for the sick emerged in the early United States (1750–1850) and Europe that were predecessors of modern hospitals. The first was the public almshouse, or poorhouse. Caring for the sick was one of the social services provided to the poor, mentally ill, disabled, and/or dispossessed by the public almshouses. Private charitable organizations operated voluntary hospitals that treated patients without charge during the same era. However, admission to the voluntary hospitals was selective. Individuals deemed undesirable were transferred to the almshouses.

In time some of these organizations focused more specifically on caring for the sick and subsequently became public hospitals, many of which (such as Bellevue Hospital in New York City, formerly New York Almshouse) continue to provide care to poor and underserved communities. Generally, wealthier individuals avoided these institutions. Public hospitals in the United States maintain their historical role of providing healthcare to the uninsured and indigent populations that still exist.

Our more modern understanding of the role of health and healthcare is rooted in the deprivation associated with the worldwide Great Depression in the 1930s, during which the impact of poor health on the ability of individuals to work became a national concern for many nations.

During the Depression era, national leaders, including President Franklin Delano Roosevelt (FDR), Eleanor

Roosevelt, William Beveridge, John Maynard Keynes, and Henry Baxter White, promoted the pursuit of policies designed to bring about, within their lifetimes, a "world without want." The foundations of this vision of the future were announced in FDR's influential January 6, 1941, State of the Union address, known as the "Four Freedoms" speech: "In the future days which we seek to make secure, we look forward to a world founded upon four essential human freedoms. The first is freedom of speech and expression—everywhere in the world. The second is freedom of every person to worship God in his own way—everywhere in the world. The third is freedom from want, which, translated into world terms, means economic understandings which will secure to every nation a healthy peacetime life for its inhabitants—everywhere in the world. The fourth is freedom from fear, which, translated into world terms, means a world-wide reduction of armaments to such a point and in such a thorough fashion that no nation will be in a position to commit an act of physical aggression against any neighbor—anywhere in the world. That is no vision of a distant millennium. It is a definite basis for a kind of world attainable in our own time and generation."

The "freedom from want" that constituted Roosevelt's "third freedom" cannot be attained unless a society's population remains healthy. Postwar policymakers believed that widespread access to healthcare services—and specifically to medical care—was necessary to create and foster a healthy population. Accordingly, after the conclusion of World War II, healthcare policy became a major governmental concern in the United States and Europe, and also in newly emerging international institutions such as the United Nations and the World Bank.

In the United States, President Harry Truman (1945–53) strove to create a system of universal, comprehensive, prepaid national health insurance. In 1945, 1947, and again in 1949, Truman promoted legislation that would have accomplished this goal. All three times, however, the U.S. Congress declined to enact Truman's legislative proposals into law.

In 1965, as part of President Lyndon Johnson's (1963–68) War on Poverty, the U.S. Congress enacted the Medicare program, which provides universal, comprehensive healthcare coverage to all U.S. senior citizens 65 years of age or older. By providing universal healthcare coverage to the elderly, Medicare has apparently played a role in fighting poverty among that group. From 1966 to 2003, the poverty rate of persons over age 65 in the United States dropped precipitously, from

The World Bank reports that in 1994 about nine percent of global GDP, or \$2.33 trillion, was spent on healthcare worldwide.

17.9 percent to 9.9 percent, even as this group has grown in size as a share of the population, according to the U.S. Census Bureau.

Despite Medicare's relative success at the improving health status (and economic status) of the elderly, healthcare coverage for persons in the United States who are younger than 65 has never been guaranteed. In the 1990s, President William Clinton (1993–2000) revived Truman's efforts to create a national system of universal health insurance in the United States. As in the 1940s, however, in the 1990s the U.S. Congress again declined to enact such presidential proposals. The United States thus now is practically alone among high-income countries in failing to guarantee universal access to healthcare services. (In 2001, public coverage in the

The UN seeks to improve maternal health and reduce maternal mortality by three-quarters from 1990 to 2015.

United States was a mere 25 percent of the population. Among the remaining high-income countries, the Netherlands had public coverage of 76 percent of the population, followed by Germany at 90 percent.) Accordingly, in 2004, although the United States has the fourth highest GDP per capita of all nations on earth, its population ranked 46th in longevity, with an average estimated life span of 77.4 years, according to the Central Intelligence Agency.

Ironically Roosevelt's 1941 "Four Freedoms" speech ultimately may have spurred the governmental provision of healthcare coverage outside the United States more than at home. In November 1942, the noted English economist and civil servant William Beveridge presented the British Parliament with a report entitled "Social Insurance and Allied Services." Beveridge's report echoed FDR's speech in calling for the abolition of want (as well as disease, ignorance, squalor, and idleness). Greatly influencing the creation of the welfare state in the United Kingdom, Beveridge's report directly sparked the establishment in 1946 of the British National Health Service (NHS)—the world's first universal, publicly financed healthcare system. Subsequent to the creation of the NHS, the health of the British population improved substantially. The NHS has become a model for many nations attempting to create a system of equitable access to healthcare.

In the same postwar period, international institutions emerged that sought to address issues of reconstruction, poverty, and development worldwide. In 1945 the Charter of the United Nations was signed in San Francisco, with 51 nations as founding members.

From its outset, the goals and purposes of this new international organization were highly influenced by FDR's "Four Freedoms" speech.

In 1946 the Economic and Social Council of the fledgling United Nations established a Commission on Human Rights, initially chaired by Eleanor Roosevelt. René Cassin of France, a future recipient of the Nobel Peace Prize and P. C. Chang of China were elected vice chairs. The commission was directed to specify a universal set of individual human rights that should be the birthright of every human being, without regard to variations in local culture or forms of government. The commission was also directed to determine whether the protection of such human rights would be better safeguarded through a formal treaty or a nonbinding international agreement.

In December 1948, after three years of work by the commission, the United Nations General Assembly adopted the Universal Declaration of Human Rights. Of a total of 60 nations, 48 nations voted to adopt the declaration, eight abstained, and two were absent. Although the declaration's acceptance by the General Assembly bore substantial moral weight, the document did not purport to be legally binding on its signatory nations.

Article 25 of the Universal Declaration of Human Rights expressly linked health and well-being to poverty and access to medical services: "Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control; and motherhood and childhood are entitled to special care and assistance. All children, whether born in or out of wedlock, shall enjoy the same social protection."

Thus aspirationally, if not in fact, the Universal Declaration of Human Rights established the right of access to needed healthcare services as a fundamental human right of all persons. In pursuit of this human rights objective identified in the Universal Declaration, the United Nations established the World Health Organization (WHO) in April 1948.

The WHO is a specialized agency that promotes the improvement of health status for all people worldwide. Another important sister institution to the United Nations, the International Bank for Reconstruction and Development (World Bank), was created in the same postwar era.

The World Bank was formed at the 1944 United Nations Monetary and Financial Conference in Bretton Woods, New Hampshire, largely under the auspices of famed British economist John Maynard Keynes and Harry Dexter White, the U.S. Treasury's chief international economist at the time. The World Bank's mandate is to fight poverty worldwide by loaning money to finance development projects and promote economic growth, particularly in the developing world.

The World Bank began lending money to finance the provision of healthcare services in 1970, when it adopted a Health, Nutrition and Population (HNP) program. The purpose of the early loans was to strengthen and expand basic healthcare programs. One of the most successful World Bank programs in HNP was the Onchocerciasis Control Program (OCP), launched in 1974.

World Bank-financed programs had almost eliminated river blindness in 11 countries.

Onchocerciasis, more commonly known as river blindness, is a parasitic disease that is caused by flies that breed in fast-moving water. When the flies bite people, they deposit their larvae, which cause itching, disfigurement, and blindness. By the late 1980s, World Bank-financed programs had effectively eliminated river blindness in 11 countries of west Africa. The World Bank's expanded objectives for the HNP sector in the 21st century, per the bank's "Health Nutrition and Population Sectors Strategy Paper" (2002), include:

To assist client countries to improve the health, nutrition, and population outcomes of the poor and to protect the population from the impoverishing effects illness, malnutrition and high fertility;

- 1) To enhance the performance of healthcare systems by promoting equitable access to preventative and curative health, nutrition and population services that are affordable, effective, well-managed, of good quality, and responsive to clients;
- 2) To secure healthcare financing by mobilizing adequate levels of resources, establishing broad-based risk-pooling mechanisms, and maintaining effective control over private and public expenditure.
- 3) To achieve these objectives, the World Bank will lend money to finance suitable projects undertaken by other international institutions (including the UN and WHO) or national governments, often with substantial participation by local communities, local governments, and the private sector.

RECENT EFFORTS

In September 2000, with the endorsement of 189 member nations, the UN General Assembly adopted the Millennium Declaration. The Millennium Declaration identifies eight Millennium Development Goals (MDG) that seek to improve the lives of people by the year 2015. While general poverty reduction is the primary focus of the MDGs, three of the eight goals relate specifically to improvements in health status, and other goals address issues of public health. The eight goals are:

Goal 1. Eradicate extreme poverty and hunger: to halve, by the year 2015, the proportion of the world's people whose income is less than one dollar a day and the proportion of people who suffer from hunger.

Goal 2. Achieve universal primary education: To ensure that by 2015, children everywhere, boys and girls alike, will be able to complete a full course of primary schooling and that girls and boys will have equal access to all levels of education.

Goal 3. Promote gender equality and empower women.

Goal 4. Reduce child mortality: reduce the under-5 child mortality rate from 1990 to 2015 by two-thirds.

Goal 5. Improve maternal health: reduce the maternal mortality from 1990 to 2015 by three quarters.

Goal 6. Combat malaria and other major diseases: to have by 2015 halted, and begun to reverse, the spread of HIV/AIDS, malaria, and other major diseases that afflict humanity.

Goal 7. Ensure environmental sustainability: by 2015 to halve the proportion of people who are unable to reach or to afford safe drinking water.

Goal 8. Develop a global partnership for development: in partnership with the pharmaceutical industry, ensure that the developing world has access to lifesaving medicines.

In June 2005, approximately a third of the way to the MDG target date, the United Nations released an interim Millennium Development Goals Report, 2005 (MDGS). The interim MDGS details the progress, if any, that has been made toward achieving various development goals from 1990 to 2002/03. Although some progress has been made, much remains to be achieved, particularly in sub-Saharan Africa.

By placing many of these measurable, well-defined objectives, complete with a timeline for achievement, on the world's agenda, the United Nations has offered the world a second chance to achieve FDR's vision of a world without want that secures "to every nation a

healthy peacetime life for its inhabitants—everywhere in the world" in our own time and in this generation.

Heifer Project

THE HEIFER PROJECT International (HPI) is a privately funded relief agency that reports having impacted the poor in 128 nations over the last 60 years by providing impoverished families with livestock and other domesticated animals.

HPI's philosophy was first envisioned by its founder, Ohio farmer Dan West, who served in 1937 and 1938 as a relief worker during the Spanish Civil War. There he directed a Brethren, Quaker, and Mennonite feeding program, providing children with powdered milk from Holland, fortified with cod liver oil. He was ladling out rations of milk to hungry children, he would write later, when he realized, "These children don't need a cup, they need a cow."

Returning home, West explained his dream to his home church, where several farmers donated heifers, cattle feed, and cattle care. The first cow was christened "Faith" and the next two "Hope" and "Charity." The only requirement of the poor family receiving a young female bovine was that they would donate their first female calf to another poor family, passing the gift along.

Refining the concept, West persuaded leaders from the three church groups' national leadership to participate in sending to poverty areas young dairy cows that had been bred and were due to calve in a few months. The cow would give milk for several years. Her female or heifer calves would also furnish milk, and her male or bull calves could be used for breeding or butchered to furnish protein.

In 1944 the first shipment of 17 pregnant heifers left York, Pennsylvania, going to families with malnourished children in Puerto Rico. In subsequent years, HPI also donated chickens, pigs, oxen, water buffalo, honeybees, llamas, frogs, and rabbits to low-income, rural people.

The program's emphasis on animals as "capital assets" has garnered critics in the animal rights community. Jennifer O'Connor of People for the Ethical Treatment of Animals (PETA), stated, "I applaud their efforts to help families who wouldn't have enough to eat otherwise but the land each cow grazes on could be used to feed 100 people if they were growing vegetables"—an assertion that, particularly at HPI, prompts rebuttal.

In 2004, HPI's annual contributions were reported at \$69 million with assets of \$54 million and a budget of \$59 million. Now based in Little Rock, Arkansas, HPI remains faith-based, with funding and board directors drawn from the national leadership of the Church of the Brethren, the Christian Church (Disciples of Christ), Episcopal Relief and Development, the Evangelical Lutheran Church in America's Division for Global Mission, the National Catholic Rural Life Conference, the Presbyterian Hunger Program, the United Church of Christ, and the United Methodist Committee on Relief.

HPI says that its "most fundamental principles" are "Heifer's Cornerstones for Just and Sustainable Development," which for more than 60 years have served to "light the way for people who are on the road to self-reliance." Those cornerstones form an acronym: PASS-ING on the GIFTS, which stands for:

P: Passing on the gift allows families and individuals who have received animals to be donors themselves. This spirit of goodwill ripples through the community as animals are passed on and bonds are formed in a group effort to better their own lives.

A: Accountability allows for organization at the grassroots level. Community members decide together what kind of animal and assistance they would like. They also set goals, plan appropriate strategies to achieve those goals, and evaluate their success.

S: Sharing and caring embody Heifer's belief that global problems can be solved if all people are committed to sharing what they have and caring about others.

S: Sustainability and self-reliance are necessary for the long-term success of projects. Heifer can only fund a project for a limited time so the families Heifer works with must plan to support themselves.

I: Improved animal management means that project participants learn how to keep their animals safe, healthy, and productive through proper food, shelter, healthcare, and reproductive management.

N: Nutrition and income are the rewards Heifer expects recipients to reap from their gift animal through the consumption and/or sale of products such as milk, eggs, cheese, honey, and wool.

G: Gender and family focus encourages women and men to share in decision-making as well as in the benefits the animals and training bring.

... on the ...

G: Genuine need and justice ensure that those most in need are given priority in receiving animals and training.

I: Improving the environment includes such agroecological techniques as improving soil fertility with animal manure, promoting forestation, respecting and encouraging biodiversity, monitoring watershed conditions, and minimizing erosion.

F: Full participation is expected within the groups that Heifer works with. Leaders at the grassroots level should be committed to involving all members in decision-making.

T: Training and education include formal sessions as well as informal farm visits and demonstrations. Each project group decides on its own training needs and local people are involved as trainers. Some topics of education include human nutrition, food processing, marketing, and leadership development.

S: Spirituality is expressed in common values, common beliefs about the value and meaning of all life, a sense of connectedness to the earth, and a shared vision of the future. Heifer Project International works with people of all beliefs in their efforts to overcome poverty and hunger.

Rob Kerby Independent Scholar

Heilbroner, Robert (1919–2005)

ROBERT LOUIS HEILBRONER was the author of *The Worldly Philosophers*: *The Lives, Times, and Ideas of the Great Economic Thinkers*, which sold over four million copies in seven editions published between 1953 and 1999.

Heilbroner was born into a wealthy German Jewish family in New York City. His father, Louis, founded Weber and Heilbroner, one of the best-known men's clothing businesses of the era. When he went to Harvard University in 1936, the American economy was still in the grip of the Great Depression and John Maynard Keynes's *General Theory* had just been published. A Phi Beta Kappa economics major, Heilbroner became a keen observer of furious debates over economic theory and policy. Taking courses from notables like Joseph Schumpeter, Edward Chamberlin, Wassily Leontief, Edward Mason, and Alvin Hansen, he was especially influenced by Paul Sweezy, who subsequently became the foremost American Marxist economist of the post-World War II period.

After college, he worked at a commodity-trading firm before a brief wartime stint at the Office of Price Administration, and served as chief intelligence officer in a combat division in the Pacific Theater and later in occupied Japan—for which he was awarded a Bronze Star. After the war, he became a successful freelance writer on topics ranging from economic policy to celebrity interviews.

Concurrently he enrolled in graduate school at the New School for Social Research, where he was greatly influenced by Adolph Lowe and became a democratic socialist. His doctoral research became the basis of *The Worldly Philosophers*, which was eventually translated into 15 languages. Awarded a Ph.D. in 1963, he was hired by the New School, where he spent the remainder

of his career as the Norman Thomas Professor of Economics.

The success of *The Worldly Philosophers* is generally credited to Heilbroner's remarkable, masterful prose, his ability to clearly and engagingly explain complex issues, and his success at integrating the history of the field into a broader picture. The chapters of *The Worldly Philosophers* focus on Adam Smith, Thomas Malthus, David Ricardo, utopian socialists, Karl Marx, Thorstein Veblen, John Maynard Keynes, and Joseph Schumpeter. Critics complain that the work is a "highly prejudicial, unbalanced view of economics." Without mention of Milton Friedman, Ludwig von Mises, or Friedrich Hayek, "free-market proponents" were "poured down an Orwellian memory hole," according to Mark Skousen.

Heilbroner, who served on the editorial boards of Dissent and Challenge, disdained the term "free market," countering that "markets aren't free. They depend on government." He wrote extensively about the contradictions and shortcomings of capitalism in works like The Limits of American Capitalism (1966) and Business Civilization in Decline (1976). However, he increasingly questioned the Marxist commitment to socialism as a historical destination that can be attained by "scientifically" guided analysis, in works like Marxism: For and Against (1980).

After the collapse of communism in eastern Europe (which he contended to be a "defeat ... for human aspiration"), he famously opened a 1989 New Yorker essay titled "The Triumph of Capitalism" this way: "Less than 75 years after it officially began, the contest between capitalism and socialism is over: capitalism has won. The Soviet Union, China, and eastern Europe have given us the clearest possible proof that capitalism organizes the material affairs of humankind more satisfactorily than socialism: that however inequitably or irresponsibly the marketplace may distribute goods, it does so better than the queues of a planned economy; however mindless the culture of commercialism, it is more attractive than state moralism; and however deceptive the ideology of a business civilization, it is more believable than that of a socialist one." In retrospect he concluded that he had accorded too little adaptability to capitalism and too much to socialism.

The overarching theme of Heilbroner's policy writing in books like An Inquiry into the Human Prospect (1974) was the case for an extensive, predominant government presence within the economy as a means of creating a more equitable society, reducing poverty, and dealing with ecological disturbance. A Primer on Govern-

ment Spending, written with Peter Bernstein in 1963, presented a strong defense of Keynesian deficit spending, and played a role in pushing President John Kennedy's tax cuts.

In addition, Heilbroner, who served as vice president of the American Economic Association (1983–84), was a critic of mainstream economics, accusing it of taking an increasingly narrow, analytical, mathematical focus, which gave it "rigor, but, alas, also mortis." Economics, in his view, could only be correctly approached as a form of systematized power and of the socialized beliefs by which that power is depicted as a natural and necessary form of social life.

Help the Aged

HELP THE AGED IS an older persons' advocacy group with units in Canada and Great Britain. Its mission is to secure and protect the rights of older persons anywhere in the world so that in the future older people will be much more highly valued than they are today. Help the Aged seeks to work with older persons so that their needs can be met in all the ways that are needed for them to live better lives. This means, in Help the Aged's view, that significant changes are needed in society so that the aged live richer lives and their voices are properly heard.

As an advocacy organization, Help the Aged does research into issues affecting older persons. The research seeks to analyze the problems faced by senior citizens and to develop solutions to their problems. Help the Aged conducts campaigns that address the issues basic to older people. It lobbies governments for pensions for the aged, for legislation to combat ageism, for relief from poverty, and for other issues.

To finance its work, Help the Aged conducts fundraising drives. Its financing comes through individual donations of gifts, door-to-door collections, and other sources, including an annual raffle. Financing also comes through corporate partners, student volunteers who collect funds, fundraising by celebrities, and grants from foundations and governments.

To better perform its mission, Help the Aged seeks to inspire and recruit others into the work of helping those who, because of age, are weak, impoverished, or disabled in some way. The organization's overall strategy is to combat the barriers that are placed in the way of older persons. These barriers are attacked as irrational and immoral hindrances to the living of active and fully human lives by the aged.

Often low standards of care are accepted as though they were normal.

Help the Aged has identified four major obstacles that hinder the advancement of the aged into a fuller life. The first obstacle is poverty. Consequently, Help the Aged is engaged in a battle with poverty. The second obstacle is isolation. Many older persons have lost family and friends and consequently are left alone in strange circumstances. Reducing isolation and encouraging inclusion are a primary goal for Help the Aged.

Ageism is the third major target for Help the Aged. It is in keeping with the philosophy of Help the Aged that the aged are persons of value, and that a person's value does not diminish with age. The fourth obstacle that Help the Aged is battling is the all-too-common poor-quality healthcare that the aged receive. Often low standards of care are accepted as though they were normal. Help the Aged therefore actively promotes quality care for the aged as well as for people of all ages.

Help the Aged provides a variety of services including SeniorLine, which is a telephone advice service. It also provides SeniorLink, which is a telephone response service. Through its SeniorMobility program, Help the Aged can place voluntary groups at the doors of older people for transportation needs. Its HandyVan program puts workers into homes to equip them for handicap devices in order to improve home safety. Its Adopt a Granny program supports older persons

abroad, and its gardening program provides older people with expert gardening help.

Hinduism and Poverty

HINDUISM IS AN old religion. Its origin dates back about 5,000 years. Hinduism originated in India and survived despite invasions by the Huns and the Greeks in the 2nd and 3rd centuries, followed by Muslims and the British. The Indian population is multiracial, multireligious, and multilingual. About 80 percent of the Indian population are Hindu, 12 percent are Muslims and 2.5 percent are Christians.

Hinduism is generally associated with a multiplicity of gods, and it does not advocate the worship of one particular deity. The gods and goddesses of Hinduism number in the thousands, all representing the many aspects of only one supreme absolute called Brahman. It is assumed that there are many manifestations of the Brahman (God) in the form of deities; each deity is an aspect of the Brahman.

Hinduism suggests that God exists in humans, animals, and natural forces. Polytheistic beliefs were practiced through idol worship, the idols being in human or animal form. Each of the idols symbolizes qualities such as strength, knowledge, and wealth. Hindus believe that God exists in the soul of the individual, who after many rebirths ultimately merges into a cosmic force called *Paramatma* meaning "universal soul."

Hinduism, also known as Sanatana Dharma (everlasting religion/truth/rule), outlines certain values (Dharmas), which are considered important for the well-being of the individual and of the society as a whole. Human beings can achieve divinity by following the Purusharthas, a set of guidelines for achieving the goals of a human life. Hinduism states that each person is born with duties or Runas. The three Runas are Deva runa, duty toward God; Rishi runa, duty toward saints and

wisemen; and *Pitra runa*, duty toward parents and ancestors. Following the *Purusharthas* can complete these duties. The religion lays out four *Purusharthas*: *Dharma* (righteousness), *Artha* (wealth), *Kama* (sensual pleasures) and *Moksha* (liberation from Samsara). The objective of *Dharma* is to enable everything in the universe to function according to the Laws of Nature. We humans have the ability to exercise our will against nature. *Dharma* allows us to distinguish right from wrong and ensure that we do not violate the Laws of Nature. According to *Sanatana Dharma*, humans are allowed to pursue desires in life, such as *Artha* and *Kama*, so long as they fall within the boundaries of *Dharma*.

In 1996, India had the greatest number of poor of any country in the world.

The Purusharthas are achieved by passing through systematic stages in life called the Varanasrama Dharma. There are four life stages. The first two are Brahamacharya (student to age 25) and Grahasta (householder/family man until age 50). The last two stages are Vanaspratha (retirement from household duties and rituals until age 75) and Sanyas (retirement, renunciation), and detachment from family life). In the last two stages of life one should detach him- or herself from material life and devote time to spirituality with the aim of attaining Moksha. Moksha is salvation from the endless cycle of birth and death.

According to Hindu philosophy there are three characteristic categories. These categories are called *Satwa*, *Rajas*, and *Tamas*. *Satwa Guna*, or the quality of goodness, is the most ideal. *Rajo Guna* is the quality of passion, and *Tamo Guna* is the quality of ignorance. A true *Yogi* transcends all three qualities of mankind. The *Yogi* is free of material existence and has realized his or her true identity. The *Yogi* is therefore not bound by goodness, passion, or ignorance. In Hindu philosophy, *Yoga* is a means to attaining the supreme state of mind. It is a skill to be acquired and an art to be learned. There are countless *Yogas*.

Bhakti Yoga is considered by many teachers of Hinduism to be the highest and the best form of Yoga. This is the path of devotion. Bhakti Yoga teaches how to cultivate a devotional relationship with God. Some aids used include chanting the Lord's names and singing His praise. Jnana Yoga is an approach to spiritual enlightenment through discrimination and reason. This path makes strong use of the powers of the mind. It is the

path of the philosopher who wants to go beyond the visible universe. It is said to be extremely difficult for the ordinary person to practice. *Karma Yoga* teaches how to discharge worldly duties in a spirit of detachment and yet harness the natural desire to be productive. This *Yoga* lays stress on doing one's duty (*Karma*) without the expectation.

Hinduism believes in transmigration of the soul. Such transmigration is what results in reincarnation or rebirth. All forms of life on earth do not undergo the same experiences. The human being is the most superior form of life. Even among humans, we constantly witness differences in our modes of existence. There are many variations among human beings. For example, some are born rich, others born in poverty; some are extremely healthy, and some disease-prone. There must be a reason for these different experiences that all forms of life go through, even within their own species. Hinduism's answer to this question is the theory of *Karma*.

Karma and rebirth are interrelated concepts in Indian philosophy. According to the theory of Karma, we are all part of a cycle of birth and rebirth. This cycle has neither beginning nor end. We are simply experiencing the results of our own actions in our journey through each cycle. Each spoke in the cycle precedes the next spoke. When a cycle moves, all spokes move one after the other in a never-ending chain. Good actions cause good effects (Law of Cause and Effects), while bad actions cause bad effects.

POVERTY

In 1998 in south Asia, which includes India, Nepal, and Bangladesh, there were about 522 million people living in extreme poverty. In 1996, India had the greatest number of poor of any country in the world—about 300 million people, more than one-third of its population. Some scholars state that the caste system and the theory of reincarnation associated with Hinduism help perpetuate some of this poverty.

Hinduism, as a philosophy, does not advocate that humans live a life of poverty. However, Hinduism can be linked to poverty indirectly. The current state of poverty in people's lives is seen as predestined because of their *Karma* in their past life. Hinduism states that whatever is happening to us currently is for our good, what will happen is for our good, and what has happened was also for our good. Thus humans should be content with their lot in life. This philosophy could lead to learned helplessness, passivity, and a lack of motivation to do better. This would explain the acceptance of

poverty in general by people in India. Hinduism states that when human beings achieve contentment, they have achieved the highest reward in life.

A general spirit of renunciation pervades Hinduism. The monastic life has great appeal to religious-minded Hindus. People who cannot earn a livelihood are able to obtain food when they wear monk's clothes. Another reason is that because of the frustrations of foreign domination, many Hindus sought escape from the demands of life by renouncing the world and making a cult of poverty and asceticism. This accounts for a large number of monks in Hindu society. The general tenor of Hinduism has been to encourage householders to enjoy material goods without deviating from the path of righteousness. The concept of the good life as described in the *Vedas* and *Puranas* is a joyous, affirmative, optimistic, and creative life.

Indian poverty cannot be blamed on Hinduism. Hinduism has never condemned a rich and full life in the world or extolled poverty as a virtue in itself—though the case is different with monks, who voluntarily take the vow of mendicancy. *Dharma*, or right-eousness, has been defined as what is conducive to both the enjoyment of legitimate material pleasures and the realization of the highest good, according to people's different stages of evolution. The *Upanishads* encourage people to enjoy life for 100 years, giving up greed and possessiveness.

Wealth, or *Artha*, is valued as one of the four legitimate goals—along with *Dharma*, love, and liberation. In India, individuals are admired when they give away whatever little resources they have and adopt a life of renunciation. One is admired for one's courageous abandonment of the world and for living in a state of voluntary poverty.

Within the Hindu tradition how much wealth a person possesses is subject to three principles of sustainability: Yajna, Dhana, and Tapas, meaning "sacrifice," "giving," and "penance." These are the three ecological principles for replenishment of the earth. Through Yajna you replenish the earth. For example, if you wear cotton clothes, you ought to spin cotton for others. The best thing is to take as little as possible. Whenever you take, eat, or consume, you must consider whether you have left something for others—for God, for nature, for the poor, and for future generations. This is sacrifice, or Yajna.

Second is *Dhana*, giving. This is replenishment of society. Just as we take from nature, we also take from society. We should not be only consumers. We must make our own sacrifice to replenish society. *Dhana* is

not only the little gift one gives to the poor. We need to contribute to society through giving money, labor, intelligence, time—any resources a person has. This maintains the ecology of society. If society is based on *Dhana*, there will never be poverty, exploitation, or deprivation. In Hindu philosophy, environment is not only nature, it includes the social and human world.

Third is *Tapas*, self-control, which replenishes the soul, our own internal spiritual environment. One must not only make sacrifices for nature and give back to society, but also one must replenish one's own inner environment. If a person undertakes a fast or takes a vow of silence, that is *Tapas*. Hindus practice *Tapas* by fasting or praying. At other times they go on pilgrimage to holy places like *Vrindavan*. That is also *Tapas*. Meditation is *Tapas*. Because of all the things humans do in this world, there is a great amount of wear-and-tear on the soul, and it has to be replenished. That replenishment can happen only when you are engaged in *Tapas*.

According to the Mahabharatha, "Poverty is a state of sinfulness."

In sum, Hinduism is a philosophy of life. Individuals are free to pursue wealth and sensual pleasure so long as they behave morally and ethically. Hinduism encourages the following of the *Purusharthas* and avoiding evils such as *Himsa* (violence), *Nirdaya* (lack of compassion), *Krodha* (anger), *Mada* (pride), *Maya* (infatuation), *Lobha* (greed), *Dvesha* (hatred), and *Trishna* (craving). Actions resulting from these emotions are believed to be the primary cause of suffering and injustice in the world.

Hinduism does not advocate a life of poverty. According to the *Mahabharatha*, "there is no poverty for the industrious" and "poverty is a state of sinfulness." Therefore Hinduism promotes moderation and good *Karma* (deeds).

History of Poverty

PEOPLE OFTEN AVOID their poor relations, and historians, preferring to write about monarchs, wars, high politics, and diplomacy, only began writing systematically about poverty in the last 150 years. This shift was part of a greater focus on social history that began as a focus on social conditions, often called the "social question," in Europe in the 19th century.

Poverty as a field of academic study came of age in the Industrial Revolution in England and France in the 1830s and 1840s and was one of the first areas studied in the new social sciences of sociology and statistics by individuals like Louis René Villermé (1782–1863) and Eugène Buret (1810–42), by journalists like Henry Mayhew (1812–87), and by social reformers like Charles Booth (1840–1916) and Seebohm Rowntree (1871–1954).

It also became a prominent theme of socialists like Pierre-Joseph Proudhon (1809–65), Louis Blanc (1811–82), Friedrich Engels (1820–95), and Karl Marx (1818–81), who criticized the capitalist economic system associated with the Industrial Revolution and the visible rise in urban poverty after 1830. A century earlier, poverty and its effect on human happiness and human potential were a topic in philosophical discussions in the Enlightenment by such thinkers as Jean-Jacques Rousseau (1712–78), François-Marie Arouet (Voltaire) (1694–78), and the Marquis de Condorcet (1743–94).

However, there are no studies of the history of poverty as such. As subjects of historical study, poverty and the poor in Europe and the United States since 1900 have received the most scrutiny, first by such pioneer scholars as Sidney (1859–1947) and Beatrice Webb (1858–1943), and then by their American counterparts Frances Fox Piven (1932–) and Richard Cloward (1926–2001). National and regional histories of poverty received an impetus from the 1960s War on Poverty in

the United States, but studies on poverty in the rest of the world have not mustered the same historical energy until very recently. When researching poverty outside Europe and the United States, historians most often encounter books and articles that study poverty in terms of development, a field dominated by Western-influenced institutions such as the World Bank and the International Monetary Fund (IMF), which regard development as a way to end poverty by globalizing capitalism.

Who the poor are and what they do are only important insofar as knowledge of them and their current situation allows them to be regulated and their condition to be abolished at some future date. What is interesting in these contemporary sociological and economic approaches to poverty is that the economic system that first inspired poverty studies, because it was seen as instigating and augmenting a human-made (rather than a divinely-sanctioned) gap between rich and poor, should now be seen as the global solution to impoverishment. The bibliography at the end of this article, however, provides a good starting point for investigating the history of poverty and the numerous approaches to understanding it.

ANCIENT AND CLASSICAL SOCIETIES

Poverty and poor people have, of course, been around for millennia and their existence was noted by many writers, but none saw fit to write a history of poverty. Rather poverty was a moral and political concern and was cast in those terms. Poverty probably first arose with the Agricultural Revolution and the rise of unequal, class-divided urban societies in Mesopotamia, Egypt, the Indus Valley, and the Yellow (Huang He) River Valley.

Urban societies kept records and censuses, which we can consult, and earlier Neolithic hunting-and-gathering societies did not, so it is difficult to judge the issue of impoverishment in those societies. Such historical hunting and gathering societies, much like their modern counterparts, did not create large economic surpluses and lived very near subsistence, but almost everyone was equally rich or equally poor. In other words, poverty was not a measure of one's status relative to other people in society. The whole society lived at a certain level of existence, met its basic needs, and reproduced, so there was no absolute poverty, and no one had significantly more than any other member of society because of an ethos of reciprocity and redistribution (for example, potlatch), so there was no relative

poverty either. These societies successfully adapted to their environments for centuries and millennia.

In ancient and classical urban societies with larger amounts of disposable wealth and more specialized divisions of labor that became expressed socially in the formation of classes, visible signs of poverty (old, worn, and torn clothing and shoes, deteriorated housing, and ineloquent speech) were one external marker of inferior social or class status.

In urban class societies, poverty was closely associated with lack of paid work. The living embodiment of wealth for others, with the exception of some lucky individuals in rich or royal households, the majority of slaves in ancient and classical Afro-Eurasia and Mesoamerica lived lives at or below the socially accepted minimum standard of living.

Free men and women who were not slaves and worked in a cash or barter economy could accumulate wealth, but the vicissitudes of war, markets, or weather could impoverish workers and middle-class traders alike. The Odyssey mentions beggars and vagrants, as do the poet Hesiod's (ca. 700 B.C.E.) Works and Days, the Old and New Testaments, the plays of Aristophanes (448–385 B.C.E.), the Republic of Plato (ca. 427–347 B.C.E.), the gospels of Siddhartha Gautama (the Buddha) (ca. 623–543 B.C.E.), the teachings of Mahavira (ca. 599–527 B.C.E.), and the Analects of Confucius (551–479 B.C.E.). Most of these authors did not take poverty or the poor as an object of study. Poverty was an object lesson.

Concerned with social ethics and personal virtue in a class-stratified society during the time of the Warring States in China, Confucius wrote that "riches and honors are what men desire. If they cannot be obtained in the proper way, they should not be held. Poverty and baseness are what men dislike. If they cannot be avoided in the proper way, they should not be avoided" (Analects, IV.5). He and his mother experienced poverty after his father died (Confucius was 3 years old) but, being from a noble family, he still received the best education available to him, so even in poverty, class standing and access to other resources could matter and make a difference in a person's life. His earlier experience influenced his philosophy: a key Confucian concept is Jen, a form of compassion that is often expressed by helping those in need.

In classical India (ca. 500 B.C.E.—500 C.E.), Buddhist and Jain monks and Hindu holy men took religious vows of poverty and rejected material comfort as part of their desire to attain higher spiritual consciousness. Classical Hindu scriptures outlined four stages of life.

In the third stage, when a man had become a grandfather, with his hair turning white and his skin beginning to wrinkle, he was expected to retire to a forest, live as a hermit, and spend his time in contemplation of the gods. The fourth and final stage was a period of asceticism and renunciation of the world. Living alone, he was expected to discard all attachments to the material world and strive for spiritual perfection so his soul could be reborn (reincarnated) into a higher social group (caste) or achieve *nirvana* and merge with the divine force of the universe.

Begging was considered a civic disgrace in classical Athens.

Thus for classical Hindus, poverty and a renunciation of worldly goods and attachments were encouraged as part of the normal cycle of life. Hinduism, Jainism, and Buddhism strongly encouraged the lifelong practice of monastic lifestyles, which included vows of poverty as ways to achieve greater spiritual perfection and purity. Believing in divine providence, most itinerant, mendicant monks survived through the kindness of strangers by begging for a living. Jain monks and nuns owned no property except a broom, simple robes, bowls, food, and walking sticks. They were allowed to live in buildings only briefly and they had to beg for all their food. The key Jain principle, ahimsa (nonviolence), required positive acts of kindness, compassion, and charity by all Jains, monks and laity. An influential religious minority in India, secular Jains used their business wealth to set up and run hospitals, rest houses, and almshouses for people of all castes and creeds.

However, since begging was considered a civic disgrace in classical Athens, the statesman Pericles (ca. 495–429 B.C.E.) undertook large public works projects so that the unemployed poor could be kept out of abject poverty by the state but not sitting around and doing nothing. He also sent numerous expeditions to found colonies in places like Naxos and Thrace to receive the idle poor of Athens.

In Rome during the era of Tiberius Gracchus (163–132 B.C.E.), homeless people wandered the roads of the republic performing casual labor on the docks and farm labor during harvesttime. During this period free grain (annona civica) was given to the Roman masses for the first time and became so common in the first century C.E., that the Roman satiric poet Juvenal (ca. 55–127 C.E.) remarked that the people of Rome

yearned only for two things, bread and circuses. The armies of Marius and Sulla and other Roman generals in the 1st century B.C.E. were generally recruited from the ranks of the urban poor and their pay was based on looting and conquest. The Roman practice of giving land to discharged soldiers was a means to prevent a return to impoverished circumstances, but it required further conquests.

No one gathered statistics on poverty or poor people in the ancient and classical world. Poverty, like death, was regarded as an inescapable part of life. One could and should try to avoid it, but it could befall anyone and was certainly inescapable in a class society that could only support a minority of rich and well-off individuals and families.

While poverty may not have been ascribed to individual responsibility given the wide range of natural and human-made calamities that could befall individuals in the ancient and classical world (for example, earthquake, war, disease, poor hygiene, famine, drought, etc.), poverty that was the result of idleness was regarded harshly in classical Greek society and resulted in chastisement or being sent to a colony and essentially banished from the city to support oneself as best one could.

Monks and nuns loved and honored poverty as bringing them closer to spiritual perfection.

Idle poor, the Roman *proletarii*, whose name meant they served the state only by begetting children (that is, future mercenary soldiers), were most often seen as a threat to public order by their individual and collective behavior: they undermined the civic good by their bad and idle example, they drained the public purse of funds for their support, they stole to meet their needs when all else failed, they formed mobs that endangered commerce and safety, they could be recruited by generals to serve as troops in civil wars against the government, and they could storm the homes of the rich in a social revolution. The poverty produced by a class society was rightfully recognized as a threat to its good order and stability.

In the 5th century C.E., the civic revival and urban wealth of the Gupta empire promoted the development and spread of "hospitals" throughout India. These facilities provided shelter for poor and disabled homeless people and resembled almshouses rather than modern hospitals. Around 540 C.E., institutions similar to those

in India spread to China and the Middle East. The Muslim followers of the Prophet Muhammad (ca. 570–632), himself an orphan, incurred an obligation to give alms to relieve the misery of the weak and poor and paid a *zakat* (purification tax) as one of the Five Pillars (obligatory duties) of Islam that provided institutional support for the poor.

They also reached Europe around the same time, and the first of these "hospitals," the Hôtel Dieu (house of God) established in Lyons, France, was run by monks and lay volunteers. In Tang China, the Empress Wu (625–705) initiated a social reform program for a state-sponsored Buddhist monastery and operated almshouses to care for the poor.

THE POSTCLASSICAL WORLD

In the last centuries of the Roman Empire, Christian monasticism became an increasingly popular expression of piety. It thrived in the Byzantine Empire and medieval Europe as well. *Monasticism* derives from a Greek word that means the act of "dwelling alone." It came to signify a mode of life in which people lived in seclusion from the world, usually under religious vows and subject to a fixed set of rules, as monks, friars, or nuns.

Christian monasticism followed the basic idea of Hindu and Buddhist monasticism in promoting seclusion or withdrawal from the world or society and a renunciation of worldly ties in the interest of spiritual development. Since the world desired and honored wealth, so the ascetic monks and nuns loved and honored poverty as bringing them closer to spiritual perfection and away from the temptations of the flesh and material comfort, which they regarded as obstacles to loving God.

St. Basil of Caesarea (329–379), patriarch (religious leader) of Constantinople and what became the Eastern Orthodox Church, established rules for monastic communities that regulated the lives of monks and nuns and mandated a life of work, prayer, and material asceticism. Basilian monasticism spread rapidly throughout the Byzantine Empire in subsequent centuries. The communities they ran could become quite wealthy but the individual monastic monks and nuns lived the vow of poverty.

In western Europe, some of the Roman Catholic Church's wealth was used by Pope Gregory I (ca. 540–604) to organize programs to assist the poor directly and promote the expansion of "hospitals" to major urban centers, and around 787 clergy established

the first European foundling hospital (orphanage) for abandoned children in Milan, Italy.

Besides Egypt and Mesopotamia, Christian monastic communities grew in Italy, Spain, Gaul, and the British Isles. St. Benedict of Murcia (480–547), perhaps in imitation of St. Basil, created a Rule for Roman Catholic monastic communities where poverty, chastity, and obedience became prime virtues along with prayer, meditation, and work. Like Buddhist monasteries and Muslim religious foundations, western European monasteries served as charitable institutions and places of refuge for the poor who suffered from the effects of natural disasters, were orphaned, or needed medical treatment.

Through vows of poverty, their lack of consumption allowed for the accumulation of great institutional wealth, which often went toward alleviating the suffering of poor individuals. Early monks did not see poverty as a disgrace if it was freely chosen as a way to achieve spiritual perfection or if it befell an individual because everything was part of God's creation.

They believed that poverty brought them closer to God and to Jesus of the New Testament.

By the High Middle Ages (ca. 1100–1450), monasteries had acquired so much wealth that Benedictine monasteries had become comfortable retreats, and reformers like St. Dominic (1170–1221) and St. Francis of Assisi (1182–1226) founded mendicant (begging) orders of friars to counter what they saw as the corruption and materialism of the church. They believed that poverty brought them closer to God and to the Jesus of the New Testament. Using Jesus as a model, mendicants had no personal possessions and had to depend for their food and material needs on the people to whom they preached and tended. Mendicants were especially active in medieval towns and cities, where they tended to the poor and worked to persuade heretics to return to the Roman Catholic Church.

The Franciscans and Dominicans joined a large number of people in the High Middle Ages who earned a living from begging, not to mention thievery and fraud. Vagrancy, or moving from town to town, was increasing in this period as rural economic conditions changed, new land was brought under cultivation, money circulated more freely, long-distance trade revived, and there was climate change (causing crop failures and famine), war, disease, and plague.

Departing from the Greco-Roman view of the poor, medieval western European Christianity had a powerful commitment to caring for the unfortunate that was based on the beliefs, as embodied by early Dominicans and Franciscans, that poverty was a holy state, accepting alms was no disgrace, and charity was a pious act as well as a key to eternal salvation. The poor were often presumed to have special influence with God: friends of a deceased person often gave alms to beggars on the condition that they perform prayers for the soul of the dead comrade.

Beggars were not only inevitable but also indispensable elements of medieval communities: if there were no beggars, one could not give alms and win favor with God for kind deeds or penance for one's evil deeds. Such symbiosis was a necessary element of the medieval Christian worldview and allowed other paths to redemption. Around 1084, after the Norman Conquest, almshouses for poor and disabled people, similar to the "hospitals" in France, were established in Canterbury and began to spread throughout England.

In the early 12th century, the Roman Catholic Church promulgated the *Decretum*, a compilation of canon law, which included an extensive treatment of the theory and practice of charity. It affirmed that rich people had a legal and ethical obligation to aid the poor and destitute. Around the same time in southern India, King Nissanka Malla (1187–1196) erected almshouses to care for the poor and embody charity in Dambadiwa and Sri Lanka.

Still, the idea of avoiding work was reprehensible even for those who emphasized a life of contemplation like monks who had a regular work regime. According to Christian beliefs, Adam's fall had condemned all people to live by labor, so the principle of charity was upheld, but with limited resources to care for non-productive individuals in preindustrial societies, charitable priorities were established. The main distinction, which exists down to the present day in European societies and their global offspring, was between the deserving and the undeserving poor.

The deserving poor were those, like widows, children, and the maimed or sick, who became impoverished through no fault of their own or whose skills or health was not sufficient to support themselves or their families. Undeserving poor were persons who were willfully idle: they could work and earn a sufficient living but chose not to do so. Thus a claim to aid was increasingly tied to the willingness to work one's way out of poverty. Poverty was no longer a God-given condition but a condition that could often be changed by individ-

ual action. Poverty was no longer a sanctified state but increasingly a rather disreputable one by the 12th century, when some church legal scholars took the position that anyone who was able to work but unwilling to do so should be denied help no matter what the circumstances of life. Other scholars thought that alms given to the poor should be associated with efforts to make them change their ways and discussed whether punishment (in the form of work) or education would be the best means of correction.

In a complete turnaround from the earlier medieval attitude, which saw poverty as a blessed state, by 1400 poverty was increasingly associated with personal vice and immoral behavior, especially in urban centers as population decreases associated with the wars, famines, and plagues of the 14th century thinned the ranks of laborers and sent them migrating across Europe to seek better wages and working conditions. Rural depopulation and a labor shortage left many churchmen and bourgeois with little sympathy for people who would not work for a living.

A legal distinction was made between the "worthy poor" and the "unworthy poor."

In 1349 Edward III of England issued the Statute of Labourers, which required people to remain on their home manors and to work for whatever the lords wanted to pay. It prohibited begging and almsgiving except for older people and those unable to work. For the first time, a legal distinction was made between the "worthy poor" (older people, disabled people, widows, and dependent children) and the "unworthy poor" (able-bodied but unemployed adults). The latter were considered "valiant beggars" who needed to be compelled to work for their living.

In 1350 Jean le Bon of France declared that those "sturdy" beggars and others able to work would be penalized by deportation or incarceration and that no charity be given to them by the clergy. In 1351 Pedro the Cruel of Castile declared that all sturdy beggars in his kingdom would be flogged. None of these measures could be enforced, but they signaled a new attitude toward poverty and the poor among the states of late medieval Europe that would inform subsequent developments there and around the world.

The European poor did not sit idly by as their lot worsened in the 14th and 15th centuries. In 1378 the Ciompi Revolt of artisans and laborers in Florence overthrew the government for a time, and Wat Tyler's rebellion of peasants in England in 1381 burned London and got King Richard II to abolish serfdom and the Statute of Labourers, albeit only temporarily. Major disturbances of the urban and rural poor broke out over the next century in France, Catalonia, Scandinavia, and Bohemia, among other regions, and there were 14 revolutions in the city of Genoa alone between 1413 and 1453. As economic conditions improved after 1450, greater class inequalities arose between artisans and merchants and between artisans and workers while enclosure for sheep-raising displaced peasants, who became part of an impoverished migratory workforce. Gradually "the poor" came to mean those who have no property except their labor power, their ability to work.

THE MODERN WORLD

The lack of employment and the growing numbers of poor were causes of great concern among the upper and middle classes because of the experiences of the recent past, the late 13th and early 14th centuries, when the poor turned to social upheaval and revolution to improve their position. In 1526 Juan Luis Vives (1492–1540), a Spanish philosopher and humanist who spent his adult life in France, England, and the Low Countries and was horrified by the physical condition of the abjectly poor and the inability of voluntary charities to aid them, worked out a theoretical justification for state-run poor relief and developed a plan to organize and regulate charitable relief, which included registering the poor, raising private funds to help them, and creating employment for the able-bodied poor. Many of the ideas in his book De Subventione Pauperum influenced subsequent practice in European cities and various European poor laws.

For instance in 1529, the city-state of Venice enacted a poor law requiring people seeking alms to obtain a license and to do some public-service work in order to get the license. England followed suit in 1531 with its first statute on poor relief, which required justices of the peace to interview and license certain people (the old and disabled) to beg in their own neighborhoods and to punish harshly any unlicensed beggars.

In France the city of Lyon established the Aumône-Générale (general fund) in 1534 after a bloody uprising of the poor in 1529 sacked the city, to discriminate among the poor and to help those who had been evaluated as worthy of aid. The basic idea behind this municipal poor relief system (called *gemeinde Kasten* in

German) was to establish a comprehensive system of local relief for the worthy poor and then ban begging for those deemed unworthy. Any unauthorized beggars could then be considered criminals and driven out of town, jailed, or forced to labor on civic projects.

The Habsburg Emperor Charles V (1500–58) expanded this idea and issued an edict banning begging in his territories (Spain, the Low Countries, Austria, Mexico, Peru, etc.) in 1531 while instituting municipal poor relief, and the French king François I (1494–1547) issued a similar order in 1536. The English Act for the Punishment of Sturdy Vagabonds and Beggars (1536) classified the poor and established procedures for collecting and spending donations at the local level, and the English state under King Henry VIII (1491–1547) assumed a more active role in the caring (and policing) of poor people as a secular activity.

European visitors to China in the 16th century praised the maintenance by the state of almshouses and hospitals. The year 1601 represented a major milestone in the history of poverty when the Elizabethan Poor Law was established. Built on experiences from the earlier Henrician Poor Law (1536) and the Parish Poor Rate (1572), this legislation became the legal basis for dealing with poor and disadvantaged people for the next two centuries in England and its colonies. Retaining the administration of poor relief at the local level, the Poor Law taxed people in each parish to support the parish poor, established apprenticeships for poor children, developed workhouses for the chronically unemployed, and dealt harshly and punitively with the able-bodied poor.

The operative assumption was that work was available for all who wanted it (that is, there was no surplus of labor power), and no study of the actual conditions of the poor was undertaken by any of these agencies. Such studies would wait until the 19th century. In many of the nations that did not turn to Protestantism during the Reformation, the church rather than the state retained more responsibility for the care of poor people.

For instance, in 1625 Vincent de Paul established seminaries, religious orders, and charitable organizations to care for the poor people of France and is considered the founder of organized private charity in Europe. However, in 1642, Plymouth Colony enacted the first poor law in the English-speaking New World, based on the Elizabethan Poor Law of 1601.

Growth in population was one cause of the rise in the number of poor people. In 1600 the population of Europe was around 60 or 70 million people, twice what it was in 1500. Repeated crop failures set off a chain of misery and unemployment that also increased the number of poor in the 16th and 17th centuries.

Following a Confucian model, in China the Emperor Kangxi (1654–1722) of the Qing Dynasty (1644–1912) organized a nationwide system of grain storage in silos based on the precedents of earlier dynasties to alleviate the suffering and starvation of the poor in periods of natural or civil disaster. For European rulers in the age of mercantilism, overseas colonies became ideal places to dump the poor, who were expelled for illegal begging or who were just becoming more numerous. King James I of England (1566–1625) ordered the colonization in Virginia of poor and idle young people while Georgia and Australia served as English penal colonies for the criminally poor in the early and late 18th century, respectively.

In the age of mercantilism, overseas colonies became ideal places to dump the poor.

The directors of the West India Company urged the importation of poor and orphaned children from the Netherlands into New Netherlands in 1645 and France and Spain enforced similar measures. Of course, the enforced enslavement of millions of Africans from 1450 to 1888 created a large pool of impoverished individuals in the Americas, some of whom were able to save and buy their freedom in Spanish and Portuguese colonies, but the standard of living of field slaves in a plantation economy was uniformly low—often not even allowing for natural replacement through biological reproduction, as witnessed by the short life expectancy (five to seven years) of recently arrived slaves in the Caribbean and Brazil.

The era of mercantilism began a final shift in the history of poverty, a shift that is still being worked out today. The attitude of mercantilists and government officials like Thomas Mun (1571–1641), Antoine de Montchrétien (1576–1621), William Petty (1623–87), and John Locke (1632–1704) was an expression of their class attitudes to the poor in general: they were seen as a drain on national wealth. They argued that lower wages would increase efficiency by spurring the poor to work harder in order to earn a bare subsistence, they attacked poor relief as an incentive to idleness and poverty and a waste of public resources, and they believed that lazy and poor workers allowed those who would work to command higher than normal wages. In many ways they presaged the arguments of Thomas

By the 21st century, the poor increasingly appear as a social problem that requires new ways of being managed.

Malthus (1766–1834), whose work on population and poverty has been foundational for modern global discussions of poverty.

Their concerns led to the development of the workhouse. The first true workhouse was apparently opened in Amsterdam in 1596 and spread from there to the rest of Europe and Britain, where an English version was founded in Bristol in 1697. The system was designed to lower parish poor taxes by denying aid to anyone who refused to enter a workhouse. These institutions were usually run by private businessmen who contracted with local authorities to provide for the residents in exchange for using their labor to make products for sale.

With some exceptions, residents were usually given minimal care and worked long hours as virtual captives. By the 1850s, the majority of those forced into workhouses were poor but not work-shy: they were the old, the infirm, the orphaned, unmarried mothers, and the physically or mentally ill. Most workhouses lost money and failed to accomplish their purposes even if they persisted well into the 20th century: they were officially abolished in Britain in April 1930.

It is against this backdrop of the workhouse and the concern with the displacement and poverty that accompanied the early Industrial Revolution in the late 18th and 19th centuries in Europe that poverty as an object of social inquiry rather than as a moral, legal, and disciplinary concern, came into its own. Poverty was increasingly seen as an obstacle to development, personal as well as industrial and economic, and a continued threat to political order. In 1795 the English developed the Speenhamland system as an alternative to the workhouse and to riots and other civil disturbances caused by food shortages. A poverty line was developed for the first time in the English district of Speenhamland and workers were eligible for subsidies whenever their wages fell below this amount. The amount was based on the price of bread and the number of dependents a worker had to support. As prices increased or wages declined, the local treasury made up the difference.

Malthus believed that the poor laws and the Speenhamland system in particular promoted poverty because they allowed the number of poor to exceed its natural mathematical limit as determined by low wages, malnutrition, disease, and misery. Increases over that limit merely multiplied the future misery of the poor, whose increased numbers would have to diminish like a law of nature when they outstripped the available food supply.

Classical economists like Malthus and David Ricardo (1772–1823) argued that working-class poverty was caused by overpopulation, that hunger would compel everyone to work, and that there was work for all who wanted to labor. With the persistence of poverty and surplus labor despite the expansion of wealth and output that industrialization made possible, reformists and socialist critics would begin an empirical and theoretical investigation of poverty and the workings of the capitalist system to disprove the largely deductive system advanced by the classical economists.

An early social study by Sir F.M. Eden, *The State of the Poor* (1797), was followed by empirical investigations by the legislatures of Massachusetts and New York in the 1820s, by studies of the poor in northern France, and by the English Poor Law commissioners in the mid-1830s. The poor remained the "dangerous class," especially after the Europe-wide revolutions of 1848.

Marx regarded unemployment and the poverty it spawned as entirely normal and necessary aspects of capitalism and as a major reason for doing away with the system altogether: modern poverty resulted from the operations of the laws of the market, not from natural causes or personal vice. Empirical researchers like Charles Booth, whose research in East London found 35 percent of the people living in abject poverty, and conservative politicians like Chancellor Otto von Bismarck (1815–98) of Germany supported measures that they described as "limited socialism" (state-supported old-age pensions, unemployment insurance, and accident insurance), which could help workers avoid poverty in the normal operation of the capitalist system. Booth and Bismarck both believed that if the government failed to take action, their countries were in danger of experiencing a socialist revolution.

Such arguments did not gain widespread acceptance until the Great Depression of the 1930s threw 10 to 30 percent of a nation's population out of work and achieved theoretical justification in the writings of John Maynard Keynes (1883–1946). The "welfare state" would manage, police, support, and coopt the poor created by the operations of capitalist markets by taxing the economic surplus created by that system and redistributing part of it to the poor.

Hundreds if not thousands of studies were conducted on the poor in nearly every country in the world, and the fear of social unrest underlay them all as this model of social-contract capitalism was exported from Europe and the United States to other countries. Some analysts noted a "discovery" of mass poverty in Asia, Africa, and Latin America after 1945 that provided an anchor for restructuring global culture and economics along capitalist lines.

Annual per capita income became the sole measure of wealth or poverty, even in countries whose economies were not monetized. The awareness of poverty on a global scale was the result of a comparative statistical operation in 1948 when the World Bank defined as impoverished countries in which the annual per capita income was below \$100.

If the problem of poverty was construed as essentially lack of monetary income, then the solution was economic growth and an increased supply of money, based first on Keynes's theories and then on neoliberal ones.

By the 1980s, not only was the welfare state under attack in Britain and the United States but the World Bank, the International Monetary Fund, and the governments of the wealthiest industrialized nations promoted a neoclassical regime for eliminating poverty in Asia, Africa, and Latin America based on the writings

of Malthus and Ricardo. We live in the midst of this situation in the 21st century.

CONCLUSION

A break occurred in the earlier conceptions and management of poverty with the end of the European Middle Ages and the rise of mercantilist states like Henry VIII's England, François I's France, and Charles V's Spanish empire. The poor laws passed by these monarchs and refined in subsequent years helped shape the development of capitalism in 17th-century Europe and the Industrial Revolution of the 18th and 19th centuries. The advent of systems to manage the poor based on assistance as well as punishment provided by impersonal institutions transformed the poor into the "assisted" with profound consequences.

This reconceptualization of the poor, as assisted or dependent, not only signified a rupture of traditional social relations in which poor but independent people, including beggars and mendicant monks, coexisted alongside wealthy individuals, but also set in place new mechanisms of control. The poor increasingly appeared as a social problem that required new ways of being managed and, in the process, of managing society as a whole.

The management of poverty in 19th-century Europe required government interventions in education, health, hygiene, morality, and employment and led to a multitude of interventions that created a domain of knowledge and practice that many researchers have called "the social." The rise of sociology and social statistics was one measure of the formation of this domain, which has now been extended globally by institutions like the World Bank and the International Monetary Fund.

HIV/AIDS

THE RAPID SPREAD OF HIV through all social strata and all sexual orientations has proved that the initial risk categories and the identification of the virus with gay men make little sense. Yet with the passing of years, the true risk category linked to the virus may be that of the poor, with poverty representing a considerable risk factor.

The AIDS epidemic is not only a health issue but also a socioeconomic and security issue. AIDS has killed millions of adults, reducing the workforce, exacerbating famine, impoverishing families, and orphaning millions of children in the regions hardest hit. As Stephen Lewis, the United Nations (UN) special envoy for HIV/AIDS in Africa, has put it in his notes on one of his travels to Lesotho, Zimbabwe, Malawi, and Zambia, there is a clear link between hunger and AIDS.

Western governments are all too often hiding behind the doubt that the African developing countries may not even have the will to fight the virus. During his travels, Lewis noticed "how even in the most extreme of circumstances, such as those which prevail today in the four nations [he] visited, Africans are engaged in endless numbers of initiatives and projects and programs and models which, if taken to scale, if generalized throughout the country, would halt the pandemic, and prolong and save millions of lives." Yet African countries lack adequate financial resources to face the pandemic effectively, and Lewis defines this shortage as "mass murder

by complacency": "This pandemic cannot be allowed to continue, and those who watch it unfold with a kind of pathological equanimity must be held to account. There may yet come a day when we have peacetime tribunals to deal with this particular version of crimes against humanity."

Lewis's account goes on to detail the links between poverty and AIDS, which, according to the UN special envoy, were visible everywhere: "In Malawi, for example, analysis of the data shows that 50 percent of poor households are affected by chronic illness due to HIV/AIDS. You can't till the soil, grow the crops, feed the family, when disease stalks the land." Lewis appeals to G-8 countries to augment their contributions to the Global Fund so that African countries may be provided with the necessary resources to fight the pandemic.

Yet he also concludes that the Global Fund seems more ready to finance wars (the report was written a few months before the second Gulf War) than schemes to fight AIDS in developing countries. The account of the UN special envoy shows the grip of poverty on people living with AIDS in Third World nations and the reluctance of the more industrially developed countries to intervene. While poverty and AIDS are now firmly associated with one another, when the virus made its first appearance in the 1980s, such a link was ignored and the pandemic was considered only a Western phenomenon, limited to risk categories.

As Sharon Walker reminds us, although the virus spread rapidly through developing countries right from its discovery, no links were made between the Western victims of AIDS and those who died from it in Africa. In the late 1970s, the virus was identified as a disease of the gay community as a group of gay men from San Francisco and Los Angeles showed signs of rare opportunistic diseases. The very name initially given to the virus, GRID (Gay Related Immunodeficiency), points to the first definition of the virus as a new "gay plague."

No one wanted to make the connection between the virus that was spreading through Western countries and that which was affecting Africa. Making this connection would have implied the recognition that poverty and heterosexuality were important factors in the diffusion of the disease. From 1982 on, however, the presence of the virus in women and children even in Western countries could no longer be ignored. So the name of the disease was changed to AIDS (Acquired Immunodeficiency Syndrome). The following year the virus that caused the disease was isolated. Yet until the late 1980s, AIDS largely remained a disease of intravenous drug users and homosexuals.

AIDS is caused by the human immunodeficiency virus (or HIV). The virus can show no symptoms of its presence in the body for a phase as long as 10–15 years. During this phase, however, the immune system is constantly attacked and becomes compromised. Moreover the individual is able to transmit the disease. The virus damages the immune system by destroying those cells, the so-called helper T-cells, that function to detect and eliminate infections in the body.

The absence of helper T-cells and the consequent lack of activation of the immune system cause the body to become prey to multiple infections. As the immune system deteriorates, these infections become increasingly serious and can cause pneumonia, pulmonary tuberculosis, musculoskeletal pain, and neuropathy. HIV is transmitted between individuals through seminal or vaginal fluids, contact with infected blood (including blood transfusions), and between mother and child during pregnancy, childbirth, and breastfeeding.

People usually become infected a few weeks after the primary contact with the virus and suffer with fever for several days with or without muscle and joint aches, fatigue, headache, sore throat, swollen glands, and sometimes rash. These symptoms are very similar to those of other common illnesses, thus AIDS is difficult to diagnose at this early stage. Several treatments against HIV exist; however, there is no known cure or vaccine.

Fidelity to a partner who has contracted the virus is as dangerous as promiscuity.

The progression of the disease varies greatly among individuals and is influenced by many factors, such as host susceptibility, immune function, healthcare, the presence of co-infections, and peculiarities of the viral strain. The most effective prevention against AIDS is condom use. Yet while the adoption of condoms and of screenings in blood transfusion has proved effective in Europe and North America, in other regions of the world these have proved controversial.

Conservatives, led by the George W. Bush administration, and some church members both oppose the use of condoms and argue that the best way to prevent AIDS is through abstinence from sexual intercourse and faithfulness to one's partner. Abstinence promotion is criticized for denying young people, especially in poorer countries, information about HIV prevention. In addition, fidelity to a partner who has already contracted the virus is as dangerous as promiscuity.

As New York Times journalist Nicholas D. Kristof wrote: "President Bush is focusing his program against AIDS in Africa on sexual abstinence and marital fidelity, relegating condoms to a distant third. It's the kind of well-meaning policy that bubbles up out of a White House prayer meeting but that will mean a lot of unnecessary deaths on the ground in Africa. The stark reality is that what kills young women here is often not promiscuity, but marriage. Indeed, just about the deadliest thing a woman in southern Africa can do is get married."

GLOBAL REACH

Figures on AIDS make it impossible to deny its global reach. The Joint United Nations Program on HIV and AIDS (UNAIDS) and the World Health Organization (WHO) reported that between 36 and 44 million people around the world were living with HIV in December 2004. During 2004, between 4.3 and 6.4 million people were newly infected with HIV and between 2.8 and 3.5 million people with AIDS died. The region of sub-Saharan Africa, initially ignored in reports on AIDS, remains by far the worst-affected region, with 23.4 million to 28.4 million people living with HIV at the end of 2004. Just under two-thirds (64 percent) of all people living with HIV are in sub-Saharan Africa, as are more than three-quarters (76 percent) of all women living with HIV. South and southeast Asia are the second most affected areas, with 15 percent. AIDS caused the deaths of 500,000 children. After more than 20 years of AIDS, there is still no vaccine for the disease or a cure for those who have been infected.

Yet the so-called cocktails of drugs that combine at least three medicines based on two different classes of antiretroviral agents have proved to be extremely effective in inhibiting the development of AIDS. During the 1990s, the life spans and the living conditions of people living with HIV considerably improved in spite of the many side effects of the cocktails.

The combinations of different drugs and antiretroviral agents, however, are extremely costly and this has reduced access to the treatment for patients in developing countries. Testing is expensive too and the most common test, ELISA, can produce false-positive results in individuals who have been exposed to parasitic diseases such as malaria.

This is a serious problem in developing countries where both AIDS and malaria are common. Thus the majority of people living with HIV/AIDS cannot receive adequate medical testing and therapy. The virus

prevalence is stable throughout sub-Saharan Africa, although in countries such as Madagascar and Swaziland it is still rising.

On the contrary, Uganda has provided the best response to the pandemic in the entire region with a consistent prevalence decline since the mid-1990s, although recent research has challenged the official statistics. The diffusion of HIV has considerably reduced life expectancy in African countries from an average of six to 11 years. HIV has also had a serious impact on African agriculture, although many scholars have underestimated this. As Joel Negin has pointed out, "rural agriculture is a source of livelihood for millions on the African continent" and is a crucial contributor to economic growth.

Because of the invalidating effects of AIDS, the disease "has a vicious, circular, rippling effect through an economy as it initially feeds off poverty and weak health systems and then perpetuates that poverty and continues to overburden health care schemes." The impacts on African economies and health services have also been worsened by the late response of governments to the diffusion of the virus. For years, several African countries denied that AIDS was a problem for the continent.

FINANCIAL RESOURCES

Financial resources given to healthcare have traditionally been limited in African countries, leaving national health services totally unable to face the AIDS pandemic. After independence, African regimes privileged military spending and developed countries were only too eager to satisfy their requests. In addition, the legacy of colonial rule of health services left them geared toward cures rather than toward research and prevention.

Yet prevention is the core for an effective response to the virus and this rethinking of the entire structure of health services has proved an enormous task. Education is an important part of prevention policies and is instrumental in fighting stereotypes and dangerous practices related to AIDS, such as the belief held in some regions of Africa that sexually violating young girls can cure men of the disease.

Other harmful stereotypes that can be defeated through education regard condom use and are well summarized by the African saying, "Who wants a sweet with the wrapper still on?" Inadequate healthcare, lack of the expensive antiretroviral medicines, and insufficient nutrition will cause the development of fullblown AIDS in large sectors of the population of African and other developing countries. Antiretroviral agents can be afforded only by 7 percent of all the six million AIDS patients in developing countries. Access to these drugs is essential to AIDS treatment.

Although the virus cannot be completely eliminated, antiretroviral treatments can slow the progression of the virus, thus allowing patients to continue to work and support their families. With adequate treatment, people who have contracted the virus can still participate in the social and economic lives of their countries. Yet to be effective, antiretroviral medication must be continuous once it is started. Otherwise patients develop strains of the virus resistant to drugs, and these can spread dangerously.

The cost of antiretroviral cocktails depends on patents that allow pharmaceutical companies to have a monopoly on them, banning the development of generic versions of brand-name drugs. Pharmaceutical companies argue that the patent status makes possible further research, but international aid organizations have repeatedly challenged this claim. Several countries such as Thailand, India, and Brazil have breached international drug patent laws, arguing that the societal need for advanced treatments is more important than the rights of pharmaceutical companies.

Because fees are not paid to patent holders, these generic versions can be distributed at prices that governments and patients in developing countries can afford. In turn, competition from generic products has led patent holders to reduce the prices of their brandname drugs. The production of generic drugs has helped reduce the annual cost of treatment from \$15,000 a patient to a little more than \$200 in less than 10 years.

Yet the World Trade Organization (WTO) has supported the right to intellectual property put forward by pharmaceutical companies. This has put pressure on those countries that had developed copies of patented drugs. India, for example, has already passed a bill that restricts the reproduction of patented drugs and these consequences for developing countries may be devastating.

The issue of intellectual property rights (IPR) links once again AIDS, poverty, and the dangers of globalization for those who are excluded from its benefits. With such a strict definition of IPR as that enforced by the WTO, a clear imbalance is created between the public interest and the monopolistic privileges of patent holders. The WTO ban on generic AIDS drugs will make it impossible for developing countries to effectively con-

tain the diffusion of the disease, which will continue to impact on the economies of developing countries through its vicious cycle of poverty and death.

Hobbes, Thomas (1588-1679)

THOMAS HOBBES IS best known for his famous book *Leviathan*, which was published in 1651. Influenced by the scientific discoveries of his time and by his readings of philosophers, he became the first philosopher who tried to modernize political thought and, to a degree, emancipate it from the premises of religious ethics. His work was innovative, for he introduced scientific methods to the study of individual behavior, which stood for the first time at the center of political analysis.

But Hobbes's philosophy and his persistence on the question of social order were at the same time influenced by the social disorganization caused by the civil war in England and the struggle between the old and the new regime, between monarchy and the embryonic market society. The interpretations of his philosophy by modern political science and sociology are not ho-

mogenous and the views about his theory are to a great degree contradictory. While a part of political sociology considers him a pleader of the absolutist state and a defender of the bourgeois society, another view emphasizes his influence on the theory of liberal democracy and the theories of social contract.

Hobbes's analysis derives from his conception of human nature. For Hobbes man is not necessarily a social animal. On the contrary, the human natural instincts are based on selfishness and interest. People are forced to abandon their state of nature and live together in the society. They do so not out of humanism or solidarity, but for the fulfillment of their own special needs. Rich individuals are exclusively interested in the reproduction of their own wealth and indifferent to the poverty of others. Human nature is for Hobbes individualistic, utilitarian, and competitive (homo homini lupus). It contains native inclinations, desires, and needs that cannot result in a harmless social coexistence and in peace, but in a struggle with the other members of the organized society.

In order to avoid the interpersonal struggle and the social conflicts caused by human competition, an "Artificial Man" (homo artificialis), the state, is necessary. For the maintenance of social order and the avoidance of conflict and disorganization, social subjects should deliver their own individual power and political will to the state. Through the obedience to the state and the acceptance of its political predominance, individuals contribute to the creation of a commonly accepted, sovereign power, which consists of individual wills and at the same time stands upon them.

According to Hobbes, this institutionalized, sovereign common power has both an internal and an external role: it not only protects men from each other, but also protects them and their property from the invasion of enemies and is the only one responsible for the establishment of law and political decision-making. The authorization of a third, external power, the state, to protect individuals from competition and struggle and the right of the state to exercise power and violence for the purpose of social order is the basis of the Hobbesian social convention: "I Authorize and give up my Right of Governing my selfe, to this Man, or to this Assembly of Men, on this condition, that thou give up thy Right to him, and Authorize all his Actions in like manner."

With his emphasis on individualism, Hobbes (and later John Locke) expressed the transition to the new so-cioeconomic era of private property supported by liberal democracy. But the regime of private property, as a

regime of increasing class differences, economic inequalities, and the poverty of larger social groups, could not function autonomously.

On the contrary, it needed a sovereign state in order to regulate the new economy and the social order. In the Hobbesian thought, the power of God is being replaced by the hegemonic and monarchical power of the state. The secularization of God's power is realized in Hobbes's political theology through the absolutist state. The Hobbesian argument about the state's sovereignty is based on his utilitarian conception of human nature and it combines a political (the Artificial Man) with a psychological (human nature) point of view.

While Niccolò Machiavelli studied the ways in which political power would become more effective for the establishment of order, Hobbes focused on the ways in which individuals would become more effective for political power. His analysis of the complex among state, society, and private property became of paramount importance in the development of modern liberal philosophy.

Hobson, John (1858-1940)

JOHN ATKINSON HOBSON was born in Derby, England. He went on to study at Lincoln College, Oxford, before becoming a teacher of classics and English literature at schools in Exeter and Faversham. In 1887, on the invitation of the journalist William Clarke, Hobson joined the Fabian Society. A group of nonrevolutionary liberal socialists who drew heavily from London's arts communities, the Fabians counted among their members George Bernard Shaw and Beatrice Webb.

At the end of the 19th century, Hobson wrote a series of influential works dealing with issues of economics, social development, and social reform. Among

these are *Problems of Poverty* (1891) and *Problem of the Unemployed* (1896), both written as publications of the Fabian Society, and *Evolution of Modern Capitalism* (1894) and *John Ruskin: Social Reformer* (1898). His most acclaimed and influential work, *Imperialism: A Study* (1902), would later impact the writings of Bolshevik leaders Vladimir Lenin and Nicolai Bukharin. Hobson also wrote for socialist journals, including the *New Leader*, the *Socialist Review*, and the *New Statesman*. His approach to socialism always stressed the moderation of capitalism through reforms rather than a revolutionary transformation of capitalist social relations.

Hobson's humanist approach to economic theory made an important contribution to the development of welfare policy and influenced later welfare state economics. Notably Hobson's theory of underconsumption and trade cycles prefigures the later work of John Maynard Keynes. This theory, presented initially in *The Physiology of Industry* (1889, with A.F. Mummery) and developed more fully in *The Industrial System* (1909), suggests that the unequal distribution of income leads, especially through underconsumption and tendencies of the rich to save their wealth, to growing unemployment.

Specifically, unequal income distribution places vast quantities of wealth in the hands of the rich, who tend to save large proportions of their income. In addition, competition among capitalists for further wealth leads to growing industrial concentration as less successful capitalists are absorbed by their stronger competitors, who come to monopolize markets and develop the economic strength to influences state policies in their own interest. Monopoly power leads to even greater profits and savings, which lead to further decreased consumption and an extension of unemployment and poverty.

The solution for Hobson, anticipating Keynes, was to redistribute income through taxation and the nationalization of monopoly industries as means to disperse the social surplus. Increased demand would provide adequate markets for increases of investment and production. Even more, Hobson develops his analysis, in *Imperialism:* A *Study*, into a theory of global competition and imperialism. For Hobson, imperialism is based in the failure of consumption to keep up with production for the reasons outlined above. This led capitalists to seek foreign markets for the sale of goods that were otherwise left unsold and for new investment opportunities. Imperialism was marked, however, by the same problems of unequal income distribution, underconsumption, competition, and monopoly.

Despite his advocacy of government-sponsored social reform programs, Hobson opposed statist socialist visions of a planned economy directed through the state and advocated instead a mixed economy allowing both individual private property and public property. At the same time he opposed classical liberalism in arguing for an expanded role of the state in managing the economy.

Given the social conditions that he observed in England at the turn of the century, Hobson was convinced that classical liberalism offered little in addressing key issues of poverty, inadequate housing, unsafe working conditions, poor health, and illiteracy. Against the *laissez-faire* liberalism that was rampant in English economics and politics during the late 19th and early 20th centuries, Hobson proposed a perspective of New or Social Liberalism, which opposed the unbridled individualism of classical free-market liberalism.

Where advocates of classical liberalism presented an atomistic view of individuals without communal responsibility, Hobson argued that the development of the individual must contribute to a healthy and progressive society. For this to be achieved required that individual freedoms and social welfare provisions go hand in hand. Using the biological metaphors popular in the social thought of his era, Hobson argued that society has a direct stake in assisting the development of each of its members just as an organism requires the health of its individual cells.

For Hobson, society was a rational moral organism that had a character and existence that could not be reduced to its individual members. This is worth reflecting upon in the current context, in which many politicians and social policy analysts have joined with Margaret Thatcher in suggesting that there is no such thing as society.

Hobson resisted the dualism between individualism and collectivism, drawn in opposing ways by both liberals and socialists. For Hobson, society must allow for the development of collectivist and individualist tendencies, which were, in his view, combined within human nature. A progressive society will be constructed through the interplay of these complementary characteristics.

As a thinker, Hobson has suffered the fate of other heterodox or nonprofessional socioeconomic theorists. His works on poverty, unemployment, and social welfare have been largely forgotten and there is little engagement with his works, either in economics or sociological circles. Yet his writings on each of these issues as well as his attempt to develop a democratic so-

cialism or social liberalism, in addition to his writings on imperialism, offer much of value in the current era of neoliberal capitalist globalization.

JEFF SHANTZ YORK UNIVERSITY

Homelessness

SHELTER IS ONE OF THE basic necessities of life. However, many people in this country lack a stable place to call home. Homelessness describes the condition of lacking a permanent, regular, and adequate nighttime residence so that during the night a person uses a supervised shelter designed for temporary living accommodations or uses a private or public place that is not meant for, or designed for, regular sleeping accommodations. Homelessness is a severe form of poverty, as homeless people not only lack a permanent residence but lack all the amenities that come with that—a place to bathe, eat, store belongings, be found by friends and family, and from which to negotiate for employment and other social activities.

BACKGROUND OF HOMELESSNESS

Homelessness is not a new phenomenon: the United States has had people without permanent dwellings since the colonial era. The Elizabethan Poor Laws, brought over from England, guided the colonists in their handling of poverty. From this early period, policies and beliefs emphasized work and family responsibility, thereby keeping the numbers of idle people limited and out of sight.

It was not until larger urban areas developed that pockets of homelessness arose. Periods of economic or social upheaval, such as after the Civil War or during the Great Depression, witnessed larger and visible pop-

Homelessness in America: the estimates of the homeless population based on information gathered by the U.S. Conference of Mayors indicates 41 percent are single men. A root cause of homelessness is poverty.

ulations of homeless people. While they were still considered vagrants, there was more tolerance of homelessness when it seemed to be caused by large-scale disturbances such as war or economic depression. By the 1960s and into the 1970s, with the development of social programs for the poor, homelessness seemed to dissipate and fade from social awareness. By the 1980s, this had changed. Homelessness emerged as a national concern. Media attention publicized the lives of people in shelters and those living on the streets.

Two factors seem to have contributed to the growth in the numbers of people who were homeless and their visibility. During the 1960s, a movement called deinstitutionalization emerged. This public policy change involved closing public mental hospitals and encouraging people who had been institutionalized or would be institutionalized to live within their communities. This movement was facilitated in large part through the cre-

ation and advancement of psychotropic drugs, medications that could help people with serious mental illnesses to cope with day-to-day living and not be institutionalized.

While positive in its intent, the policy had one major drawback. The social and medical support resources needed to help people maintain their regimen of medication and healthcare never fully materialized. Deinstitutionalization, removing people from living in state mental hospitals, required the development of a network of community mental health centers. While some were created, the extent of services was never adequate for the need. This left many formerly institutionalized people without resources and skills to live safely on their own, and added to the homeless population.

Much of the visible homeless population of the 1970s was an outgrowth of deinstitutionalization. Coupled with this growing number of individuals was a new

group, homeless families. During the 1980s, cutbacks in social programs, growing costs for housing, and economic decline for lower-end workers contributed to the growth in the numbers of homeless families with children. It was during the 1980s that the term *homelessness* came into popular use.

Earlier terms used to describe homeless people have included vagrants, idle poor, sturdy beggars, paupers, bums, and indigents. Historically, the image of a homeless person has been that of a single man wandering from town to town as during the Great Depression, or one who could not hold a job and consumed too much alcohol. While these images of homelessness portray the experiences of some people in the United States, the homeless population of today is varied and includes significant portions of other groups, such as families and children.

EXTENT OF HOMELESSNESS

Most attempts to count homeless people are based on the numbers who use shelter services, and counts in geographic areas where homeless people are known to gather. These methods exclude the numbers of people who double-up and live with family and friends, but still lack a permanent home. Thus, while these numbers are useful, population counts of homelessness are variable and likely to underestimate the full extent of the problem. Accurate counts of homeless persons are very difficult to obtain.

The nature of homelessness, living without a permanent residence, sometimes in locations that are not legal places to stay, means that people who are homeless are difficult to find and move a great deal. Approximately 3.5 million people experience homelessness each year. Because people move in and out of homelessness, other research suggests that two to three percent of the U.S. population (five to eight million people) experience at least one night of homelessness. For many it is temporary, brought on by a natural disaster, but for others it is a longer-term condition, and one that impacts all facets of life.

Most people experience homelessness for a relatively short time. Possibly 80 percent exit homelessness within two to three weeks, drawing on personal and social resources for help. About 10 percent experience homelessness for a longer period, several months, because of the inability to find an affordable place to stay. Another 10 percent are homeless on a long-term basis, facing hardships that they cannot overcome easily. Because there are differences in the homeless population,

strategies to combat homelessness vary depending on the target group to be helped.

WHO ARE THE HOMELESS?

The majority of people who are homeless are single adults, most of whom are men. However, a growing proportion of homeless people are parents with their children who are under 18 years of age. Many of these families include adults who are working, but their monthly income is very low. Over 90 percent are located in urban areas, most in the central city, but some in surrounding suburbs, and a disproportionate number are members of nondominant ethnic groups. A disproportionate number of homeless people have health problems, including alcohol- and drug abuse-related problems and mental health problems.

More than a million children experience homelessness each year.

Overall the estimates of the homeless population based on information gathered by the U.S. Conference of Mayors indicates 41 percent are single men, 40 percent are families with children, 14 percent are single women, and five percent are unaccompanied youth. Estimates of the number of veterans among the homeless vary. Some urban areas report that as much as 20 percent of the homeless population are veterans, particularly of the Vietnam War.

Recent numbers indicate that families with children are the fastest growing group among the homeless population. Research reveals that over 40 percent of the homeless are made up of families with children, primarily young children. It was this surge in the number of homeless families that drew public attention to the problem during the 1980s.

More than a million children experience homelessness each year. Homeless children have worse health and greater depression and anxiety than do housed children. Homeless children also perform lower academically and have more behavior problems, in large part exacerbated by moving frequently and home instability. One-fifth of homeless children do not attend school at all. Homelessness is very stressful on families, and often leads to separation. Families must often split up because of age restrictions at shelters or because family and friends can accommodate only some members of the homeless family.

Older children, teenagers, and young adults tend to experience homelessness away from their families. The image of youth on their own used to convey a message of adventure and rebellion, much the way that the books *The Adventures of Tom Sawyer* and *Huckleberry Finn* portrayed running away. While some youth may leave home for adventure, research over the past 20 years has revealed that for young people on their own, the reality is that most have been running away to escape abusive home conditions.

A study of youths in shelters found that half reported significant conflict or physical harm by a family member as the major reason for their homelessness, and almost two-thirds reported that a member of their household had let them know that they were not wanted in the home. Homeless youths experience physical and sexual abuse two to three times the rate of other children. For youths, living on the street is particularly dangerous. At least one out of five becomes a target for sexual assault, and the majority experience physical violence while living on the streets.

Runaway and homeless youths are at greater risk for drug abuse as well. Approximately 71 percent of homeless youth in a study in Los Angeles were found to have an alcohol or drug abuse disorder. The longer a young person is homeless, the more likely he or she will develop a substance abuse disorder.

SHELTERS

The most common social service response to homelessness has been the provision of temporary shelter. Most common are short-term facilities that offer a night's or several nights' stay. Other more long-term services provide transitional housing, which may be available for longer periods, even years, to help families stabilize their economic resources and become financially independent.

Homeless shelters are insufficient for the need. Homeless individuals and families are turned away when shelters are full. In 2004, 23 percent of the requests for emergency shelter by individuals and 32 percent of the requests by homeless families went unmet, according to the annual survey of homeless shelters conducted by the U.S. Conference of Mayors. Approximately 70 percent of the cities reported an increase in requests for shelter, and almost 90 percent anticipate an increase in the coming year. While the need for shelters is increasing, resources are declining. Funding cuts in government programs impacted over 40 percent of emergency food and shelter agencies in 2005. As fund-

ing is cut, the numbers of emergency shelter beds will decline.

WHY ARE PEOPLE HOMELESS?

No one single reason explains why people are homeless. Instead there are numerous reasons, and individuals and families may experience a combination of these reasons at any given time. The overriding problem for homeless people is that they lack enough resources to secure an affordable and safe place to live. This may be because of economic conditions, physical limitations, mental health problems, or family issues.

Poverty is likely the leading cause of homelessness. This has been particularly true for families with children. During the late 1990s, more than five million families with children had incomes below the federal poverty line, yet 76 percent of these families had one or more working parents, and 31 percent of them had that working parent employed year-round and full-time. Working full-time at the minimum wage is not sufficient to pay fair market rent in any region of the country. Low-income families have faced increases in rent that have not been matched by increases in income. Almost five million families pay more than half their income to live in housing that is considered substandard. The majority of these families have children.

Between 1947 and 1973, incomes nearly doubled for all families. However, since 1973, growth in income has been uneven. Over the past 30 years incomes grew 12 percent for low-income families compared to 67 percent for high-income families. At the same time, the costs of housing and daily living have increased, and today the wage a family needs for decent housing is at least \$15.37 per hour, above the typical hourly wage in America. More than a quarter of the population earns less than \$10 an hour, making it extremely difficult to afford housing. Homeless people are those who are at the lowest end of the wage scale.

The lack of sufficient numbers of affordable places to live, compounded by the poverty that many people and families experience, has added to the numbers of homeless people. The U.S. Department of Housing and Urban Development considers affordability as spending no more than 30 percent of a household's monthly income on housing. For low-income people, this proportion is unattainable. To spend \$500 per month for housing, a reasonably low sum by today's standards, a person would need to earn at least \$20,000, almost \$10 an hour at full-time, year-round work. One-quarter of all workers earn less than \$10 an hour.

Besides poverty and drug or alcohol abuse, another cause of homelessness is mental illness. Many people who are homeless suffer from serious mental illness and are unable to hold a job or adequately manage the tasks of daily living.

Housing affordability has become more critical in recent years. Prior to the 1960s, many poor individuals and some families found permanent places to live through the rental of single rooms, often located in former hotels. These rooms are commonly referred to as Single Room Occupancies (SROs). SROs, while typically lacking kitchen facilities, offered affordable housing that was a relatively safe place to stay on a regular basis.

However, with the advent of urban development and efforts to "clean up" central cities, the areas common to SROs became prime locations for redevelopment. From 1960 to the mid-1980s, one million SROs disappeared. In 1970 there was more affordable housing available than there were poor families in need. By 2001, there were almost five million more low-income households in need of housing than there were affordable places to live.

During the 1990s, the number of affordable rental apartments decreased by 25 percent. With less affordable housing, more people found themselves priced out

of permanent housing and became homeless. Lack of affordable housing is now the number one cause of homelessness identified in urban areas.

Inability to work and consequent dependence on other means of support place people with disabilities in precarious financial circumstances. Most people with disabilities rely on entitlement programs such as Supplemental Security Income (SSI). SSI monthly benefits averaged about \$425 during 2004. Without additional income, the inability to work leaves people with disabilities vulnerable to homelessness. Furthermore the priority of obtaining shelter and food outweighs medical care, so once a person with a disability becomes homeless, his or her health is likely to deteriorate.

Many people who are homeless suffer from serious mental illness and are unable to hold a job or adequately manage the tasks of daily living. The proportion of people who are homeless with serious mental illnesses is five to six times greater than the rate of mentally ill among the general U.S. population. About 20 to 25 percent of people who are homeless have a serious

mental illness. Leaving homelessness is much more difficult for them; they are homeless more often and for longer periods of time.

Although typically the majority have had prior contact with the mental health system, they report less than positive experiences and often go untreated. Their mental illness symptoms make them vulnerable to other physical health problems that often go untreated as well. Many are estranged from their families or have exhausted the resources and caregiving ability of their family and support networks. The result is that people who are homeless with serious mental illnesses are the most difficult group to move out of homelessness and therefore often the most visible, although not the largest proportion of the homeless population.

A growing contributor to homelessness is untreated problems related to substance abuse. Research suggests that at least 10 to 15 percent of homeless persons have a substance use disorder. This estimate may be very low, as in some urban areas service providers see from one-third to two-thirds of single, homeless individuals with substance abuse characteristics.

Alcohol and drug abuse may be the major problem for homeless people. While not every person who has trouble with alcohol or drugs becomes homeless, the link seems to be very strong. Recent research has found that almost 88 percent of alcohol-abusing men and 84 percent of alcohol-abusing women were diagnosed with the disorder before they became homeless. Alcohol or drug abuse appears to put people at risk of becoming homeless and endangering their lives once homeless.

Many families become homeless when there is disruption due to violence in the home. While this is a primary reason young adults cite for their rationale to run away, for women with children this is also a contributing factor. While technically some women and their children have a home to return to, it is one that is dangerous and thus places them among the numbers of homeless families. Among homeless women and children, domestic violence is often cited as the reason for their homelessness. In many urban areas, as many as half of all homeless women and children are in shelters in an effort to avoid domestic violence in their homes.

POLICIES TO ADDRESS HOMELESSNESS

While public policies have fluctuated, recent laws have moved from providing services and treatment to criminalization. During the 1980s, legislation was enacted that would expand the services needed to address homelessness. In 1987, the Stewart B. McKinney Act

was passed, which outlined extensive efforts to serve the homeless population. The McKinney Act is the first and only major homeless policy established by the federal government. The original act included 15 programs that provided a range of services. The main components of the legislation were the provision of resources for emergency shelter, transitional housing, job training, healthcare, and education.

By the 1990s, efforts to provide services gave way to laws that tried to contain homelessness.

Evaluations of the McKinney Act programs have been very positive. However, the biggest limitation is that Congress has not fully funded the programs under the McKinney Act, making the extent of reach for the programs insufficient to cover the need. Furthermore, the programs focus on emergency measures responding to the symptoms of homelessness, not addressing the causes, such as low wages, lack of affordable housing, and inadequate services for poor, seriously mentally ill people.

By the 1990s, efforts to provide services gave way to laws that tried to contain homelessness, making it a criminal offense to loiter, panhandle, or congregate in public spaces. Antihomeless laws passed during the 1990s and 2000s included the outlawing of sitting on sidewalks, loitering, urban camping, panhandling, and congregating. Additional laws were passed to privatize formerly public spaces such as outdoor malls and some parks. By making these places private, exclusionary policies became easier to enforce than in public spaces. This latest trend in public policy and homelessness reflects a departure from the service-delivery emphasis of the 1980s.

SOLUTIONS TO HOMELESSNESS

There are two ways to respond to homelessness. The first is to provide services that address the immediate situation, the emergency of being without a nighttime residence. The second approach is to focus on the deeper, structural causes of homelessness.

Most experts agree that the biggest obstacle to preventing homelessness is the shortage of affordable housing. Longer-term solutions need to focus on creating more affordable housing and helping people to become employed in living wage-paying jobs. Assistance with housing has proven to be a cost-effective way to

support families. For example, one of the results of broken families is that children often end up in foster care. Nationally, it costs about \$48,000 for a year of foster care compared with about \$9,000 for a permanent housing subsidy. We need to reclaim abandoned and substandard housing to create subsidized housing that is safe and accessible for low-income people.

Other longer-term solutions focus on employment and education as key preventive measures to poverty and homelessness. The efforts of the McKinney Act to create training education programs for adults and education services for children have been successful. Full funding of these programs would help toward preparing people to leave homelessness permanently.

Services that need to be provided include most that are currently under the McKinney Act—shelters, transitional housing programs, healthcare access, and education for homeless people. Healthcare, with an emphasis on substance abuse treatment and mental health services, needs to be targeted to homeless people. While deinstitutionalization represented the worthy goal of allowing people to integrate freely in the mainstream society, the outcome has been otherwise. We need to create programs that provide permanent housing coupled with mental health services. This means developing programs that provide medical care in unconventional ways and places, such as from mobile clinics that visit places where homeless people live or gather. While such programs exist, the numbers are insufficient for the existing need.

Although homelessness has always been a social problem, the extent and composition of the homeless population today present a very serious issue that needs to be addressed. Children who grow up homeless are less likely to be able to break the cycle of poverty in their families. They experience stress that affects their health, their ability to learn, and their behavior. Homelessness splits families apart, contributing to other problems. Alcohol and drug abuse are serious problems in general, and particularly harmful when linked to homelessness. Physical and mental healthcare are also significant areas that need to be addressed in an effort to ameliorate homelessness.

ELIZABETH A. SEGAL, PH.D. ARIZONA STATE UNIVERSITY

Honduras

THE REPUBLIC OF HONDURAS in Central America was originally part of the Mayan civilization but later came under the domination of Spain. In 1821, Honduras won independence, along with many neighboring countries.

From 1957 to 1982, political power remained mostly in the hands of the military. In 1982, a democratic election established civilian rule. For most of the 1980s, Honduras served as host for the anti-Sandinista Contra movement, which was dedicated to ridding neighboring Nicaragua of its Marxist government. Honduras also proved to be an ally of the leftist guerilla forces of El Salvador.

Honduras is subject to frequent but mild earthquakes. The hurricanes and floods that occur along the Caribbean coastline, however, are often destructive. Such was the case with Hurricane Mitch, which hit Honduras in 1998, killing 5,600 people, causing \$2 billion in damage, and devastating the economy.

Because of its status as a Heavily Indebted Poor Country, Honduras has worked with the World Bank and the International Monetary Fund (IMF) to reduce its substantial debt and is making progress toward economic growth. Honduras has also signed a free trade agreement with the United States, a move that is expected to have a significant impact on the Honduran economy. However, high crime rates serve as a deterrent to foreign investors.

Honduras has a vast potential for further development through exploitation of its resources, which include timber, gold, silver, copper, lead, and hydropower. The Honduran economy has become more diverse in recent years, but 34 percent of the labor force are still employed in the agricultural sector. Approximately 45 percent are engaged in services, and 21 percent work in various industries. Unemployment is massive in Honduras, with a current rate of 28.5 percent.

As a result of high unemployment and deteriorating social conditions, around 35,000 citizens leave Honduras each year. Most emigrate to the United States. The Honduran economy is annually boosted by remittances of around \$1 billion that workers send back to their families in Honduras. Some estimates suggest that up to 25 percent of these remittances are sent in ways that are outside the control of the Honduran government, so the total may be much higher.

With a per capita income of \$2,800, Honduras is one of the poorest countries in the western hemisphere, although it is a lower-middle-income nation by world standards. Income is unevenly distributed, with the richest 20 percent claiming 58.9 percent of income and resources while the poorest 20 percent share only 2.7 percent of income and resources. Honduras is ranked 55 percent on the Gini Index of Human Inequality.

The poverty rate in Honduras is currently 53 percent. Poverty is concentrated in rural areas, where poverty rates are estimated as high as 75 percent. Some 44.4 percent of Hondurans live on less than \$2 a day, and 23.8 percent live on less than \$1 a day. Around 21 percent of the population are malnourished. Women and children are among the poorest of Hondurans.

Despite high levels of poverty, social spending has declined by as much as 40 percent in recent years, and social programs are vastly underfunded. In 2004 the government launched a three-year poverty reduction program based on IMF guidelines.

The population (6,975,204) of Honduras is relatively young, with a life expectancy of 65.6 years, but

life expectancy has been steadily rising for the past several decades. The median age is 19.15 years. Nearly 41 percent of the population are under the age of 14, and 3.7 percent are at least 65 years of age. The HIV/AIDS epidemic represents a serious threat to Honduras. With a prevalence rate of 1.8 percent, 63,000 people are living with the disease, which has killed over 4,000 Hondurans.

Access to healthcare is limited in Honduras, and there are only 87 physicians for every 100,000 residents. It is estimated that less than 49 percent of the population have access to affordable essential drugs. About 12 percent of Hondurans lack access to safe drinking water, and one-fourth of the population has no access to improved sanitation.

The Ministry of Health has been charged with overseeing efforts to reduce childhood mortality and making healthcare more accessible to all children. Between 1970 and 2003, infant mortality fell from 116 to 32 infant deaths per 1,000 live births. The mortality rate of all children under 5 plunged from 170 to 41 deaths during that same period. Around 17 percent of all children under the age of 5 are malnourished, and 13 percent of infants are underweight at birth. Approximately 29 percent of under-5s experience moderate to severe stunting. Much has been done to improve immunization rates in Honduras. Among children from birth to 23 months, disease immunization rates are in the 90 percent range.

Fertility rates are also excessively high in Honduras, but they have been declining over the past decades. Between 1970 and 2005, the total fertility rate dropped from seven to four children per woman. The Maternal and Child Department oversees efforts to reduce fertility in Honduras, but the Honduran government no longer promotes sex education. The distribution of reproductive health handbooks in the schools has also been discontinued.

Information on family planning is distributed to teenage mothers in response to rising adolescent fertility rates. In 2003, that rate was 103 out of 1,000 births. Approximately 62 percent of Honduran women use some method of contraception. Trained medical staff attend 56 percent of all births in Honduras, and 83 percent of Honduran women receive professional antenatnal care. According to modeled estimates for 2000, maternal mortality occurs at the high rate of 110 deaths per 100,000 live births.

Among the Honduran population over the age of 15, 76.2 percent can read and write. Females (76.3 percent) are slightly more literate than males (76.1 percent).

Rates of illiteracy have steadily declined since 1980, when 38.1 percent of males and 42 percent of females were illiterate.

About 79 percent of all Honduran children complete primary school, but many students have to repeat grades, with more than 50 percent of students taking over nine years to complete primary school. Girls now outrank boys in primary school attendance. More than half of all students attend private rather than public schools. The quality of education is somewhat higher in these schools, but overall quality of education remains low.

Human Development Index Rank: 116 Human Poverty Index Rank: 39

ELIZABETH PURDY, Ph.D. INEDPENDENT SCHOLAR

Hoover, Herbert (Administration)

HERBERT CLARK HOOVER was born in Iowa in 1874, but the death of his father led him to live with his uncle in Oregon. Initially he was a highly successful engineer. He secured a partnership in Bewick, Moreing, and Company in 1901. By 1908 he had worked on mining projects around the world. In 1909 he lectured on mining at Stanford University and these lectures were published as a book. He went into public service during World War I. Hoover became well-known for his work on famine relief. He organized a relief program for Belgium, which had been invaded by Germany.

After the United States entered the war, President Woodrow Wilson appointed Hoover as head of the Federal Food Administration. After the war Hoover organized food shipments to central Europe as head of the American Relief Council. This included food ship-

ments to Bolshevik Russia. Some objected, but Hoover insisted that politics must not interfere with relief.

Hoover was also a member of the Supreme Economic Council. He proposed a reconstruction plan for America, which included construction of public dams, promotion of unions and collective bargaining, regulation of the stock market, a federal home loan bank, and direction of capital by the Federal Reserve Bank. These plans did not go into effect.

President Warren Harding appointed Hoover as secretary of commerce. As commerce secretary he advised Harding to intervene in the depression of 1920. Hoover pushed for public works spending and high wages. The idea behind this policy was that high wages would keep household income high, in turn keeping consumer spending high and helping business conditions. Harding resisted most of Hoover's recommendations, so his policies never went into effect. The Harding administration tended to do the opposite of what Hoover wanted. The depression ended in 1921.

"We in America today are nearer to the final triumph over poverty than ever before ..."

President Calvin Coolidge kept Hoover on as commerce secretary. Hoover played a role in the formation of the Federal Radio Commission (now known as the Federal Communications Commission). Coolidge decided not to run for another term. Hoover ran for president instead, and won.

While the Coolidge administration had presided over widespread prosperity, Hoover's administration would endure perhaps the worst economic period in U.S. history. Upon entering office Hoover declared that "we in America today are nearer to the final triumph over poverty than ever before in the history of any land. The poorhouse is vanishing from among us." Yet the Hoover years were marked by increasing poverty for millions.

Amid this hardship, some prospered as never before. The economy began to slow after Hoover entered office. Few recognized the deterioration of economic conditions until the stock market crash on October 29, 1929. Hoover's initial reaction indicated that he did not appreciate how serious the situation was. On October 25, 1929, he said, "The fundamental business of the country, that is, the production and distribution of commodities, is on a very sound and prosperous basis." Hoover reacted to this crash by organizing conferences

of industrial and labor leaders during November and December 1929. Hoover urged industrial leaders to avoid cutting wage rates and many industrialists pledged to maintain wages. He thought that maintaining wages would spur economic recovery because these wages would also maintain consumer spending. His program did not deliver its intended effect.

This was a period of deflation. The Federal Reserve pulled back on monetary policy in 1929, and this worked to slow the economy. Subsequent bank failures led to a collapse of the money supply and a falling price level. With consumer prices falling, Hoover's program to keep wages from falling meant that real wages, adjusted for deflation, rose dramatically. For example, real wages in the machine tool industry rose four percent in 1930 and eight percent in 1931. However, employment in that industry fell 38 percent in those two years. In the iron and steel industry real wages rose 1.5 percent in 1930 and 7.5 percent in 1931, but employment in this industry fell 68 percent. Other industries that followed Hoover's policies experienced similar results.

Unemployment rose to 15.9 percent in 1931 and 23.6 percent in 1932.

Those workers who retained full-time employment during these early years of the Great Depression benefited from wage increases. In fact, many of those who still had jobs prospered as never before during the Hoover years. Those who lost their jobs endured severe poverty. It was also the case that many workers were only employed part-time.

The overall employment rate skyrocketed during the Hoover administration. Gross National Product (GNP) had been \$203.6 billion in 1929, but it fell to \$183.5 billion in 1930, \$169.3 billion in 1931, and a dismal \$144.2 billion in 1932. Per capita GNP for this period fell from \$103 to \$58. The severity of the poverty caused by this decline in average GNP is even worse when one considers that many industrial workers had increased wage incomes—others with lower wages were even worse off than per capita GNP figures indicate.

The Hoover administration increased federal spending dramatically. He worked to increase federal spending on public works as soon as he entered office, before the onset of the Great Depression. The federal budget was \$2.9 billion in the year before he entered office. In his first year it increased to \$3.1 billion. By 1932 he had increased the federal budget to \$4.7 billion. Much of

this increased spending went into public works projects, including the Boulder, California Valley Central, and Grand Coulee Dams. His Employment Stabilization Act established the Employment Stabilization Board, which pushed for more public works. He did this during a collapse of federal tax revenue, from \$4 billion to \$2 billion. This resulted in massive deficits, whereby over half of federal spending added to public debt. The federal budget ran a deficit of close to \$.5 billion in 1931 and nearly \$3 billion in 1932.

In January 1932 Hoover founded the Reconstruction Finance Corporation. Initially Hoover had encouraged private banks to form the National Credit Corporation (NCC) as a means to support banks in financial difficulty. The NCC began its operations on November 11, 1931. The Federal Reserve pressured Hoover to create a federal agency to perform this task. Congress passed legislation founding the Reconstruction Finance Corporation (RFC) on January 22, 1932, and it began its operations on February 2, 1932.

At first Congress funded the RFC with \$1.5 billion. This organization initially paid out massive loans to banks and railroads and financing was later extended to industry and agribusiness. By July RFC funding had been expanded to \$3.8 billion. Large banks, like J.P. Morgan, benefited heavily from RFC funding. When it came to poverty relief for poor families, Hoover advocated voluntary charity. Ultimately the RFC allocated \$300 million in loans to states for relief to poor families.

Hoover also acted to keep wheat and cotton prices high. These policies did not deliver their intended effect. Instead joblessness rose, poverty deepened, and excess stocks of agricultural produce accumulated. The overall unemployment rate had been 3.2 percent in 1929. It rose to 8.9 percent in 1930, 15.9 percent in 1931, and 23.6 percent in 1932.

Hoover insisted that his policies had worked. In 1932 he said, "We could have done nothing. That would have been utter ruin. Instead, we met the situation with proposals to private business and to Congress of the most gigantic program of economic defense and counterattack ever evolved in the history of the republic. ... For the first time in the history of depressions, dividends, profits, and the cost of living, have been reduced before wages have suffered. ... They were maintained until the cost of living had decreased and the profits had practically vanished. They are now the highest real wages in the world."

The American electorate disagreed with his appraisal of the situation. While some did have higher

wages, about one out of four workers had no wages at all. One interesting thing to note is that while poverty and inequality increased among industrial workers, the percentage of total disposable income received by the top five percent of households fell slightly during the Hoover years. This is likely because of losses in investment income.

The Hoover administration ended with the landslide victory of President Franklin Roosevelt in the election of 1932. This was due in part to the dire economic conditions, and also to an incident in which federal troops led by Douglas MacArthur drove a group of peaceful protestors out of Washington, D.C.

Hoover lived longer after leaving office than any other president—31 years. During this time historians developed a harshly critical and some say well-deserved appraisal of his administration. The Hoover administration has one of the worst records on general economic conditions and poverty in the history of the American presidency. Of course, there are others who share blame for all that went wrong during the Hoover years, especially the Federal Reserve Bank and Congress. Yet there is little doubt that Hoover did attempt to deal with the Depression, and this attempt failed.

Household Consumption

THE CONCEPT OF HOUSEHOLD, like its kindred concept of family, is beset with methodological problems and difficulties in cross-cultural comparison. It

survives in anthropological studies of poverty partly on account of researchers' desire to export the concept from industrial societies in attempts to apply existing economic models to small-scale societies. This led to a conceptual manipulation of indigenous forms of economic organization to fit the model of household. The term first came into use in English and referred to a feudal form of organization that remained in later industrial and postindustrial forms of production, consumption, and resource management.

In developed societies, especially in Europe, it has become a key analytical and policy unit for measuring and responding to socioeconomic inequality. The household is perceived as an economic unit of individuals sharing a permanent residence. This definition has been reinforced by the ideological legacy of the nuclear family in Europe and the United States that critics conceive of as politically and morally influenced. Feminist critics first started to question the measure of "head of household's" income to ascertain socioeconomic status in survey methods. This was seen to undermine the input of women into household economies, as head of household was seen as synonymous with the male breadwinner role. This also undermined alternative living arrangements, such as shared flats and people living in homes for the elderly being seen as marginal forms of

Economists became interested in households in the 1960s so as to make predictions from household economic behavior on the behavior of the wider economy. In the modernist rationalist fervor of the time, the household was conceived as a factory with capital goods, raw material, labor, and a manager. The rise of feminist critiques in the 1970s brought the transactional and conflict-ridden nature of household decisions to the fore, undermining the idea that there was one household decision-maker or the notion that households acted as a singular economic entity. More recently the purchasing power of children in market economies has also been recognized.

The importance of noneconomic transactions has also emerged, connected to an interest in social capital. Social capital has drawn attention to reciprocal transactions involving extended kin and nonrelated individuals that can make a contribution to household economies, such as informal childcare. These favors, though not measurable economically, may facilitate economic activity, such as involvement in paid work. This can make a crucial contribution in single-parent households where there is evidence of such reliance on extended kin. This pushes the boundary of household beyond the shared

residence and reflects earlier notions of extended family and gift relationships.

The household's central place in government policies of the West has led some critics to suggest that these policies (especially those related to welfare) have overstated or even artificially maintained the household in a certain outmoded form. Both Margaret Thatcher in the United Kingdom and Ronald Reagan in the United States based welfare reform along the lines of the traditional nuclear family, which underpinned their own moral standpoints.

A preference for traditional male-breadwinner families was undermined by a decline in traditional male employment that provided wages capable of supporting families. One consequence of this was the pushing of women in traditionally structured households into the labor market. Later, so-called third-way social policies recognized the change in family forms, notably those referred to in the United Kingdom government's Supporting Families green paper.

Household Employment

IN OUR SOCIETY TODAY, household employment has fluctuated up and down depending on the economy. There are different types of households that vary with the average income.

In many cases the division centers on whether or not the household is a one-income household or a twoincome household. Some of the factors impacting household employment are as follows: region of the country, type of occupation of the person, and education and age of the householder.

One--income households vary by gender of the householder. The average one-income household inearns \$28,500 and the average female one-income household earns \$20,800. Another division of the one-income household is the age of the householder. For example, of the 31.1 million one-income households in the United States, 4.5 million householders are under the age of 25 and 9.9 million are over 65.

The average family income in the United States is currently about \$43,625 a year. This is a household with a two-person income in the United States. Two-person income and quality of life vary by whether or not there are children in the household. If no children are present in the household, the couple will have more discretionary income to purchase luxury items. If there are children in the home, the family income will become very strained by the expenses that occur with children in the household.

Employment in the area of residence is a major factor affecting household income. In 2004, Hawai'i had the lowest jobless rate and Alaska and Oregon had the highest jobless rates. There were 16 other states that had above-national-average unemployment rates of 5.5 percent in 2004. Thus the region of the country will have an impact on household income. Another state that has an unemployment problem is Michigan. Michigan is making a transition from a manufacturing economy to a service economy. On the other hand, the Colorado economy is good because people are moving to Colorado from all parts of the country.

The type of job a person holds in many cases dictates the income of that person. In society today, there are several booming occupations that are listed as paying well. According to the Occupational Prestige Ranking, the top five occupations in the 2000s are as follows: physician, college professor, dentist, architect, and lawyer.

As society changes from an industrial economy to a service economy, degrees and diplomas matter in the job market. It has been indicated that people with a college degree earn more in a lifetime than individuals with a high school diploma. The top five occupations all require education. If a household does not have individuals that have credentials, the income of the household suffers.

As the age of a person goes up, the income goes down because many older individuals are on a fixed income. Social Security remains the number one source of income for individuals over 65. There are other sources of income for the elderly. For example, many individuals over 65 can obtain income in the form of assets, pensions, earnings, and public assistance. Overall the poverty rate for individuals over 65 fell from 25 percent in 1976 to 17 percent in 2000.

Household Income

HOUSEHOLD INCOME IS regarded as a critical variable for measuring the economic well-being of families and households and an important indicator of household welfare and poverty status. Increases in income in the long run contribute to an improved quality of life, because income provides the means to obtain nutrition, health, education, and overall socioeconomic status. Household income provides resources for household consumption and provides an indication of potential future consumption. Household debt and credit also have an effect on household consumption patterns and well-being outcomes. Credit may add an immediate effect on cash resources for consumption expenditures, while debt repayment will do the opposite. The consumption and investment pattern of a household is of course subject to a system of separate individual decisions and activities.

Household income generally consists of the combined gross money income of all persons who occupy a single housing unit. Household income can be composed of the gross money income earned by one or more families, one or more unrelated individuals, or a combination of families and unrelated individuals who occupy a single housing unit.

Household income is a flow variable defined within a specified time period, usually one year. It generally consists of the sum of inflows from all sources, including wage income or salary income, net income from entrepreneurial and farming activities, rental income, pension or retirement income, remittances received, government transfers, investment income, and gifts. In practice there is considerable variation in terms of which categories of inflows are included in the measurement of income. Even when comparability of components is consistent across countries, international comparisons require some way to compare the purchasing power of a given income in different countries.

Household income can be very difficult to measure reliably and accurately, and it is commonly understood that income tends to be underreported in survey studies. Because it is made of multiple sources there can be great variation in which components may be included in any one measurement, which makes comparability of data limited (across countries, across studies). Respondents often regard income as personal and confidential information; thus the accuracy of self-reported data is questionable.

Additionally, because of multiple sources of household income, it is necessary to gather information on all the sources and it may not be easy to identify all of them. Formal sources such as wage employment are easier to track than informal sources, such as odd jobs or informal self-employment earnings. Additionally, if one assigns value to in-kind contributions such as food, or if the time of household members is valued, then the imputed value of maintenance activities such as meal preparation, washing clothes, or childcare might be included in a calculation of household income.

Other issues also affect the accuracy, reliability, and comparability of data collected on income. Collecting accurate data on a flow variable is more difficult than collecting data on a stock variable like assets, which can be measured at one point in time. Further complicating the picture are fluctuations in income flows. Income flows may vary widely during a defined period of time. Collecting income over a longer period of time such as a year can help account for the effects of fluctuations. The more frequent and regular the intervals that income data can be collected, the greater the accuracy. The real value of income must also be taken into account. Comparing household income over time must take into account changes in the value over time, such as inflation, and be adjusted accordingly in order to compare household gains or losses over time.

Housing Assistance

HOUSING ASSISTANCE IS provided to the poor and low-income buyers in a variety of ways in the United States. The Housing Assistance Corporation (HAC) is a federally registered nonprofit organization. Its mission is to help families buy homes. If a family is given an HAC grant to purchase a home, the grant does not have to be repaid. In this way dream home ownership can become a reality.

Legally HAC is a federally registered 501(c)(3) corporation. It has a working relationship with other federally registered 501(c)(3) organizations with which it issues home grants. The Home Grant program is a Special Down Payment Assistance Program. In order to purchase a home on credit a down payment is needed and many low-income families cannot muster a down payment. The Special Down Payment Assistance Program gives the down payment to individuals or families across the nation so that they can purchase a home.

Many thousands of low-income individuals and families have been aided by these home grants, which do not have to be repaid. The funds donated for this purpose are used to pay the down payment and the closing costs. A stipulation of the grant is that the individual or the family must accept training in homeowner education.

The many nonprofit organizations that participate in the program are spread across the United States. These supporting organizations are staffed by experienced real estate professionals who are dedicated to the vision of aiding low-income home buyers. Among the services that home grant workers perform are debt counseling, budgeting skills, credit management, and fiscally responsible spending. The Special Down Payment Assistance Program and the people who work in it

are committed to helping low-income or first-time young buyers to achieve the American dream of home ownership. The program allows for home purchases with "little or no money down."

In other areas of housing assistance, the federal government has relief housing available after natural disasters. In 2005 following devastating Hurricanes Katrina, Rita, and Wilma, a program of Emergency Temporary Housing Facility houses was instituted by the Federal Emergency Management Agency. The houses were temporary emergency housing that was very similar to travel trailers.

In order to be eligible for emergency housing people had to register and include some kind of mailing address through the United States Postal Service or a phone number. While people were living in temporary housing, a program of disaster assistance was available. This program would give people assistance with repairing or rebuilding their hurricane-damaged home. The program was designed to help people repair, rebuild, replace lost household items, and pay for other related expenses.

Hull House

AMERICAN REFORMER Jane Addams founded the Hull House settlement in Chicago in 1889 on Halsted Street, then one of the poorest neighborhoods of the city. Addams and her companion Ellen Starr were inspired by what they had seen in Toynbee Hall in the East End of London, a settlement that was designed for students from Oxford and Cambridge Universities to work among the poor during their vacations.

In the same way, Addams and Starr wanted to provide middle-class women like them the opportunity to be both socially useful and independent, an opportu-

nity that was denied the majority of women at the time. Hull House provided an outlet for the intellectual and practical abilities of the young females who became its directors. Without such an outlet the fate of these young women, Addams writes in her autobiographical volume *Twenty Years at Hull-House* (1910), would be comparable to that of "the other great mass of destitute lives." By 1900 the settlement had flourished as a popular center of political, educational, and social activity. Because of Hull House, Addams became well-known and a nationwide settlement house movement began. In 1897 there were 74 settlements in the United States, and by 1900 there were over 100. In 1911, leaders of the settlement movement founded the National Federation of Settlements.

Most of the people living in the area surrounding Hull House were recent arrivals to America, mostly European immigrants. The neighborhood of Hull House was part of poverty-stricken Chicago's 19th ward. Hull House soon came to include 13 buildings. To the poor immigrants living in the area the center became a meeting place where they could talk about their needs. Although Addams's description of the poor in *Twenty Years at Hull-House* is outdated and patronizing at best, the settlement quickly responded to most pressing requests of the immigrants and acted as a mediator between them and government officials.

The settlement went on to include daycare centers for children of working mothers, opened adult high schools, and provided cooking and sewing classes. An art gallery was also created, and Ellen Starr organized art classes and exhibitions. A coffeehouse, a gymnasium, a clubhouse, and even a theater were added in the 1890s. In its mission to help the poor, Hull House recruited university professors, students, and social reformers such as John Dewey, Clarence Darrow, and Frank Lloyd Wright.

Partly influenced by her small-town background, Addams tried to reconstruct a face-to-face rural community within the expanding urban context. In her article "A Function of the Social Settlement" (1899), Addams defined the function of a settlement as bringing "to life the dreary and isolated" and bringing them "into a fuller participation of the common inheritance," so that residents of the neighborhood could establish meaningful relationships to each other. Immigrants were involved in national evenings where traditional dances, games, and food of their countries of origin were offered. Hull House was first inspired by the values of Christian socialism, also due to the presence of Florence Kelley, a member of the Socialist

Labor Party. Hull House thus also became a center for social reform, with Kelley organizing research into the sweatshop trade in Chicago, which eventually led to the Factory Act (1893) and to her appointment as chief factory inspector for the state of Illinois. These activities were central in the development of social work as a profession.

The settlement was also the founding place for the Women's Trade Union League, which supported workers in their negotiations with industrialists. This, together with Addams's stance against World War I, provoked tensions with some of the donors, who withdrew their financial support. Such support was indispensable to keeping the settlement alive as its expansion to a city block provoked a sharp rise in the costs.

When Addams died in 1935, Louise Bowen became the director of the settlement. Hull House continued in its task to integrate immigrants into American life and to improve living conditions for the poor in Chicago. However, Bowen did not have good relationships with the two head residents that she appointed, first Adena Miller Rich, and later Charlotte Carr. Carr, in particular, shifted Hull House toward the left, encouraging the neighborhood residents to join trade unions. Although attendance at the settlement grew sharply, Carr was fired when she refused to give up its membership of the left-wing Union for Democratic Action.

After Bowen's retirement, the main focus of Hull House and its new resident head, Russell Ballard, became children's welfare. In the 1950s, Hull House was closed as part of the scheme to turn the area of the settlement into a university campus. The bitter dispute that the case engendered arrived in front of the Supreme Court with residents Jessie Binford and Florence Scala appealing against closure. The ruling of the Court went against them. In 1963, Hull House was reopened as a museum.

Human Capital

WE USUALLY THINK OF CAPITAL as money that is kept in banks, invested in shares or stocks, or concretely represented by material goods such as a car, a house, or industrial infrastructures. However, investing in training courses, education, and healthcare can be equally productive forms of investment to relieve poverty.

The expected returns of such investments can be higher salaries and the improvement of medical care. These, then, are all investments in human capital, usually described as the most valuable yet elusive of assets. Human capital constantly reevaluates itself as knowledge increases with practice. It is also easily transferable across individuals and national boundaries. Chicago School economist and Nobel Prize laureate Gary Becker was one of the first to theorize the existence of human capital in his eponymous 1964 study. Becker compared human capital to "physical means of production," such as factories and machines. Of course human capital cannot completely replace land, labor, or capital, but it can substitute for them to a certain extent.

The exponential growth of Asian economies in the 1980s and 1990s is a clear example of the way human capital can create wealth and fight poverty. Although Japan and Taiwan lack natural resources and import almost all their energy from abroad, these countries grew rapidly by relying on a well-trained, educated, hardworking, and conscientious labor force that made excellent use of modern technologies.

Studies have shown that training and education can substantially improve people's salaries. In addition, in developing countries, these can be means to make their citizens the protagonists of their countries' development. Investments in human capital could be a first step to shifting from a mere "assistentialist" model, where developing countries are dependent on industrialized nations not only for financial help but also for professional know-how, to one that could enable a more independent development.

Healthcare programs also play an important part in human capital investments. Scholars have argued that the health of a population matters greatly. A healthy person not only works more efficiently but can also devote more time to productive activities. Microeconomic evidence suggests that, like education, health can produce variations in wages. Macroeconomic research has pointed out that health capital positively influences aggregate output. David Bloom and Jaypee Sevilla have demonstrated that up to one-third of annual Gross Do-

mestic Product (GDP) growth can be attributed to health capital, and an increase in life expectancy of one year is associated with an increase in the long-run growth rate of up to four percentage points in both developing and industrial countries. Good health also promotes better education.

While Asian countries have reduced poverty through economic growth, African countries have made uneven progress and are still vulnerable to pandemic diseases, including HIV/AIDS. Healthcare projects that can upgrade human capital are imperative. Corruption still plagues the provision of services associated with the improvement of human capital, and policymakers have pointed out that increasing public spending cannot always be the best of solutions if it is not accompanied by increased levels of efficiency and renewed labor policies. For example, human capital investments in education should also be paralleled by an increased demand for skilled labor. Investments in human capital are vital for the development of the poorer regions of sub-Saharan Africa.

Human Development

HUMAN DEVELOPMENT IS the gradual process of evolution and differentiation that occurs in the well-being of individuals over their life spans. Such changes may be economic or otherwise. Thus achievement of a higher level of income is only one dimension of development. Other dimensions include better nutrition, health, and education, and general improvements in the prosperity and security of individuals over their life-time.

Human development invariably involves individual choices that are made given the constraints individuals

face. Some of these constraints may be a consequence of their earlier choices (for example, unwillingness to undertake training or work). Other constraints may be beyond their control and due to the conditions faced (for instance, poor genetic endowments, illness, discrimination, or political repression). Articles in specialized journals such as *Human Development* offer insights into development during the human life span.

Naturally, human development necessitates expansion of the choice set available to individuals, which is often facilitated by increases in income. Clearly, many dimensions of human development, such as better nutrition, are often determined by income. At the same time, other dimensions, such as freedom of expression and political rights, are not necessarily income-related.

At a macro level, human development concerns improvements that occur over time in the welfare of the citizens of a country as a whole. Hence human development in a country may be measured through indexes combining various aspects of social development in the country such as health, education, and opportunities for advancement. Two of the best-known indexes are the Human Development Index (HDI) and the Physical Quality of Life Index (PQLI).

The HDI, computed by the United Nations Development Program (UNDP), is based on three aggregate indicators of development: life expectancy at birth, real Gross Domestic Product (GDP) per capita, and educational attainment (as measured by a combination of adult literacy and combined primary, secondary, and tertiary enrollment ratios). The UNDP's annual publication, the *Human Development Report*, ranks countries around the globe, giving their HDI scores. The 2004 report places Norway and Sierra Leone at the top and bottom, respectively, for their levels of human development.

The PQLI, developed by M.D. Morris, utilizes what he regards as more accurate measures of well-being for individuals: infant mortality rate, life expectancy at age 1, and basic literacy. The PQLI scores indicate that poorer countries do not always suffer from low levels of human development. For instance, citizens of poorer countries such as Cuba and Sri Lanka enjoy high quality of life at levels comparable to some rich countries and higher than many rich countries.

These measures do not capture all aspects of human development, such as political rights and freedoms, the level of income inequality, and the status of women. In a step to defray criticism for not focusing on women's development, the UNDP has recently begun publishing a Gender Empowerment Measure, capturing the rela-

tive empowerment of women and men in political and economic spheres of activity—as well as a Gender Related Development Index, which makes a gender-sensitive adjustment to HDI, using the disparity in achievement between women and men. The nonprofit institution Freedom House, on the other hand, provides rankings for countries on the basis of political freedoms and civil liberties enjoyed by their citizens.

It therefore appears that no single index is capable of capturing all aspects of human development. In any case, most researchers agree with the sentiments expressed by T.N. Srinivasan that, since most components of any index are correlated with each other, the choice of what to include in an index is arbitrary.

Various measures of human development in countries worldwide may be found in UNDP's *Human Development Report*, or the World Bank's flagship statistical publication *World Development Indicators*, published annually (also available on CD). A more compact version of the latter is World Bank's *World Development Report*, a publication that provides selected world development indicators.

Human Poverty Index

WHILE PER CAPITA INCOME is the most commonly used and most widely accepted measure of a country's economic achievement, it has long been recognized that composite measures of economic progress might better reflect a country's true level of development. Composite measures combine a variety of qual-

ity-of-life variables into a single statistic. While a variety of composite measures exist, probably the most well-known of these statistics is the Human Development Index (HDI), which has been calculated and published by the United Nations Development Program (UNDP) annually since 1990. The HDI is designed to measure human development, defined as the ability "to lead a long, healthy life, to acquire knowledge, and to have access to the resources needed for a decent standard of living." Through a complex formula, the HDI combines a country's Gross Domestic Product (GDP) per capita adjusted for purchasing power, literacy rate, mean years of schooling, and life expectancy into a single statistic ranging numerically from 0 to 1.

While income, educational attainment, and life expectancy are generally closely correlated, the relationship is not exact and many examples exist of relatively poor countries having well-educated populations with long life spans and of rich countries with poor levels of achievement in these areas. For example in 2002, South Africa had an average life expectancy nearly 20 years lower than Vietnam's as well as a lower literacy rate despite a per capita income over four times higher.

In 1997, the UNDP began to publish a similar composite statistic related directly to poverty, known as the Human Poverty Index (HPI). While the HDI measures a country's progress toward a high standard of living, educational attainment, and longevity, the HPI measures a country's level of deprivation of these variables. Composite measures of poverty are known as deprivation Indexes, among which the HPI is probably the most widely recognized. As is the case with the HDI, the HPI provides a broader measure of the overall level of poverty in a country by focusing on statistics beyond simply income.

The UNDP calculates the HPI differently for developing countries and high-income nations. The Human Poverty Index for rich countries, known as the HPI-2, is the weighted average of four variables: the percentage of the population not surviving to age 60, the level of functional illiteracy among adults in the country, the percentage of people living below the income poverty line defined as 50 percent of the median-adjusted disposable household income, and the rate of long-term unemployment exceeding one year in duration.

The Human Poverty Index for developing countries, HPI-1, is the weighted average of three variables: the probability of a person not surviving to age 40, the adult illiteracy rate, and the combined percentage of the population without access to safe water and the prevalence of underweight children. Both the HPI-1 and HPI-

2 are weighted in such a manner as to place a greater emphasis on the components in which there is the highest level of deprivation.

Because of the nature of the variables used in estimating the HDI and HPI, as well as the calculation procedures, there are generally only small differences in the numeric values of the HDI for rich countries, while the values of the HPI can vary widely. For example, in 2002 while less than one-hundredth of a point separated the HDIs of Sweden and the United States, the HPI-2 for Sweden was 6.5 percent compared with a figure of 15.8 percent in the United States. As a rough interpretation this means that an American was about two-and-a-half times more likely than a Swede to suffer from one of the four deprivations measured by the HPI-2.

As might be predicted, the primary criticisms of the HDI and HPI are the choice of variables used to calculate the indexes and the weights placed on each of the variables. In particular, many economists believe that the formula used to convert incomes into the HDI does not fully reflect the higher standard of living enjoyed by the very richest countries. The primary criticism of the HPI is that it stresses the distribution of income too strongly over the average income level in a country. Finally, as with most national measures of poverty, a relatively low overall HPI can disguise pockets of extreme deprivation within certain geographical areas or ethnic groups.

Human Rights and Poverty

IN THE FIELD OF POLITICAL economy there are several approaches to understanding and remedying poverty. They tend to depend, in part, on the underlying idea of human nature and the conditions of social life that are best suited to human beings. If one begins with the idea that human nature is to make it possible for most people to act creatively and productively, the

most important question about poverty is, what conditions would make productive activity most likely in human communities?

If, however, one begins with the idea that human nature renders most people victims of their circumstances, mostly passive entities who must be moved in order to thrive, that too would invite the question of what conditions of a human community will foster such thriving. If, alternatively, human nature makes most people subject to the will of a deity, whose grace determines the fate and fortunes of people, that too will invite a certain kind of community.

Human beings possess free will and can rationally organize their lives.

These three alternative conceptions of human nature could be designated as free agent, passive patient, and subject of God's will. The political economies these would support, respectively, are classical liberalism, welfare state egalitarianism, and theocracy. Briefly, the first of these ideas suggests that a society that secures the negative right to liberty or freedom for all is most suitable to human beings; the second of these ideas would suggest that a society that secures the positive right to well-being or capability would be best suited to human beings; and the third would suggest that a form of government with leadership and guidance provided by those who best understand such works as the Bible or the Koran would be most fitting for human community life.

PERSONS AS FREE AGENTS

According to this view human beings possess free will and can rationally organize their lives, given their various circumstances. Some, of course, may begin with great disadvantage, yet these persons, as all others, have the capacity to advance themselves through ingenuity and entrepreneurial savvy. If someone is born into poverty, this is not necessarily a severe impediment, not unless the sociolegal conditions make personal advancement by means of creativity, productivity, ingenuity, and entrepreneurship very difficult.

In a community wherein free, voluntary interaction is legally protected from both criminals and the government, the poor are often able, if not always willing, to extricate themselves from poverty. The crucial requirement is a legal infrastructure in which individual human

rights to liberty, private property, entering into binding contracts, and other conditions of agency are given effective protection. No guarantee of success in flourishing, or even in survival, is promised in such a system, but the probability of prospering, it is argued, is greater than in other sorts of systems.

Do human beings fit this viewpoint? If they do, it would have to be the case that they have the capacity to initiate some of their crucial conduct—to put to work their minds and bodies so as to achieve prosperity, to attain their goals, to flourish in careers and family life, and to embark upon trade. One serious objection to seeing people along such lines is the doctrine of determinism: they are merely being moved by forces not under their own control, so there is no personal initiative possible in human affairs.

If, however, a different doctrine is correct, according to which persons grow up to become self-determined, capable of initiating their own actions—if this kind of causation is possible in the world and human beings are capable of it—then this viewpoint is likely to be correct.

This conception of human nature and the resulting idea of community life stress what are commonly referred to as negative or liberty rights. Having such rights amounts to an imperative to all, including governments, to refrain from intruding on persons and from invading their "person and estates," as phrased by John Locke, by securing the "moral space," as described by Robert Nozick, and by respecting their rights to private property. Governments are envisioned as agencies instituted to secure such rights by way of the consent of the governed (who, by instituting government, are exercising their right to self-defense).

PERSONS AS PASSIVE PATIENTS

The central contention of this view of human beings is that they are a variety of matter-in-motion, driven to behave as they do by the various forces that operate in nature, including their instincts, genetic makeup, and the forces of evolutionary biology. In the case of human community affairs, especially economics, this would mean that persons are at the mercy of such factors as their parents' prosperity or lack thereof, the economic conditions in which they find themselves at any particular time, and the natural scarcity or abundance that happens to surround them. Accordingly, in order for those who are in a condition of dire need to make improvements to their lives, it is necessary that they obtain whatever will render them capable of prospering.

They themselves are viewed as largely incapable of bringing about such improvements, given the conditions that have rendered them poor in the first place.

For example, John Rawls has argued that most people inherit even their virtues. The assertion that we "deserve the superior character that enables us to make the effort to cultivate our talents is ... problematic; for such character depends in good part upon fortunate family and social circumstances in early life for which we can claim no credit."

So, Rawls continues, "Those who have been favored by nature, whoever they are, may gain from their good fortune only on terms that improve the situation of those who have lost out."

Serena Olsaretti, suggesting that the thrust of the defense of the free market rests on the belief that all those who own wealth or assets deserve it, extensively develops this idea. Which is to say, the redistribution of wealth is a general moral and public policy imperative. Entrepreneurial efforts cannot reasonably be expected from those who lack "fortunate family and social circumstances in early life."

Rights commonly translate into entitlements that those in need must be provided.

In cases such as those found in countries with large populations of extremely poor people, the central or at least first remedy is to transfer to them the "surplus" from those in wealthier nations. As the philosopher Peter Unger notes, "On pain of living a life that's seriously immoral, a typical well-off person, like you and me, must give away most of her financially valuable assets, and much of her income, directing the funds to lessen efficiently the serious suffering of others." This view has also spawned the international efforts of the Nobel Laureate Amartya Sen, called the "capability ap-

In contrast with the earlier idea of negative or liberty human rights, this conception of human nature and human community life supports the idea of positive or welfare rights, rights to be provided with support that will enable or render one capable of living and flourishing in dignity. In the modern era such rights commonly translate into entitlements that those in need must be provided. Governments are instituted not merely to protect negative or liberty rights, but to protect positive or welfare rights, which requires them to engage in extensive taxation and wealth redistribution, based on the needs of those whose circumstances are seen as preventing them from advancing in life on their own initiative.

PERSONS AS SUBJECTS OF GOD'S WILL

This conception of human nature rests on the view that everyone is a creation of God and subject to God's—or Allah's or some other deity's—will. Thus the central task in life is to obtain accurate directions from God, which is mostly seen as accomplished by the reading and following of the tests that are considered to contain God's words—the Bible, Koran, Torah. Such reading is mostly accomplished by way of entrusting various church leaders, scholars, or theologians with the task of translating the texts into usable guides for public policy.

This approach to government has an ancient pedigree and extends to the modern era, for example, in Islamic countries, although others, too, are accustomed to this approach—Israel, for example, has a state that rests many of its policies on certain religious ideas and some of the countries of western Europe continue to maintain at least a ceremonial connection between church and state (England, Sweden, Norway, Holland).

Is there any distinctive relationship between such theocratic systems and some doctrine of human rights? Of course, there was the doctrine of the divine rights of kings but this is not, properly speaking, a theory of human rights, which are generally understood to be the rights of all human individuals, not only of the monarch.

CHRISTIAN POLITICAL THEORY

Within the Christian theological tradition, however, the latter, individualist theory of human rights gains support from the view that every individual human being is a child of God and thus possesses dignity. The natural rights doctrine of John Locke owes something to this view, as does the earlier natural rights position of William of Ockham. Because within Christianity each person possesses free will and must choose to follow Jesus as a matter of his or her choice, not because coerced to do so, there is a close affinity between the political (natural law) theories of at least post-Thomist (yet also Augustinian) Christians and the modern theory of individual human rights.

It is arguable, as well, that the Christian position on politics is troubled by the strong obligation to follow Jesus coming into conflict with the freedom of everyone to embark on such a life. Some argue that the Holy Inquisition was itself a result of this conflict, leading to the torture of those who would not accept Jesus freely but who would, once tortured, accept the Lord on their own accord. Others dispute that the Roman Catholic Church conducted a monolithic Inquisition.

The religious conception of human nature suggests mixed views about human rights.

Still, if one takes a more deterministic view of the idea of "God's will," it is difficult to combine this with the classical liberal—that is, Locke's—notion of individual rights. That is because the classical liberal idea of human agency ascribes to every normal individual the capacity to initiate action, especially in the economic realm (that is, vis-à-vis entrepreneurship). One way to escape this problem is to embrace Immanuel Kant's position that although our phenomenal selves are fully determined—that is to say, as far as how our bodies behave, there is no freedom from universal mechanical causation—in the noumenal realm of the mind or spirit each person is free and morally responsible. This gives rise to individual human rights once again, since, as Immanuel Kant noted, "ought" implies "can," so every person requires a realm of liberty so as to be able to act in morally significant ways. Thus the religious conception of human nature suggests mixed views about human rights, with some religions making ample room for this concept, and others none at all.

ISLAMIC POLITICAL THEORY

Muslims are divided into two communities, the Sunni majority and Shii minority, and they adhere to different ideas as to political rule. They are known as the Sunni caliphate and the Shii Imamate.

At Muhammad's death, most Muslims, since they thought that Muhammad did not name a successor, relied upon the decision of a group of his cohorts, the caliphate; each member was chosen by way of consultation (*shura*) and agreement (*ijma*) and took an oath of loyalty (*baya*) that is sworn by those who elect him, and the compact (*ahd*) with the people to govern by Islamic law (*Sharia*) developed into what is widely regarded as legitimate government for Sunni Islam.

However, the Shii rejected the Sunni caliphs and regarded them as subverting Islamic law. They adhered to the idea that Muhammad had selected Ali, who was reported to be his cousin and son-in-law, to be the ruler

(*Imam*) of Muslims. They held that the oldest (male) descendant (*Ahl al-Bait*) must be the divinely anointed, religious, and political chief. Abbasid rule (750–1250) formed Islamic political theory as theocratic, with theologians as the legal authorities who had royal privilege and professed to uphold the divine goal for the Muslim community under Abbasid edicts. As matters now stand, there is no unified Muslim political theory that enjoys widespread acceptance.

Yet it is a well-known aspect of contemporary Islamic politics that human rights are not respected universally. Most notably, women are not taken to have the sort of self-governing authority men tend to possess in Muslim societies. So it is fair to say that this religious political tradition does not embrace the idea of individual equal human rights for all.

JEWISH POLITICAL THEORY

Jews, as such, do not adhere to a firm political creed, unlike many Muslims, but tend to embrace varieties of democratic, even liberal, institutions while also encouraging some socialist economic practices and certain mild forms of theocracies, depending on the version of Judaism they embrace. Thus they embrace some variety of human rights theory, mostly a combination of negative and positive individual rights.

Jewish political ideas derive mainly from the belief that Jews are a separate, unique—chosen—people, not merely adherents to a different religion or a system of moral principles that emerge from such a religion. (Of course this idea is shared by nearly all traditional and organized religious groups.) Jewish political ideas pertain to how the Jews, as a unified people, have held on to a political community throughout the centuries, without becoming amalgamated into communities wherein they live as exiles, and how they shaped these by giving clear expressions of their own culture and forms of political conduct.

HUMAN RIGHTS IN PRACTICE

In the contemporary world, being treated as free agents to carry on with life on our own initiative plays the most important role in the realm of civil, religious, and journalistic affairs. In the United States, which is commonly linked to this tradition of rights theory, the First Amendment provides legal protection against negative human rights: coercive treatment in legal proceedings, censorship, and religious intolerance. At the same time, positive human rights are widely protected in the realm

of economic affairs, where those in dire need are entitled to various provisions (minimum wages, unemployment compensation, consumer protection, and affirmative action mandates).

Sometimes the public policy efforts to protect both of these types of human rights lead to problems since the negative right to, for example, associate only with those one chooses conflicts with affirmative action mandates to hire members of minorities whether they are chosen as employees or not. If one has the positive right to healthcare while healthcare providers have the negative right to refrain from offering their services, this too can lead to conflicts such that the protection of the former will appear to lead to involuntary servitude by the latter.

On the international front, where poverty is a great concern in many regions of the globe, the doctrine of positive rights is often deployed to urge governments to engage in substantial wealth redistribution, although often a less legalistic approach is taken via NGOs (nongovernmental organizations), closely associated with the World Bank and the International Monetary Fund. The United Nations may be regarded as an organization with legal standing but without legal power, so its efforts to promote wealth redistribution are usually a matter of imploring governments of various developed countries to provide extensive foreign aid. Major figures in the discipline of international economics, such as Jeffrey Sachs, and political economy, such as Amartya Sen and Martha Nussbaum, are active in urging such governments to heed the United Nations' call.

Critics of this approach argue that one way poverty has been widely encouraged is by making it a policy to treat it as a kind of disease rather than a temporary malady that individuals throughout the globe need to learn how to escape by means of voluntary organizations and, especially, their own economic initiative. To provide help in other than draconian circumstances—such as when a tsunami occurs—leads to repeated reliance on such help, instead of self-development.

As we have already seen, this debate ultimately takes us back to the discussion of human nature. As things stand, most of the officials involved in working to abate poverty embrace some combination of views, seeing people as both casualties of their harsh circumstances and capable of overcoming such circumstances, if political and legal infrastructures do not hamper them.

Perhaps the most novel approach in political theory is that of the communitarians, such as Charles Taylor, whose analysis makes it difficult to involve any strong conception of human rights. Taylor insists that we belong to our communities and thus the lives we have are not actually ours—we do not, thus, have the right to life, let alone to liberty and property. He speaks approvingly of "a principle which states our obligation as men to belong to or sustain society, or a society of a certain type, or to obey authority or an authority of a certain type."

According to this view there is not just a moral responsibility to be generous and charitable toward those who are poor. There is an actual, enforceable legal obligation to contribute to the community of which the poor are members, thus alleviating their poverty not only within one's own region of the world but in the human community as such, globally.

The classical liberal or libertarian tradition of human rights theorizing, especially that which emerges from Locke and, more recently, Nozick, Ayn Rand, and some neo-Aristotelians (such as Eric Mack, Douglas B. Rasmussen, and Douglas J. Den Uyl), would take issue with this approach and reaffirm, based on various philosophical arguments, the vital importance of negative individual human rights. It would hold that respecting and protecting these would serve most effectively to counter poverty, although never guarantee against all of it since individuals can, even when they have the right to work, neglect to exercise this right wisely or prudently, and because nature is often simply merciless.

Hungary

THE CENTRAL EUROPEAN NATION of Hungary was part of the pre-World War I Austro-Hungarian Empire. After World War II, Hungary was incorporated into the Soviet bloc. An attempt to withdraw from this alliance in 1956 was quashed by Soviet military might. Despite this, Hungary developed a more liberal brand of communism that became known as "Goulash Communism." The Republic of Hungary was established after the collapse of the Soviet Union, ushering in the transition to a market economy. Hungary joined the North Atlantic Treaty Organization in 1999 and became a member of the European Union in 2004.

Hungary's diversified economy is heavily dominated by services, which employs 66.7 percent of the labor force. Approximately 80 percent of Hungary's Gross Domestic Product (GDP) comes from the private sector. Hungary has shown strong economic growth, partly because of billions of dollars from foreign investors that have poured into Hungary during the post-transition period. While unemployment remains a concern, the unemployment rate has been reduced to 5.9 percent.

In the late 1980s, Hungary instituted a program of social assistance in which approximately one-third of the GDP was spent on social programs, mostly on cash benefits. From 1987 to 1989, the rate of poverty in Hungary increased from 20 to 26 percent. Yet it is clear that more people would have been living in poverty without government aid. By 1989 four out of every 10 persons receiving benefits were no longer poor. In the 21st century, Hungary is an upper-middle-income na-

tion with a per capita income of \$14,900. Some 17.3 percent of the population live in poverty, and 2.5 percent of Hungarians are malnourished. After the transition to a market economy, poor people were likely to be unemployed, receiving social support, elderly, female, or very young.

The Hungarian government initiated the National Action Plan for Social Inclusion to address the problem of poverty, and additional antipoverty measures were adopted after entry into the European Union. While inequality is at a low level in Hungary, it continues to exist. The country is ranked 24.4 percent on the Gini Index of Human Inequality. The poorest 20 percent possess only 7.7 percent of resources while the richest 20 percent claim 37.5 percent of resources.

The Hungarian population of 10,006,835 experiences a life expectancy of 72.4 years, and life expectancy has been steadily increasing over the last several decades. With a life span of 76.89 years, females outlive males (68.18) by almost nine years. The median age in Hungary is 38.57 years. Nearly 16 percent of the population are under the age of 14, and over 15 percent have reached the age of 65. Only one percent of the population lack access to safe drinking water and improved sanitation. There are 355 physicians per 100,000 residents, and 95 to 100 percent of Hungarians have access to affordable essential drugs.

Infant mortality is relatively low in Hungary at a rate of eight deaths per 1,000 live births, a decline from 36 per 1,000 in the 1970s. Females (7.83 deaths per 1,000 live births) have an advantage over males (9.27 deaths per 1,000 live births). Between 1970 and 2003, the mortality rate of children under the age of 5 fell from 39 to seven deaths per 1,000. Nine percent of Hungarian infants are underweight at birth, and 2.2 percent of under-5s are malnourished. Three percent of under-5s experience moderate to severe stunting, and two percent suffer from moderate to severe wasting. Among children from birth to 23 months, 99 percent receive necessary immunizations.

The Hungarian government has instituted sex education in the schools to promote family planning and to teach safe sex. Condom-dispensing machines and informational pamphlets about the risks of pregnancy and sexually transmitted diseases are widely available. As a result, approximately 73 percent of all Hungarian women use some method of birth control. The fertility rate for teenage mothers is 27 per 1,000 births, and the total fertility rate is 1.2 children per woman. Maternal mortality occurs at a rate of 16 deaths per 100,000 live births.

Less than one percent of the Hungarian population over the age of 15 are unable to read and write. Gender differences in this ability are negligible. Hungarian students are expected to attend school for at least 15 years. In 1999, 89.5 percent of all Hungarians in the relevant age group were enrolled in primary schools, and 86.9 percent were enrolled in secondary schools. All children enrolled in primary school complete the program.

Human Development Index Rank: 35 Human Poverty Index Rank: Not included.

Hunger

THE GREAT MAJORITY OF the hungry live in rural areas in Latin America, Asia, and Africa. Most of the world's underfed teenagers and most of the underfed mothers and fathers of hungry children help to grow and harvest the world's food. Nevertheless they go hungry day after day, year after year. Every year some 14 million children under the age of 5, according to the United Nations' UNICEF and the World Health Organization, die from a combination of malnutrition and common illnesses, most of which can be prevented by relatively simple, low-cost methods.

Famine from the effects of war or other causes remains part of the world hunger problem. The lives blighted and brought to death by chronic hunger, however, number hundreds of millions. Africa is the region

where hunger is growing most rapidly, but Asia is still home to 57 percent of the world's chronically hungry people and 83 percent of its malnourished children, concentrated especially in the seven countries of south Asia. Most victims of hunger in any region will be found in households dependent for their income on microenterprises or casual day labor, households with poor land to farm or none at all, and especially households headed by women, which tend everywhere to be the poorest of all. The percentage of woman-headed households is growing as men migrate to cities in search of higher income. Women manage alone in 40 percent of the households now in some parts of rural Africa. In other regions, the percentage of woman-headed households ranges from 10 percent to 30 percent.

Some 15 million of the world's hungry do not survive their fifth birthday.

Even in the same household, the extent of hunger often differs from one person to another. For example, nutritional ignorance commonly leads to neglect of the extra needs of small children and of women who are pregnant or breastfeeding. In many poor households, survival for everyone dictates a strategy that protects the strength and energy of male income earners. Men and older boys eat, therefore, even when others go hungry. In a situation where a culture traditionally grants low status to the female gender (as in India, Bangladesh, or Pakistan), women and girls typically suffer much more severe malnutrition than men and male children, a fact reflected in far higher female death rates.

Each year about 14 or 15 million of the world's chronically hungry people do not survive their fifth birthday. Most of those who do survive early child-hood eventually establish their own households. In rural areas, they are families of landless day laborers and subsistence farmers, along with poorer sharecroppers, tenant farmers, herdsmen, and nomads. In urban areas, they are families without steady income or those that earn very little at the most menial tasks or working in many kinds of microenterprises, from cottage industry to street vending.

The hunger that is their daily companion is not only the physical and psychological discomfort the well-fed call hunger. This hunger means having too little to eat to obtain the minimum food energy and protein needed for an active life. When eaten in sufficient quantity, rice, wheat, and other staple foods will supply not only enough energy and protein but also many essential vitamins and minerals, especially if eaten together with beans, nuts, or vegetables. Underfed people, by definition, do not get that quantity. They are undernourished. Lacking food enough for calories and proteins, they almost always also lack critical vitamins and minerals. Anemia is very common. Vitamin A deficiency is also common, damaging vision and lowering resistance to every kind of infection and infectious disease. The chronically undernourished sicken often, age early, and die too soon.

CAUSES OF HUNGER

The major conventional factors behind food shortages are overpopulation, rising affluence, ignorance, weather disturbances, and a shortage of resources such as land, water, energy, and fertilizer. However, the primary cause of hunger and malnutrition is poverty. There are also varieties of middle- and upper-class malnutrition. Widespread malnutrition generally comes from not having enough money to obtain adequate food.

The amount of food produced and the number of people are generally treated as the two basic variables that determine the world food situation, with changes in the growth rates of either of them causing or ending hunger. The most influential thinker on the subject is Thomas Robert Malthus, who believed that the number of people grows in a geometrical fashion, whereas the amount of food available to feed them progresses but at an arithmetical rate. Malthus has been proven wrong over the last 200 years: food production more than managed to follow population growth, and the heavy discrepancies between the two that the theory predicted did not materialize. Yet this theory remains popular even today.

Most thinking about hunger on the international level is characterized by a (neo-) Malthusian principle of hunger as the outcome of the competitive relation between two essentially biological and/or economic variables, or more concretely the conflict between the food production variable and the population growth variable. This neo-Malthusian principle is the central element of the international hunger regime: the causal link between hunger on the one hand, and excessive population growth or insufficient food production growth is constantly made. The same principle, in a simplified form, is also propagated by the popular media, who usually present hunger as an unavoidable catastrophe hitting countries with too low food production and too high population growth rates.

A second, competing principle of the cause of hunger, which to a large extent contradicts the first one, is that hunger is caused by poverty. People are malnourished not because of a physical lack of food, but because they lack the means to purchase sufficient food to avoid hunger. In international documents, both principles coexist on an almost equal footing. Hence, the international hunger regime is quite ambiguous, referring to two basic principles that have opposite implications.

HUNGER AND POLITICS

Hunger is primarily a political phenomenon since the aggregate availability of food in this world is at present largely sufficient to feed everybody. Even during the years of the world food crisis of the 1970s, when famines ravaged parts of the Third World, food prices quadrupled. Moreover the potential production of food in the world is much larger than the actual production. It is now generally agreed that the world can feed many more people than it really does. Estimates vary considerably, with the world being able to increase production 2.5 times, three times, five times, and much more. If hunger continues to exist, then, it is not a matter of some unavoidable necessity, but of choice about the allocation of scarce resources, a societal choice that is essentially political.

In light of the different uses societies make of the resources at their disposal, the amount needed to try seriously to end hunger is high but not prohibitively high. Hunger is a matter of distribution, preference, power, and choice—and not one of technical necessity or unavoidable doom.

Willful withholding or destruction of food has been used as a weapon.

Another link between hunger and politics resides in the fact that acute starvation often occurs in countries that are at war. People in Ethiopia, Afghanistan, Sudan, Liberia, Mozambique, and Somalia suffer from starvation while their country is engaged in either domestic or international wars. In these and other cases, willful withholding or destruction of food has been used as a weapon.

Another way of pointing to the political nature of hunger is to disaggregate the figures on food consumption, looking at which individuals are malnourished and what their socioeconomic position is. They show there is no direct link between food production and hunger: neither for countries nor for people. Even within low-income food deficit countries, not everyone suffers from hunger: many people actually have diets quite like those common in the rich countries. They are neither the rich nor the poor. But also within food-surplus countries, not all residents have enough food: often large proportions of the population are undernourished.

The most famous case is Brazil: its average food availability is 108 percent of all needs, and it is a large food exporter; yet the majority of the people suffer from hunger. The same situation characterizes much of Latin America, but also countries such as Zimbabwe and India. Poverty, then, and not failing food availability, explains the incidence of malnutrition. Poverty itself is the outcome of the interaction among different social, economic, and political processes.

POLICIES AND HUNGER

Different norms and solutions follow from different principles. The "hunger is caused by poverty" principle gives rise to norms and solutions that stress equality, income transfers, and redistribution in the short term, and increasing the income of the poor in the long term, whereas the "hunger is caused by lack of food" principle leads to norms that give priority to increasing food production and decreasing birthrates.

At the international level, the norms that are linked to the latter principle are much more dominant than the others. The principle that hunger is fundamentally caused by poverty somehow gets lost when it comes to its operation, while the neo-Malthusian principle gets translated much easier into standards of behavior. Reference to the need for policies that favor greater equality is regularly made, especially during the second half of the 1970s, at the time of basic needs—but no real norm or international standard of behavior exists that places equality or the rapid eradication of poverty above increasing production, especially not during the 1980s.

