Society as a whole can be involved by being given practical ways to help during disasters, such as donating clothing, money, food, blankets, and medical aid supplies. This fosters a spirit of togetherness, love, solidarity, and satisfaction as everyone rallies together to rebuild and upgrade the quality of life of the poverty-stricken. Attention should be given to helping the poor get employment or learn skills that make them employable. The poor also need the Christian gospel preached to them, says the Salvation Army.

LUTHERANS

The Lutheran Church, of course, is where the term *Protestant* began. Today's Lutheran churches adhere to Martin Luther's teachings, particularly concerning poverty and caring for the poor. The Reformation did not repudiate caring for the poor. On the contrary, when Lutheran princes confiscated Catholic Church property, one of the beneficiaries of the income from that property was the poor.

For example, in 1522 the city of Leisnig (in today's Germany) took over the administration of lands formerly belonging to a local Catholic monastery. The document of agreement stipulated that income from the confiscated properties be used to support monks who had been displaced in the process, and that the rest of the income was to be used for various community causes.

The document identifies the beneficiaries of the income as the aged and infirm poor, orphans and dependent children, the "working poor," and jobless newcomers. An elected committee of 10, consisting of two from the nobility, two from the incumbent city council, three from among the common citizens of the town, and three from the rural peasantry, was to allocate the funds, and each of the four constituencies was to have its own key so that no single group could open the locked chest without the approval and presence of the others.

The Leisnig document mentions the damage done by the practice of usury—charging excessive interest. Luther called it "an odious and hateful practice" that benefited the rich and further obligated the poor. He was equally aware of the miserable effects of begging. The common chest explicitly challenged these practices by rejecting any endowments that had grown through profits from usury and by forbidding begging. The poor were to be cared for adequately so that begging would be unnecessary.

In America, many of the Lutherans of the 1700s were among the poor. The oldest continually worshiping Lutheran congregation is in the Virgin Islands,

where Danish mission work among African slaves had borne fruit. In 1800, the 1,000 Lutherans there were about equally divided between slave and free.

In Pennsylvania, many of the German immigrants who arrived before 1800 came as indentured servants, agreeing to work without pay for up to seven years in exchange for the price of a ticket to America. Even among these struggling new immigrants, concern for the poor did not languish. Refugees arriving in America from Austria founded an orphanage near Savannah, Georgia, in 1737. Lutheran colonists in Delaware and on the Hudson River were urged to give to the poor and to help with calamities in families, such as the loss of a breadwinner.

In 1750 the newly founded Lutheran Ministerium of Pennsylvania arranged for the appointment of a guardian for children who had been orphaned during the voyage to America to see "that they were not deprived of their rights by deceivers and unjust persons."

By the early 1800s, a number of Lutheran societies had been founded, including the American Education Society, which provided scholarships for the poor; the American Temperance Society; various antislavery societies; and organizations working for the establishment of public schools, raising the status of women, and providing orphanages.

The two world wars stirred Lutherans to create a new method for meeting human need—the national funding appeal. During World War I, the money first went to benefit soldiers and sailors, then through the Lutheran World Service to help Europeans. In its first 10 years, that program raised over \$8 million and involved one in four U.S. Lutherans. Some of the money went to Third World missions that had been cut off from European financial support because of the conflict.

During World War II, Lutheran World Action and Lutheran World Relief provided homes for at least 300,000 refugees relocated in the United States and helped with resettlement of many others overseas.

Today, Lutherans continue to focus on poverty and its causes. Pilot projects have introduced the concept of asset mapping to groups involved in faith-based community organizing and a Help the Children initiative aimed at changing the attitudes of middle-class Lutherans toward those who live in poverty.

Rural poverty was a factor in the creation of Rural Ministry Resources and Networking in 1999. That same year, Lutherans designated \$3 million for poverty-related programs at home and overseas, and organized the Ministry Among People Living in Poverty.

Protestant Ethics

THE PHRASE *Protestant work ethic* was coined by the German Max Weber, one of the most influential sociologists of the 20th century. Weber linked it to the development of capitalism in his classic essay "The Protestant Ethics and the Spirit of Capitalism." He argued that the emergence of Lutheran and Calvinist theology during the 16th century stimulated in the following century the development of a work ethic, which became associated with the religious doctrine of Puritanism.

Protestantism created the basis for what Weber defined as "inner-world asceticism," a philosophical vision that considered work as a moral activity and an end in itself. In his reading of capitalism and Protestantism, Weber found that the former could develop primarily through a particular cultural climate rather than because of particular economic conditions: "One of the fundamental elements of the spirit of modern capitalism, and not only of that but of all modern culture: rational conduct on the basis of the idea of the calling, was born—that is what this discussion has sought to demonstrate—from the spirit of Christian asceticism."

This Protestant view clashed with the premodern and precapitalist Catholic attitude toward work, which

conceived it as curse or a necessary evil, at best. The formation of a Protestant work ethic promoted industriousness over idleness and favored views that equated poverty with sin. This is well exemplified by the Protestant idea that "idle hands are the devil's workshop." This persuasion, which in its secularized version faults the poor for being lazy, continues to inform the way poverty is described by certain sectors of contemporary society.

Capitalism requires workers to combine high levels of production with an attention to diligence and punctuality. Protestant theology encouraged this combination by the doctrines of vocation and double predestination. Luther's theorization of vocation, Weber explained, not only had an impact on religious faith but also applied to any occupation or trade. To Martin Luther, individuals full of spirituality may be engaged in the most menial of vocations. In addition, John Calvin's doctrine of double predestination, according to which men did not all belong to the category of the saved, made Protestantism a religion of doubt rather than of certainty. Weber stressed how, as a result, Puritanism equated wealth and industry with morality. The crisis generated in the believers about their prospects for salvation prompted an increased level of productivity, as they started to look for signs that could reveal that they had been saved. The constant quest for worldly activity was mainly a quest for God's presence in the world. Economic success became a symbol of God's grace. Hard work was identified as the inevitable way to personal and collective salvation.

Because of their careful reading of the Bible, Puritans found many sources that confirmed their vision of hard work as ennobling. The exclusion of Adam and Eve from the Garden of Eden, which forced Adam to work for their subsistence, was read by Puritans as the indication that work could rectify man's faults. They found support for their rational pursuit of economic gain in Proverbs 10:4, which says, "Poverty brings a man low: but the hands of the vigorous make rich."

In the same vein, they found a rejection of idleness in Proverbs 6:6: "Go to the ant, O sluggard; and see and emulate his ways, and become wiser than he. ... Or go to the bee, and learn how diligent she is, and how earnestly she is engaged in her work; whose labours kings and private men use for health, and she is desired and respected by all: though weak in body, she is advanced by honouring wisdom. How long wilt thou lie, O sluggard? and when wilt thou awake out of sleep?"

These beliefs shaped the 18th- and 19th-century vision of poverty as moral degeneration. For those who

equated industry with morality, social problems were obviously the outcome of collective personal weakness. They also pointed out that social defects did not derive from faults of society itself. Puritans saw in hard work an antidote to the major failings of individuals, and therefore of society. There was evidence that at first glance seemed to confirm the belief in self-improvement through industry and thrift. The diffusion of Puritan asceticism made the accumulation of wealth an end in itself, leading the way to the formation of capitalism. Paradoxically, according to Weber, Protestant theologians started a process that would lead to an increased secularization and rationalization of the world.

By the time Weber wrote his essay at the beginning of the 20th century, the Protestant ethic had been so universally embraced that it did not need any theological support. Weber takes the writings of the American inventor and statesman Benjamin Franklin as documents of the capitalist spirit, which they contain "in almost classical purity." Franklin represents the beginning of the secularization of the Protestant work ethic in the United States.

Weber quotes Franklin's proverbs, according to which "time is money" and "money is of the prolific, generating nature," and concludes that Franklin's philosophy is one of avarice. Its peculiar ethic, Weber argues, "appears to be the ideal of the honest man of recognized credit, and above all the idea of a duty of the individual toward the increase of his capital, which is assumed as an end in itself." It is this attitude of "worldly asceticism," this accumulation of wealth "combined with the strict avoidance of all spontaneous enjoyment of life" that, to Weber, is responsible for the establishment of the "iron cage" where we are all confined.

Franklin embodies the capitalist ethos, which makes the accumulation of wealth an end in itself, thus conferring to "material goods ... an increasing and finally an inexorable power over the lives of men as at no previous period in history." More than a century after Weber's essay, the iron cage still influences the way we see and represent poverty and the poor.

Public Goods

THERE ARE CERTAIN CASES, known as market failures, in which free markets do not efficiently allocate resources. Public goods are an example of such market failures. A free market tends to underprovide public goods (or overprovide public bads) because people do not have an incentive to pay their full personal valuation for the good. This is the free-rider problem. Examples of public goods include national defense, lighthouses, the ozone layer, vaccinations, and even abstract ideas such as the legal system, financial stability, and peace.

Globalization is increasingly interconnecting countries, which is leading to the development of global public goods. Governments can promote the efficient consumption of public goods through taxes, international cooperation, or other systems that force people to pay their true valuation. Providing the proper amounts of public goods is an important tool to combat poverty.

A pure public good has two defining characteristics. First, it is nonrivalrous, meaning that once the good is provided to one person, there is no additional cost to society for providing the good to others. Consider the services of a lighthouse: once the lighthouse becomes available to a boat at sea, other boats can also use the lighthouse without increasing the costs to the lighthouse. The other important characteristic of a public good is that it is nonexcludable. This means that once the good is provided to one person, it is not possible to prevent others from consuming the good.

For example, consider a fireworks display above a city. There is no realistic way to exclude certain people from enjoying the fireworks above their homes. As for another example, if a nation provided an army to defend itself from attack, it would not be realistic for the army to protect only one house from an invasion. Generally, all homes will be equally protected. Few goods could truly be classified as pure public goods, though

many goods exhibit some characteristics of public goods. Note that the definition of public goods is unrelated to government provision. Some public goods are not provided by governments, and some private goods are provided by governments, such as housing subsidies and medical care. The key distinction is that private goods are rivalrous and excludable. The owner of a pizza can prevent others from eating it, and once the pizza is eaten, no one else can enjoy it.

Free markets may find it difficult to provide the efficient amount of a public good for society to enjoy. This is because of the free-rider problem. Since everyone can enjoy a public good once it is produced, members of the society have an incentive not to contribute to the cost of the public good in the hope that others will pay for the cost instead. The free market is not producing efficiently because the properties of nonrivalry and nonexcludability allow users to enjoy the benefits without internalizing the costs of their consumption.

Government policy can be used to help ensure that the appropriate amounts of public goods are provided to a society. This can be accomplished through taxation to fund the goods or through other requirements such as mandated military service by young people. Government toll roads also provide an example of the government forcing the users of a public good (a road) to pay for its costs. Governments can also subsidize the providers of public goods.

Globalization is increasing the importance of global public goods. An essential example of this is the Asian financial crisis of 1997. Globalization made local financial stability important for countries on the other side of the world. The collapse of Thailand's financial system was a contagion that spread from east Asia to Russia to Brazil and to the United States. International cooperation will become increasingly important for providing global public goods such as financial stability.

Public Policy

ANY ANTIPOVERTY PROGRAM requires public policies to protect the aged, young, sick, and unfortunate. Low income, lack of healthcare, inadequate nutrition, substandard education, and inadequate housing or homelessness require effective public policy measures and adequate public expenditures. As programs for reduction of income inequality, public goods and services are general antipoverty programs most commonly found in the industrialized world. On the other hand, poor countries need first to adopt growth policies that are effective in reducing poverty. In the latter case, both macro and micro measures are necessary for an effective fight against poverty.

Worldwide, antipoverty programs focus on both micro- (sectoral) and macropolicies in the fight against poverty. Monetary policy should aim at ensuring growth and protect the real value of wages by focusing on inflation, interest rates, and exchange rates. Fiscal policy should focus on allocating adequate funds for the development of human capital and infrastructure, and protection of property rights to encourage private investment. It should also focus on the level of national debt and overall policies that promote both growth and more equal distribution of income for the bottom one-fifth of the income quintile.

In the United States, although the poor are persons of all ages, races, religions, and ethnic backgrounds, poverty is more commonly found along the lines of race, gender, and ethnicity. Since the 1930s, many federal and state programs and policies have been adopted to protect these groups. Fifty-three percent of all the federal expenditures go to income security programs. The programs include Social Security, Medicare, veteran and other retirement programs, and unemployment insurance. Temporary Aid to Needy Families, Supplemental Social Insurance, Food Stamp, Medicaid, Head Start, childcare and development funds, housing assistance and special programs for employment incentives are among the antipoverty programs the federal government provides to assist the poor.

Despite these efforts, the United States has the largest population of poor among the 27 Organization for Economic Cooperation and Development (OECD) countries. Comparison of the Gini coefficients (a basic measure of concentration of income that shows the share of income by population quintiles) for 2000 indicates that the United States has the fourth largest concentration of disposable income among the top quintile of its population, after Mexico, Turkey, and Poland.

According to a survey of the OECD countries, in the United States public opinion is not in favor of government action to reduce income inequality. The OECD computations show that from the mid-1970s to mid-1980s, the United States had a moderate increase in income inequality, as it did from the mid-1980s to mid-1990s, along with six European countries; and from the mid-1990s to 2000, it remained constant for the United States and nine European countries.

In the United States the income share of the top one percent of the population grew substantially after 1980, and it reached 34 percent of the top 10 percent during 1986-97. The United Kingdom and Canada both fell well below these levels during this time. France not only fell below all these countries in these years; it even experienced a decline in concentration at the top from 1988 on.

Although the Gini coefficient shows a great deal about income inequality, care should be taken to interpret it correctly. One limitation of the Gini coefficient is that it provides an aggregate measure of income inequality. We need to examine the income data for different population quintiles in order to better understand the trends in income distribution and poverty. We should not jump to the conclusion that because the Gini coefficient is lower in a country compared to another that the lowest fifth of the households has a greater percentage of income. Comparison of shares of income quintiles provides more detailed data on distribution of income and thus a measure of relative poverty.

When the relative poverty rate (individuals with income less than 50 percent of the median for the entire population) is used for comparing the OECD countries, the United States has the second highest position after Mexico, and nearly twice the average for the OECD countries. When the thresholds move to 60 percent, the United States has the second highest relative poverty rate among the OECD countries after Mexico.

The size of the income transfer that is required to raise all those in poverty up to the poverty threshold of 50 percent of the median equivalent disposable income for the United States is nearly twice the requirement for the OECD average.

Income inequality among the population of working-age people also places the United States among the highest countries, after Turkey and Mexico for the mid-1980s, mid-1990s, and 2000.

An analysis of the distribution impact of the tax and transfer system for 13 OECD countries shows that these programs do not heavily target lower-income groups, except in Australia. Yet these data show that transfers constitute a large share of disposable income in the bottom deciles of the population in these countries. Also transfers as a percentage of share of income have increased substantially for all countries, except Belgium and Germany.

ANTIPOVERTY PROGRAMS

Antipoverty programs in the United States include income-security programs, public assistance, special services, and tax credits to assist low-income individuals and families. In addition to these programs, the federal minimum wage and earned-income tax credit have been enacted to improve income distribution and assist the

The federal welfare entitlement program was established in 1935, which created a welfare system that included cash payments, medical care, and food stamps. The Personal Responsibility and Work Opportunity Reconciliation Act of 1996 fundamentally transformed the American welfare system.

The most important change was the elimination of cash welfare payments. Instead, two grant programs were introduced to provide funds to states for cash payments and other benefits to help families to support their children while seeking work, and also to encourage the formation and maintenance of two-parent families. Temporary Assistance to Needy Families (TANF) replaced the old system to reduce dependency on welfare and encourage work.

TANF is a federal program that provides grants to states to assist the poor. After 1996, TANF replaced Aid to Families with Dependent Children (AFDC) and Emergency Assistance (EA), which provided temporary assistance to needy families, and an employment and training program (JOBS), which assisted AFDC recipients. The average monthly payments paid to the needy families vary substantially from state to state.

Supplemental Security Income (SSI) is part of the Social Security program. SSI is a federally funded program that provides cash transfers to the aged, the blind, and the disabled, who qualify by a means test. Most states supplement the basic federal payments to these individuals. Therefore, the payments vary with their income from other sources.

MINIMUM WAGE

During the Great Depression, in an attempt to protect low-skilled workers from poverty, the National Industrial Recovery Act (NIRA) was passed in 1933. In 1935, the U.S. Supreme Court ruled NIRA unconstitutional. However, the Fair Labor Standards Act of 1938 established a national minimum wage of \$0.25. The act applies to 90 percent of all workers who are not employed in supervisory jobs.

Since 1979, some states have adopted living wages to raise the minimum wage above the federal level. As of 2005, 15 states have adopted rates higher than the national rate. Minimum wage remains a controversial area of research among economists. Some suggest that it hurts the very same people the law intends to protect, while others refute this conjecture and provide counterevidence.

Many economists remain concerned about the effect of the minimum wage on employment of low-skilled labor. When states adopted living wages that were 50 percent to 200 percent higher than the current minimum, 71 percent of economists believed it would decrease the number of hires, and 68 percent of respondents said it would cause companies to hire workers with better skills or experience. The survey was conducted for the Employment Policies Institute in Washington, D.C. However, a study for New Jersey has shown that a higher state minimum wage did not adversely affect low-skilled labor.

The structure of the minimum wage is different in some European countries. For example, England offers three tiers for minimum wage, which varies by age. Under this program, families headed by low-wage earners are likely to receive the higher rate. For the last three years, the Commission of Low Wages has been investigating the need for raising the minimum wages. If the commission implements the expected raises, they will become effective in 2005 and again in 2006.

EARNED-INCOME TAX CREDIT

The U.S. Earned-Income Tax Credit (EITC) at the federal level has been more effective than the minimum wage or living wages in lifting many individuals, including many children, from poverty. It also has encouraged able workers to work.

The Earned-Income Tax Credit is one of the most significant antipoverty programs in the United States. More than five million working families were lifted from poverty when this program was greatly expanded in 1993. This program was first introduced in 1978. The number of families receiving EITC grew from 6.2 million in 1978 to 18 million in 1996. Average credits per family grew from \$200 to \$1,400.

Through this program, nearly 20 million individuals have been removed from the tax rolls. This program can, in effect, increase the nominal value of the minimum wage by nearly 40 percent. EITC has been a more important policy than the minimum wage for lifting the poor from poverty. A large number of states have supplemented the federal credit. Recently, some states have substantially expanded their EITC. These measures are effective in reducing poverty. However, variations among states create inequities (and inefficiencies) that need attention. States' Earned-Income Tax Credit and most other antipoverty programs that states provide are piecemeal in nature. There is a need for examining a constellation of these policies to evaluate their overall effectiveness.

HEALTHCARE

Poverty and poor health create a vicious cycle. Poor health is a cause of ill health, and ill health is a cause of poverty. Poor health, malnutrition, and high birthrates are the main reason for many households becoming poor. In the Western world, many believe that every individual, regardless of income, should have adequate access to healthcare, and therefore they view medical care differently from many other commodities.

In the United States, federal and state governments play a large role in the healthcare system. Medical expenditures represent the third largest government spending. The challenge of a large population of uninsured people, increasing longevity, rapidly rising cost of health services, and skyrocketing medical liability insurance costs require reforms that will determine the future course of policy in this area.

Medicare and Medicaid are two government programs to help the aged and poor in the United States, respectively. Federal government provides Medicare—healthcare for eligible individuals 65 and older and qualified disabled individuals. Medicare benefits include insurance for physician services and eligible hospital services. Effective in 2006, a new program for prescription drug coverage was implemented. This program requires a subscription payment and pays up to 75 percent of the fees allowed for these services.

Medicare is financed through a payroll tax of 2.9 percent that is paid as part of Social Security taxes the federal government collects. Medicaid, on the other hand, is largely financed by states to provide health insurance to low-income families with dependent children and to aged and disabled individuals. The federal government also subsidizes the Medicaid program. Cur-

rently, states and local governments jointly provide for up to 50 percent of these services.

Some economists believe that healthcare provides a merit good and therefore its social benefits exceed private benefits. This view is the foundation of public assistance for healthcare. Many also believe that no individual, regardless of his or her income, should be denied adequate care. Many developed countries provide a minimum level of care.

In low-income countries, governments face a fundamental challenge in providing healthcare. Most of these countries provide basic inoculations, doctor visits, and hospitalization. In the absence of adequate funding, they collect fees. However, many either lower their fees or waive them for the poor.

EDUCATION

Across the world, governments provide public elementary and secondary education. Education is the most important vehicle for lifting people from poverty and providing class mobility.

In the United States, public education is largely financed by local taxes at the school district level. Grants from the states, and to some extent from the federal government, supplement local revenues. State constitutions typically address the right of residents to equal public education. Yet more than 40 states have been challenged by litigation to provide equitable education. Variations in fiscal capacity of both school districts and states are challenges school districts face in delivering equitable education.

In recent years, many developing countries have been forced to collect fees for tuition, supplies, and uniforms to meet their shortfalls. However, many offer waivers or reduced fees to poor individuals.

HOUSING

In the United States, the government provides housing assistance through a myriad of programs. These programs include public housing as well as subsidized housing, mortgage and rent subsidies, and tax credits to developers who build mixed-income housing. Public housing programs in the United States have been greatly criticized for their disincentive effect and social disintegration, among other things. After the enactment of the Housing and Community Development Act of 1987, a new program was launched to provide coupons to low-income households that can be used to rent private housing rather than live in public housing. Cur-

rently, about two million families receive vouchers. Yet in some cities, wait lists are either long or completely closed. Many families cannot afford basic housing until they earn \$16,000. Without a housing voucher, many families would need about \$27,000 to make ends meet.

In the United States, the lowest income quintiles are likely to have housing problems. Nearly half of these individuals face a severe cost burden. In addition, many live in inadequate housing conditions. The supply constraint in the low-cost segment of the housing market is far lower than the demand. And the average rent for more than nine million units is about \$4,800, which is almost half the average annual income of low-income renters. It is clear that the stock of housing available for low- and moderate-income families is a critical factor in helping the poor and preventing homelessness.

Current rate of population growth and migration to urban centers in developing countries have created serious housing problems. The annual need of urban centers in developing countries is estimated to be near 35 million units during the first decade of the 2000s. The United Nations has developed a housing-right program to empower the poor and homeless and promote security of vulnerable groups. Estimates show that about 95,000 new urban housing units have to be built every day in developing countries to bring housing conditions to acceptable levels.

FOOD STAMPS

Many poor countries have food stamp programs to subsidize the poor. Government outlays for food subsidies range from one percent of the total outlays to as much as 17 percent. In some of the urban centers of these countries the amount of the subsidy exceeds 11 percent of the income of the poorest fifth of families. Subsidies in these countries are usually for basic staples, such as bread or wheat, that the poor need most. Some countries have a ration system for subsidized food to ensure a fair distribution of these essential staples, whereas some have a distribution channel for free or heavily subsidized food to reduce malnutrition among children and pregnant women.

EXPENDITURE IN OECD COUNTRIES

Countries with higher social expenditures as a percentage of their Gross Domestic Product (GDP) have been very successful in reducing their rates of poverty among children. In general, data show that Sweden, Norway, and Finland have the lowest child poverty rate.

In contrast, the United States has the lowest expenditures and the highest child poverty rate.

Compared to other industrial countries, public expenditures as a percentage of GDP in the United States are among the lowest. Considering nondefense expenditures, U.S. spending is particularly low in an international comparison.

MACROECONOMIC POLICIES

The most important factor in reducing poverty in the developing world is economic growth, although the experience has varied substantially. Only 60 percent of the countries that have reduced poverty also have reduced income inequality. Macroeconomic reforms should be supplemented by sector reforms. The level, composition, and quality of public-sector expenditures make a difference in winning the war against poverty.

The OECD Employment Outlook shows that while relatively few people experience continuous poverty, many have multiple years of income levels that do not rise above the poverty line. The profiles of households that have a lower-than-average risk of encountering poverty are strikingly similar. In general, the risks of poverty are higher for households headed by women, young, and single individuals. It is not surprising that a common adage is that "poverty has a female face."

Many researchers also measure poverty among the lowest quintiles in terms of their relation to other quintiles and adequacy of their disposable income—relative poverty. More specifically, relative poverty is a scale that is based on adequacy of total annual disposable income, adjusted for family size. Applying this scale, individuals are defined as being in poverty if their income falls below 50 percent of the median equivalent of disposable income in a given country. In this context, researchers have examined the intensity of poverty among different groups at a point in time and for multiple years. Applying these measures of poverty, researchers are now focusing on the dynamics of child poverty.

Public Welfare

PUBLIC AND/OR SOCIAL welfare is the mechanism for providing assistance to vulnerable populations. In the modern world, beginning in the 20th century, it is connected to individuals living in poverty, especially females and their children. As A. Orloff notes, gender roles and the sexual division of labor are profoundly linked to social welfare.

Beginning in about 1902, there were a variety of legal reforms enacted worldwide to establish minimum public health, housing, and work safety standards, which, in the United States, represented the first urban reform movement. At the same time, Nordic and European countries were working on and implementing similar types of reform. For Europeans, public welfare was related to questions about rights of full employment because individuals and governments believed that citizens had the right to be fully employed. John Maynard Keynes had suggested that all individuals who were capable of working should have the right of full employment—public welfare assistance was one process for moving people toward full employment.

Modern welfare has its roots in the Great Depression, which was a worldwide event, and began to be constructed in the 1930s through full-fledged government programs aimed at reducing the impact of poverty. Until the 1920s, various private institutions and foundations were responsible for providing assistance to the needy. As noted by B.S. Jansson, "those who must bear the brunt of social problems—individuals contending with poverty, discrimination, and disease—have depended in considerable measure not only on their personal and familial tenacity and on commu-

nity supports but also on the policies of public and nonpublic agencies and of federal, state, and local governments." These groups, for example, children, mothers, widows, and the elderly—of various racial/ethnic backgrounds—are the targets of social welfare policies worldwide.

FACTORS SHAPING PUBLIC WELFARE

As researchers have shown, there are a variety of contextual factors and political processes that shape social welfare policies and implementation, which include cultural, economic, social, legal, and other factors. Each of these factors can be used to reduce or expand the services available in social welfare settings.

In addition, political processes steer the direction of and limitations placed on public welfare so that policy enactment leads to service delivery or program implementation by governments at a variety of levels. In a democratic and/or civilized society, these policies should be based on the "first-order ethical principles, for example, not killing people, autonomy of target populations, freedom, honesty, confidentiality, equality, social justice, fairness, due process, and beneficence," according to Jansson. However, the current research on policies indicates that this is not often the case.

WELFARE MODELS

In 2006, a range of welfare systems exist whose goals are to alter social forces to attempt to produce greater equality among the people living in a state; however, some of the systems ameliorate the impact of gender inequality on poverty and others contribute to this inequality. The welfare state has been "conceptualized as a state committed to modifying the play of social or market forces in order to achieve a greater equality," wherein it is "operationalized as the collection of social insurance and assistance programs that offer income protection to those experiencing unemployment, industrial accident, retirement, disability, ill health, death or desertion of a family breadwinner, or extreme poverty," according to A. Orloff.

In many societies, equality may not be possible since societal structures give males more public power than females. Thus there is inherently a gender inequality in any public welfare system, which disadvantages women.

Much of the literature indicates that the implication of transforming a state to providing social welfare is linked to the symbolic transference of private patriarchy to public patriarchy, that is, it was used to promote the gender division of labor, with women being responsible for caregiving and household work, while men were held accountable for providing economic resources. This structure was supported along with a family-wage system and traditional marriage in the western European sense (nuclear family with father, mother, and dependent children).

Women's work in the household was seen as unpaid and, therefore, women's work had no economic status. If the male breadwinner left, the female householder most likely did not have skills to contribute to the working world and any wages she did earn were less due to "lack of experience," to quote Orloff. Interestingly, although social insurance was given to those individuals whose breadwinners were injured or died early in the development of the welfare state, there was considerable stigma attached to receiving these benefits.

Restructuring public welfare has focused on urban poor in industrialized countries.

At the start of modern public welfare initiatives, public welfare was, and still is, aimed at men and women differently. For women, public welfare is conceptualized in terms of social assistance (to aid in taking care of the family), but for men, public welfare is thought of in terms of social insurance (to allow men to make claims because they are workers in a market system). Thus public welfare was originally conceptualized as a way to support the male breadwinner through services such as pensions, workers' compensation, and unemployment insurance in the post-World War II era. Since women's work was not paid, it was not seen as part of the larger work/policy scheme.

In the 1960s the Nordic countries, Belgium, and France began a policy shift so that priority of family services and policies to make motherhood and careers compatible was acknowledged. Prior to that time care of children and elderly was seen as a family responsibility to be done by women whose primary work was within the household. During the 30 years from 1945 to 1975, welfare states were at their peak globally due to institutionalized "pay-go" models where "contributions paid by active workers are immediately used to finance the benefits to paid pensioners," according to M. Ferrara. These models promoted the concept that individuals had rights to a minimum amount of monies if they were in need.

According to Orloff, there are three basic types of regimes, which can be defined along with their impact on public welfare for women and their children. First, there are the liberal regimes of the United States, Canada, Australia, and Britain that "promote market provision wherever possible, [and] encourage social dualisms between the majority of citizens who rely mainly on the market and those who rely principally on public provision." These regimes do not offer people "alternatives to participating in the market for services and income" and do not effectively combat poverty and inequality issues relating to social welfare.

The second type of regime, the social-democratic system, "promote[s] significant decommodification of labor," explains Orloff. These systems, which are located in the Nordic countries, promote "an individual model of entitlement and provide services allowing those responsible for care work to enter the paid labor force," says Orloff. In other words, these systems encourage workforce participation by women and provide assistance in terms of childcare and/or elder care if these are necessary for people to continue their work in the labor market.

According to R.H. Cox, successful public welfare and/or welfare reforms are based on the "efforts to reward people for staying in, or returning to the labor force." The best reforms of this type are seen in Denmark, the Netherlands, and New Zealand, which all recently implemented new transformational welfare policies. These countries instituted comprehensive legal changes for public welfare, while Germany, a country that recognized a need for change, had authority only to make small changes in the policies.

Third, there are conservative-corporatist regimes that "condition their relatively generous benefits on strong ties to the labor market" but that also "promote subsidiarity," which increases women's dependence on their families (Austria, France, Germany, Italy, and the Netherlands), according to Orloff.

IMPACT OF PUBLIC WELFARE

Three groups, children, women, and the elderly, are impacted by public welfare differently. The consequence of public welfare on these individuals has to do with which model (noted above) a country employs when providing them with assistance.

According to some studies, children who are raised in poverty are at risk for living in poverty themselves, for being less educated, and for having poorer health than are children who are not raised in poverty. Children's poverty status is directly linked to the poverty level of their mothers. Public welfare is intended to change family characteristics that lead to and keep children in poverty. The Nordic countries, Belgium, and France have attempted to increase women's employment and caregiving options so that they can experience a decrease in poverty. Their programs are based on the idea that being an employed mother is the best way to decrease the risks associated with poverty for children. For many countries, the problems that arise lie in the lack of education, and thus work skills, for women. Without education and skills, it is problematic to effectively employ women. Countries that pay for or subsidize childcare for working women or women who are attending training to develop skills are those countries that tend to be women-friendly and have lower poverty rates for working women with children.

Thus Nordic countries using subsidies have reduced poverty quite successfully, while Anglo-Saxon countries that are driven by more affordable market services have not been as successful in reducing inequalities in public assistance and/or poverty levels for vulnerable populations.

In 2004, the largest group of poor was children in the United States, with 16 percent of them living in poverty. In the United States in 1935, the Social Security Act enacted a program called Aid to Dependent Children (ADC) to provide assistance when the breadwinner (thought of as a male) was no longer able to provide for his family.

In the 1970s, as the number of two-parent households declined—in 1996, 56 percent of the 71.5 million children in the United States lived in two-parent households—there was a rise in need for welfare programs and services. ADC went through a variety of iterations, and through the enactment of the Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA) in 1996 has become a different program, called Temporary Aid for Needy Families (TANF) in the United States. The goal of TANF is to "provide assistance for needy families to care for their children" and "end welfare dependence by promoting job preparation, work, and marriage," among other items. Available also for children in terms of public assistance for healthcare are Medicaid and Children's Health Insurance Program funds (CHIP).

For women, a variety of factors, for example, "the proportion of families headed by single mothers, the extent of women's labor force participation, and the degree of gender equality in the labor market," according to Orloff, dictate the benefits and impact of public wel-

fare has on women's poverty levels. Where there are more political opportunities for women (Germany and France, for example), social assistance is more developed for women and their children. As some studies note, restructuring public welfare has focused on urban poor in industrialized countries, thus adding another layer of inequality with urban-rural distinctions. In the United States in the 1980s, political concern centered on how to reduce dependent welfare mothers and make them work to be productive members of society. This concern was addressed in 1996 with PRWORA, which was one portion of welfare reform. PRWORA ended entitlement and devolved the program more completely to the states, while detailing specific timelines for people to be welfare recipients.

Aging populations have fared very well and their poverty levels have decreased.

In other words, the United States was attempting to move more in line with the European ideas of full employment. In order to participate in public welfare programs, work is mandated for women who need assistance in the United States. Thus welfare reform was comprehensive in the United States, emphasizing work and/or marriage for women; however, reform took place in Europe, Australia, and New Zealand as well.

The impact of poverty on the elderly was a critical consideration in developing and implementing public welfare reform in the United States and other countries. By 1935, people aged 60 or older could not expect to be supported by their children or families as they aged. Thus the U.S. Social Security Act (enacted in 1935) was a relief to older individuals because it provided a savings program for the elderly based on their salaries.

The downside to the Social Security Act was that originally it did not provide for individuals who did not make a taxable living wage. In 1972, the Supplemental Security Income act was passed, which provided assistance to seniors who did not have the advantage of Social Security benefits because they and/or a spouse had not paid into that system. In the 1990s, welfare reform was able to cover approximately 82 percent of the elderly in the United States who were living in poverty. Welfare reform in other countries indicates that aging populations have fared very well and their poverty levels have substantially decreased.

In Latin America, public welfare for the aging population focuses on pensions and pension reform. Work-

ing individuals are responsible for contributing to a savings account to develop their pension. There has been a move to develop a multipillar approach that has individuals using pay-go systems, individual savings accounts, governmental contributory accounts, or a combination thereof. The multipillar approach is mandatory for individuals who make over a certain amount of money and appears to be effective for individuals who are fully employed before they retire.

In summary, modern public welfare is aimed at encouraging women to be either working members of society or married members of society to decrease their poverty levels. Australia, Europe, New Zealand, the Nordic countries, and the United States are all attempting to reduce poverty levels for children, women, and the elderly by using one of three implementation and economic models.

In 2006, although all of these countries have undergone public welfare reform of some type in the past 10 to 15 years, the countries that use a social-democratic public welfare system seem to be able to lower poverty levels by providing the most rewards for encouraging vulnerable populations to enter and continue being members of the workforce.

Qatar

QATAR IS ONE OF THE Persian Gulf states, meaning it depends on exporting oil as a major source of gaining hard currency. Industrialization has a limited share of the Gross National Product of Qatar and oil revenues make the living standard high, especially among nationals. On the other hand, some poor among expatriates live in bad conditions, as a wide gap in the standard of living exists between the nationals and noncitizens in Qatar.

The poverty status in Qatar is related to the large number of foreign laborers, reflecting the status of poverty in some Asian countries that send their labor to the Gulf states, such as Qatar. The first survey on poverty in Qatar was conducted in 2005. Studies revealed that Gross Domestic Product per capita annual income was \$23,000, nearing the level of many western European countries. Earnings versus the affordable essentials, using prices that prevailed in the local market in 2001–02, showed that technically there are no poor people in Qatar.

Another study on poverty conducted by the National Planning Council (NPC) in 2005 found that five to nine percent of expatriates in Qatar live in poverty-

like conditions. The survey also found that no Qataris live below the poverty line, although 3.3 percent were found surviving with little more than what was set by the international poverty standards. However, according to data provided by the Zakat Poor-Due Fund, the number of families applying for Zakat Poor-Due has increased threefold over the last four years, and in 2004, 2,500 families were found to be needy.

According to the U.S. Central Intelligence Agency, Qatar has been ruled by the Al Thani family since the mid-1800s, and "transformed itself from a poor British protectorate noted mainly for pearling into an independent state with significant oil and natural gas revenues. During the late 1980s and early 1990s, the Qatari economy was crippled by a continuous siphoning off of petroleum revenues by the emir, who had ruled the country since 1972. His son, the Amir Hamad bin Khalifa Al Thani, overthrew him in a bloodless coup in 1995. In 2001, Qatar resolved its longstanding border disputes with both Bahrain and Saudi Arabia. Oil and natural gas revenues enable Qatar to have one of the highest per capita incomes in the world."

Quran Definitions of Poverty

THE QURAN IS THE DIVINE book of Islam that contains the tenets and religious laws upon which the faith of Islam is founded and is also the source of its morals and ethics. It was sent from God to Prophet Muhammad about 1,440 years ago.

The Quran pays intense attention to poverty and poor people: it established a formula for poverty alleviation based on Zakat, or "poor-due." The Arabic word Zakat, which literally means "purification," has no actual and precise English equivalent; the term nearest to its meaning is "poor-due."

Zakat, the fourth of the acts of worship in Islam, is thus the Muslim's worship of God through an obligatory form of giving to those in need. It is assessed at approximately 2.5 percent per year on cash or capital that is beyond one's immediate needs. The Quran thus seeks to raise the standard of the poverty-stricken and to lower the standard of those who are given to excess, so that the life of all may become happier and more orderly. In addition, it is not confined to the peoples or religion of Islam, but rather is universal, incorporating all the downtrodden of humankind.

The Quran does not consider poverty a reason for despising a man, for a poor man, even in his need, may be superior in the eyes of Islam to men of wealth and authority. This consideration gave the poor their first consolation. When Islam first examined the lot of the poor, it discovered that poverty was caused by an inability to earn, either because of some handicap or because of the absence of an opportunity to work.

As Muslims believe in the afterlife, the Quran introduces different kinds of poverty either in life or in the afterlife. The poor in life are those needy people who

have a very low standard of living. Also, the poor in life are those people who are disobeying the Quran's instructions and obligations. Those people will suffer and be punished in the afterlife, becoming the poor in the afterlife. In other words, those disobeying will not benefit from the promise of further rewards in the afterlife.

The Quran wards off poverty by preaching virtuous behavior. It curbs the forces of evil and vice through law and reason. If its methods were more widely employed to crush evil and vice and to propagate virtue and goodness, the Islamic family would cohere and every member would realize his duty and moderate his desires. This would constitute one of the most effective weapons for resisting poverty, for the greatest causes of poverty are excessive cupidity, indulgence in vices, and neglect of the body's health and of the religious decrees, which are designed to regulate both body and spirit. The Quran has fought the ills of poverty through awakened consciences and legislation and has made work the basis of its aims. Giving money to the needy is not the only solution for poverty, according to the Quran, and is not the best solution either. Work is one of the main bases or ways of eradicating poverty.

Islam has established the principle of equality, the greatest of principles for resisting social evils, particularly poverty. It has planted this principle in the conscience of the Muslim and has caused it to govern his actions in his worship and in his social conduct.

Fighting poverty, according to the Quran and Islam, is related to some other values like solidarity, work ethics, "poor-due," equality, and justice. Moreover, the economic policy in Islam is divine in its source and positivist in its practice. Thus it is a stable and developing policy at the same time.

The Muslim would not be a Muslim if he doubted that the poorest and most incapacitated of his brethren shared equal rights with him. This justice is what makes almsgiving to the needy a duty of those capable of providing for them, not a favor.

Racial Discrimination

RACIAL DISCRIMINATION, also known as racism, is the practice of limiting people's rights and privileges based on their phenotypic appearance as members of particular groups called races. Some common racial categories are black, white, yellow, red, Caucasoid, Mongoloid, and Negroid, and racial determinants can include skin color, nose shape, and hair texture. Often ethnic affiliation, family lineage, national origin, and cultural practices are also used to determine race. It is important to note that while the impact of racial discrimination is concrete, the scientific basis for human racial classification is spurious—all people share a common origin and belong to only one race, human.

Racial classification and discrimination are relatively new ideas within the scope of world history and are the result of an intentional and systematic process developed by Europeans and European Americans meant to justify their enslavement and colonization of Africans, Asians, and Native Americans over four centuries beginning in the 1500s.

Much of what we consider modern racial discrimination is rooted in European and American intellectual thought dating from the 17th through the 19th centuries. British scholar Martin Bernal has shown that as 18th-century Europe became more powerful through its increased economic and industrial strength and its expansion into and exploitation of other continents, it also became more chauvinistic. Many intellectuals asserted that by progressing later in history, European-descended civilizations were necessarily superior to prior civilizations in Asia, the Middle East, and Africa because they were able to improve upon them.

Further, this idea of progress became intertwined with racist thought and expressed in the writings of people such as Oliver Goldsmith, a popular writer of the 1770s, who wrote that "those arts which might have had their invention among other races of mankind have come to their perfection [in Europe]." From the 1650s on, scholars and writers like John Locke, David Hume, Kristophe Heumann, C. Meiners, and J.F. Blumenbach espoused racist theories justifying the exploitation and

murder of non-Europeans. Blumenbach, a natural history professor at the University of Gottingen in Germany, claimed that white or Caucasian was the first and most talented race from which all others had degenerated (Blumenbach was the first to publicize the term Caucasian in 1795).

Types of chauvinism are characteristic of many civilizations throughout world history. This European development, however, is the first time that race, rather than religion, geography, or kingdom, played the central feature. Even though some writers, such as Winthrop Jordan and Carl Degler, assert that racial discrimination is an ancient tendency, the historical record clearly indicates that prior to the 17th century, advanced civilizations were widely recognized and credited for their achievements whether in India, Europe, China, or Africa. Race, then, was a mechanism by which a modernizing Europe and America could fabricate their superiority on the basis of an exclusive and relatively permanent feature—white skin. By organizing race into an hierarchy with white at the top, members of the white race could believe that they were naturally inclined to dominate members of other races; that is, that white supremacy was the "natural order of things."

Members of the white race benefit from white supremacy even if they are not bigoted.

While racial discrimination can take many forms, scholars such as Theodore Allen, Lerone Bennett, Joe Feagin, Neely Fuller, Frances Cress-Welsing, and Eric Williams have identified white supremacy as the archetype for racial oppression. Where racial discrimination is conceptually applicable to many groups in several instances, that is, one can imagine cases where nonwhites discriminate against whites; most racial discrimination occurs in the context of white supremacy. Neely Fuller points out that white supremacy is not simply a pattern of individual bigotry or even its institutional practice but that it is a determined systemic effort to establish, maintain, and expand white domination and world control over nonwhite people. Furthermore, it is important to note that members of the white race benefit from white supremacy even if they are not themselves bigoted, because it is a system organized to ensure unjust power and undue privilege to a group of people based on a readily identifiable marker, skin color.

Although Arab Muslims captured and used Africans for laborers and domestic servants from the 700s,

the European institution of chattel slavery did not take hold until the 1500s. At that time, the Portuguese had captured the west African island of São Tomé, planted sugar, and begun a sugar-slave complex that would last for over three centuries. During the 16th century, while the Portuguese exploited portions of Africa and Brazil, the Spanish conquered much of South and Central America, concentrating on procuring precious metals, mainly gold and silver, from the New World.

This mining required vast amounts of labor, more than what it could force from the indigenous populations it had not already killed. As a result, Spain joined Portugal as one of the main slaveholding nations during the 16th century.

Some countries, such as the United States and South Africa, fostered racial antinomies.

By the 18th and 19th centuries, both Spain and Portugal would lose their economic and military strength and thus their ability to control trade. In their absence, the Dutch, British, and Americans took up the increasingly lucrative trade in enslaved Africans. Throughout the 20th century, racial discrimination remained problematic, despite efforts to promote racial equality and democracy in some countries such as Cuba and Brazil. In contrast, some countries, such as the United States and South Africa fostered racial segregation and erected barriers to racial democracy.

SOUTH AFRICA

During the 1600s, the Dutch East India Company established a trading outpost in Cape Town, South Africa. Over time this mixture of Dutch, German, and French settlers known as Boers spread smallpox epidemics, waged war, and forced indigenous African groups farther and farther from their homelands. Characteristic of all European colonial incursions in Africa, ethnic groups were divided against one another by a system of favoritism, deceit, and force, thus making it easier for the Boers and later, the British, to conquer them and expropriate their land. More heavy-handed approaches were also used.

For example, after forging a successful African confederacy and defending against a British takeover, a Xhosa leader named Hintsa was lured into a negotiating session with British officers, captured, and then murdered. European settlers justified their actions by call-

ing what they did "civilizing missions" meant to pacify African "savages" by forcing European culture and Christianity on them.

Throughout the colonial period many indigenous South Africans were enslaved on their own lands while the European colonial settlers reaped the profits of their labor. By 1909, after years of fighting over territory, the Boers (also called Afrikaners) and British colonists agreed to establish an independent state based on a national policy of segregation and white supremacy. The new South African government did everything in its power to enforce racial discrimination, including passing many laws aimed at excluding indigenous Africans from wielding any power whatsoever. One of the most pernicious laws was the 1913 Natives Land Act, which divided the country into areas based on race. This act allocated 13 percent of the land to native Africans, who comprised 84 percent of the population, while giving the rest to the white settlers.

By 1948, the Afrikaners' National Party managed to win control of South Africa. They instituted a policy of apartheid, an Afrikaans word meaning "separateness," and proclaimed that the indigenous African population was innately inferior to the settled European one. Afrikaners then enacted laws, many patterned directly after Jim Crow laws in the United States, to further deprive indigenous people of their rights. Among these laws was the Bantu Act, a consolidated version of the pass laws that had existed in many forms since 1809. This act required every African to carry a reference book containing all his personal information in order to work, travel, or simply move about the country. It placed such tremendous restrictions on indigenous people that it became one of the catalysts spurring the resistance movement against white supremacy that eventually succeeded in bringing down the apartheid government in 1994.

In contrast to South Africa, the African population of the United States was kidnapped, enslaved, and forced into labor under the system of chattel slavery for over 200 years. From its colonial roots to its national founding, the United States orchestrated a system of *de jure* racial enslavement that would not only deny African-descended people any rights but also compromise their humanity.

Reflecting the needs of a burgeoning capitalist economy, the U.S. Constitution made allowances for enslavement in order to protect the property and wealth of rich white businessmen and landholders. For example, Article 1, section 2 allowed enslaved African Americans to be counted as three-fifths of a person in order

to apportion taxes and to increase the representation and therefore political power of southern slaveholding states.

Even though there were people, black and white, who spoke out against racial discrimination in the early days of the nation, most white Americans had little issue with the system of white supremacy, which allowed them to secure and maintain unjust power and undue privilege. It was not simply a southern plantation phenomenon; widely respected men such as William Penn, Thomas Jefferson, George Washington, and Benjamin Franklin held African Americans in bondage. In fact, white supremacy had become so much a part of America that in the 1857 case Dred Scott v. Sandford, it became law. Writing the majority opinion for the Supreme Court, Chief Justice Roger Taney, himself a slave-holder, declared that African Americans were "unfit to associate with the white race, either in social or political relations and so far inferior, that they had no rights which the white man was bound to respect."

RECONSTRUCTION

Following the Civil War, America experienced Reconstruction (1865–77). As a result of the Thirteenth, Fourteenth, and Fifteenth Amendments, African Americans made rapid progress in business and politics. Some were elected to local, state, and federal posts while others took advantage of a better social and economic environment. By the end of 1865, 40,000 African Americans in the South were cultivating their own crops on their own land, many who had reunited with family and friends to make a better life. In addition, the United States Congress created the Freedmen's Bureau, an agency that assisted emancipated African Americans to obtain land, enroll in schools, settle legal disputes, and gain access to social services.

However, President Andrew Johnson sabotaged the bureau's work by ordering the land of thousands of former Confederate soldiers restored, land that had been given to African Americans as compensation for slavery. The result was the advent of sharecropping, a system of wage slavery that forced African Americans to work for the same white southern landowners who had enslaved them. When, in 1877, the Hayes-Tilden compromise withdrew the federal troops protecting African Americans in the south, Reconstruction and the dreams of many African Americans collapsed completely.

At the turn of the 20th century all across the south, most African Americans were barred from voting in ad-

dition to being shut out of employment sectors and denied equal access to quality housing and education opportunities under a system called Jim Crow. Moreover lynchings were pervasive and violence against African Americans was so common that the summer of 1919 became known as "the red summer." One of the most infamous lynchings occurred in 1955 when Emmett Till, an African-American teenager from Chicago, was visiting relatives in Money, Mississippi.

On a dare, Till bought candy at a grocery store and said "Bye, baby," to Carolyn Bryant, the store owner's wife, after making his purchase. Till was subsequently kidnapped, tortured, and murdered by Bryant's husband and brother-in-law. An all-white jury found the two not guilty (the two would confess to the murder the following year but would escape justice even then). Emmett Till's murder galvanized the African-American population and expanded a growing civil rights movement in America.

CIVIL RIGHTS

By mid-century, African Americans were transforming the nation. Leaders such as Ella Baker, Bob Moses, Martin Luther King Jr., and Fannie Lou Hamer worked to end racial injustice in organizations such as the Student Non-Violent Coordinating Committee (SNCC), the Southern Christian Leadership Conference (SCLC), and the National Association for the Advancement of Colored People (NAACP). The civil rights movement organized massive support from forward-thinking and acting people of all ethnic groups to end voting restrictions, employment obstacles, and discriminatory housing policies.

It was, in many instances, a movement guided by youthful enthusiasm for a better tomorrow and an adamant refusal to accept injustice. In essence, the movement was exemplified by the actions of four North Carolina Agricultural and Technological State University freshmen who, after debating the idea for months, decided to challenge the system of racial discrimination at the local Woolworth store. On February 1, 1960, Ezell Blair, Jr., Joseph McNeil, Francis McCain, and David Richmond sat down at the "whites only" lunch counter and demanded that they be served. Although they were not waited on, news of their actions spread quickly and within a week students all over the south were demanding that "whites only" facilities be desegregated immediately.

During the 1950s and 1960s, progressive Americans demonstrated against and demanded an end to all ves-

tiges of racial discrimination. Although the civil rights movement was making progress, many problems still faced African Americans including, widespread acts of bigotry, police brutality, and unequal access to public accommodations. Perhaps even more debilitating were discriminatory practices that denied African Americans access to basic needs.

For example, realtors and homeowners used restrictive covenants and redlining to effectively exclude African Americans from "white" neighborhoods and segregate them into urban ghettos. Residential segregation resulted in educational imbalances and inferior schools, limited access to social services, and restricted employment opportunities in both the private and public sectors. In addition, millions of citizens in the south were denied the franchise because of race. However, in what is often seen as the crowning legislative achievement of the civil rights movement, African Americans were able to organize and demand that their right to fair political representation be secured. In 1965, their demands were met when President Lyndon Johnson signed the Voting Rights Act into law.

BLACK POWER

Unfortunately, white supremacy and racial discrimination persisted whenever and wherever close-minded whites could muster the support of reactionary sentiment. Understandably fed up with this racial discrimination, large numbers of African Americans shifted to a more aggressive form of social protest. This Black Power movement called for African Americans to determine their own course in charting freedom rather than wait for government agencies to create agencies or enact laws that would slowly ameliorate the situation. However, as many government agencies, employers, and private citizens took every opportunity to deny equality to African Americans, frustration grew.

On August 11, 1965, in the predominantly African American neighborhood of Los Angeles called Watts, the calm would break. After a prolonged stormy relationship between the community and local police, a traffic stop turned violent, resulting in a riot that lasted six days and became the touchstone for similar riots all across the nation.

At the dawn of the 21st century, many people feel that racial discrimination has largely been eliminated. However, daily news stories reveal that people of color are still singled out for racist practices in employment, education, housing, and police brutality. Moreover, as M. Oliver and T. Shapiro have demonstrated in their

book *Black Wealth/White Wealth*, disparities in income, education, healthcare, and housing continue to persist.

Whether or not it is possible to eliminate racial discrimination remains to be seen. Many prominent scholars such as Derrick Bell and Joe Feagin believe that it is a permanent feature in the social fabric of America and the world. Clearly, no matter what one's belief, there is still much work to be done if we are to move closer to Dr. Martin Luther King's dream of a world where people are judged not by the color of their skin but by the content of their character.

Rationing

RATIONING IS THE authoritative reallocation of scarce resources of goods and services. The authority may be a parent or family member, an officer in a private organization, a military officer, a government official, or some other kind of authority. Rationing allows a person or an agency to receive a ration. If it is food, then the ration is a share of what is available. It is not necessarily enough to meet the needs of the person receiving the ration.

Ethics is a major part of the activity of rationing. The question of what is fair or just or equitable is at the heart of rationing. Capitalist economists argue that markets should be the authoritative mechanism for allocating resources. The net effect when markets determine the reallocation of scarce resources is that those

who have the resources will be able to get what they want, but those who are poor may not get a ration no matter how grave the need. In times of sufficiency the market works well. In times of scarcity it can allow hoarding and distortions in distribution so grave that people suffer, sicken, or even die.

Rationing in a market economy usually occurs though the pricing of goods and services. However, in an unfettered market in times of supply shortages, speculative demand, panic buying, or hoarding may drive the price to extremes. In cases such as these, governments have resorted to price controls as a form of rationing. In some instances the price control is a likely market value and merchants who exceed the limit may be prosecuted for gouging the public.

COMMAND ECONOMIES

Nonprice mechanisms for rationing can be used. One of these is the use of long lines. This was the mechanism used in the United States during the Arab oil crisis in 1973.

In command economies the central authority allocates the resources according to its plan. A command economy does not guarantee that resources will be equitable any more than a market economy guarantees that some "invisible hand" will guide the trading of the marketplace to a harmonious conclusion.

Command economies ration according to the interests of the ruling elite. If their principle is a form of distributive justice, then the rations that people receive will be approximately equal. However, this may not be fair. The reason is that the needs of people vary, often enormously. For example the amount of food needed for a young active athlete or soldier is many more calories per day than it would be for a sedentary octogenarian. Consequently command economies usually ration according to matters of political expediency even if the distribution seems to be based upon an equitable principle.

In times of war or severe civil distress caused by natural disasters or supply disruptions, market economies have resorted to rationing by different kinds of regulations. The military often uses rationing in order to make supplies last for the duration of a battle or a voyage.

During World War I and World War II, rationing was often used. The public was given coupon books for just about every good or service available, from sugar to automobile tires. In general these policies worked well. Such things as clothing swap shops and regulations to

control the styles of clothing in order to save cloth were patriotically received by the public, desirous of doing its part for the war effort. Rationing often leads to black markets where goods and services are sold at a price that is whatever the traffic will bear.

The concern of many in rationing situations is that the poor will have to bear a greater burden of the sacrifices. In the world situation in the 21st century, there have been potential situations that could produce rationing and have a severe impact upon the poor. The areas of concern include energy, health, water, education, and others. In the case of water rationing the expansion of population and industrial water usage has limited supplies in times of drought.

More of concern is energy rationing. The growing consumption of fossil fuels, especially oil and natural gas, has contributed to supply problems and possibly to a greenhouse effect. The oil supply problems are as much related to political instability in oil-producing areas as they are to great increases in demand. Governmental efforts to limit consumption are also motivated by worries about greenhouse gas emissions. The rising costs could affect not only transportation but food supplies.

Probably of gravest concern is the rationing of health services. Rationing in this area arises first from the growing healthcare costs of an aging population in the industrialized world. Rationing of medical care, which leads to the most severely ill dying, is a very cost-effective form of rationing. Limiting medical treatment so that cosmetic medical care is denied is another form of rationing. The gravest form of medical rationing could come during times of a pandemic, such as an influenza outbreak like the Spanish flu in 1918. Shortage of vaccines or of medical facilities could be devastating for the poor.

Rawls, John (1921-2002)

REGARDED AS ONE OF the most important social philosophers of the 20th century, John Rawls was born in Baltimore, Maryland. He attended the Kent School in Kent, Connecticut, and earned a B.A. from Princeton University in 1943. Serving in the U.S. infantry from 1943 to 1945, he had tours in New Guinea, the Philippines, and Japan. He returned to the United States in 1946 to attend graduate school at Princeton, receiving his Ph.D. in philosophy in 1950.

He taught at his alma mater for two years before accepting a teaching position at Cornell University. He was an assistant and associate professor there from 1953 to 1959, then was professor of philosophy at the Massachusetts Institute of Technology from 1960 to 1962. He joined the Harvard Philosophy Department in 1962. His 1971 groundbreaking work, A Theory of Justice, was nominated for a National Book Award. He was appointed the Conant University Professor at Harvard in 1979, allowing him the freedom to more fully develop his ideas on social justice and fairness.

He responded with a number of other important works, including Political Liberalism (1993), The Law of Peoples (1999), Collected Papers (1999), Lectures on the History of Moral Philosophy (2000), and Justice as Fairness: A Restatement (2001). Rawls received the National Humanities Medal from the National Endowment for the Humanities in 1999. He suffered the first of several debilitating strokes in 1995, but continued to work out his ideas until his death from heart failure in his home in Lexington, Massachusetts.

Rawls used A Theory of Justice to refine the theory of the social contract forged by thinkers like Jean-Jacques Rousseau and John Locke. Individuals in their "original position," or natural state, most social philosophers argued, created a social contract. (It should be noted that these ideas were theoretical rather than historical in nature.) This contract defined the rights and obligations of all members of a given community or society. While some argued that the strongest and most talented in such a society would fare better than those who were weaker or less fortunate, Rawls's thoughts on the social contract were predicated on a "veil of ignorance"—that is, the representatives in this social contract should design laws without specific knowledge about their constituents' intelligence, wealth, or other factors. This, he argued, was the best way to ensure true fairness.

These representatives would also desire justice, and would use two guiding principles (which he collectively called "justice as fairness"): liberty and difference. The liberty principle would provide all citizens with a satisfactory number of basic rights—as many as the society could allow. While different rights might be added or subtracted for the purpose of gaining the most satisfactory collection of rights, this principle was absolute and could not be violated. The difference principle would study all of society's inherent inequalities and design laws or systems that benefit the least powerful social group.

Some inequalities, such as differences in pay, were still beneficial for society, so long as the skills of the better paid, such as doctors and lawyers, were available to all. Rawls also developed the idea of the "maximin" (or maximizing the minimum). A theoretical example of the application of Rawls's ideas might be found in a society's contemplation of the institution of slavery based on race. Ignorant of the race of one's family or friends (veil of ignorance), desiring to protect basic liberties (liberty principle), and working to defend the rights of any marginalized race (difference principle), the idea would be soundly rejected. Any rational person would avoid living in a society where s/he might be enslaved, and would seek out one where s/he would be most free. Rawls's later works refined his concepts of justice, considered the long-term viability of the system he advocated, and addressed his critics.

PAUL HILLMER CONCORDIA UNIVERSITY

Reagan, Ronald (Administration)

RONALD REAGAN CAME TO office in 1981 promising moral reform, tax cuts, smaller government, and deregulation of industry. He also promised to be tough on crime and restore American supremacy in the world.

Reagan helped Republicans capture control of the Senate for the first time in 28 years. During Reagan's first 100 days he had several accomplishments. When PATCO, the government union that represented air traffic controllers, went on strike, Reagan fired the controllers and then spent \$1.3 billion to hire and train new controllers. Although PATCO was one of two government unions that supported Reagan during the campaign, he wanted to make the point that there were limits to the power of federal employee unions and also show businesses that the administration could be tough on workers. He survived an assassination attempt on March 30, 1981, by John Hinckley, a deranged fan of movie actress Jodie Foster.

Reagan concentrated on fixing the economy during much of his first term. He instituted several draconian measures to deal with stagflation, a new phenomenon consisting of a slow economy and inflation. Reagan supported raising interest rates to tighten up the money supply. It drove down prices, but created a severe recession.

He then demonstrated his faith in supply-side economics by drastically cutting taxes in an effort to boost investment. Reagan convinced Congress to pass a series of across-the-board tax cuts reducing income taxes by 25 percent over a three-year period. To offset this measure he slashed \$41.5 billion from unpopular programs designed to help the poor and minorities. He made deep cuts into food stamp, student aid, public-service job, student loan, and mass transit programs.

By 1983 the U.S. economy staged a comeback, as inflation dropped to 4.1 percent by 1988. The unemployment rate fell from 7.5 percent to 5.3 percent as more than 16,753,000 new jobs were added to the economy by 1988. Reagan's promised reductions in spending never materialized, as he engaged in the largest peacetime military buildup in history, spending more than \$1.2 trillion on military expenditures during his eight years in office.

To pay for this massive buildup Reagan borrowed heavily, increasing the deficit to \$207.8 billion. By 1988 the yearly deficit was at \$155 billion, as Reagan had created the largest deficit in American history to that point, more than three times its size when he came to office in 1980. While the economy improved, the gap between the wealthy and poor increased dramatically as the wealthiest two percent of the nation saw more of the nation's wealth concentrated in their hands. The poorest 20 percent of Americans experienced a six percent decrease in their income. Meanwhile the top 20 percent saw an unprecedented 20 percent increase. Dur-

In restructuring the economy, Ronald Reagan made deep cuts into food stamp, student aid, student loan, and mass transit programs.

ing Reagan's years, the top one percent experienced a doubling in their after-tax income. By 1989 the top 20 percent earned as much as the other 80 percent combined, and the top one percent earned as much as the middle-fifth of the population. This upward redistribution of wealth was caused by the tax cuts and economic displacement in manufacturing. The top tax bracket was reduced from 70 percent to 31 percent.

This economic disparity was most obvious when looking at actual wealth. Between 1983 and 1989, family wealth increased from \$13.6 trillion to \$16.1 trillion. The top 0.5 percent of Americans received 55 percent of the increase, while the poor and middle class experienced a \$236 million net loss of wealth. The number of blue-collar jobs fell significantly, as there was a precipitous fall in the number of people working in manufacturing when American industry lost hundreds of thousands lost jobs in the auto, steel, and farming sectors, as the country transitioned to a postindustrial society. Companies engaged in labor-intensive production

moved to Third World countries to cut labor costs, while those working in the service sector increased dramatically. Membership in labor unions declined significantly as industrial jobs disappeared. In 1984 Reagan steamrolled Democratic opponent Walter Mondale, winning 49 of the 50 states and expanding the Republican hold over the U.S. Senate.

Critics assailed Reagan's handling of the HIV/AIDS epidemic; Reagan chose to ignore the hundreds of people dying from the malady because he viewed it as a gay disease. The first official acknowledgment that the crisis existed did not come until October 15, 1982, when his press secretary made a joke about it. Reagan did not mention the disease until 1985, when actor Rock Hudson died; the number of AIDS deaths had exceeded 6,000 with more than 12,000 reported cases. With growing public concern, Reagan finally acted appointing a presidential commission to study the epidemic. As a result of the commission's report, Congress appropriated \$1.3 billion to fight AIDS and began an aggressive campaign to educate the public.

Reagan was a strident anticommunist whose foreign policy was based on communism's destruction. Reagan chose to challenge the Soviet Union, engaging in a massive military buildup designed to bankrupt the Soviet economy and ensure American military superiority. He supported governments fighting communist insurgents all over the world. He succeeded in forcing the Soviet Union to the bargaining table, getting concessions that called for reductions in armaments by threatening to develop a missile defense system. The so-called Strategic Defense Initiative (SDI), which critics called "Star Wars," planned for using orbiting satellites to track and shoot down missiles fired at the United States.

During his second term, the Reagan administration was plagued by several high-profile scandals, but none of them seemed to dent Reagan's image. Called the "Teflon President" because of his ability to avoid condemnation for indiscretions Reagan was finally tarnished by his involvement in the Iran-Contra scandal and his unsympathetic attitude toward the poor. He was able to shrug off such criticism and left office as one of the most popular presidents in history. In 1989 Reagan quietly retired to his ranch in Santa Barbara, California, where he wrote his autobiography. He eventually moved to a mansion in Bel Air.

In November 1994 Reagan informed the nation of his Alzheimer's disease diagnosis. After years of slow decline, Reagan quietly died on June 5, 2004, at his home in Bel Air and was buried at his presidential library on June 11, 2004.

CLEMSON UNIVERSITY

Rebuilding Together

REBUILDING TOGETHER IS an organization bringing together volunteers intending to preserve and revitalize low-income houses and communities. The mission is to ensure that low-income homeowners, from the elderly and the disabled to families with children, are able to live in safety, warmth, and independence. Rebuilding Together seeks to re-create from history the tradition of neighbors helping each other in times of need, particularly the example of barn-raising, when a community would join together to help build a barn for a neighboring family.

A community of people working together is able to achieve more than its constituent members working alone. This was the motivation for a group of Texans who created Rebuilding Together in 1973. Its ideas slowly grew and spread until, in 1988, 13 similarly minded programs working on a similar basis joined together as part of the Christmas in April project and established an office in Washington, D.C. Subsequently, hundreds of other affiliate programs have joined the network to provide services in a thousand towns and cities across the United States. Services provided by Rebuilding Together include emergency repair and maintenance, home modifications, and protection against the elements.

Many of the more than seven million Americans in the lowest income categories spend more than the 30 percent of their income on housing, which is recognized by government as a warning signal of high-cost housing. In these cases, people find it very difficult either to repair old housing or to adapt it to changes in circumstances, necessitated perhaps by a change in the

number of people living together, health problems, or aging. Inability to meet these costs can result in exposure to disease and general ill health, not to mention increased likelihood of suffering crime and social problems. Problems are likely to be exacerbated in the future for demographic reasons, such as the increase in the number of elderly people. Climate change is also intensifying threats to housing and health from the weather. Improving houses through weatherization that is, for resisting the harsh effects of climate—has the additional benefit of helping to lower energy bills over the long term, which is also important for society as a whole. Home improvements can also reduce the risks of bodily harm to the elderly. Annually, one in three Americans over the age of 65 suffers a fall, and this results in more than \$20 billion in direct medical costs. This number is set to increase, as is the number of lowincome families, and the population as a whole.

Rebuilding Together is supported by a number of corporate sponsors, both financially and in providing time release for employees to join Rebuilding Together volunteer schemes. In addition, many professional construction organizations provide assistance. In 2004, it was reported that 96,300 families had received safe, dry housing as a result of Rebuilding Together's activities, and volunteers had provided more than \$93 million in market-value labor. The amount of support provided by Rebuilding Together, although very valuable to those who receive it, is only a very small fraction of what is required throughout the country.