This means that at the international level, the following solutions dominate the hunger regime: first, reduce population growth rates so that there are less mouths to be fed; second, increase food availabilities so as to be able to nourish more people. Both are usually advocated together. The latter, it is usually held, can be done in two main ways: by increasing local food production or, if a country has no comparative advantage therein, by importing food. Food aid can constitute a temporary third way. International assistance to any of these issue areas—family planning or food production—can be, and often is, justified along the lines of this regime as leading to the eradication of hunger.

The most globally advocated among these four solutions is to increase food production. One way of doing this, according to the corporate sector, is with genetically engineered foods. This argument has strong opponents and genetic foods have yet to gain the full trust of the public, especially in the Third World. Second to the desirability of increasing food production comes increasing food trade.

Third, the need for reducing population growth rates is advocated—and often implemented—by the governments of almost all countries on the globe, while a large variety of public and private international organizations are active in it. Finally food aid is almost without exception favored at present, despite the fact that it is also very much the subject of criticism because of its potentially negative impact. It is thus usually seen as a temporary remedy, not a part of the solution.

WORLD POVERTY

I

Iceland

THE REPUBLIC OF ICELAND is an island located in northern Europe between the Greenland Sea and the north Atlantic Ocean. At different points in its history, Iceland has been ruled by Norway, Scotland, Ireland, and Denmark. In 1875 the Icelandic economy was devastated by the eruption of the Askja volcano, which resulted in one-fifth of the population immigrating to the United States and Canada. Iceland achieved independence in 1944.

By the 21st century, Iceland has developed into a high-income nation with a per capita income of \$31,900 and a high quality of life. While Iceland operates on the basis of a market economy, the country has an extensive welfare system that includes a national health plan, generous housing subsidies, training, and education. Inequality is minimal in Iceland, and poverty as it is usually defined does not exist.

The Icelandic economy is heavily determined by its location, and most exports come from marine products. Iceland also exports aluminum, ferro-silicon alloys, pharmaceuticals, and fishing-related products. Financial services, information technology, and life sciences and related services have become increasingly im-

portant to the Icelandic economy. Tourism is rapidly expanding, and whale watching has become a popular activity. The United States is the largest foreign investor in Iceland. The small agricultural sector depends on government subsidies and protection for survival. While the unemployment rate of 3.1 percent is relatively low in comparison with most countries, it is considered high in Iceland.

The national government finances 85 percent of health services, while individuals pay the remaining 15 percent. There are 352 physicians for every 100,000 residents, and 95 to 100 percent of Icelanders have access to affordable drugs. The entire population has access to safe drinking water and improved sanitation. As a result of the high quality of life and accessible healthcare, citizens' life expectancy is one of the highest in the world at 80.19 years. At 82.34 years, females have a four-year advantage over males (78.13). Among the population of 296,737, the median age is 34 years. Over 22 percent of the population are under the age of 14, and almost eight percent have seen a 65 birthday.

With an infant mortality rate of 3.31 deaths per 1,000 live births, Iceland ranks among the lowest in the world in infant mortality. The infant mortality rate in the 1970s was 13 deaths per 1,000 live births. The mor-

tality rate of children under the age of five fell from 14 in 1970 to four per 1,000 in 2003. Four percent of Icelandic infants are underweight at birth. Childhood immunizations among children from birth to 23 months are generally in the low to high 90s. However, the rate of infant immunizations against measles dropped from 99 to 88 percent between 1990 and 2002, and infant immunizations against DPT fell from 99 to 92 percent during that same period.

Between 1970 and 2005, the fertility rate of Icelanders dropped from 2.8 children per woman to 1.92 children per woman. The fertility rate for adolescents occurs at a rate of 22 births per 1,000. With universal healthcare and excellent postnatal and antenatal care, Iceland has virtually abolished maternal mortality. According to modeled estimates for 1995, the maternal mortality rate was 16 deaths per 100,000 live births. At present, not a single maternal death occurs out of 100,000 live births.

Literacy is virtually universal in Iceland among both males and females, and primary school completion rates are 100 percent. Data for 2000 reveal that 54 percent of all students in upper senior school programs are female. At the tertiary level, women outnumber men in all fields except math and computer science.

Human Development Index Rank: 2 Human Poverty Index Rank: Not included.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Immigration

ESTIMATES FROM THE Global Commission of International Migration (GCIM) suggest that there were 200 million migrants worldwide in 2005. The numbers

of migrants are increasing yearly. In 1970, there were 82 million international migrants. By 2000 the number had increased to 175 million. With the degree of geopolitical unrest seen in the Middle East and southwest Asia and the continued degradation of land areas in the arid regions of the world, there is every indication that international migration will continue to grow over the next decades.

Over 40 percent of the world's migrants are found in only five countries. These include the United States with 35 million, the Russian Federation with 14 million, Germany with seven million, Ukraine with seven million, and India with six million. Migrants leave their home countries for a number of reasons. Among the most dominant are unemployment and low wages in the home country and the prospect of finding higher paying jobs elsewhere; deplorable living conditions in developing countries where life expectancy is far below more affluent countries; displacement from the land because of drought and desertification; and the extraordinary poverty levels, especially in sub-Saharan Africa, coupled with the lowest education levels in the world.

Immigration to countries in both Asia and Africa has declined since 1970 while that in North America and countries in the former Soviet Union has increased. In 2000, it was estimated that over 22 percent of the world's migrants chose North America as their region to live in. Not surprisingly, immigration in the developed world in the decade of the 1990s accounted for nearly 60 percent of population growth. The increase in the population of developing countries through immigration during that same decade was only three percent.

For Europe during the 1990s, immigration accounted for nearly 90 percent of population growth. The explanation for this high percentage is that the rate of natural increase in the European countries is close to or below zero. Had it not been for immigration in Europe during that decade, total population would have declined. Europe is the sole world region to have completed the demographic transition where birthrates and death rates are both low and comparable in number.

Sociologists point to two factors in explaining migration: push factors and pull factors. If conditions in the homeland become intolerable, an individual or family may compelled to leave. This illustrates a push factor. The individual or family "pushed" from their homeland will choose a place to relocate that has some redeeming value and is judged to be superior to the original homeland.

This indicates a pull factor—something positive is expected in the new location. Virtually all migrations

involve both push and pull factors. Further, three types of push and pull factors have been identified. They are economic, cultural, and environmental. The economic factors are easy to understand. Moving to a region where there is the prospect of employment and a better way of life has occurred for centuries. The economic incentive, in particular, explains the seemingly unending stream of immigrants into the United States and some European countries in recent decades.

Also, the aging of the Japanese population has resulted in a shortage of workers in that country. Japan is now considering allowing immigrants to enter the country on a permanent basis in order to make up the growing worker shortfall. In the past, the Japanese have allowed only guest workers to come into the country for temporary stays. The racial and cultural makeup of the Japanese population could radically change depending on the number of permanent immigrants allowed into the country. Homogeneity in both the racial and cultural categories has marked the country all through its history.

Cultural push and pull factors can be equally compelling. Perhaps the most tragic large-scale example in the cultural realm occurred during the era of slavery in the 18th and 19th centuries. Millions of people were taken from their homelands before this insidious practice was ended. However, even in modern times episodes of internal political strife within a country may force people to leave their homes to become immigrants in a new land.

In some cases, people are forced to leave their homeland and are fearful of returning later because of reprisal. These people are considered to be refugees, a special category of migrants who are uprooted from their home but are unable to be legally accepted into another country. Of the estimated 200 million migrants worldwide in 2005, over nine million (4.5 percent) were refugees.

Environmental push factors are especially evident in Sub-Saharan Africa because of perennial land degradation resulting from decades of desertification. Millions of people from the Sahel region have relocated to places where opportunities for a better life are possible. For example, people from Sudan became immigrants to African countries to the south following the loss of their agricultural land. The host countries for the Sudanese immigrants are Ethiopia, the Central African Republic, Uganda, Kenya, and Rwanda.

Patterns of immigration have changed over time. From the 1820s through 1935, the great European migration to North America occurred. Millions of people

made their way to North America, primarily induced by the search for favorable economic possibilities. In addition the immigrants arrived at the time that the great agricultural, industrial, and urban expansions were under way in both the United States and Canada. Their presence satisfied the demand for workers during this period of vast economic growth. Immigration in the United States and Canada slowed dramatically during the 1930s with the economic slowdown brought on by the Great Depression.

For example, the total number of immigrants from all European regions was approximately 500,000 in 1920. Fifteen years later, in the depths of the Depression, only about 50,000 thousand immigrants arrived from Europe. The pull of economic gain clearly was not present in North America during the decade of the 1930s.

As many as one million Latin Americans illegally enter the United States each year.

In the years following the end of World War II, the number of immigrants in North America again increased. However, the source regions had changed. In 1950, approximately 200,000 immigrants arrived in the United States. Over two-thirds of them arrived from European countries. In the 1960s and 1970s, European immigrants were far outnumbered by those from Africa and Asia.

By 2000 over 900,000 immigrants arrived in the United States and 75 percent of them were from countries in Latin America and Asia. The Asian influx during the last three decades of the 20th century represented people primarily from three countries: China, Vietnam, and the Philippines.

The greatest number of Latin American immigrants come from Mexico. In addition to those legally entering the United States from Latin America, it is estimated that as many as one million Latin Americans, mainly from Mexico, illegally enter the United States each year. Immigrants in this category are officially referred to as "irregular migrants."

GCIM estimates indicate that more than 10 million immigrants live in the United States in an irregular migrant status. Further, the GCIM reports that approximately half of the 4.8 million Mexican-born people living in the United States have irregular migrant status. Another category of migrant is identified as "trafficked."

These migrants have been kidnapped and forced to go to another country for illicit reasons. One of the most insidious of these human smuggling operations brings young girls from Lithuania to western European countries to serve as prostitutes. GCIM estimates that human traffickers realize at least \$10 billion annually from these illicit practices.

IMMIGRATION AND POVERTY

Views on the relationship between immigration and poverty vary regionally. In the poorest regions of the world, migration from one country to another will, of course, not change the poverty picture in either country. Should the numbers be extremely high, as has occurred in the massive movements of people out of Sudan and Ethiopia following severe droughts or political upheavals, then the consequences for the host countries can be very demanding. Some regions of the world are devastatingly poor.

It is estimated that more than half of the world's population lives on less than \$2 per day (2002 estimate). In both sub-Saharan Africa and south-central Asia, 75 percent of the population live at that level. In China, a country with a very high rate of industrialization and a seemingly unquenchable thirst for crude oil to keep its economic engine going, 47 percent of the population live on less than \$2 per day.

When immigrants from poorer countries enter a rich country, the impact on poverty levels is not as straightforward. For example, if poor families migrate to the United States, it is clear that they add to the cohort of poor already living in the country. This is one of the most frequently raised cautions by politicians and others about the influx of irregular immigrants from Latin America.

However, studies indicate that the poverty rates of the newly arrived poor decline over time much faster than the rate for all persons. For example, between 1994 and 2000 the poverty rate in the United States for all people declined from approximately 14 percent to 11 percent. The decline for all immigrants during that period was 26 percent to 18 percent. The greatest drop in poverty percentage came from the more recent immigrants during that six-year period: 34 percent to 23 percent. It is clear that declines in poverty rates, whether data on immigration are considered or not, will occur more readily in times of both high economic growth and job availability. The 1990s exemplified this. The post-September 11, 2001, economic picture, complete with wars in Afghanistan and Iraq and the very real

threat of international terrorism, is not yet in clear focus.

Imperialism

IN A GENERAL SENSE, imperialism is defined as the extension of a country's power over another territory. The inhabitants of the occupied territory are subjected to the rule of the occupier, by force if necessary. This generalized definition of imperialism would apply to conquerors reaching back to the time of the Roman Empire and the Mongols. This is pure imperialism wherein the goal of the invading force was to extend its territory and take the riches of the occupied land. The form of imperialism related to 19th-century European territorial usurpation has a more restrictive focus and a set of specific theories and models attached to it. The "new" imperialism got its start in England as part of an effort led by Joseph Chamberlain to expand British influence beyond the confines of its island empire and to acquire territories in Africa and Asia. Those in England objecting to this expansionist thrust were labeled "Little Englanders" by the imperialists.

A competition soon started, involving England and other European countries, to determine which of them would gain spheres of influence and establish colonies in Africa and Asia. The period from the 1880s to the

onset of World War I became known as the Age of Imperialism. The Berlin Conference convened in 1884 to determine which European countries would occupy and colonize which regions of Africa. The eventual "carving up of Africa" was under way with the avowed justification of bringing "civilization" to the nonwhite races. By 1900, 90 percent of the African continent had been colonized by European powers. Polynesia was 99 percent occupied, Asia 57 percent occupied, and Australia entirely occupied. Great Britain gained the greatest amount of colonized territory followed by France, Belgium, and the Netherlands. Germany, a late entry in the race, came into the colonizing picture in 1914.

In his 1902 book, *Imperialism*, the British scholar J. A. Hobson categorized imperialism as an economic action. He put forward the "accumulation theory" of capital, contending that the surplus capital deriving from the production processes in England was flowing out of the country because the impoverished working class was too poor to purchase goods in any significant volume.

Hobson's work influenced Vladimir Lenin, whose book Imperialism: The Highest Stage of Capitalism later became the basis for a neo-Marxist interpretation of imperialism. In his book, Lenin argued that imperialism and its attendant colonizing activities represented a natural progression in the evolution of capitalism. In his thesis, Lenin concluded that the European capitalist countries needed overseas territories to provide raw materials for their production processes and ways to invest the capital that was accumulating. In addition, the colonies became markets for the high value-added goods made from the raw materials taken from these same colonies. Lenin also concluded that capitalism was not a necessary economic stage to go through before reaching socialism. In this regard, he departed from the views of Marx.

The guiding paradigm of capitalist imperialism, the form exhibited following the "Scramble for Africa," was the accumulation of capital through the exploitation of the materials and laborers in the occupied colonies. In every occupation, the sole purpose was to invest only as much in the colony as necessary in order to ensure the uninterrupted acquisition and delivery of the identified goods to the production facilities in Europe. Full regional development of the colony was never the goal.

For instance, northern Nigeria has extensive areas of fertile land ideally suited to agriculture. However, this resource was not developed during the British occupation of the colony. In the case of Nigeria, agricul-

tural products were not the main targets of the colonial process. Following independence in the 1960s, Nigeria proceeded to open this valuable land to agricultural activity. The record of European activities within their colonies points to the creation of an economic system intimately tied to Europe and the transformation of the internal culture groups and their integration within the system (but not ownership in it).

A basic necessity of capitalism is growth. If the capitalistic system stagnates or slows, it runs the risk of collapsing. Capitalist operations must expand. In the 19th century in Europe, these principles provided the basis for the rise of imperialism. When overseas territories were occupied, little attention was paid to the settlement forms of the inhabitants. For instance, major rivers were arbitrarily chosen as the boundaries between European occupiers. However, the indigenous culture groups settled in river basins, with the river within their settlement. Using the river as the boundary resulted in the splitting of the homeland of the indigenous culture group. The colonial period changed the cultural fabric of the indigenous populations.

The new imperialism continues to generate global inequity and the repression of people.

In the 1960s, the era of colonialism essentially ended. Colonies received their independence but not necessarily their complete separation from their colonial masters. Independent or not, these former colonies were now part of a growing and all-inclusive capitalist global system. Expansion and the accumulation of capital remained as the basis for capitalism. In the 1960s, a number of theories centering on "neocapitalism" appeared in the development literature. Among these was a series of essays by Harry Magdoff that contended that the end of colonialism did not signal the end of imperialism. On the contrary, the new imperialism emerged in the form of a global capitalist market. Magdoff contends that the new imperialism continues to generate global inequity and the repression of people in the developing world. He concludes that a basic modification to the framework of capitalism itself would be necessary in order to break the inequity hold.

Paul Baran, an economist at Stanford University in the 1950s, contended that the economic surplus produced in the colonies was sent to the European occupiers and little, if any, of the funds was used for the internal development of the colony. His "concept of the surplus" was articulated in his book *Political Economy of Growth*. Baran also suggested that the form of capitalism that exists in the developing countries is a "dependent" capitalism. Andre Gundar Frank proposed a similar concept in what is called "dependency theory." Frank contended that low levels of economic development in the colonies resulted from the workings of a world capitalist system that used surpluses from production for its own purposes and used little of it in the development of the colony itself. Further, Frank states that poverty in the colonies persists because of their dependent status in the global economy.

Many development scholars have been critical of Walter Rostow's model of economic growth, which implies a dual economy consisting of a traditional sector and a modern sector. Rostow's stages of economic growth assume that a traditional society will eventually discover or obtain the means by which to advance to a higher level of economic growth. When this occurs the society has reached stage two in the model, preconditions for takeoff. With sufficient incentive and investment, the society will achieve the next stage, takeoff, and the economic development process is under way. The next stage is called the drive to maturity, a condition of fully sustained economic growth.

Finally, stage five is marked by an age of mass consumption in which individuals in the society have accumulated capital and can take part fully as consumers of the products they have made. Other development scholars for a number of reasons criticized Rostow's model. One of them was his contention that in every instance societies would progress through the same five stages before reaching full economic development. Also, his notion of mass consumption was deemed to be an unrealistic goal within the developing world.

The work of Immanuel Wallerstein is of great importance in current discussions of the global capitalist system. In his "world-system," Wallerstein contends that all countries in the world are linked within a single global market driven by capitalism. Each country is categorized as belonging to the core, semiperiphery, or periphery.

The core consists of the highly developed countries in which the greatest wealth has accumulated. The periphery is made up of the developing countries, known also as countries of the Third World. Those in the semiperiphery are on the verge of breaking into the core and serve as an incentive to peripheral countries to work harder and rise to a new level. Not unlike the colonial relationship between colony and occupier, Wallerstein states that the relationship between the core

and periphery stresses exploitation. The core countries are the drivers of the global system. The periphery provides necessary materials, labor, and services to maintain the core.

The attribute of core control of the world-system echoes one of John Friedmann's conclusions in his "heartland-hinterland" model. Freidmann points out that the diffusion of innovations from the core controls the economic relationship between the core and periphery. Thus the core determines all global economic activities and wields the power in both the core and the periphery.

As such, the periphery is totally dependent on the core, a situation not unlike the relationship between the occupying country and the colony. Given this relationship it is not surprising that Wallerstein concludes that within the capitalist world-system there will always be a core and a periphery. Further, any gains made by the periphery will be equaled or more likely exceeded by the core. If this proves to be true, then the development gap between the core and the periphery will certainly expand.

Income

ANNUAL PER CAPITA or household income is the most commonly used statistic in measuring poverty. Income is an appealing statistic because it is widely available, lends itself moderately easily to comparisons

across time and between countries, and can be used to measure both the prevalence and the depth of poverty. While the primary criticism of using income as the main indicator of well-being is that it measures only material welfare, income tends to be strongly correlated with nearly every measure of development from life expectancy and child mortality to access to sanitation, healthcare, and education. For example, the simple correlation across countries between income and the literacy rate is 0.55 and between income and life expectancy is 0.67. So while the old adage that "money can't buy happiness" is indeed true, money can buy many of the most important goods and services that lead people to lead long, healthy, productive lives.

MEASURING POVERTY USING INCOME

Income is often used to define thresholds that define whether a household is considered in poverty. These income thresholds are known as poverty lines and can be estimated in two ways. The standard food basket variant determines a poverty line by first calculating the cost for a household of a certain size to meet its basic nutritional requirements and then multiplying this figure by the percentage of household income spent on food to set the poverty threshold. The standard food basket variant is used by many countries, including the United States, to set the official poverty line.

The poverty line can also be set using a relative income standard, which fixes the poverty line as some fraction of the average income of a country or region. For example, in calculating the Human Poverty Index, the United Nations Development Program (UNDP) defines a country's poverty line as 50 percent of the median income level for that country. Similarly, the European Union defines poverty in its member countries as 60 percent of national median income.

Using household income and poverty lines, the prevalence of poverty in a region can be estimated by calculating the percentage of households whose annual income falls below the designated poverty threshold. This percentage is known as the headcount index or the poverty rate. The depth of poverty can be determined by how far below the poverty line the typical poor household falls, a statistic known as the poverty gap or poverty gap index.

Creating comparisons in poverty rates can be tricky because of inflation and international divergences in the cost of living as well as differences in the way in which the poverty line is set in various countries. For example in the United States in 2003, the official poverty

line for a single American was an annual income of roughly \$9,400 while the corresponding figure for Mexico was roughly \$400.

International agencies have attempted to standardize definitions of what constitutes poverty by using the \$1-a-day definition of absolute poverty, which corresponds to an annual income of \$365 adjusted for inflation and international differences in costs of living (also known as purchasing power parity, or PPP). By the \$1-aday threshold, the poverty rate for the developing world was 20.6 percent in 2001, corresponding to just under one billion persons in poverty. These figures represent significant decreases from past numbers largely due to declining poverty rates in India and China. In 1981 and 1990, the headcount indexes for the developing world were 40.7 and 27.9 percent, respectively; however, because of population growth, the total number of persons below the \$1-a-day threshold has declined much less rapidly, falling from 1.40 billion in 1981 to 1.14 billion in 1990.

Any definition of poverty that relies solely on the poverty rate can be subject to criticism. Proponents of "fuzzy" measures of poverty suggest that a strict line defining whether a household is poor or not is inadequate for defining poverty. Others propose that income alone cannot determine poverty if a household has unmet basic needs despite an adequate income. Many poverty statistics combine income along with other measures of impoverishment to create a composite measure of poverty known as a deprivation index or composite index.

MEASURING INCOME

Household income can be measured in many ways. Often income is measured using the Gross Domestic Product (GDP) per capita. GDP is the dollar value of all goods and services produced for final consumption within a country's borders within a set period of time. GDP is an appealing statistic to use since it is widely available for most countries over a long time period. Indeed, for cross-country comparisons of living standards, GDP per capita figures are the most widely used indicators of economic development. As with poverty lines, care must be taken in comparing GDPs over time and between countries because of inflation and international differences in the "cost of living." International comparisons of standards of living must be done using incomes adjusted for PPP.

There are several other theoretical problems with using GDP per capita as a primary welfare measure.

First, basic GDP statistics fail to account for the distribution of income. A relatively high mean income can disguise pockets of extreme deprivation within certain geographical areas or ethnic groups. This problem can be partially rectified by reporting median rather than mean income and by reporting GDP per capita by income quintile or decile. Other more advanced methods for measuring income distribution, such as the GINI coefficient and Lorenz curves, can also be used.

GDP also doesn't account for the composition of production. A country like North Korea may produce many dollars' worth of goods and services, but the production is in the form of nuclear weapons and prestige products that provide little in the way of benefits to a typical citizen of the country.

In addition GDP doesn't account for black market or nonmarket activities. The GDP will, therefore, understate economic development in countries where a significant portion of the economic activity occurs in the underground economy. In particular, since women are more likely than men to work in the house doing domestic chores, the use of GDP statistics tends to undervalue the economic contribution of many women in society.

Finally, GDP does not reflect leisure. For example, in 2002 the GDP per capita in the United States was \$35,750, compared to just \$27,100 in Germany, suggesting that Americans were significantly better off than Germans. The average American worker, however, put in 1,800 hours per year on the job while the average laborer in Germany worked only 1,450 hours. Using GDP alone does not reflect the additional vacation and leisure time enjoyed by German citizens. Similarly, demographics may affect per capita GDP figures. If a significant portion of a country's population is either very young or very old, in other words outside the usual working age, GDP per capita will be lowered. In comparing countries with largely different age profiles, GDP per worker may be a more accurate indicator of development.

A second commonly used way to measure family income is through survey data on individual households. Generally, these surveys ask families to report their cash income or cash income after taxes for a specified period of time. Household income data are most commonly used for determining poverty rates within countries.

The use of cash income data to determine poverty rates can also be problematic. First, noncash income is generally ignored in these surveys, largely because respondents often do not know the dollar value of these benefits. For many workers, up to one-third of their total compensation may come in the form of noncash benefits such as health, life, and disability insurance or pension contributions. Other families may receive large government benefits in the form of subsidized health-care, food, or housing. Welfare payments that take the form of goods or services rather than cash are known as "in-kind transfers" and are not included in most measures of a household's income. Therefore, a household's standard of living may be much higher than indicated solely by its level of cash income.

Next, homeowners receive nonmonetary housing benefits by living in their home. This return to home equity is difficult to measure and generally excluded from income calculations. Finally, unrealized capital gains are also generally not included in this type of income measure. For example, a person whose pension fund or home value rises sharply will experience a large increase in net wealth but will not report this increase as income under most measures of household income.

There is also the important question of whether to include government transfers or welfare payments in household income when estimating poverty. At the very least, poverty statistics must make clear whether incomes include any monetary government assistance received by families. For example, a country with generous welfare benefits may have many persons living below the poverty line before transfers but little or no poverty after welfare payments are included.

Income Distribution Theories

THE DISTRIBUTION OF INCOME has been a central topic of economics since the time of Adam Smith

and the classical economists. How income is distributed in a capitalist market economy is a vast, complex, and highly controversial area of economic analysis. In terms of distribution, the focus of classical economics was the so-called functional distribution of income among the three broad factors of production, namely the suppliers of labor, land, and capital.

Wages represented the return to labor, rents the return to land (that is, natural resource ownership), and profits (including interest) the return to capitalists (that is, the owners of various kinds of business enterprise). A key distinguishing characteristic of alternative theories of distribution is whether there is a surplus to be captured by some group and, if so, who will dominate.

David Ricardo developed the leading and most explicit classical theory of distribution in the early 19th century. According to Ricardo, an "iron law" dictated by Thomas Malthus's theory of population governed wage payments. If wages happened to rise above the level required for subsistence by the worker and his family, workers would be induced to rear more children. The increase in population and labor supply in time would drive wages back down to the subsistence level. On the other hand, the return to landowners (land rent) was determined by the cost of production at the margin of cultivation.

Finally, profits were assumed to depend on the wages needed to be paid to sustain the labor force. If wages rose, profits declined. The basic dynamics of Ricardo's theory are as follows. Given a growing population, the demand for food will rise. Since lands of less and less productivity must be brought into cultivation to increase food supply, food prices must rise to cover the higher costs of food production. Rising food costs in turn would cause a rise in the subsistence wage.

Thus firms would face rising labor costs and a squeeze on profits. Finally, falling profits would cause a decreased rate of accumulation and investment. In the very long run, a stationary state would result as investment ceased, the limits on food production checked population growth, and all surplus value was captured by landlords in the form of land rents. The very long run presented a dismal picture indeed.

THE MARXIAN CHALLENGE

A range of exploitation theories quickly and strongly challenged classical ideas on income distribution and the private ownership of land and capital. The most elaborate and influential of these is the exploitation theory of Karl Marx. Marxian theory fuses Ricardo's eco-

nomic theory with sociological concepts and a grand theory of history.

To begin with, like Ricardo, Marx believed that wages in general would be held down to a subsistence level. The mechanism forcing wages down, however, is not Malthusian population pressure. Marx's thesis was that a capitalistic economy tends to generate a reserve army of unemployed. Moreover Marx built his theory upon a central concept of classical theory, namely the labor theory of value. This theory posits that labor is the fundamental source of all value in the economy. In brief, the value of goods reflects the labor time required to produce such goods.

According to Marx, however, workers did not receive wages equal to the value of their production. Given a reserve army of unemployed, the capitalist need only pay a subsistence wage representing a fraction of the total value of labor. This surplus value was expropriated entirely by the capitalist. Furthermore Marx argued that the laws of motion of capitalism lead to the increasing exploitation of workers and the increasing concentration of industry and wealth in the hands of fewer and fewer capitalists. Finally Marx predicted that workers would rise up and overthrow the capitalist system of exploitation.

NEOCLASSICAL DISTRIBUTION THEORY

In the late 19th century, neoclassical distribution theory emerged in response to the challenge of Marxian exploitation theory. The central ideas of the so-called marginal productivity theory are the following. First, all factors of production, not just labor, are viewed as contributing to producing the economy's output. Second, the demand for a productive factor depends upon the value consumers place upon the product that the factor is producing.

Finally, in long-run competitive equilibrium, there is no surplus value to be captured by any factor. The value of the economy's total output is distributed to each factor in strict accordance with its productive contribution, and this distribution just exhausts the value of the total output. In brief, if labor creates, say, 70 percent of the total value of output, labor will receive 70 percent of the economy's income. Likewise for all other resource inputs, and consequently no surplus emerges.

Strictly speaking, neoclassical distribution theory is a theory of the demand for the factors of production in a perfectly competitive economy. For example, in employing, say, labor, profit-motivated firms will compare two quantities, namely the additional revenue (value of marginal product) expected to be generated by hiring an additional worker relative to the cost of hiring this worker. To maximize profits, a firm will continue to hire workers up to the point where the additional revenue gained just equals the market wage. Consequently workers are paid according to their productive contribution to the firm's output.

The neoclassical or marginal productivity theory has been the mainstream theory of distribution since the late 19th century. As one would predict, the theory has long faced withering criticism from many alternative schools of thought: Marxian, neo-Ricardian, and post-Keynesian, among others. Some of the criticisms focus on narrow technical issues (such as the measurement of capital and the slopes of the factor supply and demand curves). Other criticisms examine more fundamental issues such as the assumption of perfect competition, that the theory is static rather than dynamic, and the cyclical instability of a capitalist economy.

NEOCLASSICAL THEORY EVALUATED

Few would argue that neoclassical distribution theory is perfect. Significant flaws and gaps remain. However, such deficiencies do not necessarily imply that the theory is completely illogical and useless and that an existing alternative is superior. In this respect many critics of neoclassical economics seem to suggest that it should be rejected outright because the theory is not complete and perfect like many theories in the natural and physical sciences. But such thinking represents a lack of understanding of the many fundamental controversies that actually exist in the so-called hard sciences.

One example is the theory of quantum mechanics, the theory that underlies all modern electronics. This theory is often cited as the most successful theory in the history of science. Yet leading physicists are well aware of the many fundamental controversies, gaps, and flaws that remain with respect to this theory.

The validity of alternative theories is also judged on how well key predictions of the theory conform to real-world experience. Key predictions of neoclassical theory tend to be well supported by real-world evidence. One important piece of historical evidence is found in the large relative income changes caused by the outbreak of the bubonic plague—the Black Death—in 14th-century Europe. Within a few years the population of Europe was reduced by about one-third. This sharp decrease in labor supply raised the marginal product of labor and resulted in a dramatic increase in wages, doubling, by some estimates. In addition, neoclassical the-

How income is distributed in a capitalist market economy is a vast, complex, and highly controversial area of economic analysis.

ory predicts that the marginal productivity of land would fall since fewer workers were now available to work the land. Indeed economic historians estimate that land rents declined 50 percent or more.

Neoclassical theory also seems well supported for modern market economies, at least in cases where careful statistical analysis is made. For example, in the United States in recent decades many have challenged the alleged link between labor productivity and wages. Such critics point to data showing that wages have been stagnant or declining, whereas labor productivity has risen sharply.

For example, by one estimate, between 1982 and 1995, inflation-adjusted wages rose only 7.4 percent while productivity rose 21.4 percent. Such data sharply

contradict marginal productivity theory. However, one must note the numerous measurement errors that are generally made with respect to such comparisons. First, inflation-adjusted wages can only be measured correctly if one uses an unbiased price index. Second, in modern economies wages and total labor compensation are significantly different. In the United States in recent years, fringe benefits have comprised almost 30 percent of total labor compensation.

Finally it is important to measure the trend in labor compensation over several decades, not just a few years. For example, adjusting U.S. data for the above measurement problems and using the period 1950–95, inflationadjusted labor compensation increased 144.2 percent and labor productivity increased 144.9 percent, surely an insignificant difference.

In contrast, the central prediction of Marxian theory is that a capitalist economy functions to generate a reserve army of unemployed that continually serves to force wages down to a subsistence level. Workers will only be exploited under capitalism. Yet by the late 19th century it was absolutely clear that workers in England and the United States were experiencing a rising standard of living, albeit along a rather unstable growth path, especially before World War II.

Indeed, per capita income in high-income countries today is generally 10 to 20 times higher than a century ago. Moreover, empirical studies suggest that in capitalist economies labor's share of national income is generally some 75 to 85 percent when proprietors' income is included in labor's share. The evidence also indicates that the long-run trend has been a fairly stable share for labor, or in some cases, a slightly increasing share. Finally, real-world experience in the latter half of the 20th century demonstrated conclusively that modern capitalist economies—including the capitalist welfare states (such as Sweden)—with strong incentives for saving, physical and human capital investment, and entrepreneurship have superior records of economic performance relative to socialist planning systems.

Income Inequality

INCOME INEQUALITY IS THE uneven distribution of earnings among the population of a country, region, or entity resulting in an inequality of access to commodities. Income inequality may also stem from lack of access to some goods and services. For instance, lack of opportunity to receive education and training leads to lower earnings for a subset of the population. The causation may proceed in both directions simultaneously, suggesting the existence of a self-perpetuating circular flow.

In asserting that there is income inequality, one may be stating a fact (that is, using positive economics, which is free from value judgments) or declaring that a different group occupies a more or less advantageous position. The latter uses normative economics, which involves value judgments. Using social judgments, some of the factors that are likely to impact upon the size of income inequality are resources in relation to needs, opportunity and outcome, and tastes and choices of individuals.

One of the best-known theories of differences and changes in income inequality is Simon Kuznets's Inverted-U hypothesis. Kuznets suggests that as per capita income rises, inequality may initially rise, reaching a peak at some medium level of income, but then de-

clines as the country evolves to a richer, more industrialized status. Cross-section data (that is, data for a number of different countries in the same time period) provide mixed support for this hypothesis. There is even less support for the hypothesis when time-series data (data at different time periods for the same country) are utilized.

Income inequality does not necessarily imply the prevalence of consumption inequality.

In most societies, the existence of income inequality is not necessarily viewed as undesirable, since with equality of opportunity it is not unreasonable to permit inequality in earnings in order to provide sufficient entrepreneurship and effort among individuals. In any case, the existence of income inequality does not necessarily imply the prevalence of consumption inequality, which may be more disconcerting for societies. In that sense, poverty in a country or region may be more closely linked to consumption—rather than income—inequality.

Various measures of income inequality exist. A Rawlsian-type measure would gauge inequality simply in terms of the position of the poorest members of the society. Obversely, one could measure inequality in terms of the stance of the society's richest citizens. Other measures take into account the incomes of both the rich and poor. One popular measure, the 20/20 ratio, is the ratio of the income of the top quintile of the income distribution to that of the bottom quintile.

Another is the Lorenz curve, which after ordering the population by income, plots the cumulative percentage of a country's income received by the poorest x percent of families against x. Complete income equality would of course result if the poorest y percent of families received exactly y percent of the income—resulting in the line of perfect equality. The distribution of income shows greater inequality as the Lorenz curve bows toward the bottom right corner.

A problem in using Lorenz curves to compare income inequality across countries or for a country across time is that the curves may cross. Using the Gini coefficient overcomes this problem since it measures how far a Lorenz curve lies from the line of perfect equality. The coefficient is equal to the area between the line of perfect equality and the Lorenz curve divided by the area under the line of perfect equality. A coefficient of zero suggests full equality and one suggests complete

inequality. Gini coefficients are reported in the official publications of some countries, and in the World Bank's annual publications World Development Report and World Development Indicators.

Income Poverty

DESPITE THE LACK OF international consensus regarding definitions of poverty, a focus on income poverty clearly restricts the discussion to economic well-being or the command over economic resources. In the narrower sense, then, income poverty refers to economic deprivation. The typical measures of income poverty (hereafter referred to as "poverty") specify some minimum standard below which various family types are considered poor, that is, lacking adequate resources to meet basic needs. Most analytic definitions usually begin with food, clothing, and shelter as core components of basic needs. Some include a variety of other purchases, such as transportation, childcare, and reading materials. A major difficulty, therefore, involves what constitutes a meaningful definition of basic needs, which inevitably will be linked to certain value judg-

Another important distinction concerns the difference between absolute poverty (or extreme poverty) and relative poverty. According to the Copenhagen Declaration of the World Summit for Social Development, *absolute poverty* refers to "a condition characterized by severe deprivation of basic human needs, including food, safe drinking water, sanitation facilities, health, shelter, education, and information."

The World Bank has developed poverty thresholds equivalent to a few dollars a day in its research on developing nations in Africa and Asia. The approach reflects an absolute minimum standard of poverty below which human survival would be compromised.

While the above approach makes sense in studies of the developing world, there are obvious limitations as applied in other contexts. More specifically, what one considers basic needs can only be meaningfully defined relative to the standards of the society being studied. Someone reasonably well-off in terms of the prevailing standards of a developing country might be considered desperately poor in advanced industrial countries. As the socioeconomic and cultural contexts differ, the definitions of poverty will vary as well. Hence much comparative research relies upon the concept of relative poverty, meaning that those classified as poor achieve that status only if they fall below certain thresholds as compared with others in their society. Relative standards of poverty usually include measures such as income inequality or family income as a proportion of society's median income.

The measurement of poverty clearly depends upon how one conceptualizes poverty. Some analysts have set their poverty thresholds at relatively low levels by considering only the most basic physical needs necessary for short-term survival in their definitions. Others have set the bar much higher in pointing out that the long-term well-being of families implies much more than merely meeting their barest necessities, for there must be sufficient resources available to participate meaningfully in the relationships and customary behaviors typical of a particular society. In assessing poverty in developing countries, the dominant strategy has been to draw upon nationally representative surveys to calculate standardized household income or consumption, normalized for household size.

One of the best measures, which accounts for currency exchange rates and has been adjusted for inflation, is the Purchasing Power Parity (PPP) estimate for consumption that the World Bank's Data Group has produced. The commonly used figure of \$1 per day represents a measure of extreme poverty in developing countries. Researchers using the measure have estimated that roughly 21 percent of the populations living in developing countries lived in extreme poverty in 2001, reflecting a significant decline as compared with two decades earlier. Converting the percentage to population figures reveals an absolute decline from 1.5 billion individuals living in extreme poverty in 1981 to 1.1 billion in 2001. In global population terms, one-third of the world's population lived in extreme poverty in 1981 as compared with roughly 18 percent 20 years later. Over the time span, sub-Saharan Africa has emerged as the world region with the highest incidence of extreme poverty (46.9 percent), which further accounts for 29 percent of the global population living in extreme poverty.

On the other hand, a doubling of the poverty threshold to \$2.15 per day at the 1993 PPP levels reveals that more than half of the world's population living in developing countries continues to experience a high level of deprivation. In fact, converted to population figures, these data indicate that more than 2.7 billion individuals lived below that poverty threshold in 2001—or nearly 300 million more than in 1981. More than half of the impoverished live in either India (826 million) or China (almost 600 million).

In the developed world, standards of living are dramatically higher and income poverty tends to be studied in a different fashion. Poverty studies in rich countries typically focus on disposable income, or monies from all sources of market income plus public transfers, less income taxes and social security payments. The poverty measures used may be either absolute standards, or relative measures based on the more general distribution of income across family types.

One must always consider local contexts and the normative standards that prevail.

One common absolute poverty measure involves a basic market-priced bundle of the costs associated with food, clothing, and shelter plus a small additional amount for other living costs. These data derive from national surveys of household spending patterns, which are adjusted over time to determine the income necessary for families to achieve a minimum standard of living in a particular societal context. The United States's official poverty rate and the Canadian low income cutoffs, or LICOs, establish minimum standards for various family sizes, although their formulas differ in terms of what comprises the market bundle and the multipliers used to establish the final thresholds. For example, although the U.S. poverty rate was 12.1 percent in 2002 and 9.5 percent of Canada's population were living in low-income situations that year, these figures cannot be compared directly.

Instead one must always consider local contexts and the normative standards that prevail to understand more fully the different usages and measurements of poverty. Analysts often prefer to work with relative measures of poverty, which usually involve defining the poverty line as some fraction of either the mean or median annual income levels for particular social units such as families. The most commonly used relative measure of poverty for a developed nation defines individuals and families as poor if their annual income falls below 50 percent of the disposable median income for comparable units. That measure has been especially popular in analyzing the comparative data gathered under the auspices of the Luxembourg Income Study (LIS).

Although the data available in the LIS vary by year, the data permit standardized comparison of relative rates of income poverty based on household income surveys across 25 developed nations. Over time the evidence indicates that the Nordic countries generally have lower poverty rates than continental Europe (usually less than 10 percent), while Anglo-American countries tend to have relative poverty rates somewhat higher, or ranging from 12 percent in Canada to 17 percent in the United States. Yet such a measure does not provide any information about shifts in average income levels over time or absolute standards of living, which can be vastly different across national contexts.

In conclusion, income poverty measures continue to be a hotbed of social-scientific controversy, primarily because of the conceptual difficulties and subjective judgments involved in deciding what constitutes basic needs and an adequate standard of living. Moreover income-based measures of income poverty exclude measures of property and wealth, as well as other sources of nonmarket income and services not readily captured in cross-national surveys.

Such research ignores entirely the degree of resource sharing that occurs across households and generations, not to mention other issues such as the subjective well-being of individuals and families, the extent to which they experience social exclusion, and the depth of poverty and inequality experienced across societal contexts. Those interested in pursuing the study of income poverty must be especially attentive to the nature of the datasets involved and the aforementioned methodological issues to arrive at meaningful conclusions.

India

POVERTY AND A LOW standard of living have been the bane of Indian society. Famines, natural calamities, infant mortality, and illiteracy have been the fate of the majority of Indians for centuries. During the colonial period, the Indian National Congress outlined a poverty eradication program. After independence, on August 15, 1947, the constitution of the Republic of India clearly spelled out the concept of a welfare state. Indian political leaders have tried to alleviate poverty through various programs, and Prime Minister Indira Gandhi even coined the term *garibi hatao* ("abolish poverty"). Eradicating poverty, maintaining steady economic growth, and fighting overpopulation have remained India's major goals.

India, with a population of about 1.05 billion, has a population growth rate of 1.55 percent. It belonged to the category of Low Human Development, with an Human Development Index (HDI) of 0.416, 0.443, and 0.481 in the years 1975, 1970, and 1985, respectively. From 1990 onward, it surged to more than 0.500, and it was categorized as a Medium Human Development group with an HDI of 0.519, 0.553, and 0.590 in the years 1990, 1995, and 2001, respectively. The largest number of poor people live in India with a per capita

Eradicating poverty, maintaining steady economic growth, and fighting overpopulation have remained India's major goals. In urban areas in India, the amenities of modern life coexist with the unmet necessities of those living in poverty.

income below \$400. About 15 million children are bonded to labor in India. Substantial portions of the population are deprived of the bare necessities of life such as drinking water, healthcare, food, and shelter. India presents a land of contradictions, with skyscrapers and large slum areas in the metropolitan areas. The life expectancy was 62.86 years and the infant mortality rate was 63.19 deaths per 1,000 live births per a 2001 estimate.

A slow growth rate until the 1980s did not help government efforts to combat poverty; the increased growth rates of the past decades did not lead to a dramatic decrease in poverty, either. For the first time, assurance of basic minimum needs found an explicit and prominent place in the Fifth Plan. The concept included not only an assurance of purchasing power sufficient to procure a collection of basic items of consumption but also elementary education of all children up to 14 years of age; minimum public health facilities integrated with

family planning and nutrition for children; protected water supply; amenities for landless labor; and slum improvement in larger towns, rural roads, and rural electrification. The idea of a direct, targeted poverty alleviation program quickly took root and gained widespread acceptance across the entire political spectrum. Governments at the center and in the states have since vied with each other in increasing allocations and devising new schemes (or the same schemes with different names) under this rubric.

The Planning Commission of the government established a committee in 1993 that recommended the following measures for a wholesome picture of living conditions and well-being of the poor: the composition of the poor population in terms of dominant characteristics, that is, their distribution by region, social group, family characteristics (such as size, education, age, sex of household head, dependency ratio), and the way it is changing over time. Much of this can be done by appro-

priate tabulation of employment and consumption survey data.

The second measure affects the nutritional status of the population: levels of intake of principal nutrients, incidence of malnourishment, anthropometrics measurements and activity patterns by age, sex and socioeconomic categories. This can be done by the National Institute of Nutrition.

The third measure affects health status: mortality (overall, infant and child, maternal), access to and use of health services (public and private), and castes. The quinquennial surveys of public consumption as well as mortality indicators based on the Sample Registration System and the morbidity surveys need to be put on a systematic and continuing basis.

It is certainly true that outlays on targeted poverty alleviation programs have increased.

The fourth measure affects educational status: school enrollment by region, sex, and age group and by economic social class and reach and quality of public education services and costs. Here again information from social consumption inquiries and the all-India Education Survey, suitably restructured, would provide the basic data.

The fifth measure affects living environment: distribution by density as settlement, living space per head, type of house, access to safe drinking water and sanitation, and access to amenities like post, telephones, railways, good roads, and markets. The committee further suggested the preparation of a "State of Poverty" report every five years covering the above aspects and highlighting the condition of the poorest 28.6 percent of the country's population.

It is indisputably clear that a large proportion of the country's population cannot afford the bundle of goods and services, including food, education, and health that constitutes the currently accepted norms of a minimum living standard. The deficiencies in both absolute and relative terms are considerably larger in rural India than in urban areas.

Scheduled caste/tribe households, being disadvantaged on all these counts, have a considerably higher incidence of poverty than other groups. Overall poverty incidence in rural areas is seen to be largely a reflection of differences in mean per capita incomes across states and less as inequalities within states. More detailed analysis using household-level data from the National

Council of Applied Economic Research (NCAER) survey suggests that the livelihood of a household, or being poor, is influenced by the social and economic infrastructure of the village lived in, some characteristics of agricultural technology, and the demographic and other features of the household. The effect of agricultural technology is the largest, followed by household characteristics. Both are seen to have more market influence on poverty incidence among cultivator households than other categories. The relative importance of factors varies among different groups.

Poverty studies deal mostly with rural areas. Urban poverty has received comparatively less attention even at a descriptive level. Available surveys show urban areas to have a higher level of mean per capita consumption as well as higher inequality. Mean per capita consumption in urban areas is higher and more unequally distributed than in rural India. Regional variations in both respects are marked, poverty incidence being higher than average in Bihar, Madhya Pradesh, and Orissa and less than average in Assam, Punjab, Haryana, and West Bengal. In nine of the 15 major states, namely Bihar, Gujrat, Haryana, Karnatak, Kerala, Maharastra, Punjab, Rajastan, and Uttar-Pradesh, and in the 15 states taken as a group, the performance in terms of poverty reduction was better during the 1990s on all the indicators such as the Head Count Ratio (HCR), Poverty Gap Ratio (PGR), and Squared Poverty Gap (FGT).

Additionally in Assam, with a slower annualized increase in headcount ratio and the number of poor, the situation was better in the 1990s on other indicators. In four states (Andhra Pradesh, Madhya Pradesh, Orissa, and West Bengal) the poverty performance was worse during the 1990s on all the indicators. Additionally Tamil Nadu, where there was a decline in poverty on all the indicators during the 1990s, the pace of decline was slower during the 1990s in some of the indicators. In urban areas, in eight states (Andhra Pradesh, Gujrat, Karnatak, Madhya Pradesh, Maharastra, Rajastan, Tamil Nadu, and West Bengal) and in 15 states taken as a whole, the 1990s performance was better on all the indicators.

Additionally Punjab recorded a better performance during the 1990s. Six states (Assam, Bihar, Haryana, Karnatak, Orissa, and Uttar Pradesh) fared worse in the 1990s in respect to poverty reduction on all the indicators. Considering the total (rural plus urban) population, in 11 out of the 15 states, and in the 15 states taken together, the poverty reduction performance was better during the 1990s on all the indicators. Assam recorded

a reduced rate of increase in respect to Head Count Ratio and the number of poor. In the three remaining states, Madhya Pradesh, Orissa, and West Bengal, there was a clear worsening of poverty reduction performance during the 1990s.

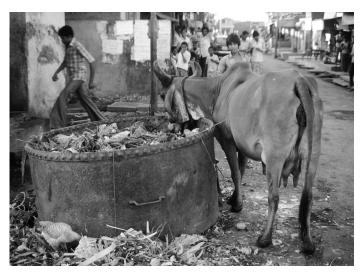

RHETORIC OF POVERTY

The basic needs and minimum living standards figure so prominently not only in the rhetoric of all political parties but also in the sizable public resources committed for this purpose. This is a reflection of both moral and political compulsions. The evolution of policies and programs meant to tackle this problem may be haphazard and in some respects even incoherent. Nevertheless one can see a clear pattern in the way they seek to recognize and address differing needs of backward areas with special problems, and of different segments of the poor and underprivileged. The structures, content, and funding of these programs remain mostly in the hands of the central government.

There is considerable overlap among these schemes, as well as between them and development schemes included under the normal state plans. Typically each program is administered by a separate agency, each with its own line of hierarchy and operating independently. These features, taken together with the rigidity of central guidelines, make for fragmentation and duplication of schemes; coordination is difficult as are monitoring of accomplishments in terms of efficacy of targeting, the quality of works actually completed, and the impact on the beneficiaries.

DISTRIBUTION

The public distribution system (PDS) does not accomplish its ostensible aim of assuring essential consumer goods to the poor at reasonable prices. Large parts of the country (especially states that have the largest concentration of poor) simply do not have a distribution network to reach the supplies where they are most needed. In states (Kerala, West Bengal, Tamil Nadu) that have such networks, the coverage is not limited to the poor, and attempts to ensure better targeting have been thwarted by administrative difficulties and political opposition. The efficiency of PDS as a poverty alleviation measure and the desirability of continuing it in the present form are being questioned. Supporters of PDS, who see it as a measure instrument for ensuring food security for the poor, strongly oppose this prescription even as they recognize the need for restructur-

Basic needs and minimum living standards figure prominently in the rhetoric of all political parties in India.

ing the program. It is certainly true that outlays on targeted poverty alleviation programs have increased rapidly both in absolute terms and relative to total public-sector plan outlay. Prior to 1970, these were limited to special schemes for nutrition, scheduled castes and tribes, social welfare, backward areas, and a minuscule rural works programs during the Fourth Plan (1969–74). Total outlay for these was less than four percent of the public-sector plan.

During the Eighth Plan (1992–97), the outlay on a vastly larger and more varied poverty alleviation program was about 11 percent of the total public-sector plan. Outlays on poverty alleviation programs have grown considerably faster than total plan outlay in a period marked by severe infrastructure shortage and bottlenecks. However large these figures might seem, the fact remains that they account for barely one percent of the Gross Domestic Product.

This is not to deny the need and immense scope for improving the efficacy of poverty alleviation programs by better targeting, reducing waste and corruption, recognizing the relevance of local needs and priorities, and creating institutional conditions for greater accountability. The focus should be on rationalizing the approach, organization, and priorities of the poverty alleviation program rather than on cutting back the outlay. The number of poverty-relief programs should be drastically reduced and streamlined to minimize duplication and fragmentation.

In implementing integrated regional resources planning, it would be perfectly legitimate to earmark allocations, and even provide special extra funds, for use in

regions that rank low in terms of per capita income and employment. The distribution of funds among regions must, however, be based not only on needs, but also on the potential for development of land, water, and livestock resources as part of integrated area development plans.

The passage of the 73rd and 74th constitutional amendments, which provides for a three-tier system of local government, mandatory elections every five years, and devolution development functions with authority and resources from the state to these bodies, has created a space and opportunity for decentralized participatory local development efforts with inbuilt pressure for accountability. Implementation of these provisions is far from complete. Several states have not held local body elections as required by the constitution. Even those that have show a strong unwillingness to hand over to the elected bodies the authority and the resources to decide and implement local development.

The growing economic differentiation of rural society, the rapid diversification of activity, and its commercialization have loosened traditional social structures. The process will lead to a significant realignment of the power structure in a substantial part of rural India, favoring the disadvantaged groups. Such realignments will not occur in all cases spontaneously and in a manner that gives effective voice to the poor and promotes their interests. The process initiated by Panchayat Raj and the potential for changes created by it are much more important than the immediate outcomes. Interventions in the process must therefore focus on creating conditions that will facilitate and encourage the realization of its potential. In this context three aspects deserve special attention.

First, a great deal of knowledge and experience is needed to assess local resources and their potential, different ways of exploiting the potential, the costs involved, and raising resources. The knowledge, much of it technical in nature, is often not available locally. Strong support from state agencies and/or nongovernmental organizations (including educational institutions) is necessary to make it accessible to the communities and their leaders.

A major change in the role of government agencies is also necessary. Instead of planning, deciding, and implementing schemes on their own, as they now do, the agencies will have to play a supportive role by providing expertise, helping elected bodies to make informed decisions, and facilitating coordination between related schemes of different communities and in the larger regional context.

Second, the determination of priorities in the context of limited resources inevitably involves a process of bargaining among different groups. In order for this to work in favor of the poor/vulnerable, the latter have to articulate their needs and actively persuade or pressure the relevant forums to take necessary action to meet their needs. None of this occurs easily or automatically. Conscious measures to encourage and strengthen institutions of civil society are essential.

Third, rising expectations and assertiveness of the people vis-à-vis government and bureaucracy increases pressure on the latter to perform. Panchayat Raj institutions generate demands for a larger devolution of resources from the state and central governments; there is little stake or incentive for them to address the task of efficient use of resources. It is therefore imperative that local bodies be required to mobilize their own resources to meet a significant part of the costs of their programs and given greater control over their staff engaged in various activities.

The five basic services—drinking water, healthcare, public transport, public distribution, and primary school—are analyzed on four dimensions: easy access, extent of use, quality and reliability, and satisfaction with services. A household is considered to have a significant income capability disadvantage (ICD) when it is living in a *kutcha* house (hut), the head of the household is illiterate or has not received formal schooling, and the head of the house is a daily wage earner. In addition to ICD, the study considered scheduled caste and tribe households and households from small villages (with population lower than 1,000) as disadvantaged.

Drinking water is accessible to 55 percent of Indian households within a distance of 100 meters from home. A quarter of all households depend on unprotected sources of drinking water. One-fourth of the users of public sources of water have reported frequent breakdowns in supply. Access to reliable drinking water supply is thus a problem for a significant proportion of households.

Public health facilities are accessible to over 40 percent of the households within a distance of one kilometer. The presence of doctors at public health facilities leaves much to be desired. One-third of the patients do not find a doctor present during their visit.

Approximately 60 percent of all households report absence of public roads in their villages. Government buses are rated quite low on punctuality and frequency in many states of India.

The Public Distribution System (PDS) has wide coverage across the country, with over 80 percent of the

households owning ration cards. But only one-fourth of the households report regular availability of food grains in the shops.

The effectiveness of PDS is greatly hurt by the high degree of unreliability and nontransparency associated with the service. Government-owned or supported primary schools are available to 80 percent of the households within one kilometer of their homes. The dependence on government schools is significantly high, especially in rural areas.

Whether public services are reaching the poor and other disadvantaged groups is a matter of great concern to most policymakers. Here again one sees a mixed picture. Primary education and drinking water are two services that have done reasonably well in terms of access for the poor. The poor are worse off in terms of access with respect to the other three services. Despite the barriers to access, a large proportion of the poor use most of the services rather than other households, the singular exception being public transport. In terms of reliability and satisfaction, the poor give lower ratings to almost all the services across the country compared to nonpoor households.

For about the last 15 years, the country has shown signs of development, and the level of poverty is being reduced. The affirmative action by the government is reducing inequality among different groups. The reserve of jobs for the deprived section of the population, like scheduled castes and tribes, has resulted in many in crossing the poverty line. A sizable number of people in these groups belong to the middle class. The population living under the national poverty line was 36 percent in 1993–94 and it was reduced to 28.6 percent in 1999–2000. The future is not that bleak for the nation.

Indicators of Poverty

INDICATORS OF POVERTY ARE quantitative measures used to determine whether individuals and households suffer from poverty at various levels of intensity. The nature of these measures depends on such factors as ability to measure them, ideological understanding of poverty, and changing definitions of poverty itself. The debate about the nature of suitable indicators and the development of capacity to measure them are important aspects to consider.

In recent years, the Millennium Development Goals (MDGs) have been adopted as a global measure of poverty reduction and, hence, represent a coherent set of poverty indicators that may be used to indicate progress toward agreed targets. However, these represent only a subset of all useful poverty indicators. The MDGs are: to eradicate extreme hunger and poverty; to achieve universal primary education; to promote gender equality and empower women; to reduce child mortality; to improve maternal health; to combat HIV/AIDS, malaria, and other diseases; to ensure environmental sustainability; and to develop a global partnership for development. Most of these goals are in fact constructs—that is, they cannot be measured directly but must be considered as combinations of specific

variables that may or may not be possible to measure. Hence the goals rest upon indicators such as access to different types of drugs and medicines, access to hospital treatment and other health services, prevalence of different types of population, and so forth. These may be both objective and subjective in nature, although strictly qualitative data may be difficult to capture with a standardized research instrument and problematic in terms of statistical analysis.

Since new forms of technology enter society and different expectations affect people's understanding of the future, the nature of the portfolio of indicators required to measure poverty needs to be assessed and reassessed as time passes and minor adjustments are required. Different rates of inflation internationally lead to requirements to update income levels and other financial information.

This leads to occasional debate as to the appropriate levels of change to make. Some household income levels are based on "baskets," or combinations of commonly sought consumer goods. As demand for different products changes over time, the composition of the basket should also be amended to reflect those changes. Uncertainty over the nature and extent of changes in cost for important inputs such as oil and heating also makes this process more difficult, especially as there must be some consideration of future levels of cost and revenue.

MEASURING INDICATORS

In order to gather data on poverty indicators, it is necessary to recruit and train a variety of field researchers, supervisors, statisticians, and, in cases where access to the data of local people may be difficult to obtain, local facilitators. Since field researchers in particular will need expenses for travel and accommodation, among other things, the costs of data collection can be high. To this may be added the cost of computers for data analysis and possibly expensive training by foreign technical experts. As a result, since the data collection process does not directly tackle problems of poverty, some sections of the population may challenge the value of the process. Further, equipment and skills necessary for the process also need to be maintained and updated periodically.

The need for methodological rigor when approaching the measurement of indicators is also important in determining the accuracy of the results. Since policies depend or, at least, should depend, on data collected, it is important to make sure that the best quality of re-

search possible is obtained. There is clearly a role for universities and nongovernmental organizations in this case.

ALTERNATIVE MEASURES

Different cultures attach different levels of importance to common environmental situations, and these differences may need to be captured in data collection. For example, familial and social networks are central to village life in a number of countries, and these are important in not just ameliorating poverty but also in determining quality of life. Such factors would not necessarily be captured through employing a more Western development model. Cultural sensitivity is required, therefore, in designing a suitable poverty indicator regime.

Variant understandings of poverty and its implications for behavior and well-being also call for different measurements and indicators of poverty. Zygmunt Bauman's conception of the New Poor, for example, as individuals alienated from the consumption process that now dominates most Western societies, includes them as members of the poor. Understanding the variables that underlie this alienation and then correctly recording them at the individual level would most likely require a considerable reevaluation of current poverty indicator processes.

Indigence

INDIGENCE REFERS TO A STATE in which people are unable to obtain basic human needs, especially food, because of poverty. It is also known as primary

poverty. In the Western world, the popular concept of the indigent is of a person who is homeless and almost completely without any possessions. Being homeless causes people to be excluded from receipt of government services in many countries, and makes it very difficult for them to improve their situation by obtaining employment, since many potential employers view the indigent as morally defective in some way, or at least unreliable.

In other countries, people can be indigent but living in their customary home, although that home may be a poorly constructed shack or in some form of slum. Because of a lack of enforceable property rights, the indigent in this category are generally reduced to improvised self-instigated forms of income generation, such as scavenging, which is common, for example in Cairo, Egypt, the barrios of Latin America, and in urban regions of east and southeast Asia. Indigent people are particularly vulnerable to external effects and may be powerless to avoid exploitation and forced into theft, prostitution, or other unsafe activities.

INDIGENCE AND MIGRATION

Historically indigence has driven migration. People seek multiple sources of food because of the possibility of the loss of one source. When environmental change of one sort or another occurs, or when other groups deny access to one or more of those sources of nutrition, then people move to where new sources are available. However, as people have increasingly settled into urban areas and as political laws have created a system in which cross-border travel is problematic, such migration may no longer be possible and instead indigence leads to death.

Throughout history, there are numerous examples of famine or drought leading to the creation of large numbers of refugees who are denied entry to areas where food is available because of fear or resentment. As global climate change and scarcity of water may force many millions of people into indigent refugee status, societies of neighboring countries will be obliged to accept the migrants within their own societies, reluctantly or otherwise, or else accept the consequences of denying them resources.

Changes in economic circumstances, even in modern economies, can very quickly lead to indigence. Large-scale economic collapse resulting from, for example, the problematic International Monetary Fund (IMF) intervention in Russia, or the Asian Financial Crisis of 1997, for example, clearly did dramatically in-

crease the level of indigence in the affected areas. However, even in the most advanced states, inadequate welfare provision or access to charity, company retrenchments of jobs, or personal hardship through illness or death can result in indigence in a very short time. The thousands of children who run away from home every year in just about every industrialized country automatically are classified as indigent, since they are by law forbidden from working and have an incentive to stay away from social services.

Inadequate and inappropriate treatment of ex-offenders and people suffering from mental illness can also increase indigence. Research shows that the numerous homeless, indigent people in Western countries suffer from substance abuse or mental health problems. They too are vulnerable to crime and to becoming involved in unsafe activities.

Providing services to the indigent requires creative use of both governmental and civil service organizations. In states where extended social networks exist, it is possible for indigence to be prevented, or at least deferred through early intervention. In situations where social cohesion is low, for example in impersonal urban environments and where internal and cross-border migration is common, awareness of neighborly need is limited and external intervention is required. This means that access to government services should be not just convenient but also nonthreatening and not perceived to lead to negative outcomes.

In many cases of human trafficking, the reason the predominantly female victims offer for why they did not use their few moments of liberty to escape is that they had been convinced that the state was predatory or would in some other way persecute them. Voluntary organizations such as the Salvation Army, Pratham, and the National Coalition for the Homeless are among those groups that are involved in trying to alleviate indigence.

Indonesia

THE NATION OF INDONESIA is composed of an archipelago of nearly 14,000 islands, approximately half of which are uninhabited. The island chain extends for 3,200 miles from east to west and 1,100 miles from north to south. It has a total land area of some 750,000 square miles, of which the greatest part is concentrated on the three largest islands of Borneo (Kalimantan), most of which belongs to Indonesia, Sumatra, and the western part of New Guinea known as Irian Jaya.

Additional important areas include the capital island of Java, the Celebes, and the Moluccas. Although Java is a comparatively small part of Indonesia, it has for much of known history constituted the central part of a thalassocratic state and also has been known as the spiritual center of the region, control of which provides legitimization for any monarch. The capital city of Jakarta is also located on Java.

The total population of the country is estimated to exceed 240 million and the largest cities include Jakarta (population nearly nine million), Surabaya (population around three million), Bandung (population two million), and Palembang (population approximately 1.5 million). The country has the fifth largest population in the world and, partly for cultural and religious reasons and partly because of government promotion, fertility is high, as too is the proportion of young people in the population. The proportion of the population living below the poverty line is 27 percent and the average annual Gross Domestic Product per capita is approximately \$3,500.

The majority of the people are Muslims, although there are islands with different religious affiliations, such as the Christians of Aceh and the Hindus of Bali. There is also a significant Chinese ethnic minority that has become associated with commercial success. The wide range of ethnicities has resulted in numerous incidents of racially or religiously inspired violence. In the aftermath of the 1997 financial crisis, ethnic Chinese people, particularly women, were targeted for mob violence. The extremist religious group Jemaah Islamiyah (II) is widely believed to have been responsible for bomb attacks on Bali, which killed more than 200 in 2002 and 22 in 2005. However, the government of Indonesia has yet to ban the organization and maintains there is insufficient evidence to do so. The potential for widespread disorder and revolution for religious reasons exists, although it is unlikely.

The numerous islands contain a wide variety of natural resources, including the various spices that inspired the colonization by the Portuguese and subsequently the Dutch. There are also considerable reserves of oil and gas, which are not being fully exploited because of lack of investment. Indonesia has macroeconomic problems, notably unemployment, while the history of authoritarian regimes has stimulated pervasive corruption throughout every level of the economy.

COLONIZATION PERIOD

The islands of Indonesia had been producing cloves, nutmeg, and other spices that had been transported through networks of traders from the Moluccas to the Mediterranean world for thousands of years before Europeans set foot there. Chinese, Cham, Javanese, Persian, Indian, and Arab traders, among others, traveled in a variety of vessels around the known world and established complex, diverse, sophisticated multicultural trading centers. Islamization of the islands occurred at a quite rapid pace for a combination of political, economic, and personal spiritual reasons. Southeast Asians making the Hajj pilgrimage to Mecca were for a long period recognized as the richest Muslims in the world.

It was the years of colonization that created poverty and ignorance.

Early European accounts, whether by the original colonists, the Portuguese, or the Dutch who supplanted them, described Indonesians generally as healthy and strong. There is no mention of them as being in any way smaller or poorer than the Europeans. It was the years of colonization that created poverty, ignorance, and general social and cultural deprivation from which so many millions suffer today.

The early Dutch outpost troops on Java (then called Batavia) cowered inside their fortresses for fear of the constant attack and harassment from the Javanese. Eventually, superior military organization and technology permitted many islands to be brought into full colonial status. The Indonesian people—although until the very modern age there was no real conception of Indonesians as a single people—received generally harsh treatment and were denied promotion or ownership of natural resources or the fruits of investment in those resources.

The colonial economy was organized to maximize profitability of economic activities and the extraction of that profit to benefit a tiny privileged elite and the population of another country. However, there is a belief among some historians that the effects of colonization were quite limited and the political processes of Indonesian islands were not strongly affected. The history is contested, in part, because of the desire to emphasize the role and importance of indigenous people vis-à-vis foreigners that is partly inspired by ideology. In any case, the later years of the empire seem to have been much more efficient in extracting profits than the earlier centuries.

World War II (1939–45) brought the invasion of Indonesia by the Japanese and the defeat of the European colonists who had previously been considered to be invincible. The eventual victory of the Allies was followed by an attempt by the Dutch to restore their empire. This was strongly resisted by the Indonesians, whose confidence had been boosted by the example of the Japanese, no matter how harsh their occupation had been, as well as the empowering communist ideology.

In the ensuing fighting, thousands were killed until finally independence was secured. This was the culmination of several decades of resistance by a variety of groups, both geographically and ideologically distinct from each other. The government of the Netherlands agreed in 1949 to transfer sovereignty of the islands to a newly formed United States of Indonesia, with the exception of the territory of what was to become Irian Jaya, which was to be subject to subsequent negotiations.

MODERN INDONESIA

Following independence, Indonesia entered a period of parliamentary democracy that floundered as a result of the inability of any party or coalition of parties to establish a competent, transparent administration with a sufficiently large base of constituents to be sustainable. Sukarno had established himself as a dominant political force during the revolutionary period, and as he became disillusioned with the value of democracy, he emerged as an interventionist president prepared to institute a period of guided democracy—that is, democratic institutions guided by (or controlled by) the president.

Sukarno ordered the seizure of Dutch-owned assets and indulged in a variety of grandiose projects that were intended, at least in part, to glorify his image. He became embroiled in the *confrontasi*, or confrontation, with Malaysia and other policies that destabilized the country. In 1965 the murder of six army generals was the opportunity for General Suharto to begin to gather

together the reins of power in his own hands in the interests of national unity and security. Indonesia was run as a military dictatorship for the next three decades, albeit a dictatorship that, under the New Order policies, was able to deliver much improved economic performance and the modernization of much of the country. Inward investment was attracted to developing natural resources and some rural poverty was ameliorated through regional development. However, this success could not disguise the systemic corruption riddling the government, much of which originated from Suharto's family and associates.

The possibility of attempted secession is real in several different parts of the country.

Moreover, many development projects had been initiated without regard to environmental sustainability and, as a result, many people lost their ability to continue with their traditional lifestyles. In recent years, especially, some radicalized Muslims have seized upon Western-style development goals as undermining Indonesian society, and this has become linked with anger over perceived injustices in the treatment of Muslims in other parts of the world. Social change certainly resulted in a growing bureaucracy and a burgeoning middle class that rose to prominence in the context of the decline of the aristocracy, which had traditionally governed Indonesian society.

Suharto was deposed in 1998, and since that time several presidents, including Megawati Sukarnoputri, the daughter of Sukarno, have struggled to hold together sufficient coalitions of diverse regional, political, cultural, and religious interests. The possibility of attempted secession is real in several different parts of the country but the central state has always been resolute in taking whatever action has proved necessary to maintain the unity of the state.

TIMOR LESTE

Timor Leste (East Timor) was a Portuguese colony and a remnant of that country's previous imperial holdings among the islands. In the 17th century, Portugal had ceded West Timor to the Dutch but maintained this single colony. In 1975, East Timor declared independence from Portugal and was, nine days later, invaded and occupied by Indonesian troops. In the subsequent years, a relentlessly pursued pacification policy led to

the deaths of thousands of East Timorese—estimates range up to 250,000 people. Opposition to Indonesian rule continued and, in 1999, a United Nations-sponsored referendum resulted in an overwhelming majority of East Timorese opting for independence.

However, West Timorian militias, aided by some Indonesian forces, refused to accept the results and in subsequent violence 1,300 East Timorese were killed, 300,000 were forcibly moved into West Timor refugee camps, and the infrastructure of the country, especially around the capital of Dili, was almost totally destroyed. Many concerns remain for the security of Timor Leste and its economic recovery and ultimate development.

BALI

Bali is an island east of Java that has a long and rich history of cultural and artistic expression. A long-standing practice of Hinduism is responsible for the creation of cultural artifacts that, in combination with the island's location and beaches, make it a significant tourist destination for Western tourists, particularly Australians. The economic development of Bali and its tourist facilities has been challenged by some fundamentalist Muslims and in 2002, Al Qaeda-linked terrorists exploded bombs in various tourist locations and killed more than 200 people from a variety of countries, many of whom were native Balinese. The decline of the tourist industry, particularly after the second bombings in 2005, has seriously damaged the economy of Bali and increased the prevalence of poverty.

1997 FINANCIAL CRISIS

In 1997 a series of speculative financial attacks on the currencies of several southeast Asian nations that were believed to be unsustainably priced led to a massive and disastrous collapse in the value of the Indonesian rupiah. The crisis caused capital flight and numerous bankruptcies, and in turn led to a sharp contraction in the economy, increased unemployment, and social unrest.

The trend of reduction in poverty rates was reversed, although the exact rate is difficult to establish because of contested versions of the poverty statistics. Much of the poverty is concentrated in rural areas, which are particularly affected by the removal of all or part of the government subsidies for vital consumer goods such as cooking oil and gasoline. Significant proportions of children were removed from schools so that they could assist in searching for additional family in-

come. Dropout rates from schools ranged up to 15 percent for junior high schools and universities.

Public health suffered too as loss of revenue led to government cuts in the healthcare budget, which made many treatments suddenly unaffordable. The loss of social cohesion caused by riots and violence aimed at the Chinese ethnic minority, because of the spurious belief that Chinese had somehow caused or benefited from the crisis, will take many years to heal.

THE 2004 TSUNAMI

On December 26, 2004, an earthquake with an epicenter close to Aceh in the western part of Indonesia triggered a series of tsunami waves that directly caused the immediate deaths of some 250,000 people. Approximately 150,000 of these people were living on Aceh. Another 500,000 were made homeless. Exact figures will never be known, as the scale of destruction was so massive. Immediate and subsequent emergency aid was held up to some extent because of the long-term tension between the central government and the Acehnese people. Aceh has for years been home to a particularly vocal independence movement and this has led to considerable levels of fighting and violence in recent years, particularly with respect to clashes between Muslims and Christians.

The long-term implications of the earthquake and tsunami disaster depend on the extent to which the Acehnese authorities can cooperate with the central government and with international donors in establishing and funding long-term development projects that provide income to the Acehnese people. Improved property rights and bureaucratic procedures would also be helpful. More immediately, in addition to emergency relief, there is an urgent need for psychological counseling in a part of the world in which such health needs are rarely appreciated.

Industrial Revolution

HISTORIANS CONSIDER the Industrial Revolution to be the beginning of the modern era in the Western world. The revolution is marked by a century-long transition from small-scale domestic craftwork to the extensive use of machinery and mass-production techniques. The revolution began in Great Britain about 1750 and continued to the middle of the 19th century. During this period, major changes occurred in all phases of European life. Industrial processes became more centrally located within fast-growing cities and people were displaced from rural areas and took low-paying jobs in the new factories. Once in the cities, workers and their families lived under crowded conditions in less than adequate housing. Sanitary conditions were extremely bad and disease was rampant.

The revolution was supported by improvements in transportation systems and machinery that was capable of generating enormous amounts of energy. The first industry to take full part in the revolution was textilemaking. Population increases, which began in earnest in the middle of the 18th century, and the relocation of domestic clothmakers to the cities led to increased demand for scarce textile products. Investments by wealthy businessmen provided the initial start-up financing and once the industry was under way, profits from sales generated subsequent growth. Inventions such as the flying shuttle, the spinning jenny, and the water frame greatly increased the ability to process cotton into cloth and, in turn, created increased demand for cotton. Eli Whitney's invention of the cotton gin led to greatly increased production of cotton and the enhancement of the textile industry in the United States.

The Industrial Revolution depended on machines to do the work that people had done in times past. Richard Compton's "mule" required waterpower for its operation, ushering in the era of factory location on rivers. With James Watt's steam engine, the Industrial Revolution reached an even higher plateau in productivity. The steam engine provided virtually unlimited power to industry and transportation. The iron and steel industry was also a prime mover in the Industrial Revolution. In order to produce the high temperatures necessary for the making of steel, charcoal and coking coal were required. In 1740, 17,000 tons of steel were produced in Great Britain. One hundred years later over three million tons of steel were made to ensure the continuance of industrial growth in that country.

The change from decentralized production of goods to the urban-based factory system exemplified and defined the Industrial Revolution more than any other single process. The new steam-powered machinery of industry required the relocation of production facilities to the cities. As a result people moved from the rural areas into the burgeoning urban places. Health conditions in the cities and factories were not ideal. Long work hours in smoky factories and the generally unsanitary situation within the hastily built urban homes led to illnesses and epidemics for thousands of workers and residents. Poverty was widespread within Great Britain and other European countries during the early decades of the Industrial Revolution and socioeconomic improvements came slowly through the latter half of the 19th century.

It is true that poverty was not solely a result of the Industrial Revolution. There had always been some measure of poverty throughout European history. The period of feudalism held peasants in poverty for several centuries before the advent of industrialization. In fact the move of discouraged and unemployed rural dwellers to ill-equipped and unclean cities occurred in significant numbers long before the factory system located in cities.

The Industrial Revolution, however, created its own forms of destitution and poverty. In 1830 the British physician Thomas Southwood Smith published his *Treatise on Fever*, in which he contends that poor people were impoverished by fever resulting from widespread and endemic diseases that robbed them of their energy. Smith's findings would eventually lead to the institution of a countrywide healthcare system.

Another British physician, Charles Turner Thackrah, published a book on industrial hygiene, which included suggestions on the removal of certain chemical agents from the workplace that cause disease. Thackrah concluded that the workplace was generally injurious to health but that little progress had been made in alleviat-

ing the situation because of thoughtlessness or apathy on the part of the factory owners. The literature of the Industrial Revolution is replete with arguments of this type, observations that management was concerned only with the operation of the factory and making profits and paid little if any attention to the plight of workers.

Findings of the Poor Laws Commission study in 1838 linked poverty in Great Britain to disease, poor housing, and inadequate sanitation. The report went on to state that families were engaged in dangerous, unhealthy work for long hours; living in poorly furnished, badly ventilated homes; and eating nonnutritious foods. Children were especially exploited in this period. Since work in the factories was a family affair, it was not uncommon for children and women to work long hours in the factory setting.

A number of laws were passed in Great Britain during the 1830s and 1840s to alleviate the strenuous and degrading conditions under which women and children labored. The Factory Act, established by the Royal Commission on the Employment of Women and Children, limited the hours that a child could work in the factories. In addition, the act set up a program to employ permanent factory inspectors. The prominent 19th-century writer Elizabeth Barrett Browning caught the dimmed spirit and worn body of the child worker in her poem "Cry of the Children" in 1843:

"For oh" say the children "we are weary,
And we cannot run or leap—
If we cared for any meadows, it were merely
To drop down in them and sleep
Our knees trumble sorely in the stooping—
We fall upon our faces, trying to go;
And underneath our heavy eyelids drooping,
The reddest flower would look as pale as snow.
For, all day, we drag our burden tiring,
Through the coal-dark underground—
Or, all day, we drive the wheels of iron
In the factories, round and round. ...

The unsanitary conditions in London led on three occasions to cholera outbreaks, which took the lives of those least resistant to the disease. In 1848 over 62,000 died of cholera in Great Britain. Great Britain was not alone in suffering the ravages of disease. A typhus epidemic in Upper Silesia was attributed to unsanitary conditions; hundreds of millworkers were affected. The German physician Rudolph Virchow draws attention to this outbreak in his "Report on the Typhus Epidemic in

Seeking cooler air during the summer on a rooftop, 19th-century tenement dwellers suffered the consequences of industrialization.

Upper Silesia" and concluded correctly that "medicine is a social science and politics is nothing but medicine on a grand scale. ... Doctors are the natural advocates of the poor, and social problems are largely within their jurisdiction." Virchow is another forward thinker in suggesting that countrywide efforts were needed to address the devastating outcomes of epidemics brought about by unsanitary conditions that could be identified and eradicated before the damage was done.

The famous British novelist Charles Dickens did not withhold his condemnation of conditions in London in the 1850s. In his novel *Bleak House*, Dickens eloquently captures the acrid London air created by the spewing of smoke from hundreds of factories: "Smoke lowered down from the chimney-pots, making a soft black drizzle, with flakes of soot in it as big as full-grown snow flakes—gone into mourning, one might imagine, for the death of the sun."

Smoke was a serious health problem and so was the discarding of refuse of all types into the rivers of Great Britain. Professor Michael Farraday wrote in 1855 on the decrepit condition of the river Thames in London. The entirety of the river, he reported, was an opaque brown fluid flowing through miles of the city and allowed to become a fermenting sewer. Farraday concluded that the condition of the Thames was probably

true of all rivers in Great Britain that were associated with the dumping of factory and city wastes.

Two years later the British Royal Commission on Sewage Disposal began work on efforts to clean the Thames, which became identified as the source of the "Great Stink" from all of the refuse put into it. In 1860, Florence Nightingale wrote, "a large part of London was in the daily habit of using water polluted by the drainage of its sewers and water-closets." It was not until 1876 that the British River Pollution Control Act made it illegal to pour sewage into a river or stream.

In 1867 the Factories and Workshops Act was in place in Great Britain. This legislation expanded protection to workers in a number of industries not previously covered. The legislation also placed additional restrictions on employing women in particularly threatening occupations and set further limits on child factory labor.

The British Health Act in 1875 resulted in the consolidation of authority over regulation of the areas of housing, water pollution, and occupational diseases. After many decades of unfit conditions in the cities the country was taking positive steps to change the situation. In that year, Liverpool was widely regarded as having the most crowded and unsanitary conditions of all British cities. Liverpool's population density was twice that of London and thousands of the living quarters for workers were in dark and damp cellars. In Manchester, a major center of industry, the death rate was approximately 70 per thousand in the population, whereas the measure for the country as a whole was 40 per thousand.

Restrictions on environmental degradation were enacted in the United States as well during the heyday of the Industrial Revolution in that country. In 1881, Chicago, Illinois, became the first city in the United States to regulate smoke emissions. Within a few years, St. Louis, Missouri; Pittsburgh, Pennsylvania; and Cincinnati, Ohio, followed suit.

The famed French author Emile Zola wrote in 1885 about the inhuman working conditions in the mines and factories of France. The English writer Edward Carpenter published his provocatively titled book Civilization: Its Cause and Cure, in which he describes the air in Sheffield as a "vast dense cloud, so thick that I wondered how any human being could support life in it, that went up to heaven like the smoke from a great altar."

The ills of the Industrial Revolution are well documented. In hindsight, however, these seeming insults to humanity were most likely impossible to avoid given the rapidity of change and the zeal for growth and industrial expansion. In time, many of the poor socioeconomic conditions were improved and the industrial growth in Europe spread to North America, Russia, and Japan. The Industrial Revolution in the United States and Canada began in earnest in the late 19th century and resulted in the most productive and expansive economic system the world has ever seen. The case may be made that a form of Industrial Revolution is continuing now in some regions in Asia and Africa, as Europe and North America shift to a more service-oriented economic structure.

Industrialization

INDUSTRIALIZATION IS THE investment of capital in power-driven machinery with the goal of replacing costly but slower-skilled human labor power with unskilled labor and increasing output. While it sounds simple, industrialization is a complicated process involving social, political, economic, and technological changes that favor and enrich some individuals, social classes, and countries and disfavor and impoverish other people.

Industrialization is never completed: new ways to manufacture, new machines (steam-driven, electric, internal combustion), new sources of power (water, coal, petroleum, nuclear), and new processes (mechanical, chemical, automated) constantly revolutionized the industrial production process. In addition, industrialization has spatial as well as temporal and social components: it began in northwest Europe; spread to North America, central Europe, and Japan by 1880; and moved to much of the rest of the world after 1945. In all cases it fundamentally altered the previous social structure, created new winners and losers, and left many in poverty.

INDUSTRIAL REVOLUTIONS

The first Industrial Revolution occurred in England from around 1750 to 1830 for a variety of reasons. The English landed classes controlled a government that was sympathetic to the interests of private capitalists and industrial development and passed legislation supporting those interests. English agriculture was efficient enough to support a large number of nonfarming workers, land had been consolidated into fewer hands by enclosure acts passed by Parliament that favored large commercial farmers, and population growth had been sharp enough (and the enclosure movements ruthless enough) to create substantial reserves of cheap and impoverished labor.

The wealth of the already wealthy increased, while the wages of the poor declined.

In 1763 England emerged victorious from two centuries of military and naval conflict with its European rivals and gained access to the markets and resources of most of the world from India to the Americas. The key to English industrialization was cotton. The English cotton industry, which unquestionably benefited from technological inventions like the flying shuttle (1733), steam engine (1769), and water frame (1769) that revolutionized and sped up the production of cotton cloth, grew with the English conquest of India, the slave trade, the cotton plantations of the Caribbean and the Americas (whose work regimens some historians argue were the models for the later steam-powered industrial factories in England), and the huge market of its colonies.

Between 1750 and 1769, British cotton exports increased over tenfold and once the British destroyed the cotton handicraft production of their Indian colony, their major competitor in the global cotton textile business after 1800, India became a net importer of British

textiles and its handicraft producers were reduced to unemployment and poverty. Cotton, integrated with world empire, was one industry where goods could be produced cheaply on a massive scale, creating enormous profits and benefiting from slight improvements in technology.

During the first decades of this first Industrial Revolution, the technological capacity of society and the wealth of the already wealthy increased considerably, while the wages of the poor declined. Handloom weavers, who were displaced by factory production, were especially hard hit, but the real wages of factory workers declined as well. Poverty amid affluence, low wages, unorganized workers, and diseased slums in every manufacturing city were hallmarks of capitalist industrialization and were repeated in every subsequent industrial revolution. It was not until 1880 that average real wages reached their preindustrial levels in England and the second Industrial Revolution, this time powered by coal and steel industries, was well under way.

The United States and Germany industrialized during this period with strong government direction, state subsidies, and the erection of huge tariff barriers to keep out cheap English cloth and steel and protect fledgling industries. The Industrial Revolution in these countries originated in the 1840s but increased in the 1870s and was led by heavy industry and the production of capital goods (trains, ships) rather than by light industry and consumer goods like textiles.

The governments of both countries actively promoted industrialization as well as monopolies and cartels in railroad, steel, petroleum, and other heavy industries. It was the golden era of the industrial robber barons, tenements, and slums. Both countries relied on the massive influx of cheap labor from dispossessed and impoverished central and eastern European farmers to meet labor shortages and help keep wages down. Industrial wages were higher than farm-labor wages because of labor shortages, but the work was hazardous and the slums bred and spread disease.

German and British workers unionized more quickly and effectively than American workers to fight the impoverishing and debilitating effects of industrial labor, partly because many workers in the American workforce could speak little or no English, which made organizing more difficult, and the government declared unions and strikes illegal. However, industrialization allowed for the modernization of armed forces, increased national wealth and Gross National Product, and slowly raised standards of living and literacy. Other world powers like Japan, Russia, France, and Italy embarked

on government-sponsored industrialization programs to catch up with their rivals, especially in the militarily critical industries of coal, iron, and steel.

SUBSEQUENT INDUSTRIALIZATIONS

The next Industrial Revolution involved a return to the production of consumer goods like cars, refrigerators, stoves, and other durable appliances. This industrial age was typified by Henry Ford's assembly-line production of cheap cars starting around 1910 in the United States. Industrial workers made good wages, mass strikes won unions legal recognition, and mass industrial production made goods cheaper for consumers. Poverty, while not eliminated, became more localized and class differences, while not reduced, became more muted. Consumer durables led industrialization in the core capitalist countries, while the new Soviet Union embarked on forced, state-directed capital goods industrialization beginning in 1928 with its first Five-Year Plan and lasting through World War II.

In Asian, African, and Latin American countries after 1945, wealth was concentrated in the hands of a small elite group (typically one to two percent of the population controlled 70 to 80 percent of a country's productive assets) and the overwhelming majority of the people were very poor, a situation reminiscent of England in 1750.

Leftist parties agitated among the poor peasantry and, concerned about peasant discontent and uprisings, elites looked to industrialization to create a bigger economic pie, some of which would eventually trickle down to the poor and leave elite economic interests intact. Industrialization held out the promise of increased national and personal wealth, economic independence, and a way out of trading in cheap primary agricultural commodities (for example, bananas, coffee, and tea).

Many large Third World countries that embarked on industrialization in the 1950s, especially in Latin America, followed the North American or German model rather than the British one. That is, they followed a path of import substitution (ISI) to encourage domestic production for domestic markets. India and Brazil were the best examples of this strategy, which developed local products to replace imported commodities, put up high tariff walls on those commodities, provided state subsidies to domestic industries producing them, and lowered tariffs on raw materials needed for their production. The idea was to produce highly demanded consumer products and improve the nation's export position and balance of payments.

By the late 1970s, Brazil was able to supply the bulk of domestic demand for steel, textiles, transportation equipment, and pharmaceuticals. India was an important exception to this focus on consumer industries because India already had a strong consumer-goods industry sponsored by the British before they left in 1947. India emphasized capital goods production in the 1950s and 1960s, notably energy, iron and steel, and cement, but by the 1970s most import-substitution production was in consumer goods.

Urban income rose much faster than rural income, causing a large migration to cities.

ISI worked best in countries with a large potential consumer market, like India and Brazil; however, ISI had little effect in reducing imports and in many cases increased imports of certain commodities. It also did not reduce social and regional inequalities. A relatively small but highly influential group of workers and their families benefited from working in ISI factories and the higher wages paid there. The other principal beneficiaries were factory owners. The poorest groups in society had a declining share of income, whereas the middle income groups increased their share, much like the British, North American, French, German and previous industrial revolutions. As in previous industrializations, the urban/rural divide worsened, since urban income rose much faster than rural income, causing a large migration to cities and their slums.

The second major strategy followed by first-time industrializing countries after World War II was called an export-oriented strategy (EOI). Hong Kong, Taiwan, Singapore, and South Korea pursued this route. They developed a capital goods sector that emphasized sales in foreign markets, their domestic markets being unable to absorb rising industrial production. EOI attempted to achieve industrial growth through successful competition in international markets, and in all cases of successful EOI, the state played an active role in achieving comparative advantage.

In Taiwan and South Korea in particular, state-run and state-subsidized economic development, combined with extreme export orientation, led to a new system of monopolies (called *chaebols* in Korean). The state intervened to keep labor costs low by controlling and suppressing unions and stabilizing (subsidizing) food prices. Over the long term, the standard of living in these countries has risen for the majority of people, but there

are signs that poverty is increasing as international markets become saturated and new competitors like China have appeared.

A form of EOI that follows a more free-market model was pursued by other nations, including China, southeast Asia, Mexico, and Central America. This involved building factories employing large numbers of unskilled workers to produce labor-intensive products (for example, textiles) or to carry out a stage of production that is labor-intensive (for example, the assembly of computers) with the purpose of exporting the product.

The firm, most often foreign-owned, located a labor-intensive production process in a place where suppression of unions and workers' political parties kept wages low and provided a comparative economic advantage. These factories were located in export processing zones (called *maquiladoras* in Mexico) and they exploited and reinforced a low-wage economy. The workers in these factories had little hope of increasing wages and buying any of the products they manufactured. They remained poor and lived in makeshift shanty-towns and slums near the factories.

CONCLUSION

Since its inception, industrialization has held out the promise of cheap but uniformly produced commodities whose consumption, along with rising wages, would improve living standards for the mass of workers engaged in manufacturing. The promise has not always been kept. While living standards did rise in the early or core industrializing countries of Europe, North America, and Japan, income differentials did not close and most of the popular benefit derived from industrialization was due to the struggles of workers to unionize and strike. The strength of socialist and social democratic political parties rose to ensure that the benefits and wealth created by industrialization reached those who actually produced the commodities. Where workers were legally disenfranchised, unions were outlawed, and government and military repression of workers' political voice was strong, workers reaped few benefits from the long hours and monotonous labor of factory work and remained impoverished.

Inflation

INFLATION IS AN ECONOMIC situation in which the average price level of all goods and/or salaries rises steeply, which affects most severely those with fixed or relatively unresponsive incomes, such as pensioners. Inflation decreases consumer purchasing power and lowers national savings rates. When inflation comes during a time of high unemployment, it means a crushing burden on those whose income is already decreased. It favors the debtor at the expense of the creditor, since repayment will be made in depreciated money. The decline of real wages and real savings exacerbates many economic and political conflicts. If inflation results in the rise of prices by a few percentage points per year, then it is only a social irritant.

German inflation in the early 1920s had a significant impact on the poverty level in the country, as the rate of price inflation reached several hundred percent per year. The level of prices often doubled in a day, or even an hour. In 1923, one U.S. dollar was worth 4.2 billion German marks. In the United States, inflation was observed in all periods of business cycle expansion. After every war, countries experienced inflation: the Revolutionary War, the War of 1812, the Civil War, World Wars I and II, the Korean War, and the Vietnam War.

From 1900 to 1958 consumer price levels in the United States quadrupled, and they doubled between 1938 and 1958. Starting from 1945 wholesale prices increased by 52.6 percent, and consumer prices rose 33.7 percent. After the Vietnam War, inflation became progressively worse. This shocked workers, as real takehome pay had been rising steadily.

A new disturbance in the world economy began with a fresh surge of inflation in industrial countries at the beginning of 1979. In the first four months of 1979, wholesale prices in the major industrial countries rose at an annual rate of 11 to 13 percent, compared with five percent in 1978. Price rises in the United States were a result of the sharp depreciation of the U.S. dollar from late 1977 to the end of 1978. The oil crisis was

to some extent brought on by this renewed inflation and the depreciation of the U.S. dollar. In 1975 the official U.S. government statistics show that 25.9 million Americans were living below the government-defined poverty level (\$5,500 annual income).

Inflation declined sharply during Ronald Reagan administration's term from 1980 to 1989. There were two reasons for this: the high value of the dollar reduced the cost of imports and forced high-wage production in the United States (for example, automobiles and steel), and high interest rates brought about recession. However, the common effect of inflation and depression brought lower real salaries to the largest portion of American workers in the period from 1965 to 1981. Each extra percentage point of unemployment was accompanied by decline of at least two percent in real output, or \$700 per household.

During the same period, the inflation rate was accelerated in many developing countries. In 1983 Brazil's annual rate of inflation was nearly 300 percent. Argentina's inflation rate was even higher than Brazil's. However, Mexico, through strong efforts, had reduced inflation from nearly 100 percent in 1982 to 55 percent in 1983. Such events just confirmed that the countries that had been dependent on foreign borrowing must be careful in monetary policy implementation. Borrowing abroad, rather than increasing domestic savings, produced the kind of debt crisis that occurred later in Argentina.

Rapid liberalization in the former Soviet Union and other central and eastern European countries led to economically and politically unmanageable inflation. Authorities of those countries weren't prepared to effectively control inflation with a tight monetary policy, and the banking system didn't function properly. Because of inflation, much of the domestic production went into bankruptcy, which increased unemployment and poverty. Such increased poverty levels can be compared only with the decline experienced during the deep economic depression of the 1930s.

The history of the last 30 years teaches us that each time inflation took place, the average level of unemployment rose. Higher inflation, followed by higher unemployment, equals a higher poverty level.

JAROSLAV DVORAK KLAIPEDA UNIVERSITY

Institute for Research on Poverty

THE INSTITUTE FOR Research on Poverty (IRP) is a nonprofit, nonpartisan, university-based research center that aims to investigate the causes and consequences of poverty and social inequality in the United States. It was established in 1966 at the University of Wisconsin, Madison, by the U.S. Office of Economic Opportunity, which was the body charged with reducing poverty in the country. The IRP is one of three area-based poverty research centers that are now managed by the Office of the Assistant Secretary for Planning and Evaluation (ASPE) of the U.S. Department of Health and Human Services. Faculty at the university conduct research at the IRP together with teaching, while external faculty can also conduct research through the center. Grants for specific projects are made through the center.

The IRP has a record of solid development in the 40 years since its inception and has been instrumental in designing and evaluating some of the major public policies and programs to reduce poverty. A particular competency has been developed in the center for the quantitative analysis of large data sets. The research agenda and source of sponsorship have varied over the years in line with differing ideologies of prevailing presidential administrations.

The IRP has sought to maintain academic levels of rigor over the years, irrespective of the stated or unstated opinions of governmental figures. The research agenda also changed in line with alterations in the demographics of the U.S. economy, for example by explicitly including a number of ethnic minority people who previously were not considered individually. A national competition in 1995 resulted in the receipt of a core grant from the ASPE and designation as a National

Center, and this has provided more stability over the last decade. In 2004, Maria Cancian was appointed director of the center and has subsequently added to the range of research activities.

Activities currently include outreach work, provision of training, and sharing of information, in addition to core research work. The research agenda includes low-wage labor welfare, methodological issues in poverty research, regional analyses, child and family well-being, and welfare reform. Publications include research reports, books, policy briefs, and newsletters and similar items for a more general public.

At their best, university research centers are able to use their intimate local knowledge and contacts to obtain high-quality data that may then be set in the context of the most current thinking. The implications and lessons of the research may then be communicated with policymakers and other stakeholders, most notably the members of the local community. To achieve this, universities have had to overcome the occasionally justified prejudice about them that they are too remote from real life, and also have had to learn how to work with modern technology to provide information in a variety of the most useful formats, from peer-reviewed journals to broad audience media stories.

Institute for the Study of Homelessness and Poverty

THE INSTITUTE FOR THE Study of Homelessness and Poverty (ISHP) is a nonprofit, nonpartisan research organization that is based at the Weingart Center, described as being "in the heart of downtown Los Ange-

les' Skid Row." There were estimated to be more than 82,000 homeless people in Los Angeles County in 2003, out of a total of up to 3.5 million homeless people in the United States as a whole. The 2000 U.S. census indicated that more than 1.6 million people were suffering from some level of poverty in Los Angeles County, with the proportion highest for single people, at more than 22 percent.

The ISHP works in this context to provide reliable data and analysis to public-sector officials, individuals, and academic institutions, with a view to creating collaborative relationships and new policies and programs to address the problems of homelessness and poverty. The ISHP is governed by an advisory council and is part of the Inter-University Consortium on Homelessness and Poverty, which brings together academics and researchers from universities and other institutions in the United States and, also, the University of São Paulo, Brazil. The Weingart Center Association aims to deliver high-quality services in Los Angeles to help people break the cycle of homelessness and poverty.

The ISHP's programs include research and publication, provision of customized information, and research assistance. Publications include the *Just the Facts* series, which is aimed at a broad range of audiences, as well as more scholarly articles and reports and regular newsletters and updates. Institute staff present new research findings and recommendations at colloquia and also provide personal research assistance to community organizations and other interested parties.

The ISHP provides extensive resources and recommended links online and publishes new findings and information. Interns and volunteers are recruited to assist academic staff in providing these services. Commissioned research is also offered. The institute believes there is a need to increase the public's awareness of homelessness and poverty issues, as these problems have continued to afflict modern America, increasing inequality.

John Walsh Shinawatra University

Institute on Race and Poverty

THE INSTITUTE ON Race and Poverty (IRP) is a research institute based at the University of Minnesota, which has the aim of investigating "the ways that policies and practices disproportionately affect people of color and the disadvantaged." The IRP has a staff of 10 and is led by the Fesler-Lampert Chair in Urban and Regional Affairs. Its goals include ensuring that people have access to opportunity and helping the places where people live develop economically to provide opportunities while maintaining social stability. Issues investigated include metropolitan equity, concentrated poverty, and urban sprawl.

The IRP was founded in 1993 by legal scholar Professor John A. Powell, who had personal experience of the research agenda as a young person. Powell's research has shown him that the causes of racial segregation, of clustered poverty, and of disparities in treatment of people of different races are structural in nature, that is, "What these disparities have in common is that they are rooted in laws and policies that disadvantage people of color and over-advantage whites. They simply cannot be explained by racial animosity on the part of whites nor by bad choices made by people of color."

In other words, only legal change will make any significant difference in the level of inequality and, therefore, charity and kindness, though it is to be valued in its own right, should not be confused with genuine solutions to problems, but might even work to obscure real causes and hence be counterproductive. Powell is prepared to make his case in the national media and to apportion blame for what he believes are ills in American society, and this has, inevitably, caused him to become a target for some of those who do not share his views. Powell left to join the Kirwan Institute and his position was filled by Myron Orfield.

The IRP now organizes a variety of research projects thematically linked to its core goals and is also involved with conference management and information dissemination. In 2005 the IRP jointly authored a report entitled "Segregation of Opportunities," which helped to demonstrate in the Chicago area that housing location has a distinct impact upon access to opportunities and that housing location is affected by ethnicity.

InterAction

INTERACTION IS THE American Council for Voluntary International Action. It describes itself as "the largest alliance of U.S.-based international development and humanitarian non-governmental organizations." More than 160 such organizations are part of the network and together they seek "to overcome poverty, exclusion and suffering by advancing social justice and basic dignity for all."

The organization is based in Washington, D.C., and its CEO as of 2005 was Mohammad Akhter, who heads a board drawn from individuals representing leading secular and faith-based charity and development organizations. Akhter became well-known in the United States in the weeks following the terrorist attacks on September 11, 2001, when he appeared on media sources in his previous role as executive director of the American Public Health Association. In this role, he helped develop numerous interagency relationships and networks, which proved to be a precursor to his leadership of InterAction.

InterAction currently has four program committees that are charged with organizing and coordinating research, policy formulation, and information dissemination activities within their mandated areas. These committees work on the basis that the many members of the network in combination operate as more than the sum of their parts and that the power of their voice is, therefore, multiplied. The Development Policy and Practice Committee has priority areas of USAID reform, multilateral development institution reform, capacity strengthening, and development effectiveness.

The Humanitarian Policy and Practice Committee has priority themes of operations in disaster response, protection and rights of displaced persons, durable solutions, security, nongovernmental organizations and military relations, transition, peace and conflict, professionalization of humanitarian workers; and improvement in humanitarian performance of the international community and the U.S. government. The Public Policy Committee has priority themes of building consensus and improving effectiveness, foreign assistance budgets, millennium change accounts, and other issues. The final committee is the Commission on the Advancement of Women, which has priority themes of building organizational capacity for gender-sensitive development, documenting "best practices" for gender and development for particular sectors and regions, advancing women in leadership, and advocating for gender mainstreaming in bi- and multilateral donors.

In addition, the Diversity Challenge is an InterAction campaign designed to encourage organizational development in the particular area of diversity awareness. Organizations wishing to take this challenge, which is rewarded by recognition and by enhanced awareness by stakeholders of commitment to progressive goals, work through the Organizational Stocktaking Matrix to determine their current state of awareness of diversity issues and the necessary steps to take to improve it. InterAction members can challenge one another to evaluate and improve their performance.

Inevitably, in the context of early 21st-century American politics, all individuals and organizations calling for change and reform within the rest of the world are subject to comment and criticism in the popular media and in society at large. However, the prestigious nature of many of InterAction's members has so far shielded it from the worst types of attacks.

Inter-American Development Bank

THE INTER-AMERICAN Development Bank (IDB) was founded in 1959 to have, according to its charter, a mission to "contribute to the acceleration of the process

of economic and social development of the regional developing member countries, individually and collectively." The IDB has been successful in its aims, and its lending and technical cooperation programs exceeded what was customary for banks at the time.

The IDB has proved to be an attractive model for the creation of other regional development banks internationally. The original bank members were Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, the Dominican Republic, Ecuador, El Salvador, Guatemala, Haiti, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, Uruguay, Venezuela, and the United States. Other countries to join as regional members are Barbados (1969), Jamaica (1969), Canada (1972), Guyana (1976), Bahamas (1977), and Suriname (1980). Countries must have prior membership in the Organization of the American States (OAS) to become regional members.

Nonregional members may also join, so long as they are members of the International Monetary Fund (IMF) and, like regional members, subscribe to both Ordinary Capital and the Fund for Special Operations. A total of 17 European countries have joined the bank as nonregional members, as have Israel, Japan, and South Korea.

Despite its apparent success in achieving its aims, the IDB has attracted controversy.

Bank operations include not just arranging loans, borrowing funds, and making investments, but also providing technical cooperation, research and advocacy, publications, and organizing seminars and training. The IDB organized the Third Inter-American Conference on Corporate Social Responsibility in Chile, which drew more than 400 experts from 22 countries. The IDB also acts as a focal point and repository of knowledge and information about development projects in Latin America and the Caribbean. Just like the World Bank's, IDB publications help to frame the international debate on development issues in the region and provide the vocabulary for it.

In 2004, the IDB borrowed \$4.7 billion in a diversified variety of currencies and instruments. It continued to receive AAA ratings by major agencies. It approved 56 loans amounting to approximately \$5.3 billion. To date, it has not yet been required to write off any of its loan projects. There are three classifications of lending areas, which are competitiveness, social-sector reform, and reform and modernization of the state. From 1961

to 2004, a total of nearly \$136 billion has been provided in loans, of which 13.8 percent was devoted to energy, 12.1 percent to social investment, and 11.2 percent to transportation and communication. Social investment received more than 42 percent of all loans in 2004.

The IDB has taken a leading role in attempting to meet the targets for the Millennium Development Goals in the region in which it is interested. As President Enrique V. Iglesias noted: "The mandate of the Inter-American Development Bank of promoting economic growth and reducing poverty and inequality is fully compatible with the agenda prompted by the Millennium Development Goals. We have developed a farreaching institutional response ... and we stand ready to continue to support our borrowing member countries in their efforts to achieve the Goals." Progress has been mixed to date, as it has been around most of the world. Consequently the IDB is pressing ahead more urgently with policies that are aimed more at social inclusion and public participation than was previously the case.

Despite its apparent success in achieving its stated aims, the IDB has attracted controversy as a result of the ideology underpinning its operations. Just like the New Economic Partnership for African Development (NEPAD), the IDB reflects an agenda based on World Bank and IMF priorities, which are criticized for both the inappropriateness of many of the economic and social conditionalities attached to its loans and its usurpation of indigenous understanding of and desire for development and environmental management.

For example, the IDB has been instrumental in creating water privatization plans for Latin American countries despite the concerns derived from international experience that privatization leads to increased water prices and the spread of disease and deprivation. In addition the IDB has been linked with the kind of structural adjustment programs (now renamed poverty reduction strategies) that have led to unemployment, impoverishment, and transfer of state resources to international investors, most notably Enron.

Whether these claims are valid or not, it is true that the IDB has focused on projects based on maximizing economic gains within donor countries, with much less if any attention placed on social or ethical considerations. Consequently human development may not benefit from loans to the same extent and may in fact be reduced. In any case, the accountability of the IDB, together with other international finance institutions, is limited and a greater level would both increase transparency of operations and promote civic ownership of sponsored projects.

International Development Cooperation Forum

THE INTERNATIONAL Development Cooperation Forum is part of the Carter Center's Global Development Initiative and was established by former President Jimmy Carter. The Carter Center is located in Atlanta, Georgia, and is operated in partnership with Emory University. Carter and his wife Rosalynn established it in 1982, with a mission to advance human rights and alleviate unnecessary human suffering and poverty. It has provided assistance to people in more than 65 countries, working alongside both the poor and disadvantaged and also high-ranking officials.

The center is a not-for-profit nongovernmental organization that is managed by an independent board of trustees and relies upon donations from individuals, organizations, and countries. Among its successes are mediation in international conflicts, strengthening of democracy, and the near eradication of Guinea worm disease. It has a staff of some 150 people and deploys an annual budget of around \$35 million.

As part of the center's peace programs, the Global Development Initiative (GDI) aims to provide a new model of international cooperation that has three core principles: greater country ownership of development strategies, increased participation of civil society in governance and policymaking, and effective international partnership and cooperation.

The GDI works on a bilateral basis with four countries: Albania, Mali, Guyana, and Mozambique. It also convenes international development forums at which high-level officials meet to discuss, analyze, and search for solutions to issues arising from the impact of global forces on poor countries and people. Carter Center facilitators aim to maintain a neutral stance and enable various members of poor countries to fashion National Development Strategies, which aim to outline the transformations necessary within the country not only to withstand the pressures of globalization but also to benefit from them.

The first Development Cooperation Forum was held in December 1992 and was chaired by Carter and former United Nations Secretary-General Boutros Boutros-Ghali. This forum considered development prospects in a generally optimistic atmosphere resulting from the end of the Cold War. The second forum was held in June 1996 and focused on the developmental process in Guyana. This meeting was designed to review the attempts to create a National Development Strategy for Guyana and involved many different members of Guyanese society.

The third forum was held in February 2002 and was aimed at considering the impact of 10 years of development strategies and changes in the four partner nations of the center. Carter then forwarded the findings of the forum to the subsequent International Conference on Financing for Development, which was held in Monterey, Mexico. The findings included the conclusion, "Duplication of efforts by donors and a lack of accountability among recipient countries continued to perpetuate donor fatigue and developing country disillusionment."

The findings further called for greater generosity from developed countries in helping others meet their Millennium Development Goals obligations, as well as greater cooperation among the trade, investment, and overseas development policies of the developed countries, which are frequently contradictory and result in negative outcomes overall.

Carter was awarded the Nobel Peace Prize in 2002 as a result of his international conflict-mediation work and other activities. The fourth forum was scheduled for late 2005 to consider international progress toward meeting the Millennium Development Goals.

International Food Policy Research Institute

THE INTERNATIONAL FOOD Policy Research Institute (IFPRI) is a multinational nongovernmental organization with a vision of a world free of hunger and malnutrition. This vision is based on the belief that there is a human right to adequate food and nutrition and recognition of the inherent dignity of all members of the human family. The IFPRI is involved with both policy formulation and research and information dissemination in support of its vision.

Its mission involves, therefore, "identifying and analyzing alternative international, national, and local policies for improved food security and nutrition, with an emphasis on low-income countries and poor people and on the sound management of the natural resources base that supports agriculture; contributing to capacity strengthening of people and institutions in developing countries conducting research on food policies; and actively engaging in policy communication, making research results available to all those in a position to apply or use them, and carrying out dialogues with those users to link research and policy action."

The IFPRI is supported by numerous donors, including many national governments and international organizations such as UNICEF, the United Nations Development Program, and the Asian Development Bank. The IFPRI is governed by a board of trustees composed of a multinational selection of distinguished academics and public servants, chaired by Isher Judge Ahluwalia in 2005. It works in collaboration with many partners at the national and international levels to conduct research into beneficial food policy for the poor, to determine impact of policies and policy changes, and to

establish networks uniting developing countries, research institutes, and agricultural industry bodies. The IFPRI responds to changes in the international political and economic environment by adjusting its own structure to reflect better-evolving situations, for example, the increased focus placed by the World Trade Organization on domestic distortions and standards in trade negotiations. It was decided that the previous distinction between national and international trade issues was no longer valid and, hence, those aspects of research were placed under the newly constituted Markets, Trade, and Institutions Division. This is one of a number of divisions in which leading researchers and their assistants and administrative support conduct activities.

As of 2005, IFPRI strategy was focused on 15 main themes under four distinct headings. The four areas under Global Food System Functioning were global food situation and scenarios of policy risks and opportunities; globalization, retail food industries, and trade negotiations related to food and agriculture; managing natural resources of particular importance to food, nutrition, and agriculture; and food systems in disaster prevention and relief and rebuilding after crises. The five themes under Global and National Food System Governance were "governance structures and policy processes in food and agriculture, the role of the state, the private sector, and civil society; food and water safety policies; policies addressing hidden hunger, enhanced food and diet quality for poor people, and the nutrition transition in developing countries; policies and interventions for sustainable poverty reduction and nutrition improvement; and crosscutting research on country and regional food, nutrition, and agricultural strategies.

The four themes under Food System Innovations were food- and nutrition-related science and technology policy serving poor people; the future of smallholder farming in efficient and equitable food systems; urban-rural linkages and nonfarm rural development in efficient and equitable food systems; and knowledge systems and innovation. Two other themes covered two-way communications between the IFPRI and its stakeholders and capacity development.

International Fund for Agricultural Development

THE INTERNATIONAL FUND for Agricultural Development (IFAD) is an international organization of the United Nations (UN) established in 1977 as an outcome of the 1974 World Food Conference and has as its mission statement "Enabling the rural poor to overcome poverty." IFAD is governed by an Executive Board of 18 members and 18 alternates drawn from representatives of member states and other organizations and which elects a president to oversee operations. As a part of the UN, IFAD has a democratic structure with many efforts to introduce into its governance. Its headquarters are in Rome, Italy, and its approach to development is bound by a specific ideology that food production is limited not just by technical or technological issues but also by social and political ones.

IFAD's operations include offering grants for projects, strengthening capacity, conducting research, formulating policies, and disseminating information. IFAD helps to create Country Strategic Opportunities Papers (COSOPs) for individual states and these papers are used as the basis for identifying subsequent development projects. Proposed projects are strictly appraised and monitored to ensure that they are appropriately targeted toward relevant constituencies and have achievable goals.

An independent evaluation unit subsequently ensures that projects have been completed. Projects are informed by its ideology and so feature technical attempts to increase food production, employ poor and landless farmers, and reduce hunger.

Activities conducted by IFAD include the implementation of its rural finance scheme. IFAD estimates that one billion people do not have access to the financial services necessary for them to organize their lives. Providing financial services to them, in an environment in which functioning markets exist, enables the rural poor to enjoy enhanced asset formation, food security, and productivity. Approximately \$2.7 billion was distributed to states as part of IFAD's project portfolio as

of September 2003. In cases of destitution or states without functioning markets, direct transfers are required as financial services are inadequate to address the problems.

Gender issues are also central to IFAD's operations. It observes that without gender sensitivity, many projects can lead to increases in women's workload since they are considered to be in addition to women's traditional labor within the house and as caregivers. It notes that women "are the most significant suppliers of family labor and efficient managers of household food security." As a consequence, IFAD's projects are intended to have a transformative effect in societies in which it works by providing equal opportunities for women. This is not welcomed by all in traditional and conservative societies. Nevertheless, empowering women has an immediate and lasting impact.

Numerous other projects are organized around the world focusing specifically on the very poor and most disadvantaged. The impact of macroeconomic policies and practices on such people is also of central importance to IFAD's work.

International Labor Organization

THE INTERNATIONAL LABOR Organization (ILO) was founded in 1919 as part of the Treaty of Versailles, which marked the creation of the League of Nations and it is the only surviving institution dating from that agreement. It was originally conceived as a humanitarian response to the plight of many millions of workers around the world and had been envisaged by the eminent industrialists Robert Owen (1771–1853) and Daniel Legrand (1783–1859). Its fundamental precepts are enshrined in the preamble to its constitution: "Whereas universal and lasting peace can be established only if it is based upon social justice. ... Whereas also

the failure of any nation to adopt humane conditions of labor is an obstacle in the way of other nations which desire to improve the conditions in their own countries." Specific objectives and principles of the ILO include these beliefs: "(a) labour is not a commodity; (b) freedom of expression and of association are essential to sustained progress; (c) poverty anywhere constitutes a danger to prosperity everywhere; (d) the war against want requires to be carried on with unrelenting vigor within each nation, and by continuous and concerted international effort in which the representatives of workers and employers, enjoying equal status with those of governments, join with them in free discussion and democratic decision with a view to the promotion of the common welfare." These four values were part of the Philadelphia Declaration of 1944 and this became part of the charter for the ILO.

In 1969 the ILO was awarded the Nobel Peace Prize for its work.

In 1946 it became the first specialist institution to be affiliated with the then recently founded United Nations (UN). Its headquarters are in Geneva, which hosts the annual International Labor Conference. Major publications include the *International Labor Review* and the Year Book of Labor Statistics.

The ILO was initially involved primarily with codifying international labor standards in the Western world and, during the 1930s, trying to combat the effects of the Great Depression. However, its scope of operations broadened after World War II when the breakup of Western empires and the improved ability to address the issues facing developing nations allowed it to become a truly global organization. The ILO now has more than 200 members, and nearly all but the smallest or most obtuse states have joined. In 1969 the ILO was awarded the Nobel Peace Prize for its work.

The main activities of the ILO include creating and promulgating international labor standards, providing technical expertise, promoting good workplace governance, and research and publication. Conventions and recommendations include provisions on minimum labor rights in the areas of freedom of association, the right to organize, collective bargaining, abolition of forced labor, equality of opportunity, and treatment. Technical expertise is provided in the areas of vocational training and rehabilitation, labor law and industrial relations, labor statistics, and occupational safety

and health. The ILO provides services to both workers and employers and maintains a tripartite structure in negotiations uniting workers, employers, and government.

Convention No. 182, issued in 2002, called for an end to the worst abuses of child labor and was very rapidly ratified by more than 100 members. Public education and awareness of child labor and other abuses have helped to raise consciousness of the conditions facing many millions of workers in the 21st century, even though they may have disappeared almost entirely from the West.

Other high-profile issues include forced labor or slavery, human trafficking, and continued discrimination. Alone, the ILO finds it difficult to ensure that states abide by their commitments or to require non-members to improve their rights. However, working in partnership with nongovernmental organizations and government agencies or others, it is possible to enforce change. Nevertheless the standards imposed by the ILO occasionally exceed the capacity of government agencies to comply with them, and the very great range of development across borders sometimes means that standards possible in some parts of the world are not yet feasible in others.

Inability to comply seems to be best dealt with through poverty reduction and capacity strengthening rather than punitive action. Further, there is a need for the ILO continually to refine its activities and policies because of the increasing sophistication of international business organizations and the changes wrought by globalization. "Fair Globalization—Safe Workplace" was the theme of the ILO-supported conference held in Dusseldorf, Germany, in October 2005, representing one of the main themes being explored by the ILO.

The ILO is divided into a number of functional divisions relating to core areas such as standards and fundamental principles and rights at work, employment, social protection, and social dialogue. It also maintains regional offices to cover all areas of the world: Africa, Latin America and the Caribbean, Arab states, Asia and the Pacific, and Europe and central Asia.

International Monetary Fund

IN JULY 1944, WHEN the Allies had clearly turned the tide of war against the Germans and Japanese, representatives of the United Nations (UN) met at Bretton Woods, New Hampshire, for a conference on postwar monetary and financial issues. The participating nations were concerned that several factors might combine to cause another catastrophic economic depression, which might then sow the seeds for another terrible conflict.

In particular, they wished to offset some of the effects of the unprecedented destruction caused by the war, as well as the problems caused by discharging millions of combatants into the labor pool while shifting from military- to consumer-oriented production. More than anything else, the participating nations wished to avoid the economic protectionism that had been seen during the Great Depression as a brake on economic decline, but had actually accelerated the decline. An emphasis on the salutary effects of increasing international trade defined the atmosphere at the Bretton Woods conference. The conference resulted in the creation of two institutions that would continue to shape the world's economies long beyond the immediate aftermath of the conflict's end: the International Bank for Reconstruction and Development and the International Monetary Fund (IMF).

The primary architects of the institutions that emerged from the Bretton Woods conference were the British economist John Maynard Keynes and the American Harry Dexter White. The IMF formally came into existence on March 1, 1947. Initially established with \$8.8 billion in contributions from participating nations, the International Monetary Fund was framed to aid nations whose currencies did not trade well internationally. Those nations could contribute their own currencies to the fund and draw out an equivalent amount in more

flexible currencies such as the U.S. dollar or the British pound.

The key to managing the fund would be to maintain a balance between the weak and strong currencies, and a number of regulations were put in place to ensure that such a balance could be maintained. First, if possible, nations wishing to "borrow" from the fund, had to "trade" gold reserves or currencies convertible to gold equivalent to 25 percent of what they wished to borrow, though no nation would be required to "trade" more than 10 percent of its total gold reserves or convertible currencies.

Second, borrowing nations had to pay a service fee of .75 percent of what they were borrowing. In addition, they would pay interest of .5 percent at six months, of one percent at one year, of 1.5 percent at two years, and of two percent at three years. If their borrowing exceeded 25 percent of their original contributions to the fund, the interest rates would increase by .5 percent at each stage, and if it exceeded 50 percent of their contribution, the interest would increase by still another .5 percent at each stage.

If the interest rate reached four percent, the IMF would put the borrower on notice that its borrowing privileges were in danger of being revoked. If the interest rate reached five percent, the International Monetary Fund could impose whatever sanctions it deemed appropriate to expedite its recovery of as much of the borrowed funds as possible.

Third, in any year in which a nation's gold reserves or convertible currencies increased, the nation was obligated to apply 50 percent of that increase to its outstanding balance with the IMF. Fourth, for every \$400,000 originally contributed to the fund, a nation received a vote, but for every \$400,000 subsequently borrowed from the fund, a nation lost one of those votes, with the votes being transferred to the nations whose contributions were being borrowed.

Last, if a nation was discovered to be using borrowings from the fund for any purpose other than facilitating its international trade, its privileges could be revoked and sanctions imposed against it. Such terms were clearly meant to discourage long-term and reckless borrowing from the fund. Indeed the fund could not hope to cover anything approaching the immediate postwar needs of nations whose economies had been devastated by World War II. Instead it was intended to forestall deepening economic crises until those nations' economies could be reestablished and until sustained economic growth would reduce the demands on the fund.

Initially, 29 nations contributed to the IMF. The 15 largest contributors to the fund were the United States, which contributed \$2.75 billion; the United Kingdom, \$1.3 billion; the Soviet Union, \$1.2 billion; China, \$550 million; France, \$450 million; India, \$400 million; Canada, \$300 million; the Netherlands, \$275 million; Belgium, \$225 million; Australia, \$200 million; Brazil, \$150 million; Czechoslovakia, \$125 million; Poland, \$125 million; South Africa, \$100 million; and Mexico, \$90 million. The smallest contributions were from Liberia and Panama, which contributed some \$500,000 each.

Therefore, without incurring extra charges, France could borrow up to \$112.5 million, and the United Kingdom could borrow up to \$425 million. Given that France was facing a postwar annual trade deficit of about \$2 billion and that the United Kingdom was facing a postwar annual trade deficit of about \$5 billion, neither nation could come anywhere near to covering those deficits by borrowing from the IMF. But both nations could use the available funds in a very targeted way to accelerate their economic recovery from the war.

THE MODERN IMF

The basic principles that defined the IMF's operations at its beginnings have continued to define its operations as it enters its sixth decade. By the late 1960s, the independence movements in the Caribbean, Africa, Asia, and Oceania had increased membership in the IMF to 107 nations.

By the late 1990s, the independence of most of the remaining colonial possessions, the dissolution of the former Soviet Union and the fragmentation of several European states, and the inescapable reach of the new "global" economy combined to increase IMF membership to 186 nations. Of UN member states, only Cuba and North Korea, along with several very small states including Andorra, Liechtenstein, Monaco, Nauru, and Tuvalu, are not also members of the IMF.

The unprecedented economic growth and increases in standard of living in First World nations, along with the dramatic economic recoveries of nations devastated in World War II, in particular the former Axis states of Germany and Japan, are the most dramatic successes that can be attributed in part to the IMF. Supporters of the IMF also argue that the organization has shown a great deal of flexibility in adapting to postcolonial and post-Soviet realities. They argue that the IMF should be credited with several major and continuing contributions to international economic stability.

The rapid dissolution of the former Soviet Union and of its strict political and economic control over the Warsaw Pact nations of eastern Europe could have had dire consequences beyond the region. But the former communist nations have been making the transition to capitalist economies more quickly and more smoothly than most forecasters predicted, despite the deepening evidence of just how moribund the formerly state-controlled economies had become.

Likewise, despite severe impediments to economic growth—including rapid population growth, environmental degradation, and political repression and corruption—much of the Third World has experienced economic growth that has ameliorated the effects of conditions well beyond the control of the IMF or any other outside agency. Supporters of the IMF argue that, without the IMF, the bad conditions in many Third World nations would certainly be much worse. Indeed the best evidence of the benefits of the IMF is that the world has not had a prolonged economic downturn—certainly nothing approaching the Great Depression—since it and the World Bank were created.

CRITICS OF THE IMF

Despite these seeming successes, critics of the IMF, the World Bank, and globalization have been diverse and very vocal. Each international meeting of the World Bank's and IMF's major creditor nations is an occasion for mass demonstrations against the institutions' policies. In the late 1990s these demonstrations became increasingly violent, with the widespread rioting surrounding the meeting in Seattle, Washington, receiving a great deal of press attention throughout the United States.

The IMF's critics have charged that it is designed to benefit the richest nations at the expense of the poorest nations. It ensures that economic problems in Third World nations do not disrupt the economic growth of First World nations, but it has not succeeded in truly developing the economies of Third World nations. If anything, the gap between most of the Third World and the First World has continued to widen, and much of the Third World has been forced to accede to their economic exploitation, which in some ways is more pernicious than the depredations of direct colonization.

The IMF's Structural Adjustment Policies (SAPs), the "strings attached" to IMF loans, have, in effect, reduced nations' control over their own economies and have greatly benefited international conglomerates at the expense of local and nascent industries. The IMF's

worst critics have compared its tactics to those of loan sharks. According to these critics, the IMF has not typically improved the economies of impoverished nations but has, instead, offered the chimeric possibility of such improvement to entice the governments of those nations into even deeper economic crises.

Worse, the IMF's policies have often sustained the regimes of Third World tyrants whose "kleptocracies" have looted both IMF funds intended for economic development and whatever national wealth has remained after IMF obligations have been met. The "proof" for these charges is the deepening debt of the world's poorest nations, many of which have been ruled by some of the most brutally oppressive political regimes in recent history.

Ranging from Haiti to the Congo to Bangladesh, the world's most impoverished nations have become so hopelessly indebted that the creditor nations have begun to advocate debt forgiveness rather than debt relief. Indeed advocates for these "poorest of the poor" among nations have argued that even debt forgiveness is not enough, since it simply leaves the nations economically destitute and simply clears the balance sheet to permit renewed dependence on international loans.

MARTIN KICH WRIGHT STATE UNIVERSITY

International Nongovernmental Organizations

WHILE INTERNATIONAL governmental organizations (IGOs) have emerged as decisive in structuring political relations and shaping the behavior of state actors, international nongovernmental organizations (INGOs) do not occupy formal positions of power. Instead, INGOs collectively function as an important cultural force, socializing the global citizenry with world society principles. And unlike IGOs, whose members are typically nation-states, INGOs connect individuals and private groups from different countries who share a common set of goals or interests. Despite the difference in formal power between IGOs and INGOs, the latter nevertheless serve as important mechanisms for transmitting world culture, and have proven instrumental in the area of development and poverty relief.

TRANSMITTING WORLD CULTURE

Sociologists have recently detected the presence of a world culture that acts as an autonomous force on nation-states. These sociologists suggest that culture is organized at the global level, noting the isomorphism that countries exhibit across a wide range of organizational features.

These organizational models include the widespread adoption of universalistic welfare systems, a universal rise in state authority and organizational activity, the expansion of women's suffrage, a growing concern for democracy and human rights, a growing conception of individualism, liberalized same-sex policies, environmentalism, the spread of science and models that privilege scientific authority, as well as the expansion of mass education along with a standardized curriculum. One important mechanism that triggers the spread of these models is a state's linkage to international organizations. Cultural models are more likely to, and will more quickly, penetrate countries with a large number of membership ties to international organizations. Ultimately, countries that are embedded in world society are "socialized" to adopt organizational models that adhere to world cultural principles.

INGOs, in particular, are important enactors and carriers of world culture. The rapid increase in INGO membership suggests that a world culture is indeed forming through these organizations. INGOs have expanded dramatically, from approximately 200 active INGOs in 1900 to almost 4,000 in 1980, to over 5,000 by 1995, with the vast majority of this rapid expansion occurring during the post-World War II era.

DIFFUSING A LOGIC OF PRIVATIZATION

INGOs have become well-known for taking on a humanitarian character and spreading progressive values across the world. INGOs often serve as transnational bodies that set global standards and principles, and broadly represent all of humanity vis-à-vis states and other actors of transnational prominence. Many tackle social problems and are characterized as encompassing a grassroots, or social movement, quality.

Amnesty International (AI) and the League of Red Cross and Red Crescent Societies (Red Cross) represent two of the world's most prominent INGOs. Founded in 1961 and headquartered in London, AI's organizational goal is to secure the release of political prisoners (those nonviolent individuals who are imprisoned simply for their beliefs and/or demographic characteristics) as well as call an end to the torture and execution of all prisoners. The Red Cross, currently headquartered in Geneva, Switzerland, was founded in 1919 and coordinates humanitarian activities with the goal of preventing and alleviating human suffering.

However, with no formal authority, INGOs cannot impose their respective goals or principles on global actors. Rather the diffusion of these norms and cultural models must occur more informally, through gradual socialization that stems from contact with, or membership in, these INGOs. Quite often, INGOs enjoy great success in coopting transnational governing bodies and state machineries to formally adopt their cultural models. However, these models are often loosely coupled compared to the way they are actually implemented. For example, INGOs were involved in the United Nations' (UN) General Assembly adoption of the Univer-

sal Declaration of Human Rights in 1948. However, many of the articles are repeatedly violated by member states without any formal consequences. Also, while the UN General Assembly unanimously adopted the Declaration on the Protection of All Persons from Being Subjected to Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment in 1975, this declaration has been largely ignored by some UN member states where violent practices have continued.

Nevertheless, INGOs have dramatically expanded their role in the world and have become more powerful in their ability to promote global welfare. While many sociologists have noticed the diffusion of cultural principles by INGOs, INGOs are also responsible for the diffusion of material resources. INGOs have provided clean water, housing for the poor, job training, social services, and vaccinations for children. They also have constructed schools, health clinics, and other medical facilities, and have started health and education programs for children. INGOs have been able to penetrate weak states that are unable and/or unwilling to adequately provide these important needs for its citizens.

INGOs promote democratic principles whose models are loosely adopted by nation-states.

Thus INGOs have had mixed success in their ability to achieve their progressive and humanitarian goals. While the political and human rights models that INGOs diffuse are loosely coupled with their implementation, INGOs have had greater success penetrating states economically to provide on-the-ground aid and services. In short, while INGOs promote democratic principles whose models are loosely adopted by nation-states, they fulfill economic welfare needs for collapsed governments by providing developmental assistance. In diffusing a logic of privatization, these INGO efforts result in institutionalizing the removal of state control over both political and economic outcomes.

PROMOTING DEMOCRATIC PRINCIPLES

Of course most INGOs do not actually promote a humanitarian agenda as an organizational goal. Of the 13 INGO sectors, those comprising a science and technology megasector make up over one-third of all INGOs. These include INGOs whose areas include medicine, healthcare, the sciences, mathematics, space, technical standards, infrastructure, and communications. INGOs

in the economic megasector (which includes industry, trade, industrial groups, the service economy, finance, and tourism) comprise almost one-quarter of all INGOs. Together these two megasectors form the core of world culture, and typify world culture's technical-rational foundation. The next largest megasector is the progressive set of INGOs (which includes individual rights and welfare) and comprises one-eighth of the total. Thus, while these progressive INGOs occupy an important megasector, most INGOs do not actually substantively represent humanitarian or social welfare causes.

However, the diffusion of world culture through INGOs does not only refer to organizational content, but also to organizational structure and process. INGOs promote voluntary action by individual members, and their organizational structures obey norms of open membership and democratic decision-making. AI's internal governance structure is highly democratic. The International Council Meeting (ICM) that meets every few years governs AI. Individual members either directly elect delegates to the ICM or elect a national section board that, in turn, elects ICM delegates. The ICM delegates debate and vote upon various issues, including the scope of AI's mission, AI's policies, campaigns, and membership actions, as well as organizational and financial matters. The ICM also elects nine members to a governing board, the International Executive Committee, which runs the organization between congresses and appoints the secretary-general who functions as Al's top spokesperson, as well as the top senior manager of the International Secretariat in London.

Regardless of the substantive goals that INGOs promote, INGOs structurally promote five basic world cultural principles: 1) universalism (INGO goals and activities transcend boundaries to encompass the world); 2) individualism (INGO members are mostly individual people, and INGOs utilize the one-person/one-vote democratic principle in their decision-making); 3) rational voluntaristic authority (emphasizing a decentralized formal structure and collective action that represents consent rather than coercion); 4) human purposes of rationalizing progress (this principle stresses adherence to rationalism as a goal, relying on scientific methods, formal expertise, and professionalism); and 5) world citizenship (individuals are world citizens, above and beyond other salient identities, who are entitled to certain rights and protections, and these are applied equally to everyone). Thus it is not only through the pursuit of its substantive goals that INGOs are able to promote world cultural values but through its international membership base, democratic organizational structure, and rationalized procedural norms that particular models are disseminated across the globe.

However, the democratic models that INGOs diffuse are loosely created from the forms that are actually implemented by nation-states, resulting in a distorted democracy as it is actually experienced. It is democracy in the sense that the diffused political model calls for mass participation in the election of state leaders. It is distorted, however, in the sense that the choices available to the population are narrowly defined. Moreover, elections focus on the selection of representatives rather than, or in addition to, referendum items to allow the citizenry to become directly involved in the decision-making process.

Transnational corporate entities are able to influence the structure of political regimes.

Democratic models that include the INGO norms of universality, individualism, and (world) citizenship all promote the idea of formal political equality through mass participation in free elections. Most importantly, though, the principles of rational voluntaristic authority and human purposes of rationalizing progress legitimate the idea that election results reflect a rational process that expresses the consent of the governed, thereby moving away from dictatorial regimes that rule by coercion.

Thus not only does the diffusion of these models bring about increases in formal political participation (voting for representatives), without necessarily any corresponding increases in direct participation (voting for policies), but this system of governance also forces the citizenry to accept the decisions made by political elites since they were elected voluntarily, regardless of how narrow the range of choices are. This, of course, results in a more orderly and stable political environment for governing elites, as states achieve legitimacy by adopting democratic models.

Additionally this privatization of the political process shifts the production of ideology over to the "invisible hand" of the market, thereby opening the door for corporate messengers. Instead of state elites monopolizing the production and distribution of cultural and political messages, the market controls this process by shaping public discourse and subsidizing political campaigns. In this way, transnational corporate

entities, and their local subsidiaries, are able to influence the structure of political regimes and the policies that they choose to implement.

In short, both local/political elites and global/economic elites benefit from distorted democracy, the favored political system of the world capitalist economy.

FULFILLING ECONOMIC DEVELOPMENT

Groups like AI and Human Rights Watch (HRW) are prominent Western INGO leaders in the fight for political freedom. However, within the INGO community, and the world community more generally, there is a noticeable lack of equity with respect to supporting both political and economic rights. The UN's Universal Declaration of Human Rights mentions the rights to social security, employment, fair remuneration, and a decent standard of living, including food, clothing, housing, and medical care.

However, only six articles of the declaration involve economic rights, while 19 articles are devoted to political rights. In 1966 these human rights were codified into international law through two treaties, the International Covenant on Civil and Political Rights and the International Covenant on Economic, Social, and Cultural Rights. However, the two treaties are not on equal footing, as the political rights covenant is stronger in terms of monitoring compliance and providing additional protocols. More generally, within the human rights community, violations against political rights and civil liberties that result in imprisonment and torture are deemed unacceptable, while violations of economic and social rights that result in poverty and starvation are considered merely misfortunes.

The fact that many political INGOs have shown great reluctance to give economic and social rights equal status in their formal platforms has not gone by unnoticed within the human rights community. FoodFirst Information and Action Network (FIAN), founded in Heidelberg, Germany, in 1986, was essentially a splinter movement from within AI as a reaction to AI's refusal to incorporate economic, social, and cultural rights into its mandate. FIAN's activities include human rights education and public relations work, monitoring, and lobbying of governments and international organizations, all in the effort to apply pressure on governance structures to enforce economic rights.

However, most INGOs that are concerned with economic and social rights focus their activities on development and humanitarian assistance. INGOs such as OXFAM and Cooperative for Assistance and Relief

Everywhere (CARE) are development-oriented groups whose objectives are to free societies from poverty, hunger, and famine. Thus perhaps the most important difference between "political" INGOs and "economic" INGOs are the different roles they play.

While INGOs promote democratic principles whose models are loosely adopted by nation-states, they fulfill economic welfare needs for collapsed governments by providing developmental assistance. Both sets of activities involve diffusing a logic of privatization, resulting in the removal of state control over political and economic outcomes. This reflects not only the ability of economic INGOs to penetrate deeper into states, but also the relative failure of political INGOs to fully implement the models they widely diffuse.

What explains the relative success of economic INGOs is their ability to penetrate weak states in ways that core states or transnational corporations cannot. During the past several decades, there has been tremendous growth in using NGOs to channel financial transfers from the industrialized to the developing world. In 1970, NGO activities represented only 0.2 percent of official development assistance. In 1994, though, over 10 percent of public development aid was channeled through NGOs. In 1992 the Organization for Economic Cooperation and Development (OECD) estimated the total flow to be \$8.3 billion, or 13 percent of all development assistance.

The proportion of World Bank-funded development projects that involved NGO or community-based organizations (CBOs) increased from 20 percent in 1989 to 46 percent in 1997. Between 1973 and 1997, provision for NGO/CBO involvement was highest in projects whose primary objectives were to improve gender equality (80 percent), improve the environment (54 percent), and reduce poverty (48 percent).

And not only have nongovernmental groups become more important for the diffusion of official governmental assistance, but governmental assistance has become more important to NGOs. Whereas previously, nongovernmentals had relied almost exclusively on voluntary donations from individuals for fundraising, now they have increasingly taken public funds. In 1970, public grants represented only 1.5 percent of NGO income, whereas that percentage had grown to 35 percent by 1988.

Many INGOs have established formal relationships with the UN, serving in participatory roles or gaining access to its resources. Formally UN Charter article 71 allows the Economic and Social Council (ESOSOC) to consult with nongovernmental organizations. While

this is the only mention of NGOs in the charter, it marks a break from previous world gatherings. NGOs were completely excluded from the Hague conferences in 1899 and 1907, and were only informally integrated with the League of Nations.

The Committee on Nongovernmental Organizations, elected each year by ESOSOC, supervises process of the admission nongovernmental groups to consultative status. NGOs can be granted consultative status in one of three categories: I, II, and "the roster." NGOs in category I have broad economic and social interests and broad geographic scope, while those in category II are more specialized. The remainder of accepted applicants are placed on the roster and make infrequent contributions. Whereas governments have greater rights of participation in the UN system, the nongovernmental groups remain largely under ESOSOC control. Category I groups have the broadest access to the ESOSOC and may propose agenda items to the Committee on Nongovernmental Organizations, which may ask the ESOSOC to include these items on a provisional list. Both category I and II groups may send observers to all meetings and may submit written statements on their subject matter, and the ESOSOC may ask for written statements from any of the consultative NGOs.

INGOs are consequential for the operations of the world political economy.

Nongovernmental access to the UN through the ESOSOC has grown significantly during the post-Wold War II era. Category I admissions have grown from seven in 1948 to 41 in 1991, while category II admissions have grown from 32 to 354 during the same period, and even faster expansion has taken place on "the roster," such that over 900 INGOs now have consultative status with the ESOSOC.

However, the growing linkage between governments and INGOs has drawn considerable criticism in recent years. Some scholars suggest that while colonial powers were previously able to cloak their geographic accumulation with the "face" of Christian missionary work and the salvation promised by such interventions, today's core powers now use INGOs as a normative force to serve as their "face" for introducing other penetrative forms.

Other scholars argue that NGOs have increasingly become involved in what they refer to as the international development industry, altering the way in which NGOs operate and bringing into question their ability to preserve their independence from northern core powers.

No longer supported only by voluntary donations from individual contributors, NGOs have increasingly become subsidized by public institutions. During the 1980s, the rate of growth of official development aid to NGOs increased significantly.

In addition they suggest that multilateral agencies, such as the World Bank, are increasingly relying on NGOs for the implementation of their projects. In order to put a more acceptable face on assistance, the development industry is integrating NGOs into its infrastructure, allowing development projects to penetrate deeper into the global south. Thus, through nongovernmental entities, northern funders have discovered another avenue on which they are able to exercise control and decision-making powers over southern localities.

Over the past several decades, the major INGOs that focus on relief efforts have expanded their previous emphasis of just saving lives to now also integrating developmental interventions into their work, focusing on the implementation of projects. In many cases, instead of protecting the local community's indigenous practices involving agriculture, health, and resource management, the NGOs actually serve the interests of the wider market by integrating the penetrated community in ways that meet the imperatives of global capitalism. Foreign NGOs oftentimes help proletarianize the local population, transforming environments featuring subsistence-based production into ones that obey market logic dependent upon external linkages where production volume is regulated by foreign businesses.

CONCLUSION

In short the diffusion that INGOs have undertaken generally results in one of two ways. The models that these organizations propagate either are only ceremonially adopted by states in order to obtain legitimacy (for example, democratic models, human rights instruments), which are then loosely implemented from actual practice, thereby distorting the initial diffusion, or are adopted and fully implemented, but in ways that simultaneously benefit wealthy, core states and harm weaker states in the periphery (for example, neoliberal policies that facilitate capital penetration into, and surplus extraction from, developing countries).

Thus INGOs are consequential for the operations of the world political economy in two ways. First, when

working alone, INGOs diffuse progressive models supporting democratic/egalitarian principles that are loosely coupled with how these models are actually implemented. These distorted models provide legitimacy and stability for state regime, while simultaneously facilitating corporate penetration into the political sphere, thereby securing influential relationships with state actors.

Second, when functioning as intermediaries for government or corporate entities, INGOs diffuse economic development models that are forced upon peripheral targets. INGOs can more easily penetrate local communities, establish ties, and provide assistance that increasingly involves development projects that necessarily imply the adoption of core economic models. In both instances, the practical result is to loosen the economic, political, and social grip of state regimes over nations, thus opening the door for transnational corporate infiltration into these spheres.

Ultimately INGOs diffuse a logic of political and economic privatization, moving states away from authoritarian models of governance.

International Poverty Rates (\$1 and \$2 a Day)

POVERTY CAN BE defined as the inability to achieve a certain level of well-being. Well-being is the level of command over resources an individual has or, alternatively, is the general ability to function in society; poverty is a failure to achieve sufficient levels of either of these attributes. In economics the focus is usually on whether individuals have a minimum level of monetary resources. These monetary resources, in turn, are linked to a certain level of consumption that is thought to be sufficient to maintain a minimum level of well-being—valuing in terms of money gives a measurable proxy to the diverse goods and services that lead to well-being that are really being measured.

The monetary resources needed to achieve the minimum level of well-being define the poverty line. Individuals who do not have these monetary resources necessary to meet the most basic needs of food, clothing, health, and shelter are considered to be poor, while those who are above this level are not considered to be poor. Defining this minimum level of well-being and hence the poverty line is quite subjective and somewhat arbitrary.

It should also be noted that using a one-dimensional (that is, money) measure of poverty, although convenient and more easily measurable, glosses over many aspects of poverty. The United Nations, for example, has developed a multidimensional Human Poverty Index that takes into account illiteracy, malnutrition, early death, and poor healthcare. A monetary standard uses money as a proxy for these less quantifiable factors.

One way of setting a poverty line is by comparing individuals within a country to each other: how well off is each person relative to others in the country? A relative poverty line would then be set, tailoring each one to the contingent factors within a country. Thus a relative poverty line for a poor country such as Sudan would be much lower than one for a rich country like the United States. This would also mean that comparisons between

countries of the percentage of the population living in poverty would be invalid, as a person considered poor in the United States would quite likely be considered middle-class in Sudan.

This leads to a second way of setting a poverty line: using an absolute standard (in monetary terms) that is invariant across countries. Anyone, in any country, whose consumption is valued (in equivalent monetary terms, adjusting for price and currency differences) below this standard would be considered poor. This method of determining a poverty line allows for comparisons across countries of the percentage of the population living in poverty. It also allows for judging the impact of anti-poverty programs over time.

The most widely used absolute poverty line for world comparisons is the World Bank's consumption expenditures of \$1 (or \$2), at purchasing power parity, per day. A person whose average consumption expenditures are less than \$1 per day would be considered poor, in whatever country he or she lives. This standard is set to reflect conditions in the poor developing countries, as it represents an extremely low level of consumption. In contrast the official Census Bureau poverty line for a family of four in the United States is \$18,500, or about \$12 per day per person, implying that virtually no one in the United States is poor by the international \$1 (or \$2) per day standard.

At \$2 per day, most of the people in south Asia and Sub-Saharan Africa live in poverty.

Developed in 1990, the \$1-per-day poverty line adjusts for purchasing power parity at 1985 prices. Adjusting for differences in currencies and prices among the different countries allows the data to be converted to a common, standard measure. Thus the \$1 represents the same purchasing power among countries, that is, it represents an equivalent consumption bundle across the world.

The extreme poverty line of \$1 per day was chosen to be representative of the national poverty lines of low-income countries—it is the median of the lowest 10 poverty lines of a set of poor countries chosen by the World Bank. The poverty line of \$2 per day represents nationally defined poverty lines of a second, somewhat higher-income set of low-income countries that may be called lower-middle-income countries.

The lower poverty line has since been updated to \$1.08 at 1993 purchasing power parity, while the \$2-per-

day poverty line has been updated to \$2.15 at 1993 purchasing power parity. While convenient and useful, choosing the poverty line in this way is necessarily arbitrary. It does, however, establish a common standard for worldwide comparisons that is particularly useful for low-income countries. Whether measuring with the old \$1 (\$2) or the new \$1.08 (\$2.15) level, this widely adopted standard has proven quite useful in measuring the extent of poverty worldwide.

Currently poverty is most extreme in sub-Saharan Africa, with 47 percent of its entire population living below the \$1-a-day standard of extreme poverty. All 11 of the countries that have more than 50 percent of their population with consumption expenditures lower than \$1 per day are located in sub-Saharan Africa, including Uganda, the country with the most extensive poverty in the world (84 percent of its population live in extreme poverty).

Of the 20 countries where more than one-third of the population is living in extreme poverty, 17 are in sub-Saharan Africa. If the \$2-per-day standard is used, the situation appears even worse, with over 75 percent of the population in both south Asia and sub-Saharan Africa living in poverty, and over half of the total population of all these regions living in poverty.

If we look at the numbers of people these percentages represent, we can see that this is an economic problem on a massive scale. The total number of people who subsist on less than \$1 a day (21 percent of the population) is about 1.1 billion, while the corresponding figure for the less than \$2-a-day standard (53 percent of the population) is 2.7 billion. That billions of people live in such abysmal material conditions is certainly one of the most pressing economic and political problems of our day.

The trends in poverty show mixed results since 1981. Overall the proportion of the world's poorest populations living in poverty has declined, from 40 percent (or 67 percent at \$2 a day) in 1981 to 21 percent (or 53 percent at \$2 a day) in 2003. This masks, however, significant differences by region and nation. East Asia (including China) has experienced a large drop in both the number and percentage of its population living in poverty. South Asia (including India) has also experienced a (somewhat smaller) decline in poverty. The Middle East and north Africa, as well as Latin America and the Caribbean, have seen a slight decrease in the percentage of their populations living in poverty. Eastern Europe and central Asia, and even more so sub-Saharan Africa, have experienced increases in poverty, with the number of extremely poor people living in sub-Saharan Africa (below the \$1-a-day level) nearly doubling.

In 2000, 189 states of the United Nations, in making a commitment to reducing poverty and fostering economic and social development, adopted the Millennium Development Goals. One of these eight goals is to "eradicate extreme poverty and hunger," or more specifically to reduce by half the proportion of people who suffer from hunger, and to reduce by half the proportion of people living on less than \$1 a day by 2015. Efforts to reduce world poverty in the aggregate have been successful, with the caveat that the situation is getting worse in sub-Saharan Africa. It will take a concerted worldwide collaborative effort in order to achieve the Millennium Development Goals by 2015.

The \$1- and \$2-a-day poverty levels are widely used for measuring poverty in low-income countries. As such, they essentially define world poverty in a quantifiable and comparable manner. Other standards are used (for example, most countries define their own national poverty levels), and should be used, in addition to the \$1- and \$2-a-day standards. However, as absolute poverty lines, the \$1- and \$2-a-day levels have proven their usefulness in describing world poverty.

International Red Cross and Red Crescent Societies

POVERTY WOULD NOT immediately seem to be the focus of the International Red Cross. However, addressing poverty's causes is directly linked to the Red Cross's

mission of responding to natural or human-made calamity. Human need in time of catastrophe is the primary focus of the 183 national Red Cross organizations within the International Federation of Red Cross and Red Crescent Societies, which claims to be the world's largest humanitarian organization. The only larger worldwide organizations of national entities are the United Nations, with 191 member nations, and the Federation Internationale de Football Association (FIFA), the international soccer governing body, with 207 national member societies.

"This is the front line of the struggle against poverty and all affronts to human dignity."

The Red Cross was started in 1864 by an urgent need to treat battlefield wounded. The focus of the various international Red Cross societies worldwide has expanded over the years, and some of the locally autonomous national member societies have diversified more than others. For example, the American Red Cross provides relief in time of disaster, but also offers first aid and water safety education and is a key administrator of human blood supplies for medical needs—as well as empowerment of the impoverished.

Juan M. Suarez del Toro, president of the International Federation of Red Cross and Red Crescent Societies, speaking to the United Nations Economic and Social Council in Geneva on July 1, 2003, stated: "Many of the world's poverty priorities concern crises of direct interest and concern to the International Federation and to over 180 National Red Cross and Red Crescent Societies in almost every country in the world. They will be central issues for National Red Cross and Red Crescent Societies when they conduct their own dialogues with governments and other national partners.

"These issues will be at the heart of the December 2003 International Conference of the Red Cross and Red Crescent, which will also address the vital issue of community involvement and local capacity-building. This is the front line of the struggle against poverty and all affronts to human dignity. It is here that the most effective partnerships are formed, most frequently with Red Cross and Red Crescent Societies at the national or local level."

The founding idea behind the Red Cross was treating wartime wounded as well as protecting those coming to their aid. Prior to that time, armed forces' medical services deployed on the battlefield were not

entitled to any form of legal protection. Doctors and nurses, just like the soldiers they cared for, were the direct targets of attack. It was not until 1864, at the instigation of the nations then forming the International Red Cross, that the first Geneva Convention was signed and a universal protective emblem—a red cross on a white background—began to signify noncombatant relief workers on the battlefield.

The international Red Cross movement began when Gustave Moynier, the president Geneva Society for Public Utility (GSPU), received in the mail a book, A Memory of Solferino, by Henri Dunant. As president of the prestigious GSPU, Moynier was accustomed to receiving appeals for various causes, but the graphic depictions of suffering on the battlefields held his attention. Dunant described the bloody carnage at the Battle of Solferino, Italy, in 1859. There, French and Sardinian allies under Napoleon III had fought the Austrian armies of Emperor Francis Joseph. Dunant described young soldiers wounded and abandoned to agonizing death because their armies lacked doctors, nurses, dressings, or field hospitals to stay behind and care for casualties. Dunant appealed for the formation of voluntary aid societies that could furnish supplies and trained medical workers to attend to this humanitarian need.

Moynier met with Dunant, inquiring what efforts he had made to bring such relief work into being. Dunant described having his book printed at his own expense and sending it throughout Europe to influential decision-makers. Beyond that, he had not attempted to organize anything, instead hoping his book would "attract the attention of the humane and philanthropically inclined."

A Committee of Five was formed with Guillaume-Henri Dufour, a retired Swiss general serving during the first year as committee president, then as honorary president thereafter. The other four members were Moynier, Dunant, and two Geneva physicians, Louis Appia and Théodore Maunoir. Soon afterward the members of the committee changed the name to the International Committee for Relief to the Wounded, and in 1876 adopted its current name, the International Committee of the Red Cross (ICRC).

Directly following the establishment of the Geneva Convention, the first national societies were founded in Belgium, Denmark, France, Spain, Prussia, Württemberg, and another state now part of Germany, Oldenburg. In 1864, original Committee of Five member Dr. Louis Appia and Charles Van de Velde, a captain in the Dutch army, became the first independent and neutral

The Red Cross and Red Crescent at work in a refugee camp near the Ethiopia and Somalia border in Africa.

delegates to work under the symbol of the Red Cross in an armed conflict.

RED CRESCENT

In 1876 the red crescent emblem was adopted instead of the red cross by the Ottoman Empire during its war with Russia, because the red cross symbol was offensive to Muslim soldiers. The red crescent was recognized by the 1929 Geneva Convention along with the Persian red lion and sun, which was abandoned in 1980 by the Iranian government in favor of the crescent.

Today national societies may use only one emblem and it must be the same as that used by their country's armed forces medical services. In 1949 the Magen David Adom, or the Red Star of David, the Israeli national society, applied for membership and was rejected since surrender of its emblem was stated as a require-

ment of membership. The Israeli society's membership has never been approved. However, a new symbol, the red crystal, which is diamond-shaped, has been proposed for use by nations that find either the cross or crescent offensive; in 2005, 150 of the 192 member nations were using the red cross as their official emblem.

AMERICAN RED CROSS

The American Red Cross was founded by Clara Barton. In 1861 she had been living in Washington, D.C., working at the U.S. Patent Office. At the outbreak of the Civil War, she learned that many of the wounded from the First Battle of Bull Run had suffered the need for medical attention. She advertised for donations and began an independent organization to distribute medical goods. In 1862, U.S. Surgeon General William A. Hammond granted her a general pass to travel with army ambulances "for the purpose of distributing comforts for the sick and wounded, and nursing them."

For three years she followed medical workers, attracting national notice. She also expanded her outreach by organizing a program for locating those missing in action. By quizzing Union soldiers released from southern prisons, she determined the status of thousands of missing and notified their families.

By 1869, Barton had worked herself into exhaustion. On doctor's orders, she traveled to Europe to rest. There she learned about the ICRC and was particularly alarmed that the United States had refused to sign the Geneva Convention. She returned to America in 1873 and began to crusade on behalf of the movement. As a result the American Red Cross was formed in 1881 with Barton as the first president, and the United States signed the convention in 1882.

Several years later, she wrote an amendment to the Red Cross constitution that provided for disaster relief during peacetime as well as war. She remained Red Cross president, expanding the organization's outreach to include relief work for disasters such as famines, floods, pestilence, and earthquakes in the United States and throughout the world. The last operation she personally directed was relief for victims of the 1900 Galveston, Texas, hurricane.

In 1906 the 1864 Geneva Convention was revised for the first time. One year later, the Hague Convention X, adopted at the second International Peace Conference in the Netherlands, extended the scope of the Geneva Convention to naval warfare.

At the outbreak of World War I, there were 45 national societies throughout the world. The movement

had grown beyond Europe and North America (the United States, Mexico, and Canada) to Central and South America (Argentina, Brazil, Chile, Cuba, Mexico, Peru, El Salvador, Uruguay, and Venezuela), Asia (China, Japan, Korea, and Thailand), and Africa (the Republic of South Africa). At the onset of the war, the ICRC set up an International Prisoners-of-War Agency with about 1,200 mostly volunteer staff members. During hostilities the agency transferred about 20 million letters and messages and 1.9 million parcels. About 200,000 prisoners of war were exchanged and repatriated to their home countries.

The war confronted the ICRC with enormous challenges, requiring it to work closely with national Red Cross societies. Red Cross nurses from around the world, including the then-neutral nations of the United States, Canada, and Japan, were brought in to serve the armed forces of the European combatants.

The ICRC received the 1917 Nobel Peace Prize for its wartime work.

The ICRC also monitored compliance with the Geneva Conventions and forwarded complaints about violations to the offending country. When chemical weapons were used for the first time in history, the ICRC vigorously protested. The ICRC also began attempting to assist suffering civilian populations in occupied territories, and 41 ICRC delegates conducted inspection visits to 524 POW camps.

The ICRC received the 1917 Nobel Peace Prize for its wartime work. It was the only Nobel Peace Prize awarded in the period from 1914 to 1918.

During World War II, 179 delegates conducted 12,750 visits to prisoner-of-war (POW) camps in 41 countries, and 120 million messages were exchanged. The Central Information Agency on Prisoners-of-War had a staff of 3,000, and a card index that tracked prisoners contained 45 million names. A complication of World War II was that two major combatants, the Soviet Union and Japan, were not party to the Geneva Conventions and were not legally required to follow those rules. Nor were other countries bound to follow the conventions regarding Soviet or Japanese prisoners. Germany was a signatory, but the Nazi-controlled German Red Cross refused to answer inquiries concerning reports of deportations of Jews to death camps. The ICRC did obtain permission to send parcels to concentration camp detainees with known names and locations. Because the notices of receipt for these parcels were often signed by other inmates, the ICRC managed to register the identities of about 105,000 Jewish detainees and delivered about 1.1 million parcels to the Dachau, Buchenwald, Ravensbrück, and Sachsenhausen concentration camps.

Fearful that its work with German-held POWs was at risk, the ICRC backed off applying pressure concerning the Jewish camps. Today the ICRC cites its inability to prevent the genocide as its greatest failure in history. On March 12, 1945, ICRC president Jacob Burckhardt received a message from German SS General Ernst Kaltenbrunner accepting the ICRC's demand to allow delegates to visit the Jewish concentration camps. This agreement was bound by a condition that Red Cross delegates would have to stay in the camps until the end of the war. Ten Red Cross workers accepted the assignment and visited the camps, remaining there as permanent guests. Delegate Louis Haefliger is credited with saving about 60,000 inmates at Mauthausen-Gusen from execution by evacuating Nazi guards, when he alerted advancing American troops. His actions were condemned by the ICRC because they risked Red Cross neutrality, but in 1990 the ICRC condemnation was reversed by ICRC president Cornelio Sommaruga.

In 1944 the ICRC received its second Nobel Peace Prize. On August 12, 1949, further revisions to the existing Geneva Conventions were adopted. Additional protocols of June 8, 1977, were adopted, and today the conventions contain more than 600 articles compared to the 10 articles in the first 1864 convention.

On October 16, 1990, the UN General Assembly granted the ICRC observer status for its assembly sessions and subcommittee meetings, the first observer status given to a private organization. The resolution was jointly proposed by 138 member states and introduced by the Italian ambassador Vieri Traxler in memory of the organization's origins in the Battle of Solferino on Italian soil.

Today the international body consists of three entities, the International Committee of the Red Cross (ICRC), the locally autonomous national societies, and the International Federation of Red Cross and Red Crescent Societies.

The ICRC remains a private, independent group of 25 Swiss citizens who can serve an unlimited number of four-year terms. As official guardian of the Geneva Conventions and of Red Cross principles, it promotes their acceptance by governments, suggests their revision, works for further development of international humanitarian law, and recognizes new national societies.

It also sends its Swiss delegates into prisoner-of-war camps, supervises repatriation, attempts to trace members of the military who are missing in action, and supplies material relief as needed. The ICRC mission statement proclaims that "the International Committee of the Red Cross is an impartial, neutral and independent organization whose exclusively humanitarian mission is to protect the lives and dignity of victims of war and internal violence and to provide them with assistance. It directs and coordinates the international relief activities conducted by the Movement in situations of conflict. It also endeavors to prevent suffering by promoting and strengthening humanitarian law and universal humanitarian principles."

The locally autonomous national societies of the Red Cross or Red Crescent each operate on national and international levels through their volunteer members. Each must be recognized by the International Committee and all have Junior Red Cross or Red Crescent Societies. Most have disaster relief programs and carry on social welfare programs, such as community health and safety instruction. Many have also established refugee services.

The International Federation of Red Cross and Red Crescent Societies is a coordinating world federation of these societies. It was established in 1919 and maintains contacts among the societies, acts as a clearinghouse for information, assists the societies in setting up new programs and in improving or expanding old ones, and coordinates international disaster operations.

This move, led by the American Red Cross, expanded the international activities of the Red Cross to include relief assistance in response to emergency situations that were not caused by war, such as man-made or natural disasters. The American Red Cross already had great disaster-relief mission experience extending back to its foundation. The first relief assistance mission organized by the federation, then called the League of Red Cross Societies, was an aid mission for the victims of a famine and subsequent typhus epidemic in Poland. Within five years the league launched 47 missions to 34 countries, bringing emergency supplies to famine victims in Russia, Germany, and Albania; earthquake survivors in Chile, Persia, Japan, Colombia, Ecuador, Costa Rica, and Turkey; and refugees in Greece and Turkey. The first large-scale disaster mission came after the 1923 earthquake in Japan, which killed about 200,000 and left more than one million hurt and homeless. As a result the Red Cross Society of Japan received goods from societies around the world worth about \$100 million.

Today the international federation's programs are grouped into four main core areas: promoting humanitarian principles and values, disaster response, disaster preparedness, and health and care in the community. Guiding and supporting the development of its member national societies is one of the federation's fundamental tasks. Creating the opportunity for national societies to network and work together is another of the federation's key challenges.

International Trade

GENERALLY, TRADE REFERS to the exchange of goods and services for money. International trade refers to sales that cross juridical borders. Thus, international trade can be defined as the exchange of goods and services across international boundaries. In most countries, it represents a significant share of Gross Domestic Product (GDP). International trade has been present throughout much of history (for example, the Silk Road and Amber Road).

However, the emergence of capitalism and accompanying industrialization and advanced transportation greatly increased the economic, social, and political importance of international trade.

There are many reasons why trade occurs between countries, among which are differences in technology, resource endowments, internal demand for goods and services, and existence of economies of scale in production. In sum the exchange takes place because of the differences in costs of production between the countries, and because it increases the economic well-being of each country.

Similarly there are several principal theories that attempt to explain international trade. Mercantilist theory, or mercantilism, asserted that a country should try to achieve a favorable balance of trade (export more than it imports), since this would increase the amount of gold in the surplus country. In order to achieve that, mercantilists advocated strict government control of all economic activity and economic nationalism. Classical economists, such as Adam Smith and David Ricardo, condemned mercantilism for its advocacy of government control over trade in order to achieve export surpluses.

Smith developed the theory of absolute advantage, according to which countries engage in trade since each of them has an absolute advantage in producing selected goods. Smith advanced the argument that when one nation is more efficient than another in production of one commodity, but less efficient than the other nation in producing a second commodity, then both nations can gain by specializing in the production of the commodity of its absolute advantage and exchanging part of its output for the other country's commodity.

Ricardo argued that even if one nation is less efficient than the other nation in the production of both commodities, there is still a basis for mutually beneficial trade. The countries should specialize in the production of the commodity in which the absolute advantage is the greatest, while it should import the commodity in which the absolute disadvantage is the greatest. The Ricardian model serves as an explanation for the existence and pattern of international trade based on relative (opportunity) cost advantages among different countries producing different commodities. The law, however, does not explain the very root of these advantages.

This question has been addressed by another principal theory of international trade, known as factor endowments theory, or the Heckscher-Ohlin theory. Different countries are differently endowed with economic resources that are used in the process of production. Countries differ as to the type and quantity of raw materials, their climate, the skill and size of their labor force, their stock of capital, and their institutions. According to the Heckscher-Ohlin theory, countries will tend to export those commodities whose production requires relatively more than other commodities of those resources of which it has the most.

Other theories deal more with the patterns of production and trade. The international product cycle theory states that products will be first produced in the countries in which they were researched and developed (industrialized countries). Over the product's life cycle, production will shift to foreign locations, in particular to developing and emerging economies, as the product reaches the stages of maturity and decline. Country similarity theory states that most of the modern-era trade occurs among industrial countries because of their similarity and compatibility of their economies and institutions.

Regardless of the specific assumptions of the particular theory, they all advocated the concept that international trade should be free from restrictions. Thus international trade became the engine of economic growth in the 19th century. Countries dropped their restrictions on free trade, and the gold standard was used worldwide to measure the value of goods and currencies, providing a universal currency. With the rise of a global trading system at the time of European colonial expansion, a colonial division of labor emerged in which developing countries exported primary products, agriculture and minerals, while Europe and North America exported manufactured goods.

The outbreak of World War I, the redistribution of the colonies among the Great Powers, the collapse of the gold standard, and the economic depression of the 1930s gave rise to economic nationalism and protectionism. Free trade gave way to government intervention and tariffs; quotas and other protectionist measures became dominant features in international trade.

The end of World War II brought about the revival of the free trade philosophy. The General Agreement on Tariffs and Trade (GATT) was formally established in January 1948. This international organization was instrumental in organizing negotiations among contracting parties, aimed at the reduction of tariffs, from the first meeting in Geneva in 1947 up to the so-called Uruguay Round of trade negotiations, which began in 1986 and concluded in 1993.

The trade negotiations led toward the elimination of quotas, substantial reduction of tariffs, and limiting almost all other forms of protectionism. The Uruguay Round focused on agricultural export subsidies, restrictions on trade in banking and insurance, and restrictions on foreign direct investment.

Following the conclusion of the Uruguay Round, GATT was replaced by the World Trade Organization (WTO). The WTO is charged with the further develop-

Global trade and the resulting exchange of currencies seem to help developed countries more than developing ones.

ment and policing of the multilateral trading system along the principles followed by the eight rounds of trade negotiations.

In addition to the expansion of free trade, the structure of world trade has begun to change since World War II and particularly in the last three decades. Important characteristics of current global trade patterns are that 75 percent of the world's exports are from developed countries, while only 25 percent are from developing ones; developed countries export mainly manufactured goods: 83 percent of their total and 62 percent of all world exports.

Developing countries also export more manufactured goods than primary products: 56 percent of their total and 14 percent of world exports; and more primary products are exported by developed countries than by developing countries: 14 percent of world exports, compared with 11 percent.

However, despite the overall increase in economic welfare generated by international trade, the expansion of international trade raises many questions. In particular, what is the true connection between trade globalization and economic growth and poverty reduction, and who benefits more from increased trade?

The basic statistics on international trade provide mixed answers at best. From 1950 to 1970, developed countries gained in the share of total world exports, and developing countries lost; developing countries in east Asia significantly increased their manufactured exports, and this increased their share of the world trade during the 1980s. Latin America's share fell substantially from 1950 through 1990, and then began to increase slightly; exports from west Asia and north Africa fell since 1980. In addition, there has been a historic decline in the exports of the sub-Saharan countries. Their share of the world total has dropped from over three percent in 1950 to barely one percent in 1996.

These results prompted free-trade advocates to proclaim that the real losers from increased liberalization of international trade (globalization) are those developing countries that have not been able to seize the opportunities to participate in this process.

However, it has been contended that the presence of uneven liberalization is the principal cause of industrial countries being the primary beneficiaries of globalization. In addition to the drastic reduction of protectionism of developed economies regarding developing countries, the multilateral trading system warrants redesign in order to address the needs of the world's poor.

International trade can play a powerful role in reducing poverty in developing countries. However, the current approach overemphasizes the direct impact of trade liberalization on poverty, rather than the indirect impact on poverty caused by countries' level and pattern of trade and the long-term dynamics of change.

Thus policies focused on poverty reduction need to shift from analyzing trade liberalization and poverty to examining objectively the links of trade and poverty. This constitutes a new developmental approach. The core of this approach is that poverty reduction occurs through the efficient development and utilization of productive capacities in a manner in which the labor force becomes fully employed.

The best trade policy would be the one that would facilitate and not hinder this process: trade performance has to be adequate to enable sustained economic growth and poverty reduction, the link between trade and growth has to be strong, and the export expansion

needs to lead to domestic resource mobilization and consequent poverty reduction.

Intrahousehold Transfers

AN INTRAHOUSEHOLD transfer is one in which items are passed among members of a household, either formally or informally. It includes money paid by working adults to grandparents to offset childcare costs, rent or lodging fees, allowances made to children and young people, and contributions to family income arising from child labor.

Government transfers such as those intended for child benefit are also a form of intrahousehold transfer, because they are necessarily paid to someone who is not the intended recipient and it would be very difficult to try to ensure that the benefit is effectively transferred to the one it is intended to reach. In a harmonious and rational household, transfers will take place to ensure that all members receive according to their needs. However, households are not always such happy places and, in any case, information asymmetries dictate that not all household members will be aware of the most equitable distribution of resources.

There are also, of course, many examples of abusive or predatory household members who cause transfers of resources to themselves that are wholly unjustified by genuine need. Generally, then, it would be wrong to treat a household as having a unitary set of goals in the way that economics supposes that individuals have. In many societies, work and access to household resources are both affected by gender; most commonly, women are restricted wholly or in part to work inside the house, while men work outside. This may not be the most efficient arrangement of resources and, in any case, there is sufficient evidence to believe that men and women have different priorities in terms of household resource allocation. Since, globally, women receive less pay than men for the same work, men will generally have more power in the household to determine the extent to which intrahousehold transfers take place.

Resolving the extent to which this takes place is likely to require negotiation and debate and, again, this may not be the most efficient use of time. One result of these arrangements is that development efforts are often focused on providing resources to women to overcome such inefficient distributions. Examples include the Grameen Bank and similar microfinancing institutions. In many parts of the developed world, too, domestic work is frequently considered to be part of a woman's domain and to be properly valued at a very low rate. This perception further skews the distribution of resources in terms of rewards within the household.

Gender and age factors also affect the distribution of inheritance resources to children. Some societies frequently favor boys over girls with respect to inheritance and, also the older is favored compared to the younger. In such cases, the less privileged child may face a much lower standard of living, while, if property is distributed equally among a large number of children, all may face the same fate.

In the wake of the 1997 Asian Financial Crisis, many of the poorest people who suffered job losses were those who had migrated from rural to urban areas for factory work or similar jobs. Once jobless, they returned to their rural households and were supported by intrahousehold transfers, to which they could contribute some labor. Most such people became underemployed rather than unemployed as a result.

Iran

A MULTIETHNIC STATE of over 70 million people, Iran is a Middle Eastern country under an Islamic system of government. Largely because of the complexities involving the Islamic Revolution, regime change, and the war with Iraq, economic growth was below two percent per year in the 1980s and recovered to around four percent in the 1990s, according to the International Labor Organization in 2001.

Despite Iran's massive supply of natural gas and oil, poverty and unemployment have been critical issues in recent years among a large segment of the population. Accurate estimates of employment levels have been difficult partly because of the state's inability or unwillingness to maintain labor data based on international standards. The 1991 census determined that over 25 percent of the population were economically active and 11 percent of the workforce were unemployed.

A recent International Monetary Fund (IMF) report estimates that Iran's overwhelmingly young demographic profile has led the workforce to grow by 3.5 percent, bringing 600,000 new job seekers to the labor market each year. Job creation, however, has lagged at some 450,000 new positions. Official data for 2001–02 put the unemployment rate at 16 percent, though the Economic Intelligence Unit put the actual figure closer to 20–25 percent. Another estimate, from Jane's Publications, puts the unemployment rate among 15- to 29-year-olds in 2004 at 31 percent. The percentage of the population living in poverty is estimated at 15 percent—with poverty defined as households making less than \$89 a month in urban areas and \$60 in rural areas.

A sign of inadequate economic opportunities is the continuing emigration of thousands of young and skilled Iranians, many to Europe and North America. Iranian Azeris, who constitute the largest ethnic minority, are in an economically better position as compared to the rest of Iran's population. Iranian Azerbaijan, formed of three northwestern provinces, has the largest concentration of industry outside of the capital city, Tehran. Because of its large population and a severe drought over the past several years, Iran became one of

the world's biggest buyers of wheat during 1999–2001, importing an average of six million tons per year. Some of the effects of the drought, combined with the increasing price of oil, are likely to be long-lasting. Many small agricultural producers, for example, are thought to have abandoned their holdings and moved to towns seeking alternate employment. Furthermore poverty, combined with political repression and a highly restrictive and patriarchal culture, has led to social ills.

Among other things, organized crime has been on the rise, with drug trafficking, prostitution, and corruption being widespread. Despite the Islamic republic's ban on the growth, production, and distribution of drugs, a relatively large segment of the Iranian population (over two percent) is addicted to opium and heroine. The high rate of dissatisfaction and depression among the population—especially the youth—brought about by strict idiosyncratic Islamic social laws, in conjunction with lack of sufficient economic opportunities, is a likely reason behind the surge in drug addiction. Iran is also the world leader in drug seizures, with much of the interdiction taking place along the border with Afghanistan and Pakistan.

Prostitution has also been on the rise. According to the government, there are hundreds of thousands of (largely female) prostitutes in Tehran alone. The surge in prostitution is due to the ongoing economic crisis and the lower status of women in Iranian society. Women constitute de facto second-class citizens in Iran with significantly less political power and social and economic clout as compared to their counterparts in the West and male citizens in Iran—though they wield more power as compared to their cohorts in many other Muslim-majority states. The government has even sanctioned a sort of Shia Islamic arrangement whereby temporary marriage (sigheh)—or quasi-prostitution—is legal. Prostitution is largely unregulated, however. As a result, the spread of AIDS and sexually transmitted diseases is thought to be on the rise.

Corruption is also widespread. Despite his somewhat fundamentalist political and religious views, the election and appeal of the new Iranian president, Mahmoud Ahmadinejad, were largely due to his apparent commitment to fighting corruption. According to a 2005 Transparency International survey, Iran was placed 87th out of 145 countries in terms of degree of corruption. In addition to bribe-taking, the 1979 Islamic Revolution instituted several wealthy Islamic foundations, with an estimated worth exceeding \$15 billion, which acquired much of their assets by illegally confiscating the property of individuals and organiza-

tions suspected of being opposed to the Islamic regime. Still, among the positive developments in today's Iran is the marked reduction in fertility rate—estimated at two births per childbearing female—the relatively high and growing female literacy rate, and the rise in global oil prices, all of which directly and indirectly contribute to the fight against poverty.

Furthermore Iran is an overwhelmingly young nation, with over 35 percent of its population under 15 years of age. Its population will thus continue to grow, but will likely stabilize at 100 million people by the mid-21st century. These factors are thought to significantly contribute to an eventual and significant reduction of poverty and to improve the socioeconomic status of the population.

Iraq

THE ISSUE OF POVERTY in Iraq has become an intensely contested and controversial one. The controversy is rendered more opaque by a lack of credible data in many cases, and the intensity of the political debate concerning the invasion and occupation of the country by U.S. military forces. The invasion was backed by a small number of allies, ostensibly in the search for weapons of mass destruction that did not exist. In the aftermath of the invasion, significant loss of life continued with bombings and shootings on an almost daily basis. This was created by opposition to the occupation and by internecine religious and ethnic con-

flict. The long, porous borders of the country meant that many extremists had been able to enter Iraq to participate in and stimulate further violence. Much of the infrastructure, destroyed by the invasion, had yet to be repaired by 2006 and suffering, hunger, and lack of medical services and sanitation was prevalent across the country. Deposed dictator Saddam Hussein presided over a brutal, murderous regime that benefited various sections of society, while oil incomes sustained a subsidized lifestyle for preferred elites.

Historically, Iraq has been one of the most civilized and prosperous parts of the world. The invasion of the Mongols led to the destruction of the Middle East and its agricultural and social systems to the extent that the population of the region today is, according to some estimates, even lower than it was then. The geographic area of Iraq was always integrated into larger or at least different territorial units and did not exist as an independent, separate nation until the division of the Ottoman Empire by the Western powers following the end of World War I.

The Ottoman Empire had long run out of the vigor that had characterized it as one of the most vibrant cultures of the Western world and, by the 20th century, Baghdad was no longer one of the great shining beacons of world civilization but had become something of a backwater. As a separate, autonomous country, Iraq was created under British influence and set in a context of other, neighboring states with the same genesis. It is bordered by Iran to the east, Kuwait and Saudi Arabia to the south, Jordan and Syria to the west, and Turkey to the north.

Much of the northern region is dominated by the Kurdish people, who are part of the most numerous people in the world not to have a home state of their own. To the southeast there is a narrow entrance to the Persian Gulf, which is the principal route by which Iraq has been able to export oil extracted from its significant amount of reserves. Iraq has a population of just over 26 million. Gross Domestic Product (GDP) per capita has been estimated at around \$2,100 in 2004, although unemployment is very high and may exceed 30 percent in some areas. Excess deaths caused by the invasion have been estimated at 100,000, and are still rising by some sources. This may be added to the number of people who died or who suffered extensively as a result of the sanctions enforced on Iraq in the wake of the first Gulf War. These are estimated as including the preventable deaths of 170,000 children under the age of 5, the creation of nearly two million refugees, and the reduction of GDP to 0.5 percent of its prewar level.

A survey for the World Food Program found that 21 percent of the population of Iraq's southern and central region lived in chronic poverty; this figure is equivalent to some 4.6 million people. In addition, approximately 60 percent of the total population were entirely reliant on monthly food rations provided as emergency aid. Continued violence, poverty, and repression are likely to inspire hatred and resentment in the future.

Ireland

THE COUNTRY OF IRELAND is composed of fivesixths of the island of Ireland. The remaining portion of the island has become known as Northern Ireland. The Irish people have spent much of their history trying to rid themselves of English rule. After centuries of fighting and repression, 26 counties in predominantly Catholic southern Ireland became independent of the United Kingdom in 1921.

Six northern (Ulster) counties continued to be part of the United Kingdom. Ireland withdrew from the British Commonwealth of Nations in 1948. Repeated efforts to reunite Ireland have been unsuccessful. In 1998 the Good Friday Agreement halted the bitter fighting within the country, but tensions have remained high.

Despite the years of political turmoil, in the summer of 2005, Ireland became the second richest country in the European Union (EU). Ireland's per capita income of \$31,900 is outranked in the EU only by Luxembourg, with a per capita income of \$58,900. Ireland's journey to prosperity began with the implementation of free secondary education in the 1960s. As a result of free education through the secondary level, only two percent of the population over the age of 15 are unable to read and write. All students complete primary school, and nearly all complete secondary school.

In the 1980s, Ireland experienced an economic slump because of declining exports and years of protectionism and mismanagement. The economy revived only when the major trade unions, farmers, and industrialists banded together to pressure the government to institute fiscal austerity by cutting corporate taxes and promoting foreign investment. The government also made college education basically free. The result has been phenomenal. Nearly one million people were added to the workforce between 1990 and 2005, and increased levels of education have led to a well-trained workforce that attracts a host of investors from all over the world. In 2005, unemployment stood at 4.3 percent.

Agriculture has declined in importance in Ireland and the agricultural sector now employs only eight percent of the workforce. Services dominate the Irish economy, engaging 63 percent of the workforce. Approximately 29 percent of the labor force are involved in industries, accounting for 46 percent of the total Gross Domestic Product (GDP) and 80 percent of all exports. Ireland's abundant resources include natural gas, peat, copper, lead, zinc, silver, barite, gypsum, limestone, and dolomite.

Even though Ireland has prospered economically, poverty has continued to be a persistent problem. The Irish government defines the poverty line as those earning less than 70 percent of the median income. From 1990 to 2001, the number of those living in poverty according to this definition fell from 15.1 percent to 5.2 percent as unemployment declined and social assistance increased.

When poverty is determined according to the number of individuals earning less than 60 percent of the median income, data for 2002 indicate that 4.7 percent of women and 3.5 percent of men fell into this category. On the other hand, when poverty is defined according to those who earn less than 50 percent of the median income, the poverty level increases to 12.3 percent. This is the figure generally accepted as the most accurate assessment of poverty in Ireland. The poorest 20

percent of the population live on 7.1 percent of resources, while the richest 20 percent hold 43.3 percent of resources. Ireland ranks 35.7 on the Gini Index of Human Inequality.

Individuals who face the greatest risk of poverty in Ireland are those under the age of 16, women, the elderly, the disabled, migrants, ethnic minorities, prisoners and ex-prisoners, and the rural and urban poor. Antipoverty measures established in the National Action Plan Against Poverty and Social Exclusion includes the promotion of income adequacy, employment, education, health, and housing. In practice, this has meant that Ireland has increased assistance chiefly to children and the elderly. Government grants are awarded to help individuals learn new skills and receive education and training that will allow them to reenter the workforce.

Healthcare is widely accessible in Ireland, and there are 239 physicians for every 100,000 residents. From 90 to 100 percent of the Irish have access to affordable essential drugs. Life expectancy in Ireland is 77.56 years and has steadily increased for several decades. With a projected life span of 80.34 years, females outlive males (74.95) by more than five years. The population of 4,015,676 experiences a median age of 33.7 years. Nearly 21 percent of the population are under the age of 14, and over 11 percent have reached the age of 65.

Between 1970 and 2005, infant mortality in Ireland declined from 20 deaths per 1,000 live births to 5.39 deaths per 1,000 live births. From the 1970s to 2005, the mortality rate of children under the age of 5 dropped from 27 deaths per 1,000 to seven deaths per 1,000. Six percent of all Irish children are underweight at birth. Childhood immunization rates have ranged from percetages in the mid-60s to the low 90s over the past decades. Infant immunizations against measles dropped from 78 to 73 percent between 1990 and 2002. On the other hand, infant immunizations against DPT rose from 65 to 84 percent. About 90 percent of infants have been immunized against tuberculosis, but only 84 percent have been immunized against polio. Approximately 78 percent of children between the ages of 12 and 23 months have been immunized against measles, and 85 percent have been immunized against DPT3.

In the 1970s, Irish women bore an average of 3.8 children each. By 2005 the fertility rate had declined to 1.87 children per woman. The fertility rate for adolescents is currently 15 out of 1,000 births. Around 60 percent of all women use some method of contraception. The Irish have made prenatal and antenatal care top priorities, and trained medical staff attend all births. The Maternity and Infant Care Scheme provides

infant and maternal care free of charge. Ireland has promoted natural childbirth to such an extent that it has one of the highest rates of natural childbirth in the developed world. In response to accessible healthcare, maternal mortality has declined. Based on modeled estimates for 2000, maternal mortality occurred at a rate of five deaths per 100,000 live births. Within three years, maternal mortality had dropped to zero.

Irish Famine

DURING THE CENTURY and a half preceding the Great Famine, Ireland's population had dramatically increased to about eight million people. The widespread cultivation of the potato, imported to Europe from the western hemisphere, had provided an unprecedented source of nutrition for Ireland's poor, the bulk of the island's population. Despite the crowding that was created by the population growth and that was exacerbated by the shift from tenant farming to grain planting and sheep grazing on the estates of many absentee landowners, the potato had sustained increases in birthrates and longevity.

On even an acre or two, tight rows of plants treated with simple and readily available fertilizers (such as seaweed that could be gathered after each tide and mounded around the seed potatoes) produced fairly bountiful harvests. In the century and a quarter preceding the Great Famine, there had been some 20 instances in which blight had regionally or seasonally ruined harvests, but no one seems to have anticipated the possibility of widespread and sustained blight.

During the Great Famine, blight ruined the potato crop from one end of Ireland to the other for five consecutive years. One and a half million of the eight million Irish people died of starvation or of disease that was a consequence of malnutrition or the ever-worsening living conditions. More than one million Irish emigrated to other nations—in the greatest concentrations to the United States, Canada, Argentina, Australia, and, ironically, England.

In the United States, they were initially treated with great disdain because of their impoverishment and because of the perception that they were not simply more subject to disease but virulent carriers of disease. Still, despite their initial mistreatment, the Irish arrived in such great numbers that they doubled the populations of eastern cities such as New York and Boston in less than or little more than a decade, and they learned to marshal their numbers to great local and regional political advantage.

The Great Famine had a major impact on historical conditions in the United States.

Later groups of immigrants of other nationalities would arrive in greater numbers in the last two decades of the 19th century. But no other group would come to constitute a majority of the population of major American cities and accrue the same sort of political power that the Irish were able to acquire and then sustain in those cities. Thus the Great Famine had a major impact on subsequent historical conditions in the United States and other nations, as well as in Ireland.

Among the survivors of the Great Famine, the indigenous hatred of the English was compounded by the deep belief that the English had welcomed the reduction of the Irish population and had done very little to mitigate the famine. Although millions of Irish were starving in public view, record grain shipments were being produced on the great Irish estates and shipped through Irish ports to English cities.

Reflecting the prevailing belief that the poor suffered because they had not properly learned the hard lessons of self-reliance, the British government was slow to offer relief. Although it eventually earmarked the unprecedented sum of 8 million pounds sterling to famine relief, it required the relief to be delivered by private entrepreneurs, who typically were more concerned with maximizing profits than with the urgency of alleviating the famine.

In his classic, dark satire, "A Modest Proposal," Jonathan Swift punctures the then-commonplace and now seemingly incomprehensible concern that alleviating the famine in the short-term might create long-term moral problems among the survivors. The great British historian A.J.P. Taylor has argued that the English failure to act aggressively to alleviate the famine was tantamount to genocide, but more recent scholars such as Cecil Woodham-Smith have viewed that failure as more the result of cultural rigidity than of malicious intention.

Islam and Poverty

MUSLIM PERCEPTIONS of human development differ within and among the various traditions and Islamic religions. As well, Islam has often held the potential for conflict, one of the most crucial impediments to development, and on the rise in relation to the shape of fundamentalism. This major world religion constructively shares immense values grounded in a genuine concern for the supports of human flourishing. While poverty is considered a complicated phenomenon, an effect of lack of growth and inequality, Islam has today come to make decisive contributions toward poverty reduction and social advancement.

Nonetheless an evolving revitalization of Islam in almost all Muslims countries worldwide has generated the necessity for a harmonious scenario of the schemes that Islam has to offer for relying upon a universal notion of well-being, and to counter diverse hurdles currently coping with humanity, especially in the realm of economics.

Of specific importance is a strategic action that could help to decrease the large external imbalances that most nations throughout the globe are now indeed experiencing, and could empower them to secure full employment, alleviate poverty, meet basic human needs, and curtail inequalities of income and wealth. Against this context, the following questions tend to fairly appear regularly. Could the Muslim countries implement such a policy within the setting of the secularist worldview of capitalism, socialism, and the welfare state? How could they rely on Islam to help solve problems and achieve their visions? What kind of a strategy package do Islamic lessons suggest?

This article portrays the Islamic approach to the issues of poverty as well as the role played by the built-in institutions of the Islamic system in this regard. The following sections explore how a number of Islamic economic institutions play a significant role in eradicating poverty and enhancing income distribution for the establishment of a just socioeconomic order. Drawing from the cardinal challenges facing Islam at present, the study concludes with some forward-looking remarks that efficacious Islamic policies require empirical and technical understandings of poverty that are connected with dynamic institutional arrangements and a favorable process of societal values.

POVERTY REDUCTION

The poverty reduction strategies of Muslims cannot be alienated from their ethical moorings. The Islamic way of life is a constitutional requirement of any Muslim; yet they look for secular solutions to the socioeconomic dilemma of poverty like every other problem. Hence the epistemological importance of poverty needs is to be understood as defined in Islam. Regarding the Islamic ethos as an ideal through which socioeconomic strategies deal with poverty reduction, the following fundamental tenets of the Islamic ethical framework may be identified.

First, Islam views society as a unified entity in which individual freedom and human dignity are supreme, though subject to the axiom of responsibility. Second, these ideological tenets show that strategies must not cultivate dependency, amoral activities, or lead to the institutionalization of poverty. Third, strategies based on changes that do not lift the poor from their de-

pendency status should be avoided, except in cases where such a shift is not feasible. To be more comprehensive, the predominant principles of Qur'anic economics include "purification," giving up a portion of wealth as alms, and the "return" of property. Just as Allah (God) distributed his "surplus" as a gift that can never be reciprocated, so were Muslims expected to give freely and unstintingly. The Qur'anic community indeed consists of those for whose wealth there is a recognized right for the beggar and the deprived. Thus it is apparent that Islamic ethics support the poverty alleviation policy based on the norm of promoting economic growth with productive equity.

An Islamic state is bound to provide sustenance to its citizens.

In Islam there are two basic categorizations of the poor: *faqir* (poorest of the poor) and *miskin* (whose legitimate needs exceed their capacity). In contrast to the interest-based cosmetic approach, the Islamic way of poverty elimination intrinsically focuses on strengthening human resources and providing relevant job opportunities.

Islam, through the actions of *zakat* (poor-due), *sadaqah* (charitable action), and *kifalah* (assistance) by the nearest kith and kin, emphasizes the duty of charity for the sake of the poor and indebted, and also for orphans, travelers in difficulty, and those involved in the collection and distribution of *zakat*. *Zakat*, which comes from the Arabic verb "to purify," is one of the five pillars of Islam, and requires a person to make an annual alms payment of 2.5 percent of his or her excess wealth accumulated over one year. This ensures that wealth continues to circulate through society. A Muslim is always encouraged to perform charitable action.

The Prophet Muhammad ("peace be upon him,"—a prayer that is read after the name of a prophet is mentioned) said, "Even a smile is charity." However, a particular form of charity is waqf (pious endowment). An asset (for example, a business, houses for rent, etc.) is bought or donated, and the return on the asset is then used to sustain charitable projects, for example, schools, hospitals, or social welfare programs. In this interrelation, it can be enumerated that an Islamic state is bound to provide sustenance to its citizens irrespective of their religion.

The state fulfills this responsibility by the collection of *zakat*, encouraging other emergent charities, and rais-

ing taxes. The enormity of such relief to the poor under Islam cannot be disputed. Instead of taking religion out of public life, if the citizens of any Muslim nation stress integrating Islamic principles in their day-to-day life, the social response to poverty, irrespective of the involvement of the state, will be far more supportive than all the donated funds together. Zakat and bait-ulmal (public treasury) are the two institutions that, if used properly, can address the crux of poverty to a great extent. The institution of bait-ul-mal has enormous prospects for reaching the poor and helping them to escape the poverty trap without engaging in the "curse" of microcredit. Accordingly an evaluation of both zakat and bait-ul-mal, in terms of their proper utilization and rehabilitative contribution, is urgently required.

DEBT AND INTEREST

Debt, which is exacerbated by interest payments, is often central to the obstacles faced by the poor. The response of a Muslim to the taking or giving of loans is further governed by the Islamic prohibition on the taking or paying out of usury or *riba* (interest). Interest is seen as destabilizing for society from the Islamic perspective, as money is made from money, without any productive activity, to be paid irrespective of the success or failure of the venture.

Islam requires the borrower and the lender to share equally the risk of success or failure.

As poor individuals and nations are trapped into borrowing their way out of poverty, the burden of debt can become swollen by interest, resulting in the widening of the gulf between rich and poor. In contrast Islam requires the borrower and the lender to share equally the risk of success or failure, and so loans are organized on a profit-share basis. This is crucial in encouraging responsible lending by creditors. If the debtor meets with straitened circumstances, relaxing repayment conditions or even the forgiveness of the debt is recommended as a gesture that will earn the creditor spiritual reward.

According to the Al-Qur'an (Sura 2:280): "If the debtor is in a difficulty, grant him time till it is easy for him to repay. But if ye remit it by way of charity, that is best for you if ye only knew." The significance of Islamic arrangements for poverty alleviation lies in the

fact that the poor cannot afford loans at a 20 to 25 percent interest rate, which makes them defaulters, or the staff of concerned organizations get involved in corruption by using funds reserved for other purposes as recovery of the microcredit.

So instead of purely relying on interest-based loans, we should look into Islamic ways, like *mudariba* (interest free), *musharika* (profit and loss sharing), and *khumus* (of the booty), for supporting the needy, irrespective of color, creed or clan. Nevertheless, while each of these Islamic institutions can make an exemplary contribution toward the goal of poverty alleviation, the integrated consequences of all will be greater than their respective impacts.

It may be questioned why Muslims should be called on to play a part, and what they are to do. The irrefutable fact is that the global Muslim community has the following necessary roles to play in order to address the injustice of world poverty.

First, "Charity begins at home," so Muslims as individuals must be rational about poverty issues in their own countries. The majority of Muslims in the world still live under conditions of abject poverty, which has not adequately been taken care of, given that some of the Muslim countries possess vast natural resources that can be put to better use.

Second, Muslims constitute over a fifth of humanity, and so have tremendous capability to bring to bear. Muslim countries, through diverse regional blocs and organizations, will have to play a more far-sighted diplomatic role in boosting formation of internationalism based on consensus and the common well-being of all nations. As their own well-being is dependent on the well-being of other countries, they ought to be very interested in reinforcing the creation of global public goods.

Since a number of Muslim nations have huge resources, they could contribute funds toward such an endeavor. Finally millions of those who suffer from poverty are themselves Muslims. Above all, Islam has historically made a vibrant contribution to civilization, and Muslims believe their faith has much to offer in helping to face the barriers to modernity.

There is a unique responsibility for Muslims who are to be regarded as the diaspora to advocate good courses in their own country. Muslim charitable organizations have an obligation to seek innovative ways to effectively deal with the poverty challenges in their own nation. Moreover many Muslims who occupy influential positions can influence the direction of their government's policies.

ISLAMIC FINANCIAL INSTITUTIONS

With one-fifth of the world's population living on less than \$1 per day, something is certainly wrong. The ongoing poverty reduction measures indicate that regardless of the truth that markets do not alleviate poverty, as they tend to move new wealth away from the poor communities, most of the governments and the nongovernmental organizations (NGOs) follow capitalist market doctrines. By concentrating investments in comparatively favorable environments, they attempt to obtain dividends.

As a result, the poorest people in the poorest places have practically disappeared from government programs and NGO networks, almost as obviously as they dispersed from business plans and private marketing surveys. Consequently, without coming back to Islam for getting resolutions to these challenges, the lofty missions, whether they are in the domain of poverty eradication or any other domain of our collective and individual lives, might never be attained.

Islam is not just confined to rituals but is a complete code of life that encompasses overall spectra, including the economy and banking. The Islamic financial industry, which began about three decades ago, has made substantial growth that has attracted attention from bankers and investors. Growing at an estimated 15 percent annually, the Islamic finance market is by now estimated to be worth more than \$300 billion, with more than 200 Islamic finance institutions in operation. Hundreds of investment companies and conventional banks, including Western ones, have already established special units to deal in products compliant with *Shari'ah* (Islamic law).

The main differences between Islamic and conventional banks have been dealt with thoroughly. Moreover Islamic banking has been helping to alleviate poverty in many Muslim countries around the world in recent years. For example, in 2003, the Muttahida Majlis-e-Amal government introduced interest-free Islamic banking, named Khyber Bank, that has taken root; and experiments are being done in Islamic banking not only in Pakistan but all over the world to replace the prevalent banking system. People are showing an interest in Islamic banking, and deposits in the Khyber Bank have increased manifold.

Notwithstanding, while it is hoped that the Islamic banks worldwide will play a bigger role in the fight to eradicate world poverty, and it is suggested that the Islamic endowments in finance could solve the problem of poverty, the Islamic finance industry is repeatedly accused of doing little on the matter. Some attribute the poor performance to the fact that the Islamic banks do not offer beneficial loans without interest and do not play a pivotal role in addressing social ills. Besides, the issue of *tawarooq* (securitization) has sparked hot debate in recent times.

Militant Islam is not a product or by-product of poverty.

For instance, the Islamic Fiqh Academy, which is affiliated with the Islamic World League, ruled in 1998 that *tawarooq* transactions are *halal* (lawful or permitted). Five years later, it redebated the issue and forbade the transactions, run by banks, which sell a commodity to a customer with a higher price in installments, then sell the same commodity on behalf of the customer with a lower price in cash, and then give the customer the low price, and finally require him or her to pay the higher price. Therefore it would be admirable if it were regarded as permissible in case of necessity in line with the well-known tenet "necessities relax prohibitions."

Concerning Islamic aid agencies, it is true that they see some victories every day in the battle to overcome poverty. But they should seek to make more immediate and lasting improvements to the lives of people affected by poverty, war, and disaster. Islamic experts agree that they must expand and replicate successful projects, which include both emergency relief and long-term solutions to poverty, and should support projects that provide those most basic and immediate needs like clean water and healthcare.

While partnership requires understanding and trust among partners, it is sad that lack of interaction, and prevailing ignorance, prejudice, and social tensions often hinder partnerships among different communities and faith groups. Since the faith-based groups play a very important part in working toward the Millennium Development Goals (MDGs), as well as when an emergency like the 2004 tsunami happens, it is also vitally essential that Islamic aid organizations build a cohesive partnership with other international donor agencies. Finally concerned people could cherish a great mission by heightening their knowledge of Islamic economics to establish a welfare society, combating the challenges of the new era.

Conceding that the events of September 11, 2001, have intensified a long-standing debate over whether poverty causes militant Islam, many analysts have con-

cluded that militant Islam is not a product or by-product of poverty. In essence Islam, a religion of peace and harmony and a liberal and pluralistic spirit, endeavors to promote interfaith dialogue and freedom. It truly intends to stimulate people to reflect upon their individual and universal responsibilities and commitments.

By sharing this vision, championed by Islam and aspired to by millions of Muslims across the globe, a significant as well as a startling fact must emerge, that is, that the values of Muslims and of those millions of non-Muslims who work tirelessly for social justice are identical in practice on a wider array of issues. In respecting this mutual ground and facing ignorance and prejudice, broad-based partnerships among communities could definitely be a possibility for mankind. When this vision has become a reality, one-fifth of the world population will have a means to escape the poverty trap and debt.

Israel

THE MODERN STATE of Israel occupies much of the Fertile Crescent land bridge between Africa and Asia. The country was established by a United Nations resolution (181) on November 29, 1947. Resolution 181 par-

titioned Palestine into two states—one Jewish and one Arab. The new state of Israel ended the historic diaspora created by the Romans at the end of the Jewish Wars in 70 C.E. A Palestinian state has not been created.

Since its establishment the people in Israel have been able to create a modern technological society that is a sophisticated producer of goods and services. Despite the high-level modernization, poverty exists in the country for several reasons. But how much poverty may be open to debate.

According to the Israeli newspaper *Haaretz*, Dr. Daniel Gottlieb, a senior adviser to the Bank of Israel, four different methods of measuring poverty yielded four different results: "He found that on the basis used in the United States, the rate of poor families in Israel reaches 28 percent; according to the Canadian standard, the rate drops to 24 percent; the method proposed by the National Research Council in the United States lowers the rate further to 23 percent; and the Israeli method calculates the rate of poverty in Israel at 18 percent" of the population.

Nevertheless, poverty does exist in modern Israeli society because of war and civil conflicts, high birthrates, and an economy unable to absorb large numbers of new immigrants.

The virtual state of war that has existed between Israel and the Arab League countries since the first Arab-Israeli War (1948) has forced enormous sums to be spent on arms. Currently most of the Arab portion of the land that is controlled by Israel is an area of deep poverty. The Arab population in both Israel and Israeli-controlled territory has a high birthrate, which has added to the poverty rate. It has been reported by the World Bank that in the West Bank and Gaza occupied territories, 60 percent of Palestinians live on less than \$60 a month.

The enormous hostility hampers economic development. Extremist groups willing to use violence against the people, economy, and state of Israel abound. This means that war and the Intifada (Palestinian uprisings) have led to a failure to address the root causes of poverty among Palestinians, which is an issue that goes beyond Israel proper.

The poverty levels are demographically concentrated. Jewish immigrants to Israel have come from all over the world. One poverty factor has been the immigration of Sephardic Jews from north Africa or from Middle Eastern countries. Many of these arrivals were from impoverished backgrounds. They have a high birthrate, which means that poor people are producing numerous poor children. The Jewish immigrants from

Europe tended to be Ashkenazim with a lower birthrate, better education, and much less poverty.

Many Haredi Jews (ultra-Orthodox) spend their time in religious studies and do not enter the job market. They also have high birthrates. These Jewish groups and the Arabs make up much of the poverty-stricken population.

Since the country's inception, there have been repeated waves of immigrants to Israel from around the world. Many of the immigrants to Israel, even when well-educated, have been placed in rural or unsettled areas with frail economies. Many of the immigrants, economically stable or prosperous at home, were forced to leave much of their wealth behind.

The most recent immigrant wave has been from the old Soviet Union. While often well educated, they were ignorant of Hebrew and came in such great numbers that absorbing them into the economy has been very difficult. The unemployment rate in 2005 was 15 percent and often has been higher.

Estimates are that a third of the children (600,000) in Israel live in poverty. It has been reported that 400,000 families experience conditions of hunger. Hunger is usually reported as "nutritional insecurity," which is a way of saying that people eat insufficient portions, skip a meal, or do not eat some days. The poor in Israel are 60 percent Jewish, 20 percent Arab, and 20 percent recent immigrants. The poverty line has dropped in the last 20 years and is not improving; the poverty line for a family of four in 2000 was the equivalent of \$937.50 per month for an Israeli family of four. The severity of poverty is demonstrated by the existence of soup kitchens in Jerusalem visited by approximately 1,000 people each day.

Italy

ECONOMICALLY AS WELL as culturally, Italy is a country sharply divided between north and south. The industrially developed regions of northern Italy enjoy higher living standards, while southern Italy is still predominantly agricultural and industrially underdeveloped. According to the National Italian Institute for Statistics (ISTAT), in 2004, 13.2 percent of the Italian population lived under the poverty line, an increase of over one percent in comparison to the previous year.

Such a line is calculated in relative terms by considering poor those people whose monthly expenditure is equal to or below the national average. The large majority of Italian poor are concentrated in the south. Of the 20.7 million people (36.1 percent of Italians) living in southern Italy, 7.3 million (35.4 percent) are poor, living on less than 521 euros per month. Some 4.6 million of these people (63.3 percent) are extremely poor, living on less than 435 euros per month.

With such an economic profile, if southern Italy were an independent European country, it would be the European country with the highest poverty rate, weighted for national income. The proportion of people at risk of poverty, redistributed based on a value of one as the European Union average, ranges from a minimum of 0.3 in Slovakia and a maximum of 1.4 in Ireland. Italy's average value is 0.6, but is 0.4 in the north, 0.9 in the center, and 2.3 in the south. If we considered the south of Italy as an independent state, it would be the one with the highest poverty risk. Yet in recent years, warnings from national and international institutions that poverty may represent a problem for the whole country have become increasingly frequent.

The south of Italy has historically been less economically and financially developed than the north. The unification of Italy in the second half of the 19th century did not efficiently tackle the social problems left behind by the backward Spanish administration of the Kingdom of the Two Sicilies. The economic structure of the Kingdom of the Two Sicilies retained a predominantly feudal basis. In addition, the Italian south was far from the main European markets and poor in raw materials and resources. The historical process of unification in Italy was the result of the alliance between the northern industrial bourgeoisie and southern aristocrats who, to limit the social upheavals of the unification, supported the Piedmontese in exchange for the preservation of their privileges and status.

Neither the totalitarian Fascist regime nor the many democratically elected governments before and after

Poverty can be found even in southern Italian quaint villages such as Cetara, above. The industrially developed regions of northern Italy enjoy higher living standards, while southern Italy is still predominantly agricultural and industrially underdeveloped.

Benito Mussolini could or wanted to find solutions for the sharp north-south divide. Throughout the 20th century, there were difficult periods for the whole country (such as the 1920s and the postwar years after the fall of Italian Fascism), which prompted many Italians to emigrate either to the United States or to more developed European countries.

Yet the southern regions were also excluded from the massive industrial and technological advancements of the 1960s. Even in the years of the so-called economic miracle, the south remained cut off from the rest of the nation and its inhabitants started a massive process of migration toward the north. Unemployment is still one of the major causes of poverty and social marginalization in the south of Italy, particularly on the outskirts of big urban centers. Not surprisingly it is in these areas that the Mafia thrives, exploiting social and economic deprivation and discouraging, through its system of intimidation and blackmail, the opening of new

businesses. The situation of the Italian south has been worsened by the economic policies of cuts to local councils that have been a characteristic feature of the right-wing coalition governing Italy since 2001. Such cuts, together with the federalist state model sponsored by the Northern League, a political party whose agenda includes the recognition of the north's major contribution to the national economy, have endangered equal access to public welfare for all Italian citizens.

Over the last 15 years the number of poor families in the north has remained stable, while in the south this number has increased considerably. Paradoxically for an area that has witnessed governments' apparent inability to solve its problems, the south of Italy has always been an electoral reserve for the ruling parties. As Judith Chubb has pointed out, disadvantaged economic conditions have favored the persistence of traditional forms of political behavior—a politics based primarily on personal ties and patronage rather than on ideology.

Yet according to the Eurispes survey on Italy for 2004, the problem of poverty is no longer limited to southern Italy. The results of the survey point out that the purchasing power of the middle classes has declined by 20 percent within a year because of the failure to adjust salaries to the level of inflation. In addition, Italians showed little hope that the country would recover from the economic stagnation that has affected the nation for several years.

In addition to those citizens living below the poverty line, there are another 10 percent of Italian families that are at risk. The widening gap between prices and salaries has modified the purchasing habits of the nation, which according to the survey, are increasingly oriented toward low-quality goods. An astonishing 48.2 percent of Italians judged the economic situation as having worsened in comparison to the previous year.

Only seven percent of Italians perceived improvements in the economic situation, while 14.4 percent noticed no significant difference from 2003 to 2004. The majority of Italians (56.4 percent) thought it was unlikely that they could be able to save considerable

amounts of money. With the recent price rises and the corresponding lack in pay arises, margins for saving become extremely limited. Only 5.5 percent of Italians stated that they were sure to be able to put some money aside for the future.

WORLD POVERTY

J

Jackson, Andrew (Administration)

ANDREW JACKSON WAS SEEN as the first U.S. president of the "common man." Despite the fact that he was a wealthy slave-owning planter, he came from relatively humble origins and lived in the west, and this appealed to many people. Although he was a lawyer and had held many political offices (as congressman, senator, and governor), he was best known as a military general. His years as a tough Native American fighter and especially his victory against the British at New Orleans in 1814 made him a hero.

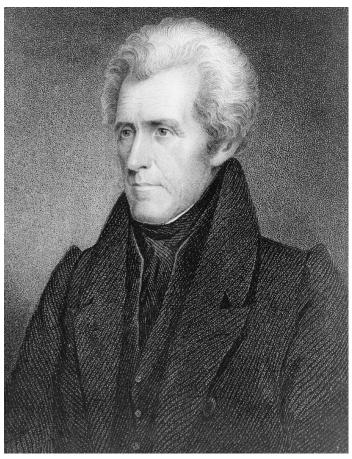

In 1824 Jackson received the most votes for president, but for the only time in American history, no candidate received a majority of electoral votes. The House of Representatives selected second-place candidate John Quincy Adams to be president. Jackson supporters saw this as a corrupt deal, as Adams immediately appointed House Speaker Henry Clay to be his secretary of state, the traditional stepping-stone to the presidency. Four years later, Jackson easily won the White House.

Although previous administrations had used patronage jobs to benefit their supporters, Jackson did this on an unprecedented scale. Jackson claimed to be getting rid of corrupt officials and purging northeastern

arrogance, but opponents saw it as an abusive political maneuver to help friends and hurt enemies. Although previous presidents considered it appropriate to veto only in cases in which they deemed the legislation in question to be unconstitutional, Jackson regularly used the presidential veto to shape policy—a practice in use to this day.

Like most westerners, Jackson believed that the frontier must be open to settlement. Native Americans who did not assimilate into American society—despite often being "civilized" and politically advanced—would be forced to move west. Tribes in Georgia, Alabama, and Mississippi objected to treaty violations that forced them to submit to state law. The U.S. Supreme Court agreed and found for the tribes in several cases. Jackson ignored the Court's opinions, famously exclaiming, "[Chief Justice] Marshall has made his decision, now let him enforce it." Jackson's policies resulted in the forcible expulsion of these tribes—many at gunpoint on what is known as the Trail of Tears. Without their traditional hunting grounds, many Native American tribes were left to survive in poverty in their new environments.

The greatest issue dividing north and south during the Jackson administration was not slavery but tariffs.

Andrew Jackson's attempts to destroy the Second Bank of the United States eventually led to the Panic of 1837.

High tariffs on imports made many items more expensive for most southerners, while northern industries benefited from the protectionism. Much of the money raised was used for internal improvements, such as canals, which again primarily benefited northern business interests. While in the Senate, he had supported federal projects to build canals and other infrastructure that were sorely missed during military campaigns. However, he came to see such projects as corrupt projects benefiting the wealthy. He also began to support significant tariff reductions.

Most southerners thought the reductions did not go far enough. South Carolina sought to block collections of federal tariffs at its ports. It also began to discuss secession. Jackson threatened to find the leader guilty of treason if they went through with their threats. That, combined with further tariff reductions, ended such talk.

The Second Bank of the United States was seen as an institution critical to the national economy. It supplied a stable currency and maintained all government revenues, as well as acting as a private bank. The federal government, however, controlled only 20 percent of the bank. The rest was owned by wealthy businessmen and companies, many of them in foreign countries. Jackson was hostile to the bank but most people were shocked when he vetoed its charter renewal. Jackson saw the attempt at early renewal just before the 1832 elections as an attempt to intimidate him. He responded by deciding to destroy the bank.

Jackson removed all federal funds from the bank before its charter expired. He fired and replaced his secretary of the treasury for refusing to go along. The bank reacted by limiting the money supply and reducing loans, expecting that the credit crunch would show the bank's necessity and force renewal. Instead, it backfired. Seen as financial manipulation for its own benefit, public support for Jackson's position grew and the charter was not renewed. Federal money was deposited in various state banks that lent money much more aggressively, creating a speculative boom in western lands that eventually led to the Panic of 1837 and years of recession, thus creating more poverty in the United States.

Jamaica

SINCE GAINING independence from Great Britain in 1962, the Caribbean island of Jamaica has experienced decades of deteriorating economic conditions and political violence that have resulted in a poverty rate of 19.7 percent and an unemployment rate of 15 percent. Tourism is a major revenue source for Jamaica, but tourists have been frightened away in recent years by the growing unrest. Other government revenue resources include the production of bauxite/alumina and regular remittances from Jamaicans who work abroad. Just over one-fifth of the labor force is engaged in agri-

culture. In this lower-middle-income country, Jamaicans have an average annual income of \$2,690. Nevertheless 13.3 percent of the population live on less than \$2 a day. The poorest 20 percent of the population subsist on 6.7 percent of the country's resources, while the richest 20 percent share 46 percent. Jamaica is ranked 37.9 on the Gini Index of Human Inequality.

Among Jamaica's population of 2,731,832, life expectancy is 76.29 years, with females outliving males an average of four years. The median age is 27.25 years. Almost 28 percent of the population are under the age of 14, and 6.9 percent have reached the age of 65. Jamaicans generally enjoy easy access to healthcare. There are 85 physicians for every 100,000 residents, and only around five percent of the people are unable to afford essential drugs. However, eight percent of Jamaicans lack access to safe water and proper sanitation.

With an HIV/AIDS prevalence rate of 1.6 percent, Jamaica has reported more HIV/AIDS cases than any other country in the Latin American/Caribbean region. Eight percent of the infected are under the age of 10. Many of these children contracted the disease from their mothers at birth. At least four-fifths of these children come from poor families. One in every four children with HIV/AIDS is abandoned. Since 1995, adolescent infection rates have doubled every year, and girls are three times more likely than boys to contract the disease. Overall, some 22,000 Jamaicans have HIV/AIDS, and 900 people have died from the disease and its complications.

Infant mortality is relatively low in Jamaica, with 12.36 deaths occurring out of every 1,000 live births. That number had declined significantly since the 49-per-1,000 infant mortality rate recorded in 1970. Between that time and 2003, the mortality rate of children under the age of five dropped from 64 to 20 deaths per 1,000. Four percent of all children under the age of five are malnourished, and rates of wasting and stunting are low. Ranging from a percentage in the mid-80s to the high 90s, childhood immunizations have improved over the last few decades but are still below the level to keep all children healthy.

Fertility rates have dropped considerably in Jamaica over the last decades. Between 1970 and 2005, total fertility declined from five children per woman to 1.95 children per woman. Adolescent fertility is currently estimated at 81 births per 1,000. Some 65 percent of Jamaican women use contraceptives of some sort. Trained medical staff attend 94.6 percent of all births in Jamaica. According to modeled estimates, maternal mortality dropped from 120 deaths per 100,000 live

births in 1975 to 87 deaths per 100,000 in 2000. Jamaica bases its definition of literacy on the percentage of those over 15 who have attended school. By this definition, 87.9 percent of the relevant age group is literate. Literacy among females is higher at 91.6 percent than among males at 84.1 percent. While children are more likely to attend school than in the past, some 30 percent of students, mostly boys, are still believed to be functionally illiterate when they finish primary school. Primary school completion rates have dropped in recent years.

Between 1999 and 2003, the number of males completing primary school fell from 89 to 85 percent while the number of females completing school at this level decreased from 91 percent to 85 percent. As a Jamaican student ages, patterns of low attendance and withdrawals become more common. These patterns are usually a result of the increasing numbers of children who work or who live on the streets.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Japan

JAPAN IS A COUNTRY located on an island chain in east Asia between the north Pacific Ocean and the Sea of Japan. It is east of both the Korean peninsula and the coast of China. It has four main islands and is slightly smaller than California. The islands contain numerous volcanoes, some active and some dormant. The islands also suffer from recurring earthquakes. Its current population is around 128 million people. The northern islands were originally settled by immigrants from the

Asian mainland. In the southern islands, many came from islands to the south. Minorities of Koreans and other people are present almost everywhere. Japan is a homogeneous nation and yet has enormous diversity because of its historical developments and geographic isolation.

Japan's long history reached a low point of defeat and devastation at the end of World War II, when it surrendered to the Allied powers. Since 1945 it has rebuilt both its industry and infrastructure. It has been able to rise from the poverty of the postwar era to become a prosperous nation with a democratic government and an industry that promotes a strong work ethic. The unemployment rate in 2005 was 4.5 percent. However, there were no official figures available for those below the poverty line.

Japan has been generous with its wealth in eliminating poverty in foreign lands.

In 1945 most Japanese were living in poverty. Today only a few do. In postwar Japan the Japanese government was able to develop policies that promoted equality and economic achievement. These policies required social compromise from the old elite. The compromises were accepted because of national need, the growing wealth of the old elites who went into business, and the obvious benefits that came to both the Japanese people and to the Japanese state.

RELIEVING POVERTY ABROAD

Japan's government has been very active in promoting antipoverty programs. It has been generous with its national wealth, which has been used for many projects to eliminate poverty in foreign lands.

The Japan Fund for Poverty Reduction (JFPR) was established in May 2000 by the Japanese government. The fund in 2005 had \$326 million available for relieving the economic consequences of the 1997–99 global economic and financial troubles. The JFPR provides not only immediate relief but also long-term development funds for projects.

Another form of assistance is the Japan Social Development Fund (JSDF). It was established in June 2000 by the government of Japan and by the World Bank. Its goal is to provide direct assistance for the poorest among the eligible member countries of the World Bank Group. It seeks to support innovative programs

that respond directly to the needs of the poor with programs that build participation by both the civil society and participating nongovernmental organizations. By 2005 the JSDF had provided over \$250 million in assistance.

An additional important fund is the Japan Women in Development Fund (JWIDF). It was established in 1995 in order to support programs for promoting the betterment of women through their empowerment and especially with the establishment of gender equality. The goal is to aid the social, political, and economic power of women through a number of innovative projects that can act as catalytic change agents. The program cooperates with the United Nations Development Fund on projects such as developing girls' education in Guatemala.

Japan has adopted as part of its international policies the United Nations Millennium Project goals to end extreme poverty. The Japanese government in support of the Millennium Development Goals has partnered with the African Village Research Project. The project will work in eight cluster villages around Africa. The villages were chosen for their locations in a range of agro-ecological zones. They each represent distinct challenges to poverty reduction. It is also an aim of the project to provide useful knowledge for increasing human security and environmental protection in ways that create healthy and economically productive livelihoods and lifestyles.

Japan has also been active in international debt forgiveness. In November 2005, it forgave \$444 million in debt owed by the Central American country of Honduras. The money had originally been loaned by Japan to Honduras to help with Honduran antipoverty programs. Japan is a member of the Paris Club, a group of creditor nations. In forgiving the debt, it was acting to recognize the devastation caused in Honduras by hurricanes in the last several years. These have only worsened conditions in Honduras, which is one of the poorest countries in the western hemisphere.

In publishing its foreign policy, the Japanese government has promised that it will cancel a small portion of the debt of developing countries. It has done this in part to facilitate changes in the international monetary system. Until at least 2000, the goal of the nation's debt-relief program was not to cancel international debts, but to restructure or reschedule them. At times grants-in-aid were given to debtor nation, so that the cost of the restructuring was low.

A feature of Japan's debt-forgiveness programs is the fact that most of the debt relief has been for Asian countries. Some critics of Japanese foreign policies have claimed that Japan is not doing good with its good works. The view that it is acting selflessly is not correct, the critics argue—Japan, they claim, is doing good works in order to further its own interests.

POVERTY AT HOME

Despite its wealth and prosperity Japan has in recent decades experienced growing problems with poverty. The problem of poverty is hidden in Japan in part because it is a relatively rich country. The stagnation of the Japanese economy, along with the "baby bust" that has led to an aging population that will have to be supported by a smaller number of workers has created hidden problems that the Japanese have not yet addressed.

Among these problems is underemployment. Some people, especially women, have only part-time jobs. Many college-educated young people have had difficulty finding jobs. Unemployment is often hidden from view, but it exists.

The number of children growing up without fathers has grown to over 1.25 million. The figure represents a massive social problem. It is the highest figure ever recorded in Japan, representing a 28.3 percent increase in five years. The statistic represents more than numbers; it declares that Japan is in danger of creating a massive underclass of impoverished families.

A survey taken in 2003 found that there were many children living below the poverty line. The survey from the new Health, Labor and Welfare Ministry displayed a failure of Japan's government.

Historically Japan has had a very strong group consciousness. People in Japan were members of groups in such a way that the bonds of the group—whether family, military, business, social, or religious—were so strong that to be expelled from the group was virtually a death sentence. It meant a total loss of place in society and not infrequently starvation or enormous social degradation. For this reason, not only manners but also extreme service and loyalty were values and behaviors cultivated by the Japanese.

The enormous stress on the Japanese economy in recent decades has moved into mainstream society with enough power to dissolve old loyalties. Divorce is on the rise. The consequences of the new larger number of divorces are the great new number of families with children but without a father present. The weakening of the traditional Japanese family is forcing major changes in the way that poverty is calculated in Japan. Moreover the economic downturns have forced many elderly

Japanese into poverty. Elderly Japanese and large numbers of children who are living within a household that has too little money now account for most of the poverty numbers. The problem of Japanese extreme poverty has reached the point where there have been cases of single mothers or their children dying of starvation. There have also been incidents of single mothers freezing to death from want of fuel.

Some countries have programs to care for the poor through tax credits, free childcare, or other similar services, but Japan has not adopted these poverty-fighting policies. The reason lies in the sufficiency of its system in prior decades, especially during the most prosperous of times.

Japan has a social services system, but it no longer works well for all of the elderly.

Another factor of the growing poverty in Japan has been the relative decline in wages. Japan has one of the highest rates of employment among single mothers of any country in the world. However, the prolonged problem of Japan is its economic recession, which lasted for much of the last quarter of the 20th century. It has pushed wages into a large gender gap situation. Women, especially poor single mothers, are often pushed into low-paying occasional work that further marginalizes them. They are not only affected by recessions, jobs that are unstable employment, but also by the low pay.

These and other factors are acting to keep single mothers from the mainstream of economic life; they become trapped in poverty with no way to escape. The women in this condition also include elderly women, homeless women, and migrant women. To this list could be added foreign women residents in Japan, such as Korean, Chinese, and other Asian women.

There are also women who have been victimized by one of Japan's natural disasters—cyclones, earthquakes, tsunamis, fires, or floods. Japan has a social services system, but it no longer works well for all of the elderly, nor does it work adequately well in caring for women and children.

Japan's child welfare system is weak and its system of enforcement of child-support payments by absent fathers is extremely weak. Many single mothers are forced into divorces in which child-support payments are not required. The absence of an enforcement system for delinquent payment collections makes the

problem hard to address. Japan's legal system is not efficiently organized to deal with these kinds of issues. The court costs are often much higher than the acceptance of partial childcare payments. The system, in effect, leaves the abandoned family at the mercy of the absent father.

Japan's social policies are still based upon the assumption that all families have both parents with one parent (the father) the sole breadwinner. The assumption that the family can take care of social needs (as was done in the past) is being challenged by changing social facts.

Because of these problems, the government has been forced to make some hard choices involving welfare payments. Unfortunately the choices were hard on children, whose welfare payments were cut or shifted to the elderly. The reasons for cutting children from the welfare rolls may lie in the political reality that the elderly vote and children do not.

Homelessness is on the rise in Japan. This was never seen during the boom years of several decades ago. It has given rise to cardboard box villages of people in the rare empty spaces of Tokyo. One cause of homelessness is the high cost of housing and heating, especially for the elderly on fixed incomes. Another cause is the sheer lack of jobs for the young. Alcohol and drug abuse are also notable contributors to homelessness and poverty.

Andrew J. Waskey Dalton State College

Jefferson, Thomas (Administration)

WHEN THOMAS Jefferson became the third president of the United States in 1801, the nation could not have looked more different than the superpower that it has since become. But Jefferson's administration produced three major accomplishments without which the geographical and economic expansion of the nation would simply not have been possible. Ironically, all three of these accomplishments are now at least indirectly at the center of the debates over the erosion of American prosperity and of the standard of living of the average American.

The Louisiana Purchase not only opened the way for American expansion to the Pacific coast, but it also allowed the United States to absorb the great wave of European immigration that occurred in the second half of the 19th century. Without the availability of homesteads on the central and Great Plains, the near-anarchic expansion of American cities would have become absolutely untenable. The opening of the vast breadbasket also sustained the expansion of the railroads, which then made possible the rapid industrial expansion during the Gilded Age.

The embargo's negative effects had rippled through the American economy.

Indeed, agricultural produce became America's first great export, and the Jefferson administration secured the rights of American commercial interests throughout the world with two major efforts.

First, it successfully prosecuted a war against the Barbary states of north Africa that essentially sponsored piracy. Second, it responded to continued British and French predations on American shipping by imposing the Embargo Acts of 1807. For several years, all trade between the United States and those contending European powers and their allies was curtailed. Jefferson hoped that the economic effects of such an embargo would force the British and French to recognize American rights as a neutral state to trade freely with both nations. After several years, however, it became clear that the embargo had failed in this goal and that it had, in fact, harmed American shipping interests much more than their European counterparts.

In addition, the embargo's negative effects had rippled through the American economy, creating massive unemployment in ports that depended on shipping and

shipbuilding and severely constraining the profits of both farmers and shippers within the interior of the nation itself. On the positive side, however, nascent American industries expanded rapidly to compensate for the prohibited imports of European manufactured goods. The economic potential of these industries became so apparent that the interests of industrialists were subsequently advanced over the interests of shippers through the imposition of stiffer tariffs on foreign goods. This shift in emphasis was also because of the federal government's dependence on tariffs for most of its revenue and the need the revenues lost because of the embargo.

From the beginning, the government's budget crisis has thus been intertwined with economic and trade policies. Indeed, the most pressing current issues related to American economic performance have included the demise of family farming, the decreasing importance of manufacturing within the American domestic economy, and the increasing trade imbalance between America and states such as China, India, South Korea, and Mexico for whom global free-trade policies have been a boon. And all of these issues can be traced back through the events set in motion by the accomplishments of the Jefferson administration.

MARTIN KICH WRIGHT STATE UNIVERSITY

Jesuits

FORMALLY ESTABLISHED under Pope Paul III in 1540, the Society of Jesus, popularly known as the Jesuits, is a religious order of Roman Catholic priests and brothers. They trace their origins to the insight and vision of their founder, St. Ignatius of Loyola who, along with six like-minded companions, bound themselves not only to the traditional religious vows of poverty and chastity, but also to apostolic labors in the Holy Land or any other apostolic activity commissioned by the pope. Today the Jesuits boast a membership of

more than 20,000 men, making them the largest religious order in the Roman Catholic Church.

The purpose of the society is the salvation and perfection of both the members of the order and all those who are touched by their diverse ministries. These works include communications, education, missionary activity, pastoral assignments, spiritual direction, and social ministry, with particular concern for the poorest members of society. While not often showcased, the commitment to confront poverty has been key to Jesuit ministry from its inception, realizing that one cannot achieve spiritual perfection without a basic degree of temporal welfare. Accordingly members of the society demonstrated commendable courage and determination in their efforts to attend to the sick, plaguestricken, and their ministry to the poor. Frequently the earliest Jesuits volunteered for chaplaincies in galleys, prisons, as well as other forums where the poor represent the majority of the population. Additionally the society established orphanages, women's asylums, and other institutions of social assistance.

The Jesuits have committed themselves to the fight against poverty in 112 countries.

During the 32nd General Congregation of the Society of Jesus in the mid-1970s, the Jesuits were trying to rediscover their roots and their mission. While noting their commitment to the poor and marginalized throughout their 400-year history, especially in light of the Second Vatican Council's summons to all members of the church to address the griefs and anxieties associated with these groups, they also acknowledged their failures.

They acknowledged the need to establish a clear connection among identity, creed, and ministry. This renewed understanding of their mission was being expressed in decrees three and four, which advocate "the service of the faith and the promotion of justice," noting in particular that "since evangelization is proclamation of that faith which is made operative in love of others, the promotion of justice is indispensable to it."

As part of that mission, there was a greater awareness of the need to engage people directly who were living on the margins, and this gave rise to an increased emphasis on the importance of "inserted communities," namely groups of Jesuits living with those who were poor. This ministry of presence led to a genuine experience of solidarity incarnated by an authentic

"preferential option for the poor" on the part of the society. In the decades that followed, the Jesuits have committed themselves to the fight against poverty in 112 countries, where they serve by addressing the basic human needs of the poor, educating and enabling the poor to become productive and respected members of the economy, and advocating for specific policies that would ensure that the poor would become part of the economic mainstream.

Of paramount importance in the Jesuit ministry to eradicate poverty is a letter addressed to the leaders of the countries of the G-8 summit, drafted by the Social Justice Secretariat of the Society of Jesus on July 1, 2005. In this missive, the Jesuits call upon these leaders and their member nations to "adopt the means necessary so that, once and for all, the poverty in which a great part of Humanity lives might pass into history."

They note many of the destructive consequences of poverty, including premature death, illness, illiteracy, discrimination, violence, and the inability to participate in the public arena, to name but a few. Additionally they identify the normative economic climate of the First World as a breeding ground for world poverty. Accordingly, they propose a five-measure policy that would lead to the eventual eradication of world poverty.

First, the letter calls for an increase and improvement in the quality of international developmental aid. Second, it calls for the discovery of a "definitive and just solution" to the ever-increasing problem of external debt in developing and Third World countries. Third, the society advocates the promotion of a system of international trade with a clear focus upon authentic human development. Fourth, the letter encourages the development of international institutions that represent the poor, encourage their development, and work to redistribute global resources in an equitable fashion. Fifth, the society asks member countries of the G-8 to serve as models of sustainable development through the promotion of solidarity, responsible consumption of goods, and environmental respect.

In addition to active lobbying, the Jesuit commitment to the eradication of world poverty continues to be a part of its mission of higher education. Through programming such as "education for justice," Jesuit colleges and universities across the globe promote poverty awareness and advocate personal active response on the part of students. Jesuit academic settings also often introduce students to the Jesuit Volunteer Corps. Since 1956 this national and international program has allowed more than 12,000 men and women to live and

work with the poorest and most marginalized of society to aid in their authentic human development.

JOHN J. SLOVIKOVSKI MOUNT ALOYSIUS COLLEGE

Johnson, Andrew (Administration)

ANDREW JOHNSON HAD one of the strangest career paths to the U.S. presidency. As a senator for Tennessee, he was the only southern senator to refuse to accept his state's vote of secession and remained in the U.S. Senate. When Union troops took control of most of Tennessee in 1862, Lincoln appointed him military governor of the state. In 1864, Republican President Abraham Lincoln selected him as vice president, primarily to reach out to southerners and bring them back into the Union.

As a southern Democrat, most of the Republican Congress was already quite hostile to the new vice president. He did not help matters at his inauguration. He was given whiskey to help with a cold. His inaugural address came across as drunken and incoherent. The man who rarely touched alcohol got an instant reputation in Washington as an incompetent drunkard.

On April 15, 1865, Lincoln died from an assassin's bullet, only a few weeks into his second term. There has probably never been a more hostile relationship between Congress and a president from the outset, than when Johnson ascended to the presidency.

Johnson generally shared Lincoln's view that southerners should not be punished for the war. Rather the government should reach out to southerners to rebuild the Union and rekindle southern loyalty. Lincoln might have been able to convince the Radical Republican Congress to do this. Because he had led the nation through the war, he had an established reputation for being tough when necessary. As the leader of the Republican Party, he was in a good position to convince

his fellow Republicans to follow his policies. By contrast, Johnson was a southern Democrat. His efforts for southern conciliation were viewed at best as a form of surrender in the face of victory. Others viewed his actions as an outright betrayal of those who had fought for the Union. Further, Lincoln's assassination had only increased congressional hostility and a demand for retribution against the south.

Johnson had always been a strict constructionist who believed in limited government. Although he had accepted emancipation, he wanted to leave it up to the states to decide how to treat the new freedmen. He saw military occupation of the south as a temporary measure and wanted to return to democratic government as soon as possible. Although southerners, both black and white, faced great poverty, Johnson believed that local solutions once government was restored were the best way to resolve the problems.

Johnson's critics pointed out that his policies left the new freedmen at the mercy of a hostile white majority, and that quick removal of the military would turn these states back to people who had been traitors just a few years earlier. The Radical Republicans who dominated both houses of Congress sought to maintain military dictatorship over the southern states, as both punishment for the war and to protect the newly freed slaves from mistreatment.

Johnson opposed almost all congressional measures designed to protect the rights of blacks, including the proposed Fourteenth Amendment, which guaranteed equal rights to the newly freed slaves. He also opposed extended military occupation. The Congress overruled most of his vetoes and the relationship between Congress and the White House remained hostile. In 1867 Congress also passed laws, over Johnson's veto, disbanding the civilian governments that Johnson had established in the south, thus retaining military authority over the region.

The Radical Republican Congress also tried to limit Johnson's power as president. In 1867, Congress passed the Tenure in Office Act over Johnson's veto, taking away his right to fire his cabinet members without Senate approval. Since Lincoln had selected the cabinet, this left Johnson with a hostile cabinet. Many members made it quite clear that their loyalties were to Congress rather than the president.

When Johnson fired his secretary of war, the House voted to impeach him. After a lengthy trial, the Senate failed by a single vote to reach the two-thirds majority necessary to convict him. Johnson finished his final year in office and returned to Tennessee. He remained

relatively popular in Tennessee. In 1874 he was reelected to the Senate but died only a few months after taking office.

Johnson, Lyndon (Administration)

WHEN AN ASSASSIN'S bullet struck down President John Kennedy on November 22, 1963, few knew what to expect from Lyndon Johnson. Johnson came to Congress a liberal supporter of Franklin Roosevelt's New Deal in 1937, yet he had usually sided with the conservative block of southern Democrats who controlled the Senate. Many saw him as a pragmatist with little ideology who was added to the ticket largely to help Kennedy win Texas.

Johnson, however, quickly set one of the most aggressive agendas ever proposed by any president. His domestic policy, called the Great Society, is one of the great experiments in modern American liberalism. Less than two months after taking office, Johnson laid out much of what would later become known as his Great Society agenda. He declared an "all-out war on human poverty and unemployment." The Great Society would come to promote greater federal involvement in aid to the poor, urban renewal, civil rights, education, healthcare, safety, and environmental protection. The next few years saw an unprecedented level of congressional activity. Hundreds of bills became law.

WAR ON POVERTY

Before the antipoverty programs got off the ground, Johnson shepherded through Congress the tax cut proposed by Kennedy. The Revenue Act of 1964 was designed to help spur a faltering economy; the taxes cut amounted to about 10 percent of the federal budget

To galvanize public support for his War on Poverty, President Lyndon B. Johnson (center) conducted a "Poverty Tour" in 1964. Here he shakes the hand of one of the residents of Appalachia, one of the poorest regions in the United States.

and, because of stimulated growth, led to an increase in revenues of about 20 percent from 1963 to 1966, when the cuts were fully implemented.

The central pillar of Johnson's War on Poverty was the Economic Opportunity Act of 1964. This act created the Office of Economic Opportunity (OEO), instituted in order to break away from the existing bureaucracies, thus allowing a single administrator to manage and coordinate all antipoverty initiatives. The OEO managed a whole range of new antipoverty programs, including VISTA (Volunteers In Service To America), the Job Corps, the Neighborhood Youth Corps, Head Start, adult basic education, family planning, community health centers, congregate meal preparation, economic development, foster grandparents;

legal services, neighborhood centers, summer youth programs, and senior centers. Although the act received strong congressional support, the OEO remained controversial from the outset. Especially controversial was its use of Community Action Agencies (CAAs) that bypassed state and local governments and tried to avoid a centralized management system run from Washington, D.C. The idea was that poor people would form committees that would decide how best to attack poverty in their neighborhoods by giving them federal assistance with limited oversight.

The plan did not live up to the ideal. Many local CAAs were filled with politically connected people who worked as appendages of state or local agencies. Others siphoned off money through high salaries, pa-

tronage jobs, or insider contracts. Still others took over the local committees in an attempt to leverage the resources toward bringing about social revolution. They organized rent strikes, sit-ins, and rallies, and used other disruptive tactics to take on perceived injustices.

Criticisms that the federal government was subsidizing political movements, many of which were considered socialist or communist, led to even greater opposition. Johnson considered shutting down the OEO. However, fearing a political backlash from the left, he continued to support it and worked toward improving the problems. One significant early change gave most local CAA authority to state and local officials rather than directly to poor people. President Richard Nixon greatly weakened the OEO after taking office and finally closed it in 1974.

Throughout the 1960s, race riots across America left many inner cities devastated.

In addition to the Economic Opportunity Act, numerous smaller programs were created or enlarged for direct aid to the poor. The Food Stamp Act of 1964 made permanent an earlier pilot program, and in 1966 the administration got Congress to amend the minimum wage laws to cover many more workers and increase the minimum wage to \$1.60 per hour over five years.

URBAN RENEWAL

A central component of the War on Poverty was the elimination of centers of poverty in large cities. Following World War II, the middle class had largely left the cities for the suburbs, leaving large poor groups, mostly minorities, with few resources. Throughout the 1960s, race riots across America left many inner cities devastated.

The Urban Mass Transportation Act of 1964 provided federal matching funds to develop rail systems in cities. The plan was criticized for supporting only capital expenditures rather than operating costs, but subsequent administrations greatly expanded this program to provide far more support. The Housing and Urban Development Act of 1965 provided federal funds for better housing for the poor. It also provided for urban renewal programs and improvement of public housing. Congress established the Department of Housing and Urban Development to oversee these programs.

In 1966 the Model Cities program coordinated federal and local efforts to contain urban blight, rehabilitate urban slums, and develop better central planning for future development. Legislation in 1968 focused attention on home ownership by providing government guarantees for mortgages.

CIVIL RIGHTS

A major focus of the Great Society was ending racial segregation, which kept many minorities poor and marginalized. The Civil Rights Act of 1964 was the most sweeping civil rights legislation since Reconstruction. It outlawed discrimination based on race or sex in places of public accommodation such as restaurants, hotels, and stores (Title II); in employment (Title VII); or by any entity that received federal funds (Title VI). While highly controversial at the time of passage, this legislation has been nearly universally accepted as helping women and minorities gain protections in the workplace and marketplace.

Also in early 1964, the Twenty-Fourth Amendment outlawed poll taxes for federal elections. Poll taxes required citizens to pay for the privilege of voting, which discouraged many poor people, particularly southern African Americans, from voting. Johnson strongly supported the amendment and the Supreme Court soon held that such taxes were also unconstitutional for state and local elections.

In 1965 the Voting Rights Act removed further barriers to voting by putting an end to literacy tests, used to keep many southern African Americans from voting. It also established federal oversight of voter registration and redistricting, particularly in the south where such functions had been used systematically to disenfranchise or dilute the voting power of African Americans.

That same year, Johnson issued Executive Order 11246, which required government agencies to develop programs to ensure that applicants and employees did not suffer discrimination based on "race, creed, color, or national origin." It also directed that all government contractors "take affirmative action" to ensure that applicants and employees did not suffer from such discrimination. In 1967 he amended his order to include sex discrimination. Presidents Franklin Roosevelt, Harry Truman, and Kennedy had already issued orders banning discrimination by the government and government contractors. Johnson's order did not set numeric goals or timetables, as did orders by subsequent presidents. However, it was seen as a major step in the affirmative action movement.

EDUCATION

Education was considered a major component of the Great Society. In 1965 the Elementary and Secondary Education Act (ESEA) led to the first major federal funding involvement in early education. It provided over \$1 billion for public schools and additional assistance to provide basic services at private schools. The main focus was to help poor students who attended substandard schools. It has been revised and expanded several times since its passage and remains a significant federal program.

The Higher Education Act of 1965 complemented ESEA by providing support to colleges and universities. Like ESEA, the act focused on disadvantaged children, providing financial aid and support to underfunded African-American colleges. It has also been expanded over time, providing much more federal financial support to higher education.

The Great Society legislation did not stop with traditional schools. The National Endowments for the Arts and the Humanities began in 1965 to provide federal funds to raise public awareness about the arts and humanities. The Public Broadcasting Act of 1967 created the Corporation for Public Broadcasting, whose goal was to provide educationally valuable television broadcasts for the general public.

HEALTHCARE

The Social Security Act of 1965 created Medicare for the elderly and Medicaid for the poor. These were the first major federally funded healthcare programs. Payment of the program came through a tax on wages paid by employees and employers. Medicare and Medicaid have remained major government programs. However, increased medical costs have resulted in significant tax increases on wages over the years.

SAFETY AND ENVIRONMENT

The Great Society also encompassed plans to make sure the public was better protected from pollutants and other hazards. It also attempted to protect natural beauty for future generations. The Wilderness Preservation Act of 1964 protected more than nine million acres of federal land from development, logging, or mining. The Water Quality Act and Motor Vehicle Pollution Control Act, both of 1965, made efforts to reduce pollution. The Highway Safety Act and the National Traffic and Motor Vehicle Safety Act, both passed in 1966,

authorized the first federal safety standards for motor vehicles and highways. Congress also authorized the creation of the Department of Transportation.

VIETNAM WAR

Johnson's declared domestic agenda soon began to give way to the Vietnam War. The Cold War with the communist Soviet Union during the Johnson years saw no major direct confrontations, such as the Berlin Wall and Cuban Missile Crisis. But the communist threat remained a real concern. Determined not to allow the communists to expand their influence by taking over South Vietnam, Johnson committed hundreds of thousands of troops and millions of dollars to stop them.

The escalating costs of the Vietnam War took needed dollars from the Great Society. As more American soldiers died, it cost Johnson much of his popular support. This undercut his ability to get congressional support for his domestic programs. It also turned much of the core constituency for the Great Society against his presidency. The president also had less time to focus on domestic matters.

ELECTIONS AND LEGACY

In 1964, Johnson faced a Republican challenge from Senator Barry Goldwater of Arizona. Goldwater had opposed Johnson's Great Society legislation and supported a much more aggressive action against the communists, and suggested potential use of nuclear weapons. The result was a landslide victory for Johnson, which also expanded into Congress. The 89th Congress gave the president a House and Senate where more than two-thirds of each were Democrats. Only a few Congresses during the Great Depression exceeded the large Democratic majority that assisted Johnson. However, a large number of the Democrats were southerners who opposed much of the Great Society. By the 1966 elections, voters began to turn on the Democrats, the House lost 48 seats, and the Senate lost four. Most of the losses were liberal northern Democrats who had supported the Great Society. Finally, by 1968, it became clear that several Democrats would challenge Johnson in the presidential primaries, running on an anti-Vietnam War platform. In response Johnson decided not to run for another term in office.

The American public initially seemed enthusiastic about the Great Society programs. However, after only a few years, support quickly faded. Southerners had always opposed them. They disliked a more powerful federal government and saw most of the programs as a way to force racial desegregation on them, as federal funds going to schools, hospitals, or any other program carried a requirement that the programs be desegregated.

Northern resistance grew over time. Race riots in northern cities grew in size and levels of violence rose throughout the 1960s. Even as more resources were provided to inner-city African Americans, violence continued to grow. Many worried that additional resources would be seen as rewarding the rioters. In other cases, young idealists affiliated with the Great Society through the Legal Services Corporation, or even programs such as Head Start, tried to use their positions to stir up unrest among the poor. Many of them encouraged social and political protests to help the poor. The resulting controversies led to even more opposition.

The most powerful enemy of the Great Society was money.

In addition, many were worried about whether the poverty programs were having the right effect on society. Studies showing a breakdown of poor families, primarily among minorities, led many to believe that welfare requirements that "punished" work or having a father living with the family were contributing to this.

Welfare rolls soared during the mid-1960s, partly because of government policies, but also because of the work of activist organizations like the National Welfare Rights Organizations, which hoped that, by encouraging more people to go on welfare and overloading the system, the federal government would move toward a policy of guaranteed income for the poor. Many working-class families also objected to well-publicized welfare protests demanding higher aid. Many found repugnant the idea that the poor would angrily demand more of their tax dollars as a matter of right.

But the most powerful enemy of the Great Society was money. The federal budget grew from around \$102 billion in 1965 to \$158 billion in 1969. While the Vietnam War accounted for much of the new spending, Congress was reluctant to provide requested funds for domestic programs at a time when it had more competing financial demands. Johnson went to his grave arguing that much of the Great Society did not succeed only because Congress failed to provide sufficient funds.

The chaotic 1968 Democratic Convention in Chicago, Illinois, showed the country the deep divisions within the Democratic Party, and the public turned to Nixon in the November elections. The Nixon administration did not kill the Great Society outright, but continued to reduce funding for many of its programs, many of which ultimately were discontinued in the Ronald Reagan administration. Other programs, including Medicare, Medicaid, and Head Start, have continued to grow and thrive over the years. Much of the legislation concerning civil rights, education, the environment, and safety has changed over time but remains today.

SUCCESS OR FAILURE

However, the fact that a program remains does not necessarily mean it was a success, nor does the end of a program signify failure. Assessments of the Johnson initiatives often depend on one's views on government in general. Advocates of limited government have alternately cited an alleged success in the War on Poverty as grounds for discontinuing programs that are targeted at no-longer-existing social problems, but also have argued that the alleged failure of the War on Poverty proves government programs are ineffectual and wasteful. Similarly, proponents of liberal policies point to a perceived success in the War on Poverty as proof of the effectiveness of government programs, yet elsewhere claim that the continuing high poverty rates must be seen as a call for action to increase government involvement in providing support.

Part of the dispute relates to how one measures poverty. Government calculations consider pretax cash income related to average expenses for food and other necessities, but do not consider noncash benefits such as food stamps, housing assistance, or Medicaid. Thus, under this measure, a family who received such assistance would not be considered any better off than a family receiving that assistance.

Most measures show that poverty rates decreased throughout the 1940s, 1950s, and 1960s while the country moved from a more agriculturally based economy to more of an industrial base. Experts dispute whether government programs helped, hindered, or did not affect this trend. By most measures, poverty rates fell during the period of implementation, but then seemed to rise in the 1970s, as inflation and a sagging economy contributed to problems. Conservatives argue that the Great Society programs caused many of the subsequent economic problems, while liberals argue that killing those programs caused the resurgence in poverty.

Success or failure, the Great Society represented the last real attempt to apply the New Deal-style, big gov-

ernment approach to resolving social issues. While the federal government has certainly continued to grow since that time, no president has attempted to press forward with so many initiatives to take on fundamental domestic problems.

Joint Center for Poverty Research

THE JOINT CENTER for Poverty Research (JCPR) is a project of Northwestern University and the University of Chicago. Officially the Joint Center is called the Northwestern University/University of Chicago Joint Center for Poverty Research. The JCPR began with a grant issued in July 1996 by the Office of the Assistant Secretary for Planning and Evaluation (ASPE) of the U.S. Department of Health and Human Services. The grant (\$7.5 million) was awarded to Northwestern University and the University of Chicago to pay for the establishment of a research center that could advise on issues of poverty.

The Poverty Center is jointly administered by the Institute for Policy Research at Northwestern Univer-

sity and the Harris Graduate School of Public Policy Studies at the University of Chicago. An Executive Committee composed of members from both institutions and a senior Policy Center staff member oversees operations. In addition an External Advisory Board composed of leading experts in poverty research and policies meets biannually with the Executive Committee to give advice. Faculty members from both institutions have been engaged to produce research into the questions of poverty. In addition, doctoral graduate students at both schools are provided opportunities for research as emerging scholars.

The JCPR supports academic studies of poverty in America. There are two sides to its research agenda. First, it seeks to identify the human and social causes of poverty. This means that it is especially concerned with research that seeks to show what it means to be poor and live in America. It does research to find the social, economic, and behavioral factors that cause poverty. The second side of the JCPR research agenda is to examine the policy process in American poverty law. The center seeks to identify the problems of poverty and to understand issues involved with the adoption, implementation, and evaluation of poverty research. The center also examines labor markets and how they change and the causes of inequalities in these labor markets. Moreover, it is concerned with the impact that urban poverty has on the function of families and upon the well-being of children. It seeks to identify the impact that the dynamics of the policy process and the development of new programs have upon people.

The mission statement of the JCPR says that its "mission is to advance our understanding of the causes and consequences of poverty and the effect of policies designed to reduce poverty. By social science research, JCPR seeks to influence the discussion and formation of policy, and the behavior and beliefs on individuals and organizations. The research activities of this Center should be useful to those whose goal is a long-term reduction in poverty in the United States."

In order to carry out its mission the JCPR encourages and aids research on poverty. It also promotes intellectual exchanges among scholars, researchers, and policymakers in all disciplines and policy areas. It provides training in the scope, methods, tools, and techniques used to address issues of poverty. Finally, the center promotes communications about and among policy analysts, policymakers, the media, and other interested parties about both research results and emerging research questions on poverty. The JCPR regularly issues the products of its research in the form of books,

articles, policy briefs, reports, research summaries, and other pertinent documents. In addition it publishes a regular newsletter (*Poverty Research News*) on its work. The JCPR promotes academic conferences, research seminars, congressional briefings, and research briefings.

Jordan

THE WORLD BANK estimated the poverty rate in Jordan in 1992 at 15 percent. More recent figures from the Economic and Social Commission of Western Asia indicated that in 1995 as much as 23 percent of the Jordanian population were considered poor. This poverty measure included a wide range of indicators, such as income, health, nutritional status, as well as school enrollment figures. Based on a 1997 Household Expenditure and Income Survey, the number of Jordanians living below the poverty line amounted to 523,000 in 1999.

A profile of the poor in Jordan during the 1990s and beginning of 2000 yielded the following characteristics. There is a high incidence of poverty among female-headed households, which is attributed to the generally low education level among females, and in many cases the lack of a male provider. The risk of being poor is significantly higher for households where the head has no education than for households that have more than a secondary education. This is irrespective of whether the main provider in the household is employed or not.

Unemployed Jordanians constituted less than six percent of the poor, which highlights the fact that poverty is a problem of low family income rather than unemployment. When considering the marital status of the household head, being divorced is associated with a high risk of being poor. Divorcing often means that persons are disassociated from relatives as well as the immediate family. Households in the capital city of Amman

generally have higher income levels than households in other regions.

Especially affected by the risk of poverty are camp refugees. Camp refugees and the displaced, groups made up mainly of Palestinians, have had to carry a burden of being poorer that is twice as high as for non-refugees, irrespective of education and employment status. That results from the fact that they have less wealth in the forms of savings and durable capital goods, and are more affected by economic recession since they work in the construction sectors that are very vulnerable to economic recession.

Jordan's economy has proven to be extremely vulnerable to external shocks. This was manifested on a number of occasions during the 1980s and 1990s. Jordan experienced an economic crisis in the late 1980s, leading to an overall decline in average incomes, a substantial increase in poverty, and worsening inequality. The Jordanian government responded to the economic crisis by implementing a structural reform program in order to enhance economic growth, reduce trade and fiscal imbalances, and protect the poor. A subset of the reform policies included the gradual elimination of general food subsidies such as bread, rice, and sugar. Despite the simultaneous adoption of some compensatory measures (target cash assistance), especially to protect the poor, the removal of food subsidies was widely believed to have caused greater hardship and to have increased poverty even further. Violent riots ensued in various cities and the police had to intervene in order to establish order.

Potential foreign investors remain extremely cautious of Jordan's geopolitical position because of its proximity to Iraq, the Palestinian territories, and Israel, and it is seen as a major liability. The imposition of sanctions on Iraq in 1990 severely constricted bilateral trade since, up to that point, Iraq had been Jordan's main trade partner. The Gulf War induced a large number of workers and their families to return from Kuwait to Jordan, along with repatriation of their financial assets. Growing demand for skilled workers in the Gulf attracted thousands of Jordanians to the benefit of Jordan through the receipt of remittances by families or savings accounts. Remittances from expatriate workers in the Gulf worth \$1.3 billion in 1989 were drastically curtailed, and in the case of those in Kuwait (80 percent of the overseas workforce), stopped completely.

Economic performance in 2003 was badly affected by the Iraq War. The Iraq War meant the temporary shutdown of one of Jordan's most important trade partners, while the important tourism sector was also badly affected. The downfall of the Iraqi regime also meant the loss of heavily subsidized oil from its neighbor. The collapse in domestic revenue was only offset by foreign grants. To a large extent, several of these shocks can account for the increase in poverty witnessed during these years.

Jubilee 2000

ENTITLED THE Jubilee 2000 Coalition, a vision of Martin Dent and cofounder Bill Peters, this campaign to "Drop the Debt" was first launched in the United Kingdom (UK) under the direction of Ann Pettifor and the assistance of many individuals and organizations. Over a period of five years, this collective effort brought together over 20 million people in 155 countries from diverse aid groups and religious agencies.

They signed a petition supporting the world's poorest countries in 100 percent cancellation of their debts to creditors (a collective amount of over \$2.4 trillion) by 2000, the Jubilee year. In camaraderie, 60 other countries conducted Jubilee 2000 campaigns based on the UK model.

The word *jubilee* originates from the Old Testament in Leviticus 25:8-55. Of symbolic relevance to the Jubilee 2000 cause are the passages where Yahweh speaks to Moses about the freedom of the Israelite slaves (47-55) and the return of property to its original owner (13). However, the UK movement differed from the religious faith-renewing program of preparation for the Great Ju-

bilee in the Year 2000, as proposed by Pope John Paul II to the Roman Catholic Church, in the document "Tertio Millennio Adveniente" (November 10, 1994).

This grassroots response was part of an ongoing struggle against Third World debt that was putting pressure on the World Bank and the International Monetary Fund (IMF). In 1996 these two international organizations published a list of 41 Heavily Indebted and Poor Countries (HIPC). The politics and events surrounding this document fueled further activist involvement that culminated in the Jubilee 2000 movement.

CAMPAIGN PLATFORM

At the local, regional, national, and international levels, the most explicit goals of this nonviolent campaign were to persuade the G-8 (the eight wealthiest countries of the world) to offer their unconditional participation in debt cancellation, signifying their solidarity with the Third World; to empower First World audiences with information about the debt crisis and expose them to the kinds of structural injustice resulting from a country's debt—a population's widespread suffering due to poverty; to inspire involvement in the international financial process; to advocate for a new, democratically influenced, transparent financial order, one that could support justice and human rights, free Third World countries from the burden of debt, and create the legal means to assure a country adequate time and tools for proper restructuring and development of economic credibility (a form of international bankruptcy protection); to lobby against and eliminate harsh, unfair, unfavorable, and/or corrupt policies and politics (visible and invisible) imposed by the IMF, the World Bank, international creditors, and political leaders; and to gain the support of the United Nations and other international organizations that would help to ensure the pursuit of international law and international human rights for all.

THE CAMPAIGN'S IMPACT

Advocating their case to the world with its professional research teams, Jubilee 2000 UK succeeded in creating a sense of global awareness of debt issues. The campaign effort achieved international mass media attention that attracted the support of well-known scholars, international figures, celebrities (Youssou N'Dour, U2's Bono, Muhammad Ali, the Spice Girls), and religious figures (Pope John Paul II). The sentiment of Jubilee 2000 continues today as the Jubilee Movement International (JMI), which includes Jubilee South, Jubilee USA, and

Jubilee Australia, and Jubilee UK. Each organization collaborates in research efforts to fight for social economic change and contributes to the achievement of the United Nations Millennium Development Goals (MDGs). Jubilee Research and JMI have supported campaigns like Make Poverty History and have brought the issue of Third World debt to the fore of the G-8 and media agenda, evidence that Jubilee networks are successfully creating a mainstream space for radical global resistance against international public debt and the poverty it creates.

Judaism and Poverty

JUDAISM is a major, historically significant, monotheistic world religion, with its spiritual and ethical principles embodied chiefly in the Bible and the Talmud. Moses played a significant role in the long history of Judaism, leading his people in the 13th century B.C.E. out of bondage in Egypt to the edge of Canaan.

Poverty means the state of being poor, of lacking or being deficient in money, material possessions, or means of subsistence. It is necessarily a relative concept: poverty in one country or culture may not be considered so in another place or setting. Social justice has been a strong component of Judaism throughout its long history. The Hebrew word for charity is tsedakah, which derives from the root for "justice," and means "righteousness" or "justice." In contrast the Latin word caritas translates as "love," which has a particular historical meaning for Christianity. In Christianity, by defin-

ing charity as *caritas*, one person helps another as an expression of love. In Judaism the emphasis on justice prevails. This hardly means that Judaism is devoid of love, or Christianity is devoid of justice. In Judaism, *tsedakah* is balanced by *chesed*, which is loving kindness. Social welfare and charity must ideally include both justice and charity in both Judaism and Christianity (and in a number of other world religions as well). In this respect, St. Augustine once stated that charity "is no substitute for justice withheld." Judaism could surely be conjoined with this statement.

HISTORY OF JUDAISM AND POVERTY

One of the strongest declarations about the importance of charity can be found in early Judaism. Amos, the oldest prophetic book in the Bible and the name of a prophet who prophesied during the reign of Jeroboam II (775–750 B.C.E.), called on the Jewish people to embrace charity. This emphasis on social justice and on charity was present in a long line of Hebraic prophets—Micah, Hosea, Isaiah, Jeremiah, to name only a few.

In the Bible one can find established rules for tsedakah by use of the rule of peah, whereby corners of the fields were left unharvested. Leviticus (23:22) stated, "when you reap the harvest of your land, you shall not finish off the corner of your field in your harvesting and the gleanings of your harvest you shall not take." Here, landowners provided opportunities for the poor to gather food from land they simply could not afford to own. Also, this provided an opportunity for the poor to work for their food. In other words, this was not a welfare-like entitlement or benefit per se.

This important principle was later to be demonstrated well in the noted work of Moses Maimonides (1135–1204 C.E.). Maimonides (known as Rambam) is most remembered for his detailed philosophical integration of Greek philosophy into Judaism. It might be said in this respect that what Maimonides did for Judaism, Thomas Aquinas did for Christianity.

Maimonides adapted and developed the basic concepts of *peah* into eight levels of giving in his Laws of Gifts to the Poor. Maimonides wanted to provide for the needy, while at the same time maintaining the dignity of the individual.

The bottom level of charity for Maimonides was to simply give alms to the poor when asked. Intermediate levels of charity might be giving without being asked, and giving anonymously. Finally the highest level of charity consists of providing a person with the dignity and independence of employment. This would compare with the old dictum of teaching a person how to fish instead of simply giving a person fish that had already been caught.

In the Pentateuch, or Torah, there appears to be something of a contradiction regarding the poor. Deuteronomy (15:4) states that there "shall be no needy among you." However, Deuteronomy (15:11) also states that there "will never cease to be needy ones in your land." There have been various interpretations of this. Indeed there have been at times seemingly contradictory views on poverty by various biblical and rabbinic writers over the centuries.

Throughout Jewish history, the obligation to aid the poor was pervasive.

Sometimes poverty was regarded as a real misfortune, while at other times a view of poverty as building character would emerge. An example would be Isaiah 48:10, "I will test you in the furnace of affliction." However, these views never predominated. As so often is the case with Judaism, a balanced, middle perspective prevailed. It was thought that some kind of general mean between poverty and wealth would be preferred.

Throughout Jewish history, the obligation to aid the poor was pervasive. The Talmud defines a poor person entitled to receive charitable assistance as one with total assets not exceeding 200 zuz (ancient Hebrew silver coins).

The amount that one ought to give to charity is onetenth of one's initial capital and one-tenth of all subsequent earnings. However, the Talmud does caution here that one should not give in excess of one-fifth of one's earnings, because by doing so one might become destitute and require assistance oneself.

So strong is the obligation to support the poor throughout the history of Judaism that *tsedakah* obligated each individual to give to the poor, even obligating the poor themselves to do so. Funds collected for the poor were kept in a *kuppah*, or community fund. Contributing to the *kuppah* was the responsibility of everyone in the community, including the recipient. Some communities had an additional fund, the *tambui*, which would collect food from various householders and distribute enough for two meals each evening to those in need.

The *kuppah* was available only to local residents, but the *tambui* was open to anyone in need and was of assistance to anyone passing through. Deuteronomy (16:20)

states that: "Justice, justice, shall ye pursue." Surely, it has been pursued in Jewish history and in Judaism.

For Max Weber, the historical importance of Judaism as the parent of both Christianity and Islam is only part of the story. It is hard to overemphasize the importance of this numerically small-world religion in respect to views on poverty, social justice, and much else. Weber found two components of Judaism to be of special significance, its rationality and its ethicalism. In respect to its ethicalism, it is difficult to imagine a world religion that has devised a more coherent, comprehensive, and humanistic approach to meeting the needs of the poor and the needy. The impact of its teaching on the other Abrahamic religions (Christianity and Islam) is obvious.

Historically Judaism has looked at charity as being within the context of *mitzvot*, or commandments. Judaism views charity as part of a systematic, organized network of social obligations rather than a voluntary act of kindness. This can perhaps best be seen by examining the sizable and impressive Jewish communal welfare organizations designed to address human needs. There are approximately 200 Jewish federations in the United States that provide a wide variety of services to Jews and non-Jews alike. The Jewish Communal Service Association, founded in 1899, publishes a journal that is concerned with these issues, the *Journal of Jewish Communal Service*.

THE JEWISH POVERTY MYTH

There has been an unfortunate myth that poverty is not a problem in the Jewish community. Naomi Levine and Martin Hochbaum provided a valuable service in this respect by editing a 1974 book, *Poor Jews: An American Awakening*, revealing a different reality. A study done in New York City, which has the largest Jewish population in the United States, found that about 13 percent of all Jewish households in the city fell considerably below the federal poverty standard.

Many Holocaust victims have experienced much trauma and hardship. The Jewish community experiences most of the human and social problems experienced by other groups. The harsh and pervasive experience of anti-Semitism over the centuries has not been an easy burden to deal with. One could say that the experiences of the Jewish people with anti-Semitism and discrimination (with an often hostile larger environment in which the Jewish community lived) have made Jews unusually sensitive to those who have experienced the heavy hand of inequality and hardship.

One can see throughout the history of the American civil rights movement a strong Jewish presence (to name only two examples, Andy Goodman and Michael Schwerner gave their lives in civil rights efforts in Mississippi). The commitment to social reform among so many Jews is matched only by Jewish philanthropic and charitable contributions to address the needs of the poor and to meet the needs of many people, Jewish and non-Jewish alike.

Thomas D. Watts, Ph.D. University of Texas, Arlington

WORLD POVERTY

Kazakhstan

SITUATED IN CENTRAL Asia and bordering Russia, China, Uzbekistan, Kyrgyzstan, Turkmenistan, and the Caspian Sea, Kazakhstan is the ninth largest country in the world. Its territory is four times the state of Texas and five times the territory of France. Part of the former Soviet Union, and having gained its independence in 1991, Kazakhstan in the 2000s has an estimated population of 15.5 million.

Postcommunist transition has exacerbated poverty for some segments of the population, while others have gained economically. Even during the Soviet era, some level of inequality existed in Kazakhstan, especially as perceived by the ethnic Kazakh population regarding their level of socioeconomic status and political influence, when compared to the ethnic Russian population of Kazakhstan. There have always been interregional income disparities in Kazakhstan as well.

For example, the estimated per capita real income ratio between the former capital city of Almaty and the Zhambyl region was six to one in 1999, according to K. Anderson and R. Pomfret. Still, overall poverty is known to have declined rapidly in recent years because of the trickle-down effects caused by the rapid growth

in Gross Domestic Product (GDP), itself growing because of the burgeoning oil and gas sector of the country.

The share of the population living below the poverty line (\$35 per capita per month) was estimated at 24 percent in 2002, compared with 34 percent in 1998, and the Ministry of Economy estimates this share to have fallen further in 2003, to 19 percent. In 2003, Kazakhstan had an estimated per capita income of about \$2,000 per year, ranking it 14th among the 27 postcommunist states and the richest among the Commonwealth of Independent States (CIS) outside Russia.

Annual average unemployment, estimated at 8.8 percent of the workforce in 2003, largely improved as compared to the estimated 13.5 percent figure in 1999. One indication of relative prosperity is the large number of illegal immigrants flowing into Kazakhstan from neighboring central Asian republics, especially Uzbekistan and Tajikistan. Jobs in Kazakhstan pay salaries at least five times higher than those in the neighboring central Asian states.

But not all sections of the population have shared in the benefits of economic growth and foreign investment. Rural poverty is still deeply entrenched, with ethnic Kazakhs in the southern part of the country known to be among the poorest among the population. There is also a lag in the tangible outcomes of economic growth. Potable or safe drinking water in rural areas, for example, is not readily available to all. Furthermore, because of slow structural reforms, there is considerable hardship in the largely ethnic Russian industrial cities in northern Kazakhstan.

Many have unofficial jobs, and the shadow economy is estimated to constitute as much as 30 percent of GDP, according to the Economic Intelligence Unit. The presence of oil as a natural resource is thought by some to have been more of a curse than a blessing. Among other things, oil extraction is known on the local level to have polluted the air, soil, and water and food supply of some of the local communities. The oil and gas industry has also engendered a culture of corruption.

According to Transparency Kazakhstan, corruption is systematic and rampant, and particularly widespread in the oil and gas industry. Kazakhstan has not ratified any of the existing international conventions against corruption, and effective domestic anticorruption legislation is lacking. A corruption scandal surrounding oil deals in the mid-1990s has dogged the government and in 2003 resulted in the jailing of an American businessman in the United States accused of having paid \$78 million in bribes to the Kazakh president, Nursultan Nazarbayev, and a former prime minister, Nurlan Balgimbayev. Nazarbayev in turn has denied all connection to the bribery allegations, describing it as "a set-up."

Kennedy, John (Administration)

WHEN JOHN FITZGERALD Kennedy was inaugurated as the country's 35th president, the United States was entangled in a struggle of epic proportions with the Soviet Union. Just three years before Kennedy took office the Soviets had taken the lead in the space race with the launch and orbit of satellite Sputnik. The early years of the Cold War gripped the world with concern as the two superpowers and their respective allies positioned themselves to confront the terror of nuclear holocaust and hopefully to avoid it. There is no question that Kennedy inherited a host of international problems when he took office. Indeed his presidency is noted primarily for the many international situations that occurred during his nearly three years in office. Among them were the Cuban Missile Crisis, the Bay of Pigs debacle, and the successful nuclear test ban treaty with the Soviets.

Despite the need for Kennedy to continually stay on top of international concerns, he was a president who spoke passionately about domestic issues and the rights of man, which he believed should come not from the generosity of the state but from the hand of God. In his inaugural address, he made it clear that his generation of Americans was "unwilling to witness or permit the slow undoing of those human rights to which this nation has always been committed, and to which we are committed today at home and around the world."

Kennedy made it clear in his inaugural address that his concern for freedom and an end to poverty was not just a domestic issue but global in reach: "To those people in the huts and villages of half the globe struggling to break the bonds of mass misery, we pledge our best efforts to help them help themselves, for whatever period is required ... because it is right. If a free society cannot help the many who are poor, it cannot save the few who are rich."

Kennedy continued his address with an introduction to a planned initiative in Latin America "to assist free men and free governments in casting off the chains of poverty... and to join with them to oppose aggression or subversion anywhere in the Americas." This pronouncement was an overture to what eventually became the Alliance for Progress, a very successful joint effort involving the United States and the Latin American countries.

Although he did not mention the Soviets by name in his address, he did refer to "both sides" in his invitation to work together to eradicate disease, conquer the deserts, encourage the arts and commerce, and "heed in all corners of the earth the command of Isaiah—to 'undo the heavy burden [and] let the oppressed go free." He called for a united struggle against the common enemies of man: tyranny, poverty, disease, and war.

The most remembered statement in Kennedy's inaugural address is, of course, a call to Americans to ask not what your country can do for you but what you can do for your country. Not as well remembered, perhaps, is his next sentence: "My fellow citizens of the world: ask not what America can do for you but what together we can do for the freedom of man."

Kennedy's interest in public life and in serving in government solidified following the end of World War II. He returned from serving in the navy, and his father, Joseph Kennedy, convinced him that it would be honorable to run for the House of Representatives. Kennedy did so and was elected in 1946 and went on to serve three terms in that office. This service was followed by election to the Senate in 1952.

In 1956 he was close to being picked as the vice presidential nominee of the Democratic Party. Although he was not selected, Kennedy decided then to seek the nomination for president in 1960. He was nominated for that position in July 1960, and he selected Lyndon B. Johnson as his running mate. On November 8, 1960, Kennedy was elected in a very close race, defeating Richard M. Nixon, President Dwight Eisenhower's vice president. The new president created the New Frontier and described it as being a way of thinking and acting. Kennedy envisioned nothing less than freedom for the entire world brought about by new discoveries in science, enhancement of education systems, and the expansion of employment.

One of Kennedy's first accomplishments was the establishment of the Peace Corps, a program that brought Americans to all corners of the earth to help in healthcare, sanitation efforts, education, and construction. This program has been in place since its inception.

The most serious domestic problem faced by his new administration was racial discrimination. In 1952 the Supreme Court ruled that the notion of "separate but equal" was unconstitutional, thus overturning its earlier ruling in *Plessey v. Ferguson*, and segregation in public schools would no longer be legal.

The situation in Topeka, Kansas, brought about this monumental change and it stemmed from an incident in which a man named Oliver Brown complained that his daughter walked past a white elementary school on her way to catch a bus to her black school. A lower court threw out Brown's challenge on the grounds that

the schools were separate but equal. The Supreme Court overturned the lower court's ruling. The new law stemming from *Brown v. Board of Education* was ignored by a number of schools in the south, where discrimination was widespread not only in schools but in movie theaters, on buses, and in restaurants, hotels, and other business places.

Martin Luther King, Jr., and other civil rights leaders demanded that the federal government step in with legislation to guarantee the rights of disenfranchised citizens. Kennedy delayed at first believing that to hold public protests and to legislate for African Americans in the south would convince members of Congress who were not civil rights enthusiasts to vote against this legislation. However, in June 1963, following violent uprisings and confrontations in the south, Kennedy proposed a new civil rights bill to Congress.

He went on television to explain to the American public that African Americans in the south were not really free, although it had been over 100 years since President Abraham Lincoln declared them emancipated. Kennedy reminded everyone that the country was founded by people from many nations and backgrounds on the principle that all men are created equal. Kennedy insisted that all Americans, regardless of skin color, had the right to a happy and productive life in the United States.

Kennedy believed that the world had the capacity to eradicate hunger and poverty everywhere. All that was needed was the concerted and collective effort of all countries capable of addressing the issues. In an August 1960 speech at Hyde Park, New York, on the 25th anniversary of the signing of the Social Security Act, then-Senator Kennedy stated that the job that President Franklin Roosevelt set out to do in 1935 was not yet complete. He pointed out that 60 percent of Americans over 65 years of age must struggle on an income of less than \$1,000 a year and that Social Security recipients get a monthly check of only \$72 a month, which he considered to be wholly inadequate. Kennedy believed that such substandard incomes lead to and solidify poverty and hardship, which can lead to despair and illness. He pointed out that Americans 65 years or older suffer twice the rate of chronic diseases as do younger citizens.

In his Hyde Park speech, Kennedy proposed that the government enact a comprehensive plan to enable older citizens to receive the medical care they need and without a means-testing provision. Although Kennedy was not able to bring this about during his presidency, it was enacted by his successor, President Lyndon John-

John Kennedy called for a united struggle against the common enemies of man: tyranny, poverty, disease, and war.

son, in the epic legislation authorizing Medicare and Medicaid. When Johnson became president following Kennedy's assassination, he promised to fulfill the goals and plans of the fallen leader. The Medicare and Medicaid programs are proof of his pledge.

Kennedy also called for the expansion of Social Security benefits in his Hyde Park speech. In addition he called for raising the amount of money that a Social Security recipient could earn. Further, he wanted to ensure that a retired person could go back to work if he or she chose to do so. In line with that initiative, Kennedy called for training for older Americans to go along with new job opportunities. He called for the provision of adequate housing for the aged within their home communities and to provide incentives for builders to construct homes to meet this special need.

Kenya

BORDERING ON THE Indian Ocean, the sub-Saharan African nation of Kenya straddles the equator. Historically the Republic of Kenya has been beset with problems that range from charges of human rights abuses and government corruption to severe droughts and extreme poverty. Charges of human rights abuses stem from Amnesty International's reports that Kenyan police have killed more than 100 people and engaged in widespread torture. Government corruption has been so extensive that the International Monetary Fund (IMF) withdrew development funds from Kenya in 1997.

In this country, in which 75 percent of the population are engaged in subsistence agriculture, a yearlong drought that began in 1999 was so devastating that water and energy were rationed, further reducing the food supply through ensuing reductions in agricultural output. Even though the IMF granted aid to Kenya throughout the drought, funds were again withdrawn in 2001 for the same reasons as before. After the drought, sporadic rains produced some relief, but the Kenyan economy has recovered slowly.

By 2004, moderate growth and anticorruption measures began restoring confidence in the shaky economy. Nevertheless problems associated with a poverty rate of 52 percent, an unemployment rate of 40 percent, increased infant mortality and death rates, the high prevalence of HIV/AIDS cases, and disappointing population and growth rates threatened Kenya's economic stability.

Kenyans live on an average annual income of \$360, with 58.2 percent of the people living on less than \$2 a day and 23 percent surviving on less than \$1 per day. Kenyans are also subject to drastic inequalities in income and landownership. The richest 20 percent of the population share 51.2 percent of the wealth, while the poorest 20 percent claim only 5.6 percent. The poorest

70 percent of the population hold only 43 percent of all land. Kenya is ranked 44.5 on the Gini Index of Human Inequality.

Among Kenya's population of 33,829,590, the median age is 18.19 years, and life expectancy are 47.99 years. Some 42.5 percent of the population are under the age of 14, and a mere 2.3 percent are over the age of 65. Kenyans have less than a 50 percent chance of living to the age of 40. The devastating 6.7 percent HIV/AIDS prevalence rate in Kenya is a major reason for high mortality rates. Approximately 1.2 million Kenyans live with HIV/AIDS, which had resulted in 150,000 deaths by 2003.

Some 43 percent of Kenyans lack access to safe water. Approximately 21 percent obtain water from boreholes and another 28.3 percent derive water directly from lakes and rivers. The lack of adequate sanitation is also a major problem in this country where 72.8 percent of the population use pit latrines to dispose of human waste. Only 7.1 percent have access to main sewers, and a scant 2.5 percent use septic tanks and cesspools.

As a result of unsafe water and poor sanitation practices, Kenyans face a very high risk of contracting food- and waterborne diseases such as bacterial and protozoal diarrhea, hepatitis A, and typhoid fever. Water contact diseases such as schistosomiasis and vectorborne diseases are also common. A tough strain of malaria has surfaced that has proved resistant to the "malaria cocktail" used to treat the disease. There are only 44 physicians for every 100,000 Kenyans, and almost half of the people lack access to affordable lifesaving drugs.

As in many societies, Kenyan children are most vulnerable to the effects of poverty. By 2005 estimates, the infant mortality rate is 58.62 deaths per 1,000 live births. In 2003, mortality rates for infants and for those under the age of 5 were reported at 79 and 123 (of 1,000) respectively.

One-fifth of all Kenyan children under 5 are malnourished, and four percent are classified as severely underweight. Some six percent of this age group suffer from moderate to severe wasting, and 31 percent experience moderate to severe stunting. In 2003, measles immunization rates for children aged 12 to 23 months was 72 percent, and the DPT3 immunization rate were 73 percent. Approximately 72 percent of all Kenyan infants are immunized for measles, but this is a four percent decrease since 1999. Less than one-third of all infants receive lifesaving rehydration therapy when it is needed.

Kenya's fertility rate is estimated at 4.96 children per woman, and the fertility rate of women aged 15 to 19 is estimated at 94 per 1,000 births. Fertility rates have begun to decline in response to higher levels of education and wider access to family planning services. Some 38 percent of Kenyan women use contraceptives of some sort. Professional medical staff attend 41 percent of all births in Kenya. However, maternal mortality is unusually high, even among poor African nations, at 1,000 deaths per 100,000 live births.

Poverty affects Kenyan women more than men because of historical inequalities and discriminatory practices. The numbers of women and their dependent children who live in extreme poverty have been steadily growing since the 1990s. A task force was created in 1993 to determine the status of women in Kenya. Four years later, a study conducted by the Kenya Welfare Monitoring System III revealed that the 25 percent of rural families headed by females were those most deeply affected by poverty.

As in many societies, Kenyan children are most vulnerable to the effects of poverty.

In 1999 the Kenyan government established the Poverty Eradication Program, which is in effect until 2015, with the intention of enhancing female education and training and also promoting job opportunities. The women's task force issued its report in 1999 with recommendations that the government eliminate all practices, traditions, laws, and policies that discriminate against women. Specific proposals included the passage of child and domestic violence acts, the creation of a National Gender and Development Council, and the establishment of a family court system.

Over time the quality of education in Kenya declined in response to a cost-sharing system in which parents paid a portion of school fees. The practice forced many poor families to choose between educating their sons and their daughters because they could not afford to educate all their children. The greatest impact of this inequality was on children from poor families who lived in regions susceptible to famine and its accompanying hunger.

The Early Childhood Care Development and Education program was created to address this inequality by promoting readiness for education among children from birth to 6 years old. By 2003, parity within this program was realized with a female enrollment of 49.9

percent. The government also introduced the Education for All policy and passed the Children's Act of 2001, guaranteeing free primary education.

While relative gender equality has been attained at primary and secondary levels, inequality continues in higher education. Women make up only 30.8 and 54.5 percent respectively of those enrolled in public and private universities. Literacy rates have, as might be expected, risen in Kenya since education has become a priority, and Kenya's literacy rate of 85.1 percent is higher than that in many other countries in Africa. However, the 79.6 percent female literacy rate lags behind male literacy (90.6 percent).

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Kiribati

IN 1971, AFTER WINNING the right to autonomy, the Gilbert Islands became the Republic of Kiribati. Eight years later, Britain ceded rights to the neighboring Line and Phoenix Islands to Kiribati in a treaty of friendship. The country, which straddles the equator, is composed of 33 coral atolls in the Pacific Ocean. Kiribati's economy is almost entirely tied up with tourism and the production and export of copra and fish. The phosphate deposits that made the island valuable to the British were exhausted by 1979. Among Kiribati's population of 103,092, approximately 8,000 workers are

economically active. This figure does not include those involved in subsistence farming. There is a severe shortage of skilled workers on Kiribati, and 70 percent of the population are underemployed. Another two percent are unemployed. The islands suffer from a widely fluctuating economy and a weak infrastructure. A combination of foreign aid from Great Britain, Australia, New Zealand, and China and regular remittances received from Kiribati people who work abroad provides the islands with sufficient income to classify it as a lower-middle-income country.

Assessing poverty on Kiribati is difficult because almost no data are available on major social indicators. The United Nations Human Development Report does not rank Kiribati on overall quality of life issues. In comparison to most countries in the region, Kiribati lags behind in healthcare, education, and life expectancy. Death rates are unusually high for the region. However, poverty on Kiribati is not extreme since most families can feed themselves by gardening, fishing, carpentry, or selling handicrafts. Kiribati has a per capita annual income of \$800, but income is unequally distributed, and this pattern has continued for generations as wealth is handed down within families.

Life expectancy on Kiribati is 61.71 years, and females outlive males by approximately six years. Between 1980 and 2000, life expectancy for males increased from 50 to 59 years, and the projected life span for females climbed from 54 to 65 years. The median age is 38.9 years. Just over one-fifth of the population is under the age of 14, and 3.3 percent have seen a 65th birthday. Over half of all islanders lack access to safe drinking water and improved sanitation. There are 30 physicians on the islands, and 50 to 79 percent of the people have access to affordable essential drugs.

Infant mortality on Kiribati is high, but it has improved in recent years. Between 1990 and 2005, the number of infant deaths decreased from 65 per 1,000 live births to 49 per 1,000 live births. With a death rate of 43.16 per 1,000, female infants are likelier to survive than males with a 53.64-per-1,000 death rate. Between 1990 and 2003, the mortality rate of all children under the age of 5 fell from 88 per 1,000 to 66 per 1,000.

Approximately 13 percent of all children under the age of 5 are underweight, and five percent of babies are underweight at birth. Some 28 percent of all under-5s suffer from moderate to severe stunting, and 11 percent experience moderate to severe wasting.

Childhood immunization rates have increased in Kiribati over the past decades, ranging from 88 to 99 percent among children from birth to 23 months. Be-

tween 1980 and 2005, the total fertility of Kiribati women fell from 4.6 children per woman to 4.2. The fertility rate of females between the ages of 15 and 19 is 53 per 1,000 births. Barely one-fifth of the women on the islands use birth control of any sort. The rate of attended births rose from 72 percent in 1995 to 85 percent in 2000. About 88 percent of Kiribati women receive antenatal care. No maternal mortality rate is available.

There is no literacy rate available for Kiribati. Between 1990 and 1995, the percentage of males progressing to the fifth grade declined from 93 to 86. The drop was even greater for females, as fifth grade progression fell from 99 to 86 percent. By 1998 the number of Kiribati children progressing to fifth grade had reached 95 percent.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Korea, North

IN 1997, ONE YEAR away from the 50th anniversary of formal assumption of power of the communist regime in North Korea, the economic crisis in the extremely reclusive nation became so acute that accounts of mass starvation there became international news. Normally disdaining international assistance, which it regarded as "interference" in North Korean affairs and

as an unwholesome admission of national weakness, the North Korean regime announced that it would now accept international food aid. More than anything else, this signaled that the nation was indeed in the midst of a great crisis.

The Soviet Union installed Kim Il Sung as the leader of North Korea shortly after its forces occupied the northern half of the peninsula as Japanese resistance was collapsing in August 1945. Within two years of the formal establishment of a North Korean state in 1948, Kim Il Sung launched an invasion of South Korea. Armed with Soviet weapons and reinforced by Korean divisions that had been battle-tested in the Chinese civil war, Kim Il Sung's forces succeeded in driving South Korean forces and their American advisers into a small pocket in the southeast corner of the country.

Only Douglas MacArthur's daring landing at Inchon prevented a North Korean victory. Indeed, after cutting off and annihilating most of the North Korean forces in the south, the American and United Nations forces drove northward against diminishing opposition to the North Korean border with China. Only the introduction of hundreds of thousands of Chinese troops into the conflict prevented the elimination of North Korea as a separate state. When the armistice was finally arranged, the border between North and South Korea remained largely where it had been at the beginning of the conflict, though millions of Koreans on each side of the border had perished.

After the close of active hostilities, North Korea was largely in ruins and its population had become widely dispersed. Kim Il Sung took advantage of this grim opportunity to remake his state from top to bottom.

Cities were rebuilt as extensive monuments to the authority of the state and of Kim Il Sung himself. All suspect groups, including practicing Buddhists and Christians, were sent to forced labor camps. The membership of the Communist Party was also purged, with 450,000 of the 600,000 party members being punished for all sorts of violations of party rules.

Even among those in Kim Il Sung's inner circle, many found themselves stripped of influence, sentenced to the forced labor camps, or facing execution. Seeking to make North Korea impervious to outside influences, Kim Il Sung sealed the borders of his country, promoted agricultural and industrial self-sufficiency, and created a million-man military to intimidate both South Korea and his own people. With the help of Soviet investments and subsidies, North Korea was able to maintain the illusion that its collectivized farms were ef-

Kim Il Sung (left), whose totalitarianism caused much poverty in North Korea, presents a gift to Jimmy Carter (right) in 1994.

ficiently meeting its food needs and that its state-controlled heavy industries were producing enough foreign-exchange monies to maintain their technological viability. The central doctrine of *Juche*, or self-reliance, appealed in an extreme and, ultimately, absolutely paranoid way to the long-standing Korean concern about foreign domination, even as North Korea became increasingly dependent on Soviet and, to a lesser extent, Chinese economic and political support.

Over several generations, the determined indoctrination of the population and the creation of a cult of personality around Kim Il Sung and then around his son, Kim Jong Il, seemed to have turned North Korea into the most completely controlled totalitarian state in modern history.

The dissolution of the Soviet Union, however, represented an economic as well as a political collapse of the communist regime, and it spelled the end of the subsidies provided to client states such as North Korea. Almost overnight it became clear that without such subsidies to disguise their inefficiencies, North Korean heavy industries could not compete with those of other nations and, in any case, there was no mechanism for finding new markets for North Korean goods.

Within a short time, many of North Korea's factories simply stopped production, and those that remained open were typically operating at about a quarter of their capacity. Given the tight restrictions on travel in North Korea and the danger in even suggesting that any aspect of life under the regime was less than ideal, most former factory workers had no choice but to wait for some sort of relief as they watched their children, their elderly relations, and their wives starve in the stark apartment blocks in which they lived.

The average height and weight of North Koreans has declined significantly.

The provision of basic utilities, such as electricity and water service, to those apartment blocks became unpredictable and then very intermittent. In addition to the collapse of the industrial sector, state control of agriculture allowed no flexibility in responding to crop failures. In fact Kim Jong II remained more concerned about losing any degree of control over all aspects of North Korean life than about alleviating his people's suffering.

Consequently, in 1996, when by most outside estimates more than one million North Koreans starved to death, his regime outlawed the tilling of private gardens and the sale of produce in farmers' markets. It was telling that even government bureaucrats had their rice rations reduced to six and then three ounces of rice per day.

But many of their less-privileged countrymen were literally reduced to eating grass as a regular part of their diet. In contrast to international trends, over the last two decades of the 20th century, the average height and weight of North Koreans declined significantly. Health scientists have speculated that malnutrition has become such a sustained fact of life that it has likely had a very adverse effect on the average intelligence of North Koreans.

China has now become North Korea's main trading partner, with the value of its trade approaching \$1.5 billion in 2005. But not surprisingly, given the free-market reforms that have stoked economic growth in China, the Chinese seem to have little interest in subsidizing moribund industries in North Korea. Although the Chinese may have once viewed North Korea as a valuable buffer state between it and South Korea, Japan, and American military reach, they now seem to be more concerned about the danger of a sudden collapse of the

North Korean regime than about sustaining the regime indefinitely.

Likewise the South Koreans are less fearful of some planned military aggression by North Korea than of what might follow if the North Korean regime senses that it is on the verge of becoming destabilized. At the beginning of the 21st century, North Korea's bankrupt regime has been reduced to using nuclear blackmail as the basis for its foreign policy. The regime's nascent weapons program provides its only asset of any international significance, but the threat that it might sell such weapons to terrorist groups is very chilling. Indeed, the regime of Kim Jong II seems to believe that the threat provides enough leverage for it to acquire significant economic aid without any preconditions related to its permitting any changes in North Korean economic and political life.

MARTIN KICH WRIGHT STATE UNIVERSITY

Korea, South

THE REPUBLIC OF KOREA occupies the southern half of the Korean peninsula and shares a border with the Democratic Republic of Korea (North Korea). Prior to 1945, the two Koreas were one entity. However, following the end of World War II, Korea was divided into two regions at the 38th parallel, with the Soviet Union controlling the northern region and the United States occupying the south. The division was intended to last only until the Koreans could hold elections and establish a national government. The plan did not come about.

In July 1950, North Korean military forces invaded the south. A protracted war ensued for the next three years between North Korea, with support from both China and the Soviet Union, and United Nations forces, primarily represented by the United States. When a cease-fire was finally reached in the summer of 1953, the line separating the opposing forces became the boundary between the two countries. Although talks have occurred between the two countries, an adversarial relationship persists and the long-held hope for reunification of the two Koreas has yet to become reality.

The division of Korea initially left both countries severely disadvantaged. North Korea held virtually all the manufacturing operations, heavy industry, and mineral resources, while South Korea had most of the agricultural land. It then became necessary for each of the countries to work steadily to develop those sectors of the economy they lacked because of the territorial split.

The United States provided South Korea with financial and technical assistance and the materials needed to initiate the building of a diversified economic base. In the north, support was forthcoming from the Soviet Union and China. Over the years, South Korea has achieved remarkable economic growth and today its per capita income is about 14 times that of North Korea.

The area of South Korea is heavily mountainous, with extensive coastal plains in the west, near the capital city of Seoul, and in the south adjacent to the im-

portant shipping center of Pusan. South Korea's population is 48.4 million (July 2005) and its rate of natural increase reflects the country's success in achieving complete demographic transition: 0.5 percent. In 2001 it was estimated that only four percent of the South Korean population were living below the poverty line. Not surprisingly, literacy rates in South Korea are exceptionally high. Of the total group of people age 15 and over, 98 percent can read and write (2002 estimates). The male literacy rate was estimated to be 99 percent and the female rate stood at 97 percent.

The composition of South Korea's labor force reflects its rise to economic prominence in east Asia and on the world scene. The service sector is the clear leader with nearly three-quarters of the labor force. Industry is second with 19 percent, and agriculture follows at eight percent. Agricultural products include rice, a mainstay of the Asian diet, barley, a variety of vegetables, and fruit. Animal products include cattle, chickens, dairy items, and fish. South Korea is essentially self-sufficient in food production.

The country's array of industrial products clearly illustrates its level of economic development: telecommunications, electronics, automobiles, chemicals, crude steel, and ships. Its manufactured products have found ready markets throughout the world. If the country has one serious shortfall in the industrial sector, it is energy sources. South Korea is reliant on outside sources for both crude oil and natural gas. In 2004 the country's major export partners were China, the United States, Japan, and Hong Kong. Imports came primarily from Japan, the United States, China, and Saudi Arabia. The latter reflects the country's need for crude oil from foreign providers.

Only four percent of South Koreans were living below the poverty line.

South Korea maintains a strong military. Military service is required of all South Korean males and military expenditures exceeded \$16 billion in 2004. A strong military is a necessity given the ever-present threat from the north. The military Demarcation Line has separated the two countries for over 50 years and the South Koreans are on constant alert against the threat of military action against them. The city of Seoul, located less than 60 miles from the demilitarized zone, is particularly vulnerable to attack, and alert levels are high.

GERALD R. PITZL NEW MEXICO PUBLIC EDUCATION DEPARTMENT

Kuwait

KUWAIT IS A RENTIER state that earns most of its income from its oil exports and from foreign investments. Oil revenues have been used to sustain an extensive infrastructure and industrial development, as well as a welfare system not based on taxation. Some of the benefits allocated by the state to citizens are low-interest loans, subsidies and special prices, social allowances, and gifts for marriage dowries. More than 90 percent of Kuwaiti citizens are employed by the public sector, which has led to an increasingly bureaucratic organization of society.

Kuwait has seen significant improvements in infant mortality, life expectancy, and other social indicators. Official government statistics indicate relatively low levels of absolute poverty and income inequality. However, if one is to extend the definition of poverty to include power relations and social as well as political exclusion mechanisms, then a slightly different picture emerges.

Although Kuwait is fairly homogenous in terms of its level of urbanization and infrastructure development, there seem to be strong indications that several administrative regions have varying socioeconomic and demographic disparity, which is most clearly illustrated when comparing the capital city (Kuwait City) with AlJahra. This latter district was made up mainly of non-Kuwaitis, who are predominantly temporary migrant workers from east Asia.

Non-Kuwaiti is a status allocated to those who are not citizens of Kuwait and hence the term carries certain disadvantages. Non-Kuwaitis have no legal rights, and cannot secure a working permit or residency without the guarantee of a Kuwaiti national. Furthermore, non-Kuwaitis do not have access to the welfare system to which Kuwaitis are entitled, and Kuwaitis are preferentially recruited, need lower qualifications for the same job, and are preferentially promoted over non-Kuwaitis regardless of qualification.

Even in limited cases when naturalization is granted to non-Kuwaiti citizens, they are considered second-class citizens. They may not vote in elections and may not run for elected office at the subcabinet level or above the executive branch. Moreover they are subject to deportation and their citizenship status is subject to revocation at the discretion of the minister of the interior. Citizenship delineates a crucial distinguishing criterion between those entitled to certain privileges (citizenship and economic security) and those denied those privileges (noncitizenship).

The legal status of tens of thousands of *bidoon* residents remained unresolved. The *bidoon* (an Arabic term meaning "without" as in "without citizenship") are Arabs who have residency ties to the country, some persisting for generations and some for briefer periods, but who either lack or have failed to produce documentation of their nationality. The exact number of *bidoon* residents is unknown, but has been estimated at upward of 100,000.

Since the mid-1980s, the government has actively discriminated against the *bidoon* in areas such as education, medical care, employment, and mobility. Although the government eliminated the *bidoon* from the census rolls and discontinued their access to most government jobs, some *bidoon* work in the armed forces and are now being accepted in the institutions of the Public Authority for Applied Education and Training. The government has denied the *bidoon* official documents such as birth certificates, marriage certificates, civil identification, and drivers' licenses, which made it difficult for many unregistered *bidoon*, particularly younger *bidoon*, to find employment.

Kuwait has experienced economic downturns because of such events as the Iraqi occupation and the ensuing Desert Storm operation, which turned out to be extremely costly because of Kuwait's major financial contribution to covering the cost of the coalition military operations against Iraq. Of equal proportion, with major social and political ramifications, was the 1982 collapse of the Souq al-Manakh stock market, which

came crashing down after massive, speculative stock purchases with postdated checks. All of these economic problems have been overcome. Nonetheless, structural challenges are looming and might cause future economic consequences for the state of Kuwait.

A major problem facing Kuwait has been the large rate of population growth and the age pyramid, which is heavily skewed toward the younger end of the population spectrum; the population under the age of 15 exceeds 44 percent. This will cause growing demands on the already limited social services provided by the government, alienating large portions of the population who have become accustomed to expect extensive welfare benefits as their right as citizens.

Kyrgyzstan

SITUATED IN CENTRAL Asia and bordering China, Kazakhstan, Uzbekistan, and Tajikistan, Kyrgyzstan has a population of about 5.5 million and a territory nearly the size of South Dakota. Kyrgyzstan was part of the former Soviet Union and gained its independence in 1991. Its estimated real annual per capita income of \$379 in 2003 makes it the third poorest former Soviet republic after Uzbekistan and Tajikistan, according to the Economic Intelligence Unit (EIU).

Agriculture constitutes 35 percent of the country's Gross Domestic Product (GDP) and, alongside services (which account for another 40 percent of GDP), remains a bedrock of the economy. Kyrgyzstan also has

substantial amounts of gold and antimony, with mining of these compounds taking place in remote mountain areas, according to the EIU.

The economy plummeted by 50 percent in the first four years after independence, until growth began again in 1996, driven mainly by agriculture and, to a degree, the development of the Kumtor gold mine, which by itself accounts for about seven percent of GDP. As much as a 25 percent decrease has been achieved since 1998 in the number of people living below the poverty line (considered to be \$42 per month).

Nonmonetary indicators of well-being have also become manifest. Infant mortality, considered one of the key integrated poverty and human development indicators, declined by 1.4 percent in 2003 and amounted to less than 20 percent in 2004, by International Monetary Fund (IMF) measurements. Despite some hopeful signs, about half of the population, or 500,000 families, still lives below poverty. According to the IMF, the majority (70 percent) of the poor live in rural areas. Workers in the healthcare and agricultural sectors earn only half the national average.

Regional income disparities also exist mainly between the primarily agricultural south and the more industrialized north, as measured by the EIU. The IMF estimates that its policies will have reduced poverty from a high of 55 percent to 39 percent in 2005. Many people rely on alternate modes of income generation, aside from their official jobs. As such, the extra income via trade, generated by some teachers and doctors for example, may not necessarily be reflected in official statistics.

Attitudes on the transition from communism is strongly correlated to one's socioeconomic status (SES): a 2001 poll found that those categorized with high SES in Kyrgyzstan are more likely to mention the positive impacts (76 percent) of transition on their lives and those with low SES are more likely to mention negative impacts (72 percent). On the whole, two-thirds of those surveyed felt that their economic situation was either somewhat bad or very bad, with 64 percent of the population being dissatisfied with the overall conditions in the country, economic difficulties being the most often-cited reason for their dissatisfaction.

The higher the perceived financial status of individuals polled, the more positive was their attitude about the economy and the faster the pace desired toward a market economy. Ethnic Russian citizens of Kyrgyzstan were more pessimistic about the economic situation than ethnic Kyrgyz and Uzbek citizens, according to IFES (an agency promoting democracy) in 2002.

After independence, Kyrgyzstan was known as "the most liberal country in the region," according to the United Nations. However, the Organization for Security and Cooperation in Europe (OSCE) heavily criticized the government over alleged vote rigging in the 2000 parliamentary and presidential elections and in the May 2003 parliamentary by-elections. Though the parliament soon after put in place laws guaranteeing greater transparency by giving observers full access to electoral documents, such moves may have been too little, too late; the government has been unable to prevent popular anger over a variety of perceived misdeeds, including widespread corruption and cronyism, as discussed by the EIU.

In March 2005, protests in the capital city and other major towns led to the downfall of the government of President Askar Akayev, who was forced to flee Kyrgyzstan for the safety of Moscow, Russia. Some observers have viewed Kyrgyzstan's 2005 regime change as part of the relatively peaceful "velvet" revolutions in the post-Soviet era that led to similar political transformations in Georgia (2003) and Ukraine (2004). Among other frustrations of the Kyrgyz public was Akayev's third consecutive standing for the position of president, which had raised considerable criticism leading to the February 2005 elections. Though Akayev won a third term in the president's office, many observers considered the vote rigged.

WORLD POVERTY

Labor Market

THE LABOR MARKET is the main arena in which employers and workers interact, and the institution that determines hiring, firing, wages, benefits, and hence profits. In economic terms, the labor market is composed of all the buyers and sellers of labor and is the market that allocates workers to jobs and coordinates employment decisions. Any understanding of labor markets needs to account for the analysis of labor supply and demand. The demand for labor accounts for employer behavior in renting labor, and the supply of labor describes the behavior of workers in and out of the labor force.

Neoclassical economic theory dictates that, under conditions of perfect competition, perfect mobility, and full information, the equilibrium conditions that result from the interaction of supply and demand result in the allocation of workers into various industries, occupations, and geographic regions as well as working conditions and wages. Labor economists critical of the neoclassical paradigm suggest that such employment outcomes are part of a wider historical-political relationship between workers and employers. The critics also tend to emphasize class and the bargaining power

of workers and employers, in addition to structural demand-side considerations.

The study of labor markets aims to explain the social and individual behavior associated with work, and therefore is important in understanding some of the causes of poverty. Natural questions arise surrounding the existence of labor market discrimination, unemployment, unions, immigration, and a host of other pressing social issues. The analysis of labor markets can also foster the adoption of public policy to address the effects of work-based antipoverty programs, antidiscrimination laws, occupational health and safety standards, and minimum/living wage laws.

CLASSICAL POLITICAL ECONOMY

The contemporary economic analysis of labor markets can be traced back to the intellectual father of the modern capitalist system, Adam Smith. Published in 1776, the same year as the U.S. Declaration of Independence, chapter 10 of Smith's Wealth of Nations, entitled "Of Wages and Profit in the Different Employments of Labour and Stock," remains a seminal contribution to the neoclassical construction of knowledge pertaining to the functioning of labor markets.

Women constitute a high percentage of those facing poverty and also can encounter discrimination when seeking employment.

A major component of labor economics attempts to understand why certain professions are paid more than others. For example, why are some bankers better paid than university professors, who endure much longer and harder training? To answer similar questions facing 18th-century industrial Europe, Smith developed his theory of equalizing differences, encapsulated by the quote: "The whole of the advantages and disadvantages of the different employments of labor and stock must, in the same neighborhood, be either perfectly equal or continually tending to equality."

Hence if two jobs share similar characteristics in terms of advantages and disadvantages, we would expect them to be paid equally. If not, as Smith states, "Every man's interest would prompt him to seek the advantageous, and to shun the disadvantageous employment." As noted by economist Alan B. Krueger in his introduction to Smith's Wealth of Nations, Smith's theory of equalizing differences has become the fundamental equilibrium concept of modern labor economics, encapsulating the theory of compensating differentials for work amenities and the theory of human capital accumulation. Smith proposes five principal circumstances that contribute to the "natural" tendency of the market to equalize differences.

"First, the agreeableness or disagreeableness of the employments themselves; secondly, the easiness and cheapness, or the difficulty and expense of learning them; thirdly, the constancy or inconstancy of employment in them; fourthly, the small or great trust which must be reposed in those who exercise them; and fifthly, the probability or improbability of success in them."

The first, third, fourth, and fifth situations can all be attributed to the theory of compensating wage differentials, which states that, all else being equal, higher wages are paid to compensate workers for undesirable working conditions. The second principal situation is what motivates the theory of human capital accumulation, which examines the investment decisions regarding the knowledge and skills embodied within each worker. For modern applications of Smith's equalizing differences, see Sherwin Rosen's *Theory of Equalizing Differences* (1986).

It is also necessary to note two main features that distinguished labor supply from other commodities. The first primary feature is that labor is a flow; the worker retains her human capital; she only rents it out and cannot sell it. For this reason, the market for human capital is institutionally different from physical capital. The second main component is that the conditions of how labor is used matter to the owner (the worker). This last point is the source of equalizing differences, implying that working conditions matter and that an employer cannot divorce the capital embedded in the worker from the worker.

DEFINITIONS OF KEY LABOR MARKET TERMS

The labor force consists of all those over working age (16 years of age in the United States) who are either employed or actively seeking work. The unemployed population comprises workers in the labor force but not currently employed for pay. The total number of employed and unemployed equals the labor force. A discouraged worker is a person not considered in the labor force because he or she is not actively looking for work. The labor force participation rate equals the labor force divided by the total population. The unemployment rate is the ratio of the unemployed to the total labor force. The nominal wage is what workers get paid per hour in current dollars whereas real wages are nominal wages divided by some measure of prices (adjusted for inflation).

Various terms are also used to distinguish different types of unemployment. In the canonical model of competitive labor markets, the market is said to be in equilibrium when, at the prevailing market wage, the quantity of labor demanded equals the quantity of labor supplied. In this model cyclical unemployment is nonexistent. There could be, however, frictional and structural unemployment. Frictional unemployment occurs when workers are between jobs. Job search frictions such as the nature of job postings and costly interview processes contribute to the level of frictional unemployment.

Structural unemployment is the level of unemployment that occurs when there exists a mismatch between the supply of and demand for workers in a given geographical or occupational area. If wages were perfectly flexible and workers could move freely with no transaction costs, economic theory would predict structural unemployment to be virtually nonexistent.

Yet in reality, moving between industries involves costly and lengthy retraining, and moving freely across geographic locations involves a great cost both materially and psychologically (leaving family, friends). In addition, wages are not completely flexible given the necessity of wages to provide baseline subsistence for workers, legislated through wage floors such as minimum wages or living-wage ordinances.

Both the above types of unemployment can occur when, in the aggregate, labor supply equals labor demand. Demand-deficient unemployment occurs when the aggregate demand for labor declines as a result of the rigidity of wages.

ALTERNATIVE MEASURES

While official unemployment statistics cover a portion of the unemployed population, various other measures have been created to gauge the level of labor underutilization. In addition to the definition of discouraged workers above, workers may also be classified as marginally attached. Marginally attached workers are persons who currently are neither working nor looking for work but indicate that they are available for a job and have looked for work sometime in the recent past. Workers who work part-time for economic reasons are defined as those who want and are available for full-time work but have had to settle for a part-time schedule.

For example, in June 2005 the official U.S. unemployment rate (series U-3) was 5.2 percent. In addition the U.S. Bureau of Labor Statistics publishes monthly information on various forms of labor underutilization. The number of people unemployed 15 weeks or longer, as a percentage of the civilian labor force, totaled 1.5

percent (U-1). Job losers and people who completed temporary jobs, as a percentage are of the civilian labor force, totaled 2.3 percent (U-2).

Total unemployed plus discouraged workers, as a percentage of the civilian labor force, totaled 5.5 percent (U-4). Total unemployed, plus discouraged workers, plus all other marginally attached workers, as a percentage of the civilian labor force, plus all marginally attached workers equaled 6.2 percent (U-5).

Finally, total unemployed, plus all marginally attached workers, plus total employed part-time workers, as a percentage of the civilian labor force, plus all marginally attached workers, equaled 9.3 percent in June 2005.

DISCRIMINATION

A major focus of debate within the public policy arena is labor market discrimination. In the United States, it is a fact that African Americans are twice as likely to be unemployed as Caucasians and earn 25 percent less when they are employed.

As defined by the economist Kenneth Arrow, current labor market discrimination is "the valuation in the labor market of personal characteristics of the worker that are unrelated to productivity." The existence of labor market discrimination has haunted neoclassical labor economists, as it runs contrary to the profit-maximizing behavior of employers, a fundamental assumption of neoclassical economic theory.

While past histories of labor market discrimination are acknowledged in premarket determinants of earnings differentials, the attempt to quantify current labor market discrimination has sparked a debate among labor economists, with one camp suggesting that racial and gender earnings differentials are the result of premarket determinants (education, aspirations). On the other hand, a number of researchers attribute the poor labor market performance of minorities to systematic discrimination in the labor market. Innovative recent research by economists Marianne Bertrand (University of Chicago) and Sendhil Mullainathan (Harvard) suggests that discrimination is a severe problem facing U.S. labor markets, with African Americans receiving 50 percent fewer job callbacks than equally qualified Caucasian applicants.

U.S. FEDERAL UNEMPLOYMENT POLICY

The U.S. government, since the early 1960s, has been involved in policies to reduce structural unemployment

and hence alleviate poverty. From the Manpower Development and Training Act of 1962 (classroom and onthe-job training) and Comprehensive Employment and Training Act of 1973 (job training with emphasis on public sector) to the Job Training Partnership Act of 1982 (public-private training initiatives), the U.S. government has operated job-training programs with a focus on human capital accumulation for unemployed workers.

Recently the Workforce Investment Act (WIA) of 1998 has signaled a shift in emphasis of U.S. unemployment policy. The emphasis of WIA has resulted in a systematic movement away from a human capital accumulation approach of investing in workers toward emphasizing labor force attachment services that facilitate unemployed workers' job search.

U.S. unemployment policy is quite illuminative of the failings of neoclassical labor economics as a whole. At their best, unemployment programs have presumed that unemployed workers lacked the skills required by the labor market; at their worst the active labor market programs "presumed a 'deficit model' of the unemployed: that one of the reasons why they are out of work is that they do not know (or have somehow forgotten) how to work."

Neoclassical labor economics currently fails to examine more structural, demand-side considerations, such as the increasing reliance on low-wage work in our economy, work that has given rise to the working poor. Unemployment programs that focus on human capital accumulation can ensure that better-skilled workers will enjoy labor market success only with structural changes to labor markets that ensure workers' bargaining power in the labor market.

Only then will unemployment programs focused on raising the skills of workers translate into lifting workers out of poverty.