Recession

A BUSINESS CYCLE IS defined as fluctuations in the real Gross Domestic Product (GDP) of a nation over the time. Along the business cycle, the economy expands and contracts between peaks and troughs. Contractions (recessions) start at the peak of the business

cycle and end at the trough. A recession is the stage in a business cycle when the real GDP of a country falls in two consecutive quarters in a year. When a recession is prolonged in a country, its economy will fall into depression. The duration and intensity of a phase in a business cycle vary significantly. No business cycles have the same length and intensity. For example, many post-World War II recessions were shorter and less intensive than the Great Depression of the 1930s.

CHARACTERISTICS OF A RECESSION

A recession is characterized by a decrease in consumer confidence and consumption. It affects investor confidence, which contributes to a reduction in investment. In other words, recession crowds out businesses because they feel pessimistic about the future. Thus, demand for investment decreases.

During a recession, both employment level and output growth decline. Nevertheless, the price level does not shrink rapidly. The price level will probably drop only if the recession is severe and lengthened, as in a depression. The cost of unemployment is the loss of production, the intensification of inequality, a bigger gap between the rich and the poor, and an escalation of human misery, according to economists.

Any recession or depression will disrupt economic activity and weaken economic strength for a long period. However, it does not mean that all recessions always entail acute and extended unemployment. Also, a cyclical peak does not always entail full employment and a high economic growth rate.

THE ROLE OF GOVERNMENT

During a recession, the government faces the challenge of a budget deficit because of lower tax revenue and social welfare commitments. Fewer jobs mean lower income tax revenue (assuming that the tax rate has remained the same). Higher unemployment means more people need financial assistance. Hence, government intervention through fiscal and monetary policies is needed to boost the demand for goods and services, which sequentially can help increase the levels of employment and output.

Fiscal policy refers to the adjustment of taxation and public spending. When a recession occurs, an easy/expansionary fiscal policy should be applied. This policy aims to reduce taxes and increase government spending, or a combination of these two tools, in order to reduce adverse effects of a recession. Lower income

When a recession occurs, one method that is used to alleviate the adverse effects is to increase the money supply in the market.

taxes will lead to higher disposable income, and thus households have more to spend, which increases the demand for goods and services. Lower corporate taxes can increase profit expectation and therefore can attract more investment.

Monetary policy refers to the adjustment of the money supply in the market. When a recession occurs, an easy/expansionary monetary policy should be applied. This type of policy aims to increase the money supply in the market in order to lower the interest rate. Lower interest rates will lead to higher consumption and financial investment.

Overall, the recovery of an economy from a recession depends on how soon and how well the government reacts to the crisis by implementing appropriate fiscal and monetary policies and other measures.

HUONG HA Monash University

Redistribution

THE EXPERIENCE OF the Great Depression in the United States and Europe brought about renewed thinking about the need for redistributive programs to remedy severe imbalances in monetary and material holdings between wealthy individuals and the poor. What would appear to be a rather straightforward effort to redistribute wealth from the "haves" to the "havenots" has proven to be difficult proposition, one that has been argued by economists and others on a number of levels.

One of the major sticking points is embedded in the controversy over the manner in which poverty can be reduced, and wealth in its many forms can be redistributed: should poverty reduction be accomplished through increased economic growth or direct redistribution?

The argument for economic growth specifies the "trickle down" outcome, which states that increases in wealth in the overall economy, through business expansion, will result in more wealth tricking down to lower-income families and will reduce levels of poverty. Programs of redistribution, on the other hand, use a more direct transfer method, rather than waiting for increases in wealth within the economic system to activate the trickle-down mechanism.

The historical record indicates that during the period from 1960 through the end of the 1970s, the trickle-down effect was positive. In 1960, prior to the War on Poverty, soon to be initiated in the Lyndon Johnson presidency, the poverty rate in the United States was 18.1 percent. By the middle of the 1970s, the rate had fallen to less than nine percent. However, by 1980 the rate began a steady rise, which continued into the new millennium. In 1990, the poverty rate had risen to 10.7 percent and in 2004 the poverty rate for individuals was 12.7 percent.

Although there have been some notable successes in redistribution efforts in the United States over the past several decades, it cannot be said that the goals of the War on Poverty have been met. Significant differences in the poverty rate can be seen within subgroups in the United States in 2005. The white population had a 10.8 percent rate, while the rate for the blacks was over twice as high at 24.7 percent. The Hispanic population was not far behind at 21.9 percent. Even more disturbing is the disparity between the rates for children under 18 (17.8 percent) and those 65 years of age and older (9.8 percent).

The rate for the older population cohort was partially explained by the accumulation of greater wealth through a lifetime of employment for most of them. However, the high poverty rate for children under 18 is distressing and reflects a shortfall in the trickle-down effect, already documented, and the inadequacy of the existing redistribution system. Allowing a high rate of poverty within the young people of the United States does not bode well for the future economic strength of the country.

The redistribution system in Europe is much more effective. There are a number of "safety nets" in place in European countries that disallow the development of extreme inequities. For example, government expenditures on social programs in the United States average approximately 30 percent of the Gross Domestic Product (GDP), while in European countries social spending is at 45 percent or higher. The difference is indicative of Europe's greater expenditure on social welfare programs, which effectively shift money from the wealthy to the poor.

The immense inequities in wealth remain obstinately in place.

The vast differences between rich and poor countries at the global level suggest the literal absence of a truly equitable redistribution system. Although the United Nations and other world bodies have continually stressed the crucial importance of addressing the plight of poor people in the developing world, the immense inequities in wealth remain obstinately in place. Countries like Japan, the United States, and other developed nations have annual per capita incomes reaching or surpassing \$30,000. Many countries in sub-Saharan Africa have vast populations barely surviving of less than \$1 per day per capita. Disparities of this

magnitude demand that more efficient redistribution systems be immediately put in place. Implementation of a system of this magnitude would require an effective global governance organization and an effective global redistribution mechanism, a scenario that is far beyond the current capability of the United Nations.

GERALD R. PITZL, Ph.D. NEW MEXICO PUBLIC EDUCATION DEPARTMENT

Regulation

REGULATION IS "A SPECIFIC set of commands or rules" that are set and implemented by government or other authoritarian agencies, as defined by R. Baldwin and M. Cave, to achieve certain economic, social, and political goals. D.J. Gow argues in *Business-Government Relations: Concepts and Issues* that government uses regulation as a tool to persuade or to request or forbid certain activities by individuals and organizations. Regulation is implemented by specific appointed regulatory and enforcement government agencies.

Regulation is usually considered a form of restriction of undesirable behavior and activities and aims at preventing the occurrence of such behavior or activities. Nevertheless, regulation can improve market efficiency and increase the protection of some groups of citizens who will be more disadvantaged without government interference.

Economic regulation provides guidance to businesses in certain industries in order to ensure their best practices, and to achieve goals in the public's interest. Examples of such regulation are price control, quotas, and the promotion of free and fair competition. Social

regulation aims to achieve social goals that can generate benefits to the community, according to H. Colebatch et al. These regulations usually relate to environmental protection, consumer protection, workplace safety, and occupational health. Functional regulation may or may not be directly inflicted on business, but may influence their operations in terms of costs; for instance, a green tax or rules on land use.

At the microlevel, regulatory and legal systems affect the ability of firms to enter or exit the industry, to employ and sack employees, to enforce agreements and contracts, and many other business and operational activities, as described by the Cato Institute. At the macrolevel, regulation affects economic growth, social development, and political stability.

Government needs to correct the distortions caused by market failure and needs to improve market efficiency. Government creates a conducive environment for all sectors by providing the proper legal framework and ensuring the enforcement of law. The most popular form of government intervention is setting laws and regulations to command and control certain activities. Trade legislations contribute to the stabilization of the economy. Social policy can help to tackle poverty.

Government can also give incentives to the involved parties in order to encourage desirable economic and social activities, such as regulation on environmental protection. In some cases, government can take direct action to punish wrongdoing. Government can also harness the market by setting competition laws to ensure a free and fair business environment for all stakeholders. Competition regulation also makes sure that consumers receive sufficient protection when conducting commercial and financial transactions.

ARGUMENTS FOR REGULATION

The pro-regulation school argues that regulation is important for the provision of a basic regulatory framework (minimalist view), efficiency, convenience, and welfare.

According to the minimalist view of Colebatch et al., stakeholders in society need a basic regulatory framework to "make self-interested exchanges." Without law and order, the market would be in chaos, agreements could not be put into effect, and fair business and competition would not be in compliance. There would not be sufficient confidence for sellers and buyers to conduct transactions without fear of unfair treatment. Thus, it requires a certain degree of government

intervention to ensure that market exchanges happen in an orderly fashion.

The second rationale for regulating is the occurrence of market failure or market inefficiency. In this case, government interference is needed to correct the market. According to the Asian Development Bank, market failure is defined as:

The inability of a system of market production to provide certain goods either at all or at the optimal level because of imperfections in the market mechanism; or the inability of a system of markets to fully account for all costs of supplying outputs. Market failure results in the overproduction of goods and services having negative external effects and the underproduction of goods and services having positive external effects. Market failure occurs for different reasons, for example, inadequate information, inadequate capacity, regulation of the movement of labor and capital, or rent-seeking behavior by producers. The existence of market failure provides a case for collective or government action directed at improving efficiency.

The essential categories of market failure are public goods, externalities, asymmetric information, monopoly, income redistribution, and windfall profit.

Public goods have the two characteristics of nonexclusion and nonrivalry. Nobody can be excluded from the consumption of such goods and everybody will enjoy the same level of satisfaction when consuming such goods. The problems of the free rider and moral hazard occur when everyone wants to consume the goods, but few want to pay. Excessive consumption of the goods "without regard to the resource costs" will harm society, according to Robert Baldwin and Martin Cave. Therefore, government needs to intervene by providing public goods. Nonetheless, regulatory constraints may be necessary to deter excessive consumption of these goods. A good example of public goods is medical care.

Externalities happen when the price of a good or service does not reflect the actual cost to society. In other words, the consumption of a good or service will incur benefits (positive externalities) or costs (negative externalities) to third parties. Regulation is essential to encourage the production and consumption of products that can generate positive externalities, such as education. Government should subsidize educational costs so that more people can enjoy education, because

education is one of the factors that can empower individuals to have more job opportunities, and thus it can contribute to the elimination of poverty caused by prolonged unemployment. Regulation can also deter the production and consumption of products generating negative externalities, such as the consumption of cigarettes. In this case, government should discourage negative externalities by imposing higher taxes or setting quotas to limit the quantity of goods sold.

An asymmetric situation occurs when consumers cannot receive sufficient information or receive imprecise/incorrect information, which may reduce their ability to make the best decision during a purchase. Some suppliers may not fully disclose the required information about their products and services, business registration, and terms and conditions in contracts. Some dishonest merchandisers may mislead consumers by providing distorted information or by colluding with other traders to reduce the flow of information.

Monopoly occurs when there is only one large supplier for the entire market. This supplier provides unique goods or services that have no close substitutes, that is, consumers cannot replace these goods and services with others. There are extensive barriers for new firms to enter the industry, or for the existing firms to remain in the market. In this scenario, the market is inefficient because of the lack of competition. The supplier has power to manipulate the quantities and prices of goods or services in the market. Hence, the market can be corrected by competition regulation (antitrust law) in order to create a favorable environment for free and fair business.

Nevertheless, such competition laws may not be applicable to a natural monopoly. Natural monopoly takes place when the cost of production increases when there is more than one firm in the market, because of the large economies of scale available in the production process. In this circumstance, government allows a natural monopoly to operate.

Income redistribution may help to close the gap between the rich and the poor. Information about poverty rates, indicating the types of family units that need financial and social assistance, is necessary for the design of policy related to social security. Usually taxation and transfer payment systems are used to address income redistribution issues.

Regulation is also necessary when a company can enjoy windfall profits by getting cheaper sources of supply, or when an organization has anticompetitive behavior and predatory pricing, or there is unequal bargaining power among the involved parties. Competition regulation will improve consumer protection and create opportunities for firms of any size to have an equal chance to compete in the market.

Regulation can create standards that can help avoid inconvenience to the society. Without regulation, each individual or each group will take for granted that it can do it wants, when it wants, and for its own interests. For example, without traffic rules in a country, each driver does not know what side to drive on, or how to avoid other vehicles. At an international level, conventions of units of measurement, financial requirements, and trade agreements are necessary for different countries to engage in trade.

Regulation is needed when the market cannot function properly.

Without regulation, self-regarding exchange can still take place, but the possible outcomes may be undesirable in terms of social and cultural values. For instance, primary education should be compulsory and cultural, and sport activities should be subsidized because they are considered socially desirable for everyone, per Colebatch et al. Many people are not able to afford these activities, and thus they rely on government assistance. Regulations on safety in the workplace, on healthcare, and on the speed limit can also enhance social welfare. Antidiscrimination acts, the provision of public and merit goods, and transfer payments can ensure equity and equality for all. These regulations should help prevent some groups of people, such as minorities, the disabled, and women, from being marginalized from the mainstream of the economy.

Other rationales for regulating are "scarcity and rationing, rationalization and coordination, planning," income distribution, and merit goods, according to Baldwin and Cave. Resources are limited, while wants are unlimited. Government can fix market failure by allocating scarce resources to produce goods and services that are essential to the public and cannot be effectively and efficiently produced by the private sector. Overall, regulation is needed when the market cannot function properly, or when social and economic goals are not met by nongovernment activities within society.

ARGUMENTS AGAINST REGULATION

It is inevitable that regulation can affect all activities in society. M. Siddiqi argues, "a well-regulated and open

market economy is a powerful tool for growth and poverty alleviation in developing countries." However, bureaucratic and political processes and other impediments affect the implementation of regulation. The desired outcomes of a specific set of regulations may not be achieved, or the actual outcomes may cause adverse effects.

The World Bank also finds that regulation is associated with bureaucracy, red tape, higher operation costs, and delays, which in turn lower productivity. It is costly to comply with regulation. Thus, governments in many countries are encouraged to implement pro-business policies in order to provide a favorable business climate. Too many regulations or too frequently changed and unclear regulations, uncertain policies, as well as an unstable macroeconomy will discourage investors. In addition, lack of regulation on foreign investment, property rights, and copyrights, and lack of regulation dealing with corruption and red tape will crowd out domestic and international investment.

There is a tradeoff of different values among different groups when regulation is imposed. A regulatory framework may be efficient and justifiable at a certain time and to certain groups of recipients, but it may not meet public and business expectations at another time. Thus, no sets of regulations can remain static. Consequently, governments must continuously look for new economic approaches to improve the policymaking process in order to address social, economic, and political issues.

REGULATORY REFORM

Regulatory reforms have been taking place since the late 1970s. Deregulation, coregulation, and self-regulation have been introduced in order to reduce the burden of public service and public spending. A significant reduction in economic regulation and an increase in social regulation will lessen the operational costs for businesses, and reduce barriers to entering and exiting the market. De-regulation empowers local and state governments to have more autonomy in addressing issues in their jurisdiction. Coregulation calls for more involvement of the private sector and civil society. Self-regulation requires an organization or an industry to develop its own codes of conduct or a system of rules that are applicable to its members.

Overall, regulatory reform aims to enhance the effectiveness, efficiency, accountability, transparency, and democracy of the regulation-making process and implementation. In short, although it may help to correct

market failure, regulation, which benefits only a certain group or benefits a person by a small amount, may not appeal to politicians and the public.

Relative Deprivation

RELATIVE DEPRIVATION replaced notions of absolute poverty as the most important factor to be taken into account in understanding the objective and subjective consequences of inequality. Its prominence in inequality research has strengthened because measures of absolute poverty are unable to adequately describe the experiences and consequences of economic inequality among countries with differing living standards, or within countries that, despite increasing levels of prosperity for the population as a whole, still experience deprivation for those at the lower end of the wealth distribution. In the second circumstance the term has become closely linked with the social policy concept of social exclusion. Whereas absolute poverty relates primarily to material deprivation and subsistence, relative deprivation better takes account of multiple deprivations and how factors other than material subsistence, notably psychosocial factors and discrimination, combine to produce experiences of poverty.

The term was first employed by S. Stouffer et al. and given later comprehensive treatment in relation to social justice by W. Runciman. Stouffer identified a psychosocial component of relative deprivation, believing it to emerge when members of a society compared themselves unfavorably with others (real or imagined)

in similar situations. Early in its development, this form of comparison with one's reference group was thought to be an important engine of political change, especially by J. Urry; however, later analyses have tended to highlight the negative or pathological aspects of this comparison for the individual and wider society.

R. Layard has suggested that happiness has declined as wealthy societies have become richer, linked in no small part to consumer economies encouraging aspirant comparison. Relative deprivation also produces problems for societal cohesion and can be linked to increases in crime and related to the "epidemiological transition" of wealthy societies whereby population mortality rates are no longer linked to per capita economic growth but to levels of inequality within a given society, according to author R.G. Wilkinson.

The growth of materialism and inequality are crucial to understanding rising crime rates in affluent societies. Although the psychosocial mechanisms (or individual motivations) are inferred (and make intuitive sense), they are not explored scientifically. In linking health inequalities to economic inequality, some researchers do, however, provide a testable model.

In affluent societies the preeminent trends in population mortality and morbidity are related to the so-called diseases of affluence that affect individuals in an inverse relationship to their place on the socioeconomic ladder.

These nations have high measures of absolute living standards, such as central heating, televisions, refrigerators, telephones, and other consumer goods, and access to nutritious diets. There is evidence to suggest that feelings of subordinate social status initiate physiological pathways related to stress that are detrimental to individual health even when access to material components of subsistence is controlled, as noted by M. Marmot and Wilkinson.

An operational problem with the concept of relative deprivation is that all societies with inequality will have those who exist at a level below average and, by this definition, they are described as poor. It also requires a concept of need that constantly changes to reflect the dynamism of a particular society and a change in what is seen as an average lifestyle.

As societies acquire wealth and become technologically advanced, these standards are less likely to be reached by those on low incomes. For example, the growth in car ownership and public policies aimed at supporting car use (such as investment in roads over public transport) can impact those without access to cars, as amenities such as shops and leisure destinations

located in out-of-town developments and roads become more hazardous to pedestrians. It is in this regard that a concept of social inclusion can be useful in identifying the ability to take part in activity deemed normal for that society as a crucial component of a definition of deprivation.

The government of the United Kingdom adopted a relative income standard of poverty after P. Townsend's work on the persistence of poverty in that country. This has been set at 50 percent or less of the national average income. However, Townsend himself has highlighted difficulties with this definition, claiming it is an arbitrary line and that economic inequality can be mediated by factors such as the nature of a country's welfare system and the individual's lifestyle that is associated with material shortage but is not the same as the shortage itself.

Relative-Income-Based Measures of Poverty

RELATIVE INCOME MEASURES of poverty typically identify the poor as being below a specific income threshold, such as 50 or 60 percent of the median income, for the country in which they live. The median income is the income figure that divides a society's income distribution into equal parts such that half of the population have incomes above the median and the other half have incomes below. At 50 or 60 percent of the median, a person is deemed to be much worse off than the societal average. If the median income is \$300

People perceive themselves relative to one another: relative income measures of poverty measure one's distance from the norm, in terms of income, within a specific community.

per week and the poverty measure is set at 50 percent of median income, then a weekly income of \$150 per week would be considered poor.

Relative income measures of poverty are the commonly used basis for international comparisons of poverty, especially for comparisons of child poverty. The European Union (EU) views this as the "risk of poverty rate." Not all people whose incomes are below the median threshold are living in poverty, but the EU identifies their situation as being at risk of becoming poor.

Unlike absolute measures of poverty, which measure one's inability to meet certain basic needs, relative income measures of poverty measure one's distance from the norm, in terms of income, within a specific community. Relative income poverty measures, in addition to providing a picture of the prevalence of poverty within a specific political community, such as a nation

or province, also offer a measure of the degree of inequality. Relative income measures of poverty can provide insights into the depth of poverty within a society by showing the distance and distribution of people from the income norm. Interpretations of this distance and distribution reflect views about how wide a gap between members of the same society is acceptable.

Relative income measures of poverty show that incomes at different levels do not grow at the same rate. Typically, low incomes grow at a slower rate than higher incomes. For one thing, poor people's jobs tend to provide income raises or promotions less frequently and at lower levels. Precarious work, which leads to serial employment at entry-level rates, also slows income growth for poor people. In addition social transfers, such as welfare or disability payments, which poor people often have to rely on, grow at much slower rates, if at all, than rates from employment and profit. Thus even in a pe-

riod of income growth the instance of relative poverty might not drop.

A weakness of such measures is that they do not show an increase in poverty in periods such as an economic downturn, when personal income is declining and poverty may actually be increasing. The reason is that unemployment will reduce the median income along with the income of poorer households.

Being poor means having no access, or having only tenuous access, to resources.

The Organization for Economic Cooperation and Development (OECD), a mainstream economic organization, argues that relative income measures of poverty are preferable to absolute measures of poverty since such measures have little meaning in advanced industrialized societies where virtually everyone earns more than \$1 or \$2 per day. Understanding poverty means going beyond a focus on the deprivation of basic needs and looking at one's exclusion from the standards of living broadly available within one's community.

The OECD suggests that in order for people to participate fully in the social life of a community, they require a level of resources that is not too far below the norm for that community. Even further, the OECD argues that from an ethical perspective social development can be considered unfair when members of a community do not benefit equally from an overall increase in prosperity.

Social justice advocates prefer the use of relative income measures of poverty as opposed to so-called absolute poverty measures, since they reflect that poverty is experienced as a position of marginality or distance in relation to a society's general, or mainstream, standard of living. Many crucial social indicators, such as health and literacy, are linked to people's relative income within society rather than to their experiences of absolute deprivation.

Beyond reference to any absolute income number, being poor means having no access, or having only tenuous access, to the resources or opportunities that are regarded as being necessary for personal or social well-being at a generally acceptable level. Simply put, it makes a difference whether one's income is \$20,000 in a society where the median is \$60,000 as opposed to earning \$19,000 in a society in which the median is \$17,000.

Nobel Prize-winning economist Amartya Sen's research shows that countries with a similar GDP (Gross

Domestic Product) exhibit important differences in terms of poverty, and these differences are related to the gap between incomes for the poor and those for the rest of society. Poor African Americans have a lower life expectancy than citizens of some poorer countries despite having higher absolute incomes.

Relative income rates vary considerably among countries, suggesting to social policy analysts that relative income poverty can be significantly lowered in specific contexts through changes in social transfer systems and increased minimum wages.

Relative Welfare Index

AN INDEX IS AN organized list of indicators that point to the location of specific instances of the indicator. Or it may permit meaningful comparisons among widely varied populations. A welfare index is a statistical indicator that provides a representative number to indicate poverty. It may also be used as a poverty measure or a benchmark against which other poverty indicators can be measured. It is relative because it is compared with other statistical indicators.

Indexes are used in many economic areas. In the area of investments they provide guidance for investors. Economists also use the Consumer Price Index (CPI) to measure changes in the price of a market basket of goods. The index is composed of a basket of goods, but these are also priced relative to a "normal" year.

The Housing Price Index (HPI) is used to measure the cost of housing. This index tries to incorporate fluctuations in interest rates, season of the year, age and condition of housing, location, and other factors. For people who are working to invest in the poor as human capital, similar statistical measures for effectively investing in humans can be used. These indicators are not simply for providing relief, but providing growth to selfsufficiency is the investment goal.

The relative welfare index is a measure of the complex social, economic, and individual issues that are involved in measuring welfare. Two or more indexes may be combined to form an aggregated total index. For example, a health index may be combined with an environmental index. This could be an indicator that is predictive of the life expectancy of mothers, alcoholics, or others. The statistical use of indexes allows decision-makers to combine different sets of information in ways that provide mathematical answers to questions about the needs of the poor and the supplies that will be needed to meet their needs.

The use of indexes allows variables to be standardized in ways that allow for comparison across geographic areas or population groups. For example, a welfare index for a country would include not just food, but activities such as recreation that are important for human well-being.

The relative welfare index could be constructed as a standard index that allows all countries to be compared. It could also then show arithmetical means and other standard statistical descriptions of populations, but as they compare relative to each other. Equal weights for each variable are used so that the variables of economy, level of education, health, environment, leisure time, income, age, and many more factors can be compared from country to country with meaningful results rather than with mere anecdotal descriptions.

A welfare index would include not just food but activities such as recreation.

The use of a relative welfare index can show that a country like the United States may rank high in income, but may be much lower in other areas, so that other countries with lower incomes may actually have higher conditions of relative welfare as general well-being. This is rather like saying that while people in one area may be poorer when compared by income with people who are rich, the people who are poor may actually be much happier than the rich. Consequently the poor may have a higher relative welfare index since their general conditions of life bring greater satisfactions.

The use of a relative welfare index can allow for different components to be introduced or withheld. The use of variable index components can permit research analysis by manipulating the elements in the welfare index and is valuable to policy planners.

Religion

VIEWS OF POVERTY AND ITS meanings in the world's major religious traditions—Judaism, Christianity, Islam, Hinduism, and Buddhism—are complex and at times contradictory, as reflected in scriptures, religious institutions, social practices legitimized by religious principles (such as the giving of alms to the poor), and the emergence of sects, movements, and reformist or millenarian trends within, or outside of, established churches or hierarchies.

Three views of poverty find their expression in practically all of the major religious traditions: 1) voluntary poverty, which can be seen as a part, but not the entirety, of an ascetic way of life, as a means of seeking spiritual perfection or union with God, an idea that is especially prominent in Hinduism, Buddhism, and Christianity; 2) poverty as a necessary condition in a sinful or fallen world, and an opportunity for more fortunate believers to exercise the prime religious virtue of charity for the benefit of the poor and the donors' own salvation; and 3) the attempts, by prophetic or millenarian movements that claim divine inspiration, to overthrow the unjust social order in which the poor are exploited by the rich, and create a new world of equality; such revolutionary events were, before the French Revolution, usually religious rather than secular in nature and in many countries in the Third World retain their religious character.

It has been common for those who compare religious traditions to emphasize their differences, often with less than disinterested motives. Christian missionaries in India and China during the 19th century re-

ported to congregations back home on the alleged fatalism and self-centered nature of Hinduism and Buddhism—their preoccupation with individual salvation rather than helping one's fellow man—without acknowledging that Hindus and Buddhists had their own social welfare institutions and viewed charity (among Buddhists, *karuna*, or "compassion") as a prime religious duty. Along with images of the "desperate starving masses" of Asia, these representations were meant to legitimize the Christian missionary enterprise.

In fact, most religious traditions emphasize the importance of some form of self-imposed poverty as a way of overcoming the sinful attachments of the world, put a high value on charity, and sometimes pose radical visions of a world remade, "at the end of time," when there will be no more rich and poor. These themes are a reflection of what could be called not only the commonality of human nature, but also the development of that nature within a specific evolutionary context: the emergence of cities and organized states in ancient times, and the parasitic relationship between the nonagricultural urban population, particularly its elites, and the countryside.

City-states emerged in the valleys of the Tigris, Euphrates, Nile, and Indus Rivers as early as the 4th millennium B.C.E., and the later appearance of the so-called world religions took place in distinctly urban contexts: Gautama Buddha, scion of a prominent family in a north Indian city-state in the 6th century B.C.E., achieved enlightenment in the wilderness but returned to the cities of the Ganges Valley to preach his doctrine.

Christ's preaching brought him from Galilee to Jerusalem, the city of Kings David and Solomon, and early Christianity spread within the urban centers of the Roman Empire (so much so that the Latin word paganus, which originally meant "rustic" or "country person," came to have a meaning nearly synonymous with "heathen"). Muhammad was a native and merchant of Mecca, an ancient metropolis that is now Islam's holiest city, to which millions of Muslims make annual pilgrimage.

Indeed, if any basic contrast needs to be made among the diverse religious views and practices of human beings, it is between the universalism of the major religious traditions (what Max Weber called "salvation religions"), which emerged in urban or urban-rural contexts, and the folk religions—often described as animism or spirit worship—that typify the religious life of preliterate or preurban societies, most of which have been isolated from urban centers and contain small, technically unsophisticated populations. Animist

religions—such as those found in the remoter parts of Africa, Asia, and Oceania—tend to sanctify distributions of power and property (for example, among chiefs, commoners, and slaves) in a manner that is more absolute and unyielding than the religious values of more complex societies, which can uphold, but also challenge, the economic-political status quo.

Archeological evidence suggests there was no contrast between poverty and wealth.

For example, in the hierarchical society of the Chins of the mountainous Burma-India border area, the chief (ram-uk) was not only ruler and war leader but the holder of wealth, controller and distributor of tribal and forest land, and, most significantly, the tribe's chief priest, the major link between the Chins and their guardian or ancestral deities.

The foundation of ancient cities involved not only hitherto unimagined concentrations of human beings of diverse backgrounds, but also the creation of coercive mechanisms (the state) to forcibly recruit laborers for building projects (for example, the Hebrew slaves who built the tomb-cities of the pharaohs in the Book of Exodus), to fill the ranks of armies that warred with neighboring states, and, most fundamentally, to extract resources from adjoining rural populations.

Both within the city and between the city and the rural areas that nourished it, one could see unprecedented gaps between rich and poor that posed spiritual as well as economic questions: "Again I saw all the oppressions that are practiced under the sun. And behold, the tears of the oppressed, and they had no one to comfort them!" (Ecclesiastes 4:1). The inhabitants of preurban Neolithic farming communities, the principal form of human settlement in agriculturally favored parts of the world before the emergence of cities, may not have been equal in material terms, but archeological evidence suggests that there was no great contrast between desperate poverty and luxurious wealth, as was later the case.

Tax collection and the imposition of forced labor or *corvée* are necessary for the sustenance of urbanbased states, and the resentment they generate among the common people has long been a theme in world literature (for example, the description of officials as "big rats" devouring the farmers' grain in the ancient Chinese Book of Odes). Indeed, the history of cities over the millennia has not only been one of conflict between

the urban rich and poor, including large populations of slaves in antiquity, but also a tug-of-war between city and countryside that was sometimes expressed in millenarian revolution, but more often in fatalism, passive resistance, or deception on the part of the rural exploited. It is in these contexts that distinctly religious attitudes toward the problem of poverty emerged: that it is to be embraced, ameliorated, or overthrown.

VOLUNTARY POVERTY (ASCETICISM)

The renunciation of worldly possessions and comforts by the religious adept—whether he or she is the founder of a religion such as the Buddha, a saint such as Francis of Assisi, an ordinary priest or monk, or a layperson leaving the world in search of spiritual renewal—is a universal theme based on the fundamental principle of transcendence found in the major or salvation religions: that some spiritual realm, embodying God or Truth, stands above, or apart from, the world of appearances in which men and women dwell, and that the person who aspires to spiritual calm, enlightenment, or an intimate relationship with God must sever his or her attachments to this physical world, including material possessions.

In Hinduism, four values are defined as especially appropriate to the different stages of a person's life: as a youth, a person pursues *kama*, or pleasure; as a younger adult, *artha*, wealth and power; as an older adult, *dharma*, or one's duty within the social sphere; and finally, in old age, *moksha*, spiritual liberation, which entails the casting off of one's worldly identity and appetites. In his short story "The Miracle of Purun Bhagat," Rudyard Kipling eloquently captures this idea in telling of a high-caste Brahmin, formerly the prime minister of an Indian state, who leaves his post and family and spends his final years as a cave-dwelling hermit in the Himalayas, his only possessions being an offering bowl, a staff, and a robe and his only companions the beasts of the hills.

Buddhism, which grew out of Hinduism, supplies the prime example of this justification for voluntary poverty: according to its teachings (the Four Noble Truths), suffering, which is inherent in life and unavoidable ("life is suffering"), is caused by the desire to be attached to those things or persons one likes (and conversely, to be separate from those which one dislikes). In addition, Buddhism teaches impermanence: that all things, including the self, are subject to decay and death (though also rebirth), and that true refuge cannot be found in the things of the world.

The ultimate goal is to radically separate oneself from the world and attain *nibbana/nirvana*, release from the cycle of rebirth and suffering, a difficult concept understood imperfectly even by Buddhist scholars, but which is compared to the extinguishing or snuffing-out of a candle: not a kind of heaven (though a Western paradise figures in some schools of Buddhism) but complete liberation from worldly forms and attachments.

Buddha seems to have been representative of certain elite individuals in ancient India who, enjoying unprecedented power and prosperity, grew tired of worldly delights and sought a spiritual realm, finding it initially in India's long-established tradition of world-renouncing ascetics (sannyasins). It is significant that ancient cities such as the one in which he lived generated this world-weariness, for it is difficult to imagine its emergence among the simpler communities of rural villages, or in the pre-urban age, when the overriding concern was physical survival in an economy of universal scarcity.

It is better to teach a man how to fish than to give him fish to eat.

One evening, following what seems to have resembled a Roman-style orgy, Siddhartha (as the Buddha was known before his enlightenment) looked upon the exhausted partygoers with profound disgust, and resolved to undertake the Great Going Forth, leaving his father's palace and becoming a mendicant. His renunciation of all possessions (save for those needed for his homeless existence, such as his robe, staff, and begging bowl), worldly status, and power is reenacted by those men and women who become Buddhist monks and nuns. In Burma, young boys who enter the sangha or monkhood for a brief period of time, an important life-cycle event for males, undergo the shinbyu ceremony: first dressed in the garb of a prince like Siddhartha, shaded from the sun by ornate umbrellas, a sign of royalty, they are taken on horseback to a monastery, where they don the saffron robes of a monk and have their heads shaved

This cutting-off of the hair, which Buddhist nuns also undergo, is most symbolic of the vow to cut one-self off from the world. Buddhist monks in Myanmar, Thailand, and Sri Lanka, where the Theravada school of Buddhism is strongest, in principle do not own property, are not allowed to earn or handle money (the fi-

nances of monasteries, temples, and pagodas being the responsible of specially appointed laymen), and live according to strict rules (the *vinaya*, allegedly set down during the lifetime of the Buddha), which regulate in precise detail their interactions both inside and outside the monastic community.

The spiritual value of poverty is also recognized in Western Christianity, and its most amiable representative was St. Francis of Assisi, whose life in some ways resembled that of the Buddha. Like Siddhartha, he was born into wealth, the son of a prosperous cloth merchant in northern Italy. Though he had many friends among the local nobility and a youthful taste for worldly pleasures, he became disillusioned with them (according to some accounts, after a bout of illness) and showed an indifference to the making of money that caused him to break with his father, renouncing his inheritance and becoming a hermit living in the hills around Assisi.

Following Christ's admonition in the Gospel of Matthew that he who sets off to proclaim the Kingdom of God should "take no gold, nor silver, no copper in your belts, no bag for your journey, nor two tunics, nor sandals, nor a staff." His asceticism was comparable to that of the Buddha himself. He and the order of friars that he established in 1209 preached to the masses and ministered to their suffering, while refusing comforts or material possessions.

Yet there is a fundamental difference between the Hindu and Buddhist idea of the spiritual value of poverty and that of the Christian: for if in the former, voluntary poverty was a means of severing worldly attachments and achieving liberation, for the latter it was seen as obeying God's commandments, a celebration of his creation, and as such was intimately linked with the idea of charity.

CHARITY

The commandment to be charitable toward those less fortunate than oneself is found in practically every culture in some form; it is mentioned in the Sumerian, Egyptian, and Babylonian inscriptions (including the Code of Hammurabi, ca. 1750 B.C.E., which enjoins that the poor not be treated unjustly), and plays an important role in Jewish ethics: in the Talmud, giving alms to the poor is described as both the recipients' right and a means for the donor to acquire merit in the eyes of God.

The Jewish thinker Maimonides argued that it is better to give small sums to the poor over a long period of time than to give a single large sum all at once, since the long-term giving of small amounts promotes the habit of generosity. The highest form of charity (tzedakah in Hebrew, a word derived from "justice"), he claimed, was to enable the poor to have the opportunity to gain a livelihood and become self-sufficient, a wise variant on the popular saying that it is better to teach a man how to fish than to give him fish to eat.

The long history of Jewish thought on the godliness of giving to the less fortunate contributed to the adoption of welfare state policies in Israel when it was established in 1948, and the creation of communities, especially the *kibbutzim*, which stressed solidarity, economic equality, and joint (if not socialist) ownership of property.

Based on a foundation of Old Testament teachings, Christianity—with its unique claim that "God so loved the world that he gave his only Son" (John 3:16)—places charity at the core of its doctrines: the word *charity* itself is derived from the Latin word *caritas*, which is synonymous with the Greek *agape*, meaning "nonerotic love," encompassing not only the idea of God's love for man and the ideal love that Christians ought to feel toward each other ("This is my commandment, That ye love one another, as I have loved you"—John 15:12) as fellow believers, but alsolove toward their (non-Christian) neighbors ("you shall love your neighbor as yourself"—Matthew 22:39) and even their enemies ("do good to those that hate you, bless those who curse you, pray for those who abuse you"—Luke 6:27–28).

The equivalence of charity with love shows it was originally a much more fundamental and interesting concept than the word's present-day usage, often meaning little more than a voluntary (and tax-deductible) form of social welfare: "And now abideth faith, hope, charity, but the greatest of these is charity" (I Corinthians 13:3).

That charity must be reflected in action as well as in the heart is seen in the vocation of not only St. Francis but in an earlier church figure, St. Martin of Tours, who as a young man served as a legionary in the Roman army in Gaul. Seeing a thinly dressed beggar freezing in the cold of winter, he cut his military cloak in half and gave one half to the man. Later he had a dream in which he saw Jesus, who said, "here is Martin, the Roman soldier, who is unbaptised; he has clad me." For in giving to the poorest and most unfortunate, the story of St. Martin tells us, the faithful donor gives to the Savior himself.

Because charity meant to be an expression of the Christian's love of God and his desire to fulfill God's

A Buddha statue in Bangkok, Thailand, emphasizes compassion toward all living things, including the poor.

commandments, it necessarily has both an internal and external dimension; that is, both a proper motive, based on faith and love, and consequences. Giving to the poor, to those less fortunate than oneself, does not count as charity if it is marked by ulterior motives.

One would not claim, for example, that the German chancellor Otto von Bismarck's institution of social security programs in imperial Germany in the 19th century was an act of Christian charity, for its objects—promoting national unity, drawing the German working classes' support away from the alternative of social revolution—were not particularly holy. The purity of heart that characterizes true acts of charity—such as those of Sts. Martin and Francis, or a modern figure such as Mother Teresa—also precludes the self-

serving complacency that the wealthy often feel when they donate a small amount of their fortune to the poor, either at home or in distant countries. Christian charity, in its purest (and most saintly) form, is truly radical in the sense that it dissolves the reassuring barrier between Self and Other that makes us see other people, the wretched of the earth, the unwashed, the unclean, as "different" from ourselves and thus not worthy of serious consideration. Such charity is, in fact, a most rigorous asceticism.

The charitable approach to poverty in Christianity was strongly institutionalized in the medieval church, which defined the distribution of goods to the poor as a duty. By the 10th century, the monasteries assumed the major role in charitable activities, especially the Benedictine, Cistercian, Franciscan, and Dominican orders of monks and friars, who established hospitals throughout Europe; these institutions not only cared for the sick and the dying, but gave shelter to poor people and wayfarers.

It is also reflected in the Christian missionary movement, which extends back to the earliest years of the religion ("go ye unto all the world") and which, among the world's faiths, is matched only by the proselytizing zeal of Muslims. By the late 19th century, Catholic and Protestant missionaries operated in tandem, if not necessarily in cooperation, with the European and American colonial empires established in Asia, Africa, and Oceania, and many of them were convinced that the Christianization of the world was imminent. At that time, a controversy emerged among Protestants between those who saw the missionary's primary duty as administering to the spiritual needs of non-Christians (evangelization) and those who promoted a "social gospel," building hospitals, orphanages, food kitchens, and schools to improve their standards of living, and even offering instruction in agronomy and other practical sciences.

By such good works, they argued, the way to Christ could be opened up for the poor people of Asia and Africa who otherwise would be unconvinced by preaching, which those missionaries of an evangelistic turn thought was not only necessary but sufficient for their vocation.

The roots of modern movements to combat poverty, disease, and social oppression around the world are found in the work of the "social gospel" missionaries, and the needs they encountered in countries such as China and India—home to famine, disease, female infanticide, drug abuse (including consumption of opium brought to China by Anglo-American merchants),

and rampant superstition—seemed at least as urgent as those encountered at home. Some of the most successful missionaries were those who ministered to marginal or tribal peoples in the Asian hinterland.

The 19th-century Baptist missionary Adoniram Judson worked among the Karens of southern and eastern Burma, an undeveloped tribal people dismissed by the Buddhist Burmans as "the cattle of the hills"; not only did he and his successors provide the Karens with schools and hospitals, but they devised a writing system for the Karen language, standardized its various dialects, translated the Bible and other books into Karen, and fostered a sense of pride and identity among Karen converts that won them a place in the mainstream of colonial Burmese society.

Zakat is a compulsory donation required of all Muslims.

Islam also has a well-established tradition of charity, embodied in the *zakat*, which goes back to the time of the Prophet Muhammad and is one of the Five Pillars (basic duties) of the religion. This is a compulsory donation, required of all Muslims, that is given to less fortunate believers, including not only the poor but wayfarers and those who wish to free themselves from bondage or slavery. Mecca, before Muhammad established Islam as its religion, was a largely pagan place characterized by oppression of the poor by the rich, and the *zakat* emerged as a way of supporting the small and beleaguered community of early Muslims.

Today, the wealth generated by oil exports has enabled countries such as Saudi Arabia, the United Arab Emirates, and Brunei to aid poorer Muslim countries such as Pakistan and Bangladesh, building schools, hospitals, and public works projects, and helping out during natural disasters.

One of the *Jataka Tales*, which recount the lives of the Buddha before his reincarnation as Siddhartha, describes the *bodhisattva* (Buddha-to-be) encountering a starving tigress who cannot feed her cubs and is about to devour them; he offers his own body to the tigress so that both she and her offspring might live.

Such an exemplary story expresses not only Buddhism's emphasis on *karuna* (compassion) toward all living things—in some ways the functional equivalent of Christian *agape*—and the certainty of a favorable rebirth following such a meritorious act, but the very insubstantiality of life itself, as the *bodhisattva* focuses his

efforts on attaining the ultimate goal of nirvana not only for himself but for all sentient beings. The Buddhist ruler, of whom the Indian Emperor Ashoka is the ideal, cares for his subjects, indeed the whole world:

I am not satisfied simply with hard work or carrying out the affairs of state, for I consider my work to be the welfare of the whole world. There is no better deed than to work for the welfare of the whole world, and all my efforts are made that I may clear my debt to all beings. I make them happy here and now that they may attain heaven in the life to come. (Sixth Rock Edict).

The 12th-century Cambodian ruler Jayavarman VII, who built the famous Bayon temple at Angkor, was a fervent Mahayana Buddhist who initiated an ambitious public works program to provide his kingdom with hospitals, rest houses, and reservoirs in order to lighten the burdens of his subjects. Ironically, such projects, requiring corvée labor, probably imposed great hardship on the populations they were designed to benefit. It is perhaps not unfair to say that Buddhist charity, at least as practiced by kings, was both more cosmic and more impersonal than its Christian equivalent, perhaps a reflection of the central importance of the concept of samsara (the cycle of rebirth), which is not found in the Western monotheistic religions.

In Theravada Buddhist societies such as Thailand and Burma, dana (a Pali term meaning "charity" or "giving"; also translated as "wealth") is, along with sila ("moral precepts") and samadhi ("concentration; meditation"), the chief means of attaining merit and a fortunate rebirth—and ultimately nibbana/nirvana. But as anthropologists such as Melford Spiro have discovered, in modern Burma, the most efficacious way to gain merit is not through donations to benefit the poor, but through religiously oriented charity such as sponsoring shinbyu or ordination ceremonies, giving offerings to members of the sangha and constructing or contributing to the construction of pagodas, where relics of the Buddha are enshrined.

Spiro writes in Buddhism and Society: A Great Tradition and Its Burmese Vicissitudes that the inability of some people to escape poverty is attributed by Burmese Buddhists to their stinginess in giving dana in previous lifetimes.

Even today, Burmese pagodas, monasteries, and other sites associated with Buddhism are often lavishly endowed with extensive use of gold and gold leaf. In 1999, Burma's military junta, the State Peace and Development Council, sponsored the replacement of the gold- and jewel-encrusted hti, or finial, on the summit of Shwe Dagon Pagoda in Rangoon, the country's holiest Buddhist site. Many Burmese people doubted the military rulers' cetana (Pali: "goodwill"), suspecting them of using the project to buy popular support; but many others, taking advantage of an unprecedented opportunity to earn merit and a better rebirth, lavishly donated to the hti from their own, often very limited resources, including gold and gemstones. This great transfer of wealth to the pagoda took place in a country that is one of Asia's poorest, with widespread malnutrition among children, a major AIDS epidemic, and healthcare facilities that are at best rudimentary for the poorest Burmese.

Although Buddhist charity is often seen as impersonal and otherworldly, some Buddhists have promoted a more social orientation. U Nu, who was Burma's prime minister after it became an independent nation in 1948, enacted social welfare programs (known as Pyidawtha, or "sacred happy country") on the conviction that improved standards of living would enable people to further their own progress toward *nibbana*, while Thai Buddhists such as the Bhikkhu Buddhadasa and Sulak Sivaraksa have advocated a "socially engaged" form of the religion that addresses the problems of poverty and economic inequality—not only within Thailand but between the developing and developed countries.

SOCIAL PROTEST AND MILLENARIANS

The charitable approach to the alleviation of poverty is generally based on certain assumptions: that "the poor are always with us" (indeed, their existence may be God's plan to give the devout the opportunity to be charitable), and that those doing charitable good deeds should not become involved in politics, either out of respect for the separation of the spiritual and temporal worlds, a prominent theme in the medieval church as well as today, or out of fear that any state, no matter how unjust, is better than revolution or anarchy.

But the major religious traditions, based on some concept of the transcendence of the divine or spiritual realm, hold within them, in different forms, the potential for social protest or even revolution, even as established churches and hierarchies cooperate with the political-economic status quo. In the debate over slavery and the slave trade during the 18th and 19th centuries, some Anglo-American Protestant denominations,

especially the established Anglican Church, defended the "peculiar institution" of slavery (usually arguing that it "civilized" the "savage" Africans while bringing all sorts of economic benefits to white men), while nonconformist churches pronounced it a moral abomination that should be overthrown. Abolitionism was revolutionary given the immense economic interests bound up in slavery, not only on southern and Caribbean plantations but in the countinghouses of London and Boston.

More recently, liberation theology, a trend that appeared among some theologians and clergy in the Catholic Church after the Second Vatican Council, has emphasized the social justice aspects of Christian ministry and has become especially prominent in Latin America and the Philippines, where the church has traditionally supported the economic-political establishment and the poor suffer terrible oppression; but the Vatican leadership has been reluctant to embrace the trend, given its radicalism and affinities to Marxism (though many, if not most, advocates of liberation theology pursue nonviolent methods of resistance).

In the prophetic tradition of the Old Testament, God expresses his anger and disappointment with his Chosen People, the Hebrews, through the words of the prophets, who condemn Israel's injustice and idolatry:

Woe to those who decree iniquitous decrees, And the writers who keep writing oppression, To turn aside the needy from justice, And to rob the poor of my people of their right, That widows may be their spoil, And that they may make the fatherless their prey... (Isaiah 10:1–2)

Yet God's instrument was not revolution, but a foreign aggressor: "Assyria, the rod of my anger, the staff of my fury! Against a godless nation I send him." (Isaiah 10:5–6). That the hardships suffered by nations and peoples may have a retributive meaning is also found in a very different tradition, that of Confucian China.

The Chinese believed that natural disasters—earth-quakes, floods, and famine—marked the closing days of an imperial dynasty that had lost the Mandate of Heaven (Chinese: *tian ming*), its right to rule, and that the reason for this was its incompetence and oppression of the poor.

The emperor's benevolent and paternalistic rule, including his care for the poor, was a part of cosmic harmony, and nature as well as man proclaimed the wrongness of a decadent regime or, more precisely, a de-

generate sovereign who failed in his duty to rule benevolently. The Mandate of Heaven was connected with a vague concept of popular sovereignty. When a disciple of the philosopher Mencius asked whether it was possible for one ruler (Yao) to give the empire to his successor (Shun), the philosopher replied that only "Heaven" and no mortal man could confer the right to rule, and that "of old, Yao recommended Shun to Heaven and Heaven accepted him. He presented him to the people and the people accepted him" (Meng Tzu, V A:5). Mencius's concept of heaven was, like that of other Confucians, distant and impersonal, with none of the emotional immediacy of the Yahweh of the Old Testament. But it, too, had a critical and "prophetic" potential, which often justified struggle against unjust and oppressive authority.

The transcendent character of the major salvation religions—that a spiritual or Godly world exists apart from and above the world of human societies and states (what St. Augustine called the "City of God" as opposed to the "City of Man")—has generated many millenarian movements that have occurred at times of social and economic distress and widening gaps between rich and poor. The theme of eschatology—that the "end times" or the "end of time" is drawing near, that God will judge a corrupt world—has quickened the millennial impulse to create a new spiritual order on earth, especially in the history of Christianity.

Thomas Münzer, a German contemporary and rival of Martin Luther, preached the establishment of a radical community of believers who were free from the authority of the state, scripture, and the inequalities of the decrepit feudal system. Münzer became a leader of the Peasants' War (1524-26), which the German princes, with Luther's support, suppressed with over 100,000 insurgent deaths, including Münzer himself. It is perhaps ironic that the anti-religious German Democratic Republic (East Germany) celebrated Münzer's revolutionary career as the forerunner of Marxist class struggle though he was a clergyman and apparently a sincere, if unorthodox Protestant. In Buddhism, the concept of the Maitreiya, the Future Buddha who will appear at the dawn of a new cosmic era, similarly inspired uprisings against authority: for example, the White Lotus Sect in late 18th-century China, which resisted the Manchu Qing (Ch'ing) Dynasty.

The 19th-century Heavenly Kingdom of the Taipings, which controlled large areas of central and eastern China and came close to overthrowing the Qing Dynasty, was established by a failed scholar, Hong Xiuquan, who claimed that he received a series of visions in

which he was ordered by Jesus Christ, Hong's "elder brother," to establish a new, divinely inspired order on earth. Influenced by but generally shunned by Western missionaries, Hong's revolution anticipated that of the People's Republic of China a century later: the execution of landlords, abolition of private property, equality of men and women, and abolition of such customs such as foot-binding, opium-smoking, gambling, and the keeping of concubines. The Heavenly Kingdom was finally extinguished by the Qing armies, with the fall of its capital, Nanjing, and a horrendous massacre in 1864 (the civil war between the Taipings and the Qing cost at least 20 million lives).

On the island of Java, a mystic religious community emerged among poor peasants.

Like the Peasants' War, the Heavenly Kingdom was eulogized by a 20th-century communist regime, which praised its egalitarianism and mobilization of the masses; but the Chinese communists have paid less attention to its religious elements, including Hong's decree that Christianity (as he conceived it) would replace Confucian orthodoxy in the civil service examinations through which government officials were selected.

Though Christian eschatology seems especially conducive to millenarian movements, they have occurred within most other religious traditions as well as a number of new religions. And they occur most often when people are deprived not only of livelihood but of hope in their worldly prospects. On the island of Java in the Netherlands East Indies (now Indonesia), a mystic religious community emerged among poor peasants in the early 20th century.

Known as the Science of the Prophet Adam, its leader, Surantika Samin, preached mystic detachment, quietism, and economic self-sufficiency. Though not violent, his movement resisted authority by refusing to pay taxes or perform *corvée* service. Samin was exiled by the Dutch colonial authorities, who feared that his movement could grow into active resistance, but it persisted among the villages of central Java until the 1960s.

Along the Thai-Burma border region, where Christian-led Karen ethnic insurgents have carried out resistance against the Burmese central government since the end of World War II, a new movement emerged in the late 1990s known as God's Army, a breakaway faction of guerrillas who were led by 9-year-old twins, Johnny and Luther Htoo; the twins were believed to have super-

natural powers, including invulnerability to bullets, and to command hundreds of thousands of "angel warriors" in battles against the Burmese army.

God's Army broke up after its boy leaders surrendered to Thai authorities and were tearfully reunited with their mother. But its short, tragicomic history showed how actively the millenarian imagination works among the poor and oppressed of the world.

Republican Party

THE REPUBLICAN Party (also known as the Grand Old Party, GOP) is one of the two major political parties in the United States. It is known as a more conservative, right-of-center political party, as opposed to the Democratic Party.

The Republican Party emerged amid a tumultuous time in American history, before the Civil War. In the 1850s, the Whig and Democratic Parties were unable to resolve their differences over the issue of slavery and over the growing economic, social, and cultural issues between the north and the south. President Abraham

Lincoln (a former Whig) was elected in 1860 as a Republican. During and after the brutal Civil War that followed, the GOP was the party for the freedom of slaves and for the unity of the country.

The Great Depression of the 1930s was a severe blow to the Republican Party, for a Republican was in office at that time, President Herbert Hoover, and so the GOP was blamed for the economic and social effects of the Great Depression. This plagued the GOP for decades. The elections of President Dwight Eisenhower (1952 and 1956), a hero of World War II, seemed to be an election that in some ways celebrated a great person and not so much the election of a political party.

The spirited campaign of Republican Senator Barry Goldwater in 1964 resulted in a sizable defeat to President Lyndon B. Johnson. However, Goldwater's campaign galvanized a budding conservative movement, and seemed to pave the way for Republican President Richard M. Nixon's successes in 1968 and 1972, and certainly for the historic election of Republican President Ronald Reagan in 1980. In 1990, President George H.W. Bush was elected, and in 2000 and 2004 his son, President George W. Bush, was elected. Under George W. Bush's leadership, the GOP gained a majority in both the House and Senate, something that it was not able to achieve for decades.

IDEOLOGY

In some respects it might be said that both the Republican and Democratic Parties in the United States are long on pragmatism and short on ideology. Ideology may appear to be important for a time, only to seemingly fade into the background when a strong personality appears on the political scene, or a particular combination of events transpires.

Certainly, the rise of the modern conservative and neoconservative movement is perhaps the largest, most impactful development in the last several decades of Republican Party history. Books that seem to exemplify this movement are Capitalism and Freedom (1962) by Milton Friedman, Conscience of a Conservative (1960) by Barry Goldwater, and the many works of Russell Kirk. National Review magazine, founded by William F. Buckley, certainly had an influence, as did Buckley's book, God and Man at Yale (1951). The conservative movement so influenced the modern Republican Party that the liberal Republican wing of the GOP (former Vice President Nelson A. Rockefeller would be an example) found itself struggling to maintain an identity. Perhaps one could compare this to the conservative wing of the

Democratic Party, which migrated in sizable numbers over to the GOP, particularly when President Ronald Reagan was elected in 1980 (the term *Reagan Democrats* was often employed to describe this group).

However, conservatives are not of one stripe any more than liberals are of one stripe. Classical conservatives (like GOP 1964 presidential candidate Goldwater) believe in a strict separation of church and state, and would be pro-choice, for the most part, on the issue of abortion. Cultural conservatives, in contrast, would be largely pro-life on the abortion issue and would argue for a strong role for the government in respect to positions on issues they consider to be immoral, such as abortion, homosexuality, pornography, and others. For them, the natural law, original sin, and fallen human nature play sizable roles. Whereas classical conservatives focus more on economic issues, such as the health of capitalism (for example, deregulation of capitalism so that it can function in more unfettered ways), cultural conservatives focus more on moral issues. For cultural conservatives, there is a serious moral slide in the country that needs correcting.

Within the Republican Party, there are other conservative schools of thought as well. Certainly, neoconservatives such as Irving Kristol and others have attacked the welfare state, and have called for more assertive, free-enterprise, and private-sector alternatives to the welfare state. Whereas the older conservative wing of the GOP did not seem too concerned with social welfare issues, the neoconservatives are.

Neoconservatives want to bring the market sector and privatization into the heart of social welfare. Neoconservatives are also interested in an assertive foreign policy, advocating the bringing of democracy to areas of the world that have not known democracy before. This is in sharp contrast to the foreign policy of Old Right conservatives like that of "Mr. Republican," Senator Robert A. Taft of Ohio, who was critical of the American globalism ideas of his day.

ATTITUDES TOWARD WORLD POVERTY

The attitudes toward world poverty and its resolution vary with the ideological perspectives and values of individual Republicans. Some say that poverty is a human condition that has been with humankind for generations, and will be so for generations to come. Certainly, Republican or conservative ideology would posit that the government role in addressing world poverty should not be an extensive one. Government by its very nature, they say, cannot be truly effective in combating

world poverty. Further, it is not government's role to take such action.

Rather, the focus here would not be on national government of any kind, but on the private sector in all its many forms. Nongovernmental organizations (NGOs) are uniquely equipped to confront world poverty. NGOs are more flexible and adaptive than government, and often more humane (perhaps particularly religious organizations). Two NGOs that have received attention for their efforts in addressing poverty in meaningful ways are Habitat for Humanity and the Grameen Development Bank. Both are in the private sector, and both require involvement and effort on the part of participants. There is no free lunch, Republicans remind us. They also remind us that government is terribly limited in what it can do or is capable of doing.

The greatest progress will come from the employment of the private sector.

Privatization in all its forms is advocated as a better means to combat poverty than the well-worn government approaches of the past, which they say lead to dependency on government. OXFAM and other private based relief organizations can do more for combating world poverty than can government programs, they say. Asset-based programs, which are focused on building the assets of the poor, are favored. Some government involvement is a component in such efforts, but nowhere near the degree of government involvement in sizable welfare state programs. Of course, some moderate or liberal Republicans allow for slightly more government involvement, but only the in a sense of a means to an end. They would assuredly state that government should eventually step out of the picture once some progress has been made. But again, for them the greatest progress will come from the employment of the private sector in combating world poverty.

Republicans (particularly religious conservatives) state that rapid population growth is not something that should be ignored, but would nevertheless have some concerns about some current developments and practices in this area. Republicans would remind us that countries are having problems supporting their welfare commitments to the aged and to other groups because of insufficient population growth. In the United States, demographic trends point to the dependency ratio significantly increasing in the years ahead. In 1960, the worker/beneficiary ratio was five to one, in 2001 it had

dropped to 3.4 to one, and by 2025 it is expected to be two to one.

The dependency ratio is the number of workers who are required to pay into the Social Security system to adequately support one retired worker living on Social Security. In other words, for the system to work, new, younger workers have to be entering the labor force, which of course implies some measure of population growth.

Globally, many Republicans do not share the assumption that world population increase will automatically result in increases in global poverty. Still further, the means to accomplish family planning goals by the United Nations and other bodies, such as the use of abortion and artificial contraception, are seriously disputed. Instead, natural family planning approaches, education, and economic development strategies carried out by the private sector are advocated.

For Republicans the way to combat world poverty is not through more welfare programs.

Development strategists have long pointed out that an effective way to lower fertility rates in countries with rapid population growth is to increase the education levels of women. Many women in developing countries are still lagging behind men with respect to basic literacy levels. Here, Republicans and liberal feminists can meet on some common ground. Other areas of concern for Republicans center on the ill health effects of abortion and artificial contraception.

Beyond this, there are cultural and ethical mores that need to be respected. Religious conservatives would strongly remind us that abortion stops a beating heart and that the unborn child has rights, including the fundamental right to life. There are sensitive, humane ways that global poverty policy efforts can approach family planning. One way that is universally abhorred by Republicans is the Chinese policy toward family planning, with its perceived authoritarian, enforced prohibitions on how many children families can have. We come back to a fundamental Republican tenet: it is the individual and the family, and the market economy that is the centerpiece, not government.

In conclusion, for Republicans the way to combat world poverty is not through more welfare programs run by the government. Instead, the way to combat world poverty is through economic growth and development, and through asset accumulation on the part of those on the lower ring of the economic ladder. Republicans usually advocate free trade, because it is believed that free trade increases economic opportunities for everyone.

While some Republicans like Patrick Buchanan have problems with free trade, most would favor it. The issue of free trade has been much discussed and debated. A leading conservative tenet is embodied in free trade, and that is the concept of freedom. The great economist Adam Smith, in his Wealth of Nations, championed the ideas of free enterprise and free trade. This "father of capitalism" is a major figure in Republican thinking, and the very economic system that he so forcefully advocated, capitalism, is viewed by Republicans and conservatives as the major way out of poverty. So global poverty, in their thinking, can best be combated utilizing the very economic approaches embodied in capitalism itself.

Thus, it is not the sometimes-questionable practices of corporations that are viewed as the problem. The social system or the environment is not viewed as the problem, but rather the activities and behaviors of individuals laboring within the system. Another way of putting this is that individualist explanations are favored over other approaches. In summary, for the Republican Party the solution to world poverty is economic, nongovernmental, and not welfare-based.

A still-lingering question for Republicans, as well as for Democrats, is how much of a role government should play in confronting poverty. It might be said that Republicans have erred in having too pessimistic a perspective on the possibilities of government intervention, whereas Democrats have erred in having too optimistic a perspective on the possibilities of government intervention.

RESULTS

RESULTS IS A NONPROFIT, grassroots American organization that advocates for the poor. Its goal is to create the political will to eliminate hunger and the worst features of poverty by effectively lobbying policymakers. The vision that RESULTS wants to share is one of a world without chronic hunger and the crushing defeat that poverty imposes. Starting from a 1976 report of the National Academy of Science that the resources were available to end poverty, the inevitable conclusion drawn was that the political will is missing. The political activities that RESULTS promotes are designed to encourage individual initiative. The goal is to so empower people with courage, information, and political skills that they will be able to exercise their personal and constitutional rights in an effective and politically powerful way.

Petitioning governing authorities for the redress of grievances is a basic right. To exercise this right effectively in the policy process means that people have to have the knowledge and skills to effectively lobby public officials if their grievances are to be ended. The RESULTS organization recognizes that a solitary individual, especially if poor, will have a hard time "beating" city hall. However, a group of highly motivated activists, especially if registered to vote, can often move political forces so that policymakers will not only grant a fair hearing to issues but will act to make significant changes, especially if these are helpful but not expensive.

The lobbying RESULTS engages in is based on the premise that elected officials have the right and the power to do much more for the poor than is currently being done. It also rests upon the belief that all people, even the poor, have a right to full participation in the

political process. As a citizens' grassroots lobby, RE-SULTS has organized over 100 local groups across the United States. The local groups typically have four to eight activists who meet monthly, or more often. The grassroots groups are engaged with either domestic poverty issues or global poverty issues.

RESULTS is focused on educating voters on the issues of hunger and poverty both locally and globally. To promote its educational work it has created an Education Fund. The educational mission conducts public forums, trains citizens in democracy (so that people cannot be kept from exercising their political rights by ignorance), and holds media conferences. It also is devoted to educating the public, the media, and civil and political leaders about the issues of poverty. Materials for its education program are produced by research and adopted for other sources.

RESULTS trains volunteers in various activist milestones. These are concrete activities that are step-by-step guides for leaders to use to introduce new volunteers and other community activists to advocacy in the political process. These milestone actions build a cadre of people who are the foundation of a local group. The activists trained with this method are soon able to effective lobby policymakers.

Ricardo, David (1772-1823)

IN HIS SHORT LIFE David Ricardo managed to amass a fortune, live the life of a country gentleman, serve in Parliament, and most of all, become one of the founding fathers of classical English political economy. The works for which he is chiefly known are *The High Price of Bullion*, a Proof of the Depreciation of Bank Notes (1809), "Essay on the Influence of a Low Price of Corn on the Profits of Stock" (1815), and On the Principles of Political Economy and Taxation (1817).

Finding employment with his father, Ricardo started his professional career at the age of 14. Despite a falling-out with his father—Ricardo had married outside of his Sephardic Jewish faith—Ricardo had, at an early age, accumulated a fortune in the London stock exchange. This early success allowed Ricardo to retire from business in 1814 and to devote the remaining years of his life to pursuing his various studies, which included, of course, political economy. Ricardo's brilliant career in economics lasted only the remaining 14 years of his life.

Among Ricardo's contributions to economics are a clear statement of the quantity theory of money, a theory of value, a theory of production and distribution, a theory of international trade, and the introduction of the deductive method. Ricardo's name, unlike many other classical economists', is still remembered today among the students of economics—he is still mentioned in today's textbooks on economics—principally for his monetary economics, principle of comparative advantage, theory of rent, and iron law of wages.

Ricardo recognized that it was opportunity costs that mattered and not absolute costs.

According to Ricardo, increased productivity, capital accumulation, free trade, and technological progress leads to economic prosperity. He was much in accord with the modern dictum that "a rising tide lifts all boats."

Certainly, there is no doubt of his enormous influence on the theory and application of monetary economics. Ricardo formulated and espoused his views on money during the bullion controversy in the second decade of the 19th century during the Napoleonic Wars. Britain had suspended the convertability of paper notes into gold.

This led to an inevitable increase in Bank of England notes, as there was no monetary restraint. This in turn led to an increase in the general price level and a fall in the exchange rate. Parliament took notice and began an investigation in which a number of witnesses were called to give evidence. Among those expert witnesses was Henry Thornton, whose theory on money was adopted by Ricardo.

Ricardo, however, developed a more rigid quantity theory of money than Thornton and unlike Thornton was unconcerned with the dynamic process of a monetary disturbance. Ricardo followed Thornton in the crucial role played by the interest rate in producing monetary equilibrium. According to this theory, an increase in the quantity of money would lower the rate of interest. With the rate of profits determined by real factors, a lower rate of interest compared to the profit rate would mean an increase in the quantity demanded of loanable funds.

So long as the rate of interest was low compared to the profit rate, businesses would be willing to borrow and spend. This spending would lead to a rise in the prices of goods. Ricardo thus had a quantity theory of money that worked through the interest rate mechanism. This holds true whether circulated money was paper or gold. When it was gold, Ricardo believed in David Hume's price-specie flow mechanism whereby gold flows would determine price levels among various countries through export and import changes. Ricardo also accepted Say's Law, whereby any increase in saving is met by an equal increase in spending.

With the principle of comparative advantage, Ricardo's talent as a theorist especially shines. Unlike his illustrious predecessor, Adam Smith, who put forth a theory of international trade based on absolute advantage, Ricardo recognized that it was opportunity costs that mattered and not absolute costs. His famous example of trade between England and Portugal is almost as well remembered as that of Adam Smith's pin factory illustrating the division of labor.