KERIM ODEKON UNIVERSITY OF WISCONSIN, MADISON

Laissez-Faire

LAISSEZ-FAIRE IS THE economic doctrine of "leaving alone," or more literally, "letting make" or "letting do." The term arises from the 18th-century French slogan "laissez faire, laissez passer," which was employed as a rallying cry against government intervention in the economy.

Laissez-faire economics emphasizes the need to let market activity occur without interference from governments or similar coercive actors. In the English-speaking world, it is most strongly associated with the thinking of Adam Smith (1723–90) and his claims that competition among trading individuals can prove beneficial for all, so that a harmony of interests can emerge even without it being set in place by a political ruler. To promote prosperity, governments may "leave alone" their subjects within the prescribed sphere of the market. For Smith this is a sphere that is formed by government securing of negative property rights, and is intruded upon by the type of interventions that occur with government-imposed tariffs or mercantilist monetary policies. Smith argues that such interventions generally damage a nation's prosperity.

Notable forerunners of Smith are Richard Cantillon (1680–1734), who gave an account of the beneficial operations of the unguided market, and Anne Robert Jacques Turgot (1727–81), who likewise argued that economic harmony could be achieved by the unguided market.

Unfortunately there is no single, widely accepted standard for what counts as a proper form of economic "leaving alone." Even Smith can be seen to have implied that local government is to have a role in funding education, and Smith very clearly argues that certain long-term projects, such as road-building, are to be funded by the government. Other examples abound: a notable one is found in the person of a leading 20th-century economist, Friedrich Hayek, who is typically associated with *laissez-faire* economics but who nonetheless argues for at least a limited form of the welfare state. Putting these conceptual difficulties aside, we can say that *laissez-faire* economists emphasize the way in which consis-

tent minimization of government interference with individuals' actions can lead to increases in both overall societal prosperity and the material well-being of most individuals in society, and the economic dangers posed by government activity that goes beyond offering protection of negative property rights.

With this understanding in place, we can point to a number of types of challenges to the two key features of *laissez-faire* thought. First, there is the instability thesis, which claims that markets, when left to their own devices, fail to maintain their character as uncoordinated promoters of prosperity. Marxists offer one instability thesis with their claim that capitalism leads inevitably to the proletariat's seizure of the means of production. John Maynard Keynes offers another with his claim that the market may remain stuck on the downward slope of the business cycle unless regulated by appropriate monetary and fiscal stimuli.

The pure laissez-faire approach emphasizes private-sector job creation.

Second, there is the inefficiency thesis, which suggests that prosperity can be more effectively achieved by combining with generally *laissez-faire* policies certain carefully designed, ongoing government interventions. Typically these are interventions deemed necessary to produce requisite levels of so-called public goods (drinking water, electricity, education, clean environment) and, in particular, goods prey to the free-rider problem. Hayek, James Buchanan, and many members of the Chicago School can be seen as offering versions of the inefficiency thesis.

Third, there is the paternalist thesis, which suggests that individuals will not choose what is in their own (true) interest without coercive redirection of their spending toward areas such as domestically produced goods, education, culture, and religion, and away from areas such as foreign goods, drugs, and pornography. Some members of the German Historical School in economics, many post-Hegelian political theorists of nationalism, and some proponents of the Asian way or the sociopolitical addition of Asian characteristics to Western ideas can be seen as offering versions of the paternalist thesis.

Fourth, there is the equality thesis, which is the widely hailed idea that intervention in individuals' action is needed in order to secure greater socioeconomic equality.

The instability and inefficiency theses suggest that unhampered markets are not reliable means to increasing overall societal prosperity, so that markets may be in need of coercive correction lest generalized poverty ensue. In contrast the paternalist and equality theses are not centered on increasing overall societal prosperity, but on providing better and/or more equitable distributions of the stock of available goods among members of society. In practice, of course, challenges to *laissez-faire* tend to involve more than one of the listed theses, so that, for example, the paternalist will argue that both socioeconomic equality and real overall societal prosperity are furthered by some intervention that is also cast as having some more specific social goal, such as maintaining domestic heavy industry.

Marxist formulations of the instability thesis are seen by most economists as untenable, particularly in light of the marginalist revolution that occurred in the 19th century, which cast in doubt labor theories of value such as those employed by Smith and Karl Marx. Keynesian ideas continue to exert a greater influence on economic theory, although the central aspects of Keynesian economics were dealt a seemingly fatal blow by the post-World War II work of Milton Friedman. At the same time, various inefficiency theses are currently central to research in economics, while the validity of the paternalist and equality theses is properly decided through philosophical and political debate that moves well beyond the confines of academic economics.

Contemporary laissez-faire economic theories, such as found in Kenneth Arrow and Gerard Debreu neoclassicism, Friedmanite Chicago School analysis, Austrian-oriented evolutionary and knowledge-dispersion approaches from authors such as Hayek and Israel Kirnzer, and Austrian praxeology propagated by Ludwig von Mises and Murray Rothbard, are all able to offer trenchant critiques of proposals to increase overall societal prosperity through government intervention, particularly when it comes to proposed means such as tariffs and price controls.

What contemporary *laissez-faire* theory has less to offer is showing that losses in the size of society's wealth pie outweigh gains made in offering what is, from the viewpoint of a substantive moral theory or religious worldview, a better or more fairly divided pie. At the same time, the Chicago School, the Virginia School founded by Buchanan, and the Austro-Libertarian School centered on Ludwig von Mises do address some of the more global dangers posed by government intervention. All these schools point to the runaway spending seen as emerging in democracies with large-scale

government intervention into the domestic space. They also point to alleged distortions in social behavior in areas such as marriage, child rearing, and respect for elders and religious traditions.

APPROACHES TO POVERTY

Laissez-faire approaches to the problem of poverty tend to come in two basic varieties. First, there is the supply-side approach, which emphasizes that embracing a more laissez-faire economic approach in the present will lead to greater taxable wealth in the future, so that in the long run there will be both more poverty-ameliorating wealth in the private sector and more revenue available for government antipoverty programs.

Second, there is the pure *laissez-faire* approach, which does not include a focus on government's role in ameliorating poverty. The pure *laissez-faire* approach emphasizes private-sector job creation, alleged market support for traditional social ties needed to provide proper guidance and care to individuals, and charitable giving by relatively wealthy individuals that can allegedly be better targeted to support the deserving poor.

Laos

THE LANDLOCKED and multiethnic Lao People's Democratic Republic, with a population of 5.6 million (2001), is one of the least developed countries of the world. Since the establishment of the Lao People's Democratic Republic on December 2, 1975, the country has been beset with problems. The new regime faced a shortage of technician personnel, an abundance of dissident movements, and a deteriorating economic situa-

tion. The country has one of the lowest annual per capita incomes in the world (\$300), with about 31 percent of the population living below the poverty line. The corresponding estimate of poverty incidence in rural regions is a bit higher. About 75 percent of people live on only \$2 per day. Agriculture is the main occupation, with about 70 percent of the population engaged in farm-related activities. The main task of the government was to provide relief from poverty through economic reforms, along with receiving assistance from nongovernmental organizations, regional associations, and international organizations.

The Phak Pasason Pativat Lao (Lao People's Republican Party, LPRP) introduced a series of reforms from 1986 onward, like the removal of trade barriers, relaxation of state economic control, and allowance of a private-market sector. This Chintanakan Mai (New Economic Mechanism) resulted in a free-market system and foreign investment. The country achieved significant macroeconomic performance with annual economic growth of seven percent.

Although Asia's regional economic crisis of 1997 hurt Laos severely, with its currency, the *kip*, dropping and consequent inflation, by the middle of 2000 its economy had stabilized. Laos witnessed moderate economic growth in 2001 because of past economic reforms. At the start of the 21st century, its currency hovered at between 7,500 and 8,000 to \$1. Foreign currency reserves remained steady in 2001. Industry achieved an annual growth rate of nine percent. Laos built industrial zones also to attract foreign investment.

The tourism sector is also growing. Exports increased by about nine percent during the last few years. The reforms in tax structure raised government revenue to about 15 percent of Gross Domestic Product (GDP) in 2003. Investment in the hydropower and mining sectors gives hope for the economic recovery of Laos, and GDP growth has increased steadily from four to six percent. The undernourished percentage of the total population decreased from 29 percent during the 1990s to about 20 percent in 2004–05. There was also women's empowerment, with an increase in the female literacy rate, and women's seats in the legislature increased from about 9.4 to 22.9 percent in seven years.

In the age of globalization, Laos receives help on bilateral, regional, and international levels. On July 23, 1997, it formally joined the Association of Southeast Asian Nations (ASEAN), paving the way for long-term economic benefits. As a member of the Mekong River Commission Council (MRCC) since 2001, Laos boosted rice production. It has achieved self-sufficiency in rice

production with a reserve surplus. Laos is cooperating in the Mekong-Ganga Cooperation Plan, which links India with five countries—Thailand, Vietnam, Laos, Cambodia, and Myanmar.

Under construction in 2005, the Asian Highway Project will join the capital of Vientiane with important cities in south and other parts of southeast Asia. Laos, along with Vietnam and Cambodia, also came under the \$18 million Mekong capital fund of the Asian Development Bank (ADB), which is making investments in private businesses. The International Monetary Fund approved a three-year loan worth \$40 million in April 2001.

The World Bank has taken a major role in poverty-alleviation programs in Laos since 1977, with \$711 million in credits and \$31 million in grants. It had provided technical experts and supported the 1,070-megawatt Nam Theun 2 hydroelectric project with \$270 million in loans. About 100 nongovernmental organizations are active in areas like agriculture, education, health, and rural development of infrastructure. Laos has a target date of 2020 to exit from the status of a least developed country, through governmental welfare programs as well as external supports.

Latvia

THE EASTERN EUROPEAN nation of Latvia was conquered by Poland in the mid-16th century. Latvia was occupied by Sweden from 1629 to 1721. For almost

200 years thereafter, Latvia was dominated by Russia. A brief period of independence took place after the Russian Revolution, but by 1940, Latvia had been incorporated into the Soviet Union. During the German occupation of World War II, some 70,000 Latvian Jews were massacred. Latvia again declared independence in 1991 after the collapse of the Soviet Union. Because of the tensions between the Latvian majority (57.7 percent) and the Russian minority (29.6 percent), the government initially limited citizenship to native Latvians and foreigners who had been in the country before 1940. Latvia was subsequently forced to liberalize citizenship laws in order to become a member of the North Atlantic Treaty Organization (NATO). Latvia joined the European Union in 2004.

During the transition to a market economy, Latvia found it necessary to practice economic austerity. As trade dependency on Russia decreased, ties with Western nations increased. Most banks and real-estate holdings are now privatized in Latvia, but the state has maintained control over large enterprises. Services dominate the Latvian economy, employing 60 percent of the labor force. One-fourth of the population is involved in industry, and 15 percent are engaged in agriculture. There has been some concern in recent years about the possibility of Latvian banks taking part in illegal activities. If this is the case, the discovery could damage the financial sector and play havoc with the 7.6 percent growth rate that Latvia is experiencing. Unemployment in 2005 stood at 8.8 percent.

With a per capita annual income of \$11,500, Latvia is an upper-middle-income nation, but it is also severely indebted. Latvians suffer from the "feminization of poverty," in which women and their dependent children become the group that is most vulnerable to poverty. Other groups that have a tendency to be poor are households with three or more children, the elderly, and those who live in rural areas.

In 2003, government data revealed that 39 percent of children lived in the poorest 20 percent of Latvian households. Because women make less than men throughout their lives, pensions for elderly women are lower than those of men, and thus they are more likely to be poor. Government data show that around 45 percent of rural Latvians are poor.

Latvia does not have an official poverty line, but social assistance bases aid on whether or not an individual can afford to buy basic items identified in the Minimum Crisis Basket. This poverty line works out to roughly \$3 a day, and 19.4 percent of the population are poor when using this criterion. Approximately 28 per-

cent of the population survive on less than \$4 a day, and six percent of them are undernourished. Inequality is further demonstrated by the fact that the poorest 20 percent of Latvians share 7.6 percent of available resources, while the richest 20 percent claim 40.3 percent. Latvia is ranked 32.4 on the Gini Index of Human Inequality.

During the posttransition period, Latvia continues to have difficulty in providing the population with safe drinking water and an adequate sanitation system. There are 291 physicians for every 100,000 residents, and 80 to 94 percent of the people have access to affordable essential drugs. Life expectancy in Latvia is 71.05 years. With a projected life span of 76.7 years, females outlive males (65.78 years) by approximately 11 years. Among the population of 2,290,237, the median age is 39.12 years. Over 14 percent of the population are under the age of 14, and just over 16 percent are at least 65 years old.

Childhood mortality rates have declined only slightly over the past decades. The infant mortality rate is 9.55 deaths per 1,000 live births. Among children under the age of 5, the mortality rate is 12 deaths per 1,000. Five percent of infants are underweight at birth. Immunization rates for children between birth and 23 months vary from 97 to 98 percent.

On the average, Latvian women bear 1.26 children each. Teenage mothers give birth at a rate of 32 per 1,000 births. Some 48 percent of all women of child-bearing age use some method of contraception. Trained medical staff attend all births in Latvia. According to modeled estimates for 2000, 42 maternal deaths occur out of 100,000 live births. Over 99 percent of both males and females over the age of 15 can read and write. Primary school completion rates are in the low 90th percentile, but most Latvian students attend school for 15 years.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Lawyers Without Borders

A MID-CAREER TRIAL lawyer from Connecticut, Christina M. Storm, founded Lawyers Without Borders in 2000. She envisioned a global association of lawyers dedicated to the promotion and protection of human justice through the provision of *pro bono* services. In just a short time it has grown to be the largest global organization of its kind. It is composed entirely of volunteer lawyers who offer a wide range of legal services for free to promote and protect human rights, rule of law, and justice.

Lawyers Without Borders links its members to nonprofit and community-based organizations working with low-income, underserved, and disadvantaged communities in need of human rights protection. Lawyers Without Borders is widely supported and highly acclaimed. In 2003 it was granted associative status with the United Nations Department of Public Information (UN-DPI). This status will improve Lawyers Without Borders' growing efforts to participate in UN functions aimed at collaborating with nongovernmental organizations (NGOs). Lawyers Without Borders was placed on the State of Connecticut Pro Bono Honor Roll of 2003 in recognition of its contribution to the *pro bono* community.

In 2004 the Economic and Social Council division of the United Nations (ECOSOC) granted Lawyers Without Borders special consultative status. The approval of consultative status opens additional opportunities for Lawyers Without Borders to meet other NGOs and to collaborate with various international organizations. This status gives Lawyers Without Borders the ability to obtain UN grounds passes, designates authorized representatives to sit as observers at public meetings of the council and its subsidiary bodies, and permits members of Lawyers Without Borders to attend international conferences called by the UN.

Volunteers who donate their time and expertise to the Lawyers Without Borders cause help achieve the goals in several ways: researching rule-of-law issues and human rights; analyzing information and report writing, as well as in-country research; writing reports, newsletters, and concept papers; attending human rights conferences, United Nations conferences and sessions, and educational and training programs; initiating independent and self-funded assessment teams for rapid response and interventions; and issuing neutral observations and reports.

Lawyers Without Borders has several core programs: the Pro Bono Law Link program recruits lawyers to represent nonprofit organizations around the world on a *pro bono* basis. In linking volunteer lawyers with nonprofits, the talents, resources, issues, interests, and needs of both lawyers and nonprofits are given careful consideration. A goal of each linkage is to create a rewarding *pro bono* experience for both lawyers and their nonprofit clients, increasing the potential for a sustained lawyer-client relationship. This initiative gives lawyers a place as key players in global efforts to increase capacity-building of NGOs.

The Lawyers at Risk program provides rapid response and intervention in conflict and turmoil regions, especially to lawyers who, in defending human rights, become targets of criminal prosecution. The Lawyer-to-Lawyer program links lawyers to mentor lawyers in developing nations. The Neutral Observers program provides neutral and independent legal observations of prison detainees, closed courts, and other internal functions. The Creating Legal Accessibility and Resources for Students program links current law students with human rights or international law-research needs of nonprofit organizations.

The Rule of Law ABC project involves rule-of-law assistance, legal resources, and computers—key tools for any system attempting to operate after emerging from years of protracted conflict. A unique feature of each Rule of Law project is to focus on including components to train and/or equip current law students in the region (where there are functioning law schools) who will be the first practitioners to function within the newly emerging system. Recent projects that led to the development of this model include work in northern Iraq and Liberia. In 2005 several African nations were being considered for replicating this project in the months ahead.

Lebanon

ACCORDING TO a report on Lebanon commissioned by the United Nations Economic and Social Commission for West Asia, 28 percent of the population live below the set poverty line of \$2.20 per capita per day. Between 1993 and 2003, the average real growth in Gross Domestic Product (GDP) was only 3.8 percent per year. A review of various studies that have been conducted on the economic conditions in Lebanon has identified some general characteristics of the poor in Lebanon.

First, poverty tends to be more prevalent in rural areas and there are significant discrepancies between different regions, with areas of south Lebanon more impoverished than Mount Lebanon. Second, unemployment has proven to be highly correlated with poverty, with the proportion of the unemployed among the poor being much higher than among the general public. It has been established that low wages and type of employment have been contributing factors in the spread of poverty. The scarcity of employment opportunities and widespread unemployment constitute a striking trend in recent years. Third, the size of a poor family in Lebanon is estimated to be larger than the national average of 4.7 members. Another correlation that stands out is the one between the level of education and poverty. The poor tend to be illiterate or have obtained low educational status.

Three groups are disproportionately represented among the poor. Palestinian refugees residing in various refugee camps have been extremely affected by the poor economic conditions. The status allocated to Palestinians by the Lebanese government prohibits them from taking official employment in skilled professions. The dire situation of Palestinians in Lebanon is exacerbated by the fact that even unskilled Palestinian laborers have to compete with large numbers of Syrian and Asian workers who are not required to obtain work permits, and thus work for considerably lower wages. Many Palestinian refugees who work illegally receive only a

fraction of the salaries and benefits that Lebanese employees enjoy. A second group, namely Lebanese Shiites, has also been subject to economic deprivation. The lack of educational, health, commercial, and industrial facilities in the Shiite strongholds, further aggravated by Israeli raids in southern Lebanon, provides a strong impetus for migration to urban centers. However, even upon migration to Beirut's suburbs, the basic social services and economic and educational opportunities remain absent. Poverty belts, composed principally of Shiites, encircle the greater Beirut area. A third group of people commonly called internally displaced people (IDP), estimated at 500,000, lives in poor conditions, often in crowded areas, lacking essential health and social services.

Government losses resulting from corruption are estimated at over \$1 billion every year.

Between 1975 and 1990, Lebanon was the venue of a costly and protracted civil war that is commonly cited as the predominant cause of poverty in the country in the last 25 years. The war caused significant damage to Lebanon's means of production and its infrastructure, with material losses calculated at over \$25 billion. Moreover the war resulted in the deaths of more than 65,000 people and the displacement of some 500,000 others.

Stunted growth, inflation, and massive destruction also led to a migration of skilled workers to other countries, resulting in a brain-drain, since a high percentage of emigrants are generally well educated. Remittances from Lebanese working abroad have traditionally been a staple source of national income. On average, the remittances from Lebanese workers abroad provided up to 35 percent of Lebanon's Gross National Product (GNP).

However, this rate has been subject to fluctuations in recent years, and the government's hope that expatriate Lebanese might use some of their substantial funds to invest in their country's reconstruction is only slowly being realized. Instability caused by the volatile political situation and the assassination of Lebanese Prime Minister Hariri have further depressed investor confidence.

Corruption is endemic to the Lebanese political and economic system, and factors believed to contribute to this widespread phenomenon are linked to sectarianism, the low salaries of civil servants, and the lack of an independent judiciary. Government losses resulting from corruption are estimated at over \$1 billion every year.

Because of the nature of politics in Lebanon, poverty is a politically charged issue often utilized by various groups to mobilize public opinion against the government. Lebanon has a confessional system by which political representation is awarded by religious groups, each according to its size, whereby the main offices are reserved for different religious sects. Sectarian divisions continue to plague Lebanon and ultimately cause economic inequalities across religious divides.

Les Misérables

THE NOVEL LES MISÉRABLES by Victor Hugo was published in 1862. But Hugo had worked on this novel, which many regard as his masterpiece, since the 1840s, in a first unpublished version that was called Les Misères. This long period of work reflects the scope of the novel, which embraces many experiences in France during the first part of the so-called long 19th century. The principal story is about Jean Valjean, a longtime prisoner convicted of stealing bread in 1795.

When he finally is liberated in 1815, society blocks any reintegration. Therefore Valjean changes his identity (a new "criminal" act), creates an invention, and becomes a rich and respected industrialist in the city of Montreuil-sur-Mer. He even becomes mayor of that city, but the police-inspector, Javert (the negative protagonist), still haunts him. Valjean has to leave Montreuil and decides to take with him Cosette, a young girl he

had "adopted" from a poor dying mother (Fantine). Valjean and Cosette go to Paris, where he wants to live a peaceful life protected by the anonymity of a big city. When Cosette grows up, she falls in love with Marius, who becomes a revolutionary in the uprisings of 1832. Police-inspector Javert, who still haunts Valjean, falls into the hands of the revolutionaries, but is saved by Valjean. This help from his "enemy" Valjean irritates Javert to such an extent, that he commits suicide.

Valjean is able to save an unconscious Marius from Royalist reprisal after the uprisings fail. Marius and Cosette marry, but only on his deathbed, and a reunion among Marius, Cosette, and Valjean brings the novel to a tragic yet satisfying end.

The ongoing success of Les Misérables as a book, theater piece, movie, and—last, but not least—musical is due to the immense intensity of the characters created by Hugo and his literary achievement in including many aspects of 19th-century social and political practice in a novel of high quality. Whereas Valjean stands for the poverty-stricken suffering of common people during that period, Marius symbolizes the idealistic revolutionary of the first half of the 19th century. He is no longer only a bourgeois revolutionary fighting for representation, but already has a social agenda. Police-inspector Javert, on the other hand, stands for an oppressive state without any social conscience; only immediately before his suicide does he show human emotion.

Hugo was born into the family of a Napoleonic officer on February 26, 1802. He became a conservative romanticist, but transformed himself from a Bonapartist to a modern Republican at the end of his life. He soon established himself as a famous writer and from the 1840s on he held political office.

When he fell out of favor with Louis-Napoléon (the later Emperor Napoléon III), he went into exile in Belgium and on the Channel Isles during the 1850s and 1860s. When the Third French Republic was established in 1870, Hugo returned to France and became an icon of that republic. His death on May 22, 1885, was followed by a lying-in-state beneath the Arc-de-Triomphe in Paris and a burial in the Panthéon. The official adoration of Hugo came from his change from a Catholic Monarchist to a Republican.

Hugo not only was popular in bourgeois circles, but was seen as a fighter for better living conditions for the poorer classes, too. His ongoing popularity is due to the force of his descriptions of social conditions in an entertaining way. At times that entertaining aspect of the work supersedes Hugo's political ambitions. This is particularly true for the musical Les Misérables, by Alain Boublil and Claude-Michel Schoenberg, in which the historical context and setting of Hugo's figures are somewhat neglected.

Lesotho

FORMERLY KNOWN AS Basutoland, the southern African nation of Lesotho won its independence from the United Kingdom in 1966. After 23 years of military rule, a democratic government was established in 1993. In 1998, however, at the request of the South African Development Community, a brief military mutiny was put down by the intervention of troops from South Africa and Botswana. Lesotho is currently experiencing a period of peaceful stability, but the government is faced with excessively high mortality rates, low life expectancy, low population and growth rates, and a poverty rate of 49 percent. Some 27 percent of the population are malnourished, and 18 percent of all children are underweight. Over half (56.1 percent) the population lives on less than \$2 a day, and 36.4 percent live on less than \$1 a day.

Access to safe drinking water in Lesotho is somewhat dependent on the weather. Some 38 percent of the population draw water from unprotected springs and wells that may contain infected water. Only 35 percent of Basotho who live in rural areas and 65 percent who live in urban areas have access to adequate sanitation. The Basotho people experience significant inequality, with the poorest 20 percent sharing only 1.5 percent of all income and the richest 20 percent claiming 66.5 percent. Lesotho ranks 65.2 on the Gini Index of Human Inequality. With 86 percent of the population involved

in subsistence agriculture and a 45 percent unemployment rate, Lesotho is heavily dependent on remittances from South Africa, where some 35 percent of employed Basotho males work. Lesotho also depends on customs duties from the Southern Africa Customs Union. After completion of a hydropower facility in 1998, Lesotho began selling water to South Africa. The industrial sector has become more important in recent years with increases in the production of garments and farm-related products. Even though Lesotho is still considered a low-income nation, its debt status is now defined as moderate. All economic advances have been undercut, however, by the HIV/AIDS epidemic.

Government officials, including the prime minister, were tested for AIDS.

The Basotho population of 1,867,035 is somewhat older than many of its African neighbors. Life expectancy declined in Lesotho from 52 and 55 years for males and females respectively in 1980 to 36.86 and 36.49 years respectively in 2005. This decline is due in large part to the high prevalence of HIV/AIDS. Some 36.9 percent of the Basotho people are under the age of 14, and 5.5 percent are over 65. The average Basotho resident stands a 68.1 percent probability of not surviving until the age of 40.

Out of a population of 1,867,035, some 30 percent have been infected with HIV/AIDS, ranking Lesotho fourth in the world in the number of HIV/AIDS cases. By 2003 estimates, 320,000 Basotho live with the disease, and 29,000 others have died. Approximately 55 percent of those infected are female, and those between the ages of 15 and 29 make up 75 percent of all HIV/AIDS cases. In the spring of 2004 the government of Lesotho became the first in Africa and the second in the world (after Brazil) to promote universal testing for HIV/AIDS. Through the Know Your Status Campaign, the government encouraged villagers around Lesotho to submit to voluntary AIDS testing. Codes rather than names were used to ensure anonymity. Government officials, including the prime minister, were tested. The lack of safe drinking water and the prevalence of improper sanitation practices have left many Basotho vulnerable to other infectious diseases, such as those spread by infected water or soil. Some areas have also experienced outbreaks of typhus and plague.

The infant mortality rate in Lesotho is high at 84.23 deaths per 1,000 live births, as is the death rate of 99

out of 1,000 for children under the age of 5. Between 1990 and 2001, the infant mortality rate dropped from 102 to 91, and the under-5 mortality rate declined from 120 to 87. In 2000, the government revealed that respiratory infections, diarrheal diseases, and skin infections were responsible for most deaths of children under 5 years of age. The fact that only 29 percent of Basotho children receive oral rehydration therapy indicates that many of these children might have been saved with proper care.

Approximately 18 percent of children under 5 are malnourished, and four percent are severely underweight. Five percent suffer from moderate to severe wasting, and 46 percent suffer from severe to moderate stunting. The United Nations UNICEF maintains that 85,000 Basotho children under the age of 5 need emergency supplementary feeding. Health data reveal that since May 2001, the number of Basotho children who are underweight has increased markedly because of the food shortage. Beginning in May 2002, the number of children with low birth weights also increased markedly. The rate of measles immunizations among children 12 to 23 months old is 70 percent, and the rate of DPT3 immunizations is 79 percent. Among infants, 83 percent are immunized against tuberculosis, 79 percent against DPT3, 78 percent against polio, and 70 percent against measles.

In 2005 the general fertility rate was estimated at 3.35 children per woman, showing a decrease from 2003 when the overall rate was 4.3 births per women and the adolescent fertility rate was 76 out of 1,000 births. Almost one-third of Basotho women employ some method of contraception. By 2003 estimates, maternal mortality is 550 deaths out of 100,000 live births. Professional medical staff now attend almost 60 percent of all births in Lesotho. The country's educational level is more than twice that of the poorest African nations, and most Basotho attend school for at least 11 years. From 1980 to 2000, primary school enrollment for males rose from 55 percent to 80 percent, and female enrollment rose from 79 percent to 87 percent.

Leviathan

LEVIATHAN IS A SEMINAL work of political philosophy by Thomas Hobbes (1588–1679). Advocating strong government, the first English edition was published in 1651. A Latin edition with significant variations appeared in 1668. Hobbes grew up in politically unstable times. As an adult, he feared religious warfare. These unsettling experiences preoccupied Hobbes and shaped his political theorizing in Leviathan. The title is an image borrowed from the biblical sea-monster in the Book of Job. It communicates his preference for a powerful "common-wealth" or state.

Human beings are roughly equal in ability, according to Hobbes. But human equality immediately causes a problem. In *Leviathan*'s "state of nature," equality leads to destructively ruthless competition, a "warre of all against all" in which "life of man, [is] solitary, poore, nasty, brutish and short." Without Hobbes's commonwealth, there simply is no place for industry, trade, commerce, or agriculture.

Patriarchal institutions stood in the way of Hobbes's proposal. Not evident in the "state of nature," marriage and the family are creations of the commonwealth. As a corollary, custody of children does not automatically revert to the father. Contemporaries like Bishop John Bramhall, William Lucy, and Edward Hyde, the Earl of Clarendon, attacked Hobbes's views on marriage.

Hobbes's *Leviathan* was not the first to use the concept of state of nature. But in contradistinction to later social-contract political theorists like John Locke (1632–1704) and Jean-Jacques Rousseau (1712–78), Leviathan's "commonwealth" does not naturally evolve from the state of nature. Instead it is created. Hobbes's social contract invests authority in a sovereign, and that ruler will guarantee peace and economic prosperity by regulating the otherwise unrestrained quest for power.

This contract creates a limited civil society under a monarch. The "social covenant," however, is an agreement among humans and not a contract between citizens and the sovereign. Thus an individual's property rights may limit the rights of other subjects, but they do not infringe on the sovereign's rights. More importantly, without the social contract, valid business contracts are not possible.

Hobbes's *Leviathan* recommends strenuous government intervention in the economy. The political institutions of his absolute state will protect people from the chaos, poverty, uncertainty, and insecurity that they would experience in a chaotic business environment. In an apparent exception, self-defense of one's own life is acceptable. The sovereign can enforce future performance that is part of the typical business contract. The commonwealth is embodied in the sovereign, and the sovereign is above the law.

Money is the lifeblood that nourishes the commonwealth. Therefore, theft and counterfeiting are outlawed. Export and import trading can increase the commonwealth's power. Moreover a minimum standard of living is promised to all. Well in advance of modern social security systems, private charity was not assumed to be sufficient. Instead the commonwealth should provide welfare for those physically and cognitively unable to hold regular jobs. Others were required to work, and if society's labor supply exceeded the available jobs, transmigration to colonies in North America was an option.

Privately held religious thoughts are tolerated in the commonwealth, but acting on those beliefs in concert with others threatens the social order. For example, biblical doctrines of churches might stimulate these organizations to champion social grievances of the working classes. Less surprisingly, "guilds" or craft unions are proscribed in Hobbes's commonwealth. If Hobbes were consistent, *Leviathan* would be a blueprint for authoritarian state capitalism. However, one's "covenant" with the commonwealth ceases when the sovereign becomes unable to protect its citizens. Deducing a future endorsement of stable democracies from Hobbes's preference for the status quo remains problematic.

VINCENT K. POLLARD UNIVERSITY OF HAWAIʻI, MANOA

Lewis, Arthur (1915-91)

W. ARTHUR LEWIS WAS BORN in Saint Lucia, a British territory in the Caribbean, on January 23, 1915. Having won a St. Lucia government scholarship to a British university, he enrolled at the London School of Economics in 1933, graduating in 1937, and earning a doctorate in industrial economics in 1940. Lewis notes in his Nobel Prize autobiography that he had wanted to be an engineer, but ended up going into economics because "neither the government nor the white firms would employ a black engineer."

Lewis began his career teaching at the London School of Economics, moving to the University of Manchester in 1948. From 1963 until his retirement in 1983, he was a professor at Princeton University. In addition to his academic posts, Lewis worked for the United Nations in different capacities, was president of the University of the West Indies, and also set up the Caribbean Development Bank. He was knighted in 1963.

Lewis is known for his work in two fields: the history of the world economy since 1870 and development economics. In the first, Lewis studied how economic growth in the least developed countries was related to growth in the developed economies. It is in the second field, which can be considered an outgrowth of the first, however, where Lewis made his most lasting contributions.

Based on an article published in 1954 in *The Manchester School* ("Economic Development with Unlimited Supplies of Labour") and a book published in 1955 (*The Theory of Economic Growth*), Lewis can be considered one of the founders of economic development as an economic field in its own right. As part of his life-

long goal of alleviating poverty in developing countries, he recognized that not all economies were like the advanced capitalist economies; some economies, such as those in Africa, Latin America and the Caribbean, and Asia, were of a different nature and should be treated as such. This meant that he had to develop a new way of looking at these economies and their interactions with the developed capitalist world.

His seminal work in this area was his introduction of the concept of a two-sector economy in poor countries in the 1954 article on economic development. In this article, in adopting a classical approach to surplus labor and wages, Lewis discarded the marginal utility approach and the neoclassical framework in an effort to assess "the fundamental forces determining the rate of economic growth." He was interested in explaining the situation as he saw it that existed in developing countries; the model describing capitalist economies simply did not apply. Not surprisingly this approach generated much controversy.

Lewis was deeply concerned about the economic conditions of developing countries.

In this 1954 article, Lewis divided the economy of a developing country into two sectors: a capitalist sector and a subsistence sector. In the subsistence sector he rejected the neoclassical assumption that the quantity of labor is fixed by positing an unlimited (infinitely elastic) supply of labor. Some of this surplus, low-wage labor then migrates to the capitalist sector (where productivity was increasing), thereby driving down wages in this sector. As a result, profits are high and rising in the capitalist sector. As these profits are reinvested, growth occurs, and economic development continues while wages remain low.

Over the last 50 years, *The Manchester School* article has remained a cornerstone in the development economics literature. Virtually every textbook or course in development economics contains a detailed discussion of this seminal article. Although a half-century old, this article still resonates for developing economies in the 21st century.

Based primarily on the 1954 article and his 1955 Theory of Economic Growth, Lewis was awarded (jointly with Theodore Schultz) the Bank of Sweden Prize in Economic Sciences in Memory of Alfred Nobel (the Nobel Prize in Economics) in 1979. According to the Nobel committee's press release, "Lewis has tackled is-

sues which are basic to the causes of poverty among populations in the developing world and to the unsatisfactory rate of economic development." In accepting this award, the most prestigious in economics, Lewis became the first and only black (out of 57 total laureates) to receive the prize.

Throughout his career Lewis was deeply concerned about the economic conditions of the developing countries and about the pervasiveness of world poverty. While most economists looked at the world from the perspective of the developed capitalist economies, Lewis wanted to add the perspective of the poor, underdeveloped countries to the analysis. It is a tribute to his genius and humanity that his ideas are still discussed and debated today.

Paul A. Swanson William Paterson University

Liberation Theology

LIBERATION THEOLOGY IS a controversial philosophy held by certain Christian activists, primarily within the Roman Catholic Church, that the teachings of Jesus Christ and the Apostle Paul call for Christians to be involved in a political and military struggle for Third World economic equality and human rights.

Liberation theology takes the view that Jesus Christ's primary role was as a social liberator with a special compassion for the poor. Liberation theologists hold to the traditional view of Jesus as a sacrifice or ran-

som on behalf of the sins of mankind, but also teach that he came to liberate the poor and oppressed from the bondage of earthly slavemasters.

A case can be made that liberation theology has its roots in the populist Latin American politics of the 1950s and 1960s, but it also has historical roots in the tradition of missionaries from the earliest colonial days in Latin America. Many of those questioned the position of the church in the way that indigenous peoples, black slaves, mixed-race mestizos, the poor rural, and the urban masses were being treated.

As early as the 1500s, Friar Bartolomé de Las Casas vehemently defended the rights of indigenous Native Americans forced into slavery by their Spanish conquerors. The Dominican missionary was infuriated by their brutal treatment and wrote a compelling account published in 1552 describing atrocities in the Caribbean, Central America, Mexico, and Peru.

He argued to King Philip II that when he first arrived in the New World he had supported the acts of barbarism, but became convinced the horrendous acts would lead to the judgment of Almighty God and the destruction of Spain. He declared it was the responsibility of the Spanish to convert the natives to Christianity rather than kill them and loot their gold. Largely through his efforts, laws were adopted in 1542 ending native slavery.

His voice was joined by Dominican friar Antonio de Montesinos, who proclaimed in a sermon delivered in 1511, "I am the voice of one crying in the wilderness. This voice declares that you are in mortal sin by reason of the cruelty and tyranny that you practice on these innocent people. Tell me, by what right or justice do you hold these Indians in such cruel and horrible slavery? By what right do you wage such detestable wars on these people who lived mildly and peacefully in their own lands, where you have consumed infinite numbers of them with unheard of murders and desolations?"

Against such a historical backdrop, in the 1960s and 1970s a premise emerged that traditional Christian theology is biased to perpetuate the interests of white, North American/European, capitalist males; that it legitimates a corrupt system (democratic capitalism); and that it is responsible for exploiting and impoverishing the world's poor. In this mindset, modern Christianity must be approached from the perspective of the oppressed.

Liberation theologian and author Gustavo Gutierrez rejected the idea that Christianity is a systematic set of truths unchanging for all generations. Rather he said that it is dynamic and must change with the times. For example, he said the concept of sin can no longer be defined in terms of a set of Ten Commandments. Instead "sin is not considered as an individual, private, or merely interior reality. Sin is regarded as a social, historical fact, the absence of brotherhood and love in relationships among men."

Thus, it is held, capitalist nations are sinful because they have oppressed and exploited poorer nations. Capitalist nations succeed, it is said, at the expense of impoverished nations. That is the basis of dependency theory, which holds that the prosperity of rich countries depends on the poverty of the downtrodden. However, with the rise of such Third World entities as Singapore, Malaysia, South Korea, Hong Kong, and Taiwan (not to mention an increasingly capitalistic People's Republic of China), dependency theory is heard less and less.

INCONSISTENCIES

Liberation theology also holds that those who are oppressed can sin by submitting to such slavery and not fighting back. Instead they must overthrow the exploiters, with violence if necessary. Such an endorsement of violence is in stark contrast to the biblical Jesus who, according to the Gospels, submitted to unfair public punishment and execution, taught his followers to turn the other cheek, and rebuked the Apostle Peter for defending him with a sword. An inconsistency is seen in that liberation theologians regard violence as sinful if committed by an oppressor, but permissible if committed by peasants trying to overthrow the bourgeoisie.

Liberationists argue that traditional Christian dogma understands God as watching mankind from a distance. Not so, according to Gutierrez, who teaches that God is dynamically involved on behalf of the poor and disadvantaged, standing against oppression and exploitation. Thus those who believe in him must take action—that "to know God is to do justice."

Liberation theology arose after the widespread reforms of the Second Vatican Council in the 1960s and is sometimes spoken of as Christian Marxism, refuting the perception that the two philosophies are mutually exclusive. It had particularly widespread influence in Latin America and among the Jesuits after the Second Vatican Council (1962–65) lamented the wide gulf between the rich and poor nations of the world. Church leaders even proclaimed a "preferential option for the poor," and the 1968 Medellin Conference of Latin American Bishops denounced the extreme disparities among social classes.

However, Pope John Paul II largely put an end to official support for liberation theology among the Catholic Church's hierarchy by his statement in January 1979, on a visit to Mexico, that "this conception of Christ as a political figure, a revolutionary, as the subversive of Nazareth, does not tally with the church's teachings."

"When I see a church with a machine gun, I cannot see the crucified Christ ..."

The Sacred Congregation for the Doctrine of the Faith (the Vatican's defender of orthodoxy) in 1984 issued the Instruction on Certain Aspects of the Theology of Liberation, which warned against promoting Marxist principles, terminology, methods, and goals. Then in 1986 the Instruction on Christian Freedom and Liberation cautioned that those who take action by the oppressed must do so "through morally licit means, in order to secure structures and institutions in which their rights will be truly respected."

Since succeeding Pope John Paul II, Benedict XVI has continued his predecessor's opposition. Benedict had long been known as an opponent of liberation theology in his position as prefect of the Congregation for the Doctrine of the Faith from 1981 to 2005.

Among liberation theology's vocal proponents is Jesuit priest Jon Sobrino from the Central American country of El Salvador, who teaches that the poor are a privileged channel of God's grace. "The world lives with a great sin. The needy and oppressed die slowly and violently. Believing in God means being in solidarity with them." Another prominent proponent is Phillip Berryman, who writes that liberation theology is "an interpretation of Christian faith through the poor's suffering, their struggle and hope, and a critique of society and the Catholic faith and Christianity through the eyes of the poor."

On the other hand, in 1985, a leader of the conservative wing of the Roman Catholic Church in Latin America, Bishop Dario Castrillon Hoyos, archbishop emeritus of Bucaramanga, Colombia, and prefect of the Congregation for the Clergy, denounced liberation theology in no uncertain terms, saying: "When I see a church with a machine gun, I cannot see the crucified Christ in that church. We can never use hate as a system of change. The core of being a church is love."

ROB KERBY
INDEPENDENT SCHOLAR

Liberia

THE REPUBLIC OF LIBERIA is located in western Africa along the north Atlantic Ocean. In this nation of 3,482,211 people, 80 percent live on less than \$1 a day and 52 percent live in extreme poverty; 85 percent are unemployed. The economy is largely dependent on subsistence agriculture, in which women provide most of the labor.

Out of all countries in the world, Liberia has the worst record on health and nutritional indicators. That only 10 percent of the population have access to adequate healthcare is largely because of the destruction of most healthcare facilities outside the capital city of Monrovia. In all likelihood, poverty in Liberia is even more extensive than it appears because data on key social and economic indicators are absent.

Throughout the 1990s, Liberia was devastated by a 14-year civil war and a long history of government mismanagement and human rights abuses. In 1991, at the invitation of both sides of the Liberian conflict, the Carter Center of Emory University, known worldwide for its success in negotiating peace and easing human suffering, opened an office in Monrovia.

By 2000, reports of human atrocities had grown so extensive that former president Jimmy Carter elected to close the office. In 2003, with assistance from United Nations peacekeeping forces, 100,000 armed combat-

ants were disarmed. A coalition government, composed of members from both sides of the conflict, was elected and given the challenge of restoring political and economic stability to Liberia. They have been only partially successful. In this low-income, severely indebted nation, annual per capita income is \$140, and one out of every six individuals survives on international food aid.

With a life expectancy of 47.69 years and a median age of 18.06, only 3.7 percent of the population live to reach the age of 65. Individuals have a 47.2 chance of not surviving until the age of 40. Some 43.6 percent of all Liberians are under the age of 14. Poverty and a malfunctioning infrastructure continue to be a way of life, and excessive death and mortality rates drain the government of needed resources. These high rates, which are consequences of poverty and high incidences of preventable diseases, have placed Liberia 43 out of 46 sub-Saharan nations in death rates.

Liberia's HIV/AIDS prevalence rate of 5.9 has resulted in the deaths of some 7,200 people. Unofficial estimates place the prevalence rate at 20 percent in some areas. By 2003 some 100,000 Liberians were living with HIV/AIDS, and tens of thousands of others had been affected by the epidemic. Efforts to educate the public about prevention have been threatened by the low literacy rate. The Liberian population is also susceptible to a number of food- and waterborne diseases such as bacterial and protozoal diarrhea, hepatitis A, and typhoid fever. In some areas, malaria and yellow fever have also taken a toll. Schistosomiasis, caused by contact with infected water, and Lassa fever, caused by contact with aerosolized dust or soil, are also common, particularly among the poorest people.

In Liberia, 128.87 infants die out of every 1,000 who are born. In 2003 the rate was even higher at 157, and mortality of those under the age of 5 was reported at 235. Some 27 percent of all children under the age of 5 are malnourished, and eight percent are severely underweight.

Some 39 percent of this group suffer from moderate to severe stunting, and six percent suffer from moderate to severe wasting. In 2003, immunization rates for children between the ages of 12 and 23 months were documented at 53 and 38 percent against measles and DPT3 respectively. Rates for infants were reported at 43 percent against tuberculosis, 38 percent against DPT3, 39 percent against polio, and 53 percent against measles. Immunization efforts have been severely hampered by the fact that between 350 and 400 of 500 immunization sites no longer operate.

Among the total female population, Liberian women bear an average of 6.09 children each. Adolescent fertility, according to 2003 estimates, was high at 192 out of every 1,000 births. Only 10 percent of all women use contraceptives of any sort, and the government has not provided free condoms or successfully disseminated family planning information. Before the intense fighting of 2003, Liberia's maternal death rate was the highest in the world at 578 deaths out of 100,000 live births. In that same year, trained medical staff attended only 50.9 percent of all births in Liberia. These deaths were due in large part to a lack of antenatal and emergency care and the fact that 63 percent of all births took place at home.

In 1998, yielding to pressure from international human and women's rights groups, Liberia passed a bill to end all legal discrimination against women. The government also established the National Women NGOs Secretariat to oversee collection and distribution of data and to lead the effort of incorporating women into the mainstream. Antipoverty efforts were focused on improving the standard of living through increasing education on family planning, curbing violence against women, ending the practice of childhood marriages and female genital mutilation (FGM), improving literacy rates, and creating and extending social institutions designed to help women and children. Despite these lofty goals, only efforts to gender-sensitize policymakers were carried out because government resources were redirected toward the ongoing civil war.

Literacy rates illustrate the sexual inequality that exists in Liberia. Less than half of all females over the age of 15 can read and write (41.6 percent), but 73.3 percent of males in this group can do so. The drop in female literacy is particularly telling when the current rate is compared to the rate of 86.5 percent in 1980 before the war created obstacles to female education. In 1999 only 21 percent of males and 10 percent of females completed primary school. The drop in school attendance has been a direct consequence of poverty and war. Even those students who remained in school have been disadvantaged by the scarcity of trained teachers. Somewhat belatedly, in 2003 the government pledged its support for providing free and compulsory education at both preschool and primary levels.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Libya

THE SOCIALIST PEOPLE'S Libyan Arab Jamahiriya (Libya) is a country in north Africa located on the coast of the Mediterranean Sea and borders Egypt, Sudan, Niger, Chad, Algeria, and Tunisia. It has a territory of nearly 700,000 square miles, but the great majority of this is part of the almost uninhabitable Sahara Desert, and the population of some 5.8 million is almost entirely located along the coastal region.

The discovery of oil in 1959 completely changed the economy of the country from one entirely dependent on transfers from outside to a welfare state where government services are newly provided. A wealthy monarchy was established, only to be broken up 10 years later by a coup, which saw the installation of Colonel Muammar Gaddafi. The long-standing leader Gaddafi has supported various anti-Western policies and groups, and thus Libya has had less opportunity to benefit from economic growth stimulated by cross-border business investment than other countries.

However, ties with the former colonial power of Italy have been more productive and there are signs that Gaddafi has moderated his stance in any case. The U.S. government instituted a trade boycott in 1982 and the United Nations enforced an international boycott in 1992 as a result of Libya's alleged complicity in the Lockerbie (airplane) bombing. These boycotts were lifted at the end of 2004 after the state renounced the intention to acquire and use weapons of mass destruction.

Statistics describing quality of life show that Libya compares favorably with other north African and Arab countries. Mortality and life expectancy rates are better

The Sahara Desert dominates the majority of the Libyan landscape, forcing most of the population to live in the coastal region.

than those of its neighbors. As an Islamic state, Libya's women have fewer opportunities to access education and to have a career, but with an overall adult literacy rate of 81.7 percent, it is a more socially liberal regime than most in the region. Libya is one of only three African nations to have ratified the Protocol on the Rights of Women in Africa, which seeks to eradicate female genital mutilation.

Oil dominates the Libyan economy, representing 99 percent of the value of all exports while employing only 10 percent of the domestic workforce. Lack of human resources has meant the presence of large numbers of foreign workers in Libya to service the oil industry, although these are now being repatriated because of the extreme drain of foreign reserves owing to remittances. The government has acted as the principal means of redistribution of revenues so that all Libyans can benefit from health and education services. As a self-proclaimed socialist state under its guide, Gaddafi, who has no formal position in government, Libya's political system is unclear and its policies and decisions difficult to challenge. Committees run various aspects of the state but it is believed that in reality, Gaddafi rules unopposed.

Libyan agriculture is very limited, hampered by low levels of technology and investment and vulnerable to external shocks, such as plagues of locusts. Libya has been working with the Food and Agriculture Organization of the United Nations to improve its agriculture and that of its southern neighbors, and to search for ways to help control locusts. The famine in Libya's southern neighbor, Niger, in 2005 demonstrates the

suddenness with which food insecurity can strike. Libya recognizes its responsibility in assisting neighbors both for ethical reasons and also because of the potential for instability if large numbers of refugees seek to enter Libyan territory. Much of the state's charitable international work is organized through the Gaddafi Foundation.

John Walsh Shinawatra University

Liechtenstein

IN 1719 THE PRINCIPALITY of Liechtenstein was founded as part of the Holy Roman Empire. The name of the country is derived from the Liechtenstein dynasty. The principality joined the German Confederation in 1815, but opted for independence in 1866. Two years later, Liechtenstein abolished its army, thereafter maintaining a position of neutrality in international affairs. Nevertheless, close ties with Austria led to economic devastation for Liechtenstein during World War I. After the war, Liechtenstein established an ongoing customs and monetary relationship with Switzerland. The principality was able to remain neutral during World War II.

Much of Liechtenstein's current prosperity is due to its low taxes. There is a 20 percent maximum tax on businesses. Almost one-third of Liechtenstein's revenues are derived from high-profile businesses that have taken advantage of the low tax base to establish nominal offices in the principality. In the midst of strong economic growth, Liechtenstein was faced with an international scandal when concerns surfaced concerning the likelihood that its financial institutions were engaged in

money laundering. As a result, the country was internationally blacklisted. Subsequent reforms led to Liechtenstein and the United States signing a Mutual Legal Assistance Treaty.

Liechtenstein's monarch, Prince Hans-Adam II, is considered to have more real power than any other European ruler. The prince uses his personal fortune to support himself, even paying for some state functions out of his own pocket. His family worth is estimated at several billion dollars. Under Liechtenstein's constitution, the monarch has broad emergency powers and exercises a veto right over all legislation. In 1990, Liechtenstein joined the United Nations and quickly articulated an agenda directed toward expanding the rights of women and children around the world.

Almost half of Liechtenstein's labor force is made up of foreigners, including some 13,000 workers who commute from Austria, Switzerland, and Germany on a daily basis. Current unemployment is 1.3 percent. Liechtenstein's only resources are a potential for developing hydroelectricity and the arable land. Currently the country imports over 90 percent of all energy requirements. Liechtenstein has been a member of the European Free Trade Association since 1995.

Liechtenstein's highly industrialized and diversified market economy has produced a per capita income of \$25,000. Consequently the standard of living is comfortable for most residents, and housing loans are interest-free. The Liechtenstein government has developed a comprehensive network of social programs that include social security and financial assistance for those who are in need. Data on major social indicators for Liechtenstein are unavailable, and this makes it difficult to accurately analyze poverty.

The government has developed a large network of social programs.

Life expectancy in Liechtenstein is high at 79.55 years. With a projected life span of 83.16 years, females generally outlive men by approximately seven years. Among the population of 33,717, the median age is 39.22 years. Over 17 percent of the population is under the age of 14, and 12 percent have seen a 65th birthday.

Infant mortality occurs at a rate of 10 deaths per 1,000 live births. Male infants (6.34 deaths per 1,000 live births) are more than twice as likely to die as female infants (3.05 deaths per 1,000). Among children under the age of five, the mortality rate is 11 deaths per 1,000.

All children over the age of 10 in Liechtenstein can read and write. The low fertility rate, which was estimated at 1.51 children per woman in 2005, helps to raise the quality of life for the children of Liechtenstein.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Lincoln, Abraham (Administration)

THE PRESIDENCY OF ABRAHAM Lincoln is inescapably linked with the crisis and devastation of the American Civil War, but this crisis also helped to shape and define modern America. From his inauguration in March 1861 until his assassination in April 1865, Lincoln presided over an economy and a society that were not only torn apart by unparalleled and appalling hostilities, but that in the long-term influenced national identity and public policies.

Violence and warfare invariably disrupt production and economic exchange and increase the prevalence of poverty. Given that the Civil War was the most disruptive conflict in American history, the Lincoln administration witnessed extraordinary economic distress. This was a widespread economic anguish that was pervasive and disproportionate enough, compared to earlier economic crises, that it necessitated some corresponding response.

Over the course of the 19th century, the United States was becoming more industrialized and more economically integrated, and the Civil War hastened the emergence of national markets and helped to foster a meaningful sense of the United States as an entity rather than as a compilation of discrete states. Given

the threatening degree to which the Civil War gripped the lives of individuals and institutions across the nation, it is not surprising that the 1860s saw the appearance of some national public policies. Many social scientists look upon the mid- to late 19th century in both the United States and England as the heyday of laissez-faire capitalism, in the sense that as much as any time since the advent of the Industrial Revolution it was an era in which public policies and attitudes extolled the efficiencies of competitive forces along with individual liberties, and where there was minimal public-sector interference in commercial activities.

Then, as now, the issue for those who champion the free enterprise system was essentially summarized in the dictum that if private citizens can provide for themselves, then public intervention is not justified. Yet drastic circumstances often necessitate changes in attitudes and public policies. The degree of public intervention in mid-19th-century social and economic activities remains a matter of some debate, and it is likely that social scientists tend to underestimate the extent of interventionist policies in the economic and social life of people and firms throughout this time period. Nonetheless, in the Victorian Age in England, under the reign of Queen Victoria (1837–1901), as well as in Lincoln's America, there were fewer attempts to enact rules and regulations about poverty, income, and commerce than would become apparent in later years.

During Lincoln's years in office, federal government spending and federal involvement in the national economy noticeably increased. Measured as a ratio of federal government spending to the nation's Gross Domestic Product (GDP), the relative size of the federal government rose from around 1.4 percent in 1861 to the then-unprecedented level of 14.2 percent of GDP in 1865. However, the expanded size of the federal government was due to the demands of wartime expenditures and not because of a large commitment of financial resources to social welfare or other relief programs. Within just a few years after the war, this ratio dropped back into the range of two to three percent of GDP, which while somewhat larger than it had historically been in the antebellum period, was more in line with the gradual long-term growth of federal spending over the course of the 19th century.

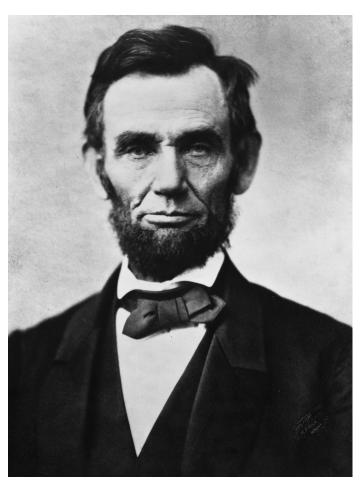

Traditionally, social and economic issues were often seen as dependent on and responsive to individuals, local conditions, and institutions. Limited provisions were modestly allocated as needed for some disabled and elderly workers under the influence of local poor laws, but not as a coordinated general policy. Consequently the treatment of the poor and remedies to poverty during much of the 19th century were more likely to be considered short-lived issues and local and private charitable activities rather than requiring consistent public policy initiatives. This can be an essential distinction, since adopting a public policy designed to lessen the injurious effects of poverty not only involves a different mindset from a private, charitable response but also requires an alternative commitment of resources.

The magnitude and breadth of economic, social, and human destruction and disruption from the American Civil War forced an alternative response. Even with the enormity of the economic and social crisis associated with the Civil War, it would still require another pervasive crisis in the form of the Great Depression, several generations after 1865, in the 1930s, for the adoption of such notable national antipoverty relief programs as the Social Security Act of 1935, the Fair Labor Standards Act of 1938, and various federal housing legislation.

Public opinion about the appropriateness of establishing a national pension program was generally positive, although support for these programs was plainly stronger among those directly affected, and was normally more intense in larger towns and cities. Monetary benefits to Civil War veterans and their families were offered by the federal government as well as by state and local governments, and thus in the postbellum period the organization of pension and disability insurance programs began to be more national rather than merely local or regional.

Moreover nationally based programs would prove to have elementary, although perhaps less evident, effects on persistent levels of poverty. Typically, 19th-century poor laws and programs, when present, were concentrated in more urban and industrial centers, leaving rural and agricultural communities cut off from relief programs, and these locations had early on begun to lag behind with regard to sustaining income levels. Inconsistent and insufficient income levels often have a number of dire short-term and long-term consequences, not the least of which is the ability of a community to foster future economic growth that in turn would generate future economic opportunities and incomes.

The pension program set up during the Civil War compensated not only disabled soldiers and sailors but also the widows, orphans, and dependent mothers of those killed or maimed in the war's hostilities. The death and or injury of a husband, father, or son re-

Born into poverty in 1809, Abraham Lincoln had views on the poor that were swayed by the circumstances in which he lived.

duced a family's income and heightened the risk of indebtedness and poverty. Studies indicate that the proportion of female inmates in poorhouses increased during the Civil War, but declined in relative terms immediately after the war, so there is reason to believe that initially the intent of the pension program as a relief program was at least partially fulfilled. Other studies have questioned how the pressures of late 19th-century political pressures and patronage affected the administration and effectiveness of the pension program.

Lincoln has become such an iconic figure in American history that it is not surprising that politicians and social theorists with varying ideological positions have interpreted his words and writings on contentious issues in alternative ways.

Born into poverty in 1809, Lincoln had views on the poor and poverty that were swayed by the circumstances in which he lived. In his first annual message to Congress in December 1861, he expressed his belief that a free, hired laborer provides hope and not only im-

proves economic conditions in general but in particular improves the conditions of those battered by poverty and missing opportunities. Moreover the poor and those with limited economic opportunities were willing and able to assume a productive position in an expanding economy and society. Lincoln openly thought of himself as a man of the people and he largely adopted economic policies that were consistent with prevailing economic writings of his day, such as the idea that labor was the principal basis from which human wants are supplied. Honest and fairly compensated labor provides new and expanded opportunities in both economic and political terms, and Lincoln held that society could rely upon those rising from unprivileged conditions, indeed that "no men living are more worthy to be trusted than those who toil up from poverty."

Since the occurrence of women and children living in poverty is often disproportionate to their numbers in the general population, some attention ought to be paid to the cause and duration of their poverty. Economic opportunities can be limited by any number of policies that either restrict ownership or access to or participation in market activities. The widows and orphans of Civil War veterans remain a prominent feature in the legacy of the Lincoln administration's policies on social welfare (the last surviving widow of a Civil War veteran died in May 2004, 139 years after Robert E. Lee's surrender at Appomattox, leaving a handful of surviving children of Civil War veterans on the benefit rolls of the Veterans Administration even into the 21st century). It is worth considering the role of gender in the history of American social policies. With respect to both the origins and the duration of poverty there are a number of interesting issues relative to gender, family structure, childcare, and education. Some have argued that pension programs and other government policies have pressed some women into the workforce, though typically not in labor markets with high wages. Others have argued that these pension programs were designed to limit benefits to those deemed socially and morally fit by the standards established in a politicized and patriarchal system.

The Lincoln administration's most consequential and enduring effect on the incidence of American poverty likely remains, like so much of his presidency, invariably related to the Civil War. The war ended institutional slavery and emancipated nearly four million men, women, and children who had been living in bondage. Freed from the legal restrictions of slavery, former slaves and their descendants had the chance to more fully participate in an expanding American econ-

omy, and thus poverty theoretically ought to have been reduced.

Regrettably the end of slavery did not mean the end of racial subordination since various forms of economic, social, and political segregation along with other discriminatory practices led to a number of economic inefficiencies and helped to sustain the incidence of poverty.

TIMOTHY SULLIVAN
TOWSON UNIVERSITY

List, Friedrich (1789–1846)

FRIEDRICH LIST SUGGESTED ways to overcome poverty and the lack of industrialization. Neither Soviet-style planned nor Western capitalist market economies have brought about the development necessary to lift Third World countries out of poverty. Since the early 1950s, development has equaled economic growth; however, neoliberalism has missed the point of social justice, which is crucial for any strategy of development. Globalization has not necessarily helped Less Developed Countries (LDCs); on the contrary, statistics show that rich countries have become richer, poor countries poorer. The theories of industrialization have not delivered the "wealth for nations"; what has become obvious is the ineffectiveness of these theories.

For Germany the economic nationalist Friedrich List had advocated a self-sufficient economy, guided by a strong, interventionist government that would use its economic resources for national industrialization. List argues against David Ricardo's "free trade" and Adam Smith's policy of "laissez-faire." He favored protectionism against the superior British-manufactured exports.

List lived for some years in the United States and read Alexander Hamilton's "Report on the Subject of Manufacturers," where Hamilton advocated governmental measures for the encouragement and protection of domestic industries—the classic infant industry argument, whereby the government helps developing industries, protecting them from foreign competition, to catch up.

Statistics show that rich countries have become richer, poor countries poorer.

There is a direct link between the American critique of the English Navigation Acts and Hamilton's advocacy of national protection and encouragement of infant industries, and it stretches from Hamilton to List. Prussia became equal to Britain with the help of quasimercantilist, selective self-reliance organized by its strong state. Britain's technological superiority and industrial advance were the lynchpin of its hegemony. Because of its predominance, it could dictate the course of other states' development.

During the 1800s all countries were confronted with two options. They could follow Ricardo's concept of comparative advantage and the advice of British industrialists and politicians and integrate into an international division of labor oriented toward Britain, whereby Britain produced manufactured goods for exports and imported resources from other countries. Or they could disregard the benefits of comparative advantage and enact a forced industrialization based on one's own national productive forces. The first option meant, besides the economic arrangement, a political arrangement of colonial or quasi-colonial status. The second option meant potentially political, if not military, conflicts as the country developed economically and politically, becoming an equal to Britain and remaining independent.

List considered that the seductive voice of British economic liberalism would, however, lead to dependence. Free trade was for him a cover-up for unequal relations among nations. That is why he advocated a vigorous and pervasive policy of state-led national development in the latecomer Germany, in which protec-

tionism, investment infrastructure, and a strong emphasis on education were crucial.

For List "the power of producing wealth is infinitely more important than wealth itself," as has been phrased by J.A. Tickner. The development of scientific, technological, educational, and transport infrastructure and industrialization became a necessary adjunct to politics.

Protectionism would vary from country to country and industry to industry and might not be necessary for some industries. The key point for List was for a country to develop its productive powers, even if this meant hardship for consumers—this was only a short-term effect, strengthening industries and benefiting consumers in the long term.

Any state that tries to exert its influence risks disinvestment and capital flight.

The development of productive powers needs political institutions and a state to provide infrastructure, particularly an internal system of transportation. This state depends on an advanced level of agriculture and must be politically integrated. Late-developing countries, as a matter of fact, had an advantage, as they were able to learn from the mistakes in the industrialization strategy of more advanced countries. This is the core of List's strategy.

Local self-reliance and diversity are the purpose of economies and trade. Many would argue, however, that the idea of a domestic economy hemmed in by defined borders and managed by the state is now obsolete. Statistics show that rich countries have become richer, poor countries poorer. The state has little effective influence or control over these forces. Any state that tries to exert its influence risks disinvestment, capital flight, and recession. However, many experts would argue that globalization leads to economic insecurity, financial instability, and ambiguous identities.

First, List believed that free trade was the policy of the strong. Second, statism, the crucial role of the state in the process of industrialization, was necessary for him, and the World Bank agrees with List. Despite neoliberal pronouncements to shrink the state sector as well as the existing rise of supraterritoriality, collapsing states such as Belgium, Lebanon, and Uganda have recovered, and the divisions in Ethiopia, the former Yugoslavia, former Czechoslovakia, and former Soviet Union have led to more sovereign states, not fewer.

Sovereignty traditionally means a claim by the state to be supreme, comprehensive, unqualified, and exclusive over its territorial jurisdiction. This type of sovereignty never fully existed. However, we do live in an "intermestic" (an international and domestic mutually penetrating) world.

Maybe sovereignty has been eroded to a degree, but the state still exists as a main actor, and globalization does not dissolve the state or sovereignty. However, globalization has added global governance, regionalism, and substate transborder relations (ties among Italy, Slovenia, Croatia, and Austria around the area of Trieste, for example).

National governments are sandwiched between global forces and local demands, but what this exactly means for the future is not obvious at all. Hyperglobalists see everybody in poor countries as much as in rich countries as benefiting from globalization; skeptics argue that increased competition, deregulations, privatization, and open capital markets have made many millions poorer in LDCs. List gives an answer about how LDCs should respond to this uneven globalization.

List was fully aware of the pressures on a less industrialized country to follow the rules as developed by the stronger partner. If the developed and less-developed countries were completely isolated from one another, there would be no problem. Just as soon as societies with unequal levels of development come into contact with one another, displacement competition arises.

For R. Wade the success of some Asian countries can only be explained by industrial policies that lead the market and reflect government anticipation of future comparative advantage. This governed-market approach uses price and nonprice methods to channel investment away from unproductive uses, expand technological capacity, strengthen links with foreign firms, and give a directional thrust to selected industries.

These interventions need to be based on a plan for the pattern of trade and industry over time, and this plan must be open to feedback from the market. That is, governments must not help uncompetitive industries indefinitely; assistance in the form of tariff rebates, fiscal incentives, selective credit, and so on must be made conditional on performance. With this "new interventionism," which seeks to guide markets but not to replace them, the Listian strategy has been refined, not refuted.

Lithuania

LITHUANIA IS THE LARGEST of the three Baltic States. It borders Belarus, Kalining (a Russian region), Latvia, and Poland. Vilnius is the capital (with a population of 553,000). The population totaled 3.418 million in 2005; however, during the past decade the population has declined. Its ethnicity is 83.5 percent Lithuanians, 6.3 percent Russians, 6.7 percent Poles, and 2.2 percent others. Lithuania's workforce is highly skilled and educated. In 2004, Lithuania became a European Union member and joined the North Atlantic Treaty Organization.

Lithuania was dominated by agriculture until the greatest part of its industrialization took place under Soviet occupation. Lithuania was among the most in-

dustrialized economies of the former Soviet Union, with a per capita Gross Domestic Product (GDP) in the 1990s about 50 percent higher than that of Russia.

After the collapse of the Soviet system in the early 1990s, Lithuania regained its independence. Major economic reforms started right after independence. Reform targets were to liberalize prices and withdraw government subsidies. The Civic Front Party, Sajudis, introduced a voucher program in 1991, which aimed at a fast privatization process with relatively equal distribution of wealth. The Labor Party developed this process in 1993.

Privatization was one of the factors that caused a quick increase in the number of people who were poor. Pensioners, employees, and people occupied in cultural, educational, and agricultural spheres became the losers in the property redistribution process. Finally, privatization caused social polarization, with dangerously growing potential for social group conflict.

Following the adaptation of price liberalization after 1990, however, GDP fell significantly before showing signs of growth in 1994. Prices increased sharply during 1991 and 1992. The official inflation rate soared to 383 percent in 1991 and 1,163 percent in 1992, before moderating to 45 percent in 1994 and 36 percent in 1995. Real wages in the public sector fell dramatically through 1993, and since then have improved slightly. Pressure from the International Monetary Fund (IMF) resulted in more wage controls at the end of 1992.

In the summer of 1993, Lithuania introduced its own currency, the *litas* (LTL), and in April 1994, it implemented a currency board, fixing the *litas* directly to the U.S. dollar. This step was done to give stabilization policy more credibility.

A serious banking crisis in 1995–96 had a big influence on Lithuanian citizens' poverty level. However, a general indicator of the nation's well-being, per capita GDP (in comparative prices), grew by 4.9 percent from 1995 to 1996, and by 5.8 percent from 1996 to 1997. The overall percentage of people living below the relative poverty line decreased from 18 percent in 1996 to 16.4 percent in 2001.

Unfortunately a huge poverty gap exists today between rural and urban areas. In rural areas, the percentage of people living below the relative poverty line has actually increased from 26 percent to 27.3 percent, while in urban areas, the percentage of people living in poverty fell from 14.3 percent to 11.3 percent. The basic problem is that the officially declared relative poverty rate can't be used to reflect the real proportions of poverty problems in the country. For example, living

standards differ two to four times between the city or town and countryside. Approximately 40 percent of the rural population are considered relatively poor.

The average monthly disposable income per capita by residential area increased 25 percent from 326.7 LTL in 1996 to 409.5 LTL in 2001. The disposable income of urban and rural areas increased 29 percent, while that of the rural areas increased only 16 percent.

The government, in November 2002, approved the National Poverty Reduction strategy. Main targets were to eliminate extreme poverty in Lithuania by 2003, reduce relative poverty to at least 13 percent in 2005, and reduce the poverty level of the poorest social groups.

Human Development Index Rank: 39 Human Poverty Index Rank: Not included.

Live Aid

LIVE AID WAS A SERIES of rock music concerts taking place at different venues on both sides of the Atlantic on July 13, 1985, to raise funds for famine relief in Ethiopia. Bob Geldof and Midge Ure organized the event as a response to the public sensation caused by journalist Michael Buerk's BBC documentary in October 1984, which highlighted the horrors brought about by drought and civil war.

Live Aid followed another Geldof-Ure project, the successful charity single record *Do They Know It's Christmas Time*, which, the previous winter, had grouped several important British and Irish performers in Band Aid. The main sites of the event were Wembley Stadium in London, where more than 70,000 people

gathered, and JFK Stadium in New York, where more than 90,000 fans attended. Approximately 1.5 billion viewers in 100 different countries watched the live broadcast, one of the largest television broadcasts in history. Live Aid performers included Status Quo, The Style Council, Adam Ant, Queen, Sting, Phil Collins, U2, The Beach Boys, David Bowie, Elton John, Madonna, Dire Straits, Paul McCartney, Duran Duran, Eric Clapton, Neil Young, B.B. King, Hall & Oates, Mick Jagger, Tina Turner, and Bob Dylan.

Some said that performers were there as much for their careers as for the Ethiopians.

Described as the Woodstock of the 1980s, Live Aid went on for 16 hours. The two main events in London and Philadelphia were closed respectively by Band Aid's Do They Know It's Christmas Time and USA for Africa's We Are the World. The BBC was mainly responsible for broadcasting the event in Europe, while ABC was in charge of the U.S. broadcast.

Throughout the event, Geldof and the television presenters solicited donations from viewers. In the end, Live Aid managed to raise \$245.4 million, which far exceeded initial expectations. The largest donation came from the ruling family of Dubai, and the country that donated the most was Ireland, which at the time was experiencing a severe economic depression. Together with success came controversies.

Dylan's remark on how some of the money raised could go to American impoverished farmers who were losing their business was dismissed by Geldof as "a crass, stupid, and nationalistic thing to say." As often happens at philanthropic events, some speculated that Live Aid performers were there as much for their own careers as for the Ethiopians suffering from famine. This was also the view taken by the irreverent anarchist band Chumbawamba, who ridiculed the event in their record *Pictures of Starving Children Sell Records* (1986).

In addition, concerns were raised on how money was spent, how much of the money actually went to starving populations. In June 2005, just as Geldof's new charitable event, Live 8, was approaching, Fox News TV host Bill O'Reilly claimed that much of the money had in fact gone to the government of the totalitarian Ethiopian dictator Mengistu.

David Rieff espoused the same position in his article "Dangerous Pity," where he wrote, "donors became participant in a civil war." Many reporters indicted cor-

ruption, rather than famine, as Africa's main problem. On its 20th anniversary, Live Aid was also subjected to criticism for the image it projects of Ethiopia and Ethiopians, one that is 20 years out of date and does not take into account the progress made by the country since the 1980s. Celebrations of the anniversary, its critics said, simply scared off prospective foreign investors.

Living-Standards Measurement Study

THE LIVING-STANDARDS Measurement Study (LSMS) was established in 1980 by the World Bank Policy Research Department (now called the Development Economics Research Group, or DECRG) to explore ways of improving the type and quality of household data collected by government statistical offices in developing countries, in support of the negotiations between the countries and the World Bank and the adoption of national social policies.

The first surveys were fielded in the Ivory Coast (1985), Peru (1985–86), Ghana (1987–88), and Mauritania (1988); now over 30 developing countries have been surveyed. Funding was initially supplied by the World Bank, and by 1987, surveys started to compete for resources from other development agencies, including USAID.

The objectives of Living-Standards Measurement Studies are to gather household data that can be used to assess household welfare and behavior, to develop new survey methods for monitoring progress, to improve communications between analysts and policymakers, and to evaluate the effect of various current and proposed government policies on the living conditions of the population.

The study is organized as a multitopic questionnaire into four major topics or modules: household, commu-

nity, prices, and anthropometric data (largely focusing on children). The modules are adapted to the objectives of specific surveys and to the study area, so that not all modules are included in every survey. Household module measures the broadest set of variables with respect to the individual members, the household, and housing. The various dimensions of well-being are questioned, including attitudes and perception of welfare, and the community module examines the local conditions common to all households in the area.

Major changes in the questionnaire structure took place in 1988, introducing health, education, and migration variables, and performing a scale-dependent assessment by urban population size.

Between 800 and 36,000 households are fielded in each study, which includes research on the following groups of topics: household composition, housing characteristics and tenancy, expenditures, and durable goods owned; ethnicity, language, and religion; education, childcare, literacy and education level, and educational costs and accessibility; health status, care expenses, care use and access, fertility, and mortality; employment, dependent and independent activity, employment status, time use, and wages; and credit sources and amount, savings, and borrowing.

The research also includes receipt of social benefits social assistance, maternity and childcare allowances, vouchers, or subsidies; migration motives, areas, and times; expenditures on food and consumption of food produced by the household, daily expenses on food, food value and items, seasonal products, and monthly and annual expenditures; farming and forestry activities, land use, costs and revenues, inputs, machinery, labor and crop production, and farm capital assets; nonagricultural household activities, type, operation, and investment; other income sources, remittances from abroad, gifts, and pensions; and social capital, social participation, exclusion, and citizenship.

In addition the questionnaires include attitudes toward standard of living, perception of welfare, and poverty and its causes; characteristics of the community, collective actions, transport infrastructure and public transportation, road maintenance, community services (electrical energy, public lighting, piped water, sanitation, waste management, telephone, mail service, community security, public market, recreation), education facilities (preprimary, primary, and secondary), health facilities, and social and environmental problems; prices and availability of food and nonfood products commonly purchased; and child anthropometric data (height and weight).

Living Wage Campaign

IN THE UNITED STATES, living wage campaigns support the enactment of laws to guarantee that the lowest-paid workers earn enough to support their families. Living wage laws are enacted at the local level and specify minimum per-hour pay rates that are higher than minimum wage rates mandated by national and state laws. By 2005 over 100 local governments in the United States had enacted living wage laws.

The living wage campaign was inspired by a steady erosion of wages for almost all working Americans between the late 1970s and the early 2000s—a process that hit lowest-income workers the hardest. From 1979 to 1999 (the latter year falling during the economic boom of the 1990s), the lowest-paid 10 percent of workers saw their average wages decline by 9.3 percent, while the percentage of workers earning poverty-level wages increased from 23.7 percent to 26.8 percent. During approximately the same period (1977–99), the income of the wealthiest one percent of Americans increased by 115 percent.

In addition to mandating wage levels above the national and state minimums, living wage laws typically apply only to businesses that have government contracts or that get development assistance (such as subsidies or tax credits) from local governments. Supporters of the laws argue that government should not help or do business with firms that pay poverty-level wages. There are two main types of living wage laws. Contrac-

tor-only laws apply to businesses that have contracts with the governmental unit that passed the law. Business-assistance laws apply to any company to which the governmental unit has given some form of assistance, such as tax breaks or subsidies. Of the two types, business-assistance laws appear to have greater effects, both positive and negative.

The principal argument for living wage laws is that they enable the lowest-paid workers to earn enough to rise above the poverty level. The principal argument against living wage laws is that they enable some workers to earn more by causing other workers to become unemployed. Economic theory predicts that, in general, when the price of a good increases, consumers or businesses reduce the amount of the good that they purchase. Applied to labor, this means that if wages increase, businesses will reduce the amount of labor that they purchase, thereby causing unemployment.

Opponents of living wage laws advance this argument to contend that such laws do not, in fact, reduce poverty. Empirical studies of living wage laws paint a more complicated picture. The economic-theory argument assumes that purchasers buy the same good at both higher and lower prices. However, higher-paid workers are more reliable and less likely to quit, leading to lower costs from employee turnover. In addition, living wage laws apply only to the lowest-paid workers who are employed either by government contractors or recipients of government business assistance.

Living wage laws enable the lowest-paid workers to rise above the poverty level.

As a result, living wage laws appear to have a net positive effect. Depending on the type of living wage law and the local economy where it is enacted, the laws often do (but sometimes do not) cause a small amount of unemployment. However, this negative effect is more than balanced by higher wages that lift a greater number of families out of poverty. As one study by S. Adams and D. Neumark observed, "even coupled with some employment reductions, living wages can lift a detectable number of families above the poverty line."

Living Waters for the World

LIVING WATERS FOR the World (LWW) is a mission of the Synod of Living Waters. The synod encompasses all of the churches of the Presbyterian Church in the United States (PCUSA) located in the states of Alabama, Mississippi, Tennessee, and Kentucky. The mission of Living Waters for the World is to train and equip mission groups and others for giving the gift of clean water to communities in need.

Living Waters for the World is seeking to meet a critical need among the poor in the world by installing water purification systems in poor communities. It also develops related educational programs associated with providing clean water. LWW conceives of its mission as a way to address a critical niche in the world's water crisis. Participation in Living Waters for the World's ministry is open to all church denominations and to civic groups. The ministry of providing clean water is a lifechanging activity for many people who participate in the program.

Living Waters for the World was the idea of the Reverend Wil Howie, who had been a psychologist prior to entering the ministry. Called to serve in a church in the Synod of Living Waters, he soon felt led to bring lifesaving "living" waters to people thirsting around the world for clean water. The LWW project began in the early 1990s. The Hunger Network of the Synod of Living Waters adopted it in late 1992. With full synod approval the first project was completed in the spring of 1993 when a purification unit was installed in Reynosa, Mexico.

Living Waters for the World uses a program of church partnerships to locate and install its water purification units. In one of the earliest installations, the Minnesota Valleys Presbytery joined with Occidente Presbytery to install a unit at Sibila in western Guatemala. Roman Catholic, Methodist, and other churches have also participated with mission partners. In addition, Children of the World has helped to install units in India and Haiti. Using mission partners helps the

people who will be using the purification units with more than the material good of a clean water unit. It empowers them with a sense of accomplishment and with an opportunity to build a better life for themselves and others.

The water purification system was designed by a group of Presbyterian engineers. It has been installed in over 50 sites in Mexico, Guatemala, Brazil, Honduras, Haiti, Belize, Nicaragua, El Salvador, and India. In 2005 and 2006 the first installations in Africa and new Asian countries were scheduled to take place. The system is designed to purify water in 300-gallon batches. It can be used at clinics, churches, schools, orphanages, or other places where relatively small groups of people gather. Following the great destruction caused in August 2005 by Hurricane Katrina on the Mississippi Gulf Coast, units of the system were deployed to the area as part of the disaster relief. Presbyterian Disaster Assistance installed and operated units providing much needed water.

Locke, John (1632-1704)

BORN IN WRINGTON, Somerset, England, John Locke is well-known for his liberal political philosophies and as the founder of English empiricism. Because he spent a majority of his life in England, Locke's work was influenced by a tumultuous political and religious British reign, his connection to politics and political leaders, and the intellectual works of his European peers. Well educated, Locke had interests ranging from science and medicine to education and politics.

His works primarily addressed theories of knowledge and pedagogy, religious perspectives, educational theory, and political theory. He was the author of several noted publications, including *Two Treatises on Governal*

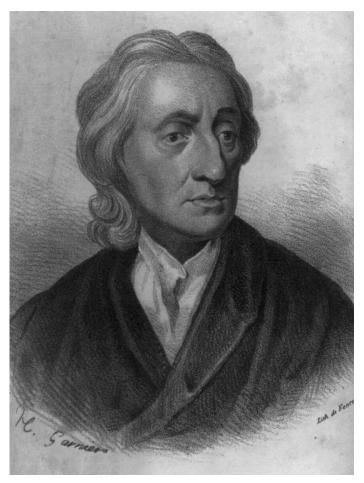

ernment (1690), "Essay Concerning Human Understanding" (1690), "A Letter Concerning Toleration" (1689), and "Some Thoughts Concerning Education" (1693), among others.

Locke's belief in the structure of nature and social life influenced his work profoundly. While it was popular belief at the time that people were born with innate knowledge, particularly in regard to God and moral codes, Locke was of the belief that our knowledge of these matters stemmed from our experiences. It was through our personal experiences that our understanding of natural order would enforce conceptions of religion and morality.

It was his belief in a "natural order" that also set Locke apart from many of his day. Locke believed that even without the intense regulation enforced within a civilized society there was a certain structure to social life, and this was accompanied by inalienable rights assured to humanity. It is from this belief in humanity's inalienable rights to "life, liberty, and estate" (estate can be taken to mean property) that Locke's work had profoundly influenced the construction of many societies' political ideologies and structures (notably within the Constitution of the United States).

Locke argued that part of a government's mission was to protect the property of its subjects. This argument was enforced by his belief that the ownership of property was part of God's divine plan. Locke, within his second Treatise of Government, did not particularly expand or explain this assertion. Nor did he explain why the Creator's plan could not be interpreted to imply communal ownership of property or the means of production. Further, Locke argues that a person's labor was part of his property, of which a person had the right to sell this property (that is, labor), and that the products of this labor would then belong to the purchaser of said labor (capitalists)—this is in some respects a contradiction of Locke's assertions of a natural order and the nature of ownership and serves as a particular limitation to his theoretic work.

While Locke did believe in the natural virtuosity of man, he also supported the existence of government. From his perspective government should be tasked with the protection of property, but should also serve as a means to foster and inform the virtue of man. Locke did not specifically argue against the conception of rule via divine right (as was seen in many of the monarchies of his day); he did, however, argue that those being governed should consent to being ruled. Thus the government or system of rule was to be enforced and legitimized by the consent of the people. This would

John Locke's political philosophy raised the question of government's responsibility to relieve poverty, among other social ills.

not only enforce legitimacy of the ruler or government but would encourage moral leadership.

Within his second *Treatise of Government*, Locke articulated the first modern theory of popular sovereignty. He argued for the necessity of government to serve as a trustee to the people and that its power should be regulated and limited in scope. Thus, the purpose of government should be directed by the pursuance of the good of the people, and that the governed should have the ability and right to challenge, or transform, a government that is not serving these purposes. It is within this framing that revolutions and restructuring of government can be justified. In this government pursuance of the good of the people, Locke was also stating that government had a responsibility to relieve the people's poverty, among other ills of society.

Locke is noted for distinguishing various functions of government, in particular into the branches of executive, judicial, and legislative. Locke believed that the greatest political power should be placed with the executive branch to help ensure the responsiveness of the government to the will of the people. But by having various branches, this would help foster a balance of power within the governing system. While in his earlier works Locke defended the right of government to legislate religious ceremony, he later was convinced of the importance to draw boundaries between civil and religious societies. If a government were allowed to dictate religious behaviors and beliefs, it would be difficult to limit legislation in other aspects of social life.

His perspectives on property ownership and government structure have proven Locke's continuing importance in world political and economic structures. Many governments, perhaps most notably Britain and the United States (as well as other previous British colonies), have political foundations rooted in Locke's political philosophies. These foundations continue to enforce ideologies of innate human rights to property and wealth worldwide.

Low-Income Cut-Offs

A LOW-INCOME CUT-OFF, or LICO, is an income threshold used to identify those having low-income status. The term usually refers to Statistics Canada's official LICO. Statistics Canada describes a LICO as an income threshold below which a family will likely devote a 20 percent larger share of its income to the necessities of food, shelter, and clothing than would the average family. Unlike most income poverty lines, the LICO thresholds were designed to change as consumption norms changed. As a result the LICO is unusual in being a relative measure of low income that identifies individuals who are unable to meet relatively determined basic needs. In the absence of an official poverty

line, the LICO has become the most popularly reported poverty line in Canada.

BACKGROUND

During the 1960s, the U.S. War on Poverty introduced new social policies and programs and the first official U.S. poverty line. In Canada a similar campaign led to the redesign and expansion of Canada's social safety net and the introduction of the first official LICO. Like the U.S. poverty line, Canada's new LICO was conceived as a critical measurement tool in the battle against poverty. Not surprisingly the methodology adopted for determining the LICO was strongly influenced by the recent development of the U.S. official poverty line and its identification of thresholds at which income becomes inadequate to afford basic needs.

Beginning with S.B. Rowntree, the most common way to establish such income sufficiency thresholds was to construct minimum budgets that provided for basic needs. In addition to being intuitively appealing, the budget approach had the advantage of allowing income adequacy to be adjusted according to family size, age composition, place of residence (farm or urban), and regional prices. While Mollie Orshansky based the official U.S. poverty line on a budget approach, Jenny Podoluk sought a different method for constructing Canada's LICO thresholds.

An important reason for Podoluk's decision to develop an alternative to the budget approach was mounting evidence that "the standards set as needs usually rise as over-all real incomes rise." Podoluk was also aware of the idea that subsistence budgets were strongly influenced by current consumption norms and the current level of societal concern with poverty, and with the review of the many conceptual and statistical barriers to estimating minimum budgets. Podoluk was also concerned by Orshansky's discovery that small and reasonable changes in budget allowances could increase the measured number of identified poor by up to 50 percent.

While Podoluk rejected the budget approach, she accepted the view that income adequacy to afford basic needs was an important characteristic of any income sufficiency threshold. As she put it, "the poor are those who do not have sufficient income resources to satisfy these needs." Since poverty lines tended to rise with general living standards, Podoluk proposed that any threshold for income adequacy should reflect the affordability of relatively determined basic needs. The new methodology for establishing the LICO was there-

fore intended to establish a relative standard of basic needs consumption, determine income adequacy to afford these relatively determined basic needs, allow income adequacy to be adjusted according to needs that varied with family size, and do this while avoiding the problems identified with the U.S. budget approach. In addition, by focusing on low-income status instead of poverty, the new LICO was also intended to avoid the unsatisfying and irresolvable debate over whether poverty standards should be absolute or relative. Low income is less controversially a state of relative deprivation, and Statistics Canada has consistently argued against interpretation of the LICO thresholds as poverty lines.

THE LICO METHODOLOGY

Podoluk began her identification of low-income status by looking at how Canadian families spend their income. The 1959 Survey of Family Expenditures (FAMEX) indicated that, on average, about 50 percent of family income was devoted to food, housing, and clothing purchases. Generalizing on Engel's Law, Podoluk noted that the fraction of income devoted to these "necessities" tends to rise as income falls, while the income available for discretionary consumption declines. Rather than appeal to an expert scale or budgetary allowance, Podoluk adopted a deliberately arbitrary standard in which a family would be judged to be in "straightened circumstances" if necessities expenditures tended to consume a 70 percent or larger share of their income.

There is a possibility that the LICO might be abandoned by Statistics Canada.

The 1959 FAMEX data revealed that food, shelter, and clothing expenditures reached 70 percent of family income when families of size 1, 2, 3, 4, and 5 or more had incomes of \$1,500, \$2,500, \$3,000, \$3,500, and \$4,000 respectively. These thresholds were then adjusted using the Consumer Price Index (CPI) to 1961 prices and applied to family income data from the 1961 census to estimate low-income rates. Subsequently, inflation-adjusted LICO thresholds were applied to family income data from the Survey of Consumer Finances (SCF) to get low-income rates for noncensus years. The result was the first comprehensive view of Canadian patterns of poverty.

In 1971 the Special Senate Committee on Poverty in Canada criticized the simple updating of the LICO thresholds using the CPI as failing "to take account of changing socioeconomic conditions over the last decade in Canada." The response by Statistics Canada was to use the most recent FAMEX evidence to "rebase" the LICO thresholds using a four-step procedure:

- 1) Estimate the average proportion of income spent on necessities (defined as food, shelter, and clothing) from the FAMEX survey.
- 2) Add 20 percent to this average proportion to get the cut-off proportion of income spent on necessities.
- 3) Estimate a log-linear Engel curve for different family types whereby family types are distinguished by the size of the family and the size of the community of residence. (Region of residence categories were explored but not implemented.)
- 4) Use the estimated Engel curve to identify the income level corresponding to the cut-off proportion for each family type. For each family type, this income level then became the Low-Income Cut-Off (LICO) for identifying families having low-income status.

Using this method, the LICO thresholds were rebased using the 1969, 1978, 1982, 1986, and 1992 FAMEX, though the 1982 LICO thresholds were not published. In the years between the FAMEX surveys, the LICO thresholds were indexed upward using the CPI to adjust for inflation. In each instance, the LICO thresholds were intended to be interpreted as identifying low-income status, whereby low-income status was having a family income in which a disproportionately high share was consumed in the provision of necessities. Not surprisingly, rising living standards have caused the proportion of income spent on food, shelter, and clothing to fall for the average family from 50 percent in the 1959 FAMEX to about 35 percent in the 1992 FAMEX. Therefore the most recent LICO thresholds are intended to represent an income level at which at least 55 percent of income is required to meet expenditures on necessities.

Statistics Canada has also introduced an after-tax LICO that is intended to improve on the original LICO in two ways. First, the distribution of after-tax incomes better reflects the redistributive impact of tax and transfer policies. This makes it a better measure of the effectiveness of redistributive policies in helping the poor. Second, the purchase of "necessities" is made with after-tax dollars.

The number of people in low-income families is estimated by applying the LICO thresholds to the major available survey on family income. Until 1996 this was

usually the Survey of Consumer Finances (SCF). Subsequently the Survey of Labor and Income Dynamics (SLID) has become the primary source for family income data. This estimate is then used to calculate the low-income rate and the low-income gap.

The low-income rate is calculated by dividing the estimated number of people in low-income families with the total population. Low-income rates are also regularly calculated for subgroups identified by age, sex, region of residence, family type, and other categories of interest. For instance the low-income rate for children is calculated as the number of children in low-income families divided by the total number of children.

The low-income gap is calculated as the average difference between a low-income family's income and its associated LICO threshold. For example a family with an income of \$20,000 and a LICO of \$25,000 would have an income gap of \$5,000 and the low-income gap would be the average income gap of all families. The low-income gap is also expressed as a percentage. For instance the family with an income of \$20,000 and a LICO threshold of \$25,000 would have an income gap of 20 percent, and the low-income gap is the average percentage gap of all families.

Despite Statistics Canada's caution against interpreting the LICO thresholds as poverty lines, LICO-based statistics have become widely used indicators of poverty trends. This is not that surprising. The LICO was the first official indicator of low-income status, and the statistics generated from the LICO have provided a long and familiar set of time series that have proven very useful in identifying trends in the earnings of low-income Canadians.

In the absence of an international consensus on what poverty is, it becomes impossible to test how effective LICO-based statistics are in tracking poverty. For the same reason, alternative measures of low income cannot be shown to be better proxies of poverty. In the absence of such a standard, past practice argues in favor of continued reliance on familiar LICO-based statistics by groups interested in poverty.

Third, the well-defined LICO methodology requires fewer expert judgments than earlier budget approaches, which encourages the view that the LICO is a stable and intuitive test of low-income status. For instance the Canadian Council on Social Development (2001) and the National Council on Welfare (2004) both defend the continued use of the LICO. Important contrary voices do exist, with C. Sarlo and Kari Norman being prominent among those who advocate replacing the LICO.

While LICO-based statistics have become popular indicators of poverty trends, the LICO does not approach the status of the official U.S. poverty line. In particular, LICO thresholds have not been used as qualifying thresholds for means-tested social program entitlements. In Canada, provincial and local governments administer most social programs aimed at the poor and each jurisdiction uses its own set of qualifying thresholds. While the LICO is not used as a qualifying threshold for accessing social programs, it is used as a minimum standard for assessing financial capability to sponsor an immigrant under the family class sponsor-ship program.

PROBLEMS WITH THE LICO

Despite the popularity of the LICO, it has a long list of well-understood weaknesses. Perhaps the most obvious defect is that there is a predictable discontinuous jump in the poverty rate every time the LICO thresholds are rebased. This is related to a deeper problem: the years in which the LICO thresholds are rebased provide a measure of change in relative poverty, while the years in which the LICO thresholds that are merely indexed upward using the CPI provide a measure of change in absolute poverty. The combination of irregular rebasing and annual indexing creates considerable confusion about what the LICO is actually measuring.

The obvious solution to this dilemma is to rebase the LICO annually. Explored by scholars, this option became possible when the annual Survey of Household Spending replaced the irregular FAMEX in 1997. Statistics Canada has not chosen to pursue this option, leaving those interested in tracking poverty to find other solutions to the rebasing jump. The most common solution is to simply choose LICO thresholds from a single base year, and only adjust these thresholds for inflation. The cost of this solution is that each LICO threshold becomes an absolute standard that, over time, becomes increasingly disconnected from its usual interpretation. In addition the choice of base year can influence conclusions concerning how serious poverty is and how effective policy is in ameliorating the poverty problem.

Other common complaints with the LICO relate to the arbitrariness of many of the assumptions used in calculating the LICO thresholds. For instance the addition of 20 percent to the average in determining the cut-off proportion of income spent on necessities is not sufficiently justified, nor is the convention of categorizing all food, housing, and clothing expenditures as "necessities" and all other purchases as discretionary

goods. Another set of concerns is associated with what is excluded in the definition of pre- and posttax family income. For instance implicit rents accruing to those who own their own homes are excluded from family income, as are public goods, household goods, and unrealized capital gains. While direct taxes are included in the calculation of posttax income, the impact of sales taxes on consumption possibilities is excluded. Finally the exclusive use of an annual period of accounting tends to cause the duration of poverty to be overlooked. Studies have shown that reasonable changes to any of these measurement conventions can have a meaningful impact on where the LICO thresholds would be drawn and the extent of low income as measured by the LICO rate and gap.

Another set of complaints is associated with the use of the Engel curve in constructing the LICO thresholds. M.C. Wolfson and J.M. Evans point out that the modified Engel's Law relationship between the log of income and the log of expenditures on "necessities" is quite weak. This suggests that estimates of the share of family income devoted to necessities are not reliable, and that welfare judgments resting on these estimates are of dubious worth. Added to this is G. Anderson's evidence that the log-linear equation used to estimate the Engel curve is misspecified, which invalidates the standard interpretation of the LICO thresholds.

Other complaints include the way that the average expenditure on necessities is calculated, differences in the definition of the family income unit in the FAMEX and SCF, the difficulties in making international comparisons with low-income or poverty, and the lack of an absolute low income cut-off. Statistics Canada has responded to the last two criticisms by developing two new low-income cut-offs to supplement LICO-based low-income statistics, and it is to this that we next turn.

LICO AND OTHER THRESHOLDS

The problems with the LICO have encouraged Statistics Canada to develop alternate methodologies for identifying families who have low-income status. One proposal prompted Statistics Canada to introduce the Low-Income Measure (LIM) as the first alternative to the LICO. The LIM is estimated as 50 percent of the median of an adult equivalence scale-adjusted family income distribution. Any family whose adjusted family income falls below this threshold would be considered a low-income family.

There are a number of advantages to the LIM. First, the intuition is simpler and less likely to be misunderstood. Second, all that is required is survey information on family income and family size. This allows many of the problems associated with the LICO (from irregular rebasing up to income unit differences across surveys) to be avoided.

Third, it is more a purely relative measure than the LICO. Finally, it is closer to the methodology advocated by other nations, and as such is more internationally comparable.

One problem with the LIM is that it is not in any way tied to the ability to afford necessities. In fact the LIM makes no attempt to adjust for price variation between communities. This is a problem for the many users of low-income statistics who feel that the affordability of necessities should matter in determining low-income status.

Statistics Canada recently introduced the Market Basket Measure (MBM) of low income to address this and several other concerns. Under the MBM, low-income status is identified with having an income that is inadequate to afford a basket of food, shelter, clothing, transportation, and other "necessities" required for participation in the life of the community. This basket was constructed using the recommendations of a number of expert panels, and it includes many necessities beyond those required for mere subsistence.

The basket is then priced to reflect the cost of living for a family of two adults and two children according to region of residence and size of community of residence. For families of different sizes, the cost of the basket is then adjusted using an adult equivalence scale. The resulting MBM income thresholds provide an absolute measure of low-income that complements the purely relative measure of the LIM.

These new measures raise the question of what should be done with the LICO. While the LICO has enjoyed popularity as Canada's unofficial poverty line, Statistics Canada has been uncomfortable with this use, especially given its many problems. Certainly Statistics Canada has shown no enthusiasm for rebasing the LICO, despite the introduction of a new survey in 1997 that allows annual rebasing.

Given that the LIM and the MBM are more intuitive and suffer from fewer methodological problems, there is a real possibility that the LICO will eventually be abandoned by Statistics Canada.

PETER IBBOTT KING'S UNIVERSITY COLLEGE

Lumpenproletariat

LUMPENPROLETARIAT in Marxist terms is the opposite—with a negative meaning—of proletariat. In Marxist theory capitalists and proletarians are distinguished by the ownership and nonownership of the means of production. Whereas nobility in a feudal society was inherited, the status of capitalist and proletarian is in principle "open," that is, the capitalist losing his ownership of means of production may become a proletarian (and, more seldomly, vice versa). The ownership of means of production is the determinative factor for a categorization into a class within a class society, but class-consciousness also plays a role. A proletarian is defined not only by his nonownership of the means of production, but also by his self-consciousness of his belonging to a certain class, that is, his class-consciousness.

A member of the lumpenproletariat could be described as a proletarian without class-consciousness.

Within the large number of Marxist theorists, this is probably the most common denominator for lumpen-proletariat. In an early stage of capitalist development, peasants no longer are active as peasants, but are not yet in the workforce within urban industries and might count as lumpenproletariat, too. But as lumpenproletariat always has a pejorative meaning, the simple fact of the economic condition of people would generally not qualify alone for the label lumpenproletariat.

The German Marxist tradition of the late 19th and early 20th centuries led to the emergence of a large labor movement, both in unions and in a political party (SPD, Social Democratic Party of Germany). Within this tradition the unorganized proletarian could be regarded as a "member" of the lumpenproletariat, as his economic condition should have led to the development of a class-consciousness, which would have forced him to organize. His failure to develop this class-consciousness disqualifies him as a "real" proletarian, and he becomes a "lumpenproletarier" or "lumpenprolet."

The emerging anti-Semitism in the late 19th century (as opposed to the older anti-Judaism of Catholic origin) was interpreted by many Marxists as a form of propaganda by the capitalists. Nevertheless anti-Semitic opinions were widespread within the labor movement itself, which led some theorists to link the notion of lumpenproletariat with anti-Semitic proletarians (this link was especially outlined by August Bebel, the pre-World War I leader of the SPD). In this use of the term lumpenproletariat the failure to develop class-consciousness by some of the proletarians leads to the tortuous path of a racial (supremacy) doctrine instead of a social explanation of economic inequality.

In the Leninist Soviet Union and later within the whole Eastern bloc, the term *lumpenproletariat* was used as part of the Marxist terminological legacy. Nevertheless the Leninist development of Marxism made the term on some occasions inappropriate, as the Leninist approach to a revolution in a not-yet-industrialized country (Russia) made the whole Marxist notion of proletariat (and hence lumpenproletariat) theoretically problematic.

The Soviet-style revolution of 1917 was made before *proletariat* in the Marxist meaning had emerged on a large scale in Russia. In the transformation process following the revolution (and not preceding it), millions of people passed through economic conditions that bore a resemblance to the traditional meaning of *lumpenproletariat*.

Therefore the term was seldom used to describe people within their own (socialist) society, but as a label for noncommunist labor movements in capitalist states it was still a perfect propagandistic term.

Luxembourg

FOUNDED IN 963, Luxembourg became an independent state under the Netherlands in 1815 and established itself as the Grand Duchy of Luxembourg. By 1867, Luxembourg had attained full independence. Despite taking a position of neutrality in World War I and World War II, the country was invaded by Germany in both wars. Luxembourg retreated from its position of neutrality after World War II and joined the Benelux Customs Union in 1948, followed by membership in the North Atlantic Treaty Organization in 1949. As one of the founding members of the European Community, now known as the European Union, Luxembourg maintains close economic ties with its European neighbors.

Luxembourg's economy is highly diversified within the service sector, and 86 percent of the labor force are involved in services. The financial sector provides around 22 percent of the Gross Domestic Product (GDP). Some 13 percent of the labor force are employed in industries that include steel, chemicals, and rubber. Out of a labor force of 293,700, some 105,000 workers commute daily from neighboring countries, chiefly France, Belgium, and Germany. Many of Luxembourg's largest banks are foreign-owned, and foreign investors play a major role in economic growth in Luxembourg. Around one percent of the labor force are employed on small family-owned farms.

With a per capita annual income of \$58,900, Luxembourg is by far the richest nation in the world. Its closest contender for this position is the United States, with a per capita income of \$40,100. Luxembourg's prosperity is a result of solid growth, low inflation (2.4 percent), and low unemployment (4.5 percent). Economic prosperity has allowed Luxembourg to provide a high standard of living for its population of 468,571. Nevertheless inequalities do exist. The poorest 20 percent of the population live on 8.4 percent of the nation's resources while the richest 20 percent claim 38.9 percent of resources. Luxembourg is ranked 30.8 on the Gini Index of Human Inequality.

After the government collected data to analyze social exclusion in 1989, new legislation was passed to guarantee a minimum income to all citizens. Initially 63 percent of social assistance recipients were female and 37 percent were male. In 2002, 57 percent of the recipients were female and 43 percent were male. Around 13 percent of single-parent families receive social assistance, and almost 96 percent of those families are headed by females.

Elderly women are also likely to need government aid because many of them accrued little or no benefits while raising children. In the total population, six percent earn less than 50 percent of the median income, and 0.3 percent live on less than \$11 a day.

Luxembourg is by far the richest nation in the world.

Life expectancy is high at 78.74 years. In general, women enjoy a projected life span (82.24) that is seven years longer than that of males (75.45). The median age is 38.51 years. Nearly 19 percent of the population are under the age of 14, and over 14 percent have reached the age of 65. All citizens have access to safe drinking water and improved sanitation. Healthcare is widely available, and there are 254 physicians for every 100,000 residents. From 95 to 100 percent of the population have access to affordable essential drugs.

Between 1970 and 2005, infant mortality in Luxembourg declined from 19 to 4.81 deaths per 1,000 live births. Among all children under the age of 5, the mortality rate fell from 26 to five deaths per 1,000 during that same period. Four percent of all infants are underweight at birth. Childhood immunization rates for children between birth and 23 months range from 91 to 99 percent. Education is compulsory, and most children attend school for 14 years. All of the Luxembourg population over the age of 15 is able to read and write.

Sex education is taught in the schools in Luxembourg, and birth control information has been widely disseminated. As a result the fertility rate is low. Women bear an average of 1.79 children each. Among teenage mothers, the fertility rate is 15 births per 1,000. Trained medical staff attend all births. According to modeled estimates for 2000, maternal mortality occurs at a rate of 28 deaths per 100,000 live births.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Luxembourg Employment Study

THE LUXEMBOURG Employment Study (LES) is a database containing labor force characteristics. It was created in the 1990s by means of surveys. The study gathered a large amount of data on individuals in families. The 13 major categories of data are: demographic, work status, employment characteristics of the main job, information about a second job, previous work experience of person not in employment, searching for employment, situation of inactive persons, education and training, situation one year before survey, labor force status, earnings and income, technical items, and slot variables.

Within each of the 13 categories of the survey are 90 places for information to be gathered for each person. For example, within the demographic category data were gathered on relationship to reference person in the household, sex, age, marital status, nationality,

years of residence in this country, country of birth, ethnicity, region, urban or rural indicator, household type, family type, number of persons in household, number of children in household, number of employed in household, number of pensioners in household, and usual/main economic status.

The LES uses several international classification systems to evaluate the people in the survey. These classification systems include the International Standard Classification of the Occupations (ISCO), the General Industrial Classification of Economic Activities within the European Communities (NACE), the International Standard Industrial Classification of all Economic Activities (ISIC), and the International Standard Classification of Education (ISCED).

The LES gives researchers a powerful tool for understanding labor conditions.

Nearly two dozen European countries and the United States have participated in the study. The data are now available for researchers. LES provides a database of labor force surveys that allow different features of the labor market to be analyzed in a comparative way. For example a researcher might be interested in unemployed, middle-aged women out of the labor force with some education. The data were standardized and digitally stored by the government of Luxembourg in its mainframe computer at the Centre Informatique de l'Etat.

Using SPSS or SAS programming language, a researcher can analyze the data with an individually designed research design. Users of the system are required to register and to sign a statement obligating them to properly identify themselves and to conduct only ethical research.

Since the data are computerized it allows researchers to probe the database with questions. The database is so constructed that national microdata and standardized data are available, but access to the original surveys is not available, thus guaranteeing privacy to the original individual respondents to the survey.

Researchers using the LES include academics, marketing firms, labor researchers, and financial institutions such as the Federal Reserve Bank of Dallas, Texas. The ability to analyze new data with the standardized data of the LES gives such researchers a powerful tool for understanding current labor conditions and the prospects for future trends.

Luxembourg Income Study

THE LUXEMBOURG INCOME Study (LIS) is a project that brings together household surveys from 25 countries (surveys from four other countries are under negotiation) into a common database to make studies of international economic comparisons easier. For instance, it includes current population surveys from the United States, French surveys of income, and a Hungarian income study. LIS was founded in 1983 under the joint sponsorship of the government of the Grand Duchy of Luxembourg and the Centre for Population, Poverty and Policy Studies (CEPS).

LIS is a nonprofit cooperative project with a membership that includes 29 countries in Europe, the Americas, Asia, and Oceania, with members ranging from industrialized countries to those in transition to ones in the developing stage. LIS is funded primarily by the national research foundations of its members. Its main objective is to construct a comprehensive and useful database that can be considered as the best source for international comparative studies.

To further the objective, LIS initiated in 1994 the Luxembourg Employment Study (LES), which has constructed a databank containing Labor Force Surveys from the early 1990s from countries with quite different labor market structures. These surveys provide detailed information on areas like job search, employment characteristics, comparable occupations, investment in education, and migration. In 2003 the Luxembourg Wealth Study (LWB) was initiated with the goal of constructing cross-national comparable datasets from existing data, establishing a network of producers of microdata on household worth, and the production of guidelines for data producers.

The LIS, LES, and LWB collect datasets, that is, sample surveys that have already been collected by the Central Statistical Offices of the various member countries. The micro-datasets received are then transformed according to a variable structure in order to make them comparable across countries.

In other words, LIS, LES, and LWB are databases that put together and make comparable surveys of different countries for cross-country research purposes. The database includes household-income surveys that provide demographic, income, and expenditure information on three levels: household, person, and child. The average survey includes about 9,000 households, with more than 20,000 individuals.

The LIS uses over 200 variables, but not all of them are included in each survey. Because of the confidentiality of the information, users must register with the LIS to be given access. Registration must be done through its official website. A researcher working for an academic, government, or nonprofit organization affiliated with an LIS member country is allowed unlimited free usage of the LIS/LES database. The LIS member countries pay usage fees on behalf of their researchers. A link to a list of member countries is available on the LIS website.

PAUL AND TANYA SLOAN INDEPENDENT SCHOLARS

Luxemburg, Rosa (1870-1919)

ROSA LUXEMBURG, THE youngest of five children of a lower-middle-class Jewish family, was born Rosalia Luxemburg in Zamosc, in the Polish area of Russia. Her

family moved to Warsaw in 1988, where she finished Girl's Gymnasium in 1887. She became interested in politics while still at school and joined Proletariat, a left-wing Polish party, in 1886. In 1889 Rosa emigrated to Zurich, Switzerland, where she studied law and political economy along with many other socialist revolutionaries, including Anatolii Lunacharsky, Alexandra Kollontai, George Plekhanov, Leo Jogiches, and Pavel Axelrod. She joined Leo Jogiches and Julius Karski to form the Social Democratic Party of Poland in 1893, and edited the party's newspaper, *Sprawa Robotnicza* (*Workers' Cause*) in Paris, France.

After gaining her German citizenship by marrying Gustav Lubeck in 1898, Rosa settled in Berlin, where she joined the Social Democratic Party of Germany (SDP). With Karl Kautsky she attacked the revisionism of Eduard Bernstein, who argued that the best way to obtain socialism in an industrialized country was through trade union activity and parliamentary politics. In 1905 Luxemburg became the editor of the SPD newspaper, *Vorwarts* (*Forward*). From 1904 to 1906 she was imprisoned three times for her revolutionary activity. Luxemburg's experiences during the failed revolution of 1905 led her to believe that a socialist revolution can take place not only in an advanced industrialized country such as Germany or France but also in an underdeveloped country like Russia.

Luxemburg taught Marxism and political economy at the Social Democratic Party School in Berlin between 1907 and 1914. Her continuing advocacy of a violent overthrow of capitalism by general strike alienated her from previous party leadership, personified in Karl Kautsky and August Bebel.

Opposed to German participation in World War I, she organized demonstrations calling for public disobedience. Because of her antigovernment activities she was sentenced to a year in prison. Nevertheless, the unanimous support of war subsidies by the SDP deputies meant a bitter and personal defeat for Luxemburg. In August she joined with Karl Liebknecht, Franz Mehring, and Clara Zetkin to establish an underground political organization called Internationale, which became Spartakusbund (Spartacus League) on January 1, 1916. The name of the organization symbolized the struggle of Spartacus, a Thracian slave, against the Roman Empire. Luxemburg herself took the name Junius, after Lucius Junius Brutus, alleged founder of the Roman Republic.

On May 1, 1916, after the Spartacus League came out into the open and organized demonstrations against World War I in Berlin, Luxemburg was arrested and im-

prisoned. While in prison, Luxemburg wrote *The Russian Revolution*, and criticized Vladimir Lenin and the dictatorial and terrorist methods being used by the Bolsheviks in Russia.

Luxemburg was released on November 9, 1918, when Max von Baden granted amnesty to all political prisoners. Two months later on January 1, 1919, Luxemburg, Karl Liebknecht, Leo Jogiches, Paul Levi, Ernest Meyer, Franz Mehring, and Clara Zetkin established the German Communist Party (KPD). A badly designed uprising, which both Luxemburg and Liebknecht opposed, erupted a few days afterward. Friedrich Ebert, the leader of the Social Democrat Party and Germany's new chancellor, called in Freikorps, the nationalist volunteer force, to put down the rebellion. By January 13 the rebellion had been crushed and most of its leaders were arrested. Luxemburg and Liebknecht were executed without trial on January 15, 1919.

The revolution, to fight in its battles—this was her highest happiness.

Luxemburg's life was one of an unwavering socialist revolutionary. Clara Zetkin, Luxemburg's comrade and contemporary, described her as the person whose great ambition was to pave the way for socialism. To experience the revolution, to fight in its battles—this was her highest happiness.

Among Luxemburg's numerous works, her book on economic imperialism, *The Accumulation of Capital* (1913), has been the best known and most influential. In this heavy reading for an individual unfamiliar with classic Marxism, Luxemburg advances a classic Marxian thesis from his *Kapital* that "the last cause of all real crises always remains the poverty and restricted consumption of the masses as compared to the tendency of capitalist production to develop the productive forces in such a way that only the absolute power of consumption of the entire society would be their limit."

The essence of her argument has been that capitalism is dependent on the continuous penetration into noncapitalist societies and economies. This capitalist penetration, according to Luxemburg, will deepen and broaden the market in the noncapitalist economies and increase demand for goods and services from industrialized countries, thus increasing production, decreasing unemployment, and increasing workers' wages in the industrialized economies. Thus one can argue that Lux-

emburg's views on capitalism were those of the perpetual and simultaneous generation and alleviation of poverty on a global scale.

WORLD POVERTY

Macedonia (FYROM)

MACEDONIA IS A FORMER constituent republic of the Socialist Federal Republic of Yugoslavia, having a population of 2,042,262 (2005). Because of a name conflict with Greece, Macedonia's official name is Former Yugoslav Republic of Macedonia (FYROM). According to the 2002 census, the majority of the population are ethnic Macedonians (64.2 percent), ethnic Albanians (25.2 percent), ethnic Turks (3.9 percent), and Serbs (two percent). The official language is Macedonian, along with Albanian, Turkish, Roma, and Serbian in the areas where these ethnic groups constitute at least 20 percent of the population. The poverty level in Macedonia remained significant in 2005, with approximately 23 percent of the total population living below the national poverty line.

According to the International Monetary Fund, "Poverty in Macedonia today is the result of two factors: fall in aggregate consumption during the 1990s; and rise in inequality in its distribution. Factors that have contributed the most toward deterioration of the economic and social well-being of the population, according to existing research, are the following: drastic decrease in economic activity; fall in real wages, pen-

sions, and other social incomes of the population; increase in income differences among groups of the population; implementation of privatization and other structural reforms, which have produced an army of unemployed workers; and solvency and liquidity problems of banks and enterprises as well as the high deficits of the off-budget social funds."

HISTORY

South Slavs moved into the ancient province of Macedonia in the 6th century. The region was continuously contested by Bulgaria, Serbia, and the Byzantine Empire. In 1345, Serbian Emperor Dušan the Mighty proclaimed Skoplje, the largest city in Macedonia, the capital of Serbia.

However, the region was conquered by the Ottoman Turks at the end of the 14th century. The Balkan wars (1912–13) were followed by the division of Macedonia among Serbia, Bulgaria, and Greece. Vardar Macedonia became a part of Serbia, known as South Serbia, and after World War I it was incorporated into the Kingdom of the Serbs, Croats, and Slovenes.

During World War II, Macedonia was divided between Bulgaria and the Italian-sponsored puppet state

of "Greater" Albania. After the war, the communist government of Yugoslavia granted federal status to the territory of Macedonia and created a new ethnic Macedonian identity.

Macedonia peacefully seceded from Yugoslavia in 1992, but was soon embroiled in an internal dispute between ethnic Macedonians and ethnic Albanians. Open hostilities between government forces and Albanian insurgents erupted in March–June 2001. A North Atlantic Treaty Organization (NATO) monitoring force, and diplomatic intervention ended hostilities by granting the Albanian minority substantial political, cultural, and territorial autonomy.

Macedonia was the least developed of the Yugoslav republics. Lack of infrastructure; United Nations sanctions on Serbia and Montenegro, Macedonia's largest trading partner; and a Greek economic embargo over a dispute about the country's constitutional name and flag hindered economic growth until 1996. While Gross Domestic Product (GDP) subsequently rose through 2000, economic development was undermined by the ethnic Albanian insurgency of 2001. The economy shrank 4.5 percent and hardly recovered with an estimated rate of 1.3 percent in 2004. The GDP annually per capita is \$7,100 (purchasing power parity) and unemployment is 36 percent.

Macroeconomic Policies

MACROECONOMIC POLICIES can be defined as sets of rules or regulations aimed to influence or control macroeconomic variables, such as aggregate income, unemployment, growth, and the general level of wages, prices, and interest rates. Macroeconomic poli-

cies can be broadly divided into demand-management policies and supply-management policies.

Demand-management policies are indirect management policies by which a government attempts to influence the level and composition of income and output, indirectly through the control of velocity, the money supply, and interest rates. Fiscal policy, monetary policy, and debt-management policy represent these types of economic processes.

Fiscal policy generally refers to the use of taxation and government expenditure to regulate the overall economic activity. Consequently if unemployment is high, income and expenditure taxes may be varied to stimulate the level of aggregate demand. The use of fiscal policy presumes changes in the government's budget, including the possibility of deficits. Alternatively, fiscal policies can be described as the budgetary processes that control the velocity of the money supply. Thus, a deficit budget would increase the velocity and stimulate aggregate demand. A surplus budget reduces velocity and restrains the aggregate demand.

Monetary policy is a macroeconomic policy by which the central bank changes the amount of money supply in circulation and/or the general level of interest rates. The tools of a monetary policy include reserve requirements, liquidity ratios, discount rates, lender of last resort facilities, and open market operations.

Debt-management policy denotes the action taken by the central bank to regulate the size and structure of the outstanding debt. It also can be described as the practice of funding the federal government's debts by using securities with differing maturities to influence economic activity. By changing production costs and expectations of the future, the federal government indirectly influences economic activity. In addition, debt management affects the foreign exchange rate and the balance of payments by making securities more or less attractive to foreigners.

Unlike the indirect demand-management policies, supply-management policies may be both direct and indirect. These macroeconomic policies operate on the supply side of the market and influence the level and composition of income and output either by control of production and distribution processes or through tax incentives. Direct supply management policies were more prevalent in the former socialist economies and a number of developing countries.

On an international scale, the prevailing conceptions of macroeconomic policy has experienced a marked evolution over the past few decades. In the industrialized nations, the focus of policy has moved

away from countercyclical fiscal prescriptions. The interest rate policy has become the major instrument in demand- and supply-side management. Improvement of international trade policies around the world is seen as a principal avenue for promoting economic expansion for all trading partners. Moreover, secular issues, especially those related to budget deficits and entitlement programs have gained in prominence.

In developing nations, the approaches to economic policy have moved away from attempting to plan the expansion of output, by sectors and principal products, to policy reforms aimed toward creating sound macroeconomic climate and geared toward removing structural imbalances between various sectors.

The direct controls on the economy have been steadily removed and policies that enable decentralized decision-makers (household, firms) to function more effectively have been promulgated. These measures have been favored to generate additional employment and increases incomes. Policies for investment have broadened from the calculation of gross external financing requirements to the development of policies aimed at stimulating domestic saving and encouraging domestic and foreign investments.

These changes have been accompanied by an emphasis on different macroeconomic policy instruments. Currently, policy in developing countries tends to focus on fiscal instruments (revenue and expenditure policies), debt instruments, monetary targets, trade policies, foreign exchange reserve management and interest rates. In some countries, reserve ratios still play a role in monetary management. Trade policies are based on customs duties rather than on quantitative controls.

The considerable amount of policy work in developing countries is focused on issues such as budgetary processes, public service reform, rates and tariffs on public services, investment and taxation codes, privatization of state-owned enterprises, financial regulations, land tenure issues, labor market regulations, environmental regulations, rules for management of natural resources, and the financing of local government.

The principal aim of macroeconomic policies remains the achievement of macroeconomic stability and a promotion of economic growth. Poverty reduction is seldom a principal goal of a particular macroeconomic policy. Rather, poverty reduction appears to be a byproduct of a broader macroeconomic goal. Nevertheless, while solutions to poverty cannot be based exclusively on economic policies, economic growth remains the single most important factor influencing poverty. Macroeconomic stability is essential for high

and sustainable rates of growth, and must therefore be a key component of any poverty reduction strategy.

The principal controversy regarding poverty reduction focuses on specific macroeconomic policies and the prevailing economic paradigm epitomized by the World Bank and International Monetary Fund (IMF) programs. According to this paradigm, known as the Structural Adjustment Programs (SAPs), the government budget, including the country's poverty reduction strategy, must be financed in a sustainable, noninflationary manner. Fiscal, monetary, and exchange rate policies need to be supportive of the objectives of sustainable growth, low and stable inflation.

THE POVERTY PARADIGM

Poverty reduction strategies need to be designed, then costed, and finally financed within the overall budget in a noninflationary manner. If credible poverty reduction strategies cannot be financed from available resources, World Bank and IMF staff should and will assist countries in their efforts to raise additional financial support from the donor community. Nonetheless, in situations where financing gaps remain, a country must revisit the intermediate objectives of its strategy and reexamine its priorities. Since the objective of macroeconomic stability should not be compromised, poverty reduction remains a secondary goal of the overall economic activity.

In addition, the paradigm rests on the assertion that trade liberalization and openness to trade increase the growth rate of income and output. It is argued that a sound trade policy is the key link in the transmission of price signals from the world market to the national economy. An open trade and investment regime encourages integration into the global trading environment and the import of diverse and modern technologies that are important for productivity improvements. Trade liberalization can therefore be expected to help the poor overall, given the positive association between openness and growth.

The criticism of this paradigm asserts that many developing nations are in debt and poverty, partly due to the policies of the IMF and World Bank. In addition, it is argued that increased dependency of developing or Third World countries on the richer nations comes as a direct result of these programs.

The critics, labeling the SAPs as neoliberalism, claim that these programs have been imposed to ensure debt repayment and economic restructuring. However, this has required poor countries to reduce spending on health, education and development, while debt repay-

ment and other economic policies have been made the priority. Thus, according to critics, the IMF and World Bank, by the virtue of the prescribed macroeconomic policies, require that macroeconomic stability be achieved, even at the price of lowering the standard of living and growing poverty.

While this debate is far from being over, it is evident that macroeconomic policies in developing countries that follow the prevailing paradigm often fail to incorporate poverty reduction, which is a major impediment to achieving macroeconomic stability and growth. The recognition that lower-income groups require special assistance of various types is missing from the blueprints of macroeconomic policies in developing countries.

Julian Schuster University of New Haven

Macroeconomics

MACROECONOMICS IS essentially the study of the behavior and performance of the economy as a whole. More importantly, it studies the relationship and interaction among the factors or forces that determine the level and growth of output and employment, general price levels, and the balance-of-payment position of an economy.

Macroeconomic theories use models to explain the behavior of variables and specify the nature of relationships between them. The most important aspect of macroeconomic theories is that it provides a framework and analytical model to analyze phenomena. The theories of income determination, consumption, investment, employment, price-level determination, product and money market equilibrium, exchange rate, and balance of payments constitute the main body of the macroeconomic theories.

Regarding policy orientation, macroeconomics analyzes the workings and effects of government policies,

especially the monetary and fiscal policies, on the economy. The working knowledge and efficacy of these policies are extremely useful in devising appropriate policy measures for controlling and regulating the economy to achieve the desired goals. The policy aspect of macroeconomics is so important that in the opinion of some economists, macroeconomics is first and foremost a policy science. Macroeconomics as a policy science provides a framework and instruments for restructuring the economy and guiding it on the path of growth and stability.

The macroeconomics of poverty focuses on the relationships among the structure of the macroeconomy and poverty, and on the macroeconomic policies that target poverty. It studies the effects of growth; fiscal, monetary, and exchange-rate policies; financial and trade liberalization; privatization; and deregulation on poverty. These stabilization and liberalization policies shape the structure of the economy and affect income inequality and poverty. The United Nations Development Program (UNDP) has recognized the importance of pro-poor macroeconomic policies in poverty eradication, and has launched its Regional Program on Macroeconomics of Poverty Reduction.

On the practical side, both developed and developing economies are constantly confronted with some kind of macroeconomic problem, for instance, recession and depression, unemployment, persistent inflation or stagflation, balance-of-payment deficits, outflow of capital, mounting debt burden, or a country falling into the debt trap. An appropriate and sustainable solution to these problems has to be found, if an economic collapse like the Great Depression of the 1930s is to be averted. Even if an economic catastrophe of this magnitude does not take place, macroeconomic problems like recession, unemployment, inflation, and increasing external-debt burdens need to be redressed because they have sociopolitical implications for the country in general and the government in particular.

The need for government intervention with the market system and management of the economy by the government has arisen out of the failures of the market mechanism to ensure efficient allocation of resources, to achieve socially optimum production and distribution patterns of goods and services, and to bring stability in growth, employment, price levels, and foreign exchange rates. Economic history reveals that capitalist economies have often suffered from business fluctuations.

One very important purpose that macroeconomics has served is that it has provided the basis and logical

framework for devising appropriate tools of intervention and for formulating suitable macroeconomic policies to direct and regulate the economy toward desirable goals.

British economist John Maynard Keynes (1883–1946) laid down the foundation of modern macroeconomics as a separate branch of economics, in his revolutionary book *The General Theory of Employment Interest and Money* (1936). Though the use of the macro approach can be traced back to the writings of the mercantilists, the growth of macroeconomics and changes in approach toward macroeconomic issues can be reviewed under classical macroeconomics, the Keynesian revolution and macroeconomics, and post-Keynesian developments.

The Great Depression of the 1930s proved all classical postulates relating to the existence of full employment wrong in the long run, and exposed the inadequacy of the theoretical foundations of the *laissez-faire* doctrine and its failure to explain persistently violent business cycles. Classical economics had no solution to the problems of economic fluctuations, thus the Great Depression caused the collapse of classical macroeconomics.

The period between the late 1930s and mid-1960s is called the period of the Keynesian revolution or the Keynesian era. Perhaps the most fundamental achievement of the Keynesian revolution was the reorientation of the way economists viewed the influence of government activity on the private economy. Contrary to the classical view that government spending "crowds out" private investment, Keynesian economics stresses the favorable macroeconomic effects of government spending on national income and employment through its multiplier effect.

The post-Keynesian developments in macroeconomics include growth of monetarism, neoclassical macroeconomics, supply-side economics, and neo-Keynesian macroeconomics, which is still in the process of developing as a complete science.

Madagascar

THE ISLAND OF Madagascar, located near southern Africa in the Indian Ocean, is one of the poorest countries in the world. Some 71.3 percent of the people live in poverty, with 83.3 percent living on less than \$2 a day, and 49.1 percent living on less than \$1 a day. In this land of inequality, the poorest 10 percent of the population share 1.9 percent of the island's wealth, while the richest 10 percent share 36.6 percent. The country ranks 47.5 on the Gini Index of Human Inequality.

Madagascar has experienced political stability since regaining independence from France in 1960, except for a contested presidential election in 2001 that threatened civil war. The following year, the controversy was settled without bloodshed by a decision of the High Constitutional Court. Since the mid-1990s, Madagascar has moved away from a socialist economy by privatizing and liberalizing its economy along the guidelines established by the World Bank and the International Monetary Fund (IMF).

The poorest 10 percent of the population share 1.9 percent of the island's wealth.

Agriculture, which includes fishing and forestry, dominates the economy, employing 80 percent of the population. The island is subject to cyclones, drought, and locust infestations that wreak havoc with agricultural profits. Despite some setbacks, the island's economy has shown slow but steady growth in recent years, partly because of duty-free apparel exports to the United States. The government has announced twin goals of growing the economy and reducing poverty over the next few years. This task may be made easier if the Group of 8 (G-8) adopts a proposal designed to mitigate the plight of the 18 poorest countries, including Madagascar, by setting aside funds to be used for social programs and debt relief.

With a life expectancy of 56.95 years and a median age of 17.46 years, Madagascar has a young population. Some 44.8 percent of the island's 18,040,341 residents are under the age of 14, and only three percent have reached the age of 65. The people have only a 29 percent chance of living until the age of 40. Madagascar has not been untouched by the HIV/AIDS epidemic that continues to ravage much of sub-Saharan Africa; however the 1.7 percent prevalence rate is comparably low. In 2003 approximately 140 people were living with

this disease, which was responsible for the deaths of at least 7,500 others.

Residents of the island are prone to the same infectious diseases that are common among other African nations: bacterial and protozoal diarrhea, hepatitis A, typhoid fever, schistosomiasis, malaria, and plague. Because over half the population lacks access to a sustainable improved water source and 58 percent lack access to proper sanitation, general health is poor. The Malagasy are at very high risk for food- and waterborne diseases as well as for those resulting from contact with infectious materials. Between 50 and 79 percent of the people have access to affordable life-saving drugs, but there are only nine physicians per 100,000 people on the island.

Infants experience a total mortality rate of 76.83 deaths per 1,000 live births. Female infants are hardier, with 68.36 deaths per thousand as compared to male infants with a rate of 85.05. Between 1990 and 2003, infant mortality dropped from 103 to 78 per 1,000 live births. During this same period, the mortality rates of children under the age of 5 decreased from 168 to 126 per 1,000. While these decreases are encouraging, the United Nations UNICEF reports that nearly 100,000 children under the age of 5 die each year from preventable causes that include malaria, diarrhea, and acute respiratory illnesses. Less than one-third of ailing children receive the oral rehydration therapy that can save lives in many circumstances.

Approximately one-third of all infants are underweight, and 11 percent classify as severely underweight. About 49 percent experience moderate to severe stunting, and 14 percent suffer from moderate to severe wasting. Madagascar has also made progress in reducing the number of children under the age of 5 who are malnourished, but one-third of Malagasy children in this age group are still underweight. Additionally, 40 percent of the total population are malnourished.

Low immunization rates also place Madagascar's children in jeopardy. In 2003, only 55 percent of children from 12 to 23 months were immunized against measles and DPT3. Between 1990 and 2002, infant DPT immunizations dropped from 71 to 62 percent; infant polio immunizations decreased from 64 to 61 percent; and infant tuberculosis immunizations dropped from 81 to 73 percent. However, infant measles immunizations rose from 57 to 61 percent.

On the average, women bear 5.66 children. The fertility rate rose from the 2003 average of 5.2 children, although it is below the average of 6.6 children recorded in the 1970s. Fertility is particularly high among females

between the ages of 15 and 19 who account for 153 out of every 1,000 births. Less than 20 percent of all women use any method of birth control. Between 1995 and 2000, maternal mortality experienced a drop from 580 to 550 per 100,000 live births. Trained medical staff attend only 46.2 percent of all births. Births outside the province of trained professionals also mean that one out of every four children has no birth certificate and is unable to establish rights of property ownership and inheritance.

Women in Madagascar lag behind males on most social and economic indicators, and literacy is no exception. Approximately 62.5 percent of females over the age of 15 can read and write as compared to 75.5 percent of all males who have achieved these basic skills. Around 82 percent of children attend school, and primary school completion rates have steadily risen since 1990, when only 22 percent of all children reached the fifth grade. In 2003, 47 percent of all males and 48 percent of all females completed primary school.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Madison, James (Administration)

JAMES MADISON WAS born into a wealthy Virginia planter family in 1751. During the American Revolution, Madison served on the local Committee of Safety and in 1776 he participated in the Virginia Convention that declared independence and drafted a state constitu-

tion. In 1777 he was elected to the Governor's Council, where he served under Governors Patrick Henry and Thomas Jefferson.

In 1780, Madison became a delegate to the Continental Congress, operating under the Articles of Confederation. His frustration with Congress's inability to accomplish anything led him to become a proponent of a stronger national government. After four years, he left to serve in the Virginia legislature.

Madison was a leading advocate for a convention to reform the Articles of Confederation. When a convention was called in Philadelphia in 1787, Madison arrived with a draft that formed the basis of the new Constitution. Following the convention, opponents objected to the power given to the federal government and the lack of a Bill of Rights. Madison's writings in a series of articles that would become known as the Federalist Papers and his debates against Patrick Henry at the Virginia Ratifying Convention were critical to ratification.

Madison failed to obtain a Senate seat. Instead he was elected to the House of Representatives, and only won that election (defeating James Monroe) by promising to enact a Bill of Rights, something he had opposed during ratification. Madison proposed 19 constitutional Amendments. Twelve were sent to the states for ratification. Ten became the Bill of Rights, while another was eventually approved as the Twenty-seventh Amendment in 1992.

For years Madison had been an advocate of stronger government. However, as a congressman, he began opposing such measures. Two of his main adversaries were his coauthors of the Federalist Papers. He opposed Alexander Hamilton's plan to assume state debts from the revolution, toning down his opposition only after Jefferson brokered a deal between them. He also opposed creation of the Bank of the United States as well as a large army or navy.

He allied himself with Secretary of State Jefferson as the two fought Hamilton's influence over George Washington's presidency. During the John Adams administration, Madison anonymously drafted the Virginia Resolutions, arguing that a state could nullify unconstitutional federal actions.

Upon Jefferson's presidential election in 1800, Madison became secretary of state. During this time, Britain and France were at war, giving Madison the opportunity to negotiate the Louisiana Purchase from Napoleon. The war, however, proved costly. Both Britain and France seized American ships with impunity to prevent trade with the enemy, and often tak-

ing sailors who would be pressed into service on foreign naval vessels. Because the United States had no significant navy, it could not resist militarily. Madison proposed the idea of an embargo, simply ending all trade with both countries in the hope that this would force a compromise. Instead most of the harm fell on New England, which depended on such trade. Congress eventually voted to end the embargo over Madison's opposition.

Despite the controversy over the embargo, Madison won the presidential election overwhelmingly, winning most states outside of the New England coastline. His presidency, however, turned out to be quite weak. British outrages on the high seas continued. By 1812, Madison urged Congress to declare war. Madison hoped to capture Canada and force Britain off the continent forever. Unfortunately the U.S. military was not up to the task. The British invaded all along the coastline, including a raid on Washington, D.C. Madison attempted to direct defenses, escaping only just ahead of British troops who burned the White House.

The only early victories came from the small U.S. Navy that Madison had opposed for so many years. The navy captured or destroyed several British naval vessels in the Great Lakes and in the Atlantic, but their small numbers ensured that Britain would continue to dominate the seas. The Americans successfully repulsed an invasion into New York State. But the biggest victory ironically came in 1815, when Andrew Jackson defeated the British in the Battle of New Orleans, not having heard that the Treaty of Ghent had ended the war a few weeks earlier.

With the war over, Madison focused on a domestic program that repudiated many of his earlier positions on small government. He supported a stronger professional army and navy and rechartering the Bank of the United States. He also supported a tariff to protect U.S. industries and federal money for roads and canals to bind the nation together. However, as much as his views on government had moderated, Madison never saw a role for the government in alleviating poverty.

Madison left office in 1816 having seen the election of his secretary of state, Monroe, to the presidency. He died in 1835, the last survivor of the Constitutional Convention.

Make Poverty History

MAKE POVERTY HISTORY is a British and Irish initiative launched in 2005 to energize various groups behind bringing an "end to poverty in the world." Capitalizing on the recent high international exposure of the United Kingdom (UK), with a UK presidency of the European Union for the second half of 2005 and the UK hosting the G-8 Summit and other high-level meetings, the Make Poverty History campaign urges the United Kingdom to assume global leadership in poverty eradication.

Numerous domestic and international nongovernmental organizations, labor unions, politicians, student and church groups, charities, and celebrities with different social, political, and economic backgrounds are involved in the campaign, which has adopted a white band as its symbol. U2 lead singer Bono, the Church of England, Prime Minister Tony Blair, and OXFAM are a few of those involved. Several public events, such as Live 8 concerts, demonstrations, and parties, have brought high exposure to the campaign within a short period of time.

The campaign supports the cancellation of the debt of the world's poorest countries.

The three interrelated pillars of the campaign are trade, debt, and aid. It is argued that free trade does not necessarily serve the poor in the developing world. Export subsidies and protection of the agricultural sector by industrial countries not only deepen poverty in the agricultural sector of developing countries but also perpetuate it.

In addition the contemporary trade regime harms labor and the environment in developing countries. The system allows high-pollutant industries to migrate into developing countries and allows the privatization of natural resources like water. At the same time, outsourcing and offshoring undermine labor standards in low-wage countries. Hence the campaign supports a form of trade justice and fairness that allows individual countries to decide on their own trade regimes.

Like Jubilee 2000 and the Millennium Development Goals, the campaign supports the cancellation of the entire debt of the world's poorest countries without any conditions imposed by industrial lender countries. Such relief from the debt repayment would create needed additional resources for poverty alleviation.

More and better aid is the third driver of the campaign. Recognizing the fact that the G-8's commitment to gradually increase aid to the poorest countries to \$50 billion a year by 2010 is failing to meet the immediate needs of the poor, the campaign urges the United Kingdom to come up with new creative means of financing the war against poverty immediately, an action that would provide much-needed leadership in poverty alleviation. It is also argued that aid should be directed to the basic needs of the poor.

These three proposals are not new, but they reemphasize the importance of freeing antipoverty initiatives from the neoliberal grip of the World Bank and the International Monetary Fund. These proposals regard poverty alleviation as a separate fundamental human right rather than as part of the standard liberalization package prepared by international economic organizations. As such, the campaign advocates direct involvement by the poor and civil society organizations in developing countries in the design of domestic development strategies and priorities.

M. Odekon General Editor

Malawi

AS ONE OF THE WORLD'S least developed countries and with 65.3 percent of its 12,158,924 people living in poverty, Malawi continues to face an uphill battle

in attempting to grow the economy while meeting the needs of its fragile population. Although government corruption is a major problem, officials must also combat the effects of poverty and a chronic food shortage along with stemming an excessive population growth and a debilitating HIV/AIDS epidemic. With an average annual income of \$160, some 76.1 percent of Malawians survive on less than \$2 a day and 41.7 percent survive on less than \$1 a day. Vast inequalities exist, with the poorest 20 percent of the population living on a 4.9 percent share of the country's wealth while the richest 20 percent hold 56.1 percent of income. Malawi ranks 50.3 on the Gini Index of Human Inequality.

Some 90 percent of Malawians are employed in the agricultural sector, which makes up 40 percent of Malawi's Gross Domestic Product (GDP) and 88 percent of export revenues. Malawi is one of the world's largest producers of maize, but a fluctuating market caused one-fourth of Malawian farmers to pursue other, more profitable avenues. Malawi also depends heavily on tobacco crops, which comprise 50 percent of exports.

New farming techniques are sorely needed to increase the food supply and improve agricultural production. In 2000 the International Monetary Fund (IMF) and the World Bank accepted Malawi into its Heavily Indebted Poor Countries (HIPC) program, and Malawi's economic prospects improved. However, these funds may be cut off if the government fails to stamp out corruption.

Malawi is a young nation with a life expectancy of only 36.97 years and a median age of 16.34 years. Nearly half of the population is under the age of 14, and only 2.8 percent are over the age of 65. Malawians have a 59.6 percent chance of dying before the age of 40. Death rates are high in large part because of poverty and the 14.2 percent HIV/AIDS prevalence rate.

In 2003 it was estimated that 900,000 people were living with this disease, which had been responsible for 84,000 deaths and enormous costs in human suffering. Malawians also face very high risks of contracting foodand waterborne diseases. In some areas, malaria and plague create additional risks. Some 43 percent of the people have no sustainable access to an improved water source, and 24 percent lack access to adequate sanitation. Half the population has no access to affordable lifesaving drugs.

Children face a myriad of problems in Malawi, and many of them never reach the age of 6. According to 2005 estimates, 103.32 Malawian infants die out of every 1,000 live births. While the 103.32 infant mortal-

ity rate is grim, it is an improvement over the 2003 rate of 112. In that year, the mortality rate for children under the age of 5 was reported at 178 out of 1,000. Because of extreme poverty, one-fourth of Malawian children under age 5 are malnourished. Approximately 45 percent of under-5s experience moderate to severe stunting, and five percent suffer from moderate to severe wasting.

Malawi has made progress in immunizing its children against certain communicable diseases. In 2003, 77 percent of all children between 12 and 23 months old were vaccinated against measles, and 84 percent were vaccinated against DPT3. Infant immunization rates have followed a fluctuating pattern, and more attention needs to be paid to this problem.

Over half of the population is poor, but poverty affects women disproportionately.

Malawian females lag behind males on most quality-of-life issues, and literacy is no exception. While 76.1 percent of males over 15 can read and write, only 49.8 percent of females can do so. Literacy rates for both males and females have risen slightly over the past few years. Most Malawian children are expected to attend school for at least 12 years, and basic education has been free and compulsory since 1994. Between 1999 and 2003, male primary school completion rates dropped by one percent (72 to 71), but female completion rates rose by one percent (68 to 69).

Recognizing the need for a government role in family planning, Malawi initiated the National Reproductive Health Policy in 2000, increasing the availability of services. Between 1994 and 2000, the rate of contraceptive use more than tripled among married women (seven to 26 percent).

As a result, the fertility rate dropped from 7.6 children per woman in 1992 to 6.2 in 2000 and to 5.98 in 2005. Malawian females between the ages of 15 and 19 are responsible for 136 out of every 1,000 births. The fact that fertility rates have continued to be high is indicative of low education and literacy rates. Some 61 percent of all births are now attended by trained medical staff, and 91 percent of all women receive some sort of professional antenatal care. However, maternal mortality has continued to rise and was estimated at 1,800 out of every 100,000 live births in 2005.

Over half of the Malawian population is poor, but poverty affects women disproportionately. By 2003 es-

timates, 75 percent of all Malawian women were poor. Women make up 70 percent of agricultural workers and 71 percent of all casual laborers in the estate sector. In 1997 the Malawian government developed a program directed at poverty alleviation and gender empowerment that included literacy and training programs, extended credit opportunities, and increased numbers of women in decision-making positions.

Malaysia

SINCE THE INDEPENDENCE of Malaysia in 1957, the government has focused on a strategy for rural development. However, the economic imbalance among the major races of the country was substantial and this led to racial unrest in 1969. The government then formulated a long-term economic strategy that emphasized growth with equity, with the ultimate objective of creating national unity in the multiethnic country.

As part of the implementation of the development plans, the Malaysian government put a number of policies into effect, and poverty eradication was one of the main objectives. Various Malaysian governments have always expressed support for the antipoverty cause, as revealed by a series of pronouncements on antipoverty policies and programs. The first plan was the New Economic Policy (NEP), which was implemented over a 20-year period, 1971–90. The National Vision Plan followed

from 1990 to 2020. During implementation of the NEP, the emphasis was on the eradication of poverty among the general population, irrespective of ethnic origin, and the restructuring of society to eliminate the polarization of economic functions along racial lines. These factors were of immediate concern at the time because of the economic situation inherited from the colonial period. The eradication of poverty was implemented through the development of the rural and agricultural sector as well as the industrial sector. The restructuring of society was to be achieved through increased participation of minorities in the corporate sector. Modernization of services was also promoted to bring about better quality of life.

The National Development Policy (NDP) (1991–2000) emphasized the creation of national unity through similar objectives. The development of the rural and agricultural sector was still made an important national agenda through the modernization and commercialization of agriculture. The services sector was further modernized, while increasing private-sector participation in the economy was encouraged through the privatization of several key government-owed entities

The National Vision Plan, launched by former Prime Minister Mahathir Mohammad, continues to carry on the objectives of previous development policies, but also emphasizes policies pertaining to achieving higher economic resilience and growth, raising quality of life through poverty eradication, increasing competitiveness, building a competent and skilled workforce, and creating long-term sustainable development. In other words, the main objectives of development plans in Malaysia were to promote an equitable society by eradicating poverty and reducing imbalances among and within ethnic groups as well as regions.

Through these efforts, Malaysia introduced a model of economic development and poverty eradication. The implementation of the development plans resulted in enlarging the economic "pie," and then emphasized economic balance among the major races of the country. Malaysia had a head start in terms of human capital and has widened its lead over other developing economies. Malaysian governments built on this base by focusing on educational spending in the lower grades, initially by providing universal primary education.

The Malaysian model of poverty eradication was based on human-resources development. This was done by fighting illiteracy and unemployment. At 93 percent, Malaysia's literacy rate is one of the highest in the world. Also, over 95 percent of all 7-year-olds are en-

rolled in public schools. Development programs were directed toward the enhancement of education, health, and housing for the lower-income groups.

Islam, the major religion of Malaysia, played a role in creating the economic plans and policies. Malaysia established Islamic banks that are able to attract foreign investment and reduce the unemployment rate. In addition, Islamic values helped Malaysia to promote its development process, including protecting minorities' rights, work, and education.

Malaysia has an annual per capita Gross Domestic Product of \$9,512 and, perhaps proving the success of its development programs, in 1998 only eight percent of the population still lived below the poverty line.

CAIRO UNIVERSITY

Maldives

THE REPUBLIC OF MALDIVES, a chain of 1,190 islands located in the Indian Ocean in southern Asia, is one of the least-developed countries in the world. The Maldivian economy is dependent on tourism, which makes up 20 percent of the Gross Domestic Product (GDP), over 60 percent of all foreign exchange receipts, and 90 percent of tax revenues. Fish are the islands' most valuable natural resources, and the fishing industry is second only to tourism as an income producer.

At present, only around 22 percent of the labor force are involved in agriculture, and most food is imported. Manufacturing revolves around garment pro-

duction, boat building, and handicrafts. In 1989 the government initiated economic reforms designed to liberalize regulations and encourage foreign investment. The country is currently experiencing a movement toward greater political freedom after riots in 2004.

Maldives is still in the process of recovering from the tsunami that hit the island in December 2004, killing 83 people and injuring 2,214 others. The tsunami left physical, emotional, and economic devastation in its path. Nine islands were flooded by tsunami waves, and 13 were abandoned. Thousands of islanders were forced to flee their homes, and schools and businesses were demolished. The tourist industry floundered. The tsunami also created a healthcare crisis.

The tsunami left physical, emotional, and economic devastation in its path.

The giant waves destroyed a regional hospital, two atoll hospitals, 14 health centers, and 20 health posts. Maldivians were faced with contaminated water and inadequate sanitation, increasing risks for water- and vectorborne diseases that included diarrhea, typhoid, hepatitis, viral fever, and dysentery. While the specific poverty rate is unknown, it is evident that the tsunami increased the number of poor in the Maldives.

The Maldivian population of 349,106 has a life expectancy of 64.06 years and a median age of 17.69. The projected life span has steadily risen since the 1970s. Some 44 percent of the population are under the age of 14, and 3.1 percent are 65 or over. Over 90 percent of Maldivians are likely to live to see a 40th birthday. Normally all Maldivians have access to safe water, and 54 percent have access to proper sanitation. Health clinics are located around the islands to make medical care accessible. There are 78 physicians for every 100,000 people, and most Maldivians are able to afford essential drugs.

Childhood mortality has declined drastically in the Maldives over the past decades. Between 1970 and 2005, infant mortality dropped from 157 deaths to 56.52 per 1,000 live births. Mortality rates for children under 5 plunged from 255 per 1,000 in 1970 to 77 per 1,000 in 2002. However, almost one-third of all children in this age group are malnourished. Over 20 percent of babies are underweight at birth, and seven percent of children under 5 are severely underweight. Approximately 25 percent of under-5s experience moderate to severe stunting, and 13 percent suffer from moderate to

Before the tsunami of 2004, the Maldives enjoyed a strong tourist trade, such as with the resort above. Poverty has since increased.

severe wasting. Immunization rates are high on the island, remaining stable in the 90 percent range.

In 2003, total Maldivian fertility rate was reported at four children per woman, and adolescent fertility was recorded at 42 per 100 births. Projections for 2005 suggest fertility may be as high as 5.02 children per woman. Less than one-third of all Maldivian women use contraceptives of any sort, but the government has initiated family planning programs and added sex education classes in the schools. Health clinics have been built on some of the larger islands to increase access to medical care for those who live on the smaller surrounding islands. Trained medical staff attend more than 70 percent of all births. The 1985 to 2002 model for determining maternal mortality estimated that figure at 350 deaths out of 100,000 live births. Current maternal mortality is considerably lower at 110 deaths out of 100,000.

Most Maldivians attend school for at least 12 years, and primary school completion rates are 100 percent. The literacy rate is one of the highest in this region. Only 2.7 percent of females and 2.9 percent of males over the age of 15 lack the ability to read and write. By comparison, in 1980, 7.5 percent of males and 9.5 percent of females lacked these basic skills.

The islands have made education a priority, building new schools and renovating older buildings. Secondary schools are scattered among the islands to make access easier, but no colleges or universities exist. Maldives has made an effort to equalize education by teaching subjects such as needlework, cooking, fishing, and carpentry to both sexes.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Mali

THE REPUBLIC OF MALI ranks as one of the three poorest nations in the world, with a poverty rate of 63.8 percent, and one-fourth of the population suffering from malnutrition. Malians survive on an average annual income of \$230, with 90.6 percent of the population living on less than \$2 a day and 72.8 percent living on less than \$1 a day. The Malian population is subject to vast inequalities, with the poorest 20 percent sharing 4.6 percent of the country's income and the richest 20 percent holding 56.2 percent. Mali ranks 50.5 on the Gini Index of Human Inequality.

Approximately 80 percent of Mali's labor force are involved in agriculture and fishing, which are centered in the riverine area irrigated by the Niger River. Recurring droughts and flooding frequently exacerbate existing economic problems. Mali's chief exports are cotton and gold; however, Mali is seriously underdeveloped. Deposits of bauxite, iron ore, manganese, tin, and copper have been identified but never exploited. Some 65 percent of Mali's land is classified as desert or semi-desert.

Approximately 70 percent of the population reside in rural regions, where unemployment is 5.3 percent. Unemployment is almost three times that amount in urban areas, where the remaining 30 percent of the population live. Mali's economic prospects have improved somewhat since officials adapted the International Monetary Fund's guidelines for growing and diversify-

ing its economy, but the country is still economically fragile.

Mali's population of 12,291,529 has a life expectancy of 45.09 years and a median age of 16.35 years. Nearly half of the population is under the age of 14 and only three percent are over 65. Malians have a 35.3 percent of dying before the age of 40. With an HIV/AIDS prevalence rate of 1.9 percent and 140,000 Malians living with this disease, the government has been forced to direct both resources and attention to dealing with the epidemic. The 12,000 AIDS-related deaths were responsible for increasing the Malian death rate to 19.05 deaths per 1,000 in 2005.

In 1991, Mali recorded 16,024 incidences of Guinea worm disease, a debilitating condition caused by contact with infected water. After several years of working with representatives from Emory University's Carter Center through the Mali Guinea Worm Eradication Program, the incidence rate decreased to 829 in 2003. The Carter Center also works with locals to educate the public about trachoma, which is the second most prevalent cause of blindness in Mali. Trachoma is a bacterial conjunctivitis that affects 35 percent of all Malian children under the age of 10, but is not limited to children. Malians are also at high risk for contracting food- and waterborne diseases as well as those caused by contact with infected materials. Infections are common because 35 percent of Malians lack access to safe water and 31 percent lack access to adequate sanitation.

These deaths are generally due to poverty and preventable diseases.

The Malian infant mortality rate of 116.79 deaths per 1,000 live births illustrates the dangers that confront children, particularly those under the age of 5 who face a mortality rate of 220 deaths per 1,000. These deaths are generally due to poverty and preventable diseases.

One-third of all Malian children under the age of 5 are malnourished, and 11 percent are severely underweight. About 38 percent suffer from moderate to severe stunting, and 11 percent suffer from moderate to severe wasting. Much attention has been paid to child-hood immunizations in recent years. In 2003, 68 percent of children between 12 and 23 months were immunized against measles, and 69 percent were immunized against DPT3. Since 1990, immunization rates for infants have risen for DPT, polio, and tuberculosis, but

measles vaccinations declined from 43 percent to 33 percent.

In Mali, 53.3 percent of the adult male population can read and write, but only 39.6 percent of the female population can do so. Even though literacy rates are low, Malian officials have made great strides in literacy education since 1999, when only 35 percent of males and 15.4 of females over the age of 15 were literate. On the average, Malian children receive five years of schooling. Primary school completion rates have increased over the past few years. From 1999 to 2000, male completion rates increased from 31 to 40 percent, and female completion rates rose from 24 to 32 percent.