Ricardo's theory of rent was shaped at a time when other writers examined the high rents in England and attributed the cause to the same reason as did Ricardo. According to Ricardo's theory, rent is a residual. It is not price determining. Rents are paid, Ricardo tells us, because not all land is equal. The higher the price of certain commodities, such as corn, the greater the rent received on land according to how it compares with the marginal land. The lasting effects of Ricardo's economics, at least in the wider sense, may lie in his approach. He was clearly an ardent advocate of the deductive approach, and certainly J.S. Mill and Mill's follower Alfred Marshall, both of whom exerted an enormous influence on the course of economics as a science, profited from Ricardo's approach.

Romania

POVERTY IN ROMANIA follows a pattern found in many of the former command economies of the former Soviet Union and other areas of eastern Europe. The Romanian economy continues to undergo a painful transformation from state-owned to primarily privately owned enterprises, which started with the fall of the communist Nicolae Ceausescu regime in late 1989.

Despite significant progress, corruption, lack of transparency in government, and lack of economic opportunity remain major problems. Also, large sectors of the economy, such as the mining sector, have yet to undergo privatization. The impact on poverty is comparable to that in other parts of eastern Europe, such as Ukraine and Bulgaria. Integration into the European Union, slated for 2007, is driving reform efforts in the economy and government, including key social policies such as child welfare.

Poverty levels in Romania are driven by economic growth. Many households were thrown into poverty during the early transformation period, followed by a limited recovery that continued into the mid-1990s. Necessary efforts to rein in inflation led to a decline in Gross Domestic Product (GDP) from 1997 through 1999, causing a marked increase in poverty. Subsequent recovery in the national economy saw a decline in poverty from a peak of 35 percent in 2000 to 29 percent in 2002, and in severe poverty (based on the ability to obtain a minimum daily caloric intake) from 14 percent to 10 percent. Research by the World Bank also indicates that a sustained GDP growth rate of five percent could halve the poverty rate by 2007. However, the same report states that corruption, the slow pace of privatization, and other problems could threaten future economic growth.

RURAL DEPRIVATION

Based on a human development index developed for rural areas, a World Bank report determines that poverty follows a strong spatial pattern, concentrated in the eastern provinces and also spread as pockets throughout the rest of the country. Poverty enclaves are typically isolated in outlaying areas away from town or city centers, with limited road networks. On average, central villages had an index 30 percent higher than found for outlying villages, with central villages located close to cities on hillsides showing the highest level of development.

Poverty also shows a very strong ethnic pattern. The Romanian Roma (Gypsy) population is estimated at 2.5 million, the largest in eastern Europe. Poverty rates for the Roma have been estimated to be 10 times greater than those for other groups. Roma poverty also serves to reinforce negative stereotypes and discrimination.

Poverty is daunting because formal social networks, such as private professional organizations, usually exclude the poor and tend to help transfer income to their own, wealthier, members. The dislocation experienced by the poor since 1989 has also tended to disrupt their informal networks; hence the poor have less trust in neighbors and people in general and have little access to problem solvers and means of informal assistance.

In cooperation with the United Nations, the European Union, other international donor organizations, and domestic and international nongovernmental organizations, the Romanian government seeks to reduce poverty by various means. These efforts include the development of business and technology incubators throughout the country and enhanced access to information technology systems for disadvantaged youth.

Human Development Index Rank: 64 Human Poverty Index Rank: Not included.

DAVID W. HUGHES WEST VIRGINIA UNIVERSITY

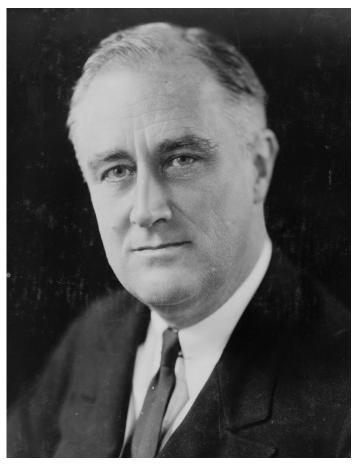

Roosevelt, Franklin (Administration)

HARDLY ANY PRESIDENTIAL administration holds a more prominent place in history than that of Franklin Delano Roosevelt (FDR). Most think of FDR as one of the greatest American presidents, though some think the opposite. None can doubt that his presidency spanned some of the most important events in American history, for better or worse.

Roosevelt was born on January 30, 1882, in a prominent New York family. He attended the Groton School and Harvard College. He became a lawyer after attending law school at Columbia University. He married his distant cousin, Eleanor, in 1905. They had six children, one of whom died in infancy. Roosevelt was elected to the New York State Senate in 1910. He served in the Woodrow Wilson administration as assistant secretary of the navy. The Democratic Party nominated him for vice president in the election of 1920. He and presidential candidate James M. Cox lost to Warren G. Harding in a landslide. In 1921, Roosevelt was crippled by polio. In time he reentered politics and became governor of New York in 1930. By this time, America was in the early stages of the Great Depression.

Over the next two years the nation sank deeper into the Depression. Unemployment rose, and the promises of President Herbert Hoover that prosperity was around the corner seemed empty. Discontent over economic conditions made it likely that Hoover would lose to his Democratic opponent. The Democratic Party nominated Roosevelt, and his personal charm made him effective in political campaigning. He won by seven million popular votes and with 472 electoral votes. Dealing with the nation's economic conditions would prove more difficult.

The Great Depression was unprecedented in terms of both its severity and duration. The unemployment rate had been 3.2 percent in 1929. It rose to 8.9 percent in 1930, 15.9 percent in 1931, and 23.6 percent in 1932. Industrial workers and farmers bore the brunt of these job losses. The Gross National Product (GNP) was \$203.6 billion in 1929, but it fell to \$183.5 billion in 1930, \$169.3 billion in 1931, and \$144.2 billion in 1932. Per capita GNP for this period fell from \$103 to \$58. There had also been waves of bank failures, a collapse of the money supply, and deflation. Approximately 10,000 banks failed in the panic of November 1930, including some of the nation's largest institutions. Many people lost their life savings in bank runs. The money

Franklin Roosevelt expanded the federal government to deal with the impoverishment of millions during the Great Depression.

supply fell by one-third. Hoover also converted a federal budget surplus of \$1 billion into a deficit of close to \$500 million in 1931, and nearly \$3 billion in 1932. While there had been considerable prosperity during the boom of the 1920s, the early 1930s were marked by the impoverishment of millions. Crises in the past had generally not lasted for long. This crisis seemed to worsen with each passing year.

The Roosevelt administration took an active approach in dealing with the Depression. Hoover had increased spending on public works and formed the Reconstruction Finance Corporation, but Roosevelt extended the role of the federal government further. He formed a "Brain Trust" within his administration to design a New Deal for the American people. Key members of this group were Harry Hopkins, Henry Morgenthau, Lewis Lowe, Averill Harriman, Cordell Hull, Harold Ickes, Frances Perkins, Sam Rosenman, Raymond Moley, and Rexford Tugwell.

Roosevelt closed banks with the Emergency Banking Act in an effort to stem bank failures. His adminis-

tration worked with Congress to pass legislation creating new federal agencies. This legislation created the Agricultural Adjustment Administration (AAA) to support farm prices. It also created the Civilian Conservation Corps (CCC) to employ 250,000 young men, and the Federal Emergency Relief Administration (FERA), which paid \$500 million in grants to state relief projects. The Glass-Steagal Act established the Federal Deposit Insurance Corporation (FDIC). This agency insured deposits up to \$100,000 with the aim of preventing bank runs. The Security and Exchange and Federal Securities Acts regulated the stock market.

Additional legislation established the Tennessee Valley Authority (TVA) in a public works project to produce hydroelectric power. The Rural Electrification Administration and the TVA served as vehicles for a federal energy policy. The National Industrial Recovery Act established detailed controls over industry, and the Fair Labor Standards Act created minimum wages. FDR also intervened in private housing with the Homeowners Refinancing Act, the Resettlement Administration, and the Home Owners Loan Act. The Social Security Act established pensions for retired and disabled workers.

Roosevelt faced opposition within his own party from Louisiana Governor Huey Long. Long claimed that Roosevelt was beholden to business interests. Long's "share the wealth" program would supposedly "make every man a king." Roosevelt had already advocated redistributing wealth from the rich to the poor. Yet his policies often did the opposite. Much of his New Deal was financed through excise taxes that fell mostly on poor and middle-income households.

Also, his measures to keep agricultural prices high imposed hardship on unemployed and part-time industrial workers. Such people could hardly afford to pay more for food during the Depression. In addition New Deal fiscal measures redistributed income from the poorest region of the nation, the south, to other parts of the country where Roosevelt needed more political support. Federal money often went to east and west coast electoral swing states, where incomes were 60 percent higher than in the poverty-stricken south. As a governor of a poor southern state, Long had good reason to doubt Roosevelt's commitment to redistribute income from rich to poor. There was a real basis for his challenging Roosevelt from the left, but this challenge ended with Long's death in 1935.

Many Americans were concerned with the power that Roosevelt was concentrating in the executive branch of the federal government. Roosevelt had asked Congress to allow him power "as great as the power that would be given me if we were in fact invaded by a foreign foe." The New Deal did, in fact, expand the powers of the executive branch greatly. While some merely complained about "that man in the White House," members of the Supreme Court acted against the Roosevelt administration's New Deal. The Supreme Court overturned some of the New Deal programs as unconstitutional. Consequently, many of the controls that Roosevelt had established, especially with the National Industrial Recovery Act and the AAA, fell to Supreme Court rulings.

Some studies indicate that the policies actually prolonged the Great Depression.

Roosevelt was elected to a second term in another landslide. Frustrated with opposition to his programs, he sought to "pack" the Supreme Court with his supporters. Part of this involved the mandatory retirements of Supreme Court justices at age 75. The other part involved increasing the size of the Court from nine to 12.

These moves would allow Roosevelt to appoint enough justices to guarantee support for his policies. His attempt to "pack the court" galvanized opposition, and the effort failed. Yet the Supreme Court never challenged his programs again. Roosevelt also opposed five senators of his own party in the 1938 mid-term elections so as to purge the opposition. All five won reelection.

The Roosevelt administration increased the powers of the Federal Reserve Bank. The Gold Reserve Act of 1934 and the Banking Act of 1935 vested great powers in the Federal Open Market Committee and increased federal control over bank reserves. In August 1936, Federal Reserve officials increased reserve requirements dramatically. The unemployment rate had fallen to 16 percent, but the increase in reserve requirements triggered a new crisis in the banking system.

The GNP bottomed out in 1933 at \$55.6 billion. It went up to \$65.1 billion in 1934, \$72.2 billion in 1935, \$82.5 billion in 1936, and peaked at \$90.4 billion in 1937. Unemployment had peaked at 24.9 percent in 1933 and fell to 21.7 percent in 1934, 20.1 percent in 1935, 16.9 percent in 1936, and 14.3 percent in 1937. The new crisis in 1937 reversed this anemic recovery. The GNP fell to \$84.7 billion in 1938, and unemployment rose to 19 percent.

A slow recovery followed this crisis. Unemployment fell slightly to 17.2 percent in 1939, and to 14.6 percent and 9.9 percent in the next two years, respectively. With unemployment in excess of 14 percent during every year of the first two terms of Roosevelt's administration, there is no doubt poverty remained prevalent at this time. In some respects, relative income inequality fell. The percentage of disposable income held by the top five percent fell from 30.4 to 25.4 percent during these two terms in office. Yet this trend began with the onset of the Depression in 1929, and persistent double-digit unemployment resulted in the absolute impoverishment of millions. Of course, one should not automatically blame a president for everything that happens during his term in office. However, some studies indicate that the policies of the Roosevelt administration actually extended and prolonged the Great Depression.

Unemployment fell to low levels during World War II, but this did not restore prosperity. War production demanded great sacrifices. Household consumption expenditures rose slightly during these years, but most of the increases in GNP were from military expenditures. Consumer spending skyrocketed after the war, but prior to this, most Americans endured relatively spartan conditions because of the war rather than the economic policies of Roosevelt's administration.

While some praise Roosevelt's administration for the way it handled the Great Depression, there are many reasons to disagree. The Depression did persist and at one point worsened during his first two terms in office. Those with a left-leaning perspective can easily criticize Roosevelt's administration not only for allowing mass unemployment to persist, but for implementing price controls and fiscal measures that intensified poverty, especially in the south. Those with a right-leaning perspective condemn him for interfering with the capitalist system. While people can disagree with the exact causes of poverty during this administration, there is no doubt that millions endured severe economic hardship.

D.W. MacKenzie Fairleigh Dickinson University

Roosevelt, Theodore (Administration)

THEODORE ROOSEVELT (1858–1919) was the 26th president of the United States and served from 1901 to 1909. He has something of a larger-than-life reputation and made his mark in many different fields, being a naturalist, historian, and writer in addition to a statesman. During his presidency, he was concerned with expanding the power of the state to take effective action against abusive corporations and with the United States' increasing involvement in world politics, taking a full part in the imperial system.

There was a correlation between Roosevelt's support for legislation that improved quality of life, such as new food and drug standards and conservation measures that included the creation of a national park system, and his interest in ensuring that businesses could fairly compete and that workers would be compensated fairly for their labor. Although the improvements in the average American's standard of living would be very gradual, Roosevelt's stance on business trusts and labor unions would set the stage for the eventual rise of organized labor in the 1930s and 1940s and for the merging of the working class into the middle class in the 1950s and the 1960s. His Square Deal for American workers would eventually be expanded through Franklin Roosevelt's New Deal into a safety net for poor Americans and through Lyndon Johnson's Great Society into an attempt to eliminate poverty outright.

Roosevelt was born into a noted Anglo-Dutch family and, as a boy, suffered from ill health, especially

asthma. As a consequence, he developed an extensive regime of physical exercise—the "strenuous life"—that subsequently served him well, as his life was one of relentless energy and achievement. He was elected at the age of 23 to the New York Assembly and began to establish a reputation in battling corruption within the local political scene.

When the Spanish-American War broke out, he commanded the Rough Riders volunteer cavalry force that was dispatched to Cuba, and performed with such spectacular success that Roosevelt became a national hero. He was so popular that he was encouraged by the Republican Party power brokers to run for governor of New York. He did so, was successful, and spent the next two years persecuting the corrupt, as well as developing the capacity of government agencies to enforce regulatory regimes.

Alarmed by this apparent lack of loyalty, Republican leaders managed to shunt Roosevelt off into the vice presidency, believing that he would be unable to wield any meaningful influence in a post that is customarily only ceremonial. This plan was initially successful, and Roosevelt fretted impotently for a while, until President William McKinley was murdered and Roosevelt gained the presidency.

As president, Roosevelt designated some 230 million acres of land as federal reserves of one sort or another, which is emblematic of the nature of his entire administration. He recognized that the flora and fauna of nature were an important public good, that is, everyone in the country benefited from their presence and no individual or organization should be permitted either to own or to damage what should be part of the birthright of all Americans.

Permitting market mechanisms to determine the fate of such public goods would inevitably mean negative outcomes to the public, as those with power to buy access would first enclose nature for their personal use and, second, modify it as they saw fit, which generally would be in a unsustainable manner. Roosevelt set the precedent for the modern presidential office, which has been replicated by nearly all subsequent incumbents, as an interventionist institution acting for the common good and creating access to sufficient resources to meet the goals set.

In the same vein, he founded the Department of Commerce and Labor and a Bureau of Corporations, in part to restrain unregulated corporations that exploited labor. Trust-busting, which is the breaking-up of monopoly-owning firms, was an important part of his administration. Previous *laissez-faire* presidencies had

Theodore Roosevelt sought to restrain monopolistic corporations, just as the concept of poverty relief emerged in the United States.

enabled corporations to collect power to themselves, to the great detriment of public health and social equity.

To ensure that such firms were obliged to produce goods and services that were of an appropriate level of quality, Roosevelt introduced measures such as the Meat Inspection Act, following his investigation into the Chicago meatpacking industry and the publication of Upton Sinclair's well-known novel, *The Jungle*. The Pure Food and Drug Act resulted from abuses in the patent medicine industry and had the same intent to protect the public from unscrupulous business. Roosevelt had an almost unremitting battle with Congress, which was filled with members sponsored to various extents by the industries that the president was seeking to control.

His intervention on behalf of the United Mine Workers of America against their coal industry employers was unprecedented. The Hepburn Act, which acted against the rail barons, was also the fruit of an almost one-man crusade. His use of the Sherman Anti-Trust Act of 1890 was also almost as unprecedented since the previous presidents had refused to activate it.

Roosevelt was not universally admired within his own party, since his actions damaged the personal interests of many powerful people. His personal friend and colleague, William Howard Taft, had been handpicked as his successor, but was of a more conservative bent, and eventually the two fell out as a split in the party intensified. Losing the nomination to Taft, Roosevelt left the Republicans to found the Progressive Party (widely known as the Bull Moose Party) and ran again with a manifesto espousing New Nationalism.

Benefiting from this split, the Democrat candidate Woodrow Wilson secured a crushing victory. Roosevelt, who had been shot while campaigning, continued to proclaim his personal beliefs and, as World War I approached and then erupted, he strongly supported the British Empire and its allies. He had some wish to run once more for presidency in 1916 but he was already regarded as yesterday's man.

Roy Wilkins Center

THE ROY WILKINS CENTER for Human Relations and Social Justice (RWC) is a joint endeavor by the University of Minnesota and the Roy Wilkins Foundation to honor the memory and continue the work of the eponymous social activist and leader. It was founded in 1992.

The RWC's mission is to "undertake research to guide and empower policymakers and community leaders to develop and promote solutions to the problems of racism and racial and ethnic inequality." The main activities of the RWC have been research, dialogue, and community partnerships. It is part of the Hubert H. Humphrey Institute of Public Affairs and was inaugurated as the only endowed chair and center in the memory of Roy Wilkins in the United States. The chair was endowed with \$2 million and its first holder was the economist Dr. Samuel L. Myers, Jr.

Roy Wilkins (1901–81) was a leading black American civil rights activist who rose to become elder statesman of the National Association for the Advancement of Colored People (NAACP). He also achieved prominence for his newspaper work and in organizing events such as the 1963 March on Washington. Throughout his life he worked to promote racial equality through nonviolent means, specifically through the legal system, and abhorred racism in all its forms, including the concept of black supremacy. Under his leadership, the NAACP provided legal support for some militant groups and solidarity with nonviolent direct action groups.

The RWC continues to explore the questions that drove Wilkins: what is the nature of social justice for all and how can it be achieved? The goals of the RWC are inspired by this quest and are stated as "Promote discussion on issues of discrimination, inequality, and racism by bringing together concerned stakeholders from all communities and disciplines to propose innovative, well-rounded solutions. Foster discussion and bridge building within and among the different communities of color to help them discover their common interests, discuss their differences, and work together to advance the needs of all people of color. Conduct quality research on issues of most pressing concern to minority populations to understand the causes of these concerns and propose solutions to them. Educate greater numbers of students of color in public policy to help their communities gain a more active role in policy discussions and decision-making that affect people of color."

These goals have been approached through research, outreach activities, the production of reports and videos for public distribution, and other forms of dialogue. Dialogue is interracial and interdisciplinary and is used to help create innovative curricula and learning opportunities for students, who can then be inspired further to meet the RWC's goals. International conferences were held in 1996 and 1998 devoted to remedies to racial and ethnic economic inequality and these helped to build bridges with researchers in other countries working in similar fields.

Rural Antipoverty Programs

ANTIPOVERTY PROGRAMS are government-supported policies aimed at reducing poverty within society. Rural antipoverty programs are the same but are aimed specifically at reducing poverty in rural areas, which have particular problems with respect to poverty. Governments may also work with international aid donors and nongovernmental organizations (NGOs), secular or faith-based.

Since the nature of rural areas varies significantly from country to country, the type and scope of rural program that may prove effective also vary. However, it is possible to state that rural areas share the general characteristics of scarce infrastructure, lower population density and markets, and lower incomes resulting from reliance on low value-added agricultural products. There may also be social costs involved in living in rural areas resulting from isolation and social deprivation.

Conversely, some societies are able to produce intricate social networks in rural areas that unite people in villages and rural communities and enable them to withstand external shocks. An additional issue to consider is that many regions will have a majority of ethnic minority people who may have difficulty in communicating with or receiving sympathy from the state authorities and from the dominant ethnic group. In some cases, predatory government administrations have used poverty-increasing policies in some areas in order to punish or impoverish groups.

Local projects necessitate local answers to poverty reduction. Awareness of specific types of foodstuffs, fertilizers, and other inputs is essential to the creation of a successful project, as is the need for proper data collection, monitoring, and postproject evaluation. This most commonly means that local people's knowledge is required as an integral part of the poverty reduction strategy. Unfortunately, local people's voices are often lost when experts arrive from the capital or descend from overseas with internationally designed research instruments using a vocabulary and discourse with little or no connection to the people for whose ostensible benefit experts are working. Consequently, many projects fail.

In many parts of the world, people living in rural areas rely upon subsistence agriculture, which involves very small or no cash exchanges. People grow crops and husband animals, supplemented perhaps by fishing, hunting, and gathering fruits and vegetables for alternative sources of protein. They are customarily unable to build anything other than a nominal surplus of goods or money to deal with a sudden shortage or requirement for resources. An environmental problem, consequently, can result very suddenly in outbreaks of famine affecting hundreds or thousands of people.

For example, the River Mekong in the Isaan region of northeastern Thailand is subject to flooding, and the remainder of the region, much of which rests on a large salt pan, is subject to droughts because of the unpredictable nature of the monsoon rains on which agriculture depends. In either case, farmers lose their harvest and, customarily, are required to borrow money from the local rice merchant, which, since they are able to acquire very little surplus, generally means they are entering into long-term indebtedness, which makes their position vulnerable to abuse.

Government ownership of debt should at least prevent exploitation of debtors.

Historically, heads of households were able to sell family members into temporary or even permanent slavery to pay off such debts. This system is no longer legal but, in its place, agents exist who will facilitate entry into the sex industry or into human trafficking. Suitable antipoverty programs in this case, therefore, will focus on both the provision of short-term emergency assistance to ensure good health and the longer-term provision of government welfare to alleviate indebtedness. Government ownership of debt should at least prevent exploitation of debtors, even if it is no easier for the poor to repay what they owe.

Programs such as this are predicated on the idea that welfare is a good and suitable policy for government on the basis that repayment is unlikely to occur. It is possible to justify policy on the basis of possible social disorder as a result of famine, although most people recognize the need for relief of the poor. Indeed, most societies have fostered a favorable sentiment toward farmers and people in rural locations, generally that they are somehow more closely related to the cultural heart of society and are spiritually superior.

One of the immediate responses of people to poverty is to move to find better opportunities. Within countries, people tend to move from rural areas to urban areas since these are believed to be more effective in generating cash-paying jobs. Since large-scale migration can lead to many social problems, ranging from intense pressure on local services, such as housing and sewage, to family breakdowns and substance abuse, this is an undesirable phenomenon.

Governments may pursue regional development programs to provide income-generating jobs within villages and rural communities to deter migration. One example from Japan that has been developed further in both Thailand and Laos focuses on identifying cases in which traditional or cultural forms of production result in items for which sustainable demand at a regional, national, or even international level may be expected. Governmental agencies assist with distribution and marketing and a portion of the resulting income is returned to the villagers. Programs have been introduced that have shown initial levels of success but their sustainability has yet to be determined.

Women may further suffer in some societies from lack of opportunity to participate in economic or social activities for cultural or historical reasons. Many can benefit from the provision of social skills and enhancement of confidence in their own ability. Women in urban environments and in richer countries may have received these skills from basic education to which the rural women may nit have had access.

A project in Gansu Province of China, for example, has empowered women to open their own small businesses, focusing on adding value to traditional agricultural production. The concept of gender mainstreaming is central, therefore, to rural antipoverty programs. It is defined as being mindful of issues specifically related to women and gender distinctions and integrating these issues directly into all projects and evaluations.

Rural antipoverty programs in more industrialized countries tend to focus less on the possibility of primary poverty or indigence and more on remedying potential economic inequalities. This includes the provision of infrastructure, including information com-

munications infrastructure. As the importance of internet technology grows in providing opportunities both in education and in the knowledge economy, the need to bridge the digital divide intensifies. Some governments are planning to introduce low-cost personal computers for schools and even laptops for individual children. These may use the clockwork technology, which previously was used with great success to produce clockwork radios in many countries across Africa. These radios, created originally by British inventor Trevor Bayliss, have helped in broadcasting health and educational information in accessible formats for rural people.

Strengthening regional institutions can be an important aspect of rural poverty reduction. These include both private- and public-sector institutions. The former include the ability to access market-related facilities enabling rural people to distribute, brand, and promote their value-added products and networking possibilities in terms of sharing market information. The public-sector institutions offer government services and welfare provision, including labor market information, job-matching possibilities, business advice and support, and social support.

Rural Deprivation

DEPRIVATION IS INADEQUATE access to various goods and services, including but not limited to food and money. Rural deprivation relates to the lack of ade-

Rural deprivation means the lack of access to transportation, technology, healthcare, education, and other social commodities that can keep a rural population in many countries from escaping poverty.

quate resources for people living in rural areas. Since poverty is more commonly associated with rural than with urban areas, rural deprivation is more common than urban deprivation and includes dimensions such as lack of transportation and telecommunications access, which urban areas are less likely to suffer.

The divide between rural and urban has intensified in recent years, as capitalist development tends to take place in designated centers of activity, and market-friendly economic policies on a nearly global basis have acted to privilege the urban and exclude the rural. Economies of scale and scope affect the provision of nearly all goods and services and hence the measurement and consideration of rural deprivation can involve as many dimensions as may be measured. This also means that nearly all goods and services that are available are more expensive in rural areas, while income is frequently lower because of reliance on agricul-

ture and other low-valued activities. Education and health services are high-cost services that are best provided in the context of scale economies. This is particularly true of specialist services, such as mental health and special needs education. Consequently, those in rural locations needing these services will almost certainly be required to travel to urban areas or be deprived. Since many rural locations appear unattractive as homes to professionals, posts are often difficult to fill and may be filled by necessity by improperly trained individuals.

Lack of affordable public transportation affects both the ability to access goods and services provided in regional centers—towns and villages—and also the ability to take goods to market. The availability of comparatively low-cost motorcycles has helped many rural people in developing economies to travel to nearby communities for wage labor during times of seasonal

agricultural work. However, many people face personal isolation and reduced inability to access services.

The digital divide refers to the difference in access to educational and work opportunities and achievement dependent on availability of information technology and, particularly, the internet. Pupils in developed countries, for example, often receive assignments that require access to internet resources for full and timely completion. Workplace requirements can often be managed better through electronic communications. However, not only is coverage less likely, less reliable, and more expensive in rural locations, but for developing countries, lack of education and language skills may preclude use. Clearly, access to electronic cultural resources and productions will also be affected. Some governments have sought to tackle these issues through free radio and television educational programs and free or low-cost computers and software.

In the majority of societies, women's work is customarily defined as being within the household. Consequently, they have reduced ability to travel and this can lead to isolation and difficulties with childcare. Depression and spousal abuse are associated with this kind of situation. The reality of rural life is frequently different from the type of idealized rural lifestyles so common in popular culture around the world.

Immigrant communities may also suffer as a whole from being effectively ghettoized in rural communities, especially if their new environment is very different from the home one. Many immigrants in the northern United States are subject to stress for this reason.

Most activities in rural areas revolve around agriculture and, especially, in developing countries, this involves low value-added activities, with products subject to negative environmental effects and increased competition through the forces of globalization. High costs and small local markets make industry or effective entrepreneurial behavior difficult. Ambitious, talented, or simply indebted individuals are frequently required to travel to urban areas to obtain better financial and career opportunities.

Governments have most commonly tackled rural deprivation through programs of rural development. However, a small number of predatory governments have chosen to ignore rural deprivation or even exacerbated it for punitive political reasons. Rural development has historically concentrated on improvements in agricultural processes and land reform. However, more recently, attention has been paid to more integrated and supportive sets of policies through a holistic understanding of the rural environment. Strengthening ca-

pacity and existing networks of relations between rural people and households, market institutions, and other partners has been an important aspect of newer programs. In developed countries, many rural communities have sufficient infrastructure and underutilized assets to be able to participate effectively in a knowledge economy.

In the absence of rural development, large-scale internal and external labor migration may develop, as has happened in China and many countries in southeast Asia, not to mention the United States, where labor mobility has traditionally been high. Labor migration is frequently associated with negative familial and social outcomes and places great pressure on local services.

Rural Poverty Research Center

THE RURAL POVERTY Research Center (RPRC) was established in 2002 as the result of a three-year grant from the U.S. Department of Health and Human Services Office of the Assistant Secretary for Planning and Evaluation. It is housed jointly at the University of Missouri-Columbia and Oregon State University, and is part of the Rural Poverty Research Institute (RPRI). The RPRC has as its mission "to examine both the causes and the consequences of poverty in rural areas and the factors affecting the success of policies to improve the self-sufficiency and well-being of low income workers and families in rural America." The goals of the center are to help create an integrated research

agenda for rural poverty, to strengthen capacity to explore that agenda, and then to involve and engage with policymakers to put into practice recommendations drawn from research findings. This entails conducting research and hosting working paper series written by external researchers, providing mentoring and coaching services for young researchers, offering opportunities for researchers to become affiliates of the RPRC, and organizing conferences and other events where knowledge may be transferred and networking activities can take place.

Although poverty rates in the United States have declined over the last decades, there are still some seven million rural poor in the country and rural poverty rates are significantly higher than urban rates. Most, indeed 90 percent, of the 500 poorest counties in the country are rural, and 95 percent of persistently poor counties are rural. Urban poverty tends, in other words, to be less endemic than it is when it afflicts rural areas.

Four trends inform the RPRC's research agenda: "Persistent poverty appears to be concentrating in rural counties. High barriers to economic self-sufficiency in rural areas continue to yield worse outcomes for rural workers and families. Rural communities still do not have the capacity to provide work and family supports that lead to success in the labor market. Policies to improve the well-being of low-income families are becoming less effective in rural relative to urban areas." The poorest areas in the United States are clustered in the south, Appalachia, and the southwest.

Rural Sociological Society

THE RURAL Sociological Society (RSS) describes itself as "a professional social science organization that promotes the generation, application and dissemination of sociological knowledge. The society seeks to enhance the quality of rural life, communities, and the en-

vironment." It was founded in 1937 and has achieved prominence in it s field as a provider of research and research-based policy on issues related to rural life and rural poverty.

In support of its objectives, the RSS supports a number of research and interest groups, as well as advisory committees. Research interests include rural gender and ethnic minority issues, health and poverty, agriculture, and other industries. Various interest groups relating to these issues serve to bring together researchers and other interested people to help formulate and provide advocacy for policy. Much of the research is published by the society through the peer-reviewed journal *Rural Sociology*, which has since 1937 provided a forum for up-to-date research and policy formulation from a variety of multidisciplinary standpoints.

The Rural Sociologist, another publication, is a quarterly containing letters, announcements, and articles of general interest to its audience. Research of a more extensive nature may be published in book form through the Rural Studies series organized through the Penn State University Press. The society's annual meeting offers an opportunity for concerned people to share the latest research findings, to network, and to exchange information on emergent themes and opportunities.

Rural sociology focuses on rural issues and topics, including communities, agriculture, social equity, youth and families, natural resources and the environment, and food systems. It also focuses on applications of sociology, such as research-based information for decision-makers, sociological theory to explain social phenomena, and models of social action. It also pays attention to international dimensions of rural life, such as global environmental systems, international development, natural resources, and food systems.

In general, rural society is characterized by working in agriculture, high birthrates, isolation, and migration to urban centers for better social and economic opportunities. The digital divide, which separates learning and income opportunities into those with and those without access to information technology such as the internet, is intensifying gaps between many urban and rural locations. These problems are frequently exacerbated for those who are vulnerable in society or suffer from discrimination.

Russia

THE PROBLEM OF POVERTY in Russia is not new. It was a taboo to discuss it under communism, when poverty was pervasive but officially did not exist. The Bolshevik Revolution of 1917 was not an isolated event in Russian history: tzarist economic policies, especially during World War I, were characterized by rigid bureaucratic regulations and an imperialistic and militaristic agenda, and led to widespread poverty, income inequality, and further pauperization of both peasants and industrial workers.

It set the stage for the Bolshevik coup d'état and establishment of the deadliest dictatorship in human history. Lenin's government produced an endless stream of economic decrees and policies that resulted in mass starvation, epidemics, and consequent depopulation of the cities. During the first five years after the revolution, Russia experienced a population decrease of 18 to 20 percent through mass starvation, civil war, and Bolshevik repression, as well as emigration and very low fertility combined with the highest mortality rates ever experienced by Russia.

Bolshevik economic policies in 1918–21, also known as war communism, were an attempt to introduce full-blown communism based upon the orthodox Marxist utopian vision of a new society. They tried to introduce the direct power of the workers at all levels of management and to construct a whole pyramid of organs of worker control, from the individual enterprise to the entire economy, as institutions of centralized management. This experiment with orthodox Marxism led the country to complete disaster: workers were interested in consumption rather than production and the advancement of communism.

Vladimir Lenin had chosen the only possible way of managing the economy under socialism: direct government terror and coercion. The absolute command economy (the Leninist pattern of socialism) was created. Solely the central government performed the management of production and distribution. There was a period, as in 1919–20, when communists seriously discussed the imminent abolition of money and transition to distribution purely in kind. Both the actions and the talk of communist leaders put the country on the verge of complete economic catastrophe within three years of the beginning of the socialist experiment.

Lenin introduced the first series of reforms, known as the New Economic Policy (NEP), in March 1921, a temporary retreat from orthodox Marxist methods of advance toward communism. These reforms would be introduced as a last resort for saving communism, not abandoning it. Liberalization of economic life under NEP, coupled with the introduction of the gold standard, revived economic activity and led to the fastest rates of economic growth and rising living standards in Russian history.

It could not last for long: the rapid growth of the private sector in those sectors of the economy in which it was permitted, and its evident competitive advantages, represented a political threat to the regime. Realization of this threat by Joseph Stalin and other communist leaders led to the abandonment of NEP in the late 1920s, and creation of the command system of Soviet socialism as it did survive (with minor modifications) until Mikhail Gorbachev's *perestroika* (liberalization) in the 1980s.

This system was based on liquidation of the market and government rationing of both means of production and consumer goods. The Soviet government created horrific noneconomic institutions of compulsion to work: mass repression, providing millions of slave laborers in the Gulag system, and a ban on peasants leaving collective farms, supplemented later by a similar ban on jobs and residency changes for urban residents that completed the enslavement of the whole population.

Many believe that Stalin's terror and deprivation took place mainly in the cities, against intellectuals and political opponents. However, the great purges were really an assault on the countryside. Over half of all executions took place in rural areas. The liquidation of the *kulaks* (relatively wealthy peasants) ended up in 10 million of them being deported to Siberia, where most of them died of starvation. In Ukraine alone, Stalin starved to death over seven million peasants in 1930–33. Communist leaders ended up deporting the poorest—women, children, and crippled people who were of no political threat to the government.

With fanatical zeal and stunning brutality, the Soviet government was cleaning the country of millions of "nonpersons." Stalin's famous dictum—the "death of one person is a tragedy, while death of millions is a sta-

tistic"—became the background of one of the worst human tragedies in history. It is beyond the abilities of economic analysis to calculate the true cost of the socialist experiment in Russia, but the human toll is estimated to be 42 million people, who perished in a dreadful Gulag, in collectivization, purges, campaigns against "unearned" incomes, and other programs. The elimination of private property ensured the security of the one-party apparatus. Along with the dreadful Gulag, NKVD (political police), the state monopoly on resources and employment, created a ruthless totalitarian system.

The market was replaced by a system of commands based on the mechanism of central planning and state ownership. The final goal of Karl Marx, that the social anarchy of production under capitalism gives way to a social regulation of production upon a definite plan, was achieved. It led to severe dislocation and waste of resources, widespread shortages, and massive loss of human life and starvation. The price of labor was set at the subsistence level, with the average wage in the 1930s at less than \$7 a month. Abolition of private ownership of property led in Russia to a poor and decimated society.

The first sign of the coming Soviet economic collapse at the end of the 1970s and the beginning of the 1980s was an urgent necessity to increase state subsidies to unprofitable enterprises. Huge losses imminent to the nonworking system were covered by foreign currency obtained from the overseas sales of oil, gas, and other natural resources, and credits readily provided by the Western governments and banks. These funds enabled Kremlin bureaucrats to purchase food and basic consumer goods in the world market in order to make up for domestic production failures and prevent mass famine and consequent uprisings.

By the mid-1980s, the deterioration of the Soviet economy reached a critical point. More than 50 percent of state business enterprises were permanently unprofitable and survived through huge subsidies, while the agricultural sector required an infusion of more than 100 billion rubles in the years 1986–90 to support the collective farm system based on state ownership of land and forced labor.

Productivity declined and shortages (as well as a corresponding rationing of consumer goods) became widespread. Western credits and emission of inflationary money were not enough to perpetuate Soviet socialism. With the election (by 11 Politburo members) of Gorbachev as general secretary of the Communist Party of the Soviet Union in March 1985, reformers

gained new hope. Gorbachev, without himself knowing or wishing it, gave the process of change a powerful impulse, which determined the future development not only of his own country but also of the many states within the Soviet sphere of influence.

A devoted communist, Gorbachev was trying to solve problems of widespread poverty and declining productivity. *Perestroika* was the most far-reaching attempt to reform socialism, and the ensuing collapse of the socialist economic system was an unforeseen consequence of Gorbachev's government actions. Under *perestroika*, individuals were allowed to start their own small "cooperative" businesses, encouraging the development of the market economy. Prices of most goods continued to be set by the state, and all large and medium-sized enterprises remained in state ownership.

After the dissolution of the state, poverty in Russia became a very predominant issue.

At the same time, *perestroika* led to the break-through out of socialism and laid the foundation for the postcommunist restructuring of Russia and eastern Europe. The end of 1991 marked the collapse of both the Soviet economic system and the Soviet Union as a unitary state. After the dissolution of the state in December 1991, poverty in Russia became a very predominant issue. Many international organizations, including the World Bank and the International Labor Organization, focused on the situation of the Russian poor.

Russia experienced a high incidence of poverty and income inequality both before and after the collapse of the Soviet Union. As a part of the economic transition, in 1992 price controls were removed on most commodities except energy. The inflation rate for the year exceeded 3,000 percent, and continued at a very high level until 1995. Average wages and salaries failed to keep pace, so real income per capita fell significantly by more than 50 percent from 1991 to 1992.

The living standards of ordinary Russians were also affected by a substantial reduction in formal-sector employment, which led to higher unemployment and greater reliance on informal (and often black market) economic activities.

A privatization campaign created large fortunes for some, but most Russians saw their savings disappear through government-organized inflation and privately operated fraudulent investment schemes. Russian economic and social statistics, however, were and still are

unreliable because of their political, rather than economic, nature.

Some link the widespread poverty in Russia to the process of economic transition. Approximately 77 percent of Russians believe that there has been a dramatic increase in poverty since the collapse of the Soviet Union, and 41 percent of surveyed Russians consider themselves as being "poor." Soviet socialism, however, was not egalitarian with the real incomes differential being one of the highest in human history. In reality, under socialism, people were poorer, but their perception of poverty was blurred by the propaganda of free education, healthcare, and subsidized but largely substandard housing.

The ruling class enjoyed a high standard of living, but its consumption was hidden from the masses. All surveys of "poverty" in Russia revealed that despite their rising incomes, respondents still felt worse off than they used to.

In part, this is because the adjustment to a new system itself was traumatic. Even if standards of living rose across the board, other people's standards of living were rising a lot faster. In the Soviet days, everyone seemed equal on the surface: perquisites and privileges, such as access to modern healthcare, foreign goods, and travel, were mostly invisible.

After Russia became independent from the Soviet Union in December 1991, Russian economic performance was characterized by high inflation; a significant decline of real Gross Domestic Product (GDP), consumption, real wages, and household incomes; an increase in inequality and overall poverty; and mass unemployment unheard of under communism.

According to the World Bank, Russia's Gross National Income of \$2,140 per capita in 2004 is one of the lowest in Europe, with 60 percent of the economy being in the "informal" (black market) sector. The United Nations Development Program (UNDP) downgraded Russia from 57th position in 2004 to 62nd in 2005 because of low life expectancy and economic instability. UNDP economists believe that the situation will hardly change if Russia continues to rely on petro-dollars. Russian citizens will still rank among 40 percent of the world's poorest population, spending less than \$2 a day.

The Russian population decreased from 148 to 143 million between 1991 and 2004. The Russian fertility rate has declined to among the world's lowest, while its abortion rate is the highest. Low fertility, coupled with a dramatic increase in mortality, especially among working-age men, has led to a situation whereby the annual number of deaths exceeds the number of births. As a

result, Russia has the lowest life expectancy for males in a developed country (59 years) and the largest disparity in the world between male and female life expectancy (13.5 years).

One of the explanations for increased mortality is endemic alcoholism. Russia's rates of homicide and suicide are among the highest in the world. In addition, deaths from illness and chronic and degenerative diseases have also increased sharply.

More than 30 percent of the rural population lives in poverty.

The Russian government defines poverty as a monthly income of 1,000 rubles (\$38). According to official estimates, in 1992 one-third of the population had incomes below the poverty line. In 1994-96, that was down to about 25 percent, and then increased again in 1997-98 to about 34 percent. After the economic depression of 1998, the economic situation in Russia significantly improved through high oil prices and some business-friendly reforms of the Putin government. The official poverty level peaked in 1999 at 41.5 percent; it was cut in half by 2002 to 19.6 percent, and further decreased to 17.8 percent of the population in 2005. The poorest is the rural population. More than 30 percent of the rural population live in poverty. Among age groups, children under 16 have the highest incidence of poverty, about 25 percent. The north Caucasus, south Siberia, and parts of central Russia are the poorest regions in the country.

The major cause of poverty is unemployment—in the north Caucasus, it ranges from 11.7 percent in north Ossetia to 46.7 percent in Ingushetia, far above Russia's 6.5 percent average, according to the Federal Service of State Statistics. Widespread poverty in the region is a breeding ground for terrorism. "My antiterrorist operation is to create jobs—so that the young aren't attracted to automatic weapons but to agricultural machinery," said Ingushetia President Marat Zyazikov. "The more we put young people to work, the more we minimize their flow to groups of people who have chosen the wrong path."

The average monthly wage in north Ossetia is 2,596 rubles (\$87), about half the figure for the whole of Russia. Dagestan residents earn an average of 1,886 rubles a month (\$63), while Ingush residents make 1,392 rubles (\$46). The statistics service does not compile wage data for the war-ravaged Chechnya.

The Kremlin in Moscow has overseen Russia's economy from totalitarian socialism to modern capitalism. The Russian government defines the poverty line as a monthly income of 1,000 rubles (\$38).

A unique feature of the socialist legacy in Russia is that many people may have low incomes and consumption levels but live in expensive apartments, own summer cottages, and land, and still can receive social assistance. The number of officially poor in Russia is seriously overstated by the official statistics because of the widespread "informal sector" based on the black market, tax avoidance, and other characteristics of the "shadow economy."

Rural Russia, which has a surplus of labor, suffers from chronic poverty. Even the most selective social aid cannot rectify this situation because everyone would have to get such benefits all the time. It is necessary to create alternative jobs in rural areas. Labor migration is just about the only quick and cheap solution for people to find employment.

Russian experts have established that the amount of stolen funds is directly proportional to federal budget subsidies to any territory for poverty elimination purposes. Overall, poverty in Russia is connected with the situation in the labor market: 60 percent of all poor Russian families have at least one unemployed adult, thus making up 70 percent to 80 percent of the entire income deficit.

The Hermitage Museum in St. Petersburg once represented the ostentatious wealth of the upper classes in Tzarist Russia. The government was purchasing artwork for the collection, while the peasants starved.

The Vladimir Putin government set as its goal to halve the spread of poverty by 2007. To achieve this, the consumption levels should grow by a significant five percent a year. Social policy in Russia is conducted through more than 1,000 different programs of social assistance. At the federal level, 182 programs are providing benefits payable to 242 categories of the population. The number of those in need of social assistance, among them the "new poor" (low-paid categories of the working population, including a considerable share of those employed in the public sector), increased considerably, but had fallen to about 11 percent by 2005.

Data on the distribution of income show wide disparities in Russian society. The gap between the highest and the lowest 20 percent of population (quintiles) was 14 to 1 in 1993, and widened afterward. Developed market economies display the six-to-one disparity on average. The most recent figures report a Gini value in Russia of 48 percent, a level traditionally associated

with the most unequal societies of Latin American or African nations. The share of foodstuffs in a household budget amounts to 34.35 percent.

According to Engel's Law, with rising incomes, the share of expenditures for food declines. In the United States it is 9.7 percent, and the other developed countries all have rates lower than 18 percent; a 34 percent food expenditure in the budget is characteristic of developing economies.

The high level of poverty during the transition is due more to the rise in inequality than to the reduction in average incomes. Economic growth was strong (five to six percent annually) during recent years, and especially after the economic depression of 1998. Russia's Federal Service of State Statistics estimates that average income soared by 8.3 percent in 2004. Moreover, average wages increased by 23.3 percent. The current boom is mainly caused by increased oil exports coupled with high and increasing world oil prices.

The major difference between the poverty in Russia and that in developed market economies is the wide-spread phenomenon of the "working poor"—skilled and semiskilled full-time workers who are not able to break out of poverty. Most of the poor workers are employed in the public sector, including teachers, physicians, workers at the publicly owned enterprises, low-ranking civil servants, and the military.

More than half of all officers in Russia's underfunded military live in poverty: 56 percent of officers live under the official poverty line. Because of the thriving "shadow economy," widespread barter, in-kind payments and transfers, transitory income, and economic mobility are very important for understanding variations in income; it is difficult to gauge the degree of inequality in Russian society using official data on the distribution of income. When these factors are taken into account, they tend to suggest that economic well-being is more equally distributed than is official annual income.

Russian government policies are distorting labor markets by preventing labor mobility through the institution of *propiska*, a "residence requirement." As a result, the housing market has not yet developed and there is no transparency in these and any other markets in today's Russia. Most respondents blame the state policies for their poverty. The reasons cited are unfair laws and regulations under which an employer can defer wages for months, but there is no legal remedy available to address these and other injustices.

Ineffective social programs are the result of the ineffective performance of Russia's social institutions, rather than an ineffective methodology for identifying the most underprivileged groups. Russia's social institutions are mostly focused on helping the elderly, the handicapped, and veterans. In reality, poor people often are not members of these three groups. Veteran's organizations, groups representing the handicapped, and Chernobyl (nuclear accident) cleanup workers managed to secure additional assistance through their political influence in the Duma (Parliament). Since January 1, 2005, Russian local governments have had to pay all monetary benefits.

The absence of rule of law, blurred property and other human rights, widespread corruption, and the existence of the failing public sector (especially in rural areas) are the chief causes of poverty and the low standard of living in Russia. The fact that property rights and private ownership dominate the wealthiest economies of the West points to the economic inferiority of the state or collective-based ownership solution.

Rwanda

ONE OF THE SMALLEST and most densely populated countries in Africa, Rwanda is also one of the poorest, with an estimated 60 percent of the population living below the poverty line. Rwanda has maintained an average of 160 out of 177 on the United Nations Human Development Index over the past five years. Poverty in Rwanda is highly concentrated among rural populations and in households headed by women, children, and former prisoners.

The origins of Rwanda's modern economic decline lie in a controversial ethnic conflict between Hutu and Tutsi groups. The diversification of separate ethnic groups and their eventual disparity were instilled by colonizers, who deemed Tutsi individuals as more apt to manage the majority population of Hutu workers. From the start, the so-called ethnic tensions felt in Rwanda and neighboring Burundi were a type of abstracted class system that has continued to have farreaching economic consequences.

Political strife across Hutu-Tutsi lines escalated beginning in 1989, when a drop in the price of coffee and tea, Rwanda's two main exports, resulted in economic depression. The Hutu-Tutsi conflict reached a boiling point in April 1994, when President Juvénal Habyarimana was assassinated and a three-month civil war and genocide began. Nearly a decade later, in 2003, the new Rwandan government was officially installed by na-

tional democratic elections. Although Rwanda has been rebuilding its infrastructure for over 10 years, repercussions from the atrocities committed during the civil war have prevented a smooth transition to democratic rule and civil security.

Rwanda's population, which has doubled in the last 30 years despite the death of nearly one million people in the genocide, was growing at a rate of close to three percent in 2004, and was a major determinant of the nation's poverty problem.

An influx of refugees from the Democratic Republic of the Congo in 2004, and the scheduled return of dissident Rwandans from the Democratic Republic of the Congo in 2005, exacerbated the overcrowding experienced in Rwanda, and lowered the standard of living in some regions.

In addition to these itinerant populations, in late July 2005, the Rwandan government decided to release tens of thousands of incarcerated individuals who had confessed to participating in the genocide, which significantly augmented the population of unemployed persons in Rwanda. These displaced populations caused overwhelming local problems, which affected poverty levels when they supplemented already crowded regions that faced shortages of social services and resources. Population movements after 1994 heavily affected Rwandan poverty.

Rwandan life expectancy, which was below 40 years in 2004, was a grim indicator of the child poverty that plagued postgenocide Rwanda. In many cases where entire families were decimated in 1994, orphaned children without extended family support became marginalized

in a fierce competition for food, housing, and public healthcare. Moreover, poor health indicators compounded the intense struggle for survival faced by Rwanda's many destabilized populations. Approximately 60 percent of the population were without access to clean water in 2000 and an astronomical 92 percent of the population were without sanitation services. The prevalence of HIV/AIDS was a moderate five percent, but was expected to worsen as a result of the high incidence of unsafe reproductive habits.

Adult literacy was moderate for sub-Saharan Africa at 70 percent in 2004. While primary school enrollment and youth literacy were both around 84 percent, few children advanced to secondary school. Unemployment was frequently a symptom of low levels of education, but it was also commonly a result of oversaturated urban job markets. In the agricultural sector, land tenure, social and economic isolation, and severe environmental conditions such as drought, disease, soil fer-

tility, and degradation led to high poverty rates in addition to the suffering of the national economy.

Saint Kitts and Nevis

SAINT KITTS AND NEVIS is a small state in the eastern Caribbean composed of two islands in the Antilles chain. Europeans, primarily the British, colonized the islands shortly after Christopher Columbus mapped their location. Sugar was adopted as the primary industry for the islands. In 1882, Saint Kitts and Nevis was formally joined as a state with Anguilla and independence followed in 1967. However, complaints from Anguilla of domination by Saint Kitts led to the removal of Anguilla and, in 1983, Saint Kitts and Nevis achieved independence in its current form.

The country has suffered from its colonial status, in which monocropping of sugar was introduced. Fluctuating commodity prices, declining output, and high production prices have all hampered the industry, while a succession of five major hurricanes had devastating impacts on the islands. It has been estimated that, while overall Saint Kitts and Nevis maintains an annual per capita Gross National Income exceeding \$6,500, nevertheless some 30 percent of its people face poverty and 11 percent extreme poverty, in which food insecurity is a very real threat. Overcoming overreliance on a single commodity requires extensive diversification in the

economy and the creation of higher value-added outputs from the sugar crop. Tourism is one sector that has witnessed growth, albeit from a very modest base, while the agricultural sector possesses the comparative advantages necessary to produce alternative goods, but not the human or financial capital necessary to bring about such a change. Poverty rates are strongly correlated with location and with occupation. Approximately 60 percent of the poor are under 25, 60 percent are women, and 50 percent have no educational certification. The total population of the country just exceeds 40,000 and so the absolute number of the poor amounts to around 12,000. The infant mortality rate in 2003 was 19 per 1,000 live births and the under 5 mortality rate was 22 per 1,000 children. The country nevertheless ranks within the top 50 of developed countries according to United Nations measurements of development, indicating a degree of inequality.

Saint Kitts and Nevis suffers from many of the problems facing very small island countries—it is the smallest in the Caribbean. These include heightened vulnerability to external shocks, lack of managerial and technical skills, low levels of spare capacity in health and education sectors, small domestic markets, and reliance upon important imported goods and services,

leading to balance-of-trade difficulties. Plans to develop the economy through offshore banking havens and more extensive tourism development may be successful for a small number of people but, without strong governmental institutions able effectively to redistribute such earnings, only a small number of people would benefit, many of whom would not be local people.

Saint Lucia

LOCATED BETWEEN THE Caribbean Sea and the north Atlantic Ocean, the island of Saint Lucia is 27 miles long and 14 miles wide. Because of its excellent harbors, England and France hotly contested ownership of Saint Lucia in the 17th and 18th centuries, but the United Kingdom ultimately established possession in 1814.

Saint Lucia became independent in 1979 after 10 years of self-government, achieving both political and economic stability. Saint Lucia's sandy beaches and mineral springs attract large numbers of tourists, and the island has become a popular wedding spot.

Saint Lucia has a diversified economy, with 53.6 percent of the labor force involved in service industries. Only 21.7 percent are engaged in agriculture, mostly the export of bananas. This enterprise has been seriously threatened by international events and increasing competition from Latin American countries. Saint Lucia is experienced an unemployment rate of 20 percent in 2005, despite the fact that foreign business and investment, particularly offshore banking and tourist-related enterprises, were steadily increasing. Saint Lucia's man-

ufacturing sector is considered the most diverse in the eastern Caribbean area, and the island is believed to have geothermal potential.

Economic stability on Saint Lucia is important in protecting the quality of life for Saint Lucians, particularly among the poorest segment of the population, because resources are unevenly distributed. The poorest 20 percent own only 5.2 percent of the island's resources, while the richest 20 percent share 48.3 percent. Saint Lucia is ranked 42.6 percent on the Gini Index of Human Inequality.

While official poverty assessments are unavailable, a report by the Caribbean Development Bank states that 18.7 percent of Saint Lucian households and 25.1 percent of all individuals are poor when the concept is defined according to the amount of money spent on food and nonfood items. The report also reveals that poverty is most prevalent in rural areas.

Life expectancy has increased in Saint Lucia over the last few decades. The population of 166,312 enjoys a life expectancy of 73.05 years, with women surviving their cohorts by an average of more than seven years. The median age is 24.81 years. Over 30 percent of the population are under the age of 14, and 5.2 percent are at least 65 years old.

Most Saint Lucians have access to good healthcare and basic needs. However, two percent do not have safe drinking water and 11 percent lack access to proper sanitation. These individuals are generally those who live in remote areas. There are 58 physicians per 100,000 residents, but 20 to 50 percent of Saint Lucians are unable to afford essential drugs.

On Saint Lucia, infant mortality occurs at the rate of 13.53 deaths per 1,000 live births. That rate declined from 19 deaths per 1,000 live births in 1990. Between 1990 and 2003, the mortality rate of all children under 5 fell from 24 deaths per 1,000 to 18 deaths per 1,000. Eight percent of all babies are underweight at birth. Approximately 14 percent of all children under 5 suffer from malnutrition. About 11 percent of this group suffer from moderate to severe stunting, and six percent experience moderate to severe wasting. Childhood immunizations are readily available in Saint Lucia, and rates are stable in the 90 percent range.

Between 1980 and 2000, the fertility rate of Saint Lucian women was more than halved, from 4.4 children per woman to 2 children. The fertility of females between the ages of 15 and 19 is 73 per 1,000 births. Nearly half of all women use contraceptives of some sort. Virtually all births in Saint Lucia occur in the presence of trained medical staff. Modeled estimates

for the period 1985 to 2002 place maternal mortality at 30 deaths per 100,000 live births.

Saint Lucia defines literacy rates according to the number of those who have attended school. About 65 percent of males and 69 percent of females meet this criterion. School is universally available, and most students attend school for at least 13 years. Primary school completion rates are 100 percent for both males and females.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Saint Vincent and the Grenadines

SAINT VINCENT AND the Grenadines is a Commonwealth nation within the Lesser Antilles chain of the eastern Caribbean Sea. The northern part of the Grenadines chain, including Bequia, Mustique, and Union Island, is administered as part of Saint Vincent and the Grenadines while the southern part is administered by Grenada. Saint Vincent is dominant but has a territory of only 134 square miles and, like all the islands in the state, is vulnerable to external shocks such as hurricanes and faces the problems of few resources and lack of economic diversity.

Saint Vincent is likely to have been visited and named by Christopher Columbus, but its Caribbean population was not greatly disturbed. A shipwrecked slave ship led to Africans reaching the island in 1673, and they integrated with the indigenous population. Subsequent attempts to establish colonies were mostly unsuccessful, but eventually a struggle between the French and the British during the Seven Years' War led to the islands changing hands several times. A Frenchinspired rebellion of Caribbeans led to the British exiling most of them to the Bay Islands, and strengthening

their control over the remaining black slaves involved in the sugar industry. The emancipation of the slaves in 1834 led to a temporary labor market shortage that was filled with the importation of settlers from east India and Portugal. Hurricanes and a volcanic eruption in 1902, together with declining sugar prices, led to economic problems that have never been fully overcome. Saint Vincent and the Grenadines achieved independence from Britain and became a member of the Commonwealth in 1979, having been autonomous since 1969.

The state is almost entirely dependent on the export of agricultural commodities.

The total population of Saint Vincent and the Grenadines is just over 109,000 and, with an average life expectancy of 72.9 years and an annual per capita income of \$2,820; the overall standard of living is moderate. However, the legacy of slavery and colonization means that the state is almost entirely dependent on the export of agricultural commodities. The prevalence of agriculture means that many people live in rural areas where poverty is more likely and access to health and education services much less likely. In 1996 (most recent figures), 20 percent of children under the age of 5 suffered from malnutrition.

Additional economic activities include a small-scale offshore banking sector that does not spread benefits very far and so allegations have been made of connections with the illegal narcotics trade as a transshipment point. Bananas have surpassed sugar as the principal agricultural export in recent decades. Production peaked in 1990 at 90,000 tons but has since more than halved as a result of institutional changes in the principal market of the European Union (EU) and increased competition from Latin America. Preferential EU export schemes were due to expire at the end of 2005 and this leads to further uncertainty for future income.

Salvation Army

THE SALVATION ARMY IS one of the largest and most successful charitable organizations in the world. William and Catherine Booth established it in 1865 as a Methodist ministry in the East End of London. From the start, the Salvation Army adopted a military model and those who joined were obliged to obey military-style organization. It was one of the first religious institutions to offer leading positions to women.

From London, the Salvation Army spread to many parts of the United Kingdom and subsequently became internationalized into more than 80 countries. The army describes itself as: "The Salvation Army, an international movement, is an evangelical part of the universal Christian Church. Its message is based on the Bible. Its ministry is motivated by the love of God. Its mission is to preach the gospel of Jesus Christ and to meet human needs in His name without discrimination." This mission statement shows the aspiration of the Salvation Army to be a global organization.

FOUNDING OF THE SALVATION ARMY

The Salvation Army spread rapidly in its early years, partly as a result of its adoption of the quasi-military structure that it still has and which is symbolized by the wearing of uniforms, awarding of ranks, and so forth. The military symbology is adopted on the basis that its members are in spiritual combat with the various forces of evil and, being well organized and equipped as an army should be, its members have a better opportunity to win the particular battles in which they are involved.

However, to be successful, an army requires discipline and this has always been difficult to ensure in so many Christian organizations, especially Protestant organizations. One early schism involved the American branch of the Salvation Army.

The organization had rapidly spread across Britain and then internationalized. The American branch wished to become independent and struggled against William Booth to this end in 1884. Eventually it was expelled and soon withered, having sought to become the

American Salvation Army. Activities subsequently became successful in America, although not before hostile reactions led to the deaths of several army members. Second, Ballington Booth, a son of the general, again sought to establish his own independent society, which he did through resigning and establishing the Volunteers of America. This has grown into a large and successful venture that now employs some 14,000 professionals and 70,000 volunteers in a variety of programs.

The Salvation Army early in its life established its role as a worker among those who were often outcast or despised by society. These people included alcoholics, the homeless, prostitutes, and drug addicts. Army members traveled through the districts of cities in which people with these characteristics were likely to be found and would seek to offer personal assistance and relief while, at the same time, attempting to persuade them to convert to the religious beliefs the army members favored. This occasionally brought about confrontation with other people who rather resented being told that their lifestyles were sinful and shameful and should be radically changed. Violence occasionally threatened and so army members took to taking bodyguards with them. In due course, the bodyguards sought to disguise their role and this was the origin of the brass band music that has become so redolent of Salvation Army activity.

RELIGIOUS STYLE

Individuals who wish to become members of the Salvation Army must first sign various Articles of War to demonstrate their commitment. They spend two years undergoing training in residence, followed by five years of advanced studies. Members are posted to a corps, which is the basic organizational structure of the Salvation Army, and corps are part of divisions that are grouped into territories, which are generally individual countries, apart from in the United States where there are four separate territories.

Booth's original religious doctrines are still followed. He believed that salvation did not require application of the sacraments but could instead be achieved by public confession, professions of faith, and the attendance at various informal prayer sessions which tend to feature individual statements of belief, singing, hand-clapping, and so forth. Salvation Army members are generally well trained and capable in public communications and relations and are able to lead such sessions as well as to locate new recruits.

ROLE OF WOMEN

Women are accorded exactly equal status with men. This equality of status was awarded from the very beginning of the organization's existence and is extremely unusual in religious organizations, especially Christian ones. Booth created the Slum Sisters as part of the Slum Crusade, in which the women traveled the slums of the East End of London armed with cleaning equipment, with a view to improving hygiene and nutrition in areas where people lived who had little education in such things. This campaign may have been gender-distinct but this did not mean that it was gender-biased. Of course it is possible to search for individual occasions on which women were treated improperly, but this is to miss the point of the organizational and institutional arrangements that ensure equality.

ACTIVITIES

Taking into account the imprecation in the Bible to go and make disciples of all nations, the Salvation Army is now active in most regions of the world. Members aim to fulfill their mission through the following means: "by our presence in the world, by our public proclamation of the gospel, by personal evangelism, by pointing to evidence of the Holy Spirit's power to transform lives, by identifying with and offering compassionate service to the poor and disadvantaged, and by working with the oppressed for justice and liberty."

This involves several different areas of activity, including the provision of international health services, community development, evangelism, relief work, promotion of women's ministries, and campaigns to reduce human sexual trafficking. The Salvation Army has been active in tackling human trafficking since the 19th century, when it was initiated by Josephine Butler, who had for years been concerned with rescuing young women from brothels in London and found an opportunity to do so.

Through both practical action in providing refuges and media activity and advocacy, including naming and shaming some of those involved in the trade, the army fought against Britain's Maiden Tribute. Subsequently, army troops have been active in a number of countries, although often on an informal basis since many governments do not recognize the issue and, hence, it is necessary to work with discretion.

The health program works also in an international context and with the aim of creating an integrated package of activities in which community involvement is an

important component. This is described as follows: "The Salvation Army's commitment to health programs is rooted in our understanding of God's saving purposes for the world and our commitment to world evangelization.

"The Army emphasizes that compassionate care is linked to healing, social inclusion and whole person transformation. With a commitment to integrated mission we recognize that in spite of human brokenness and sin, all individuals and communities have the potential for growth, for wholeness, for better relationships and for reconciliation with God." The religious aspect to health provision is thoroughly included in every part of its operations. This can lead to some conflict when recipients or host governments maintain different views on religious practice than are pursued by the army.

SIGNIFICANCE OF THE SALVATION ARMY

The Salvation Army is of particular importance as a charitable organization because of its close links and commitment to local communities, especially to working-class people who are often vulnerable to poverty or to unsafe forms of personal and social behavior. By offering an alternative lifestyle choice, it has provided opportunities to many young people. Through lifelong commitment to the cause, army members further demonstrate the value of permanent solutions to the issues they hope to tackle.

Samaritans

IN THE NEW TESTAMENT in Luke 10:30-37, Jesus tells the story of the Good Samaritan who stops to help a wounded Jewish man lying in the road after several Jews have crossed to the other side and refused to help. The story gains new significance in light of the fact that Jews hated the Samaritans, who were a mixed race and who were considered idol worshippers. A small group of biblical Samaritans still survives in Palestine and Israel today. Jesus used the Good Samaritan to teach a lesson about helping those in need. The charge that Christians should help all people in need, regardless of race or religion, serves as the foundation of Samaritan's Purse, the international nondenominational Christian charity. The Samaritans, an English-based suicide prevention group with chapters around the world, has also adopted the story of the Good Samaritan as its creed.

Samaritan's Purse, which was founded in 1970, is headquartered in Boone, North Carolina. The charity also has offices in Australia, Canada, Germany, Ireland, the Netherlands, and the United Kingdom. Franklin Graham, son of evangelist Billy Graham, has led the charity since the death of founder Bob Pierce in 1978. Smart Money magazine has called Samaritan's Purse the most efficient of all religious charities, noting that 88.8 percent of its budget is used for project activities. Savings account for 12 percent of the budget, and 3.7 percent is used for fundraising activities. The projected budget for Samaritan's Purse in 2004 was \$210 million. Overall, the charity is viewed in a positive light, but criticism has been abundant.

Controversy erupted in 2001, for instance, when the *New York Times* criticized Samaritan's Purse for using government funds to spread religion in the name of disaster relief in El Salvador. Officials admitted that three percent of its budget for the project had come from federal funds but defended its actions in accepting the grant for earthquake relief.

While spreading the gospel message of the Christian faith, Samaritan's Purse travels the world to help victims of war, disease, disaster, and famine. During the wars in Afghanistan and Iraq, Samaritan's Purse has provided water systems, shelters, and medical kits for over 100,000 people. Nevertheless, the charity's presence in Iraq, which is 97 percent Muslim, and in Afghanistan, which is 99 percent Muslim, has added to ongoing criticisms about the practice of mixing aid and religion.

In December 2003, Samaritan's Purse visited Sudan to talk about peace and freedom of religion with Presi-

dent Omar al-Beshir. The charity also opened medical facilities, dispensed food and school materials, and oversaw agricultural projects. Traveling to war-torn Liberia in the spring of 2004, workers for Samaritan's Purse opened rehabilitation facilities for demobilized female soldiers and military wives.

In 2005, Samaritan's Purse pledged \$13 million in relief after parts of Asia and Africa were devastated by tsunami waves in December 2004. The money was used to set up food kitchens at emergency shelters and buy fishing boats to help people return to work. Additionally, Samaritan's Purse provided individuals and families with rebuilding kits containing basic tools, plastic sheeting for shelters, household supplies, water filters, mosquito netting, and direct aid. The antipoverty element of the charity is geared toward providing basic needs to people while teaching them about prevention of diseases and proper handling of household waste.

The inclusion of the comic book has led to charges of proselytizing.

Samaritan's Purse is known around the globe for Operation Christmas Child, which involves sending shoeboxes full of small gifts to children around the world at Christmas. In mid-November each year, more than 100,000 volunteers from churches, schools, businesses, and civic groups donate and pack the boxes, following careful guidelines.

Volunteers come together in the United States, Canada, the United Kingdom, Australia, the Netherlands, Germany, Ireland, Austria, Switzerland, Finland, and New Zealand. The boxes include such items as books, small toys (but no toy guns), school supplies, hygiene items, wrapped candies, gum, socks, caps, t-shirts, jewelry, and batteries. Notes of encouragement may also be included. There are 1,800 dropoff sites in the United States alone.

Along with the shoeboxes, children receive a comic book of Bible stories, *The Greatest Gift of All*, which tells the gospel message. The inclusion of the comic book has led to charges of proselytizing, which is specifically against the law in many countries. In 2005, 7.4 million shoeboxes were delivered to children in 95 countries.

Samaritan's Purse also sponsors the Children's Heart Project, which identifies children with heart defects and brings them to the United States for treatment. Doctors and hospitals perform the work for free,

and local groups provide support while families are in the United States.

Through the World Medical Mission, Samaritan's purse sends physicians and dentists into countries such as Kenya, Rwanda, Bangladesh, Egypt, Papua New Guinea, Haiti, and Ecuador on both short-term assignments and two-year residencies. One element of this program deals specifically with immunizing children in remote villages against communicable diseases and with providing antimalarial medication. The World Medical Mission program has been criticized for its work against HIV/AIDS because opponents say the charity deals with the issue from a Christian rather than a medical perspective.

Samaritan's Purse also employs workers to serve as managers, grant writers, emergency workers, builders, administrative assistants, and in various other positions. These workers serve from two to 12 months, accomplishing such tasks as building homes and schools, setting up hospitals and clinics, and dispensing food, water, and emergency supplies.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

Samoa

THE INDEPENDENT STATE OF Samoa is composed of two large and seven small islands in the south Pacific Ocean. The largest islands in the chain are Upolu and Savai'i. Once known as Western Samoa, the islands were administered by New Zealand under the United Nations Trust Territory of the Pacific until 1962. Upon gaining independence, the country became known as Samoa. According to the United Nations, Samoa is one of the 49 least developed countries in the world.

Historically the Samoan economy has relied heavily on development aid and regular remittances from Samoans who work abroad. Two-thirds of the labor force is involved in agriculture, which provides 90 percent of all exports. The fishing industry has declined in recent years because of overfishing. Small-scale industries on the islands revolve around the processing of agricultural products. The tourist sector is rapidly growing on Samoa, and tens of thousands of visitors come to the islands each year. Economic reforms are underway that are designed to deregulate the financial sector and encourage investment. If inflation remains low, and if fiscal discipline persists, the Samoan economy has a chance for strong growth in the coming years.

Samoa is a lower-middle-income nation with substantial debts, but it has made great advances on a number of major social indicators in recent years. A 1999 study by the United Nations and the South Pacific Commission revealed that 48 percent of all families in Samoa were living in poverty on less than \$1.34 a day. While poverty existed throughout Samoa, it was concentrated on the island of Savai'i. Some 55 percent of the residents of this island were poor.

Data from the study revealed that most of those living in poverty resided in large families in which the head of the household was unemployed. Conditions in those households were primitive with no access to basic necessities. Over the last few years, access to basic necessities has been expanded with the help of an improved economy and international agencies.

Life expectancy has been steadily increasing on the islands, particularly among females. In 1980 the projected life span was 63 years. Currently the Samoan population of 177,287 enjoys a life expectancy of 70.2 years. The projected life span for females is 73.65 years as compared to 67.93 percent for males. The median age is 24.59 years. Some 27 percent of the population are under the age of 14, and 6.4 percent have reached the age of 65. Approximately 99 percent of the population now have access to safe drinking water and improved sanitation. There are 34 physicians for every 100,000 residents on Samoa, and only five percent lack access to affordable essential drugs.

Infant mortality has significantly diminished on Samoa over the past decades. From 1970 to 2003, infant deaths dropped from 106 to 19 deaths per 1,000 live births. Among all children under the age of 5, mortality was slashed from 160 to 24. Because of improved conditions, only two percent of all children under the age of 5 are malnourished, and four percent of infants are underweight at birth. Childhood immunization is al-

most universal among Samoan children from birth to 23 months old.

While fertility is high on the islands, it has declined considerably in the past decades. In 1970, women produced an average of 5.7 children each. By 2003 the fertility rate had dropped to 4 children per woman. Adolescent fertility stands at 25 per 1,000 births. Less than a third of Samoan women use any form of birth control, but contraceptive use has climbed from 18 percent in 1980. Between 1990 and the present, the number of trained medical staff attending births on Samoa rose from 76 to 100 percent. According to modeled estimates for 2000, maternal mortality occurs at a rate of 130 deaths per 1,000 live births.

Literacy is almost universal on Samoa, and 99.7 percent of the population over the age of 15 can read and write. The gender difference in literacy rates is negligible at present, although female literacy has traditionally lagged slightly behind that of males. Most Samoan children attend school for at least 12 years, and completion rates have been steadily increasing over the last few years. All Samoan children now complete primary school.

San Marino

THE THIRD SMALLEST nation in Europe, the Republic of San Marino is completely surrounded by Italy with which it maintains close political and economic ties. The Sammarinese believe that their country is the oldest republic in the world. This nation of 61.2

square miles is considered one of the most peaceful places in the world because it has remained intact through repeated attacks by other Italian states, including during the Napoleonic wars, unification of Italy, World War I, and World War II. After joining the United Nations in 1992, San Marino began taking an active role in international diplomacy. The government of San Marino maintains poverty alleviation should be a major priority in the international community.

San Marino is the eighth richest nation in the world, with an annual per capita income of \$34,600 and an unemployment rate of only 2.6 percent. Over half of the Gross Domestic Product (GDP) is generated through the tourist industry. Some three million people travel to San Marino each year. Approximately 57 percent of the Sammarinese labor force are engaged in services, and banking is a key industry. Approximately 42 percent of the workforce are employed in industries that include wearing apparel, electronics, and ceramics. Only one percent of the labor force are engaged in agriculture, mostly producing wines and cheeses. Because of the small agricultural sector, San Marino imports most of its food supply from Italy.

Little data are available for San Marino on major social indicators. This makes it difficult to access poverty or the quality of life. However, San Marino does have an extensive social net to help those in need. Government aid is given to those Sammarinese whose incomes fail to provide a basic standard of living.

The life expectancy of the Sammarinese people is 81.62 years. With a projected life span of 85.43 years, women generally outlive men (78.13 years) by more than seven years. The median age is high at 40.29 years among San Marino's population of 28,880. Almost 17 percent of Sammarinese are under the age of 14, and approximately 17 percent have reached the age of 65. Fertility is low in San Marino at a rate of 1.33 children per woman. There are 252 physicians in San Marino, and all residents have easy access to healthcare.

In 2005, infant mortality in San Marino was estimated at 5.73 deaths per 1,000 live births. At 6.16 deaths per 1,000 live births, male infants were less likely to survive than female infants at 5.26 deaths per 1,000 live births. The mortality rate of all children under the age of 5 declined from 10 deaths per 1,000 to five deaths per 1,000 in 2003. About 10 percent of all infants in San Marino are underweight at birth.

Overall, childhood immunizations are high in San Marino. Around 96 percent of all infants have been immunized against polio and DPT. However, measles vaccinations have been more of a problem. In 2002, only

84 percent of all infants had received measles vaccinations. By the following year, however, that number had increased to 91 percent. Among children between the ages of 12 and 23 months, 91 percent have been immunized against measles, and 96 percent have been immunized against DPT3.

Within the population over the age of 10, 96 percent of Sammarinese can read and write. With a 95 percent literacy rate, females lag behind males at 97 percent. All children in San Marino progress past the fifth grade.

Sanitation

SANITATION IS THE ATTEMPT to keep the environment clean in order to prevent and control diseases. It is a concern of public health, governments, armed forces, and individuals. Sanitary practices seek to control the environment and individual hygiene in order to prevent diseases.

Historically more soldiers have died of diseases while serving in the armed forces than have died of battle wounds. More civilians have died of diseases than have died in wars. Fleas, rats, lice, viruses, and water are very closely intertwined throughout human history, with the majority of deaths from poor sanitation occurring from among the ranks of the poor.

The development of sanitation in modern times has led to the growth of many new professions and to the creation and expansion of many new governmental agencies that all focus on protecting the health of cities, towns, and communities. The engineers, physicians, biologists, chemists, and others work to design ways to

control the purity of water and food stocks. Together with governments and private companies they work with sewage treatment and solid waste removal. Numerous government agencies are actively developing, adopting, and administering laws to promote and protect a healthy environment.

The many industries and professions that work in the area of sanitation are protecting water and food supplies, evacuating sewage and solid waste. They are also protecting against insects, rodents, mold, poor air quality, and other threats to public health.

WATER

Water treatment is essential because most of the water supplies on earth are no longer pristine even in remote locations. The more heavily populated an area, the more its water supplies need to be carefully handled to prevent pollution that can cause not only disease but also debilitating or deadly epidemics. Potable water for drinking, bathing, swimming, cooking, or laundering is vital. Without it people will die in great numbers because they will be exposed to water that contains bacteria, viruses, or other microbes that can cause illness.

Untreated water may also contain unpleasant odors as well as bacteria. It may also contain chemicals that can cause illness or interfere with the cleansing power of water. To have sufficient supplies of clean water, cities and towns build water treatment plants or they assign this important function to private corporations. Almost all the water to be purified for human use comes from groundwater, rivers, or lakes. A growing amount comes from desalination plants.

Most small towns use groundwater from a spring or from wells. Larger cities use rivers or lakes. Sometimes the water is from an artificial lake created by a dam. If there are insufficient supplies of water from ground, river, or lake sources, the water will have to be piped in or trucked in from some distant source. This is a method used by the ancient Romans. The Middle Ages, with a great decrease in population, used much fewer sanitation measures.

WELLS

Some commentators have assessed the world's water supplies and have declared that there is a global water crisis. Many nongovernmental organizations (NGOs) are helping to provide clean water supplies in poor countries. NGOs have dug and are digging a variety of wells all over Africa and on other continents.

Reestablishing the water supply after the Iraq War was a top priority to help alleviate poverty conditions.

For example CARE in the last 50 years has provided water improvement projects to over 10 million people in over 40 countries. These water projects are connected to sanitation needs.

FOOD

Food supplies used by humans have always been vulnerable to pollution from the field to the kitchen; there are many hazards that can affect the foods people eat. These pollutants can affect human health seriously or mortally. Cereal grains can be infected with different diseases caused by fungi, rusts, molds, or other diseases. These infections can adversely affect human health if the infected cereal grains are consumed. Consequently consumer advocacy groups are often allies of public or agricultural officials in efforts to keep contaminated foodstuffs from markets.

Animals, birds, or fish consumed by humans can affect human health if they are sick or have consumed heavy metals in the food chain. Fish with high levels of mercury when consumed by humans can contribute to nervous disorders or other illnesses. Birds infected with avian influenza that are consumed by humans can infect people with strains of a virus that may lead to human versions of influenza with high morbidity and mortality rates. Or, eating pork infected with trichinosis worms that has not been thoroughly cooked can cause trichinosis in humans. This is a very painful condition in which the worm cysts lodge in human muscle tissue.

The eating of bush meat in Africa has been practiced from ancient times. However, today it is a source of diseases that with globalization can have severe consequences. Ebola fever is a hemorrhagic fever that has a very high mortality rate. It is contracted from diseased animals. It affects the poor in Africa who eat wild animals and it could spread to towns and to the wider world.

Freshly killed meat that is hung in marketplaces in the poor countries in the world exposes the meat to flies and to other airborne health hazards. The practice of hanging meat in this manner is connected with a lack of refrigeration. Sanitation laws to protect foods in many countries include either governmental or religious stockyard inspections, slaughterhouse inspections, processing plant inspections, or even inspection of cooking conditions.

In wealthier countries the guarantee that the conditions are sanitary is the restaurant's inspection report card. In poor countries the guarantee arises from the boiling of water for tea or coffee. The cooking of food such as steamed rice or vegetables provides some assurances that the food is safe to eat. In wealthier countries modern refrigeration is helping to preserve food, lower its cost, and reduce its health hazards immensely. However, the cost of refrigeration is still beyond the budgets of millions in the poor counties and classes of the world.

Food inspections that are an extension of sanitation concern are those that involve safeguarding food from contamination by allergens. Some foods can cause illness or death in people who are allergic to foods like shellfish or peanuts. Keeping foods free of them is important to the health of some people.

SEWAGE

Sewage treatment of wastewater is the removal of sewage waste material produced by people. Sinks and toilets in homes and other places such as restaurants, offices, public buildings, farms, factories, sporting arenas and sporting events, and other places are the sources of this kind of waste. Sewage is about one percent solid waste and the remainder is water. However, it is highly toxic and also disease-laden. This form of sewage, along with industrial sewage and other forms of waste, must be cleansed before it is returned to streams, rivers, or lakes.

Unfortunately many towns and cities all over the world have used a policy of cleansing water taken into their water systems, but ignoring water discharged back into the environment. Unless the sewage is treated, it contaminates the waters into which it is discharged. Eventually pollution consequences occur. Swimming is prohibited because the water is too polluted. Algae blooms occur, fish die off, aquatic plants choke streams, and other negative effects occur.

There are numerous ways to treat human sewage. Among these are sewage treatment plants that use chemicals or other means. Effluent ponds will also consume large quantities of human sewage where bacterial processes will naturally restore the water to pure conditions. Septic tank processes are used widely around the world. In many poor countries outhouses are used. When the hole in the ground is filled, the outhouse is moved. Then a tree is planted over the spot. The tree uses the natural fertilizer to nourish itself, and to produce its fruit.

In many countries such as Japan, human waste from latrines has long been used for fertilizing crops. Gathered in "honey pots," the waste is spread over fields, including vegetable plots. The vegetables from such plantings are a health hazard even when well washed. In poorer countries such practices expose people to diseases that are preventable with better sanitation practices.

INDUSTRIAL WASTE

Industrial waste is a major concern because it is often very toxic to fish, animals, and humans. Many chemicals are carcinogenic. Air pollution can cause numerous respiratory problems. Legislation in industrial countries has been adopted that seeks to clean up old chemical dump sites and to provide ways that keep industrial waste from contaminating the environment.

Convenient rural sites for dumping huge quantities of industrial waste have proved to be more than eyesores. They have often proved to be a danger to water that filters through the area, leaching out toxic chemi-

Sometimes buckets and jugs are the only viable means to transport potable water, such as in the Democratic Republic of the Congo.

cals. Some poor countries have found that some corporations are very willing to use undeveloped and unsuspecting areas as a source for dumping unwanted waste materials.

Mining around the world has often left pollution from empty mine pits or dangerous mine shafts. The holes alone are a hazard to health. The tailings of mines have often had ores or minerals in them that could not be economically processed. In the case of some mines, water-soluble minerals leached dangerous chemicals into the water table or into surface water supplies, making the human water supplies unsafe to drink.

It should be noted that some industrial discharges are beneficial. There have been cases where oxygen or oxygen-producing chemicals discharged into rivers or bodies of water, positively impacted the environment by helping to clean other pollutants. Solid waste is refuse that includes garbage, brush, dead trees, animals,

junk, and other matter. It also includes mining, manufacturing, and farming waste. It has become a growing problem in many areas. Not only are garbage dumps ugly, but they can be sources of disease. In industrial countries they have been built into huge hills that continue even after closed to be expensive places to keep from leaking.

In poor countries poor people may use garbage dumps as a resource for finding food, materials, or salvage. These conditions exist in many countries, where even children are used to picking over garbage for anything of value.

Strictly speaking, every human activity inevitably involves some waste. Disposing of the waste is a universal problem. How this is done is important not only to those who have produced the waste, but to the poor who may be unwilling victims of the waste of others. One of the facts of human life is that the poor suffer the most when sanitation is not practiced at all or poorly.

The United Nations World Health Organization (WHO) has published on the poor sanitation of around two billion people around the world. One of the Millennium Development Goals is to bring basic sanitation to the two billion who need it. WHO has also observed that poor sanitation affects young children more than any other age group. Around two million children die each year from the failure of adults to provide adequate sanitation. Diarrhea is one of the most common causes of infant and toddler deaths. It is a preventable and treatable disease, but often fatal because of poor hygiene and sanitation.

Many governments have recognized that poor sanitation is expensive. It drains an economy because it loses the full labor of the healthy. It also costs in medical expenditures. Hygiene-related diseases such as cholera, dysentery, worm infestations, and malaria are promoted by poor sanitation. However, all too many governments ignore the causes and the costs of poor sanitation. Governments are usually for water projects, however, as some observers have noted that sanitation does not have a political home. Until it does, the lack of sanitation will continue to be a source of ill health and poverty.

Sankara Nethralaya

THE LITERARY MEANING OF *Nethralaya* is "temple" or "abode of the eye," and *Sankara* is the Hindu god Lord Shiva. The famous eye hospital of Chennai (Madras, India) was the brainchild of religious guru Sankaracharya of Kanchi. He had the idea of establishing a hospital to serve the common people. It was in tune with a famous doctor, Dr. S.S. Badrinath, who along with some of his colleagues set up the hospital on September 6, 1978.

The Nethralaya, from its inception, has helped millions of visually impaired people with the latest techniques in eye care at an affordable cost. It also has developed research wings, like a vision research foundation, and an elite school of optometry (ESO). The philanthropic activities of the organization include poverty alleviation programs.

The hospital treats common eye diseases like corneas, cataracts, and glaucoma. It has an outpatient wing and beds for patients, along with drugstores and canteens. It has developed into a hospital with sophisticated services in neuro-ophthalmology, ocular oncology, orbital diseases, oculoplasty, ocular prosthesis, vitreoretinal diseases, electra-diagnostics, and other specialist services relating to eye diseases for all age groups. The hospital gets patients from all over India and abroad.

In May 2005, Sankara Nethralaya examined 36,896 people and performed surgeries on 2,507 patients. About 40 percent were operated on for free. Another milestone was connecting by internet with other eye

hospitals on August 9, 2005. With the help of the Indian Space Research Organization (ISRO), the hospital has developed tele-ophthalmology projects to treat patients all over the country. In May 2005, 370 patients were advised through telemedicine. Sankara Nethralaya also trained eye doctors from Afghanistan. Sankara Nethralaya conducts awareness programs about eye care in cities of south India like Kanchipuram, Vellore, and Thiruvallur. It regularly conducts seminars and invites eminent ophthalmologists from all over the world.

Sankara Nethralaya has a strong research base and importance is given to higher medical education, and it runs higher-level courses on optometry leading to M.Phil. and Ph.D. degrees. It also trains technicians in various branches of ophthalmology. The eye hospital plans to have more ESOs throughout the country. This is essential because India has only 10,000 optometrists.

The hospital recruits volunteers from rural areas and trains them. Healthcare is essential for the alleviation of poverty and the hospital holds lecture programs to educate the public. For all its benevolent and philanthropic activities, the Chennai eye hospital has been declared the best eye hospital by well-known magazines of India like *Outlook* and *The Week*. For eye patients, particularly poor people, it has become a beacon of hope. India, which has 25 percent of the total blind population of the world, needs more hospitals like Sankara Nethralaya.

PATIT PABAN MISHRA SAMBALPUR UNIVERSITY

São Tomé and Principe

LOCATED IN WESTERN Africa astride the equator, the islands of São Tomé and Principe are dependent on subsistence agriculture and fishing for survival. Cocoa continues to be the main crop for São Toméans, but production has been vulnerable to drought and mismanagement. The islands are not self-supporting and

must import all fuels, most manufactured and consumer goods, and much of its food. Economic growth on the islands is hampered by a lack of skilled workers. Some 54 percent of São Toméans live in poverty. Politically, the islands have been unstable since gaining independence from Portugal in 1975.

Economic prospects for São Toméans have brightened with the recent discovery of oil in the Gulf of Guinea, and the islands have great potential as a tourist mecca. In the immediate future, however, São Tomé and Principe must deal with huge foreign debts and an inability to control poverty, although the quality of life is slowly improving for its 187,410 residents. Accurate measures of São Toméan social indicators are hampered by a lack of data.

Life expectancy among São Toméans is higher than in most of sub-Saharan Africa. Between 1990 and 2000, male life expectancy rose from 60 to 63 years, and female life expectancy rose from 64 to 68 years. By 2005, the São Toméan life expectancy had risen to 66.99 years, and the median age was 16.12. Nearly half the people are under the age of 14 and less than four percent have reached the age of 65. The people of the islands have a 90 percent chance of living to the age of 40. São Toméans are susceptible to the food- and waterborne diseases that are common in the area, and malaria is prevalent. There are 47 physicians for every 100,000 residents on the islands, and one-half of the population has access to affordable lifesaving drugs.

Infant mortality in São Tomé and Principe rose from 69 deaths per 1,000 live births in 1990 to 75 deaths per 1,000 live births in 2003. The mortality rate of 118 per 1,000 children under 5 has not changed since 1990. Some seven percent of São Toméan children experience low birth weight, and 13 percent of children under the age of 5 are malnourished. Approximately 29 percent suffer from moderate to severe stunting, and four percent suffer from moderate to severe wasting.

UNICEF, the United Nations organization for children, has promoted programs designed to increase vaccination coverage, eliminate polio and neonatal tetanus, and improve the health and nutritional status of women and children. As a result, childhood immunizations have risen in São Tomé and Principe. In 2003, immunizations for children between the ages of 12 and 23 months were reported at 87 and 94 percent for measles and DPT3 respectively. In 2002, 99 percent of infants were immunized against tuberculosis, 85 percent against measles, 93 percent against polio, and 92 percent against DPT. Some 23 percent of children under the age of 5 sleep under insect-repelling netting. One-fourth of São

Toméan children receive lifesaving oral rehydration therapy when needed, and 61 percent are given antimalarial drugs.

Fertility rates in São Tomé and Principe are high, but they have begun to drop. Between 1970 and 2005, the fertility rate of all women of childbearing age dropped from 5.4 children per woman to 4 children per woman. In 2003, the fertility rate of women between the ages of 15 and 19 was 138 out of 1,000 births. Maternal mortality was estimated at 100 deaths per 1,000 live births in 2003. Some 29 percent of women now use contraceptive measures. In 2000, professional medical staff attended 79 percent of all births, and 91 percent of new mothers received antenatal care.

The literacy rate for São Toméan males is relatively high at 85 percent, but only 62 percent of the female population are considered literate. São Toméans receive an average of eight years of school, and 98 percent of São Toméans in the relevant age group are enrolled in primary school. In 2002, 61 percent of males and 66 percent of females completed school at this level.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Saudi Arabia

ALTHOUGH SAUDI Arabia occupies the first rank among oil-exporting countries in the world, it announced in February 2003 a timed plan to fight poverty and established a fund to help Saudis in need. This perspective of setting a national plan for eradicating poverty came after an unprecedented visit by the crown prince in November 2002 to poor quarters in the capi-

tal, Riyadh, where the people live in bad conditions. He has appointed a director general for the work team to draw a national strategy to fight poverty in Saudi Arabia, according to a proposal by the minister of labor and social affairs. There are no figures on the number of poor in the kingdom, only information that there are Saudi families living below the poverty line among the population of 23.3 million. There is no mechanism in Saudi Arabia for doing surveys on poverty rates. For example, the World Bank, which collects figures, cannot collect statistics that spell out inequality and poverty in Saudi Arabia.

The implementation of the national plan for fighting poverty is based on cooperation between the state and the private sector. Charitable organizations in various parts of the kingdom are expected to play an active role in the fight against poverty, as they provide assistance to the poor through donations and free facilities. The national plan also depends on drawing lessons from poverty-eradication campaigns in some developing countries, such as Malaysia, Argentina, Tunisia, and Yemen, and some developed countries, such as Ireland. In addition, the wealthy people of Saudi Arabia were called to do more for the poor, which is the Saudi way of addressing urgent social issues.

From its side, the government has sanctioned SR100 million (around \$26.6 million) to implement the national strategy to fight poverty and set up a special fund to assist the poor. The national plan is long-term; it will take 30 years to bring poverty to internationally acceptable levels in the kingdom. The kingdom's perspective is that it is impossible to eradicate poverty by 100 percent; the government is trying to bring it down to the internationally accepted level of 2.5 percent of the population within a period of 30 years.

Unemployment, unofficially estimated at 25 percent by the Central Intelligence Agency (CIA), is the main reason for poverty in the kingdom. Thus poor men and women are to be given training so they can earn a salary. According to the CIA, "The government is encouraging private sector growth to lessen the kingdom's dependence on oil and increase employment opportunities for the swelling Saudi population. Priorities for government spending in the short term include additional funds for education and for the water and sewage systems. Economic reforms proceed cautiously because of deep-rooted political and social conservatism."

NILLY KAMAL EL-AMIR
CAIRO UNIVERSITY

Save the Children

SAVE THE CHILDREN IS a transnational private aid agency, first established in England in 1919 to combat the serious economic and social problems caused by World War I and its aftermath. Animosities at the end of the war gave way to vengeful actions, such as the blockade of food supplies to the Germans and Austrians, even after they had surrendered. Conditions in Europe were appalling, especially for women and children who were bereft of the essentials of food, clothing, and shelter.

While some members of the public may have supported the continued enforced misery of the central powers, many found this attitude intolerable and worked to improve the situation. Among these were the British philanthropist Eglantyne Jebb, who with her sister Dorothy Buxton and others founded the Fight the Famine Council in 1919, the precursor to the Save the Children organization.

The goal of the council was to create an international network of organizations aimed at improving the lives of impoverished children around the globe and advocating self-help rather than charity. In tandem with working to improve children's lives on a physical level, Jebb was instrumental in pushing for legislation that would safeguard the rights of children everywhere. In 1923, Jebb wrote the text of a children's charter. Known as the *Declaration of Geneva* and adopted by the League of Nations in 1924, this document is the precursor to the United Nations Convention on the Rights of the Child. The convention, adopted by the United Nations

in 1989, was developed by the International Save the Children Union, and underpins the work of Save the Children.

Today the mission of Save the Children is to fight for children's rights and to deliver both short- and long-term improvements to the lives of children. As of 2004, there were 29 Save the Children organizations making up the International Save the Children Alliance, an umbrella group created in 1997. These not-for profit, non-denominational organizations operate in more than 100 developed and developing countries. Save the Children is unique among aid agencies in that its national affiliates, including those in developing countries, are encouraged to act independently. This differs from most other transnational aid agencies, where planning for programs and use of funds are determined by developed nations.

Save the Children organizations often work at promoting children's rights through advocacy and ameliorating their conditions both in their own countries and abroad. For example, Save the Children USA works with children in rural areas in the poorest American states, as well as in countries in Africa, Asia, Latin America, and the Middle East. In tandem with advocating rights for children, the International Save the Children Alliance has mandated programs in four areas: ensuring children's education, promoting HIV/AIDS awareness in children, protecting children from abuse and sexual exploitation, and emergency response for children during times of conflict or disaster.

Funds for Save the Children national member organizations are raised through donations from individuals and corporations, fundraising, and government funding. In the field, Save the Children organizations deliver their programs working with governmental and nongovernmental agencies. In the 1990s, Save the Children USA came under intense media criticism for having excessive overheads and for failing to see overseas programs to fruition. In 2003 the combined income of all Save the Children organizations was over \$570 million worldwide.

Scarcity

THE CURRENT PROSPERITY of the West and recent rapid economic growth of countries such as China and India are, from a historical perspective, an aberration. It is an exception to the rule. For most of time, the overwhelming majority of people on earth have lived in poverty and suffered tremendously. The overwhelming natural shortage—omnipresent scarcity—of most goods was a historical norm. Food, shelter, healthcare, and security do not naturally exist in sufficient quantities to satisfy the needs and wishes of all people. Scarcity is therefore a defining feature of our world and would remain so even if the earth were converted into the Garden of Eden.

Though scarcity cannot be completely eliminated, it can be partly alleviated. People's efforts to overcome scarcity gave rise to several scientific disciplines that analyze the consequences of the existence of scarcity for social life. The existence of scarcity implies, on the one hand, the necessity of choice. As resources are scarce, people have to choose which resources will be used to satisfy their distinct needs. The science of economics is designed specifically for this purpose—to analyze under which conditions the most urgent preferences of people will be satisfied, or in other words, under which social institutions prosperity will be produced and which will cause only waste of scarce resources and, ultimately, poverty.

On the other hand, scarcity of resources implies the possibility of conflict. With scarcity in place, two (or more) people may want to use a particular scarce good for incompatible purposes. And since only one (or some) purpose can be pursued, there will be some who will be ultimately able to use the scarce good and benefit, and others who will be deprived of this possibility. The existing conflict over the scarce resource can be solved in principle only by two means—brute force or peacefully. Here we see how scarcity becomes a reason for having a science of law that would come up with a resolution to these conflicts, and through principles of property create a foundation of peaceful coexistence among human society within the world of scarcity.

The respect of these elementary insights within these two sciences—the crucial need for people to demonstrate their preferences in economic activities for the functioning of the economic system and production of prosperity, and respect for property rights as a precondition of peace—changed the gloomy picture of the world. Prosperity and peace, rather than poverty and perpetual conflict, are today a standard in some parts of the world.

It should be emphasized that poverty and omnipresent scarcity is not a product of climate, availability of natural resources, or geographical location, but primarily of social organization. Social institutions play a decisive role in overcoming scarcity. Adam Smith, generally considered to be a founding father of economic science, in his famous book *An Inquiry into the Nature and Causes of the Wealth of Nations*, developed exactly this point.

Wealth of nations is generated by people seeking their own interest in an ordered fashion. Butchers and bakers—to echo Smith's most famous quote—are led by the invisible hand to the general benefit only if their property in meat and bread is secure, only if they can make their choices of when and for how much to sell them and make a profit. History provides us with ample evidence of post-scarcity utopias. Societies that decided to ignore economic science and opted for abolishing property invariably did not end up in the Garden of Eden, but in a state of disorder and poverty.

Scientific Definitions of Poverty

SCIENCE CAN BE DEFINED as the systematic application of human reason in order to answer specific questions about a subject of study. Poverty as a subject of study evokes a variety of questions with a corresponding variety of definitions and answers. Scientific defi-

nitions of poverty, unlike moral, theological, political, legal, or other definitions, seek to establish a universal definition that is rationally based, value-free, and objective for all to publicly see.

In Europe, the United States, and elsewhere, there have been for decades numerous debates about the definition of poverty. However, there has been no universal agreement about the definition nor has there been agreement about the approaches best used to define poverty. The struggle to define poverty in a scientific manner has been ongoing since the Industrial Revolution and its impoverished workers inspired intellectuals to seek solutions to the problem of poverty.

The problem is rather like the conclusion of a traveler to the desert Bedouin in an earlier time. The traveler, seeing people who move about in tents with little to eat except camel milk, concluded that they were poor. However, they in turn considered themselves rich because of their freedom and their elaborate oral culture of poems, stories, folklore, or songs.

Measuring poverty simply as a material condition may not be an accurate description of the reality because other factors can come into play. Measuring is difficult because of the numerous factors that comprise the making of a whole human life; the absence of those factors can produce deprivation.

Without a doubt income is important but access to other public goods such as education, clean water, reliable transportation, good roads, healthcare, and markets are also very important. Political decisions by the governments of the world are important because they will often be the institutions supplying great sums of money to meet the needs of the poor, or developing economic strategies for ending poverty.

While a monetary line is often favored for the definition of poverty, the use of income statistics problematically treats as equals things that are not equal. It would cost different amounts of money to supply the needs of adults versus babies. An additional problem with defining poverty in terms of income is that poverty is dynamic as well as relative. Factors such as a severe month of cold weather can wreck a family budget when it is assumed that its income is adequate because it has been measured against a historic norm. A scientific definition would allow for greater accuracy in measuring the dynamic features of poverty.

In attempting to define poverty, terms such as *absolute*, *extreme*, *overall*, *relative*, *permanent*, and *peripheral* have been used to describe the conditions or effects of poverty; scientists have sought to define poverty in terms other than just money. A scientific definition of

poverty seeks to use broad universal concepts of resources rather than cash. This enables the scientific definition to be usable in poor countries, where payments in kind or barter is the rule for trade rather than using cash.

A scientific definition in terms of resources also is easier to use operationally as a measure of wealth in goats, sheep, services, or other values that are not readily stated in cash terms for the lack of a market or some equivalent mechanism for assessing value. The scientific definition also permits measurements that can be correlated between income and standard-of-living changes.

The scientific definition of poverty includes both material and social conditions in which people live, as well as their participation in the economic, social, cultural, and political life of the country. Poverty, scientifically defined, includes those resources whose absence will place a person or family into conditions of deprivation, in which life is at best mere existence.

The problem of global poverty is so acute that there is an urgent need for developing a scientific definition of poverty that will permit universal measurements. The quest for a scientific definition would include ideas of substance, basic needs, and relative deprivation. However, it would also include measures to combine with a human poverty index and an income gap ratio. These measures would permit a more comprehensive picture of poverty to be presented to those who have the interest and power to treat problems of poverty.

Scope

SCOPE IS A DISABILITY organization dedicated to helping people with cerebral palsy through information, education, job placement, and advocacy. It operates in England and Wales. Scope's aim is to help disabled people achieve equality in such a way that they will not fall into poverty and will have the same human and civil rights as all others do. To achieve this aim, it conducts research on issues that affect the disabled and supports campaigns. Scope is a social and political change agent, promoting policies that will be beneficial to the disabled. In addition to advocacy, Scope acts as a community organizer by conducting national and local campaigns on issues of importance. These issues may include special educational needs, civil rights, or other concerns.

Scope was begun in 1952 by a group of parents and a social worker as the National Spastics Society. In 1963 it merged with the British Council for the Welfare of Spastics to become The Spastics Society, which was renamed Scope in 1994. Scope currently has a permanent staff of around 4,000 and an additional 3,000 volunteers. Its current budget is 100 million pounds. In Australia there is an independent Scope organization (nonprofit) working with the disabled that operates in Melbourne and in the state of Victoria in Australia.

Scope maintains a toll-free hotline in England and Wales to directly aid the disabled, especially those with cerebral palsy. The hotline provides information on services available through Scope and it also makes referrals. Since there are 1,500 babies born in Great Britain every year with cerebral palsy, the need for advocacy and services is constant. Services needed by people with cerebral palsy include communications, mobility, accessibility to services, buildings, education, and the kinds of support that enable people with cerebral palsy to live life to the fullest as they choose. Scope's goal is to change British society so that disabled people will have full equality. To achieve its goal, Scope provides housing, information and advice, education, and a campaign to advocate disability rights.

For parents with children in schools and colleges, Scope assists in promoting inclusion of disabled pupils. It also aids in developing an educational plan to meet their needs and abilities. The organization promotes a better quality of life for persons with cerebral palsy though its Living Options program. It runs residential and small group homes, as well as supporting independent living plans. Scope aids adults with work opportunities through skill development centers. It works with government agencies and with private businesses to place its clients into permanent jobs. Basic to Scope's program of information, advocacy, and services is its Community Team concept. A team can be put in a community almost immediately to meet needs and to found a program for both individuals and the commu-

nity of the disabled through supportive local groups and governments.

Secondary Poverty

THE MEASUREMENT OF poverty, and what constitutes poverty, have varied over time as well as across disciplines. One common means for determining poverty has been the amount of income earned within a calendar year. This measure is currently referred to as absolute poverty and is a concept that originated from the term *primary poverty*. Although rarely used any longer, *primary poverty* was a term coined by Seebohm Rowntree in 1901. Rowntree made a distinction between primary poverty and secondary poverty. Primary poverty refers to subsistence below minimum standards, whereas secondary poverty is a condition whereby income would be sufficient if it was optimally spent.

The origins of secondary poverty began in 1899 when Rowntree embarked on a study of poverty. The study, which resulted in a paper, "Poverty: A Study of Town Life," was a groundbreaking publication in which Rowntree first expressed recognition of a type of poverty separate from income insufficiency. Secondary poverty, according to Rowntree, was poverty that resulted from a failure of moral character rather than from a lack of income.

In his study, Rowntree first identified families who appeared to be living in squalor. He then compared their income with a minimum requirement for subsistence. Those families whose income fell within the poverty level were considered to be living in primary poverty, whereas the impoverished condition of the remainder of the families was attributed to secondary poverty. Therefore, secondary poverty was a residual category that existed after the exclusion of primary poverty conditions.

Those who were living in secondary poverty, according to Rowntree, were families who had sufficient

income to afford the minimum necessities but lived in squalor because of overspending on nonessentials. While some of the spending was considered useful, spending on items such as alcohol was considered wasteful. Rowntree attributed secondary poverty to such things as drinking, betting, gambling, and household mismanagement. Families with fluctuating incomes and those with incomes only slightly above poverty level were the most susceptible to secondary poverty through household mismanagement.

Secondary poverty was a commonly used term in the Edwardian era, the years between 1900 and World War I. A common belief during that time was that poverty was the consequence of some moral failure of the individual. Rowntree's explanation of secondary poverty supports the idea that poverty may be due to individual failure; therefore, social investigators readily adopted the concept of secondary poverty during the early 20th century.

Secondary poverty, as defined by Rowntree, is rarely used in the 21st century, as it is viewed as more of a multidimensional condition attributed to factors of the individual, of the community, and of society. However, the idea of distinguishing between types of poverty is an approach often used when examining the extent and depth of poverty. For example, the term secondary poverty is often used to describe short-term poverty, or poverty that is transitory.

Poverty was the consequence of some moral failure of the individual.

Another use of the term *secondary poverty* is in describing an individual's level of subsistence, outside of the family's income. Measures of poverty often assume that the distribution of resources within a household is equal. However, in countries such as Honduras, Mexico, and Costa Rica, men may withhold up to 50 percent of the household income, thereby placing their wives and children in an impoverished condition. Researchers of world poverty refer to this as secondary poverty because there is sufficient family income, yet individuals within the family are living in poverty.

Primary poverty continues to be defined as poverty that is chronic and is the result of insufficient income. Secondary poverty is often used to explain poverty that is not primary poverty. While these two concepts are similar to Rowntree's explanation, researchers currently refrain from attributing poverty to only individ-

ual characteristics. Instead, many assert that poverty is caused by low wages and other structural factors, rather than from too much drinking or gambling.

While researchers may distinguish between types of poverty, the effects of any type can be extensive. Implying that the situation is caused by the moral failure of an individual only intensifies the impact of poverty, unfortunately a moralistic concept of poverty as due to individual failure remains.

Segregation

THE MENTION OF segregation immediately evokes images of racial separation, with oppressed minorities living in destitute shantytowns or crime-ridden urban ghettos and barrios. However, is there a direct correlation between segregation and poverty? Consider today's Dalits of India, the traditional "untouchables" of Hindu society who are doomed to lives of servitude, humiliation, and discrimination because of supposed acts they committed in earlier lives. As punishment by the gods, they have been, according to Hindu teaching, reincarnated at the lowest human status possible.

Untouchability was abolished under India's constitution in 1950; however, the continued imposition of discrimination against the Dalits remains very much a part of life in rural India. Dalits may not cross the dividing line segregating their part of the village. They are barred from using the same wells, may not visit the same temples, nor may drink from the same cups in tea stalls. Dalit children sit in the back of classrooms if they are allowed to attend school at all.

Despite hiring quotas set by the Indian government to bring Dalits into the mainstream of society, in rural

areas they continue to live in extreme poverty without land or opportunities for better employment. From birth they are relegated to the most menial of tasks, such as removing the village's human waste, disposing of dead animals, sweeping the streets, and tending the city dump. Dalit children are often sold into bondage to pay off debts to upper-caste creditors. Dalit men, women, and children numbering in the tens of millions work as agricultural laborers for about 35 cents each day.

GHETTOS

While their segregation from the rest of society results in their abject poverty, not all segregation has that effect. The Middle Ages' forced segregation of Jews did not result in destitution or poverty. The first Jewish ghettos appeared in Italy, Germany, Spain, and Portugal during the 13th century. The term *ghetto* comes from a section of Venice that had been an iron foundry or *getto*. It became one of the most affluent parts of town, inhabited by merchants and moneylenders. Non-Jews were not allowed to live there, nor were Jews allowed to leave without a written pass. Iron gates were locked at night.

Such enclaves exist although no laws established a Jewish part of town.

In 1555, Pope Paul IV created the Roman Ghetto and issued papal bull Cum nimis absurdum, forcing Jews to live there. Pope Pius V recommended that all countries set up Jewish quarters, and by the 17th century, many large cities had done so. However, poverty did not result in Prague and Frankfurt, whose Jewish ghettos had wealthy populations with buildings that were often taller than those in the rest of the city. Officials justified the enforcement of ghetto laws by citing incidents of Jews coming under persecution. The ghetto system, they said, protected Jews from pogroms, persecution campaigns directed at Jews.

By the 19th century, most Jewish ghettos had been abolished and their walls demolished, but no mass exodus of residents resulted and predominantly Jewish sections of town remained. In New York City, such enclaves exist today although no laws there have ever established a Jewish part of town.

The last European ghettos for Jews were abolished in 1870, but Adolf Hitler reinstituted them when he

rose to power in the 1930s, segregating Jews into tightly packed areas of the cities of eastern Europe, such as the Lodz, Poland, ghetto with about 160,000 people and the Warsaw ghetto with a population of about 380,000. Any Jew found outside of the walls without a written pass was likely to be executed on the spot.

In Warsaw, 30 percent of the city's population were forcibly compacted into 2.4 percent of the city's area, a density of 9.2 people per room. This segregation inflicted starvation and deprivation when water, electricity, fuel, and food were cut off; shortages were created intentionally; and public health conditions reached crisis levels. Blaming the problem on the Jews inside, Nazis began emptying the ghettos for "health reasons," citing the situation as proof that the residents were subhuman. Many were taken to concentration camps where an estimated six million men, women, and children were executed.

RICH SEGREGATION

Segregation has been practiced in a number of societies to isolate and subjugate aboriginal peoples, such as the Bantus of southern Africa, the Aborigines of Australia, and the nomadic, tribal natives of both Americas.

In each instance, specific minority racial groups lacking political status and whose land was desired by ethnic majorities were forced to relocate to assigned reservations or lands often lacking water, wild game, tillable soil, or other natural resources. The segregated minorities were disarmed and forced to give up centuries of tradition and culture. Roaming hunter-gatherers were forced to be dependent on the victorious invaders for food, fuel, and housing. The result was extreme deprivation and a loss of basic security.

One such forced segregation, however, resulted in immense wealth. The Osage tribe originally roamed southeastern Kansas. When settlers sought their territory, the tribe reluctantly accepted a financial settlement from the U.S. government and in 1872 moved to Indian Territory in what is now the state of Oklahoma. With the treaty money, the Osage Nation bought 1.4 million acres, comprising what is today's Osage County. However, in 1887 the Dawes General Allotment Act divided up reservations into individual parcels of land. The Osage tribe was forced to deed its property to its 2,229 tribal members, giving members tracts of about 640 acres each in 1906 shortly before Oklahoma was granted statehood. Then oil was discovered.

Overnight, the Osages became among the richest people in the world—a status that continued through-

out the Great Depression in stark contrast to the stereotypical Oklahoman "Okies," poor, bankrupted white farmers from the Dust Bowl heading to the west coast in one of the largest migrations in American history.

Black Africans and their descendants throughout the modern era have experienced segregation at its worst and poverty at its most extreme—slavery. A slave is property and lacks all rights, including to own property, travel at will, marry, raise families, engage in free enterprise, or be paid for work. However, it is a serious misconception that slavery has been inflicted only on black Africans. Slavery has been practiced since the earliest recorded history—often with victors taking the vanquished captive, regardless of race.

SLAVERY

Slavery in the ancient Mediterranean cultures was a mixture of debt-slavery, slavery as punishment for crimes, and the enslavement of prisoners of war. In ancient Athens and Sparta, slaves were a crucial factor in the economy. The Roman Empire also built its wealth on the labor of slaves acquired through conquest. Slavery allowed owners the leisure to engage in intellectual and cultural pursuits.

As late as 1649 and 1653, slavery continued to be used as punishment by conquering English armies against native Catholics in Ireland. Under the command of Oliver Cromwell, thousands of Irish Catholics had their lands confiscated and were transported to the West Indies as slaves. Until 1861, Russian peasants were bound to the land where they were born and served involuntarily for the nobles who held title. The serfs were denied property ownership, education, or opportunity for advancement.

In the United States, Abraham Lincoln's Emancipation Proclamation and the northern states' victory over the south in the Civil War abolished African-American servitude in the United States. However, racial segregation continued through "Jim Crow laws," which enforced strict separation of the races in housing, entertainment, athletics, education, and eating establishments. Such legalized segregation lasted up to the 1960s and was practiced throughout the United States, although it was institutionalized by law mostly in the south.

Even so, state constitutions such as California's gave local government rights to regulate where members of certain races could live. Throughout the United States, land developers often included restrictive segregationenforcing covenants in deeds that prevented blacks or Asians from purchasing property. Utah passed in 1899 and repealed in 1963 prohibitions against marriage between a white person and anyone who was a "mulatto," or half negro; any "quadroon," or one-quarter African American; "octoroon," or one-eighth; as well as any "Mongolian," or "member of the Malay race."

Although African Americans have spent years fighting for equal rights and integration into the mainstream of American society, a small, separatist African-American political movement seeks a separate homeland for black people. Its leaders hold that whites are racist oppressors of blacks and there can be no black advancement within any white-dominated society. They believe the only solution for blacks is to break away and to create a separate, segregated black society.

Similarly, some Hispanic separatists in the United States have advocated racial segregation from whites. Some call for an independent republic to be called Atzlán in the southwestern United States, composed of territories won by the United States from Mexico after the Mexican-American War of 1848.

SEGREGATION AROUND THE WORLD

Segregation is certainly not uniquely American. It was required by law until 1994 in the Republic of South Africa, where apartheid ordinances barred black Africans and immigrant Asians from living in the same neighborhoods as the ruling white minority. Extreme poverty existed in the nonwhite areas of South Africa, where nonwhites were denied economic opportunities, education, or equal rights.

France was accused of racial segregation, leading to riots in the autumn of 2005.

In Australia today, there are no existing government policies that segregate aboriginal native Australians, however, their historically poor financial status typically leaves them segregated from most of Australian society. Ample debate can be made as to whether this informal but very real segregation suppresses opportunities for the aborigines or whether their own cultural self-segregation has kept them from assimilating fully into Australian society.

France has recently been accused of racial segregation, leading to nationwide riots in the autumn of 2005 in large housing blocks dominated by nonwhite residents from former French colonies. Similar accusations

have been made in the Netherlands and Scandinavia where Muslim immigrants have settled in concentrated areas—although no laws require such segregation.

Many militant Islamists teach that Judaism, Zionism, and Israel's treatment of Palestinians are discriminatory and a form of segregation, with resulting poverty and denial of economic opportunity to non-Jews. Supporters of the Jewish state respond that the non-Jewish residents self-segregate by personal choice into Muslim and Christian enclaves.

Segregation continues to be found worldwide. Its causes are not always legislated, as evidenced by a visit to the average American public high school cafeteria. There, self-segregation exists with ethnic, cultural, racial, and language divisions—black teens sitting with other blacks and playing music by black musicians, while Hispanic youth socialize with other Hispanics listening to salsa music, Asians sit with other Asians, Muslims with fellow Muslims, and the various subsets of Caucasians congregate together. However, such segregation is not mandatory, and many youth cross the barriers, socializing outside of their ethnic and racial group.

Self-segregation is not uncommon. The Basques of southern France and northern Spain seek independence and a segregated, separate state. The group has called government attempts to assimilate and desegregate the Basques into Spanish and French society discriminatory and racist, since the result would be a de-emphasis of Basque identity.

Self-segregation occurred violently in 1949 and 1950, when colonial India was granted independence and self-governance. Great Britain passively observed an abrupt migration that resulted in self-segregation on the part of Hindus and Muslims. Two predominantly Muslim sections of India were allowed to split away and became today's Pakistan and Bangladesh.

After elections in Bahrain in 2002 brought the radical Islamist party Al Wefaq Islamic Action to power in the capital city of Manama, its newly installed mayor, Murthader Bader, called for the introduction of racial segregation and the removal from the city of all non-Bahraini inhabitants and for the creation of a new township to house them.

Two military coups on the island of Fiji in the south Pacific in 1987 removed from elected power immigrant Asians and mandated ethnic Fijian ownership of all land. International criticism followed, as well as the exodus of many non-Fijian professionals.

The formation of modern American racial ghettos and the creation of racial underclasses have sparked one of the most heated debates in sociology. One of the earliest studies examining the modern phenomenon of ghetto formation was done by the late Daniel Patrick Moynihan in 1965. The report noted that a quarter of all black children were born to unmarried women and that the percentage was rising, described the ghetto as a "tangle of pathologies," and predicted that conditions would worsen, not improve. Immediately controversial, the report was met with howls of protest and the criticism that Moynihan was blaming the victims. Today in the Washington, D.C., metropolitan area, white and Hispanic poor are widely scattered throughout the region's suburban neighborhoods, while the majority of the area's poor African Americans are self-segregated in highly concentrated pockets of poverty.

In the high-poverty neighborhoods, almost half the adults lack a high school diploma, compared with only 15 percent for the metropolitan region as a whole. Unemployment is nearly four times greater in those poor neighborhoods than in the metropolitan area. Almost three-quarters of families with children are headed by single women, compared with only one-quarter of families throughout the region.

However, poor Hispanics in the District of Columbia have avoided racially concentrated, inner-city, poverty-stricken enclaves. The region's total Hispanic population more than doubled between 1980 and 1990 to 213,000. But only five percent of Hispanics lived in neighborhoods that are predominantly low-income.

Looking at New York City, sociologist Roger Waldinger pointed out that a number of ethnic groups there tend to self-segregate, such as Koreans, Pakistanis, Dominicans, and Chinese—and that they often do better economically than American-born blacks. His conclusion was that segregation into ethnically or racially specific communities neither causes nor prevents poverty.

Selectivity

ONE OF THE GREATEST challenges facing Russian President Vladimir Putin in 2001 was the problem of "selectivity" in serving the poor. In speaking to a conference of social workers, he noted, "it is necessary to answer the question of how and whom to support. To do so, one must have precise information on incomes." This was at a time in Russian history when an overwhelming majority of the population was in distress and needed social services and government protections.

Not everyone suffering from the ravages of poverty could be served because government resources were limited. So, rather than choose who would be assisted on the basis of political connections, or past service to the nation, or ease in delivery, the principle of selectivity was invoked—to determine who needed help the most.

In emergency medicine, the principle of selectivity is demonstrated in triage, a system first developed by French surgeon Dominique Jean Larrey during the Napoleonic wars. He devised a method to quickly evaluate and categorize the wounded in battle, then evacuate those requiring the most urgent medical attention—with no regard to rank. Three levels were assigned to the wounded: 1) the "walking wounded" whose treatment could wait; 2) the severely injured for whom emergency care was less urgent because they were unlikely to survive; and 3) those with life-threatening wounds, but who could recover if they received immediate emergency care. Likewise in social work, choosing who will receive services is not done lightly.

Selectivity is also demonstrated in the World Bank's efforts to improve its effectiveness in serving countries with high levels of poverty. "The principle of selectivity (deploying resources where they can have the greatest positive impact) is clear but its practical applica-

tion is challenging," noted an internal study that reviewed how "selectivity is exercised at three levels: across countries, within countries, and in the context of global programs and partnerships." The study also noted "the importance of selectivity across countries—with regard to need as measured by relative poverty or income per capita." In evaluating who should receive assistance, the memo noted, "a country must be pursuing sound policies to promote growth and reduce poverty."

The selectivity principle also directs U.S. assistance organizations when they are investing scarce aid resources on a limited budget. Often the determination is made on three criteria: humanitarian need, the foreign policy interests of the United States, and the commitment of a country and its leadership to reform.

In Afghanistan the restored Kabul-to-Kandahar highway illustrates the selectivity principle. More than 35 percent of the country's population live within 50 kilometers of this highway; however, 20 years of war and government neglect had devastated the road. Restoration of the highway was a high priority for President Hamid Karzai.

The U.S. Agency for International Development (USAID) was asked to assist and approved the project on the following principles: that the highway was crucial to extending the influence of the new government, the road would lead to increased rates of economic development, it would foster the growth of civil society, and it would help ensure unity and long-term security in the country. Additionally, it was determined that the road circulated through a significant number of Taliban strongholds. Thus, upgrading the road diminished the Taliban's ability to exert influence in that portion of the country.

In employing the selectivity principle, USAID officials said they factored in the developmental need the highway would serve (access to markets and cities), the foreign policy interests of the United States (promote economic development and country unity, counteract Taliban influence), and the commitment of a country and its leadership to reform (Karzai is an acknowledged reformer with exceptional commitment to the project). As a result, the project was made a high priority and was approved for funding.

Sen, Amartya (1933-)

AMARTYA SEN, THE world-renowned authority on welfare economics and Nobel laureate, was born in Santiniketan, India. Ashutosh Sen, his father, used to teach chemistry at Dhaka University, Bangladesh. Like his mother, Amita, Sen studied in Visva-Bharati, Santiniketan. Afterward, he was educated at Presidency College, Kolkata (Calcutta), and Trinity College in Cambridge, the United Kingdom. Sen became the chairperson of the Economics Department of Jadavpur University, Kolkata at the age of 23. He was awarded a Ph.D. by the University of Cambridge in 1959. His teaching career spanned the universities of the globe: Kolkata, Delhi, Cambridge, Oxford, and Harvard. Sen did research on various aspects of economics and was very much interested in philosophy; he wrote on epistemology, political philosophy, and ethics.

Sen became the first Indian to receive the Nobel Prize in Economics, instituted by the Sveriges Riksbank (Bank of Sweden), for his contribution to welfare economics. The citation of October 14, 1998, mentioned that Sen's study of the welfare of the poorest people in society had broadened knowledge about the underlying factors behind famines. With methodologies from both economics and philosophy, he had given an ethical touch in analyzing economic problems.

The president of India awarded him the highest honor of the nation, the Bharat Ratna. He also received the Frank E. Seidman Award in Political Economy, Senator Giovanni Agnelli International prize in ethics, Edinburgh Medal, Presidency of the Italian Republic Medal, Eisenhower Medal, Honorary Companion of Honor of Great Britain, Alan Shawn Feinstein World Hunger Award, and Brazilian Ordem do Merito Cien-

tifico. He was professor of economics and philosophy at Harvard University until 1998, and then became the master of Trinity College, Cambridge, United Kingdom. But he did not cut his connections with Harvard.

Sen studied different dimensions of poverty, going beyond the mathematical theories and approaching it with a social vision. Poverty, for an individual, was not living beyond an imaginary poverty line with a specified income per day. It meant deprivation from certain basic elements like education, healthcare, land, justice, and resources. It meant that the individual's earnings were not sufficient for meeting the basic requirements of life.

According to Sen, poverty should be measured by taking into account the things that a person can get through earnings, rather than calculating by income level. It had wide variance depending on the particular individual and the place to which he belonged. In rich countries like the United States, there are many poor people who do not have access to education and health services.

In "Poverty and Famines: An Essay on Entitlement and Deprivation," Sen challenges the traditional view that the cause of famine is a shortage of food. The devastating Bengal famine of 1943, where about two to three million people perished, left a deep imprint on Sen's mind as a student in Santiniketan. After studying the Bengal Famine of 1943, the 1973–75 famines of Ethiopia, famines in the Sahel area of Africa in the early 1970s, and the 1974 famine of Bangladesh, Sen found that social and economic factors were responsible for the opportunities of different classes in a society.

There was export of food from famine-affected regions, and the supply of food was not that low compared to nonfamine years. The reason for famine lay in the capability of persons to have access to a range of different goods (entitlements) in an economic system. Starvation occurred when entitlement was inadequate to buy food. The income distribution and entitlement to food were the reasons for famines. The link between the values of a person and collective choice as a whole is central to the theory of social choice. The means by which society would derive its preference from its members was emphasized by Sen.

The dichotomy between majority rule and individual rights was best dealt with in a scientific way in his book, Collective Choice and Social Welfare. The ideas and values of a single individual should not reflect a collective decision-making process. They should be consistent with individual rights. The different alternatives had to be compared, and this comparability was essential. Sen also formulated an index for poverty and wel-

fare indicators. Sen is not an armchair theoretician juggling with the problems of economics. Although he has been working abroad since 1971, Sen is concerned with Indian affairs and gives lectures. He voices his protest against fundamentalist forces. Literacy, healthcare, and female empowerment are issues on which he focuses. Sen has established the Pratichi Trust with his Nobel Prize money to look into these issues.

Sen Index

THE SEN INDEX IS a sophisticated method of measuring the prevalence and severity of poverty in a society. The index was developed in 1976 by Amartya Sen. Sen is a Nobel Laureate in Economics who achieved prominence at Cambridge and Harvard Universities. Because the Sen Index provides a realistic methodology for quantifying variation in the levels of deprivation among the poor it is used by policymakers worldwide who seek to ameliorate poverty and improve the social welfare of the poor.

Prior to the development of the Sen Index, economists generally described poverty in terms of specific income-based measures such as the poverty line and the poverty gap. These measures, while useful, did not incorporate certain aspects of poverty of concern to policymakers. For example, as a nation's overall wealth increases, individuals who do not share in the increase grow poorer in comparison with their countrymen. Yet prior to the Sen Index, no existing measure of poverty reflected the impact of changes in nations' overall prosperity in the wealth status of individuals.

In his 1976 paper entitled "Poverty: An Ordinal Approach to Measurement," Sen published a method for measuring the multidimensional aspects of poverty. Sen's measure of poverty, now known as the Sen Index, incorporated earlier measures such as the "poverty line" and the "poverty gap." However, it also required continuous recalibration, so that a nation's Sen Index value would increase if a person below the poverty line experienced a reduction in income (this is known as the "monotonicity axiom"), and increase if a person below the poverty line transferred income to anyone richer. (This is known as the "transfer axiom").

The Sen Index is calculated from three principal components. The first component is the headcount, a measure of the share of a nation's population living below the poverty line. This component measures the extent of poverty in a nation. The second component is the poverty gap, or aggregate income shortfall of the poor. This component measures the intensity of poverty for those who experience it. The third component, income inequality among the poor within a nation, is measured by a Gini Index among the poor and captures variation in deprivation among the poor. Changes in any or all of these three elements will impact the overall measure of poverty. As formulated in 1976, the algebraic formula for calculating the Sen Index is:

P = H[I+(1-I)G]

Where

P = poverty measure

H =share of population below poverty line

I = income gap or shortfall ratio

G = Gini index of poverty gap among poor

In a 1983 paper entitled "Poor, Relatively Speaking," Sen expanded his concept of poverty to reflect two additional new elements. First, Sen argued that a person is impoverished if circumstances deprive her of the capability to fulfill her human potential. Therefore, an ideal poverty index should attempt to quantify such impediments to capability.

Second, Sen argued that wealth, properly measured, includes access to public resources. Because access to resources varies across and within communities, an ideal poverty index should measure the relative lack of access to resources. Although these concepts may be difficult to quantify in practice, Sen suggests, "the direction in which to go would be that of some kind of efficiency-adjusted level of income with 'income' units

reflecting command over capabilities rather than commodities."

It is important to note that income poverty and capability poverty are related. Typically, as capabilities expand, so do productive capacity and earning potential. Thus, statistics such as rates of mortality, undernourishment, and illiteracy may reflect deprivation even more directly than low income. By the 1990s these capability concepts were incorporated into the Human Development Index (HDI) used by the United Nations to measure poverty and development. Inspired by the Sen Index and Sen's later refinements, the HDI counts as part of a nation's wealth: the longevity of its population, its cumulative knowledge (a measure combining literacy and years of schooling), and its standard of living using local Gross National Product adjusted for purchasing power parity.

The original Sen Index initiated a broad effort to expand our understanding and improve our measurement of poverty. Sen's work spurred contributions by numerous other researchers concerned with human development and influenced international organizations to refine their concept of poverty in the interest of improving the economic, social, and political opportunities of people throughout the world.

Senate Hunger Caucus

THE SENATE HUNGER Caucus is a bipartisan group of U.S. senators who have joined together to promote antihunger causes. Blanche Lincoln, an Arkansas Democrat, and Gordon Smith, an Oregon Republican, formed the caucus in June 2004. In the words of the co-

founders, the Senate Hunger Caucus was formed "to bring awareness to national and international hunger issues, serve as a forum for members and staff to receive information through briefings about hunger issues, create a coalition of senators to support nonpartisan initiatives to help address hunger, and serve as a vehicle for local, state, and national antihunger nonprofits to communicate to Congress about hunger issues." As of the summer of 2005, the caucus listed 33 senators as members and was chaired by Senators Lincoln, Smith, Elizabeth Dole, a North Carolina Republican, and Richard Durbin, an Illinois Democrat. A House Hunger Caucus led by cochairs Tom Osborne, a Republican from Nebraska, and Jim McGovern, a Democrat from Massachusetts, also operates.

The current Senate Hunger Caucus follows in the footsteps of similar organizations from the past. George S. McGovern, a South Dakota Democrat and his party's presidential nominee in 1972, led a prominent Senate select committee on hunger in the 1960s and 1970s. In 1984, Texas Democratic Representative Mickey Leland formed the House Select Committee on Hunger to bring attention to the issues of domestic hunger and international famine.

Following Leland's death in 1989 in a plane crash during a humanitarian visit to Ethiopia, Congressman Tony Hall, an Ohio Democrat, chaired the committee until its elimination in 1993. A House Hunger Caucus, formed in the wake of the House committee's demise, was also disbanded in 1995.

While the Senate Hunger Caucus has only been in existence a short time, within its first year its members led the ultimately unsuccessful fight in 2005 to restore \$8 billion in funding cuts to the Food Stamp program and introduced the Hunger Free Communities Act of 2005, a bill that would commit the United States to cutting U.S. food insecurity in half by 2010 and ending hunger in the country by 2015, as well as providing funding for poverty data collection and local hunger initiatives.

VICTOR MATHESON, Ph.D. COLLEGE OF THE HOLY CROSS

Senegal

IN THE LOW-INCOME sub-Saharan nation of Senegal, 54 percent of the population live in poverty and 48 percent of the labor force are unemployed. Some 70 percent of Senegal's labor force are involved in subsistence agriculture, and parts of the country are subject to seasonal floods and periodic droughts. With an average annual income of \$6,530, which is high for the sub-Saharan region, Senegal's wealth is divided unequally. The poorest 20 percent of the population live on 6.4 percent of the country's resources, while the richest 20 percent claim 48.2 percent. Senegal is ranked 41.3 on the Gini Index of Human Inequality. Among the poorest Senegalese, 67.8 percent live on less than \$2 a day, and 26.3 percent subsist on less than \$1 a day.

In the mid-1990s, Senegal instituted major economic reforms, which began a period of steady growth. As a member of the International Monetary Fund's Highly Indebted Poor Countries (HIPC) program, Senegal has wiped out much of its former debts, allowing the government to direct some resources toward other areas. Despite some progress, Senegal is faced with a highly armed population that has claimed thousands of victims, 60 percent of whom are women and children. The government is suspected of widespread corruption, and the weak political system provides few measures to deal with these problems.

The Senegalese population of 11,126,832 experiences a life expectancy of 56.75 years and a median age of 18.15 years. Approximately 42.8 percent of the population are under 14 and three percent have reached the age of 65. The Senegalese have a 27.7 percent chance of failing to see a 40th birthday. While Senegal has not totally escaped the HIV/AIDS epidemic that has ravaged Africa, the country has a prevalence rate of 0.8 percent. In 2003, 44,000 people were living with the disease, and 3,500 had died from the disease or its complications.

Because 22 percent of Senegalese lack access to safe water and 30 percent lack access to improved sanitation, the Senegalese have a very high risk of contracting the food- and waterborne diseases and respiratory ailments that affect much of Africa.

In the spring of 2005, the World Health Organization recorded an outbreak of cholera in Senegal that affected several hundred residents. Vectorborne diseases such as dengue fever, malaria, yellow fever, Crimean-Congo hemorrhagic fever, and Rift Valley fever pose problems in some areas. Guinea worm disease, which is caused by contact with infected water, has been wiped out in Senegal through cooperation between locals and

the Carter Center of Emory University, founded by former president Jimmy Carter. Fighting diseases is complicated in Senegal by the fact that there are only 10 physicians for every 100,000 residents, and 21 to 50 percent of the population lack access to lifesaving drugs.

The Senegalese have made great strides in combating high infant mortality rates. These rates declined from 173 out of 1,000 live births in 1960 to 55.51 out of 1,000 live births in 2005. Between 1960 and 2003, the mortality rate of children under the age of 5 plummeted from 300 to 137. Despite improved mortality rates, almost one-fourth of all children under the age of 5 suffer from malnutrition, and six percent are severely underweight. One-fourth of children under 5 suffer from moderate to severe stunting, and eight percent suffer from moderate to severe wasting.

Among the poorest Senegalese, 67.8 percent live on less than \$2 a day.

Senegal has had difficulty with childhood immunizations in recent years. Between 1990 and 2002, infant DPT immunizations dropped from 69 to 66 percent; polio immunizations declined from 60 to 55 percent; measles immunizations fell from 57 to 54 percent; and tuberculosis immunizations slipped from 71 to 70 percent. In 2003, 60 percent of children between 12 and 23 months old were immunized against measles, and 73 percent were immunized against DPT3. Only one-third of Senegalese children receive essential oral rehydration therapy when needed.

On the average, Senegalese women have 4.75 children each. This is an appreciable drop from the 6.8 rate recorded in 1980. The adolescent fertility rate is 86 per 1,000 births. Less than 11 percent of Senegalese women use contractive methods, but this number has risen from seven percent in 1990. Trained medical staff attended 47 percent of all births in 1995. Five years later, that number had increased by 11 percent. While maternal mortality has declined, too many women continue to die from childbirth and its complications. Estimates for 1995 place the maternal mortality rate at 1,200. By 2000, maternal mortality was estimated at 690 out of 100,000 births.

One-half of the adult male population of Senegal can read and write, but less than one-third of Senegalese women can do so. Literacy rates have increased slightly since 1999, when the rates were recorded at 46.4 and 26.8 percent for males and females respectively.