It has become increasingly clear that Mali's resources are unequal to the task of supporting its total fertility rate of 6.5 children per woman, or its adolescent fertility rate of 173 per 1,000 births. Less than 10 percent of all Malian women use contraceptive measures. Malian women are vulnerable to disease and general ill health because of a lack of adequate healthcare. Professional medical staff attend only 40.6 percent of all births in Mali. Estimates for 2000 place maternal mortality at 1,200 deaths per 100,000 live births.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Malnutrition

MALNUTRITION IS a general term for the medical condition of a person caused by an unbalanced diet.

There is either too little or too much food, or a diet is missing one or more important nutrients. Most commonly, malnourished people either do not have enough calories in their diet or are eating a diet that lacks protein, vitamins, or trace minerals. Medical problems arising from malnutrition are commonly referred to as deficiency diseases.

Common forms of malnutrition include proteinenergy malnutrition (PEM) and micronutrient malnutrition. Protein-energy malnutrition refers to inadequate availability or absorption of energy and proteins in the body. Micronutrient malnutrition is the inadequate availability of some essential nutrients, such as vitamins and trace elements, that are required by the body in small quantities. Micronutrient deficiencies lead to a variety of diseases and impair normal functioning of the body. Deficiency in micronutrients such as vitamin A reduces the capacity of the body to resist diseases. Deficiency in iron, iodine, and vitamin A is widely prevalent and represents a major public health challenge. Malnutrition is responsible for a considerable amount of suffering across the globe. At least one-fifth of the worldwide loss of years of life to premature death and to disability is due to undernutrition.

COMMON FORMS OF MALNUTRITION

Protein-energy malnutrition is the combined failure to provide enough calories and is considered to be the most widespread form of malnutrition. Individuals who exist on a diet consisting of grains might be at risk for protein deficiency. Poorer segments of the population may be at risk for protein deficiencies because of the relative inability to obtain nongrain ingredients, which are typically more expensive.

When diets do not have enough protein and calories, individuals may adjust by altering their energy outputs. This will often have implications for energy expenditure for adults during paid employment as well as in other activities. A worker who is malnourished will not be able to work longer shifts and will need more breaks during work, which can contribute adversely to work performance and job retention. Children may alter their behaviors in important contexts such as the classroom and with peers. Children may be unable to concentrate on learning activities and behave aggressively and be withdrawn. Another issue regarding too few calories and proteins is weight loss and stunted growth among children.

When energy expenditure outstrips calorie supplementation, a body can react by metabolizing reserves of,

first, stored body fat, then muscle, and even organ tissue. Weight loss accompanies this process but is eventually followed by a medical condition called wasting. Death is the ultimate outcome of this process, but often hunger-related deaths are due to opportunistic infectious diseases. Malnutrition and infection are mutually reinforcing, as disease leads to deterioration in nutrition and malnutrition leads to susceptibility to diseases. Some estimates of children in developing countries suggest that malnutrition contributed to approximately half of all child deaths because of the role of infectious diseases.

The efforts to reduce malnutrition should be accompanied by a policy of greater equity.

Lack of protein and calories is not the only reason for malnutrition; an individual can receive enough calories but lack high enough levels of micronutrients such that medical problems arise. The most common form of malnutrition due to the lack of micronutrients is deficiencies in iron, iodine, and vitamin A.

Of these three micronutrients, iron deficiency is believed to be the most common, especially in south Asia and Africa. Approximately 20 percent of the world's population are believed to have an iron deficiency severe enough to cause medical problems, and this is especially likely to occur among women of reproductive ages. It is also perhaps one of the most ignored problems, despite its serious effects. Iron is used to transport oxygen in the blood, and when it is not present, there are problems in carrying oxygen to the cells in need.

In mild cases, iron deficiency is associated with lack of physical energy and difficulties in concentration. The more extreme case is anemia, and is a marker for poor and unhealthy environments. Anemia is a medical condition that refers to below-normal blood hemoglobin levels, and is caused not only by a lack of iron but also by a lack of vitamins B2 and B12, which are needed to help the body use iron effectively. Over time, iron deficiencies can prolong poverty because of the cycle of reduced physical and cognitive performance that promotes poor performance in work situations, which leads to more poverty.

Iodine deficiencies are more likely to occur in areas with iodine-poor soils, which are typically mountainous areas with heavy rainfall. This problem can also occur in other regions where intake of foods containing iodine is low. Imported foods can be helpful in this situa-

tion, but imported foods are typically more expensive than the locally produced foods, so there is a connection with poverty. This scenario is most likely to play out in southeast Asia, but also happens in parts of Africa and Latin America.

Iodine deficiencies can affect an individual both mentally and physically. One outcome of iodine deficiencies is cretinism, which is mental retardation resulting from the adverse action of iodine deficiency on the maturation of the child's nervous system. Cretinism usually occurs during gestation. Goiter, which is a swelling of the thyroid gland, is another physical condition that can occur when there is an iodine deficiency in an individual.

Deficiencies in vitamin A are often associated with child blindness. This condition can cause children to have increased mortality because these children are especially vulnerable to infectious diseases. Milder vitamin A deficiency is associated with more susceptibility to respiratory infections, diarrhea, and measles. Pregnant women in low-income countries are also affected. Vitamin A deficiency is a public health problem in many countries, especially in Bangladesh, India, and Indonesia.

MALNUTRITION AND POVERTY

There is a two-way link between poverty and health in which nutrition plays an important role, both as an active and as a mediating factor. Poverty is one of the most influential risk factors for ill health, and ill health can lead to poverty. Not so well recognized and understood is the fact that good health can make an important contribution to lifting people out of poverty. A healthier child can learn better, and healthier adults are more able to work and are more productive.

Poverty used to be linked to those severe forms of malnutrition, particularly in children. Today we know that poverty also affects nutrition throughout the life span and in a variety of ways, such as increased susceptibility to many diseases, reduced ability to do physical work, and increased exposure and vulnerability to lifestyle-related and environmental risks.

Poor nutrition starts in pregnancy, and its adverse consequences become apparent in early postnatal life and track through adolescence into adulthood in terms of higher risk, lower endurance to disease, and reduced ability to work. The girls who survive to reproductive ages have higher risks of bearing low-birth-weight babies, who in turn have a lower chance of survival than normal-weight babies. Poor nutrition during the first

year has important consequences from which recovery is difficult and often incomplete.

Poor children have higher rates of infections and less access to adequate nutrition and are more exposed to the consequences of the lack of information that is common in their family settings. The results of inadequate nutrition in this first year usually compromise intellectual capacity and do not manifest themselves until later, at school age. Infections and lack of nutrients in preschool children intensify the adverse effects of intrauterine growth retardation. The problem is particularly important in girls because they represent the intergenerational link that perpetuates the consequences of poor nutrition.

Adolescence is a period of rapid growth. There is a sharp increase in the nutritional demand rarely satisfied in the poor, who carry the burden of past deprivation and lack of access to adequate nutrition and sanitation. Better-nourished girls have earlier menarche and faster growth. Even in the unlikely event that they attain the same final height as nonpoor female teens, poor girls grow for a longer period and are usually still growing during their first pregnancy and "competing" for nutrients with the developing fetus.

The impact of poverty upon health is largely mediated by nutrition, and this is seen throughout the whole life course. However, nutrition as well as health is not very responsive to mere economic growth. When income distribution is unequal, economic growth usually does not reach the undernourished, and nutrition may be negatively affected. Increased income alone cannot guarantee maximal nutritional benefit, because key nonfood factors such as environmental hygiene and adequate healthcare are not purchasable with increased income. Empowerment of the poor and of the women within households in terms of knowledge and education is essential for resources to be used rationally. Poor families usually use money to buy more low-nutritionalquality food. This practice has no impact on improving nutritional status but instead promotes obesity and overweight.

Economic growth can lead to substantial improvements in nutrition only if the results of expansion are equally distributed. Countries that have developed equitable distribution strategies have generally experienced more economic growth. Therefore the efforts to reduce malnutrition should be accompanied by a policy of greater equity, both as a matter of human rights and as an economically appropriate strategy.

An interesting way of considering the linkages between poverty and malnutrition is to focus not on the

There is a clear connection between malnutrition and poverty. This connection is a two-way link in that poverty and malnutrition mutually reinforce each other. Improving nutrition can lead to important gains in promoting the healthy development of nations.

causes of malnutrition but on the consequences of good nutrition. We know, for example, that poverty increases malnutrition. But the reverse is also true: good nutrition reduces poverty. Similar arguments can be made in other areas, such as gender, education, human rights, and health. Regarding education, 36 percent of children under 5 are growth-retarded (that is, their height-for-age is low). This figure may rise to around 50 percent for school-age children. Growth retardation is associated with a substantial reduction in mental capacity and adverse school performance, even in mild to moderate cases. Nutrition affects school performance indirectly as well.

Undernourished children tend to be enrolled later in school than better-nourished children. This could be because parents may consider shorter children to be younger, because they do not believe the children are physically large enough to attend school, or perhaps because they are investing more in the better-nourished

children. Whatever the process, late enrollment compounds the problems of intellectual impairment caused by nutritional deficits.

Malnutrition can affect population growth as well. Good nutrition reduces maternal and child mortality. Improved child survival helps slow population growth by increasing birth intervals and reducing the demand for large families. Lower rates of pregnancies, in turn, reduce the risk of maternal death. Agricultural productivity is a powerful force for poverty reduction and economic development.

However, agricultural productivity in developing nations has been impacted by problems with rural infrastructure and access to consumer markets. Improved nutrition can support agricultural development by enhancing rural people's ability to perform strenuous tasks necessary in small-scale farming.

The gender roles that men and women play interact with biological factors to affect the nutritional status of

the family. Poor nutrition among women early in life reduces learning potential and increases reproductive risk. This is combined with women's diminished ability to gain access to assets later in life and can perpetuate gender inequalities. In this way, women with poor nutrition can be uniquely entangled in a cycle of poverty and malnutrition. Gender inequality is not only bad for women, but also makes for bad economics. It results in the misallocation of scarce resources and impairs the development capacity for the countries in which it occurs.

Good nutrition is an important tool for crisis prevention, mitigation, and management.

Good nutrition is also an important tool for crisis prevention, mitigation, and management. Good nutrition relieves the social unrest underlying violent conflict. Reducing malnutrition decreases the human vulnerability that transforms shocks into disasters. Finally, good nutrition lowers the death rate and promotes a quicker return to equitable development in the aftermath of a crisis. Globally, good nutrition will help countries meet a wide range of goals that are crucial to accelerating development. As such, it is an excellent investment and a sound global antipoverty strategy.

In summary, malnutrition is associated with a wide range of problematic developmental and health outcomes for individuals and nations. There is a clear connection between malnutrition and poverty. This connection is a two-way link in that poverty and malnutrition mutually reinforce each other. Improving nutrition can lead to important gains in enhancing individual functioning as well as promoting the healthy development of nations.

LORI KOWALESKI-JONES UNIVERSITY OF UTAH

Malta

THE REPUBLIC OF MALTA is composed of five islands in the Mediterranean Sea off the coast of Italy. The islands of Malta, Gozo, Comino, Comminotto, and Filflawith have a combined population of 398,534. Originally a possession of Great Britain, Malta became part of the British Commonwealth of Nations upon achieving independence in 1964. In 1975, Malta opted to become a republic. The island economy has been expanding since the mid-1980s because of Malta's status as a transshipment point and the development of a thriving financial center. Tourism continues to provide a major portion of government revenues. In 2004, Malta joined the European Union.

With a per-capita income of \$18,200, Malta is considered a high-income nation. While the only natural resources are deposits of limestone and salt, Malta benefits from a productive labor force and a favorable geographic location. Over 70 percent of the labor force are engaged in services, and 24 percent are employed in industry, mostly electronics and textiles. Only five percent of the population are employed in agriculture, producing one-fifth of Malta's food supply. The islands have limited freshwater resources and must import all energy requirements. Foreign investment is crucial to Malta's economic stability, which has suffered from a sluggish European economy in recent years. Unemployment currently stands at seven percent.

Malta has almost no poverty other than comparative poverty, but isolated pockets of poverty do exist. While social security provides a basic standard of living, working families are sometimes forced to choose among basic requirements. Overall the poorest individuals on Malta are female-headed households with small children, elderly women, and rural residents. Over the past decade, Malta has instituted a number of measures designed to improve the quality of life by recognizing the importance of families to society. Benefits have been established for part-time workers, most of whom are female, and family leave has been expanded.

Malta's population enjoys a healthy life expectancy of 78.86 years. With a projected life span of 81.15

years, women tend to outlive men (76.7 years) by five years. The median age on Malta is 38.36 years. More than 17 percent of the population are under the age of 14, and 13.6 percent have reached the age of 65. The entire population has access to safe drinking water and improved sanitation. Healthcare is widely accessible, and there are 291 physicians for every 100,000 residents. Less than five percent of Maltese lack access to affordable essential drugs.

Between 1970 and 2005, infant mortality on Malta dropped from 25 to 3.89 deaths per 1,000 live births. At the same time, mortality among all children under the age of 5 fell from 32 to six deaths per 1,000. With one exception, childhood immunization rates for children from birth to 23 months are in the mid- to high 90s. The rate of infant immunizations against measles rose from 80 percent in 1990 to 85 percent in 2002.

On the average, Maltese women bear 1.5 children each. The fertility rate among adolescents is nine births per 1,000. Healthcare is free on Malta at the point of use, and the islands have made prenatal and antenatal care widely available. Approximately 98 percent of births in Malta take place in the presence of trained medical staff. Out of every 100,000 live births, not a single mother dies. Among the Maltese population over the age of 10, 92.8 percent can read and write. With a literacy rate of 93.6 percent, women are more literate than men (92 percent). Primary school completion rates are over 100 percent, and most Maltese children attend school for at least 14 years.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Malthus, Thomas (1766-1834)

THOMAS MALTHUS was an English economist and demographer who theorized that population growth tends to exceed food supplies. Thus the improvement of living conditions of humankind is impossible without a strict policy of birth control. Malthus's economic theory is pessimistic at its core, as it describes poverty as inescapable for humankind. His controversial ideas contributed to his fame and he is considered a key figure in the development of classic economic thought. John Maynard Keynes explicitly recognized Malthus as a forerunner of modern economic thought. Yet his ideas have also been indicted as having had a strategic role in defending capitalist political economy against more inclusive and democratic movements.

Malthus was born into a wealthy liberal family and was largely educated at home until his admission to Jesus College, Cambridge, in 1784. He earned his master's in 1791 and became a professor of political economy at the East India Company's college at Haileybury, Hertfordshire, in 1805. Malthus lived there for the rest of his life and was elected to prestigious bodies such as the Royal Society, the Royal Society of Literature, the French Académie des Sciences Morales et Politiques, and the Royal Academy of Berlin.

The American and French Revolutions characterized Malthus's formative years. The young Malthus grew up in the cultural context of the Enlightenment and his father acquainted him with the ideas of leading intellectuals of the period such as David Hume and Jean-Jacques Rousseau. Yet in his own economic thought, Malthus was to depart from the Enlightenment principles of liberty and happiness.

In 1798, Malthus published "An Essay on the Principle of Population as It Affects the Future Improvement of Society," which received wide public attention and established his fame. The essay clearly reflects his economic pessimism, as the hopes for social improvement and the betterment of human living conditions are dismissed as vain. Malthus defines the growth of the population as geometric while the progression of the means of subsistence is at best only arithmetic.

While the Enlightenment promoted the perfectibility of society, Malthus did not believe that social imbalances were the result of evil institutions. To Malthus, misery and poverty were not the direct outcome of unfair institutions, but of the fertility of humankind. This definition of poverty as a simple imbalance between population and the means of subsistence was a clear reaction against the Enlightenment, the French Revolu-

tion, and its supporters. A particular target of Malthus was the English radical philosopher William Godwin, who had theorized that the future held the promise of a full development of man's rationality. Thus, people would live without the need for laws and institutions. Looking at the realities of his times with the empiricist gaze of a would-be sociologist, Malthus saw no evidence for Godwin's optimism.

Malthus's theory of population growth became part of classical economics and the starting point for discussions of demographic problems. Because of its pessimism, Malthus's theory gave economics the label of "dismal science." It also influenced Charles Darwin's ideas on evolution as a struggle for resources. Darwin applied Malthus's concepts to the natural world.

The "Essay on the Principle of Population as It Affects the Future Improvement of Society" had six editions, each increasing the empiricism of the discussion. While the first edition is more abstract and theoretical, the subsequent ones are more firmly grounded in factual data, although commentators claim that Malthus did not interpret these with statistical accuracy.

Malthus's essay had immediate effects on British social policy. Up to its publication, a high rate of reproduction had been considered as contributing to the national wealth, not as impoverishing it. The Poor Laws encouraged the formation of large families through the supply of doles. Malthus commented that if these laws had never existed, "there might have been a few more instances of severe distress," yet "the aggregate mass of happiness among the common people would have been much greater than it is at present." Malthus also found that the Poor Laws blocked the mobility of labor and suggested their abolition.

In other works, Malthus claimed that public and private expenditure could solve economic problems. Public works and private luxury investments, according to Malthus, function as deterrents to economic growth. Malthus was also critical of those who considered saving as the foundation for a sound economic policy. On the contrary, he argued, "The principles of saving, pushed to excess, would destroy the motive to production."

Mapping Poverty

MAPS ARE PICTORIAL depictions of the earth. When data are linked to geography, it is called georeferencing. The maps created with this process provide visualization of various indicators affecting humans. A seemingly simple concept, poverty maps are spatial representations of poverty assessments; however, assessing poverty is not a clear-cut process. As computer technology has advanced, it has become easier to create more detailed maps using large datasets and complex statistical models. Whereas the work is increasingly sophisticated, the map products are relatively simple to understand and they allow us to see statistics as a picture rather than as equations and tables.

The concept of poverty is multidimensional and uses a variety of determinants. In addition to the standard indicators of income level and Gross Domestic Product (GDP) per capita, other determinants might be consumption levels, education, health, economic opportunity, climatic factors, the existence of or access to services, infrastructure, etc. The determinants selected will vary according to the level of geography under consideration as well as the intended purpose of the map.

GEOGRAPHY AND DATA

Poverty maps are created by using specialized software called Geographic Information Systems (GIS) and a variety of data. The maps are built with layers depicting various elements appropriate to the geography being examined and the determinants selected by the researchers. The determinants of poverty can be joined using a statistical model and by creating layers within a map. It is important to understand that the earth's land and peoples are divided in multiple ways. The most obvious and immediate division is the use of geopolitical boundaries at the national level. Other layers might include a different level of boundaries (for example, states, regions, counties), topography, points representing services such as schools or hospitals, and data representing different variables.

Mapping poverty at the national level provides the ability to compare and assess the economic status and well-being of a nation's citizenry in relation to the citizens of other countries. However, aggregate national-level indicators can hide important differences among smaller geographical areas. For instance, mapping poverty for the United States as a whole will not show variances among states, counties, metropolitan regions, or within cities. Display of data in smaller geographic detail is called a disaggregated map. This makes it possible to display more detailed layers depicting essential elements such as schools, healthcare facilities, or grocery stores.

Display of data in smaller geographic detail is called a disaggregated map.

In many ways, disaggregated data provide a more accurate picture of spatial patterns. Continuing to use the United States as an example, poverty can be mapped according to state boundaries. While this provides more detail, and a level of detail that might be appropriate depending upon the purpose of the map, many variances will still be hidden. For greater understanding of spatial patterns of poverty within the states, data can be depicted at the county and/or city levels or even down to the level of the census block group. This is the smallest level of geography provided by the U.S. Census Bureau, which represents approximately 100 households while maintaining the confidentiality of each individual household. This level of geography allows us to see intricate patterns of variance and similarity among rural and urban populations that would otherwise go unrecognized. These principles of mapping data apply to other countries and regions of the world.

When mapping poverty or analyzing poverty maps, it is essential to know which data were used and how the data are displayed. A map displaying the percentage of population living below the official poverty level likely will look different from a map displaying the same indicator in whole numbers. This is because total population numbers vary. An area with a small, dispersed total population with a large number of persons in poverty will display differently from an area with a large, highly concentrated total population with the same number of persons in poverty.

Simultaneous display of these maps allows comparison, which will likely lead to different conclusions (that

is, mapped by percentage, the first area will show higher need for resources; mapped by total number of persons in poverty, the maps will show that each area has equal needs based on income alone). Also while mapping poverty, it is beneficial to consider other demographic factors such as age. The needs of children and the elderly living in poverty should be evaluated differently. For example, if a map demonstrates a high concentration of elderly persons in poverty, resources should be targeted to ensure proper nutrition and aging services rather than education and job training resources that are no longer needed by this population.

More complicated but also important are maps that depict regions without regard to political boundaries. Similar techniques are utilized to create maps that display patterns of poverty in other parts of the world. Depending upon the purpose and intent, poverty data can be displayed by continent using country as the unit of analysis. Regardless of level, georeferenced information can free analysis from the restrictions of fixed geopolitical boundaries when appropriate.

USING POVERTY MAPS

Poverty mapping has become an important tool in identifying ways to improve living standards. These maps are created and used by governments, nongovernmental organizations, researchers, teachers, etc., to learn and to aid decision-making. As the world's population grows, the demand on the earth's natural resources is constantly increasing. The world's economy is dependent upon these resources and the well-being of people is dependent upon resource distribution, whether for use or for production. Poverty maps provide information about the spatial distribution of the elements of poverty, the historical patterns of poverty, and the distribution and availability of resources. All of these inform decisions on current and future need. These maps also allow quicker and more accurate targeting of natural, financial, and human resources for intervention and development.

As noted in the previous section, georeferenced information can free analysis from the restrictions of fixed geographical boundaries. This is valuable when decisions need to be made for ecological purposes since natural resource management needs do not always match political boundaries. For example, protecting rain forests is essential to reducing climatic change. A rain forest may stretch across several countries and the organization working with these countries can use maps to demonstrate how the people of the entire region will

be affected. While this example seems disconnected from poverty, deforestation has caused drought, famine, and natural disasters such as flooding and mudslides. All of these impact living standards and economic opportunity.

Regardless of the purpose and intended audience, mapped information at all levels of geography helps make the results of often-complicated analysis more accessible. These maps provide an easily understandable product to students and nonspecialists and encourage better understanding and knowledge of our world and its people.

Furthermore, different maps displaying different dimensions of poverty and/or its determinants allow simultaneous comparison. Easily understood statistics support better decision-making for targeting resources or responding to the world's critical problems.

Denese M. Neu HHS Planning & Consulting, Inc.

March of Dimes

THE MARCH OF DIMES Birth Defects Foundation is a nonprofit organization and the successor to the (U.S.) National Foundation for Infantile Paralysis. President Franklin D. Roosevelt established the foundation in 1938 with his law partner, philanthropist Basil O'Connor. Infantile paralysis, commonly known as poliomyelitis (polio), was of great concern to the American public in the early 20th century as it faced severe polio epidemics during World War I and in the decades that followed.

Polio is an infectious viral disease affecting the nervous system with symptoms including weakness and paralysis of the muscles, with children under 5 being particularly vulnerable. In popular memory, polio raises the specter of children in leg braces and iron lungs.

Roosevelt, who contracted polio as an adult in 1921 and suffered from its symptoms throughout his life, was alarmed by the physical, psychological, and financial toll that the disease took, especially on young people.

At its inception, the National Foundation for Infantile Paralysis differed from other philanthropic foundations through its focus on research. It was among the first foundations to spearhead research in the sciences, providing financial support for research on polio, including pioneering work resulting in the invention of the successful vaccine developed by Jonas Salk in 1952. That year coincided with the highest incidence of poliomyelitis in the United States, with more than 57,000 cases reported and more than half of them resulting in paralysis.

Using the Salk vaccine, widespread vaccination against polio began in the United States in 1955. As a result of the foundation's work, polio has not been seen in the United States since 1979. The disease is rare even in developed countries. In 1988, when the World Health Organization, along with other partners, launched its Global Polio Eradication Initiative, there were 350,000 cases worldwide. As of March 2005, there were 1,263 cases recorded for 2004. The virus continues to be endemic in six countries. In order of severity the countries are Nigeria, India, Pakistan, Niger, Afghanistan, and Egypt. Most worrisome, however, is the fact that previously polio-free countries in western and central Africa, such as Sudan and Côte d'Ivoire, are seeing a reestablishment of the disease, the ensuing result of civil unrest and displacement.

The foundation has been particularly successful at grassroots fundraising. Putting a spin on the highly popular newsreel series of the 1930s and 1940s, *The March of Time*, comedian Eddie Cantor coined the phrase *March of Dimes*, appealing to Americans to send their dimes to the White House. In this manner, over \$3 million was collected in 1940 alone. As polio disappeared from the United States, the foundation changed its focus from eradicating polio to improving the health of babies by preventing birth defects and infant mortality, while continuing to emphasize research and public education in 1958. The name was officially changed to the March of Dimes Birth Defects Foundation in 1979.

Since the 1950s, 11 researchers funded by March of Dimes grants have won Nobel Prizes. Financial support for research in the prevention and treatment of inherited or otherwise acquired diseases in newborns has had positive results. For example, research in the late 1950s supported by the foundation led to the development of the PKU test, which involves a pinprick of

blood taken from the heel of a newborn. Today this test is carried out on newborns to identify certain kinds of mental retardation so that they can be treated immediately and appropriately. In 1985 the March of Dimes funded research leading to the use of surfactants to treat respiratory distress syndrome, a common lung disorder in premature infants that causes difficulty in breathing.

Through education, lessons from applied research have a trickle-down effect that can be especially effective at the popular level. For example, in 1973, March of Dimes researchers discovered that alcohol consumption during pregnancy causes birth defects. This finding has had a positive impact on prenatal maternal education and newborn health. Similarly in 1994, the March of Dimes launched a campaign urging women to take folic acid prior to and during pregnancy to help prevent neural tube birth defects such as spina bifida. This seemingly simple suggestion (that is, taking a vitamin supplement that included the prescribed amount of folic acid) resulted in a 21 percent decrease in the occurrence of neural tube defects between 1995 and 2000.

In 2003 the foundation launched the March of Dimes Prematurity campaign with the twin goals of raising awareness of prematurity among women and the general public and reducing the rate of premature births. Approximately 470,000 babies are born prematurely each year in the United States. Premature births have increased 29 percent in the last two decades and account for 12.1 percent of births.

Babies born prematurely may be at risk for death or lifelong health problems such as mental retardation and blindness, and pose large financial as well as physical and emotional burdens. The goal of the prematurity campaign is to bring the rate down to 7.6 percent by 2010. The March of Dimes will focus on finding causes for premature births, educate the public on recognizing preterm labor, continue funding for neonatal care units, and provide support for families of premature babies. Finally, since prenatal education and healthy babies go hand in hand with consistent healthcare, the March of Dimes will continue to advocate for access to health insurance and for the adoption of core newborn screening tests in all states.

The March of Dimes has a sophisticated and farreaching education program for the public operating through its main website as well as through local chapters. For healthcare professionals it also provides guides, statistics, and online training. To raise public awareness and funds, the March of Dimes coordinates WalkAmerica, an annual walkathon event that has raised more than \$1.5 billion since its inception in 1970, and selects a child to be national ambassador each year to travel across the country.

Research and education, funded and spearheaded by the March of Dimes, can improve outcomes for citizens of other countries as well. Consequently the March of Dimes is also working with international partners in Latin America, Asia, central and eastern Europe, and Africa toward common goals. In 2003, revenue for the March of Dimes stood at \$217.5 million, of which 74 percent went to funding activities such as research, advocacy, community programs, and education activities.

Marion Medical Mission

THE MARION MEDICAL Mission (MMM) is head-quartered in Marion, Illinois, and is an American non-profit organization. All designated donations, including those designated for administrative costs, go to their assigned use. All undesignated funds go to work in Africa. All of its volunteers pay all of their own travel costs to Africa as well as their own support while engaged in ministry there. The president (2005) of the MMM, Tom Logan, is also its founder. He worked with Albert Schweitzer, Martin Luther King, Jr., and others prior to graduating from McCormick Theological Seminary in Chicago (Presbyterian).

Spiritually the MMM is an ecumenical Christian ministry with team members belonging to Baptist, Lutheran, Methodist, Presbyterian, Roman Catholic, and other denominations. It seeks to show Christian love and unity through several kinds of ministries. Begun in 1985, the MMM has conducted medical missions in Ghana, Republic of Congo (Zaire), and Malawi. Since 1990 it has focused much of its work in Malawi in

cooperation with the Synod of Livingstonia of the Church of Central Africa Presbyterian. The MMM gives short-term medical care to people who are suffering from a lack of modern medical care. It works closely with the Embangweni Hospital in Malawi.

Part of the MMM's strategic mission is the promotion of self-help projects that can be sustained in the rural village without outside assistance. These self-help projects are designed to improve rural village life. Among the projects are those involved with digging shallow wells in rural villages, where the only source of water is a waterhole shared with animals.

Shallow wells are providing clean water to over 1.25 million people.

A shallow well, dug to the water table in the dry season, is lined in the bottom with a layer of gravel. A well wall is built by cementing burnt brick into place. The well's top is a cement cover, through the top of which PVC pipe is inserted. A technologically appropriate hand-pump device is used to bring water to the surface. Pump replacement parts are available and affordable to the village. Donors pay for the cement, PVC pipe, and well-pump materials. The current cost is \$300 per well to supply a village with clean water free from the frequent diseases and avoidable deaths that come from using waterholes. Since 1990 the MMM has built over 5,000 shallow wells in Malawi, Tanzania, and Zambia. These shallow wells are providing clean water to over 1.25 million people.

The MMM also builds needed schools. With the Synod of Livingstonia it opened the only school for deaf children in northern Malawi. In 1992 it opened the Chizimya Full Primary School. It has provided funding for teacher homes, school buildings, and libraries, and has aided the operation of seven schools, including the Kasoba-area Christian Muslim School.

Market Efficiency

MARKET EFFICIENCY IS ONE of the most problematic concepts in all of economics. In the model of general equilibrium, markets operate efficiently if all the assumptions of so-called perfect competition are fulfilled. One of them, omniscience, or perfect knowledge regarding the past, present, and future, ensures that people never err and hence follow only the optimal, efficient paths. As this is never true in reality, it often makes people believe that market efficiency is impossible, hence real markets are considered to fail, and therefore some remedy through the operation of the public sector is needed. Examples of textbook market failures include: monopoly power, externalities, public goods, and free-rider problems.

Critics of this approach argue that efficiency is not dependent on omniscience—which is an unattainable goal, indeed—but is built into every activity of every single market participant. Everyone bases his decisions on the market upon the comparison of perceived benefits and perceived costs and chooses only those activities where the benefits outweigh the costs. Since only the individual in question knows his subjective costs and benefits, every individual action of every individual must be considered (at least ex-ante) efficient, and hence the sum of individual actions, that is, market, must be considered efficient as well. So rather than "efficient never" as in the first approach, we have the "efficient always" approach.

EFFICIENT ARRANGEMENTS

Another group of economists building on Armen Alchian's pioneering article argues that a crucial point in the consideration of efficiency is relative efficiency, one's aggregate position relative to actual competitors, and not some hypothetically perfect competitors. In the real economy, as in a race, success is reached by the relatively fastest, regardless of the quality of his competitors. Hence efficient arrangements can be differentiated from inefficient arrangements over time on the basis of whether firms are making positive economic profits or not.

Douglass North, a Nobel Prize winner, challenges the criterion of survival of efficient arrangements over time, as many obvious inefficient structures have prevailed over very long periods of time. He consequently has come up with a concept of adaptive efficiency—a move of a market toward being more efficient if such an "inefficient" arrangement is dismantled.

Another attempt to rehabilitate the concept of efficiency has been made by James Buchanan, another Nobel Prize winner. His arguments for an alternative concept of efficiency are rooted in subjectivist-contractarian (Austrian-Wicksellian) tradition. From this intellectual background comes his focus on the process through which changes take place and on identification of obstacles to this process. He claims that some constraints to economic development are of an artificial nature, for example, imposed by governmental decree and political authority.

In the presence of such observed artificial constraints, the market can be labeled as "presumably inefficient" because profit-seeking entrepreneurs cannot freely operate to overcome the obstacle. Thus the space opens for a solution to this problem through compensation.

If those harmed by the existence of the barrier to efficiency improvement can compensate those who benefit, the efficiency-inhibiting barrier will be removed. If no such arrangement seems to be possible, the hypothesis of presumed inefficiency is falsified.

Despite the differences among authors, inefficiency is generally seen as the existence of unused potential for market transactions, so that somebody can be made better off without somebody else being made worse off as a result. The question then arises—and here comes the area of dispute: how can we identify that somebody was really made better off and somebody else was not made worse off?

As long as economics remains a science founded on subjective utility and individual evaluation of available opportunities, the question of improvement of "market efficiency" through a deliberate act of a governing authority will be very tricky.

JOSEF SIMA UNIVERSITY OF ECONOMICS, PRAGUE

Marshall, Alfred (1842–1924)

ONE OF THE FOUNDERS of neoclassical economics, Marshall was the most influential economist of the early 20th century and was the teacher of the most influential economist of the mid-20th century, John Maynard Keynes.

Marshall invented the familiar supply-and-demand curves. Though his father wanted him to enter the clergy, Marshall developed an early love of mathematics in general, and of geometry in particular. As a boy, he hid volumes of Euclid's *Elements* under his coat and studied them in every spare moment with the kind of zeal that a modern youth might apply to comic books. In 1862, he entered St. John's College at Cambridge University. He achieved the second-highest score on Cambridge's math competition, which gave him the title of "second wrangler" in mathematics.

In spite of his passion for mathematics, Marshall retained an ethical outlook that would have suited him well for the clergy. After graduating in 1865, he went to Germany to study philosophy. When he returned to Cambridge as a teacher (a fellow), he became a close friend of Henry Sidgwick, the eminent moral philosopher. After reading books by the classical economists David Ricardo and John Stuart Mill, Marshall chose economics as a career because he saw it as a way to help the poor.

His concern with poverty is reflected in his writings. He argued that poverty, especially extreme poverty, prevents people from leading a complete life. He stated that the poor suffered from low self-esteem and lack of aspiration, and that only improvements in their economic condition can improve the quality of their lives. He emphasized the importance of economic growth and education, along with the formation of appropriate institutions, in poverty alleviation.

As he wrote in his magnum opus, *Principles of Economics* (1890): "Now at last we are setting ourselves seriously to inquire whether it is necessary that there should be any so-called 'lower classes' at all: that is, whether there need to be large numbers of people doomed from their birth to hard work in order to provide for others the requisites of a refined and cultured life; while they themselves are prevented by their poverty and toil from having any share or part in that life."

In 1877 he married Mary Paley, who was one of the first female students at Cambridge and would have been a mathematics wrangler herself if women had been given the opportunity. Because Cambridge fellows were

forbidden to marry, he took a position teaching economics at University College, Bristol, which he held until 1881. After a brief stint at Oxford, Marshall returned to Cambridge as professor of political economy, a position not in conflict with his married status. He remained at Cambridge until his death in 1924.

Marshall emphasized the continuity of his own work with that of classical economists such as Ricardo and Mill. His most important contributions to economics were: to develop the notion of elasticity of demand using the supply and demand curves; period analysis; and marginalism.

Period analysis recognizes that different market forces are dominant in the short and long term. In the short term, supplies of goods and disposable incomes are more or less fixed. In the long term, on the other hand, anything can change: productive facilities, consumer tastes, disposable incomes, and even technology. Marshall agreed with other economists that market forces such as supply and demand determined prices in the short run.

Where Marshall differed from his contemporaries was to insist that in the long run, costs of production were also an important factor in determining prices. Marginalism is the idea that both consumers and businesses make decisions based on the enjoyment or profit they anticipate from the next unit of something that they might purchase or produce. Marshall did not originate the idea, but he developed it fully.

Despite using it in his own analyses, Marshall minimized the mathematics in most of his published work. To succeed in using economics to improve the world, he wrote books for the general public and confined most of the math to footnotes and appendixes. Marshall's influence as an economist and his moral example as a human being continue to influence scholars even in the 21st century.

SCOTT PALMER, Ph.D. RGMS ECONOMICS

Marshall Islands

THE REPUBLIC OF THE Marshall Islands is composed of a group of atolls and reefs in the north Pacific Ocean. Formerly under the administration of the United States as part of the United Nations Trust Territory of the Pacific Islands, the Marshall Islands became independent in 1986 but continues to host the U.S. Army Kwajalein Atoll (USAKA) Reagan Missile Test Site. A number of claims have been filed against the United States in connection with nuclear testing that was conducted on the islands before President John Kennedy banned the practice in 1962. Economic ties to the United States remain strong, however, and the economy would be devastated without U.S. aid.

With a per capita annual income of \$1,600, the World Bank classifies the Marshall Islands as a lower-middle-income nation. Over one-fifth of the labor force is involved in agriculture, mostly at the subsistence level. Coconuts, breadfruits, melons, and tomatoes are the most commercially viable crops. Another fifth of the labor force is engaged in small-scale industries that revolve around handicrafts, tuna processing, and copra. The rest of the labor force is employed in the service sector. Unemployment on the islands is estimated at 30.9 percent. In the future, the expansion of tourism may be the Marshall Islands' best hope for offsetting recent economic setbacks that occurred in conjunction with recent international events.

Poverty assessments for the Marshall Islands are rather difficult because data on important social indicators are not available. As a result, the United Nations has not ranked the Marshall Islands on general quality-of-life issues. No poverty rank is available, and the extent of poverty on the islands is unknown. As it exists on the islands, poverty is defined as a lack of access to basic human needs, including potable water, healthcare, and a primary education.

Even though the Marshall Islands suffer from a lack of potable water, 85 percent of the population use improved drinking water. Approximately 82 percent of the people have access to sanitation, but rural residents (59 percent) lag behind urban residents (93 percent) on this basic necessity. There are 46 physicians on the islands, and 92 to 100 percent of the population have access to affordable essential drugs.

Life expectancy on the Marshall Islands has fluctuated in recent years. From 1990 to 1995, male life expectancy fell from 68 to 65 years, then dropped again in 2000 to 63 years. During that same period, female life expectancy decreased from 73 to 70 and then to 68

years. By 2005 the projected life span for the 59,071 people on the islands had risen to 70.01 years. The median age is 19.95 years. Over 38 percent of the population are under the age of 14, and 2.7 percent have reached the age of 65.

While childhood mortality rates continue to be high, they have decreased in recent years. Between 1990 and 2003, infant mortality fell from 63 deaths per 1,000 live births to 53 deaths per 1,000 live births. The mortality of all children under the age of 5 dropped from 92 per 1,000 in 1990 to 66 per 1,000 in 2003. About 14 percent of all infants are underweight at birth. The extent of malnourishment among children under the age of 5 is not known. Childhood immunization rates range from 68 to 90 percent among children from birth to 23 months.

On the average, Marshallese women produce 3.93 children each. Around 37 percent of all women on the islands use contraceptives of some sort. Only five percent of births occur outside the presence of trained medical staff. Maternal mortality rates are not available. Among the population that is over the age of 15, 93.7 percent are able to read and write. Gender differences in this skill are negligible.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Marx, Karl (1818–83)

KARL MARX, THE SON of Hirschel and Henrietta Marx, was born in Trier, Germany. He came from a long line of rabbis, and his father, an admirer of Voltaire, abandoned his Jewish faith when Marx was a child and agreed to be baptized as a Protestant, so that he would keep his job as one of the most respected lawyers in Trier.

After schooling in Trier, Marx enrolled in the Faculty of Law at the University of Bonn at the age of 17. Soon thereafter he became engaged to Jenny von Westphalen, the daughter of Baron von Westphalen, a prominent member of Trier society and the man responsible for interesting Marx in Romantic literature and Saint-Simonian politics. The following year, his father, terrified by the fact that Marx was wounded in a duel and was running large debts, forced him to transfer to the academically superior Friedrich-Wilhelms Universität in Berlin.

In Berlin, Marx became interested in philosophy. He came under the influence of Bruno Bauer and joined the circle known as the Young Hegelians, known for their critique of the religion and the establishment. Marx was especially impressed by G.W.F. Hegel's dialectics, that is, that a thing or thought could not be separated from its opposite. Hegel's theory of the evolving process of history, and the notion that unity can be achieved only by equalizing the opposites, made a lasting impression on Marx.

After the death of his father and the dismissal of his mentor from the university, Marx moved to Cologne and, in October 1842, became editor of the influential Rheinische Zeitung. In January 1843 he published an article on the poverty of the Mosel wine farmers. This highly critical article provoked the government and the Prussian authorities, who quickly banned the newspaper. Fearing an imminent arrest, Marx married his fiancée and emigrated to France, where he became an editor of a political journal, Deutsch-Französische Jahrbücher (Franco-German Annals). The principal contributors to the journal were his old mentor, Bauer; the Russian anarchist, Mikhail Bakunin; and Friedrich Engels, son of a wealthy industrialist with whom Marx developed close cooperation a and devoted, lifelong friendship.

Paris experiences and especially the poverty of the working class made a deep and lasting impression on Marx. In an article published in February 1844, Marx argued that the workers would eventually emerge as the emancipators of the society. In the same year Marx wrote Economic and Philosophic Manuscripts. In this seminal work he developed the concept of alienation. At the end of 1844 Marx was expelled from Paris and he and Engels moved to Brussels where they cowrote The German Ideology, a critique of the philosophy of Hegel and the Young Hegelians. The basic premise of the manuscript was the thesis that "the nature of individuals depends on the material conditions determining their production." According to this materialist con-

ception of history, a human activity, rather than thought, plays the crucial role.

At the same time he also wrote a polemic, *The Poverty of Philosophy*, against idealistic socialism and joined the Communist League. This was an organization of German émigré workers, with its center in London, of which Marx and Engels became the major theoreticians. Marx and Engels took a prominent part in the league's Second Congress in London, in November 1847, at whose request they drew up the Communist Manifesto, which appeared in February 1848. Based on an earlier draft called *Principles of Communism* written by Engels, this document summarizes the theory of the class struggle and the role of the proletariat in building a new, classless society.

In London, Marx lived in extreme poverty; four of his children died soon after birth.

Within a month of publication of the manuscript, Marx was expelled from Belgium. He moved back to Germany but was expelled again in 1849. His hope of witnessing a socialist revolution in France did not materialize, since the French government ordered him out of Paris almost immediately.

England remained the only country that resisted the pressure of the Prussian authorities, and the British allowed Marx to emigrate there. In London, Marx lived in extreme poverty, four of his children died soon after their birth, and his wife contracted smallpox. Engels continuously provided financial support to Marx's family, who, in order to survive, sold most of their possessions.

DAS KAPITAL

In 1859, Marx published A Contribution to the Critique of Political Economy. His principal assertion was that the existence of a man is determined not by his consciousness but by the social circumstances in which man exists. The first volume of Das Kapital (Capital) was published in 1867.

In this work Marx analyzed the capitalist process of production and elaborated his version of the labor theory value and the exploitation that would ultimately lead to a falling rate of profit and the collapse of industrial capitalism. Marx worked on Volume II and Volume III of *Capital* for the rest of his life and Engels published them posthumously.

On September 28, 1864, the First International was founded in London. Marx was elected to the General Council and spent endless hours fighting the anarchists led by Mikhail Bakunin. The bitter struggle forced a move of the organization to New York City and led to its subsequent decline. In 1871 the citizens of Paris rebelled against their government, an event known as the Paris Commune. Marx, who called the Commune the "greatest achievement" since the revolutions of 1848, wrote one of his famous pamphlets, *The Civil War in France*, a passionate defense of the rebellion.

The bloody suppression of the Commune, the strenous work on the International, his relentless writing and organizing, and the deaths of his wife and eldest daughter all delivered a fatal blow to his already fragile health. Marx passed away peacefully in his armchair on March 14, 1883, and was buried next to his wife at Highgate Cemetery in London.

Julian Schuster University of New Haven

Maternal Mortality and Morbidity

POVERTY AND THE RISK OF maternal morbidity and mortality are explicably linked. As noted by A. Germain, "one of the greatest disparities between rich and poor countries and, often, rich and poor people, is in maternal mortality." Where countries have (and are willing) to spend the money in developing and maintaining effective environmental and healthcare systems, women's risk of becoming ill or dying during pregnancy declines.

However, "political and ideological roadblocks have obstructed progress on the nondisease elements of reproductive health: contraception, safe abortion, and comprehensive sexual education." In other words, instead of providing access to and infrastructure for reproductive health, governments attempt to control childbearing as a means to reduce risks to women and

children. The need to decrease maternal morbidity and mortality was recognized even before the Alma Ata Conference in 1978, is thoroughly discussed in *Health for All* documents for the years 2000 and 2001, and was made a major priority at the United Nations International Conference on Population and Development in 1995.

However, in 2000 there were 529,000 maternal deaths, with 13 countries (India, Nigeria, Pakistan, Democratic Republic of Congo, Ethiopia, United Republic of Tanzania, Afghanistan, Bangladesh, Angola, China, Kenya, Indonesia, and Uganda) accounting for 67 percent of these deaths. Since there has been continuous research and discussion about these problems for more than 30 years, why has there not been a significant positive change for women and their families with a reduction in maternal morbidity and mortality?

This article will provide definitions of, and examine the known underlying causes and risks for, maternal morbidity and mortality. In addition it will discuss the impact of these conditions on families and communities, review some of the data collection issues surrounding these conditions, and conclude with a consideration of the various recommended strategies for reducing maternal morbidity and mortality in this century.

DEFINITIONS

Maternal morbidity is not as well defined as maternal mortality. Maternal morbidity is often considered to be a "near miss." A *near miss* is "defined as pregnant women with severe life-threatening conditions who nearly die but, with good luck or good care, survive" by R.C. Pattinson and M. Hall. Others, such as M. Oates, consider perinatal psychological illnesses, for example postpartum and other pregnancy-related depressions, as morbid conditions during pregnancy.

Maternal morbidity is an area that needs considerable research in order to further define the concept as well as the impact it has on pregnant women and their families, especially since it has been suggested that maternal morbidity is a better indicator of the quality and effectiveness of obstetric care than mortality, as noted by some scholars.

On the other hand, maternal mortality has been well-defined (and redefined) over time. Currently, maternal mortality is defined in two ways—by the maternal mortality rate and the maternal mortality ratio. The maternal mortality rate is based on the total number of births and obstetric risk per birth, that is, this rate is the number of maternal deaths divided by the number of

women of ages 15 to 49, or those women of reproductive age.

The maternal mortality ratio, which is a commonly used biostatistical indicator, is the number of maternal deaths per 100,000 live births and is a measure of the risk of death once a woman has become pregnant. The regions of the world have different maternal mortality ratios, with Africa having the highest ratio at 830 estimated maternal deaths per 100,000 live births—and sub-Saharan Africa has the highest in the world with 920 estimated maternal deaths per 100,000 live births.

The lowest maternal mortality ratios can be seen in the developed world in Europe and North America, with Europe having 24 estimated maternal deaths per 100,000 live births. Globally the regions can be ranked in the following order from highest to lowest estimated maternal deaths: Africa, Asia, Oceania, Latin America and the Caribbean, North America, and Europe. In terms of specific countries, the top eight with the highest maternal mortality ratios are Mali, Rwanda, United Republic of Tanzania, Niger, Angola, Malawi, Afghanistan, and Sierra Leone.

A final note about the definition of maternal mortality is that time is a factor for considering whether a woman's death is recorded as a maternal death. According to the *Tenth Revision of the International Classification of Diseases (ICD10)*, "a maternal death [is] a death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not accidental or incidental causes."

If a woman dies within six weeks of giving birth or while pregnant and it is not an accident, the death is considered a maternal death. Approximately 75 percent of maternal deaths occur from the last trimester of pregnancy to about six weeks after delivery.

RISK FACTORS

The top two risks for maternal morbidity and mortality are being female and becoming pregnant; however, a variety of biological, social, and medical factors are important risks as well. In addition to being female, other biological risk factors are age, race/ethnicity, and nutritional status. Women who are short, thin, and anemic are more likely to experience morbidity and/or mortality during pregnancy.

There are a number of social factors that put women at risk for morbidity and mortality. These are socioeconomic status, country of delivery/ruralness of country, access to healthcare, and maternal education level. Gender dynamics, wherein the government in a country does not adequately provision the maternity care system, and so the services delivered cannot meet the needs of women who are of reproductive age, is a social indicator for risk as well.

An interesting point of fact is that in the United States and other developed countries, reductions in maternal and infant mortality occurred as urban environmental interventions (for example, sewage and refuse disposal and safe drinking water) improved. In addition, an improved standard of living based on increased monies, access to education, and a decline in fertility rates all aided families in improving their health and nutritional status. These social factors are all connected to decreased poverty and increased earning power and health status.

Currently research is focusing on the area of violence towards women, especially when they are pregnant. Violence perpetrated on women of reproductive age or on pregnant women takes a heavy toll. Violence may be domestic/family violence and/or caused by warfare. A serious issue connected to violence is that warfare leads to decreased funding for needed maternity services.

Medical risks for women arise when standards and guidelines for appropriate maternal care are lacking and there is inadequate training for and supervision of health workers. In addition, infection prevention in many maternity care settings may be substandard (for example, lacking adequate running water and cleanliness of all areas). Disparities in access to care often occur by race and ethnicity in the United States, and are most likely linked to similar problems in other developed countries as well. In the past 15 years, HIV/AIDS status has had an increasingly significant impact on maternal morbidity and mortality.

As a final note, these risk factors impact women differently throughout the world. For example, in Nepal vitamin and nutritional deficiencies may play a major role in morbidity and mortality rates of pregnant women, while in Indonesia hemorrhage, infection, and toxemia are the key risk factors.

CAUSES

Maternal morbidity is due to complications related to pregnancy. The top causes of morbidity, according to experts, in developed countries are miscarriage, ectopic pregnancy, excessive vomiting, diabetes, hemorrhage, infection, pregnancy-induced hypertension, premature labor, and cesarean delivery. In addition to the same causes seen in the developed world, malaria, anemia, maternal depletion (due to poor nutrition and heavy workload), and HIV/AIDS are indicators for maternal morbidity.

IMPACT OF MATERNAL DEATHS AND ILLNESS

Although maternal morbidity and mortality are considered problematic at the governmental and health system level, it is at the family and community level that a larger impact is felt. J. O'Loughlin states this very clearly when he says, "the death of a mother is almost twice as dangerous for her surviving children as the death of a father, and her daughters are almost twice as likely to die as her sons." Women carry almost all of the household workload and are the main producers of food for families. The food a woman produces is not only for her family but may be for sale as well in order to provide family income.

The woman's death may push a family into further poverty or into poverty due to the decrease in income. When a woman dies, the workload she carries must be covered by another person—usually another woman who may not be the mother to the children in the household. In addition, when a woman dies in child-birth, the infant she is carrying dies with her about 74 percent of the time. Therefore a reduction in maternal mortality rates could have a positive impact in decreasing infant mortality rates as well.

DATA COLLECTION ISSUES

Currently data on maternal morbidity and mortality are collected through a variety of direct and indirect methods, including hospital deaths/vital records, surveys, census data, and interviews with surviving family members (for example, household surveys, sisterhood method). Each of these methods is a way to estimate maternal deaths and to "draw attention to the existence and likely dimensions of the problem of maternal mortality," according to C. AbouZahr and T. Wardlaw. Since the numbers are only estimates from these methods, some countries have decided to conduct special surveys to attempt to more accurately measure maternal morbidity and mortality.

These surveys estimate the time of a woman's death and its relation to pregnancy to better clarify if the death might be a maternal death. Whatever the data collection method used, the purpose should be to collect as accurate a set of data as possible so that "evidencebased healthcare" can be developed and provided to women of reproductive age.

In terms of hospital-based information, not all women use hospitals, many times the information on the death records is incorrect or incomplete, and the diagnoses may be differently defined within a country. Although the information may be readily available, it is not clear how complete the information is, and suggestions have been made that these estimates should be adjusted upward by a factor of 50 percent.

One way of handling these data are to use the hospital information and identify the deaths of all women between the ages of 15 and 49 (reproductive age) and read through each death record to determine if there was the likelihood of a maternal death. This method, along with interviews, appears to provide more comprehensive information about maternal mortality.

Some scholars point out that the sisterhood method uses smaller sample sizes but provides only data about the previous 10 years. It does not actually "measure pregnancy-related deaths" and is not particularly "useful for monitoring changes," according to AbouZahr and Wardlaw.

However, confidential inquiry, another method used, provides information only about the deaths of which family members and others in the community are aware. Maternal morbidity is not being measured in this way and is usually estimated based on families noting that a woman was ill and could not complete her normal work while she was pregnant.

There is increasing agreement that countries need to complete censuses so that there is generational data on maternal morbidity and mortality. This method would allow for specific questions to be officially asked as well as for the data to be used to develop trend analyses. For this type of data collection, a variety of data variables should be included, for example, demographic, economic, social, and health system, to allow for comparisons across countries and global regions.

STRATEGIES

The primary strategy for reducing maternal morbidity and mortality is to ensure that skilled birth attendants, community health workers, and/or midwives are available for every birth. These professionals, who know the women and their families because they live in the community, are able to determine when a woman is having a high-risk pregnancy and when she needs care from the clinic or hospital. The ability of these healthcare providers to access the larger healthcare system is cru-

cial for women who are having complications due to pregnancy.

Other tasks that could aid in improving maternal health are, according the World Health Organization (WHO): 1) to provide easy family planning access to all women—some countries require a husband's approval and/or that the woman be married to receive family planning services; 2) to encourage later marriage for girls so they are less likely to be at risk of becoming pregnant at an early age; 3) to create healthcare clinics that are close to people's homes and ensure that these facilities have trained health professionals; 4) to develop more effective protocols and statutes for regulating practice so that obstetric risks are consistently identified; and 5) to provide safe abortion services.

Another important strategy for reducing maternal morbidity and mortality is to provide healthcare based on more accurate and relevant evidence. Evidence-based healthcare means that practices in healthcare settings and services provided by professionals will be based on scientific information that allows for a "more effective resource allocation" to ensure that women are better able to survive their reproductive years.

In conclusion the link between poverty and maternal morbidity and mortality needs to be highlighted for governments to have a more complete understanding for action. Increasing women's nutritional status and their educational status, as well as their ability to access healthcare, will, in conjunction with the strategies mentioned earlier, improve maternal health. As WHO has stated, "the death of a woman during pregnancy or childbirth is not only a health issue but also a matter of social injustice."

UNIVERSITY OF UTAH

Mauritania

IN THE REPUBLIC OF Mauritania, located in northern Africa, 46.3 percent of the population live in poverty and one-fifth are unemployed. Mauritanians live on an average annual income of only \$280, with 63.1 percent living on less than \$2 a day and 25.9 percent living on less than \$1 a day. Mauritania's wealth is unevenly divided, with the poorest 20 percent claiming only 7.3 percent of the country's income, while the richest 20 percent share 39 percent. Mauritania is ranked 39 on the Gini Index of Human Inequality.

Mauritania's dependence on agriculture, which employs 50 percent of the labor force, has resulted in overgrazing. Problems are compounded by the scarcity of natural freshwater resources except around the Senegal River. Water resources are further threatened by periodic droughts and crops are at risk from locust infestations. The proceeds from Mauritania's large iron ore deposits make up almost 40 percent of the country's exports; however, this market has recently declined in response to declining demands.

The coastal waters of Mauritania are considered to be among the richest in the world, but this valuable asset has proved vulnerable to foreign exploitation. A history of government mismanagement was in large part responsible for huge foreign debts that led to Mauritania's inclusion in the Heavily Indebted Poor Countries (HIPC) program in 2000. Prospects for combating poverty in the coming years have improved with the discovery of offshore oil wells in 2001, but until they are operational the effects of poverty are devastating.

With a life expectancy of 52.73 years and a median age of 16.98, Mauritania is a young country. Approxi-

mately 46 percent of the population are under the age of 14, and some two percent reach the age of 65. Mauritanians have a 30.5 percent chance of dying before they turn 40. While Mauritania's HIV/AIDS prevalence rate is relatively low for sub-Saharan Africa (0.6 percent), 9,500 Mauritanians were living with the disease in 2003 and another 500 had died. The population is also susceptible to the food- and waterborne diseases, chiefly because 63 percent lack access to safe water and 67 percent lack access to adequate sanitation. Some locations experience malaria and Rift Valley fever, and respiratory diseases are common.

Before the Carter Center of Emory University became involved in Mauritania in 1995, Guinea worm disease, which is spread through contact with infected water, was endemic in 221 villages. By 2003 only 13 cases were reported among nine locations. Even preventable diseases take the lives of many Mauritanians because they lack access to adequate healthcare and lifesaving drugs.

The infant mortality rate for Mauritanian infants was estimated at 70.89 per 1,000 live births in 2005. This is a significant improvement since 1970, when the rate was 150 deaths per 1,000. Mortality rates for children under the age of 5 have also decreased drastically, declining from 250 in 1970 to 107 in 2003. Even so, childhood mortality rates remain unacceptably high. Approximately one-third of all Mauritanian children are underweight, and 10 percent are severely malnourished. Approximately 35 percent of children under 5 suffer from moderate to severe stunting, and 13 percent suffer from moderate to severe wasting.

Rates of childhood immunizations have fluctuated somewhat in recent years. In 1999, 63 percent of children between the ages of 12 and 23 months were immunized against measles. That rate increased to 81 percent in 2000 but declined to 71 percent in 2003. In 2003, 76 percent of children in this group received DPT3 vaccinations. According to reports for 2002, infant immunizations were somewhat higher, with 98 percent immunized against tuberculosis, 81 percent against measles, 83 percent against DPT, and 82 percent against polio.

Only 41.7 percent of the adult population can read and write. Less than one-third of all females and just over half of all males are literate. Male literacy rates decreased from 59.5 percent in 1980 to 49.3 percent in 2000, then rose to 51.8 percent in 2005. Female literacy rates declined from 82.5 percent in 1980 to 69.9 percent in 2000, then decreased again in 2005 to 31.9 percent. Mauritanian children receive an average of seven years

of schooling. Between 1995 and 2000, primary school completion rates increased for both males and females. Among males the increase was from 61 to 68 percent, and from 53 to 64 percent among females.

Mauritania's fertility rates are high. Estimates for 2005 place the fertility rate of women of childbearing age at 5.94 children. Two years earlier, the fertility rate was 4.6 children for all women and 110 out of 1,000 for adolescents. Only eight percent of all women use contraceptive measures. Some 43 percent of all women lack professional attention when giving birth, and the maternal mortality rate is estimated at 1,000 per 100,000 live births.

In response to pressure from international groups, the Mauritanian government has acknowledged the unequal status of women by adopting new policy initiatives. These initiatives include poverty reduction, improved educational equality for girls, professional training and greater economic opportunities for women, improvements in maternal and infant health, and increased numbers of women in decision-making positions.

Mauritius

THE ISLAND OF Mauritius, located in the Indian Ocean, has grown from a low-income agricultural country to a middle-income nation with a diversified econ-

omy. The per capita annual income of \$4,900 is one of the highest in Africa. Independent since 1968, Mauritius is a stable democracy that provides an environment conducive to foreign investment. While much of its income is derived from industry, finance, and tourism, the Mauritian economy is still tied to the sugar industry, and growth has declined somewhat in recent years in response to declining sugar prices and poor weather. The majority of Mauritians experience a comfortable standard of living, and income is relatively equally distributed; however, approximately 10 percent of the population live in poverty and five percent are malnourished.

The entire population has access to safe water and improved sanitation.

Mauritius's population of 1,230,602 experiences a life expectancy of 72.38 years and a median age of 30.5 years. Almost one-fourth of the population is under the age of 14, and 6.5 percent are over the age of 65. Mauritians have a 4.6 percent chance of dying before the age of 40.

High educational levels and literacy rates, combined with quality of healthcare, have allowed Mauritius to virtually escape the HIV/AIDS epidemic that has swept much of Africa. In 2001, 700 people were living with the disease and fewer than 100 had died of the disease or its complications. Malaria and polio have been eradicated in Mauritius, and high quality of life protects Mauritians from the infectious diseases that are common in other African nations. The entire population has access to safe water and improved sanitation, and virtually everyone has access to affordable lifesaving drugs.

The Mauritian infant mortality rate is remarkably high when compared to its African neighbors. In 2005, out of 1,000 live births, this rate was estimated at 12.27 for females and 17.74 for males, with an overall rate of 15.03 deaths. Two years earlier, the mortality rate was 16 per 1,000 for infants and 18 per 1,000 for children under five.

About 13 percent of all Mauritian babies experience low birth weight, and 15 percent of children under the age of 5 are malnourished. Averages for the period 1995 to 2003 reveal that only two percent of Mauritian children under 5 were severely underweight, 14 percent suffered from wasting, and 10 percent of children experienced stunting.

Careful attention to childhood immunization rates has resulted in healthier children. Between 1999 and 2003, the number of infant immunizations against measles rose from 80 percent to 94 percent. Infant immunizations were reported at 88 percent against polio and DPT and 87 percent against tuberculosis. In 2003, 94 percent of children between the ages of 12 and 23 months were immunized against measles and 92 percent were immunized against DPT3.

The low fertility rate of 1.96 children per woman in 2005 is further evidence of a comparably high standard of living for Mauritians, as is the adolescent fertility rate of 39 per 1,000 births. Approximately 26 percent of Mauritian women use contraception of some sort. In 2000, maternal mortality was estimated at 24 deaths per 100,000 live births.

These rates have been controlled in recent years by the attendance of professional medical staff at 98.5 percent of all Mauritian births. While there is no definite poverty line in Mauritius, it is estimated that some 10 percent of the total population of Mauritius suffer from poverty. The poorest Mauritians are women and their dependent children, resulting in what has become known in much of the world as the concept of the feminization of poverty.

While more needs to be done to improve literacy in Mauritius, rates are comparably high for the area. In 2003 the literacy rate was recorded as 85.6 percent, with an 88.6 percent rate for males and an 82.7 percent rate for females. Education in Mauritius is free and compulsory, and most Mauritians receive at least 13 years of schooling. At the primary level, all Mauritian children are enrolled in school, but completion rates have dropped in recent years. As a result, the Ministry of Education and Scientific Research has established a monitoring system to track student school attendance, and some children are being redirected toward vocational schools.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

McKinley, William (Administration)

WILLIAM MCKINLEY (1843–1901) was the 25th president of the United States, serving from 1897 to 1901. He is most commonly remembered for his raising of import tariffs and his role in starting the Spanish-American War, which led to the United States obtaining a global empire.

Born in Ohio, McKinley served with distinction in the American Civil War and then went on to make a career in law. He became involved in politics and achieved a considerable level of electoral success as a representative of the Republican Party. His political views may best be summarized as compassionate conservatism. The strength with which he held to his position on protectionism was founded on genuine concern for the poor, especially the rural poor, who he thought would be best served by this stance.

In the 1890s, when he first began to plan seriously to become president, America was isolationist and suffering from economic depression. The economics debate was dominated by the gold standard, supported by McKinley, and the bimetallic standard, favored by his Democrat opponent, William Jennings Bryan. Assisted by the wealthy industrialist Mark Hanna, who obtained enormous campaign donations from big business (much of which was used in negative campaigning against Bryan), McKinley was elected despite scarcely leaving his own house.

McKinley ordered the United States into war with Spain in 1898, largely on the basis of the violent suppression of an independence movement by the Spanish in Cuba, and because of an explosion that destroyed the USS *Maine*, for which the partisan American press wrongly blamed the Spanish. The war was quickly won, as the Spanish then had only a few weak military forces spread across the world.

America then had to decide what to do with the captured Spanish possessions in the Philippines, Guam, and Puerto Rico. By a slender margin, the overseas possessions were voted to become imperial colonies. This act enabled the United States to challenge the European

William McKinley's protectionism was founded on a genuine concern for the poor, especially the rural poor.

powers as a major player on the world stage, and the colonies represented sources of cheap resources and overseas markets for American products. There was a significant proportion of the American public that opposed this overseas expansion, but McKinley sided with imperialism on the basis that America would be better able to provide for the welfare of the poor people of the colonies. To the people of the colonies, the name of the colonizer made little difference and fierce insurrections erupted, notably in the Philippines, where bloody fighting continued for years. McKinley was successfully reelected in 1901 but, on September 6, he was

shot twice by the anarchist Leon Czolgosz and died a week later.

Means-Tested Government Antipoverty Programs

MEANS-TESTED GOVERNMENT antipoverty programs are governmental attempts to reduce poverty that target only those who are in genuine need. It seems intuitively reasonable that such programs would be more efficient in reducing poverty, because government services and resources would be more tightly focused on appropriate recipients.

However, results have generally been disappointing because of the highly complex nature of welfare programs, and because of the ways in which recipients are selected and monitored. Further, the difficulties attendant upon measuring changes in circumstances (and hence noneligibility to benefit from the programs) have also rarely been successfully negotiated.

Among the best-designed means-tested programs are reputed to be those that have recently been implemented in the United States. These have recorded very low rates of seepage to noneligible households (that is, including those who should not be included) or of exclusion error (that is, not including those who should be included), although participation rates have fallen, which suggests the presence of negative incentives to attempt to joint the schemes.

Effective management has been based upon devising appropriate criteria involving income and assets as well as thorough and rigorous verification of results. Outreach efforts, including partnership with nongovernmental organizations, might help in improving

participation rates. While effective, this method is quite resource-intensive and would necessitate perhaps considerable levels of capacity building in lesser developed countries. This is particularly true when the entire network of often-interlocking programs necessary to target all relevant target audiences is considered. The minimum requirements include accurate population statistics with systems to keep them updated, systems for recording residency and eligibility, skilled and motivated government staff at the front line, and sufficient funds and resources to meet advertised benefits. Raising expectations that cannot be subsequently met in part or in full often proves to be more demoralizing than offering nothing at all.

The desire for means-tested programs rather than universal benefits is often motivated by political means. Some people believe that there are a comparatively large number of people who are willing and able to cheat the system and, hence, the onus for demonstrating their eligibility should be upon the potential participant. This argument is related to the unsubstantiated claim that people perceive poverty as negative, and hence receipt of transfer payments offers a superior lifestyle to not being in poverty. So long as people in these tendencies focus their efforts on improving the efficiency of systems rather than questioning their need, then the damage they do will be limited.

Raising expectations that cannot be met often proves to be demoralizing.

Methods of improving means-tested government programs include the use of joint applications across different programs, centralized computer services for record-keeping, and better advertising of services in terms of benefits and eligibility criteria. In general these programs are better aimed when they are intended to promote active change in the recipient's life and circumstances, stimulating behavioral change, and linking the client with further suites of services that are designed to provide a smooth rather than staccato transition process out of poverty.

JOHN WALSH SHINAWATRA UNIVERSITY

Means Testing

MEANS TESTING IS THE PROCESS by which people are assessed for their eligibility for public assistance schemes, such as welfare payments or tax credits, on the basis of their existing income. Since universal provision of payments can be very resource-intensive, restricting transfers to those with genuine need can enable schemes to continue without being prohibitively expensive.

However, the very complex nature of many programs and eligibility criteria makes the process of application expensive and subject to administrative error, not to mention fraud, while filling out forms and presentation for interview represent possible barriers to access for a number of people. Furthermore change in personal circumstances also affects eligibility for meanstested benefits, including those for whom the benefit is clearly intended, and this can lead to further sources of administrative error.

Means-tested benefits are subject to criticism from people who object to government transfers generally. They claim that these benefits promote a culture of reliance and underachievement. Means-tested benefits are also subject to criticism when they are too restrictive or complex and hence fail to reach those who would need them the most. However, these forms of criticism usually concern administrative rather than ideological issues.

Means testing has a long history in European economies and was for a long period associated with the notion of the "deserving" and the "undeserving" poor—the former being those willing and able to improve their lot and the latter not, with little thought being given to why some people were unable to improve themselves. It has been used in the United States since the time of the Great Depression and its merits are continually debated with respect to expensive schemes such as Medicare. Ross Perot, a 1992 presidential candidate,

advocated greater use of means testing to determine eligibility, but there has been little progress subsequently as the issue has become mired in partisan politics. Internationally, means testing is expanding to former Communist countries that previously offered, if some times only nominally, universal levels of benefit. Greater capacity in developing countries is also enabling a larger provision of means-testing terms of government welfare provision, and there is a need for high-quality research to determine the long-term impacts of such schemes and to identify the best practice in managing them. Irrespective of optimal arrangements for distribution of resources, poorly considered or presented schemes will arouse widespread resentment.

Médecins Sans Frontières

MÉDECINS SANS FRONTIÈRES (MSF) or "Doctors without Borders" is an international humanitarian organization that is dedicated to providing emergency medical aid anywhere it is required in the world, irrespective of color, creed, or any other issue. MSF is also dedicated to raising awareness of the need for medical aid and assistance. It is the world's largest independent provider of health services and is currently active in 68 countries around the world.

In addition to providing healthcare, MSF publishes research and policy advocacy in support of its origins in 1971, when a group of doctors decided to take action to counteract what they perceived to be injustice in terms of attaching political considerations to humanitarian interventions. Arguing that humanitarianism should come

first independent of any political considerations, MSF members, who draw upon 2,000 or more doctors internationally as well as other professionals, work in every country of the world in which they perceive there to be a need. Unfortunately interventions in Afghanistan and Iraq have been ended after persistent use of violence against MSF workers.

One of the more important issues facing international humanitarian organizations at the beginning of the 21st century is the difficulty inherent in avoiding either being co-opted into the efforts of a partisan (occupying) force or being viewed as part of that effort irrespective of ideological neutrality. The lack of international support for the American-led invasion and occupation of Iraq and the huge amount of so-called collateral damage caused (that is, the death and injury of civilians) have stimulated the belief that humanitarian intervention is part of the invasion and, hence, a suitable target for those prepared to use violence to end the occupation.

MSF was awarded the Nobel Peace Prize in 1999 "in recognition of the organization's pioneering humanitarian work on several continents." In the Nobel lecture given in response to this prize, MSF's James Orbinski summarized the philosophy of the organization: "Our action is to help people in situations of crisis. And ours is not a contented action. Bringing medical aid to people in distress is an attempt to defend them against what is aggressive to them as human beings. Humanitarian action is more than simple generosity, simple charity. It aims to build spaces of normalcy in the midst of what is abnormal. More than offering material assistance, we aim to enable individuals to regain their rights and dignity as human beings. As an independent volunteer association, we are committed to bringing direct medical aid to people in need. But we act not in a vacuum, and we speak not into the wind, but with a clear intent to assist, to provoke change, or to reveal injustice. Our action and our voice is an act of indignation, a refusal to accept an active or passive assault on the other."

MSF does not, therefore, act purely as a neutral provider of emergency assistance but acts also as a facilitator in helping people to restore peaceful and normal conditions in their lives. Since the causes of conflict and warfare are so often related to governments or groups who would form governments, it is inevitable that its advocacy will clash with some governmental versions of events. MSF believed that it was obliged to withdraw from the Democratic People's Republic of Korea (North Korea), for example, because despite the evidence of clear need for millions of people, it found the

government's interference and obstructionism in its work necessitated the withdrawal.

HISTORY

MSF was established in 1971 by French doctors who had been active in Biafra and who had become disillusioned by the political considerations surrounding humanitarian intervention as well as by the neutrality of the International Red Cross Commission, which they believed failed to maximize relief by failing to challenge certain state actions that may obstruct it. Both in Biafra—a state in eastern Nigeria seeking autonomous rule—and in East Pakistan (now Bangladesh), MSF founders, led by Bernard Kouchner, observed occasions on which they believed they should speak out in the desire to reduce suffering.

Since they are required to work in states that were unable to offer any meaningful local health service infrastructure, MSF volunteers were often obliged to work directly with government ministries to assess needs and deliver services. However, they refused to do this when government officials involved were suspected of being culpable of human rights abuses.

Accusations against officials in Zaire (Democratic Republic of the Congo) and Tanzania that they had been involved in massacres in Rwanda led to the expulsion of MSF from those countries. There have also been high-profile appeals for change and intervention in Chechnya and Kosovo, among other places. These are complemented by various public education campaigns aimed at young people and communities and other outreach activities.

One particularly important public information campaign has been Access to Medicine, which calls for affordable medicines for all people. This effort is aimed at reducing prices of existing drugs, bringing back into production drugs that have been abandoned as unprofitable but which could still help many people around the world and increasing research and development by both public- and private-sector institutions.

An international conference on research into neglected diseases was held in June 2005 at which some 200 experts from around the world gathered to debate the issues involved with creating strategies to promote exploration of remedies. The associated Drugs for Neglected Diseases Initiative aims to "raise awareness of the need to research and develop drugs for those neglected diseases that fall outside the scope of market-driven research and development." Millions of people fall victim to diseases such as malaria, HIV/AIDS, and

tuberculosis, but these diseases receive comparatively little attention from the scientific research community apart from those cases in which profitable exploitation of new drugs seems possible. This includes those HIV/AIDS treatments that are primarily aimed at comparatively rich Western sufferers. MSF, meanwhile, is establishing programs to treat victims of HIV/AIDS as a comprehensive package, which includes provision of condoms and other preventive methods, education, and the provision of antiretroviral treatments (ART). ART is now being provided by MSF to 40,000 patients across a total of 29 countries.

Médecins Sans Frontières is the largest independent provider of health services.

The programs are working and many patients are gaining weight and living longer and fuller lives. However, there are still problems, such as including oftenneglected populations such as children and also obtaining ART medicines at affordable costs. This has brought MSF into further engagement with international trading rules and regimes as they aim further to modify rules to permit low-cost, generic alternatives to proprietary drugs to be produced and distributed across the developing world.

MSF's income exceeded 373 million euros in 2003, with 80 percent of this being derived from private individual sources. Expenditure is primarily on operations, at 82 percent, with 11 percent spent on fundraising and six percent on management and administration. The country on which the largest proportion of resources was spent was the Democratic Republic of the Congo, which received 26.4 million euros, followed in descending order by Sudan, Angola, Liberia, Afghanistan, and Ethiopia.

MSF volunteers accept their professional duties and obligations as physicians and expect no additional recompense for their time and expertise beyond what MSF is able to provide. Some provision is made for the many thousands of local people who act as partners in MSF's operations and who may have no other source of income. This structure helps to preserve the independence of MSF's activities and maintain its ideological commitment to challenging injustice wherever it may be found.

In addition to its importance as a humanitarian intervention organization, MSF is particularly significant in the leads that it gives to people around the world who wish to contribute to relief and also have a strong commitment to international norms of human rights and justice.

Medicaid

MEDICAID IS A U.S. program that pays for medical and health-related services for certain individuals and families with low incomes and resources. It does not provide medical assistance for all poor persons because the program is not based on income alone. Individuals must meet eligibility criteria to be enrolled in the program and fall within certain coverage categories. Medicaid is the largest source of funding for medical and health-related services for America's poorest people. In 2000 it provided coverage to approximately 46 million persons.

The program became law in 1965 with the passage of Title XIX of the Social Security Act. Jointly funded by the federal and state governments (including the District of Columbia and the Territories), the federal government ultimately oversees the program via the Centers for Medicare and Medicaid Services (CMS). This is accomplished through established guidelines, statutes, regulations, and policies.

The states have discretion in the application of the program so long as they operate within the federal rules. Each state establishes its own eligibility standards; determines the type, amount, duration, and scope of ser-

vices; sets the rate of payment for services; and administers its own program.

In order for states to receive federal funds to support the Medicaid program, the states must provide Medicaid coverage for most individuals who receive federally assisted income maintenance payments (generally referred to as welfare), as well as for related groups not receiving cash payments. Beyond that, the rules for eligibility can be complex and vary a great deal from state to state. Administrative and definition differences in financial criteria are important because cost of living and wages differ throughout the country.

Without the allowance for geographical differences, an inequitable economic climate would be created by the use of one calculation throughout the United States. The states use a variety of methodology to create a determination threshold, and eligibility in one state does not automatically make a person eligible in another state if he or she changes residence.

In addition to the required coverage, most states have additional, optional programs to provide medical assistance for specified poor persons who do not qualify for the Medicaid program. These programs do not receive federal funding.

Medicaid should not be confused with Medicare, which is an entirely different program. Medicare is an entitlement program that provides hospital insurance and supplementary medical insurance to persons over the age of 65 and certain disabled persons. Some persons are eligible for both programs. When dually eligible, Medicare is the primary insurer and Medicaid helps pay for out-of-pocket medical expenses.

ELIGIBILITY

Because Medicaid is a program designed to assist the poor, financial status (income and resources such as bank accounts or real estate and other items that can be sold for cash) is a primary criterion for eligibility. The rules regarding allowable income and resource levels vary by state and according to the classification of the person applying for services. These considerations are age; whether or not a person is pregnant, disabled, blind, or aged; and legal citizenship or immigrant status. Marital status is not a criterion.

Total household income and resources of a married couple are considered, thus reducing the likelihood of eligibility for many poor working adults. Regardless, CMS recommends that any person with a low income who matches an eligibility criterion should apply for the program. After applying, a caseworker evaluates the sit-

uation and need in relation to the eligibility criteria of the various programs. The eligibility program coverage rules can be complicated; however, the following is a generalization of groups who are eligible for coverage:

Pregnant women and infants: if a woman is eligible because of pregnancy, she and the child will both be covered for at least the first year after birth if he or she remains in the mother's home and the mother remains eligible for the program. The mother is guaranteed eligible for 60 days following birth if pregnancy was the primary determinant for program eligibility.

Low-income families with children: if the family meets certain eligibility requirements in the State's Aid to Families with Dependent Children (AFDC) plan, the family should be covered.

The largest portion of Medicaid spending goes to the support of the disabled and aged.

Children whose family incomes fall a certain amount below the federal poverty level, recipients of Supplemental Security Income (SSI), and recipients of adoption assistance and foster care are likely eligible.

States also have the option of establishing "categorically needy" groups for coverage and creating a "medically needy" program. Categorically needy groups share characteristics with the groups covered by mandate. However, members of these groups are eligible based on separate and distinct criteria.

Examples are targeted low-income children whose families do not meet the more restrictive eligibility criteria, institutionalized individuals with income and resources below specified levels, persons who would be institutionalized but are receiving care under home- and community-based service waivers, and persons in need of specific treatment but not otherwise eligible for the Medicaid program.

The optional medically needy program allows states to extend Medicaid eligibility to persons whose incomes are too high to qualify under the mandatory or categorically needy programs. This option requires the person to incur a level of medical expenses or care expenses to offset the excess income. This is called "spend down."

In other words, the person or family does not meet the financial definition of poor but the medical expenses so greatly reduce the amount of income available for other needs such as housing and food that eligibility for public support is created. Another option under this program is the offering of state insurance programs in which some persons can receive Medicaid coverage by paying a premium for enrollment in the program. This is a good option for the working poor who earn too much to be eligible but do not have the financial means to purchase healthcare coverage elsewhere.

COVERAGE FOR THE DISABLED AND AGED

The largest portion of Medicaid spending goes to the support of the disabled and aged. In 2000, 29 percent of Medicaid dollars paid for institutional long-term care. Medicaid pays for institutional care of the disabled and aged if these persons meet the criteria guidelines. In many cases of the disabled, children who are diagnosed with mental retardation require too much care to remain in the family home without additional support from public sources.

During the past few decades, the disability advocacy agenda has pushed for deinstitutionalization and programs that help persons with disabilities remain in the community. As a result, smaller community homes have opened and are funded through the Medicaid program. These facilities, while more homelike, are essentially mini-institutions with 24-hour care and services provided 365 days a year. Many states have expanded their Medicaid programs to support persons with disabilities in their own home if it can be accomplished at a lower cost than for the person residing in a long-term care facility.

Nursing homes are also forms of institutional care. In the case of elderly couples, nursing home expenses can rapidly decrease retirement assets and leave the person remaining at home in poverty. Congress addressed this socioeconomic problem in 1988 by enacting provisions to prevent spousal impoverishment. These rules apply when one member of a couple enters a nursing facility or other medical institution and is expected to remain there for at least 30 days. Essentially, all resources are considered joint property regardless of ownership. For the purpose of Medicaid eligibility, the home, household goods, an automobile, and burial funds are protected. The remaining resources are divided by two to determine the spousal share of resources for eligibility determination.

In many cases, persons who have become disabled often have trusts created by the money received in a lawsuit or inheritance. How the trust is treated for purposes of determining eligibility is dependent upon the type of trust and other legal issues, which determine if

the funds are available to the individual. In general, if the person has assets in a trust but receives services through the Medicaid program, the trust must provide that the state receives any remaining funds, up to the amount of the Medicaid benefits paid on behalf of the individual, when the person dies.

MEDICAL COVERAGE

Medicaid is not socialized medicine whereby government employees provide medical services. Rather it is a government-provided medical and pharmaceutical insurance benefit. The enrollees use the benefit to purchase medical services and prescriptions from the private sector. As the population grows and ages and medical technology advances, the cost of medical care is also increasing. In 2000, health spending in the United States totaled \$1,130.4 billion, of which 17 percent was paid for by Medicaid programs.

Much attention has been given to these economic impacts on middle-class and working-class families. Many of the same concerns apply to the public-sector insurance programs. Medicaid is funded through federal and state tax dollars, so it is important that these programs be managed well to contain costs. Spiraling program expenses might later demand tax increases or a reduction in the amount of services available to the poor and medically needy. Given the economic pressures on the middle class, support for funding might diminish and put the poor at even greater risk.

Some states have implemented managed care programs to help control costs. Poor persons are less likely to have a primary care physician, the education levels for effective medical self-advocacy, and other resources for managing their health. Statistics indicate that they have less access to health diets and exercise, use emergency rooms more frequently, and often do not receive preventive care to diagnose and treat potentially dangerous diseases such as hypertension and diabetes.

Medicaid managed care plans attempt to respond to each of these needs by assigning program enrollees to a primary care doctor. This is similar to private insurance companies that use this service method for cost containment. It is further noted that some states contract with private companies to administer portions of the Medicaid insurance program, removing them from the often expensive and inefficient public management system.

Many of the national health initiatives, such as decreasing healthcare disparities among minority populations, can be aided through the Medicaid program. In

fact, blacks comprise 12.7 percent of the U.S. population but account for 24.2 percent of persons enrolled in Medicaid. Regardless of race, good health is essential to maintaining employment and personal development. Medicaid, if used properly, can serve as an economic support for poor persons to become more financially independent. It also serves as a safety net for persons who are not only poor but have other barriers to self-sufficiency.

Perhaps most importantly, it provides the preventive and medical care to children of poor families. More than 50 percent of Medicaid enrollees are under the age of 21. The opportunity for better health provides a stronger foundation for these children to learn and grown into healthy, independent adults. Health is essential to the pursuit of educational and economic opportunities that will break the cycle of poverty; ideally the Medicaid program supports this.

Medicare

"MEDICAL CARE WILL free millions from their miseries. It will signal a deep and lasting change in the American way of life. It will take its place beside Social Security, and together they will form the twin pillars of protection upon which all our people can safely build their lives and their hopes," said President Lyndon Johnson in June 1966, just before implementation of the Medicare program, speaking to the National Council of Senior Citizens.

Medicare is a social insurance program administered by the U.S. federal government that provides health insurance to the elderly and people living with a permanent disability. In 2004 Medicare was a source of

health insurance coverage for 42 million Americans, 35.4 million elderly, and 6.3 million nonelderly people with permanent disabilities. Medicare was established as Title VIII of the Social Security Act in 1965 and serves all eligible beneficiaries regardless of income or medical history.

BACKGROUND

The enactment of Medicare in the United States followed several decades of debate over how best to meet the healthcare needs of vulnerable Americans. The program, modeled after the existing private health insurance market, was developed during Johnson's administration in the 1960s. Coinciding with the popular ideology of the Great Society and the War on Poverty, Medicare was designed as a non-means-tested program serving those considered to be worthy. As such, its configuration builds on the series of legislative efforts dealing with social insurance programs and entails sharing the costs across the population by raising funds through payroll withholdings contributed by both employers and employees.

Medicare was originally instituted to aid the elderly, officially defined as those people over 65 years old who are eligible for Social Security benefits. In 1972 the program was extended to include people less than 65 years old entitled to federal disability benefits for at least two years as well as those with end-stage renal disease.

FUNDAMENTALS OF THE PROGRAM

Medicare insures more Americans than any other healthcare program, serving one in seven Americans, representing 14 percent of the U.S. population in 2004. The \$297 billion (2004 annual budget) program is administered by the Center for Medicare and Medicaid Services as part of the U.S. Department of Health and Human Services.

Medicare has four distinct parts; A, B, C, and D, each administered differently. Parts A and B, the two primary components, were established with the original passage of Medicare in 1965 while Part C was added in by the Balance Budget Act of 1997 and Part D was created by the Medicare Modernization Act of 2003.

Part A: Hospital Insurance covers inpatient hospital and postacute care and is currently the largest category of benefit expenditures. In 2004 approximately 46 percent of Medicare spending fell under Part A. Part A is financed via the Medicare hospital insurance trust

fund, composed of contributions by current workers and their employers in the form of a regressive payroll tax. Enrollment is automatic for individuals who meet the eligibility requirement for Social Security.

Part B: Supplementary Medical Insurance covers physician services and outpatient tests and procedures. It is financed by a combination of general federal tax revenues and monthly premiums paid by beneficiaries. Enrollment in Part B is voluntary and is open to those individuals who are entitled to Part A. In 2004 roughly 36 percent of Medicare spending was for services covered by Part B.

Medicare is the single largest health insurer in the United States.

Part C: The Medicare+Choice program accounted for 14 percent of Medicare expenditures in 2004. This new component of the program created Medicare HMO plans, allowing beneficiaries the choice of receiving their Parts A and B Medicare benefits through HMOs and other private health plans offered.

Part D: Medicare Drug Benefit entails the voluntary outpatient prescription drug coverage that became effective in January 2006. Prior to its enactment outpatient prescription drugs were not Medicare-covered services. The new drug benefit is twofold: a voluntary discount card and a coinsurance program. Financing for the new Medicare drug benefit will come from a combination of beneficiary premiums and contributions from states as well as general federal tax revenue. The composition of Medicare spending will shift with the addition of the prescription drug coverage, as Part D is projected to account for 20 percent of Medicare spending by 2010.

SCOPE OF MEDICARE

Medicare is the single largest health insurer in the United States, yet its annual administrative costs consistently operate at less than 2 percent. Currently Medicare finances a growing share of the U.S. health system, 17 percent of the U.S. health expenditure; as such its impact on the structure of the U.S. healthcare system is substantial. For example, in 2004 Medicare paid \$1 out of every \$5 spent on healthcare in the United States and consequently contributed greatly to setting pricing regulations throughout the entire healthcare system. Moreover, as part of its payment structure,

Medicare provides supplementary payments to hospitals that function as teaching hospitals, and serves a disproportionate amount of low-income individuals and those located in isolated rural areas.

Medicare is one of the fastest-growing programs in the federal government, presently comprising roughly 12 percent of the federal budget. As a result of the demographic shifts in the population as well as the rapid rate of increasing medical costs, program expenditures have risen dramatically since Medicare's inception. Between 1966 and 2004, the number of elderly beneficiaries more than doubled and the pending retirement of the Baby Boomer generation (those born between 1946 and 1964) is projected to more than double the number of elderly beneficiaries to 78 million by 2030. As the elderly population expands in size, so too, do their life expectancy, utilization of health services, and disability rates.

This growth, coupled with the decline in the ratio of taxpayers to retirees and the fact that inflation of the healthcare sector continues to outpace the general rise in prices, threatens to strain the solvency of Medicare's future financing.

MEDICARE AND POVERTY

Along with Social Security, Medicare is one of the most well-liked government programs, long maintaining popularity among the general public as well as its beneficiaries. During Medicare's 40-year history, the program has considerably altered the lives of seniors and Americans living with disabilities. By providing healthcare coverage, access to quality medical care, and critical financial protections against the high costs of healthcare, Medicare has become crucial to the American public.

By guaranteeing health insurance coverage to the elderly and giving them access to healthcare, Medicare has substantially increased the number of seniors insured. In 1964 the elderly were among the least likely Americans to have health insurance, as nearly half of all seniors were uninsured. Yet currently over 97 percent of seniors are covered by Medicare, making the elderly the most likely population to have insurance. Because Medicare provides access to medical care and procedures, the program has helped to improve the quality of life for many seniors, allowing them to remain healthier and independent longer.

As a group the elderly spend a higher proportion of their income on healthcare than the general population. This is both because they have higher healthcare costs, on average four times those of the under-age-65 population, and because they have lower, fixed incomes. Most beneficiaries rely on Social Security for the bulk of their income; for 80 percent at least half of their income comes from Social Security benefits, and as a result they are especially vulnerable to the rising cost of health services.

In conjunction with Social Security, Medicare has significantly decreased the number of elderly living in poverty. While healthcare spending has risen dramatically since 1965 for all Americans, Medicare beneficiaries are shielded from a substantial portion of that increase and are in turn less likely to become impoverished as a result of illness or disability. In 1959, 35.2 percent of Americans over 65 were living below the poverty line, while in 2004 roughly 10 percent of seniors were living in poverty.

Although the economic status of the elderly as a group has improved over the past 40 years, many elderly individuals have modest incomes. Correspondingly, most Medicare spending is for beneficiaries with modest incomes. In 2003 four in 10 elderly people had incomes below 200 percent of the federal poverty level, with higher rates among Hispanics, African Americans, women, and those beneficiaries over age 75. Compounding these income disparities, Medicare beneficiaries with lower incomes are generally in poorer health than their counterparts with higher incomes. Nearly 65 percent of Medicare beneficiaries have annual incomes below \$25,000. Roughly 70 percent of Medicare expenditures are on behalf of these individuals.

MEDICARE AND MINORITIES

Medicare has also played a pivotal role in the provision of healthcare for minority seniors. In 2004 one in five Medicare beneficiaries was a member of a racial or ethnic minority. Prior to Medicare's enactment, discrimination on the part of hospitals against racial and ethnic minorities was rampant. Many minority Americans were denied access to medical facilities and consequently were forced to rely on separate and often inferior hospitals and clinics to receive medical care. By requiring hospitals that received Medicare funds to be integrated for all patients, Medicare was critically instrumental in expanding access to quality care for minority seniors.

MEDICARE AND MEDICAID

Because of their low incomes and high medical costs, approximately 17 percent of the Medicare participants

are enrolled in both the federal Medicare program and individual state Medicaid programs. The seven million dual-eligible beneficiaries are Medicare-eligible individuals who also qualify for state Medicaid benefits on the basis of financial need. This includes those who become eligible for Medicaid by spending down their assets because of high medical costs and the need for long-term care, which is not covered under Medicare. Dual-eligible members currently account for roughly 30 percent of Medicare's annual spending.

Medieval Thought

POVERTY WAS NO DISGRACE during the Middle Ages. Throughout the writings of John Chrysostom, Basil, Jerome, and Augustine of Hippo is a disdain for wealth with a view that man best pleases the Almighty by repudiating material possessions.

Christians had an obligation to help the poor. In Jesus Christ's own words from the Gospels, the faithful knew that "inasmuch as you have done it to the least of my brethren, you have done it to me." Thus, during the early Middle Ages, the church administered a tithe on Europe's total annual production to help the poor. Many church leaders felt God had made the poor to give people the opportunity to gain merit through charity, so they were unselective in whom they assisted.

Poverty was an affliction but was viewed as a source of virtue, a form of earthly humiliation that rendered man more dependent on God, giving the faithful opportunities to earn God's approval through obedience to the Gospel admonitions to serve the poor. St. Eligius stated: "God could have made all men rich, but He wanted there to be poor people in His world, that the rich might be able to redeem their sins."

St. Bernard of Clairvaux argued: "It is one thing to fill the belly of the hungry, and another to have a zeal for poverty. The one is the service of nature and the other the service of grace."

The church embraced its role to protect widows, orphans, the blind, the lame and maimed, and those disabled by disease. The poor, viewed in the image of the suffering Christ, had a right to material assistance. In his writings, Jacques de Vitry seemed more concerned about dishonest alms collectors than about the possibility of unworthy or lazy paupers.

The Franciscan movement flourished in this environment, with friars in lepers' rags preaching that being poor was a wonderful thing, since the poor were so much closer to God than the rich, and that Lady Poverty should be pursued like a lover. But, beggar friars were humbly taking on the role of beggars without any real possibility that they would actually starve. Furthermore, by wandering around taking odd jobs in exchange for a beggar's crust of bread, the Franciscans took jobs beggars might have been able to do, and devoured the crusts that the beggars actually needed.

As populations grew in the 11th to 13th centuries, so too did the number of the poor. During the 1100s, as the number of poor boomed, the church was no longer as capable to help those in need.

By about 1200, many concerned clerics and laity were calling on the church to give up all of its wealth to aid the paupers —a short-term solution at best. Their obligation to care for the poor and the impossibility of doing so were a serious problem, since scripture, particularly Jesus' words in the 25th chapter of the Gospel according to Matthew, emphasized that charity was essential for obedience.

Attitudes shifted as the Vatican issued the Glossa Ordinaria to the Decretum, which among a great many other things stated that the church should not give aid

to able-bodied but idle beggars, "for strong men, sure of their food without work, often do neglect justice." The bishop of Ravenna differentiated between those who publicly accepted alms and those who had to be sought out at home to be helped. The neighborhood poor emerged as a distinct and separate group worthy of charity. The writings of Thomas Aquinas sound a similar note. Assistance to the poor became increasingly discriminate.

After 1300 the Black Death brought the numbers of the indigent down drastically.

In Barcelona (in today's Spain) in 1322, nonresident beggars were barred from the city and citizens were discouraged by severe penalties from helping them. The Kingdom of Castile's Pedro I in 1351 attempted to outlaw begging altogether and ordered that all except the very young, the aged, and the sick should work by the labor of their hands. The honest poor, on the other hand, he declared, those who were too humiliated by their financial woes to beg—friends and neighbors who had fallen on hard times through no fault of their own—were worthy of assistance.

Writings from Catalonia and the Kingdom of Valencia singled out the ashamed poor, particularly the working poor, as worthy of special attention. Adam di Salimbene and Giordano di Rivalto and the Castilian historian Rodrigo Ximénez de Rada continued to extol charity's benefits for the giver by insisting that the poor who were receiving aid had a reciprocal obligation to pray for their benefactors.

After 1300 the Black Death brought the numbers of the indigent down drastically, particularly since the well-to-do were not in the streets and gutters where disease-ridden rats were spreading the plague. With about a third of the population wiped out in the pandemic, however, laborers were suddenly in short supply—severely impacting the well-to-do, who needed cheap labor to sustain their own extravagant lifestyles.

By the close of the 1500s, many previously wealthy had fallen into poverty, and there were stirrings of protest against the nobility. The Peasants' Revolt of 1381 was exemplified by John Ball's question, "When Adam was digging and Eve spinning, where was the noble by birth?" Into the 14th and 15th centuries, wealthy individuals continued the custom of bequeathing funds to provide handouts of bread, meals, or money indiscriminately to whosoever of the poor

should appear on the day of their funeral or the anniversary of their death. But commentators such as Franciscan friar Francesc Eiximenis thundered stern sermons against helping the false and undeserving poor.

How, then, to characterize medieval attitudes toward the poor? A useful place to begin is with Gratian, the 12th-century canonist, who distinguished between two forms of assistance: hospitalitas and liberalitas. The first is the giving of alms gratuitously and is thus, properly speaking, charity. As Gratian put it, "In hospitality there is no regard for persons."

On the other hand, *liberalitas* differentiated between friends and strangers, the honest and the dishonest, and the humble and the arrogant. Gratian said, "In this generosity due measure is to be applied both of things and of persons; ... of persons, that we give first to the just, then to sinners, to whom, nevertheless, we are forbidden to give not as men but as sinners."

Mendicant Orders

MENDICANT OR "BEGGING" orders are societies within the Roman Catholic Church whose members have by a formal vow of poverty renounced all ownership, not only individually but also in common, relying for support on their own work and on the charity of the faithful.

There remain today from the Middle Ages four mendicant orders that were recognized by the Second Council of Lyons in 1274. They are the Order of Preachers (also known as the Dominicans), the Friars Minor (the Franciscans), the Carmelites, and the Hermits of St. Augustine (Augustinians).

Their vow of poverty forbade them to own anything individually or even to possess property in common. They begged or worked for their living and, unlike monks, were not bound to live in one place in seclusion, but were able to move from area to area. Their pastoral role was a mission of religious education through preaching, although the emphasis differed according to the order. For example the focus of the Franciscans was on the penitence of laymen and leading them toward a more devout lifestyle. The Dominicans, on the other hand, focused on heresy by providing instruction in the Catholic faith.

Franciscans can be recognized by their brown or gray cloak, tied at the waist by a rope with three knots, representing the religious vows of poverty, chastity, and obedience. Dominicans wear a white tunic and scapular underneath a long, black cloak with a hood.

Originally the vow of poverty was restricted to the Franciscans (founded in 1209) and the Dominicans (founded in 1220), but the Carmelites (founded in 1245) and the Augustinian Hermits (founded in 1256) also obtained church permission to pursue the mendicant disciplines.

Members take vows of poverty, which consist of a promise to God of a constant and lifelong renunciation of material goods in order to allow the person to better follow Christ's example and teachings. Those making such vows repudiate all personal ownership of any material or appreciable possession that has a money value. They give up any right to acquire, possess, use, or dispose of property.

During the Middle Ages, a certain animosity against church wealth had emerged, and Arnold of Brescia preached that monks and clerics who possessed property could not attain eternal salvation. John Valdes founded the Poor Men of Lyons, soon followed by several similar sects in France and Italy, with an undercurrent of animosity toward clergy and religious officials who had attained wealth.

That animosity threatened to grow into rebellion, but was tempered by Giovanni Francesco Bernardone, later known as St. Francis of Assisi, and by Dominic de Guzman, known today as St. Dominic, who both included in their rules strict obedience to the clergy and church hierarchy.

Absolute poverty was not the only characteristic of the mendicant orders. Their maxim was non sibi soli vivere sed et aliis proficere, or "not to live for themselves only, but to serve others." Thus they departed from the contemplative isolation of earlier orders such as the Benedictines and Cisterians. They often located their monasteries inside towns so as to have ready contact with the populace.

Following the example of Francis and Dominic, many orders emerged and the church saw a large increase in the number of mendicant orders such as the Theatines, whose rule was to live on alms and spontaneous gifts. After several years, it was decided that mandatory poverty worked only for certain orders. Indeed a constant state of destitution created challenges, particularly for administrators attempting to feed and clothe large communities of friars. Daily begging was conducive neither to intellectual activity nor to sequestered monks' solitude. Consequently the Council of Trent identified only four orders that should continue as mendicants.

Another characteristic of the mendicants was that they devoted themselves to evangelism and missionary outreach—preaching and teaching while doing charitable works of service. The work of the mendicants in the service of the sick, weak, poor, and socially outcast had no parallel in the Middle Ages.

Since mendicants, unlike cloistered monks and nuns, were not bound to one monastery or convent, they could be sent all over the world. Thus Franciscans accompanied Christopher Columbus and others on their voyages to the New World and established the Spanish missions along the California coast that are today San Diego, San Jose, San Bernardino, Los Angeles, and San Francisco.

Mercantilism

FROM THE START OF THE Modern Ages, Europe fell prey to the effects of inflation. The buying power of salaries dropped and there was a succession of plagues,

famines, and wars. This situation was worse in the Protestant regions, where, following the expulsion of the Catholic Church, charity became much less common. Hence the number of paupers grew. In a context that considered population growth to be equal to wealth, society adopted two measures: on the one hand, to take the poor into care and, on the other, to use them as cheap labor.

In the case of Spain, from the Middle Ages on it was the sole responsibility of the church and the upper classes to help the poor in the name of Christian charity. But from the 16th century onward, the growth in numbers of the needy and, perhaps, the influence of the Reformation meant that new measures were needed. The pioneer of moral literature on poverty was Juan Luis Vives, who, in a secular context, suggested confining the poor in hospitals, which would serve as educational and employment centers.

However, society's general lack of interest in charity gave rise to a debate between those who defended the church's "charity for all" as the pauper's right, such as Domingo Soto, and those who were in favor of placing the poor in workhouses so that the state could administer their welfare, such as Juan de Medina.

This controversy over the functions of church and state continued through the second half of the 16th century, when authors such as Miguel Giginta defended the work of the poor in Houses of Mercy; Cristóbal Pérez de Herrera attempted to distinguish between real and false paupers; and Juan de Mariana followed the same line as Vives, promoting the hospitalization of the poor.

FRENCH MERCANTILISTS

These problems also troubled the French mercantilists, who, faced with the problem of poverty, adopted two stances to solve it: the charitable standpoint, mitigating misery as part of their policy to ensure order in the kingdom, and the economic approach, forcing the idle to work.

Thus various edicts denounced the criminality that was linked to vagrancy and idleness, recommending that able-bodied beggars be put to work, be either expelled from the kingdom or condemned to the galleys. This use of the poor was an actual policy during the 17th century. Places of reclusion were gradually created, first of all in Lyons, and then at the General Hospital in Paris, the model then spreading to other cities. The destitute were shut away to reduce vagrancy and avoid immorality, thus responding to the duty of char-

ity. However, another objective was also met: to employ able-bodied mendicants in the manufacturing sector. There were many cases.

In Lyon they were used in a ribbon factory and to prepare silk. In Paris a ruling issued in 1635 ordered vagrants and girls "to be ready and willing for work in 24 hours, or else the men will be sent to the galleys and the women whipped and exiled." A. Montchretien was concerned about the people's welfare and the words he said to the king, "the wealth of your subjects is also your own," clarify his posture, insisting on the need to create public workshops to fight against poverty.

The edict published in August 1661 sums up the position of the minister Jean-Batiste Colbert regarding poverty: to hire those idle beggars who are fit for work. Meanwhile, in his letters to the Intendants, he sought to free France of beggars and vagrants. The second way in which Colbert attempted to deal with destitution was to set up, in Paris, a home for refugees and the needy.

Another edict, issued in 1662, ordered the founding of hospitals in every city in the land, so that the poor sick folk, beggars, and orphans could be given training. In 1660, there were 20,000 people employed in hospital workshops carrying out numerous tasks: making vinegar, watches, tapestries, cord, shoes, knives, pins, and soap, as well as spinning and weaving.

ENGLISH MERCANTILISTS

This view of matters was even stronger in England, where work was regulated by the 1563 Craftsmen's Law and the Poor Laws of 1601, 1662, 1795, up to the 1834 Welfare Law (the Speenhamland System). Here, the mercantilists of the 17th century established the "doctrine of the trade balance in work terms." This proposal defended the need to use the largest share of the population as possible in productive activities, since low wages were beneficial to foreign trade. John Hales wrote that all those who were fit to work should be employed, and William Petty stated that idle workers should be employed, even in low-production activities.

William Temple maintained that a nation's wealth was in its citizens and that they would add wealth to the country in proportion to the need that drove them to industry and to the firm.

Nicholas Barbon believed that employment was more important than the consumption and use of resources, and Josiah Child expressed concern over the "aid and employment" of the poor. According to Dudley North, trade and exchange depended on the work of men and grew alongside the increase in the supply. John

Cary maintained that a favorable trade balance stimulated production, employment, and the national income; trade was beneficial since it contributed to increasing the "employment of our people." B. Mandeville wrote that the safest form of wealth lay in the greatest possible number of "industrious poor folk," and Josiah Tucker wrote that the country was more prosperous "the more people there were employed in each branch of work."

This was a "use of poverty" that would give rise to a national policy on work that defended low wages, arguing that if they were higher than the subsistence level, the lower class's lack of moral condition would lead to a world of vice, excess, and even moral ruin. For this reason, poverty and industriousness meant that the workers lived better. B. Mandeville went further, arguing that the poor should be paid low wages so that they were unable to save and, thus would be forced to work constantly. Arthur Young observed, "anyone, except an idiot, knows that the lower classes should be kept poor, or they will never be industrious." In sum the writers of the day pointed out that a nation's wealth depends on its work, a question that drew them to comment on unemployment and to try to rehabilitate the poor and the destitute. And since, on an international market, the cost of the work factor should be as low as possible, they also defended the minimum possible wages.

Mercy Corps

THE MERCY CORPS IS an American nonprofit organization based in Portland, Oregon. It was founded in 1979 as the Save the Refugees Fund by Don O'Neill, and worked initially to raise awareness of and provide emergency relief for Cambodian refugees who were

fleeing genocide. Many thousands of people received assistance. Over the next few years, operations spread to other countries and, in 1981, the name was changed to Mercy Corps International (MCI) to reflect this change better. The range and scope of work also expanded over the years. Now more than seven million people per year have received assistance from MCI and more than \$1 billion has been distributed in 74 countries in the form of food, shelter, healthcare and sanitation, education, and small-business loans.

MCI is a leader in terms of swift response to emergencies, as it showed during the 2004 Indian Ocean earthquake and tsunami disaster. It was also one of the first organizations to link disaster and emergency relief with capacity building in the civil societies in which it is active. Recovery from environmental disaster or armed conflict requires rebuilding of the infrastructure and can also require rebuilding of community or ethnic relations in processes that are extremely difficult and require many years.

MCI is considered to be one of the United States' most efficient and innovative charities and delivers more than 92 percent of its funds in direct relief. Its mission is stated as "Provide humanitarian assistance for people in conflict or disaster; develop sustainable programs that focus on children and income generation; and create civil society initiatives that promote citizen participation, accountability, nonviolent conflict resolution and the rule of law."

As a modern, secular organization, MCI is required to focus on effective business and organizational strategies: "Craft a compelling organizational vision and set almost impossible (but believable) goals. Hire bright, problem-solving social entrepreneurs who have passion for our mission and can function in teams. Challenge and encourage staff members to think and act 'out of the box' by constantly looking for effective, more innovative ways to fulfill major organizational challenges."

MCI's activities include community fundraising and advocacy in addition to overseas voluntary work, aid distribution, and community involvement. Overseas activities are innovative and imaginative in support of MCI's goals and mission.

Projects involving economic development include microfinance and training schemes to produce female entrepreneurs in Uzbekistan and assisting rural poor in China. A football camp in Iraq and an international friendship scheme to help those affected by the tsunami are other schemes to help children recover from trauma. Advocacy has involved organizing peaceful demonstrations to raise awareness at the 2005 G-8 meet-

ing and in support of the Millennium Development Goals. The ONE campaign, organized with eight other leading nonprofit organizations, is a large-scale petition aimed at persuading the U.S. government to increase overseas development aid by an additional one percent of the national budget.

Mercy Corps Northwest (MCNW) is the only organization of MCI to be established within the United States, and it helps by, among other things, providing preferential microfinance schemes to local people to improve their economic opportunities. However, the majority of MCI's activities take place in some of the most dangerous and difficult countries of the world.

John Walsh Shinawatra University

Mexico

SINCE THE 1940s, Mexico's overall economy has grown, in large part, because of significant oil reserves. Economists often referred to the period from the mid-1950s to the mid-1970s as the "Mexican Miracle." The country enjoyed sustained economic growth at between six and seven percent annually and inflation was generally low. Mexico reached the upper end of the World Bank's list of semi-industrialized, or middle-developed, countries. The nation has witnessed improvements in areas such as infant mortality, literacy rates, and life expectancy. There has also been growth of a large, urban middle class with relatively steady incomes and access to services such as healthcare and education. Overall, poverty in Mexico fell between 1950 and 1980.

Despite Mexico's overall economic growth, in terms of economic inequalities the country has fallen behind other Latin American countries that have paid more attention to equitable distribution of wealth. In the second half of the 20th century, there was a growing gap between rich and poor in Mexico. In 1950 the richest 30 percent of the population earned 60 percent of

the country's total income, while the poorest 40 percent of Mexicans earned just 14 percent. By 1995 this income inequality had become more extreme, with the wealthiest 30 percent earning 77 percent of the country's income and the poorest 40 percent taking in a mere 11 percent.

Poverty and income inequality in Mexico became particularly acute during the so-called lost decade of the 1980s. Especially after the 1982 debt crisis, the gap between rich and poor widened in Mexico, as it did throughout Latin America. The neoliberal reforms of the Mexican government that began in the mid-1980s intensified the country's inequalities. Despite the promise of President Carlos Salinas, who was elected in 1988, to eradicate extreme poverty in Mexico, the unequal distribution of wealth proved difficult to alleviate.

In 1989, the Salinas government created the National Solidarity Program, known as Pronosal, to fight poverty. Pronosal claimed that without an effective income redistribution program, even with a sustained economic growth rate of three percent, it would still take 64 years to eliminate poverty for the poorest 10 percent of the Mexican population. Despite this awareness, uneven economic growth after the mid-1980s has prevented Mexico from reducing its poverty and inequality.

In addition to economic disparities between rich and poor, there are great regional inequalities between northern and southern Mexico and between the country's urban and rural areas. The north is generally much more prosperous than the south. Northern Mexico possesses large, modern farms that produce commercial crops for export. The geographic proximity of the United States greatly contributes to the economic success of the north. An extensive and well-maintained transportation network, the presence of large industrial cities such as Monterrey and Tijuana that provide jobs, and assembly plants called *maquiladoras* along the border all allow the north to enjoy a more prosperous economy.

In contrast, southern Mexico is home to many of the country's poor citizens. More densely populated and possessing poorer-quality land, the south is inhabited by many subsistence farmers. Transportation in the south is generally poorer than in the north, and is made worse by heavy rains and flooding. Most of Mexico's indigenous population lives in the south, where the government largely has ignored their needs and local bosses have exploited them.

Besides the divide between north and south, there is also a significant difference between urban and rural

Mexican mothers with children in Mexico's Baja California Norte are examples of an improving total fertility rate (births per woman). Mexico saw a rate of 6.6 children per woman in 1975 decrease to 2.4 in 2005.

Mexico. Most rural Mexicans have little or no access to productive land, and many leave for the cities or the United States. Nevertheless some 25 million Mexicans still live in poor, rural areas, where they work for low wages.

Often, poor agricultural workers must migrate seasonally in order to provide for their families, as some farm production can provide between as little as 20 and 100 days of employment. Those who do have land generally have small plots of poor-quality soil. They grow subsistence crops such as corn and beans, which do not attract high market prices.

Furthermore poor, rural Mexicans do not have savings that allow them to purchase fertilizers, improved seeds, insecticides, or other products that would allow them to better take advantage of the land. Once again the 1980s saw the start of a worsening economic situation in rural Mexico. Between 1984 and 1992, there

were some two million newly impoverished residents in the Mexican countryside.

The pervasive poverty of Mexico came to a head in 1994 with an uprising in the southern state of Chiapas. Many of the people in Chiapas are poor, rural small farmers. About one-third of the state's population is of Mayan descent, and in rural areas many do not even speak Spanish.

At more than 40 percent, the state suffers from the highest rate of malnutrition in Mexico. Led by the charismatic subcommander Marcos, the rebels, known as the Zapatistas, called for an end to the policies of the Mexican government that led to the impoverishment of so many of the country's citizens.

A number of factors contribute to continuing poverty and income inequality in Mexico. One problem is inadequate education, especially for the poor and in rural areas. Despite some reforms, Mexico still has high dropout rates, poor teaching conditions, and inadequate curriculum. A second problem is Mexico's trade policy since the 1980s. Before the mid-1980s, the Mexican government maintained many protectionist barriers and promoted import substitution industrialization. Such policies kept wages relatively high and unemployment low.

However, after lifting trade barriers starting in the mid-1980s and culminating with the North American Free Trade Agreement in 1994, wages in Mexico decreased, especially for unskilled laborers. A third factor is the relative absence of small and medium-sized companies in Mexico that could provide jobs. For example, between 1988 and 1993, more than 400 small firms disappeared because of the government's economic liberalization program, leading to the loss of some 43,000 jobs in the manufacturing sector alone. Finally a lack of effective programs to redistribute land and income contributes to the presence of poverty in Mexico.

Microcredit

MICROCREDIT IS THE PROVISION of small loans, usually to poor and vulnerable groups, especially women. In developing countries, loans are usually no more than a few hundred dollars, while in developed countries much larger sums are involved (a common limit is \$25,000). These loans are designed to encourage the production and consumption by the poor or near-poor through the establishment and maintenance of entrepreneurial activities allowing the borrower, or group

of borrowers, to become economically self-sufficient as well as create employment opportunities for the larger community. Loans are provided by nongovernmental organizations (NGOs) and government or commercial banks. In developing countries, the loans are unusual in that no collateral is required and flexible repayment plans are used. In developed countries, microcredit loans are also made under concessionary terms and are often provided in conjunction with financial training. While recipients often include the poor, requirements generally center on the inability to obtain financing, especially under concessionary terms, from typical business financing channels.

Group-based lending programs and variations of microcredit programs have been in existence for at least 400 years and have existed throughout various cultures. They have served as a means for the distribution of loan funds to members in need. They include less formal institutions, such as the Rotating Savings and Credit Association, in which a group of men or women contributes to a collective fund, which is then distributed to members at regular intervals as needed. A more formal example was the local, independent, and charitably constituted microcredit operations that proliferated throughout Ireland in the 18th and 19th centuries, providing, at one time, up to 500,000 loans annually.

The first modern microcredit institution is attributed to Muhammad Yunus and the Grameen Bank of Bangladesh. Established in 1983, reaching over two million individuals, and lending an estimated \$2.1 billion, the Grameen Bank has become the current model of microcredit practiced and promoted throughout the world as a development tool for poverty reduction. As pointed out by scholars, Grameen Banks have a multifaceted lending strategy based on the goals of promoting and facilitating social development through programs that they conduct and, most importantly, alleviating poverty. The latter is obtained by ensuring that clients are in the lower half of the socioeconomic hierarchy; hence loan amounts are limited and recruitment efforts are focused on poor, often female borrowers.

A flexible credit system adaptable to the needs of specific clients is employed, including small weekly payments, generally two percent of the loan amount, spread over the one-year life of the loan. Successful repeat borrowers are allowed to increase their credit limits. Most importantly borrowers are organized into small groups and group solidarity and peer pressure are employed as a means to ensure proper spending and repayment. These borrower groups also accept the responsibility of repaying the loan of a member who

defaults. The development of strong social ties within these lending groups is a primary reason for the success of Grameen Banks.

Thanks to this success, the use of microcredit as a tool for the elimination of poverty has recently become a focus of the international community. The World Summit for Social Development, held in Copenhagen, Denmark, in 1995, identified the need to increase access to credit for small rural and urban producers as well as particularly vulnerable groups such as the landless poor and women.

Recognizing that credit is both necessary for capitalist development and a basic human right that facilitates participation in economic and political processes, the United Nations has worked to mobilize agencies such as the World Bank, the United Nations Children's Fund, the United Nations Capital Development Fund, and the United Nations Development Fund for Women. These efforts were further strengthened through the establishment of the Consultative Group to Assist the Poorest (CGAP), which pairs wealthy Western donor countries with international lending institutions, and by declaring 2005 the International Year of Microcredit, encouraging an increased exploration of microcredit programs by United Nations agencies and programs designed for poverty alleviation.

Some of these programs have success, while others fail to produce economic liberation.

The success of specific institutions, along with international backing, has led to the development of microcredit lending programs across the globe, from the least economically developed nations to inner cities and rural areas in the United States. Many of these programs, especially those in developing countries, have had tremendous success while others have failed to produce the economic liberation expected and hoped for.

S.R. Khandker conducted a study of 87 villages and 2,599 households in Bangladesh between 1991–92 and 1998–99. Microcredit programs were successful in their mission of targeting women, who comprised 85 percent of loan recipients by 1999, and in alleviating moderate poverty, which fell by 20 percent for recipients, and extreme poverty, which decreased by 19 percent. Additionally, households participating in lending programs increased their consumption of food and nonfood goods, and enhanced their development of nonland assets. The study also detected spillover effects in the vil-

lages, which saw overall reductions in poverty rates as a result of increased economic activity.

Other scholars tout the success of the Philippines's Center for Agriculture and Rural Development (CARD), an organization focusing specifically on the landless poor that by 1999 had distributed 82 million pesos to 8,000 borrowers since 1990. The program appears to be largely effective, with labor productivity in operations financed with loan money 34 percent higher than market wage rates, a 117 percent rate of return on capital compared to the 46 percent interest rate charged, and enterprises funded with loans contributing 25 percent of total household incomes. Unfortunately the program was not financially sustainable as of 1999. It incurred a loss of 17 percent of its total expenses because of the operating costs associated with its intensively supervised program.

IDLE CAPITAL AND HIGH OVERHEAD

N. Bhatt and S. Tang discussed similar problems with operating costs in the United States, which as of 1997 had more than 200 microcredit programs distributing over \$33 million to 6,153 borrowers. While some programs were successful, 16 institutions in California showed an average of 50 percent idle capital and extremely high overhead costs, in one case more than double the value of the institution's portfolio. Other researchers have also identified failures in lending programs, such as a study by P. Aroca, which found negative income impacts for a group of Chilean clients.

Thus microcredit exhibits both great benefits and limitations. According to Khandker, most studies show that microcredit programs are beneficial to the poor, but that not all groups benefit equally. A study of 13 microcredit programs in Asia, Africa, and South America showed that microcredit is better utilized by the upper to middle poor than by the "poorest of the poor."

The very poor often refuse to seek larger loans because of concerns about enhanced risk. But larger loans often lead to the most lucrative investments. Lack of basic education, access to healthcare, and other more general socioeconomic factors also limit the ability of the very poor to access and properly use microcredit programs. Still, where these programs are implemented, other, more general investments, such as improvements in education and reproductive health, can benefit the poor and the very poor.

An additional problem is the high transaction costs that microcredit programs incur. These costs, already substantial in developing countries, are even greater in countries such as the United States. As Bhatt and Tang point out, cultural differences discourage a strong group mentality and reciprocity that cause the microcredit institutions in the United States to act more like banks with formal rules and policies, further distancing the lenders from the borrowers. Fortunately, where cultural issues are less of a problem or can be overcome, treating microcredit as more of a typical commercial transaction is not necessarily detrimental, partly because revenues from interest collected increase with the size of the loan portfolio.

Research by Khandker et al. shows that less than five percent of microcredit recipients are able to lift themselves out of poverty. Still, these programs do help in the reduction of individual poverty and, when coupled with other programs such as infrastructure improvements, access to healthcare, and improved education, can lead to poverty reduction on a regional level by increasing employment opportunities. It is important to remember that the effectiveness of microcredit is dependent on many factors, including a nurturing entrepreneurial environment, access to information, the entrepreneurial skills of the recipient, and regional and/or local market conditions.

Microcredit scope as a means of reducing poverty worldwide has been limited. Yet microcredit has proven to be a capable and powerful development tool that has eliminated or reduced the poverty of numerous households, especially in certain developing countries. It has provided individuals with a means of self-empowerment, thus encouraging greater participation in economic and political processes and resulting in a more equitable distribution of resources.

The Grameen Bank, in particular, has developed methods for ensuring that resources are distributed to those most in need and repaid to the institution in a timely manner. However, while the Grameen model may work in certain areas, such as the traditional societies where it was created, the model may not be appropriate or applicable for all groups or all cultures. International and domestic groups must work to develop models suited to their cultures and clientele to ensure ample investment in both the entrepreneur and its economic activities. Through appropriate applications, microcredit may serve as a means of alleviating poverty in other contexts.

Microeconomics

MICROECONOMICS STUDIES economic phenomena at a microlevel, that is, at the individual level. A systematic study of choice-making behavior of consumers and producers (individuals, households, firms, and government), allocation of resources (land, labor, and capital) between goods and services that are produced and consumed, and determination of their prices make up the central theme of microeconomics.

Individuals and households as consumers make choices among various goods and services they want to consume. The study of consumer behavior comprises the theory of consumer behavior, theory of consumption, and theory of demand. Individuals and individual firms make their choice about what to produce and how to produce, that is, the techniques to be used.

The study of a producer's behavior constitutes the theory of production or the theory of supply, including the cost theory. The theory of demand and theory of supply together form the theory of price determination, or theory of price. The study of the behavior of factor owners (labor and capital owners) is the theory of distribution or the theory of factor price determination. An extension of distribution theory is the study of what kind of allocation of productive resources between goods and consumer goods and services makes the distribution more efficient. This aspect is studied under the economics of welfare. One of the main tasks

of microeconomics is "to provide a system of generalization," or microeconomic theories that can be used to predict economic phenomena at the microlevel. This makes microeconomics a positive science.

The word positive does not mean that theoretical statements are positively true; it means that a theory has a great possibility to occur if conditions are fulfilled. Microeconomics, as a normative science, involves value judgments of "what is good" and "what is bad" for society. These values are drawn from the moral, ethical, social, and political aspirations of the society. Since microeconomics prescribes methods to correct undesirable economic events, it is also called a prescriptive science. Microeconomics is both a positive and a normative science. However, it is important to note that microeconomics is fundamentally a positive science. It acquires its normative character from the application of microeconomic theories to examine the economic phenomena from their social desirability point of view, to show the need for public policy action, and to evaluate the policy actions of the government.

SCIENTIFIC METHOD

An important element of the scientific method of inquiry in economics is model building. A model is an abstraction from reality. It represents reality in a simplified form. Economic models may take the form of a logical statement, graphs, or mathematical equations specifying the relationship among the economic variables. Models are used to work out the implications of a theory, to deduce the consequences of the assumptions, and to make predictions. Economic variables are measurable quantities, such as consumer goods, output, inputs, money, and income. The economic variables assumed to remain constant are called parameters.

The first step in the scientific method of study is to specify the problem or the economic phenomenon chosen for the purpose of study. The second step is to formulate the hypothesis. A hypothesis is a statement expressing the relationship between the cause and the effect. The third step is to make necessary assumptions. Assumptions are made to simplify the problem, to specify the components of the model, and to avoid the complexities that might arise because of the change in extraneous factors—factors that are operating outside the model.

In economic model building, assumptions in general include behavioral or motivational assumptions pertaining to the behavior of the decision-makers and their motivation or the objective that they set for them-

selves; institutional assumptions pertaining to the institutional set-up or market conditions under which the economic players (consumers and producers) seek to achieve their goals; technological assumptions relating to production technique; and input-related assumptions, those pertaining to the supply position of inputs. The fourth step is to collect the relevant data and other facts related to the problem of study and their analysis according to the model.

Economists examine how actual phenomena depart from certain ideal constructions.

After data are collected, assembled, and analyzed, the next or fifth step, is to make the deduction(s) about the relationship between the cause factor and it effect. The final step is to test the validity of the model. The test of validity of a model is determined by its power to predict. When the model is tested and retested and found to be valid, its outcome is stated in the form of a theory.

Microeconomic theory facilitates the understanding of what would be a hopelessly complicated blend of billions of facts by constructing simplified models of behavior that are sufficiently similar to the actual phenomena to be of help in understanding them. These models enable economists to examine the degree to which actual phenomena depart from certain ideal constructions that would most completely achieve individual and social objectives. The clearer the understanding of the working of the economic system, the greater the efficiency in the control and management of the economy.

Microeconomic theories establish cause-and-effect relationships between two or more economic events and, thereby, provide the basis for predicting the future course of economic events. Economic predictions are of great importance in planning the future course of economic activities by individuals, business firms, and the government. Economic predictions may be conditional and inaccurate.

For example, prediction of the future price of a commodity may take the following form: if demand for a commodity increases, other things remaining the same, its price will increase. Despite the fact that a prediction of this nature is conditional, the future trend of price is known more precisely than it would have been in the absence of any prediction. Approximate predictions are also of great importance for consumers to

make adjustments in their expenditure pattern, for the producers to plan their production, and for the public policymakers to formulate policy regarding price of the commodity.

Third, microeconomic theories contribute a great deal in formulating economic policies and in examining the appropriateness and effectiveness of economic policies. Policymakers may therefore apply relevant microeconomic theories to explain the problem at hand and analyze the implications of alternative policies and select one that seems to be most appropriate.

Fourth, microeconomic theories, particularly price theory, are profitably used in business decision-making. Although microeconomic theories may not offer a practical solution to a problem in the real business world, they do help business decision-makers in building analytical models, which help in specifying the nature of managerial problems and in determining appropriate policy actions.

SOCIAL WELFARE

Last, one of the most important uses of microeconomic theories is providing the basis for formulating propositions that maximize social welfare. Microeconomics examines how imperfect market conditions distort the allocation of resources (money, men, and material), create inefficiency, and lead to reduction in production, consumption, and social welfare. The normative part of microeconomics, welfare theories, suggests conditions for achieving "pareto-optimality" in resource allocation with a view to maximizing social welfare. It also suggests ways and means to correct inefficient allocations of resources and to eliminate inefficiency. Although theoretical welfare propositions are of little practical importance, their analytical value is not reduced by their impracticability.

In reality, a hard-and-fast line cannot be drawn between micro- and macroeconomic analysis. A general theory of the economy should cover both. It should explain prices, outputs, incomes, behavior of individuals, behavior of individual firms and industries, and the aggregate of the individual variables. Actually the line between macroeconomics and microeconomics can be precisely drawn.

A truly "general" theory of the economy would clearly embrace both: it would explain individual behavior, individual outputs, and incomes and prices, and the sum of averages of individual results would constitute the aggregates with which macroeconomics is concerned. Such a theory exists, but its very generality leaves it with little substantive content. Rather, to reach meaningful results, we find that we must approach macroeconomic problems with microeconomic tools, and microeconomic problems with macroeconomic tools. Thus the need is for a proper integration of the two approaches.

Micronesia

THE FOUR PACIFIC ISLANDS of Pohnpei, Yap, Chuuk, and Kosrae make up the Federated States of Micronesia. Formerly administered by the United States as a United Nations Trust Territory, Micronesia attained independence in 1986. As part of its administrative duties, the United States poured millions of dollars into the Micronesian economy in the 1970s. Most of the money was used for building schools, enhancing healthcare, constructing public buildings, and improving water, power, and sewage facilities. Micronesia's only valuable natural resource is high-grade phosphate. Tourism is limited because of the remote location and a lack of facilities on the islands. The Micronesian economy suffers from a poorly developed infrastructure, the depletion of fishing resources, and overdependence on aid from the United States.

With a per capita annual income of \$2,000, Micronesia is considered a middle-income nation. The government employs two-thirds of the labor force. Because government employees receive such high wages, other workers cannot earn equivalent incomes. The result is continuing inequality and a poverty rate of 26.7 percent. Farming and fishing at the subsistence level provide most domestic revenue for the islands. Unemployment hovers at 16 percent. Assessing poverty on Micronesia is difficult because data on important social

indicators are missing, just as they are for much of Oceania. Because of this the United Nations does not rank Micronesia on general quality-of-life issues or on the Human Poverty Index.

Among the population of 108,105 in of Micronesia, life expectancy is 69.75 years. The projected life span has been steadily lengthening since 1980. Females generally outlive males by four years. Over 37 percent of the population are under the age of 14, and three percent are over the age of 65. Approximately 94 percent of the population have access to improved drinking water, but less than one-third of all Micronesians have access to improved sanitation. Urban residents fare somewhat better at 61 percent sanitation access than rural residents do with only 14 percent access. There are 59 physicians for every 100,000 residents on the islands, and 95 to 100 percent of the people are able to afford essential drugs.

In 2003, infant mortality was estimated at 19 deaths per 1,000 live births. At a mortality rate of 26.97 per 1,000, female infants have an advantage over male infants at 33.3 deaths per 1,000. Approximately 18 percent of Micronesian infants are underweight at birth, but malnutrition rates for other children are not known. The mortality rate for all children under the age of 5 is 23 per 1,000 deaths. Childhood immunization rates are in the low 90s for children between the ages of 12 and 23 months. However, infant immunizations are considerably lower. Among this group, 84 percent are immunized against measles, 79 percent against polio, and 75 percent against DPT3. The rate of tuberculosis immunizations for infants is dismally low at 39 percent.

Between 1970 and 1990, the fertility rate of Micronesian women fell from 6.9 children per woman to 4.8 children per woman. By 2005 the fertility rate had dropped to 3.25 children per woman. Among teenage mothers, the fertility rate is 37 out of 1,000 births. Some 45 percent of all Micronesian women use some method of birth control. Trained medical staff now attend 93 percent of all births on the islands. Modeled estimates indicate that maternal mortality stands at 120 deaths per 100,000 live births.

Literacy rates are relatively high on the islands, and 89 percent of the population over the age of 15 can read and write. Nine percent of Micronesian males are illiterate, and 12 percent of females are so classified. Primary school attendance is reported at 100 percent for both males and females.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Mill, John Stuart (1806-73)

JOHN STUART MILL WAS ONE of those outstanding 19th-century scholars of towering intellect, making contributions in several fields, including philosophy, logic, and economics. He is, perhaps, the quintessential classical economist. Mill's chief work in economics is his 1848 book, *Principles of Political Economy*, a book that became highly regarded as the authority throughout the world for many years afterward.

Mill's main contribution in economics can be divided into several parts: production, distribution, value, growth, and methodology. One must always keep in mind, however, Mill's intellectual background when examining his economics. First, Mill was trained in the Benthamite tradition—utility plays a crucial role along with social utility. Second, the Romantic writers of the latter half of the 18th century and early 19th century influenced Mill.

Third, Mill held a high regard for the positivism of Auguste Comte. These intellectual influences channeled the direction of Mill's economics. David Ricardo, however, as acknowledged by Mill himself, exerted the primary influence on Mill's economics, and his economic analysis is a refinement, extension, and elaboration of Ricardian principles.

In the theory of production and distribution, Mill made the distinction between laws of production, given by technical factors, and the laws of distribution, given by social factors. Mill made it clear that the factors that govern the production of goods can be separated from

John Stuart Mill shaped the course of economics not only by his own theoretical contributions but also by his analytical apparatus.

their distribution. A key element of this apparatus is the wages fund doctrine, in which the wages of workers were treated as an investment, and therefore, in some sense, as a capital stock. Since production occurs over time, a certain advance to workers has to be provided until the output is able to be consumed. This advancement of wages to workers is rightly treated by Mill as investment and therefore capital.

On the theory of value, Mill subscribed to a cost of production long-run price and a short-run price determined by the interaction between supply and demand. Mill advanced Ricardo's theory of rent by extending it to any supply that is limited, so that the price of a good with an inelastic supply curve is wholly determined by demand conditions. It is to Mill's credit that he not only understood the interaction between supply and demand but also grasped the difference between a schedule and a movement along a schedule, something that classical writers often failed to notice.

In international trade, Mill's contribution was at once original and an extension of Ricardo's principle of comparative advantage. Mill approached the subject of international values by using his supply-and-demand analysis. In his theory of reciprocal demand, Mill constructed a two-good, two-country model. Although Mill made only a verbal presentation of his theory, it is easily shown that his reciprocal demand curves are offer curves as later constructed.

Another one of the fundamental features of Mill's economics was the stationary state and the progress toward it. Through the construct of a stationary state, Mill was able to provide a rationale and foundation for his interests in social reforms, such as equality among the various classes and groups of people, education, and other matters. In the stationary state, having solved the matters of provision of basic economic needs, the government can then devote its energies to social matters such as poverty.

Thus the essence of Mill's solution to growing poverty was to be found in an activist economic policy. He emphasized the economic importance of the state as the sponsor of improved educational facilities. Although very cautiously, Mill advocated that elevation in the educational level of the working class would mitigate the Malthusian danger of "overpopulation" and might lead to human control over the distribution of income.

Millennium Development Goals

THE MILLENNIUM Development Goals (MDGs) are a set of promises made by 189 heads of government to try to meet specific developmental goals within their own countries. The MDGs were created by a team of eminent people charged by the United Nations (UN) to create a list of achievable, challenging goals that would

deliver rewards that are high in human and monetary value. There are eight broad goals and 48 more specific indicators that constitute the MDGs. They were based on 10 thematic areas that the UN had identified as being the most important developmental issues affecting the world: civil conflicts, climate change, communicable diseases, education, financial stability, governance, hunger and malnutrition, migration, trade reform, and water and sanitation.

The goals aim to eradicate extreme poverty and hunger; achieve universal primary education; promote gender equality and empower women; reduce child mortality; improve maternal health; combat HIV/AIDS, malaria, and other diseases; ensure environmental sustainability; and develop a global partnership for development.

Progress toward meeting the MDGs has been mixed, subject to events and shocks.

The first goal has the two specific targets of halving between 1990 and 2015 the proportion of people who have average income of less than \$1 per day and halving, in the same time frame, the proportion of people suffering from hunger. Other specific targets, of which there are 18 in total, include reducing by two-thirds the under-5 mortality rate; halving by 2015 and starting to reverse the prevalence of HIV/AIDS, malaria, and other major diseases; and halving the proportion of people without access to safe and sustainable sources of water.

In July 2002, UN Secretary-General Kofi Annan launched the Millennium Project as an independent advisory group led by Professor Jeffrey Sachs. The Millennium Project helps to create strategies to help countries achieve their MDG targets by the agreed date of 2015. The Millennium Project published the report "Investing in Development" to summarize these strategies and to help disseminate the issues relating to achieving the MDGs.

The project's 10 key recommendations are made in the report, including the need by 2006 for all developing country governments to create Poverty Reduction Strategy Papers (PRSPs) that specify the increase in public investment, capacity building, domestic resource mobilization, and official development assistance. There is a need to strengthen governance, civil society, the private sector, and human rights.

Progress toward meeting the MDGs has been mixed, and is subject to events and shocks in the envi-

ronment. The increase in terrorism directly affects the ability of a number of states to meet their MDG targets, in addition to other impacts. Conflict and potential conflict among states has worsened the situation for many people in Iraq and Sudan, among other places. The proportion of people facing extreme poverty declined from 29 percent in 1990 to 23 percent in 1999, which is a definite improvement, but in most parts of the world the rate of change is too slow to permit MDGs to be achieved. In sub-Saharan Africa, for example, virtually no improvement at all was noticeable, and outbreaks of famine in Niger demonstrate continuing food insecurity. Approximately 27 million more African people suffered from food insecurity at the end of the 1990s compared to the beginning. In east Asia, poverty and hunger are still widespread, but have been reduced significantly.

John Walsh Shinawatra University

Milwaukee New Hope Project

THE NEW HOPE PROJECT, Inc., was a community-based organization located in Milwaukee, Wisconsin. This organization operated an antipoverty employment program, the New Hope Project, between August 1994 and December 1998. The New Hope Project's underlying principles were that people who are willing to work full-time should be able to do so, and that they should not be poor when they do work.

New Hope provided services to any adult who worked full-time (at least 30 hours per week), lived in one of two targeted low-income areas in Milwaukee, and had an income that was at or below 150 percent of the federal poverty level. Participants in the New Hope program, conditional on their willingness to work full-

time, were eligible to receive 1) an earnings supplement to raise their income above poverty (after utilizing federal and state Earned Income Tax Credit benefits); 2) subsidized health insurance; and 3) subsidized childcare. For workers who were unable to find full-time work, the program placed participants into a wage-paying community service job.

The benefit structure was designed in part to address the contradictions found in a number of welfare and workfare programs, where participants were forced off public assistance and into the labor market, yet lacked work supports (for example, childcare) and earnings, such that after working full-time they still found themselves earning below the poverty threshold. Almost 90 percent of adult participants were single mothers and 80 percent of all participants received public assistance before entering the program.

An important component of the New Hope Project was its design as a demonstration program that involved a randomly selected subsample (the treatment group) who received benefits, and the remainder (the control group) who were denied benefits while tracked to provide a counterfactual to program participation.

The purpose of random assignment was to avoid the selection issues that accompany the fact that participants may systematically differ from nonparticipants, biasing the treatment effect of the program. Milwaukee residents in both programs participated in surveys, focus groups, individual interviews, and ethnographic research. The emphasis on both quantitative program evaluation and qualitative ethnographic analysis provided rich data to appraise the success of the New Hope Project.

In a climate of welfare reform, the New Hope Project represented a genuine attempt to address the hypocrisies of conventional work-based welfare programs that required participants to work yet provided few work supports, which could make private employment a viable alternative to home-based work such as childrearing.

The findings from the five-year evaluation of the program suggest that while receiving New Hope benefits, workers in the treatment group experienced higher incomes and worked more than observationally similar workers in the control group, yet these gains quickly disappeared once the program expired. This somewhat surprising result is symptomatic of the "work first" focus of New Hope, which placed emphasis on labor force attachment, not on human capital accumulation that would provide training and help workers climb career ladders.

Aimed to go beyond conventional expenditure programs for the poor, and designed to "make work pay," the New Hope program was focused primarily on labor force attachment as opposed to strategies to foster human capital accumulation. The institutional climate of the pilot assistance program is worth noting. Milwaukee hosts the youngest African-American population out of 100 of the largest U.S. metropolitan areas, hence the importance of poverty programs that address the well-being of children and attempts to lift their families out of poverty via labor market interventions.

While New Hope failed to hold sustainable outcomes, that the New Hope program operated in an era essentially devoid of urban antipoverty programs and addressed the hypocrisies of welfare reform legislation made New Hope a step toward reducing poverty in American inner cities.

KERIM ODEKON UNIVERSITY OF WISCONSIN, MADISON

Minimum Wage

MINIMUM WAGE IS A government intervention in the labor market that does not allow employers to pay a wage below a set minimum. This applies even if both the employer and employee want to agree to a wage below the legal minimum. The idea behind such legislation is to help low-skilled workers to achieve some minimum standard of living. In the United States, the federal government sets a national minimum wage, at \$5.15 in 2005. However, individual states are free to set

higher minimum wages. Some cities, such as Boston, Massachusetts, and Ann Arbor, Michigan, have established living-wage laws whereby wages are generally significantly higher than the national minimum wage. The prevailing view in economic theory is that minimum wages lead to fewer jobs for low-skilled workers. However, some economists argue that a minimum wage could lead to increased employment if employers possessed significant power in the labor market. Consistent empirical support in either direction has proven elusive. The minimum wage could also have significant effects on the education decisions of teenagers. There is also a question of whether this legislation truly targets the working poor or simply serves as a wealth transfer to teenagers from middle-income households.

In the United States, the minimum wage was established in the Fair Labor Standards Act of 1938 and is supervised by the Department of Labor. Prior to 1938, some states pursued their own minimum wage policies. In 1912, Massachusetts was the first to do so. Often the minimum wage varied across industries, taking industry-specific factors into consideration. In all cases, the minimum wage applied only to women and minors. Men were not covered until the national minimum wage was established in 1938.

The standard theory predicts that firms will hire fewer workers as a result of the higher wage. Thus while some workers benefit from the higher wage, others lose when they lose their job. Furthermore low-skilled workers are likely to enter the labor force in response to the higher wage. There are more low-skilled workers in the labor force, but fewer of them are employed, thus the unemployment rate for these workers increases. Employers who traditionally hire low-skilled labor will over time adjust their production process away from labor and toward machinery. The transition may take some time, making it difficult to determine the employment effects of the minimum wage in practice. However, studies traditionally found a negative correlation between the minimum wage and employment for the least-skilled members of the workforce.

Newer studies contradict these findings. They argue that the minimum wage can simultaneously raise wages and employment for targeted workers. This argument rests on the assumption that employers have significant power in the labor market, allowing any individual employer to have an impact on the wage rate. In order to have market power, the employer must employ a sizable fraction of the local labor force. If this is true, then the employer will face an upward-sloping supply of labor; in order to hire more workers, the firm will have to pay

a higher wage to all workers. In this case, the cost of hiring an additional worker will be greater than the wage; it is equal to the wage paid to the new employee plus the wage increase given to the existing employees. Call this cost of hiring the last worker "c." Instead, if the company faces a minimum wage (greater than the prevailing wage), then the cost of hiring an additional worker is simply the mandated wage. Call this cost "c*." If the minimum wage is not set too high, then c* will be less than c, so employers will hire more workers when there is a minimum wage than they would without one.

Studies indicate that the minimum wage is not highly effective at alleviating poverty.

Some recent empirical studies have indeed found a positive employment effect associated with an increase in the minimum wage. However these findings focused on a narrow group of employers, fast-food restaurants in relatively densely populated states. It is not likely that these restaurants individually have significant power in the labor market. There are other issues that make it difficult to empirically test for a link between the minimum wage and employment.

In addition to affecting employment levels for target groups, minimum wage laws may also have a negative effect on schooling decisions for teenagers. Teenagers are more greatly affected by the minimum wage than older workers. They must also decide how much time they will spend in school and how much effort they will exert on their studies. The increased wage may cause some students who are on the line between staying in school and dropping out to leave school. At a minimum, as teenagers decide to seek employment because of the higher wage, time spent on school is likely to decline. Thus the minimum wage may lead to lower educational achievement and skill acquisition for some.

There is also a question of whether the minimum wage is an effective antipoverty tool. Since a large fraction of workers affected by the minimum wage are teenagers, a significant share of the increased income from the minimum wage goes to middle-income families. In fact only a small share of the added income goes to families below the poverty line. Thus studies indicate that the minimum wage is not highly effective at alleviating poverty.

Missionaries

THE EXISTENCE OF MISSIONS and the work of missionaries reaches far back into world history. The basis for missionaries is primarily religious, and all branches of religions seem at one time or another to be represented. In recent years, the type of work traditionally done through missions is being carried out by a wide variety of organizations not necessarily under the auspices of an organized religion.

One of the earliest known missionary efforts was led by Paul of Tarsus in the 1st century C.E. Paul has been characterized as a "missionary extraordinaire" and is reported to have done extensive work in Turkey, Greece, and Europe. Paul's work is recorded in the writings of Luke and Paul's own letters in the Bible. Notable as well is the work of Patrick of Ireland, a missionary to Ireland in the 5th century. His work is recorded in the text *The Confessions of Patrick*.

MISSIONARIES IN HISTORY

In the 12th century, Raymond Lull, a medieval scholar and missionary, traveled to north Africa and worked with the Muslim population. Lull is noteworthy for going to a region that no one else was willing to visit and is reportedly the first missionary to the Muslims. David Brainerd was an 18th-century missionary to native people in New York, New Jersey, and Pennsylvania. His many journals were read widely in the colonies and his writings informed the colonists of life among the indigenous Americans.

William Carey served as a missionary to India during the late 18th and early 19th centuries. Carey founded the English Baptists Missionary Service and is

considered by many historians to be the creator of modern missionaries. Another prominent early 19th-century missionary to India and Persia was Henry Martyn of Cambridge University. Martyn is described as being humble and self-effacing, bright and spiritual, and a strong advocate of the people he served.

Ann Hasseltine Judson is reported to be one of the first missionaries from America to work overseas. In the early 19th century, she and her husband represented the American Baptist Mission in Burma. Another American missionary of the late 19th century was Hudson Taylor, who traveled to China and is credited with founding the China Inland Mission.

A review of the activities of the missionaries over the past few centuries reveals three important points: 1) the number of missionaries has increased significantly over time, 2) the reach of missionaries has expanded to every continent, and 3) the focus of their work has gradually shifted from primarily conversion to Christianity to the direct alleviation of poverty in all its forms—hunger, education, employment, housing, and virtually all of the socioeconomic deficits experienced by the poor.

MODERN MISSIONARIES AND POVERTY

In recent years, the Women's Missionary Union (WMU), a Southern Baptist organization, has been furthering the efforts to combat one of the developing world's severest problems: access to safe drinking water. The WMU's ministry, "Pure Water, Pure Love," has the goal of providing people with clean drinking water through a water filtration system and the delivery of fresh water supplies to those in need. The WMU is also active in the fight against world hunger.

The mission has joined with the Baptist World Alliance, the organization Bread for the World, and the United Nations to work toward achieving the goal of halving the number of those suffering from hunger by 2015. Project HELP, an expansive project of the WMU, has established ministries to address housing shortages, deficits suffered by children, the expansion of employment opportunities, senior citizen concerns, literacy issues, home healthcare provision, and migrant issues.

The Mennonite Central Committee, along with the Church World Service, raised over \$250,000 to provide shelter and basic necessities for victims of the 2005 earthquake in northern Pakistan. Over 2.5 million people were left homeless in this earthquake, which killed nearly 40,000 people. The supplies purchased with the relief money included family-sized tents, iron poles,

plastic sheets, tools, and a host of food items. Help was needed in a hurry because of the approaching winterlike weather soon to descend on the region.

Another example of heroic relief efforts came from the World Hunger & Relief Ministries (WHRM), an arm of the International Missions Board based in Richmond, Virginia. The WHRM, true to its spiritual mandate to be involved in human needs ministries, worked diligently to relieve the suffering caused by the south Asian tsunami in December 2004.

Missions had been established in California by the beginning of the 19th century.

Missions were set up in Latin American countries concurrently with Spanish and Portuguese exploration and settlement in the region. The countries of Argentina, Bolivia, Brazil, Chile, Paraguay, Peru, and Uruguay are the sites of missions into the current era. As early as 1531, mission activity under the auspices of the Catholic Church became established in the new world. In time the number of missions grew in number as more of the region came under European control. The initial impetus for the missions was the conversion of the indigenous population to Christianity. Convincing the Indian leaders of the need to give up their traditional ways in favor of the new religion did not come easily. By the end of the 16th century over 150 Franciscan missionaries were engaged in work just in Yucatan alone.

In the 1990s, the organization Canadian Missionaries Abroad was hard at work in Haiti, one of the poorest of all Latin American countries. Hospitals were set up by the Canadians to treat people too poor to seek medical attention and those who found it necessary to escape the ravages of the Haitian military regime.

Another part of the world, recently the site of conflict and suffering, also benefited from the work of missionaries. The Balkans were one of the European sites of war in the 1990s and poverty in the region persists to this day. The Christian Initiative for Development and the WMU-initiated Project:Most seek to address the needs of the poorest people in Dalmatia, a region in southern Croatia. Project:Most is providing farm animals for milk and meat and also training in agricultural activities for the deprived citizens of this region. In addition, Project:Most is helping the people of Dalmatia set up schools and health facilities, and in general improving their quality of life. The missionaries also aim

at enhancing the spiritual life of the people, although the basic necessities of life have taken precedence.

There is no region in the world that is more reliant on outside help than Africa. Missionaries are providing that help in large measure and have done so for many years. The need is great; there are more people starving in Africa than in all the remaining world regions combined.

The Missionaries of Africa, founded in 1868, has worked tirelessly to provide healthcare, food, shelter, education, and economic development to millions of Africans sorely in need of help. It is estimated that one-third of all Africans are malnourished and that if hunger can be eliminated from the poverty equation, poverty itself will be cut in half. It follows that addressing hunger should be the primary concern for bringing the poor to a higher level of living.

The hardest-hit countries in Africa in recent years and the greatest in need of food aid are Zimbabwe, Zambia, Mozambique, Lesotho, Swaziland, Namibia, Niger, and Sudan. All of these countries, except Sudan, are in southern Africa and many of them also comprise the region with the highest incidence of HIV/AIDS. In the north, Sudan has been ravaged by war and famine, an insidious combination.

CALIFORNIA MISSIONS

A number of missions had been established in California by the beginning of the 19th century. The San Jose Mission near San Francisco Bay worked not only to convert Native Americans but also to train them as weavers, blacksmiths, leather workers, brick makers, and in various aspects of the building trades. The San Jose Mission developed a very successful agricultural business. The mission's cattle herd grew to over 350,000 head and its olive production flourished. Trade in Indian-made products brought coffee, sugar, hardware, and other supplies to the mission from the growing cities along the California coast.

By 1830 over 2,000 natives were in residence at the San Jose Mission, which at that time was the largest in northern California. The land on which the mission stood was to be given to the Indians. However, when the mission was given over to a new leader, the Spanish clergy left the mission and the land was parceled out as ranches. With the end of the Mexican War in 1848, California became part of the United States and the mission era ended.

Another California success story in the early 19th century was the San Antonio Mission, located near the

coast in central California. At this mission the activities engaged in by the Native Americans reflected the goals of the leaders: natives were trained in valuable skills such as weaving, leather tanning, carpentry, and the care of horses. Dams were built to bring river water to the arid setting and a water-powered mill was installed. Cattle, sheep, and horses were raised in significant numbers and the agricultural sector was well developed. In 1834 the Mexican government decided to discontinue the mission system. Native inhabitants dwindled to fewer than 200 within a few years and they eventually abandoned the place.

The group found extreme conditions of poverty in the American south.

In the 20th century, the work of the Edmundite Missions is noteworthy. This group arrived in Selma, Alabama, in 1937 to work with the African Americans in response to an appeal from Pope Pius IX. The group found extreme conditions of poverty in the American south. The Edmundites were joined within a few years by members of the Sisters of Saint Joseph, a missionary organization based in Rochester, New York. Working together the groups established schools and hospitals to assist poor African Americans, who were the targets of racial discrimination. The efforts of these two groups predated the enactment of the Civil Rights Act by over 25 years.

The Edmundites established a training program in licensed practical nursing at the Good Samaritan Hospital in Selma, the first of its kind for African-American women. In 1980, Good Samaritan Hospital helped to start the Rural Health Medical Program, which provides medical care to poor rural families. Currently the missionary activity continues in providing healthcare, educational programs, nutritional information, housing assistance, and spiritual guidance in the region.

MOTHER TERESA

Foremost among individual missionaries in recent years was Mother Teresa, founder of the Missionaries of Charity, a group who cared for destitute people in Calcutta. Mother Teresa was awarded the Nobel Peace Prize for her work and Pope John Paul II beatified her in 2003, an act that will eventually lead to her canonization as a saint. Mother Teresa received permission from the Vatican in 1950 to start her own order to care for all

people who were unwanted by society. These included the blind, lepers, the crippled, and all others shunned by the public.

In her work, Mother Teresa created a free hospice for the dying, an orphanage, and a home for people afflicted with leprosy. Within a few short years there were services of this type over the entirety of India. In 1965, Teresa's order was granted permission to expand worldwide. There is a Missionaries of Charity home in the south Bronx, New York.

Mother Teresa died in 1997. In that year, her order included 4,000 Catholic sisters and more than 100,000 lay volunteers. Her missions were operating in 123 countries and included a wide variety of hospices and homes to care for people with HIV/AIDS, leprosy, and other debilitating ailments. The Indian government gave Mother Teresa a full state funeral.

Moldova

LOCATED between Ukraine and Romania, Moldova has a population of 4.5 million and is the fourth poorest postcommunist nation among the eastern European states and former Soviet republics—after Kyrgyzstan, Uzbekistan, and Tajikistan, according to the Economic Intelligence Unit in 2004.

The size of the Moldavian economy shrunk by twothirds within about a decade into its postcommunist transition, with the economy having been in 1999 equivalent to a mere 31 percent of its size in 1989, as noted by the United Nations Development Program (UNDP). The breakup of the Soviet Union did away with many of the benefits of socialism, such as free, quality healthcare. Independence for Moldova thus brought about poverty and, among other things, epidemics of communicable diseases. In the mid-1990s, the country experienced outbreaks of dysentery (1994), cholera and diphtheria (1995), and mumps (1997). During the Soviet era, Moldova acted as the regional supplier of fruits and vegetables. Agriculture continues to be an extremely important component of Moldova's economy, accounting for about 25 percent of the country's Gross Domestic Product (GDP). Remittances sent by Moldavians working abroad (mostly in Russia and western Europe) accounted for an estimated \$440 million in 2003, forming another 25 percent of the GDP.

Poverty in Moldova affects children, the elderly, and large households the worst.

A civil war involving the northern and more industrialized part of the country (Transdniestr) in the 1990s further increased Moldova's dependence on agricultural exports. Incidence of poverty, however, is much higher in rural and agricultural regions and is associated with the declining terms of trade in the relative prices for agricultural and nonagricultural products. As opposed to rural areas, the economies of large cities, especially of the capital city, Chisinau, have retained their strengths and even grown because of more diversified production structure and developed infrastructure.

There exists a spatial component of poverty in Moldova: the highest poverty level is in small towns (53 percent), less in rural areas (45 percent), and least in big cities (17 percent). Poverty in Moldova affects children, the elderly, and large households the worst. The elderly suffer through insufficient pensions, which in 2002 were only 30 percent of the official minimum cost of living. Poverty among households headed by people with unfinished secondary education is 49 percent and for those with no education it is 59 percent, together accounting for over one-third of all households in Moldova.

In comparison, only 13 percent of households headed by university graduates are poor. All said, poverty by 2002 in Moldova had declined substantially from a high of 70 percent in 1999 to the level obtained just before the 1998 financial crisis (49 percent). Income inequality as measured by the Gini coefficient (a measure of inequality from zero to one) was 0.34. In general, economic growth has contributed to a reduction of poverty, yet it has not so far impacted sufficiently on inequality. Incomes of the wealthiest families in Moldova

are estimated by the International Monetary Fund to be at least 10 times higher than those of the least well-to-do.

Though the rate of unemployment is relatively low in Moldova (around seven percent), lower than most of the transition economies in central and eastern Europe (where the rate is closer to 15 percent), analysts argue that the labor market does not operate efficiently, with labor resources being substantially underutilized, job opportunities being relatively scarce, and the labor market being depressed. A general measure of the utilization of labor resources, the employment ratio (the ratio of number of people employed to the number of working-age population between 15 and 64 years) stands at 57 percent for Moldova, well below the average of 66 percent for the 24 member states of the Organization for Economic Cooperation and Development (OECD).

Some 10 percent of the working-age population in Moldova who could have been productively employed are without work, in turn translating into lower output and higher poverty, according to World Bank statistics in 2004. Government authorities have adopted a three-pillar strategy in overcoming poverty during 2004–06, which involves achieving sustainable minimum economic growth of five percent per year; reducing the proportion of the population living below the poverty line (considered as \$2.15 per day, using purchasing power parity or PPP) by 12 percent; and improving the population's health indicators via increasing net school enrollment, lowering the under-5 infant mortality rate, reducing the maternal mortality rate, and arresting and reversing the spread of AIDS and tuberculosis.

Monaco

THE PRINCIPALITY OF MONACO is an independent state wholly located within France, on the coast of the Mediterranean Sea, and between the city of Nice to the west and the Italian border five miles to the east. Members of the Grimaldi family, who have been monarchs since the end of the 13th century, rule Monaco. It is less than one square mile in size. Income and life expectancy rates are both high.

Monaco's leading industry is tourism and it is famous for its casino, the Grand Prix, the Riviera, beach life, and other high-class and high-cost activities. The principality does not charge income tax and many of its residents take advantage of this arrangement. International companies are also not taxed. However, since 1962, an arrangement with the government of France has meant that residents who have been living in Monaco for five years or less are taxed at French rates and some corporate taxes were introduced. Nevertheless most of the government budget derives from transaction taxes and government-controlled industries, including the casino. Necessarily, other residents are required to provide the comparatively low-cost labor in the tourism service sector. Foreign workers are controlled through the work permit and work contract

Residents of Monaco enjoy one of the highest standards of living in the world. In 2000 the Gross Domestic Product annual per capita income (puchasing power parity) was \$27,000. (Figures of the percentage of the population living below the poverty line are not available.) However, there have been increasing concerns that at least some of the incoming wealth derives from illegal activities and has been brought to the principality in the form of money laundering. The banking sector is also significant and has been subject to scrutiny of its governance, particularly with respect to the confidentiality offered to patrons.

Monaco has hosted a number of international organizations and networks involved with economic management and poverty reduction. These help to extend the reputation of the principality, as do international broadcast networks that are headquartered in Monaco.

Monetary Policy

MONETARY POLICY PROVIDES an important tool for fighting poverty at the macroeconomic level. Monetary policy is distinct from fiscal policy, or the taxing and spending decisions of governments. But governments can use both of these tools to influence inflation, economic output, and unemployment. Monetary policy is typically controlled by a country's central bank.

Monetary policies can either be expansionary or contractionary. By influencing interest rates and the size of the money supply, the central bank can boost the economy during a downturn, or slow down the economy during an overheating phase. Tools of monetary policy include open-market operations, setting reserve requirements, and providing loans to commercial banks. A large number of countries also use monetary policy to bring stability to their exchange rate. But countries with open capital markets are limited by their inability to simultaneously use monetary policy to influence the domestic economy and to control the exchange rate.

INFLATION, UNEMPLOYMENT, AND POVERTY

Economists have found a connection between poverty and the performance of the economy. Unemployment clearly impacts poverty as people lose their income. As unemployment increases, the people first affected are generally low-income workers already close to poverty. Inflation can also impact poverty if the incomes of those close to the poverty level do not rise with prices. However, as social insurance and social assistance benefits become indexed to inflation, many who are close to poverty will be less impacted by inflation; for them unemployment remains a bigger threat.

James Tobin found in the United States that years of real wage growth (wages grow faster than inflation) and decreased unemployment could be empirically associated with reductions in poverty. He also found that in the U.S. case, this relationship has lessened in the decades since the 1970s.

He argued that the Federal Reserve had been unwilling to let the economy grow at a fast enough rate on account of its overemphasis on inflation. Alan Blinder, who served as vice chairman of the Federal Reserve Board for a period during the Bill Clinton administration, has also made this argument.

The trade-off between inflation and unemployment is one of the central tenets of monetary policy. It is encapsulated in the Phillips Curve, and it has been a source of controversy since the 1950s. The basic idea is that low unemployment causes inflation to rise, and high unemployment causes inflation to fall. This can be understood by thinking of wage negotiations between employers and employees. When unemployment is low, employees will have more bargaining power to ask for higher wages, which will increase the costs to firms and lead to higher prices.

These ideas have been refined since the 1970s to understand that it is expected inflation that matters. Because many central banks are specifically interested in maintaining low inflation, in order to provide the most stable framework for long-term economic growth, a number of people have argued that greater emphasis should be placed on maintaining low unemployment in order to fight poverty.

TOOLS OF MONETARY POLICY

Having established a basis for the connection between poverty and monetary policy, we can now consider how monetary policy is conducted and works. The most important tool of monetary policy is open-market operations. With this tool, the central bank buys and sells government bonds or other financial assets in secondary markets, in order to influence the money supply. When a central bank buys a government bond from a commercial bank or individual, the money supply increases, because the central bank provides a monetary credit to the seller.

On the other hand, when a central bank sells a government bond to a bank or individual, the money supply decreases because the purchaser pays the central bank with money. This money no longer circulates through the economy when it is in the central bank, and so it has been removed from the money supply. With open-market operations, the central bank can exert a strong influence over the size of the money supply in its country.

Open-market operations are the most important tool, but changing the reserve requirements and changing the discount rate are other possible tools. When a government increases reserve requirements, banks must hold a higher percentage of money reserves in their bank vaults in relation to the amount of loans they have made, which helps to reduce the money supply. The discount rate is the interest rate at which banks can borrow from the central bank to meet their reserve requirements in cases where they cannot otherwise borrow enough from other banks. A higher discount rate will discourage banks from borrowing from the central bank, which limits their loan-making ability and prevents the money supply from increasing.

CONCERNS ABOUT MONETARY POLICY

For many countries, exchange-rate policy is also an important part of monetary policy. Central banks can directly influence the level of their exchange rate by buying and selling currencies in the foreign exchange markets. This is a type of open-market operations. When a central bank buys its own country's currency using its reserves of foreign currencies, there is an increase in the demand for the local currency relative to others, which in turn increases the price of the local currency. In contrast, if a central bank is using its own currency to buy foreign currencies, there will be a downward pressure on the exchange rate. The benefit of controlling the price of a country's currency is that it provides price stability for companies engaged in international trade. At the same time, a fixed exchange rate is also subject to speculative attacks when investors believe that the exchange rate is not set at its underlying equilibrium value.

The impossible trinity also applies to countries that fix their exchange rates. These countries will lose control over using monetary policy to respond to the domestic economy, if the country happens to also allow capital to move freely through its borders. This is because a central bank will have to target its open-market operations to achieve a particular exchange rate, and thus has no flexibility to use monetary policy to respond to other economic concerns within the country.

TRANSMISSION MECHANISMS

Regarding the issue of how monetary policy actually impacts the economy, there are many different theories. A number of economists still hold the position that monetary policy has no impact on real economic vari-

ables, such as the number of people with jobs or the amount of goods and services produced, and that attempts to use monetary policy only result in inflation. Most economists agree with this statement in the long run, but believing it is true in the short run is now a minority position, as much evidence shows that monetary policy can have a short-term impact on the real economy.

Economists have found many different possible transmission mechanisms to explain how monetary policy can impact the real economy. The most commonly discussed mechanism works through interest rates. The central bank takes action to increase the money supply, which then works to decrease interest rates, which makes borrowing by businesses and consumers cheaper and more attractive, which helps to stimulate investment, which increases the aggregate size of the economy.

For countries with flexible exchange rates, decreasing interest rates will also lead to depreciation of the currency, which makes a country's exports cheaper for foreigners while increasing the prices of imports to the country. This helps to expand a country's net exports, which is a key component of a country's Gross Domestic Product.

Other transmission mechanisms are related to the credit view of monetary policy. An expansion of the money supply increases bank deposits, which allow banks to increase their loans if they wish, which increases investment and the size of the economy. The key is that banks are not required to make loans, and these theories have developed more recently as a part of the economics of incomplete information.

For example, when interest rates are high, banks are more cautious about lending money, because banks must assume that anyone willing to borrow at a higher interest rate is likelier to default. Likewise an expansion of the money supply will help to boost the value of equities and improve the balance sheets of companies. Banks can then increase lending to these companies because they are more confident that the companies will be able to pay their debt since they are able to provide more collateral for the loan.

POVERTY IN DEVELOPING COUNTRIES

Unique challenges exist for developing countries in their attempts to use monetary policy to reduce poverty. Many of these countries do not have developed financial markets or government debt markets, which makes it difficult to use open-market operations. Developing countries are also frequently plagued by high and variable rates of inflation that hurt the prospects for economic growth, but monetary policy gets trapped by politicians into funding government debt, which only serves to further inflation. For many countries, an attempt to fix the exchange rate may provide the best way to control inflation, because it allows the country to peg its economy to the performance of more stable countries.

Higher inflation serves to depreciate a currency, and so a developing country with a pegged exchange rate has a clear anchor that forces it to keep its inflation in line with the country to which it has pegged its currency. Creating the appropriate monetary policy is a complicated process, but it important to develop sound monetary policies to stabilize macroeconomic performance. A stable economy is a necessary, though not sufficient, condition for fighting poverty.

Mongolia

A TOTAL OF 2,791,272 people lived in Mongolia in 2005. The condition of poverty in Mongolia is not understandable without some information about Mongolia's history and geography. One has to distinguish between the so-called Inner and Outer Mongolias, the first one an autonomous region of the People's Republic of China, the second one now called the Mongolian Republic, an independent state (that is, from China)

since 1911, which was under strong Soviet influence till the collapse of the Soviet Union starting in 1989. The country is situated in central Asia between Russia and China; most parts of it are mountainous and covered with steppe. That is why livestock herding is still carried on today by nomadic or seminomadic cattle-breeders, which is very important for the Mongolian economy.

During socialist rule under Soviet influence, Mongolia rapidly industrialized. This caused enormous social change; greater parts of the population began to live in settlements, and towns were rapidly founded in the steppe. At first industrialization seemed to be very successful; in 1975 industrial production was higher than that in traditional agriculture, but this development did not grow on firm ground.

In the early 1980s, the economy of the socialist countries went into a severe crisis—a result of the system's failures. Against this background, the Mongolian government of 1989, after the collapse of the Soviet Union, decided to follow ultraliberal Western ideas of economic development. This extremely rapid transition from a centrally planned economic system to a market-oriented liberalized one meant that government activities were very much reduced, and several kinds of restrictions (such as on international trade) were lifted.

State-owned enterprises were privatized, in the beginning by giving vouchers to the Mongolian people, and later on by selling them to domestic and foreign persons/enterprises. This extreme change led to an economic decline and during the first years (1989–93), economic growth fell below that of the socialist era. The consequence was that poverty increased—in nearly all aspects.

The per capita income collapsed in real terms (from \$1,643 in 1989 to \$374 in 1999), and many people lost their employment. This economic collapse led to consequences in different areas of life: the birthrate quickly declined (in 1989 the population growth rate was 2.9 percent per annum, in 2000 1.4 percent per annum). This can be regarded as a kind of survival strategy. Part of such survival strategies is the migration from urban centers to rural areas in order to make a basic living as herders. Others tried to earn their livelihood in alternative sectors in the towns (such as small shopkeepers and informal currency dealers).

Another indicator of increasing poverty in Mongolia is deterioration in human capital, such as education and healthcare. The quality of education in general has decreased. Though primary education principally remains universal, fewer children attend school regularly, especially nomadic children who often help with herding, which also has to be regarded as part of a survival strategy. The rural population has no adequate medical care. Poverty reduction in the Mongolian Republic will be possible in the future if government intervention is strengthened. Good governance, in the case of Mongolia, means to become less dependent on foreign aid, and to adapt education and healthcare to Mongolian tradition, culture, and lifestyle while still modernizing. The informal employment sector in towns must be examined if some parts are to be future-compliant; as for livestock herding, a balance must be found between providing the livelihood of many families and avoiding environmental damage.

RUTH ERKEN
INDEPENDENT SCHOLAR

Monroe, James (Administration)

JAMES MONROE WAS criticized for failing to react to the financial panic of 1819. This was the first recession since the adoption of the Constitution and caused increased poverty in the young United States. Monroe asserted that any corrective measures were the responsibility of the Bank of the United States and of the state governments. Other than extending payment plans for mortgages on federal land sold to private parties, Monroe did little to limit the economic burdens or alleviate economic hardship. The economy eventually rebounded and most Americans accepted and admired his restraint. During the panic, some had called for more indirect government action, but almost no one at the time saw a direct role for the federal government in alleviating poverty.

During his eight years in office, federal spending decreased from \$30 million to \$20 million per year. Federal debt shrank from \$123 million to \$84 million,

despite the 1819 financial panic, which significantly decreased federal revenues.

Monroe was born in Westmoreland County, Virginia, in 1758. He served with distinction during the American Revolution, rising to the rank of colonel. He also pursued a legal career by reading law with Thomas Jefferson, who would remain his mentor and political patron. He also developed a close relationship with James Madison while serving in the Virginia Assembly and Continental Congress.

Monroe opposed ratification of the new Constitution in 1787. He objected to the powers of direct taxation and to the power given to the Senate. At Patrick Henry's request, he ran for Congress against Madison but lost. Two years later he went to Washington, D.C., as a U.S. Senator. He soon found himself working more with Jefferson and Madison in opposition to Alexander Hamilton's attempts to increase the size and power of the federal government. In 1794 President George Washington assigned him to a diplomatic post in post-revolutionary France. His pro-French views, however, caused him to be recalled two years later. Monroe returned to Virginia. In 1799 he was elected governor of Virginia, where he served until 1802.

Under the Jefferson administration, Monroe returned to France as a special envoy to purchase a port along the Mississippi River. The resulting negotiations eventually resulted in the Louisiana Purchase. Monroe spent four more years in Europe as minister to Britain, which was at war with France and was blocking all U.S. trade. Monroe secured a treaty to relax these restrictions but President Jefferson refused to submit the treaty for ratification because it did not prevent Great Britain from boarding American vessels at sea and kidnapping American seamen for service in the British navy. Monroe's disagreement with the administration deepened when he ran against Madison for president in 1808. With Madison's election, he returned to state politics and served another year as governor. In 1811, Madison asked Monroe to return to replace a disloyal secretary of state. In 1814 he also assumed the duties of secretary of war, replacing the man whose incompetence had led to the British invasion of Washington, D.C., that year.

On Madison's retirement in 1816, Monroe easily won election as president, despite some grumblings over a "Virginia Dynasty" in the presidency. In 1820, Monroe was so popular that he ran uncontested, losing only one electoral vote nationwide.

Despite such unity, the great issue that would divide the nation for the next half century appeared on the horizon. Missouri sought admission to the Union. Many members of Congress sought to condition admission only if it outlawed slavery. Monroe, a slave owner himself, believed the federal government had no right to tell a state whether it could permit slavery. His willingness to compromise, however, allowed him to accept the agreement to admit Missouri as a slave state and Maine as a free state (thus keeping balance in the Senate) and at the same time limit future slave states to the southern territories only.

Throughout his career, Monroe consistently fought to keep power defused and the government small. While he supported projects to improve coastal defenses, when Congress sent him a bill to build canals and make other internal national improvements, Monroe vetoed the bill. Even though Madison had signed similar laws, Monroe held that the federal government had no such power and required a constitutional amendment. Later in his administration, he moderated this view and supported several such infrastructure programs.

Monroe was best known for foreign affairs. He pressured Spain into ceding Florida in 1819. He also announced a new policy, drafted by his secretary of state, John Quincy Adams, that the United States would oppose any European colonization in the western hemisphere. Although the United States did not have the military might to enforce this at the time, the Monroe Doctrine became a cornerstone of U.S. foreign policy.

Monroe left office in 1825, heavily in debt. He spent years trying to recover expenses owed by the government for his years of service. In 1829 he presided over Virginia's Constitutional Convention. He died in 1831.

Moral Poverty

WHILE MORAL POVERTY is among humanity's most pressing concerns, it eludes simple definition. One is hard-pressed to find detailed discussions of the topic in either ethical texts or forums for the discussion of moral issues. Essentially moral poverty is the foundation and setting for the nearly insurmountable economic poverty that adversely impacts the lives of billions of people across the globe. In addition moral poverty serves as the context for a plethora of other social evils, including crime, addiction, illiteracy, and homelessness. Moral poverty begins on an individual level before evolving into a contagion that afflicts entire nations and peoples.

INDIVIDUAL MORAL POVERTY

Moral poverty is first a state of being that is characterized by an arrested moral development wherein an individual's conscience is not able to mature to the level required to make decisions that are truly moral. The factors that contribute to the creation of this morally immature state are numerous. A dysfunctional family environment that fails to provide children with authentic and essential affirmation, falls short in attempting to provide adequate and necessary moral instruction, and does not insist upon remorse, apology, and restitution in the face of injustice serves as a breeding ground for moral poverty. The lack of exposure to embodied love and virtue adversely impacts the development of children.

Moral poverty, which is the equivalent of moral apathy, takes firm hold during early developmental stages, making it difficult to temper or eradicate later in life. In many cases, those individuals who suffer from moral poverty do not experience significant material or economic disadvantage.

A rampant and unhealthy individualism that is stressed by post-Enlightenment culture is yet another source of moral poverty. As a moral posture, individualism reduces human beings to their personal uniqueness, thereby ignoring the communal dimension of human experience. Personal rights and liberties are stressed over and above social obligations. Thus those persons who are guided by the philosophy of individualism in a strict sense experience moral poverty in their failure to fulfill their role as "keeper of brother and sister."

On the individual level, moral poverty assumes a very distinct form vis-à-vis world poverty. Individuals

who are morally poor adopt an apathetic disposition with regard to global economic injustice. As individuals, they argue that they are powerless in the face of vast numbers of persons who suffer from poverty, hunger, and homelessness across the world. Their inability to recognize the enormity of the plight of world poverty, to lament its ever-growing existence, or to commit personally to its obliteration is a self-stylized form of moral paralysis that results directly from their personal moral poverty, which is deeply embedded within them.

SOCIETAL MORAL POVERTY

More frequently, moral poverty is the designation given to the communal ethos, especially in terms of wealthier developed countries that fails to acknowledge the demoralization of society. Obviously individuals who are morally poor contribute to the socialization of moral poverty. With regard to the epidemic of world poverty, individual acquiescence based upon a "priority for compatriots" ideal serves as an insidious example.

Our history is deeply scarred by the effects of moral poverty.

By the same token, morally corrupt systems, structures, and institutions bear much of the burden. Such morally bankrupt institutions perpetuate certain basic myths or presumptions that fail to acknowledge the gravity of world poverty. These assumptions often include the following: prevention of poverty-related deaths is counterproductive because it results in overpopulation which will result in an even higher povertyrelated death rate; the eradication of world poverty will bankrupt the First World; redistribution of economic resources does not effectively end world poverty, and world poverty is disappearing on its own. Even a cursory analysis of these perceptions that exist in the minds of many affluent countries and prominent world organizations exposes them as unreflective moral judgments that are unreliable.

On the societal level, moral poverty is intrinsically linked to moral relativism and its claim that the recognition of cultural differences precludes the establishment of a commitment to ensuring basic human rights in a universal fashion. While one can neither deny that fundamental differences do exist in terms of the moral norms espoused by certain groups nor dispute the claim that these norms and values are culturally condi-

tioned, it is impossible that there are certain rights that are fundamental by virtue of our shared humanity and therefore cannot be denied.

Unfortunately our history, deeply scarred by the effects of moral poverty, evidences great failures in this regard. It is no small wonder that the United Nations found it necessary to respond to the consequences of moral poverty on the societal level through its creation of the Universal Declaration of Human Rights in 1948.

SOLUTIONS TO MORAL POVERTY

While there are no easy solutions to moral poverty, some steps may be taken to weaken its hold on both individuals and the systems in which they live and work. On the individual level, a recommitment to the creation of nurturing families is required. Since the context of the family serves as the initial forum for education, children must experience genuine love and affirmation from parents and other family members in order to develop the foundation for understanding the importance of human solidarity.

Accordingly, children will possess the capacity to recognize injustice and know the importance of personal response. Additionally individuals who embrace the virtue of solidarity, transcending the bounds of individualism and recognizing that the commitment to the other is a constitutive aspect of human nature, will develop a well-formed conscience that will not succumb to moral poverty and its economic consequences.

Ethicists Russell Connors and Patrick McCormick, in their discussion of the characteristics of a just or good society, propose a thorough solution to moral poverty on all levels that would resolve the issue of moral poverty while simultaneously addressing the issue of global poverty.

First, all societal systems, structures, and institutions must provide means for authentic human development, allowing equal access for all persons to the economic, social, cultural, and political resources of society. Second, social institutions and structures must ensure a legitimate personal autonomy for all persons and provide for the basic needs of their members so that they can participate fully in the life of the community.

Third, all members of society must share its benefits and burdens equally. This characteristic proves to be a particular challenge for the materially wealthy but morally poor; however, it is essential for the total elimination of both moral poverty on a societal level and economic poverty on a global level.

Fourth, societal institutions, structures, and systems must have the common good as their ultimate goal. To reach this end, these organizations must ensure freedom, justice, peace, and solidarity for their members. Fifth, and of grave importance, society must be self-critical, making certain that the victims of moral poverty are protected and that unjust structures are exposed and reformed.

The last observation offered by Connors and Mc-Cormick is critical in the search for a lasting solution to moral poverty. Reformation of unjust structures, fueled by an ethos of moral poverty and contributing to global poverty and the other social evils directly related to it, must begin with public exposure and critique. Next, members of society must participate in activities that engender their disdain for the consequences of moral poverty.

Such actions might include symbolic gestures such as peaceful demonstrations that call upon the disproportionately wealthy First World to stop ignoring the basic needs of the poor. Finally structures afflicted by moral poverty will only be reformed when governments enact legislation to protect the marginalized of society, of which the world's poor are the silent and most underserved minority.

The problem of moral poverty will not disappear without significant effort.

The problem of moral poverty will not disappear without significant and sustained effort on the part of individuals and institutions. To admit the power and extent of the grip of moral poverty upon society and its members will require radical honesty. In essence, any valid confrontation with moral poverty will require no less than a conversion on the part of all. This conversion, which by necessity will be both personal and social, must be permanent and clearly understood to evoke a genuine concern for our fellow members of the human family.

Families must become the first school of social concern and individuals must recognize their solidarity with the rest of the human race, all of whom possess an inherent dignity and who are deserving of certain basic human rights. Only after such a conversion has occurred and its effects are maintained will moral poverty be disarmed, making the realization of global economic equality less of a dream and more of a reality for millions across the globe.

JOHN J. SLOVIKOVSKI MOUNT ALOYSIUS COLLEGE

Morocco

THE KINGDOM OF Morocco is located on the northwest coast of Africa and is bounded by the countries of Algeria and Western Sahara, the north Atlantic Ocean, and the Mediterranean Sea. Morocco gained independence from France in 1956. In the late 1970s, Morocco annexed Western Sahara. However, a final legal resolution on this action has not yet been made. The coastal areas are the most productive agriculturally, with 20 percent of the total land area designated as arable.

Forty percent of Morocco's labor force are engaged in agriculture, 15 percent in industry, and 45 percent in the service sector. Agricultural products include grains, citrus, vegetables, a variety of wines, olives, and livestock. Industrial activity is devoted to the mining and processing of phosphate rock, food production and processing, leather goods, and textiles.

Tourism has also become an important economic activity in the country. Morocco's exports include clothing, fish, and a variety of minerals, fruits, vegetables, and petroleum products. Oil reserves in Morocco are 300 million barrels and reserves of natural gas equal 665 million cubic meters (2004 estimates). Morocco's most important trading partners are France and Spain. It is noteworthy that Morocco imports crude oil from Saudi Arabia despite having proven oil reserves within its borders. This is because consumption of oil within the country far exceeds internal production.

Morocco's population is approximately 32.7million (2005) and its rate of natural increase is 1.6 percent, a figure slightly higher than the world average of 1.2 percent. Life expectancy at birth is a respectable 68 years. Despite these promising demographic characteristics, Morocco is nonetheless characterized as a developing country and it faces a number of poverty challenges.

During the decade of the 1990s, absolute poverty in Morocco increased. This condition is attributed to declines in manufacturing exports, a slowdown in agricultural production, declines in new job creation, and increasing inequity in the rural regions. Although the rural areas of the country have 45 percent of the total population, nearly two-thirds of the poor people live there.

However, increases in poverty have also been seen in urban areas. Government actions to alleviate poverty include improvements in the education system. At present only 68 percent of youth (ages 15 to 24) are literate. In addition, attempts are under way to reduce infant mortality rates, currently at 40 per thousand live births; to improve health care delivery especially to the rural areas; to improve conditions for households with children; to ensure food subsidies for the poor; to expand public works projects within rural areas; and to restructure the welfare system.

Poverty alleviation in Morocco continues to be a government priority. The Living Standards Measurement Study conducted in 1999 placed priority on social policies, including education, health, social insurance, and social assistance. The primary aim of this program is to find ways to improve economic growth and to raise the living standards of the poor throughout Morocco. King Mohammed VI, enthroned in July 1999, stated that the attack on poverty is a priority. This stance gained him the title "Guardian of the Poor." One of the king's significant reforms is the Mudawana, a law enacted in 2004. The law expands rights to women but more conservative members of the Moroccan society have opposed it.

Mother Teresa (1910-97)

MOTHER TERESA WAS BORN to Nicola and Drane Bojaxhiu in Skopje, Macedonia, and baptized Agnes Gonxhe in the Roman Catholic faith. Gonxhe's parents, especially her mother, influenced her early attraction to missionary life. At the age of 12, Gonxhe experienced her first calling to a life of prayer and contemplation. In 1928, during her late teens, she received a letter of acceptance to the Sisters of Loreto in Rat Farnham, Dublin, Ireland. She left Skopje on September 26, 1928, to join the Institute of the Blessed Virgin Mary, taking the name Sister Mary Teresa after the beloved St. Thérèse of Lisieux of the Child of Jesus, known to this day as the "Little Flower." Wanting to be a missionary, she offered herself to the Bengal Mission in India.

YEARS IN INDIA

December 1928 began Sister Teresa's voyage by steamship to Calcutta, India. In the tradition of Christian holy orders, she professed primary vows of "poverty, chastity, and obedience to God" (1931), as well as her final vows to be the "spouse of Jesus" for "all eternity" (May 24, 1937). During her membership in the Loreto Entally community, where holy sisters were known as Mother, she taught history and geography to girls at St. Mary's high school, becoming headmistress in 1944. On September 10, 1946, while riding a train from Calcutta to Darjeeling to make a retreat, Mother Teresa was inspired by a "call within a call" to establish a new religious life in the slums of Calcutta. She wrote:

I was to leave the convent walls and live among the poor. But not just any poor. [God] was calling me to work with the most desperate, the poorest of the poor in Calcutta: people who had nothing and nobody, whom no one would go near, since they were a breeding ground for disease, were filthy and infested with worms and microbes; people who could not go out and beg for alms since they were naked, without a shred to cover their nakedness; people who had stopped eating, since they were too wasted and lacked strength to do so; people who were at the point of death, who had collapsed in the street, and knew that they were dying; people who no longer wept, for they had run out of tears. These were the people Jesus pointed out to me during that trip, and whom I was to love.

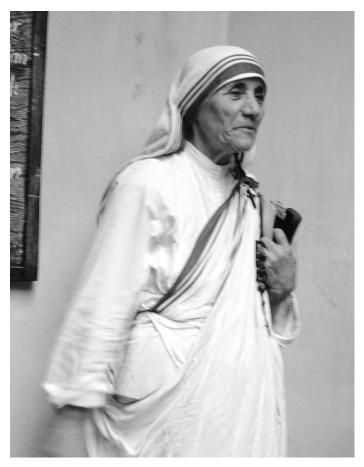

After 20 years of cloistered religious service at Loreto, Mother Teresa was permitted by Pope Pius VI on August 17, 1948, to become an unenclosed nun. She wore a white, blue-bordered sari with a shoulder cross—her only possessions—to symbolize her chosen life of poverty and solidarity with the poor.

In Patna, Mother Teresa undertook three months of basic nursing with the American Medical Missionary Sisters, and, as early as 1949, her former students appeared one after another in response to her request for help with her new mission. This order of nuns, known today as the Missionaries of Charity, was ratified by Rome on October 7, 1950. In 1952 they opened a hospice for "the destitute and the dying" to provide wholehearted and free service to the sick and dying living in the streets of Calcutta: "I chose this life to realize the Gospel to the letter, especially where it says: 'For I was hungry and you gave me food. ... I was naked and you clothed me. ... I was in prison and you came to me," Mother Teresa wrote.

Extraordinary attention to the most marginalized members of society symbolized Mother Teresa's deepest regard for the Christian principle of prayer in action. This spiritual dimension of the Missionaries of Charity is led by the idea of Christian contemplation, a humble and unconditional surrender to God and God's will: "Our vocation is nothing else but to belong to Christ. The work we do is only a means to put our love for Christ into living action."

As described in her book *Total Surrender* (1985), Mother Teresa firmly encouraged her sisters to serve the poor and one another with an attitude of absolute cheerfulness and giving, an expression of their love for God; she believed this was possible only through an unwavering dedication to prayer and thanksgiving, which would guide a daily living out of the Gospel values of humility, patience, faith, hope, love, peace, joy, and compassion.

Mother Teresa's radical response to the poor—giving them back a sense of dignity, respect, love, companionship, and the feeling of being wanted—was introduced to the world by Malcolm Muggeridge's BBC film documentary, Something Beautiful for God (1969). It

Mother Teresa: "I will never tire of repeating this: what the poor need the most is not pity but love."

shed light on the violence and extent of poverty while also conveying a unique message of unconditional love as an inspiration to those seeking to do justice to the needs of the poor: "I will never tire of repeating this: what the poor need the most is not pity but love. They need to feel respect for their human dignity, which is neither less nor different from the dignity of any other human being."

RECOGNITION FOR SERVICE

A well-known public figure, Mother Teresa was greatly admired for her lifetime of dedication to the world's poor. In 1978 she was awarded the Nobel Peace Prize, in addition to a multitude of prestigious awards, country and state acknowledgments, and honorary degrees. By her death in 1997, 4,000 members had joined Mother Teresa's Sisters, with 610 foundations established in 123 countries around the world. Her special impact on the people of India was recognized by a state funeral in the fashion of Mahatma Gandhi, even though she was not

a Hindu. Her tomb continues to be a place of pilgrimage and prayer for people of all faiths. From Rome, Pope John Paul II opened Mother Teresa's case for beatification on December 20, 2002, and the Vatican approved it on October 19, 2003.

CHRISTINA BRAID INDEPENDENT SCHOLAR

Moynihan Report

DANIEL PATRICK (Pat) Moynihan (1927–2003) was a U.S. Senator, ambassador, administration official, and academic. He authored a number of books, including a much-discussed 1965 publication, "The Negro Family: The Case of Action" (a U.S. Department of Labor report), otherwise widely known as the Moynihan Report.

Moynihan was born in Tulsa, Oklahoma, but grew up in New York City. He was raised in a poor neighborhood and graduated from Harlem High School. He served in the U.S. Navy, and then went on to receive graduate and law degrees. He served as an undersecretary of labor in the administration of President John F. Kennedy, and as well in the early part of the administration of President Lyndon B. Johnson. He worked on formulating national policies for what would become the War on Poverty.

Moynihan had a lifetime interest in social policy and in poverty policy. He had grown up in a poor household, so he no doubt had a strong affinity for social change and social justice, for helping people obtain a better life. He was first elected to the U.S. Senate in 1976, and then was reelected to the Senate three times, in 1982, 1988, and 1994. He did not run for the seat in 2000, and was succeeded by fellow Democrat Hillary Rodham Clinton. He was most influential in his career, and comfortably moved in and out of various circles, political, diplomatic, governmental, and academic.

His report hypothesized that the destruction of the African-American nuclear family structure would be a significant hindrance to further progress toward equality. Moynihan, a social scientist, made clear that he was not in effect blaming the victim, but was looking at the environment as a key force here. Nevertheless much negative reaction occurred at the time, much of it from the African-American community. Charges were made that Moynihan was stereotyping African-American families as poor, uneducated, and dysfunctional.

Interestingly, discussion and debate about this issue have continued unabated for decades after the publication of this noted report. For example, a quote from the report's introduction includes:

The most difficult fact for white Americans to understand is that in these terms the circumstances of the Negro American community in recent years has probably been getting worse, not better.

Indices of dollars of income, standards of living, and years of education deceive. The gap between the Negro and most other groups in American society is widening.

The fundamental problem, in which this is most clearly the case, is that of family structure. The evidence—not final, but powerfully persuasive —is that the Negro family in the urban ghettos is crumbling. A middle-class group has managed to save itself, but for vast numbers of the unskilled, poorly educated city working class the fabric of conventional social relationships has all but disintegrated. There are indications that the situation may have been arrested in the past few years, but the general post-war trend is unmistakable.

The Moynihan Report, released at such a critical time in the history of social policies (and race relations) in the United States (1965), was significant for the questions it raised, questions that have not been sufficiently answered even today.

THOMAS D. WATTS, Ph.D. UNIVERSITY OF TEXAS, ARLINGTON

Mozambique

MOZAMBIQUE IS A sub-Saharan African nation located in southeast Africa. It has a lengthy coastline on the Indian Ocean and the Mozambique Channel, which separates the country from Malagasay (Madagascar). It is bordered in other directions by Tanzania, Malawi, Zambia, Zimbabwe, South Africa, and Swaziland. Despite its coastal location, the extensive Zambezi River, and other natural resources, Mozambique is one of the poorest countries in the world. Per capita annual income in 2003 was estimated to be \$210, while child mortality was 101 per 1,000 live and the incidence of AIDS was 13 percent.

Vasco da Gama's voyage from Portugal to India brought Mozambique into the European sphere of influence for the first time. A Portuguese base was established there, and over the succeeding centuries Mozambique was first exploited as a producer of slaves who were exported by traders across the Americas and the Arab world. Subsequently the Portuguese colonizers created an export-based industry in which goods were extracted from the country for sale overseas to the benefit of Portuguese settlers. The people of Mozambique were denied access to economic or social opportunities and were used as conscript labor to build the transportation infrastructure.

Colonization was not ended until 1975 and was then succeeded by a bloody civil war (1980–92) among factions of differing ideological beliefs. This war impoverished even further the population, particularly those

away from the coast, who relied mainly on subsistence agriculture for income.

Approximately 70 percent of the population live in rural areas, the agriculture of which accounts for 30 percent of Gross Domestic Product. Per capita income declined to a low in 1995, when it fell to \$140. World Bank assistance has been sought since membership in 1984 and currently approximately \$1 billion of development aid has been committed to the country. This includes projects concerned with public-sector reform, education, transportation infrastructure management, capacity building, and a regional gas project.

The government's Action Plan to Reduce Absolute Poverty noted the country's continued extreme vulnerability to external shocks such as flooding and low international commodity prices for its agricultural exports. It laid out a strategy for poverty reduction based on the central vision of peace and sociopolitical stability and specified priority areas in education, health, agriculture and rural development, basic infrastructure, good governance, and macroeconomic financial management.

In 1998, Mozambique was declared to be eligible to join the Heavily Indebted Poor Country (HIPC) initiative, which provided some \$1.4 billion in debt relief. The purpose of the HIPC initiative is to reduce national debts to sustainable levels so that ongoing structural adjustment reform programs will not be endangered. However, critics observe that it is to a significant extent these programs, which are administered according to a standard template by the International Monetary Fund without consideration of local conditions, that are in fact causing the economic problems. While Mozambique is also eligible to benefit from the debt write-off announced at the G-8 Gleneagles Summit in 2005, the need for trade reform and the end of export subsidies in the developed nations was not met.

John Walsh Shinawatra University

Myanmar

MYANMAR, FORMERLY CALLED Burma/Birma, forges links between south and southeast Asia, bordering Bangladesh, India, China, Laos, and Thailand. After riots in 1988, the military junta changed the country's name, explaining that "Myanmar" would include all the different groups of the population. This change of name highlights one of the country's many problems: Myanmar is a multiracial state with many ethnicities, mostly very different in history, culture, religion, and language. Following an ethnolinguistic classification, three main groups of people live in Myanmar: Sino-Tibetan dialect-speaking groups (Burmese, Kachin, Chin, Lahu, Naga, and some others), Mon-Khmer (Mon, Wa, Palaung), and Austro-Thai (Shan).

Myanmar still is one of the poorest countries in the world, though it is potentially rich.

There are no exact numbers available for today's population situation, but it is very probable that the Burmese are the majority (estimated as 49.9 million in 2004). The Burmese and some other ethnicities (Mon, Shan) are Buddhists. Not only with regard to population but quite generally, it is extremely difficult to get reliable information about the still not democratically ruled country, in which human rights are severely violated. The government did not accept the result of the first democratic vote in 1990 (after 30 years), which was won by the National League for Democracy (whose leader is Aung San Suu Kyi, the winner of the Nobel Prize for Peace in 1991).

The military junta has maintained its hold on power, many political opponents were taken into custody (Aung San Suu Kyi, too), and the Muslim minority was persecuted, so that in 1991 about 250,000 fled to Bangladesh. This situation contributes to Myanmar's poverty profile, although the country has mineral resources and is arable in many areas. It is potentially one of the richest countries in southeast Asia. Another im-

portant reason for the country's poverty is the attempt to establish some kind of socialist economic system during the time of the Socialist Republic of the Union of Burma (1974–88). This system was inefficient and collapsed because it was managed by unskilled and corrupt military rulers, and also because of the severe economic crisis of the Third World in the 1980s caused by falling raw material prices, decreasing proceeds from exports, and increasing debts.

Fortunately the various ethnicities living in Myanmar were experienced in creating a network of activities that helped to cushion the economic fall; all over the country an efficient black-market system was developed that grew to such an extent and vital importance that the military government had to tolerate it. The black market helped to satisfy the basic needs of the population.

This black market was partly democratized; it functioned in different ways, such as small community markets and door-to-door selling. In the context of the black-market network, which made available more or less everything, the distribution of Thai and Chinese contraband products from the border areas played an important role. The economic crisis was so severe that it became inevitable to slightly open the country (or at least the economy) to the world in order to make desperately needed foreign aid possible.

In 1989, border trade was legalized by a series of trade concession agreements with China and Thailand, in order to secure tax revenue from traders and provide income for the armed struggle against ethnic minorities in the border areas. The first countries entering into official economic contact with the present (2005) military rulers are Asian: Thailand, China, Singapore, South Korea, and especially Japan. Western countries do not yet give official support, but nevertheless private Western firms have installed various ventures with the Myanmar government.

Myanmar is considered to be one of the least developed countries, with an annual growth in population of 1.3 percent (most recent estimate 2004), a life expectancy at birth of 57 years, an infant mortality rate of 76 per 1,000 live births; the corresponding maternal mortality rate was 2.55 per 1,000 live births. These dates might be higher because 80 percent of all births are home deliveries and 32 percent of all births are not attended by any trained health personnel. There are no exact data about per capita income, but in 1997 the Household Income and Expenditure Survey (HIES) revealed that about one in four households lives below the minimum subsistence level. The World Bank esti-

mates that literacy is extremely high in Myanmar, namely about 90 percent of the population over age 15. This seems to be in contrast to another World Bank estimate: 24 percent of children aged 10 to 14 are in the labor force, which in Asia means they are earning their families' livelihoods. This is certainly in conflict, too, with widespread illness and malnutrition in childhood.

UNITED NATIONS HELP

The classification of belonging to the poorest countries in the world has paved the way for United Nations agencies (United Nations Development Program, the Food and Agricultural Organization, the World Health Organization, and UNICEF) to help the people of Myanmar. Furthermore there are nongovernmental organizations that fund development projects, such as provision of pre- and postnatal care, supplementary feeding, safe drinking water, health-education projects (waterborne diseases and poor hygiene are major killers of children), and food-security projects in the context of rural development strategies.

In the early 21st century, Myanmar still is one of the poorest countries in the world, though it is potentially rich. There is some progress, as the country has slightly opened to the world; the healthcare system has improved a bit. But still, Myanmar is no democracy and human rights are widely ignored.

Myrdal's Theory of Cumulative Causation

GUNNAR MYRDAL WAS A SWEDISH economist, awarded the Noble Prize in Economics in 1974. Especially noteworthy among his many contributions are An American Dilemma: The Negro Problem and Modern Democracy, about the plight of African Americans (1944); his analysis of development issues in Economic Theory and Underdeveloped Regions (1957); and Asian Drama: An Inquiry into the Poverty of Nations (1968).

These and other works rested on Myrdal's analysis of unbalanced economic growth and resulting poverty through his concept of cumulative causation. Myrdal saw the development and underdevelopment process as an upward or downward spiral.

As opposed to the view of neoclassical economic models of development, the process of economic growth generally increased rather than decreased the gap between the rich and poor, with underdeveloped countries, regions, or social groups tending to lag even further behind their more developed counterparts. Key to his theory are backwash (unfavorable) and spread (favorable) effects, whereby in the regional context, economic growth in the more developed or metropolitan region determines economic development or the lack thereof in the less developed region.

Key backwash effects are the migration of labor and financial capital from the underdeveloped to the developed region, resulting in shortages of capital and qualified labor. Important spread effects include the diffusion of investment, innovation, and growth attitudes and institutions from the more to the less developed area and backward linkages between industries in the developed economy and input suppliers (often in raw or semiprocessed form) from the less developed region.

Myrdal felt that without appropriate actions by government, backwash effects would predominate over spread effects, thus reinforcing the backwardness and concentration of poverty in the lagging country or region. Wealthier regions enhanced their competitive position through external economies, higher-quality labor inputs, and more favorable treatment by government.

Cumulative causation also applied to disadvantaged social groups, including attitudes toward such groups. For example, in the 1940s, African Americans suffered high rates of poverty because of limited access to education, key economic inputs, and so forth. Because of their lack of education and low economic status, many

white Americans viewed American blacks with disdain and sought to maintain and even enhance limited access to key resources.

Continued limited access caused blacks as a group to lag even further behind, thus reinforcing negative stereotypes held by many Americans, which in turn provided the rationale for continued discrimination. Discrimination in turn reinforced limited access, low status, and poverty. In this situation, government or "the oppressor state" played a key role in reinforcing the downward spiral of cumulative causation, with backwash predominating over spread effects.

Myrdal viewed appropriate intervention by government (the welfare state) as the key to reversing the downward spiral of cumulative causation into an upward spiral along the path of economic and social development and poverty reduction. Or, poverty pockets (for countries, regions, or social groups) could be eliminated through appropriate governmental intervention. Hence his recommendations in *Asian Drama*, where government-led efforts in population control, land reform, and investments in healthcare and education are advanced as a means of reversing the downward spiral and leading southeast Asia out of the mire of poverty.

We wonder what Myrdal would say about persistent poverty in developed countries.

How well have his views stood the test of time? In many respects Myrdal's views have proven true. In academic circles, much of the thinking behind the recently espoused models of new economic geography by Paul Krugman, among others, and new growth theory (advanced by Paul Romer) is based on Myrdal's views.

More importantly, poverty reduction in countries such as the Asian "tigers" and China fits the cumulative causation paradigm, where appropriate and judiciously applied government policies set off a process of widely dispersed growth in per capita income and very pronounced reductions in poverty. Also, countries and regions where government has not been benevolent and farsighted, such as parts of sub-Saharan Africa, remain mired in a trap of slow growth and high rates of poverty.

Still we are left to wonder what Myrdal would say about persistent poverty in developed countries. For example, while many African Americans have obtained middle- and upper-class income since the elimination of legalized discrimination, poverty rates for black Americans still exceed the national average, and racial discrimination as a manifestation of attitudes remains embedded in the minds of many Americans. Arguably these facts fly in the face of his theory of cumulative causation.

DAVID W. HUGHES WEST VIRGINIA UNIVERSITY

WORLD POVERTY

Namibia

LOCATED IN SOUTHERN Africa and bordering on the south Atlantic, the Republic of Namibia has an abundance of natural resources that include diamonds, copper, uranium, gold, zinc, tin, silver, and tungsten, as well as suspected deposits of coal, oil, and iron ore. Mining accounts for one-fifth of Namibia's Gross Domestic Product. Namibia is the fourth largest exporter of nonfuel minerals in Africa and the fifth largest producer of uranium.

The World Bank classifies Namibia as a lower-mid-dle-income nation. Despite its potential wealth, half of Namibia's population lives below the poverty line and 35 percent are unemployed. Some 55.8 percent subsist on less than \$2 a day, and 34.9 percent survive on less than \$1 a day. Three-fourths of Namibians who experience extreme poverty live in rural areas that are dependent on subsistence agriculture for survival.

Vast inequalities exist among the people, with the poorest 20 percent holding only 1.4 percent of the country's wealth and the richest 20 percent sharing 78.7 percent of the country's resources. Namibia is ranked 70.7 on the Gini Index of Human Inequality. Less than one percent of Namibia's land is suitable for agricul-

ture, and the country has no permanent crops. Nevertheless 47 percent of the population are involved in subsistence agriculture. Periodic droughts make the lack of freshwater resources even more severe, causing Namibia to import approximately half of its cereal requirements. Namibian life expectancy is 43.93 years, and the median age is 19.79. Almost 39 percent of the population are under the age of 14, and 3.6 percent are over 65. Namibians have a 52.3 percent chance of not surviving until the age of 40.

Overall, Namibia suffers from many of the same problems that affect less affluent African countries, including low life expectancy, excessive mortality and death rates, low population and growth rates, and an out-of-control HIV/AIDS epidemic. In 2003 the prevalence rate for this disease reached 21.3 percent, and 210,000 Namibians were living with the disease and 16,000 had died.

Namibians also suffer from a high risk of food- and waterborne diseases that are common among the poorest countries of sub-Saharan Africa. Namibians are vulnerable to such diseases because 23 percent lack access to safe water and 59 percent lack access to adequate sanitation, Namibia has only 29 physicians for every 100,000 residents, and some 10 to 20 percent of the

population lack access to affordable lifesaving drugs. Infant mortality rates are high at 48.98 deaths for every 1,000 live births, but this rate is a decline from the 1990 rate of 65.

Among children under 5 years of age, deaths per 1,000 dropped from 84 in 1990 to 67 in 2002. Nearly one-fourth of all Namibian children are malnourished, as are 26 percent of children under the age of 5. Approximately 15 percent of all infants experience low birth weight, and five percent of children under 5 are severely malnourished. About 24 percent of this group suffer from moderate to severe stunting, and nine percent experience moderate to severe wasting.

Namibia has improved rates of infant immunizations against some diseases but fallen behind in others. Between 1992 and 2003, DPT immunizations for infants rose from 38 to 83 percent and polio immunizations increased from 79 to 82 percent. During that same period, however, infant immunization rates against measles declined from 77 to 68 percent and tuberculosis immunizations fell from 77 to 70 percent. In 2003, 70 percent of children between the ages of 12 and 23 months were immunized against measles and 82 percent were immunized against DPT3.

The overall fertility rate among Namibian women is 3.18 children. In 2003, women produced an overall average of 4.8 children, and adolescent mothers produced 100 out of every 1,000 births. Even though trained medical staff attend 77.7 percent of all births, maternal mortality is high at 300 deaths per 100,000 live births. Nevertheless this rate is a significant improvement over 1995 estimates of 370 per 100,000. Some 44 percent of all women and 29 percent of married women use contraceptives of some sort.

In 2003, literacy rates for Namibians over the age of 15 were reported at 84 percent. Most Namibian children attend school for at least 12 years. Between 1990 and 2000, the primary completion rate of females jumped from 80 to 98 percent, and the completion rate for males increased from 59 to 87 percent.

National Alliance to End Homelessness

THE NATIONAL ALLIANCE TO End Homelessness (NAEH) is a nonprofit organization with a mission to mobilize the private, public, and nonprofit sectors in America to create an alliance to end homelessness. The organization is based in Washington, D.C. It seeks to address what it sees as the root causes of homelessness and challenges the belief that homelessness is an inevitable by-product of the American way of life. This is guided by the NAEH's 10-year plan to end homelessness.

The plan notes that large-scale homelessness is a comparatively recent phenomenon in the United States; it was not until the 1980s that it really began as a result of decreasing affordable housing, the failure of wages at the lower end to keep pace with housing costs, and the decreased ability of families to afford essential services. Coupled with these factors have been social changes, such as the rise in use of illegal drugs and the increasing number of single-parent and teen-headed households, which it believes are groups more vulnerable to homelessness.

Further, the trend has been to move more people with mental health problems from health service accommodation into mainstream society, and this has created a new group of vulnerable people. Currently the Homeless Assistance Service is proving effective at helping people suffering from homelessness, but that very success has deflected attention from the need to improve those services that can prevent the problem permanently. Those services relate to areas such as foster child support, veterans' support, and mental health support. By focusing on these services, the supply of new homeless people must surely be significantly reduced. To this end the NAEH proposes four simultane-

Large-scale homelessness is a comparatively recent phenomenon in the United States; it was not until the 1980s that it really began as a result of decreasing affordable housing, the failure of wages at the lower end to keep pace with housing costs, and other factors.

ous steps that, it claims, if properly implemented, can end homelessness in 10 years. First, plan for outcomes: this entails collecting better data and then focusing on efforts to target services whose clients are, or may become, homeless. Second, close the front door: invest in programs that reduce the supply of new homeless people.

Third, open the back door: while most people pass through homelessness service comparatively quickly, there is a small group of people who are intensive and long-term users, perhaps by being chronically ill or chronically homeless. These people should be moved into permanent serviced housing as soon as possible to enable the homelessness services to continue with their work at full capacity.

Finally, build the infrastructure: this means providing more low-cost housing and linking the incomes of low-paid people to housing costs. While the demand

for housing exceeds the supply, there will always be homelessness and people vulnerable to homelessness through market operations. Homelessness is important because of the economic implications, which include the greater incidence of prison terms for people who are homeless, which are provided at great expense. Health treatment is also more expensive to administer, and children who are homeless find their education curtailed significantly and hence have much poorer career opportunities and lower productivity.

NAEH activities include the provision and dissemination of information about homelessness, provision of resources to help those involved with the issue, and policy formulation and advocacy. It also acts as a central exchange for various service providers to network and work together to create homelessness programs of various sorts. Major contributors include The Fannie Mae Foundation and the *New York Times*, as well as a wide

range of public- and private-sector bodies and individuals. In 2002 its revenue exceeded \$1.8 million, of which \$1.3 million was spent on research and education.

National Association for the Advancement of Colored People

THE NATIONAL ASSOCIATION FOR the Advancement of Colored People (NAACP) is a multiethnic civil organization that is aimed at ending segregation and discrimination against African Americans and fighting for their civil rights. Its major successes include the end of segregation in education and the public sphere, the passing of the Voting Rights Act in 1965, and the raising of consciousness internationally about the numerous, persistent, and pernicious forms of racism in modern life.

The mission of the NAACP is "to ensure the political, educational, social and economic equality of rights of all persons and to eliminate racial hatred and racial discrimination." It has a vision of a society "in which all individuals have equal rights and there is no racial hatred or racial discrimination."

The principal objectives of the NAACP are "to ensure the political, educational, social and economic equality of all citizens; to achieve equality of rights and eliminate race prejudice among the citizens of the United States; to remove all barriers of racial discrimination through democratic processes; to seek enactment and enforcement of federal, state and local laws securing civil rights; to inform the public of the adverse effects of racial discrimination and to seek its elimination; to educate persons as to their constitutional rights and to take all lawful action to secure the exercise thereof; and to take any other lawful action in furtherance of these objectives, consistent with the NAACP's

Articles of Incorporation and this Constitution." The NAACP was created in 1909 as a result of individuals and organizations joining together after answering "The Call," initially under the name of the National Negro Committee.

Founders included Ida Wells-Barnett, W.E.B. Du-Bois, Henry Moscowitz, and Mary White Ovington. A predecessor was the Niagara Movement, led by DuBois, which had met since 1905 with a view to discussing issues relevant to colored people in Canada, since the races were then segregated in the United States. The NAACP was initially involved with fighting the so-called Jim Crow laws—a set of legal statutes that varied in intensity and scope from state to state, but which regulated the access African Americans were given to public institutions and facilities, from buses to water fountains to enfranchisement.

These laws were most rigidly imposed in the southern states, largely to prevent freed slaves from enjoying any of the benefits of emancipation and ensure they remained of lower legal status than white people. Laws were backed not just by state legislatures but also by vigilante gangs such as the Ku Klux Klan, which took violent action against black people it accused of various crimes and misdemeanors, including lynchings. The 1915 D.W. Griffiths film *Birth of a Nation*, which glorified the Ku Klux Klan, among other racist sentiments, inspired the NAACP-led boycott, which raised the profile of the movement considerably.

In its early years, the NAACP faced intense opposition from many sectors of society. President Woodrow Wilson introduced segregation in the federal government in 1913 and refused for years to make any statement condemning lynching. During World War I (1914–18), African Americans were permitted for the first time to enter various industries that were suffering from labor shortages. This resulted in considerable resentment from white people also working in those industries, and many episodes of racially inspired violence were recorded, as well as the numerous unrecorded instances of casual racism that have continued throughout history.

One of the most notable incidents has become known as the East Saint Louis Race Riot of 1917, in which attacks by white workers on African-American workers led to the deaths of 40 African Americans and eight white people, as well as 6,000 African Americans being forced from their homes. The right for African Americans to live in nonsegregated housing had been won as the result of the *Buchanan v. Warley* law case, but the right was not generally accepted by many of the

white population. In the interwar years, the NAACP was active in civil resistance against racist organizations such as the Ku Klux Klan and the Daughters of the Revolution. Slowly, and on an individual basis, cases were brought to advance the rights of African Americans. In 1930 an eventually successful appeal against the racist Supreme Court nominee John Parker was launched.

In 1935 another case resulted in the admittance of an African-American student to the University of Maryland. During World War II (1939–45), the organization was again active in trying to ensure fair treatment for the races in employment. Persistence was required to ensure that measures, once passed by the government, were properly funded and enforced.

In 1946, the Morgan v. Virginia case resulted in the ending of segregation on interstate train and bus journeys. This was followed in 1955 by the arrest of NAACP member Rosa Parks for not yielding her seat on a segregated bus in Montgomery, Alabama. Parks's action gave rise to one of the largest-ever civil rights movement campaigns as various organizations united in the effort to end this type of discrimination.

Residential segregation and urban poverty still affect African Americans.

The campaign was expanded to take in public spaces such as lunch counters, and small victories were repeated across the country. However, the dangers were still extreme and, in addition to countless incidents of violence, Field Director Medgar Evers was assassinated in 1963. Nevertheless the 1963 Equal Employment Opportunities Act and the 1965 Voting Rights Act were both significant successes in the enforcement of equality.

With these successes achieved, focus has been switched to the defense of existing rights in the context of continual attempts to claw back equality by successive right-wing Supreme Court nominees and other electoral candidates. Voter registration drives have been used to educate people about the dangers that individuals and factions pose, and then to mobilize them to use their democratic rights to try to prevent their election. Growing influence of African Americans in the media, sport, and entertainment businesses has also provided another channel to educate and motivate society in injustice issues. The Fair Share Program enables partnership with corporate organizations, and this has been very successful in fundraising and investment. However,

efforts cannot relax, as the rise of youth violence, especially in urban areas, as well as family breakdowns and poverty, continues to afflict African Americans. The Stop the Violence, Start the Love campaign is aimed at tackling violent crime. The lack of federal response during the crisis caused by Hurricane Katrina in September 2005 in New Orleans revealed the degree to which residential segregation and urban poverty still affect African Americans.

The NAACP Disaster Relief Fund has been active in hurricane-affected areas, providing emergency assistance and reuniting families. Other divisions of the organization include Branch and Field Services, which is active throughout the country gathering information, conducting research and reporting to the board of directors. The Youth and College Department is involved with education, training, and development of young people.

The Legal Department is involved primarily with class-action suits that are relevant to the interests of the NAACP. The Washington Bureau was established in 1941 to lead the lobbying and legislative efforts. Overall the NAACP is active in a wide range of outreach and advocacy issues, including economic and social development, consciousness-raising and advocacy, as well as considering and bringing about legal changes in discrimination issues.

Inevitably, in a large and complex organization faced with numerous dangerous enemies, there have been episodes of controversy and dissatisfaction with the way the NAACP has been run. Nevertheless the NAACP stands out as one of the world's most important civil society organizations and its example has helped inspire the drive for equality and an end to discrimination around the world.

National Association for the Education of Young Children

THE NATIONAL ASSOCIATION FOR the Education of Young Children (NAEYC) is an organization of professional educators in the United States that is primarily concerned with establishing standards of education for young children under the age of 8. The NAEYC was initially established in the 1920s when Patty Smith Hill assembled, identified, and recruited a like-minded group of 25 professionals who were concerned about the proliferating number of nursery education institutions. They formed the National Association of Nursery Education (NANE) as a means of promoting recommended standards for education at that age range. Work continued during the next two decades and featured interaction with government programs such as the Lanham Act, introduced during World War II.

In the 1950s, organizational changes led to the possibility of affiliation with bodies around the United States and membership rapidly increased. The NANE was reorganized to become the NAEYC in 1964, when the federal Head Start program was also launched, and this led to further focus on the core issues with which the NAEYC was concerned. Growth in membership continued in subsequent years, and this led to the deepening and broadening of professional knowledge and competence.

In 2002, funding from the Doris Duke Charitable Foundation facilitated the launching of the Supporting Teachers, Strengthening Families initiative. The NAEYC Global Alliance was formed in 2003, in which international partners are sought who share common concerns and may jointly offer best-practice knowledge and methods to each other.

In 1985 the NAEYC created the first voluntary, national set of accreditation standards for nursery-level education. This program now covers the education of some 850,000 children throughout the country and represents a powerful way for parents to determine whether or not the institutions they are considering using are suitably accredited. A program of updating

the existing accreditation standards has been under way for several years, and is due to be implemented fully by 2006. The criteria for updating the accreditation standards are classified under 10 headings: relationships, curriculum, teaching, assessment of child progress, health, teachers, families, community relationships, physical environment, and leadership and management. These criteria reflect the need for educational institutions at all levels to be professional, modern organizations, responsive to their stakeholders and willing and able to communicate their vision for the future.

Recent research has highlighted the importance of early-years education in shaping lifetime potential for learning and achievement. For economic and social reasons, parents are increasingly required to ask other people to take care of and educate their young children. Lack of appropriate stimulation at this age is detrimental both to the child and, ultimately, to society.

It is important, therefore, for would-be educators to be aware of appropriate standards and methods and for parents to be made aware of and reassured of the quality of care that their children will receive. Conversely, the NAEYC works with educators in identifying possible areas of child abuse of various sorts and detailing appropriate forms of intervention where appropriate. The Supporting Teachers, Strengthening Families campaign has been particularly influential in this area.

National Campaign to Prevent Teen Pregnancy

THE NATIONAL CAMPAIGN TO Prevent Teen Pregnancy (NCPTP) is an American nonpartisan, non-profit organization largely funded by private donations. Its mission is to reduce the teen pregnancy rate in the United States by one-third between its founding date,

February 1996, and 2005. Teen pregnancies negatively affect teenage mothers (because of their reduced educational and life opportunities) and their wider communities, to whom some of the burden is passed in the form of taxation to meet required payments to support child-care and welfare. It is assumed that most teen pregnancies are unwanted or unplanned.

Teen pregnancy rates in the United States are higher than in other developed countries, where there are generally much more thorough and specific programs of sex education delivered through schools. However, teen pregnancy rates, as an international phenomenon, are considerably higher, resulting from low expectations, low income, and limited career opportunities and, especially, from the level of inequality. There is a tendency for pregnancy rates among young women to decline in any case as a result of economic growth and greater opportunities for women to work outside the home. Many women prefer to establish a career of their own before, or instead of, having children.

Modern America faces a particularly fierce controversy over teenage pregnancy and related issues that has arisen from the presence of religious beliefs in public policy. Many Americans believe that sexual abstinence not only is the best (perhaps only) way to combat unplanned pregnancies, but that there is a moral imperative for people to behave in this way. However, research shows that while mass-participation abstinence campaigns may be temporarily successful in postponing the commencement of sexual activity, when it does subsequently begin, the people involved, particularly women, are left vulnerable. They are less likely to use appropriate contraceptives, and hence the prevalence of unwanted pregnancies and sexually transmitted diseases remains.

Further, abstinence or faithfulness does little to protect those people whose legal or informal partners participate in risk-taking sexual activity. Again women are more vulnerable in these cases and are also far more likely to be required to participate in unwanted sexual activity, the effects of which are exacerbated by the lack of contraception. The NCPTP aims to circumvent these problems by focusing on pragmatic approaches, notably the Putting What Works to Work campaign. This includes a range of educational programs aimed at those considered to be at risk of unplanned pregnancies, such as younger siblings of those who have undergone an early pregnancy, and support for young mothers and children.

Other activities include forming partnerships with high-profile sporting and political personalities to endorse NCPTP policies, and having media personalities and shows portraying respected and popular characters assisting the program through words and deeds. Recent statistics suggest that teenage pregnancy rates in the U.S. are coming down, although NCPTP leaders stress there is still a long way to go.

National Coalition for the Homeless

THE NATIONAL Coalition for the Homeless (NCH) is an American charity based in Washington, D.C., with a mission to end homelessness. Its work is in the areas of housing justice, economic justice, healthcare justice, and civil rights. Its activities include public education, public advocacy, technical assistance, and grassroots organizing. The NCH produces educational material to assist teachers in educating children on issues relevant to homelessness and also researches and writes reports highlighting some of the startling features involved. The NCH has been recognized as one of the United States' top 100 charities, according to Worth magazine.

Under the heading of "housing justice," the NCH calls for a country in which "all people should have equal access to safe, decent, accessible, affordable, and permanent housing regardless of their unique needs or life circumstances." This is because "universal access to safe, decent, accessible, affordable, and permanent housing is a measure of a truly just society."

In terms of economic justice, the NCH calls for a Universal Living Wage, which is a campaign that calls for a situation in which all people who work a 40-hour week should be recompensed to an extent that means they will be able to afford decent housing. The Universal Living Wage is to be calculated on a single formula that links the minimum wage rate with the local cost of housing. Economic justice is also held to relate to the day wage (temporary labor) system, which, the NCH believes, is associated with homelessness because of the low levels of pay and security involved. It also believes that there is a significant and clear link between homelessness and health care justice: "Untreated disease and disability contribute to homelessness, are consequent to it, and present barriers to its ultimate end." As a consequence, the NCH is pursuing a range of public policies and practices that have these goals: "provide opportunities for people without homes to resolve or manage the health conditions that contribute to their lack of housing ... [and] establish a universal health care system."

It is clear that the NCH's ambitions extend beyond what some people consider to be the cause of homelessness and, hence, the confines within which a charity for the homeless should act. The NCH has adopted instead a holistic approach to the issue, its causes, and its potential remedies.

This is further seen in the NCH's approach to civil and voting rights, in which it is noted that "the civil rights of people experiencing homelessness are continually violated, whether it be by endangering their right to vote, by hate crimes committed against them, by denying children in homeless situations an equal right to education, and even by unjust laws making it illegal to be homeless."

The beliefs of the NCH are controversial and have been contested.

The NCH has been involved in voter registration drives in support of these beliefs. Various campaigns have been organized to educate people concerned about discrimination and violence against homeless people. All of these features and expertise are combined in the comprehensive Bringing America Home campaign. The NCH has particular expertise with respect to homelessness because many of its members and supporters have personal experience of the problem and are, therefore, well placed to understand and articulate the issues involved and their potential solutions. Nevertheless the beliefs of the NCH are controversial and have been contested by those who believe that homelessness is in-

evitable, the fault of the homeless person in some regard, or that no social change is required to end the problem.

The NCH is governed by a 38-person board and is funded by a combination of individual donations, foundation grants, telemarketing, the Combined Federal Campaign, and other sources. It is registered as a 501(c)(3) organization.

National Coalition of Barrios Unidos

THE NATIONAL COALITION OF Barrios Unidos (NCBU) (or United Neighborhoods) is a grassroots organization that aims to minimize the social problems and violence endemic in many neighborhoods of American cities that are heavily settled by people of Latin American descent.

American urban and residential systems mean that people of similar ethnicity are customarily clustered together. As a result, any social or economic problems faced by the people are multiplied. Youth crimes have been rising in the United States (although dependent on location and definition), while crime rates generally have been decreasing. These crimes are linked to a significant extent with gang membership and easy access to firearms and illegal narcotics. Chapters of the NCBU work locally, primarily with young people, to suppress violence by providing alternative opportunities. It aims to focus comprehensively and holistically on the causes and effects of violence and the gang culture among people aged between 7 and 21. The organization is based in Santa Cruz, California.

A series of citywide summits was established across affected American cities with a view to establishing truces among rival gang members and gaining commitment toward working with law enforcement officers and community leaders for a peaceful future. This was followed by a summit in Washington, D.C., at which city chapters could affirm their mutual goals and negotiate future plans. A principal leader of this movement has been Otilio Quintero, who began work at the age of 5 as a migrant farmer and who has subsequently graduated from the university and established a career of community youth service.

Programs offered by Barrios Unidos chapters include after-school supervisory services, provision of youth social group activities, presentations to families, schools and community organizations, direct intervention and counseling, street outreach and community cultural activities. These activities are concerned with building civic and cultural pride as much as prevention of illegal activities.

Former gang members take central roles in leading young people to avoid the attractions of gang membership, which are buttressed by economic and social inequality, lack of opportunity, and some irresponsible media coverage. The former members subscribe to the Warriors for Peace concept. The approach has found favor with other communities facing similar problems, especially among African Americans.

John Walsh Shinawatra University

National Coalition on Health Care

THE NATIONAL Coalition on Health Care (NCHC) is a nonprofit, nonpartisan alliance of more than 100 organizations that was formed in 1990 in order to try to secure better, more affordable healthcare for Americans, especially the poor. Member organizations include large and small businesses, labor and consumer rights groups, health and pension funds, and healthcare providers. Three former presidents, Jimmy Carter, Gerald Ford, and George Bush, are honorary cochairs of

the NCHC and other eminent people fill remaining executive roles. The NCHC is based in Washington, D.C.

According to the NCHC, three interconnected and intensifying trends affect the provision of healthcare in the United States: serious concerns about the quality of healthcare, its continuing rise in price, and the increasing number of Americans without health insurance. To address these issues, NCHC membership is united in supporting five guiding principles: health coverage for all, cost management, improvement of healthcare quality and safety, equitable financing, and simplified administration. Since the current healthcare system is so difficult to understand and appears to be inequitable, it has lost vital support in key constituencies and this has led both employers and employees to accept as sustainable loss of coverage for some.

However, this is not a sustainable position for a society that aspires towards equitable provision of healthcare services for all. The NCHC has called for rapid and systemic change in the health system, noting that the national debate in 1993–94, under President Bill Clinton, was unable to achieve consensus and the momentum may have dissipated, but that the need for reform did not decrease. Its report, "Building a Better Healthcare System: Specifications for Reform" (2004), observes that escalating healthcare costs have already sparked major labor disputes and are cited by many leading executives as being of significant concern in rising corporate costs. Healthcare expenditure is extremely high and projected to increase hugely under the current legal system.

Healthcare expenditure is much greater than that of other developed nations, though 15 percent of Americans have no coverage at all, a proportion believed to be increasing. Already in 2004, 47 percent of those uninsured had postponed seeking needed healthcare and 35 percent had been unable to obtain it at all. As demographic changes bring more senior citizens with longer life spans, the costs to be borne by the active labor market will continue to increase significantly. However, fewer people will be able to contribute to the labor market because of health concerns. It is, therefore, a vicious circle, and America already has higher infant mortality and lower life expectancy than many developed nations.

However, according to the NCHC, it is possible to reform the health system in a way that will produce massive savings. Reforms would entail "employer mandates (supplemented with individual mandates as necessary); expansion (and perhaps consolidation) of existing public programs that cover subsets of the uninsured (such as the State Children's Health Insurance Pro-

gram); creation of new programs targeted at subsets of the uninsured; establishment of a universal publicly financed program."

It is estimated that \$75 billion would be required for each of the first three years for this plan to succeed, which would prove to be a prudent investment as savings for employers would reach \$195 billion by year 10 of the plan.

National Conference for Community and Justice

THE NATIONAL CONFERENCE FOR Community and Justice (NCCJ) was established in 1927 as the National Conference of Christians and Jews and describes itself as "a human relations organization dedicated to fighting bias, bigotry and racism in America. NCCJ promotes understanding and respect among all races, religions and cultures through advocacy, conflict resolution and education."

This mission is inspired by a vision of America as being a great dream that yet remains unfulfilled: "The America we all believe in and have helped to build is still an imperfect place, in spite of great progress made in the past generation. Access and opportunity are not equal for all, and, as we imagine the equitable society we dream of, hard work, moral strength, and dedication to purpose are not yet the only requirements for fulfilling the American dream."

The NCCJ was originally an interfaith organization and, although it changed its name to the current, less religiously based one in the early 1990s, it maintains its strong links with religious belief. Since approximately 90 percent of Americans have some kind of connection to faith groups of one sort or another, faith leadership is considered to be uniquely well placed in developing closer intergroup relations: "Faith leadership is uniquely positioned to play a major role in the reconcil-

iation, healing, and building of communities as they address discrimination, bias, bigotry, stereotyping and racism across the divides of race, ethnicity, culture and faith within our society. Faith communities set a tone and spirit for attitudinal change and establish action programs and initiatives that result in behavioral change." In the organization's early years, the Tolerance Trio (Rabbi Morris S. Lazaron, Father John Ross, and the Reverend Everett R. Clinchy) traveled extensively across the nation raising awareness of issues and providing practical advocacy. This inspirational leadership continues in the 21st century.

The NCCJ now has more than 55 offices across the United States and has been recognized by many presidents of the United States. President Bill Clinton, for example, praised the NCCJ's initiatives as "contributions toward fulfilling our vision of one America." These initiatives have been innovative and important: for example, the study "The American Indian and the Media" demonstrated the problems facing American Indians in society through the common use of stereotyping in the popular media.

"Taking America's Pulse" highlighted the complexity underlying intergroup relations in the country and the challenges that face those who wish to improve them. Since the 1950s, the NCCJ has been offering residential youth leadership schemes that have achieved considerable success, and its workplace study institutions have led to improvements in opportunities for African Americans in business. Individuals who have helped break down racial barriers, such as baseball player Jackie Robinson, have become further known for their association with the NCCJ.

The Walk as One campaigns offer individuals the opportunity to demonstrate their commitment to the fight to end racism. Many of the other programs offered by the NCCJ are rooted in the desire to empower people working together, to inspire institutional change where this is deleterious to harmonious intergroup relations, and to help dismantle structural barriers to those relations.

National Education Association

THE NATIONAL EDUCATION Association (NEA) is a voluntary, professional organization of teachers and educators based in the United States, with headquarters in Washington, D.C. The NEA's origins date to the 1857 formation of the National Teacher's Association, which subsequently merged with the American Normal School Association and the National Association of School Superintendents. With some 2.7 million members, the NEA is believed to be the world's largest professional organization. Rapid growth in membership was sparked by the adoption in 1921 of a representative national assembly. The NEA is involved in a partnership with another large educational labor union, the American Federation of Teachers, although both remain separate organizations.

The 1857 mission was "to elevate the character and advance the interests of the profession of teaching and to promote the cause of popular education in the United States." In the 150 years since then, its functions and activities have changed dramatically, but the current mission reflects the original vision: "To fulfill the promise of a democratic society, the National Education Association shall promote the cause of quality public education and advance the profession of education; expand the rights and further the interest of educational employees; and advocate human, civil, and economic rights for all."

With such a large membership and wide range of interests, it is not surprising that the range of activities pursued by the NEA is complex. At the local level, affiliate organizations and individuals provide workshops and share information as well as raise funds for educational purposes. At the state level, the NEA is involved in lobbying to obtain best possible resources, improving professional standards, and filing legal suits to protect academic freedoms and rights of educators. At the national level, the NEA lobbies Congress, works with other educational organizations in formulating policy and sharing research, and provides training and educa-

tion throughout the country. The NEA also works internationally by fostering networks among educators and institutions.

The NEA has been periodically embroiled in controversy throughout its long history. This is not surprising because opinions have always differed about the appropriate nature and style of education, the role of labor unions, and the optimal organization of schools and colleges. More recently the NEA has registered its support for Democratic presidential candidates and has been attacked by Republican politicians for having a partisan stance. This has colored coverage of the organization in the popular media, which sometimes follows a partisan agenda.

NO CHILD LEFT BEHIND

The newly elected President George W. Bush passed the No Child Left Behind Act of 2001, and its provisions formed the basis of his campaign promises on education. The act is complex and extends to 670 pages. However, its main provisions are challenged by the NEA, which argues that the act's insistence on rigid, heavily bureaucratic, and standardized testing procedures and ideology is inappropriate for all contexts.

NEA opposition is stimulated by the act's insistence on "punishments rather than assistance, rigid, unfunded mandates rather than support for proven practices and bureaucracy and standardized testing rather than teacher-led, classroom focused solutions." Standardized mandatory testing leads to success for well-motivated and supported students, and to failure for pupils who do not have access to support and adequate resources. It also forces teachers to concentrate their efforts on trying to ensure that students will pass the test rather than learn more deeply or about subjects more relevant to the contexts in which the students live.

The NEA plans to use member empowerment, mass public awareness, and lobbying to effect changes in the act. Its goals are to "Continue as the leading advocate for high standards and strong accountability in public education at the state and local levels; pursue flexibility that supports student learning; increase support for teacher quality programs to recruit, train, and retain highly qualified educators for America's classrooms; make sure students, teachers, and schools are evaluated by more than just test scores; provide parents and policymakers information that helps get at the causes of school failure, not just the effects; fully fund successful elementary and secondary education programs such as Title I to help children with math and

reading; and make struggling students and schools a priority."

Since teachers are customarily college-educated and engaged with diversity, they tend to be more progressive in thought and have an understanding and appreciation of the scientific method and intellectual discourse that have brought them into conflict with ideologically bound legislators, as in the case of this act. A similar case exists with vouchers, which are proposed by some as a market-driven solution to the need to provide choice to parents of which private-sector school they wish their children to attend in preference to the assigned public-sector school.

The NEA maintains that, first of all, the debate about vouchers is a smokescreen to prevent public debate on the need to raise expenditure on education generally (which would probably require reversing recent tax cuts) and, second, that it is a means of subsidizing religious activity, since the great majority of private-sector schools are faith-based. Streaming children according to religion leads to social segregation and social tensions.

National Fatherhood Initiative

THE NATIONAL Fatherhood Initiative (NFI) was created in 1994 to lead a societywide movement (in the United States) to challenge the issue of father absence—that is, the problems caused when fathers are not living with their families. These problems include those relating to low income, but also higher tendencies for failing at school and in society and lack of positive role models, thereby leading to repeated father absence

in subsequent generations. Problems do not affect everyone in this group but arise mostly through lack of resources, including time and the ability to deploy parenting skills, although some people also attribute moral failings to people suffering from these practical issues. Father absence is, therefore, an issue disproportionately affecting the poor and those in vulnerable groups. It has been estimated that as many as 40 percent of American children do not live with their fathers.

The NFI's mission is "to improve the well being of children by increasing the proportion of children growing up with involved, responsible, and committed fathers." To achieve this, the NFI is involved with "Educating and inspiring all Americans, especially fathers, through public awareness campaigns, research, and other resources. Equipping and developing leaders of national, state, and community fatherhood initiatives through curricula, training, and technical assistance. Engaging every sector of society through strategic alliances and partnerships."

As many as 40 percent of American children do not live with their fathers.

The NFI was born as a result of dialogue held by prominent thinkers such as Don Eberly, Wade F. Horn, and David Blankenhorn, who have subsequently led the NFI. In 2001, Eberly and Horn left the NFI to join the administration of George W. Bush, and Roland C. Warren was named the new president of the NFI. A major sponsor of the NFI is the Scaife Family Foundation, which is an organization that supports pro-family schemes from a conservative perspective. However, the issue of reuniting families with fathers has broad political support as a whole, and the Million Man March of October 1995 showed the issue to be one touching the national sensibility.

The NFI has achieved an admirable record of attracting sponsorship in media channels and of creating national advertising campaigns such as the "Moments" campaign, showing shared moments between fathers and children, and the "Golden Dads" campaign. More practical assistance is also offered through outreach activities and in researching ways to make families and marriages more stable. These ideas resonate with the agenda of many faith-based organizations as well.

National Interfaith Committee for Worker Justice

THE NATIONAL Interfaith Committee for Worker Justice (NICWJ) is a network of 37 local American committees promoting workplace issues. It unites faith-based organizations with labor unions and other representatives of workers. Religious principles inform the NICWJ's approach to economic justice and lessons are drawn from religious scriptures to show that "Work is sacred. Workers should be treated with dignity and respect. Workers should be paid fairly and on time—Community members should take care of one another—Leaders should be elected who are honest and have good standing in the community."

Consequently it is necessary for those with faith to have an interest in economic justice and to act to maintain work standards and improve living standards. The NICWI was founded in 1996 by Kim Bobo to mobilize and educate the religious organizations of the United States concerning workplace issues. It was funded by private and organizational donations as well as by religious and labor organizations, to equal extents. A total of 45 religious leaders form the governing board. Initial projects included the Religious Employers Project (REP) and the Poultry Workers' Justice Project, which aims to improve working conditions for the approximately 200,000 poultry workers, which are often deplorable and exacerbated by the fact that many such workers are newly arrived migrants lacking the skills to obtain their rights. The REP aimed to reduce tensions between religious organization-owned healthcare providers and labor unions.

The NICWJ has been reconstituted as Interfaith Worker Justice (IWJ) with the same aims and with head-quarters in Chicago, Illinois. It protects workers' rights and builds relationships between the religious and labor sides of IWJ, since the relationship between the two has not always been harmonious. IWJ also develops resources, engages with religious employers, organizes local interfaith workers' committees, continues to sup-

port poultry workers, and supports direct-care workers, since this is a sector characterized by low-pay, poor and often unsafe conditions, and extensive working hours. IWJ has been developing partnerships with the Department of Labor (DOL) at local and state levels in order to inform workers about their rights and the law, to help train advocates in the workplace, and to create secure places in which workers can bring grievances to the DOL.

In May 2005 a national conference was convened by IWJ to bring together and establish relationships among religious and workers' support groups and to exchange information and resources for better future cooperation. Current campaigns include raising the minimum wage and the promotion of the Employee Free Choice Act, which would give workers the opportunity effectively to create a labor union when a democratic decision is made to create one. This is increasingly necessary for workers in an environment in which globalization, outsourcing, and restrictions on free speech and political debate are all used to reduce workplace security and representation.

JOHN WALSH SHINAWATRA UNIVERSITY

National Low-Income Housing Coalition

THE NATIONAL LOW-INCOME Housing Coalition (NLIHC) is a membership advocacy and research organization "dedicated solely to solving America's affordable housing crisis." The National Coalition for the

Homeless (NCH) estimated in 2003 that more than 14 million Americans faced "critical housing conditions, that housing relief could make the difference between housing security and insecurity but that demand exceeded supply, while housing rentals were increasing at a rate greatly outstripping rises in earnings." As a result, it is clear that the need for affordable housing will increase in the future and that it will vary in intensity across the country.

The NLIHC was established in 1974 to address the affordable housing issue through advocacy, research and dissemination of information, and organization of concerned individuals and groups to help further the policy agenda. The NLIHC's founder and chair emeritus, Cushing N. Dolbeare, died in March 2005. A new structure to the organization was introduced in 2005, reflecting changes in legislation and the economy affecting affordable housing issues.

The NLIHC is a membership organization that includes nonprofit housing providers, homeless service providers, fair housing organizations, state and local housing coalitions, public housing agencies, private developers and property owners, housing researchers, local and state government agencies, faith-based organizations, residents of public and assisted housing and their organizations, and concerned citizens.

The federal government has stated that people spending 30 percent or more of their income on housing are "cost-burdened"—that is, paying more than they can afford to pay on a sustainable basis. NLIHC research has revealed that almost half of people renting accommodations in the United States' biggest cities and counties are spending more than 30 percent on housing, and that the problem is worsening. This is partly the result of low interest rates, which have enabled many more people to enter the home-owning market, and those who remain renting are comparatively less well off than those who have left it.

Further, family breakdowns leading to renting are also frequently associated with reduced incomes. Low-income people facing housing insecurity are also disproportionately likely to be members of the ethnic minority and vulnerable groups.

The NLIHC is composed of four main policy areas, each of which is addressed through NLIHC members of the corresponding policy committees: resident issues, production, saving housing resources, and housing plus services. Committees also take into account the crossarea issues of fair housing, homelessness, rural housing, and choice of tenancy. In terms of research, the NLIHC has five overarching policy goals:

- 1) The general public will have improved knowledge of low-income housing issues and will increase its support for progressive low-income housing policy.
- 2) Low-income housing will be a priority issue on the federal political agenda.
- 3) There will be a decrease in the loss of federally assisted housing.
- 4) There will be an increase in federal investment in low-income housing.
- 5) More low-income people will be engaged in self-advocacy on housing issues.

Since low incomes, lack of housing security, and low voter turnouts tend to be positively correlated, issues related to affordable housing often receives less attention in the public arena. Further, issues affecting affordable housing are often of considerable complexity and the effects may be second order in nature and, hence, neither immediately obvious nor amenable to a simple sound bite or slogan.

National Poverty Center

IN 1964 PRESIDENT LYNDON Johnson declared the War on Poverty. The establishment of a national poverty center was part of that effort. Much like the National Institutes of Health (NIH), which conducts and sponsors health research, the National Poverty Center (NPC) is a federally sponsored research center designed to conduct and support research that can be used to help the nation understand the causes and effects of poverty and to inform policymaking.

Unlike the NIH, the National Poverty Center has always been located at a nationally prominent research university, and the center receives financial support from its host institution to complement the funds received by the federal government. The university location allows the center to assemble renowned scholars

from many different disciplines—which is important because poverty is a multifaceted social problem—all while operating in a nonpartisan fashion and free from political influence.

This government-sponsored center was located at the University of Michigan in Ann Arbor, Michigan, in 2005, with Dr. Rebecca Blank, dean of the Gerald Ford School of Public Policy, and Dr. Sheldon Danziger, the Henry J. Meyer Collegiate Professor of Public Policy, serving as codirectors.

When the U.S. federal government declared the War on Poverty, the Office of Economic Opportunity (OEO) was assigned primary responsibility for carrying out Johnson's poverty-related initiatives. In 1966 the OEO determined that it would be useful for the nation to have a center where experts could perform basic research on the nature, causes, and consequences of poverty in the United States, along with research examining ways the nation might reduce poverty.

This unbiased, nonpartisan, innovative research could then be used to shape and evaluate policies designed to fight poverty. The OEO and the University of Wisconsin, Madison, joined forces in 1966 to create the first center, located at the newly created Institute for Research on Poverty (IRP) at the University of Wisconsin.

The University of Wisconsin was a natural choice because many of its faculty members, particularly those in the fields of economics and sociology, had a long tradition of conducting applied social policy research. Several had served in advisory roles for the federal government when the government's antipoverty strategies were being crafted. Dr. Robert Lapman, a professor in the University of Wisconsin's economics department who had once worked for the Council of Economic Advisors, became the first interim director of the institute.

While many researchers, government officials, and community activists working to battle poverty in the 1960s may have hoped that the War on Poverty would be swift and decisive, the problems of poverty in the United States persist today, and the federal government continues to sponsor research through a university-based research institute for this reason. The OEO was eliminated in 1973, and many of its research responsibilities and functions were transferred to the U.S. Department of Health and Human Services (HHS). The HHS Office of the Assistant Secretary for Planning and Evaluation (ASPE) currently has the task of overseeing funding for the National Poverty Center.

While much of the funding authority for the federal government's involvement in sponsoring poverty

research remains tied to Section 1110 of the Social Security Act, the government has modified the way it provides its sponsorship for poverty research over the years. In 1996 the Joint Center for Poverty Research, maintained by both the University of Chicago and Northwestern University, joined IRP as a nationally sponsored site for conducting poverty research. From 1996 to 2002 there were therefore two national poverty centers.

Poverty is obdurate and the challenges it poses are constantly changing.

In 2002 more changes came. After a competitive selection process, ASPE awarded funding to a new site, and the federally sponsored research center moved to the University of Michigan's Gerald R. Ford School of Public Policy. ASPE also authorized the creation of three Area Poverty Centers, charged with the task of specializing in poverty issues specific to local regions of the country. IRP became one of the government-sponsored Area Poverty Research Centers at this time. It was joined by the University of Missouri's Rural Poverty Research Center (RPRC), which focuses on the unique characteristics of rural poverty, and by the University of Kentucky's Center for Poverty Research (UKCPR), which specializes in issues related to poverty in the south, where rates of poverty and participation in public assistance programs are highest.

The current center at the University of Michigan, which is the first to use the moniker "National Poverty Center," is jointly funded by ASPE and the University of Michigan. The NPC combines a diverse group of multidisciplinary experts on poverty research and practice, including faculty from the university's School of Public Policy, its School of Public Health, the School of Social Work, the School of Education, and the departments of economics and sociology.

Its mission is to sponsor research on policy-related topics, to disseminate researchers' results to the wider academic and policy communities, and to train a new generation of poverty scholars and practitioners. Pursuant to these objectives, the NPC offers grants to researchers to support path breaking and innovative work. It sponsors conferences to bring researchers together to discuss the problem of poverty in the United States, and it offers special programs for young scholars. In many ways the NPC can be viewed as an incubator for ideas and a cultivator of talent.

Poverty is obdurate and the challenges it poses are constantly changing. Dynamic labor markets, industrial shifts, migration patterns, and globalization all affect the forms that poverty takes and the specific problems that it presents to populations and regions that suffer through it. The NPC ensures that the nation's best minds are tapped to battle poverty.

NGINA CHITEJI, PH.D. SKIDMORE COLLEGE

National Research Council

THE NATIONAL RESEARCH Council is a part of the National Academies. These consist of the National Academy of Sciences, the National Academy of Engineering, and the Institute of Medicine. All of the National Academies are private, nonprofit organizations. The U.S. Congress chartered them as private organizations that could be advisers on science, technology, and health policies considered or reviewed after adoption.

The National Research Council was organized in 1916 by the National Academy of Sciences in order to network the wide-ranging groups and individuals working in pure science or in technological fields. In addition, the National Academy of Sciences has the goal of advancing knowledge as well as advising the government of the United States.

Over the decades of its operation, the National Research Council has become the chief operating agency for the National Academy of Sciences and the National Academy of Engineering. The council works under the direction of general policies adopted by the academy. It is administered jointly by the Academies of Science and of Engineering, and also by the Institute of Medicine through the National Research Council Governing Board.

In 1990 a congressional committee asked the National Academy of Sciences/National Research Council to conduct a study of the official U.S. poverty measure. The study was conducted with the view that reforms may be necessary. Mollie Orshansky developed the official measure in 1963, and it was still in use in 1995. Her original intention was not to develop a measurement of poverty but to measure the relative risks of low economic status. Her measurement was derived from the Agriculture Department's economy food plan. The measurement was named the poverty threshold and it was used thereafter, despite its problems.

In June 1992 the Committee on National Statistics of the National Research Council appointed a panel to study the old poverty measurement. It was a two-part study. The first part examined the statistical issues that arise from attempts to measure and understand poverty. The second part was concerned with issues that might arise if a national minimum welfare benefit were established.

The new measure to be used in the future would continue to define poverty as economic deprivation. However, instead of deriving poverty thresholds by means of a food plan and a multiplier, the panel proposed a poverty threshold that would be a budget combined with an allowance for food, clothing, shelter, and additional sums for other miscellaneous needs. Using a reference family (two adults and two children) as a touchstone, the panel set a reasonable range for a median annual expenditure for these items as guided by the Consumer Expenditure Survey.

The panel's report was published in 1995. The report proposed that the Survey of Income and Program Participation should become the basis of the official United States income and poverty statistics, in place of the March income supplement to the Current Population Survey.

Under the proposed measure and using 1992 figures, the panel said a reasonable range for the poverty threshold would be \$13,700 to \$15,900 (in 1992 dollars) for a family of two adults and two children. This figure does not differ dramatically from the 1992 poverty line of \$14,228, but the new method calculates family resources very differently.

Natural Disasters

WHEN HURRICANE KATRINA struck the U.S. Gulf coast on August 29, 2005, the resulting floods in downtown New Orleans, Louisiana, and raised some disturbing questions about the roles of race and poverty in disaster-relief efforts. With television images of poor African American families stranded on rooftops, pleading for help, officials in Washington, D.C., and Americans in the rest of the country suddenly realized that New Orleans evacuation orders had a decidedly financial aspect to them. Those who could afford to escape the ravaging waters did, while those with few resources and transportation alternatives were left behind.

The fact that city, state, and federal agencies were first negligent to provide transportation for poor evacuees, and then subsequently slow to respond to help those left behind, posed an ethical question: would the situation have been the same if the unanswered pleas for help came from the wealthier white suburbs?

Analysts, scholars, the press, and government agencies will debate this question for years to come. As the Center on Budget and Policy Priorities points out: "Many Hurricane Katrina victims faced difficult living conditions even before the storm arrived. Mississippi, Louisiana, and Alabama are, respectively, the first, second, and eighth poorest states in the nation. And of the 5.8 million individuals in these states who lived in the areas struck hardest by the hurricane, more than one million lived in poverty prior to the hurricane's onset."

Hurricane Katrina and other natural disasters clearly illustrate how poverty plays a role in disaster relief. In the more academic sense, we can examine the terms and conditions of poverty and natural catastrophes. Natural hazards and disasters are classified into a range of major categories: atmospheric (hurricanes, windstorms, tornadoes, heat waves, droughts), hydrological (floods, snow avalanches), geological and geomorphological (earthquakes, volcanic eruptions, tsunamis, landslides, erosion), and biological (human epidemics, pests, wildfires).

The dimension of the disaster is a key element for public awareness, since media, converging with policy options, usually draw more attention to rapid-onset extreme events for their dramatic nature, and less to slow-acting or biological processes like epidemics, famine, drought, or soil erosion, which have midterm effects, concealed victims, and extended environmental degradation.

The exposure of populated areas to hazardous events may threaten inhabitants, functions, and goods and generates risk. Risk is a measure of the probable impact and the subsequent economic and noneconomic losses. It is a concept intrinsically connected to civilization, since change itself is normal to natural environments. An impact is an incidental interaction between a hazard, initiated in the natural system, and an exposed vulnerable set of persons, goods, functions, or resources within the human system. If an extreme event hits an unpopulated or undeveloped area, the effect on society is null, while slight rapid changes in a populated area do not commonly have a negative effect.

Those with few resources and transportation alternatives were left behind.

The disaster is the substantiation of a risk, a disruption of the social functioning produced by an extensive loss as a result of a hazardous event. Hazard is potentiality, risk is probability, and disaster is factuality.

Various effects—economic, social, institutional, environmental—and levels of impact are observable in a disaster. Criteria are needed to differentiate it from lower-energy accidents, and the principle used is the magnitude of the loss. However, there is no universal agreement regarding the criteria. The number of casualties, deaths and injured, and a specified economic loss are used as thresholds, despite their use and application being arguable. This allows attribution of administrative responsibility or financial liability, and the determination of whether the loss will be covered by individuals, insurance companies, administrations, or nongovernmental organizations. Common criteria applied to drought as a disaster are looser, requiring a larger number of people affected, and even some exclude drought victims from ordinary natural disaster

The differentiation between disaster and catastrophe is likewise weak, again a matter of dimension. A country or a community recovers from a disaster with

A flooded section of New Orleans after Hurricane Katrina breached the city's levees in 2005. How the city, state, and federal governments reacted to the crisis came under scrutiny after thousands of poor residents were left stranded.

resources of its own, at variable costs with or without aid, but the magnitude of a catastrophe reaches a point that domestic resources are not enough to cope with response and recovery, and large external assistance is needed. Losses are enormous and critical, for there is a general devastation of buildings and infrastructures, emergency facilities are not operational, administration is dismantled, and everyday life is interrupted. This was the case with Hurricane Mitch in 1998 in Honduras.

The effects of a disaster are as complex as the causes, and their magnitude is measured as damage severity. Primary effects on people are loss of life, injury, and handicap; damage or destruction of resources, property, and built heritage; and disruption of production, commerce, transport, lifelines, and services. Secondary damages are derived from secondary hazards; urban fires may follow the destruction caused by an earthquake. Tertiary damages or aftershocks are derived from primary effects, but are not directly connected to

the hazard energy, as they are effects caused by vulnerability and insufficient preparedness. Social functions are interrupted, causing starvation, illness, unemployment, social violence, displacement and migration, disruption of the employment market, and inflation.

Losses increase the vulnerability of the previously vulnerable to diseases, debt, or homelessness. Side effects observable in demography are a decline in fertility and people displacement as a result of panic and the loss of resources, although there is a contradictory effect from the return to former homes.

The effects of a disaster in developing and developed countries are significantly different. While in developed countries more commodities are at risk, in developing countries more people are at risk. In the first case the major impact is economic, for example, the Kobe (Japan) earthquake in 1995 caused estimated damage of \$150 billion, the most costly disaster in the 20th century. In the developing world the two most

deadly events were the Bangladesh cyclone in 1970 with 300,000 fatalities, and the Tangshan (China) earthquake in 1976 with 250,000 victims. Again in Third World countries, the Indian Ocean tsunami in 2004 caused an estimated 275,000 deaths.

The impact of natural disasters is increasing, regardless of better measurement and the thresholds applied, for there is a growth in world population. This is at a higher rate in developing countries and particularly in urban areas, as a result of migration from rural areas. Population and affluence growth demand more land, and the pressure on more vulnerable and marginal areas increases. Affluence and economic growth increase the value of the exposed properties, principally in wealthy regions.

Social and economic vulnerabilities depend on the income, social class, age, sex, ethnicity, or minority of the individual or household. Individual and collective disadvantages result in incidental or structural weakness, reducing opportunities to access resources. Casualties in earthquakes principally happen in community buildings and homes, where commonly deaths are women, children, and the elderly, although they are also dependent on other factors like the time of the day.

Poor people are more vulnerable for they lack resources to contend with every phase of the risk process. Largely they dwell in hazard-prone areas, as they are landless and invade vulnerable areas. They do not get ample information for they do not easily reach media, they are not integrated in the risk preparedness system, and their low education level conditions their perception of the environmental threats. Evacuation is a challenge because of the reduced mobility of the young, the elderly and the impaired, and the families in general who do not own vehicles, which makes them dependent on public transportation and services to leave the areas in emergency situations.

Also, natural disasters have become an additional factor restraining development in developing countries because the structural human and economic costs of response and recovery delay the effects of investments.

U. Fra Paleo University of Extremadura

Nauru

THE REPUBLIC OF NAURU is the smallest independent republic in the world. Formerly administered by Australia as a United Nations Trust Territory of the Pacific Islands, Nauru became independent in 1968. Over time a multinational consortium virtually destroyed the ecology of Nauru through phosphate mining. As a result, much of the island is now a wasteland. Although Nauru has a per capita annual income of \$5,000, 90 percent of the people on the island are unemployed. The 10 percent who are employed are engaged in public administration, phosphate mining, education, and transportation.

Nauru is dependent on the \$2.5 million Australian that will be received annually until 2013 in response to a judgment by the International Court of Justice for damage done to the island through phosphate mining. Additionally New Zealand and the United Kingdom settled by offering one time payments of \$12 million each.

When officials realized that incomes from phosphate mining were diminishing, they placed phosphate income into trust funds. Subsequent borrowing from those trusts, however, forced the government into virtual bankruptcy. As a result, wages are frozen, government staffs have been downsized, public agencies have been privatized, and overseas consulates have closed. All public sectors, including housing, hospitals, and schools, have been affected by the shortage of funds. Nauru is placing hopes for economic recovery on attracting offshore banks and corporations to the island.

No poverty rate is available for Nauru, and there are no indications that absolute poverty exists. The United Nations Human Development Report does not rank Nauru as it lacks data. Since the Nauruan government has traditionally employed 95 percent of the labor force, downsizing has created an environment in which incomes are diminished or totally absent. With a population that possesses few job opportunities, limited skills, and low levels of education, the result has been a 90 percent unemployment rate. Fortunately Nauruans have a strong social net made up of closely knit families and a supportive culture.

NCH

NCH IS ONE OF THE United Kingdom's leading children's charities, whose aim is to help children reach their full potential. Unusual for a children's charity, NCH works with children and families across a range of issues. More than 500 projects are spread across the United Kingdom, aimed at supporting the most vulnerable and excluded children and young people.

The organization began in 1869 as a small children's home founded by a Methodist minister, Thomas Stephenson. Children who were unable to stay with their families at this time were usually admitted to large-scale institutions. Thus a more family-oriented system of care was unique. This style of care grew, and the National Children's Home and Orphanage was created in 1908. Throughout the early 1900s the charity also began to place children into foster families, and subsequently became an adoption agency as well. Diversifying even further, in the latter half of the 20th century NCH worked with children who had experienced abuse and children with disabilities, issues that are still a main focus of NCH work.

Placing children with families remains a major part of NCH work. Both adoption and foster care are provided through the organization. In 1997 a new fostering program called the Community Alternative Placement Scheme (CAPS) was created by NCH in Scotland. The scheme aimed to place young people with caregivers as an alternative to being placed in secure accommodations. Specialist training, regular respite, and 24-hour intensive support were given to caregivers as well as increased remuneration. M. Walker et al. studied 20 young people in an independent evaluation. Results showed that those taking part in the program found it beneficial, with those having spent at least a year with their caregiver or having built a good relationship gaining the most.

Young people emphasized benefits to their well-being or self-esteem, whereas a comparison sample in secure accommodations who felt they benefited from their stay emphasized being kept safe. A total of 16 young people in the study sample remained in the community, leaving only four who were transferred to institutional care. However, young people who had withdrawn from the service early or abruptly were found to live in less stable accommodations, such as homeless providers.

Children and young people are also vulnerable to social exclusion for a variety of reasons. One large risk factor for this group of people is the experience of local authority care. Research shows that those who left their caregivers gained substantially fewer qualifications at school and had much higher rates of unemployment.

In Scotland, six out of 10 16-to 17-year-olds leaving care had no qualifications. While the Children (Leaving Care) Act of 2000 has had positive impacts on creating systems to support young people as they reintegrate into communities, for many children further educational support is needed before this point. NCH argues that underachievement for this group is not for lack of ability, but a failure of existing systems, with more attention needed by all providers to raise expectations and level of care.

NCH is also the biggest service provider in the United Kingdom to disabled children and young people. Projects are diverse, covering residential and daycare services, special play facilities, and short family holidays, as well as advice, advocacy, and outreach support. Caerphilly Children's Centre in Wales facilitates medical support such as physiotherapy and occupational therapy as well as social care. Young people are supported in accessing facilities in the community, including local groups or clubs or even a volunteering

family. Respite and advice are also given to family members who have their own support group as well as respite time. While supporting 140,000 children and families across the United Kingdom, NCH also campaigns and lobbies for the safety and inclusion of young people across all its areas of work.

Needs

NEEDS ARE UNIVERSAL requirements necessary for survival, development, and well-being of a living organism. Needs are different from wants and desires. Needs are objective and innate, and desires are subjective and acquired. The concept of need has a long and recognized history in the field of psychology. The field of business management also has a large literature on this topic. H.A. Murray describes needs as driving forces that motivate an individual to action (that is, to search for or avoid). Needs "organize perception, apperception, intellectualization, and action." According to Murray, for an individual who is extremely hungry, for example, "he dreams food, remembers food. ... he perceives only food, and he wants only food."

Numerous ways have been proposed to organize the nearly exhaustive list of potential human needs. Basic needs are classified by P.J. Richards and A.M. Thomson as 1) minimum requirements of an individual or family such as food, shelter, clothing, and home equipment, or 2) essential services for the community such as safe water, sanitation, and transportation. Abraham Maslow proposed fundamental need categories necessary to sustain life and facilitate development.

His popular Theory of Needs is composed of five broad need categories that are central to human experience and motivation of behavior. Based primarily on his clinical experience, Maslow asserted that individuals show a pattern of needs organized into a hierarchy. The need categories include (in ascending order): 1) physiological, 2) safety and security, 3) belongingness and love, 4) self-esteem, and 5) self-actualization. Lower-order needs includes physiological and safety/security needs. Higher-order needs include belongingness and love, esteem, and self-actualization. Individuals attempt first to satisfy lower-order needs that are not yet satisfied. With relative gratification of needs (such as satisfaction), higher-order needs move to the forefront and the prior, now satisfied needs, become less important. Current unsatisfied needs dominate an individual's focus and influence behavior. Maslow's need categories have been widely accepted as a logical framework to understand behavior. Limited empirical data are available to support the hierarchical nature of the need categories.

Physiological needs are the most basic and are vital for survival. Examples of physiological needs include food, water, rest, shelter, school supplies, laundry needs, transportation, and money. In rural settings, having enough to eat all year round and having a good harvest are basic needs.

Most people consider medical care a basic need. The "body is poor people's main asset" and poor health brings further economic difficulty, according to D. Narayan et al. Safety and security needs involve aspects of physical safety, job and economic security, and emotional security. Examples include a safe neighborhood, availability of assistance in crisis, job tenure, home insurance, and satisfaction with pay. Love and belongingness needs include valued involvement, fit within a compatible social system, and meaningful caring bond(s) with another.

Satisfaction of these needs results in an individual feeling accepted, loved, and part of a social organization. Self-esteem needs involve an individual's appraisal about all aspects of self based on internal and external sources. Self-esteem involves self-acceptance and self-worth. Self-actualization needs involve the expression of one's individual potential. Self-actualization is manifested in altruism, creativity, openness to new experience, and inner-directedness.

POVERTY AND NEEDS

Poverty involves basic needs, primarily unsatisfied needs. Poverty is most often viewed as material lack, such as a lack of food or housing. Yet reports by people in poverty and support from theoretical need frameworks, such as Maslow's theory, illustrate an array of needs potentially lacking in conditions of poverty.

Safety and security needs may be jeopardized with the presence of physical threat, family chaos, job termination, or debt accumulation. Many in poverty experience uncertainty and insecurity with violence, corruption, wars, and natural disasters around them. Love and belongingness needs can be thwarted by social experiences that result in feelings of shame, worthlessness, and humiliation.

A process called "othering" reflects a lack of belonging and a "we versus them" experience. Loneliness, stigma, and alienation pull individuals in poverty down. An individual from Ghana quoted by D. Narayan et al. described how "it is neither leprosy nor poverty which kills the leper, but loneliness."

POVERTY CRITERIA USING BASIC NEEDS

Poverty policy debates continue, primarily centered on how to measure poverty most accurately. The poverty line in the United States is a fixed income amount (adjusted yearly for inflation) that reflects a basic survival budget (food and a percentage added), according to the Canadian Council on Social Development. Household income level alone is a poor measure of poverty and how families or individuals manage and meet basic needs. Traditional measures of poverty (such as an income cutoff adjusted for family size) have been extensively criticized.

Growing discontent exists with current measures of poverty.

Many sources charge that official measures of poverty in the United States are outdated and insufficient to provide a real picture of poverty among individuals and families. Many necessary costs in current family budgets are not considered in the poverty measurement calculation. Work-related costs, for example, such as transportation and childcare, are not considered in poverty measures. Housing, transportation, and utilities are much larger portions of family spending budgets than decades ago when poverty measures were developed in the United States.

Poverty criteria based on basic needs approaches have been proposed in several countries. A basic needs poverty line (market basket measure) has been started in Canada as an alternative measure of poverty. The Canadian basic needs poverty line identifies items needed to maintain a decent standard of living. The initial list of

needs included items such as food, rent, clothing, local phone service, household furnishings, transportation, healthcare, and personal hygiene supplies. Later revisions to the need list added out-of-pocket healthcare costs, home insurance policy, school supplies, stamps, and laundry needs. Basic needs are determined at a level deemed minimally decent. For example, shelter estimates for a family of four use average rents for two- and three-bedroom apartments in several areas across the country. Such a measure of poverty has been controversial in that the determination of the basic needs "basket" involves subjective judgments.

In May 1995, the Panel on Poverty and Family Assistance, appointed by the National Research Council, recommended a new approach to measuring poverty in the United States. It was recommended that poverty thresholds be based on a budget for basic needs in the three categories of food, clothing, and shelter (utilities included) and a small amount added for other needs (such as household supplies, personal care, and non-work transportation). It recommended that consumer expenditure data be used to determine budget amounts. The U.S. government has made no significant changes, however, to the established poverty measure.

Basic needs are intricately related to poverty and poverty measurement. Growing discontent exists with current measures of poverty that focus exclusively on income-based poverty. Newer approaches to measuring poverty consider the package of basic needs that are necessary for decent living.

Neoclassical Thought

NEOCLASSICAL economics is the body of thought that developed in the latter half of the 19th century and continued on through the 20th century and beyond. The term is used to demarcate a methodological break with the previous body of thought known as classical economics. The expression *neoclassical economics* goes back to Thorstein Veblen and was originally attributed to the Marshallian School.

The beginning of neoclassical economics can be placed around 1870, when the so-called marginal utility revolution began. This revolution in economics is usually associated with three or four contributors, although there are a number of important precursors. William Stanley Jevons, Karl Menger, and Leon Walras were in the forefront, while Alfred Marshall, who wrote around the same time but published later, was the fourth creator of the new approach to economics. What characterized the new approach was the self-declared use of mathematics and marginalism. It was more scientific in its approach in many ways. Economics became the science of scarcity—thus of measures—and it is no long shot to describe neoclassical economics as the quantitative method in contrast to classical economics.

Classical economists focused on development and growth, the distributive shares of income among capitalists, landowners and laborers, international trade, money, and population. The focus in their economics was the national economy. With neoclassical economics, this prominence gave way to the individual in economics, that is, to the microeconomics of the household, firm, and industry.

The three writers most responsible for launching neoclassical economics, Menger, Walras, and Jevons, all independently discovered the neoclassical paradigm. No longer would the science be called political economy but economics. Although the three writers emphasized marginalism and utility in their economics, they each had a different tack. Of the three, two—Menger and Walras—established genuine schools with followers to elaborate and extend their economics.

Menger founded the Austrian School of economics with his *Principles of Economics* in 1871. The school would be famous for its subjectivism and methodological individualism. The school stressed the importance of theory as well as empiricism, as opposed to undirected empirical analysis. Austrians opposed the historicism of the German School.

Walras is the founder of the general equilibrium approach. Economic systems—with firms and consumers

giving way to supply and demand in various markets—have a great degree of interdependence. Markets must determine many prices and quantities simultaneously, and when any one market is not at equilibrium, a situation where there is excess demand or supply means that some other market will also be in disequilibrium. Walras constructed a mathematical model whereby he showed a general equilibrium occurring with consumers maximizing utility and firms maximizing profits.

Although Jevons failed to inaugurate a sizable following, he did manage to pave the way for the Cambridge School, founded by Alfred Marshall. Jevons's focus was on a theory of exchange based on utility-maximizing individuals. He did not formulate a theory of the firm. Jevons also made original contributions in the problem of index numbers and in capital theory.

The final major contributor to this revolution, although he had a later publishing record, was Marshall, founder of the Cambridge School. Marshall's *Principles of Economics*, whose first edition appeared in 1890, sold remarkably well and became the standard text among English-speaking nations for many years.

Marshall's approach to markets was to study them in partial equilibrium, where the ceteris paribus assumption is all necessary. Marshall also divided time into components according to the fixity of certain market elements. Marshall brought to the forefront a theory of the firm. He also worked out the idea of consumer surplus and in a spark of high originality, developed the concept of elasticity. Marshall would build a reputation upon which a considerable number of followers would disseminate his ideas throughout the world.

By the early 20th century, the central features of neoclassical thought were determined: a theory of the firm, the consumer, the industry and market structure, general and partial equilibrium analysis, welfare economics, capital and interest, and money was in place. All rested on the neoclassical paradigm, that is, an analytical scheme that placed rationality and the maximizing efforts of firms and consumers as central in determining equilibrium.

Neoclassical economics fashioned itself as the science of scarcity, whereby opportunity cost becomes the overriding factor in determining individualistic behavior. And it is the individual who reigns supreme in neoclassical thought. The neoclassical school placed much of its effort on microeconomics.

The consumer is assumed to be rational and maximizes utility with a budget constraint. Value is demanddriven in many neoclassical formulations, with the

consumer taking prices as given. The concept of marginal utility—the idea the whole revolution giving rise to neoclassical economics rested upon—plays a crucial role in determining the equilibrium of the consumer. Maximizing utility, along with the law of diminishing marginal utility, means that with given prices and income, the consumer will allocate his budget so that the last dollar spent will yield a similar final marginal utility. This is the famous equimarginal principle. At first economists assumed that utility can be measured in some sense—at least this was necessary to their analytical apparatus.

In the theory of the firm, the marginal principle was also applied. Starting with the notion of a profit-maximizing firm, the firm would hire resources up to the point where their additional values added would be equal to their costs. Thus neoclassical economists were able to construct a theory of value and distribution displacing the old Ricardian framework. No longer would there be a residual landowning class receiving rent as a residual.

This language of mathematics would become the tool for later economists.

In industrial structure the early writers assumed that markets operated at bipolar ends of the spectrum; it was either perfect competition or monopoly. Monopoly was assumed to be the exception so that most production was assumed to take place under competitive conditions. By the 1920s and 1930s the concept of perfect competition was called into question. Joan Robinson and E.H. Chamberlin, each working independently, introduced in 1933, into economic theory, imperfect or monopolistic competition. This form of market structure or industrial organization sought a more realistic picture or framework. It combined elements of monopoly and perfect competition. At first thought to be revolutionary, it was later to be found lacking; however, it made economists aware of the variety of market structures that actually exist and paved the way for the study of oligopolies.

One of the lasting innovations of the neoclassical school was its unabashed adoption of the mathematical approach. Since economics is concerned with quantities, one is naturally inclined to use mathematics as the language of expression. The early writers were sometimes hesitant to put mathematics in the forefront—Marshall was reluctant to put mathematics in the main

text for fear of diminishing general readership. Nonetheless, neoclassical economist relied on mathematics to communicate their most important ideas. There were few exceptions. This language of mathematics would become the tool for later economists working after the era of neoclassical economics, roughly speaking, 1871–1930.

Economists, armed with the toolbox created by the neoclassical writers, began to venture into other areas, such as game theory and the economics of information and knowledge. And though once the mainstream focused on value, production, and distribution within the neoclassical paradigm, a more heterodox approach began to emerge. The American institutionalists, led by Veblen, began to challenge, question, and offer new approaches to the neoclassical paradigm.

In the realm of macroeconomics, the early neoclassical school subscribed to a quantity theory of money with a reliance on the self-correcting mechanisms built therein. The quantity theory of money appeared in various forms, including the transaction cost approach, the cash-balance approach, and the income approach. In its simplest form, the quantity theory of money asserts that the general price level is directly related to the quantity of money. Any immediate doubling of the quantity of money will cause the price level to also double. How this doubling takes place is critical to understanding the dynamics of the quantity theory of money.

Neoclassical economic theory treats poverty rather narrowly. At the microlevel poverty is perceived as "voluntary." In the context of growth theory, where the focus is why poor nations are poor, the emphasis is on the low levels of savings, capital accumulation, and technical progress in low-income countries. As a result, the income gap between the poor and rich nations rises. The policy implication for these theoretical findings for poor countries is to open their economies to free trade and foreign investment to stimulate growth and to enjoy the resulting externalities and economies of scale.

BANKING SYSTEM

Now, as mentioned, the process whereby an injection of money into the system is to cause prices to increase is vital. This may mean stimulation to the economy creating very real effects. In the version of the quantity theory, this happens in the loanable funds market through the interest rate. The banking system comes to play a crucial role in the process of driving prices upward in a monetary expansion. Since the loanable funds market is directly involved, the roles of saving and investment be-

come critical variables in determining national income and equilibrium.

One may almost say that in the realm of macroeconomics, the neoclassical approach is very classical in that it accepted a quantity theory of money along with a self-adjusting mechanism to bring about full employment. John Maynard Keynes, in his *General Theory* would change the face of macroeconomics. Keynes's theory emphasized the role of quantity adjustments as opposed to price adjustments and that the economy may operate below full employment for extended periods of time. The Keynesian revolution swept macroeconomics and created new analytical frameworks for analyzing the economy; for instance, the Hicks IS-Lm framework became a standard tool. Economists have sought to reconcile the Keynesian School with neoclassical thought by constructing the neoclassical synthesis.

Since the 1960s there has been a revival of the classical approach. The rational expectations method has brought the discipline almost full-circle. Tensions, of course, remain. But where the "new classical" economists once debated heatedly with the Keynesians, they now have the more conventional approach.

To assess the contribution of the neoclassical contributions to the literature is almost to evaluate the entire science of economics. One cannot separate neoclassical economics from the writings or approaches of the mainstream economists of this day.

Julian Schuster University of New Haven

Neoliberalism

NEOLIBERALISM has become, over the last decades, a synonym for a series of new economic policies related to global free trade. The economic oil crisis of 1973,

when the Organization of Petroleum Exporting Countries (OPEC) quadrupled oil prices for Western countries; the decline of the postwar Keynesian model of economic regulation in the late 1970s; the increasing privatizations of public property; and the deregulation politics of Margaret Thatcher (1979–90) in England and of Ronald Reagan (1981–89) in the United States signaled the emergence of the neoliberal era.

At the same time, an ensemble of various, interdependent processes framed the socioeconomic context of neoliberalism: the internationalization of capital, the denationalization of the state, the modernization of the postnational world economy, and the deregulation of the welfare state, including public administration and social services. New economic principles became influential, like the EEE principle (economy, efficiency, and effectiveness) and the idea of new public management.

The market alone is not capable of resolving possible social crises.

The basic task of neoliberal, post-Keynesian governments was to facilitate enterprises to achieve free trade and free movement of capital in the cheapest way, not only to maximize profits and efficiency but also to obtain economic status through the extension to new international markets. Economic agents like the International Monetary Fund (IMF) and the World Bank were designed by John Maynard Keynes and Harry Dexter White at Bretton Woods (1944) for reasons of financial stability, and initially had no serious power over national economic policies, but are now called upon to play a major role in the neoliberal world order. The Keynesian ideas of the welfare state have gradually been replaced by neoclassical economics and the neoliberal theories of the free market of Friedrich August von Hayek (1899–1992), Ludwig von Mises (1881–1973), and Milton Friedman (1912–).

What is actually "neo" in neoliberalism is the revised interest of governments and economic, multinational, or global elites in the deliberation of markets and free trade in response to the economic crisis that capitalism underwent during the late 1970s and early 1980s. More than ever in its history, the market is considered self-regulating through market pressures and demand.

The idea that the interference of the state damages the movement of the market and the circulation of capital and products is becoming an economic and political orthodoxy. For there is no generally acceptable definition of or theoretical perspective on both liberalism and neoliberalism; the analysis of the concept, economic principles, and theory of neoliberalism and its connections with poverty requires primarily a short analysis of the concept of liberalism.

On the economic level, liberalism expressed the need for a free market. Adam Smith (1723–90), who is considered the first liberal philosopher and economist, theorized in his book *The Wealth of Nations* (1776) that the market is a self-regulating economic space. The competition among economic actors, products, and markets would not result in economic inequality and the poverty of special parts of the population, but in a natural, self-regulating economic and therefore social balance.

According to the theory of economic liberalism and the physiocratic doctrine of *laissez-faire*, *laissez-passer*, for the accomplishment of such goals, governments should minimize all the possible barriers to the free functioning of the market. Such antiliberal barriers to be fought off are the national tariffs system, the economic regulations and measurements assessed by governments, standards like taxation laws or economic legislation, and the restrictions on capital flows and private investments. In liberal terms, social order is achieved through the free market, which must not be a political field of governments, like the judiciary and the military.

INEVITABLE POVERTY

In this frame, poverty is not an accidental characteristic of this division of economic power. It is rather a structural part of economic liberalism and is considered as inevitable. The competition among market agents causes economic inequality. Social groups neither enter the market (the process of production and the labor market) equally nor have the same consumption chances. Their economic behavior and the economic chances they have are rather defined by their social class, which in turn affects their position, status and power in the market.

The task of political power in economic liberalism is not to prevent this kind of inequality and the resulting poverty of greater parts of the population, but—through noninterference in economic structures and processes and the political support of the investing classes—to maintain and reproduce the social stratification out of which economic liberalism cannot operate. Poverty becomes a social and political problem only to

the degree that it threatens the requisites for capitalist conditions of social order and cohesion, and as long as its effects lead to social disorganization.

On the political level, liberalism is related to the theories of social contract, especially that of John Locke (1632–1704). In his *Two Treatises on Government*, Locke opposed absolutism, emphasized the need for individual rights (the natural rights of life, liberty, property), and defended the right to individual property. For the British empiricist, the liberal state should provide economic safety and protection of individual property rights.

Poor individuals are now responsible for their position.

Other philosophers who influenced political liberalism are Jean-Jacques Rousseau (1712–78), with his emphasis on the concept of general will; Jeremy Bentham (1748–1842), with his ideas about utilitarianism as a principle for law- and policymaking; and John Stuart Mill (1806–73) with his revised democratic utilitarianism. From the Enlightenment to the French and American Revolutions, political liberalism expressed the transition from feudalism, monarchy, and low social mobility to capitalism, modernity, and gradually liberal representative democracy and constitutional law. The idea of the individual and his rights against the polity, as well as the fundamental importance of private property in political liberalism, has been combined with the idea of the external power of the sovereign state.

In the theory of political liberalism, the state should guarantee equality for all of its citizens and for all various social groups. Marxist critics (for example Louis Althusser and Nicos Poulantzas), however, have underlined that the achievement of economic equality and the reduction of poverty has barely been the case in liberalism. On the contrary, the liberal state of capitalism is considered to have played a historical role in the reproduction of inequality and social exclusion of economically weaker classes.

ECONOMIC INEQUALITY

In the frame of political liberalism, the state has a double role. On the one hand, the state provides equality on the legal level (although liberals from the beginning have not been for universal suffrage and for the majority's principle). On the other hand, through the promo-

tion of free enterprise and adherence to the competitive entrepreneurial classes, the state contributes to the reproduction of economic inequality.

One of the most fundamental characteristics of the liberal state of capitalism is that it managed to bridge this specific contradiction and conflate economic inequality with legal equality. It managed, in other words, to convert the economic conflict into a political one. This important aspect characterizes not only classical liberalism but also neoliberalism.

Neoliberalism celebrates free trade and the free market as the most important of the economic priorities. It also promotes the image of a neutral state, which no longer intervenes in the rules of the free market, and it is therefore no longer responsible for economic inequality and poverty. But as the so-called Regulation School has shown, the market cannot operate without the intervention of the state. Neomarxist theorists of the Regulation School like Joachim Hirsch, Bob Jessop, and Michel Aglietta have underlined that markets need regulation by the state. This happens for a number of reasons.

First, the formation of an attractive investment environment and competitive capitalism is based on several structures that cannot be provided by the economic agents of capitalism, who *ex definitione* focus on profit's maximization, but by the state, which is responsible for the general reproduction of the economic system. Such tasks are, for instance, public infrastructure, legislation mechanisms, effective laws, and modernized administration systems.

Second, the market alone is not capable of resolving possible social crises caused by market failures and dysfunctions. The avoidance of social crises that could harm the general economy and the maintenance of social order are tasks of the state, also for its own reproduction.

Third, the state and its institutions are not independent and ideologically neutral social agents. They are rather the product of the distribution of power in the society. This does not mean that the state services exclusively the interests of a specific social class, for instance the investing upper class. This kind of clientelism would not allow the neoliberal state to extract the social consensus of the members of society. Claus Offe's view is at this point of paramount importance: "The state does not patronize certain interests, and is not allied with certain classes. Rather, what the state protects and sanctions is a set of rules and social relationships which are presupposed by the class rule of the capitalist class. The state does not defend the interests

of one class, but the common interests of a capitalist class society."

LATE 20TH CENTURY

At this historical stage of post-Keynesian capitalism, namely the neoliberalism of the late 20th and early 21st centuries, the state is once again called to regulate the processes of capital's accumulation, which are now taking place on a global scale. The dismantling of national economic regulations, a new emphasis on economic growth based on private investment, an increasing market individualism, and the ideology of competition are now framing new forms of poverty and social exclusion. Poverty is expanding on a global scale and is becoming more a structural part of the economic system.

Within the ideology of competition caused by the deregulation of the social state, unprivileged social groups, marginalized economic actors, and poor individuals are now responsible for their position. Their economic position is their own fault. What produces poverty and inequality is not the social and economic system, but the individual pathologies and the problematic individual structures. Neoliberalism is being legitimized and naturalized not only to the economic but also to the social level.

Liberalism believed that the market should regulate the social processes and the economic life of individuals and groups, while the state would keep the *ultima ratio* with regard to political decision-making, legislation, and social order. Neoliberalism and the new focus on free enterprise de-emphasize the principle of *ultima ratio* and the idea of a fairer allocation of wealth. Neoliberalism stands out for the continuation of global inequality and the exploitation of poverty in the name of the free market and competition.

Nepal

NEPAL, A KINGDOM situated at the southern part of the Himalayan Mountains between India and China (Tibet), has been a constitutional monarchy since 1959 (under English influence). The real transition to multiparty democracy started only in the spring of 1990. This late transition influenced Nepal's economic development, because there is a lack of governmental coherence and ability to efficiently use domestic revenues.

Nepal is divided into three ecological zones: the terraces, hills, and mountains. Not all zones can be used agriculturally, so—with a population of 24 million, growing at 2.3 percent per year—the ratio of population to arable land is one of the highest in the world.

These are some of the reasons why Nepal remains one of the poorest countries in the world (despite improvements in the past two decades) with a per capita annual income of about \$250r. The level of absolute poverty is among the highest in Asia: more than nine million people, accounting for about 40 percent of the population, are estimated to live below the national poverty line (\$77 per year).

Not only is income poverty very severe in Nepal, but so is nonincome poverty: almost two-thirds of the adult population is illiterate, and only 71 percent of the total population have access to safe drinking water. The country has the highest infant mortality rate in south Asia, at 75 deaths per 1,000 live births. Even malnutrition is widespread: about half of all children below 5 years of age are underweight.

Large disparities appear when comparing the various geographic regions and the different socioeconomic groups. Income poverty, as well as human development poverty, is higher in rural areas than in urban ones, being the highest in the midwestern and far western hill and mountain districts.

Another very important reason for severe poverty is social exclusion referring to gender, ethnicity, and caste. Gender-based exclusion is deep-rooted in Nepal, with discrimination against women in all aspects of poverty, including even their physical survival, medical care, education opportunities, ownership of assets, mobility, and social reputation.

There is a long tradition of being socially excluded because of belonging to the lower caste (referring to the Hindu caste hierarchy), though recent laws (the new civil code of 1963 and the constitution of Nepal in 1990) ensure equality for all citizens irrespective of caste, creed, or gender. Even today the Dalits (untouchables) earn their living through tasks considered unclean by other castes/social groups, so it is very difficult for the Dalits to escape income and nonincome poverty (that is, lack of education and healthcare).

Ethnicity also is often intertwined with poverty; some ethnic groups still have their own language and cultural roots (Janajaties), some of them are indigenous, and some groups are migrants (for example, of Tibetan origin). They do not belong to the Hindu-based caste hierarchy, some of them live as nomads, and access to education and healthcare opportunities is limited. Political instability, like rapidly changing governments, and the Maoist insurgency contribute to economic decline.

About 50 years ago, Nepal's rulers started to modernize the country. Through the 1990s there was some progress, but during the most recent years, poverty has increased because of serious social and political instability, including the Maoist insurgency, lack of good governance, and changing governments.

Netherlands

THE KINGDOM OF the Netherlands is a modern and industrialized western European country. The country is one of the Benelux group (Belgium, Netherlands, and Luxembourg) and it has prospered economically since the end of World War II. In addition to a strong industrial base, the Netherlands has a productive and modern agricultural sector. The area of the Netherlands is 42,526 square kilometers, of which nearly 20 percent is water. The Netherlands has a long coastline on the North Sea, giving the country access to the oceans of the world. The country claims a 200-nautical-mile "exclusive fishing zone." Located between Germany and Belgium and having three major European rivers within its borders (Rhine, Meuse, and Schelde), the Netherlands has a significant measure of transportation advantage, an attribute that has enhanced its economic growth.

A significant amount of the land is reclaimed from the sea. A series of dikes keeps the North Sea from inundating the low-lying land. It is not surprising that the potential for flooding is the greatest natural hazard faced by the country. The Netherlands has developed a successful agricultural sector. Major products include a variety of grains, potatoes, sugar beets, vegetables, fruits, and livestock. The country's burgeoning industrial sector includes agricultural processing, metalworking, engineering processes of all types, electrical machinery and equipment, chemicals, petroleum products, and microelectronics. Proximity to the North Sea has also allowed the Netherlands to develop an important fishing industry.

Trading partners with the Netherlands are primarily in western Europe, with Germany being the largest. Although the Netherlands produces both crude oil and natural gas, the amounts of each fall far short of that required to keep its economy going. As such, both of these important energy sources must be imported in large volumes.

The population of the Netherlands was 16.3 million in 2002, with a rate of natural increase of 0.4 percent. The latter figure is indicative of a country that has completed the demographic transition and is in a slow growth mode. In fact the estimated population for the Netherlands in 2050 is 16.9 million, an increase of only 600,000 people in 45 years.

Other demographic data for the Netherlands are on a par with other western European countries: life expectancy at birth is 79 years (females 81 and males 76); and Gross National Income per capita in 2004 was

Despite the economic success of the Netherlands, 10 percent of households live below the poverty line, mostly in urban settings.

\$31,220, a figure that is higher than the western European average.

Despite its economic success, it is estimated that 10 percent of households in the Netherlands live below the established poverty line. Those in poverty are primarily immigrants from Turkey, Morocco, and the Antilles. In addition a higher number of households in the large cities (Amsterdam—the country's capital, Rotterdam, and The Hague) live in poverty.

Research indicates that the number of immigrants living in poverty will most likely increase in the near future, as will the elderly and people who are lacking in education. This prospect may be softened if the predicted rise in economic activity in the Netherlands in 2006 is realized.

New Partnership for Africa's Development

THE NEW PARTNERSHIP for Africa's Development (NEPAD) is a vision and strategic network for Africa's renewal. The Organization of African Unity (OAU) mandated that the heads of five African states (Algeria, Egypt, Nigeria, Senegal, and South Africa) create an integrated socioeconomic develop framework for Africa, which was then formally adopted at the OAU meeting in July 2001. This framework was required to combat rising levels of poverty in Africa, underdevelopment, and the continent's marginalization.

The framework aims "to eradicate poverty; to place African countries, both individually and collectively, on a path of sustainable growth and development; to halt the marginalization of Africa in the globalisation process and enhance its full and beneficial integration into the global economy and to accelerate the empowerment of women." NEPAD aims to build on previous, largely unsuccessful attempts to create partnerships through consensus-building and broad-based support from governments throughout Africa.

NEPAD has adopted the following guiding principles: good governance as a basic requirement for peace, security, and sustainable political and socioeconomic development; African ownership and leadership as well as broad and deep participation by all sectors of society; anchoring the development of Africa on its resources and resourcefulness of its people; partnership between and amongst African peoples; acceleration of regional and continental integration; building the competitiveness of African countries and the continent;

forging a new international partnership that changes the unequal relationship between Africa and the developed world; and ensuring that all partnerships with NEPAD are linked to the Millennium Development Goals and other development goals and targets. It is hoped that, by explicitly employing the language and methods of international institutions such as the International Monetary Fund, NEPAD will be successful in fostering international confidence in its ability to support and sustain large-scale flows of foreign direct investment.

NEPAD plans to achieve its goals by establishing the conditions for sustainable development (for example, peace and security, democracy, regional cooperation and integration, and capacity building), policy reforms, increased investment, and resource mobilization. NEPAD is in itself potentially of value, but must be set in the context of generally poor macroeconomic performance in much of Africa; the continued extreme vulnerability to external shocks, famine, and pestilence; and also the very widespread belief that the continent's governments are mostly corrupt. While allegations of corruption are in many cases true, the problem did not prevent states of east Asia from enjoying rapid industrialization, and does not affect international opinion to the same extent as it does in Africa.

The economic basis of the NEPAD program depends to a considerable extent upon the ability to attract inward foreign direct investment, which has been slow to arrive. A lack of transparency prevents investments from seeking market access, and general insecurity has inhibited resources seeking access. Previous attempts at foreign direct investment have become discredited through association with unpopular autocratic leaders, environmental despoliation, and general exploitation of the local people.

In its place, there is a need to upgrade the competitiveness of African industries, especially export industries, and above all, fair access to the domestic markets of developed nations such as was accorded to the Asian Tigers. The 2005 G-8 Summit was very successful in achieving debt relief but less spectacularly successful in terms of economic fairness and market access.

New Poor

THE NEW POOR ARE THOSE people suffering from poverty as a result of changes in lifestyle and society. They are not, in other words, from the classes of society that have historically been vulnerable to sudden onset of poverty on a large scale. The new poor include divorced women and their children, unskilled urban workers, and those unable to manage the modern emphasis on consumption and personal financial management.

Thrust into debt or poverty as a result of external economic shock or rapid change in personal circumstances, the new poor may find themselves vulnerable to indigence or obliged to resort to selling sexual services or committing crime in order to obtain income. Zygmunt Bauman, the leading sociologist and seminal figure in the creation of the concept of postmodernism, characterizes the new poor as "flawed consumers" who are unable to manage the competing pressures of modern consumer-driven society.

Such people, he argues, are stigmatized as being part of the undeserving poor and, consequently, it is considered inappropriate for government to support them. The process of creating the new poor begins with the transition of society from one of producers to one of consumers. Whereas previously all people produced in similar ways but consumed in different ways according to choice, now social pressure is placed upon the mode and extent of consumption as being a central part of life. Those who are marginalized by their consumption decisions or who prefer to practice self-marginalization are effectively outcast from society and suffer from the deprivations of poverty.

The concept of the new poor is related to that of alienation, which considers the ways in which people may become disconnected from mainstream society and social life, leaving them suffering from a sense of meaninglessness, powerlessness, normlessness, and social isolation. As societies develop, technological advances lead to improvements in productivity that

enable them to move from being based on agriculture to being based on manufacturing, then services, and finally knowledge or information. As this progression continues, people move further and further away from the traditional methods of production and of consumption. They are removed from the land and from forms of work that are intuitively understandable as leading to the production of food or basic items that are usable by people. Instead their work—if work is available—appears essentially pointless, as it cannot be perceived how it leads to worthwhile results. Alienation can result from other causes, but in any case results in negative mental health problems and occasionally violent outbreaks.

As methods of working continue to develop, and the number of people brought into the capitalist system of supply-and-demand-led markets increases, the issue of the new poor also increases both in terms of numbers and in geographical scope. The process of globalization, according to Bauman, will intensify the spread of modernization to all corners of the globe and will ultimately produce generations of useless people with no purpose other than disorder. The number of people, especially young people, battling depression and other mental illnesses is taken as a symbol of this emerging trend.

The new poor are unable to manage the pressures of a consumer-driven society.

Processes of internal and international migration also contribute to the total number of "useless lives" since migrants tend to gather in large urban centers in which public social services are unable to cope, and hence the consumption function desired by migrants is not possible.

A prominent example of a possible process of alienation has taken place in China. The years in which the Chinese government enforced a one-child-per-family policy have led to an imbalance in the number of boys over girls in contemporary society. Once these boys become men, they form part of the so-called bare branches generations who have no access to sufficient women to hope to establish a conventional family life. They, too, will be outcast from common conceptions of society, and will be considered part of the new poor.

New Zealand

NEW ZEALAND CONSISTS of two large and a number of smaller islands in the south Pacific Ocean, more than 1,000 miles from its nearest neighbor, Australia. The chain of islands is more than 1,000 miles long but no more than 280 miles across. New Zealand administers the Tokelau group of islands, while the Niue and Cook Islands are autonomous states that are in partnership with New Zealand.

Aotearoa is the alternative name for New Zealand and recalls a name used by indigenous Maori people, who arrived on the islands in about 800. The country was annexed by Britain in 1840, was administered as a colony, and attained full independence as a member of the commonwealth in 1947. It now has a population of just over four million and a generally high standard of living, with an annual per capita Gross Domestic Product in excess of \$23,000. The country is a parliamentary democracy, which led the way in permitting votes for women.

The principal industry in New Zealand continues to be agriculture, although industrialization has made strides in the last few decades. Agricultural exports drive economic growth and this is often based on low-cost goods that require low wages. The availability of skilled or semiskilled urban jobs is limited, and although average income and quality-of-life indicators are high by international standards, the picture is mixed within society.

Reliance on agricultural commodity exports resulted in economic slowdown in the 1970s and the existing regulatory regime of protected markets was considered to be uncompetitive. Various reform measures have helped to improve the economic system but at the cost of reduced government services, which necessarily falls hardest upon the most vulnerable.

As an open and generally liberal society, New Zealand has witnessed a great deal of discussion and debate about the issue of poverty in the country. Attention has focused on disadvantaged groups in urban areas and from certain ethnic minorities and migrant communities, particularly Maori and Pacific island peoples who have faced particular difficulties in obtaining access to economic opportunities. The Child Poverty Action Group, for example, was formed in New Zealand in 1994 to meet the need to tackle what it believed was "endemic" and "increasingly intractable" family poverty. Low education and societal expectations exacerbate the problems faced.

The government of New Zealand has taken a leader-ship role in helping Pacific island nations achieve their Millennium Development Goals, providing assistance with technical consultation, capacity building, and information sharing. This is led by the creation of NZAID (New Zealand International Aid & Development Agency), which has the principal goal of poverty reduction in the Pacific Ocean and also works in east Asian countries and farther afield. It has provided bilateral and multilateral assistance, emergency, and disaster relief, and other forms of aid.

Human Development Index Rank: 19 Human Poverty Index Rank: Not included.

JOHN WALSH SHINAWATRA UNIVERSITY

Nicaragua

WHILE THE REPUBLIC OF Nicaragua is the largest country in Central America, it is the most sparsely populated. Nicaragua won independence from Spain in 1821 and established itself as a republic in 1838. Over the next century, liberals and conservatives battled for

power in Nicaragua. Civil war broke out in 1978 in response to accusations of government manipulation and corruption, and the Marxist Sandinista guerrilla forces gained power. The conservative U.S. administration supported the Sandinistas. When the U.S. Congress refused to fund aid to Nicaragua because of widespread human rights abuses, the Ronald Reagan administration allegedly sold arms to Iran to finance the Contras.

A series of free elections led to the eventual defeat of the Sandinistas, and Nicaragua began rebuilding its economy. A setback occurred in 1998, when Hurricane Mitch devastated the country at a human cost of 9,000 lives. Over two million people were left without homes, and damages were estimated at \$10 billion. In response the United States established a temporary amnesty program to provide homes for thousands of refugees.

Economic progress in Nicaragua has been threatened by massive unemployment and substantial external debt. In 2004, Nicaragua was admitted to the Heavily Indebted Poor Countries program, which paved the way for a debt relief package of \$4 billion. Negotiations are under way on a free-trade agreement with the United States. Nicaragua also has potential for economic growth through development of natural resources, which include gold, silver, copper, and lead.

With an annual per capita income of only \$2,300, Nicaragua is the second poorest country in the Latin American/Caribbean region. The agricultural sector employs 30.5 percent of the labor force. More than half (52.3 percent) of all workers are engaged in services, and 17.3 percent of the labor force are employed in industry. Currently employment is estimated at 7.8 percent, but 46.5 percent of the workforce are underemployed.

Half of the Nicaraguan population lives below the poverty line. Around 20 percent live in extreme poverty, and 40 percent live in unacceptable conditions. Nearly 80 percent of Nicaraguans live on less than \$2 a day, and 45.1 percent live on less than \$1 a day. One in three children is malnourished, and 29 percent of the total population are underweight. Women and children are disproportionately affected by poverty in Nicaragua, as are rural residents.

Approximately 28 percent of rural residents lack access to safe drinking water, and 30 percent have no access to improved sanitation. Resources are vastly unequal, with the richest 20 percent holding 59.7 percent of resources and the poorest 20 percent sharing only 3.6 percent. Nicaragua is ranked 55.1 percent on the Gini Index of Human Inequality.

Nicaragua's Enhanced Poverty Reduction and Growth Strategy plan focuses on social inclusion and economic growth. The Work-for-Food program pays participants in food rather than in wages, while other programs furnish job counseling and referrals. The Social Security Institute provides temporary financial support for maternity, illness, disability, and bereavement. Pensions are paid on a more permanent basis.

Most hospitals, health centers, and clinics are stateowned in Nicaragua, but many are at least partially privatized. Social Security and the Unified Health System are now separated. Even the poorest people have to pay for services and drugs in hospitals and clinics. There is a severe shortage of basic supplies and drugs, and Nicaragua has only 62 physicians for every 100,000 residents. Life expectancy in Nicaragua is 70.33 years. Females (72.49 years) outlive males (68.27) by around four years. The population of 5,465,100 has a median age of 20.56 years. Just over 37 percent of Nicaraguans are under the age of 14, and 3.1 percent have seen a 65th birthday. Overall 23 percent of Nicaraguans lack access to safe drinking water, and 15 percent lack access to improved sanitation. Because of its location on what is familiarly known as the Mosquito Coast, Nicaraguans in those areas face a high risk of contracting malaria.

Half of the Nicaraguan population lives below the poverty line.

Nicaraguan infant mortality rate is high, but rates have been steadily declining. Between 1980 and 2004, the infant mortality rate fell from 113 to 32 deaths per 1,000 live births. Among all children under the age of 5, the decrease was even more dramatic, falling from 165 to 38 deaths per 1,000. About 13 percent of infants are underweight at birth. One-fifth of all children under 5 suffer from moderate to severe stunting. Immunization rates have increased recently, ranging from 84 to 98 percent among children between the ages of 12 and 23 months.

Fertility rates have also dropped in recent decades. Between 1970 and 2003, fertility decreased from 6.8 to 3.4 children per woman. The adolescent fertility rate is 114 per 1,000 births. Around 69 percent of Nicaraguan women use some method of birth control. According to modeled estimates for 2000, maternal mortality occurs at the excessively high rate of 230 per 100,000 live births. Trained medical staff attend 67 percent of all births in Nicaragua, but many deaths are caused by the lack of prenatal and antenatal care. Mortality rates are one-third higher in rural areas than in urban areas.

Literacy rates are low in Nicaragua, but rates of illiteracy have been dropping for over a period of decades. Currently 67.5 percent of the population over the age of 15 can read and write. In 1980 only 59 percent could do so. Over 85 percent of children are enrolled in primary school, but only 39 percent are enrolled in school at the secondary level. Education has been partially privatized in Nicaragua. As a result, many parents cannot pay the costs of sending children to school.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Niger

THE WESTERN AFRICAN nation of Niger, which borders the Sahara Desert, is one of the poorest countries in the world. In Niger 63 percent of the people live in poverty, and Nigerien women make up two-thirds of that number. The Nigerien government offers few social services, even to its poorest residents. Nigeriens live on an average annual income of \$180, with 85.3 percent of the population subsisting on less than \$2 a day and 61.4 percent surviving on less than \$1 a day.

Inequality is prevalent in Niger, and the poorest 20 percent of the population claim only 2.6 percent of resources as compared to 53.3 percent for the richest 20 percent. Niger is ranked 50.5 on the Gini Index of Human Inequality.

With 90 percent of Nigeriens dependent on subsistence agriculture, Niger has done little to develop natural resources, which include coal, iron ore, gold, and petroleum. Niger's uranium deposits are among the largest in the world, but uranium prices have declined in recent years. Because Niger is landlocked, there is

limited access to freshwater sources. Crops are frequently destroyed by prolonged droughts, and poor farming practices have created widespread soil exhaustion and erosion. In 2000 Niger was admitted to the International Monetary Fund's Highly Indebted Poor Countries (HIPC) program and the government committed itself to poverty reduction and improved education and services. Some 50 percent of the Nigerien budget is derived from foreign donors.

The life expectancy of 42.13 years and the median age of 16.25 are indicative of the poor quality of life for most Nigeriens. Nearly half of the population of 11,665,937 is under the age of 14, and only 2.1 percent reach the age of 65. Nigerians have only a 38.7 percent chance of surviving to the age of 40. Nigerians are subject to the common food- and waterborne diseases that affect much of sub-Saharan Africa. Approximately 41 percent lack access to safe water, and 80 percent lack access to proper sanitation. With a 2003 HIV/AIDS prevalence rate of 1.2 percent, 70,000 Nigeriens live with the disease and 4,800 have died. Common health conditions become life-threatening in Niger because of a shortage of physicians and lack of access to affordable lifesaving drugs.

While the infant mortality rate of 154 deaths per 1,000 live births recorded in 2003 is extremely high, the rate is a definite decline from 197 per 1,000 in 1970. During that same period, the mortality rate for children under the age of 5 declined from 330 to 262 out of 1,000. Mortality continues to be high, however, in large part because children lack proper access to nutrition and healthcare. Some 40 percent of all children under the age of five are malnourished, 14 percent severely so. About 40 percent suffer from moderate to severe stunting, and 14 percent experience moderate to severe wasting. Less than 40 percent of Nigerien children receive lifesaving oral rehydration therapy when needed.

Even though childhood immunizations can save lives, immunization rates in Niger are unacceptably low. In 2003, for example, 36 percent of children between 12 and 23 months old were not immunized against measles and 48 percent were not immunized against DPT3. Even so, small gains have been made. Between 1990 and 2002, infant measles immunizations increased from 25 to 48 percent and tuberculosis immunizations rose from 32 to 47 percent. At the same time, DPT and polio infant immunizations increased from 22 to 23 percent and from 20 to 25 percent respectively.

Fertility rates in Niger have shown only minimal improvement. Between 1989 and 2005, the fertility rate fell from 7.6 to 6.75 children per woman. Adolescent

fertility rates remain high at 201 per 1,000. Nigerien women have little knowledge about family planning, and low educational and literacy levels interfere with dissemination of the information available. A scant 14 percent of Nigerien women use any method of contraception, but this is a definite improvement over the 1990 rate of four percent. The maternal mortality rate in Niger is estimated at 1,600 out of 100,000 live births, and this number has been steadily increasing since 1985. Maternal mortality is high because trained medical staff attend less than 16 percent of all births and Nigerien women receive little or no prenatal and antenatal care.

Niger has one of the lowest literacy rates in the world, and only 25.8 percent of males and 9.7 percent of females over the age of 15 can read and write. Even these extremely low literacy rates have improved somewhat since 1999, when rates of 23.2 and 8.1 percent were reported for males and females respectively. Most Nigerien children receive no more than three years of schooling. There has, however, been some improvement in primary school completion rates.

Nigeria

LOCATED IN WESTERN AFRICA on the border of the Gulf of Guinea, Nigeria has the largest population in Africa and its economy is one of the weakest in the world. With 350 ethnic groups speaking 450 dialects, Nigeria has a long history of ethnic and religious tensions. This unrest, combined with government corruption and mismanagement, has been devastating for the people of Nigeria. Approximately 60 percent of the population live in poverty, and 70 percent live in rural areas away from the limited resources that are available to urban Nigerians. With an annual per-capita income of \$1,000, 90.8 percent of Nigerians live on less than \$2 a day and 70.2 percent subsist on less than \$1 a day.

Unequal distribution of income is a major problem in Nigeria, with the poorest 20 percent sharing 1.6 percent of the nation's wealth, and the richest 20 percent claiming 50.6 percent. Nigeria is ranked 50.6 on the Gini Index of Human Inequality.

Although 70 percent of the labor force are engaged in subsistence agriculture, Nigeria is unable to feed its population of 128,771,988 and is forced to import food. Women provide 70 percent of the food that is grown in Nigeria, but they have traditionally been excluded from agricultural resources that would improve the quantity and quality of agricultural products. Crops in Nigeria are susceptible to droughts and flooding.

Nigeria's economic health is largely dependent on petroleum, which makes up 20 percent of Gross Domestic Product and 95 percent of foreign exchange earnings. In 1999, Nigeria adopted a new constitution and subsequently established a civilian government after some 16 years of military rule. The Nigerian government is rebuilding the oil industry after years of revenues lost to government misconduct.

Nigeria has the highest incidence of disease in the entire world, but only 27 physicians for every 100,000 people. Affordable lifesaving drugs are available to less than half the population. Some 38 percent are without access to safe water, and 36 percent lack access to improved sanitation. The Nigerian life expectancy of 46.74 years and the median age of 18.63 years reflect these problems. Some 42.4 percent of the population are under the age of 14 and 3.1 percent are 65 or over. Nigerians have a 34.9 percent chance of dying before the age of 40.

The high mortality rate in Nigeria is a result of many factors, and the 5.9 percent HIV/AIDS prevalence rate takes a major toll. In 2003 it was estimated that 3.6 million Nigerians were living with this disease, which had killed 310,000 people. Nigerians also have a very high risk of contracting food- and waterborne diseases, which include hepatitis A and typhoid fever. The Carter Center of Emory University, founded by former president Jimmy Carter, is heavily involved in programs

in Nigeria to wipe out parasitic diseases such as Guinea worm disease, lymphatic filariasis, schistosomiasis, river blindness, and trachoma. Other preventable diseases that are common include malaria and Lassa fever.

Between 1970 and 2002, Nigerian infant mortality dropped slightly from 120 to 110 deaths out of 1,000 live births. That number dropped further to 98.8 deaths per 1,000 births in 2005. Between 1970 and 2002, mortality rates for children under 5 decreased from 201 to 183 per 1,000. The decrease was virtually wiped out the following year, however, when the rate was recorded at 198 per 1,000. Mortality is high in part because 29 percent of Nigerian children under the age of 5 are malnourished, and nine percent are classified as severely malnourished. About 38 percent suffer from moderate to severe stunting, and nine percent experience moderate to severe wasting.

Nigeria's economic health is largely dependent on petroleum.

In addition to poor nutrition, children suffer from a lack of proper healthcare and exposure to diseases that are preventable through immunizations. Some parents choose to forego immunizations for their children because they do not trust Western healthcare workers. This was the case with a polio epidemic that hit Nigeria in 2003. Rumors surfaced that immunizations were part of a Western plot to make Muslim girls infertile and to spread AIDS.

In 2003, 35 percent of children between the ages of 12 and 23 months failed to receive measles vaccinations, and 65 percent of that group received no DPT3 vaccinations. Infant immunization rates have fared little better. Between 1990 and 2002, infant measles vaccinations dropped from 48 to 40 percent; DPT immunizations decreased from 56 to 26 percent; and polio immunizations declined from 35 to 25 percent. However, infant immunizations against tuberculosis rose from 46 to 54 percent. Less than one-fourth of Nigerian children receive oral rehydration therapy that can save their lives.

Some 68 percent of the Nigerian population over 15 can read and write, but females lag behind males at 60.6 percent compared to 75.7 percent. Between 1980 and 2000, male literacy rates dropped from 55.3 percent to 27.8 percent, and female literacy rates declined from 78.3 to 43.9 percent. Between 1990 and 2002, the primary school completion rate of Nigerian males remained at approximately 82 percent, while female

completion rates rose from 62 percent to 73 percent. The government has identified universal primary education as an unrealized goal.