Unfortunately, literacy rates have dropped considerably since 1980, particularly for females, when rates were reported at 69.5 percent and male literacy rates were recorded at 88.3 percent. Most children receive at least six years of schooling, but only three in four children are enrolled in primary school. Primary school completion rates are even lower. Between 1995 and 2002, primary school completion rates for boys declined from 56 to 49 percent, while completion rates for females jumped from 40 to 48 percent.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Sen-Shorrocks-Thon Index

THE SEN-Shorrocks-Thon (SST) Index is a poverty index proposed by A.F. Shorrocks in 1995, based on the pioneering work of A.K. Sen in 1976. It has also received the name "modified Sen Index" in discourse by Shorrocks and Sen. As noted by B. Zheng, this index is identical to the limit of D. Thon's modified Sen Index.

In 1976, Sen proposed an axiomatic approach to poverty measures. He argued that poverty indexes should satisfy certain ethically defensible criteria, or axioms, and that the desirability of a poverty measure should be evaluated in terms of these axioms. Therefore, if we evaluate antipoverty policies according to their ability to reduce this type of poverty index, our evaluation will be consistent with the ethical criteria that inspire the poverty measure.

The index is a weighted sum of the poverty gap ratios of the poor. The weights decrease with the rank

order in the income distribution such that more weight is given to the poverty gap of the poorer individuals. The index is normalized to take values between zero and one: it is equal to zero when all the incomes are above the poverty line and so there are no poor people; it reaches a unit value in the extreme case when all the individuals are poor and they have zero income.

Of course, these are extreme hypothetical cases. In a comparative study of 23 Organization for Economic Cooperation and Development (OECD) countries, L. Osberg and K. Xu report a range of indexes between .014 in Austria and .125 in the United States during the 1990s.

This index has some very attractive properties:

- 1) Homogeneous of degree zero: The index is invariant to changes in the scale of the income distribution and the poverty line.
- 2) Focus axiom: The index does not depend on the income levels of the nonpoor.
- 3) Impartiality axiom: It depends only on the vector of ordered incomes and not on the identity of the individuals.
- 4) Replication invariant: The poverty index does not change if it is computed based on an income distribution that is the k-fold replication of the original income distribution.
- 5) Monotonicity axiom: A reduction in a poor person's income, holding other incomes constant, increases the poverty index.
- 6) Continuity axiom: The index is a continuous function of individual incomes.
- 7) Transfer axiom: The index increases whenever a pure transfer is made from a poor person to someone with more income.

In order to understand the relevance of these properties, it is useful to compare this index with other commonly used poverty measures. The poverty rate or headcount ratio, H, is a commonly used poverty measure. It is defined as the proportion of people whose incomes are under the poverty line. This measure meets properties 1) to 4), but it violates the monotonicity, the continuity, and the transfer axioms because it does not depend on how far and how unevenly the individual incomes of the poor fall below the poverty line.

Using this index to design and to evaluate antipoverty policies can lead to undesirable results. For instance, the easiest way to reduce the poverty rate is to subsidize the richest of the poor with just barely enough additional income to lift them out of poverty. This seems a very controversial policy action. Another commonly used poverty measure is the average poverty gap ratio of the poor (APGR). This index violates the transfer axiom because it is insensitive to the distribution of income among the poor. An income transfer from one poor person to another poor person without lifting any of the two out of poverty will not change the average poverty gap ratio. Finally, the Sen Index satisfies properties 1) to 5), but it violates the continuity and the transfer axioms. These limitations of the Sen Index led Shorrocks to propose the modified Sen Index, or SST index.

The SST index has a multiplicative decomposition in terms of the poverty rate, the average poverty gap ratio, and one plus the Gini coefficient of the censored gap ratios. This decomposition gives a much more straightforward interpretation of poverty intensity. Furthermore, the formula allows us to compute the index when we do not have access to the original individual-level data but we have information on the components.

Poverty indexes are typically calculated using a random sample of individuals from the population and not the whole population. Therefore, these values are estimates of the true population value of the index and they are subject to sampling error. It should be noted that when the sample size is relatively small, this asymptotic approximation is not precise enough.

Serbia and Montenegro

THE STATE UNION of Serbia and Montenegro (SCG), formed in February 2003, is made up of two member states, the state of Montenegro and the state of Serbia, which includes the Autonomous Province of Vojvodina and the Autonomous Province of Kosovo and Metohija, which is currently under an international administration in accordance with United Nations Security Council Resolution 1244.

Situated in southeastern Europe, SCG has a population of 10,019,657, of which 9,396,411 live in Serbia (2,116,725 in Vojvodina and 1,800,000 in Kosovo and Metohija) and 623,246 in Montenegro. The majority of the population is Serb (62.6 percent), with Albanians at 16.5 percent and Montenegrins at five percent. The sizable minority includes Hungarians, Muslims/Bosniaks, Croats, and Slovaks. Orthodox Christians are the most numerous, with the strong presence of other religious communities—Islam, Roman Catholic, and Protestant.

Because of the decade-long international sanctions, wars of succession, and NATO (North Atlantic Treaty Organization) bombing campaign, the economy of SCG has badly suffered. Upon the collapse of Slobodan Milosevic's regime in October 2000, the SCG economy has been slowly reintegrated into the international community. While Gross Domestic Product (GDP) grew at 6.9 percent in 2004, the GDP per capita of \$2,400 is seriously lagging when compared to other transitional economies. The unemployment rate is close to 30 percent and severely impedes economic restructuring and liberalization of the market. The complexity of SCG's political relationships, legal uncertainty over property rights, and scarcity of foreign-investment are holding back the economy.

Poverty analyses show that poverty in the union is at about 11 percent; approximately 800,000 in Serbia and 87,600 in Montenegro live below the national poverty lines, with consumption (per equivalent adult) at less than \$85 per month in Serbia and \$135 in Montenegro, that is, \$2.90 and \$4.70 per day. Poverty is higher among vulnerable groups and in rural regions. Additionally, in both republics, many people are at risk of falling below the poverty line, while 15 percent of Kosovo's population live in extreme poverty, surviving on less than \$1.10 per day.

Serbs, the strongest and the most numerous amongst the South Slavs, populated the territory of former Yugoslavia in the course of the 6th and 7th centuries. The first Serbian state emerged in 1077 and was recognized by Pope Gregory VII. Serbia prospered the

most under the medieval Nemanjic dynasty, which ruled from 1168 to 1371.

Following the Battle of Kosovo in 1389, Serbia first became a vassal state of the Ottoman Empire, and then in 1459 was conquered. Serbia liberated itself from Turkish rule in the beginning of the 19th century, and gained independence along with Montenegro at the Congress of Berlin in 1878.

After World War I, Serbia and Montenegro joined the Kingdom of the Serbs, Croats, and Slovenes in 1918. In 1945, Serbia and Montenegro became republics in the Socialist Federal Republic of Yugoslavia. Upon the unilateral secessions of Slovenia, Croatia, Bosnia and Herzegovina, and Macedonia, Serbia and Montenegro formed the Federal Republic of Yugoslavia in 1992. In 2002, they came to a new agreement that led to the formation of a loose confederation called the State Union of Serbia and Montenegro, instead of the Federal Republic of Yugoslavia.

The legislative power of SCG is exercised by its unicameral parliament made of 126 members (91 from Serbia and 35 from Montenegro). The executive power is vested with the president of SCG, who is elected by the parliament, and the Council of Ministers. In addition to the joint parliament, the Council of Ministers, the president, and the court, every member state has its own parliament, president, and government.

Julian Schuster University of New Haven

Seychelles

THE REPUBLIC OF Seychelles, a group of 40 volcanic and 75 coral islands in the Indian Ocean, is located off eastern Africa. Seychelles is an upper-middle-income nation with a relatively high quality of life. However,

Seychelles is severely indebted, and debt payments drain away some of its resources. Only 10 percent of the population are now involved in the subsistence agriculture that dominated Seychelles before independence in 1976. Tourism has skyrocketed in recent years, providing over 70 percent of hard currency earnings and employing 30 percent of the labor force. Tuna fishing also boosts the Seychellois economy. Even though foreign investment is welcomed in Seychelles, the government also promotes farming, fishing, and small-scale manufacturing.

Unlike most of sub-Saharan Africa, Seychelles has no widespread level of poverty. However, poverty does exist at a lower level, and most of the people who are poor are women and children. Seychelles has established a welfare system to assist the elderly, the chronically ill, the physically and mentally disabled, and members of disadvantaged groups. Government programs designed to provide employment for those who need jobs include the Unemployment Care Program, the Youth Training Scheme, and the District Beautification Program.

The Seychellois population of 81,188 enjoys a life expectancy of 71.82 years. Females have a projected life span of 77.4 years compared to 66.41 years for males. The median age of 27.7 is high for the region, and the Seychellois population is older than that of most sub-Saharan countries. Some 26.4 percent of the population are under the age of 14, and 6.2 percent have reached the age of 65. Healthcare is readily available to the Seychellois, and over 80 percent of the population have access to affordable essential drugs.

Infant mortality rates in Seychelles are low. Between 1990 and 2005, infant deaths dropped from 17 deaths per 1,000 live births to 15.53 deaths per 1,000. Mortality rates for children under 5 fell from 21 deaths per 1,000 in 1990 to 16 deaths per 1,000 in 2002. Approximately 10 percent of all babies are born at below normal birth weight, and 5.7 children under the age of 5 are malnourished. Some five percent of Seychellois children suffer from moderate to severe stunting, and two percent experience moderate to severe wasting. These numbers are extremely low for sub-Saharan Africa. The same is true of childhood immunizations, and only one percent of Seychellois children are not immunized against common childhood diseases.

Family planning has become important to the Seychellois, and this fact is reflected in the 1.75 children-per-woman fertility rate of 2005. This number is best understood in comparison with the 1980 fertility rate of 3.8 children per woman. The adolescent fertility rate in

Seychelles is 52 out of 1,000 births. Women in Seychelles have easy access to medical facilities, and they receive essential prenatal and neonatal care.

Literacy levels in Seychelles are also high. In 2003, approximately 92 percent of adults over the age of 15 could read and write. Seychelles has free and compulsory education, and most Seychellois children attend school for 14 years. In 2002, all male and female children were able to complete primary school.

Share Our Strength

SHARE OUR STRENGTH (SOS) was established by Bill Shore in 1984 in response to the Ethiopian famine. Seeking to create a sustained source of support for worldwide hunger relief and prevention, and to bring new groups of volunteers into the antihunger movement, Shore tapped the creative talents of chefs, restaurateurs, and food service professionals.

Collecting funds from restaurants nationwide, Shore relied on chefs to spread the SOS message to colleagues and customers. Since 1984, SOS has helped finance the emergency food bank system in the United States, saved lives through famine relief, financed social development projects in developing countries, recruited new groups of antihunger activists, created new wealth for communities, and provided grassroots nutrition education to persons at risk of hunger.

Beginning in 1988, SOS initiated an ongoing series of programs—Taste of the Nation, Writers Harvest: The National Reading, Charge Against Hunger, Opera-

tion Frontline, Kids Up Front, Community Wealth Ventures, Inc., and the Great American Bake Sale—designed to enlist antihunger volunteers in raising funds for antihunger programs while developing partnerships in which cause-related marketing initiatives offered corporations opportunities to make money (doing well) while being philanthropic (doing good). By 2005, SOS reported raising \$180 million to support more than 1,100 antihunger and antipoverty programs throughout the world.

By 2005, SOS reported raising \$180 million to support more than 1,100 programs.

Taste of the Nation is an annual series of events in some 70 cities in North America. Tickets are sold for food and wine tastings, seated dinners, brunches, and barbecues that enable participants to enjoy the company of their peers while contributing funds to antihunger efforts. Corporate sponsorship by American Express and Jenn-Air and contributions by restaurants, chefs, and volunteers cover the SOS overhead. They make it possible for 100 percent of ticket sales to support grants for food, health, nutrition education, economic self-sufficiency, and advocacy programs in the United States; and community development and advocacy programs internationally.

The SOS Great American Bake Sale raises money for grants to expand coverage of summer and after-school meal programs for children, advocates children's rights, supports child- and family-focused nutrition education, and provides for family basic needs in the poorest areas of the United States. The program is a partnership between SOS and *Parade* magazine with sponsorship by ABC Television and Betty Crocker. Individuals, faith-based and youth groups, civic organizations, and businesses are encouraged to host bake sales and contribute the profits to SOS. Since 2003 an estimated one million Americans have baked, sold, or bought at Great American Bake Sales in all 50 states, raising \$2.5 million toward ending childhood hunger in the United States.

In Operation Frontline, SOS-trained chefs teach sixweek cooking/nutrition classes to low-income people. Participants are taught to shop smart, to eat more fruits and vegetables, and to cook low-cost, nutritious recipes. Kraft Foods is the sponsor of a similar nutrition education program for children—Kids Up Front. The SOS Charge Against Hunger campaign (1993–96) was a

cause-related marketing campaign that attempted to provide American Express a competitive advantage during the winter holiday buying season by increasing cardholder loyalty, building merchant relationships, and mobilizing employees. American Express advertised widely that it would donate a portion of every credit card transaction to antihunger efforts, believing that cardholders were concerned about hunger and would respond to the antihunger incentive to use their American Express cards. American Express donated three cents from every transaction during the fourth quarter of the year, raising \$21 million for SOS antihunger grants.

In addition to encouraging corporations to consider the benefits of cause-oriented marketing, SOS established a for-profit subsidiary—Community Wealth Ventures, Inc. (CWV). CWV helps nonprofits generate revenue through business ventures and corporate partnerships and helps for-profit corporations increase their profits through community investments.

Shelter

SHELTER IS A BASIC NECESSITY for many kinds of animals and for all humans. Human survival in most places and at most times depends upon adequate shelter from the elements. Shelters provide humans protection from cold, heat, storms, dangers, or even insects. Without shelter, humans would probably either sicken or die from exposure.

Shelters may be natural or constructed, but all attempt to provide a place of refuge from the assaults of nature or, in the nature of the human condition, the assaults of other humans. Caves are among the oldest natural shelters used by humans. They are still in use in various parts of the world. However, most people

throughout history have used constructed shelters. These may be as simple as an igloo, a wigwam, a tent, a thatched-roof house, or a houseboat.

A variety of materials have been used by people to build shelters. Materials have included animal hides, fibers, snow, straw, wood, adobe, bricks, stone, metal, and other materials. The materials used are almost always directly related to the availability of materials with which to build. Snow in the Arctic, tent materials in the deserts, mud bricks in arid regions, burnt brick in wet regions, stone in rocky regions, and wood in forested regions are just a few of the materials used because these are the materials available to builders.

Shelter in the form of housing has become a major part of the interests of modern governments. Many governments have instituted housing programs to ensure housing for all of their citizens. In socialist countries housing needs have been met by government housing projects that provide apartments for large numbers of citizens, especially those who live in cities or around factory towns.

HOUSING PROGRAMS

Housing programs produced by socialist programs have often been described as drab or lacking in spiritual value. The apartment or house is materially adequate but was built without regard for the values of the human spirit. These values include such things as a sense of beauty and a sense of community.

In capitalist countries government-sponsored housing projects for the poor have been built in great numbers since the Great Depression of the 1930s. Many of the same complaints that have been made about similar projects in socialist countries have been echoed in capitalist countries.

All too often public housing projects have become ugly centers of decay and crime. This has been true not only in the United States, for example, but in France where large numbers of immigrants from former colonies have been quartered in marginal housing, with few opportunities for participating in an economy where upward mobility is possible.

To provide housing for people with middle-class incomes and for war veterans, both state and national governments in the United States have instituted a variety of housing programs. Many of these include guarantees that housing loans will be paid to lenders if the borrowers should default. The United States has been especially active in developing loan guarantees for both low-income borrowers and veterans. Millions have been

able to buy and pay for a home because of these programs.

Ideological debates about government sponsorship of loans have become universal with the adoption of international agreements, such as the 1948 United Nations Universal Declaration of Human Rights (Article 25). The net effect is that shelter or housing has been defined by many as a human right. The only problem with this is, who gets to identify those with the duty to support that right? The argument was made explicit by Michael Harrington in *The Other America* when he accused the U.S. Congress of lying because it had "promised" housing to all Americans in the Housing Act of 1949.

Harrington may have misunderstood the nature of the act, which set as its goal the housing of all Americans. According to former Congressman Albert Rains, author of the Housing Act, the goal was "a target to be achieved as soon as practicable." Part of the disagreement lies in the moralistic language used by some poverty advocates versus the managerial language used by many producers or distributors in society, as described by John Guinther in his 1976 book *Moralists and Managers*.

An important element in the building of housing and other kinds of buildings is the need to improve the ability of structures to resist fires, hurricanes, or earthquakes. Modern building codes have been developed and improved in recent centuries to prevent the terrible fires that burned much of Chicago to the ground in the Great Chicago Fire. Other building codes are seeking to reduce the damage from earthquakes, storms, or other natural events that could have a disastrous effect on housing.

SHANTYTOWNS

In poor countries shantytowns have been built with any materials that can be found. Often these shelters are built on or near the garbage dumps of great cities. For a growing number of people, used cargo containers abandoned by ocean shippers have become a source of shelter. Some aid agencies have begun to refurbish these metal boxes into homes that are livable.

Shelters for the homeless as places where they can find protection from the weather have been a new development on a large scale in recent decades. The problem of homelessness that became visible in the late 1970s captured the attention of many people at the time. The need for such shelters has continued into the first decade of the 21st century. It is a problem that is

In the country of Mali, in Africa, women take shelter from the sun, along with their animals and few possessions.

unlikely to disappear in the foreseeable future. To meet the needs of the homeless, numerous homeless shelters were opened across the United States. After this phenomenon appeared in Europe in the late 1980s, the same attention was given to the problem there.

HOMELESS SHELTERS

In the United States the opening of homeless shelters was an addition to the shelters that had long been provided to urban derelicts, most of whom were alcoholics or drug addicts. These shelters have met with a variety of public responses. In some communities they have been accepted. Some towns, such as Hope, Arkansas, childhood home of former President William Clinton, organized a community task force that used a grant from the Hands-Across-America fundraising event to purchase an old motel (the Cain Courts) in order to have a homeless shelter. Examples of generous actions by individuals and groups would be too numerous for telling, but the lives of the homeless have been made more bearable because of the shelter provided.

Moreover, for those sheltered, food, medical care, and other necessities have been provided by churches, charitable organizations, and caring individuals, including physicians.

In others places all manner of opposition has been generated to prevent the opening of or to force the closure of homeless shelters. As a consequence a significant body of case law has developed dealing with the needs of people who are forced to resort to living in a homeless shelter. Some of the cases involving homeless shelters and the homeless have been about the demographics of shelters. By law it would be difficult in the United States to operate a homeless shelter that practiced racial discrimination. However, the homeless of the 1980s and beyond have included many women and children. The propriety and the legality of housing the homeless by gender or as families have been a matter of continuous conflict as providers have disagreed over ideology.

Shelters not only provide a physical refuge from the natural elements but also provide a refuge from dangers. One of the terrible facts of the human condition is that of war. It has necessitated that shelters also provide defenses against the violence of warring armies. Forts, castles, bomb shelters, or other kinds of shelters from attack have long been a part of the shelter needs of humans.

Of the over 2,000 shelters, most, for reasons of safety, do not reveal their location.

Other types of shelters are those opened for battered women. The increase in violence in domestic life and the refusal of women to tolerate it any longer have given rise to shelters, which can protect them from abusive husbands, fathers, boyfriends, or others. These shelters keep their location and identity a secret. It is standard procedure for the person who is bringing an abuse victim to a shelter to be met by a shelter representative at a neutral location. Of the over 2,000 operating in the United States, most, for reasons of safety, do not reveal their location. However, the shelters that have made their locations visible have found that it increases volunteerism and donations. Also it increases the public's awareness of domestic violence. It has also been found that the abusers do not come knocking on shelter doors. The few that operate this way have had only minor problems.

Halfway houses for the mentally ill are also a form of shelter for the at-risk in society. The advent of modern drugs that help the mentally ill allowed numerous mental hospitals to be closed at a great savings to the taxpayers in many states and localities. However, in the United States the great tragedy was that about 3,000 community mental health centers were to be built, which would provide local care so that the mentally ill could be seen by healthcare providers. However, only about a third of these facilities were ever opened. The

failure to provide adequate shelter for the mentally ill, who are only partially able to care for themselves, is a direct cause in the large number of the mentally ill who have joined the ranks of the homeless on the streets of America.

Many shelters are operated by faith-based communities. The faith-based communities range from the Salvation Army to a wide variety of religious groups. The use of public money to fund the operation of these shelters has generated a great deal of controversy during the administration of President George W. Bush.

Sierra Leone

THE TINY COUNTRY of Sierra Leone, which is only 71,620 square miles in area, is situated in western Africa bordering the north Atlantic Ocean. Sierra Leone is one of the poorest countries in the world, with a poverty rate of 68 percent and an annual per capita income of only \$140. Some 74.5 percent of the people live on less than \$2 a day, and 57 percent live on less than \$1 a day.

Inequality is widespread in Sierra Leone, and the country is ranked 62.9 on the Gini Index of Human Inequality. The poorest 20 percent of the population hold only 1.1 percent of Sierra Leonean income, while the richest 20 percent share 63.4 percent. The United Nations ranks Sierra Leone near the bottom of 177 countries on its Human Development Report, which ranks countries according to quality-of-life issues. Between 1991 and 2002, civil war took a heavy toll on Sierra

Leone, with 500,000 dead, 100,000 mutilated, and one-third of the population displaced from their homes. Large numbers of the displaced fled to neighboring countries. A 17,000-strong delegation of United Nations peacekeeping forces and personnel, the largest ever deployed, helped to restore order until a new government could be put in place. Political stability continues to be tenuous in response to situations in Liberia and Guinea that may involve Sierra Leone in the future.

Although Sierra Leone's natural resources include diamonds, titanium ore, bauxite, iron ore, and gold, the country remains undeveloped. The Sierra Leonean economy is dependent on subsistence agriculture and international aid, which do not provide sufficient income to turn the country around economically. Sierra Leone's severely indebted status also drains resources that are sorely needed to meet the needs of the population of 6,017,643.

Life expectancy in Sierra Leone is 42.52 years, and the median age is 17.53 years. Life expectancy has increased since the 1980 rate of 34 years, but the increase has occurred slowly over a period of years. Some 44.7 percent of the population are under the age of 14, and 3.3 percent have reached the age of 65. Sierra Leoneans have a 57.5 percent chance of not surviving until the age of 40. One reason for this is that the population lacks access to healthcare and affordable lifesaving drugs. Additionally, some 43 percent of the population lack access to safe water and 44 percent lack access to proper sanitation.

Resources that are needed elsewhere are channeled toward fighting Sierra Leone's high HIV/AIDS prevalence rate of seven percent. In 2001, it was estimated that 170,000 were living with this disease, which had caused 11,000 deaths. Sierra Leoneans also face a very high risk of food- and waterborne diseases that are common in sub-Saharan Africa, and malaria and yellow fever present problems in some areas.

Infant mortality is extremely high, even for sub-Saharan Africa. In 2005, 143.64 deaths occurred out of 1,000 live births. Male infants were more likely to die than were female infants with a rate of 161.06 compared to 125.69. Between 1970 and 2002, infant mortality rates dropped from 206 deaths per 1,000 live births to 165 deaths per 1,000. The mortality rate for children under the age of 5 decreased from an appalling 363 in 1970 to a still unacceptable 284 deaths out of every 1,000 in 2002. Some 27 percent of all children under the age of 5 are malnourished, and nine percent are severely underweight. Approximately 34 percent of children under 5 suffer from moderate to severe stunting,

and 10 percent suffer from moderate to severe wasting. Only 29 percent of Sierra Leonean children receive essential oral rehydration therapy.

Rates of childhood immunizations remain lower than acceptable, and the availability of vaccinations varies among regions. Between 1990 and 2002, infant DPT immunizations dropped from 83 to 50 percent and infant measles immunizations fell from 75 to 60 percent. During that same period, polio immunizations rose from 43 to 50 percent and tuberculosis immunizations increased from 60 to 70 percent. In 2003, 73 percent of children between the ages of 12 and 23 months were immunized against measles and 70 percent were immunized against DPT3.

Some 74.5 percent of the people live on less than \$2 a day.

Sierra Leone is unable to support its high birthrate of 5.72 children per woman or its adolescent fertility rate of 178 per 1,000 births. Even so, some progress has been made since 1970, when the fertility rate was 6.5 children per woman. The average rate of contraceptive use between 1995 and 2002 was a scant four percent among married women. In 2000, professional medical staff attended 41.7 percent of all births, but the lack of professional healthcare leaves women vulnerable to the complications of childbirth. In 2000, maternal mortality rates were estimated at an abysmal 2,000 out of every 100,000 births. Even this low rate compares to the 1985–2002 maternal mortality average of 1,800 per 100,000 births.

Low literacy rates in Sierra Leone negatively affect all other aspects of life. While a lack of data hampers accurate reporting, it is possible to estimate the extent of illiteracy. In 1991, for example, less than one-third of the population over 15 could read and write English, Mende, Temne, or Arabic. The picture was even worse for females, with a literacy rate of 18.2 percent as compared to 45.4 percent for males.

Sierra Leonean children receive an average of seven years of schooling. From 2002 to 2003, the primary school completion rate for males increased slightly from 54 to 56 percent; however, the female completion rate rose substantially, from 28 to 45 percent. One-half of Sierra Leone's primary schools have not been restored to operation after the war, but school is being held in tents and temporary shelters furnished by UNICEF, the United Nations organization for children.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Singapore

SINGAPORE, A SMALL country in southeast Asia, gained independence from Great Britain and Malaysia after 1965. A developing country with a low Gross Domestic Product (GDP) per capita in 1960, Singapore became a newly developed country in 2004. It has one of the highest GDPs per capita in the world (\$27,800 in 2004). Singapore's vision, to become an intelligent society and a technological hub in the region, has materialized with the successful implementation of national policies and the IT2000 Masterplan. Four main factors helping Singapore to escape poverty are leadership, political stability, appropriate social policies promoting racial harmony, and steady economic growth.

Singapore has a one-party government and a unicameral parliament. The People's Action Party (PAP) has dominated Singapore politics since 1965. Under the leadership of Mentor Minister Lee Kuan Yew (the first prime minister of Singapore, from 1959 to 1990) and Senior Prime Minister Goh Chok Tong (the second prime minister of Singapore, from 1990 to 2004), the country enjoyed political stability, an efficient government, a very low level of corruption, and minimized bureaucracy and red tape, and has implemented effective public services.

Singapore began restructuring its economy in 1979. Educational, economic, and social policies were modified to adapt with regional changes and to stimulate economic growth. Attractive education and healthcare

programs have enabled Singapore to become a regional hub for first-class universities and medical services. Intensive technological investment and advanced educational systems with computer education have provided Singapore with a highly skilled workforce. Financial incentives such as tax concessions, and faster business registration processes and approval have been offered to enterprises, especially those in the high-tech, biotechnology, and life science industries. Relevant industries have been encouraged to improve the quality of products to achieve international standards.

Other economic activities focus on the innovative development of main industries such as manufacturing, the high-tech sector, biotechnology, and the life sciences. Promising local enterprises have been financially and institutionally supported in order to develop their potential and to increase their competitive advantage in the global market. With the establishment of the Monetary Authority of Singapore (MAS) in 1979, fiscal and monetary policies have been well formulated and implemented in the country. Together with the Amended Employment Act and the Industrial Relations Act in 1968, the tripartism approach in industrial relations has helped to promote industrial harmony.

A public housing program was given top priority. The government has promoted racial harmony by setting the racial ratio in the recruitment of public servants and in the occupancy of public housing, and by organizing many cross-cultural activities. The foreign talents program has drawn many international professionals to work in Singapore, and has significantly contributed to its economic expansion.

Consequently, Singapore can attract foreign investment because of its central location in the region, efficient planning, advanced infrastructure, highly skilled workforce, a well-established financial system, and a stable legal environment. Although the 1997 economic crisis and the 2003 SARS outbreak slowed down the economic growth rate, Singapore has maintained a strong economic foundation, and social and political stability. Overall, Singapore has successfully transformed from a Third World to a First World country. The Singapore government has proved its ability to lead the country through the hard times and to deal with new threats and challenges.

HUONG HA Monash University

Slovakia

THE SLOVAK REPUBLIC was formed from the "velvet divorce" of 1993, when Czechoslovakia split into the Republic of Slovakia and the Czech Republic. As part of Czechoslovakia, Slovakia had been pulled into the Soviet orbit after World War II. The relationship between the Slovaks and the Czechs has not always been smooth, although they are related culturally. In 1969, the Slovaks achieved a measure of independence from the Czechs by becoming the Slovak Socialist Republic of Czechoslovakia. After the collapse of the Soviet Union in 1989, Slovaks renewed efforts to become completely independent and succeeded in 1993. In 2004, the Slovak Republic joined the North Atlantic Treaty Organization and the European Union.

Slovakia is an upper-middle-income nation with an annual per capita income of \$14,500. Within the diversified economy, 55.9 percent of the labor force are employed in services. Over 29 percent are engaged in industry, and 5.8 percent are involved with the agricultural sector. Slovakia's natural resources include brown coal and lignite, as well as small deposits of iron ore, copper, and manganese ore. The economic transition from a state to a market economy is in the final stages in Slovakia. Foreign investors own most banks, and liberalized business laws and a 19 percent flat business tax have encouraged foreign investment in other areas. In 2003, unemployment hovered around 15 percent, but by 2005, it had been reduced to 13.1 percent.

Slovakia has a well-developed social net to meet the needs of those who do not earn sufficient income to provide a basic standard of living, and food security is guaranteed. Around seven percent of the population earn 50 percent less than the median income. Eight percent of Slovaks live on less than \$4 a day. Those who are most likely to be poor in Slovakia include women and dependent children, large families, those with low levels of education, rural residents, and the unemployed. Antipoverty measures include financial assistance, housing

assistance, counseling, social services, home nursing, transport services, and communal meal services. Inequality is not widespread in Slovakia, but the poorest 20 percent of the population live on 8.8 percent of resources while the richest 20 percent share 34.8 percent. Slovak is ranked 25.8 percent on the Gini Index of Human Inequality.

In 2005, life expectancy in the Slovak Republic was estimated at 75.5 years. With a projected life span of 78.68 years, women outlive men by an average of eight years. Slovakia's population of 5,431,363 experiences a median age of 35.43 years. Around 17 percent of the population are under the age of 14, and nearly 12 percent have reached the age of 65. All Slovaks have access to safe drinking water and improved sanitation. There are 326 physicians for every 100,000 residents, and healthcare is widely accessible. From 95 to 100 percent of the population has access to essential drugs.

Between 1970 and 2005, infant mortality declined from 25 deaths per 1,000 live births to 7.41 deaths per 1,000 live births. The mortality for all children under the age of 5 dropped from 29 in 1970 to eight deaths per 1,000 in 2003. Seven percent of all infants are underweight at birth. Among children from birth to 23 months old, 98 to 99 percent have received all the necessary immunizations.

On the average, Slovak women bear 1.32 children each, a decline from 2.3 children per woman in 1970. Among adolescent mothers, the fertility rate is 23 per 1,000 births. The government has established a goal of reducing this number by 50 percent by 2010. As a result, sex education classes have been introduced in the schools. Some 74 percent of Slovak women now use some method of contraception.

The government has been successful at reducing the number of abortions by nearly 60 percent over the last decade through an emphasis on family planning. According to modeled estimates for 2000, maternal mortality in Slovakia occurs at the low rate of three deaths per 100,000 live births.

The literacy rate in Slovakia is 99.7 percent. Education is free at the primary and secondary levels in Slovakia. Consequently, most students attend school for 14 years. All children complete primary school, and 87 percent are enrolled in secondary schools.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Slovenia

SLOVENIA IS A FORMER constituent republic of the Socialist Federal Republic of Yugoslavia, and gained independence and international recognition in January 1992. With its historical ties to western Europe, Slovenia enjoys a Gross Domestic Product (GDP) per capita substantially higher than that of the other transitioning economies of central Europe. Privatization of the economy proceeded at an accelerated pace from 2002 through 2004, especially in the banking, telecommunications, and public utility sector. The growth of real GDP was 3.9 percent and GDP per capita was \$19,600 (purchasing power parity) in 2004.

Structural reforms to improve the business environment have allowed for greater foreign participation in Slovenia's economy and have helped to lower unemployment. While further measures to curb inflation and corruption are still needed, the Slovenian economy is strong and competitive. Slovenia is the wealthiest country in central Europe, with a low poverty level when compared with other countries in transition.

According to the data, the risk of poverty diminished from 12.9 percent in 2001 to 11.9 percent in 2002. The risk of poverty in Slovenia is thus considerably below the European Union (EU) level, which is 15 percent. In a survey by the Dublin Foundation, Slovenia ranked third among the EU member states with the lowest at-risk-of-poverty rate, immediately after the Czech Republic and Sweden. The share of GDP for social benefits did not increase considerably (in 2002 it amounted to 25.4 percent) and was below the EU average (which in 2001 amounted to 27.5 percent). This is an indication of the increased effectiveness of Slovenia's system of social benefits.

Slovenian tribes arrived in the Balkan peninsula in the 6th century. After failing to establish an autonomous state, the Slovenes fell under foreign rule in 745 and remained subdued until 1918. Slovenes, although not entirely, were liberated following the formation of the Kingdom of the Serbs, Croats, and Slovenes on December 1, 1918. After World War II, the Slovenian republic was established in 1945. On June 25, 1991, Slovenia unilaterally seceded from Yugoslavia. Slovenia joined the North Atlantic Treaty Organization (NATO) and the EU in 2004.

Slovenia is a parliamentary democratic republic. The head of the state is a president who is elected by popular vote every five years, and the executive branch is headed by a prime minister and cabinet, which are elected by parliament. The Slovenian parliament is bicameral, with a National Assembly (90 seats) and a National Council (22 seats), and elections are held every four years. There are eight regions and 193 municipalities in Slovenia, 11 of which have urban status.

Smith, Adam (1723-90)

THE SCOTTISH POLITICAL economist and moral philosopher Adam Smith is unanimously considered the founding father of modern economics. His concepts were influential on such diverse 19th- and 20th-century thinkers as David Ricardo, Karl Marx, Thomas Malthus, John Maynard Keynes, and Milton Friedman. His major book, An Inquiry into the Nature and Causes of the Wealth of Nations (1776), was widely read at the time of its publication and it was translated into all the major European languages before Smith's death. This commercial success was extremely unusual for a book on economics.

In The Wealth of Nations, Smith championed economic and politic liberalism, which he considered the

necessary basis for national economic prosperity. The Scottish economist has proved an influential authority for those policymakers who wish to limit government intervention in economic and social affairs. Such intervention is not required because the individual who tries to promote his own gain is "led by an invisible hand to promote an end which was not part of his intention. By pursuing his own interest he frequently promotes that of society more effectually than when he really intends to promote it. I have never known much good done by those who affected to trade for the public good."

Although businesspeople may act selfishly, the free-market economy still benefits society as a whole. People's intentions are therefore irrelevant, as Smith understood economics to work in a mechanical and natural way. For example, when a product shortage occurs, its price rises, increasing its margin of profit and thus encouraging others to enter production, eventually solving the shortage. Economy is a self-regulating system. This *laissez-faire* attitude, which Smith derived partly from the Enlightenment enthusiasm for natural science, has generated a controversy for its implications to the poor and the exploited that still continues today.

Smith was born at Kirkcaldy, Fife, in Scotland. His father was a customs inspector and died six months before Smith's birth. When he was 15, Smith entered the University of Glasgow to study moral philosophy. In 1740, he started his disappointing period of study at Balliol College, Oxford, where he remained for six years. After his return to Scotland, he started to lecture in Edinburgh, first on literary subjects and then on more economic themes.

These are the years when Smith began to develop the ideas that would later go into *The Wealth of Nations*. In 1751 he became professor of logic at the University of Glasgow and, the following year, he obtained the chair of moral philosophy. During this period, Smith met the philosopher David Hume and the two of them soon became close friends. In 1759, Smith published *The Theory of Moral Sentiments*, which, to some Smith scholars, stands in sharp contrast to *The Wealth of Nations*.

As Geoffrey Gilbert points out, the volume contains little-studied remarks on poverty, which "is treated not as a condition of economic deprivation but as a cause of social isolation and psychic unease." The book also satirizes those who continuously strive for material goods and wealth. In the 1760s, Smith resigned his professorship to become the tutor to the Duke of Buccleuch, with whom he traveled extensively throughout Europe, particularly in France, where he met the

Adam Smith, a founder of classical economics, believed poverty could not be solved through charity.

most influential Enlightenment thinkers. After his return to Scotland, he spent almost 10 years writing *The Wealth of Nations*, which gave him popularity and allowed him to be appointed to the position of commissioner of customs. Smith died in Edinburgh in 1790.

The idea of "the invisible hand" of the market that turns the possible selfish intentions of individuals into a benefit for the rest of the society has been widely discussed. Especially at a time when economic globalization is being challenged and the morally dubious behavior of international corporations is being exposed, *laissez-faire* capitalism is held accountable for its profit-driven exploitation of the poor.

One does not have to be an antiglobalization activist to feel moral outrage over child labor in Third World countries or over the economic marginalization of entire nations from the wealth of global capitalism. These are typical phenomena that stem from the selfishness of corporate power and that Smith's invisible hand cannot seem to solve.

However, following Smith, some scholars claim that government laws to regulate corporate action or citi-

zens' boycotts to lobby them could have worse results. Poverty, Smith argued, cannot be solved through charity: "It is not from the benevolence of the butcher, the brewer, or the baker that we expect our dinner, but from their regard to their own interest. We address ourselves, not to their humanity but to their self-love, and never talk to them of our own necessities but of their advantages."

Social Assistance

SOCIAL ASSISTANCE IS a term used widely in English-speaking countries, Scandinavia, and elsewhere, to mean public financial aid given on the basis of need. The Organization for Economic Cooperation and Development (OECD) International Social Assistance Study, undertaken in 1994 at the University of York in England, notes: "The term *social assistance* does not have a fixed or universal meaning. For the purposes of this study we are concentrating on those income-related or means-tested benefits, available to people whose resources are officially held to be insufficient to maintain a minimum standard of living without such additional help."

The OECD study, released in 1996, surveyed academic experts and government officials from the 24 member countries concerning aspects of social assistance.

Canada, which uses the term extensively, provides the following official definition from the Department of Finance: "Payments made to Canadians on the basis of need by provinces and municipalities, supported by federal contributions provided under the Canada Social Transfer." The same governmental source describes the Canada Social Transfer as a program of federal revenue sharing with provinces and territories to support higher education and social services, as well as social assistance. Federal participation includes the prohibition of residency requirements for recipients of social assistance.

In the British Commonwealth and other former English colonies, including the United States, social assistance provisions are descended from the English Poor Laws, a series of statutes enacted and amended from medieval times into the 19th century. Social assistance is akin to what once was called "outdoor relief," or benefits available to eligible individuals who did not reside in institutions, such as poorhouses.

The Poor Laws established public responsibility for poor relief, and they also introduced features that continue to be issues in modern social assistance programs, including the residual concept of public aid as a last resort and local residency requirements. Poor Law concepts have remained stronger in the United States than in many other English-speaking countries, where labor or socialist political forces advanced the concept of social assistance as an entitlement.

In the United States, the terms *public assistance* and *welfare* have been used more frequently than *social assistance* for means-tested aid. Public assistance programs in the United States have been residual in nature, have carried stigma for recipients, and have lost public support in recent years. There have been two very significant changes in public assistance in the United States since federally funded programs began with the Social Security Act of 1935.

In 1974, assistance programs for the elderly, blind, or disabled poor were combined into Supplemental Security Income and placed under the federal Social Security Administration. This move served to standardize eligibility and grants on a national basis and to remove much of the stigma associated with receiving help from state welfare offices. Aid to Families with Dependent Children (AFDC) remained a state-administered assistance program. Then welfare reform in 1996 placed new limitations on the period of time a recipient may receive Temporary Assistance to Needy Families (TANF, formerly AFDC).

Even in European countries long considered social welfare states, where social assistance has been an accepted entitlement, eligibility for services and levels of support became matters of political controversy during the 1980s and 1990s. In many other countries, as in the United States, social assistance provisions have been scaled back.

Social Democracy

SOCIAL DEMOCRACY IS THE name of an international political movement that advocates a strong, stable, and just democratic society, to be achieved by regulation and management of the capitalist economy. Social democracy is a variant of socialism, and as such the ideas behind it can be traced back to 18th-century Enlightenment critiques of private property, the early 19th-century models of reform capitalism (for example, Robert Owen, Charles Fourier, P.J. Proudhon, Henri St. Simon), and the monumental critique of modern capitalism formulated by Karl Marx and Friedrich Engels.

With the rise of an industrial proletariat in the second half of the 19th century, and especially after the failed social revolutions of 1848, workers' movements arose in many western European cities to fight for the right to organize and vote for improved working conditions and for health, disability, and other kinds of insurance. Social democracy was thus born with the idea of improving the lot of the working classes and evolved into a larger political vision of a more humane, just society.

In 1864 Karl Marx, along with the Italian revolutionary Joseph Mazzini and the secretary of the English Carpenter's Union, Robert Applegarth, founded in London the International Working Men's Association, commonly called the First International. This moment marked the beginning of the struggle for a socialist ver-

sion of modern democracy. At about the same time in Germany the charismatic Jewish lawyer, thinker, and activist Ferdinand Lassalle (1825–64) fought for the workers' rights to organize, vote, and form their own productive associations. He founded the General German Workers' Association in 1863, a year before he died in a duel. At the time, the association represented only a small number of the workers who had emigrated from rural areas into the new industrial cities.

In 1875, Lassalle's group merged with a rival association, the Social Democratic Workers' Party (ADAV), to form the German Socialist Workers' Party (SAP). From 1878 to 1890 the party was suppressed and laws were passed to prohibit members of the party from organizing public demonstrations or circulating party literature. These antisocialist laws, promulgated by Otto von Bismarck and enforced by Germany's secret police, had the effect of giving the organization a coherence and militant purpose it might not otherwise have enjoyed. Bismarck also tried to co-opt the workers by introducing progressive social legislation of his own, which had the effect of giving the workers a stake in the capitalist system but also anchoring the idea of protection of workers' rights in state law. After the antisocialist laws were relaxed in 1890, the SAP changed its name to the Social Democratic Party of Germany (SPD), which still exists today.

English workers were immune to revolutionary Marxism.

In 1891 the Social Democrats promoted a platform at their party congress in Erfurt that called for the overthrow of the capitalist system of private property, but at the same time demanded a long list of reforms that would improve the lives of the workers within bourgeois society. This compromise platform satisfied the theoretical purists who did not want to abandon the ideas of Marx and other socialist thinkers who had predicted the imminent demise of capitalism, but also appealed to the rank and file of workers who saw their living standards rise from year to year and were happy to fight for a bigger piece of the capitalist pie.

In the latter third of the 19th century, workers' movements across Europe grew in strength and put pressure on the liberal and reactionary elites to deal with the "labor problem." This pressure in fact created the modern welfare state. Between 1870 and 1901 the working-class population of the advanced industrial

states grew from about one-fifth to one-third. In Germany Bismarck took the lead by introducing factory inspections, state health insurance, accident insurance, and old-age pensions.

Bismarck had been influenced by what he observed as ambassador to France during the reign of Napoleon III. The French populist emperor had won over the working classes, using their support as an anchor against the democratic bourgeoisie by implementing universal male suffrage, grand public projects, and pension and insurance schemes, and by encouraging limited self-organization of the workers at the factory level.

FABIAN SOCIETY

In England, the Victorian era was one of steady material progress, political stability, and cultural florescence. The Conservative and Liberal Parties took turns ruling and both did their best to gain the adherence of the working classes through widening suffrage and improving working conditions. As a result English workers were immune to revolutionary Marxism and stuck by their trade unions. Leading thinkers, such as George Bernard Shaw, H.G. Wells, and Sidney and Beatrice Webb founded the Fabian Society, which advocated gradual reform to bring about a peaceful socialist state. The English Labor Party was formed in the 1880s as a result of a fusion between the Fabians and the trade unions. Thus as European social democracy moved in a reformist direction, leaving anarchism and revolutionary Marxism behind it, the idea of using the strong state to advance economic security, even at the price of individual liberty, grew as strong on the left as on the right.

After 1890 the material gains made by workers started to erode as capitalism went through a series of economic crises throughout continental Europe and in North America. Strikes were rampant and class antagonism grew. Many Social Democratic parties were torn apart between the "revisionists," who continued to believe in gradual reform, and the radicals, who maintained that nothing short of the abolition of private property would emancipate the working class. In 1903 the Russian Democratic Party split in this way.

Vladimir Lenin was the leader of the radicals, and after having won a majority vote on a relatively minor issue, called his faction the Bolsheviks (the Russian word for "majority"). Little noticed at the time, this split would have worldwide historical repercussions when Lenin came to power in 1917, overthrowing the Russian state and replacing it with the dictatorship of the Communist Party. In Germany too, the Social De-

mocratic Party split in 1918 over the issue of support for the war. Throughout the 1920s and until the rise of the Nazis, the Social Democrats and the German Communist Party were bitter rivals.

From 1918 to 1945, European social democracy was caught between the ideological pincers of the powerful totalitarian ideologies of communism and fascism. In the smaller countries in Scandinavia, Belgium, and Holland, social democracy survived, but in fascist Germany and Italy Social Democrats were persecuted and went into hiding or into exile. In communist Russia, Stalin crushed the reformers. After World War II, as the Iron Curtain descended on eastern Europe, Communists and Social Democrats were formally reunited in socialled People's Parties, but in fact these organizations were puppet entities controlled by Moscow.

Only in West Germany, in the Federal Republic, did the Social Democrats reconstitute themselves. They remained in the opposition, however, until the 1960s, when they abandoned their anticapitalist platform and advocated a "social-market economy," that is, a capitalist system tempered by government programs that assist the poor, disabled, and unemployed.

The Conservatives came to power with a program to revive competitive capitalism.

In France and Italy, the Communist parties remained strong, but, repelled by the conditions in the Soviet Union, they proposed Euro-communism, a supposedly more democratic and just version of communism. By the 1970s the French and Italian Communists and Socialists had become more like the German Social Democrats, prepared to accept the parliamentary system and bourgeois society, seeking only to repair what they perceived as an unjust distribution of wealth.

In Great Britain the Labor Party eclipsed the Conservatives after the war, as the English trade unions were able to flex their muscles and the population supported the creation of a vast welfare state, including the nationalization of industry, a national healthcare program, and generous unemployment benefits. In the 1970s the English economy suffered from heavy regulation and inability to compete on the world market. Margaret Thatcher and the Conservatives came to power in 1981 with a program to revive competitive capitalism and reform the bloated welfare state.

When the Berlin Wall fell in 1989, European social democracy entered a new era as capitalism triumphed,

in which all nations now competed in a global marketplace. States could no longer afford to protect their citizens from global competition. Social Democrats had to rethink their most cherished notions about the welfare state. As a result, new parties emerged that sought to maximize efficiency and productivity on the one hand, while protecting the environment and cushioning citizens from the hardest blows of globalized competition on the other.

SUCCESSFUL TRANSITION

The new social democratic strategy was to support entrepreneurship and the creation of national wealth in order to pay for state programs. The Scandinavian Socialists were most successful at this transition. Tony Blair's New Labor Party and Gerhard Schroeder's Red-Green coalition were able to wrest power from the conservatives based on a similar formula.

The social democratic movement can take pride in its history of advocacy of basic rights for workers. Without the efforts of Social Democrats, laws protecting the health and safety of workers would have taken much longer to be implemented and the standard of living for the broad masses would not have improved so dramatically. The Canadian and European welfare states of today provide a measure of security and comfort for their citizens undreamed of in the 19th century, when activists began thinking about a more just society.

In the United States, the New Deal era of the 1930s and the Great Society programs of the 1960s can be thought of as social democratic projects. But today, the pressures of globalization and the high costs of maintaining generous benefits for aging populations are challenging all welfare states. As in the past, social democracy will have to adjust to rapidly changing conditions in order to maintain the ideal of a social contract that balances both liberty and justice.

Social Disqualification

SOCIAL DISQUALIFICATION IS a concept developed in Europe to describe the way in which different segments of the labor force become marginalized. Marginalization leads to the destruction of social ties and the loss of opportunity to regain a place in society with a living wage.

The history of European society is one of great class differences. The differences may have lasted from Roman times until today, stemming from Roman conquests and from the various barbarian tribes who rampaged across Europe in the Middle Ages. The defeated often went to the bottom of the socioeconomic system, from where it was difficult to move upward because of race and language differences that grew into social differences.

The concept of social disqualification describes a process of stages through which whole sections of the population progress. The end result is to marginalize some people more than others and the effect of the process varies from country to country. The concept, while applicable across Europe, is also used to describe social discrimination in many poor countries around the world.

In Europe, the process of social disqualification can lead to isolation and to even greater poverty because the social support network is lost. This means, for example, that if a person is out of work and a job becomes available, she may not learn of the employment opportunity because she lost contact with the network of people who would pass along the information. Social isolation is usually greater in northern Europe than in southern Europe.

Social disqualification leading to isolation can be the result of a number of factors. Being stigmatized as a social "leper" because of illness, race, creed, gender, sexual orientation, or some other factor can lead to social disqualification because "that kind" is not wanted for work. Diseases such as AIDS/HIV, tuberculosis, and malaria; injury; or illness can lead to social disqualification in all countries of the world. This is most espe-

cially the case in the world's poorest countries, where there are no laws to protect the disadvantaged from discrimination. Social disqualification can also be the product of long-standing social practices. For example, in the history of nursing in England, the profession was held in high regard from the beginning because Florence Nightingale drew its first members from idealistic and well-educated young women from the upper classes. However, in the history of nursing in Austria, the women who filled the profession were drawn from the poor.

WOMEN'S EXCLUSION

The United Nations, in its work with poverty in the poorest of countries, has found that there are numerous social disqualification factors operating to the disadvantage of the poor. This is especially true in the case of the disadvantages that women face. In the poorest of cultures there is some social discrimination against boys. Religious discrimination can be a form of social disqualification. Traditional clothing may create the same separation. Other social disqualifications against women include exclusion from the healthcare system because the physicians are male. The female patient is then denied healthcare benefits because of a social taboo. This same gender bias operates in matters of inheritance, in courts, or in social practices such as female circumcision.

The right of life is often denied in practices of infanticide, demands that widows join their husbands in death, and crimes of honor. In addition, women who may have been the victims of rape during the horrors of ethnic cleansing in the Balkans or in Sudan can experience social disqualification from rejoining their people. The victims of rape are treated as if they were in the same class as prostitutes or slaves.

Social Exclusion

SOCIAL EXCLUSION IS A broad concept describing the numerous ways an individual can be prevented from full participation in society. Its origins lie in debates about the concepts of absolute poverty and relative deprivation and the inadequacy of purely material models of poverty and marginalization. The term emerged in developed nations particularly in the European Union (EU), in the 1990s, where it was enshrined in the EU's Social Charter, and it was recognized as a major social policy concern in the United Kingdom with the establishment of the Social Exclusion Unit after the election of the New Labour government in 1997.

Although the broadening of a definition of poverty to incorporate subjective experiences of marginalization was widely welcomed, critics have identified its role in furthering the political ends of Third Way social policies such as those of Tony Blair's New Labour Party in the United Kingdom. They would claim that strategies for creating social inclusion focus upon including more people in the workforce (seeing work as being beneficial in itself) rather than focusing on wealth redistribution through taxation. In such social policies, social inclusion is premised on individuals' participation in the market economy, often as low-paid worker, as being preferential to state dependence.

It does, however, recognize the multidimensional nature of poverty and of "being shut out, fully or partially, from any of the social, economic, political and cultural systems which determine the social integration of a person in society," as phrased by M. Haralambos and M. Holborn. Importantly, social exclusion is a process that happens to people, rather than a process they instigate themselves. It therefore not only avoids the personalization of failure inherent in notions of the underclass, according to C. Murray, but also can encourage analysis of how an individual's marginalization from the mainstream is framed within a context of a globalized market society.

The concern expressed by the EU in the need to tackle social exclusion is tacit recognition that union into an enlarged market economy produces social exclusion as an almost inevitable consequence. It encourages reflection on the linkages between problems that affect people, or indeed geographical areas such as unemployment, poor skills, low incomes, poor health, high crime rates, family breakdown, and bad housing. It also can adapt to accommodate the dynamic nature of mainstream society and material increases in living stan-

dards, thus avoiding the limitations of absolute standards of poverty, the thresholds of which are likely to shift over time and place. Social exclusion, while seeing economic marginalization as an important and inseparable part of social marginalization, can be invoked to explain a variety of forms of inequality, such as the circumstances of an HIV-positive individual, a member of a minority ethnic or sexual group, or an older worker unable to find employment in a postindustrial economy.

The United Kingdom's New Labour government's policy responses to its conceptualization of poverty as social exclusion have included the instigation of social programs such as SureStart (for young families in urban areas) and Connexions (for young people trying to enter the labor market). These responses are characteristically joined up in their approaches encompassing education, training, and health, reflecting the recognition of multiple causes of exclusion.

The breadth of social exclusion may be one of its strengths, but it also makes the measurement and operationalization of the concept problematic. In this regard it is even more beset with problems than its kindred concept of relative deprivation, which at least can be linked to national and societal averages in income. Social exclusion covers a range of economic factors, some of which, it has been claimed, such as the breakdown in community life, may be beyond the efficacy of government in a globalized world economy.

Peter Seaman University of Glasgow

Social Inequality

IN MODERN political economy two concepts have been prominent, liberty and equality. They receive nearly identical ranking in importance to community life in the American Declaration of Independence. There, we are told, human beings are "created equal" and possess "certain unalienable rights; among these ... are life, liberty and the pursuit of happiness." A certain kind of equality and a certain kind of liberty are supposedly due everyone, with government instituted so as to secure those equal rights.

Critics point out that the equal possession and protection of the rights in question—especially the liberty to acquire and hold property—engender great unfairness or injustice in human communities. Those born into unfavorable social and economic circumstances—the poor, the ailing, and the meagerly educated—are far less free than those born fortunate. Such socioeconomic inequality, the critics argue, is a major failing of this political tradition.

So, modern (as distinct from classical) liberals and social democrats argue that the sovereignty of each individual is vital, but first everyone needs to be socially and economically equal. From thinkers like the German neo-Marxist Jurgen Habermas to the American legal theorist Ronald Dworkin (of New York University and the University of Oxford School of Law), not to mention radical egalitarians like Kai Nielsen (of the University of Calgary, Alberta, Canada) and the more moderate ones such as James P. Sterba (Notre Dame University), the assurance is that yes, liberty—individual rights, personal sovereignty or autonomy—is vital, but only if people start from the same circumstances in their lives and are guaranteed fairness as they make their way through life.

Defenders of the classical liberal stance claim that the qualification ruins the thing being qualified. Guaranteeing an equal start for everyone, let alone a fair journey, is impossible because any effort to establish such fairness or equality must involve massive unfairness and inequality of power over others.

The late Harvard political philosopher Robert Nozick argued this view with his Wilt Chamberlain example in *Anarchy, State, and Utopia* (1974). Even in a system of total economic equality, the choice millions make to spend their resources on viewing Chamberlain's basketball virtuosity would involve transfers of enormous, vastly unequal wealth to him (and to similarly favored people), which then would have to be confiscated so as to reestablish economic equality. This, in turn, would involve a government with vastly unequal power to those whose wealth it would equalize.

People aren't born with equal health, with parents of equal socioeconomic position, with equal willingness to work hard, or with looks that are equally attractive to others, so all this would have to be radically and repeatedly adjusted, requiring massive force, since few would volunteer to give up their advantages, minor or major. Unfairness would prevail, and this would need to be eliminated. The power to impose all this, critics of the egalitarian stance argue, would constitute massive and insidious inequality and unfairness.

One way to resolve this dispute may be that the imposition of socioeconomic inequalities by the legal system, and the authorities administering needs, be systematically removed from a country, while full socioeconomic equality must be given up as a goal of public policy. The remaining inequalities would be akin to what we have in most sports, due to the accidents of nature and personal efforts. These cannot be reasonably objected to, and the avoidance of them would bring on far worse inequalities. Of course, this may not suffice as a solution to many who want socioeconomic inequality completely erased in human communal life.

Social Insecurity

INDIVIDUALS AND HOUSEHOLDS are socially insecure when they lack sufficient opportunity to access resources and services to secure the basic human needs of livelihood, health, and safety.

This includes the inability to enjoy fundamental human rights such as self-determination, freedom from manipulation and discrimination, and freedom from abuse and conflict. Social insecurity stems from an inequity in the utilization of resources, particularly when lack of legal rights, political instability, and conflicts are prevalent. The circumstances associated with social insecurity expose households and individuals to risks associated with poverty and need.

Social insecurity is directly linked to an absence of assets and asset-building opportunities—the resources and capacities that enable individuals to maximize opportunity and build secure lives. Opportunity, resources, and services emerge through development of 1) human capital assets, such as equal and full access to education, and skills for moving out of poverty conditions; 2) financial assets, such as land and housing, tools for production, and savings or resources that can be used to maintain basic livelihood, needs in times of crisis; and 3) creating and preserving an asset foundation, by supporting sufficient wages and other protections that ensure livelihood such as primary healthcare, and unemployment or old-age income, and laws and other social protections that provide mutual safeguards in cases of economic, social, or environmental instability.

The conditions of social insecurity, particularly the lack of opportunity to acquire needed assets, are at the core of world poverty. Social insecurity is the composite of political, social, and economic constraints that contribute to poverty, including conditions that weaken needed social connections and promote civil conflict.

SOURCES OF SOCIAL INSECURITY

The United Nations Development Program has identified seven dimensions of human security: economic, food, health, environmental, personal, community, and political. These dimensions are interrelated in that the lack of one can precipitate the lack or diminution of others, thereby resulting in social insecurity. The lack of economic security, for example, generally results in food insecurity and poor health.

Globalization is an important factor that contributes to social insecurity through the movement of people between and within countries for economic reasons. As these population shifts impact traditional communities and family structures based on kinship, ethnicity, and religion, the concomitant shift of social connections increases social insecurity. The loss of traditional support systems and the resulting increase in social insecurity aggravate the conditions of poverty.

The unequal distribution of economic and political power is another key factor contributing to social insecurity. Limited government investment in the health, education, and political rights of populations reduces broad-based economic growth because economies require sufficient numbers of secure, healthy, skilled workers to thrive. Many nations fail to make economic and social interventions to reduce social insecurity because of political and economic corruption. Often the

failure to act is based on the contention that human needs will be met through engagement in a world economy and market forces alone. The poor also typically receive inadequate protection from the judicial system, limiting their access to protection from crime and manipulation by stronger groups and forces.

Social insecurity often stems from a lack of access to resources and opportunities, not necessarily their absence. J. Dreze and A. Sen note, for example, that homelessness results from lack of access to housing or land, not necessarily from an absence of available housing or the opportunities to establish housing. Similarly, famines result not from lack of food, but from people's inability to buy or access existing food sources. The issue of access is closely tied to the distribution of power and political choices.

Finally, it is notable that certain cultural factors and beliefs promote social insecurity. Gender discrimination reduces women's access to education and their legal status for financial decision-making. Ethnic minorities often have little political power or face discrimination because of religious differences or status, such as caste. And people with physical or mental disabilities often are marginalized.

EFFECTS OF SOCIAL INSECURITY

The absence of broad governmental investments and protections limits access of the poor to political participation and economic opportunity, resulting in human capital that is untapped and unproductive. More egalitarian societies work to increase political participation and other avenues to opportunity, thereby promoting security through the acquisition of household and community assets. Social insecurity limits the ability of individuals and families to assume responsibility for their own well-being. By compromising many aspects of people's lives, it limits opportunities and choices, thereby hampering self-determination and producing poverty and dependency.

There is a strong relationship between political and social violence, limited judicial protection, and poor economic growth. Limited or uneven growth often leaves the most vulnerable unable to fend for themselves, increasing social insecurity and resulting in the likelihood of violence between communities.

POLICIES AND SOCIAL INSECURITY

The United Nations Commission on Human Security suggests a number of policy options to address the po-

litical, social, environmental, economic, military, and cultural systems that provide people with the building blocks of survival, livelihood, and dignity. They affirm that access to resources and services for livelihoods, and protection from threats and conflict, help to ensure personal economic security, self-determination, and social well-being.

The poor need to be able to influence policy to help meet their needs.

Economic growth is necessary to reduce social insecurity because it results in increased government revenues and provides critical resources for increased investments in social services, infrastructure development, and environmental protections.

Economy-related poverty-reduction strategies must include asset-focused social policies to build sustainable resources and services for literacy, education, health, medical care, housing, employment, and arrangements for unemployment compensation, survivors' benefits, old-age pensions, maternity benefits, and similar social provisions.

Opening avenues to political participation is yet another important way to reduce social insecurity. The poor need to be able to influence policy to help meet their needs as well as participate in larger national development. Involving the poor in the formal democratic process enhances their access to opportunity, resources, and political accountability. Because levels of social insecurity reflect policy choices and structural conditions, policy choices and structural factors mediate the link between economic growth and social insecurity.

Accordingly, the International Labor Organization (ILO) calls for the introduction of minimum social standards across continents to ensure that economic progress is accompanied by social progress, particularly employment and social protection policies that are convergent with rather than independent of each other.

Collectively, governmental policies designed to provide households and individuals with meaningful opportunity to acquire and build assets are needed for establishing social security and greater self-sufficiency. This social security includes access to work, sufficient incomes, social capital, and wealth-building opportunities.

Social Insurance

SOCIAL INSURANCE REFERS to a broad range of insurance programs administered by governments. These include old-age insurance, disability insurance, unemployment insurance, survivors' insurance, and health insurance. Such programs help people to offset potentially large and uncertain expenses and losses of income; they provide an important tool for keeping people out of poverty. In this regard, social insurance is similar to privately provided insurance. But because of the economic problem of adverse selection, governments may be the only feasible provider of certain types of insurance.

Also, unlike private insurance, government-provided insurance programs often include mechanisms to redistribute income. For instance, if a retirement annuity is actuarially fair, then it will be equal on average to the amount of money contributed by a worker plus interest. But social insurance programs will tend to provide a larger benefit than is actuarially fair to poorer beneficiaries, and less than is actuarially fair to wealthier recipients. Social insurance schemes have contributed greatly to the reduction of poverty in many of

the countries where they have been implemented. Insurance exists because people are generally willing to sacrifice a portion of their current consumption to pay insurance premiums in order to receive some compensation if the unlucky event occurs for which they are insured. Economists refer to this as consumption smoothing.

The insured population will be different from the overall population.

Many types of private insurance exist, though social insurance generally refers specifically to insurance programs provided by governments. Old-age insurance protects against the prospect of living longer than the insured person has planned for financially. Disability insurance provides income in the event that an insured person becomes disabled and is no longer able to work at the same job. Unemployment insurance provides income in the event that the insured person loses her job for reasons beyond her control, such as a layoff. Survivors' insurance provides income to spouses and children in the event that the family's breadwinner dies at a young age. Finally, health insurance helps to cover expenses in the event that an insured person develops a costly illness or medical problem.

The economic problem of adverse selection explains why governments often become involved in these insurance areas. Adverse selection refers to the problems that develop because insurance companies have less information about their potential customers than do the customers. If insurance is voluntary, then those most likely to buy insurance are those also most likely to benefit from the insurance. These are precisely the people who the insurance company would prefer not to buy insurance. For example, the people who buy old-age insurance may expect to live longer than the average population, or the people who buy unemployment insurance may know that they have a higher risk of losing their jobs. Thus, the insured population will be different from the overall population. This forces insurance companies to raise the price of insurance coverage to meet the additional costs of the insurance-buying population, which then further compounds the problem.

Governments generally justify the provision of social insurance on at least four grounds. First, governments can fix the adverse selection problem by requiring mandatory participation. If everyone participates, then those who are less likely to benefit from the

insurance cannot drop out. The second issue relates to paternalism. Because insurance matters are complicated, people may lack the foresight to purchase an appropriate amount of insurance. By learning from experience, the government may be able to better plan for such contingencies. It is also possible that people would not buy insurance because they believe that the government will bail them out in times of difficulty, and it is thus in society's interest to force everyone to participate.

The third issue relates to the ability of governments to economize on decision-making. Because of the complicated nature of insurance and annuity markets, the government can help people to avoid wasting resources to learn all of the details of insurance options. The fourth issue relates to the redistribution of income. As mentioned, social insurance programs are not actuarially fair, which means that the costs of the insurance do match the expected benefits to be received from the insurance. This is because the government incorporates redistribution goals into social insurance.

Social Insurance (Universal)

SOCIAL INSURANCE IS justified largely on the basis of income distribution, market failure, adverse selection, and lack of foresight. The main social insurance policies that address poverty are concerned with income maintenance for the aged and unemployed, their dependent children and spouses, and veterans of wars. In addition, nutrition, healthcare and education programs are commonly provided to improve human capital and induce social mobility.

Cash transfer (and conditional cash transfer) is the primary type of social assistance for reducing the income gap. Cash transfer is more common among the countries that are the member of the Organization for Economic Cooperation and Development (OECD). These programs are generally part of a broader social insurance program in these countries. In Africa, south Asia, and parts of Latin America, cash transfers constitute the primary type of social insurance.

Social Security (OASDI) is the largest social insurance in the United States and it constitutes the largest domestic spending program. Social Security benefits are based on workers' work history and individuals' earnings history. The retirement age, family status, and other earnings also determine benefits. This program also provides Supplemental Social Security Income (SSI) for the poor, disability and survival benefits, and medical care for beneficiaries who reach 65 years old.

Some countries have privatized their social security program. The United States has considered privatization of Social Security as well. Economists are concerned that privatization will have an enormous adverse effect on those who are most at risk. In addition, the unfounded portion of the benefits coming due will require some \$800 billion. Moreover, the administrative cost of a privatized system is projected to be much higher than that of the current system.

The oldest social insurance program in the United States is the Veterans' Medical Act, which was established in 1917. Social Security and unemployment insurance were enacted in 1935. Medicare, which provides health insurance to Social Security beneficiaries who reach 65, was established in 1965. These programs constitute approximately eight percent of the Gross Domestic Product (GDP) of the United States. As of 2006, Medicare provided prescription drug coverage for qualified individuals who chose to participate and pay a fee.

In many countries around the world, governments have adopted a system of user fees to cope with small public budgets for health services. User fees present some major problems. On the one hand, fees are in general regressive in the sense that poor people spend a relatively larger portion of their cash on consumption. On the other hand, fees present a barrier to medical care. Some countries have developed a program for granting a waiver to the poor. The success of these programs depends on four critical factors: widespread dissemination of information among the eligible population, timely compensation to healthcare providers, compensation for related costs of health services (for example, transportation and food costs), and establishing and implementing criteria for eligibility. Establishing criteria is a challenging task.

Most countries' social insurance programs also include access to basic services necessary for sustaining a minimum standard of living. These include education, housing, network utilities in central and eastern European countries and the former Soviet Union. Most countries across the world consider education as a desirable social good. Therefore, most of them waive any fees for tuition, textbooks, and required uniforms to assist the poor. Almost all countries surveyed by the World Bank reported waivers of these fees.

Food-related programs are also a common subsidy to the poor. Food-Based Safety Programs support adequate nutrition to the poor. The most common programs are food-for-work programs, food stamps, vouchers and coupons and food price subsidies. These programs are income transfers to the poor. In addition, many governments use tax and price subsidies to protect the poor. Since wealthier families consume more than poor families, some subsidies could benefit them more than the targeted population.

PUBLIC WORK PROGRAMS

Public work programs are commonly used by both developed and developing countries to alleviate the adverse effects of a natural disaster and other external shocks. In many countries, irrigations, dams, and other infrastructure provide jobs to unskilled labor. These types of programs have been used in many Asian and African countries. The success of these programs depends on the balance between their costs and benefits for the targeted population and therefore their effectiveness in reducing poverty.

In the United States, social insurance programs are provided at both the federal and local levels of government. Major programs at the state level include the Child Care Development Fund (CCDF), child support enforcement, food stamps, Head Start, public health insurance for children/parents, housing vouchers, Temporary Assistance for Needy Families (TANF), cash assistance, and unemployment insurance. Cross-policy data show large variations in per-recipient spending across states.

Most states also have tax-relief policies to help low-income families. Seventeen states, to date in 2005, have adopted a variation of the Earned-Income Tax Credit (EITC), which ties to the federal provision. The EITC at the federal level has been more effective than the minimum wage or the living wages in lifting many individuals, including destitute children, from poverty. It also has encouraged the able workers to work.

Social Mobility

FROM THE PERSPECTIVE of the individual, the term *social mobility* implies the degree to which social status may change for a person in the course of a lifetime. A person may begin life as a member of a relatively poor family and in time advance to a higher social status through education and the attainment of high-paying employment. An extreme example would be the rags-to-riches experience of Andrew Carnegie, who came to the United States as a poor immigrant and rose to become one of the wealthiest and most influential industrialists in history.

The study of social mobility is also applied to groups within a society. If a country has an accepted caste system, which essentially keeps individuals within a particular social level, there is little if any chance for mobility to occur for either the individual or the social group. Countries like the United States, on the other hand, do not have recognized class designations. Consequently, the potential for social mobility of individuals and groups is maximized.

Sociological research has correctly pointed out that the potential for increased social mobility is directly related to the degree of child poverty reduction that can be accomplished. This is exemplified in Norway, Denmark, and Finland, where high levels of social mobility are associated with flatter income distributions, which have the added benefit of reducing child poverty levels. In the United States, on the other hand, the range of economic inequalities is greater and levels of child poverty are consequently much higher.

For example, in the United States in 2005, 12.3 percent of the country's population were living below the poverty line. However, the percentage of children living in poverty was approximately 18 percent in that same year. Child poverty is a compelling problem. Being poor

as a child will usually mean there will be deficiencies in nutrition, which can impair the development of sound cognitive abilities in the early years of life. It has also been shown that poor children are at a disadvantage in the educational system.

Perhaps no sociologist has contributed more to the study of social mobility than the Russian scholar Pitirim Alexandravitch Sorokin. He came from a peasant childhood in Russia and rose to prominence as an esteemed member of the sociology faculty at Harvard University. Sorokin defined social mobility as the shifting of people within social space. He was less concerned with the study of individual social mobility than with the movements of social groups within a social structure.

Sorokin used the concept of social stratification in his studies of mobility. Social stratification, which he considered to be a permanent characteristic of a social system, can be seen in three distinct forms: 1) economic stratification, which is based on differences between the rich and the poor; 2) political stratification related to authority and power; and 3) occupational stratification, in which a system recognizes some occupations to be more respectable than others.

Sorokin extended his study of stratification to include the degree to which a social group may rise or decline within social strata, for example, the rise of the African American population from a position of slavery to a higher level in the 20th century. Sorokin also pointed out that the differences between the rich and poor can be reduced if sufficient equalizing forces can be applied. The example of flatter income distributions in northern European countries and reduced child poverty would apply in this case.

Sorokin also noted that social mobility would identify the movement of people to comparable positions within a social system. For example, a teacher who moves from one school system to another and occupies a similar position in the new system has accomplished what Sorokin calls a horizontal transition. Vertical transitions are also possible within Sorokin's schema. The climb from poverty to riches, as in Andrew Carnegie's case, is a clear example of upward mobility.

The reverse can also occur: a person may experience a downward move within the hierarchy, which can occur with rapidity. The 1929 stock market crash in the United States resulted in hundreds of wealthy people sliding to much lower levels within the economic strata.

NEW MEXICO PUBLIC EDUCATION DEPARTMENT

Social Poverty

SOCIAL POVERTY OCCURS when a person becomes isolated in his or her community. The World Bank reported that the poor are active agents in their lives, but are often powerless to influence social and economic factors that determine their well-being. There are several reasons for this and they are often related to discrimination and social exclusion. Voicelessness and powerlessness, social and political exclusion, and discrimination based on gender, age, ethnicity, disability, or any other grounds have been recognized as important aspects of poverty by poor people.

Discrimination is the denial of opportunities and equal rights to individuals and groups because of prejudice or other arbitrary reasons. *Social exclusion* refers to the loss of social cohesion resulting from growing inequalities and the return of mass social and economic vulnerability. Social poverty is a multidimensional and structural process, embracing precariousness of labor and unemployment, on the one hand, and the breakdown of social bonds through the crisis of the welfare state, on the other.

The economic approach to social poverty is concerned with the questions of income and production and access to goods and services from which some people have limitations and others do not. That is to say, they may be discriminated against or excluded from income, from employment, or from the satisfaction of such basic needs as housing, healthcare, and education.

The concept of social poverty is rooted in the social tradition of giving greater weight to relational issues. Lack of employment or economic activity not only denies income and output to those who are discriminated or excluded; it also fails to recognize their productive role as human beings in society. In other words, em-

ployment and other economic activities provide social legitimacy and social status as well as access to income. Access to the labor market entitles individuals to rewards and economic rights that are essential entitlements to full citizenship. It brings with it human dignity, alleviating the negative effects of discrimination and exclusion on human beings, thereby increasing the scope of social integration. Other social dimensions included in the entitlement concept concern participation of certain social groups in decision-making as well as the marginalization of such disadvantaged groups as women and ethnic minorities.

THE POLITICAL DIMENSION

The political dimension concerns the limitations and denial of certain human and political rights to certain groups of the population, including personal security, rule of law, freedom of expression, political participation, and equality of opportunity. The political limitations and exclusions may result from the lack of political representation and influence of people who are excluded and discriminated against. They have no voice because there is no politically relevant representation of their specific interests that would make them a political force.

The economic, social, and political dimensions of discrimination and exclusion discussed above are interrelated. For example, political and civil rights and liberties can draw the best out of people, raising their productivity, thereby contributing to growth, and thus overcoming economic exclusion and discrimination. Social poverty also may to some extent be patterned according to factors such as gender, ethnicity, disability, and age.

GENDER

A gendered analysis of poverty reveals not simply its unequal incidence but also shows that cause and effect are deeply gendered. The gender disparity is most visible among female-headed households, notably single mothers and single pensioners. Women are also more likely to have experienced poverty at some time in their lives and to suffer recurrent and longer poverty spells. Some structural factors are associated with women's economic dependence.

Women are paying the price for caring within a gendered division of labor, in which men do the greater share of paid work and women do the unpaid, domestic work. This continues both to confine the access of many women to an adequate independent income and to assist male economic independence and power. Prejudice and institutional employment practices combine to hinder them still further.

ETHNICITY

Racial discrimination in the labor market takes many forms. Some employers and unions willfully exclude African Americans and Hispanics. Others, perhaps less prejudiced, rely on recruitment procedures that have the same effect on minority racial groups. In the United States, poverty's racial patterning is most visible, where poverty rates for African Americans and Hispanics are roughly three times higher than for non-Hispanic whites. What accounts for these patterns of poverty? Most studies identify racism and discrimination as key factors. The World Bank, for instance, acknowledges that the cumulative effects and psychological impact of discrimination in education, employment opportunities, and information undermine the economic position of blacks in white-dominated societies.

Minority ethnic groups also tend to be disadvantaged within the welfare state. A number of factors are involved, including rules that discriminate against first-generation immigrants, universal services that fail to accommodate cultural differences, racist attitudes amongst officials, and low take-up among minority ethnic communities. Moreover, there has been a wide-spread trend to reduce access to welfare among immigrants and asylum-seekers.

DISABILITY

Disability has functioned historically to justify inequality for disabled people. That is, not only has it been considered justifiable to treat disabled people unequally, but also the concept of disability has been used to justify discrimination against other groups by attributing disability to them. In Europe and the United States, the social Darwinism of the late 19th and early 20th centuries defined persons with disabilities as a major source of social ills. In addition, disability arguments were prominent in justifications of slavery in the early to mid-19th century and of other forms of unequal relations between Caucasian and African Americans after slavery's demise.

Disability is a significant causal factor and a consequence. Although poverty is not an automatic outcome of disability, it is closely associated with it. It has been estimated that disabled people may account for as many

as one in five of the world's poorest and that as many as 50 percent of disabilities are preventable and directly linked to poverty. Many studies have reported that disabled people suffer from feelings of being patronized, avoided, ignored, abandoned, mocked by strangers, assumed to be stupid, treated as an inconvenience, and regarded as unfit for public view.

AGE

Whether younger individuals are hostile, neutral, or understanding in their attitudes toward the elderly, they still tend to disregard them and ignore their opinions, marginalizing them with respect to their place in society. Older employees are not respected in the workplace in the same way that younger workers are. Stereotypes and discrimination in employment toward the elderly prevail in most workplaces and have excluded the elderly. Thus, most older people are involved in self-employment businesses or part-time jobs.

SUNG SEEK MOON UNIVERSITY OF TEXAS, ARLINGTON

Social Security

SOCIAL SECURITY IS A program that encompasses approximately 98 percent of jobs and that currently provides monetary benefits to one in six Americans. Recipients of Social Security benefits include not just retirees and their spouses, but also disabled workers and the spouses and young children of deceased or disabled workers. In 2004, the Social Security programs for old age and survivors paid \$415 billion in benefits to such individuals, who accounted for 47.7 million Americans. As of June 2005, the average monthly benefit for a retired worker was \$946, and the average combined benefit for a worker and spouse was \$1,578. Addition-

ally, 194 million Americans were fully insured by Social Security in 2004.

To reach this present situation, Social Security has been expanded in a number of ways since its creation, though the basic nature of Social Security has remained the same throughout its history. The original Social Security Act of 1935 created retirement benefits for only the retired worker, who became eligible at age 65. In 1939, Congress passed amendments to extend benefits to spouses and minor children of retired workers, as well as to the widows and minor children of deceased workers.

Disability insurance arrived in 1954, and in subsequent years, the disability program expanded to include the families of disabled workers. In 1972, Congress passed legislation to create annual cost-of-living adjustments for benefit levels. Prior to that time, benefit increases were subject to the whims of Congress and happened only intermittently.

GOALS AND PRINCIPLES

The Social Security program in the United States combines a number of specific goals and principles. First, the program is compulsory for those in jobs covered by Social Security, which means most of the population. This ensures that everyone participates and will thus be entitled to a benefit at retirement, which helps to solve the problem that many people do not plan adequately for their financial needs after retirement.

Nonetheless, Social Security was never meant to be the only source of retirement income for the elderly, but rather a minimum floor of protection from poverty. In addition, Social Security benefits are based on incomes and all participants are entitled to a benefit, which helps to remove the stigma of welfare programs. Another principle of Social Security is that the program is completely self-financed through Social Security payroll taxes and does not receive any funding from other sources.

Though Congress maintains the right to raise or lower benefits at its discretion, benefit reduction is more difficult because of the psychological notion of ownership that people feel for their benefits. Another key goal of Social Security is income redistribution, and the program includes a strong redistribution component. While benefits grow with income, the benefit calculation formulas are such that the benefits for low-income workers constitute a much larger portion of their preretirement incomes than is available to higher-income workers.

BENEFITS AND PAYROLL TAXES

The current method for calculating Social Security benefits at retirement depends on a worker's average indexed monthly earnings (AIME). Average wages have generally risen over time in the United States, and the Social Security Administration (SSA) indexes a worker's past earnings to account for average wage growth in the economy. The top 35 years of indexed earnings, including zeros if a worker did not work for 35 years, are used for workers who qualify for Social Security benefits. The AIME is the average of this amount.

The next step is to compute the primary insurance amount (PIA). For a worker receiving benefits starting in 2005, the PIA is calculated as 90 percent of the first \$627 of the AIME, plus 32 percent of the AIME between \$627 and \$3,779, plus 15 percent of any remaining value of the AIME above \$3,779. This is where the redistributive element of Social Security takes shape, because while benefits continue to grow with wages, they grow at decreasing rates.

The PIA represents the basic benefit for a worker retiring at the normal retirement age. The normal retirement age is 65 for those born in 1937 and earlier, though it is beginning to increase so that workers born in 1960 and later will experience a normal retirement age of 67. Workers may retire as early as age 62 and receive a reduced benefit to account for the increased years of receipt. Benefits also increase for those who retire beyond their normal retirement age. Additional benefits for eligible family members are provided as a fraction of this benefit amount up to the highest possible family maximum.

Currently, Social Security is funded through payroll taxes on workers and their employers. The total payroll tax sums to 15.3 percent of income up to the maximum taxable amount, which was \$90,000 in 2005. The worker and the employer each pay half of this amount, which is 7.65 percent of the salary. Of this amount, 5.3 percent is devoted to the Old-Age and Survivors' and Disability Insurance (OASDI) program, 0.9 percent is devoted to disability insurance, and 1.45 percent is devoted to Medicare, which provides health insurance to those over age 65.

PAY-AS-YOU-GO FINANCING

Social Security is funded on a pay-as-you-go basis, which means that the current generation of workers pays directly for the benefits of the current generation of retirees. This is in contrast to a fully funded system,

in which funding for the future benefit of current workers is already available even if the program were to end. To be more precise, the current Social Security system is partially funded. Lawmakers realize that funding Social Security will become increasingly difficult in the future, and so efforts are being made to build a reserve of funds today by bringing more revenue into the program than is paid in benefits.

There will be fewer workers available to support the retirees in 10 to 30 years.

Another issue related to Social Security's funding is that the unfunded liabilities are large in part because early beneficiaries received much more from the program than they contributed through taxes. In fact, the 2005 *Trustee's Report* indicates that the present value of future costs less future taxes for past and current participants over the infinite horizon is \$13.7 trillion. The Trust Fund currently holds \$1.7 trillion. After accounting for the fact that future generations are already expected to pay more into the system than they will receive, this leaves a current unfunded liability of \$11.1 trillion.

Funding issues have motivated a number of reforms for Social Security since the 1970s. Most notably, Alan Greenspan headed a commission to examine Social Security's funding in 1983. The Greenspan Commission called for, and Congress subsequently passed into law, an increase in the normal retirement age to gradually extend from 65 to 67, increases in Social Security tax rates, and the addition of new taxes for the benefit of the wealthiest individuals. The goal was not only to solve the immediate financial problems, but also to build up a surplus over the next few decades in anticipation of the inevitable Trust Fund drain resulting from the coming baby-boomer retirement.

That Social Security is expected again to undergo funding shortages at some point in the future should come as no surprise. While Social Security is meant to be pay-as-you-go, three trends will make this an increasingly difficult task despite the present surpluses. First, the baby-boom cohort is of unprecedented size and will begin retiring in less than 10 years. Second, life spans are becoming longer, meaning that the retiring baby boomers will enjoy longer retirements.

The 2005 *Trustee's Report* indicates that when Social Security benefit payments began in 1940, the cohort life expectancies for men and women who reached the age

of 65 were 12.7 and 14.7 years, respectively. Meanwhile, the SSA expects that men and women born in 2000 and who live to reach 65 in 2065 can be expected to live for another 20.4 and 23.0 years, respectively. The third important trend is the decrease in fertility rates. During the height of the baby boom, women, on average, were having between 3.5 and four children each during their lifetimes. Now these numbers are closer to two, and the 2005 *Trustee's Report* expects the long-run fertility rate in the United States to be just 1.95.

Combining these three trends means that there will be fewer workers available to support the retirees in 10 to 30 years. In the 2005 *Trustee's Report*, the best guess for the future is that while the OASDI Trust Fund will continue to run surpluses until 2017, it is projected to run out of money by 2041 such that subsequent years will be met with drastic cuts in benefits, increases in taxes, or borrowing from the rest of the government's budget. In 2041, the tax revenue that arrives would be enough to pay 74 percent of legislated benefits once the Trust Fund is depleted.

The trustees find that an immediate increase in the payroll tax of 1.92 percentage points, or an immediate across-the-board reduction in Social Security benefits of 13 percent, or some combination of the two, would restore actuarial balance to Social Security over the 75-year horizon. Nevertheless, the changes to the Social Security system would need to be yet more severe to provide economic stability over an even longer time horizon.

Social Stratification

SOCIAL STRATIFICATION REFERS to the distribution of access to wealth, power, and prestige. In the analysis of capitalist societies it has historically been linked to the concept of class, with gender and ethnic identities seen as secondary to economically defined positions. The term borrows metaphorically from geology to indicate a pervading and ordered structure of relations that remain over time.

Challenges and debates within theories of stratification have arisen in response to the dynamic nature of the global economy and consumption patterns leading to a blurring of traditional class identities. Theories of social stratification contribute to understandings of poverty by challenging the free-market axiom that meritocracy is the organizing principle shaping the division of labor in capitalist economies. In liberal free-market ideology, stratification operates through talent, ability, and endeavor, freeing the individual of the yoke of ascribed status allocations (such as historically in the caste system of the Indian subcontinent).

Historically, three key theoretical perspectives have shaped understandings of social stratification: the structural functionalist perspective, Marxian perspectives, and the work of Max Weber. Structural functionalism was founded on the notion of meritocracy, emphasizing societal consensus on the means and processes of selection for particular roles through a system of sifting, sorting, and rewarding talent and ability, motivated by competition for qualifications that in turn structure access to wealth, prestige, and personal satisfaction. Thus the individual can invest in training to maximize rewards in a free labor market. However, the consistently lowered labor market achievements of specific social groups (migrants, minority ethnic groups, and women) have challenged this perspective, suggesting that those in control of wealth and resources require a cheap and replaceable supply of labor.

Karl Marx and subsequent analysts established an understanding of class based on an individual's relationship to the means of production. Simply formulated it breaks down into those who own and control the means of production (the bourgeoisie) and those who are required to sell their labor power in return for wages (the proletariat).

Famously, within the Marxist perspective, tension and conflict between wage earners and the owners of capital over resources have been the motor of social change. The nature of the proletariat's class-consciousness, notably its historical failure to act collectively to end its systematic exploitation, has led to debates about the relationship between the individual and her social class. For instance, economists theorized that class was something people felt subjectively. Weberian perspectives have also stressed the role of economics in shaping individual and collective action, but described a greater number of classes adding market relations and prestige to the relationship as well as collective action through political parties.

In the contemporary political discourse of Europe, North America, and other developed economies, the notion of the working class is under threat and is being replaced by a concern for the middle classes and an apparent underclass. Critics see this as symptomatic of the hegemony of global capital in the failure of a Marxist-inspired alternative. The growth in homeownership, the increased consumption of goods, and the growth of leisure consumption have led to a subjective definition of many as middle-class.

Ideologically, this is seen as serving the interests of the owners of wealth, and critics have described an alienated personal experience based around the false needs of the market economy. Capital flight in pursuit of cheaper pools of labor sees the exploitation of workers in less wealthy nations and leaves communities without work in developed nations. Labeling those unable to find long-term meaningful work "an underclass" (implying a chaotic form of personal poverty based on failure to adapt to changing circumstances) serves the dual purpose of personalizing poverty (exonerating political elites) and stigmatizing the workless to motivate the majority.

In the dual-labor market theory, whereby core (mainstream employment offering prospects for promotion and reward) and peripheral (low-status, low prestige positions) segments offer different possibilities for achievement, those in the peripheral sector are denied the possibility of experience and training that lead to social mobility.

Explanations for the failures in growth of revolutionary consciousness have included the "embourgeoisement thesis" and the emergence of the affluent worker, according to J.H. Goldthorpe et al., whereby the working class comes to share the aspirations and worldview of the bourgeoisie. By way of explanation, the influential P. Bourdieu has offered an exegesis of how certain tastes become the preserve of individuals within specific socioeconomic locations.

Bound up within experiences and dispositions toward the world shaped by structural location, individuals who share dispositions and tastes are more likely to identify with one another, share the same cultural space and act in similar ways, regardless of desire to take collective class action for change.

Social Work

SOCIAL WORKERS apply specialized knowledge and skills, guided by professional values, to help individuals, groups, and communities enhance or restore capacity for functioning and to create environmental conditions conducive to this goal.

Social workers help at all levels of society, from the individual level (including families), to the community or mezzo level, to the societal or macro level. Primarily, social workers 1) help people obtain supportive services, 2) conduct counseling and psychotherapy, 3) help communities provide or improve social services, and 4) participate in legislative processes.

HISTORICAL DEVELOPMENT

While social work is a profession practiced around the globe, it has its foundations in the history of the United States. In the early 1800s, "friendly visitors," women from economically upper-class families, volunteered to work with impoverished families to assist them in obtaining the skills necessary to function economically and socially. Providing advice over material aid, the friendly visitor spent much time diagnosing the condi-

tion of poverty and prescribing proper remedies, such as educational attainment for children, household economics, and adherence to social norms of propriety. One of the requirements of friendly visitors was to become personally familiar with low-income families in the neighborhood. Detailed case notes were kept as records of these families so that duplication of effort could be minimized. The only training friendly visitors had was field education in which they would apprentice with seasoned visitors.

As relief of poverty became more formal, friendly visitors, together with philanthropic institutions, formed Charity Organizing Societies (COS) in order to avoid replication of services and to manage the growing number of dependent families. The first such organization was formed in Buffalo, New York, in 1877. The main tool of the COS was casework, a forerunner of today's social work intervention. The main target of intervention was slum families. Cash aid was provided in the rarest of circumstances and only then to families deemed morally worthy and materialistically dire. Most recipients of attention by COSes were viewed as miscreants, drunkards, and dullards. Unfortunately, COSes failed to recognize environmental conditions as the primary cause of poverty in a capitalistic economy. Rather, individual failures were blamed for poverty.

At the same time COSes were taking shape, another urban response to poverty was forming that would also lend to the profession of social work its core mission and values. Settlement houses were models of community organizing and supportive services, best typified by Hull House on Chicago's south side.

Hull House was established by Jane Addams in 1889 with the intent of increasing individual functioning in society, particularly for new immigrants, and reducing environmental conditions in which poverty formed, including inadequate housing, lack of public health services, and limited employment opportunities. Unlike friendly visitors, Hull House staff lived, ate, played, and worked along side community members. In exchange for their work, staff received room, board, and a stipend. Their work would later formalize in social work education as social and economic justice coursework.

As the United States entered the 20th century, major economic upheavals rocked the nation. The leaders of COSes realized that volunteers visiting in homes would no longer suffice and that formally educated and trained staff would be necessary to stem the growing tide of urban poverty. So too did they learn that individual character defects and lack of moral probity failed

to explain why poverty persisted. The human condition in inner-city slums was now perceived to be multifarious, leading COSes to seek and apply formalized methods of intervention. In 1898, the first formal training of fieldworkers began in New York, with theories of applied philanthropy being the major focus of instruction. A short while later, the New York School of Philanthropy opened as a one-year degreed program. It was to become the Columbia University School of Social Work.

SOCIAL WORK EDUCATION

By 1927, 17 social work programs were training social work students in applied principles of child welfare, family casework, health interventions, and psychiatric interventions. Seeking to develop uniform educational standards, the schools organized the Association of Training Schools for Professional Social Work, which became the American Association of Schools of Social Work (AASSW).

In 1939, after a decade of educational developments, including a requirement that schools of social work be affiliated with universities, a two-year program of classroom instruction and field practice became the standard of the social work graduate degree. Other programs rejected the two-year model and instead formed a professional degree around four years of social science education coupled with social work practice, with the option of an additional year of social work education to earn a graduate degree. Such programs organized in the National Association of Schools of Social Administration (NASSA).

Eventually, with nearly 50 varying standards of social work education confusing what professional social work was and how it functioned, the differences between AASSW and NASSA needed to be settled. The National Council on Social Work Education was formed to reconcile differences in the two organizations and eventually became the standard-bearer of social work education today, the Council on Social Work Education (CSWE). CSWE oversees the education of students in both the Bachelor of Social Work (BSW) and Master of Social Work (MSW) degrees.

Earning a BSW degree prepares undergraduate social workers for professional social work practice. Generally, students first obtain two years of liberal arts education, followed by two years of concentrated study in social work theories and practice, including 1) values and ethics; 2) human diversity; 3) social and economic justice; 4) populations at risk; 5) human behavior and

Social workers help people obtain supportive services, conduct counseling and psychotherapy, help communities provide or improve social services, and participate in legislative processes.

the social environment; 6) social welfare policies and services; 7) social work practice; and 8) research. Prior to completion of the degree, social work undergraduate students must also complete 400 hours of field practicum.

A graduate degree in social work prepares students for advanced practice in social work. If the graduate student does not possess a BSW, the graduate degree provides the student with foundational knowledge of social work in the first year and advanced theories and practice methodology in the second year. Should the graduate student have a BSW, then many programs offer advanced standing graduate degrees to avoid duplication of foundational knowledge already obtained. CSWE requires at least 900 hours of field practicum for the MSW degree, coupled with supervision by a professional social worker who holds an MSW and has at least two years of post-MSW practice.

CONTEMPORARY SOCIAL WORK PRACTICE

It can be argued that, in contrast to forerunners of today's social work profession, contemporary social workers seem to betray the profession's progressive roots. Although social work began as individual and collective efforts to ameliorate the condition of poverty in society and its associated ills, it quickly transformed into something else altogether.

While most social workers embrace notions of justice and equality in society, most professional social workers are employed in organizations that help clients and their families at the individual level. This is due in large part to two trends. The advent of neo-Freudian psychology in the helping professions during the post-World War II 1950s put pressure on social work to justify itself as a helping profession. In response, social work adopted the intervention tools of psychotherapy.

As healthcare financing by third-party billing grew as an industry in the late 1970s and early 1980s, many social workers were drawn by salaries that could be earned in private practice. Still other social workers are employed in the public domain, whether it is in child welfare agencies, schools, hospitals, community organizations, or government. Although social workers have values, education, and a purpose in common, they do many different things.

INTERNATIONAL SOCIAL WORK

Certainly, the United States does not own the market in social work. The profession can be found in all corners of the globe. Yet social work tends to share similar values, trends, and educational requirements found in the United States. For instance, practice at the individual level of helping tends to be the model most often found in place in varying countries. However, unlike the United States, such direct practice often takes place in governmental agencies as opposed to private or semiprivate agencies. It stands to reason that government employs good portions of social workers around the globe, but many also work for nongovernmental organizations (NGOs). In most locales, social workers do not enjoy the same salary levels as other professionals, such as doctors and lawyers. Nor do they earn salaries commensurate with other professionals.

Whereas social work in the United States and, to a lesser degree, Great Britain is under attack by conservative political parties seeking to reduce governmental welfare programs, social workers in many developing countries struggle to implement strategies to enlarge governmental support of individuals and families. Still other social workers must contend with governments that are outright hostile to human rights workers, oppressing the efforts and sometimes threatening the lives of social workers. While past professionalization of social work in other global locations has led to duplication of social work models from the United States, more social workers are now adapting social work interventions to be better suited to the context of local need in their own countries.

In many countries, social workers are involved in social development practice. Social development practice entails carefully crafted and targeted governmental investment in the holistic economic and social well-being of citizens. Social planning, centralized governmental services, and program objectives that are measurable in materialistic units are all hallmarks of social development practice. The end goal of social devel-

opment practice is improvement in the lives of individuals, in both social functioning and economic wellbeing, which lead to elevated levels of welfare for the community and ultimately the nation.

Several multinational organizations lend to the effort of social work as a global profession in attending to human rights, individual and collective well-being, and social development. The United Nations (UN) and its satellites stand as the most obvious example. More so than peacekeeping and crisis response, development has been and remains the UN's primary mission. For instance, the Economic and Social Council operates through the cooperation of 54 member countries, overseeing projects designed to relieve poverty through economic and social programs. Evidence of its effects can be seen in reduced infant mortality rates, increased child health and well-being rates, and expanded educational attainment rates in developing countries. Other UN agencies also contribute to the goals shared by international social work.

The World Health Organization monitors international health issues, responds to health crises, and develops medical systems around the globe. The UN High Commission for Refugees is yet another example of international social work, with protection of refugees, material assistance to refugees in flight from violence and oppression, and resettlement of refugees when necessary all being carried out by social workers and their allies in the helping professions.

INTERNATIONAL SOCIAL WORK EDUCATION

There is no universal model of social work education, making the task of describing international social work education onerous. Social work education can take place within universities, as would be found in some English-speaking countries in Africa, or can take place in postsecondary schools, such as is found in French-speaking countries in Africa.

Conversely, many Asian schools of social work have formal undergraduate and graduate programs that mirror the model in the United States. In Latin America, it was historically the case that schools, sponsored by governmental agencies or ministries, provided professional training in social work. However, today most schools or programs of social work are affiliated with universities.

A growing practice in the United States is to internationalize social work programs so that students from other countries come to study in such programs, and faculty of those programs travel to countries to teach

and conduct social work research. In this partnership, educational opportunities flow back and forth between the U.S. schools and the partner countries. Thus, in many schools of social work in the United States, issues of global importance have experienced ascendancy in the social-work education curriculum, such as global child welfare, refugee and migrant challenges and needs, international family planning, protection and expansion of human rights, and vulnerable populations.

FUTURE TRENDS IN SOCIAL WORK

Social work's biggest challenges come in the form of major shifts in demographic changes. While developed nations are experiencing a rapidly aging population, with the elderly soon to outgrow the number of working adults, developing nations may experience an overwhelming number of orphaned or undersupported children with far too few elderly able to help care for them. So too will poverty likely grow in many areas of the world, in both developed and developing nations. War, famine, drought, disease, crime, and other challenges may continue to grow. This is likely to occur in tandem with a major shortage of qualified, professional social workers.

For instance, California currently has a projected shortage of 20,000 social workers. Social work likely will also face shrinking social service funds because of a jaded public who no longer places stock in the ability of social work to handle the major challenges society faces. Social work's major strength lies in its professional approach to solving problems and expanding opportunities. With the newfound methods of evidence-based practice, social work should be able to continue its professional place in global societies.

Socialism

SOCIALIST IDEAS IN VARIOUS forms have accompanied human development from time immemorial. First attempts to put it in practice are connected with medieval religious movements, but the roots of the ideology reach much deeper. The basic thought connecting all the incarnations of socialism is the elimination of private property. People are good, according to the socialist theoreticians, but the institution of private property corrupts them and is thus responsible for the evil existing in the real world.

This is the message linking the Brethren of the Free Spirit in the 13th century, Taborites of the 15th century, French utopian socialists in the 18th and 19th centuries, together with 20th-century political regimes of Vladimir Lenin and Joseph Stalin, Mao Zedong, and Pol Pot. Human history, in their view, is but a suffering that is made worthy only by the final establishment of socialism, which will put an end to history and bring about a state of unheard-of affluence and eternal peace.

The word *socialism* is much newer than the idea itself. It appeared in the first half of the 19th century. Socialism is known as a system challenging capitalism, pointing to its alleged injustices, and offering an alternative that promises to relieve the burden of the poor. It found its theoretical background mainly in the works of Karl Marx and Friedrich Engels. They incorporated into their system all the traditional utopian ideas but added a bit of originality—mainly the class struggle and the dialectical method of reasoning that was supposed to deliver it a scientific status. The core—critique of private property and individual freedom—remained untouched, however.

Marx, using his dialectical method, attempted to formulate the laws of history. On the one hand he praised capitalism for liberating the working class from serfdom that prevailed before the Industrial Revolution; on the other, he criticized it since exploitation survived though it assumed a different form. In capitalism, said Marx, the class of capitalists, the factory owners, exploits workers. His explanation goes as follows. Capi-

talists buy the working power of a worker (his full capacity to work) and pay him what this power is worth—subsistence wage, the costs of creating and maintaining the worker, in other words, his costs of living. However, the worker is able to produce more value than he is paid for; he is able to generate more than is required to feed and dress him. This is called a surplus value and is appropriated by the capitalist, though it should, Marxists insist, belong to the workers, hence the exploitation.

Even without any further exploration this inference is questionable for at least two reasons: first, capitalists do not buy the working power of workers (only the slave owners do) but rather the hours of their work, so they cannot appropriate any surplus value. Moreover the competition among capitalists for labor drives the wages high above the subsistence level, as is witnessed by the enormous rise in the standard of living in capitalist societies from Marx's time on.

Marxists considered socialism a superior stage to capitalism not only because it puts an end to exploitation of workers, but also because of its allegedly rational production system. The superiority does not, however, entail that people will recognize it and intentionally opt for socialism. Marx insisted that it is not a matter of choice; socialism is bound to come with the inexorability of the law of nature.

TRANSITORY PERIOD

Before the ultimate stage of affluence is attained, a transitory period is necessary. It is admitted that for the existence of a socialist society—where people are freed from the necessity of labor and where they "only realize their natural tendency to arrange things according to the laws of beauty," according to Marx—the birth of a new man is a must. Leon Trotsky, one of the foremost socialist theoreticians, pictured a socialist man as "immeasurably stronger, wiser, and subtler"; he predicted that "his body will become more harmonized, his movements more rhythmical, his voice more musical."

Until the nature of humanity transforms, a raw socialism will prevail. This historical period is characterized by the elimination of private property in the means of production, centralized management of production and distribution of resources, abolition of production for the market and of money relations, the centralized distribution of consumption goods "to everybody according to his needs/or work," and last but not least the dictatorship of the proletariat. Despite the theoretical proclamations, no society was able to overcome the transitory period of raw socialism, no new men arose,

people in socialist countries had to work hard, and their standard of living was far cry from what was promised by Marx and his followers.

Why did the socialist program fail? It was assumed that once all means of production got under the control of a governmental authority, central planning would substitute the "anarchy of production" that existed under capitalism, and the productive capacity of a society would consequently skyrocket until it made the problem of scarcity obsolete and irrelevant. It did not, however, happen and economics can show that it was no accident.

INTELLECTUAL QUARRELS

The dispute over the ability of socialism to generate higher living standards for the masses became one of the decisive intellectual quarrels in the field of economics, with very real practical consequences for billions of people. The crucial point of interest was an economic (and not political or philosophical) one: which system produces more material well-being? So the dispute was not about the end—both individual planners in capitalism and the central planner in socialism are assumed to aim at a better living standard—but only about the means suitable for reaching that end.

A towering figure in this debate was an Austrian economist, Ludwig von Mises, who, in his pioneering article from 1920, "Economic Calculation in the Socialist Commonwealth," stated clearly that socialist planners can never attain their own objectives of "rational planning" and guide societies to prosperity, as they lack the necessary and crucial factor upon which they must base their decisions: market prices. If there are not numerous owners of the means of production, there is no market and no trade therein, hence no prices—no social appraisal mechanism to discover relative scarcities of respective factors of production. Without prices, there is no way to decide rationally how to allocate scarce resources among various competing uses in the production structure of a society.

Imagine how a socialist planner thinks of building a railroad. Should it be built at all? The railroad will make transportation of some goods less costly. In capitalism it is possible to calculate whether this cost reduction is greater than the value of scarce resources necessary for constructing and maintaining the new line. It is calculated in money. In socialism, however, how can the planners decide whether the hours of labor; machines; tons of iron and coal; and other building material are worth more than hours saved through faster transportation?

They simply cannot. Mises sums up the distinction between capitalism and socialism in his *Bureaucracy*: "To the entrepreneur of capitalist society a factor of production through its price sends out a warning: Don't touch me, I am earmarked for the satisfaction of another, more urgent need. But under socialism these factors of production are mute." Yet even if the calculation was possible in theory—and it is not—the complexity of the real world would make it impracticable. The central plan in the Soviet Union was specified for only 105 commodities in 1934, which is a desperately small proportion of commodities produced in a country inhabited by 162 million people.

The impact on the standard of living was no doubt disastrous.

This deficiency entails enormous waste of scarce resources. The socialist objective of more rational decision-making processes and higher production is therefore impossible to reach. Hence, concludes Mises, socialism is impossible. Without private property in the means of production it is impossible that there exists a complex economy with the division of labor. One can indeed attempt to plan centrally, but the result will be a planned chaos, rather than rational production, raising the standard of living.

BEST INTENTIONS

We should keep in mind that this analysis put the socialist argument in its best light—it assumed only the best intentions on the part of the central planners. In reality, however, it need not be the case. We can easily identify other factors making socialism an unrealizable utopia. F.A. Hayek, 1974 Nobel Prize laureate, names one of the chapters in his famous book *The Road to Serfdom* "Why the Worst Get on Top."

There, he explains what kind of qualities and skills one needs to succeed in hierarchical political structure as opposed to skills and virtues that are indispensable for becoming a successful entrepreneur in the market-place. Widespread corruption, chronic political intrigues, and barbaric behavior of top political leaders experienced in socialist countries gives empirical support to these arguments.

The impact on the standard of living was no doubt disastrous. Chaos prevailed in all the socialist countries of Europe, Asia, and Africa. One example of an African country that embraced socialism is Ghana, which gained independence in 1957. At that time it was a leading exporter of cacao and produced 10 percent of the world's gold. Its Gross Domestic Product per capita equaled that of South Korea. Then, the socialist policies of Kwame Nkrumah, called "Big Push," were implemented. As a result, in the 1980s, Gross Domestic Product per capita was 20 percent below its 1957 level.

Just a few notorious examples suffice to illustrate how socialism devastated the country. One of the biggest fiascos was the cattle-hide-leather-shoe complex. The slaughterhouse was located in the north of the country. However, the market for cattle was traditionally not in the north, probably for good reason. The tannery for turning the hides into leather was in the south. As a result of this dislocation, the plant in the north could not supply enough hides so the tannery had to import them. The same irrationalities appeared in the production of shoes. The footwear factory was built in western Ghana and was equipped with machinery from Czechoslovakia—another socialist countrythat could only produce a poor-quality product, so poor that the Ghanaian consumers were not willing to buy it. The government then tried to give the boots to the police force but even they avoided them.

Another example is the sugar plant at Asuatuare, which was built without a water system and therefore remained idle for a year before this flaw was corrected. A similar story is the tomato and mango canning plant built in western Ghana. After it was built at a cost 80 percent above budget, the government discovered there were hardly any mango trees in the area of the plant and it would take seven years for newly planted mango trees to start bearing.

Economically, socialism has meant waste, corruption, inefficiency, and poverty. There is, however, much more to say about the impact of socialist ideology on people's well-being. According to R.J. Rummel, socialism can be blamed for the death of 169.2 million men and women. Most of them died as a direct consequence of the Soviet (62 million), Chinese (35 million), and Cambodian (3 million) experiments. In this context it is important to stress that other ideologies often considered as antithetical to socialism grow from the same roots. Hence, socialism is not only "red" but also "brown." Nazism (National Socialism) or Fascism is in its practice as close to pure socialism as Bolshevik's rule in Russia: four-year central plans in Germany and fiveyear plans in Soviet Russia, class struggle, an absolute dictatorial state, concentration camps, and hate for religion—all of these are essential features of both red and brown socialism. In his conversations with Herman Rausching, Adolf Hitler conceded, "I am not only the conqueror but also the executor of Marxism." He also insisted, "National Socialism is socialism in evolution, socialism in everlasting change." Not only the ideology behind it but also the outcomes bind Nazism and red socialism together. Over 20 million dead civilians rank Germany among the most tragic socialist regimes in history.

Soviet Russia was even worse; as many as 10 million casualties entailed the great famine in 1921 caused by the socialist rationing system and the elimination of monetary relations from economic reality together with collectivization of the farming sector. Poverty spread over the already poor country. In 1919 the leaders who promised to free people from any form of exploitation enacted labor conscription. Instead, abandoning one's job assigned by the state was considered desertion and punished accordingly. In 1920, 50,000 people were imprisoned in concentration camps—one of the inventions to which socialism gave birth.

Other socialist regimes did no better. The socialist experiment in Cambodia under Pol Pot left behind three million deaths, reducing the population by more than one-third in just four years. Pol Pot's regime was probably the most thorough attempt to put socialist ideas in practice. People were forced to wear cotton pajamas, as formerly only peasants did, money was banned, and banks were closed. Individuals needed written authorization to move outside their own commune.

CHINA

China is another country where socialism destroyed a great number of people. Its development was highly uneven with abrupt changes in policy. There were several campaigns intended to spur economic growth and "catch up and overtake" the West. In 1958 Mao Zedong launched the Great Leap Forward program, which was intended to bring about a substantial increase in steel production. Steel was viewed as a crucial commodity in industrialization of the country.

In three years China was supposed to produce 15 percent more steel than the United States. This goal should have been attained through the formation of self-sufficient communes, collectivization, and mass labor. Thousands of small backyard steel furnaces were built across China. The results of this policy were, however, catastrophic. Millions of people died in one of the greatest famines in the history of mankind. The pro-

duction of steel initially increased, but then plummeted, and did not recover until 1964. In order to crush the opposition and mask the failure of his policy Mao launched another program, called the Great Proletarian Cultural Revolution, in 1966. Its motto was to smash the four "olds": old ideas, old culture, old customs, and old habits. Chaos ensued as Red Guards—young civilians who were summoned by Mao to fight against evil forces in Chinese society and carry on the Cultural Revolution—destroyed temples, artwork, books, and anything associated with traditional or foreign cultures. Instead, 350 million of *Mao's Quotations* were printed and distributed. Radical leaders and the Red Guards persecuted artists, writers, and those with foreign connections.

Common people were thus made equal, but it was equality in poverty.

Victims were subjected to public criticism, humiliation, and physical abuse in meetings known as struggle sessions. Students attacked their teachers and beat them to death. The economic system was halted, as was the system of education. Destruction of 56 Chinese ethnic minorities tops the bill. The Cultural Revolution ended officially in 1981 with a death toll of several million.

European socialist countries were generally less faithful in following the Marxist dogmas. In spite of the lower number of victims, they still were characterized by totalitarian politics and widespread poverty, though much of it has not been captured in the official statistics, where the production of iron, coal, steel, and heavy equipment made the appearance of relative affluence. Yet people do not consume steel; they want cars, refrigerators, washing machines, and televisions. None of those were available because of general technological backwardness and the existence of a shortage economy. Even if some of those articles became available they were sold only "under the counter." It was true for even more prosaic goods like meat and vegetables.

Common people were thus made equal, but it was equality in poverty. Contrary to the proclamation of the leaders and official ideology, the ruling elite erected an impervious border separating itself from the ruled class. The elite had special stores with luxurious goods imported from capitalist countries, while the general population had to content itself with procuring the basic needs with goods produced in the member countries of the Council for Mutual Economic Assistance.

Members of the Politburo received special medical treatment, whereas the life expectancy of common people was substantially below the Western average and was even decreasing. Only the ruling class could travel abroad and import capitalist goods because only they had access to foreign currency.

UNFULFILLED PROMISES

The environment was devastated because it was no one's property. Contrary to capitalism, where the self-interest is led by the "invisible hand" to socially desirable outcomes, in socialism it leads to overexploitation of existing resources and poverty. Socialism therefore cannot and did not fulfill its promises.

Whenever socialism was applied strictly, the suffering was immediate and very painful; had it been applied partially—and socialist planners adopted for their planning capitalist prices emerging in the nonsocialist part of the world—the suffering and process of economic destruction would have been gradual, so that we could witness "socialist" economies in existence for decades.

Only when socialism was diluted did it work to any extent. It is the mixture of socialism and democratic capitalism in Scandinavia that has proven a successful model, and aspects of socialism have proven successful in primarily capitalist economies.

Society of St. Vincent de Paul

THE SOCIETY OF St. Vincent de Paul, founded in 1833 by a student at the University of Paris, evolved

into an international organization of Roman Catholics dedicated to the relief of the impoverished. Springing from the ruins of the French Revolution and the political and economic turmoil of the early 19th century, the society offered a concrete response to those who doubted the role of religion in modern society. In founding the group, Frédéric Ozanam (1813–53), a young law student and later professor of literature, responded to the challenge that Catholics ought to demonstrate their faith through charitable works, not just through prayer and attendance at church. The organization began with eight young men who visited needy families, taking them food, firewood, and other supplies. They named their group the Conference of Charity, eventually becoming known as the Society of St. Vincent de Paul after taking for their patron the famous 16th-century French saint and model of charity. From the beginning the organization was remarkable for its lay character. The members and leadership of the Society of St. Vincent de Paul were not clergy or members of religious orders.

Though they were nonordained men, the spiritual character of the society was paramount. Members committed themselves to following a simple rule that upheld the privacy of those being aided while providing person-to-person assistance. The members prayed together at every meeting, emphasizing the necessity of prayer in lifting up people from poverty as well as the spiritual benefits they hoped to obtain. The members of the society closely linked Christ to the poor, believing that when they served the poor, they were in fact serving Jesus Christ himself.

The model devised by Ozanam in which a handful of Catholic men would join together to respond to the material needs of their neighbors spread rapidly. Individual conferences of the society were formed from parish churches, schools, and even places of employment. The society reached Italy in 1842; England in 1844; Belgium, Scotland, and the United States in 1845; and Germany, Holland, Greece, Turkey, and Mexico in 1846. By 1860 the society counted 2,500 conferences internationally, with more than 50,000 members. In 1933, 100 years after its founding, there were 12,000 conferences and more than 200,000 members, and by 2000 there were almost 900,000 members spread among 46,000 conferences in 130 countries on five continents. An all-male organization since its founding, the society admitted women as members beginning in 1968.

The society's members have embraced Ozanam's vision that no work of charity be foreign to them. Consequently, members of the society, known as Vincentians,

have taken on work as diverse as educational and technical training; visiting the sick, homebound, and prisoners; dispensing free or low-cost pharmaceuticals; offering emergency assistance with rent, food, and utilities; and locating work for the unemployed. Though members of the society are frequently volunteers with little background in social service, the activity of the society has become increasingly specialized in recent years, relying on professionals as well as volunteers to manage a vast network of food pantries, pharmacies, thrift stores, and educational centers. However, unlike other organizations, the Society of St. Vincent de Paul is largely decentralized, with funding and volunteers coming from the same neighborhoods as those served.

DAVID J. ENDRES CATHOLIC UNIVERSITY OF AMERICA

Sociology of Poverty

THAT THERE IS A sociology of poverty is a considerable part of the problem of poverty research. That is, there is also an economics of poverty, a psychology of poverty, an anthropology of poverty, and a politics of poverty—and all of these involve concrete histories. When these are torn asunder, we get research that too often not only does not illuminate poverty but also serves to mystify it. Making matters worse, while there is some consensus in economics regarding both theory and method, this is not true of sociology: while hard science methods dominate, other researchers are divided among those who do soft qualitative work, political economy, and historical sociology. And as regards theory, there remains a deep tension between micro and

macro approaches: should the focus be on individuals or social structure? Complicating matters further, poverty research, like all other social scientific research, is embedded in a historical context and cannot escape ideological influence, beginning with the formulation of the problem to be researched. Finally, knowledge generated by poverty research will be funded by agencies, public and private, and drawn upon to make policy. In turn, these will influence the direction of future research.

There is a further consequence critical for the politics of poverty: while such research may sometimes move public opinion, it may also work to reinforce some of its least commendable features. Indeed, as Michael B. Katz, Robert H. Haveman, Sanford Schram, and Alice O'Connor have argued, there are very good grounds for thinking that no social science research is more heavily ideological than poverty research.

CAUSES AND EXPLANATIONS

We can see this instantly if we notice that researchers very often confuse two very different questions: what are the causes of poverty and what explains who is poor? To answer the first question we need to notice that there are different kinds of poverty. Consider at least these: the poverty found in advanced industrial societies, the poverty found in undeveloped nations with long histories of colonization/imperialism, the poverty found in nations recently undergoing privatization, for example, the former Soviet Union. To be sure, there will be some mechanisms and processes implicated across these three, such as capitalism, but one needs to know a good deal more than economics to explain poverty in the Great Lakes region of Africa or in rural China.

On the other hand, as regards poverty in advanced capitalist societies, it is remarkably easy to identify the cause of poverty: there is no mechanism in capitalism that ensures that everyone who wants a job can get one and there is no mechanism that ensures that all the jobs available will pay a nonpoverty wage, however poverty is defined. Of course, understanding why this is so takes us straight into the dynamics of capitalism and the wider question of inequalities of wealth and income. But a huge amount of research aimed at explaining poverty simply ignores these two uncontestable elementary facts.

Thus, sociologists ask: who are theunemployed or who are among the working poor? And they argue whether education, gender, or race discrimination is the critical fact, or whether we need to consider the psychology or skills of the poor. But even if gender and race did not count in labor markets (which they do) and even if everyone had the pertinent skills and motivation (which they do not), if the number of jobs is lower than the number seeking jobs, there will still be people who are unemployed; and if existing jobs are poorly paid, there will still be those who are employed but poor. Thus, for example, the argument that education is the solution to poverty is not an answer—even if, to be sure, extending educational opportunity would be a very good thing and even if its maldistribution does figure in understanding who is poor.

The argument against full employment is straightforward.

The idea of full employment, a substantial minimum wage, and redistributive mechanisms such as a negative income tax were at one time obvious poverty policy possibilities. Indeed, this was part of the message of Michael Harrington's *The Other America* (1962), which "discovered" poverty and is often credited with provoking the War on Poverty.

The "Keynesian consensus" had supposed, optimistically, that full employment was a sufficient answer to poverty and could be managed without structural changes in the economy. But when it gave way to the supply-side economics of Ronald Reagan, economic arguments against full employment—even as a ideal goal—were readily available.

It remains also an elementary truth of economics that what is in the interests of wage earners is not generally in the interests of those who employ them—and conversely. The argument against full employment is straightforward: using Alan Greenspan's metaphor, as the "pool of available workers" (Karl Marx's "reserve army") begins to run dry, there is a risk of wage inflation as workers seek to increase their share of profits. With inflation, creditors lose the value of their loans and investors lose confidence. Low growth results and nobody benefits.

WASHINGTON CONSENSUS

Accordingly, current theory holds that there is a natural rate of employment (NRE), the rate that is consistent with price stability. This rate is fixed at between five and six percent. Moreover, it is held that the economy can-

not grow at more than 2.5 percent without pushing the unemployment rate below the NRE.

The international version of this is the neoliberal Washington Consensus. It repudiates the Keynesian call for government-promoted full employment, and insists on fiscal austerity—to secure economies against inflation, along with privatization, and trade and financial liberalization—to secure free-market rule of the economy.

But history refutes these ideas. As a comparison of the economies of the industrial world shows, with appropriate government policies, economies can grow and corporations can be profitable, even if workers have a greater share of profits and even if there is an existing social safety net. The free market of fundamentalists does not exist. The question is not whether government has a role to play in matters of economic growth, income inequality, or poverty; the question is: what role? What policies? Similarly, while total world income has been increasing by an average of 2.5 percent annually and the gap between the rich and poor has multiplied, application of International Monetary Fund (IMF)-led austerity policies has enormously increased Third World poverty. Nor is the explanation of this, not to be developed here, a mystery.

But if we do understand the causes of poverty, the solutions will be politically difficult, exacerbated considerably by globalization. With capital and labor both mobile, full employment and a living wage cannot, today, be thought of as a national problem (as under the Keynesian consensus), but as one that requires regional and strong international institutions.

Unlike the IMF, these would need to serve not the interests of the American financial community, but the interests of workers everywhere. Indeed, there is some irony in the fact that Jeffrey Sachs, who engineered "shock therapy" for economies in transition to capitalism, now argues that less than 0.7 percent of the Gross National Product a year that rich countries have repeatedly promised but not delivered could be used to end global poverty.

And the money is there. For example, it can be shown that if the top five percent in the U.S. income distribution were to suffer a tax increase of seven percent, bringing their average of \$145,970 to \$135,834, the redistributed sum would take all the officially poor in the United States out of poverty. Of course, even if this were politically possible, there are arguments against the idea, prominently the idea that welfare dependency is a disservice to the poor. We subsequently consider this argument.

But since mainstream social science agrees with the Christian Bible that the poor will always be with us, there is a place for the questions of who is poor and why? Until the 1960s little attention was paid to poverty. The War on Poverty mobilized social science research. Hard science methods dominated. With an income-defined poverty line, researchers could consider other demographic variables and seek to establish correlations between those who were poor and, for example, their race, gender, age, educational level, or rural or urban place of residence.

This research could be characterized, following C. Wright Mills, as abstracted empiricism. It was ahistorical and quantitative; it required large data sets, and it aimed at identifying significant factors (via the use of regression techniques) that, presumably explained poverty. Since much of it was federally sponsored, it easily fit John Stuart Mill's category of "illiberal practicality," research aimed at producing predictive models and social experiments which then could be evaluated as to their success. It was no accident that at the behest of the secretary of defense, the new Office of Economic Opportunity was staffed by Defense Department and Rand Corporation policy analysts who were committed to the PPBS (planning-programming-budgeting system) style of research. Not only did this style of research put into the background structural issues that called for radical changes, but also it precluded answers to the causal questions that did get posed.

Thus, the explained variance of race on income disallowed seeing how racism was part of the fabric of practices in generating low-income neighborhoods and thus the conditions of neighborhood schools, how choices get structured by employment opportunities and by drugs, and how all this figures in the framing of expectations by peer groups.

MULTIPLE WARS

As luck would have it, just as the War on Poverty was getting started, so too was the war in Vietnam and the eruption of American cities. A consequence was that, contrary to President Ronald Reagan's belief, the War on Poverty was not lost: it was never fought. Daniel Patrick Moynihan's 1965 study, "The Negro Family," offered an argument that "the Negro family in the Urban ghetto was crumbling." This fed directly into another emerging set of ideas: a culture of poverty explained poverty. On the generous liberal reading of this idea, the culture of the poor was a reasonable adaptation to circumstances, even if it was self-defeating.

Yet, presumably changing the conditions could change the culture. One response, Community Action, was radical enough. Indeed, some people, at least, did escape their situations. Accordingly, the culturally available and politically opportune way of explaining poverty was convincing: the poor were poor because they made bad decisions and lacked the motivation that would get them good jobs (assuming, as always, that there are good jobs to be had). Accordingly, the proposed solution was to reshape the poor, perhaps with programs that provide values education, along with the right mix of incentives and penalties that would promote marital stability.

Thus, the 1988 JOBS program did not create jobs, but, aimed at mothers on welfare, it did seek to reinforce both an ethic of work and the traditional family. On this view, the worst thing that one could do would be to provide welfare that would only encourage welfare dependency. To be sure, there was qualitative research, including some important feminist research, which suggested strongly that there was no culture of poverty in any useful sense; that indeed, while it served ideological purposes to identify an underclass as not at all like "us," the distinction between the deserving and the undeserving poor had very limited application.

The problem remains: Where are the jobs that pay a living wage?

Social science did not create President Bill Clinton's aptly titled Personal Responsibility and Work Reconciliation Act of 1996, but it surely did make its contribution. Indeed, 200 studies of dependency may be found in an annotated bibliography generated by the Heller School at Brandeis University. In this context, it is worth noting that "the end of welfare as we know it" was strongly supported by a reinvigorated rational choice theory: one ended dependency by making welfare less attractive than employment. But of course, in the absence of opportunities for gainful employment, one can make welfare unattractive only by radically reducing the benefits—a surefire way to end dependency. Accordingly, seeking the help of families and friends who were also poor—and efforts at employment in the informal economy would become the only response by the jobless.

The idea that income redistribution in any form would discourage work had not gone untested. In the days when this was still on the political agenda, a series

of government-funded social experiments were conducted. While social experiments at their very best hardly meet the standards of laboratory experiments, these experiments strongly suggested that there was nearly no reduction in work effort by those who received the additional income. But if most people would rather work than take handouts, the problem remains: where are the jobs that pay a living wage?

Solidarity

AS DEFINED BY POPE John Paul II, solidarity is "a firm and persevering determination to commit oneself to the common good of all and each individual, because we are all really responsible for all." This determination refers to an unwavering decision of the will to use one's personal powers to care for each person in a social group; it is not a mere feeling of sympathy for the other, but an ability to see the other as another self and act accordingly. The basis of solidarity is the reality that all persons are members of one human race. In spite of the

wide range of cultural differences and external biological characteristics, all people have the same rational human nature, equal dignity as persons, and identical inalienable human rights. Solidarity works toward the common good by eliminating as many material and spiritual inequalities as possible so the equality of all will be manifested in a more just social and cultural life.

COMMON GOOD

The common good is the "the sum of those conditions of social life which allow social groups and their individual members relatively thorough and ready access to their own fulfillment," explained the Vatican II Council. It requires distributive justice particularly by the state, as guarantor of the common good, and on each person of authority in lower social groupings (for example, work, family, voluntary organizations). Also necessary is stewardship of the earth's resources. An international common good is required. Countries and continents exist at different levels of development and their populations, or portions of them, do not have the same access to the necessities of life. The common good is manifested in the distribution of goods and remuneration for work within and between countries.

Its two greatest threats are unbridled desire for profit and for power on the part of those in authority. Those in lower social positions threaten it by an attachment to material goods and the selfish use of personal property. Overcoming these threats requires a decrease in the pursuit of special interests, the sharing of material goods, controlled use and consumption of goods, and the use of property at the service of man.

UNIVERSAL DESTINATION OF GOODS

The earth's resources, which "all men can by natural right avail themselves, to sustain and develop life," according to Pope Pius XII, belong to all and should be distributed according to justice and love. The universal destination does not interfere with the right of private property. This has been a consistent teaching that was well articulated by Pope Leo XIII in his encyclical *Rerum Novarum*. He said:

The fact that God has given the earth for the use and enjoyment of the whole human race can in no way be a bar to the owning of private property. For God has granted the earth to mankind in general, not in the sense that all without distinction can deal with it as they like, but rather that no part of it was assigned to any one in particular, and that the limits of private possession have been left to be fixed by man's own industry, and by the laws of individual races. Moreover, the earth, even though apportioned among private owners, ceases not thereby to minister to the needs of all, inasmuch as there is not one who does not sustain life from what the land produces.... [T]hat which is required for the preservation of life, and for life's well-being, is produced in great abundance from the soil, but not until man has brought it into cultivation and expended upon it his solicitude and skill. Now, when man thus turns the activity of his mind and the strength of his body toward procuring the fruits of nature, by such act he makes his own that portion of nature's field which he cultivates—that portion on which he leaves, as it were, the impress of his personality; and it cannot but be just that he should possess that portion as his very own, and have a right to hold it without any one being justified in violating that right.

Although Leo XIII was referring to property as in land, this teaching continues to hold true. Property is necessary for people to express their personality, develop as persons, and meet personal and familial needs. If the universal destination of resources is respected and acted upon, more people could quantitatively and qualitatively enjoy a better life.

INTERDEPENDENCE

Solidarity requires an awareness of the interdependence of all people. There is a tremendous disparity between developed wealthy nations, where a minority of the world's population lives, and undeveloped poor nations, where the masses live. The former possess continued means of economic growth and a higher standard of living; the latter, especially those with exports of raw materials, accumulate debt while the standard of living declines. The gap between the two grows wider as one grows richer and the other poorer. Rich nations have a responsibility to help the poor ones, particularly if that wealth has been accumulated unjustly, both through aid (for example, economic training) and a reform of international monetary institutions.

Poor nations have a responsibility to contribute their cultural and social riches to the international community, to join with other poor nations—perhaps on a regional basis—to pool resources and work for development, and to avoid the mistakes that wealthy nations have made on their path of development (for example, progress measured, often in exclusively economic terms). Interdependence means that wealthy and poor nations will contribute to the international common good according to their means, both materially and spiritually.

The gap between the wealthy and the poor exists also in regional and local areas of nations, particularly between cities and suburbs, and between urban and agricultural ways of life.

Interdependence must be recognized at this level, with the wealthy contributing to the poor. St. John Chrysostom said, "Not to enable the poor to share in our goods is to steal from them and deprive them of life. The goods we possess are not ours, but theirs." The poor have a responsibility to work for their own betterment and not depend solely on the aid of the wealthy, and to contribute their cultural riches to the nation.

The teaching of John Paul II on this matter has been summarized by D. McCarthy as: "Every economic decision must be made as a moral decision considering the enhancement of human integrity, the improved quality of life for those directly and indirectly affected by the decision and ecological ramifications."

A recognition of this interdependence and a willingness to act on it by ensuring a just distribution of the earth's resources according to need and love will contribute to peace on the international and national levels. Pope Paul VI said, "If you want peace, work for justice."

Solidarity works to eliminate material and spiritual inequalities. The focus is often directed toward the material, but the poor include not only those who lack material means. Both those with and without material goods can be poor in terms of personal suffering from age, illness, disability, loneliness, or despair. Mother Teresa of Calcutta said, "Being unwanted, unloved, uncared for, forgotten by everybody, I think that is a much greater hunger, a much greater poverty than the person who has nothing to eat." Solidarity requires moral support and compassion for those suffering spiritual want.

CYNTHIA TOOLIN, Ph.D. HOLY APOSTLES COLLEGE AND SEMINARY

Solomon Islands

THE SOLOMON ISLANDS is a nation of more than 900 islands in the south Pacific Ocean, east of Papua New Guinea, with some of the most severe poverty in the world. The islands are a former protectorate of the United Kingdom, but obtained independence on July 7, 1978. The country remains part of the Commonwealth of Nations, an association of independent nations, most of which are former British colonies that cooperate to promote democracy and human rights.

In addition to extreme poverty, the Solomon Islands suffer from ethnic violence, political corruption, and endemic crime that have undermined the country's stability and civility. Conditions were sufficiently bad in June 2003 that country leaders requested assistance in reestablishing law and order.

A multinational force of 2,200 troops and police officers, primarily from Australia, New Zealand, Fiji, Papua New Guinea, and Tonga, arrived on July 24, 2003 and subsequently restored peace and disarmed ethnic militias. This Regional Assistance Mission to the Solomon Islands (RAMSI) was reduced to 320 police officers and 120 military troops by the end of 2004. It subsequently has helped maintain civil and political order, reinforced regional security, and assisted in the rebuilding of government institutions.

Economic and social conditions in the Solomon Islands are harsh by world standards. Its Human Poverty Index in 1999 was higher than for all the least developed countries in south and southeast Asia. Income per person has declined significantly since then. The Solomon Islands' Gross Domestic Product per capita was \$2,650 in 1999. It fell to \$1,700 in 2002.

Prior to the arrival of RAMSI, the country suffered an economic collapse caused by the severe ethnic violence, the closure of key businesses, and a lack of government funds. The continued presence of RAMSI has allowed a return of law and order, economic stability, and modest economic growth.

Contributing factors to the poverty in the Solomon Islands include the wide dispersal of the islands, the smallness of the economy, rapid population growth, illiteracy, poor education, and a lack of funds. The extremely high dispersal of landmasses over a wide area of the ocean make the development of large markets difficult. The smallness of its economy makes it difficult to achieve economies of scale in production. Combined with the country's geographic fragmentation, this implies that the cost of public administration, utilities, education, and health services is significantly higher than in larger, more developed economies. The small population also implies that it is difficult for the Solomon Islands to have experts in specialized areas of modern technology. The nation is forced to rely on foreign expertise.

Poverty in the Solomon Islands is exacerbated by its extremely high rate of illiteracy (70 percent in 1998) and low levels of enrollment in school (39 percent of 5-to-14-year-olds in 1998). Education is hampered by the multiplicity of local languages and dialects. The rapid growth of the population, about 3.5 percent per year, makes it difficult to build schools and medical facilities to keep pace. Consequently, the availability of education and healthcare is actually decreasing on a per capita basis

In the past, the government failed to collect revenues from the country's timber exports. This lack of funds and excessive government borrowing created a fiscal crisis in the late 1990s, which required additional foreign loans that have added to the country's debt problem. These conditions make it difficult to apply traditional market reforms to the economy of the Solomon Islands. The Solomon Islands receives millions of dollars in economic aid annually, primarily from Australia.

JOHN B. BUCK JACKSONVILLE UNIVERSITY

Somalia

ACCORDING TO A United Nations Development Program report, about 43 percent of the Somali population are estimated to be under extreme poverty (23.5 percent in urban and 53.4 percent in rural and nomadic areas), having a per capita income less than \$1 (purchasing power parity, PPP) per day. The general poverty, measured as persons having per capita income less than \$2 (PPP) per day, is estimated at 73.4 percent (60.7 percent urban and 79.9 percent rural and nomadic). Translated into numbers, five million people in Somalia live in poverty, 1.4 million of them in urban and 3.6 million of them in rural and nomadic areas.

In 1991 the state of Somalia collapsed totally and has not been resurrected since. During 1991 and well into 1992, most of Somalia was ravaged by inter-clan warfare, banditry and widespread famine that claimed the lives of about 270,000 Somalis. The violence disrupted economic activity and agricultural production and led to another famine that killed more than 300,000 people. The violence not only has reduced the productive capacity of the economy and worsened the operative environment for economic activity but the damage sustained by the infrastructure has also led to a breakdown of institutions to provide goods and services.

Two circumstances led to the Somalia famine of 1992. The inability of any single clan to form a government following the ouster of former dictator Siad Barre plunged the country into a civil war centered on the capital city of Mogadishu. Its is estimated that about 30,000 people died in these confrontations and the total number of deaths would not have exceeded the stated number if not for a drought that had devastated the country roughly around the same time. Because of the volatile political situation it was nearly impossible for relief efforts to succeed in getting food to the vulnerable without incident. Even after international agencies

War has created widespread poverty: a refugee at the Ethiopia-Somalia border seeking relief.

managed to send in relief supplies, they were subject to looting by various warlords who began using food as a weapon by selling it on the black market for profit.