Like much of Africa, fertility rates in Nigeria are high. In 2005 the fertility of Nigerian women of child-bearing age was estimated at 5.53 children per woman. This rate had decreased from 6.9 in 1980. The adolescent fertility rate is estimated at 122 out of 1,000 births. Some 22 percent of all Nigerian females between the ages of 15 and 19 are mothers. Approximately 87 percent of Nigerian women do not use any method of contraception. Maternal mortality, like child mortality, is high in Nigeria. Annually 800 women die per 100,000 live births. Many of these deaths occur because 65 percent of Nigerian women give birth outside the presence of professional medical staff, even though 64 percent of all pregnancies are considered to incur high risks.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Nixon, Richard (Administration)

PRESIDENT RICHARD NIXON (1913–94) came to office in January 1969 criticizing the inefficiencies and waste of his predecessor's antipoverty programs. Nevertheless, he did not terminate any major Great Society programs; some were expanded and he introduced some efficiencies. In every budget Nixon proposed, and for the first time since World War II, appropriations for all "human resource programs" were greater than de-

fense spending. Social welfare services received an increase from \$55 million in 1970 to approximately \$132 billion in the 1975 budget adopted in 1974. During Nixon's first term alone, Social Security benefits increased by 51 percent and Medicaid and Medicare benefits rose from \$7.8 billion to \$11.5 billion. Funding for the elderly went up by 71 percent. Cash transfers to those in poverty rose from \$22.4 billion in 1965 to \$34.3 billion in 1973, and in-kind transfers to the poor rose from \$10.8 billion in 1969 to \$26.6 billion in 1974, the last year of Nixon's administration.

WELFARE REFORM

Nixon considered the welfare system the biggest failure of Lyndon Johnson's War on Poverty and identified welfare reform as his Republican administration's highest domestic priority. During the 1968 presidential campaign, he promised to remake a system he considered inefficient, unfair, and demeaning. In his acceptance speech at the Republican National Convention he said, "What we need are not more millions on welfare rolls, but more millions on payrolls." His address reflected the public mood, for a poll showed that 84 percent of Americans believed that too many able-bodied people received welfare.

After entering the White House, Nixon focused on the issue. He observed that equivalent families obtained vastly different amounts of financial assistance depending on where they lived. For example he noted that through varying state contributions, a family in one state would receive only \$39 a month in benefits while a family of the same size in another state would receive \$263 a month.

He found that families without a father in the home received larger payments. Accordingly he felt this encouraged fathers to abandon their families. He noted that from 1961 to 1967, 93 percent of new households on welfare were fatherless and complained about the high rate of illegitimacy in welfare households. He learned that many received more money on welfare than working at the minimum wage and felt that the program penalized responsibility and self-sufficiency and discriminated against the working poor.

Nixon also thought the system was plagued with fraud and fostered racial resentment between poor working whites not receiving benefits and unemployed blacks on welfare. Nixon's objections also reflected his disdain for the federal bureaucracy and contempt for the social worker community, both of which he believed benefited from the status quo.

In every budget Richard Nixon proposed, appropriations for all "human resource programs" were greater than defense spending.

Nixon directed his staff to devise a completely new program that would abandon the broad-based services approach to welfare, whereby the poor received a host of services and assistance (Medicaid, food stamps, school lunches, and Aid to Families with Dependent Children). After months of study and debate within the administration, a process in which Nixon was intensely involved, the president unveiled his stunning Family Assistance Plan (FAP) during a televised speech on domestic policy on August 8, 1969. Its original working title was the Family Security System, but that name was discarded because it sounded like a New Deal enactment. What Nixon offered was bold and in his view risky, but he also felt it was the only true reform with any prospect of winning the support of the Congress and the American people.

Instead of reducing assistance, Nixon proposed dramatically expanding it by providing payments to the working poor as well as the unemployed. The FAP would make three times as many children eligible for federal financial assistance and 13 million more Americans in all. Research showed that FAP would swiftly

776

pull 60 percent in poverty above the poverty level. Families with and without fathers in the home would be treated no differently. Heads of households receiving payments would be required to work or submit to job training, unless the head of household was the mother of preschool children. Nixon would call this feature workfare. If a head of household refused to comply, only that parent's portion of the FAP payment would be terminated.

What was revolutionary was the income base proposed. Without expressly saying it, Nixon was calling for a guaranteed annual income, something he had denounced during the presidential campaign, regardless of employment status or the whereabouts of fathers. The minimum income for a family of four would be \$1,600. This was subsequently increased in a 1971 revision to \$2,500. Instead of penalizing those earning wages, Nixon's plan sought to encourage such resourcefulness and promote families' financial stability. Therefore wages earned over the original FAP income of \$1,600 would be discounted. This would allow a working family of four to receive federal payments up to a maximum combined income or salary and FAP of \$3,920. Although states were expected to continue making contributions, their financial burden would be significantly reduced.

The new program would make uniform the administration of welfare through federalization and reduce the overall combined state and federal welfare bureaucracy. Particularly pleasing to Nixon was elimination of the multiple social services strategy. This, he believed would reduce the number of social workers and erase the stigma suffered by the poor under the intrusive and patronizing broad services approach. FAP would require an initial \$4 billion first-year start-up investment, but it was thought that this and more would be recouped as recipients entered the workforce and began to prefer the rewards of employment to the dependency and limitations of welfare.

Due to FAP's progressiveness, Nixon expected opposition within his own party and did receive it from conservatives like Governor Ronald Reagan of California. What surprised him was the opposition from the left. After initial praise in the press, liberals began to attack FAP for providing too little financial assistance, despite the increases, and objected to the employment requirement. Social workers and other interest groups claimed it was oppressive, antichildren, and racist.

Nixon concluded that Democrats could not deal with the fact that a Republican had proposed a minimum annual income, something that President Johnson had rejected as too visionary. Nixon also felt that he had declared a real war on poverty that threatened the vested interests of the welfare state. After considerable effort by the administration, the House of Representatives approved FAP, but it was defeated in a Senate Finance Committee dominated by southern Democratic conservatives. In 1971 the House again approved of the measure, but it died in the Senate, "an idea ahead of its time," according to the president.

Nixon also secured national uniformity in the food stamp program.

Nixon moved to a piecemeal approach. One part of FAP that won easy congressional approval on October 17, 1972, was the Supplemental Security Income (SSI). The proposal had been included in Nixon's 1969 domestic policy speech. SSI federalized many state and local welfare programs and guaranteed a minimal annual income for the elderly, blind, and disabled. Some 6.2 million people were eligible from the start (1.6 million blind and disabled and 4.6 million elderly citizens).

Nixon also secured national uniformity in the food stamp program, increased funding for federal student loans for low-income recipients, and automatic cost-of-living adjustments (COLA) for those on Social Security to remove the issue of increases from the political process and help recipients cope with inflation. However, Nixon, no fan of public housing, lost an effort in Congress to permit public housing residents to purchase their apartments. His National Health Insurance Partnership program, which included health insurance for low-income families, also failed.

AGENCY DESTRUCTION

Despite Nixon's acceptance of much of the Great Society, he targeted certain agencies for destruction, particularly the War on Poverty's flagship, the Office of Economic Opportunity (OEO), with its locally managed Community Action Program (CAPS) and Legal Services Program. The president named Donald Rumsfeld his first OEO director with instructions to move acceptable OEO projects to government departments. A number of programs were relocated and reduced, but Nixon decided to drop the idea of dismantling CAPS because of the disorder it might spark in inner cities where its summer youth employment program offered 861,000 jobs. The administration was blocked by a

court order from ending the OEO's Head Start program but transferred it to the Department of Health, Education and Welfare in 1973.

The Legal Services Program, which conservatives accused of engaging in litigation promoting a liberal agenda rather than everyday legal aid for the poor, was extremely controversial. After Rumsfeld fired the OEO associate director responsible for Legal Services for advocating an independent operation, Rumsfeld's successor, the more ideological Howard Phillips, announced his goal of dismantling OEO in general and Legal Services in particular, but the courts blocked him. Eventually Nixon, the Congress, Legal Services supporters, and the American Bar Association united behind the idea of a nonprofit corporation to administer and distribute federal funds for poverty law services to local legal aid organizations.

Accordingly Nixon presented a bill in May 1971 to establish the Legal Services Corporation (LSC), with the stated aim of bringing stability to legal aid and the insulation of the program from politics. Nixon, however, vetoed the bill after Congress inserted limits on the president's authority to select LSC board members and removed limitations on certain types of legal activities. Nixon also found the amended bill objectionable because a childcare program was attached.

Agreements were finally reached, however, concerning the LSC board, restrictions on legal aid attorneys' activities, and the preclusion of federal funding for legal aid support centers, which were seen as encouraging liberal activism. Nixon signed the measure into law on July 25, 1974, his last important legislative achievement. In later years, many liberal opponents would come to fondly recall Nixon's domestic agenda.

Nongovernmental Organizations

NONGOVERNMENTAL Organizations, today known almost universally by the acronym NGOs, is a term referring to those organizations, typically arising or working in the less developed countries (LDCs), that are founded outside government initiative and without government direction. Generally they are civil society organizations and agencies that form spontaneously to address specific needs in a community without the direct involvement or support of the state. With the increasing reach of a global consciousness, several famous NGOs are also based in the developed countries (DCs), but cater primarily to those in the LDCs.

As indigenous self-help organizations, NGOs (or CSOs, community service organizations—there are many other acronyms to describe these organizations) have existed for centuries in many nations across the globe, but it is in the 20th century that these organizations demonstrated enormous vitality, growth, and success.

These organizations usually operate in the informal, noncommercial sector, but within the legal framework of the society. Often they work hand in glove with the established institutions in the public sector, foreign governments, and international organizations such as the United Nations and the World Bank. Amnesty International may be one of the most well-known examples of an NGO with a global presence whose work has earned the organization worldwide admiration and a Nobel Peace Prize.

While NGO activities often complement those of the state by seeking out those whom the bureaucratic or market mechanisms fail to reach, typically the very poorest, there are occasions when NGOs can even be seen as substituting for the state, as in upholding the legal rights of their clients. NGOs operating at local, regional, national, and international levels have been highly successful in meeting needs in the social, religious, advocacy, and political arenas.

In recent decades, partly because of the spread of the Internet and globalization, along with an increased distrust of governments, the NGO movement seems to have come of age. In almost every nation and continent from Ethiopia to Bangladesh, from the Urals to the Andes, thousands of NGOs addressing every conceivable area of need in civil society have cropped up. Some indication of the breadth and depth of NGO activities can be gleaned from the following summary figures. Globally there should be about 50,000 NGOs, but the exact number is unknown because the small, informal

nature of NGOs makes them hard to count. These NGOs cover every aspect of social, political, economic, and civic life and they can be roughly categorized as providing environmental and gender-related services and catering to developmental needs—health, education, and economic. As a single NGO often works in all fields, it may be misleading to seek a division of the NGOs into types. Bangladesh alone is said to have over 3,000 NGOs, of whom about 1,200 deal with problems affecting children.

DUBLIN SOCIETY

Perhaps the earliest instance of NGO activity lies in the work of the Dublin Society in the 1730s. In response to the oppression of English rule, made notorious by Jonathan Swift in *A Modest Proposal*, a group of civic-minded Anglo-Irish protested against the callous neglect of their own ruling class. They not only wrote pamphlets but also trained the poor in new techniques, distributed seeds, and awarded prizes to those who succeeded.

The society was effective and its efforts were copied in due course both in Scotland and in England. The Dublin Society also showed the major limitation of the market in dealing with human development—its reliance only on the individualistic, or self-seeking, parts of human nature. But humans are social animals and if we neglect the enormous sacrifices people are happy to make for the sake of others, we lose one of the strongest forces for changing and uplifting society.

NGOs have in a sense taken over those activities that were undertaken by churches and missions in the past. While NGOs based on religion are still quite easy to find, the recent spread of NGOs owes a good deal to modern communications, which have made the world quite compact. NGOs in the developed countries often embody ideals for all humanity—as in the case of Amnesty International for political victims, and in the work of Paul Farmer and Partners in Health for the sick of Haiti.

The rise of NGOs is a response to the demand that economic development be a part of human development and that therefore economic development be accompanied by a widespread fulfillment of basic human needs. The market mechanism has many virtues, but it is limited in that it counts every dollar as being equal, while the human imperative is to count every person as equal. When the state is strong and motivated, it can find ways to supplement the market and provide for equitable human development. But alas, one of the rea-

sons for the persistence of underdevelopment is the plentitude of weak and corrupt states. The NGO can be seen as a response to poverty in the absence of those preconditions, such as a functioning civil society and a strong caring state, that were met by a variety of means in the developed countries of the world.

It is rare for an NGO to be financially self-supporting, and the need to obtain and justify their funding puts a considerable strain on the pure intentions of the NGOs. The process of NGO growth began earnestly in the 1970s and by the mid-1980s, NGOs were so prominent that special issues of development journals were dedicated to them and there was serious talk of funneling aid through the NGOs so as to bypass the reputedly corrupt state.

In the economist's worldview, a market consists of autonomous agents who choose commodities in the marketplace to satisfy their desires. Firms produce those goods that give rise to the highest profits because these profits are a good indication of the intensity of people's desires. When faced with the reality of LDCs, this characterization is readily seen as flawed. Here are some indications of the lacunae in the economist's picture of the poor.

It is almost a definition of poverty that one is dependent upon daily effort just to survive, so the image of individuals who choose among, say, varieties of candy to maximize their preferences, has no bearing on the psychological and sociological reality of the lives of poor people. Individuals are so poor that they live in a regime of need, not of choice. Decisions are made not by all individuals but by a selected subset, typically the males, and hence the voices and needs of the women and children are seldom directly expressed. The preferences of individuals are directed by social forces and manipulated by market greed. When the poor wish for equity or redress, they find legal methods are hard to approach or implement.

The need for NGO activity arises from a consideration of all these limitations of the market. This may be seen by some examples: young girls are married off before they are adults, education and jobs are scarcer and less paid for women—so NGOs for women form a significant part of the NGO movement. Children are largely voiceless and their future stunted by a lack of education and by elementary deficiency of public health; NGOs for primary education, inoculation, and childcare cater to this gap in the market. The profits of powdered milk led companies such as Nestlé to provide powdered milk as a substitute for breastfeeding. Because of the absence of clean water this was a bad move

in any case, but the new mothers were not informed about the medical superiority of breast milk and only shown the convenience of bottle-feeding their babies. Such acts of preference manipulation for profit show how the assumption of individual autonomy needs to be used with care.

BANGLADESH

There are many excellent NGOs all over the world, but as Bangladesh is one of the poorest nations of the world, a review of the development and success of two famous Bangladeshi NGOs will be illustrative. Since its birth as an independent nation in 1971, Bangladesh, widely recognized as a disaster-prone poor nation, has seen a rapid and sustained growth in the NGO sector. Despite rather tight control maintained by the government—there is a separate department in the ministries to deal with NGOs—according to one estimate there are over 3,000 registered NGOs, of all shapes and sizes, in the country.

Many NGOs, such as the Bangladesh Rural Advancement Committee, or BRAC, and the Grameen Bank (GB), are a direct response to widespread poverty, which has haunted the people of Bangladesh for many years. The genesis of BRAC and GB can be traced directly to the violence, scarcity, and hunger that gripped the nation in the early 1970s. Their success is a testimony to the determination and ability of the human communities, however desperate, to solve their problems on their own.

BRAC is a private NGO focused on development efforts in rural Bangladesh. BRAC may be the world's largest NGO that many also consider to be one of the best known and managed of the genre. Founded in the early 1970s, BRAC and its founding executive director, F.H. Abed, have received numerous awards for their work including the Rotary International Award for community development, the World Hunger Award, the UNESCO award for adult education, and the Ramon Magsaysay Award, considered the Asian equivalent of the Nobel Prize.

These awards are in recognition of the success of BRAC in teaching oral rehydration for diarrhea to 13 million women in 68,000 villages; for establishing over 30,000 primary schools in the countryside especially for girls; and for its reputation as a learning organization that is able to scale up rapidly and effectively, according to Catherine Lovell in 1992. By 1991, BRAC employed over 4,700 full-time staff and 6,000 part-time teachers and carried on its educational and develop-

mental work amongst the "poorest of the poor" with an annual budget of \$20 million. In the early 1990s, its projects spawned 4,000 villages, involving over a half million citizens in 7,000 voluntary organizations. Members of the BRAC microcredit programs, mostly women, saved \$3 million and received in excess of \$12 million in loans. Each year over 100,000 new members in 2,000 additional villages are brought into these programs, with annual growth of expansion at 30 percent.

The Grameen Bank (GB) is one of the largest and most successful NGOs in Bangladesh. It has grown to the status of an NGO-microcredit bank partnership, highly regarded for its programs in microfinancing and technology (cell phones) to empower women entrepreneurs in rural Bangladesh. Established in the late 1970s by its founder, Professor Mohammad Yunus, by 1994 the bank counted over two million members.

The success of the Grameen Bank has spawned microfinance banks and programs not only in Asia and Africa but also in Europe, Canada, and the United States in what may be called a first "Third World Technology Transfer" to the industrialized nations. The GB philosophy rests on the principles of self-reliance, entrepreneurship, collective efforts, and viewing the poor as customers rather than simply beneficiaries or welfare recipients.

The bank operates in over 35,000 villages and is an example of what Dr. Yunus calls socially conscious capitalist enterprise, as shown by David Bornstein. A clearer vision of the role played by NGOs can be had by examining the following pledge that all new members give and to which they are expected to adhere. In 1984, in the national meeting of the Grameen Bank, members adopted a document called the Sixteen Decisions, which was to be recited at every meeting:

- 1) We shall follow and advance the four principles of the Grameen Bank—discipline, unity, courage and hard work—in all walks of our lives.
 - 2) Prosperity we shall bring to our families.
- 3) We shall not live in a dilapidated house. We shall repair our houses and work toward constructing new houses at the earliest opportunity.
- 4) We shall grow vegetables all the year around. We shall eat plenty of them and sell the surplus.
- 5) During the plantation season, we shall plant as many seedlings as possible.
- 6)We shall plan to keep our families small. We shall minimize our expenditures. We shall look after our health.
- 7) We shall educate our children and ensure that we can earn to pay for their education.

- 8) We shall always keep our children and the environment clean.
 - 9) We shall build and use pit-latrines.
- 10) We shall drink water from the tubewells. If it is not available, we shall boil water or use alum to purify it.
- 11) We shall not take any dowry in our son's weddings, neither shall we give any dowry in our daughter's wedding. We shall keep the center free from the curse of dowry. We shall not practice child marriage.
- 12) We shall not commit any injustice, and we shall oppose anyone who tries to do so.
- 13) We shall collectively undertake larger investments for higher incomes.
- 14) We shall always be ready to help each other. If anyone is in difficulty, we shall help him or her.
- 15) If we come to know of any breach of discipline in any center, we shall go there and help restore discipline.
- 16) We shall introduce physical exercises in all of our centers. We shall take part in all social activities collectively.

It will be seen how all the bases of functioning in a participatory democracy are encouraged: health, education, civic rights, and economic cooperation are all covered. While gender equity is not explicitly mentioned, it is well-known that the overwhelming majority of successful GB members are women. The point that needs to be emphasized—and it is one that becomes inescapable if one views any of the videos showing actual GB meetings and activity—is that people are being motivated to change themselves and their communities.

Despite their success, developmental NGOs are not without critics.

Not everyone is willing to make such a commitment and plunge into a lifestyle-altering venture. But for those who do, it is rewarding, both on an individual and a social level. Such explicit raising of awareness is not unique to GB. Each member of BRAC also has to learn some 17 points that bind him or her to certain kinds of social behavior. These points are repeated at the beginning of each meeting and are printed at the back of each member's savings book.

Despite their success, and indeed perhaps because of their success, developmental NGOs are not without critics. Some hold that these organizations are beholden to foreign interests and agendas since they derive the bulk of their financing from foreign sources. They have been called the tools of international capitalism by attempting to subvert the inevitable revolution. Skepticism of NGOs is now spreading in the contemporary literature. Indeed, nestled as they are between state and society, and attempting to change both, NGOs almost invite critique. The leftists believe that such organizations can only dissipate radical energies by effecting cosmetic change while the right wants all recipients to rapidly become self-sufficient and avoid social or political radicalism. NGOs cannot be radical, or neither the government nor the foreign donors will tolerate them for very long, while if the NGO projects really were financially viable, the market would serve to do the job.

These are also systemic problems. As NGOs need to compete for funds from donors, this strips them of much-needed autonomy. Current NGO culture has been critically described as follows, by Kendall W. Stiles: "They are apolitical, professional, accountable to foreigners, and often very large and wealthy relative to other civil society actors." The NGOs frequently become captive clients who have to undertake whatever the foreign donor decides to finance. While this is stated about NGOs in Bangladesh, it probably reflects a wider problem.

In such circumstances, the needs of the poor can become secondary to the need of the NGO to survive. The list of criticisms can be extended. Others have charged that NGOs represent foreign interests and undermine national interests, culture, and agendas. They introduce alien ideas, religious and other, and agendas harmful to the indigenous culture. NGOs are too small and localized to make a substantial dent in poverty, which necessitates macrolevel and substantive interventions. Finally NGOs operate below local laws, in a nontransparent manner and are not accountable, conditions that breed corruption and mismanagement.

NGOs rose to prominence in the last three decades because of the shortcomings of the state and of the market. They are local, flexible, and trust-based; hence they can be quick and flexible in dealing with community problems. However, their effect is necessarily limited because of their small size, informality, and weak linkages with the power structure. These same features mean that accounting and transparency are hard to enforce, and this opens the NGOs to suspicion of foreign manipulation.

On the whole, NGOs arise to represent real needs and are caught in an impossible vice between the powerful and the powerless; but when they work well, they are commendable. SEE ALSO: Antipoverty Organizations; Bangladesh, International Nongovernmental Organizations; Microcredit.

Nonincome Poverty

NONINCOME POVERTY IS poverty status that occurs from restricted access to opportunity and resources necessary for health and safety. Nonincome poverty includes lack of social services and infrastructure such as education, primary healthcare, water, sanitation, roads, and power. It also includes environmental degradation or the lack of natural resources necessary for human well-being. While income poverty, or the lack of adequate household income, is closely linked, nonincome poverty encompasses a wider range of factors that contribute to conditions of poverty. It also helps us to understand the extent and experience of poverty and to develop appropriate poverty reduction strategies.

While nonincome poverty is often defined as the range of contributing factors to poverty that deal primarily with noneconomic issues, such factors directly impinge on the economic well-being of households. Nonincome poverty, for example, includes a lack of asset wealth that people can draw upon to sustain themselves above poverty or use to rise out of poverty. Asset wealth comes in the form of human capital (knowledge

and skill) and in the form of financial assets such as owning property, a home, a business, or a savings account.

MEASURES OF NONINCOME POVERTY

Official measures of poverty typically focus only on income levels, underestimating the importance of household wealth, skills, and opportunities to overall economic health. While considerable literature suggests various ways to measure nonincome poverty (for example, material hardship, social deprivation, isolation, civil conflict), no single variable yields a complete picture.

In the United States, where the official poverty measure is strictly linked to income, other factors associated with hardship suggest that the official measure is not sufficient to identify the extent and nature of human deprivation. Some scholars, for example, found that the incidence of material hardship was differentially correlated with income across different demographic groups, leading to suggestions that noncash benefits, homeownership, and access to credit, among other factors, should be included in calculating official measures of poverty.

A study of household net worth and liquid wealth finds that, despite a sharp decline in the official measure of poverty, which is based on income, the asset-poverty rate in the United States barely changed over the 1984-to-1999 period and the severity of American poverty increased despite economic growth and a booming stock market.

The asset-based poverty rates are, on average, two to four times higher than the official poverty rates for almost all U.S. groups. The underlying theme is that in all nations income-based poverty measures alone are insufficient to capture the true nature and extent of poverty. Moreover the poverty experience varies, depending on culture, asset wealth, and social infrastructure of a society.

EFFECTS OF NONINCOME POVERTY

Structural factors such as economies, social policies, and political decision-making create conditions that reduce or preclude the building of household assets and human capabilities. Moreover nonincome poverty is often the outcome of inequity in the control of resources, reflecting lack of legal rights, political instability, and conflict. It also can result from cultural instability stemming from threats posed to ethnic, racial, and religious groups.

A key source of nonincome poverty is the movement of people from stable living situations. Globalization, for example, produces changes in structural conditions in societies that, in turn, lead to the movement of people between and within countries. Populations also move for security reasons, such as when refugees must flee war zones. Dislocation of populations also stems from environmental factors such as droughts. The changes associated with population movements impact traditional community and family structures based on kinship, ethnicity, and religion. As these structures break down, they often result in a loss of social capital and an increase in non-income-related poverty.

The unequal distribution of power and access to political participation is another source of nonincome poverty. Powerful and wealthy elites often control political systems and limit broad-based development, democratic decision-making, and the protection of a judicial system. The poor, in turn, do not have the wherewithal to access human capital and financial assets; resources for production such as land, credit, and seeds; and protection from crime and manipulation. Nor do they have sufficient power to influence infrastructure development that can reduce conditions that contribute to nonincome poverty, for example, roads for the transport of goods, and transit for accessing jobs, education, or healthcare.

Women and children are vulnerable to the effects of nonincome poverty.

Women and children are particularly vulnerable to the multiple effects of nonincome poverty, especially in rural areas and under conditions of food insufficiency, disease, malnutrition, and inadequate healthcare. In many African nations, as well as elsewhere, infant mortality rates are excessively high, and parents who are sick and dying of AIDS orphan older children. Educational status compounds conditions of insufficient food and healthcare. Nearly one-third of Tanzanians, for example, cannot read or write. Young people without adequate formal education and job training face severely limited opportunities for employment as they move into adulthood.

Gender biases have long been documented in earnings, employment opportunities, and time spent within the unpaid care economy. Women suffer from high levels of poverty not only because they perform a signifi-

cant amount of unpaid or underpaid work, but also because they face burdens in other areas of their lives. Girls' educational enrollment is particularly low in nations such as Chad, Yemen, Benin, Niger, and Ethiopia, representing a major gender constraint in realizing opportunities to move out of poverty. Likewise women systematically face limited access to basic economic and social assets, including ownership and inheritance rights to land. It has been shown, for example, that in Thailand and elsewhere, it is women's lack of access to assetbuilding opportunities rather than lack of income alone that limits the nature and expected trajectory of their economic well-being.

POLICIES AND NONINCOME POVERTY

Policies to promote economic and human development need to focus not only on income but also on factors such as social services, infrastructure development, human security, and democratic political participation. This includes targeted and sustainable improvements in health; education; nutrition; access to basic water, sanitation, and transport; and increased and equal opportunities for marginalized groups in society.

The United Nations Commission on Human Security identifies a number of policy options to comprehensively address the political, social, environmental, economic, military, and cultural systems that provide people with the building blocks of survival, livelihood, and dignity. Access to resources and services for livelihoods and protection from widespread threats and conflict help to reduce poverty by ensuring economic security, freedom of choice and action, social wellbeing, and freedom from corruption, violence, and powerlessness. Building sustainable services for literacy, education, health, medical care, housing, employment, unemployment compensation, survivors' benefits, oldage pensions, maternity benefits, and similar social provisions are all major factors in reducing nonincome poverty.

Studies of development initiatives in the Asian Pacific region highlight the importance of sustainable initiatives such as those mentioned above. Roads reduce travel time and provide better access to basic education and health services. Electricity provides more hours of light, increasing the time for studying and years of schooling. It also increases safety and security and enables better medical services in rural areas.

Ensuring participation in democratic decisionmaking is another highly important factor. As poverty is the result of economic processes as well as social and political interactions, it can be addressed, in part, by involving the poor in formal democratic processes thus enhancing the allocation of resources, development of services, and their involvement in the processes of accountability. Economic growth policies, however, remain central because they can increase government revenues, stimulate private-sector development and employment, and provide critical resources for investments in social services, infrastructure, and environmental services.

Government investments in physical and human capital can increase rates of social development and economic return. Nonincome poverty, for example, is directly linked to individual and household asset ownership, the resources and capacities that enable people to become more self-sufficient.

Asset policies are needed to enable people to 1) build human capital through adult literacy, universal primary education, and maintaining good health; 2) acquire financial assets through land reform and acquisition, home and business ownership, access to credit, and an infrastructure to promote and protect savings and opportunities for growth such as investment in transit and electricity; and 3) create and preserve an asset foundation by supporting sufficient wages and other protections that ensure livelihood, such as primary healthcare, unemployment compensation, and laws and other social protections that provide mutual safeguards in cases of economic, social, or environmental instability.

Maximizing human resources and ensuring the means to build assets and meaningful social and economic mobility for individuals and households constitute the broad policy approaches needed to reduce and eventually eliminate nonincome poverty.

Nonworking Poor

SINCE THE FEDERAL definition of poverty is the income-based Orshansky measure, it is no surprise that there is a correlation between not working and poverty. In 2003 nearly two-thirds of those aged 25 to 65 did not work in the week prior to being surveyed by the Current Population Survey (CPS), compared to one-quarter of the entire CPS sample.

However, the term *nonworking* includes both the unemployed and those out of the labor force, which are very different outcomes. For example, within the unemployed are those without work for cyclical reasons, which tend to be short spells. Those out of the labor force and living below the poverty line represent a more interesting paradox since they are choosing not to use employment to climb out of poverty.

Economists use the reservation wage to explain this phenomenon. The reservation wage is the minimum acceptable wage for someone to take a job. A potential worker compares the reservation wage with the wage offer, which could be an actual offer or just information about the wage for a given job. If the wage offer is below the reservation wage, then it is rational not to work.

The reservation wage represents the value of one's time. Several factors, including those specific to the individual and a geographic area, affect the reservation wage. Individual factors include attitudes/preferences toward work and leisure, education level, opportunities for home production, number of children, marital status, and household income.

In general, as education increases, the reservation wage increases since a highly educated worker views him/herself as more productive. As family size increases, the effect on the reservation wage is unclear. As the number of children increases, so do family budgetary needs but also childcare costs if working is done in place of staying home with the children. Geographic factors include idiosyncratic attitudes about the types of available jobs (for example, the industry and occupation). This rationale is the compensating differentials theory of wage determination.

Geographic differences create pockets of unemployment and poverty.

Several of the above factors also affect the wage offer. As education increases, the worker is likely to be more productive and therefore receive a higher wage offer. The wage offer could also vary across industries and/or occupations because of productivity differences, perhaps stemming from differences in the capital stock. The geographic market also affects the wage offer. If a potential worker lives in an area with high unemployment and/or few employment prospects, firms may be able to bid the wage down because of the surplus of available workers.

It is these geographic differences that create pockets of unemployment and poverty, such as inner cities, Appalachia, and the Mississippi Delta. Since the wage offer includes both job offers and information about a wage, information differences also affect the wage offer. For example, there is evidence that job seekers differ in the ability to gather job market information.

Fluctuations in the rates of poverty, the unemployed, and those out of the labor force are often driven by macroeconomic trends. The majority of the literature examining this link focuses on the relationship between unemployment and poverty, though employment growth is obviously an important part of this relationship. In general, macroeconomic expansions that create jobs increase employment and lower unemployment and poverty, though this relationship does not always hold. Some experts argue that expansion in the mid-1980s did not lower poverty as much as earlier expansions because of real wage declines for low-skilled workers.

Another line of research is the impact of government social safety nets on work incentives. If the state offers a generous welfare system, there is little incentive to become employed. The longer the spell of unemployment continues, the more difficult it becomes to

transition into work. The latter effect is referred to as the dependency problem. The literature finds that welfare, specifically Aid to Families with Dependent Children and food stamps, creates negative work incentives. Specfically the presence of these programs decreases labor force participation. In addition, higher welfare benefits tend to increase participation in these programs. However, the literature also suggests these programs are not necessarily responsible for poverty among the nonworking. Many of those who receive welfare benefits (and therefore live below the poverty line) would likely still be poor in the absence of the program.

Normative Standards

NORMATIVE STANDARDS FOR conditions of poverty arise in Western philosophy from the nature of ethics. They also rise from religious beliefs. Normative standards can be developed by groups, such as professional organizations, in the way that rules of a game like baseball or contract bridge have been developed by convention.

Ethics, a branch of the theory of value or axiology, is concerned with questions of right and wrong or of good and bad. In regard to poverty, it is usually viewed as bad when it is suffered involuntarily rather than voluntarily. Economics is concerned with the allocation of scarce resources, material goods, and services, and is actually a part of ethics; until about 150 years ago economics was taught as a part of ethics. However, the rise of a scientific approach to human problems and their

study ethics has been separated from economics. In fact the separation is artificial. All of economics is the concern of politics and both ethics and politics is the concern of ethics. Their ethical nature is concerned with the fact that they cannot be separated from humans. What happens to humans, how they treat each other and use the power of government to allocate the resources of land, labor, and capital, is inherently ethical.

The same ethical nature is at the heart of labor or work. People who are organized into groups, in corporations, companies, communes, or any other kind of economic enterprise, must of necessity have relationships. How they treat each other, how they are managed, and how their labors are rewarded are of vital ethical concern.

In the history of the West, Christian moral philosophy has viewed the voluntary assumption of poverty for the sake of service as an ideal. In Roman Catholicism monks and priests renounce the ownership of goods in order to be free to serve the church without being distracted by worldly cares. In Protestantism ministers are supported by their congregations so that the ministers may serve the congregation without the worldly concern to make a living.

Poverty is also a voluntarily assumed status undertaken by Buddhist and Jain monks as well as others. The goal of self-assumed poverty in Eastern religions is to renounce the world as an ascetic in order to gain spiritual enlightenment or purity. In Hinduism poverty is viewed as the just deserts or the working-out of the law of karma. The person who is poor is suffering from the effects of past deeds. It is therefore not the duty of a Hindu or other adherents to Eastern religions to reduce the suffering of the poor by charity.

For most of the people of the world poverty is viewed as a negative condition in life. People who are poor are deprived of opportunities for education, travel, growth, or even the necessities of life. In the Abrahamic religions of Judaism, Christianity, and Islam it is the duty of believers to aid the poor. In the case of Judaism and Islam there are merits acquired because of the good deeds done in feeding the hungry or stopping the injustices that cause economic inequality. These beliefs are a part of their views on social justice.

In Christianity, which preaches salvation by the grace of God through the atoning death of Jesus Christ, good works have no saving merit. However, they are considered a sign of the faith of the true believer. Some of the gravest condemnation for false belief in the New Testament is reserved for those who professed faith but ignored the needs of the thirsty, the hungry, the naked,

children, orphans, widows or others in need. Social justice and charity are thus considered in Christianity to be good works, and are expected because they are a sign of a grateful heart thanking the Savior for the gift of salvation. Good works do not produce faith, but without them faith may be an illusion and may even be the cause of damnation.

The history of Christianity since the 1870s has included a social gospel movement that is part of a social justice movement. Its concern arises from the humanist view that people are important. This belief is shared with the humanist moral element in socialist and communist movements, which have also viewed the treatment of people, especially of workers as a major ethical issue.

In recent decades human rights philosophies have been used to justify critiques of the economic status quo. The claim has been asserted as a moral principle that all people are created equal and are therefore entitled to a fair share of the world's production of goods and services.

North American Free Trade Agreement

THE NORTH AMERICAN Free Trade Agreement (NAFTA) is a treaty among the United States, Mexico, and Canada that abolishes or diminishes taxes and other obstacles to trade and investments among the partner states.

NAFTA was signed on December 17, 1992, and was implemented on January 1, 1994. The treaty is seen as a first step toward the creation of free trade within the

Americas, the Free Trade Area of the Americas (FTAA). Far from receiving unanimous support, NAFTA has provoked serious concerns from labor; religious and environmental groups claim that U.S. industries relocate to Mexico, taking advantage of lower wages and fewer work regulations. Its critics argue that NAFTA is not an effective agreement to fight poverty and that its ambitious promises have failed to materialize. At the other end of the political spectrum, economic nationalists also oppose NAFTA.

Many large corporations and big-business interests support NAFTA.

NAFTA establishes free industrial trade within the partner countries to be implemented within 15 years. Duties on many import categories were removed soon after the signing of the treaty, while the clauses on agriculture will be applied by 2008. The agreement also includes the lifting of trade barriers not directly linked to taxes, such as quotas or sanitary measures. Sectors explicitly excluded by NAFTA are air transport, telecommunications, and government services. Special bodies were created to supervise the implementation of the treaty, such as the Free Trade Commission, the Commission for Labor Cooperation, the North American Commission for Environmental Cooperation, and the North American Development Bank. Yet these institutions have very little power. On the contrary, the institutions created to settle possible disputes arising within NAFTA provisions enjoy wider power. The rulings of arbitration panels such as the International Center for the Settlement of Investment Disputes (ICSID) cannot be appealed in national courts.

Many large corporations and big-business interests support NAFTA. They claim that the treaty will create new well-paid jobs in the United States, improve living standards in partner countries, and give strength to Mexico's developing economy. Supporters of NAFTA point out that there has been an incredible increase in trade among the partner countries, especially between the United States and Mexico, since the implementation of the treaty.

Yet its detractors argue that NAFTA has failed to deliver its promises of increased wealth and environmental preservation. On the contrary, the treaty seriously damaged the economic and living conditions of both American and Mexican citizens. They estimate, for example, that the relocation of American businesses to

Mexico has cost over a million U.S. manufacturing jobs. The companies that relocated to Mexico made the most of the low wages in the country and local workers are still without any tangible legal rights that they can use to raise their wages.

According to Martha Ojeda, director of the Coalition for Justice in the Maquiladoras, Mexican workers in industries along the border are paid as little as \$4.20 a day, a figure that is the same as 10 years ago. Official trade unions are unwilling to fight for pay arises and for better working conditions. Workers' attempts to organize in independent unions have been met with open hostility, which included plant closure and police repression. Those Americans who lost their jobs to relocations have usually found less secure jobs than their original ones. In addition only a limited area of Mexico benefited from the trade agreement.

Commercial and industrial growth was restricted to the border region. The agricultural sector in Mexico has suffered greatly from NAFTA. Small farmers have been the most damaged category, with over one million farm families losing their business. These landless campesinos were forced to emigrate to American and Mexican cities, increasing overcrowding and unemployment. To accommodate NAFTA terms, the Mexican parliament abolished Article 27 of the country's constitution, which allowed communal landownership. The Mexican middle class is becoming increasingly impoverished as a result of NAFTA.

Environmental and human rights groups fiercely oppose NAFTA. They have announced that the border area between Mexico and the United States, where the industrial benefits of NAFTA are most apparent, has suffered considerable health and environmental problems. The lack of sewage treatment and safe drinking water has increased the rate of environmental diseases such as hepatitis to two or three times the national average. Human rights in the border area were also damaged by the introduction of NAFTA.

Immigration controls along the border have increased, and border patrols have more than doubled throughout the 1990s. In 1999 alone, 356 migrants died in desperate attempts to avoid patrols while crossing the border.

The philosophy behind opposition to NAFTA is best summarized by Zwelenzima Vavi, the head of the South African Congress of Trade Unions: "In the pursuit of profit governments are told to remove worker protections, and then use that as an inducement for investment. But development is a wider concept. It includes social development, and the living conditions of

the people. Development can't exist with mass unemployment and poverty."

Norway

THE KINGDOM OF Norway makes up the westernmost area of the Scandinavian peninsula. Approximately 70 percent of the country's area is uninhabited, covered only by mountains, glaciers, moors, and rivers. After two centuries of Viking raids from the 8th to the 10th centuries, Norway was converted to Christianity. For the next 400 years, Norway was merged into Denmark. In 1814, Norway refused to become part of Sweden, opting instead to adopt a new constitution.

Sweden's subsequent invasion could not stamp out rising nationalism, and Norway established itself as a constitutional monarchy in 1905. During World War I, Norway's neutrality did not protect the country from devastating economic losses to the shipping industry. Neither did neutrality prevent German invasion during World War II. After World War II, Norway abandoned neutrality to join the North Atlantic Treaty Organization. The question of membership in the European Union (EU) has continued to be a volatile issue in Norway over the last several decades. Despite its decision not to become a member, Norway does contribute to the EU budget.

Offshore oil and gas were discovered in Norway in the late 1960s, paving the way for Norway's emergence as the fourth richest nation in the world, with an annual per capita income of \$40,000. Norway is the third largest oil exporter in the world, after Saudi Arabia and Russia. Other natural resources include iron ore, copper, lead, zinc, nickel, and hydropower. The Norwegian economy is heavily dominated by services, which employ 74 percent of the labor force. Some 22 percent of

the workforce are engaged in various industries, and the remaining four percent of workers are involved in agriculture, forestry, and fishing. Currently unemployment stands at 4.3 percent.

Norway has an extensive welfare system that is derived from a combination of capitalism and government intervention. While the state maintains control of key industries, including the oil industry, efforts to privatize other industries continue. Well aware that the oil and gas resources are finite, the government has placed surpluses in a trust fund of some \$150 billion. The quality of life is understandably high in Norway. For several years the United Nations Human Development Report has ranked Norway as the top country in the world on quality of life issues.

As a result of the high standard of living and the low wage differential, Norway has a minimal amount of poverty. A 1995 study revealed that 4.4 percent of the population earned less than 50 percent of the minimum wage. By 2005 that number had risen to 6.4 percent. Over four percent of the population live on less than \$11 a day.

Although inequalities are not comparatively low in Norway, they do exist. The poorest 20 percent of the population claim 9.6 percent of resources, and the richest 20 percent share 37.2 percent. Norway is ranked 25.8 on the Gini Index of Human Inequality.

Norwegians most likely to be poor are children, young people, single providers, and non-Western born residents. The Action Plan Against Poverty was established in 2002 to combat existing poverty. The program promotes employment while targeting welfare schemes and enhancing social inclusion. Child support standards have also been amended to improve the quality of children's lives.

Norwegians enjoy a life expectancy of 79.4 years. With a project life span of 82.17 years, females generally outlive males (76.78 years) by about five years. The population of 4,593,041 has a median age of 38.17 years. Nearly a fifth of the population is under the age of 14 and almost 15 percent have reached the age of 65. All Norwegians have access to safe drinking water and proper sanitation. Healthcare is readily available, and there are 367 physicians for every 100,000 residents. Less than five percent of the population are unable to afford essential drugs.

Between 1970 and 2005, infant mortality in Norway fell from 13 to 3.7 deaths per 1,000 live births. During that same period, the mortality rate among all children under the age of 5 declined from 15 to five deaths per 1,000. Five percent of Norwegian infants are under-

Despite having remote regions with difficult access, such as Balstad Harbor above, Norway has been ranked by the United Nations Human Development Report as the top country in the world for several years on quality-of-life issues.

weight at birth. Childhood immunization rates range from 88 to 91 percent.

The Norwegian fertility rate is 1.78 children per woman. For adolescents the fertility rate is 10 out of 1,000 births. Approximately 74 percent of women use some method of birth control. Trained medical staff attend all births in Norway, and all women have wide access to healthcare. Based on modeled estimates for 2000, maternal deaths occur at a rate of 16 per 100,000 live births.

All of the population over the age of 15 can read and write, and all Norwegian children complete primary and secondary school. About 70 percent of the relevant age group receive a college or university-level education.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Nutrition

THE BIOMEDICAL LITERATURE clearly establishes a strong link among malnutrition, ill health, and premature death. Malnutrition is a major world problem, affecting 40 to 50 percent of the world's population. Malnutrition takes two broad forms: protein deficiency

and micronutrient deficiency. Protein-deficient diets are a leading cause of underweight babies and children. The arrested development in children is associated with major physical impairments in adulthood. Moreover once severe protein deficiency develops, the likelihood of death is approximately 25 percent. Estimates indicate that protein deficiency affects more than one-third of the world's children.

Micronutrient malnutrition is largely related to dietary deficiencies of three key elements: iodine, iron, and vitamin A. Iodine deficiency is the leading cause of preventable brain damage in the world. This deficiency causes a variety of physical and mental disabilities, including enlargement of the thyroid, dwarfism, and various degrees of mental retardation. The most common nutritional deficiency, affecting more than one billion people worldwide, is iron deficiency. Low levels of iron give rise to impaired learning, low work capacity, low birth weight, and increased maternal mortality. In developing economies more than 40 percent of women are anemic.

By some estimates, 20 percent of maternal deaths are caused by severe iron deficiency. Finally vitamin A deficiency inflicts eye damage and increased severity of infections on more than 200 million people worldwide, with some 13 million people suffering night blindness or total blindness. It is estimated that yearly, between 250,000 and 500,000 preschool children go blind from vitamin A deficiency and some two-thirds of these die shortly after becoming blind.

INCOME, NUTRITION, AND HEALTH

Economists have long established that income has a strong effect on nutrition and health. The adverse health consequences of declines in living standards in poor countries can be catastrophic. Even for countries at a middle level of development, a deteriorating economy can have serious health effects on the population. For example, in the former Soviet Union and eastern Europe, malnutrition was not a general problem from the early 1960s until the mid-1980s. Indeed in these countries the per capita availability of calories, proteins, and fats rose significantly.

However, there were serious imbalances in people's diets, especially among urban dwellers and low-income groups. In brief, diets tended to have too high a proportion of cholesterol-rich products (such as eggs and animal fats), sugar, bread, and alcohol, and too small a share of fruits, vegetables, and good-quality meat. Such dietary imbalances led to anemia and micronutrient de-

ficiencies and their related health problems as well as a high prevalence of overweight people and cardiovascular diseases.

Such health problems have been greatly exacerbated by the economic problems associated with the transition to a market economy in eastern Europe since the late 1980s. For example, in the period 1989–92, living standards in eastern Europe declined between 18 and 39 percent. Food intake was lowered and diets became even more unbalanced, especially among the poor. Nutritional deficiencies appear to have put at greater risk groups such as young children and pregnant women who require proportionally greater amounts of protein and micronutrients.

Economists have established that income has a strong effect on nutrition and health.

For example, two surveys by the Bulgarian Institute of Pediatrics indicated an eightfold rise in underweight infants by the early 1990s. Moreover, since the early 1990s, the ultrapoor in eastern Europe probably have had calorie intakes insufficient for long-run survival. This is suggested by the sharp rise in mortality rates throughout eastern Europe, with the exception of the Czech Republic and Slovakia.

NUTRITION AND ECONOMIC DEVELOPMENT

While changes in income are clearly linked to health outcomes, the converse question is also of considerable interest: will improved nutrition raise incomes or more generally, improve labor market outcomes? More theoretical controversy and less definitive evidence exist here. To begin with, a strong correlation exists among nutrition, height, and income across both rich and poor countries.

For example, data on height and wages show that for Brazilian men, a one percent increase in height is associated with almost an eight percent increase in wages. For U.S. men the corresponding figure is much smaller, around one percent. Of course, correlation does not imply causation. There are many other factors that can explain higher wages. For example, with respect to Brazilian men, taller men tend to have more education and this factor accounts for part of the higher wages. However, holding education level constant, a one percent difference in height is still associated with a 4.6 percent increase in wages.

Consequently, to gain precise knowledge of the effect of improved nutrition on labor market outcomes requires advanced statistical studies that carefully confront a large number of difficult empirical issues related to data specification, availability, and measurement. In the past decade, however, substantial progress has been made in dealing with these complex statistical issues.

First, the empirical literature provides strong support for the link between good health and increased labor supply. The evidence is less strong that poor health affects productivity and wages and requires further discussion. One key issue is the role of protein intake versus an adequate intake of micronutrients such as iodine, iron, and vitamin A. Until fairly recently, the conventional wisdom was that poor nutrition influences worker productivity largely via energy (protein) deficiency. It is now widely accepted that micronutrients also play a key role. A careful study supporting this view is a time-series analysis of 302 male rubber tree tappers and weeders in Indonesia, about half of whom were anemic.

The initial productivity of anemic workers was some 20 percent lower than the productivity of the healthy workers. Furthermore the study randomly assigned all workers to one of two groups. One group was given a special iron supplement for 60 days while the other group received a placebo. At the end of the treatment period, the productivity of the anemic workers receiving the iron supplement almost equaled that of the nonanemic workers.

Several additional studies show a strong link between per capita household calorie availability and farm output and wages. For example, a study of farm households in Sierra Leone indicates that a worker consuming 1,500 calories daily is only about 60 percent as productive as a worker consuming 2,400 calories daily. A similar study of rural workers in Rwanda measured caloric intake based on 24-hour food recalls, averaging the intake data over seven consecutive days for the entire household. This method minimizes random measurement error, a major problem in this kind of nutrition study. Again the study found that caloric intake is a significant determinant of the probability that male workers in Rwanda engage in "strenuous" and more productive labor.

EFFICIENCY WAGE THEORY

An intriguing theory that has application to many subfields in economics is efficiency wage theory. The essence of efficiency wage theory is that in some circumstances it may be profitable for producers to pay wages higher than the market equilibrium wage. Specifically, higher profits may result in cases where a producer's nonwage production costs depend in part on the wages paid to the firm's workers. For example, labor turnover costs are often a significant cost to firms. In such cases, if a firm pays wages above the market equilibrium level, that is, above what other firms are paying for this kind of work, the firm's labor turnover costs may decrease sufficiently that the firm's total profits actually rise.

With respect to developing economies, Harvey Leibenstein of Harvard University advanced a nutrition-based efficiency wage theory more than 50 years ago, with many rigorously developed variants of this theory now in the literature. This nutrition theory posits that above-market equilibrium wages are profitable in poor economies in cases where higher wages lead to better nutrition and sufficiently better productivity. While more productive workers will clearly benefit in this case, the result is the opposite for less healthy workers.

A striking implication of the theory is that if firms are induced to pay higher than market-equilibrium wages, then some involuntary unemployment will exist. And at low levels of economic development, this result suggests massive starvation. However, recent reviews of the relevant literature indicate that nutrition-based efficiency wage theory is not well supported. In particular, there is no evidence that widespread starvation is a market-equilibrium condition in poor economies. Widespread starvation clearly occurs from time to time in poor countries but for other reasons (such as climatic or politically induced famines).

In summary, contrary to the conventional wisdom held only 20 years ago, credible evidence now exists that improved nutrition has a significant and favorable impact on worker productivity, wages, and employment. In addition a smaller body of evidence suggests that the impact of improved nutrition on labor market outcomes is strongest in poor countries and weakens as economic development proceeds.

WORLD POVERTY

OECD Countries

THE ORGANIZATION FOR Economic Cooperation and Development (OECD) emerged from the Organization for European Economic Co-operation (OEEC), which was established in 1947 with support from the United States and Canada to coordinate the Marshall Plan for the reconstruction of Europe after World War II. Created as an economic counterpart to the North Atlantic Treaty Organization (NATO), the OECD took over from the OEEC in 1961.

The mission of OECD is to help governments achieve sustainable economic growth and employment and rising standards of living in member countries while maintaining financial stability, thus contributing to the development of the world economy. The founding convention calls on the OECD to assist sound economic expansion in member countries and other countries in the process of economic development, and to contribute to growth in world trade on a multilateral, nondiscriminatory basis. Since its inception, the OECD emphasis has been to build economies in its member countries, improve efficiency, foster market systems, expand free trade, and contribute to development in industrialized and developing countries.

Becoming a member of the OECD is not an automatic process. The member countries through the Council of the Organization decide whether a particular country should be invited to join the OECD and on what conditions. This decision is made at the end of the so-called accession process.

The OECD consists of 30 member countries. Twenty countries originally signed the convention on the Organization for Economic Cooperation and Development on December 14, 1960. Since then a further 10 countries have become members of the organization. The member countries of the organization are: Australia (June 7, 1971), Austria (September 29, 1961), Belgium (September 13, 1961), Canada (April 10, 1961), Czech Republic (December 21, 1995), Denmark (May 30, 1961), Finland (January 28, 1969), France (August 7, 1961), Germany (September 27, 1961), Greece (September 27, 1961), Hungary (May 7, 1996), Iceland (June 5, 1961), Ireland (August 17, 1961), Italy (March 29, 1962), Japan (April 28, 1964), Korea (December 12, 1996), Luxembourg (December 7,1961), Mexico (May 18, 1994), Netherlands (November 13, 1961), New Zealand (May 29, 1973), Norway(July 4, 1961), Poland (November 22, 1996), Portugal (August 4, 1961), Slovak Republic (December 14, 2000), Spain (August 3, 1961), Sweden (September 28, 1961), Switzerland (September 28, 1961), Turkey (August 2, 1961), United Kingdom (May 2, 1961), and the United States (April 12, 1961).

The OECD provides a framework for governments to compare their policies, identify and seek solutions to common challenges, and coordinate domestic and international policies. It helps governments to foster prosperity and fight poverty through economic growth, financial stability, trade and investment, technology, innovation, entrepreneurship, and development cooperation.

The OECD secretariat, headed by the secretary general, is located at the Château de la Muette in Paris. The OECD secretariat provides a regular flow of information to governments of member countries. The secretariat collects data, monitors trends, and analyzes and forecasts economic developments. It also researches social changes or evolving patterns in trade, environment, agriculture, technology, taxation, and other areas. The secretary general also chairs the council, providing the link between national delegations and the secretariat.

Representatives of the member countries meet in committees that specialize in specific policy areas, such as economics, trade, science, employment, education and financial markets. There are about 200 committees, working groups, and expert groups.

The OECD works in two official languages: English and French. The funding comes from member countries and national contributions to the annual budget are based on a formula related to the size of each member's economy. The largest contributor is the United States, which provides approximately 25 percent of the budget. With the approval of the council, countries may also make separate contributions to particular programs not funded from the main budget.

The size and the use of the OECD budget (around 330 million euros a year) are determined by the council.

After more than four decades, the OECD is shifting focus from its own members and is setting its analytical sights on the rest of the world that embraces the market economy. In recent years, the member countries, which produce 60 percent of the world's goods and services established active relationships with more than 70 developing and emerging market economies, including Brazil, China, Russia, as well as some of the least developed countries in Africa.

The opening of the OECD broadened its scope to include the issues and challenges of globalization. This is reflected in work on issues such as sustainable development, bringing together environmental, economic, and social concerns across national frontiers for a better

understanding of the problems and the best way to tackle them together.

Over the past decade, the OECD has tackled a range of economic, social, and environmental issues while further deepening its engagement with business, trade unions, and other representatives of civil society. Negotiations at the OECD on taxation and transfer pricing, for example, have paved the way for bilateral tax treaties around the world.

Among other areas, the OECD has taken a role in coordinating international action on corruption and bribery, creating the OECD Anti-Bribery Convention, which came into effect in February 1999.

The OECD is also expanding its relationship with civil society. Initially focused on relations with business and labor, these have broadened to include a wide range of nongovernmental organizations. Negotiations at the OECD on taxation and transfer pricing, for example, have paved the way for bilateral tax treaties around the world.

The OECD has set ambitious goals for combating poverty. The main points of the guidelines on poverty reduction are:

- 1) Eradicate extreme poverty and hunger (reduction by 50 percent the number of people whose income is less than \$1 a day and who suffer from hunger between 1990 and 2015).
- 2) Achieve universal primary education (ensuring that by 2015, children everywhere, boys and girls alike, will be able to complete full primary schooling).
- 3) Promote gender equality and empower women (eliminate gender disparity in primary and secondary education preferably by 2005 and at all levels of education no later than 2015).
- 4) Reduce child mortality (reduction by two-thirds, between 1990 and 2015, in the under-5 mortality rate).
- 5) Improve maternal health (reduction by three-quarters, between 1990 and 2015, in the maternal mortality ratio).
- 6) Combat HIV/AIDS, malaria, and other diseases (halting and reversing the spread of HIV/AIDS, malaria, and other major diseases).
- 7) Ensure environmental sustainability (integrating the principles of sustainable development into country policies and programs and reversing the loss of environmental resources; reducing by 50 percent, by 2015, the proportion of people without sustainable access to safe drinking water).
- 8) Develop a Global Partnership for Development (development of an open, rule-based, predictable, nondiscriminatory trading and financial system that will in-

clude a commitment to good governance, development, and poverty reduction, both nationally and internationally). Addressing the special needs of the Least Developed Countries (LDCs) must include tariff- and quota-free access for LDC exports, enhanced program of debt relief for indebted countries and cancellation of bilateral debt, and more generous support for countries committed to poverty reduction. In addition a global partnership needs to address the special needs of land-locked countries and small island developing states.

There are two primary criticisms of the OECD. One comes from the developing world and focuses on the fact that the OECD traditionally has been biased toward the growth strategies and institutional arrangements primarily designed for industrialized countries. The other, more narrowly focused criticism pertains to the OECD tax policies. According to this criticism, powerful countries are trying to impose a "worldwide tax cartel" that will damage smaller nations.

Julian Schuster University of New Haven

Oman

THE SULTANATE OF OMAN in the Persian Gulf has been ruled by Sultan Qaboos bin Said Al Said since 1970. Under the sultan's brand of progressivism, Oman has maintained military ties with Great Britain while keeping an independent but cordial relationship with other Middle Eastern countries. With a per capita annual income of \$13,100, Oman is an upper-middle-income nation with valuable natural resources that include petroleum, natural gas, copper, limestone, and asbestos.

Oman's economy is diversified, and most of the Omani labor force is employed in services. Agriculture is limited by periodic droughts and a lack of freshwater resources. Unemployment stands at 15 percent, but Oman is experiencing low inflation (0.2 percent) and a trade surplus. As part of the liberalizing process, Oman

joined the World Trade Organization (WTO) in 2000 and actively courts foreign investors.

While no poverty rate is available, it is clear that women are more likely than men to be poor in Omani society. To remedy this situation, Oman's Social Security Act provides financial assistance to women who have been widowed, divorced, or abandoned. Benefits are also allotted to unmarried girls and to women with a family member in prison. Among the general population, social security assists orphans, the disabled, and the elderly.

Oman is in the process of decentralizing healthcare services, and over 96 percent of Omanis are covered by accessible healthcare centers. There are 137 physicians for every 100,000 residents, and less than 20 percent of the population are unable to afford essential drugs. Because of water shortages, 61 percent of Omanis lack sustainable access to safe drinking water. However, only eight percent do not have access to proper sanitation. Between 1980 and 2005, life expectancy in Oman climbed from 58 to 70.92 years for males and from 61 to 75.46 years for females. Around 43 percent of the population are under the age of 14, and 2.5 percent have reached the age of 65.

Childhood health indicators in Oman are generally indicative of the government's position on improving healthcare. Between 1970 and 2005, infant mortality was drastically reduced from 126 to 11 deaths per 1,000 live births. The drop in mortality among all children under 5 was even greater. From 200 deaths per 1,000 in 1970, childhood mortality plunged to 12 deaths per 1,000 in 2005. Nevertheless 24 percent of all children under the age of 5 are underweight in Oman, and four percent of these are severely malnourished. Approximately 23 percent of children under 5 are moderately to severely stunted, and 13 percent are moderately to severely wasted. On the positive side, childhood immunizations are almost 100 percent among children from birth to 23 months old.

Even though fertility in Oman remains high at 5.84 children per woman, the fertility rate has been reduced from an average of 7.2 children per woman in the 1970s. The adolescent fertility rate is 53 per 1,000 births. Less than one-third of Omani women use birth control methods, but that number has more than tripled since 1994, when the Omani government initiated a family planning program and began dispensing free birth control. The emphasis of the program has been on improving maternal and infant health through birth spacing. Approximately 95 percent of all births occur in the presence of trained medical staff, and 93.4 percent take

place in hospitals or clinics. Between 1995 and 2000, Oman reduced maternal mortality from 22 deaths per 100,000 live births to 16 per 100,000. Thereafter, mortality rates began to spiral upward. By 2003, 37.5 deaths were occurring out of every 100,000 live births. The prevalence of anemia among pregnant Omani women is a major cause of maternal death because it increases the chances of hemorrhage during delivery.

Over the past several decades, the rate of illiteracy has been drastically reduced in Oman, particularly among females. In 1980, 48.6 percent of males and 83.7 percent of females were illiterate. By 2005, the rate of illiteracy had plunged to 16.9 and 32.5 percent for males and females respectively. Plans are under way to make basic education free in Oman. Most students now attend school for at least 10 years, but primary school completion rates have declined slightly and gender inequity has increased. Between 1995 and 2000, for instance, male primary school completion dropped from 76 to 70 percent, while female completion decreased from 76 to 67 percent.

One Campaign

THE ONE CAMPAIGN is a political campaign seeking to eliminate extreme poverty and AIDS in the poorest countries in the world. The campaign seeks to mobilize Americans into sufficient numbers so that the government of the United States can be persuaded to give one percent of its annual budget to eliminating poverty in

the poorest countries. One Campaign's political goal is to influence the government of the United States to join in achieving the Millennium Development Goals by donating one percent of its budget to eliminating AIDS and extreme poverty in the poorest nations. To achieve this goal, the One Campaign rallied political opinion in support of influencing the 2005 Republican administration as it prepared to meet at the G-8 Summit at Gleneagles, Pethshire, Scotland. The G-8 meeting in July 2005 was interrupted by deadly terrorist bombings in London; however, the One Campaign and other groups seem to have influenced the flow of funds to the poorest nations because an aid package of \$50 billion was pledged.

The One Campaign was founded by 11 American nonprofit, advocacy, and humanitarian organizations. They are Bread for the World, CARE, DATA, International Medical Corps, International Rescue Committee, Mercy Corps, OXFAM America, Plan USA, Save the Children, World Concern, and World Vision. They represent a broad coalition of antipoverty groups.

The One Campaign seeks to unite Americans one by one, from all walks of life, into its campaign. By August 2005 the One Campaign had gathered the signatures of over one million Americans. These people included students, professors, ministers, punk rockers, "NASCAR moms," television and movie actors, and others.

Numerous public personalities joined the effort in support of the One Campaign. These included Bill Gates, Brad Pitt, Dave Matthews, George Clooney, Jamie Foxx, Kate Hudson, Pat Robertson, Penelope Cruz, Rick Warren, Salma Hayek, Tom Hanks, Bono (lead singer for the musical group U2), Michael W. Smith, Dikembe Mutombo, Agnes Nyamayarwo, Antonio Banderas, Kate Bosworth, Steve Buscemi, John Cusack, Cameron Dias, Danny Glover, Mary-Louise Parker, Susan Sarandon, Claudia Schiffer, and many others. Musical groups that have signed include The Newsboys, Jars of Clay, No Doubt, Relient K, The Silos, REM, Switchfoot, The Nadas, Third Day, toby-Mac, and many others.

Corporate and nonprofit partners included MTV Networks, Sun Microsystems, National Basketball Association, Global Health Council, The Better Safer World Coalition, Action Against Hunger, Aerdo, Christian Children's Fund, Citizens for Global Solutions, Heartland Alliance, and many others. Religious partners included American Jewish World Service, the Episcopal Church, United Methodist Church, Mennonite Central Committee, Christian Reformed

Church, Nazarene Compassionate Ministries, The Sojourners, Church World Service, and others.

The One Campaign is directly related to the international effort to achieve the United Nations Millennium Development Goals. These goals, established in 2000, aim at eliminating several diseases, attaining universal education globally, and ending poverty. The One Campaign has found it necessary to address the corruption endemic to poor countries. Much of the corruption is rooted in nepotism that arises from tribal and traditional expectations. The One Campaign is promoting aid delivery to those directly affected around the world, and grassroots investigatory action by the poor themselves.

Outsourcing/Offshoring

OUTSOURCING REFERS TO two different practices of Western business, only one of which has a significant effect on the number of people living in poverty. Contracting out is a practice by which businesses contract with local firms that supply temporary workers (called contractors or temps) to satisfy a portion of their staffing needs instead of hiring the extra workers as employees.

For the individual business, benefits of contracting out are increased flexibility in staffing because temp workers can be let go without cause at any time; lower administrative costs because temp workers get no employee benefits from the hiring firm; and presumed greater productivity both from the temps, who know they could be fired at any time, and from the company's employees, who fear being replaced by temps.

The main cost is lower-quality work because temp workers lack experience with the company's products and have no more loyalty to the company than the company has to them. However, the wages paid to temp workers are not always dramatically lower than they would earn as employees, so contracting out per se has little impact on poverty rates.

Offshoring (outsourcing on an international scale) is a practice by which businesses either contract out some work to firms in foreign countries with lower wages and costs of living or else relocate their productive facilities to those countries. As with contracting out, the result is that businesses need fewer employees domestically, but offshore contractors sometimes produce work of inferior quality, as mentioned by O. Kharif.

Offshoring has an additional social cost in that at least in the short term, it causes a net loss of jobs and productive capacity in the country from which offshoring is done. There is also some evidence that offshoring leads to long-term decline of the economies that practice it, but this is less certain and is disputed both by offshoring's advocates and by mainstream economists.

Offshoring takes different forms, as described by J. Bhagwati et al. It can be an "arm's length" purchase of services that would otherwise be bought domestically, it can be an arm's length purchase of services that would otherwise be performed by a firm's employees in its host country, or it can be a firm's relocation of its productive facilities to a developing country where wages and factory costs are lower.

BUSINESS DRIVERS OF OFFSHORING

Companies offshore jobs and productive capacity for several reasons. The most important is to reduce labor costs. Because of differences in the cost of living, companies can pay much lower wages in developing countries than workers can afford to accept in developed Western economies. Adjusted for lower living costs, a 2002 salary of \$70,000 in the United States was equivalent to a salary of \$25,690 in Hungary, \$15,120 in China, \$14,420 in Russia, and \$13,580 in India, the last of which is the favored destination for many offshoring projects. Also, U.S. tax laws have allowed profits of offshored operations to be taxed at a lower rate than profits made domestically: 5.25 percent versus the normal corporate tax rate of 35 percent, according to R. Hira and A. Hira.

The growth of the internet as a business tool has meant that many knowledge jobs can be done anywhere. Finally most Western countries do not believe that corporate top management has any responsibility to protect workers' jobs. This stands in contrast to

countries such as Japan, where corporate top management is expected to protect workers' jobs if at all possible, as explained by L. Dobbs. For Western economies, the result is a seemingly relentless exodus of jobs and productive capacity to developing countries.

ECONOMIC ARGUMENTS FOR OFFSHORING

Mainstream economists tend to see offshoring as just another variety of free international trade in goods and services. They rely on the standard economic theory of international trade, which predicts that free trade increases the total wealth of the trading countries.

"Arguing that offshoring hurts is arguing that free trade hurts," said Haseeb Ahmed, an economist at Economy.com, a Pennsylvania-based economic research firm. Gregory Mankiw, economic advisor to the G.W. Bush administration as well as former Harvard professor and author of a popular economics textbook, agreed: offshoring "is just another form of trade, and it is probably good for us in the long run."

Economic theory predicts that offshoring will increase most people's income.

The economic case for offshoring rests on the principle that when two nations trade, their total production of goods and services can be higher than if they were not trading. The principle was stated by economist Adam Smith in his influential book *The Wealth of Nations* (1776); economics since 1776 has been called a series of "footnotes to Adam Smith." A more sophisticated version of the principle was stated by David Ricardo in *The Principles of Political Economy and Taxation* (1817). At the beginning of the 21st century, Ricardo's analysis was still the dominant view among economists.

Smith showed that if country A was more efficient than country B at producing good 1, while B was more efficient than A in producing good 2, then both could increase their output by specializing in the good for which they had an absolute advantage. By trading, each country would end up with more total income than it had before.

Ricardo built on Smith's analysis. He showed that even if country A was more efficient than country B in producing both goods 1 and 2, output could still be increased if each country specialized in making the good for which it had the greater comparative advantage. If

country B was slightly worse than A at making good 1 but much worse at making good 2, then country B had a comparative advantage in making good 1. Under Ricardo's analysis, B should make mainly good 1, and perhaps a little of good 2, while A makes mainly good 2 and perhaps a little of good 1. Then trading increases the income of both countries.

PROBLEMS OF APPLYING RICARDO

Ricardo's analysis, as far as it goes, is undisputed. However, it does not address the fact that even if it increases a society's total income, trading alters the distribution of that income in ways that can be harmful. In particular, in the short term, offshoring tends to reduce the income (or eliminate the jobs) of Western workers while it increases the income of corporate stockholders and top management.

On the other hand, offshoring does have short-run benefits for workers in developing countries. Because it transfers capital investment, technology, and know-how into those countries, it creates new jobs, increases wage levels, and tends to decrease poverty in those countries. The short-run result is that Western workers lose while stockholders, corporate top management, and workers in developing countries make gains.

Economic theory predicts that in the long run, off-shoring will increase most people's income, both in the developed country where it originates and in the developing country where it ends up. However, that result is not guaranteed and, as economist John Maynard Keynes pointed out, "in the long run, we are all dead." The short run is quite long enough for careers to be lost and for a country to lose its industrial and skill base.

However, Ricardo's analysis includes an important reservation that offshoring advocates ignore. Ricardo assumed that capital would usually not move from one country to another: "If the profits of capital employed in Yorkshire should exceed those of capital employed in London, capital would speedily move from London to Yorkshire ... but it would not follow that capital and population would necessarily move from England to Holland, or Spain, or Russia, where profits might be higher." When offshoring occurs, especially when it involves offshoring of productive capacity, then capital (including technology and know-how) is transferred from a Western country to a developing country. Combined with the developing country's lower cost structure and an adequately educated labor force, this infusion of capital, technology, and know-how can give the developing country an absolute advantage in pro-

Though it has its positive attributes for business, one of the negative aspects of offshoring is that it creates short-term (and possibly long-term) unemployment and wage decreases in developed Western economies.

ductivity rather than a comparative advantage. Thus offshoring is not "free trade" in the sense intended by Smith and Ricardo. As a result, the Western country from which offshoring is done can lose even in the long term. Considerations like these prompted Nobel laureate economist Paul Samuelson to pronounce that the conventional wisdom is "dead wrong about the necessary surplus of winnings over losings." He explained that "sometimes a productivity gain in one country can benefit that country alone, while permanently hurting the other country by reducing the gains from trade that are possible between the two countries."

In the United States, large numbers of jobs have already been lost to offshoring, and the process is ex-

pected to continue. One study, by the consulting firm Global Insight, generally supported offshoring, but predicted that offshoring of information technology (IT) services would reduce the growth of IT employment in the United States by 50 percent from 2003 to 2008, leading to a drop in the number of U.S. IT jobs created from 490,000 to 244,000. The report by L.J. Bivens predicts that new jobs in transportation and construction will replace the missing IT jobs, but that is unlikely to help out-of-work American computer programmers. Another study, by Forrester Research in Massachusetts, predicts that U.S. companies will offshore \$1.3 billion in wages and 3.3 million white-collar jobs by 2015, as found in an article by P. Engardio et al.

Offshoring also applied downward pressure on wages of those Americans still employed. In the period 2001–03, 5.3 million U.S. workers lost their jobs; by January 2004, 65 percent had found new full-time or part-time jobs, while 20 percent were still unemployed and 15 percent had dropped out of the labor force. Of those who found new full-time jobs, 57 percent had to take pay cuts.

ASSESSMENT OF OFFSHORING

Offshoring has mixed results. On the positive side, off-shoring increases total world output of goods and services. It creates new, higher-paying jobs in developing countries, thus helping to reduce poverty and unemployment in those countries. It transfers capital, technology, and know-how to developing countries, thereby laying the foundation to lift entire societies out of poverty and into the developed world economy. It raises the incomes of corporate stockholders and top management in developed Western economies. It reduces the prices of some goods and services in Western economies. And at least in the short term, it is highly profitable for companies that engage in it.

On the negative side, offshoring creates short-term (and possibly long-term) unemployment and wage decreases in developed Western economies. It lowers the incomes of the poor and middle classes while increasing the income of the most well-to-do members of society, thereby exacerbating inequality. And by moving capital, jobs, technology, and know-how to developing countries, it drains those advantages from the Western countries where they originated, possibly crippling their future competitiveness.

SCOTT PALMER, Ph.D. RGMS ECONOMICS

Overall Poverty

OVERALL POVERTY IS CONSISTENT and enduring socioeconomic isolation stemming from an absence of sufficient assets and opportunities. It is a condition of marginalization that limits the access of individuals and households to the resources and services required for basic livelihood needs; the enjoyment of fundamental human rights, including personal security; and freedom from manipulation and discrimination by stronger groups. Overall poverty is the outcome of inequity in the control of opportunity and resources, particularly reflecting a lack of legal rights, political participation, and freedom from conflict. It is frequently associated with an interrelated set of outcomes such as hunger, disease, child mortality, gender bias, and environmental degradation.

The 1995 Copenhagen Declaration of the World Summit for Social Development described overall poverty as a set of circumstances in which people suffer from a constellation of challenges experienced over a period of time. This includes "lack of income and productive resources sufficient to ensure sustainable livelihoods; hunger and malnutrition; ill health; limited or lack of access to education and other basic services; increased morbidity and mortality from illness; homelessness and inadequate housing; unsafe environments; and social discrimination and exclusion. It is also characterized by a lack of participation in decision-making and in civil, social and cultural life."

DEVELOPMENT OF THE CONCEPT

From at least the time of Adam Smith, scholars have differed over the definition of overall poverty, whether, as Smith argued, it is deprivation relative to the larger society or whether it is composed of an absolute and measurable standard based on extant human need. Recent research suggests that overall poverty is an objective condition of external deprivation but that its severity is conditioned in part by the larger culture.

Overall poverty often is described in absolute/extreme, subjective or moderate, or relative terms. Absolute/extreme poverty means having less than an objectively defined standard of existence for optimal health and development. Households in extreme poverty cannot meet basic needs for survival: they are chronically hungry, unable to access healthcare, lack safe drinking water and sanitation, do not have access to education, and often lack rudimentary shelter and basic clothing. Subjective or moderate poverty is not having enough to get along adequately, with basic needs just barely met or sometimes going unmet.

Relative poverty exists when household income and assets fall below a given proportion of average national income, and households have less than most others, where a range of available assets and opportunities exist. Overall poverty comprises the first two categories although it can have a somewhat different meaning in different societies and cultures.

Only slightly up the ladder are the 1.5 billion poor who may live just above subsistence.

In this context, overall poverty exists on a continuum of the experience of marginalization, from the most basic survival level of extreme poverty in which many highly adverse circumstances converge to a level of general or relative poverty in which more, but often insufficient, assets and opportunities exist for meeting basic human needs. Jeffrey Sachs has calculated that one billion people, one-sixth of humanity, are too hungry and destitute to get a foot on the first rung of the development ladder. They are the extreme poor fighting for survival each day, with cash earnings of only a few pennies a day.

Only slightly up the ladder are the 1.5 billion poor who may live somewhat above subsistence, but who face chronic financial hardship and lack basic amenities such as healthy diets, safe drinking water, functioning latrines, and adequate housing. These two groups, comprising 40 percent of humanity, are considered to be living in overall poverty. Another 2.5 billion are not middle-class by Western standards, but they are able to secure some comfort in housing, indoor plumbing, a

bike or motorized vehicle, sufficient clothing, adequate nutrition, and education. Beyond this level are another one billion people whose well-being is more than sufficient.

SOURCES AND EFFECTS

Overall poverty stems from economic conditions insufficient to support livelihood (such as joblessness, low wages, and resources), the lack of social institutions to build a foundation (such as support networks and infrastructure), and political and legal marginalization, especially during times of civil conflict. Overall poverty typically is driven by factors related to economic underdevelopment. Economic circumstances mediate the interaction of other factors such as disease, physical isolation, climate stress, and environmental degradation. Governments often lack the economic resources or political will to make crucial investments, ensure meaningful opportunities, or affirmatively secure the safety and political rights of citizens.

The concept of overall poverty is linked to asset ownership—the resources and capacities that enable individuals to maximize opportunity and build secure lives. Asset development builds opportunities by focusing on 1) human capital assets, such as equal and full access to education, and skills for moving out of poverty conditions; 2) financial assets such as land and housing, tools for production, and savings or resources that can be used to maintain basic livelihood needs in times of crisis; and 3) creating and preserving an asset foundation by supporting sufficient wages and other protections that ensure livelihood such as primary healthcare, unemployment, or old-age income, and laws and other protections that provide mutual safeguards in cases of economic, social, or environmental instability.

A lack of assets can make overall poverty intergenerational. Households without a sufficient asset base often do not have significant resources and opportunities to pass on to their children to advance their economic and social situations.

POLICIES TO ADDRESS OVERALL POVERTY

Government policies are key to reducing overall poverty and their impact is evident in such determinants of well-being as rising life expectancy, falling infant mortality rates, rising educational attainment, increasing access to water and sanitation, and increased equality of opportunity and access across gender, racial, and ethnic lines.

Overall poverty reduction strategies frequently target different areas. A primary focus is macroeconomic policy and infrastructure. Economic growth is necessary to reduce overall poverty because it results in increased government revenues, and provides critical resources for increased investments in social services, infrastructure development, and environmental protections. But economy-related poverty reduction strategies do not work in isolation.

To be effective they must be coupled with broadbased asset development policies to build sustainable social services for literacy, education, health, medical care, housing, employment, and various arrangements for unemployment compensation, survivors' benefits, old-age pensions, maternity benefits, and similar social provisions.

Nonincome aspects of overall poverty are particularly susceptible to policy interventions in areas such as credit, health, nutrition, sanitation, and literacy. A related focus is on creating opportunities for empowerment by putting mechanisms in place for the participation of the poor in the political process. The strength of the economic, political, and social institutions is critical to a sustainable effort to alleviate poverty.

The United Nations Millennium Project has developed a strategy for reducing extreme poverty by 2015. The Millennium Development Goals (MDGs) provide benchmarks of progress in a global attempt to alleviate poverty and set a minimum level of human and social well-being. Eight goals and associated targets address a complementary set of factors that together are the cause of much poverty and that can be addressed through policy choices at the international and national levels. While the MDGs are targeting elimination of extreme poverty, if achieved, the project estimates that the process will lift more than 500 million people out of overall poverty, among other anticipated outcomes. The MDG goals are:

Eradicate extreme poverty and hunger.

Achieve universal primary education.

Promote gender equality and empower women. Reduce child mortality.

Improve maternal health.

Combat HIV/AIDS, malaria, and other diseases.

Ensure environmental sustainability.

Develop a global partnership for development.

Maximizing human resources and ensuring the means to build assets and meaningful social and eco-

nomic mobility for individuals and households constitute the broad policy approaches needed to reduce and eventually eliminate overall poverty.

Owen, Robert (1771-1858)

ROBERT OWEN, CONSIDERED the father of the cooperative movement, was born in Newtown, Wales. His father was a saddler and ironmonger. While he was an intelligent boy who did very well at his local school, his father nevertheless sent him to work in a large drapers in Stamford, Lincolnshire. After spending three years in Stamford, Owen moved to drapers in London. This job lasted until 1787, and now aged 16, Owen was employed at a large drapery business in Manchester.

At the age of 19, he became manager of a cotton mill employing 500 people, and in just a few years, thanks to his administrative skill, he became manager and one of the partners of the Chorlton Twist Company in Manchester. After his marriage to Caroline Dale in September 1799, Owen purchased four textile factories in New Lanark for £60,000 from David Dale, his father-in-law.

When Owen assumed the control of the New Lanark factory, more than 2,000 people were employed,

500 of whom were children. Many of them were as young as 5 and were working for 13 hours a day in the textile mills. He immediately stopped employing children under 10 and reduced the labor of those over that age to 10 hours a day.

He greatly improved housing, opened a store where the people could buy quality goods at little more than cost price, and placed the sale of alcohol under the strictest supervision. His greatest success, however, was in the education of the young, to which he devoted special attention. Convinced that education was of the utmost importance in the developmet of a person, he was the first to found infant schools in Great Britain.

A firm believer that a person's character is shaped by the environment, Owen was convinced that by creating the right environment, good and humane individuals can be produced. Like ancient Greek philosophers, he argued that people are deterministically influenced by the way they are raised or treated. Consequently he banned physical punishment in all schools in New Lanark. His views were embodied in his first work, "A New View of Society, or Essays on the Principle of the Formation of the Human Character," an essay appearing in 1813. While Owen's views theoretically belong to a very old system of philosophy, his originality was to be found in his bold and benevolent application of those views.

In his report to the House of Commons regarding the Poor Laws, Owen asserted that poverty had been primarily caused by the competition between human labor and machinery. His proposal to alleviate poverty was a call for united human action and the subjugation of machinery. The basic recommendation was the formation of 1,200-person communities, each settled on a piece of land ranging from 1,000 to 1,500 acres. People would live in one large building in the form of a square and use a public kitchen. Each family would enjoy its own apartment, and children after the age of 3 would be brought up by the community. Initially Owen's plans for the cure of poverty were well received. The leading newspapers, The Times and the Morning Post, as well as the Duke of Kent, father of Queen Victoria, were impressed by his ideas. However, Owen's personal animosity to "all the received forms of religion" provoked strong opposition to his theories.

In 1825 Owen moved to the United States and purchased an area of Indiana. The community was called New Harmony and one of Owen's sons, Robert Dale Owen, became the leader. Nevertheless a peculiar mixture of community members, and the issues of individual sovereignty and private property contributed to the

rapid failure of New Harmony. Upon his return from the United States, Owen concentrated his activities in London, where he became a leading proponent of socialism and secularism.

Owen attempted to form new communities at Ralahine, Ireland, and East Tytherly in Hampshire, England. However, like New Harmony in America, both experiments came to an end after disputes among members fractured the communities. The failure of these projects and most of his political campaigns did not deter Owen from working on his "new moral order" until his death on November 17, 1858. His major works include New View of Society, the report communicated to the Committee on the Poor Law, Book of the New Moral World, and Revolution in the Mind and Practice of the Human Race.

OXFAM

ALTHOUGH OXFAM is now closely associated with development programs in Third World countries to fight gender inequality, encourage fair trade, and provide emergency relief work, it was in the beginning an organization for the relief of poverty and hunger in Europe. The Oxford Committee for Famine Relief, which was later to become known primarily with its abbreviated telegraph address (OXFAM), was set up during World War II, after Nazi Germany had invaded Greece. The Allied forces had declared a blockade in 1942 and, as a result of this, Greek civilians suffered from severe shortages of food and medicines.

Committees were set up throughout Britain appealing to the Allies to let essential supplies through the

blockade. They also started to raise funds for refugees across Europe. The Oxford Committee for Famine Relief first gathered on October 5, 1942, and, in December, Cecil Jackson-Cole, a London businessman, was appointed honorary secretary. The committee was officially registered as a charity in 1943 and its first appeal, Greek Week, raised £12,700 for the Greek Red Cross.

While many of the relief committees throughout Britain disappeared after the war, the Oxford Committee for Famine Relief intensified its activities to alleviate the suffering caused by the war. Offices were opened in Oxford in 1947 and a gift shop was established a year later, becoming the first permanent charity shop. When the Marshall Plan made most European relief committees superfluous, the Oxford Committee once again enlarged its field of action to relieve "suffering arising as a result of wars or other causes in any part of the world."

Under the direction of Howard Leslie Kirkley starting in 1951 and lasting for 24 years, the Oxford Committee attracted wide public attention for its campaigns whereby Third World poor were not stereotypically represented as passive victims but as human beings with dignity. The 1960s witnessed the expansion of the organization, which, in 1965, adopted OXFAM as its official name. OXFAM programs in developing countries increasingly focused on the support of self-help programs.

The organization played a major role in Freedom from Hunger, the United Nations campaign to fight famine through plans to allow people in Third World countries to grow their own food rather than receiving food aid. In 1964, OXFAM started its first fair trade branch, the so-called Bridge Programs, which initially marketed handicrafts produced by local communities in developing nations. The mid-1960s were also characterized by the rise of the OXFAM network of shops, which became an important source of funding for the organization. OXFAM shops sold donated items or

fair-trade products and their success made them common in every main street in Britain. Throughout the United Kingdom, there are now 750 OXFAM shops.

In the 1970s, the self-help strategy inaugurated during the previous decade led to the decision to let local people run the relief programs. The decade also saw OXFAM engaged in difficult campaigns, such as those to reduce the disastrous humanitarian effects of the civil war in Cambodia and of the war of independence in Bangladesh. The organization also started its own center for recycling, the Wastesaver Centre in Huddersfield, United Kingdom.

The success of OXFAM shops prompted the creation of a mail-order catalog, whose sales soon exceeded £1 million in the early 1980s. The decade was devoted to programs for emergency relief in the Horn of Africa, especially in Ethiopia and Sudan. Thanks to the increase in the organization income, OXFAM was able to devote part of its budget to research and publications addressing the problems related to economic globalization, such as debt burdens, unfair terms of trade, and inappropriate agricultural policies. The dramatic events following the end of the Cold War and the rise of international terrorism opened new areas such as the Balkans and the Middle East to the work of OXFAM volunteers.

WORLD POVERTY

P

Pakistan

AFTER THE END OF British colonial rule on August 14, 1947, the Islamic Republic of Pakistan came into existence. The Indian subcontinent was divided into India and Pakistan. The new country started the nation-building process amid problems like government deficits, a dependence on foreign aid, growing population, increasing defense expenditures, and military coups. In 1950, agriculture made up 53 percent of the Gross Domestic Product (GDP). Pakistan faced wars with India, ethnic strife, and a rising civil war in East Pakistan.

The 140 million people of Pakistan are among the poorest of the world, with two-thirds residing in rural areas. The population that falls below the poverty line is 44 percent. With a population growth of three percent, poor governance, low levels of literacy, and low spending on social sectors, the economic development of the nation is hampered. It is one of the few countries in the world where economic growth has slowed down, poverty incidence is increasing, and there is a declining trend in spending on development.

Pakistan presents the challenging situation of a poor nation with only 45 percent of the population having access to health services. The infant mortality rate is high, and 38 percent of children are malnourished. The decline in GDP growth rate is the immediate cause of increasing poverty in Pakistan. In the last decade of the 20th century, about 12 million people joined the population living below the poverty line.

However, Pakistan has shown signs of economic recovery in the early 21st century through foreign aid, entry into global markets, and various programs from international bodies and nongovernmental organizations (NGOs). The government is undertaking reforms, and its spending on development increased to four percent of its GDP in 2003, from two percent in the 1990s. Tax reforms have increased the government's revenue and effort has been made toward reforming various institutions. State-owned enterprises have been privatized. Agricultural trade has been liberalized, and incentive is given to cultivators. There has been an increase in industrial production, and the dependence on agriculture is diminishing. The foreign-exchange reserve is stable because of growth in exports and remittances by nonresident Pakistanis from other countries. Inflation has been contained and it has remained below five percent. Compared to an earlier number of 44 percent, presently 32 percent of the population live below the poverty line.

In June 2002, the Asian Development Bank (ADB) entered into partnership with the government in its poverty reduction strategy. Access to basic education and primary health services was stressed. The ADB provided about \$3.7 billion for poverty eradication programs and helped in a major way to create the Khushhall Bank, benefiting about 200,000 households in remote areas. Assistance was given for rural modernization projects and development of the city of Karachi.

The United Nations Development Program (UNDP) in Pakistan is trying to achieve poverty eradication through its programs of sustainable livelihood, better governance, and female empowerment. The World Bank's Global Development Marketplace program created a novel program entitled Mazoori Majboori Nahin ("Labor Is Not Helplessness"), supporting projects to prevent disability, improve medical rehabilitation services, and promote public awareness programs. Financial support of \$25,000 was given to each institution and individual to implement various projects. Through its Country Assistance Strategy, the World Bank is supporting the government's poverty reduction strategy. The World Bank will also double its assistance in 2008 to \$1.5 billion. The Aga Khan Development Network is very active in northern areas of Pakistan through its projects relating to health, education, and rural development.

To improve the livelihood of the poor, nongovernmental agencies have come to the forefront. The Rural Support Programmes Network (RSPN) is the largest organization, focusing its activities in rural areas through its 10 support programs. The Social Policy Development Center (SPDC) of Karachi offers help to the government and civil society of Pakistan through its research activities relating to poverty. An international NGO, Action Aid Pakistan, deals with poverty and educates various underprivileged groups. The Khidmat Foundation helps landless cultivators and laborers.

There are also NGOs based in different provinces participating in poverty eradication programs. With almost half of the population being female, the gender dimension of poverty in Pakistan is alarming. The rigid social mores, the lesser role of women in decision-making processes, and adherence to the *Shariyat* (Islamic laws) are responsible for a secondary role for females. The labor force participation for women is only 13.7 percent. The government and NGOs have recognized the importance of empowering women in the overall strategy of poverty alleviation.

The First Women Bank Limited (FWBL) looks after banking needs of women. The United Nations De-

velopment Fund for Women (UNIFEM) is helping to meet the essential needs of women through employment. Steps are being taken to stop the trafficking of women and children. The condition of bonded labor families in Pakistan is miserable, and the Human Rights Commission of Pakistan is actively engaged in releasing them from the clutches of feudal lords. Through a comprehensive poverty reduction strategy, the people, civil society, and government hope to achieve their Millennium Development Goals by 2015.

PATIT PABAN MISHRA SAMBALPUR UNIVERSITY

Palau

THE REPUBLIC OF PALAU, which is composed of 340 islands in the western Pacific Ocean, is both politically and economically stable with a high standard of living. Only nine islands are inhabited: Kayangel, Babeldaob, Koror, Peleliu, Angaur, Sonsorol, Pulo Anna, Hatohobei, and Helen Reef. Formerly under the administration of the United States as part of the United Nations Trust Territory of the Pacific, Palau was granted independence in 1994. As part of the compact with the United States, Palau continues to receive aid until 2009, when new terms may be negotiated. Since this financial assistance remains crucial to the island economy, the government has created a trust fund to ensure that the Palauan standard of living will not be seriously affected when the compact expires. Palau also receives foreign aid from Japan and Taiwan.

With a per capita annual income of \$9,000, Palau is an upper-middle-income nation and one of the wealthiest nations in the Pacific region. The economy is heavily dependent on subsistence agriculture and fishing, but tourism is the major revenue source for the islands. The government is the nation's biggest employer. The service industries contribute 80 percent of the Gross Domestic Project. Unemployment stands at 2.3 percent. Even though Palau is one of the most highly developed countries in the Oceanic region, data on major social indicators are often unavailable. This makes it difficult to accurately access poverty on Palau; however, it is clear that the standard of living on the islands is relatively high.

Over the past decades, life expectancy among the Palauan population of 20,303 has steadily improved. Between 1980 and 2005, life expectancy for males rose from 56 to 66.98 years. At the same time, the projected life span for females increased dramatically from 59 to 73.48 years. The median age is 31.43 years. Over 26 percent of the population are under the age of 14, and 4.6 percent are at least 65 years of age. While most Palauans have access to safe drinking water, 21 percent do not. Virtually all of the islands' residents have access to improved sanitation. Healthcare is widely accessible. There are 110 physicians on the island, and 95 to 100 percent of islanders are able to afford essential drugs.

Infant mortality on Palau is relatively low. According to government statistics, between 1990 and 2003, infant mortality fell from 34.5 deaths per 1,000 live births to 6.4 deaths per 1,000 live births. At a mortality rate of 12.99 deaths per 1,000 live births, female infants are hardier than males at 16.6 deaths per 1,000. Between 1990 and 2003, the mortality rate of children under the age of 5 declined from 34 to 28 deaths per 1,000. Nine percent of all infants born on the islands are underweight. Only one percent of children between the ages of birth and 23 months have not been immunized against measles, DPT3, polio, and tuberculosis.

According to estimates for 2005, the total fertility rate on the islands is 2.46 children per woman. About 47 percent of all Palauan women use some method of contraception. Trained medical staff attend all births on Palau.

Palauan literacy is high, and 92 percent of the population over the age of 15 can read and write. Some 93 percent of males and 90 percent of females in this group are literate. The majority of children on the islands attend both primary and secondary school. Between 1996 and 2003, primary school enrollment rose from 97 to over 100 percent.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Palestine

UP UNTIL WORLD WAR I, Palestine was a neglected part of the Ottoman Empire. Economic progress during the late 19th and early 20th centuries came from European settlers, and especially from the emerging Zionist movement. When the British took over from the Ottomans during World War I, they had promised both the Jews and the Arabs the same territory for a nation-state. The interwar period was characterized by a steady economic development of the Jewish settlements despite ongoing ethnic confrontations between the Arabic and the Jewish population. The decline of the traditional Arabic economy coincided with the political events.

After World War II the British were no longer able to control the so-called Palestine Mandate and handed it over to the United Nations. The United Nations divided the territory into two states, a Jewish state and an Arab state. The Jewish side accepted, whereas the Arab side was incited by the neighboring Arab nations to decline the partition offer and to wage war against the new state of Israel. The Arab nations were defeated.

The social situation of the Arabs living in what has just become Israel had changed dramatically: on the one hand the Arab neighbors had asked the Arabs on Israeli soil to leave the territory for the time of the hostilities (in expectation of a return after a defeat of Israel); on the other hand there was an expulsion in some places under Israeli control. At the end of the war in 1949, an important percentage of Palestinian Arabs were dislo-

cated from their former homes and refugee camps emerged as well in the non-Israeli part of the former Palestine Mandate as in the neighboring Arab states.

The remaining territories of the mandate, which the United Nations had designated as a state for the Arab Palestinians, were now claimed by Jordan (West Bank) and by Egypt (Gaza). Whereas the Arab Palestinians in the West Bank could participate in the general economic development of Jordan, the Arab Palestinians in Gaza, under control of Egypt, were separated from the Egyptian economy and had to face a deteriorating economic experience.

One of the most important sources of income for the Arab Palestinians was and still is the United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA). At the beginning in 1949 and 1950, this organization assisted some 750,000 people, but now provides aid to nearly four million people, as it counts all descendants of refugees as refugees. That means that by now, UNRWA helps not only the needy inhabitants of remaining Palestinian refugee camps of 1948 but also well-integrated Arabs of Palestinian descent in other Arab states.

In 1967, Israel took over control of both the West Bank and Gaza after defeating several Arab states. Whereas the 1970s showed a slow economic recovery, especially in Gaza, the ongoing Palestinian-Israeli confrontation from the mid-1980s (so-called Intifada) hindered any economic progress. Many Palestinians living in the territories had found employment in Israel, but after any serious Palestinian terror attacks on Israel, the territories were blocked, thus depriving the Palestinians of their workplace in Israel.

The peace process in the 1990s led to important financial support for economic recovery, especially by the European Union, but widespread corruption within the Palestinian Authority annihilated the success of such programs. The beneficiaries of the aid programs were usually not the Arab Palestinians living in the territories for the last half of the 20th century, but cronies of the leadership, returning from exile in Tunisia.

The economic and social situation of the Palestinians, especially in the Gaza Strip, was still poverty-stricken in 2005. Tourism as a major possible source of income is spoiled by the ongoing terror activities of radical Palestinian groups. A change may only be achieved with the end of terrorist activities, a real peace process in the area, and a fundamental reorganization of the Palestinian Authority, coinciding with a tough anticorruption policy.

Panama

THE REPUBLIC OF PANAMA is the southernmost of the Central American nations. After winning independence from Spain in 1821, Panama united with Colombia but spent the next eight decades trying to divorce itself from the alliance. In 1903, with United States backing, Panama finally seceded from Colombia. Afterward Panama allowed the United States to build a canal that provided a gateway between the Pacific and Atlantic Oceans. In exchange the United States was given sovereignty over a strip of land on either side of the canal.

On September 7, 1977, in compliance with the original agreement, President Jimmy Carter began the process of transferring ownership of the canal and the surrounding area back to the Panamanians despite intense controversy. The transfer was officially complete in 1999. During the interval, the United States helped to remove dictator Manuel Noriega from office. Noriega was subsequently imprisoned in Florida on drug trafficking charges, and the U.S.-backed candidate became president of Panama. Colombian rebel and paramilitary forces continue to make frequent raids in Panama, and concern has arisen over increased incidents of violence and drug and arms smuggling.

Panama's economy is heavily dependent on services, which employ 61.2 percent of the labor force and account for four-fifths of the Gross Domestic Product. These services revolve around banking, the Colón Free Zone, insurance, container ports, flagship registry, and tourism. The agricultural sector continues to be of im-

portance in Panama, employing 20.8 percent of the labor force. An additional 18 percent of the workforce are involved in industry. Panama is facing an unemployment rate of 12.6 percent.

At the end of the 20th century, Panama experienced a temporary economic slump in response to a global slowdown and the withdrawal of remaining U.S. military forces. The government initiated tax incentives and stepped up exports to offset the losses. As part of an ongoing recovery program, the Panamanian government has proposed tax and social security reforms while promoting tourism and negotiating new regional trade agreements. Panama's natural resources, which include copper, mahogany forests, shrimp, and hydropower, also have the potential to boost the economy.

With a per capita annual income of \$6,900, Panama is an upper-middle-income nation with severe external debts. It is a country of vast inequalities, with the richest 20 percent of the population holding 60.3 percent of resources while the poorest 20 percent live on 2.4 percent of resources. Panama is ranked 56.4 percent on the Gini Index of Human Inequality. To some degree, Panama has been successful in reducing poverty in the past. Between 1983 and 1997, for instance, the level of poverty was reduced from 46 to 37 percent. During that same period, extreme poverty fell from 28 to 19 percent.

Nevertheless the poverty rate remains at 37 percent, exacerbated by regional and cultural disparities. It is estimated that rural poverty may be twice as high as that in urban areas. Women and children are disproportionately affected by poverty, as are peasants and agricultural workers. Approximately 26.5 percent of Panamanians are extremely poor, and one-fifth of the population is malnourished. Around 17.2 percent live on less than \$2 a day, and 7.2 percent live on less than \$1 a day. Panama enjoys a high to medium standard of living in relation to other countries in the Latin American/Caribbean region.

Health expenditures comprise the highest element of Panama's social budget. Yet the Social Security Department, which is the chief provider of health and social security services, suffers from serious financial difficulties. Medical care is generally accessible in urban areas, and there are 121 physicians for every 100,000 residents. Rural residents, however, often lack access to healthcare. As a result, they have more illnesses, higher mortality rates, and a general lower standard of living. From six to 20 percent of the population have no sustained access to affordable essential drugs. About 10 percent of the population lack access to safe drinking

water, and eight percent lack access to improved sanitation.

Panamanians enjoy a life expectancy of 71.94 years, and life expectancy has been steadily rising for several decades. In 1980 the projected life span was 68 years for males and 72 years for females. Panama's population of 3,039,150 has a median age of 26.18 years. Almost 30 percent of the population are under the age of 14, and 6.4 percent have reached the age of 65.

Panama has made significant gains in reducing infant mortality, but more needs to be done in rural areas. Between 1970 and 2004, infant mortality fell from 46 to 19 deaths per 1,000 live births. Among all children under the age of 5, the mortality rate dropped from 68 to 24 deaths per 1,000 during that same period. Eight percent of under-5s are malnourished, and 14 percent are moderately to severely stunted. Around 10 percent of all infants are underweight at birth. Generally childhood immunization rates have risen in Panama over the last few years, but immunization rates lag behind in rural areas. Immunization rates for children from birth to 23 months old range from 79 to 92 percent.

Panama has one of the highest literacy rates in the Latin American/Caribbean region.

Fertility rates in Panama have declined considerably in response to wide dissemination of birth control information. About 90 percent of Panamanian women use some method of contraception. Between 1970 and 2005, the fertility rate decreased from 4.9 to 2.45 children per woman. The adolescent fertility rate of 67 per 1,000 births has been a major cause for concern. Trained medical staff attend 90 percent of all births, but access to healthcare in rural areas is sometimes poor. Maternal mortality continues to be high, occurring at a rate of 160 deaths per 100,000 live births.

Panama has one of the highest literacy rates in the Latin American/Caribbean region. Among the population over the age of 15, 92.6 percent can read and write. Literacy rates have increased significantly, particularly for females. In 1980, 14.4 percent of males and 15.9 percent of females were illiterate. Both public and private schools are now required to teach English as part of the curriculum.

Education in Panama is free through the ninth grade. Most Panamanian students attend school for 13 years. Primary enrollment rates have reached 99.6 percent, and 63 percent of the relevant age group are en-

rolled in secondary school programs. Among those who enroll, 98 percent of all students complete primary school. On the average, poor students receive 4.3 grades less education than students from more affluent families.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Papua New Guinea

LOCATED BETWEEN THE Coral Sea and the south Pacific Ocean, the Independent State of Papua New Guinea is made up of a group of islands that include the eastern half of the island of New Guinea as well as the outlying islands of Manus, New Britain, New Ireland, and Bougainville. After being under the administration of Australia throughout most of the 20th century, Papua New Guinea was granted independence in 1975. Generally the country is politically stable, but over 20,000 people were killed in a secessionist revolt on the island of Bougainville that lasted from 1987 to 1997.

Natural resources that include gold, copper, silver, and natural gas are not fully developed because of difficulties involved in accessing the rugged terrain and managing the high costs of development. However, mining provides 72 percent of export earnings. As part of an agreement with Australia, Papua New Guinea receives \$240 million annually. While the economy has improved in recent years, the government faces a formidable task as it continues efforts toward privatization and attracting investors. Approximately 85 percent of the labor force are engaged in subsistence agriculture.

Although the exact rate is unknown, unemployment is high on the islands. The shaky economy is frequently affected by weather-related events that include earth-quakes, mudslides, tsunamis, floods, droughts, and killer frosts. Volcanoes are also active on the island.

Papua New Guinea is a low-income, moderately indebted nation with a per capita annual income of \$2,200 and a poverty rate of 37 percent. Some 27 percent of islanders are malnourished. Available resources are unequally divided, and the poorest 20 percent of the population subsist on 4.5 percent while the richest 20 percent share 50.9 percent.

Life expectancy is low in Papua New Guinea, and the population is relatively young. However, life spans are increasing. Between 1980 and 2000, life expectancy increased from 51 to 56 years for males and from 52 to 58 years for females. Women generally outlive men by more than five years. The median age in Papua New Guinea is 21.09 years. More than 38 percent of the population are under the age of 14, and 3.8 percent live to see the age of 65. Islanders have a 19 percent chance of dying before they turn 40.

HIV/AIDS is of growing concern in Papua New Guinea. In 2003 it was estimated that the prevalence rate had reached 0.6 percent. Around 16,000 islanders have contracted HIV/AIDS, and 600 have died from the disease or its complications. Health is further threatened by the fact that 58 percent of the people lack access to safe drinking water, and 82 percent lack access to proper sanitation. Rural residents are more likely than urban residents to lack these basic necessities. Islanders face a very high risk of food- and waterborne diseases, and dengue fever and malaria present a threat in some areas. There are only six physicians for every 100,000 residents on the island, but 80 to 94 percent of the people have access to affordable essential drugs.

Infant mortality is high in Papua New Guinea, but it has substantially improved over the last decades. Between 1970 and 2003, infant mortality decreased from 106 to 69 deaths per 1,000 live births. Among children under the age of five, mortality fell from 147 deaths per 1,000 in 1980 to 93 deaths per 1,000 in 2003. About 35 percent of all children under the age of five are malnourished, and 11 percent of infants are underweight at birth. Immunization rates for children from birth to 23 months old have remained stagnant for at least a decade, with percentages ranging from the high 40s to the low 70s.

Fertility continues to be high in the Papua New Guinea, even though it has declined since 1980, when women produced an average of 5.8 children each. Cur-

rently the fertility rate stands at 3.96 children per woman. The adolescent fertility rate is 66 per 1,000 births. Although the number of women using birth control is low at 26 percent, contraceptive use has risen significantly since 1980, when only four percent of island women practiced birth control. Just over 53 percent of births occur in the presence of trained medical staff. This low rate of attended births, coupled with limited access to antenatal care, has resulted in high maternal mortality. Based on modeled estimates for 2000, maternal mortality in Papua New Guinea occurs at a rate of 300 deaths per 100,000 live births.

Nearly 65 percent of Papua New Guineans over the age of 15 can read and write. At 57.7 percent, female literacy lags behind the male literacy rate of 71.1 percent. Even though literacy rates are low, the rate of illiteracy has declined since 1980, when 42.9 percent of males and 61.3 percent of females were not able to exercise these basic skills. Most children on the islands attend school for at least six years. Between 1980 and 2002, primary school completion rates for males increased from 54 to 64 percent and female completion rates rose from 51 to 56 percent.

Paraguay

THE REPUBLIC OF PARAGUAY was originally settled by natives but was conquered by Spain during its conquest of South America. Paraguay revolted against Spain in 1811 and established itself as a republic. Between 1865 and 1870, Paraguay was involved in the War of the Triple Alliance, which ultimately cost the nation two-thirds of its male population and a good deal of territory. It took over 60 years before Paraguay's economy began to recover from the period of stagnation created by the war.

Over 30 percent of Paraguayans live on less than \$2 a day.

The overthrow of Paraguay's military dictator in 1989 signaled a turn toward democracy and free elections. Yet the political environment in Paraguay continues to be characterized by infighting, corruption, an outdated infrastructure, and high internal and external debts. Accusations of smuggling, drug trafficking, and money laundering in conjunction with the unstable political environment have served to keep foreign investment at a minimum.

Paraguay's market economy is largely informal, profiting from the reexport of imported consumer goods to surrounding countries and from thousands of microenterprises and urban street vendors. About 45 percent of the labor force are engaged in agriculture, much of it subsistence-level. The agricultural sector accounts for 25.3 percent of the total Gross Domestic Product (GDP). Services generate half of the GDP, and industries are responsible for the remaining 24.9 percent. Unemployment stands at 15.1 percent.

With a per capita annual income of \$4,800, Paraguay is a lower-middle-income nation with a headcount poverty rate of 36 percent. Poverty rates have been increasing at the same time that social spending has decreased. Inequality is prevalent, with the richest 20 percent of the population holding 60.2 percent of resources and the poorest 20 percent sharing only 2.2 percent of resources. Paraguay is ranked 56.8 percent on the Gini Index of Human Inequality. Over 30 percent of Paraguayans live on less than \$2 a day, and 14.9 percent subsist on less than \$1 a day. Approximately 14 percent of the population are undernourished.

Women head up most poor households in Paraguay, and poverty has become more entrenched among indigenous women and those who live in rural areas. Women who work tend to be employed in low-paying jobs, and most women have no social security coverage. Paraguay worked with international groups to develop the Community Development Project (PRODECO) to

provide poverty relief and promote social inclusion, but changes have been only incremental. A large number of Paraguayans have no access to health services. There are only 49 physicians for every 100,000 residents, and up to 49 percent of the people lack access to affordable essential drugs. Improvements have been made in providing access to safe drinking water and improved sanitation. Currently 78 percent of the population have access to safe drinking water, and 94 percent have access to improved sanitation.

In 1980, life expectancy in Paraguay was 65 years for males and 69 years for females. By 2005, life expectancy had increased to 74.89 years overall. With a projected life span of 77.55 years, females tend to outlive males (72.35) by over five years. Among the population of 6,347,884, the median age is 21.2 years. Almost 38 percent of the population are under the age of 14, and 4.8 percent have reached the age of 65.

Paraguayan infant mortality is among the highest in Latin America, but rates have steadily declined. Between 1970 and 2005, infant mortality fell from 57 to 26 deaths per 1,000 live births. Among children under the age of 5, the mortality rate dropped from 76 to 29 deaths per 1,000 during that period. Five percent of all children under the age of 5 are malnourished, and nine percent of infants are underweight at birth. With one exception, immunization rates for children between the ages of 12 and 23 months range from 77 to 82 percent. Around 97 percent of infants have been immunized against tuberculosis.

Despite the fact that Paraguay has had a National Plan for Reproductive Health since 1997, fertility rates continue to be high. Both government and private organizations have launched campaigns to teach Paraguayans about family planning and safe sex. Approximately 57 percent of all women now use some method of birth control. Women produce an average of 3.8 children each. Teenage pregnancy is also high, and the adolescent fertility rate is 71 per 1,000 births. Trained medical staff attend 71 percent of all births in Paraguay. Abortion is identified as the third most frequent cause of maternal death, but unofficially it is believed to be the leading cause of death. According to modeled estimates for 2000, 170 maternal deaths occur out of every 100,000 live births.

The Paraguayan population is highly literate, and 94 percent of the population over the age of 15 can read and write. Illiteracy rates have declined significantly since 1980, when 10.5 percent of males and 17.6 percent of females were illiterate. Around 92 percent of children are enrolled in primary school, and 50 percent

of the relevant age group are enrolled in secondary school. In urban areas, there is little difference in school enrollment between boys and girls. In rural areas, however, the enrollment ratio is 86 girls to 100 boys. Literacy is also lower among females in rural areas. When Paraguay made formerly same-sex colleges coeducational in 2004, it created a national outcry and led to open aggression toward female attendees.

Participation

THE TERM AND CONCEPT of participation originally took force in the 1980s and 1990s, as noneconomist social scientists began to question traditional forms of worldwide development. Previous to this time, institutions, including the World Bank, the United States Agency for International Development (USAID), the Overseas Development Agency (ODA) in the United Kingdom, and the United Nations Development Program (UNDP), maintained a philosophy of supporting disadvantaged—or Third World—countries through "top-down" approaches. Agencies would donate finances for projects to national governments that would spend the money accordingly. Thus revenues were believed to trickle down to those who were in need. However, this system was appearing to have little impact on those who required support the most.

Donor agencies then began to channel funding through nongovernmental organizations (NGOs). Many NGOs were already working on a range of issues in communities around the world. Yet even with this "bottom-up" approach, not all projects remained sustainable through time. The reality was that life on the ground was diverse and complex. Local contexts, local points of view, and local needs were still subsumed under NGO aims and perspectives. Participatory approaches began to surface within the agricultural and farming context, as it was recognized that local farmers had a great deal of knowledge about their environment. Participatory Rural Appraisal (PRA) primarily developed in natural resource management, where users became more involved in the planning, management, and monitoring of programs, as discussed by R. Chambers.

To make participation more empowering, a shift in methodology is also present.

The participation of stakeholders in program development has become mandatory, not only for the success of projects to increase but also to secure funding. The World Bank addressed its own policy on participation in the early 1990s. The bank's long-term goals included the promotion of participatory development to governments and other lenders, encouraging beneficiaries to consult and work with stakeholders, and conducting participatory techniques in evaluation. Thus participants would engage with programs more than before and essentially take on some ownership.

However, the levels and scope of participation vary extensively. A community-based project with local support and membership does not necessarily equate with participatory decision-making or power. Extra effort still needs to be made to include and mobilize the marginalized, mainly women and the poor.

Chambers argues that there are three main ways that participation is used: first, like a cosmetic, in order to attract funding, but the discourse is applied with no real change of management style; and second, a coopting style of integrating stakeholders to take part in what is still an externally lead project.

Last, participation can be empowering. A shift in thinking and direction is required in order for users to be given more tools to direct and manage their projects. External support is then in the form of facilitation, equipping local people to take the reins.

In order to make participation more empowering, a shift in methodology is also present. In research and development across the social sciences, techniques are used that have a participatory philosophy and practice. Participatory Appraisal (PA) methods commonly utilize

visual engagement, such as maps and diagrams that draw out vital contextual information, as well as local preferences or barriers to programs. Tools can be used with individuals or groups to explore people's perceptions and relationships to issues at hand. Monitoring and evaluation tools also involve strengthening the capacity of local users to take forward the findings and outcomes of a program.

While participation in development has allowed a shift of control from financial-based institutions to local people, the process does remain one of alleviating symptoms. Inclusion and rights of the poor and others facing exclusion remain limited. Participation will remain an ideal until the causes of poverty and the global relations of power are truly shifted.

Partnership to Cut Hunger and Poverty in Africa

THE PARTNERSHIP TO CUT Hunger and Poverty in Africa (PCHPA) is an independent organization of leaders from U.S. and African governments and private institutions that undertakes initiatives to reduce African poverty and hunger. The primary focus of PCHPA is to increase the level and improve the effectiveness of investments in African agriculture and rural development.

PCHPA was created in 2000 from concerns that the U.S. response to increasing hunger and poverty in Africa was inadequate. The partnership seeks increased assistance for Africa from the United States, the World Bank, and other international organizations and seeks to create a consensus among Africans and Americans

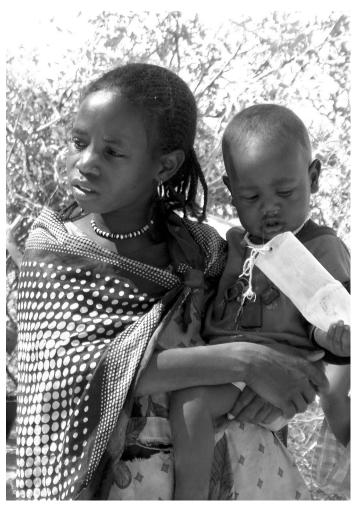

Immunizations are just one part of activities encouraged by the Partnership to Cut Hunger and Poverty in Africa. The group also promotes participation by nongovernmental U.S. organizations in African poverty relief.

about the best ways to reduce poverty and hunger in Africa.

The activities of PCHPA focus on four primary objectives. The partnership seeks to convince the U.S. government to make the reduction of hunger and poverty in Africa one of its highest priorities. PCHPA encourages the World Bank to restore agriculture and rural development as a priority for its funding. The partnership promotes increased funding for USAID's agriculture and rural development programs and improved technical capacity within the agency to increase U.S. support for African development. The group also encourages increased participation by nongovernmental U.S. organizations and seeks to concentrate U.S. aid on agricultural and rural development.

PCHPA seeks to develop and implement long-term strategies that will alleviate African poverty and create sustainable economic development. The partnership believes investment in Africa's agricultural sector will increase productivity, expand trade, and lead to the creation of other successful businesses in rural areas. American responses to short-term emergencies have been generous but insufficient for the successful development of an agricultural sector that will enable Africa to feed itself on a sustained basis.

The partnership believes one of the obstacles to the elimination of hunger and poverty in Africa is an incomplete understanding of development issues. Consequently, PCHPA initiatives seek to change some perspectives of African economic development. The partnership believes the United States should grant Africa more control over its economic development. The United States, Africa, and its partners must recognize the interdependence among agricultural and rural development and other social goals, such as health, nutrition, gender, and environmental concerns. The group

A displaced young woman with her baby seeking aid in the faminestricken Darfur region of Sudan.

also argues there is an insufficient appreciation of the diversity of political and economic conditions in African countries.

PCHPA favors the use of U.S. aid to support African-led initiatives that successfully integrate Africa into the global economy and that assist the poorest members of African society by increasing their productivity. The partnership's efforts to increase public and private investment in Africa include attempts to increase the level of African resources devoted to economic development, to encourage more overall U.S. investment in Africa, and to increase the loans and grants for African agricultural and rural development by the World Bank and other international agencies. PCHPA efforts to improve the effectiveness of U.S. aid seek to ensure that assistance efforts respond to African-led initiatives in agricultural and rural development; coordinate with initiatives of the World Bank

and other development organizations; complement other U.S. policies that affect African development, such as trade and debt relief; involve the private sector; and focus on building the capacity and institutions in Africa to achieve significant hunger and poverty reduction.

Paternalism and Welfare

IN CONTEMPORARY Western welfare systems, particularly in the United States, participants are required to exchange work effort and behavioral conformity to program mandates for cash aid. Such mandated prescriptive behavior by the government is termed *paternalistic*.

Under paternalism, critics argue, government programs treat their clients like wayward, misbehaving children who need instruction, direction, and correction enforced by threats or imposition of punitive sanctions in the form of reduction or denial of cash aid in order to get them to conform to standards of behavior.

Welfare policies were not always so overtly paternalistic in the United States. Prior to the era of welfare reform, which had its birth in the Personal Responsibility and Work Opportunity Reconciliation Act of 1996, welfare largely trusted clients to adhere to societal standards of hard work, family care, and moral probity. In order to qualify for cash aid in the earlier system, one had to merely prove need (and, in the early years of welfare, be deemed worthy of cash aid by being white and a single mother by circumstance rather than choice), not demonstrate a work ethic or conformity to a governmentally mandated behavioral code.

However, as welfare rolls increased dramatically in the 1950s through 1970s, the public demanded accountability of welfare recipients. Often the media and politicians depicted recipients as deviant from society in their lack of commitment to work or efforts to become economically self-sufficient. In response, politicians embraced welfare-to-work programs, first in programs with nonenforceable work requirements that more cajoled than coerced, and then in programs that threatened and implemented the removal of support for acts of noncompliance.

Today cash aid is provided only when a recipient works 35 hours per week or participates in limited activities designed to generate employment activities. Failure to do so results in the aforementioned sanction. Even more paternalistic is the notion that government can and should enforce standards of family formation. Mothers who receive cash aid are forced to cooperate in child support enforcement, even in cases where the mother does not desire or is fearful of contact and involvement with the father.

There are several problems with paternalism, aside from the issue of welfare justice.

Further, pilot programs are currently being tested in 10 sites around the United States where welfare clients are penalized for not marrying or staying married. With marriage in these programs comes greater monetary aid. Failure to marry or dissolution of marriage results in reductions in cash aid. Welfare clients also receive marital counseling and relationship workshops. In the near future, it is possible that such marriage incentives and nonmarriage sanctions may become welfare policy de jure.

Paternalistic welfare policies turn a blind eye to social realities for clients. The paternalistic Theory of Labor Force Attachment, upon which welfare is predicated, argues that work is abundantly available for welfare clients. However, in their dependency on cash aid, welfare clients refuse to take work. No barriers to work exist, such as lack of appropriate and affordable childcare or transportation. In their dependency and lack of work, welfare clients are freed to reject societal norms and act in ways that threaten the social order. Punitive sanctions become the only means by which government is able to enforce socially acceptable behavior and adherence to work standards.

Studies do not provide evidence supporting the claims of the Theory of Labor Force Attachment. Nor do they justify the use of paternalism in welfare policies. In fact it appears paternalism may be harming welfare clients unjustly. If it is the case that welfare clients

are dependent on welfare because jobs are not available to them that pay living wages, and thereby enable them to be independent of cash aid, then paternalism will not reduce the need for dependency. Further, if barriers to work do exist, as numerous studies show, then punitive welfare policies will only cause families to suffer, not become self-sufficient.

Despite the evidence contradicting the need for paternalistic welfare policies, such policies in the United States will likely continue to be in place for the foreseeable future. While evidence may be lacking, there is no shortage of public support for paternalistic welfare. It would seem from current policy discussions that welfare is going to become even more paternalistic, with mandatory full-family sanctions, increased work obligations, and fewer acceptable exemptions to work.

There are several problems with paternalism, aside from the issue of welfare justice. Paternalistic welfare is expensive, as it requires close supervision of clients by an effective monitoring system. More welfare caseworkers, not fewer, are needed to ensure that clients who do not conform are identified and appropriately addressed. Paternalism is antithetical to the American ethos, including violations of central tenets of freedom, individual worth, and limited government involvement in the private lives of citizens. Finally paternalistic welfare may generate deeper dependence on welfare, as clients who face deepening financial woes become clients of other governmental systems, such as child welfare agencies, hospitals, or mental health agencies.

Pauperism

PAUPERISM IS A TERM introduced into the English language with the passage of Poor Laws in the early-modern period of English history (ca. 1450–1750). Al-

An almshouse in England, where paupers sought relief under the Poor Laws. Pauperism was the "English disease" that came with the "English system," industrial capitalism.

though it was derived from the Latin *pauper*, meaning "poor," it meant not only the state of being poor or impoverished but the legal condition of being in receipt of public assistance administered under the Poor Laws and, as such, carried the social stigma of being a public burden. It implied a long-term condition of dependency and destitution.

A person entitled to poor-law relief had to be destitute as determined by magistrates or other government officials, and the moment a person obtained public relief, he or she became a pauper. As a term of opprobrium, it made its way into French, German, and other European languages by the early 19th century to describe the severe dislocations, indigence, and extensive systems of public assistance that accompanied the capitalist Industrial Revolution on the continent.

In England, measures to relieve pauperism were mainly designed to suppress vagrancy and begging as threats to public order. The Henrician Poor Law (1536) and the Parish Poor Rate (1572) set the stage for the pas-

sage in 1601 of the Elizabethan Poor Law, which maintained paupers by legislating compulsory local taxes administered by a parish; monitored them by registration, surveillance, and periodic interrogation; and compelled the able-bodied poor to work. It also required children to work if their parents were unable to support them. Local reluctance to support paupers from other locales led to settlement laws restricting migration, and poorhouses took the aged, infirm, and insane paupers off the streets and boarded them under one roof.

The Poor Law was renewed by subsequent acts and modified over time, reflecting the shifting views of elite lawmakers on how paupers and pauperism should be handled. Compelling paupers to work at any job was a common theme. Starting in Bristol in 1697, workhouses were established where paupers were expected to support themselves by work or lose support. Also in 1697, those receiving relief were obligated to wear badges of pauperism (a large red or blue "P" sewn on the right shoulder of their outermost garment along

with the first letter of the name of their parish) or face suspension of payments. Badging the poor publicly identified and stigmatized the pauper, a humiliation that continued until 1810.

In 1723 the Workhouse Act officially introduced the workhouse test, and any pauper who refused to live and work under the horrible conditions prevailing in such houses lost entitlement to support. The test was repealed in 1782 and able-bodied paupers were able to receive relief at home (called "outdoor relief" as opposed to the workhouse or "indoor relief"). The New Poor Law of 1834 curtailed outdoor relief and, hoping to compel paupers to perform any sort of work, pegged payments at a level below the pay of the poorest laborer. It remained in force until 1930. Critics of pauperism on the continent in the early 19th century saw it as a dark side of capitalist social relations. Pauperism was the "English disease" that came with the "English system," industrial capitalism.

BURDENS ON THE COMMUNITY

One early commentator, the Franco-Swiss historian and economist Simonde de Sismondi (1773–1842), wrote that pauperism (he insisted on using the English word to describe this form of destitution) was inevitable when wage workers became unemployed in a free-enterprise system, because they owned no productive property or assets nor belonged to a trade association (such as a guild) that could support them in challenging economic times.

When workers were unemployed, if they did not resort to criminal activity to make ends meet, they had no other recourse but to become publicly assisted paupers and burdens on the community. The associated stigma was not individual but adhered to an economic system that produced such economically insecure individuals.

Pension Programs

AN ADEQUATE PENSION SYSTEM for the elderly is the key to providing income security and reducing poverty. In fact, for countries with well-developed pension systems, pensions have been instrumental in reducing the poverty rates of the elderly to lower levels than for any other age group in the population. For example the poverty rate for the elderly in the United States fell from 35.2 percent in 1959 to 10.2 percent in 2003. The overall poverty rate for the United States in 2003 was 12.5 percent.

Nonetheless, pensions are virtually nonexistent in many countries. Without adequate pensions, the elderly are forced to rely on their families, maintain their employment, or live in poverty. Expanding pension coverage, either through the government or the private sector, is an important part of improving social welfare for aging populations.

Indeed pensions will become increasingly important in the future for several reasons. First, a worldwide trend of decreasing mortality rates is causing more people to live into old age. Elderly women face particular risks because they often outlive their husbands and must rely on any survivor benefits they can receive through their husband's work record. Reduced fertility rates are also creating strains for pension systems, because there will be fewer young people to support the increasing numbers of old people.

Most countries will experience rising old-age dependency ratios, and while industrial countries have highly developed pension systems, these systems will be increasingly pressured because the number of elderly will increase rapidly in the coming years in relation to the working-age population. Additionally migration and industrialization are breaking the links among family members and making it more difficult for children to support their elderly parents. Without the income security provided by pensions or other means, these new elderly will find it difficult to avoid poverty.

TYPES OF PENSIONS

Pensions can be found in a variety of forms. From the government they can either be developed as social insurance, in which a person's pension is directly related to her contributions into the system, or they can come through social assistance and welfare programs that provide a minimum income to those elderly with sufficiently low income and assets. In 1889, Germany began the first national old-age social insurance program. Pen-

sions can also be provided privately as a part of the compensation package for workers. A few corporate pension programs began in the late 19th century or earlier, but large-scale corporate pension programs would not become widespread until the 20th century. For social insurance or private pensions, the pension can either take the form of a defined-benefit scheme or a defined-contribution scheme, each with various advantages and disadvantages. Some workers are able to take advantage of both a public and a private pension, while other workers qualify for one or no pension.

The International Labor Organization provides a set of general objectives for national pension programs. They include the idea that pension coverage should be extended to all members of the population. Pensions should protect against poverty in old age, during disability, or after the death of the family breadwinner. They should also provide an income to all contributors to replace lost earnings from voluntary or involuntary retirement. Pension amounts should be adjusted to account for inflation and the general rise in living standards. Finally a country's pension framework should be designed to allow further voluntary provisions for retirement income.

OLD-AGE SECURITY

The World Bank has also developed a framework for pension systems to help provide income security during old age. The five elements of the World Bank's strategy include a minimal pension payment available to everyone regardless of contributions, a pension based on contributions that provides a replacement for some portion of a worker's earnings at retirement through a defined-benefit system, an additional defined-contribution system that works as an individual savings account, additional pension systems of a voluntary nature, and dependence on family. With these five systems in place, elderly will have strong support to avoid poverty.

Where they exist, pension programs are generally categorized as defined-benefit (DB) plans or defined-contribution (DC) plans. Between these two types of plans, there remain many possible variations. Generally a DB pension plan provides benefits that are not directly related to earnings.

Once a worker has been with an employer long enough to become vested in the program, the worker's pension benefit is based on the number of years of employment. Occasionally the worker's earnings will also play a role in determining the pension amount. Government DB plans often work on a pay-as-you-go basis,

with current workers paying for the benefits of current retirees. Historically DB programs have been more common, though they are losing popularity in recent years as the rising old-age dependency ratios strain these systems.

A main advantage of DB programs for workers is that their market risk is reduced in terms of needing to make the appropriate investments in stocks, bonds, and other financial assets. The risk of poor investment performance is shared across a larger number of workers, and even to an extent across generations. A disadvantage of DB plans for workers is that they are less portable, and a worker who frequently shifts between jobs may have a lower pension upon reaching retirement age. But this is an advantage to employers, because a DB pension program will motivate workers to stay with the firm and the employer will experience less employee turnover.

The workers will bear the full burden of risk for their retirement pension.

Workers have also faced the risk of their employer canceling DB pension programs, though countries such as the United States now insure workers for such risks. Disadvantages for employers with DB plans are that they can be more expensive to administer and can be subject to greater government regulation.

In recent years, DC plans are increasingly replacing DB plans. This is seen in countries such as Chile that have adopted DC plans at the national level, and it is also the direction of reform advocated by President George W. Bush for Social Security in the United States. For a DC plan, the employee and/or employer deposits a portion of the employee's salary into an individual savings account. The worker is then responsible for deciding how this money is invested. This allows the worker greater control to choose the appropriate level of risk and also helps to assure workers that they will receive what is in their account, but it also forces the workers to bear the full burden of risk for their retirement pension.

If a worker makes investment mistakes or is unlucky, the resulting pension could be small. Workers who change jobs will also benefit from the portability of their pension. These programs can be easier to administer for companies and they are subject to less regulation, because it is not necessary for the employer to prove that it will be able to pay the promised pension

benefits. Such programs are also easier to explain to employees. The disadvantage for employers is that since they have less control to design the pension rules, they lose the ability to use the pension as a tool to get workers to retire at the ages desired by firms.

Pension issues remain an important challenge for countries throughout the world, but for different reasons. Developing countries often lack adequate pension systems, and demographic and economic forces are reducing the ability of the traditional family system to provide for the elderly. On the other hand, developed countries often have extensive pension systems, but the trends of reduced fertility rates and reduced mortality rates could eventually overwhelm the funding mechanisms for these programs. This will particularly strain pay-as-you-go or defined-benefit pension systems that rely on population growth to ensure that the current generation of workers can provide for the current generation of retirees.

Peripheral Poverty

PERIPHERAL POVERTY IS THE impoverishment of isolated or marginal areas. This conception of poverty can be used to examine poverty within a single nation or region or can be extended to examine the socioeconomic conditions of peripheral nations within the world system.

While the lived experience of peripheral poverty is similar in nature to interstitial poverty, peripheral poverty is located on the outskirts of areas of power and wealth. Peripheral poverty can also share many of the same qualities found in persistent poverty.

While there are similarities within poverty types, those experiencing peripheral poverty may face additional obstacles to success. While those experiencing rural poverty may be more likely to experience poverty because of a lack of landownership, those experiencing peripheral poverty may actually own land. However, the type of land they own or have access to, is often nutrient depleted, difficult to farm, and may have a scarcity of water.

Without these critical factors the ownership of these lands is not useful and does not allow one to pursue agricultural efforts to gain adequate nutrition or additional resources through the sale of produce. While there may be limited ability to farm the land owned, many are unable to leave these areas for structural reasons or because there are few other social options available. Thus the inability of people living in peripheral poverty to farm their lands or to leave their land may enforce their inability to meet their basic needs, let alone move out of their economic position.

Water is an essential need of all people, so this limited resource may reinforce the inability to leave a land that has little water, particularly if surrounding areas have even fewer or unproven water resources. Without adequate water transportation systems there will be little increase in agricultural output. Even if water should become available to help enable limited agricultural output from these infertile soils, there may be limited or no available means to market these goods. The lack of water resources has been especially influential in various African and Arab arid environments and has resulted in some of the poverty in existence outside of more developed urban centers.

Without a transportation infrastructure and accessible market source, people who are able to produce goods while subsisting in peripheral poverty do not have an opportunity to improve their socioeconomic status. However, from the structural perspective there may be little social concern to address the issue of peripheral poverty, as these persons are less able to be involved in sociopolitical life and influence social change. Ultimately the peripheral poor may be neglected and forgotten not only for their limited political and economic influence, but also because of their social invisibility. These persons are less able to be seen in the more economically developed centers because of their limited resources and transportation potential.

Recent efforts in Germany to address issues of peripheral poverty have found that by actively seeking to

involve these citizens within the political decision-making process, there is an increased vested interest in their cause. Representation that is influenced by those experiencing peripheral poverty has an increased incentive to actively voice the concerns of this underrepresented group.

In the United States those experiencing peripheral poverty are also limited in their access to sociopolitical change. Those speaking on the behalf of these impoverished groups are often grassroots organizations that may be poorly funded and limited in their influence.

Permanent (Collective) Poverty

PERMANENT POVERTY IS AS the term implies: a condition of permanent material deprivation. Because it persists over time it is different from the temporary condition of poverty caused by flood or famine. Poverty that is permanent has a stable pattern of insufficient resources available for satisfying the needs and wants of all the people of an area. It is different from the transitory and impermanent cyclical poverty caused by nature or by human calamity.

Permanent poverty is concentrated over a large area among a large number of people who may have little else except for their poverty in common. Permanent poverty shared in groups may also be transmitted from generation to generation. This occurs as the result of patterns of behavior that are nonproductive and often destructive in character.

Even if resources become available, they will be squandered because of destructive cultural patterns. Permanent poverty can be found in many areas of the globe, from east Kentucky to east Africa or east Asia. People numbering in the hundreds of millions are trapped in permanent poverty where life is lived as a marginalized existence.

In places where poverty has settled in to become permanent, the effects are such that life expectancy is low, infant mortality rates are high, and the people are often further impoverished by poor health. The health factors alone allow diseases to flourish. Poor diet and the lack of modern medical services cause the energy levels of the poor to be so low that just existing day to day takes all of their strength.

Places experiencing permanent poverty have low rates of economic development. The total production of permanent poverty areas would not be better, even if all the available resources were distributed equally. The solutions to permanent poverty proposed by many concerned people or agencies are to expand the Gross Domestic Product of areas, increasing agricultural and industrial production.

Working against ending permanent poverty in many areas is the problem of overpopulation. There are a number of forces that are opposed to population control. These include sheer ignorance, traditional beliefs, the biological imperialism of some religions, the fact that children are the social security system of the aged in much of the world, and other forces. Without population control the gains made in increased agricultural and industrial production are easily negated by population growth. In a Malthusian situation the population grows more rapidly (a geometric progression) than do resources (arithmetic progression), so the improvements are negated. However, the one factor that does seem to lead to decreased population is the education of women—this empowers them to have control over reproduction.

Population growth is directly related to the reduction in mortality rates for infants that comes as the result of improving the availability of modern medical services. The survival of more infants leads to birthrates of three or four percent, which can double a population in 20 years or effectively in a generation. Some countries have tried or even imposed various birth control or family planning programs.

In the case of many areas of permanent poverty and in the countries that contain these areas, there is often an unequal distribution of the wealth, such that there are a few very wealthy "haves" and a great many "havenots." This pattern of inequality is very likely to continue despite production increases, because the powerful are able to extract an increased share in the

productive gains. The trickling-down of more than was permanently available to the poor is usually negated by the population increases, so that vast numbers of people are permanently imprisoned in subsistence conditions, where there is little likelihood of freedom from poverty. Overall the results of efforts to reduce or eliminate permanent poverty have been discouraging to many. The results have often been too meager for the resources expended.

CHARACTERISTICS OF POVERTY

One of the claims of scholars who study poverty is that crime is caused by poverty and unemployment. In a cause-effect relationship, it is argued that as poverty increases, so will crime. However, other studies have shown that this is not necessarily the case. Opponents of a necessary relationship between crime and poverty have presented data to show that the absolute poverty of the Great Depression did not produce a higher crime rate or social disorder, as happened in the 1960s and 1970s, when poverty was declining but the crime rate was increasing. These critics point to other factors, such as the decline of marriage and family, which allows for the abandonment of responsibility, especially by males.

Other advocates for the poor stress the humanity of people as an inherent human right to live and not just to survive. For these advocates human rights include the right to a share of the world's production so that permanent poverty can be eliminated by sheer redistribution. This involves the end of all discrimination by businesses or governments, so that all may have equal access to jobs or other resources without regard to age, race, religion, nationality, social status, disability, or other factors. The Western world has made great strides in eliminating these restrictions on human freedom, but a variety of discriminatory practices still abound in the poor countries of the world.

Permanent poverty can be found in rural areas of the world, where people in peripheral poverty are isolated from resources, markets, education, or other opportunities. However, permanent poverty can also be found in industrial societies. The urban areas of many industrial nations are populated by people in permanent poverty. As refugees from rural poverty, they have come to urban areas, only to be marginalized because they lack the needed skills for success in a market-driven industrial society.

To the native population of people in permanent poverty in the industrial order that is now emerging can be added a new population of illegal immigrants who have come seeking a richer life. Many, however, have found that they are in excess supply, as did many immigrants in the last several centuries. Their life may be better materially than in their previous situation, but it will also still be a life of poverty.

Solutions to the problem of permanent poverty vary. For industrialists, business people, or other investors the solution is to build production centers and markets in areas that have entrenched poverty. However, to those in the trade union movement the exploitation of cheap labor is detrimental to the future prosperity of labor in the industrialized world. Consequently labor movements are often opposed to business investments in permanent poverty areas. Opposition can also come from native elites. They may feel threatened by the arrival of foreign investors because of their enormous power.

The whole society shares in poverty and wears it as a badge of honor.

Poverty is a stark fact of life for at least one billion people in the world, but it is also a condition that previous generations have experienced. During the Great Depression huge numbers of people, including millions of Americans, were reduced to a condition of poverty that bordered on permanent absolute poverty. However, the culture of the times was accepting of some people who were poor, because it was a commonplace experience. Yet millions of the poorest were to experience discrimination and exploitation. The most compelling examples of these poor people were the Oakies who went to California. Their plight was portrayed by writer John Steinbeck in his book *The Grapes of Wrath*. For many people the experience forged them into a community of suffering.

The condition of the Palestinian Arabs who are living in permanent poverty is a collectively shared condition. The whole society shares in poverty and wears it as a badge of honor in their Intifada war against the Israeli occupying forces. The wartime conditions of the civil strife are the primary causes of this permanent poverty, but this is acceptable to most because the community is accepting poverty as the price of self-determination.

Conditions of permanent poverty create prime recruiting grounds for those who wish to engage in armed struggles against the status quo. There are a number of revolutionary ideologies, most commonly of the communist variety, that have declared the conditions of permanent poverty as unacceptable because they violate conditions of equality. Where these ideologically motivated groups arise, some turn to terrorist strategies. The result is that global stability and peace are threatened by these groups. In effect permanent poverty is a leading cause of political violence. The causality is more of a concomitant than a direct cause. Poverty per se does not cause revolutionary violence; however, it does leave people without hope, which the revolutionary ideology can exploit.

Consequently, instead of economic solutions to permanent poverty, the revolutionaries offer a political solution. The solution could work because the revolution, if successful, could have the power to so reorder the society that traditional practices that inhibit economic development, as well as the inhibiting old social order, can be swept away and replaced with a new order that allows for mechanisms to be instituted that can eliminate permanent poverty.

The current violence in Nepal is an example of revolutionary violence that is an expression of a struggle between the "haves" and the "have-nots." The outcome of the struggle is very likely to produce a changed society in which the old patterns of ownership and poverty are permanently changed.

Other forms of violence where permanent poverty exists can be found in the Darfur region of Sudan in Africa. The arid nature of the area has never permitted the population to be prosperous. However, a life of sufficient livelihood has been available. However, the virtual genocide by irregular Arab forces is reducing the area to one of permanent nomadism, where the nomadic way of life will be the new order. This would create an expansion of permanent poverty in the Sahel region.

Peru

THE REPUBLIC OF PERU is a country in South America, located to the west of Brazil and Colombia and bordered also by Chile, Bolivia, and Ecuador, with a long coastline along the Pacific Ocean. It has a population of approximately 28 million and an average annual per capita income exceeding \$2,300. Although a large store of natural resources and agricultural land offers promise for a successful national economy, the legacy of colonization, armed conflict, and corruption has contributed to a situation in which millions are still mired in poverty.

The history of Peru is dominated first by the indigenous empires of the Incas and others, which were conquered by the Spanish conquistadors in the 16th century. This resulted in 300 years of colonization in which control over profitable economic activities was taken into Spanish hands, while the indigenous population was denied access to economic or social opportunities. Independence was not achieved until 1824, when Peru was the last remaining colony in Latin America. Nearly 100,000 Chinese workers were imported to undertake some of the dirty, dangerous, and diligent jobs in the economy.

Wars with Chile and Ecuador also led to various realignments of political borders and hindered economic growth. Throughout the 20th century, military autocracy rotated with democratic or semidemocratic governments as popular support for reform was repressed by the political and economic elite. Absolute ownership of the means of production by the elite led to a system of endemic corruption in which interlocking interests reinforced each other across the whole range of economic activities.

When periods of democracy did lead to laws from which the poor could benefit, the elite class instituted extralegal means to prevent change by suborning the legal system to provide them with precedents that outweighed the common law—known as *títulos supletorios*. Military forces were available to carry out "disappearances" of those who might offer political dissidence,

and the system of repression could be justified by the activities of the Maoist resistance group the Shining Path.

Shining Path was a communist guerrilla organization that focused on empowering the native people and undertaking armed conflict against the economic interests held in Spanish hands. Tens of thousands of people died during the period of activity of Shining Path, which declined as a result of the capture of its charismatic leader, Abimael Guzmán Reynoso, in 1992.

A considerable improvement in economic conditions and equality has taken place, first under the administration of Alberto Fujimori, now living in exile in Japan, and subsequently Alejandro Toledo, who assumed power in 2001 and is a native who arose from obscurity and poverty to govern his country. As an economist and a former advisor to the World Bank, he has been unable to deliver the increase in social spending and welfare required. One significant and persistent economic problem has been inflation, which reached 45 percent in 1991 and remained significant subsequently. This has further contributed to the general unwillingness of external investors to locate inward investment in Peru.

In 1997 it was estimated that 37 percent of the population lived in poverty and 16 percent lived in extreme or primary poverty. As might be expected, the situation in rural areas was significantly worse than for the urban population, although inequalities are higher within cities. People living in different parts of the diverse geography of the country are often excluded from the economic system entirely.

A substantial number are still tempted into the production of coca for cocaine, especially when they can see no other option to earn income and the threat of capture appears low. The El Niño phenomenon has also had a negative impact upon the economy, as it has interrupted local agricultural production patterns. The country's poverty reduction strategy has, meanwhile, made some steps in documenting the extent of the poor and formulating some plans to tackle the issue.

Philippines

LOCATED BETWEEN THE Philippine Sea and the South China Sea in southeastern Asia, the Philippine islands were of strategic importance to both the Allies and the Axis during World War II. Although Japan overran the Philippines, the United States assisted Filipino forces in evicting them. Independence was declared on July 4, 1946.

Since the authoritarian rule of Ferdinand Marcos was forcibly ended in 1986, the Philippines have experienced a period of political instability, filled with corruption and failed coup attempts. The Filipino economy escaped the worst effects of the Asian financial crisis of 1998, but the country experienced a slow-down from which it is only gradually recovering.

Oil prices, interest rates, and inflation (5.5. percent) remain high. Some 36 percent of the labor force are involved in agriculture. Over half of the labor force is involved in service industries. The economy is also dependent on regular remittance from Filipinos who work abroad, adding \$7 billion to \$8 billion in revenue each year.

Political instability, massive flooding, landslides, earthquakes, and tsunamis have all taken a toll on the Philippines. Some 40 percent of the population live in poverty. Poverty analysis in 2000 identified 5.1 million Filipino families and 30.8 individuals as poor. Some 46.4 percent of the population live on less than \$2 a day, and 14.6 percent survive on less than \$1 a day. Approximately 22 percent of the population are undernourished. Unemployment is currently estimated at 11.7 percent and is steadily increasing. Filipinos experience great inequality, with the poorest 20 percent holding 5.4 percent of resources as compared to 52.5 percent for the richest 20 percent. The Gini Index of Human Inequality ranks the Philippines at 46.5 percent.

Life expectancy in the Philippines is 69.91 years, and the median age is 22.27 years. Some 35.4 percent of the population are under the age of 14, and four percent have reached the age of 65. More than 90 percent of all Filipinos are likely to see their 40th birthday. Some 14 percent of the population lack access to safe

water, and 17 percent lack access to proper sanitation. As a result of the lack of basic health precautions and the weather-related crises, Filipinos face high risks of contracting food- and waterborne diseases such as hepatitis A and typhoid fever. Rabies is a persistent threat. In some locations, dengue fever and malaria are common. There are 115 physicians for every 100,000 residents, and over half of the people can afford essential drugs.

Between 1970 and 2005, the Filipino infant mortality rate fell from 60 to 23.51 deaths per 1,000 live births. Among children under the age of 5, mortality was more than halved, dropping from 90 to 36 per 1,000. Approximately 32 percent of all children under the age of 5 are malnourished. Some 31 percent of under-5s suffer from moderate to severe stunting, and six percent experience moderate to severe wasting. Childhood immunizations are lower in the Philippines than is necessary to ensure the health of a nation's children, and rates have steadily declined from 80 to 70 percent in recent years.

Fertility is higher in the Philippines than in other southeastern Asian countries, but it declined significantly from 6 in the 1970s to the current rate of 3.16 children per woman. Fertility is higher in rural areas than in the rest of the islands. Adolescent fertility is recorded at 33 out of 1,000 births. Nearly half of all Filipino women use contraceptives of some sort. Trained medical staff attend 60 percent of all births, an increase from 46 percent in 1999. The estimate for 2000 reported maternal mortality at 200 deaths per 100,000 live births. This rate has increased since the 1970s, when the death rate was 170 out 100,000 live births.

Education is widely accessible in the Philippines, and most Filipinos attend school for at least 12 years. Virtually all children complete school at the primary level. Over 92 percent of both males and females over the age of 15 can read and write. Literacy rates as well as school attendance and completion rates are lower in rural areas. Therefore the rural population is more likely to be poor and to remain so because of a lack of education and skills.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Physiocrats

THE PHYSIOCRATS WERE a group of French Enlightenment thinkers of the 1760s who called themselves economists. The term *physiocracy*, introduced by Dupont de Nemours (1767), is derived from the Greek words *physis* ("nature") and *kratein* ("rule"), implying thus a principal postulate of this school of thought: the rule of nature.

The founding document of Physiocratic doctrine was François Quesnay's Tableau Économique (Economic Table), published in 1759. It has been argued that Quesnay developed this idea because, as a physician, he drew an analogy between the circulation of blood and the "homeostasis" of a body. However, the idea of a natural balance of income flows had already been elaborated in the economic theories of Pierre de Boisguilbert and Richard Cantillon, Cantillon, an Irish banker who lived in France, published Essai sur la nature du commerce en géneral (Essay on the General Nature of Commerce) in 1756, laying out the essential principles of physiocracy. Besides Quesnay, a physician to Madame de Pompadour and Louis XV, other prominent physiocrats included the Marquis de Mirabeau, Mercier de la Rivière, Dupont de Nemours La Trosne, and Abbé Baudeau.

NET PRODUCT

The crux of the Physiocratic doctrine was the notion that only agriculture yielded a surplus, which it called a *produit net* (net product). Physiocrats attacked monopolies, exclusive corporations, vexatious taxes, and various other abuses that had grown up under the mercantile system. Manufacturing, the Physiocrats argued, does not create net product since it uses as much value as inputs into production as it created in output.

Unlike the mercantilists, who believed that the wealth of a nation lies in its stocks of gold and silver, Physiocrats insisted that the real wealth of a nation is

exemplified by the size of its net product. They, however, did oppose commerce and manufacturing, and questioned government policies that distorted the entire economy with protective tariffs, controls, and various monopolies, none of which created net product. Physiocrats insisted that the principal aim of government policy should be maximizing the value and output of the agricultural sector. In the specific circumstances of 18th-century France, that implied the removal of restrictions of internal movements of goods and labor, removal of state monopolies, and embracing the laissez-faire attitude.

The Physiocrats were against a complex tax scheme that might cause poverty.

Quesnay derived his *laissez-faire* doctrine by modifying the natural rights theory prevalent in the 18th-century literature and gave it an optimistic interpretation. He distinguished between the natural order created by God (*ordre naturel*) and the man-made positive order (*ordre positif*) and asserted that man does not give up any natural rights by entering society. For the natural order, Physiocrats identified three classes: the productive class (agricultural laborers and farmers who cultivate the soil and pay a rent to the landed proprietors), the sterile class (*classe stérile*; industrial laborers, artisans, and merchants who produce no surplus), and the proprietor class (*classe disponible*, who appropriated the net product as rents).

Incomes flowed among sectors and, consequently, from class to class. A natural state of the economy is achieved when income flows do not cause the expansion of one sector and contraction of others. The natural state implies a balance and when achieved, the economy reproduces itself indefinitely. According to Quesnay, economic evils originate from restrictions generated by the positive order, since these disturb the harmony in the natural order. Consequently the best government is the one that governs the least. Similarly the Physiocrats were against a complex tax scheme that might distort the economy and cause poverty. They advocated the single tax on landed property.

Although their ideas and principles proved favorable to the French Revolution, the Physiocrats were monarchists who promulgated the idea that the king and his government were to enforce the economic laws of nature. The Physiocrats never obtained much direct popular influence, even in their native country, though

their writings strongly attracted many of the more gifted and earnest minds. Their heavy style did not find acceptance with the public.

Contemporaries such as Voltaire, Jean-Jacques Rousseau, and Denis Diderot loathed their pompousness and mysticism. Adam Smith borrowed a lot of ideas from them, sarcastically observing that the Physiocratic system "never has done, and probably never will do any harm in any part of the world."

The principal contribution of the Physiocrats was in laying the foundation of the system that became a principal position for studying economic phenomena. In addition their economic analysis revealed the weaknesses of the mercantile system and distortive government policies. Laissez-faire was a needed doctrine for the rapid economic growth at the end of the 18th century. The main weakness of the Physiocrats was their mechanistic and dogmatic approach to social and economic phenomena. While agriculture creates value, so do commerce and manufacturing. Similarly the singletax concept erroneously implied that income of the productive and sterile class is at the existence minimum. Nevertheless, in his main work, Progress and Poverty, Henry George espoused the concept of a single tax as a most efficient remedy for the widespread poverty and income disparity in the United States.

Pierce, Franklin (Administration)

FRANKLIN PIERCE WAS BORN in 1804 in Hillsboro, New Hampshire. His father was a prosperous farmer and Democratic politician, later becoming gov-

ernor. Pierce was elected to the state legislature at the age of 24, where he soon became speaker. In 1833 he was elected to the first of two terms in the U.S. House of Representatives, moving to the Senate in 1837, as that body's youngest member. In 1842 Pierce resigned from the Senate and returned to the practice of law, rejecting several offers to return to politics, including an offer to become James Polk's attorney general. He did serve as federal district attorney for New Hampshire.

At the outbreak of the Mexican-American War, Pierce enlisted as a private, but because of his political prominence was promoted to brigadier general, serving under General Winfield Scott. Following the war in 1848, Pierce rejected the Democratic nomination for governor and returned to private practice.

A deadlock at the 1852 Democratic Convention resulted in Pierce's nomination for president on the 49th ballot. Pierce's nomination came as a surprise to him—and most other people. He had not been seeking the nomination nor planning any return to politics. The party was deeply divided over slavery, making most pro-slave southerners or anti-slave northerners incapable of getting the necessary two-thirds vote for the nomination. Pierce was an attractive compromise because he was a proslavery northerner. He was also young and charismatic. His absence from politics also saved him from having too many political enemies who might have blocked his nomination.

The election itself was as divided as the party. Both parties tried to avoid any discussion of the slavery question. When Whig candidate Winfield Scott, Pierce's former commander, finally spoke out on his anti-slavery positions, his support in the south dried up, giving Pierce an easy victory.

Pierce entered the presidency on a somber note. Two months before his inauguration Pierce was in a train accident with his family. His last surviving son was killed. Both he and his wife were devastated. His wife fell into a deep depression and he was not much better. Thus he began his presidency without a real focus on the job. The Pierce administration upset northerners by taking pro-southern stands. He immediately alienated northerners by selecting the radically pro-slavery Jefferson Davis as his secretary of war.

Pierce's most controversial act was his reluctant support for the Kansas-Nebraska Act. Since 1820 it had been federal law that no northern territory could become a slave state. The act repealed this rule, allowing the residents of those territories to decide whether to be admitted as slave or free states. This resulted in a bloody war, primarily in Kansas, as advocates from both

sides tried to use violence and intimidation to win the fight. Many abolitionists and slave owners were murdered simply for moving into the territory and trying to influence the decision to keep the territory slave or free. Pierce had originally opposed the act, but acceded to Senator Stephen Douglas's argument that federal support for such a law was the only way to prevent eventual southern secession.

NO ROLE FOR GOVERNMENT

Poverty was not really a government issue, and certainly not a federal issue. Although poverty certainly existed, especially in many farming communities and in cities with growing immigrant populations, no one in either party saw a role for government in resolving these problems.

Nevertheless many policies had implications for poorer Americans. Thus Pierce's pro-slavery positions alienated most northerners, although it did encourage the growing Irish immigrant communities in the northeastern cities to join the Democrats. These immigrants opposed more free blacks who would compete with them for jobs. Pierce's presidency drove anti-slavery advocates out of the Democratic Party and caused the party to dump Pierce for the less controversial James Buchanan at the 1856 convention. It also led to the creation of the Republican Party and the election of Abraham Lincoln in 1860.

An initiative to purchase Cuba from Spain was seen as a way of adding another slave state. A proposal by minister to Britain Buchanan that advocated taking Cuba by force leaked to the public and caused great embarrassment to the administration. There were also unsuccessful expansionist efforts to acquire Hawaii, Santo Domingo, and Alaska. One successful acquisition was the Gadsden Purchase, which acquired the Mexican Territory, now the southern parts of Arizona and New Mexico, with the aim of building a transcontinental railroad along a southern route. This was also seen as a benefit to southern interests.