Droughts occur very frequently and lead to water shortages and starvation, particularly in the rural communities, which are more dependent on rainwater and grass for their survival in the raising of livestock and cultivation traditions. In Somalia, devastating floods often follow droughts, which has mainly affected southern parts of the country where the Juba and Shabelle flow. More recently, another natural disaster affected Somalia. The 2004 Indian Ocean tsunami killed an estimated 150 people, displaced about 5,000, and affected a total of 54,000 others in the northeastern coastal region of Somalia. In addition, the tsunami inflicted substantial damage on the Somali fishing industry, destroying a number of fishing boats and equipment.

Although an accurate picture of minority groups residing in Somalia has not yet been established, estimates show that they constitute one-third of the total Somali population. These minority groups include Bantu, Bravenese, Rerhamar, Bajuni, Eyle, Galgala, Tumal, Yibir, and Gaboye. Many of these groups live in conditions of great poverty and are exposed to numerous forms of discrimination and exclusion.

As a result, in Somalia the number of displaced persons exceeded the level of refugees anywhere in the region. Two types of refugees can be made out: first, those who fled into bordering countries like Djibouti, Ethiopia, Kenya, and Yemen; and second, those who migrated to major cities like Mogadishu in search of food. International migration has not only been driven by economic or poverty related factors but by political reasons as well. The main reason for migration has been the intertwining of political conflict and the search for economic opportunity.

Poverty and political strife in Somalia have also been the cause of massive environmental damage. Environmental degradation increases poverty since many of the poor are closely dependent on the natural environment for their survival. For example, charcoal plays an important role in the energy sector as well as the economy of Somalia.

However, the use of charcoal places a heavy strain on local wood resources, resulting in acute environmental consequences such as deforestation, which in turn leads to desertification and ultimately to the destruction of land suitable for grazing. This will inevitably affect nomadic communities who are entirely dependent on grazing. Somalia has also been used as a dumping site for hazardous toxic waste from industrialized countries. Several European firms have illegally dumped hazardous waste, and the income generated from this trade has benefited mainly local warlords, but it has polluted many natural habitats and has negatively affected the health of many poor Somalis residing close to these disposal sites.

South Africa

THE REPUBLIC OF SOUTH Africa, located at the southernmost tip of the African continent, is the most developed country in Africa. Among African countries, South Africa's annual per capita income of \$11,100 ranks second only to that of Mauritius (\$12,800), an oil-producing nation. Nevertheless, South Africa is considered a lower-middle-income nation. In 1867, Dutch settlers discovered diamonds in what is now South Africa, followed by the discovery of gold in 1886. In addition to diamonds and gold, South Africa's wealth of natural resources includes chromium, antimony, coal, iron ore, tin, uranium, copper, and natural gas. In the 21st century, South Africa has a diversified economy and great potential for growth, and the South African stock market is among the top 10 in the world.

For almost a century, South Africa's black majority was subjugated, first under colonialism and then under the system of apartheid. The system was abolished in the 1990s, and a new black-majority government was established. However, South Africa's problems were far from over. The following decade saw South Africa rise to the forefront with one of the highest HIV/AIDS prevalence rates in the world (21.5 percent). Resources were further sapped by a 50 percent poverty rate and 26.2 percent unemployment rate. Some 23.8 percent of the South Africans live on less than \$2 a day, and 7.1 percent survive on less than \$1 a day.

Despite the end of apartheid, South Africa has been identified as the most unequal country in the world. The poorest 20 percent of the population claim only 2 percent of the country's wealth, while the highest 20 percent share 46.9 percent of all resources. The per capita income of whites is nearly nine times that of blacks. The Gini Index of Human Inequality ranks South Africa at 59.3 percent.

South Africa's population of 44,344,136 experiences a life expectancy of 43.27 years and a median age of 23.98 years. Life expectancy has actually decreased

since the 1980 rate of 54 years. Some 30.3 percent of the population are under the age of 14, and 5.2 percent have reached the age of 65. South Africans have a 44.9 percent chance of dying before the age of 40.

The 21.5 percent prevalence rate of HIV/AIDS has been devastating to South Africa. By 2003 estimates, 5.3 million people were living with this disease, and 370,000 had died from HIV/AIDS and its complications. Because most South Africans have access to safe water and proper sanitation, the country escapes the food- and waterborne diseases that are prevalent in Africa. South Africans also have greater access to medical care and to affordable essential drugs than do most Africans. However, an outbreak of cholera occurred in South Africa in 2003.

South Africans have a 44.9 percent chance of dying before the age of 40.

From 2003 to 2005, the infant mortality rate in South Africa rose from 53 deaths per 1,000 live births to 61.81 deaths per 1,000. The mortality rate of children under the age of 5 is 66 per 1,000. The reason that childhood mortality rates are high for such a highly developed country is that the poorest South Africans in isolated villages lack the access to healthcare that is available in urban areas. The infant mortality rate of blacks is four times higher than that of whites in South Africa. Some 12 percent of all South Africans under the age of 5 are malnourished and two percent are severely underweight. Some 25 percent of children under 5 suffer from moderate to severe stunting, and three percent suffers from moderate to severe wasting.

South Africa has improved rates of childhood immunizations, but more needs to be done to reach children in rural areas. In 2003, 83 percent of children between the ages of 12 and 23 months old were immunized against measles, and 94 percent were immunized against DPT3. At the same time, infant measles immunizations were reported at 78 percent, infant tuberculosis immunizations at 94 percent, DPT immunizations at 82 percent, and polio immunizations at 84 percent.

The fertility rate of women of childbearing age in South Africa is 2.24 children per woman, and the adolescent fertility rate is 42 per 1,000 births. As a point of comparison, the average fertility rate for the period between 1970 and 1975 was 5.4 children per woman. Even today, fertility rates are highest in rural areas. Some 62 percent of South African women use some method of

contraception, and three-fourths of all women have used contraception at some point.

Maternal mortality is high in South Africa at 230 deaths per 100,000, despite the fact that trained medical staff attend 86.4 percent of all births. In urban areas, 98 percent of all births occur in medical facilities. However, in the eastern Cape area of South Africa, 40 percent of the women give birth at home. Some 94 percent of all South African women receive antenatal care, but HIV/AIDS and other pregnancy-related infections take a toll, particularly on poor women.

South Africa has made great strides in increasing literacy over the past decades. Approximately 86.4 percent of all people over the age of 15 can now read and write. In 1980, 22.4 percent of males and 25.2 percent of females were literate. These numbers are particularly low when compared to literacy rates of sub-Saharan Africans in 1980, when literacy rates were recorded as 50.8 percent for males and 72.4 percent for females. The reason for South Africa's low literacy rates, of course, was that under apartheid many members of the black majority were uneducated.

Most South Africans receive at least 13 years of schooling. In 1999, 87 percent of all South Africans in the relevant age group were enrolled in primary schools. By 2003, total enrollment had risen to 99 percent. Between 1990 and 2002, the primary completion rate for males rose from 72 to 89 percent and the completion rate for females climbed from 81 to 91 percent. Despite these gains, there are high repetition and dropout rates at all levels of education in South Africa.

Spain

AT THE START OF THE contemporary age in Spain, the church mainly financed welfare for the poor. However, after the successive deamortizations of property belonging to hospitals and hospices, the church and local councils seriously truncated religious charity. This was replaced by liberal state-supported welfare.

In this new form of beneficence, being poor was not a religious state (the humble, mild, or blessed as expressed in the New Testament) or the description of those who owned nothing. Rather, it referred to a person who was without work or could not work because of age. There were two main periods: one in which welfare was the responsibility of local councils (1812–55), and another that gave greater control to the provincial councils (1849–1907), a period in which the religious institutions began, once again, to play a major role.

Also, at the end of the 19th century, the socialists of the German (Verein für Sozialpolitik) and British (Fabian Society) schools began to exert their influence. In Spain, this was reflected in the establishment of social security via the Institución Libre de Enseñanza (Free Institution of Education 1876), organized by the professors of the Oviedo Group, alongside the "regenerationism" and social Catholicism of Leo XIII. This had its first antecedent in the Commission of Social Reforms (1883), created to compile information on the state of the working classes.

At the beginning of the 20th century, the Institute of Social Reforms was created, as well as the National Social Welfare Institute (INP). Their aim was to stimulate popular welfare in the form of retirement pensions and to administer voluntary mutual benefits. These initial steps led to insurance funds covering job accidents (1900), compulsory job retirement (1919), and maternity (1929). A whole series of private Mutual Aid Societies, with scarce capital, also grew up (4,517 in 1916), which insured their members against accidents, old age, and even unemployment. The Second Republic (1931–36) attempted to round off the legislation with unemployment insurance, in the midst of the 1930s crisis, which was never passed into law.

Following the Spanish Civil War (1936–39), the very destruction of the war and international isolation caused general poverty. The 1940 census recorded that social assistance agencies and the Kitchens of the Fraternity for the Poor and Needy attended to 4.5 percent of inhabitants at the start of the year. From 1940 to 1946 there were 30,000 deaths due to starvation. General F. Franco's government (1939–75) intervened in the

economy and introduced ration cards, while the black market began to flourish.

The National Social Welfare Institute was put in charge of regulating the new state's social security. In addition to the already existing insurance for accidents, maternity, and job retirement, other plans were put into place: illness (1942), special farming regime (1958 and 1966), unemployment (1940, 1945, 1954, 1961, and 1972), and family bonus programs (1942 and 1946). Franco's dictatorship also took control of the Workers' Mutual Funds and Associations, set up by firms and paid for through a tax on wages.

In 1965 there were three million Spaniards in a situation of absolute poverty.

Toward the end of the 1950s, the Spanish economy embarked upon a process of liberalization (the 1959 Stabilization Plan) and began to grow, while Keynesian ideology spread among Spanish economists. Spain experienced an annual Gross Domestic Product (GDP) growth of 6.42 percent from 1950 to 1974. This economic expansion generated structural changes in the social welfare system: emigration, a drop in the percentage of the working population employed in agriculture, and a growth in female employment. The process shattered the traditional welfare system (Cáritas, a religious nongovernmental organization, calculated that in 1965 there were three million Spaniards in a situation of absolute poverty) and forced the creation of social security in 1963 (Social Security Founding Law), which was passed in 1967 but which, by no means, meant the creation of a welfare state.

The economic crisis of 1973, the death of Franco (1975), and the arrival of democracy in Spain (the 1978 constitution) all led to the creation of a modern welfare state. The downturn of the economy caused previously unheard-of unemployment levels (2.5 percent in 1973, 21.6 percent in 1985, 11.6 percent in 1990, 18.4 percent in 1994, and 11.4 percent in 2002) and damaged the production system, thus forcing the social commitment of the newly established Spanish democracy.

As a result, the Moncloa Pacts of 1977 were signed, putting in place tax reforms and modifying the social security system, making it universal and redistributive. Thus, over the years, government expenditure in social services has grown: in 1975 it was 17.5 percent of GDP (of which social security was 9.9 percent; healthcare, 3.7 percent; education, 3.9 percent) and, by 2000, the figure

had reached 22.4 percent (accounted for by social security, 13 percent; healthcare, 5.1 percent; education, 4.3 percent). This level of protection can well be seen in the coverage rate of unemployment benefits (44 percent of the unemployed in 1987, 59 percent in 1990, and 71 percent in 1994), as well as in the number of those benefiting from public healthcare (84 percent in 1981 and 99.7 percent in 1990).

During this latter period, economic growth was high in Spain, in line with that of an industrialized nation (annual growth of 3.03 percent in the period 1974–2000). This growth has enabled the country to rid itself of Third World poverty, but that of relative poverty. Researchers calculated this relative poverty as affecting 21.6 percent of the population in the period 1973–74, dropping to 20.6 percent in 1980–81, and falling again to 19 percent in 1990–91 ("Average Expenditure over Total Population under 50 percent" criterion). This poverty level drops one percent every 10 years, though economic conditions may cyclically modify the percentage of poor people.

Finally, there are two other questions. One has to do with the geographical distribution of poverty, which, according to current data, is concentrated mainly in southern and central Spain: Extremadura, Andalusia, Castilla-Leon, Castilla-La Mancha, Ceuta, and Melilla. To a lesser extent, it is also present in Madrid, Navarre, the Basque Country, Catalonia, the Balearic Isles, Cantabria, and the northern provinces. The other question refers to the great number of immigrants who are settling in the country (legalization and family regrouping measures were passed in 2000 and 2005). This will mean that, in the long term, Spain's poverty statistics will not drop, and may grow.

Speenhamland System

SPEENHAMLAND IS NAMED for the town of Speen in Berkshire County, England, where the magistrates established a poverty relief system rooted in the belief that every citizen is entitled to a minimum standard of living. In May 1795, the magistrates declared "the present state of the poor law requires further assistance than has generally been given them" and dictated that citizens be entitled to a minimum guaranteed income, irrespective of earnings. The result was a means-tested sliding-scale wage supplementation system based on the price of bread.

Rural England was plagued by a period of soaring poverty rates during the late 18th century. The difficulty of importing foodstuffs due to England's involvement in the French wars, combined with a series of bad local harvests and the growing population, led to a rapid rise in the price of bread. Consequently, the threat of social upheaval loomed because of high prices and increased unemployment. Concern about alleviating this spurred a widespread debate and with the intention of mitigating the effects of rural poverty, the Speenhamland system emerged.

FUNDAMENTALS OF SPEENHAMLAND

Previous to Speenhamland, relief was provided only to the infirm, the aged, or the dependent in the form of outdoor relief as dictated by the Elizabethan Poor Laws of 1601. The Speenhamland system changed this by allowing able-bodied people to draw on the poor rates. The parish would supplement any given laborer's income to an established basic subsistence level through wage supplementation.

The legislation read, "when the gallon loaf of second flour, weighing 8 pounds 11 ounces shall cost 1 shilling, then very poor and industrious man shall have for his own support 3s weekly, either produced by his own or his family's labor or an allowance from the poor rates, and for the support of his wife and every other of his family 1s 6d. When the gallon loaf shall cost 1s 4d, then every poor and industrious man shall have 4s weekly for his own and 1s 10d for the support of every other of his family." Notably, the minimum weekly income for a worker would rise or fall by every member of the worker's family—the amount of which was dependent on the price of a gallon loaf of bread.

The 1662 Settlement Laws, an integral component of the Speenhamland system, dictated that entitlement to relief was reliant upon where an individual was settled. Because of the prevalence of migrant laborers and the subsequent need to protect parishes from pauper migrations, relief was regulated through a residency requirement, granting assistance to individuals only in the parish in which they lived.

The premise of these allowances spread quickly and the Speenhamland system has been credited with saving many families from starvation. Yet what was intended as a safety net to relieve poverty actually triggered adverse effects, most notably its impact on employment. The guaranteed income was seen as creating a disincentive to work and as prompting a decline in wage levels during the Speenhamland period. Furthermore, the design of the system was said to encourage early marriage and large families, as aid was dependent on the number of family members.

As employment grew less stable and access to relief became increasingly restricted, expenditures on poor relief escalated to the point of challenging the feasibility of maintaining the Speenhamland system. Speenhamland was ultimately condemned for the way it was thought to thwart the functioning of a free labor market. In 1834, the Poor Law Report and the Poor Law Amendment Act were passed, ending the Speenhamland system of poor relief.

In spite of this and the fact that Speenhamland was not a national system, the lessons of Speenhamland have had a crucial impact on social welfare and poverty policy debates for two full centuries. The remnants, primarily the promise of a minimum income, are still debated on the floor of the U.S. Congress. Most notably this premise resurfaced with the disputes over the transformation of 20th-century welfare policy—work mandates, income tax credits, and social entitlements.

Squared Poverty Gap Index

THE POVERTY GAP Index is a measure of poverty that calculates both the prevalence and the depth of poverty in a country. It is computed by calculating how far each poor individual is below the official poverty line as a percentage of the poverty line itself, and then averaging these proportional poverty gaps over the entire population. Persons above the poverty line are assumed to have a poverty gap of zero.

One problem economists raise concerning the Poverty Gap Index as a measurement tool is that it does not account for the distribution of income among the poor. All persons who fall below the poverty line are treated equally in calculating the index, regardless of how far below the line they fall. Thus, a change in the income of an utterly destitute person alters the Poverty Gap Index equally to a change in income for someone just below the poverty line cutoff. For this reason, some economists advocate the use of the Squared Poverty Gap Index to account for variations in income below the poverty line.

The Squared Poverty Gap Index is computed in a similar fashion to the Poverty Gap Index by calculating how far each poor individual is below the official poverty line as a percentage of the poverty line itself, except these proportional poverty gaps are squared before averaging over the population. In this manner, those persons who are further from the poverty line are weighted more heavily.

For example, suppose a country has 10 citizens and a poverty line of \$1,000 per year. If one person has an annual income of \$400 and a second person has an annual income of \$600, while the remaining eight persons have incomes in excess of \$1,000, then the simple Poverty Gap Index for the country is equal to .4 plus .6 divided by 10, or 10 percent. The Squared Poverty Gap Index is equal to .16 plus .36 divided by 10, or 5.2 percent.

Now suppose a policy change results in a transfer of \$300 of income from the poorer individual to the richer one so that the new annual incomes are \$100 and \$900. While this clearly exacerbates poverty among the most poverty-stricken, it is not reflected in the Poverty Gap Index, which remains unchanged at 10 percent (.9 plus .1 divided by 10). The Squared Poverty Gap Index, however, rises to .01 plus .81 divided by 10, or 8.2 percent, reflecting the change in the income distribution.

As with other poverty measures, care must be taken in comparing the Squared Poverty Gap Index across nations since the official definition of poverty may differ significantly from country to country. International agencies have attempted to correct for this deficiency by standardizing definitions of poverty.

The most commonly used standardized measure of poverty is the \$1-a-day level, which corresponds to an annual income of \$365 adjusted for inflation and international differences in costs of living (also known as purchasing power parity, or PPP). By the \$1-a-day threshold, the Squared Poverty Gap Index for the developing world was 2.5 percent. This figure represents a significant decrease from past numbers largely because of reductions in the poverty in India and China. In 1981 and 1990, the Squared Poverty Gap Indexes for the developing world were 6.4 percent and 3.6 percent, respectively.

Unfortunately, while the Squared Poverty Gap Index does account for differences in the distribution of income among the poor, it, unlike the Headcount Index and Poverty Gap Index, does not lend itself to an easy intuitive interpretation. The 2.5 percent figure has little meaning outside a numeric statistic that can be measured across countries and across time periods.

VICTOR MATHESON, Ph.D. COLLEGE OF THE HOLY CROSS

Squatting

SQUATTING REFERS TO the act of occupying land or structures with the intent of creating temporary or permanent shelter without the consent of the owner. For example, a squatter may be a homeless individual who takes up residence in an old abandoned building. Although the building is otherwise uninhabited, if the individual does not hold a lease to the property, or possess some other form of entitlement, he is acting as a squatter. Squatting is a common occurrence in cities, where abandoned buildings are prevalent, and is often the consequence of a lack of affordable housing.

Individuals or families may choose to squat for several reasons. Homelessness is a common precipitator to

squatting and the two often go hand in hand. Without adequate income, it is difficult to find satisfactory housing in many cities. Elevated rent and extended government-subsidized waiting lists force many individuals and families to the streets. Squatting is a realistic product of a desire to survive life on the streets.

In some cases, the squatter settlement can be established as a legitimate community.

Poverty and homelessness are so common in certain parts of the world that squatter settlements are familiar sights around the periphery of many cities. The migration of families from rural areas, where jobs are scarce, to the city increases city populations to the point that lack of housing is a typical phenomenon in developing countries. Homeless families establish themselves in settlements rather than live with family or friends in overcrowded conditions in the city. This grouping together that creates squatter settlements can be advantageous.

In some cases, the squatter settlement can be established as a legitimate community that is eligible for government assistance. This means that services such as water and sanitation may be provided to the settlement and members of the settlement may have access to government-subsidized programs they were ineligible for when they did not have a permanent address, as noted by S. Speak.

The relationship between homelessness and squatting may be less related in some impoverished countries. For example, it is not unusual for rural landowners in China to temporarily leave their properties and families to find work in the city in order to supplement their housing and living situation. Any income earned in the city is then remitted to the family who continues to reside in the rural area.

In order to save money while living in the city, these individuals may resort to squatting; however, even though they are living on the street, they are not truly homeless. They maintain ownership of a residence even though they may not be living there.

Squatting for political reasons has been popular in Europe and Canada in the past. Political activists may be neither impoverished nor homeless; however, their political stance is for the support and protection of the disadvantaged. Squatting activity in this regard is a political expression aimed at reducing squatting occurrences and conditions associated with squatting.

In many countries, squatting is illegal. Squatters can be arrested on charges of trespassing and breaking and entering. While squatting is a criminal offense, squatters sometimes use the courts to claim a residence as their own. Laws, such as squatter's rights, create avenues for squatters to establish land or property as their own. Squatter's rights, also known as adverse possession, refers to the right to claim ownership of property simply by living on or possessing it for a period of time. While most countries favor the rights of the property owner, most countries allow for the provision of squatters to obtain possession of property they do not own under certain circumstances. In the United States, in order for someone to claim squatter's rights, the following conditions must be met: the property must be put to use or occupied, the use must be public and visible, the land must be used or occupied without the permission or approval of the landowner, use of the property must not be shared with anyone else, and the property must be used continuously for a certain period of time. Local law determines the time period.

Homesteading is another means squatters use to obtain possession of property. Homesteading is similar to obtaining title to property by claiming squatter's rights; however, possession of the property is not hostile. The property either does not have a rightful owner or is owned by the government. The government then allows the homesteader to use the land with the expectation that she will eventually gain title to the property.

Squatting is an option for the many homeless and impoverished who are seeking refuge from living on the streets. It is an alternative to the unkempt shelters available in many parts of the world, and the social regulation and control that exist in some of the shelters make them less than appealing to those who are staunchly independent. Squatting is often a temporary solution to obtaining relief from homelessness and poverty. While it provides the individual or family with shelter and a degree of protection from the elements, the living conditions are often less than desirable and can even be dangerous. Dilapidated buildings can cause accidents to those living in them, and lack of electricity to heat a structure can result in hypothermia to squatters living in colder regions of the world.

tries," Housing Studies (2004); P. Weber, "Scenes from the Squatting Life," National Review (1987).

CYNTHA L. JUBY, Ph.D. UNIVERSITY OF TEXAS, ARLINGTON

Sri Lanka

THE DEMOCRATIC Socialist Republic of Sri Lanka, earlier known as Ceylon, became independent from British colonial rule in 1948. Its ranking in the Human Development Index (HDI) is the highest on the Indian subcontinent. Sri Lanka's Gender Development Index (GDI) was 69 percent in 2005, showing a level of human development better than the world average of 64 percent. But the ongoing war with Tamil secessionists and a mismanaged bureaucracy have hampered its social and economic development.

Sri Lanka was following the path of a socialist economy until 1977. The liberalization of its economy witnessed considerable progress, but the conflict with the Liberation Tigers of Tamil Eelam (LTTE) resulted in slowing down the growth rate of the country. In a warravaged economy, social inequality and poverty increased.

In the beginning of this century, Sri Lanka did not make much progress on social and economic fronts. There was a negative growth rate of 0.6 percent and a decrease of Gross Domestic Product (GDP) by 3.7 percent. The Gross National Product (GNP) decreased by 1.3 percent in 2001. The public debt was a staggering 104.3 percent of GDP in 2004. The cost of war was increasing. It was about five percent of GDP in 2000, whereas the figure was 1.3 percent of GDP in 1982. The foreign exchange reserve of the country was decreasing.

The percentage of people below the poverty line was 22 (1997), with 88 percent living in rural areas. Before the cease-fire of 2002 with LTTE, the economy was reeling under the protracted war, and economic progress was jeopardized. The closure of 745 small-scale industries in 2001 through privatization threatened job security. The share of the health sector was only 1.4 percent of GDP. Malnutrition became a menace because of food insecurity. The increase in prices and wage stagnation deprived people of a proper diet.

In rural areas, the condition of self-employed women was miserable. The women working abroad made a substantial contribution to national income, but the government did not take sufficient steps to check their conditions. The people suffered from taxes imposed to defray the cost of war. The conflict with LTTE left a trail of death, maimed bodies, life in refugee camps, and loss of property and livelihood. Even children were recruited in the war.

The government took measured steps after the end of the conflict to ensure economic development. The task before the nation was to increase employment and productivity, generate resources, and overcome budget deficits for economic growth and the reduction of poverty. The government is envisioning job recruitment of two million in coming years.

The rate of unemployment declined to 7.8 percent in 2004. Experts point out that public debt must be brought under control, otherwise it will grow faster than the economy of the country. The Relief, Rehabilitation and Reconciliation (RRR) program was launched to meet the bare necessities of people, promoting improved economic conditions. Increasing the productivity level and investment was emphasized. The implementation of the poverty reduction strategy by the government was facilitated by the assistance of \$4.5 billion from international donors.

In the mid-2000s, economic growth is picking up and the GDP increased to 6.5 percent in 2004. Reforms, political stability, and continuation of the peace process are helping to achieve the projected 10 percent growth rate in GDP, reducing the poverty level to a considerable extent.

Stabilization

STABILIZATION IS A general term that usually applies to calls for control of different areas of life that are

viewed by some individuals or groups as growing or declining undesirably. Controls to achieve stabilization can affect the poor positively or negatively.

Some forms of stabilization are enacted as price controls. In other cases it may be immigration or population stabilization, which means control over the growth in numbers of people. Another form of stabilization refers to the social environment, such as neighborhood stabilization. This form of action seeks to organize people so they can work together to improve the social and even physical conditions of their neighborhood.

When price controls are implemented, stabilization takes the form of rationing. The government, in conditions of price controls, artificially fixes the price of some good or service. The stabilization of the price may benefit the poor or the society in general to the detriment of others. It may on the other hand be a way to distribute goods such as gasoline during an oil shortage.

Rent control is a form of price control stabilization. It fixes rents and does not allow landlords to increase them. Landlords may be held responsible for keeping their properties in good condition even if this means incurring a financial loss. In the short run, rent controls in a city can keep the price of housing from spiraling out of control. However, in the long run the stock of housing for all may be reduced because landlords are unable to profit from their properties. In New York City the use of rent controls led to the abandonment of thousands of properties, with a subsequent loss of housing opportunities for all.

Some advocates of population stabilization do so on the grounds that their motives are purely ecological. Their announced goal is to preserve the environment. This means that people have to be restrained in their activities that could affect the environment.

Some ecological groups call for reducing birthrates and stopping immigration. Ecological advocates of population stabilization see unending population grow as a major source of environmental destruction. Since the poor usually have more children than the rich, limiting birthrates effectively limits the ability of the poor to gain access to the world's goods and services.

Some anti-immigration groups, especially those against illegal immigration, fear that large numbers of immigrants will destabilize the society and cause the original groups to lose control of the society. This is especially the case if the immigrant groups have a much higher birthrate than the native population.

Stabilization policies usually encourage a form of politics that uses euphoric language to insinuate to the

general population that the preferred policy is an unmixed blessing. Current political discussion in California and other places often centers on immigrant stabilization, which means stopping illegal immigrants from entering the state. Since the laws prohibit people from being denied welfare benefits or education benefits even if they are illegal immigrants, the impact upon taxpayers and the quality of life is significant.

Stabilization may also refer to the political conditions in a country. The United Nations Mission in Haiti has been extended beyond 2005 in order to further lower the likelihood of civil conflict that could ignite a regional conflict involving several countries.

The presence of the United States in Iraq was a mission aimed at achieving political stability. Stabilization in this case means an end to active fighting and the institution of a permanent new government.

Standard Food Basket

A STANDARD FOOD Basket (SFB) is a food-based variant of the poverty line measurement methodology. It is used to estimate malnutrition or hunger to determine absolute or extreme poverty. Usually the poverty line is considered as the level of income below which one cannot afford to purchase all the resources one requires to live. Different countries use different poverty lines. Some countries determine the poverty line as a fraction of the median income and mostly emphasize the relative or social content of the standard of living. Most countries have chosen a less relative concept for the poverty line where the typical methodology consists in the valuation of a standard food basket, which is based on actual expenditure patterns and the recommended calorie intake level.

Globally, however, it is more common to use only one poverty line in order to compare economic welfare levels. Generally, the poverty line is the cost of the basket of commodities that each equivalent adult in the household requires to attain a given minimum standard of living. The current poverty line, developed in the early 1960s, is considered to be the minimum dollar amount needed for individuals, couples, or families to purchase food and meet other basic needs. It was first calculated in the United States. Now it is used in many countries. In each country an SFB is defined for the average individual or for the average individual in each household. Individuals are classified on the basis of the households to which they belong.

It is based on diets or eating habits of the group observed in surveys of household income and expenditures. Recommended nutritional requirements in terms of age, weight and height, sex, and type of activity are important factors for an SFB calculation. The SFB uses arbitrary consumption figures, which are assumed to represent upper percentiles of the daily consumption of food items. The figures are obtained from the household surveys. Based on the surveys of household income and expenditure, the social layers with the lowest income whose purchases of food place it above the nutritional requirements are determined.

The data obtained from the surveys of households provide a list of quantities of foodstuffs that satisfy the predefined nutritional requirements of the individual. The quantities of foodstuffs are then multiplied by the prices, which in principle each household has to spend, although in practice there is usually a single range of prices or sometimes one rural and one urban. In this way the total cost of the per capita food basket is obtained.

The Standard Food Basket variant has a number of specific limitations. The procedure is not only assuming that in satisfying nutritional standards the selected group should also satisfy the rest of their basic needs, but also assuming what should be the result of the measurement exercise: that this population group is not poor. Further issues arise in measuring household living standards. The choice between income and consumption as a welfare indicator is one issue. Incomes are generally more difficult to measure accurately, and consumption meshes better with the idea of the standard of living than does income, which can vary over time even if the standard of living does not. But consumption data are not always available, and when they are not, there is little choice but to use income.

This procedure does not consider social services, which are provided by the government on a subsidized basis, as is typically the case with education, healthcare and housing. These services are not accounted for in monetary income, which forms the basis of the measurement of poverty. Neither are they considered in the calculation of the poverty line, which is based on the pattern of actual or effective expenditure. It follows that the measurement of poverty renders an incomplete picture of the standard of living of a household. It excludes social services like education, healthcare, and housing, which are no less important than market commodities for the standard of living of the population.

Standard Food Basket Variant

THE STANDARD food basket variant is any method of determining a poverty line using the cost of meeting basic nutritional requirements as the primary basis for setting the poverty threshold. The standard food basket variant is used by many countries, including the United States, to set the official poverty line.

The use of this method in the United States dates back to 1961, when Mollie Orshansky first calculated poverty thresholds for American households using the economy food plan developed by the United States Department of Agriculture (USDA). The USDA regularly calculates the cost, for a variety of family sizes, of providing a nutritionally complete diet under four differing levels of spending. The least costly plan, and the one used by Orshansky, is known as the thrifty plan (formerly known as the economy plan).

Orshansky then multiplied the annual cost of the thrifty food plan by three to arrive at the poverty line, since empirical data on consumer expenditure patterns from the 1950s showed that the typical family of three

or more persons spent approximately one-third of their after-tax income on food.

Once the original thresholds were established in 1963, the poverty lines were then adjusted over time based on changes in prices, at first in the price of the appropriate food basket but after 1969 by changes in the overall Consumer Price Index instead. Thus, while the original poverty thresholds in the United States were established using a standard food basket, the current poverty line is not based directly on the current cost of providing an adequate diet. For example, in 2003 the thrifty food plan for a family of four ranged from \$5,060 to \$5,850 depending on the ages of the household members. The official poverty line for a two-adult, two-child household in the same year, however, was \$18,660, between 3.2 and 3.7 times greater.

There are many criticisms of using the standard food basket variant for establishing the poverty line. The most common complaint is that the basic methodology of estimating the cost of food and then applying a multiplier of three is seen as arbitrary. Many advocate instead using a basic needs consumption basket for determining the poverty line. The problem with the consumption basket approach, however, is determining which items are deemed as necessities and which items are luxuries. For example, is a telephone considered a basic need that should be included in the consumption basket, or is it a luxury that should be excluded?

Others suggest that fixing a poverty line (adjusting for inflation, of course) based on consumption patterns from the 1950s and 1960s fails to account for improvements in society's general welfare levels. As society grows wealthier and the general population gains access to new and improved goods and services, it is argued that the poverty line should rise as well to allow those who cannot afford these new products to be counted as poor. For example, in the 1950s, few households, regardless of income status, had automatic dishwashers, washing machines, or television sets. Therefore there would have been no reason to count those persons without the means to acquire these items as poor.

As ownership of these products has become wide-spread, however, in a general sense, those who do with-out these modern conveniences might be considered in poverty. In short, rather than using a multiple of a fixed standard food basket as the poverty line, a relative measure of poverty should be used. Of course, a relative measure of poverty makes it virtually impossible to measure progress in the fight against poverty over time in any absolute sense, as the definition of what it means to be poor is constantly changing.

VICTOR MATHESON, Ph.D. COLLEGE OF THE HOLY CROSS

Standard of Living

STANDARD OF LIVING refers to the overall or aggregate wealth of an individual or a representative member of a larger community. Initially viewed in purely monetary terms, the concept is now considered to be more appropriately treated in broader terms, including subjective measures of well-being and opportunity. Nobel Prize-winning economist Amartya Sen has referred to capabilities as a measure of living standards. This term has the virtue of including the concept of access to opportunity, that is, a measure of economic equality embedded within. Low standards of living are identified as representing a relative level of poverty within countries, and the inability to survive on the current standard of living represents absolute poverty. Government policies, in democratic societies at least, are generally aimed at increasing the overall standard of living of society, although perhaps by privileging certain sections of that society.

In poor societies, a standard of living refers to possession of basic necessities, particularly food and personal security. As economic conditions improve, people become able to exercise taste and discrimination in selecting a combination of goods and services that they can obtain to define their own living standard. The American psychologist Abraham Maslow wrote that people have a hierarchy of needs that are to be satisfied in order, from the very basic physical security needs at the bottom, up through various levels of ownership of physical goods and services, and then into the realm of self-realization and self-actualization.

Above a certain level of income, therefore, people will strive to improve their living standard through access to opportunities that vary with an individual's personality, including intellectual expression, adventurous

travel, and spiritual development. Many such expressions of self-actualization have implications for the type of society in which the individual lives. Increasingly, understanding of the holistic nature of the environment and its impact upon personal health and well-being is stimulating citizen demands for cleaner air, safer streets, and general improvements in the living conditions of public spaces. Increasing the standard of living, therefore, is associated with improving the accountability and responsiveness of government.

The ways in which the standard of living is defined change in terms of both time and space. The five treasures of Chinese consumer life no longer include the sewing machine and radio, but are now the mobile telephone and television. In many cultures, an acceptable standard of living is defined by access to sufficient goods to provide a dowry and hence become married. Societies that favor interdependency in family life value a standard of living in which many family members can live together, which is anathema to the independence valued by many Western people.

Governments may try to promote the standard of living by increasing income opportunities, providing services that enhance the ability of people to take advantage of opportunities, or providing support for vulnerable individuals, in some cases by reducing household size.

Since the standard of living depends on total household income divided by number of household members, the standard may rise with more income or fewer people. The Chinese government enforced (with considerable social cost) a one-child-per-family policy with a view to improving household standards of living. Other governments have acted in more subtle fashion by increasing career opportunities for women, which has had a similar effect.

The World Bank operates a series of Living Standards Measurement Surveys around the developing world. These surveys employ questionnaire instruments of considerable complexity, in the hope of capturing all or at least most of the elements that constitute standard of living. These surveys have evolved over time.

Historically, a number of movements have been founded on the basis of avoiding or subverting the attempt to accumulate the maximum rate of standard of living as measured by economic terms. Sometimes this is based on spiritual reasons, such as the rejection of modern technology by the Amish people of the eastern United States. Sometimes political or secular ideological reasons are the motivation, as in the case of the

Levellers from the era of the English Civil War and the many groups of people who have sought to avoid accumulation of consumer goods as a priority. More generally, raising to a primary goal the increase in a quantified measure can lead to a heightened emphasis on physical goods at the expense of intellectual or spiritual values, since physical goods are more easily measured and their presence may be compared among different people. In such a case, the standard of living diverges from subjective measures of well-being.

Starvation

THE SIMPLEST DEFINITIONS of the word *famine* emphasize two features: famines are associated with severe shortages, especially of food, and they are causally associated with hunger and starvation. However, starvation is the characteristic of some people not having enough food to eat. It is not the characteristic of there not being enough to eat. While the latter can be a cause of the former, it is but one of many possible causes.

Another common group of definitions equates mass hunger and starvation with famine. The focus here is on the physiological plight of famine victims—famine is described in terms of inadequate food intake, rather than inadequate food availability. However, famines imply starvation, not vice versa. Starvation is a normal feature in many parts of the world, but this phenomenon of "regular" starvation has to be distinguished from violent outbursts of famine. The distinction between starvation and famine is usually made in terms of the numbers of people affected. It is generally agreed that famines affect sizeable populations over a relatively large area, while starvation afflicts individuals or small groups of people.

A third distinction between starvation and famine is the time contrast. In analyzing starvation in general, it is important to make clear distinctions among three different issues: lowness of the typical level of food consumption, declining trend of food consumption, and sudden collapse of the level of food consumption. Famine is chiefly a problem of the third kind. Thus, extreme, widespread, and catastrophic cases of hunger or starvation should be described as famine. How extreme will be determined by the area, the duration, and the number of people affected, especially in terms of excess mortality.

CHARACTERISTICS OF STARVATION

Starvation is a severe reduction in vitamin, nutrient, and energy intake, and is the most extreme form of malnutrition. *Malnutrition* is a general term for the medical condition of a person or animal caused by an unbalanced diet—either too little or too much food, or a diet missing one or more important nutrients.

Most commonly, malnourished people or animals either do not have enough calories in their diet or are eating a diet that lacks protein, vitamins, or trace minerals. Medical problems arising from malnutrition are commonly referred to as deficiency diseases. Scurvy is a well-known and now-rare form of malnutrition, in which the victim lacks vitamin C.

Common forms of malnutrition include proteinenergy malnutrition (PEM) and micronutrient malnutrition. PEM refers to inadequate availability or absorption of energy and proteins in the body. Micronutrient malnutrition refers to inadequate availability of some essential nutrients, such as vitamins and trace elements, that are required by the body in small quantities. Micronutrient deficiencies lead to a variety of diseases and impair normal functioning of the body. Deficiency in micronutrients such as vitamin A reduces the capacity of the body to resist diseases. Deficiency in iron, iodine, and vitamin A is widely prevalent and represents a major public health challenge.

In humans, prolonged starvation (in excess of one to two months) causes permanent organ damage and may result in death. According to the Food and Agriculture Organization of the United Nations, more than 25,000 people living in Asia, Africa, and Latin America die of starvation every day, and more than 800 million people are chronically undernourished. On average, every five seconds a child dies from starvation.

Starved individuals lose substantial fat and muscle mass as the body turns to these tissues for energy. The

skin's pale and dry appearance attenuates this emaciation. Vitamin deficiency is common, often resulting in anemia, beriberi, pellagra, and scurvy. These diseases collectively may cause diarrhea, skin rashes, edema, and heart failure. Individuals are often irritable, fatigued, and lethargic as a result.

Starvation is usually treated by slowly increasing food intake until no nutrient deficiencies remain. By this time, the diet of a recovering individual should consist of 5,000 calories and twice the Recommended Dietary Allowance of nutrients.

CAUSES OF STARVATION

In order to make some sense of the relationship between the very high proportions of Third World populations seemingly at risk and the relatively low and declining death rates, one can think of life-threatening undernutrition as an acute and relatively infrequent phenomenon, generated by random or perhaps seasonal misfortunes, operating against a background of continuing risk factors. However, there are situations in which some kind of relatively sudden misfortune affects a large number of people or households at the same time or cumulatively over a short period.

This might happen because of one or a sequence of harvest failures, or because of a natural disaster such as flooding or earth movements that destroy food stocks and disrupt both food production and employment. The scale of this might be beyond the level at which existing networks of mutual support and self-help, through selling possessions, borrowing, calling in debts, temporary migration, and so on, are adequate to prevent starvation.

At a certain point in this rising tide of distress and failure to cope, the process becomes self-reinforcing. Because remaining food stocks are hoarded and not sold, prices begin to rise—except for livestock that, by contrast, can become almost valueless. Normal social obligations are ignored and public institutions for relief cease to function; large numbers of people abandon their land and homes and begin to move in search of relief; deaths from starvation begin to rise and this further damages both the cohesion and viability of households and then the functioning of public services and social organizations.

There are many variants of this process of the genesis of famine, depending on the normal prefamine patterns of living, the extent to which people and social institutions have strong traditions of response based on past experience, and, in more recent times, the extent to

which external assistance is mobilized in time to prevent or ameliorate the effects of social disruption.

However, history and paleo-anthropology suggest that in the past humankind has always made use of a range of mechanisms, physiological and/or behavioral in character, which provide a "feedback" link, whereby the current density of a population influences the subsequent reproductive performance of individual members.

This results in populations that regulate themselves at levels that are always somewhat below the maximum that existing food supplies could sustain. Such self-regulated populations tend to vary in size more or less in parallel with food supplies, but do not seem to be limited by food in the short term; the observation that there are more animals where there is more food is commonplace, but examples of starvation are much more rare. This self-regulating strategy does not prevent the kind of famines that are the result of external or perhaps random processes.

People abandon their land and homes and begin to move in search of relief.

However, it does prevent them from being repeatedly and regularly caused by a population simply outgrowing the capacity of its own environment to provide a level of food energy that is sustainable in the long term. The reason why self-regulation of numbers is likely to be an inherited characteristic of large-bodied species is that those that lacked such mechanisms would be likely to damage their own ecological niche so severely that numbers could not regenerate in time to save them from extinction.

Thus, if population size is not kept in balance with resources through variation in the stream of births, then the only alternative is variation in the stream of deaths. If the balance of births and deaths over the long run is such that the ratio of population to resources falls bellow a minimum determined by the necessities of life, then mortality will increase to right that balance. The normal level of mortality could be balanced with fertility, either through widespread starvation or through an increased susceptibility to infectious disease among the malnourished. On the other hand, there could be mortality crises because of a sudden scarcity of resources that accounted for exceptional losses. Excluding periods of crisis mortality, neither the high death rates of the past nor the comparatively high death

rates of some contemporary countries can confidently be attributed to widespread starvation. It must be pointed out that even if many of the deaths in a famine period were due to disease rather than to outright starvation, the sudden rise in death rates was sometimes associated with an abrupt fall in the availability of food to some, whatever the causes of this scarcity.

WAYS OF DEALING WITH STARVATION

There are some ways by which starving people may return to the prestarvation state, including invention of new or improvement of available sources of food, acquisition by peaceful means of necessary foods from other groups, emigration of the population from the region of famine to one where there is food, and war and the forceful requisition of supplies from the well-fed groups by the starving people.

Another method is redistribution of essential foods and of the riches that are found within the group by means of unsystematic acquisition in a criminal way from the well-fed people by the hungry, massive, and to some extent organized attacks by the hungry people upon the satiated, who are seen as the holders of "food storages" and the equivalents (by way of revolts, insurrections, and revolutions). This can also take place through interference by the authorities of a given group who conducts the redistribution from above, and consequent changes in the economic-nutritional organization of the society; or through voluntary contributions by the satiated people of a part of the nutritive essentials to the hungry, either as gifts or for corresponding services (charity, foreign aid, or private agreement between the satiated and the hungry on certain conditions, which often leads to the enslavement of the latter).

Stigmatization

STIGMA IS A widely used term that connotes a less desired or devalued status. Numerous definitions of stigma exist and many publications over the past decade have attempted to clarify or enhance the definition of stigma. The concept of stigma gained popularity with the publication of Erving Goffman's (1963) classic work, Stigma: Notes on the Management of Spoiled Identity and reference to stigma as an "attribute that is deeply discrediting," causing the individual to become "tainted" and "discounted." Most definitions of stigma reference an attribute (label) and social perceptions and beliefs about the attribute (stereotypes). It is not the attribute itself that produces stigma, according to C.I. Waxman, but rather the social perception of the attribute that determines the stigma. Stigma arises "from social interactions between those who acquire potentially discrediting conditions and the individuals with whom they interact," as phrased by S.C. Ainlay et al. Stereotypes develop from negative beliefs and characterizations that may apply to some individuals and are generalized to all individuals in a given category.

A definition of stigma based on solely labeling and stereotyping is not sufficiently comprehensive. In fact, with such a definition, lawyers, accountants, or artists could then be viewed as stigmatized groups, theorize B.G. Link and J.C. Phelan. Thus, an expanded definition of stigma is needed to capture the full nature of the stigma experience. Stigma, according to Link and Phelan, is the convergence of labeling, stereotyping, separation, status loss, and discrimination together in a power situation. In their description of the stigma process, human differences are initially labeled, and dominant-culture beliefs associate labeled individuals with negative stereotypes.

Separation occurs when the label creates an "us" and "them" or in-group and out-group phenomenon. Status loss and discrimination, although not commonly included in the definition of stigma, are part of the meaning of stigma and the known outcomes that occur when individuals and groups are devalued and discounted. This definition describes the multilayered experience of stigma.

Included in the definition by Link and Phelan is the acknowledgment that stigma involves power. Power differences are often not considered in situations involving stigma but are essential for stigma to occur. An extreme example of power differences is the Nazi power that stigmatized Jewish people. Stigma involves power in day-to-day situations when individuals who control ca-

reers and housing, for example, stigmatize certain powerless groups.

CATEGORIES OF STIGMA

Stigma is generally regarded as a social construct or label given by society. Stigma is "bound by culture, time, and society," according to Ainlay. Circumstances associated with stigma reflect values and beliefs of a culture. Societies have beliefs about the degree to which specific attributes are desirable or undesirable. Attributes frequently regarded as stigmatizing in current literature include mental illness, HIV/AIDS, epilepsy, addictions, homosexuality, some cancers (e.g., lung cancer), leprosy, and welfare status.

The stigma of poverty involves relegating those in poverty to being undesirable.

Although a myriad of circumstances have been associated with stigma, general categories of stigmatizing attributes have been recognized. Goffman, in his classic book on stigma, described three categories of stigmatizing attributes: physical stigma (such as deformities), tribal stigma (such as race and religion), and deviations of individual character (such as unemployment, alcoholism, and mental disorder). The stigma of poverty does not fit neatly into any one of these categories, but rather can be part of several categories, as noted by Waxman.

The stigma of poverty has fit into a tribal stigma (or group stigma) especially in recent decades, with many people associating welfare with African Americans. Although this association is not accurate, it continues to persist. The stigma of poverty can also fit into the category of deviations of the individual with reference to unemployment, status as a welfare recipient, and in combination with other attributes. In many cases, stigma involves combined attributes such as poor disabled individuals, individuals with mental illness and poverty, and persons who are poor and use illegal drugs.

The stigma of poverty involves relegating those in poverty to a status of being undesirable and undesirably marked. Terms such as *underclass* and *welfare-dependent* are considered by many people in poverty to be stigmatizing. A qualitative study of people living in poverty by K. Underlid identified perceptions of devaluation. Individuals were conscious of prevailing views of "the poor" as worthless, stupid, troubled, or lazy, to name a

few descriptors. One respondent stated, "You hear people say 'there they go, off to the welfare office for handouts; They're just milking the system."

CONSEQUENCES OF STIGMA

Stigma is a powerful and insidious process that limits opportunities for those stigmatized in numerous farreaching ways. Discrimination and poor treatment in the areas of earnings, education, healthcare, housing, and earnings are potential consequences of labeling and stereotyping, note B. Major and L.T. O'Brien. Discriminatory practices may include, for example, refusing to rent to an individual or not treating healthcare needs equally.

Social rejection and isolation are common ways that nonstigmatized people respond to stigmatized people. Rejection and exclusion can range from overt forms (like segregation) to more subtle actions (such as being treated as if not present, not consulted in decision-making, distancing). Isolation resulting from the stigma of poverty limits access to material needs as well as cultural riches. One's social self and self-identification are developed from the society and its culture, and it is only when the person is part of society that the normative system and values can be internalized. Although stigmatized persons are aware of the normative system, they lack the in-group ownership of values and norms.

Internalized stigmas are a major effect of stigma. The internalized stigma process involves taking in negative societal beliefs and expectations. According to Waxman, for individuals on welfare, for example, society may view the need for such service "as sufficient evidence that the individual is morally defective, not to be trusted, and should be constrained in some way by society." Negative feelings and beliefs that individuals then hold affect behavior and further action. A participant attending a Coalition Against Poverty workshop described feeling "like an onion and gradually every skin is peeled off you and there's nothing left. All your self-esteem and how you feel about yourself is gone you're left feeling like nothing and then your family feels like that." Such a process is extremely damaging because it becomes independent of external support. Stigmatized persons express feeling different from others and describe feelings of embarrassment, guilt, shame, denial, and fear. Clients living in poverty describe feeling "demoralized," a loss of self-esteem, having broken dreams, and lots of self-criticism.

A profound sense of powerlessness permeates the stigma experience. A client at a meeting with a social se-

curity staff, for example, verbalized that she feels "it's them that have the power, and you sit there like ... something shriveled up on a chair."

Powerlessness is exemplified in passivity, dependence on others, uncertainty, hesitancy in planning, and doubt in performance. Powerlessness among stigmatized persons is further compounded by the lack of involvement in important roles.

Research by Major and O'Brien supports the finding that academic achievement is lower among stigmatized (versus nonstigmatized) groups, as measured by dropout rates, standardized test scores, likelihood of earning a Bachelor's degree, and percentage of public education money received. Reasons for differences in achievement are multifactorial, with discrimination often cited as a contributing factor. Lowered expectations and limited support for the stigmatized person's hopes and aspirations can further limit achievement. Stigma affects health, as stigmatized groups have been shown to be at greater risk for health problems. The effects of stigma have been shown to be barriers to seeking treatment.

Stigma research in the social sciences has grown dramatically over the past several decades, especially in the area of cognitive processing of stigma, according to Link and Phelan. The effects of stigma are powerful and pervasive in all cultures.

Stigma has been referred to as a "social death" in that it results in almost complete social rejection and avoidance. Understanding the process of stigma is important in developing approaches to change stigmatizing circumstances.

Street Children

THE UNITED NATIONS defines a street child as any girl or boy for whom the street (in the widest sense of the word, including unoccupied dwellings and wastelands, etc.) has become his or her habitual abode and/or source of livelihood, and who is inadequately protected, supervised, or directed by responsible adults.

Further, street children are categorized by the United Nations in four different ways: 1) those who spend part of the day on the street working to earn money for their family, 2) those who return home following a number of days on the street, 3) those who return home only on the weekends, and 4) those who spend their entire lives on the streets and who may travel home on occasion. Studies of street children indicate that once children spend time on the street, they tend to stay longer in that environment despite its general harshness. In addition, if there is no attempt on the part of their family to retrieve street children, they may separate themselves from their parents and become even more remote from their original home and community.

The general impression of street children is that they are criminals and represent a menace to society. Street children are in many ways feared by society simply because they are impoverished and disconnected from their homes. The organization Human Rights Watch has researched and published extensively on the theme of street children. It points out in its documents that governments worldwide subject street children to physical abuse and even murder by police. Ironically, they are considered to be a danger to society rather than children needing protection.

Common social ills associated with street children include poverty, HIV/AIDS, lack of education or interrupted schooling, disintegrated families, and substance abuse. Children living on their own without help are particularly prone to abuse and have little if any opportunity to claim their rights.

A United Nations UNICEF estimate in 2002 of the number of street children worldwide was 100 million. Not surprisingly, the majority of them reside in countries in the developing world. Latin America was the leading region in that year, with 40 million street children. Asia and Africa followed, with 30 million and 10 million respectively.

Perhaps the only bright spot in this dire scenario is the work of a number of nongovernmental organizations (NGOs), including some religious groups that are actively try to help these children. Their ability to assist in remedying the conditions in which street children exist is limited by finances and, in many instances, by the opposition of the very governments that should be helping the children. Governmental oppression of street children is common, and either outright neglect or stern institutionalization of the children seems to be the most common governmental response to the social problem.

The plight of street children worldwide is in stark contrast to the pronouncements of the Convention on Human Rights of the Child, published in 1990. The 1990 *Declaration of the Rights of Children*, an expansive and comprehensive document, provided detailed information in 54 articles to legally assist governmental organizations in the improvement of living conditions for children and to ensure that their rights were recognized and protected.

In 2002, the United Nations Special Session on Children was held for the purpose of reviewing the achievement of the goals stated in the 1990 declaration. The conclusions reached in 2002 were not positive. The 1990 declaration stated that "the well being of children requires political action at the highest level. We are determined to take that action." It would appear that only minimal progress has been made in challenging and eradicating the plight of street children.

Mexico has serious economic problems that have led to an increase in the number of street children. In 2002, 40 percent of the Mexican population lived below the established poverty line. Many families live in such abject poverty that their children are forced to work on the streets in order to augment the meager family income. A major reason for the increase in the number of Mexicans crossing illegally into the United States is the state of the economic system in Mexico. When Mexican individuals and families attempt to make the crossing, their children are often left behind, which adds to the number of children on the streets.

Colombia has experienced an enormous displacement of people in the two years from 2003 to 2005. In that period, more than three million people were forced to relocate because of the armed conflict in the country. More than half of those displaced were children under 18 years of age. In Morocco, thousands of girls working as domestics have faced both physical and psychological abuse and economic exploitation.

Surprisingly, Moroccan law denies even basic labor rights to child workers and the employers who abuse the children are rarely brought to justice. *Favelas*, or slum areas, surround Brazil's major cities. Most of the street children living in that country come from the

favelas where social conditions are so dire that the street is perceived as being a better place. With the favela or the street as their only choices, these children are truly living in a no-win situation: the favela offers no real opportunities for living a healthy life, and the street, as insidious as it is, has become a viable alternative.

Organizations in Africa such as Catholic Action for Street Children and Street Child Africa are working toward eradicating the dire conditions experienced by street children. Street Child Africa is a member of the 2005 Make Poverty History initiative, a movement to convince the G-8 countries to provide vastly increased financial aid to countries in the developing world. Street children are not restricted to countries in the developing world.

In 2005, Hollygrove Home in Los Angeles, a refuge for homeless children for over 125 years, closed its doors permanently. The closing reflected current thinking about homeless children, which suggests that it is better for children not to be institutionalized but to be placed in foster homes or the homes of relatives. Hollygrove was a stable environment. It remains to be seen if the relocation of its children to foster care or to live with relatives will succeed or eventually add to the number of street children in that west coast metropolis and other cities.

Structural Dependency

STRUCTURAL dependency, also known as dependency theory, is a method of analyzing and understanding the international economy that stresses the differences between the powerful central nations of the core and the largely powerless and impoverished na-

tions of the periphery. The idea developed in the 1960s and drew upon Marxist thought. It was given its perhaps most forceful expression by Theotonio Dos Santos, "Underdevelopment, far from constituting a state of backwardness prior to capitalism, is rather a consequence of and a particular form of capitalist development known as dependent capitalism." In other words, "backwardness" is not a fault of an individual nation or the people in it or even a temporary phenomenon that can be overcome through the use of foreign aid or development but is, instead, an inevitable process caused by capitalism. Hence, foreign aid is of little value and may even be counterproductive in covering up the need for radical change.

The economies of peripheral nations are frequently characterized by extensive reliance upon primary commodities and the extraction of natural resources. These products are sold at low prices in international markets controlled by core nations and are used as inputs in manufacturing processes, which then see manufactured exports sold in peripheral nations at inflated costs.

Core nations use their political and military power to regulate these forms of exchange and are linked to elites within peripheral nations who work according to their own class-based interests, rather than national interests, by ensuring that suppressed classes in peripheral nations are unable to obtain means by which the status quo may be challenged. This is achieved through working with multinational companies to restrict profits from resource extraction to within the elite and with the arms industry to obtain the means to suppress the mass of people.

Structural dependency is an important theme in the works of, among others, Andre Gunder Frank, Raul Prebisch, and Immanuel Wallerstein. Pope John Paul II, in an encyclical letter, also expressed sentiments that are very similar in nature and told from a moral and equity standpoint. Structural dependency is vulnerable to the charge that it cannot explain the change in status of, for example, the East Asian Tigers (South Korea, Hong Kong, Taiwan, and Singapore) in moving from the periphery to the core. It is also perhaps an unnecessarily pessimistic view that gives little credence to the possibility that less developed countries could, by virtue of better resource management, democratization, and diligence, improve their own lot. Nevertheless, structural dependency remains an important stream of thought in development studies.

JOHN WALSH SHINAWATRA UNIVERSITY

Structuralist School

THE STRUCTURALIST school emerged in the late 1940s, and reached its heyday in the 1950s and 1960s, as a school of thought that addressed the problems of development in the Third World, putting itself in the Marxist tradition and against the neoclassical theory. Its focus has been mainly on Latin American countries, although it was later embraced to tackle underdevelopment in African and far east Asian countries as well. The founder of the structuralist school is considered to be the Argentinean economist Raul Prebisch. He was the director of the Economic Commission for Latin America (ECLA), founded in 1948, which can be seen as the economic organization where structuralist theory was developed. Other main exponents of the school are the Brazilian economist Celso Furtado, the Germanborn Hans Singer, the Chilean economist Osvaldo Sunkel, and the English economist Dudley Seers.

The structuralist analysis starts by observing that underdevelopment does not depend on lack of savings and of capital accumulation, as maintained by the neoclassical theory. Rather, it depends on the combination of lack of inducement to invest and lack of foreign exchange, which are determined by structural characteristics of underdeveloped economies. The main aim of the theory is then to identify the structural characteristics that prevent countries to develop and, as a consequence, to recommend policies apt to change them. The key features of the structuralist approach to development theory can be paraphrased from D. Hunt, as follows.

Economic growth does not imply economic development, as reiterated by C. Furtado. Economic development requires not only an increase in output, but

also a change in the sectoral composition of output: there must be an expansion in the number of industries that use advanced technologies, so that labor productivity will be maximized.

Underdevelopment is the result of the historical process of incorporating underdeveloped countries into the world economy. In the international economic context, the role of underdeveloped countries (UDCs) is that of suppliers of raw materials and of markets for mass-produced goods. The path toward development previously followed by advanced countries cannot be replicated because of the position of UDCs in the current international economy: advanced countries have never been underdeveloped, but rather undeveloped—they did not have to compete with other advanced countries once industrialized.

As a consequence, underdeveloped economies are characterized by a dualistic structure: a traditional agricultural sector and a modern sector, owned by foreign capital and with a high degree of openness, which imports capital goods and produces primary products for export.

Devaluation not only would not solve the problem, it would exacerbate it.

Development cannot be sustained externally: a necessary condition to create development is for underdeveloped countries to generate their own growth dynamic. Export production must generate sufficient internal demand to induce a process of sustained investment.

Inflationary pressure and balance-of-payments (BOP) crises do not depend on easy monetary policy, as maintained by the monetarist theory. They are rather the results of economic structures of underdeveloped economies: inflationary pressures are mainly due to low internal elasticity of supply, and BOP crises are often the result of low external income elasticity of demand for primary products combined with low internal price elasticities of supply and demand for primary and manufactured goods. The role of the government is fundamental to achieve the structural transformations necessary for development. It must give incentives for both the implementation of import substitution policies and the creation of a common market among underdeveloped countries.

The structuralist school always had a policy-oriented approach to development. Structuralists identify

the key role played by the international economic context when producing their policy recommendations. More precisely, they maintain that there exist two main potential constraints on development: the long-run trend of the terms of trade, and the BOP disequilibria. According to Prebisch, as quoted by J. Love, the theory of comparative advantage does not hold. One prediction of such a theory would be that, if productivity goes up in the manufacturing sector, then the price would go down and the terms of trade for primary products would improve. This does not happen because wages and prices are downwardly rigid in the manufacturing countries because of unionization.

In this way, advanced economies are able not only to keep their productivity gains but also to reap the benefits of UDCs' productivity gains. The policy recommendation of the structuralists to UDCs is then to industrialize. In order to do so, a country requires needs to expand its modern sector. However, the expansion of the modern sector requires a short-run increase in imports. This, in turn, implies a crisis in the BOP of that country, imposing a second constraint on development. To overcome the BOP deterioration, the monetarist recommendation would be devaluation. According to the structuralist school, devaluation not only would not solve the problem, it would exacerbate it.

Indeed, the BOP would further deteriorate for three main reasons: first, underdeveloped countries are likely to have low price elasticities of demand for imports and exports, if their sum is less than one, then a devaluation would worsen that country's balance of trade; second, if export production is owned by foreign firms and if there is any constraint on expanding exports in the short-term, then the only effect of devaluation would be to raise the domestic price of exports, which in turn would be imply higher profits for the foreign firms that are likely to be remitted abroad; third, devaluation will raise the domestic price of imports, which is mainly going to affect the most capital-intensive sectors. The main policy recommendations for countries that want to reach economic development via industrialization are then:

- 1) To increase wages, as a consequence of greater productivity, in order to sustain demand even at early stages of industrialization.
- 2) To use taxation to drive away demand from goods with a high import content.
- 3) To tackle inflationary pressure in the short run not by restricting the money supply, as recommended by monetarists, which would slow down investment in the crucial initial stage of industrialization, but rather

by foreign borrowing. In the long run, inflation will be eased down as a consequence of structural changes.

4) To tackle BOP crises, in the short and medium term, by cutting nonessential imports, expanding primary exports, investing in import-substituting sectors, and promoting common markets among UDCs with the help of advanced countries in terms of countercyclical policies, reduction of protectionism, and foreign direct investment. In the long run, structural changes will diminish the importance of imports.

The structuralist school had a strong influence on development policies implemented in Latin America. The creation of the Latin America Free Trade Agreement (LAFTA) and Brazil's national development planning in the 1950s are two examples of the important role played by the structuralist theory in development policies.

In the 1960s, it also influenced economic planning in African countries, such as Ghana, Uganda, and Tanganyika. The structuralist theory has been criticized on various grounds. Following D. Hunt, we can identify four main grounds of criticism:

Methodological and empirical foundations of the analysis of empirical terms of trade: the structuralist argument of the secular deterioration of the terms of trade for the less developed countries has been criticized both for empirical inaccuracy, that is, mainly for the use of imprecise proxy variables, misleading data aggregation, and the sensitivity of results to the selection of the base year, which is also noted by G. Meier; and for conceptual errors, that is, the use of trends only in the commodity terms of trade to examine the gains from trade without any further analysis of the country's factoral terms of trade, that is, commodity terms of trade corrected for changes in productivity in export-producing sectors.

Conceptual and logical validity of the theoretical approach: criticisms focused mainly on the argument of a foreign exchange constraint to growth—it actually amounts to a savings constraint, as shown by V. Joshi—on the theories of inflation and balance of payments crises—the monetarist argument—and on the custom union argument—the welfare costs are likely to outweigh the benefits, which is also discussed by R. Lipsey.

The efficient cost of the import-substitution strategy: an import-substitution policy implies dramatic distortions in sectoral allocation.

Errors of omission: the structuralist theory has been criticized by neo-Marxists on the grounds that its policies represent only superficial reforms, since full capitalist development of the periphery is impossible without a revolutionary transformation of the political and economic power.

Following the stagnation and the increasing inequalities of the mid-1960s, the structuralist theory began to lose its appeal. It came under strong criticism under two different perspectives: neoclassical and monetarist economists criticized it because it interfered with the market mechanism, and neo-Marxists criticized it because of its inability to examine the class logic of the economic situation. However, the structuralist approach continued to influence development economists and gave rise to two alternative approaches to development, which influenced much of development policy in the 1970s: the dependency theory and the basic needs paradigm.

Students Against Sweatshops

UNITED STUDENTS against Sweatshops (USAS) is an international organization of student organizations at both the campus and the individual level, dedicated to improving labor rights and ending sweatshop conditions. The sweatshop is defined quite broadly as being any workplace in which people are required to work for very low wages in poor or unsafe conditions. Nevertheless, the term is most commonly encountered in reference to the apparel industry.

USAS has campaigned to ensure that the universities they attend adhere to the same high principles and standards that the student members support. This is

founded on three core programs: the Sweat-Free Campus Campaign, the Ethical Contracting Campaign, and the Campus Living Wage Campaign. These are pursued with the application of four principles: "We work in solidarity with working people's struggles. We struggle against racism, sexism, homophobia, classism, and other forms of oppression within our society, within our organizations, and within ourselves. We are working in coalition to build a grassroots student movement that challenges corporate power and that fights for economic justice. We strive to act democratically."

The origin of USAS shows the growing importance of information technology, especially the internet, in locating and disseminating information rapidly across large geographical distances, as well as the increase in the power of consumer activism. Concerned students became aware of the practices of some multinational clothing companies in locating factories overseas and filling them with low-wage labor. This was not a new phenomenon, but the technology enabled news of these activities to spread to the customers of the developed world and then to other interested people. The personal reports from workers proved to be particularly persuasive.

In 1998, student delegates from 30 different educational institutions met in New York to establish USAS, which then had two main goals: "1) to provide coordination and communication between the many campus campaigns and 2) to coordinate student participation and action around the national, intercollegiate debate around Codes of Conduct and monitoring systems." The campaign then spread very rapidly to more than 100 institutions and evolved into its current form.

University merchandising of clothing with official logos added is a market worth approximately \$2.5 billion per year, and most university executives were mindful of this stream of revenue when students began to demand transparency in the sourcing of these products and guarantees of good practice in their production. Sit-ins and protests led to some arrests and fines, but in terms of causing universities to change their corporate sourcing practices they must be considered a qualified success. Further, a number of very well-known branded clothing corporations have become much more open about their labor practices.

USAS is led by a committee of 13 students elected by the entire membership of the network. Part-time regional organizers coordinate activities across North America, and the USAS accepts donations to support its activities. Although interest in partisan politics among young people seems to be at a low ebb, singleissue politics still excites and stimulates widespread participation in the political process.

Subemployment

THE TERM SUBEMPLOYMENT is used in several different ways. First, measures of unemployment do not always fully capture poverty issues concerned with the condition. There are, for example, occasions when people are not fully employed or not employed at a level of compensation sufficient to keep them out of poverty, or when employment for some is not sufficient to provide a necessary level of income for all members of the workers' households. In circumstances such as these, the concept of subemployment has been suggested.

This would entail the creation of new measurement systems to give a better understanding of low-income statistics. Inevitably, since it will show higher levels of need, governments are wary of suddenly introducing subemployment measures because of possible loss of public support and increase in liability. The reported rate of subemployment might, in developed countries, represent three, four, or more times the unemployment rate.