Foreign relations played a relatively minor role at the time. The Pierce administration worked to prevent British colonization in Central America. It also recognized the dictatorship of William Walker in Nicaragua. Walker was an American who became dictator of Nicaragua, trying to establish a pro-slave nation that might have eventually joined the Union as a slave state had he succeeded.

After leaving office, Pierce made unsuccessful efforts to prevent civil war. He blamed abolitionist ex-

tremism for the war and was an outspoken critic of the Emancipation Proclamation and many of Lincoln's other wartime measures. His pro-southern views caused him to be a political outcast in his own community. He died in 1869.

Planning

AN ACT OF FORMULATING a program for a definite course of action may be thought of as planning. The process of planning includes anticipating future occurrences and problems, exploring their probable impact, and detailing policies, goals, objectives, and strategies to solve the problems. This often includes preparing option documents, considering alternatives, and issuing final plans.

Planning is also a managerial function concerned with making forecasts, formulating outlines of things to do, and identifying methods to accomplish them. Planning involves the cognitive process of thinking about what you will do in the event of something happening and also includes the act of developing or creating a program for a definite course of action. The process of anticipating future occurrences and problems, exploring their probable impact, and detailing policies, goals, objectives, and strategies to solve the problems is required. With respect to goal attainment, planning involves the process of choosing who, what, how, when, and where for the plan.

The concept of planning is a continuing process of analyzing program data, making decisions, and formulating plans and contingency plans for action in the future aimed at achieving specified goals. Planning may also be thought of as the process of identifying the means, resources, and actions necessary to accomplish an objective. A well-crafted planning process contains milestones that correspond to the completion of each phase. This allows the project to maintain alignment with the development schedule. The process of producing a plan considers the aims to be achieved, how they will be achieved, who is involved in achieving them, and the necessary finances and resources. Outcomes of the plan must be specified together with relevant success criteria.

Plans may be made to achieve goals at differing population or organizational levels. They may also be developed to respond to specific types of goal attainment inquiries, such as a strategic plan to determine the focus or direction of effort, a project plan to respond to a time-limited effort, an operational plan to determine the resources necessary to achieve a goal, a financial plan to raise or manage funds, or an evaluative plan to determine the success of a response or intervention.

Plans often begin as abstract thoughts, which are later written down. They are generally stored so that they are quickly accessible as needed to multiple decision-makers at multiple locations or differing times. Plans are often held as potential contingencies unless, and until, the need for developing and implementing them is foreseen. Plans vary in formality.

For example, business or organizational plans and military plans generally have a higher degree of formality and detail. Both detail and accessibility contribute to the plans' capacity for collaboration or execution if needed. Plans are the proposed or intended method of getting from one set of circumstances to another. They are frequently organized chronologically to move from a present situation toward the achievement of one or more future-oriented objectives or goals. Plans vary in complexity from the making of simple lists of tasks to complete to complex policy formulations with multiple complex outcomes over time.

CHARACTERISTICS OF PLANNING

Sustainability of products and services to large-scale consumer markets or populations of need requires that commercial entities and governments continually assess the fluctuating supply, inventories of products, and variable needs for consumption through continuous planning efforts. Assessing the relative need over short-term and long-term cycles of demand or consumption is highly complex.

Product sustainability is achieved in part through continuous assessment and decision-making for countless goods and raw materials and ongoing assessments of services needed to maintain both products and services. These decisions and their effectiveness are mediated to some degree by the relative environmental and social effects various goods and services may have on those being served. There is substantial interconnection between decisions made by producers and suppliers and the utilization patterns of consumers in a particular region during specific time frames.

Planning has a number of characteristics that attempt to anticipate and prepare for these variations, to both meet needs and maintain the viability of resource providers over the long term. To some extent, the success of planning efforts is reliant on timely and accurate information about fluctuations, and as related to conditions that may inhibit or increase rates of need or consumption, including transportation, economics, political and social changes, and environmental conditions.

Though planning involves anticipating and attempting to meet periodic needs on a crisis or disaster basis, for the most part planning involves planning for human growth and for human advancement and the myriad problems associated with these two contingencies. Therefore to begin to make a plan, a problem must be perceived or conceived and then defined, such that there is a common understanding of the problem and its importance.

As a result of planning, alternative responses may be further developed.

Those in a position to plan or make decisions begin to organize efforts to meet anticipated need by developing rational strategies or programs designed to address defined problems. Thus strategizing and decision-making characterize planning. Then a planned strategy or program is implemented. This may include such actions as arranging permissions and contracts, locating suppliers and producers, determining best methods of transportation and communication, prepositioning essential goods or products prior to the onset of a problem, and numerous other actions designed to reduced the effect of the perceived or anticipated problem. However, to determine the effectiveness of the planning effort, a method of reliable and consistent feedback is needed to determine if the plan and subsequent actions are having the desired effect.

The effectiveness of the planning implementation is also characterized by the requirement of feedback,

often reliant on the extensive use of available communication and information-sharing technologies. These technologies are generally designed to identify or impose patterns on information and on information processing, and to routinize essential information-gathering tasks, and then to search for discernable patterns of information relative to the perceived problem by either routine or continuous monitoring. Apportioned or sequential decisions are then made to address changes in the status of the perceived problem, and take action incremental and relative to need.

Increasingly, environmental, epidemiological, consumer, economic, and demographic information is routinely amassed and organized through sophisticated computing and information technology apparatus. Communication media, including graphical interfacing and imaging technologies, are also utilized in planning to explore complex data and to identify trends relative to defined problems, or to inform and support planning decisions and provide feedback on planning effectiveness with respect to the tasks performed and the goals achieved.

EFFECTS OF PLANNING

Planning has the effect of defining needs and improving responses to needs. Needs may be assessed either as observed or as anticipated through planning methods. Therefore planning also has the effect of anticipating need. Various assessment methods may be created to increase accuracy in organizing to meet these needs with minimal waste of effort or resources. Planning has the capacity to improve assessment methods as developed for various problems. Goals and objectives are then established based on these reasonably accurate assessments so that problems are minimized and successful outcomes are more likely. Planning therefore may be expected to have the effect of potentially improving or increasing the rate of successful outcomes.

As a result of planning, alternative responses may be further developed and selected by decision-makers based on the type and duration of the problem observed or anticipated. These alternative plans for responses, then, create numerous opportunities to develop options for implementation that may be prepared for, so that the selected responses may be tailored to provide resources that are considered most critical for resolving specific problems. Thereafter, evaluation or feedback on the effectiveness of planning and the implementation of the plan allows for improvement to responses over time. Planning can be expected, therefore,

to have the effect of improving overall responses to perceived problems over time.

Planning, then, has the effect of improving effectiveness of effort; improving the capacity for services or programs to meet goals; improving the development of resources, including human resources; building relationships among decision-makers; and improving information sharing, while also providing information on the degree of successfulness of implementation effort.

PLANNING AND WORLD POVERTY

Planning has the capacity to either increase or reduce world poverty based on the degree to which planning decision-makers select planning contingencies that implement programs of equivalent distribution of services and goods globally while controlling distribution costs. Planning efforts may be considered nationalistic or regional in nature and implemented on behalf of protecting the economic, resource, and service security of one group without consideration of others. Planning that is limited or narrowly defined tends to create supply-and-demand imbalances, as do disasters, conflict, and disease.

For example, in 2000 the United Nations Millennium Development Goals were formulated, which set forth an ambitious plan designed to radically decrease or end global poverty.

Goals of this plan included eradication of extreme poverty and hunger; achievement of universal primary education; promotion of gender equality and empowerment of women; reduction of child mortality; improvement of maternal health; combating HIV/AIDS, malaria, and other diseases; ensuring environmental sustainability; and developing a global partnership for development.

The degree to which the global planners of these goals will be able to gain and maintain the long-term endorsement and support of key national and international decision-makers and adhere to the characteristics of effective planning while simultaneously anticipating variations of need will ultimately determine their success. Though admirable, these goals may not adequately forecast such factors as the emergence of a pandemic illness, catastrophic global disaster, military or political conflict, unexpected economic or supply shortfalls, disruption of distribution methods, and other unforeseen contingencies. Such is the nature of planning that preparation for contingencies is the surest method for ensuring substantial reduction or the possible elimination of world poverty.

RANDALL E. BASHAM UNIVERSITY OF TEXAS, ARLINGTON

Poland

THE REPUBLIC OF POLAND HAS a history that has been filled with attempts by other countries to eradicate the identity of the Polish people and refuse to recognize the country's right to exist. Between 1772 and 1795, agreements among Russia, Prussia, and Austria gave each country a section of Poland. A brief period of Polish independence between the two world wars was followed by German invasion in August 1939, setting off events that turned into World War II.

Following the war, the Soviet Union annexed Poland into the communist bloc. Poland exercised a fairly liberal brand of communism that allowed it to reassert its own identity to some extent. In 1980 the Solidarity movement evolved from the formation of a trade union that a decade later transformed Polish politics when the Soviet bloc dissolved. The new government initiated a "shock therapy" brand of economics that turned Poland into one of the strongest economies in central Europe. The period of low growth and high unemployment that followed resulted in the electoral defeat of the Solidarity Trade Union. In 1999, Poland joined the North Atlantic Treaty Organization and became a member of the European Union five years later.

The Polish economy is diversified, with over half of the workforce involved in services and nearly a third engaged in industry. One of Poland's greatest resources is

A smokestack plume over the skyline of Warsaw, Poland, illustrates the the country's industrial base, which is continuing its economic privatization. Nearly 20 percent of the population were unemployed in 2005.

its 45.91 percent of arable land. Over 16 percent of the labor force are employed in agriculture, which is affected by periodic floods, inefficiency, and an investment shortage. Other resources include coal, sulfur, copper, natural gas, silver, and lead. Privatization and liberalized business laws have increased the number of small and medium-sized firms in Poland. Unfortunately, legal and bureaucratic problems persist, heightened by frequent charges of government corruption.

Poland is an upper-middle-income nation with a per capita annual income of \$12,000 and a growth rate of 5.6 percent. However, 18.4 percent of Poles live in poverty, and 19.5 percent of the labor force are unemployed. Efforts to improve living standards through healthcare, education, and pension system reforms overtaxed the state budget to the point that cutbacks of around \$17 billion have been initiated. While inequal-

ity is not great in Poland, it does exist. The poorest 20 percent live on 7.3 percent of available resources while the richest 20 percent share 31.6 percent. Poland ranks 31.6 percent on the Gini Index of Human Inequality.

The rights of Polish women are not always respected, although legal discrimination against women is a thing of the past. Women continue to lag behind men economically, and women (20.6 percent) are more likely than men (18.3 percent) to be unemployed. Women are also likelier than men to become victims of long-term unemployment.

Female employment is to a large extent dependent on adequate childcare, and many women have left the workforce in light of the fact that quality childcare has become increasingly difficult to afford since the government liquidated 50 percent of subsidized facilities in response to a declining birthrate. Government-subsidized kindergartens have been cut by 30 percent generally and by 40 percent in rural areas. In 2003, 12 percent of unemployed women were receiving some government assistance.

Life expectancy in Poland is 74.41 years. Nearly 17 percent of the population are under the age of 14, and 13 percent have seen a 65th birthday. All Poles have access to safe drinking water and improved sanitation. Healthcare is readily available in Poland, and there are 220 physicians for every 100,000 residents. From 80 to 94 percent of Poles can afford essential drugs.

In 1970, infant mortality occurred at a rate of 32 deaths per 1,000 live births. In 1990 the mortality rate had dropped to 19 per 1,000 live births. By 2003, infant mortality had further declined to six deaths per 1,000 live births. Between 1970 and 1990, the mortality rate of children under the age of 5 fell from 36 to 19 deaths per 1,000. In 2003, under-5 mortality decreased to seven deaths per 1,000. Six percent of Polish infants are underweight at birth. Infant immunization rates for children from birth to 23 months old range from 98 to 99 percent.

In the 1970s and 1980s, Polish women bore an average of 2.3 children each. In the 1990s, the fertility rate began to decline, and by 2003 the fertility rate had fallen to 1.39 children per woman. Fertility among adolescents is 16 per 1,000 births. Some 49 percent of all Polish women use some method of contraception, but access to abortion is limited. Based on modeled estimates for 2000, the maternal mortality rate in Poland is 13 deaths per 100,000 live births.

Literacy is nearly universal in Poland, and 99.8 percent of all Poles over the age of 15 can read and write. There is only a negligible difference in this ability between males and females. Most Polish students attend school for 15 years. Primary school completion rates have increased over the last decade, currently standing at 98 percent for males and 99 percent for females.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Polanyi, Karl (1886-1964)

THE HUNGARIAN POLITICAL economist Karl Polanyi rejected the economic orthodoxies of liberalism, documenting in his works the dangers of laissezfaire capitalism. His most celebrated work, The Great Transformation (1944), dated the breakdown of 19th-century world-order civilization, which many intellectuals felt in the aftermath of the two world wars, to "a hundred years back in that social and technological upheaval from which the idea of a self-regulating market sprang in Western Europe. The end of this venture has come in our time; it closes a distinct stage in the history of industrial civilization."

Polanyi criticized the ways in which a mere political and economic doctrine such as liberalism was transformed into an act of faith and was finally accepted as the law of a natural order. As economic globalization is increasingly coming under critical scrutiny, Polanyi's challenge to an unregulated free market has acquired a renewed vitality and remains powerful.

Polanyi's family background was firmly rooted in the bourgeois milieu of the Austro-Hungarian Empire. Yet Polanyi's life was characterized by exile and uprootedness. He was born in Vienna, Austria, but grew up in Budapest, Hungary. He was the son of a prominent railway industrialist who, in spite of his varying economic fortunes, was able to provide Polanyi with a complete education

Polanyi soon became a protagonist of Budapest intellectual life and joined left-wing circles, helping to found the Galilei Club during his university years. He became acquainted with promising radical intellectuals such as Georg Lukacs and Karl Mannheim. In 1908, Polanyi obtained his Ph.D. in philosophy and, four years later, he graduated in law. He was soon called to the bar, but disliked the profession. At the outbreak of World War I, he was one of the cofounders of the Hungarian Radical Party. Polanyi also served briefly as a cavalry officer during the war, but soon returned to

Budapest, where he supported the Republican government of Mihaly Karolyi and its social-democratic orientation.

However, the Karolyi government was short-lived, as the communist revolutionary Bela Kun successfully overthrew it in 1919 to establish the Hungarian Soviet Republic. Polanyi then chose exile to Vienna, where he worked as an economic and political journalist for prestigious newspapers, eventually becoming joint-editor of the weekly *Der Oesterreichische Volkswir*. In his Viennese years, Polanyi grew increasingly interested in Fabianism, a political movement originating in Britain that sought to establish a socialist society through social-democratic reforms rather than armed revolution.

Interactions among men were far more important than market relations.

Polanyi emigrated to Britain when, in 1933, fascist movements began to take hold of Austrian society. In the 1930s, Polanyi also started to work on his major book, *The Great Transformation*, which he would publish a decade later to great acclaim. He also toured the United States, invited by the International Institute of Education to speak at American universities and colleges on current world affairs.

In 1940, Polanyi moved to New York to teach at Bennington College. After the war, Columbia University offered him a teaching position in the sociology department, which Polanyi accepted. Because his wife, Ilon Duczynska, was a former communist and a major figure in the Hungarian Revolution of the early 1920s, Polanyi was forced to commute to New York from Canada, where it was easier to get a visa for her. His seminars at Columbia University were highly regarded as thought-provoking and he was the recipient of a large grant from the Ford Foundation to research the economic systems of ancient empires. This research resulted in *Trade and Market in the Early Empires* (1957).

Polanyi considered economics as embedded in social and cultural relations. His approach was defined as "substantivist" and caused Polanyi the hostility of mainstream economists, but attracted the attention of anthropologists and political scientists.

According to the substantivist approach, capitalism is an anomaly because it defines social relations in terms of economic ones. According to Polanyi, interactions among men were far more important than market relations in economic history. Capitalism, however, re-

jected such interactions, and this was the great transformation that Polanyi saw as brought about by the Industrial Revolution.

Capitalism was therefore far from natural and self-regulating. The Hungarian economist saw it as originating from the demands by the mercantile and bourgeois classes of the state to protect their firms and their uncertain social status. Therefore, Polanyi challenged the classic conception that capitalism and free-market economy were premised upon limited state intervention and proceeded to demonstrate how governments were their necessary helpers.

Polish Humanitarian Organization

THE POLISH Humanitarian Organization (PHO) is an international nongovernmental organization registered in Poland that works nationally and internationally to "make the world a better place through alleviation of human suffering and promotion of humanitarian values." The PHO has established missions in Iraq, Afghanistan, Chechnya, Bosnia, Sri Lanka, and other nations. It aims to fulfill its mission by "helping communities in crises to regain responsibility for their own future and become self-reliant. PHO shapes humanitarian attitudes among the public and creates a modern culture of mutual help. PHO combines effectiveness with the respect for human dignity."

The PHO was founded by Janina Ochojska, who suffered from polio in childhood and eventually was sponsored by the French government to travel to France to receive treatment in the 1980s. While there, Ochojska encountered members of the Equilibre Foundation, who were then organizing truck convoys to Poland on humanitarian grounds. Enthused by this work, she

transformed the existing Polish Equilibre branch to become the PHO and led a number of missions to the former Yugoslavia and elsewhere. Ochojska has been honored with a number of prestigious awards. Program activities include emergency response, field missions, wooden puppets, humanitarian education, and a refugee counseling center. The Wooden Puppet program was inspired by the story of Pinocchio, who, like the children they wish to assist, suffered from an empty stomach.

It is estimated that there are 330,000 children in Poland who require nutrition support, but state capacity to deal with this issue is very limited. Children suffer particularly where collectivized agriculture had been practiced during the preceding communist regime. The collapse of that regime led to the closure of the collective farms but no adequate substitutes have been organized. Hence poverty and starvation are significant issues in those areas and broadly throughout the country, where unemployment reaches 90 percent in some communities.

The Refugee Counseling Center assists people wishing to come and live in Poland. Around 500 people seek to take advantage of this service annually. The center aims to help refugees obtain fair access to the system and to persuade them of their possibilities and opportunities under Polish law, despite the many difficulties, while encouraging them to become active in society.

The principles of assistance are as follows: "The refugee should clearly state his expectations and co-determine the problem-solving procedure; the refugee must know the price of the assistance he/she receives. He/she should be aware of how many people are involved in assisting him and assistance received implies an obligation to assist others." These principles are examples of attempts to create an inclusive society.

This is a secular and humanitarian response to environmental and man-made disaster, especially in targeted "post-conflict societies." In a speech in 2002, Ochojska illustrated the principles of the PHO: "First: assistance means solidarity with those in need and helps to build a civil society in both donor and recipient countries. Second: assistance should unite people and not divide them. Third: humanitarian aid must respect and support human dignity, not destroy it."

John Walsh Shinawatra University

Polk, James (Administration)

JAMES K. POLK (1795–1849) was the 11th president of the United States and served from 1845 to 1849. He arose from comparative obscurity to political prominence largely through his own merits, but also benefited from personal connections.

His time in office was marked by general managerial competence at the cost of some measure of personal unhappiness, as revealed by his presidential diary. He was also a voluntary slave owner for economic reasons, and this and other character attributes has clouded his reputation subsequently.

Born in North Carolina, Polk served in the Tennessee legislature and became an associate of President Andrew Jackson, whose policies Polk strongly supported. When other potential Democrat candidates decided against backing an expansionist policy, especially in Texas and Oregon, Polk was raised to presidential candidate somewhat beyond his expectations. Successful in the election, he took office after Congress had already taken steps to annex Texas, which meant he faced confrontation with Mexico from the outset of his administration.

The focal event of the Polk administration was the war with Mexico. It resulted in an expansion in American territory almost as dramatic as that achieved through the Louisiana Purchase. It made the United States a truly transcontinental power. And it demonstrated American military hegemony in the Western Hemisphere. By the Treaty of Guadalupe Hidalgo, Mexico ceded some 40 percent of its territory to the United States, including territories that would become the states of California, Nevada, Arizona, and New Mexico, as well as portions of the subsequent states of Utah, Wyoming, Colorado, and Texas.

Given the current status of California, which is the nation's most populous state and has an economic output that would rank seventh in the world if it were a separate nation, it is difficult to overstate the significance of this "minor" war.

One of the long-term consequences of this war that bears directly on the issue of poverty has been the disenfranchisement and subsequent economic exploitation of the substantial Mexican population who lived in the territories ceded to the United States.

This population has not only made significant contributions to the culture of the southwest and of the nation at large, but it has also provided much of the labor on the farms and ranches, in the mines, and in the factories of the region.

In the last quarter of the 20th century, Mexican-Americans did make significant gains in terms of their economic and political power, but their situation has been complicated by the increasing numbers of illegal immigrants entering the states of the southwest from Mexico, including large numbers of political and economic refugees in transit from other Central and South American nations. The border issues have intensified following the North American Free Trade Agreement (NAFTA), creating a tariff-free trading zone among the nations of Canada, the United States, and Mexico.

Oddly enough, despite his aggressive nationalism, Polk was an advocate of free trade and signed into law the Walker Tariff of 1846, which significantly reduced the existing protectionist duties levied on imported goods.

It is also worth noting that Polk signed an order requiring that imports be warehoused until the tariffs on them were paid in full and that tariffs be paid in specie that would be deposited in new federal "treasuries" not affiliated with any existing commercial financial institutions. So, even though Polk was willing to reduce federal revenues from tariffs, he was determined to collect all of the revenues due to the government.

The successful expansion of territory led Polk to establish the Department of the Interior, while other innovations included a founding role for the Smithsonian Institute and the United States Naval Academy. Within a single term of administration, Polk managed to create several important institutions and kept his relationship with Congress and other key political constituencies through astutely choosing his battles.

Polk was particularly disheartened by the constant stream of people seeking to gain access to his office to plead for preferment to one position or another. This had a serious impact on his health, and he died within three months of leaving office. President Zachary Taylor, another president to suffer from ill health, succeeded him.

Poor Laws

POOR LAWS ARE LEGAL institutions that have historically been used to regulate and administer the treatment of the poor in many different countries. They tend to reflect the cultural and religious natures of the societies in which they were enacted. Swedish poor laws, for example, changed from a system of largely faith-based charitable provision to a modern, government-based and -funded central provision of welfare services to all individuals according to need. Islamic societies most commonly have charitable giving integrated into the heart of social life because it is proclaimed as one of the Five Pillars of Islam. Consequently, well-funded organizations existed to meet the needs of the poor.

British systems of poor law have perhaps been most influential internationally because of their introduction in spirit if not always according to the letter of the law in many former colonies, including what is now the United States. Various laws were passed in the 16th and 17th centuries that made provisions for feeding the poor and putting them to work. Those who were considered to be persistently idle were to be placed in correctional facilities until such time as they improved their attitude.

The concept of the deserving and the undeserving poor was already well established by this time. In other words, it was believed possible to identify some people as worthy of receiving assistance and others who were morally defective and worthy of little or no mercy, irrespective of the cause.

Children too were put to work if they did not have parents or guardians to provide for them. The poor themselves were generally considered to represent a public nuisance, located in urban areas, as author Daniel Defoe made clear: "The Multitude of Poor, who beg in the streets, are a Publick Grievance to all the Inhabitants of the City and Suburbs; and notwithstanding the Methods which have hitherto been taken to prevent it, their Numbers daily increase; they are continually interrupting Business with their Importunities, they besiege the Entrance to our Churches, and fill our Ears, in all Places of Resort, with lamentable Complaints of Distress."

Workhouses had been established from early in the 17th century as places to house the poor, which were mostly based on the parish system, that is, attached to local churches. This was to prevent internal migration. The vision of rootless poor roaming the countryside has been a discomforting situation for the ruling elites throughout history in countries such as Great Britain and China, where residential registration is still required for most people.

The 20th century witnessed various improvements to social conditions.

Workhouses, as the name suggests, provided work for the poor to do in return for their accommodation. Inevitably entry into a workhouse generally meant a long-term sentence, as it was very difficult or impossible to accumulate a sufficient surplus to enable a person to move out into private housing. This difficulty was exacerbated by those workhouses that were established as unregulated corporations seeking to make profits from the labor of the incarcerated poor.

The Speenhamland system developed a meanstested targeted approach to the provision of relief to the poor, which enabled the old and infirm to find accommodation at poorhouses while outdoor relief was provided for those able to work. This worked by establishing a form of minimum wage available to all workers and workers unable to earn this amount would receive the difference from the public purse via a levy passed on all parish members.

However, this was problematic in that it encouraged employers to reduce wages in the knowledge that the shortfall would be met by the public sector. The system, like most forms of poor laws, also allowed the ruling elite to control to a considerable extent the moral and spiritual lives of the poor, ensuring their attendance at the privileged religious ceremonies, segregating men from women, and banning the use of any product or

substance deemed morally injurious. It was also used to try to prevent the spread of revolutionary political ideals, in order to retain power for the ruling elite, of which workhouse administrators were a part, for its own sake and also because, in cases of a religious basis to the foundation, that religious belief almost universally supported the status quo in terms of society.

The Speenhamland system, which had spread in some form to many parts of the country, was replaced in 1834 by the Revised Poor Law on the basis that it encouraged laziness. People, it was believed, would rather work slowly or infrequently and wait for charitable handouts to ameliorate the indigency they almost immediately faced. This view is still held by many people, who are persuaded to accuse other people of cheating or duplicity, from which they excuse themselves.

In its place, the new Poor Law aimed to punish the poor, reinstating workhouses and organizing them on a national basis to ensure equality of standards of harshness while giving priority to independent laborers in preference to those receiving assistance. This helped to stigmatize those in receipt of poor law relief, and the shame attendant upon it was in some ways as painful to endure as the physical conditions. Nevertheless conditions outside the workhouse were often just as difficult or even worse. Various social reformers throughout the 19th century were able to achieve limited success in ending some of the worst cases of maltreatment of the poor and also of those with mental illness.

The 20th century witnessed various improvements to social conditions as emancipation of the working class and the social impact of the First World War led to a greater desire for equality in society. This was manifested in the creation of the forerunner to the welfare society and the National Health Service, which rendered poor laws obsolete, although they continued in some form until the 1940s. This trend was matched by events in most of the industrialized countries, including Germany and Japan.

The process of modernization led to the belief in scientific management, and these principles were also transferred to the management of the poor. Fortunately, in addition to the attempted transformation of people into the cogs of a machine, modernistic scientific management methods also shed more light on the structural and economic bases for poverty and, therefore, more appropriate methods for trying to combat it.

Portugal

PORTUGAL IS ONE OF EUROPE'S smallest countries, whose expectations of economic growth have increased after joining the European Union in 1986. In 2002, Portugal was also among the first countries to adopt the euro. The economic policies of privatization pursued by the different governments that have ruled the country stimulated a steady growth of Gross Domestic Product (GDP) during the 1990s.

Several state-controlled firms were privatized and entire sectors were liberalized. In 2004, estimated Gross Domestic Product reached \$188.7 billion, although in the new millennium, the country has attracted lower foreign funds because of major competition from eastern and central European states and Asian nations. In addition, it has been calculated that the 100 largest companies in the country account for 17 percent of the total GDP, pointing to an imbalance in the distribution of wealth. Despite the positive record of the 1990s, poverty has played, and still plays, an important part in the history of Portugal.

The early history of Portugal, from the Middle Ages to the mid-17th century, was marked by its leading role in the explorations and colonization of the world. Settling Brazil, several African areas, India, China, and Japan, made Portugal a rich nation. Yet, after a disastrous earthquake in 1755 and the defeat inflicted by Napoleon, Portugal began to lose its power. During the 19th century, economic recession affected the country, leading to higher levels of widespread poverty and social unrest.

The economic decline of Portugal continued during the 20th century, when the country was shaken by different coups d'etat and lost all its colonies. The longest regime was the fascist Estado Novo (New State), which Antonio Salazar established in 1933 and the bloodless Carnation Revolution overthrew in 1974. Salazar and his follower Marcelo Caetano proved unable to keep the economic development of Portugal at the same pace as the other European countries.

Thus while Europe enjoyed economic growth, Portugal remained behind, as the regime feared that industrialization would destroy the traditional values upon which it had built its political power. This policy left Portugal one of the poorest countries in western Europe and its citizens were forced to escape poverty by emigrating to other nations.

The phenomenon of emigration started in the 1950s, but took dramatic proportions the following decade when more than one million Portuguese went to take up jobs in northern and central Europe and another million emigrated to the United States. With the restoration of democracy in the mid-1970s and the economic boom that followed, emigration slowly diminished.

In spite of the economic successes of the post-Salazar years, poverty remains a serious problem in Portugal. The economic development that the country has enjoyed since joining the European Union (EU) has benefited only a sector of the population. Poverty still restricts the lives of 20 percent of Portuguese citizens. If the state subsidies received by those considered at risk of poverty are not taken into account to calculate the poverty line, the percentage rises to 26 percent.

Poverty still restricts the lives of 20 percent of Portuguese citizens.

Portugal has witnessed the largest income gap among the 15 richest EU members, and it also has had the highest growth in social inequality among western European states. The distribution of wealth has also experienced a geographical imbalance. The big cities of Lisbon and Oporto, along with other urban centers along the Atlantic coast, have experienced steady growth at the expense of the rural, inland areas.

Sociologist Luis Capucha has also estimated that 35 to 40 percent of Portuguese families spend "less on food than is considered necessary to satisfy their basic nutritional needs." A conservative estimate of how many Portuguese suffer from hunger and receive aid provided by the Food Bank Against Hunger (BACF) and by other charity institutions reaches a figure of

200,000 people. Portuguese society is still pervaded by a sense of shame attached to poverty and hunger, which has prevented a conscious recognition of the problem and the consequent adoption of effective measures to control it.

Poverty and Race Research Action Council

THE POVERTY AND RACE Research Action Council (PRRAC) is a nonprofit organization headquartered in Washington, D.C. It was organized in 1999 by major civil rights, civil liberties, and antipoverty groups. The purpose of the Poverty and Race Research Action Council is to set the advocacy of policy positions on poverty and race issues upon a sound foundation of social science research. The goal is to address problems at the points where race problems and poverty intersect.

PRRAC is national in scope and nonpartisan in its approach. It has two missions. It develops, assembles, and disseminates research on the relationship between race and poverty. It also promotes the development and implementation of policies and practices that ameliorate social, economic, and political conditions associated with poverty that are caused by race. The council

also brings together advocates and researchers in order to encourage and further their work on race and poverty issues. It also networks with researchers who are working on poverty and racial issues. Moreover it supports social research that is linked to local, state, and national advocacy strategies.

Research is guided by a Social Science Advisory Board, which is composed of scholars at leading institutions who are engaged in poverty research or civil rights research. The major areas invested in are race and racism, poverty and welfare, community organizing, criminal justice, economics and community development issues, education and poverty, employment and jobs policies, environmental issues related to race and poverty, family issues especially involving single mothers, food, hunger, nutrition, health, housing the homelessness, immigration, and rural poverty. Researchers are helped by PRRAC with funding.

PRRAC acts as a notice board for agencies or foundations that issue grants for research. In other instances it provides notices of research or poverty-work job opportunities. Publications include a newsletter (*Poverty & Race*), which is issued five times a year. Other publications include books, articles, and short pieces for use by poverty researchers and workers, including policy briefs such as "Civil Rights Implications of the 2005 Flexible Voucher Bill." A board of directors governs PRRAC. Many of the members of the board are the heads of agencies working in the area of poverty or civil rights. Others are attorneys specializing in civil rights law.

Poverty Assessment

MEASURING THE WELL-BEING OF individuals, households, and nations—the process and techniques of poverty assessment—is critical for policymakers, governments, international organizations, aid agencies,

and social scientists. Measuring poverty is complex. It is generally agreed that poverty is a multidimensional phenomenon with both monetary and nonmonetary aspects in need of analysis. Poverty can involve, among other things, reduced incomes, consumption and employment, insufficient or poor-quality nutrition, poor health conditions, limited access to education, low levels of participation in decision-making, and lack of personal empowerment, reflected in the limited possibility to influence one's life. Poverty can also be absolute or relative, temporary or chronic, and the determination of who is poor can be highly subjective depending on one's perspective and specific assessment methodology in hand.

QUANTITATIVE APPROACHES

Conventionally, poverty has been largely defined in terms of income or expenditure based on the assumption that a person's or household's material standard of living largely determines her well-being. The poor are then identified as those with a material standard of living below a certain level or poverty line. Where this level is set determines how many people are poor and how many are not, itself a rather subjective process.

Nevertheless, institutions dealing with the alleviation of poverty, such as the World Bank and the United Nations, regularly utilize the poverty threshold. Since countries and regions within a country differ in terms of their standard of living, most experts agree that the poverty threshold must be set at different levels depending, among other things, on the specific country, region, and urban/rural location.

An absolute definition of poverty assumes that it is possible to define the basic needs of the generic individual regardless of one's physical location in the world, based on the minimum standard of living and one's physiological needs for water, clothing, and shelter. In contrast, the relative approach defines poverty in relation to a generally accepted standard of living in a specific society at a specific time.

An advantage of the absolute approach is that there are some reasonably objective norms that could be applied to peoples and societies worldwide and thus allow for cross-country comparisons of poverty rates, while with the relative approach the decision of what is an acceptable minimum standard of living can be subjective and depend on the societal and personal norms of the researcher.

Systematic poverty assessment techniques have been in place since the 19th century. In 1899 a study of

poverty in the city of York, England, primarily used a quantitative approach, relying on household income and expenditure surveys. Today, cross-country comparisons of poverty are done by comparing the relative median incomes of households on what the World Bank economists have devised as the purchasing power parity (PPP) level, and by comparing the percentages of the total number of households in a given country living under poverty. In 2000, for example, based on various survey studies worldwide, the World Bank estimated that over 25 percent of the population of the developing world lived below the poverty line of \$1 per person per day on the PPP basis.

The percentage of households under the poverty threshold is normally found to be higher when using income rather than expenditure as the gauge, since income data are normally subject to underreporting by subjects. The measuring of actual incomes can be further exacerbated by the demonetization of economies, situations wherein bartering of goods and in-kind payments are common.

There are problems in comparative assessments of poverty.

The World Bank, which heavily relies on quantitative methods, mainly national household budget surveys, in addition to short-term visits by highly paid economists, has been criticized when comparing cross-country data on poverty for having painted too rosy a picture in the global progress made in reducing poverty. The choice of an appropriate poverty line or threshold is thus political in that the percentage of a given country's population living under poverty depends on the definitions and measures used.

A major shortcoming of the use of household surveys in assessing poverty is the lack of disaggregation of data within the household unit, thus not allowing, for example, for the measuring of the gender income gap within households. To remedy this shortcoming, measures of individual dimensions of poverty, including income, health, and education, have been recommended, including qualitative nonfinancial methods of poverty assessment involving consultation with communities, and self-evaluation of needs via participatory assessment methods.

Another criticism of quantitative techniques of poverty assessment is the measurement of urban poverty. The urban—as opposed to the rural—poor are

known to rely heavily on the cash economy and are as such more vulnerable to income fluctuations. But for the urban poor, there are also severe environmental and health hazards because of crowded living conditions in urban slums, dimensions usually not covered by mere quantitative monetary methods of poverty assessment.

Measuring well-being and poverty using the dimension of health and education has been emphasized by many social scientists. There are problems in comparative assessments of poverty based on health statistics, however. Countries worldwide gather information on the population's health at different times and at varying degrees of accuracy. As such, indicators of well-being and poverty via health indicators of infant mortality and life expectancy vary widely in their quality of assessment across countries.

QUALITATIVE APPROACHES

Likewise, education indicators of well-being, normally comparing the percentage of primary and secondary school attendance of children across countries, have serious shortcomings. Another measure or assessment of poverty is looking at vulnerability, which can be defined as the percentage of households in a given country that are—depending on the criteria used—susceptible to variations of income, and increases in violence, natural disasters, and hunger. There is no single agreed-upon method or indicator of measuring vulnerability, though measuring such variables as household key assets (such as farm animals, when dealing with largely rural states), human capital (education, skills, etc.), income diversification, and links to social and economic networks would be good components of a vulnerability measure of poverty.

Qualitative and participatory methods, such as the utilization of group discussions, case studies, and individual open-ended interviews, to determine the individual and group perceptions of poverty, community priority needs, and concerns and to gain insight on the effectiveness of existing policies and antipoverty programs are all good alternatives or complements to the quantitative methods.

The capability method of poverty assessment focuses on an individual's capacity to live a healthy life, free of avoidable morbidity, having adequate nourishment, being informed and knowledgeable, enjoying personal security, and being able to freely and actively participate in society.

Complex livelihood analyses, through qualitative methods, can help identify the most relevant indicators

measuring poverty, which can then be taken up in quantitative surveys. Because of the lack of resources and capacity in poor countries, however, monitoring should concentrate on a relatively small number of indicators that are not too difficult to measure. In many developing countries, national and sectoral policymaking is hampered by the absence of regular monitoring and data collection. For optimum assessment of poverty, holistic methods of data collection involving both quantitative and qualitative methods and their regular longitudinal use are encouraged.

The United Nations Development Program Human Development Index (HDI), which annually rates the overall well-being of nearly all countries worldwide, is one of the best-known poverty assessment tools utilizing multidimensional assessment techniques of measuring well-being. HDI takes into consideration such country indicators of well-being as life expectancy, adult literacy rate, a combined school enrollment measure, and per capita Gross Domestic Product (GDP). As such, in its 2003 report, the United Nations rated the countries of Norway, Iceland, Sweden, Australia, and Netherlands as the five highest-scoring countries on the HDI scale.

The World Bank has been criticized for not sufficiently applying gender dimensions.

Statistics aimed at measuring poverty but based on the level of analysis of the household are likely to bypass individual differences of poverty within a given household, especially as pertains to gender. Gender disparity in income has increased for economies in transition, such as the Commonwealth of Independent States (CIS). Statistics generated from household measures are likely to underestimate the real extent to which women are affected by poverty. Increasingly, however, feminist literature, which has long emphasized the gender disparity of economic activities, is becoming mainstream.

The World Bank, for example, regularly analyzes the status of poverty of developing and transitional (former communist) countries via its poverty reduction strategy papers (PRSPs). In the past, the bank has been criticized for not sufficiently applying gender dimensions to such assessments, failing to apply gender in a development approach, which would require measuring inequalities between males and females and proposing programs to eliminate these inequalities. As a result of criticisms, the bank is increasingly attempting to apply

"mainstreaming of gender" to ensure analyses of sexdisaggregated data of poverty and to see that both women and men are involved in project development design, planning, and implementation.

Poverty Clock

THE POVERTY CLOCK BEGAN as an idea to demonstrate the extent of poverty in the world. The United Nations Development Program (UNDP) set up the first poverty clock during the fourth World Conference on Women, in Beijing, China, on August 31, 1995. This "clock" consisted of a digitally displayed number that ticked up at a rate of 47 per minute, representing the number of babies born into households suffering from absolute poverty since the beginning of the conference.

The commonly used standardized measure of absolute or extreme poverty is the \$1-a-day level, which corresponds to a per capita annual income of \$365 adjusted for inflation and international differences in costs of living (also known as purchasing power parity, or PPP). By the end of the 10-day conference, 541,228 children had been added to the rolls of those in absolute poverty.

The poverty clock was subsequently moved to the United Nations' (UN) headquarters in New York City and turned on again on January 17, 1996, to mark the beginning of the UN's International Year of the Eradication of Poverty. The clock, which increased by roughly 25 million persons per year, remained on throughout the year as a stark reminder of the problem of absolute poverty throughout the world. The clock was also prominently featured on the UNDP's website.

The clock was eventually turned off because of the theoretical difficulties of measuring changes in the number of persons in poverty solely by calculating the number of children born into poor families. The poverty clock made no allowances for moving its numbers backward when economic development lifted families up from under the poverty line.

Indeed, over the period during which the poverty clock was increasing by 25 million per year, the actual number of people living in absolute poverty declined. By the \$1-a-day threshold, the number of people living in poverty in 2001 was just over 1 billion while the corresponding statistics were 1.40 billion in 1980 and 1.14 billion in 1990.

Poverty Dominance

THE DETERMINATION OF whether an individual, a family, or a household is living in poverty is most often accomplished by comparing their income with a poverty line, a monetary value identifying a poverty

threshold. A univariate, or single factor, measure of this type has come under criticism because it may be arbitrary in origin and does not take into account all of the major attributes that identify poverty.

For example, a World Bank description of poverty in 2000 suggested that the poor are hungry, lack adequate shelter, may well be ill and not cared for, and they are likely to be illiterate and lacking sufficient education to make them employable.

The World Bank statement goes on to claim that the poor are vulnerable to adverse conditions outside their control and that they are often treated badly or ignored both by the government that has the responsibility to protect them and by more affluent members of society who shun them.

Application of the poverty dominance method in Uganda yielded positive results.

Implicit in the World Bank definition is the need to consider more than just single factors in identifying and measuring poverty. It is clear that poverty is a complex condition, and simplistic and arbitrary procedures to identify and measure this social condition are inadequate to the task. Poverty is marked by multiple dimensions, which will vary depending on the socioeconomic system being studied.

For instance, poverty in countries of sub-Saharan Africa cannot be directly compared with poverty on the Native American reservations in the United States other than to say that a degree of serious deprivation exists. A study of poverty in South Africa solicited the views of poor people. Those living in poverty recounted that their alienation from the community was a particularly distressing factor. In addition the poor recounted their inability to feed their family, the problems associated with living in crowded conditions, having to use basic forms of energy (wood, dung) for cooking and heating, the inability to find and hold jobs that paid well, and the difficulty of living in a fragmented family.

Multiple measures of poverty are used by the United Nations Development Program in its Human Development Index, a tabulation of four attributes. These include life expectancy at birth, adult literacy, an indicator of education level attained, and Gross Domestic Product per capita. A review of the data for individual countries in this tabulation clearly indicates that one place may be very low in one of the criteria and

higher in the others. Another country will have a different set of values.

Another index used in measuring poverty is the asset-based indicator. This measure tabulates, for example, the characteristics of the household, identifying the number of rooms and the presence or absence of indoor plumbing. An additional inventory may take into account the appliances within the home, such as a television set, gas stove, and refrigerator. The aggregation of inventory information can then be used to measure the variability across a group of households identified as living in poverty. All of these measures of poverty (indexes, asset-based inventories, surveys of the poor) suggest strongly that income level alone is not an adequate and unbiased method to use in measuring the living standards of those identified as being poor.

One of the more robust and powerful approaches to measure poverty is poverty dominance (or poverty gap dominance). In this approach, groups are measured against each other using multiple indicators of poverty (health indicators, adequacy of housing, income, etc.). Poverty dominance uses a quantitative approach in measuring the attributes in question, and the technique is capable of more accurately identifying groups that remain in poverty over many years and those who are in poverty for only a short time.

Multivariate approaches, including factor analysis, in the poverty dominance family of statistical techniques are being widely discussed in the literature of poverty measurement.

Application of the poverty dominance method in a recent study of Uganda yielded positive results. A comparison was made of the historical change in the poverty line (a univariate income measure), household expenditure per capita, and the heights of children, a surrogate indicator of a child's general health. The study results indicated that incomes improved significantly while measures of child health over the same period of time did not improve to the same degree. The study adds to the growing body of evidence that 1) poverty is an exceedingly complex concept and 2) single measures of poverty do not represent the most meaningful approach to gaining a full understanding of the problem.

Poverty Gap

THE POVERTY GAP IS the difference between the poverty line and the actual income of all households below the poverty line in a country. In other words, the poverty gap is the total amount of money that would be required to bring all of a country's poor up to the poverty line. The term can also be applied to the difference between the poverty line and the actual income of a single individual or household. The poverty gap differs from the commonly used statistic of the headcount index, which simply measures the proportion of the population below the official poverty line, in that it measures not just the prevalence of poverty but also the depth of poverty. The poverty gap index is a related statistic that measures the shortfall between the poverty line and actual income averaged over the entire population.

As with the headcount index, care must be taken in comparing poverty gaps across nations. First, countries with bigger populations will tend to have larger poverty gaps since the poverty gap is a gross measure of the income required to bring an entire population up to a certain income standard. In addition the official definition of poverty may differ significantly from country to country. International agencies have attempted to correct for this deficiency by standardizing definitions of what constitutes poverty.

The most commonly used standardized measure of poverty is the \$1-a-day level, which corresponds to an annual income of \$365 adjusted for inflation and international differences in costs of living (also known as purchasing power parity, or PPP). By the \$1-a-day thresh-

old, the poverty gap for the developing world was \$111 billion in 2001, meaning that \$111 billion in annual income would be required to bring all persons in the developing world up to a daily income of at least \$1. This figure represents a significant decrease from past numbers largely because of declining poverty gaps in India and China. In 1981 and 1990, the poverty gaps for the developing world were \$189 billion and \$129 billion, respectively; however, because of population growth the world poverty gap has fallen less rapidly than the world headcount index.

A further concern that some economists have with the poverty gap as a measurement tool is that all persons who fall below the poverty line are treated equally in measuring the poverty gap, regardless of how far below the line they fall. Thus a change in the income of an utterly destitute person alters the poverty gap equally to a change in income for someone just below the poverty line cutoff. For this reason, some economists advocate the use of the squared poverty gap index to account for variations in income below the poverty line.

While not under the definition generally accepted by economists, the term *poverty gap* is also commonly used to refer simply to the difference between the incomes of the poor and the rich. Because under such a definition the poverty gap may widen even as the poor increase their incomes, if income growth among the poor is slower than that of the rich, the use of this definition of the poverty gap as a general measure of well-being is problematic.

Poverty Gap Index

THE POVERTY GAP index, also known as the poverty gap ratio, is a measure of poverty that calculates both the prevalence and the depth of poverty in a country. It is computed by calculating how far each poor individual is below the official poverty line as a percentage of

the poverty line itself, and then averaging these proportional poverty gaps over the total population. Persons above the poverty line are assumed to have a poverty gap of zero. Alternatively the poverty gap index can be calculated by multiplying the percentage of the population below the poverty line (also known as the head-count index) by the average shortfall in income for those persons below the poverty line as a percentage of the poverty line.

For example, suppose a country has 10 million citizens and has a poverty line of \$1,000 per year. If one million citizens have incomes below \$1,000 per year, and the average income of these one million poor persons is \$500, then the headcount index is 10 percent (one million below poverty line divided by 10 million total population). The poverty gap index is five percent (10 percent of the population in poverty multiplied by the average shortfall in income of \$500 divided by the poverty line of \$1,000, or 50 percent).

As with the headcount index, care must be taken in comparing the poverty gap index across nations since the official definition of poverty may differ significantly from country to country. International agencies have attempted to correct for this deficiency by standardizing definitions of what constitutes poverty around the world.

The most commonly used standardized measure of poverty is the \$1-a-day level, which corresponds to an annual income of \$365 adjusted for inflation and international differences in costs of living (also known as purchasing power parity, or PPP). By the \$1-a-day threshold, the poverty gap index for the developing world was 5.9 percent, meaning that total poverty in the developing world was the equivalent of having 5.9 percent of the population earning no income whatsoever. This figure represents a significant decrease from past numbers, largely because of reductions in the poverty gap indexes in India and China. In 1981 and 1990, the poverty gap indexes for the developing world were 14 percent and 8.1 percent, respectively.

A further concern that some economists have with the poverty gap index as a measurement tool is that all persons who fall below the poverty line are treated equally in calculating the index, regardless of how far below the line they fall. Thus a change in the income of an utterly destitute person alters the poverty gap index equally to a change in income for someone just below the poverty line cutoff. For this reason, some economists advocate the use of the squared poverty gap index to account for variations in income below the poverty line.

Poverty in History

POVERTY IMPLIES THE STATE of being poor and not having the ability to acquire basic material needs or comforts. If this general definition of poverty is applied historically, there is virtual certainty that this condition has been part of human society for as long as people have inhabited the earth. The ancient historical record does not, of course, provide empirical evidence of the existence of poverty, although biblical references to it are abundant. The earliest recorded reference to poverty is probably the missionary journeys of Paul of Tarsus in the 1st century C.E. Paul's journeys took him to modern-day Turkey, Greece, and Rome. Paul's missionary work was primarily evangelical in nature, but he paid attention as well to helping the poor to develop the notion of living the worthy life.

Paul was followed by literally thousands of individuals who took up the banner of missionary and traveled to the four corners of the earth, spreading and extolling the virtues of the religious life and helping the poor. By the 15th century, missionaries had traveled widely in Africa and south Asia in their quest for converts and to assist those in need.

With the discovery and occupation of the western hemisphere, missionaries were close companions of the European explorers sent to open and claim these new lands. The primary mission of the colonial effort in Latin America was economic. Resources of all types, including gold and silver, were gathered and sent back to Portugal and Spain as the new lands were occupied. Missionaries were there to convert the indigenous people to the ways of Christianity and to introduce the "good life" as they perceived it to be.

Early in the 17th century, missionaries had ventured into east Asia and missions were established in China and Japan with varied success. By the 19th century there was no inhabited continent that did not have a host of missionaries at work. Throughout the history of mis-

"Barnabas and Saul Go Out as Missionaries," a Christian depiction of early evangelicalism and poverty relief.

sionary work, it is clear that the number of missionaries continued to increase, the regions in which they operated expanded dramatically, and their efforts became directed more to helping the alleviation of poverty and less to the activity of religious conversion. The latter goal, of course, remained of great importance.

However, it was realized that starving people living on the edge of survival first had to be made healthy. When that necessary task was accomplished, the attempts at conversion would have a better chance of succeeding.

FEUDALISM

The European period of feudalism, which lasted from about 850 to the 13th century, had clearly identifiable characteristics of poverty. Feudalism, a term first coined in the 17th century, was based on the Latin term feudum, which referred to a fief or land granted to a regional leader or lord. Three characteristics identify feudalism: lords, vassals, and fiefs. The lord owned the land and a vassal received a parcel of land from the lord on a loan basis.

In exchange for the land, the vassal agreed to provide protection for the system in the form of military service. The land was worked by peasants who owed their allegiance to the lord and produced agricultural products. Peasants were obligated to pay taxes to the lord in the form of crops grown in the fields. The peasants were allowed to retain only as much of the product as was necessary to ensure their basic needs. As such, it may be stated with confidence that the peasants were basically poor and lived in a form of poverty.

Starving people living on the edge of survival first had to be made healthy.

By the 14th century, Europe's economy had begun to shift from its primary emphasis on agriculture to one that was money-based and considerably more diversified. In addition the geopolitical situation in Europe was changing. Movements were under way that eventually led to the growth of strong, centrally controlled monarchies and the precursors of the age of nationstates in the 16th century.

The end of feudalism, however, did not bring about an end to poverty. There were still peasants working the land and their status within the changing societies of Europe did not appreciably change. By the time of the Industrial Revolution, which got its start a few decades following the beginning of Europe's agricultural revolution in the 17th century, poverty continued, but in a new form.

INDUSTRIAL REVOLUTION

The Industrial Revolution created a sea change in the socioeconomic fabric of Europe. The revolution soon spread from England to the European mainland and then to North America and Russia. The major changes brought about were the beginnings of the factory system of production, the urbanization of the population and the growth of cities, and geometric increases in the productive process.

The Industrial Revolution ushered in the age of machines, the factory system of mass production, and the demise of local crafts industries. It sped up the movement of people to the cities, a shift that had already begun decades before as the agricultural system absorbed all the labor it could handle. In the cities, people were readily employed in the growing factories and introduced to long hours of labor in poor working condi-

tions, crowded housing, and a generally unsavory lifestyle.

The situation was exacerbated by the fact that those in charge of the factories and the new economy were doing well economically, and for most of the 19th century little was accomplished by the government to address and rectify the problems experienced by those living in poverty. The Marxist view of conditions in England in the 1840s was extremely harsh. Friedrich Engels made the following charge in his 1844 book, *The Condition of the Working Class in England*: "At the bar of world opinion, I charge the English middle class with mass murder, wholesale robbery, and all the other crimes in the calendar."

"Never before, at least, had a stink risen to the height of an historic event."

Engels and other critics of conditions in the factory towns drew attention especially to the prevailing unsanitary conditions and resulting illnesses that seemed to be ever-present. To aggravate the situation, there seemed to be little if any concern expressed by those in charge. However, beginning in the 1830s in England, documents appeared that brought attention to health problems in the workplace and in the crowded living quarters of the poor. One commentator suggested that thoughtlessness and apathy were the only barriers to changing the situation.

An 1838 survey conducted by the Poor Laws Commission in England concluded that families were engaged in dangerous and unhealthy working conditions; living in "ill-furnished, uncleanly, ill-ventilated" homes; and surviving on "meager and ill-nutritious foods." These unfortunates, the study stated, were becoming the "victims of dissipation." By the end of the 19th century, an enlightened English government had enacted a number of laws that addressed the plight of the poor and had passed legislation to clear the smoke-filled air and clean the water systems in the cities. A report by the British Royal Commission on Sewage Disposal in 1858 graphically exposed the degree of filth choking the waters of the Thames: "For the first time in the history of man, the sewage of nearly three million people had been brought to seethe and ferment under a burning sun. ... The result we all know. Stench so foul we may well believe had never before ascended to pollute this lower air. Never before, at least, had a stink risen to the height of an historic event."

Other observers at the time concluded that there probably was no unpolluted river in the whole of England. Closely associated with the Industrial Revolution and intimately tied to its success were the territorial acquisitions by European countries during the second period of colonialism, which began in the third quarter of the 19th century.

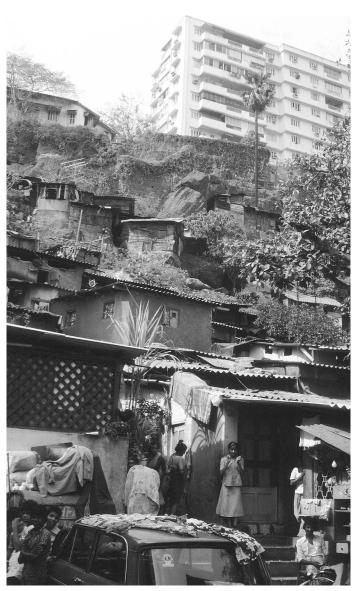

COLONIALISM

The Berlin Conference in 1884 convened to decide which European country would occupy and control which regions of Africa. The primary emphasis for the occupation was economic. The burgeoning European economies were in need of raw materials to continue their growth and future markets for goods being produced in ever-increasing volumes. In the subsequent "carving up of Africa," the major theme of the conference, England and France collectively occupied an estimated 70 percent of the colonial territory in Africa. Portugal, Belgium, Italy, and Spain also claimed smaller amounts of land. It was not until the early 20th century that Germany became a colonizer on the "Dark Continent."

Colonialism, from the perspective of the occupying countries, was extremely lucrative. Having complete control of the territory and superior strength, the Europeans had a virtual free hand in extracting the riches of the region and sending the materials back to Europe for processing in the growing factory cities. The occupiers were able to accomplish these efforts with a minimum of infrastructural investment. That is, the amount of development within a colony was limited exclusively to the projects that ensured the extraction and shipping of the targeted resources.

At no time did the occupiers engage in full regional development, which would have benefited the indigenous culture groups within the colonies. For example, railway lines were put in place in Nigeria that led to the source areas for resources to be shipped back to England. These lines terminated at the coastal ports, where materials were loaded for shipment out of the colony. No attempt was made to bring the lines farther to the north, where a region of fertile land existed. It was not until the 1960s, when the period of colonialism finally ended, that the Nigerians were able to open up and develop this region to agriculture.

If the colonial era in Africa had positive outcomes for the European occupiers, such was not the case for the indigenous culture groups. To begin with, the economic system put in place in this period was identified

Slums in the shadow of modern apartments in India echo the pattern of the "haves" and "have-nots" in history.

as mercantilism. In this system, the colonies provided the unprocessed resources, which were then shipped to the European country for processing. The producers of finished products gained the monetary benefits of the value added in the manufacturing process, whereas workers in the colonies were given very low compensation for their efforts.

An additional aspect of this economic relationship was the stipulation that the colonies were prohibited from producing the products within their region that were made in Europe. This system produced an extremely inequitable economic relationship between the European occupiers and the people in the colonies. This era marked the beginning of the "core-periphery"

relationship, which exists in a modified form even today.

When the era of colonialism ended in the 1960s and the colonies received their independence, the economic problems for the newly independent countries did not end. With limited capital and a cadre of inexperienced leaders, many of them faced the daunting task of completing their basic infrastructure (road and railroad networks, undeveloped agricultural regions, adequate housing and sanitation facilities, and health and educational systems), which had been neglected by the European occupiers.

There can be little doubt that living conditions for the indigenous culture group during the period of colonialism were decidedly poor. Although no definitive numerical information is available on income levels or other empirical measures, it is clear that people in occupied African lived in conditions of poverty or close to it. When the colonial territories were established, the boundary lines were set up for convenience along rivers. This procedure paid no attention to the fact that the areas occupied by the native culture groups focused on the river and extended outward on both sides of the river.

So from the onset of colonialism, dozens of culture groups were physically split, with one part of the society coming under the rule of one European country and those on the other side coming under the rule of another. In addition, under colonial mandate, indigenous people were not allowed to travel outside their assigned area, nor were they allowed to migrate to the cities within their area unless invited to do so for employment.

Following the end of colonialism, conditions in the previous colonies worsened. In the decades since the 1960s, the populations in the African countries increased dramatically, many of the new countries were plagued with droughts and environmental degradation, and the region of sub-Saharan Africa endured the ravages of an HIV/AIDS epidemic, from which it still suffers.

Data from the United Nations indicate that the populations of 11 countries in Sub-Saharan Africa are living on less than \$1 per day and that 20 percent of them are living on less than \$2 per day. These same countries also have the highest incidence of adult illiteracy rates, children underweight for their age, and the highest probability that newborns will not survive to age 40. In addition this region of the world has the highest percentage of the population without access to safe drinking water. This unfortunate combination of nega-

tive socioeconomic attributes unequivocally defines poverty in its most insidious form.

MILLENNIUM DEVELOPMENT GOALS

In 1990 the United Nations initiated its Millennium Development Goals (MDGs) program to address the most serious problems faced by countries in the developing world and particularly those in sub-Saharan Africa. The three major goals identified for completion by 2015 are 1) to cut in half the proportion of people whose income is less than \$1 per day, which is a level characterized as extreme poverty; 2) to cut in half the proportion of people who suffer from hunger; and 3) to ensure that children everywhere, both boys and girls, will be able to complete a full course of instruction in a primary school.

These three goals represent an umbrella policy that will look closely at the percentage of children who are underweight for their age, the numbers of people not receiving the appropriate caloric and protein intake, the establishment and/or improvement of schools to ensure that students have the opportunity to complete at least grade five, and increased employment prospects in all affected countries. These are laudable goals that could be attained if there is an adequate degree of enthusiasm and financial support from the developed world. Without significant assistance from the rest of the world's countries, it is highly likely that the goals will remain far out of reach. To attest to the gravity of the problem, attainment of the goal to cut in half the number of people living on less than \$1 per day would require that 40 percent of the population of sub-Saharan Africa and southern Asia would be elevated to a higher per capita income. The next step upward in the United Nations measurements is \$2 per day, hardly a level of affluence that would represent solving the poverty problem.

It is abundantly clear that the higher the population of those in poverty, the greater will be the effort to bring these people to a satisfactory and healthful living condition. By 2005 work on the MDGs had succeeded in bringing about some alleviation of the suffering of poor people in the regions of greatest need. However, the further outcomes of significant poverty reduction and complete poverty eradication seem virtually out of reach by 2015.

DEVELOPED WORLD

Historical poverty trends in the United States and other affluent urban-industrial countries reveal quite a differ-

ent picture. The procedures for determining poverty differ greatly and the category of extreme poverty, applicable to most of the developing world, fortunately is inappropriate for the United States and other countries in the developed world.

In the United States, for instance, the Census Bureau determined that a family of four in 2003 needed \$18,810 to meet basic needs. Assignment of a specific monetary income is an example of using an absolute poverty measure. The 2003 income level identified approximately 12.5 percent of the population as "poor" and consequently living in poverty, which meant that 35.9 million people in the United States were living in poverty.

In 1959, the first year for which poverty estimates are available, the measure for poverty was set at \$2,973 for a family of four. In that year, an estimated 22.4 percent of people in the United States were living in poverty. Since that year, the percentage of people identified as living in poverty has steadily declined as the absolute poverty level has increased, as a reflection of inflation and higher average earnings.

The percentages of people living in poverty in the 1950s not only in the United States but throughout the developing world spurred President John F. Kennedy to include several references to the problem in his inaugural address in 1960. It is clear that Kennedy's goal for his presidency was to directly address the plight of poor people in the world and to specifically aim at rectifying the problem in the United States. Unfortunately Kennedy's time in office was abruptly cut short. When Lyndon B. Johnson became president, he set an agenda for civil rights that included many of the goals that Kennedy had articulated. Johnson's famed War on Poverty was a reflection in large part of Kennedy's thinking.

MAKE POVERTY HISTORY

In May 2005 a worldwide program to eradicate poverty was initiated. Identified as Make Poverty History, the program united over 500,000 people across the globe to demand that the G-8 leaders live up to their duties to 1) cancel developing-country debt that is beyond the capability of the poor countries to repay; 2) deliver more and better aid to destitute people in the poorest countries; and 3) work to establish fair trade relationships between the developed and developing worlds.

This initiative was matched in both spirit and goal by the work of prominent personalities in industry and entertainment. In fact, three of these personalities, Bill and Melinda Gates of Microsoft and Bono, a rock star with the group U2, were named Persons of the Year in 2005 by *Time* magazine for their work in assisting people living in poverty in the developing countries.

Bono is particularly critical of countries in the developed world for not taking a more active role in assisting the poorest in the world. His belief is that poverty can be defeated if enough resources are brought to bear on the problem. In this quest, the greatest enemy is not poverty and disease but indifference. This conclusion mirrors the statements of prominent English physicians and government officials who wrote about the ills exposed in the factory cities of the 19th century, where the greatest deterrent to alleviating the suffering of the workers and their families was apathy.

Poverty Law Resources

THE LAWS covering matters pertaining to poverty are very numerous, but not always easy to locate. Usually the titles of poverty issue legislations have names such as Hunger-Free Communities Act of 2005 or Senior Nutrition Act of 2005. This means that a researcher seeking to locate poverty legislation will need some

form of guide. There are numerous books on many aspects of poverty. Some of these deal with specific legislation, covering such topics as welfare, elder law, family law, child law, disabilities law, workman's compensation law, AIDS law, consumer protections, debtor-creditor law, and more.

In the 1960s, as part of the War on Poverty of the Lyndon Johnson administration, legal aid was established within the U.S. government. In 1974, Congress created the Legal Services Corporation (LSC) to funnel funds to the nonprofit legal aid offices around the country. One of the most important resources on poverty law is the legal aid societies. These include persons trained in the legalities of poverty who provide legal services to the poor to help them with a number of issues. They are the oldest and largest providers of legal services to the indigent in many countries, including Canada and the United States.

Legal aid societies provide legal help with civil cases (private legal issues between private persons or corporations) and with criminal defense work. They also represent juveniles on behalf of poor families in family courts. Their goal is to make sure that a lack of money does not prevent people from having access to the justice system.

The attorneys who work with a legal aid society do so *pro bono*, meaning they have donated their legal services. Because legal aid societies have rejected funding that may have barred their attorneys from handling certain types of cases, they are in a position to represent clients in immigration, welfare, criminal, and wrongful imprisonment cases. One of their biggest areas is the use of class-action suits to protect the poor from onerous legislation or bureaucratic decisions.

LEGAL AID SOCIETY OF NEW YORK

As one example, the Legal Aid Society of New York offers services and operates much like other legal aid societies found on a state or city level throughout the United States. The New York office describes itself as follows: "The Legal Aid Society is the nation's oldest and largest provider of legal services to the indigent. Founded in 1876, the society provides a full range of civil legal services, as well as criminal defense work, and juvenile representation in Family Court, ensuring that poverty is not a barrier to accessing the justice system.

"Our core service is to provide free legal assistance to New Yorkers who live at or below the poverty level and cannot afford to hire a lawyer when confronted with a legal problem. Through neighborhood and court-based offices in 18 facilities in the five boroughs of New York City, more than 800 lawyers working with approximately 600 paraprofessionals and other supporting staff, handle 300,000 cases annually.

"Legal Aid's fiscal budget is \$140 million; 90 percent comes from public funding, principally for criminal defense work and representation of juveniles in child protective and delinquency matters. The remaining funding comes from the fund-raising activities of the organization, which include private donations from law firms, associates, corporations, foundations, individuals and special events. The largest source of current support is the New York legal community."

The American Bar Association (ABA) provides a center for people who are indigent with its *pro bono* program. It also has a program for people of modest means. The ABA has a *Pro Bono* Standing Committee that maintains both a directory of *pro bono* resources and a center for *pro bono* work. The center provides resources and advice to bar associations, *pro bono* programs, different kinds of legal services offices, and many others. It also operates a clearinghouse of materials on a great many *pro bono* topics and directs a Peer Consulting Project. This project provides legal assistance to peer consulting teams, legal services, bar associations, and others in the field.

In 2000 the ABA began the Rural *Pro Bono* Delivery Initiative. This program was supported by the Open Society Institute. The goal is to create models for delivering effective legal services in rural areas to clients who would not otherwise have adequate legal representation, and would thereby be denied access to justice. Around the world there are numerous legal aid societies. Some of these are supported by and operate in European countries. Lawyers who are trained in the civil law systems abroad provide volunteer legal service in Africa.

Poverty Laws

LEGISLATION AFFECTING THE poor covers a great many legislative topics regardless of the country or culture in which the legislation may be adopted. In general, poverty laws are concerned about the poor both domestically and internationally. The main issues are reducing the numbers of poor, affording them protection from thieving exploiters, providing services and goods, and regulating the poor.

Many countries have laws dealing with providing relief in foreign lands or with providing aid for economic development in foreign countries. Sometimes the legislation is straightforward. At other times it may be mixed with other topics. For example, a law that extends military aid to a country may also contain provisions to promote and establish environmental protection or economic opportunities to the poor. In some situations, such as the ethnic cleansing occurring in the 1990s and early 2000s in the Darfur region of Sudan, peacemaking conditions could be tied to family relief or to humanitarian concerns that protect people who are usually poor.

Currently in the United States Code there are approximately 50 titles dealing with poverty in one form or another. However, none of these titles are easily identified as specifically addressing poverty-issue legislation. Yet every year Congress addresses numerous bills or resolutions that are concerned with poverty. This means that the topic of poverty is spread across the code. Poverty laws are included in a great many topics, such as landlord-tenant relations, government benefits, housing discrimination, laws on the elderly, child law, and the personal life issues faced by people living in poverty.

In other words, the titles used for bills will not be such things as "legislation to end poverty," or a "bill to provide food for poor elderly people." Rather the titles will be like the "Hunger-Free Communities Act of 2005" or the "Senior Nutrition Act of 2005."

Poverty laws that seek to provide some benefits will cover matters such as disaster relief, welfare payments, low-income housing, food stamps, commodity programs, medical services, small-business financing, and student loans using a means test that favors the poor. Local regulations will also be concerned about benefits for the poor. Some local ordinances encourage or promote charitable organizations so that local centers or organizations to aid the poor can have legal recognition. As a result most communities have a variety of low-income housing that is subsidized by taxes.

Most communities have some form of community health center that was created as the result of a local law. These are operated at taxpayer expense and provide subsidized care for the poor for things like vaccinations for children, flu shots for the elderly, and treatment for HIV/AIDS victims who are so impoverished that they can no longer afford a private physician. Healthcare services are also available at all public hospitals in America. A person who is rejected by private physicians must be treated by law at a public hospital. The costs are usually incorporated in the costs of treatment paid by those who have private insurance, if there is no taxpayer-paid program to cover the costs.

Legislation may also seek to protect the poor from exploitation, dealing with different aspects of the lives of the elderly and children. For example legislation to prevent and punish child abuse, housing discrimination aimed at prohibiting children, subsidized housing, housing used by the poor such as mobile home parks, immigrant legislation, immigrant children legislation, migrant laws, and regulations covering the benefits granted to the poor are all designed to ensure fairness and to prevent fraud.

Legislation that prohibits loan-sharking or usury protects all classes of people, but it is an important protection for the poor, who are more likely to be caught in a debt trap. Bankruptcy laws also enable debtors to be somewhat absolved of debt, or at least permit a restructuring of debt. This legislation is an aid to those who are poor and who may have been caught in a cycle of credit card debt.

Court rulings have ordered all levels of government to provide an attorney for indigents for capital crimes, felonies, and even misdemeanors. Legal aid or service agencies also provide legal help for poor people. Legislation that regulates the poor may be laws regulating their movement (vagrancy) or regulating their finances (bankruptcy).

HISTORY OF POVERTY LAWS

Legislation regulating the poor has a long history. During the Reformation in England, new laws for dealing with the poor were adopted. These laws were generally aimed at regulating the poor. The laws reflected the change in the ideas of holiness that accompanied the Reformation.

In medieval practice the poor were actually needed, because the penitential system of religious discipline encouraged people to give to the poor as an act of charity. The charity was considered meritorious; the acts of giving would help people to work toward their salvation. However, with the recovery of the doctrine of salvation through grace alone, Martin Luther and the other Protestant Reformers emphasized that Christ had already earned salvation by his atoning death on the cross. The appropriate response of the Christian was to live life in gratefulness for that atonement. Not to work therefore became a sign of an unredeemed life. It was an offense to grace. Begging was therefore outlawed.

The poor would desperately take any work rather than go to the institutions.

English poor laws were to remain in effect for centuries and were to form the basis of American legislation as well. Distinctions were made between the deserving poor (widows and orphans, the physically or mentally ill) and the undeserving poor. The latter were those who could work but were not working. Work opportunities for the poor were established. Those who were poor were put into either poorhouses or workhouses.

These offered shelter and work opportunities of last resort, provided by the government. They were so onerous that the poor would desperately take any kind of work rather than go to these institutions. A stigma of shame would often accompany the family of a person who was placed there.

The late 19th century saw a transition from poor laws that were generally punitive to a welfare state that sought to provide support for the poor through a wide variety of legislative action. In Europe progressive and socialist ideas were incorporated into the legislative programs of numerous countries. The welfare state was the result. Generally the goal was to help the poor with universal medical care or with unemployment benefits during economic downturns. However, these programs became very expensive and are now in retreat in the face of the need to increase economic productivity in a global economy.

Since the Great Depression of the 1930s, the United States, despite its strong capitalist market economy, has enacted numerous laws that are aimed at protecting and providing for the poor. Yet while some laws afford some protection and benefits for the poor, other legislation seeks to control them as vagrants or indigents.

Poverty Lawyers

POVERTY LAWYERS ARE those who devote part, or all, of their careers to providing legal representation to low-income people. The term *poverty lawyers* is not one that has been defined officially. Even the word *lawyer* varies widely around the world. For example, in some countries only some of the lawyers are authorized to appear in court, and in some countries, some of the lawyers may do work limited to what is done by notaries in other countries.

In almost every country other than the United States, law is studied for the first university degree and a mandatory apprenticeship follows. In the United States, students attend three years of professional legal school after obtaining their first university degree, and after receiving both degrees they must pass a test to be licensed in whichever state they intend to practice but do not have a mandatory apprenticeship.

A poverty lawyer is any lawyer who represents lowincome people in the civil courts, that is, most would not apply the term to attorneys who simply represent the accused in the criminal system. The term would most likely be applied to attorneys working full-time in the public sector, but some would apply it also to lawyers who devote any part of their time to representing a low-income person, such as those who contribute their time for free (pro bono), those who do contingency fee work (in some countries, lawyers can agree to take a case and be paid a percentage of the money won if the case is successful), those who take cases paid by feeshifting statutes (some countries provide for the cost of attorneys' fees to be paid by a losing defendant in certain types of lawsuits), or those who do reduced-fee work for the poor. In some countries, all lawyers are required to spend a certain part of their time representing those who cannot afford a lawyer.

Other candidates for poverty lawyers might be those who work in nongovernmental organizations (NGOs). Thousands of these entities, such as Lawyers Without Borders, exist around the world and many have missions like ending poverty, fighting disease, and encouraging economic development to alleviate poverty. Lawyers working in some governmental or intergovernmental organizations also do work directly related to the alleviation of poverty.

In the United States, a national system of legal aid or legal services offices is in place. Lawyers working in these organizations indisputably would fit within the definition of poverty lawyer. These organizations are in the nonprofit sector and are funded by a combination of federal, state, and local government allocations, foundation funds, and contributions from individuals. Starting at the end of the 19th century, these legal aid offices were created and funded by bar organizations in some U.S. cities. In the 1960s, as part of the War on Poverty of the Lyndon Johnson administration, legal aid was established within the U.S. government.

In 1974, Congress created the Legal Services Corporation (LSC) to funnel funds to the nonprofit legal aid offices around the country. Congress also required that every county in the country be served by these organizations, but funding was only provided to serve at most about 20 percent of those financially eligible, defined as those making less than 125 percent of the U.S. poverty line. The high point of federal funding for poverty lawyers was in late 1981, when the LSC briefly received enough federal funds (\$321 million) to hire one lawyer for every 5,000 eligible people. In 2005, federal funding was only \$330.8 million—after adjusting for inflation, far less than in 1981.

Some poverty lawyers represent individuals on any type of legal problem that the person may have, but because of a lack of attorneys to serve the poor, most poverty lawyers take only high-priority cases that deal with serious life-threatening needs of the poor, such as those relating to their health, housing, government benefits, or family crises like domestic violence. Sometimes poverty lawyers represent large groups of clients in class-action suits to address legal problems shared by many low-income people, or lobby for laws to benefit those in poverty.

Funding for poverty lawyers has long been caught up in ideological battles. Legal aid enjoys support from bar groups and attorneys of differing political persuasions, yet some opponents of legal aid say that poverty lawyers should limit themselves to representing the poor only on routine legal needs faced by rich and poor alike. These opponents charge that some poverty lawyers have their own agenda to change the system on behalf of the poor. In the mid-1990s, the U.S. Congress tightened restrictions on what federally funded poverty lawyers could do. Congress prohibited LSC-funded attorneys from bringing class actions, collecting statutory attorney's fees, lobbying, challenging the new welfare law, or representing prisoners and many categories of immigrants.

Lawsuits challenging some of these restrictions have been successful and other lawsuits are ongoing. As restrictions were imposed on what lawyers could do in these federally funded legal aid offices, other legal non-profit organizations have formed to do the work in those parts of the country where, and if, they can raise funds from sources other than the federal government.

In addition to the services provided by legal aid offices funded by the federal government and those that have formed as a result of changes in the federal LSC system, the poor are represented by many private *probono* attorneys who contribute part of their time free of charge; by attorneys in private practice who work in areas of law that contribute to the public good; by private attorneys who create public-interest law firms; and by many nonprofit organizations, whose missions are devoted to issues such as human rights, mental health, environmental poverty, and community economic development.

Only about 20 percent of the legal needs of low-income people are met.

Despite these many and diverse efforts, the American Bar Association consistently finds that only about 20 percent of the legal needs of low-income people are met, and correspondingly, 80 percent of the need is unmet. Also many middle-class people are finding the costs of litigation beyond their means. The U.S. Supreme Court, in the landmark case *Gideon v. Wainwright*, found a constitutional right for low-income people to have free legal representation when accused of a crime.

Decades after that decision, civil *Gideon* lawsuits are being brought to extend that same right to cases within the civil system, but none have succeeded yet. Thus the vast majority of low-income people and middle-income people remain unrepresented even in the United States,

the wealthiest country with the highest proportion of lawyers in the world.

Poverty Pimp

POVERTY PIMP is a derisive term used to disparage people who advocate for the poor. By appealing to the government or to private charity for support to relieve the suffering of the poor, advocates open themselves to the charge that their motives are impure. This impure motivation is presented in the claim that advocates have a hidden agenda.

Such advocates are usually white, middle-class people with no real experience of poverty and are accused of not being motivated to help the poor, but rather of helping themselves to aid given to help the poor. For users of the term, poverty pimps want an opportunity to steal from funds offered to help the poor. The derogatory term *poverty pimp* may be applied to an individual or group. The poverty pimp is disparagingly compared to a pimp who uses prostitutes to gain funds for himself. *Poverty pimp* serves as a convenient label for those who are opposed to either government funding or to appeals for charitable aid. It enables the opponents of poverty funding to dismiss the call for aid without considering whether there is actually any merit to the appeal.

Using the term *poverty pimp* is a form of character assassination. Logically, dismissal of poverty advocates with the term *poverty pimp* uses an ancient informal fallacy called *argumentum ad hominen abusive*. The poverty claimant is abused for daring to ask for help for others, but the evidence of the argument, that the "have-nots" really need the aid and the "haves" do have the re-

sources to use, is ignored. Instead it is implied that relieving the misfortune of others is not the true motivation, but profit to the advocate is; and if the profit were removed, the real steps to alleviate poverty could take place.

Those who lobby for public funds are the most common targets for accusations of poverty pimping. However, the term is also used against some of those who solicit private charity. Conservatives, libertarians, Republicans, and others use *poverty pimp* in political debate over poverty programs. Those to whom the term is applied are usually liberal, socialist, social gospel (liberal) Christians, or the poor themselves. Users of the term may themselves be motivated by hatred of the poor, hatred of the advocates, or unwillingness to bear the cost of helping the poor.

The term has some validity, because there are some real cases of poverty pimping. One historic case appears in the New Testament. Mary, the sister of Lazarus, poured an expensive bottle of pure nard onto Jesus of Nazareth. Judas Iscariot, who was the treasurer of the apostolic band, complained that Mary had wasted perfume that could have been sold and the money given to the poor. However, the Gospel of John makes it plain that Judas stole from the apostolic treasury, and that his protest in behalf of the poor was really because he was a "poverty pimp."

In the debates over supporting or not supporting poverty programs, those who use the term *poverty pimp* often complain that too much of the cost of charity goes to the administrators of the welfare program or to overhead. The excuse is offered that well-intentioned poverty administrators get most of the poverty funds and the poor get little or nothing.

The signs of poverty pimping are those of any organization that has forgotten its mission and is focused mainly on serving its needs rather than the needs of its clients.

Poverty Politics

WE COULD DEFINE THE politics of poverty as those systems and practices of thought through which the poor, as a social class, are constantly reinvented. The concept of poverty as a social condition, invented with the advent of a monarchical type of government and of the merchant civilization in the 10th to 7th centuries B.C.E., acquired two values during antiquity: one indicated disempowerment, relational lack, and material dispossession; the other expressed poverty as a symbol of justice and virtue.

Whereas the latter developed in the Christian concept of voluntary privation and other forms of asceticism, the former developed in the history of thought in parallel with the concept of value, and embodied a social condition that is constantly being redefined. Material dispossession has its historical roots in the fracture of social solidarity, which produced a society based on ownership. The aspect of poverty as the pursuit of virtue can be referred to these activities of self-realization based on the just composition of the single and the collective. Within these two patterns (poverty as disempowerment, counterfigure of value; and poverty as virtue, as one's own force of self-realization), two corresponding politics of poverty are visible: the substitution of virtue with value, and the very invention of poverty itself.

In antiquity the concept of poverty designated a lack of social ties with the advent of sovereignty, on one hand, and the reliance on money to complete economic transactions (coinage), on the other. This rupture of the social web resulted in substituting virtue with value. In 10th-century B.C.E. Israel/Palestine, the rise of monarchy coincided with the destruction of the common tribal structure of social solidarity—it is at this time that poverty as a social condition was born.

One way to examine poverty in antiquity is to analyze the role of the slave. What the slave indicates is the fracture of the common, the fracture between single and collective work, between intellectual and manual labor, between what Aristotle defines with the concept of dynamis (potency) and that of energeia (energy)—dynamis as force and possibility of realization, and energeia as its actualization.

Poverty also expresses itself on an individual level as the loss of autonomy and self-possession. When one lacks the means to support one's autonomy, a rupture takes place between society and a human being, expressing a separation. The slave is, according to Aristotle, "a human being belonging by nature not to himself but to another"; he is "an article of property" and an article of property is "an instrument for action separable from its owner." He does not possess reason as a self-actualizing condition—the slave lacks the means to decide his life. He has nothing in common with his master. He is the one who is defined by another and whose capacity of self-realization does not belong to him.

The status of the slave, even if he or she is not poor on a material level, expresses the disconnection of virtue and value and the substitution of one with the other. The slave's virtue, his capacity of producing his life, as well as his reason, belongs to someone else. As an article of property, his value operates separately from himself. His virtue has been substituted with his value.

The introduction of money (during the 7th century B.C.E. in Greece) is another element that aided the substitution of virtue with value by setting a common measure. Coinage makes equivalence among things of different natures possible and allows their exchange.

In fact the operation of proportional setting into equivalence can be done only if the things in relation are equal. This unity, says Aristotle, is the *chreia* (need), which keeps society interdependent. The reduction to unity of the different characters of things indicates the formation of social relations on which society is based, also known as the temporary forms of social trade. This *koinonia* (common), on which society is based, is created through an operation of abstraction, which does not bear the traces of the different natures of its own formation.

The link that binds a society is the need (chreia), and this relation of equivalence among things for their exchange abstracts from their differences. Its expression is a common leveler called nomisma (money). Nomisma replaces, for convention, chreia (need). In the market, the passage from need to money results in a shift: whereas the common element of the need is a material status, it is through an operation of abstraction that a new common measure, money, is introduced (the value of one house equals "x," for example, the value of five beds).

In modern times, the situation is similar: the wealth project/system, instead of producing real richness corresponding to the need of everyone's self-realization toward happiness (virtue), works for reaffirming the medium of money (value), which abstracts from differences and takes away the freedom of each individual to access his own self-realization. A new approach to poverty politics should address the fact that the lack with which poverty as a social condition has been until now identified is not the material dispossession itself,

but the continuous production of the relational lack, that is, the subtraction of the social relation that causes material dispossession.

One of capital's features is that it creates ungraspable relations. Defining poverty through material dispossession is one example: we understand poverty only as relational lack, and this precludes the possibility of any positive interpretation, that is, the possibility of a space of its own sovereignty (autarchy), of those collective ways of being and production, which reestablish a person's capacity of self-realization. If the very aim of autarchy is the pursuit of happiness, only a political system that allows for the understanding of these "ungraspable relations" can reduce the continuation of indigence and the production of misery.

A new relation of poverty-potency should be established.

If poverty is the space of breaking off the social composition, the substitution of material relations of production with abstract relations, it is at the level of this material-immaterial interplay that we can start to reconstruct a diagram of a different mode of production. One of the first tools and most important factors of the possibility of a new politics of poverty is the relation between knowledge and production, as described by M. Rahnema.

The common ground that we strive for is knowledge, that is, the degree of composition of things achieved only in virtue of their differences. It is the legacy between aid organizations and the world productive system, the mechanisms of globalization and those of development at a national level, that should be our field of investigation.

Our common ground of knowledge lies:

- 1) In the territory, that is, in fact both the accidental context and the necessary cognitive engine.
- 2) In the localized production setting itself against abstract (global) production. Each specific territory bears differential value.
- 3) In the relation between proximity and processes of materialization. The physical and virtual proximity produce material knowledge.
- 4) In the conversion of economic value into production of knowledge. There is a singular value of knowledge, which reassesses the plane of virtue.
- 5) In the relation between virtual network and territorial space. When the medium is the virtual network,

the territorial space, instead of becoming abstract, becomes material.

- 6) In the relation between consumption and use in knowledge. Knowledge is not consumed when it is used.
- 7) In differential identities. The common multiplying engine of the cognitive system bears differences.
- 8) In that the multitudes of the poor are the heirs of cognitive labor, making of immaterial labor the productive, creative engine of the cognitive system.

To create the premises for a new poverty politics that addresses it not as a relational lack but as the potential place of the construction of a new common discourse, we need to reverse our definitions. Value should be reverted into virtue; the concept of money, resulting in the production of needs, should be dismembered. A new relation of poverty-potency should be established.

Poverty Profiles

POVERTY PROFILES ARE analytical descriptions of the poor. They provide an analytical tool for people studying poverty so that information gathered about the poor can be more effectively used. Poverty profiles try to answer questions such as, who are the poor: are they old, young, ethnic, rural, or urban? Where do the poor live? What are the chief features that define their poverty? What caused them to be poor? Poverty experts who develop poverty profiles use data from a number of sources, such as records of services delivered to the poor, surveys, and analyses of a country policy. The goal is to create a snapshot of poverty in a country at a certain time.

The data used in a poverty profile should come from both qualitative and quantitative sources. It should answer the questions posed about income and consumption, human capabilities, and access to public resources, including schools, transportation, and information. The poverty profile should give those who read the profile information that shows the extent, scope, and severity of poverty. It should also identify all the groups who comprise the poor in an area or a country. Analysis in the profile should show the characteristics that mark the poor. It should state the circumstances and issues that are of major concern. The profile reader should be able to understand how severe the poverty is.

For example, a poverty profile on current conditions in Malawi could begin with a situation analysis that reports that, beyond the current endemic poverty, a drought was occurring in 2005. The food stocks in the affected regions were low, and the reduced harvest will lead to a shortage of food for numbers of people located in identifiable areas. Imported relief supplies would be needed to make up the differences. A poverty profile would analyze the Malawi situation, and an action plan to meet the needs could be coupled to it as well.

Once a poverty profile is constructed, it can be a useful guide for influencing the policy process of a country. The policy process starts with identifying the problem. Once the problem is defined, it must be put on the agenda of the decision-makers, who will then work to formulate solutions. After a policy or a set of policies (usually identified as a program) is adopted, it must be implemented and then later evaluated for effectiveness. Then the cycle starts anew, depending upon the results of the evaluation stage of the policy process.

Policy profiles aid the early stages of the policy process. When policies are being formulated to solve a problem, such as malarial sicknesses, the poverty profile can be a basis for assessing the impact that a policy proposal will have. For example, a malarial infection map could be part of a poverty profile. If the map showed that dry, higher elevations were not troubled by the disease, then a policy proposal could be modified to concentrate resources upon the areas of greatest need. This assessment of the possible impact of a policy proposal is important because once policies are adopted, it is hard to modify them.

Poverty profiles often use poverty maps to graphically illustrate the different characteristics of the poor as well as their locations. Agencies such as OXFAM, the World Bank, and national governments have developed country poverty profiles.

Poverty, Race and Inequality Program

THE POVERTY, RACE and Inequality Program (PRIP) is one of the five principal research areas of the Institute for Policy Research (IPR), which is based at Northwestern University in Evanston, Illinois. PRIP's main activities focus on research, together with publication of research findings and advocacy. Under the leadership of sociologist James Rosenbaum, PRIP activities include analyses of the effects of poverty and welfare reforms, the spending patterns of low-income families, and the effects, particularly economic effects, of the HIV/AIDS epidemic.

Researchers also consider the Gautreaux and Moving to Equality residential mobility programs. The Gautreaux program derives from the 1966 court case in which Dorothy Gautreaux successfully sued the Chicago Housing Authority in America's first publichousing desegregation lawsuit. This led to the provision of vouchers, moving allowances, and counseling to approximately 7,000 families so that they could move to suburban areas. In 2002 another 500 families were similarly offered vouchers to move into low-poverty residential areas that had low proportions of ethnic minorities.

The PRIP is studying the effects of this move on both those who chose to take advantage of it and those who preferred to stay where they were. This is a longitudinal, qualitative study aimed at understanding and documenting from a systemic perspective the overall impact of accommodation and environment on economic and social opportunities. This program and the related Moving to Opportunity program have demonstrated positive results with respect to improved mental health, especially among women.

Other researchers are studying issues such as ethnographic analysis of the impact of welfare reform, the implications of temporary contracts and unemployment, and the impact of having a roommate of a different socioethnic background. The research program generally is aimed at evaluating the proposition that inferior ability, diligence, or aptitude explains why poor people are poor, rather than lack of access to better economic opportunities.

This clearly has an ethnic implication since so much of America's housing, particularly public housing, has led to the creation of single-ethnic-group residential areas. The Gautreaux program demonstrated that, given suitable opportunities and more amenable housing, all but a handful of those families participating were able to escape from permanent poverty.

The PRIP is linked with four other research programs at the IPR, which are the Child, Adolescent and Family Studies Stream; Law and Justice Studies; Philanthropy, Voluntarism, and Nonprofit Organizations; and Politics, Institutions, and Public Policy.

In common with the PRIP, research centers are involved with both research and publication of findings in a variety of formats, policy formulation and advocacy, and related activities. The work of relocating poor people from disadvantaged to better-designed accommodation has had a positive effect on the lives of many families.

Poverty Rate

THE U.S. CENSUS BUREAU defines poverty rate as the percentage of people (or families) who are in poverty. The concept of poverty has no single universally accepted definition. There are three basic definitions of poverty that are used most frequently. These include 1) absolute poverty, 2) relative poverty, and 3) social exclusion.

The absolute (or extreme) poverty approach would identify an individual or family who does not have sufficient resources to maintain a healthy lifestyle, and is based on a predetermined income level. Relative poverty identifies a more subjective approach to determining the living standard. For example, poverty may be defined as the number of households earning less than 30 percent of the median income.

The concept of social exclusion is a relatively new approach to measuring poverty. Social exclusion would take into account the manner in which poor people and families would not have the same degree of accessibility to the positive attributes of the socioeconomic system as would more affluent people. Such things as employment opportunities, adequate housing, and high-quality health services would not be as accessible to the poor simply because of their poverty status.

One of the most frequently used definitions uses a measure of income as a threshold to assign a poverty level. Since it uses a specified income level, this definition exemplifies the absolute poverty approach. An individual or family living below the assigned income level would be classified as living in poverty. For example, in 2004 the poverty rate, or annual poverty rate, in the United States was 12.7 percent. This meant that over 37 million people in the United States were living in poverty. The overall poverty rate masked the rates for individual ethnic groups and age cohorts.

In 2004 the African-American population had 24.7 percent of its people living in poverty, nearly twice the poverty rate of the overall country average. The poverty rate for Hispanics nearly matched that of the blacks, 21.9 percent. At the lower end of the scale non-Hispanic whites had only 8.6 percent of their people living below the poverty rate. Asian Americans were slightly higher than whites in that year with a poverty rate of 9.8 percent.

The difference in poverty rates between the youngest and oldest age cohorts in the United States is striking. While nearly 18 percent of children under the age of 18 lived in poverty, a figure nearly half again as high as the percentage for the country, approximately

11.3 percent people aged 65 and above lived below the threshold. In spite of U.S. wealth and affluence, the poverty rate for children in the United States is nothing to boast about. Further, it is clear that the problem of high child poverty rates in high-income countries is not limited to the United States.

A 2005 study by the United Nations revealed that nearly 50 million children in wealthy countries are living in poverty. The actual number of children in the United States living in poverty was estimated to be 13 million in 2004. That number accounts for 26 percent of the total number of children living in poverty in the wealthy countries. Further comparisons of the wealthy countries in this regard are revealing. It is interesting that three of the northern European countries, Norway, Finland, and Denmark, all have child poverty rates that were below three percent in 2004.

Another example of an absolute poverty rate pertains to the \$1-per-day minimum survival figure associated with countries in the developing world. This minimal amount of income is used as a proxy for identifying what must be considered a bare survival level. Nearly every country in sub-Saharan Africa and many countries in southern Asia have significant percentages of their population surviving below that level. Some of the African countries have as many as 60 to 70 percent of their people in this category. Any country in which the population is subsisting on \$1 per day is experiencing what is identified as a state of extreme poverty, a level that is as close to the edge of death as can be imagined. Regardless of the poverty definition applied to countries at this level of survival, it is clear that they are living in destitution.

In recent years, a number of proposals have been made to revise the methods used to determine and measure poverty. The single-threshold line of income has been judged inadequate because it does not take into account the subjective and comparative approaches used in both the relative poverty and social exclusion determinations. In the case of the United States, it is argued that marked changes have occurred in the economy and society and in the public policies affecting the well-being of individuals and families who are not reflected in the income thresholds.

GERALD R. PITZL NEW MEXICO PUBLIC EDUCATION DEPARTMENT

Poverty Reduction and Growth Facility

THE INTERNATIONAL Monetary Fund (IMF) established the Poverty Reduction and Growth Facility (PRGF) approach in September 1999. The purpose of PRGF is to tie the lending operations of the IMF more closely to its objective of poverty reduction and economic growth.

The idea for the IMF was first proposed in July 1944 at Bretton Woods, New Hampshire, near the close of World War II. Delegates from 44 Allied nations sought to avoid the disastrous economic policies of the Great Depression by creating a mechanism to promote the international exchange of payments for purchases between countries in an orderly and stable way. Its aims are to foster economic growth and high levels of employment, to encourage international monetary cooperation, and to help ease balance of payments when a country encounters payment difficulties.

The International Monetary Fund does not make development loans, nor does it lend to specific projects. Rather it lends money to countries that are experiencing balance-of-payments problems. The purpose of the IMF is to smooth the fluctuations in balance-of-payments so that countries can be sound trading partners. The IMF's lending is financial assistance that helps debtor countries to rebuild their international reserves, stabilize their currencies, make payments on imports, and restore conditions favorable to sound economic growth. The IMF is an international organization allied with the World Bank. It is an institution owned by 184 member countries that are its shareholders. To qualify for IMF financial assistance, a country must be a member of the IMF. It must request the loan and must be unable to find alternative financing. The loan will carry stipulations that will correct policies that have contributed to the payments problem, and which will allegedly aid restoration of strong economic growth.

The IMF was given a mandate to integrate the objectives of poverty reduction and economic growth into its lending operations. The PRGF replaced the practice used previously of issuing a concessional assistance instrument known as the Enhanced Structural Adjustment Facility (ESAF). A review was to be conducted of the PRGF after two years of lending. Among the changes expected from countries under PRGF lending agreement stipulations was reorientation of spending from military or other sectors into social sectors, basic infrastructure, or other activities that would very likely benefit the poor. In addition, tax reforms could be instituted so that stable funding for public needs could be met.

Instituting the PRGF was accomplished with the assistance of the borrowing countries. The PRGF requires IMF staff members to explain to the Executive Board of the IMF how members of the civil society of the borrowing country had been involved in the policy modifications needed to change policies and practices that had led to the balance-of-payments problem. Along with this explanation were strategies for meeting the goals of poverty reduction and economic growth. Attention was also given to the social impact of loans. If major reforms were to be instituted in the policies of the borrowing client state, then a social impact statement was needed to see what the likely impact upon the poor would be.

In 2002 the IMF staff conducted its first review. A second was conducted in 2004. The Independent Evaluation Office of the IMF did the reviews. An assessment by the Executive Board of the IMF in September 2005 found that the macroeconomic indicators for borrowing countries under the PRGF design had improved significantly; however, per capita income in general had not improved despite the increase in pro-poor public spending. The PRGF-guided lending is supported by programs that are framed by Poverty Reduction Strategy Papers (PRSPs). Borrowing countries with active participation by members of civil society and other development partners prepare the PRSPs. Part of the consideration for the terms for IMF lending by the Executive Board are issues involving debt relief for Heavily Indebted Poor Countries (HIPCs).

The PRSP method has been linked to the United Nations Millennium Development Goals (MDGs), which seek to reduce extreme poverty in the world by one-half by 2015. To accomplish this goal the HIPC initiative has been included in IMF lending practices. The HIPC initiative seeks to ensure that no poor country is forced to meet a debt burden that it cannot manage. The

HIPC initiative gathers actions by the international financial community, global agencies, and governments to adopt a policy of debt forgiveness. Loans are then written off as uncollectible and the poor country can make a fresh start at economic solvency.

Poverty Research

THE VAST MAJORITY of poverty research examines some aspect of the cause of poverty, and is typically driven by current events that have changed the amount and/or depth of poverty. Perhaps the first wave of poverty research came in the midst of the Industrial Revolution, which brought fast economic growth but also dire working conditions and urban poverty.

In 1879, Henry George captured this paradox in his popular book, Progress and Poverty. This was only the beginning of several books and articles from this era, including Life and Labour of the People in London, a 17volume study published between 1889 and 1903 by Charles Booth; The Philadelphia Negro by W.E.B. DuBois (1899); and Robert Hunter's Poverty (1904). These works are significant for several reasons other than bringing attention to poverty. First, these texts represent some of the earliest attempts at data analysis. Second, many of these early analyses use logic that mirrors modern economic theory. For example, DuBois's summary of black poverty in Philadelphia is remarkably close to human capital theory, noting that black disadvantage is partially due to lower skills and education caused by slavery. DuBois also argues that relatively few high-skill trades held by blacks suffer from competition from European immigrants. Other arguments from this era are later echoed in economic theory that proposes removing trade restrictions to increase income, and argues for increasing consumption by decreasing saving.

During the late 19th and early 20th centuries, the great migration into the United States led to a significant amount of ethnic conflict. Since many immigrants worked low-skilled jobs, they often faced an ethnic backlash and poverty at the same time. *Polish Peasant*, a five-volume set by William Thomas and Florian Znaniecki published from 1918 to 1920, examines the connection among ethnicity, social adjustment, and poverty. Just after the Great Depression, the most common poverty works focused on its causes, unemployment, and predicting the impact of Franklin Roosevelt's New Deal. Major works on unemployment during the Great Depression analyze the role of family relations in the recovery from the Depression and discuss unemployment's sociological impact.

The next major wave of poverty research came during Lyndon B. Johnson's War on Poverty in the mid-1960s. War on Poverty legislation created federally funded programs that fought poverty at both the national and local levels. Major national programs included the establishment of Medicare and Medicaid, tax cuts, and college grants for the poor. The vast majority of local poverty initiatives were created by the Economic Opportunity Act of 1964 (EOA), which established a variety of community-run but federally financed programs, including Head Start, Job Corps, Meals on Wheels, adult basic education, food pantries, and homeless shelters.

Whether or not the War on Poverty was successful fills a significant amount of literature. According to U.S. Census data, over 18 percent of American families lived below the poverty line in 1960, and by 1968 this figure had dropped to 10 percent. While this is a dramatic decrease, it is unclear how much was caused by War on Poverty legislation and how much was caused by the long economic expansion of the 1960s. Many researchers would later find connections between poverty and the macroeconomy via employment growth. Since many living below the poverty line are also unemployed, job creation during economic expansions often pulls those who find work above the poverty line.

Defining poverty also became a separate research area during this time. In 1963 Mollie Orshansky, an economist working for the Social Security Administration, developed and published an index in two articles for the Social Security Bulletin. Though Orshansky did not intend the line to be a strict measure of poverty, the

federal government adopted Orshansky's measurement for its formal definition of poverty. Orshansky's line is simple: she multiplied the cost of a family's minimum nutritional needs by three because at the time households spent about one-third of their budgets on food. She used food because it is one of the few, if not the only, household expenditures whereby there is a consensus on the minimum necessary for survival. The Census Bureau, which compiles poverty statistics, continues to use this line today.

The deterioration of the African-American family contributed to high unemployment.

The poverty line has received criticism from its inception to today. One problem is that the percentage of the household budget spent on food has decreased dramatically since the 1960s, because of technology advances in agriculture that lowered the price of food. In its place are increases in the percentage of household budgets spent on childcare, housing, and healthcare. Notable attempts at defining poverty include the National Academy of Sciences, which developed a measure that included net taxes (paid minus credits) and cost-of-living differences, and others that calculate the poverty level on consumption rather than income.

The War on Poverty also produced a rebirth in poverty research for specific demographic groups. While these were not the first attempts at understanding poverty within a racial or ethnic group, this line of poverty research continues today. These studies recognize the heterogeneity of poverty. For example, the depth and causes of poverty for inner-city blacks are likely to be substantially different than for Hispanics along the Rio Grande.

PATRICK MOYNIHAN REPORT

For African-American poverty, the Moynihan Report (1967) set off a firestorm of debate and led to a large amount of poverty research. The Moynihan Report argues that the deterioration of the African-American family contributed to high unemployment, low educational attainment, and other characteristics highly correlated with poverty. The intent of the Moynihan Report was to influence the federal government to create policies tailored toward combating African-American poverty rather than overall poverty, which had been the aim of War on Poverty legislation. Despite the

harsh backlash, many of its more controversial assertions were summaries of sociological research from the 1950s.

The Moynihan Report contains a variety of statistics, summaries of major works on poverty, and hypotheses but no formal empirical testing that opened the door for social scientists looking to confirm or refute Moynihan's arguments. At the center of many of post-Moynihan Report works was whether poverty caused family deterioration, low education, unemployment, and other negative outcomes, or if these negative outcomes caused poverty. Much of the post-Moynihan Report poverty research done by sociologists and anthropologists supported the former explanation, thereby arguing against those who linked poverty to cultural differences in the 1950s. Oscar Lewis wrote several books and articles supporting this theory.

Instead of discussing sociological and cultural factors, economists focused on how much of the African-American wage differential can be explained by market factors such as lower education, trends in monetary education returns, and racial differences in industry and occupation. Researchers produced the first formal analyses of discrimination, which continue to be referenced today. Soon after, scholars used a decomposition technique to attribute the wage differential to the above factors.

These authors identify a number of structural trends working against blacks, some of which could be traced to discrimination and others likely not. For example, since schools are funded locally and blacks have lower earnings than whites, blacks are more likely to attend low-quality schools.

Also the growth of the high school-college wage differential in the 1980s disproportionately hurt blacks and any other group with below-average college graduation rates. Income inequality also increased in the 1970s and 1980s, which again hurt any group with below-average earnings. This research does not rule out the role of discrimination, which could be in the unexplained portion of the wage gap or a cause of the differences in the market factors mentioned above.

WOMEN AND HISPANICS

Around the same time, similar works studying women and Hispanics appeared, using many of the same techniques. Studies examined the male-female and Hispanic wage differential. In general these studies found that the majority, but not all, of the wage gap is due to differences in skills (that is, education and experience) and the type of job. Again this research does not necessarily rule out the role of discrimination.

There is also a large literature on regional poverty. Poverty tends to be concentrated rather than evenly spread out. Further, poverty in these isolated areas tends to be persistent despite employment and education policies that have targeted these regions.

One popular line of regional poverty research is the spatial mismatch hypothesis. The spatial mismatch hypothesis states that racially segregated neighborhoods often leave African Americans in areas with few employment prospects, which contributes to their poverty. Several researchers tested the spatial mismatch hypothesis for a particular metropolitan area, and are generally supportive of the hypothesis. William Wilson makes an argument similar to spatial mismatch, but focuses on the behavioral consequences of concentrated poverty rather than employment. Of the many articles and books written by Wilson on this topic, The Truly Disadvantaged (1987) is the most often cited. Other impoverished regions in the United States receiving attention in this literature are Appalachia, the Rio Grande, the Four Corners, and the Mississippi Delta.

Another line of regional poverty research is convergence. Convergence studies assess how fast adjacent rich and poor areas converge to the same economic outcome via the movement of labor, capital, and technology. Tests of convergence initially appear for different countries, but are later applied to regions within a given country, particularly the United States. These papers find that the convergence process is slow, as regions take advantage of their amenities (for example, climate and coastline) to attract both labor and capital.

Poverty Research Centers

POVERTY RESEARCH CENTERS are research institutes that bring together teams of experts and needed resources to conduct research into issues related to poverty. They are most commonly affiliated with one or more universities, and may obtain central government funding from departments or agencies with which they share priorities. Their activities include basic and applied research. Basic research generally follows the research agenda of an individual or research team. These individuals may be university faculty or doctoral students and will be driven by personal interest and the need to contribute to existing knowledge. Universities and centers may provide funding for this kind of research if it meets their overarching objectives and adds to prestige.

Applied research is asked for by external clients who are prepared to fund it in whole or part. In some cases, national- or state-level programs exist to provide funding for some forms of applied research. Like basic research, applied research may involve primary research, which necessitates discovering new data, and secondary research, which involves analyzing data that already exist. Most projects require a combination of both primary and secondary research.

Primary research may be either qualitative or quantitative in nature. Quantitative research involves the use of research instruments such as questionnaires or organized forms for collecting numerical measures, for example income, calorie intake, and inequality. Qualitative research involves data that cannot be meaningfully quantified among many individuals, including opinions, emotional responses, and personal taste.

In addition to conducting research, research centers customarily publicize their research findings through a variety of different formats, depending on the particular audience. This includes maintaining a website, publishing newsletters for the general public, putting out policy briefs for legislators, and showing peer-reviewed journal papers to the academic community.

Research is used to create policies for government at state, national, or even international levels, and may also be supported by advocacy, which means lobbying or using public relations or working through the popular media to attempt to persuade legislators to act on their recommended policies. In some cases, research centers may sponsor outreach programs, which draw upon research findings to create empowerment and educational programs for individuals and organizations in society.

Poverty research centers are customarily governed by a chief executive or executive director who will herself have been most likely an eminent researcher in the field of operations and who is answerable to a board of governors that represents the interests of the funding partners. Other stakeholders may also sit on the board to help ensure that the objectives of the center are met appropriately. Staff includes a mixture of university faculty or full-time professional researchers, graduate student research assistants, and support staff.

The degree of independence researchers have, and their responsibilities for collecting funds or searching for outreach opportunities, all vary considerably from center to center and over the course of time. Changes in the political environment mean that research priorities also change. Notable poverty research centers include the Rural Poverty Research Center, the Joint Center for Poverty Research, and the Institute for Research on Poverty in the United States. Numerous others exist internationally.

Poverty Threshold

POVERTY THRESHOLDS ARE the minimum income levels, adjusted for family size and number of

children, below which household members are deemed to be living in poverty. Necessarily, poverty thresholds vary from country to country because of different levels of income and standards of living. They will change in time in response to the rate of inflation and insofar as governments aspire to bring more people out of the currently accepted definition of poverty.

Customarily the poverty threshold in developed economies is set as a proportion of the median income; mean income is an inappropriate measure because of the hugely growing inequality caused by spiraling income for the very rich in many developed countries over the past decade.

In 2004, for the United States, the poverty threshold for a single individual was \$9,827 annually for people under 65 and \$9,060 for people aged 65 and over. This rises to \$12,335 for two-people households, \$15,071 for three people, and then by approximately \$3,000 to \$4,000 per additional person (U.S. Department of Commerce figures). This was calculated by multiplying the 2003 average weighted thresholds by the percentage difference in consumer price indexes across the two years, equal to just less than 1.027.

Poverty threshold methodology is subject to criticism both on ideological and practical grounds, since it is not established that the Consumer Price Index is necessarily the best way of measuring poverty in the way it is customarily defined.

In particular, it is not true that consumption patterns remain stable over extended periods of time, and so poverty thresholds calculated by reference to the past will in themselves be inadequate. Clearly governments will have an incentive to keep thresholds lower than they might be to minimize costs.

In the United States, for example, maintaining poverty thresholds equivalent to the 1964 level would entail increasing current thresholds by some 165 percent; 1964 was the year when President Lyndon Johnson's War on Poverty was declared. Significant change has affected typical household composition since that time. Meanwhile in parts of many European countries, housing prices have risen disproportionately as a result of lack of space, and this has distorted the meaning of income levels.

Alternatives to poverty thresholds include proposing a range of meaningful, measurable variables, such that a person falling beneath any of them will be deemed to be living in poverty. However, more complex methods tend to be less successful in less developed countries because of the difficulties in obtaining timely, credible statistics. Besides, different social structures

and support networks affect the incidence of poverty in some societies.

Poverty Trap

POVERTY TRAP IS a term used to describe several similar phenomena. As an unemployment trap, it refers to a situation in which an increase in income from working leads to an overall decrease in income because of a loss of benefits or other payments. Another form of poverty trap is that suffered by low-wage workers who are unable to find alternative forms of employment that would lift them out of the comparative poverty in which they live.

This kind of poverty affects sectors such as domestic care, factory work, and cleaning. The incidence of people trapped in this way has risen in industrialized countries when the ability of workers to organize themselves across different workplaces is limited, where there is a high rate of (official or unofficial) labor migration acts to depress wage rates, and when international or regional outsourcing is possible.

Women are likely to be particularly affected by the poverty trap, as they are more likely to have responsibilities for childcare, and working outside the house means that it is necessary to make new and often costly arrangements for child supervision. People who receive benefits for disability, illness, or other inability to work are also subject to this condition. Anecdotal evidence of large numbers of people misusing the benefit system in this way is rarely borne out by genuine analysis.

Means of combating the poverty trap include earned tax credits, implementing a minimum wage rate and keeping it at a suitable level, and providing additional child support or healthcare services, among other forms of redistribution. Each of these methods is likely to be expensive and potentially incommensurate with a low tax-rate regime. Societies will decide whether they prefer to maintain comparatively high levels of tax so that revenue can be redistributed to those trapped in poverty, with the attendant benefits that are associated with greater levels of equity.

Alternatives include promoting labor mobility, so that people are more prepared and willing to move into different types of jobs or different geographical locations where higher-paying work is available. This may also require transfer payments to meet retraining or relocation costs. Countries with very powerful philanthropic or religious organizations, such as the United States and Saudi Arabia, can avoid these costs if they are borne by such charities. In most developing countries, as pointed out powerfully by Hernando de Soto, the inability of the poor to have their property properly recognized in law means they are unable to obtain benefits, such as loans or other forms of financing, to invest in their futures. In these cases, thoroughly established and policed property rights regimes are most urgently needed.

A third use of the term *poverty trap* is that which represents the national level. The United Nations Conference on Trade and Development (UNCTAD) has argued that many of the least developed countries are caught in a form of poverty trap when they are reliant on primary commodities for national wealth. Globalization processes, as currently constituted, intensify these sets of problems.

The way to counter national poverty traps, it argues, is through more effective aid and debt relief, a more supportive international environment, and policies recognizing the marginalization of the world's poorest countries and the interdependencies of the global economy.

Power and Poverty

POWER IS THE ABILITY TO affect the world and effect changes in it. Poverty represents powerlessness because it describes a state in which a lack of resources at a personal level precludes the ability to effect change. The French philosopher Michel Foucault considered power to be an inevitable aspect of human society that defined people in terms of whether or not they belonged to a social elite. Those who are excluded from the elite, depending on the nature of the society, are forced into an institution, such as a prison or mental health facility, that both represents their situation and constrains their ability to affect the environment or, alternatively, leaves them in a state of destitution (that is, without resources).

Poverty in the global north, therefore, is represented by exclusion from social institutions, while poverty in the global south is characterized by absolute or primary poverty, which is life-threatening and almost impossible for people to escape.

An alternative approach is provided by the work of Hernando de Soto, which follows the idea that the poor remain poor because they are unable to enforce their ownership of their property. Without an adequate system of rights that documents ownership and, hence, enables the poor to leverage their assets to raise funds for investment, the poor remain locked into the state of poverty. Enforcing a strict rule of law applying to all members of society would empower those members of society to improve their social situation through their own efforts when, today, many millions of people are prevented from transforming their lives by lack of power, not lack of resources, ability, or will.

One example is the Grameen Bank in Bangladesh and other microcredit programs, in which small amounts of money are lent to families, specifically women, for designated investment projects: buying a second cow, a sewing machine, or some other item that can be used in household production for commercial gain. Many of these programs have led to households drawing themselves out of poverty into comparative wealth.

At the national level, power to end poverty can be linked to democracy, though this is not a sufficient ground for empowerment on its own. As de Soto has observed, no famine has ever taken place in a state in which a functioning democracy was in place. The power to vote is often taken for granted in Western countries, in which democratic choices appear to be limited and irrelevant to actual social concerns. However, voting does

limit the ability of predatory governments to enact policies that bring about famine either deliberately or through negligence. The link between nonaccountable governmental systems and famine suggests that many, if not all, famines are avoidable. Hence global social change, including the conversion of nonaccountable regimes to accountable ones, would assist in ending famine and, in due course, poverty.

The process of colonization, whether physical or virtual, is aimed at establishing binary structures in which privileged members of the imperial elite are empowered to enclose natural resources for their own use, and the rights of the nonprivileged are removed. The British colonization of Hong Kong, for example, involved the importation of Indian soldiers to police the Chinese, who were disenfranchised and excluded from many social institutions, both by formal means and by informal means, such as the attachment of social stigmas.

Critics say that such strategies have almost universally resulted in widespread poverty.

The European colonization of Indonesia, over the course of centuries, changed the archipelago from a society of wealthy, healthy, and culturally advanced people into a physically stunted, impoverished, and culturally deprived set of millions. It is an often-ignored fact that, at the dawn of colonization, those destined to be colonized were frequently more physically and socially able than their oppressors, who had obtained an organizational and industrial advantage.

The charge laid by some against the presence by Western military forces and other institutions, including the World Bank and International Monetary Fund (IMF), is that these too are forms of colonization that are aimed at removing power from local people and the state and arrogating it elsewhere. The structural adjustment programs (now rebranded as poverty reduction strategies) imposed by the IMF in return for approving much-needed loans most frequently removed the ability of state governments to influence the economy.

Privatization, enforcing flexibility in the labor market and enforcing free-trade markets, decreases the (often democratically elected) government's ability to control prices, employment, and welfare payments. Critics say that such strategies have almost universally resulted in widespread poverty in the affected countries, charging that colonization still exists.

Pratham

PRATHAM WAS CREATED in 1994 through the offices of the United Nations to work with preschool and early-years children with the mission of "every child in school ... and learning well." Pratham was started in Mumbai, India, which is home to a number of India's estimated 140 million underprivileged children. In 2002 an accelerated learning program was put into place to help children with literacy and basic arithmetic.

More than 160,000 children have been taught to read and write since then, and more than a million overall have been helped. Street children in India are especially vulnerable to economic and personal exploitation, and basic literacy and numeric skills can make a vital contribution to quality of life, as well as providing additional benefits in terms of instilling confidence and offering networking support. The word *pratham* means "first" in Sanskrit.

Pratham has received many awards and has successfully spread operations to 13 other provinces of India. Chapters of Pratham supporters have been established in the United Kingdom, the Middle East, Canada, Germany, and the United States to help promote and support the cause. A variety of overseas funding bodies have also decided to support Pratham, while many corporate sponsors have lined up to support the cause, with ICICI Bank becoming the chief funding partner.

Government support has also been solicited and secured, enabling the project to achieve a secure infrastructure for establishing a presence across India.

Pratham's success has been based on four underlying elements: geographical coverage, all-encompassing vision, replicability, and strong foundations. The tripartite support among civil, public, and private sectors helps to create these four elements, while avoiding obtaining expensive immovable assets helps to provide a model that many others can emulate.

Identifying underused resources, including volunteers, represents an important, low-cost method of effective organization that has wide application in other developing countries, where there has frequently been the temptation to re-create Western models of nongovernmental organizations that require more intensive financial expenditure.

Pratham is now involved in a range of different activities related to its core mission. These include the production of learning and teaching support materials; remedial, outreach, and health-education programs; and cooperation with primary research projects. The mobile book library has proved to be an extremely successful initiative.

The organization's goals by 2010 are to provide education for its constituents: "In an environment that is mentally stimulating and physically attractive, with teachers who are committed, dedicated, skilled and happy, where children are not only taught the essentials of reading, writing and arithmetic but also good living habits including personal hygiene, the importance of a clean and healthy environment and respect for other people, their beliefs and their property, within a community provides its very best to child care and development and cherishes the children as the future of our nation."

Prebisch, Raul (1901–86)

RAUL PREBISCH WAS an Argentine economist who became known both for his contributions to structuralist economics and dependency theory and for being founding secretary-general of the United Nations Conference on Trade and Development (UNCTAD), which was a position he held from 1964 to 1969. He also served as head of Argentina's Central Bank.

Prebisch's early work and thought were greatly influenced by the plight of Argentina and other South American countries, much of which remained mired in poverty despite theirs many apparent comparative advantages in terms of primary products. This led Prebisch and his followers to believe that the world was divided into a dual system in which core and periphery interacted on an unequal basis.

The core nations, which included the United States, the Soviet Union, and western Europe, operated at the center of economic and political systems in which the peripheral nations acted to provide primary goods to the core nations at preferential prices, dictated by the economic and political power of the core. Core nations used the primary goods to manufacture secondary goods, which could maintain their price levels even during economic recessions when the prices of primary goods decreased.

Consequently, peripheral nations are destined to remain in their subordinate situation. This influential stream of thinking suffered from the lack of empirical or conceptual evidence to support some but not all of its premises. However, the Singer-Prebisch theory (created with the German economist Sir Hans Singer) continues to receive attention among those working with economic development.

Structuralism and dependency theory ideas were subsequently used in the work of Immanuel Wallerstein, Andre Gunder Frank, and the World System Theory scholars. They are central to several ongoing debates on economic development, and Prebisch is considered one of the most eminent Latin American intellectuals of the modern world.

As founding secretary-general of UNCTAD, Prebisch was involved with establishing the body as an important intergovernmental forum for north-south issues. He also presided over the creation of the Generalized System of Preferences (1968), which required developed countries to grant greater access to their domestic markets to products from lesser developed nations. This would help exports of manufactured goods from the periphery to the core, which was one of Pre-

bisch's policy prescriptions, resulting from his dependency theory work. Further, International Commodities Agreements were also brought established that were aimed at stabilizing commodity (primary product) prices.

Mostly because of Prebisch's leadership, the Economic Commission for Latin America became a center for radical economic thought and attracted many followers. Prebisch also became involved with the Import Substitution Industrialization (ISI) model of economic development that was so successfully used by countries such as South Korea. The ISI emphasizes the importance of restricting imports of consumer goods while doing all possible to industrialize manufacturing production to replace what consumer goods would have been imported, with additional policies to improve education at all levels and encourage savings.

Despite the evidence demonstrating the value of the ISI, most economists reject it because it does not adhere to economic theory. Prebisch advocated that the ISI for Latin America should also involve regional economic integration, thereby providing economies of scope and scale and lower transaction costs. These policies were put into practice in much of Latin America and received some initial success, but this was not sustained in the long run, as a result of various political issues and, ultimately, the oil crisis of 1973.

JOHN WALSH SHINAWATRA UNIVERSITY

Presbyterian Hunger Program

THE PRESBYTERIAN HUNGER Program (PHP) is described as "a ministry of the Presbyterian Church (USA), [which] works to alleviate hunger and eliminate

its causes, responding with compassion and justice to poor and hungry people in local communities in the United States and internationally." Supporters contribute to the PHP through both the yearlong Hunger Fund and the One Great Hour of Sharing campaign. Donations total approximately \$4 million annually and are used for direct food aid, strategic grant making, and provision and dissemination of information in print and through the internet. Other areas of activity include policy advocacy, participatory activities, and lifestyle integrity. Though they come from specifically nominated collections, PHP funds are ring-fenced against budget cutting and are much more likely, therefore, to be spent on the activities for which they were gathered.

The PHP was established in 1981 and is guided by the Common Affirmation on Global Hunger (1979, amended 1987 and 1999). The affirmation notes that "the crisis of world hunger is of such proportions that it will be with us for decades to come; the gap is widening, not only between the rich and poor countries, but also between the rich and poor within both developed and developing nations and world hunger is one of the key issues with which humankind must deal for global survival in the last decade of the twentieth century."

Facing these issues, the affirmation calls on its adherents to use their spiritual beliefs to guide their responses: "That God our Creator has made the world for everyone, and desires that all shall have daily bread. That God has been at work through history, even as evidenced in those mighty acts on behalf of the people of Israel to liberate the poor and oppressed that they may serve and glorify their Maker with their whole life. That God's prophets through the ages have pronounced judgment upon those who exploit and neglect the poor and the hungry. That Jesus Christ our Savior identified with the world's poor and came to announce good news to them. That the Holy Spirit is at work in the church, calling us to embody our Savior's compassion and struggle for justice on the earth. That God seeks the reconciliation of peoples and nations whereby the cries of the hungry and oppressed shall be answered."

In other words, the PHP is based on a religiously inspired belief in the fundamental equality of humanity and that individuals are bound to act to reduce hunger as an integral part of those beliefs.

Special programs of the PHP include Joining Hands against Hunger, which aims to build bridges between religious and nonreligious organizations to raise awareness of growing inequalities arising from globalization; the Food and Faith Initiative, which aims to bring about

food systems that are socially just for religious reasons; the Campaign for Fair Food (formerly Taco Bell Boycott), which works to promote ethical behavior in corporate buying practices; and Enough for Everyone and Just Trade, which help to promote awareness of fair-trade issues and their consequences. These programs require comment on international trade deals and institutional arrangements as, for example, in the stance taken against free-trade agreements. Politics and religion, therefore, become intertwined.

Primary Poverty

PRIMARY POVERTY REFERS to a condition of absolute poverty in which the individual or household concerned cannot afford the basic necessities of life. The definition of absolute poverty of this sort varies from country to country and according to time. Most common definitions of poverty consider an income of less than \$2 per day to indicate poverty, and less than \$1 per day to indicate primary poverty. This level of poverty is endemic in a number of sub-Saharan African countries, in individual less developed countries such as Laos in southeast Asia, and among specific regional or ethnic groups in many different countries.

Primary poverty is generally a bigger problem in rural areas rather than urban areas, because of the greater difficulty in obtaining government welfare and other service, and the likely reliance on low-income subsistence agriculture or the production of agricultural commodities. In areas of vulnerability, where people rely upon nature for their income, sudden external shocks can lead to an immediate outbreak of primary poverty.

For example, flooding; drought; the December 26, 2004, tsunami; and environmental change have all resulted in poverty of this kind. Illness in the family, requiring comparatively expensive medical treatment, can also lead to poverty.

The term is generally considered to be interchangeable with the word *indigence*. Literature on poverty tends to divide into two distinct strands. One strand concerns the belief that poverty affects primarily the morally bankrupt, the lazy, or those who are incapable of understanding what it is necessary to do in order to achieve. People subscribing to this belief tend to consider religious charity appropriate to assist the poor but that no other provision should be made and, indeed, that it would be wrong to burden the nonpoor with the support necessary.

The other strand tends toward the belief that the great majority of people who are suffering from poverty do so for underlying, structural reasons for which moral concerns are completely irrelevant. Research shows in very many cases that, when people in poverty are provided with well-targeted and -administered schemes of assistance, they nearly always manage to escape poverty successfully.

The Poverty, Research and Inequality Program, for example, showed that moving African Americans away from ghettoized low-cost housing schemes into mixed residential areas overwhelmingly enabled them to achieve a higher standard of living as a result. The Grameen Bank microcredit scheme that emerged first in Bangladesh demonstrated the same phenomenon among the rural poor. Many other examples exist. People subscribing to this belief, therefore, favor government intervention to enable the poor to escape their situation not just for its own sake, although that would be sufficient, but also because enabling the poor to contribute to society and the economy would benefit all members.

There is some evidence to suggest that the prevalence of primary poverty is related to governmental type. The Nobel Prize-winning Indian economist Amartya Sen has argued that no famine has ever occurred in a functioning democracy. In other words, when governments are accountable to the people, they are unable to carry out the kinds of policies that can lead to widespread hunger. Consequently, it is necessary for people to encourage democratization around the world. Again, this is important not just for its own sake but also to increase security, since famines customarily lead to large-scale movement of refugees.

In urban situations, people suffering from primary poverty may resort to begging or unsafe forms of behavior and may also suffer from homelessness. This makes them vulnerable to abusive behavior by other people and also, in many cases, members of the authorities. Successful policy interventions in such cases generally feature provision of housing and gainful employment as well as act to reduce abusive behavior. An important issue is to establish an equitable legal framework that can be enforced, since one of the principal causes of poverty is the inability of people to register their property according to law and thereby use it to raise funds to invest in the future.

Privatization

A DEFINING CHARACTERISTIC of economic systems is the ownership of property. In command economies, it is the state (that is, the public sector), while in free and competitive market economies it is the private sector that owns the factors of production and produces goods and services in the economy. In practice, however, even in pure market economies, certain goods must be produced by state economic enterprises.

Thus the state engages directly in the production of certain goods, the so-called public goods. Public goods have two unique features: they are nonrival and non-excludable. That is, once they are produced they are available for everyone, and their consumption by one does not exclude consumption by others. Hence they are accessible by everyone regardless of economic status.

Examples of public goods run a wide array, from water and clean air to public parks and schools. Public goods are an example of market failure: profit-maximizing private businesses would have no incentive to produce them because it is impossible to avoid free riders in the market, so the production of such goods would not be profitable.

The traditional solution to this problem has been to have public goods produced by the state. The transfer of the production rights of public goods to the private sector has serious repercussions, especially on economically disadvantaged groups that can no longer afford the consumption of these goods. Privatization inevitably is accompanied by price rises that convert public losses to private profits. Price increases ration out those who cannot pay that price, barring their access to the market and increasing their economic vulnerability.

Garrett Hardin, in his 1968 "Tragedy of the Commons" article published in *Science*, argued that unregulated public ownership of property can be inefficient and wasteful, leading to overuse because of the lack of built-in incentive/disincentive mechanisms. The advocates of privatization have used his argument to mean that private ownership is essential for the rational use of resources.

Rational private property owners guided by a longterm profit motive would make decisions such that waste and ineffiency are minimized if not completely avoided. In this way, Hardin's argument has been embraced by the private sector, especially in the 1980s as privatization became a trend.

In spite of privatization, evidence regarding its effectiveness is ambiguous.

While privatization is generally perceived as the transfer of public assets to the private sector in order to increase the efficiency of the economy to allocate goods, various specific privatization methods are in place. From a theoretical perspective, property rights can be reassigned to the private sector, or government economic functions can be relocated to the private sector to diminish the burden of the government.

Asset sale is the prominent tool of the first method, especially in developing countries, but vouchers, private-public partnership (that is, managed competition), and contracting out are other common tools that help governments relocate their functions to the private sector, at least for a limited time period. In the 1980s, the Margaret Thatcher administration in the United Kingdom and the Ronald Reagan administration in the United States started the trend in privatization.

Later in the decade, privatization became a concomitant part of the Washington Consensus (WC), the blueprint of neoliberal economic reforms imposed on developing countries under the auspices of the International Monetary Fund (IMF) and the World Bank (WB), and more recently the World Trade Organization (WTO).

The IMF/WB/WTO policies aimed to minimize the role of government in the economy and opened devel-

oping economies to transnational corporations, which have penetrated almost the entire spectrum of developing countries. Nancy Brune argues that IMF conditionality has been a force behind massive privatization in developing countries. The International Finance Corporation (IFC) of the World Bank has also been pushing aggressively for privatization, especially in education and health. The World Bank even argues that in most poor developing countries, government services fail to reach the poor and privatization would help the poor access these services. In addition, they argue, public authorities are corrupt and are not held accountable and/or are not well enough trained to carry out their responsibilities. The World Bank recommendation therefore is to reform the governments and at the same time decentralize and privatize their functions to strengthen the delivery of services to the poor. To speed up the privatization process the bank even published a step-bystep guide.

Over the period 1988–2000, annual privatization revenues increased almost fourfold, peaking in 1997 and leveling off thereafter. Privatization activity was concentrated in east and central Asia, the Pacific region, and Europe. Sales of large-scale public infrastructure and utilities have been a major source of privatization revenues for developing countries, amounting to over \$1 trillion, and additional revenues were collected from the privatization of public enterprises in manufacturing and primary sectors (for example, petroleum, agriculture, mining, and natural resources).

In spite of this massive wave of privatization, evidence regarding its effectiveness is ambiguous. Some studies have found that privatization contributed to firms' performance significantly, whereas others contend that there is no unambiguous supporting evidence. At the macrolevel Jeffrey Sachs argues that significant gains in productivity, efficiency, and output have been made in countries where production activities in industry, agriculture, and services are privatized. However, Sachs also argues that the public sector should play a major role in human capital development and in public infrastructure and utilities in an economy. In the transition countries of central and eastern Europe and in Baltic states, privatization has succeeded more than in Russia and central Asian states.

In theory, privatization is based on the following three arguments: efficiency, decentralization, and the corruption of public officials. First, publicly owned enterprises are often nonprofit economic organizations and hence do not have an incentive to be economically and technologically efficient. The result is that they incur losses that are subsidized by governments and covered by inflationary financing methods.

Consequently, fiscal constraints alone are enough to make a strong case in favor of privatization. Second, decentralization frees the decision-making power from public officials and bureaucrats regarding allocation of resources and opens it to wider public inclusion and discussion, rendering it more democratic. Finally, political pressure often leads to the concentration and misuse of monopoly power held by public officials, in turn leading to bribery and corruption.

This mainstream neoliberal economic teaching has shaped the world economy over the last two and a half decades. The IMF/WB and the WTO promoted a neoliberal development strategy that guaranteed the global mobility of capital to pursue cheap labor in developing countries. This mobility shaped the labor markets, raising unemployment and further reduced wages. Both of these developments ensured continued profitability, avoiding overaccumulation and postponing a potential capitalist crisis.

Since the 1990s, globalization of economic activity and privatization engineered by the IMF/WB/WTO has allowed transnational corporations to dominate developing economies and has weakened the role of the nation-state. The contemporary origin of the weakening of the nation-state is embedded in the "Third Way" argument. Originally proposed by Anthony Giddins as a new form of social democracy, it unveiled itself as one of the more controversial economic strategies of our times.

The main argument is that economic globalization has threatened corporations in industrial countries by opening them up to global competition and hence causing a significant reduction in profitability. To avoid the dire consequences of dwindling profitability in the industrial capitalist system, Giddins proposes radical changes. The most important one is to take the state from the demand-side of the economy, where it has traditionally been located, and place it in the supply side of the economy as a partner to the corporate sector. In its new role, the state is expected to take all the necessary measures to enhance corporate productivity and profitability.

In addition, the Third Way has targeted the economically disadvantaged and the labor markets. The role of the modern welfare state in Western society has been that of the lender-of-last-resort. The entire social welfare system has been constructed upon this premise. The Third Way targets the welfare system, arguing that it is expensive and also that it causes large governments

that are counterproductive to for-profit private business. The argument also extends to the labor markets. Pro-labor legislation and trade unionism are also regarded as counterproductive because they raise labor costs. Flexibility, especially downward flexibility, in the labor markets is considered necessary to reduce costs and is achieved through privatization and the weakening of the state, which historically backed trade unionism for political reasons. This weakening of the nation-state is a necessary condition for extending corporate ownership of the public realm in developing countries. After all, new business opportunities mean new profit sources. As a result, public assets are transferred to private corporations, a process David Harvey refers to as accumulation by dispossession.

Recently, a relatively new economic sector, the social sector, has emerged as an alternative to the private and public sectors. The social sector is an economic organization run directly by the stakeholders. Within this paradigm, the problem of economic scarcity addressed by every economic system is approached from an altruistic perspective emphasizing solidarity and collective decision-making in production and distribution. It also emphasizes a mode of production that is self-sustaining and socially and environmentally responsible.

Even though it is a relatively recent development, it is seen as a viable alternative to a free-market system and to a mixed economy and could become a key model for sustainable and responsible development. The participation in decision-making provides economic democracy and is freedom-enhancing (to use Sen's terms in Development as Freedom), because it unleashes individuals' capabilities, especially the capabilities of workers directly participating in the production process, who become stakeholders in the social sector, contributing to decisions directly affecting their welfare. Examples of the social sector are plenty. They run a wide range, from for-benefit organizations (for example, civil society organizations) in the United States to worker-managed Mandragon in Spain and Zanon (a ceramics factory) in Argentina.

Program on Poverty and Social Welfare Policy

THE UNIVERSITY OF Michigan Program on Poverty and Social Welfare Policy is jointly managed by the Gerald Ford School of Public Policy, by the School of Social Work, and by the University of Michigan Law School. The Michigan program was begun as a joint endeavor of the three schools. Its purpose is to promote an interdisciplinary approach to research on policy questions. The applied research conducted by the program seeks to answer specific policy questions. The program both sponsors and encourages research into the following questions using a multidisciplinary research approach. What are the effects of poverty and welfare on families and communities? When evaluated, what are the strengths and weaknesses of welfare reform? What results have been obtained from anti-poverty initiatives at the local, state, and federal levels?

The program sponsors and encourages field studies of welfare and social service agencies to both describe and evaluate their practices. It provides information for testifying before legislatures on social welfare policy issues. The goal is to expand knowledge in all of the social sciences on a broad range of topics related to poverty and public policy. Faculty development and professional development of welfare practitioners through poverty and social welfare seminars are part of the program's work. In addition, it conducts research training for graduate students in social welfare studies. Students are also linked with internships in agencies working with poverty issues. Or it provides invaluable practicum experiences for students in social welfare or poverty programs.

The Program on Poverty and Social Welfare Policy has recently concluded a number of important studies. Recent studies include research on barriers to the employment of welfare recipients, especially women who are welfare mothers. Other studies have included work on evaluating the New Start Employment Project, which seeks to provide transitional jobs for individuals who are reentering the workforce after a period of absence. The New Start project was a program conducted by Goodwill Industries of Great Detroit, Inc. The program also completed a low-income community services survey that examined changing variables in the lives of families who have been affected by the 1996 welfare reforms

Research themes currently encouraged by the program are those focusing on welfare reform, the well-being of families, children, the effects of poverty on family well-being, mechanisms for that lead to poverty being transmitted across generations, and the impact of poverty economically, socially, and psychologically. Other themes include issues related to working women, teen pregnancy, and adolescent motherhood.

Pro-Poor Growth

THE TERM PRO-POOR GROWTH became popular in mainstream economic circles in the late 1990s as opposition to the negative impacts of neoliberal globalization on poor people around the world grew among grassroots organizations and global civil society groups. Pro-poor growth has encouraged mainstream economists to analyze how changes in both growth and inequality affect poverty reduction. Advocates of pro-poor growth, especially those within the World Bank, argue that in the long term only pro-poor economic growth can bring poor countries out of poverty. While there is much debate about the issue of distribu-

tion, pro-poor growth also focuses on changing the distribution of relative incomes through growth.

Still, after decades of debating various notions of pro-poor growth, there is little clarity or agreement either about what the term means or how to measure it. In addition, policymakers remain uncertain about policy programs to increase the pace of poverty reduction through economic growth. Questions also remain about the role and impact of country-specific conditions in affecting distributional growth patterns.

In order to address these lingering issues, the World Bank has undertaken a Program for Operationalizing Pro-Poor Growth. This program attempts to define and measure pro-poor growth, identify policy drivers for pro-poor growth, and determine the extent to which this understanding is reflected in specific countries' poverty reduction strategies. The program is based on case studies from a number of countries, including Bangladesh, Bolivia, Brazil, Burkina Faso, El Salvador, Ghana, India, Indonesia, Romania, Senegal, Tunisia, Uganda, Vietnam, and Zambia. The program has confirmed regular tradeoffs between growth and poverty reduction.

Recent research and policy discussions identify two definitions for measuring pro-poor growth. The first is a relative definition, which compares changes in the incomes of poor people with reference to changes in the incomes of people who are not poor. Under this definition, growth is pro-poor when distributional changes accompanying growth favor poor people. This definition emphasizes inequality reductions rather than poverty reductions per se.

The second absolute definition considers growth to be pro-poor only when poor people benefit according to a standard measure of poverty. The measure of propoor growth depends on changes in the rate of poverty with reference to both the rate of growth and distributional patterns. Attempts are made to measure the "pro-poorness" of growth under each definition.

Underlying most perspectives on pro-poor growth is an unquestioned commitment to growth based on economic liberalization and the belief that higher rates of growth are essential in fighting poverty. Emphasis remains placed on competitive market economies that favor private-sector productivity and investments, and this preference, to the exclusion of alternatives, frames most discussions of pro-poor growth. The World Bank bias toward growth is clear in its assertion that while reductions in inequality might be welcomed, even becoming policy objectives, they are of limited operational use if they do not account for the impact of such actions on

growth. There is no conclusive means for determining the extent to which poverty reduction is an outcome of growth. Similarly, one cannot predict with any confidence that economic growth will translate into reductions in poverty.

There is recognition that data and analyses must be viewed from a gendered perspective.

Indeed, after decades of growth-oriented policy regimes, including neoliberal structural adjustment programs and trade agreements, poverty in poor countries is not declining. In many countries, especially in Africa, the poverty rate has increased in rural areas even where the general economy has shown growth.

Often the linkage of poverty reduction to economic growth through liberalization becomes little more than a justification for advocating structural adjustment programs to enhance investment incentives or strengthen private property rights. Each of these may contribute to the deepening, rather than the reduction, of poverty.

It is improper to attribute pro-poor growth to any one specific factor such as policymaking or economic adjustment programs, since the growth might be an outcome of preexisting conditions. While not giving up problematic assumptions related to liberalization, advocates do recognize that pro-poor growth strategies and policies differ among countries in relation to available resources, technology levels, and, of course, historical and social contexts. Furthermore, there is growing recognition that data and analyses must be viewed from a gendered perspective. Much information on which estimations of pro-poor growth are made says nothing about the distribution of wealth within households.

Various approaches emphasize three necessary characteristics for growth to be potentially pro-poor. First, growth must be labor-intensive and create employment since labor is the most significant asset available to poor people. Second, because most poor people live in rural areas, growth must be focused there. Third, growth must be based on activities and products that are essentially related to poor people's living conditions.

Protestant Churches

PROTESTANTISM IS COMMONLY referred to as one of the three major branches of Christianity, the others being the Roman Catholic Church and the Eastern Orthodox Church. However, Protestants represent a diverse range of theological and social perspectives, including unique views concerning poverty. With all three branches combined, Christianity is the world's largest religion, with an estimated 2.1 billion adherents—about one-third of the total world population. Of those, about 590 million are Protestants. They include 170 million in North America, 160 million in Africa, 120 million in Europe, 70 million in Latin America, 60 million in Asia, and 10 million in Oceania.

Twenty-seven percent of all Christians worldwide are Protestants. However, these numbers do not take into consideration what may be the largest group of Protestants in any country. China officially is atheist and reports that only two percent of its estimated 1.3 billion people are Christian—26 million. However, the majority of Christians in China worship in unofficial churches, usually private homes, prompting speculation that the total is closer to 90 million—most of them Protestant.

Protestant churches are generally considered to be those that do not recognize the Roman Catholic pope as the infallible leader of modern Christianity. Historically, Protestant churches were started on October 31, 1517, when German theologian Martin Luther protested what he saw as heresy within the Catholic Church. Over the next three years, Luther—himself a Catholic university professor, theologian, ordained priest, and former Augustine monk—published a series of convincing challenges to key Catholic doctrines.

At the heart of his protest was his theological contention that a believer gains eternal salvation as a free gift of grace from God through Christ's death on the cross, contrary to the Catholic dogma that salvation is earned through faithful participation in sacraments such as church attendance, confession of sin, and re-

Martin Luther's break with the Catholic Church 500 years ago has spawned thousands of Protestant denominations today.

ceiving communion. Luther's protestations were supported by a host of other Catholic theologians and gained a wide popular appeal. As a result, his many supporters included followers from all levels of society, from landless peasants who considered him a local hero, to knights who swore to protect him, to German princes who jumped at the chance to end what they saw as the distant Roman pope's meddling in local politics.

Concerned about open rebellion, the pope sent an emissary to Luther ordering him to retract his challenges to the pope's infallibility. Luther rebutted with new lists of objections. As a result, the pope excommunicated him and anyone who followed or assisted him.

Holy Roman Emperor Charles V wanted to arrest and execute Luther, but feared provoking civil war, as Luther had become immensely popular and had the protection of the local German prince, Elector Frederick the Wise. So Luther was summoned to a religious tribunal at the city of Worms. There, when ordered to recant, he replied on April 16, 1521: "I cannot submit my faith either to the Pope or to the Councils, because it is clear as day they have frequently erred and contradicted each other. Unless therefore, I am convinced by the testimony of Scripture, I cannot and will not retract."

Luther slipped out of Worms in the dark of night, just ahead of Charles V's soldiers sent to arrest him. What followed was a religious revolt with Luther, his German allies and northern European supporters defying the Holy Roman Empire, France, Italy, and the pope.

In 1529, the Lutheran princes were informed that their option of deciding whether Luther's teachings and worship would be allowed had been revoked. They raised a series of protests, defied the edict by embracing Lutheranism, and became known as Protestants.

The term persists today—although most of the groups so labeled deny they are protesting anything 500 years later. So what is today's Protestant church? In the categories that follow, only general affiliations are listed since there are tens of thousands of individual Protestant denominations.

ANABAPTISTS AND BAPTISTS

The term Anabaptist comes from the Greek words ana and baptizo and means "rebaptizers." It comes from their practice of performing full-immersion baptism for believers whose previous baptism, as infants, the Anabaptists claimed was not valid. As early as the 2nd and 3rd centuries, theologians Montanus and Tertullian denied the orthodoxy of infant baptism and rebaptized anyone who had experienced it. In the 16th century, the term was used to describe dissenters descending from the followers of Menno Simons, particularly the Amish, Hutterites, and Mennonites.

Anabaptists generally condemned the making or taking of oaths, refused to be "sworn in" on the grounds that the Bible forbids it, and harshly criticized any Christian suing another or taking another Christian into a court of law for judgment. They believed that Christians must not bear arms or offer forcible resistance to wrongdoers either as police or members of the military. They taught that civil government belongs to the un-Christian world. The believer who belongs to God's kingdom must not fill any office or hold any rank under government, which is to be passively obeyed. Sinners or unfaithful "backsliders" are to be excommunicated, and excluded from the sacraments and from intercourse with believers unless they repent, but no force is to be used against them.

Early English Baptists were also referred to as Anabaptists, and today still "rebaptize" any professing believer who was baptized by some mode other than voluntary immersion. In the United States, there are a wide variety of Baptists, including National Baptists, American Baptists, Free-Will Baptists, Primitive Baptists, United Baptists, Regular Baptists, Missionary Baptists, and the largest group, Southern Baptists.

The state of Rhode Island was founded by Baptist leader Roger Williams, who fled England to escape persecution of Baptists and other Protestants. There are an estimated 45 million Baptists worldwide, with about 33 million in the United States.

Baptists generally practice local autonomy in church government. Each congregation is an independent entity that sends delegates or messengers to annual meetings or conventions. However, the national entities do not have authority over the local churches, do not hold title to local buildings, and do not assign clergy.

Southern Baptist congregations generally participate in a cooperative fund that finances a variety of outreaches, including foreign and domestic missionaries, disaster relief, and charities to the poor. In the aftermath of natural disasters within the United States, Southern Baptist volunteers are a regular sight, lending a hand, helping to feed emergency crews, and helping the uninsured or underinsured clean up.

God does not intend that poverty be completely eradicated or eliminated.

Baptists tend to view poverty and human suffering around us not only as a socioeconomic challenge but as a God-given opportunity and obligation—as well as an opportunity for evangelization. They cite Christ's words that the poor will always be with us, meaning that God does not intend that poverty be completely eradicated or eliminated. Instead they believe that his divine law and command is that Christians should lovingly and sacrificially share their blessings with those less fortunate among them, and while lending a hand, should also share their personal testimony of how God has made a difference in their lives, blessing them and bringing them through the storms of life.

ANGLICANS AND EPISCOPALIANS

The term Anglican (from the "Angles," referring to the Church of England) describes religious congregations

worldwide nominally led by the Archbishop of Canterbury. The movement was founded when English King Henry VIII was refused permission from the pope to divorce his wife, who had failed to bear him a male heir. All Catholic churches in England were ordered by Henry to sever ties with Rome and instead answer to the former Catholic archbishop at Canterbury Cathedral, who was declared head of the new Church of England.

The term *Episcopalian* was coined during the American Revolution, when all Churches of England on U.S. soil severed their official ties with England. Today, those ties have been loosely restored, with U.S. churches maintaining independence from Canterbury, yet looking to England for leadership. Adherents of Anglicanism worldwide number around 70 million—more than half of them in the Third World. Rivaling the American and English churches are the enormous and theologically conservative Anglican churches of Nigeria and Uganda, two of the poverty-stricken areas of Africa.

Theologically, Anglican congregations are closer to Roman Catholic than to any Protestant denomination. Anglicans do not accept the universal infallible authority of the pope, but their communion-centered worship services are in keeping with Catholic tradition.

The Episcopal Relief and Development (ERD) organization is the international relief and development agency of the Episcopal Church of the United States. An independent nonprofit organization, ERD provides emergency assistance in times of crisis and helps rebuild after disasters. Among its cited goals are to "enable people to climb out of poverty by offering long-term solutions in the areas of food security and health care, including HIV/AIDS and malaria."

CALVINISTS, REFORMED AND PRESBYTERIAN

Calvinism espouses a stern Christian theology advanced by John Calvin, a Protestant reformer in the 16th century, and John Knox, founder of the Presbyterian Church. The Puritans were Calvinists. Calvinism is perhaps best known for its doctrine of predestination, which holds that man is incapable of obtaining salvation through his own efforts because God alone is the initiator at every stage of salvation, including the formation of faith and the personal decision to follow Christ.

This doctrine teaches that some are ordained to gain eternal salvation while others are condemned without hope. It was codified during the Synod of Dordrecht (1618–19). Calvinism places strong emphasis not only on the abiding goodness of God's original creation, but

also on the total ruin of man's accomplishments and the frustration of the whole creation caused by sin, and therefore views salvation as a new creating work of God, rather than an achievement of those who are saved from sin and eternal damnation. Another outgrowth of Calvinism is the Restoration movement, which in the 1840s spawned what have become today's Christian Church (Disciples of Christ), Churches of Christ (noninstrumental, which means that they spurn the use of any musical instruments during worship), and the Christian Churches (North American Christian Convention), all of which grew out of a revival led by Calvinists Barton W. Stone and the brothers Thomas and Alexander Campbell.

French philosopher Jean-Jacques Rousseau observed that the stern, moral Calvinists lived "like monks within the world." Indeed, an examination of the personal habits and statements of John Calvin (1509–64) shows that the great reformer's adult life focused on self-denial.

Calvinists see wealth and poverty as signs of divine judgment, and that the poor are responsible for their own plight because of disobedience to God. Whereas in medieval times giving alms to the poor was seen as a route to salvation, according to Calvinist and Puritan doctrine, poverty is the result of some moral flaw. God is withholding his blessing due to some hidden transgression or an unconfessed, unrepented sin.

The Puritans also believed that the Bible teaches that if a man will not work, neither should he eat. This means that merciful Christians should not support idleness or laziness by gifts that circumvent God's will or encourage ungodly behaviors. Instead, where there is avoidable poverty Puritans should show tenderness, compassion, and correction. The greatest help is when Puritans can educate men and women to search their hearts and lives and find what must be corrected before God's blessings will flow.

The Calvinist also believes in imparting lessons of healthy living and maintaining high moral standards to the poor. The poor must learn to trust in God's goodness and the reality that money will bring neither satisfaction nor happiness to the human soul. Instead, Calvinists must first seek God's heavenly riches, a closer knowledge and relationship with God.

METHODISTS, WESLEYANS, HOLINESS

Methodism was started by 18th-century British brothers John and Charles Wesley, both pastors in the Church of England. They sparked a religious revival

that focused on Bible study and a methodical approach to Christian living.

The term *Methodist* was a college nickname bestowed upon a group Oxford students who met regularly between 1729 and 1735 communicate every week, fast regularly, and to abstain from most forms of amusement and luxury. They also frequently visited the poor and sick as well as prisoners in jail.

From its beginnings, Methodism laid emphasis on social service and education.

Early Methodist evangelists attempted to stir the apathy of the Church of England by conducting openair meetings and establishing Methodist societies worldwide. Traditionally, Methodism has believed in free will and salvation through God's grace as opposed to Calvinist predestination. John Wesley was not a systematic theologian, though Methodist ministerial students and trainee local preachers do study his sermons for his theology.

A popular expression of Methodist theology is in the hymns of Charles Wesley. Since enthusiastic congregational singing was a part of the evangelical movement, Wesleyan theology took root and spread through this channel.

A distinctive feature of Methodism is the use of covenant services. Although practice varies, most Methodist churches annually follow the call of John Wesley for a renewal of their covenant with God. Wesley's Covenant Prayer is still used: "Christ has many services to be done. Some are easy, others are difficult. Some bring honor, others bring reproach. Some are suitable to our natural inclinations and temporal interests, others are contrary to both. ... Yet the power to do all these things is given to us in Christ, who strengthens us. I am no longer my own but yours. Put me to what you will, rank me with whom you will; put me to doing, put me to suffering; let me be employed for you or laid aside for you, exalted for you or brought low for you; let me be full, let me be empty, let me have all things, let me have nothing; I freely and wholeheartedly yield all things to your pleasure and disposal."

The first American Methodist bishops were Thomas Coke and Francis Asbury. Circuit-riding preachers, many of whom were laymen, traveled by horseback to proclaim the gospel and establish churches until there was scarcely any community in America without a Methodist church. One of the most famous

circuit riders was Robert Strawbridge, who lived in the vicinity of Carroll County, Maryland, soon after arriving in the colonies around 1760.

Today's United Methodist Church was formed in 1968 as a result of a merger between the Evangelical United Brethren and the Methodist Church and has approximately nine million members. Another related denomination is the Church of the Nazarene. Some of the charismatic or Pentecostal churches, such as the Pentecostal Holiness Church and the Assemblies of God, also have roots in or draw from Wesleyan thought. The Holiness Revival was primarily among people of Methodist persuasion who felt that the church had once again become apathetic, losing the Wesleyan zeal. Some important events of this revival were the writings of Phoebe Palmer during the mid-1800s; the establishment of the first of many Holiness camp meetings at Vineland, New Jersey, in 1867; and the founding of Asbury College in 1890 and other similar institutions in the United States around the turn of the 20th century.

From its beginnings in England, Methodism laid emphasis on social service and education. Numerous originally Methodist institutions of higher education were founded in the United States in the first half of the 19th century, and today altogether there are about 20 universities and colleges named as Methodist or Wesleyan still in existence.

Over 40 denominations have descended from the Wesley brothers' Methodist movement, such as the African Methodist Episcopal Church, the Free Methodists, and the Wesleyan Church.

The Salvation Army was founded by William Booth, a Methodist. In many respects it resembles a Protestant religious order since members devote their lives to helping the poor and the destitute. Throughout England and the United States, rescue missions, soup kitchens, and after-school programs run by the Salvation Army reach out to the poor and to disadvantaged children, and attempt to help skid-row alcoholics, homeless, and drug abusers.

The Salvation Army believes that there are many practical ways in which Christians can help the poor and alleviate human suffering. The Salvation Army does not hesitate to work in the worst neighborhoods where the poor are discouraged, neglected, stigmatized, and even brutalized. Following Jesus's example, adherents should make deliberate efforts to regularly visit and make friends of the poor and neglected and show God's love.