Second, some writers would also include within the subemployed those who are not working but who are not actively seeking employment. This would include not just those people whose unemployment is frictional—that is, they are in a process of transition (such as moving from one location or profession to another, or moving onto or off of a government training scheme), but also those not wishing to work for various reasons. Such categories are extremely difficult to measure effectively.

The actual proportion of people who would be included in a subemployment category is very difficult to establish because the criteria to be used are not clear, and because resources are scarce to conduct the appropriate research, especially in developing countries. Further, the categories in which people might fall are subject to rapid and unpredictable transition. For example, people living in small, rural villages in developing countries may use a motorcycle to travel to a local town on days or afternoons when agricultural duties are not pressing to search for casual wage labor. During periods when sufficient day labor is available, poverty is avoided, but not so when work is scarce.

Underemployment is endemic in many agricultural societies and among petty or family retailers. Family members are called upon to assist on a seasonal basis, but otherwise continue with education or other duties in other times. These situations can prove resilient in the event of external shocks. For example, during the East Asian Financial Crisis of 1997, many of those affected in Thailand by job loss in factories in urban areas were able to mitigate the worst effects of unemployment by returning to familial homes and undertaking casual agricultural or other forms of part-time work. More developed societies no longer have this capability, as the agricultural sector has become comparatively small and highly productive. The destruction of the coal industry in Britain, for example, led to structural unemployment in communities with very few alternative employment opportunities.

An additional use of the concept of subemployment is in terms of the state economy's ability to provide sufficient amounts of genuine employment opportunities for all those people in the economy who wish or need to avail themselves of them. Capitalism, according to the eminent economist Joseph Schumpeter, employs "creative destruction" in introducing new products to the market. In other words, people involved in creating outmoded goods and services lose their jobs and must seek alternative forms of work. The degree of responsibility imposed on the individual visà-vis the state for seeking out, relocating to, and preparing for new jobs varies from society to society.

Welfare states such as those of western mainland Europe and Japan, for example, redistribute tax income to governmental employment departments so that they assist in advisory and retraining services for affected workers. In noncapitalist societies, different methods are used to combat subemployment. The communist regimes of China and the former Soviet Union guaranteed employment for all members of the labor market,

even if that meant an inadequate level of meaningful work. However, few states have the necessary infrastructure to manage this level of organization and, even in China where employment was allocated by the state rather than chosen, the practice is gradually being eliminated. Government organizations in China provide pensions to former workers. Loss of this "iron rice bowl" would lead to destitution for those affected, and so progress is necessarily cautious.

When day labor is available, poverty is avoided, but not so when work is scarce.

Predatory state regimes may seek to restrict employment opportunities among ethnic or regional groups in order to limit the amount of economic and political power such constituencies are able to deploy. The divide-and-rule policy of the British Empire used this principle and helped cause inequities and bitterness that have lasted generations.

Subjective Measures of Poverty

POVERTY IS CUSTOMARILY defined as a lack of needed resources, principally food and those leading to safety. Most researchers would ideally wish to measure poverty objectively, according to some internationally recognized set of criteria. The most well-known are incomes of more or less than \$1 or \$2 (purchasing power parity) per day. In the United States, the 2003 poverty threshold for a three-person family with one child was \$14,810 per annum. However, objective measures are not always relevant. Poverty can exist in developed countries but very rarely in terms of the kind of ab-

solute poverty that can lead to threat of starvation. One approach to measuring relative forms of poverty would be to consider poverty in this case to consist of a threshold of income, which would be a fraction of the national mean, or median, income. Another approach is to ask individuals directly whether they consider themselves to be poor, and how they determine what poverty is. Subjective measures such as this tend to focus on an ability to access social and economic opportunities and comparisons with peer groups. Some might define themselves as poor because of lack of a television or as being on the wrong side of the digital divide. Analysis following these lines tends to arouse public criticism, which is often mingled with contempt for people who are deemed to be part of the improvident poor.

Subjective measures are also appropriate in field-work in societies about which comparatively little is known, and in which conventional patterns of understanding poverty may be inappropriate. For example, many developing societies have intricate family and neighborhood networks that can be used to mitigate sudden shortages of food or other items that might not be captured by rigidly conceived objective criteria. However, young men in those same societies might feel impoverished if they were unable to assemble the goods necessary for a dowry, and hence could not marry. In cases such as this, employing subjective criteria is simply good research practice. It is usually possible, in any case, subsequently to formalize subjective criteria into objective measures.

More generally, as income levels rise, societies are becoming more interested in subjective measures of personal satisfaction and self-realization. This has helped shape the debate about suitable measures of poverty by suggesting that, once certain thresholds are reached, other measures of well-being become more important. These include such issues as personal dignity, achievement, and self-esteem. They also include freedom from stress or anxiety caused by financial or housing issues, and other value judgments that are very difficult to assess accurately. In sharply unequal societies, lifting people out of poverty simply by providing income is a necessary, but not sufficient, aspect.

Subsistence

SUBSISTENCE IS THE CONDITION of living on foodstuffs or other resources that are taken from nature in small quantities that provide at most a bare living or perhaps a living sufficient for good health and a surplus for trading. Anthropologists use the term *subsistence* patterns to describe the sources and methods a society uses to get food and other necessities.

In the earliest ages of human existence all the people of the earth lived by hunting and gathering. Anthropologists have come to call this method of subsistence foraging. Foraging as a manner of living often provided food to eat in abundance when the hunting and gathering were good, but at times meant hunger and starvation when hunting failed. Shelter needs were also usually minimal, with brush shelters or caves being the most reliable places to find relief from the elements of the weather.

In human development, the domestication of animals led to a pastoral style of life, with people using or perhaps herding animals. The search for good grazing promoted a nomadic way of life. With the development of agriculture around 12,000 years ago, along with domestication of animals, the lifestyles of humans began to improve. Today agriculture and fishing are enormous businesses that produce food in abundance. Food is distributed through stores, restaurants, and other outlets.

The development of agriculture in the river valleys of the Nile, Mesopotamia, Indus, Yellow, and others permitted the development of cities and of civilization. Agricultural surpluses allowed some people to devote their energies to something other than food production. Today there are millions of subsistence farmers supporting families with the food that their small plot

will grow. This mode of agriculture is very dependent for its success in sustaining a family upon the climate, soil conditions, agricultural practices, and the types of crops grown. Usually everything is consumed by the family working the subsistence plot. To produce more or to produce a cash crop that they will not consume but will sell for cash is unlikely. Usually their plot is too small for conversion to a cash crop economy and they are usually too remote from markets where their cash crop could be sold.

There are whole countries in Africa and elsewhere that are dependent upon subsistence agriculture. In Chad, Gambia, Eritrea, and Benin subsistence agriculture is the main source of income for the whole country and in some cases the only source.

In addition to subsistence farmers, there are still peoples around the world—some of whom are no-madic and some settled, in countries such as India, Brazil, or in much of Africa—who live a subsistence lifestyle of hunting and gathering.

For example the Bisa people of the Luangwa Valley in central Zambia still engage in hunting as it has been traditionally practiced by their ancestors. Many bushmen still hunt primarily for a living in the arid regions of southern Africa. People living a traditional, subsistence, hunter-gatherer lifestyle can be found in locations from the tropics to the Arctic.

There are also nomadic pastoralists, especially in the deserts or arid zones of Africa and Asia, who are living a traditional herding lifestyle. Some of the desert herders are in the cold deserts of the Arctic, such as the Lapland people.

PROGRESS AND TRADITION

The lifestyles of the traditional subsistence people are often in conflict with more modern or technologically advanced ways of extracting a living from nature. For example the Gwich'in, an indigenous people in the southern part of the Arctic National Wildlife Refuge (ANWAR) in Alaska, are at great odds with the Inupiat Eskimo people on the Arctic Sea coast at the northern end of the ANWAR area. The Gwich'in are a militantly traditionalist people who want to preserve their traditional subsistence lifestyle. The Inupiat want to have oil exploration and drilling for the jobs and revenues that it will bring.

The government of the United States has, by treaty with various Native American tribes and others, provided for fishing by traditional methods. In addition it is promoting in a variety of ways optimum levels of fishing stocks for subsistence fishing, as well as commercial and sport fishing. In addition to the traditional peoples who live by the practice of hunting and gathering skills handed down from ancient times, there are millions of people who are subsisting on the little they get from the farming, hunting, fishing, or trading they are able to do. Numbering in the hundreds of millions, some are also welfare recipients living in cities.

As the Industrial Revolution was developing at the end of the 18th century, a revolution in agriculture was also developing. In the 20th century, great advances in fertilizers, seeds, feeds, genetic breeding of livestock, medicines, and many other features of modern agriculture led to great increases in intensive agricultural production. The results are such that whereas it took four or five farmers to produce enough food in 1800 to feed an additional nonfarming person, by 2000 one farmer could produce enough food to feed over 200 additional people.

At least one billion people are still in a bare subsistence condition.

The intensive use of agriculture has allowed a great expansion of the earth's population. However, the distribution of food stocks is uneven, usually for political or economic reasons. The result has been that at least one billion people are still in a bare subsistence condition.

Subsistence is the basic food allowance that is needed to preserve life in a fit and healthy condition. The military has historically been very interested in calculating the rations needed to feed troops in the field or sailors on long voyages.

Napoleon is famous for the saying that "an army travels on its stomach." Food supplies or the lack thereof can seriously affect the morale, esprit de corps, discipline, and physical condition of an army. The same is true of people in poverty, who may be reduced to a bare subsistence whereby their caloric intake is enough to preserve life but insufficient to provide the energy needed for creative thinking and work.

From the earliest history of the U.S. Army, Congress was interested in the caloric intake of troops in the field. This interest has been continued even into the age of flight. For example airplane crews are at risk if they fly at less than peak physical condition. This makes it necessary that palatable nutritious food be available. Otherwise the crews will be more susceptible to fatigue.

Historically, enlisted personnel were given a "basic allowance for subsistence" (BAS). This included room as well as board. The BAS is part of the cost of maintaining a military force.

There are movements in the world today that advocate and practice a subsistence lifestyle. People in these types of subsistence movements see globalization of the industrial market economy as a cause of growing world poverty. They advocate a return to older, simpler technologies. Advocates for the subsistence movement are drawn from a number of other movements, such as the women's liberation movement, the older cooperative movements, and other similar organizations. Advocates contend that subsistence food production and subsistence lifestyles will stop the unceasing drive for the accumulation of wealth that currently reigns in the capitalist economies. Instead advocates claim that the subsistence lifestyle will promote an increase in happiness, human dignity, and the quality of life.

SUBSISTENCE ADVOCACY

Advocates of the subsistence movement argue that it is the alternative to the sterilization of life and the violence endemic in the corporate-driven globalization of market and productive forces. They cite thousands of low-tech subsistence experiments with farming, herding, or cottage industry manufacturing that exist across many countries in the world.

In contrast there are some who advocate the use of coercive political policies to force peasants or people dependent upon subsistence lifestyles to abandon their subsistence labor food-producing norms for commercial labor norms. The use of coercion is presented as a way to force people to be free of imprisoning subsistence lifestyles. Others see the way an economy is organized, whether industrial or subsistence, as a political issue. Still others see it as a moral issue and use moral analysis to critique the foreign aid policies of the industrial countries.

Some governments use the idea of a subsistence level as a basic human right and a measure for subsidies or for the welfare of people in the society. In the Czech Republic, the Gypsies (Romany) have usually been on the margins of society. Recent measures have been taken to raise in their levels or subsistence levels through better jobs and other means.

The policy of a basic subsistence living can be found in the use by the Russian government of a subsistence standard for its children and pensioners. The subsistence standard is set by calculating a "consumer

basket" of goods and services and other basic expenditures that are necessary for a person to survive. In Russia this has been set at a level that exceeds the minimum wage.

In contrast the subsistence level in the Czech Republic was lowered in 2005 by the Czech government in order to use deprivation as a motivation for working. The Czech government's subsidies for the poor had been set at a level that many policymakers came to believe was too high because it left people with enough to live on without having to strive to make a living. The net effect was to subsidize the able-bodied.

In some countries, such as China, the subsistence allowance has been coupled with the minimum wage to subsidize those who work for low wages. The effect is to subsidize the income of those who are at the bottom of the rapidly growing economy.

Sudan

THE SUDAN, geographically the largest African nation, is a low-income, severely indebted nation with 40 percent of the people living below the national poverty

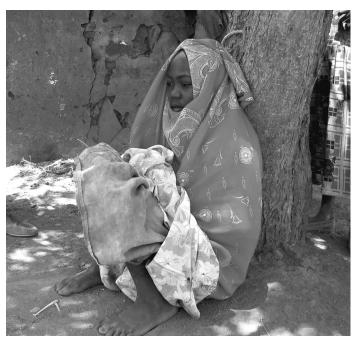

An aid worker seeks out displaced children in October 2004 in the Darfur region of Sudan. Darfur has an acute malnutrition level of 22 percent, a result of outbreaks of violence and threats to its already fragile existence.

line and 18.7 among the ranks of the unemployed. Approximately 31 percent of all Sudanese are malnourished. Sudan was involved in civil war for most of the latter half of the 20th century. The causes of the war stemmed from attempts by the Muslim-dominated north to control the southern section, which is neither Arab nor Muslim.

While northern Sudan has not escaped poverty and disease, conditions are much worse among the southern Sudanese who have less access to available health and economic resources. The World Health Organization estimated that in 2005, more than two million people in southern Sudan needed food assistance. This need is most urgent in Darfur, which has an acute malnutrition level of 22 percent in response to outbreaks of violence and threats to its already fragile existence. Some 80 percent of the Sudanese population are involved in subsis-

tence agriculture, and Sudan suffers from periodic devastating droughts. The Sudanese survive on an annual average income of \$370. Data from the Sudan are often sketchy, particularly from the south.

Because of war, famine, and human rights abuses, some two million Sudanese have been killed and another four million displaced since 1983. On January 9, 2005, the opposing forces within Sudan signed a peace agreement. In an effort to improve the economy, the government is engaged in major reforms recommended by the International Monetary Fund (IMF), instituting new economic policies and infrastructure investments. Sudan began exporting crude oil in 1999, and long-term economic prospects appear more favorable. In the meantime, the government faces a formidable task. Since the World Bank refused to extend loans to the Sudanese government so long as war continued, Sudanese

A 9-year-old famine victim of the Darfur crisis in Sudan waits for aid from relief workers.

economic health is largely dependent on reestablishing relations with the World Bank and the IMF and with those in a position to extend financial aid to the country.

The Sudanese population of 40,187,486 has a life expectancy of 58.54 years and a median age of 18.07 years. Some 43.2 percent of the population are under the age of 14, and 2.4 percent are 65 or over. The people have a 27.6 percent of not surviving until the age of 40. The Sudan has a 2.3 percent HIV/AIDS prevalence rate. In 2001, it was estimated that 400,000 Sudanese were living with this disease, which had killed 23,000 others. All indications are that the epidemic is growing.

The World Health Organization estimates that 90 percent of the diseases that plague Sudan are contracted from infected water. At times during the war, up to 90 percent of the population lacked access to safe water. By 2005, 25 percent of the population still lacked access to safe water and 38 percent lacked access to proper sanitation. The lack of these basic services places the Sudanese at very high risk for contracting food- and waterborne diseases that are prevalent in Africa. In some areas, the population is at high risk for malaria, dengue fever, and sleeping sickness. Respiratory diseases are also common.

In 1995, the Carter Center of Emory University, founded by former president Jimmy Carter, negotiated a humanitarian cease-fire, which lasted for several

months, allowing health officials to treat thousands of cases of Guinea worm disease and river blindness and to train locals in preventing these debilitating diseases. The Carter Center also assisted in instituting a child-hood immunization program. In Sudan, there are only 16 physicians for every 100,000 residents, and half of the population lacks access to affordable essential drugs. Health centers are often inaccessible and may not be equipped to deal with the problems they face. Sudanese who choose to receive care at hospitals often incur debts they cannot pay. These debts may be passed down to children who are also unable to meet such obligations.

Childhood mortality in Sudan is one of the highest in the world because of extreme poverty and rampant disease. However, infant mortality has decreased in recent decades. In 1980, 104 infants died out of every 1,000 live births. By 2005, that number had declined to 62.5 deaths per 1,000. Between 1970 and 2003, mortality rates for children under the age of 5 plummeted from 172 to 93 deaths per 1,000. Childhood mortality rates continue to be higher in the non-Muslim south than in the Muslim-dominated north. Approximately 41 percent of all children under the age of 5 are malnourished, and 31 percent of all infants are born with low birth weight.

HEALTHCARE

Most Sudanese parents fail to practice measures to protect their children from preventable diseases. Among infants, 52 percent are not immunized against tuberculosis; 51 percent are not immunized against measles; and 40 percent are not immunized against DPT and polio. Half of all children between the ages of 12 and 23 months are not immunized against DPT3, and 43 percent are not immunized against measles. Even though families do not, as a rule, place their children under insect-treated nets to protect them, half of all children do receive antimalarial drugs. Around 87 percent of all children under the age of 5 do not receive essential oral rehydration therapy when they are ill.

As a whole, Sudanese women bear 4.85 children. That number has decreased since the 6.1-children-per woman fertility rate recorded for 1980. The adolescent fertility rate is 55 out of 1,000 births. Only seven percent of Sudanese women use contraceptive measures, and the prevalence of contraceptive use has declined over the past few years.

Sudanese maternal mortality is one of the highest in the world and has not decreased substantially since

Waiting for water in the Darfur region in Sudan: Because of war, famine, and human rights abuses, some two million Sudanese have been killed and another four million displaced since 1983.

1970. In 2000, maternal mortality was estimated at 590 deaths per 100,000 live births. Like infant mortality, maternal mortality is highest in the non-Muslim south. While trained medical staff now attend 86.3 percent of all births, 86 percent of Sudanese births occur at home away from emergency facilities.

Some 61.1 percent of the Sudanese population over the age of 15 can read and write. Males have a distinct advantage over females with a literacy rate of 71.8 percent as compared to 50.5 percent for females. Literacy rates have fluctuated over the past decades, and the drop in female literacy has been significant. In 1980, 50.1 percent of Sudanese males and 81.3 percent of females could read and write. Between 1990 and 2000, male literacy dropped from 40 percent to 30.8 percent, and female literacy decreased from 68.3 to 53.8 percent.

Most Sudanese children attend school for at least five years. Primary school completion rates improved from 1999 to 2002 as rates for males increased from 42 to 49 percent and rates for females rose from 39 to 45 percent. The years between 1990 and 1995 saw a drastic decrease in male primary school completion rates in response to the volatile political situation. In 1990, 99 percent of Sudanese males completed primary school. By 1995, that number had dropped to 46 percent. Female completion rates remained at 39 percent during that period. All educational levels experience a significant rate of absenteeism and dropouts.

Supplemental Security Income

SUPPLEMENTAL SECURITY Income (SSI) is a cash assistance program administered by the Social Security Administration in the United States. However, the program is separate from other Social Security programs because it is funded from general government revenues and has no connection to Social Security payroll taxes. Also, eligibility for SSI does not depend upon having any previous work history. Legislation creating SSI passed in 1972, and the program began paying benefits in 1974. SSI replaced a collection of programs providing benefits to different types of recipients that were administered by the states as prescribed by the Social Security Act of 1935 and its amendments in 1950.

SSI provides cash assistance to the "deserving poor," who are not expected to earn a suitable income compared to the general working-age population. These groups include the aged (65 and older), the blind, and the disabled. Blind and disabled children are also eligible for SSI benefits. With SSI, the federal government assumed control of preexisting programs that had been administered through grants to individual states.

In January 2005, the federal portion of the SSI benefit for individuals totaled \$579 per month, or \$6,948 per year. The corresponding amount for married couples was \$869 per month, or \$10,428 per year. These amounts are adjusted each year for inflation. If SSI were the only source of income, then both of these amounts would leave their recipients below the corresponding

poverty thresholds. But most state governments choose to augment federal SSI benefits, and only six states abstain (Arkansas, Georgia, Kansas, Mississippi, Tennessee, and West Virginia). State-funded additions can help to bring SSI recipients above the poverty threshold. In most states, eligibility for SSI also automatically qualifies a person for Medicaid and food stamps.

Eligibility for SSI requires passing a resource test and an income test, in addition to being aged, blind, or disabled. Singles cannot have countable resources worth more than \$2,000, and married couples have a \$3,000 limit. Countable resources include cash, financial assets, land, life insurance, automobiles, personal property, and other valuables. But excluded items include the applicant's home, household goods, one wedding ring and one engagement ring, burial spaces, a car, and other limited resources.

Assuming an applicant meets the resource test, then the income test applies. One may receive the full SSI benefit amount if unearned income is less than \$20 per month, and earned income is less than \$65 per month. Any unearned income above \$20 results in a one-to-one reduction of SSI benefits. For each dollar of earned income above \$65, the SSI benefit is reduced by 50 cents.

In 1974, elderly recipients dominated SSI. About 2.15 million people aged 65 and older received SSI benefits in 1974, which was about 59 percent of the total. Initially, only 70,000 blind or disabled children received SSI benefits, and the total number of blind or disabled beneficiaries aged 18 to 64 was about 1.4 million people. The total number of SSI recipients grew from 3.6 million in 1974 to 6.7 million in 2004. But in 2004, aged recipients totaled 1.8 million people, or about 27.4 percent of the total. In 2004, there were about one million children and 3.9 million beneficiaries aged 18 to 64. Expenditures rose from \$3.8 billion in 1974 to \$34.2 billion in 2004. After accounting for the effects of inflation, this represents a 140-percent real increase.

Supply-Side Economics

SUPPLY-SIDE ECONOMICS is the body of thought that is concerned with government policy in relation to aggregate supply. It is an approach that stemmed from the reactions of policymakers, economists, and 20th-century conservatives to the Keynesian revolution, which dominated economic thought from 1936 to the 1970s, when developed nations began experiencing low or negative economic growth.

Supply-side economics emerged from this state of affairs in the 1970s and 1980s. Governments, according to these supply-siders, had focused too much of their attention on aggregate demand to undue neglect of aggregate supply. With economies sliding into recession and seemingly stagnant secular economic growth, economists, politicians, and others were ripe for a change. No one embodied the sentiments, at least in the political realm, of supply-side economics—and ushering in their policies—more than Ronald Reagan.

The foundations of the supply-side revolution have roots in classical economics with the belief that the free market works in not only correcting economic downturns, but also in maximizing output. While its foundations lie in classical economic theory, the supply-side revolution is a direct by-product of the Keynesian revolution and its economics. It is a redirection of economic policy away from demand management—actually its rejection—toward policies that focus on supply-side factors with a belief in the welfare-maximizing effects of a free-market system.

Supply-side economics is as much about monetary policy, as it is about fiscal policy with the classical principle that a monetary policy favoring price stability and low inflation is important in providing the positive conditions for planning in credit markets, labor markets, and wherever else monetary contracts are important.

To understand the supply-side revolution, it is necessary to examine the state of affairs that existed beforehand, both in theory and in policy. The term *supply-side economics* was created by Jude Wanniski in 1975 to give currency to a growing tide of discontent and its alternatives to the demand-side economics produced by the predominant Keynesian economics of the day. The events leading up to this time are crucial in understanding the opportunity of reinventing classical economics. The oil crises that shocked the U.S. economy, as well as others, led to recession and high inflation in 1974 and into 1975. The mounting importance of government presence in the economy through welfare, entitlements, and other redistributions of income financed through

higher taxes indicated a creeping socialist state and its accompanying malaise. This, along with the growing influence of monetarism, led to the foundation of supply-side economics. It was this environment that produced supply-side economics.

In the Keynesian world that dominated economics in the 1960s, aggregate demand management was advocated and was believed in principle. But the shifting Phillips Curve convinced economists and others that the tradeoff with inflation, caused by increases in aggregate demand, was short-lived and did not exist in the long run. This shifted the emphasis toward the natural rate of unemployment and full-employment output. The question became, if we cannot influence output through demand management, how can we influence employment and output through supply factors?

TAX REDUCTION

Supply-side advocates believe that reduction in marginal tax rates will increase supply-side factors, such as work incentives and investment incentives. Through increased labor and investment, real output will grow. The point is often missed, though: it is not merely about monetary incentives through tax cuts—few will deny that they exist—but is also about the size and role of government in economic activities. How large should the government be and what should its role be in the economy? It is, in essence if not in principle, a call for fiscal and monetary responsibility and competence, while keeping government involvement to a minimum.

There are no founders of a school of supply-side economic thought, but there are significant streams of influence and some notable individual contributors to supply-side economics. The Austrian School, noted for its recommendation of monetary responsibility and free markets, is one such body of thought. Supply-side economics is, as noted above, largely a reactionary school. One of the exceptions is the work of Arthur Laffer and his famous curve. This curve shows the impact of income tax rates on government revenue. The argument is as follows: when tax rates are zero, tax revenue will also be zero.

When tax rates are 100 percent, tax revenue will also be zero because there is no incentive to work. There therefore exists some curve that at first rises and then falls. There must then exist some tax rate at which tax revenue is maximized. This theory provided supply-side economists with the theoretical basis they needed for the rationale of lowering tax rates while balancing the budget.

There were some who believed that tax rates were so high that by lowering them, tax revenue would increase simply by the greater work incentive provided and therefore the higher tax base. This would, for instance, allow the Reagan administration to increase defense spending while decreasing taxes without worry that the budget deficit would grow.

The economic policies of the Reagan administration are fundamentally those of the supply-side body of thought. However, Reagan subscribed to other viewpoints that are not considered to be supply-side economics in the sense used here—as a coherent body of thought embodied by a group of academics. Many confuse Reaganomics—as Reagan's economics came to be called—with supply-side economics since both were concerned with tax cuts and their effects on economic growth and output.

Supply-side policy widened the gap between rich and poor and did not alleviate poverty.

For instance, the trickle-down effect is often supposed to be a tenet of supply-side economics. This effect occurs when taxes are eased for the classes or groups who are more responsible for economic growth, such as high-income people or businesspeople; the increased investment and work of these people will somehow trickle down to all the others. The notion is that any increase in productivity will increase demand for lower productivity factors and therefore in some sense trickle down. There is even a Laffer effect in this since the tax burdens of others will be eased.

Putting either Keynesian (demand-side) or supply-side policies into effect is no easy matter since both have consequences for both demand and supply factors. When John F. Kennedy implemented tax cuts to stimulate the economy, he anticipated demand factors being affected. However, supply-siders argued that the prosperity of the 1960s was due in part to supply-side factors being affected. There is really no way of separating the two effects.

The Reagan administration and its immediate follower, the George H.W. Bush administration, were responsible for the most conscious efforts to implement supply-side policy. Marginal tax rates were reduced during the Reagan administration and the 1980s were largely times of prosperity. Reagan decreased marginal income tax rates, thereby spurring the work efforts of the labor force, and the capital gains tax, thereby

spurring the investment incentive. Real Gross Domestic Product (GDP) responded accordingly once the economy was out of the recession of 1981–82 caused by the tight monetary policy of the Paul Volcker Federal Reserve, which was to diminish the upward spiraling of the inflation rate.

OTHER FACTORS

Many argue, however, that Reagan's policy had a greater impact on demand and that the resulting success of the economy was due to other factors once aggregate demand had been stimulated. The policy of the Federal Reserve is cited as one of the factors. The Federal Reserve gave up its belief that aggregate demand ought to be managed through discretionary monetary policy in favor of low inflation and minor adjustments. Again, no one can say for sure whether Reagan's policies affected demand factors or supply factors more.

Essentially, supply-side economics is a school of macroeconomic thought that emphasizes the importance of taxation and business incentives in encouraging economic growth, in the belief that businesses and individuals will use their improved terms of trade to create new businesses and expand old businesses, which in turn will increase productivity, employment, and general well-being.

This in turn is expected to increase the economic welfare and alleviate poverty. However, the connection between supply-side economics and poverty reduction is still to be established. The implementation of the supply-side policy widened the gap between rich and poor and did not substantially alleviate poverty in the United States.

The chief influence of supply-side economics seems to be a realization that demand management of the economy is not always the best policy—that there is an alternative. But the alternative is not so much an emphasis on supply-side factors but one on the ability of the free market to generate economic growth. It is clear that once supply-side policies are implemented and maintained with a minimum government involvement in the economy, any further tax cuts will lead to either growing deficits—and one may argue through Ricardian Equivalence that this is identical to taxes—or smaller government revenues and therefore a smaller than acceptable government presence in the economy. Therefore, supply-side policies are either a more or less one-time arrangement or an ongoing offsetting policy to demand management and a government that always has a tendency to expand beyond what is necessary.

Suriname

THE REPUBLIC OF Suriname, located in northern South America, received its name from the Surinen Indians who originally inhabited the land. Suriname became a Dutch colony early in the 17th century and was renamed Dutch Guiana. Five years after gaining independence in 1975, Suriname became a socialist republic but was ruled by a series of civilians with nominal power. International pressure led to free elections in 1987, but the elected government was overthrown two years later. By 1991, democracy had been restored, and free elections have continued.

The alumina industry dominates the Surinamese economy, providing 15 percent of the Gross Domestic Product (GDP) and 70 percent of export earnings. Services generate 65 percent of the GDP, and industry produces 22 percent. Agriculture accounts for 13 percent of the GDP. In general, the economy is still in the process of becoming a viable market economy. This change is taking place by means of structural reforms, liberalized markets, and increased competition. Austerity measures have been introduced and tax increases have been instituted. The Netherlands has temporarily resumed aid to Suriname. Prospects for future economic growth are tied to offshore oil production and bauxite and gold mining. Suriname ranks 17th in development potential among the richest countries of the world.

With an annual per capita income of \$4,300, Suriname is a lower-income nation with a poverty rate of 70 to 80 percent and an unemployment rate of 17 percent. Economic inequality has doubled in Suriname since the 1970s. The richest 20 percent of the population hold over 50 percent of the nation's wealth. Approximately 11 percent of the Surinamese people are malnourished.

In addition to lacking basic needs, many people live in constant fear. Ironically, many civil servants in Suriname have traditionally lived below the poverty line. Most of them are women, who remain in these jobs because they would not have health insurance otherwise. Proposals for establishing a state insurance fund that would cover all citizens have been debated but never passed.

In 1980, the projected life span was 64 years for Surinamese males and 69 years for females. Longevity rates have been steadily increasing over the last decades. Currently, life expectancy in Suriname is 68.96 years. Females (71.27 years) outlive males (66.75) by about four years. Suriname has a population of only 438,144. The median age is 26.13 years. Almost 30 percent of the population are under the age of 14, and 6.2 percent are at least 65 years old. With a prevalence rate of 1.7 percent, HIV/AIDS is of growing concern in Suriname. More than 5,000 Surinamese are living with the disease. Fewer than 500 have died. Access to healthcare is inadequate, and there are only 50 physicians for every 100,000 residents. Around 18 percent of the population have no access to safe drinking water, and seven percent lack basic sanitation.

Infant mortality is high in Suriname, but rates have decreased in recent years. Between 1990 and 2005, the infant mortality rate dropped from 35 to 23.57 deaths per 1,000 live births. Among all children under the age of 5, the mortality rate dropped from 48 to 39 per 1,000 deaths. About 13 percent of children under the age of 5 are malnourished, and 13 percent of infants are underweight at birth. Immunization rates for children from birth to 23 months old are relatively low, ranging from 71 to 74 percent.

Fertility rates have declined over the past decades in Suriname. Between 1970 and 2005, the fertility rate dropped from 5.3 to 2.34 children per woman. Among adolescents the fertility rate is 26 births per 1,000. Approximately 42 percent of Surinamese women use some method of contraception. Only nine percent of births in Suriname take place outside the presence of trained medical staff. Maternal mortality continues to be high, however, occurring at a rate of 110 deaths per 100,000 live births.

Literacy is high in Suriname, and 93 percent of the population over the age of 15 can read and write. With a 91 percent literary rate, females lag behind males (95 percent). All girls are enrolled in primary schools, but only 97 percent of boys are enrolled. About 63 percent of the relevant age group are enrolled in school at the secondary level.

Sustainability

SUSTAINABILITY IS A CHARACTERISTIC of dynamic systems that maintain themselves over time. As an economic, social, and environmental concept, sustainability means providing for the best for people and the environment for now and for the indefinite future, without diminishing world resources. This notion was placed on the international political and scientific agendas in 1987 with the report "Our Common Future," the Brundtland Commission Report, which was prepared by the World Commission on Environment and Development, chaired by Norwegian Prime Minister Gro Harlem Brundtland.

The report defined sustainability as meeting the needs of the present without compromising the ability of future generations to meet their own needs. This belief echoes indigenous knowledge and practice, particularly of the Iroquois Confederacy principles, which state that all decisions should be made with consideration of the effect they will have on the next seven generations to follow us. Hence sustainability is concerned with maintaining a delicate balance between the human need to improve lifestyles and feelings of well-being, and preserving natural resources and ecosystems, on which we and future generations depend. These two fundamental principles are known as quantity and quality sustainability.

Based on these principles, sustainability entails maintenance of a sustainable scale of the economy relative to its ecological life-support system; a fair distribution of resources and opportunities between present and future generations, as well as between agents in the current generation; and an efficient allocation of resources that adequately accounts for natural capital. Ideally, it is the balance between efficiency (to do things right) and effectiveness (to do right things).

TYPES OF SUSTAINABILITY

Roughly, sustainability can be classified into four main types: human, social, economic, and environmental.

Human sustainability means maintaining human capital, which is a private good of individuals rather than between individuals or societies. Health, education, skills, knowledge, leadership, and access to services constitute human capital. Investments in education, health, and nutrition of individuals have become accepted as part of economic development.

Social sustainability covers political, cultural, and all people-centered issues, except economics. It demands that the basic conditions for human life exist within society. These conditions include social justice, human well-being, strong social capital, advanced social interaction, and cultural richness. Social sustainability is related to how we make choices that affect other humans in our global community. Social sustainability emphasizes protecting the vulnerable and respecting social diversity. It involves systematic community participation and strong civil society and relates to the distribution of wealth within and between generations (that is, intra- and intergenerational equity) as well as the distribution of rights to use environmental services contained within a given ecosystem. Social sustainability is also related to more basic needs of happiness, safety, freedom, dignity, and affection. These conditions cannot be met without a healthy and sustainable natural environment and economy.

Economic sustainability means holding investment at rates sufficient to maintain stocks of capital. It also means that economic prosperity and development should be achieved without decreasing the prospects for posterity. Economic sustainability requires economic capital to be stable, to remain intact. The basic idea is to determine the maximum level of consumption by current generations such that capital (natural or man-made) accumulates to permit future generations to enjoy the same opportunities. Implied is the notion that some capital stock is maintained indefinitely in order to perpetuate future levels of consumption.

Further, economic sustainability is blind to the physical state of the ecosystem and does not directly

consider equity conditions. In addition, the treatment of common property resources, externalities, and resources without market prices is a vexing problem for economists. Thus, achieving economic sustainability is not sufficient to ensure sustainability without consideration of the set of factors related to environmental sustainability.

Environmental sustainability is a multidimensional concept. Environmental sustainability means conserving and recycling natural resources and limiting air, water, and land pollution to amounts that can be assimilated by the environment.

To measure environmental sustainability in tangible ways that make both economic and policy sense, a new practical tool called the Environmental Sustainability Index (ESI) has been developed by Yale University, Columbia University, and the World Economic Forum and introduced worldwide. This tool is also used to measure the environmental impact of social behavior. The ESI provides a measurable link between civil society and environmental management. It comprises 67 separate variables that influence environmental sustainability. These variables range from sulphur dioxide in the air to corruption, and are grouped into 22 core indicators such as eco-efficiency, population stress, and the responsiveness of the private sector.

The complex interconnections among the economic, social, and environmental aspects of present challenges of sustainability put forward a new paradigm of decision-making for all spheres of society. It projects a new perspective on current issues and challenges, and calls for a better consideration of the need for changes in human values, attitudes, and behaviors in order to achieve sustainability that will meet human needs and reduce hunger and poverty, while maintaining the life support systems of the world and preserving global resources. All these interrelated concepts call for monitoring the state of environmental and human systems, formulating effective policies, and assessing progress toward a more sustainable form of development. This concept raises many issues of how we should act in the world today in order to combat poverty and cater to the needs of the people. It also calls for best practices in order to ensure environmental protection, economic growth, and social progress.

RAISSA MUHUTDINOVA UNITED NATIONS

Swaziland

SWAZILAND IS a lower-middle-income nation in which 47 percent of the people live in poverty and 34 percent are unemployed. Early in the 21st century, Swaziland gained international renown as the country with the highest prevalence of HIV/AIDS cases in the world (38.8 percent). The epidemic has created an environment in which children head 10 percent of all households because their parents or guardians have succumbed to the disease. Swaziland has a high level of inequality and is ranked 60.9 percent on the Gini Index of Human Inequality. The poorest 20 percent of the population subsist on 2.7 percent of the country's resources, while the richest 20 percent share 64.4 percent.

The Swazi economy is heavily dependent on subsistence agriculture, in which 80 percent of the population are employed. Swazi crops are frequently threatened by droughts that sweep the area. Such a drought led to a major food shortage in 2002. The shortage was particularly damaging to children, women, the elderly, and the chronically ill. Rice is the major element of the Swazi diet, and the shortage contributed to a 61 percent increase in the price of this essential food. As a result, the poorest people often went without food. UNICEF, the United Nations' organization for children, estimated that more than 231,000 people were in need of food aid. Many families were forced to decide between feeding and educating their children.

Swaziland is landlocked, and there is a limited supply of potable water. Since the mid-1980s, Swaziland has experienced some economic diversification, with sugar and wood pulp bringing in export income. Swaziland's natural resources include asbestos, coal, clay, gold, diamonds, quarry stone, and talc, but only coal

and quarry-stone mines are in operation today. Geographically, Swaziland is almost surrounded by South Africa, and the Swazi economy is heavily intertwined with that of the larger country. Only one-tenth of Swazi exports go to other countries, and some three-fourths of all Swazi imports come from South Africa. The Swazi economy is also dependent on regular remittances from the Swazi who work in South Africa.

Total life expectancy declined from 43 years in 2003 to 35.65 years in 2005 in great part because of the HIV/AIDS epidemic. The Swazi have a median age of only 18.72 years. Some 40 percent of the population are under the age of 14, and only 3.8 percent have reached the age of 65. The Swazi have an astonishing 70.5 percent chance of not surviving to the age of 40.

With the HIV/AIDS prevalence rate, the disease has taken a devastating toll in Swaziland. By 2003 estimates, 220,000 people out of a population of 1,173,900 are living with the disease and another 17,000 have died. As a whole, the Swazi have access to medical care, and only five percent lack access to affordable essential drugs. However, the lack of safe drinking water has placed some 150,000 people at risk for developing the waterborne infections that are common in sub-Saharan Africa. Some 48 percent of the population are at risk for developing other diseases spread through inadequate sanitation.

Infant mortality has fluctuated in Swaziland over the past several decades. From 1970 to 1990, infant mortality dropped from 132 deaths per 1,000 live births to 77 deaths per 1,000. However, between 1990 and 2002, the number of infant deaths increased to 106 per 1,000. The increase in infant deaths was directly related to the HIV/AIDS epidemic. Among Swazi children under the age of 5, mortality levels decreased from 196 deaths per 1,000 in 1970 to 153 deaths per 1,000 in 2003. Nine percent of Swazi infants are below normal birth weight, and 10 percent of children under 5 are malnourished, two percent severely so. Approximately 30 percent of children under the age of 5 suffer from moderate to severe stunting, and one percent suffer from moderate to severe wasting. Only seven percent of ill children receive lifesaving rehydration therapy when needed.

The progress of immunization programs in Swaziland has been uneven. In 2003, 95 percent of children between the ages of 12 and 23 months were immunized against measles. Between 1990 and 2002, the rate of infant measles vaccinations decreased from 86 to 72 percent, and DPT immunizations dropped from 89 to 77 percent. In 2003, 95 percent of Swazi infants received

immunizations against tuberculosis, but only 76 percent were vaccinated against polio.

The total fertility rate of Swazi women is 3.7 children per woman. In 2003, total fertility was recorded at 4.2 children per woman, and the adolescent fertility rate was reported at 97 out of 1,000 births. It was estimated that during the period between 1975 and 2002, 28 percent of Swazi women used birth control. Between 1994 and 2000, the number of trained medical staff attending births in Swaziland jumped from 56 to 70 percent. In 2000, maternal mortality was estimated at 370 deaths out of 100,000 births.

Approximately 81.6 percent of the Swazi population over the age of 15 can read and write. These numbers have improved significantly since 1980, when literacy rates were reported at 36 and 43.6 percent for males and females respectively. Most Swazi children attend school for at least 10 years. In 2000, 78 percent of males and 85 percent of females completed primary school. However, school attendance and completion rates have both been negatively affected by the food shortage and by the HIV/AIDS epidemic.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Sweden

FOLLOWING WORLD WAR II, Sweden developed one of the world's most advanced capitalist welfare states. This was done via a large increase in social transfers financed by a corresponding increase in taxation. Since the late 1970s, government expenditures have

been some 60 to 70 percent of Swedish Gross National Product. In contrast, the corresponding average for the high-income countries in Europe has been 45 to 50 percent, and for the United States approximately 33 percent.

Consequently, Sweden has been a leading country in developing "cradle to grave" economic security for its citizens. Some key economic security programs are include a universal old-age pension system, tax-financed national health and education systems, income replacement for illness, a generous unemployment compensation system, large-scale government job retraining programs, an extensive system of family benefits, and a large and highly subsidized public housing sector.

Comparisons based on the rigorous Luxembourg Income Study (LIS) clearly demonstrate the effectiveness of Swedish antipoverty policies. For example, dramatic differences are shown when Sweden is compared with the United States, a country with many small social transfers.

Specifically, LIS data from the mid-1980s show that before taxes and transfers, the U.S. poverty rate was almost 20 percent whereas the corresponding figure for Sweden was even higher, some 26 percent.

However, after cash and in-kind transfers, the Swedish poverty rate fell to 4.3 percent, almost a 22-percentage-point decline. In contrast, the U.S. poverty rate fell only 6.6 percentage points, remaining above 13 percent. Moreover, the LIS data show that the effectiveness of Swedish social programs in reducing poverty among children is even greater than for the general population.

Relative to most other countries, Sweden's social transfers are significantly larger and better targeted. To begin with, Swedish old-age pensions replace approximately 65 percent of previous income and provide a standard minimum pension floor at 50 percent of median income or higher. In contrast, the United States has no effective standard old-age pension floor at even 40 percent of median income. Even more important as an antipoverty policy is Swedish family policy, since in Sweden, as elsewhere, family poverty is strongly linked to number of children.

First, Sweden provides to each family a significant cash transfer per child. Second, the government guarantees child support payments to families. Consequently, families do not suffer economic hardship because an absent spouse fails to provide the legally mandated child support. Finally, Sweden provides a range of programs to help single parents enter and remain in the labor force with earnings close to 50 percent of median income or above. Chief among these are the provision of

low-cost but high-quality childcare via a national network of public daycare centers as well as generous parental leave policies.

Sweden's system of social transfers has clearly been highly effective at reducing poverty. However, a vigorous and enduring debate focuses on the long-run viability of the Swedish welfare state. Market-oriented economists argue that the high level of taxation and massive social transfers have strong disincentive effects on labor supply, saving, risk-taking, business investment, and entrepreneurship. In addition, more subtle effects of the Swedish welfare state include potential adverse effects on the intensity and quality of work, investment in education both with respect to the level of schooling and the field of study, choice of occupation, and geographic labor mobility. The potential adverse effects noted are argued to be largely responsible for Sweden's lagging economic growth since the early 1970s. For example, in 1970 Sweden's income per person ranked fourth in the world. By the mid-1990s Sweden's income had fallen to 16th position.

However, other economists strongly challenge this view. They argue that Sweden's poor economic performance in recent decades is largely the result of defective macroeconomic policies, not microeconomic disincentive effects due to high taxes and social spending. A key argument here is that much social spending (for example on healthcare, education, family support policies) has actually increased the productivity of the economy while Sweden's effective tax rates, especially on capital income, are much lower than commonly believed. Indeed, some argue that the best empirical studies suggest that Sweden's welfare state has had no negative effect whatsoever on Sweden's long-run economic growth rate. In summary, neither economic theory nor the empirical economic literature provides definitive answers with respect to the effects of welfare state taxation and social spending on economic growth. However, the Swedish welfare state has clearly been extremely effective at greatly mitigating poverty.

Tom Nesslein University of Wisconsin, Green Bay

Switzerland

SWITZERLAND IS A landlocked country in central Europe known for its political neutrality, discreet banking system, and high standard of living. Bordered by Austria, France, Italy, Liechtenstein, and Germany, the country supports German, French, and Italian as official languages. The capital city is Bern and the total population approximately 7.5 million. Annual Gross Domestic Product (GDP) per capita exceeds \$33,000 on the purchasing power parity method. Switzerland is home to the international Red Cross and Red Crescent organizations, which are humanitarian organizations involved with disaster relief and developmental programs. The Red Cross was the creation of Henri Dunant, a Swiss man who organized emergency aid to the soldiers of both sides at the Battle of Solferino in 1859. The Geneva Convention of 1864 represented the first multilateral agreement on the treatment of wounded of any side during wartime and has been updated with further agreements specifying acceptable wartime behavior and treatment of civilians.

The reputation the Swiss have achieved for managerial efficiency is enhanced by the location of United Nations institutions in that country. Switzerland has maintained a stance of neutrality since the Treaty of Westphalia in 1648, and this has allowed it to escape the depredations of the two world wars. The confidentiality of its banking system has encouraged the development of international banking, although the lack of transparency has fueled fears of money laundering and asset hiding.

Despite the high level of income enjoyed by Swiss, there is still some inequality and poverty, with people falling into the new poor category. At the turn of the century, approximately 120,000 children were adjudged to be living in poverty in Switzerland, and more than 20

percent of single people were in receipt of income support. There was no central system of maternity leave, and child support levels varied considerably by region (canton). Aging of the population has also emerged as a significant problem. These are manifestations of the concept of the new poor, which involves categories of largely urban people who suffer from unanticipated gaps in public services.

The Swiss people generally have a strong interest in poverty reduction and international partnerships with developing nations. The private response to the Indian Ocean tsunami of December 26, 2004, for example, amounted to \$225 million. Official Development Assistance (ODA) reached \$1.55 billion in 2004, although it is likely to miss meeting its obligations to the United Nations in this respect. Nevertheless, a strong, centralized system infused by humanitarian principles has proved effective in delivering poverty reduction solutions internationally. One-third of ODA is distributed to Swiss nongovernmental organizations (NGOs), onethird to the International Red Cross and Red Crescent organizations, and the remainder is divided among United Nations agencies. Improvements have been suggested in terms of decentralizing authority to field managers and allocation procedures being restructured.

John Walsh Shinawatra University

Syria

THE SYRIAN ARAB Republic is located in one of the most volatile areas of the world. Syria's closest neighbors are Lebanon, Israel, Turkey, and Iraq, and the history and economy of Syria are closely interwoven with

those countries. For almost 40 years, Syria has maintained a military presence in Lebanon in the face of international objections. In the summer of 2005, Israel accused Syria of test-firing Scud missiles in retaliation for continued American pressure to withdraw from Lebanon. Since the 1990s, Syria and Israel have met periodically to discuss the return of the Golan Heights area, which was taken over by Israel during the 1967 Arab-Israeli War, but no consensus has been achieved.

The war in Iraq and the general turmoil in the Middle East have played havoc with the Syrian economy. Declining oil production and exports, industrial expansion, water shortages, and pollution of available water sources have also taken a toll. Nearly a third of the labor force is involved in agriculture, and the rest are engaged in services (43 percent) and industry (27 percent). Moderate reforms have been directed at slashing interest rates, creating private banks, raising prices on a number of subsidized foodstuffs, and consolidating exchange rates.

With an annual per capita income of \$3,400, Syria is a severely indebted, lower-middle-income nation. Both poverty and unemployment stand at 20 percent. The social net provided for the Syrian poor covers female-headed families, families with disabled children, and the elderly. International programs also provide aid to needy Syrians.

General health in Syria is threatened by the lack of potable water and by the severe water pollution that has resulted from improper disposal of raw sewage and petroleum refining wastes. As a result, one-fifth of the population lacks access to safe drinking water. Half that number lack access to proper sanitation. There are 142 physicians for every 100,000 residents. Around 20 percent of Syrians are unable to afford essential drugs.

Over the past decades, life expectancy has steadily increased for both males and females. Life expectancy rose from 60 percent for males and 63 percent for females in 1980 to 68.75 percent for males and 71.38 for females in 2004. The median age in Syria is 20.37 years. Over 37 percent of the population are under the age of 14, and 3.3 percent have seen a 65th birthday.

Infant mortality has been significantly decreased in Syria over the last decades. Between 1970 and 2005, infant mortality declined from 90 deaths per 1,000 live births to 23 per 1,000. The drop in mortality among children under the age of 5 has been even more dra-

matic, plunging from 129 per 1,000 in 1970 to 18 per 1,000 in 2003. Approximately 18 percent of all children under 5 are malnourished, and six percent of babies are underweight at birth.

About 18 percent of under-5s are moderately to severely stunted, and four percent are moderately to severely wasted. Childhood immunizations are almost universal in Syria, ranging from 98 to 99 percent among children from birth to 23 months old. The country has been free of polio since 1995.

In 2005, Syrian women bore an average of 3.5 children each. Teenage mothers give birth at a rate of 39 per 1,000. Fertility rates have been more than halved since 1980, when women gave birth to an average of 7.4 children each. Contraceptive use in Syria has more than doubled from the 20 percent rate in 1980 to the 48 percent rate reported in 2005. Trained medical staff attend 76 percent of all births. Based on modeled estimates for 2000, maternal mortality in Syria occurs at a rate of 160 deaths per 100,000 live births.

Education at the primary school level is compulsory in Syria. As a result, illiteracy rates have decreased significantly. Between 1980 and 2005, male illiteracy dropped from 27 to 19.3 percent, and female illiteracy fell from 66.2 to 36 percent. At the same time that literacy rates increased, the rate of primary school completions steadily declined. Completion rates dropped from 103 percent for males and 92 percent for females in 1990 to 93 and 85 percent for males and females respectively in 2000.

WORLD POVERTY

T

Taft, William Howard (Administration)

WILLIAM HOWARD Taft (1857–1930) was the 27th president of the United States, serving from 1909 to 1913. Compared to his dynamic and reform-minded predecessor, Theodore Roosevelt, the rotund William Howard Taft seemed anything but a Progressive.

His opponents in the Democratic Party and in his own party derided Taft for being an advocate of business interests. They pointed to his support for the Payne-Aldrich Tariff of 1909, which he described as a significant alteration in the existing protectionist policies, but which many others regarded as a very cynical and superficial revision of those policies. The Payne-Aldrich Tariff did minimally lower some tariff rates on some imports of manufactured goods, but it also raised rates on products associated with the major trusts, such as the mining, steel, and food-processing industries.

Indeed, through his Secretary of State Philander C. Knox, Taft initiated what he called Dollar Diplomacy, the pointed use of American political and military influence to promote the international expansion of American business. Although this policy was described

as a necessary response to the competition of the highly industrialized European powers, critics have emphasized that in places such as China and Latin America, European competition became an all-too-easy rationalization for exploiting economically underdeveloped nations that were politically and militarily unable to resist American demands.

Nonetheless, Taft did sign a number of laws extended antitrust regulations. The Taft administration oversaw the division into smaller entities of the Standard Oil Company and of the American Tobacco Company, both of which were found to be monopolies. The Mann-Elkins Act of 1910 extended federal oversight to all operations of railroads that conducted interstate commerce, and it eliminated the common practice of overcharging for short hauls because of the federal restraints on the rates that could be charged for long hauls.

It should be noted that during Taft's term, the Sixteenth Amendment was approved, authorizing the federal imposition of an income tax. Certainly, it is a matter of great dispute whether, over the long term, the income tax has reduced poverty by providing revenues for antipoverty programs or it has directly and indirectly increased poverty by reducing real incomes.

Taft also served subsequently in the role of chief justice of the Supreme Court, a position that suited his character better than his political appointments.

ALL ANGLES

Born into a privileged family in Ohio, Taft was placed under considerable pressure by his parents, and later his wife, to constantly achieve. He entered politics as a member of the Republican Party, but had only limited success in electoral contests. An extremely obese man, his personal style was ponderous as, with a lawyer's training, he attempted to consider all angles of a situation rather than take the decisive action required of a political leader. As governor of the Philippines, in the wake of the blood-soaked occupation by American forces and the violent suppression of insurrectionists, Taft was responsible for establishing a civil service that would cement American control.

Tajikistan

TAJIKISTAN, WITH JUST over seven million people, and located in the mountainous terrain of central Asia, is the poorest among the states of the former Soviet socialist republics. Its population at the turn of the century was described by J. Falkingham as "facing severe economic, physical and psychosocial stress."

By 2005, conditions had improved, but real percapita income was roughly no more than \$300 per year. Even before the breakup of the Soviet Union, Tajik-

istan was known as the poorest among its 15 republics. Then, about half of its population had per capita monthly incomes of 75 rubles (roughly \$150) as compared to 33 percent of the population in neighboring Kyrgyzstan and five percent in Russia, as noted by Falkingham.

After the unexpected breakup of the Soviet Union (1991), and an ensuing civil war in Tajikistan (1992–97), the economy began to shrink precipitously, with annual Gross Domestic Product (GDP) contractions reaching minus 30 percent and minus 28 percent during 1992 and 1993, corresponding to the deadliest period of the war, which resulted in an estimated 50,000 fatalities. The 1997 peace accord between Tajikistan's government and the Islamist-dominated opposition paved the way for gradual security and economic growth.

Since then, the GDP has continuously grown, with an average annual rate of 10 percent for the five-year period 2000–04. Still, the size of the economy by the end of 2004 was less than 60 percent that of 1989. And by 2003 the percentage of the population living under poverty (living on less than the equivalent of \$2.15 per day at purchasing power parity, or PPP, a rate of exchange accounting for price differences across countries and allowing for cross-national comparisons of real incomes) was 64 percent—a high figure, but an improvement over 1999, when an estimated 81 percent of Tajikistan's population were considered poor by World Bank calculations.

Over half of the average household's expenditures are spent on food, 11 percent on health and hygiene and 10 percent on ceremonies (such as weddings, circumcision, and remembrance of the dead), as shown by P. Foroughi.

Children, the elderly, women-headed households, and the rural population, engaged in what should theoretically be the profitable cotton-growing sector, constitute the poorest segment of the population. Households with larger numbers of children are poorer and the very old, who had previously relied on pensions to survive, can no longer do so since their official pensions cover no more than two to three days of expenses. Government expenditures, which under Soviet socialism were the chief source of sustenance for the population, have significantly dwindled.

As a percentage of GDP in 1998, Tajikistan's spending on health (one percent) and education (2.1 percent) was the lowest among all five central Asian republics, according to Falkingham. Poverty and unemployment have forced as many as 700,000 mostly male, rural citizens to seek work abroad, mostly in Russia. The remit-

tances—over \$220 million per year—sent by these workers back to their families in Tajikistan constitute a significant part of the GDP and serve as a critical survival mechanism for households.

Progress in fighting poverty is threatened by several troubling trends: first, the rate of truancy has increased. School attendance has fallen since 1999. Schools are in a state of dilapidation and the number of qualified teachers is sharply declining. Second, poverty-related health threats (such as outbreaks of typhoid, malaria, and even HIV/AIDS) have either not subsided or have risen. And third, the ongoing opium and heroin production and trafficking from Afghanistan have led to the spread of an underground illicit economy, rise in the level of drug trade and domestic drug use, and the spread of associated activities such as prostitution and human trafficking.

Payam Foroughi University of Utah

Tanzania

THE UNITED Republic of Tanzania is an east African country that is classified as a developing nation by the United Nations (UN) and other international agencies that track countries' production capacities and socioeconomic conditions. Characterizing a country as a developing or less developed country (LDC) is equivalent to calling it poor. Tanzania therefore represents a case whereby it is possible to study poverty at the national level, in addition to analyzing the poverty of individuals or families.

The nation's status as a poor country is apparent in its national income data. Tanzania's Gross Domestic Product (GDP) is low—only about \$9.8 million in 2002,

according to the World Bank's World Development Indicators. Moreover the 2004 edition of the Human Development Report indicates that income per capita was about \$580 in that same year. If one were to order the nations of the world by per capita income, Tanzania would lie in the poorest 10 percent.

Over four-fifths of Tanzania's poor reside in rural areas.

The poverty of a nation is reflected in the status of its people. In poor countries it is standard for a large portion of the population to be poor, and this most often manifests itself in low consumption possibilities and low levels of well-being. Citizens of poor countries often lack many basic goods and services that most people living in rich or developed nations take for granted. For example, access to medical services is not widespread in Tanzania and life expectancy is only 43.5 years. About 43 percent of the population are undernourished, and about 29 percent of young children are underweight. Additionally, many people do not receive schooling in Tanzania because the government cannot afford to provide this public good to everyone.

As is the case in many developing countries, poverty is most severe in rural areas, where agriculture is the main source of livelihood. Over four-fifths of Tanzania's poor reside in rural areas, where agricultural production is hampered by low productivity tied to lack of sufficient irrigation systems, susceptibility to disease and pests, soil erosion, and poor access to roads. The production and transportation problems associated with such obstacles are obvious, and the incomes earned by individuals laboring under these conditions are not high. Regions such as Dodoma (the new capital), Kigoma, Rukwa, Lindi, and Mtwara are among the poorest in Tanzania. With the exception of the latter two, these regions do not produce any of the traditional export crops; they have poor roads and are not served by any of the railroad lines.

In its annual Poverty Reduction Strategy Progress Reports, the government identifies increasing economic growth as one of the chief avenues to reducing poverty. Others outside government, the World Bank for example, have focused attention on the need to reduce corruption in order to improve the country's economic performance. Corruption in Tanzania has grown from low-level corruption, most common among low-level public officers seeking to supplement their low in-

comes, to the level of the nation's decision-makers, where abuse of office can have a telling impact on an economy.

Taylor, Zachary (Administration)

ZACHARY TAYLOR (1784–1850) was the 12th president of the United States (1849–50), although his administration lasted only 16 months before he lost his life to illness or, according to some, poisoning. Taylor's administration was beset by numerous problems that he was largely unable to solve in the time available to him. These included the possible extension of slavery across northern Mexico, the defeat of which had made Taylor's reputation and the scandal of corruption among senior cabinet members.

Taylor grew up in Kentucky and joined the army in 1806. His life was dominated by military service. During its 40 years, he served in the 1812 War, Seminole War, and Mexican War, among others. It was during this last war that he made his reputation with a string of brilliant victories, often accomplished through improvisational skill rather than slavish adherence to orders. This brought him to the attention of the Whig Party, which was then seeking a nominee to run for president. The Whig Party of America was named after its British forerunner as a political grouping resistant to inflexible command. Between 1834 and 1854, the Whigs represented a powerful political party that brought together a coalition of groups to fill the space left by the implo-

sion of the National Republican Party caused by crushing victories for President Andrew Jackson. The Whigs rarely espoused a common political line and internal conflict was rife. "Old Rough and Ready" Taylor was perhaps a natural candidate, but his willingness to continue governing in his familiar informal style meant that political disunity hampered his ability to lead. He had never held public office and, indeed, had never even voted. Nevertheless, the party received widespread support, and Taylor benefited from the enthusiastic campaigning of Abraham Lincoln, among others.

Taylor opposed the extension of slavery into new states, but was a slave owner himself, and a strong proponent of the rights of states. His victories in the Mexican War proved to be his biggest political problem, because of the wishes of many to extend slavery across the conquered territories. These included New Mexico and California. Taylor appealed to the people of the nascent states to apply for statehood, bypassing the territory stage, while drawing up constitutions outlawing slavery. This was a divisive, although principled, move. There were threats of secession from southern states, to which Taylor threatened to use military force.

Negotiations finally culminated in the Compromise of 1850, agreed on two months after Taylor's death, that successfully held off secession by a decade. The compromise provided for the concept of popular sovereignty, which was to lead to future discord, as too was the Fugitive Slave Act, which empowered judges acting alone to determine the status of escaped slaves and compel their return across state borders. This countered the work of the Underground Railroad in helping escapees find new lives, and enraged many moderates who henceforth opposed the extension of slavery in their own states. The spread of the railroad was making the need to clarify jurisdiction over land, and the ability to dispose of it, more urgent.

The clash of states and federal government was intensified during Taylor's tenure, but not resolved. However, he was able to claim that the country was at peace throughout the world and would strictly maintain a policy of neutrality in international affairs. Vice President Millard Fillmore succeeded Taylor as president.

Technology

TECHNOLOGY CAN BE defined as the processes, resources, skills, and knowledge involved in the transformation of production inputs into outputs. It consists of two major components: embodied and disembodied technology. Technology is not only embodied in physical capital but also in human capital, institutions, and social structures. It is customary for analysts to talk about the inputs and outputs of technology. Technological inputs are measured by investment in research and development (R&D) and the number of scientists and engineers employed in the R&D departments of firms and governments. Technological outputs are measured by patents, new products and processes, and the number of scientific publications.

Technological change is a process that leads to improvements in the ways in which inputs are transformed into outputs. Technological change helps to eradicate poverty and raise living standards. The affluence and rising living standards in the Developed Countries (DCs) have been attributed to the rapid technical change that has taken place in these countries. Conversely, the Less Developed Countries (LDCs) have remained poor largely because of their technological backwardness. The Newly Industrialized Countries (NICs), such as South Korea, Singapore, Taiwan, and Hong Kong, have succeeded in raising their per capita incomes and eradicating poverty by strengthening their technological capabilities. Thus, the LDCs have sought to promote technological development by acquiring, assimilating, and adapting technologies imported from the DCs.

There are three categories of technological change: labor-saving technical change, which results in the use of less labor and more capital; capital-saving technical change, in which less capital is used relative to labor; and neutral technical change, in which labor and capital are used in the same proportions. Because DCs are endowed with capital and deficient in labor inputs, they try to minimize production costs by generating labor-saving technical change.

Given the abundance of laborers in LDCs, capitalintensive technologies are not suitable for these countries. To minimize their production costs, therefore, LDCs should invest in the development of labor-intensive technologies.

CHANNELS OF TECHNOLOGY TRANSFER

While some aspects of technology can be transferred from one entity to another (codified technology), others are uncodified, tacit, or idiosyncratic. The LDCs have traditionally relied on a number of channels for acquiring foreign technologies (particularly the codified ones), including the following:

Arm's-Length Purchase of Machines. This channel is more viable when the technology is "mature," "standardized," and "stable." To be effective, however, the purchaser must have the skills to identify not only cheaper sources, but also suppliers that offer better conditions and opportunities for the purchaser to enhance its technological capability.

Licensing. This approach is usually adopted when the purchaser of the technology intends to use the seller's trademark or brand name on the final product. Thus, licensing is common in industries such as automobiles, consumer electronics, soft drinks, cement, and pharmaceuticals. In these industries, brand names and other methods of product differentiation are very instrumental in gaining market shares. Licensing is not necessary if the purchaser merely buys equipment from an equipment manufacturer and then uses the equipment to produce final goods or services.

Turnkey/Joint Ventures. In a turnkey project, a foreign consulting firm or manufacturer undertakes all the major tasks involved in setting up a venture, including the following: feasibility study, choice of equipment and suppliers, machine layout, equipment installation and start-up, and provision of managerial and technical skills. Some turnkey/joint venture agreements stipulate a time frame within which the foreign partner is expected to "transfer" the relevant managerial and technical skills to the local partners, and the former is expected to withdraw gradually from the project.

ACQUISITION, ASSIMILATION, ADAPTATION

The ability of a developing country to acquire, assimilate, and adapt foreign technologies depends, among other things, on the following factors:

The Role of the State. The experiences of the NICs have shown that the state can play an important role in helping firms to develop their technological capabilities. This can be done through the formulation and imple-

Promoting technology in less developed countries includes increasing the number of scientists, engineers, and technicians. Technological development involves the ability to modify, improve, and adapt a given technology.

mentation of policies that encourage firms to invest in technological innovation. Those policies include:

Economic Policy. Fiscal policy, such as tax incentives, can be used to spur firms into investing in technology. Trade policy that makes it expensive and difficult for firms to import machinery and equipment may also be used to encourage firms to strengthen their technological capability. Unable to import machinery and equipment more easily, firms are often forced to find creative ways of making effective use of foreign technologies. Monetary policy that provides cheap credit for investment in technology can also be instrumental for enhancing the technological capabilities of firms in developing countries.

Science and Technology policy (S&T). Economic policy can be effective in promoting technological development in the LDCs only if it is accompanied by a well-articulated S&T policy. A well-articulated S&T policy is one that explicitly identifies a country's development objectives and designs scientific, technological and skill-intensive programs for the achievement of

those objectives. A country's S&T policy must also be goal-oriented by targeting specific objectives, rather than being abstract. It must also be coherent, unambiguous, and simple so that industrialists, scientists, and researchers all understand the government's intentions.

Science and Technology Infrastructure. The level of development of a country's S&T infrastructure can affect the technological capability of firms in the country. A country's S&T infrastructure consists of all the scientific, technological, and educational resources and institutions that are available outside industry. Specifically, S&T infrastructure includes public research institutes, professional and skills development centers, and higher educational institutions. The S&T infrastructure and S&T policy constitute a country's national system of innovation.

Technoeconomic Threats and Opportunities. Some random and unexpected events that threaten the survival of firms may occur in the economy. These events may spur firms into generating technical change. For instance, fuel shortages caused by some exogenous events

may encourage firms to seek energy-saving methods of production. The government, however, may deliberately create situations that threaten the survival of firms, or situations that challenge them to be more innovative. One example is the restriction of the importation of raw materials, spare parts, machinery, and equipment.

Prior Accumulation of Scientific and Technological Knowledge. The ability of firms in a country to develop technological capability depends on the extent of prior accumulation of scientific and technological knowledge in the country. Countries with a long history of industrialization are more likely to have firms with strong technological capability. Some analysts suggest that South Korean firms were able to develop technological capability partly because Japan promoted industrialization in Korea during the colonial era.

TECHNOLOGICALLY BACKWARD

Internal and external factors are responsible for the technological backwardness of developing countries. Internal factors include: 1) overdependence on technologies developed elsewhere, which has discouraged them from developing indigenous technological capabilities; 2) protectionist policies that have encouraged LDC firms to be complacent in enhancing their technological capabilities; 3) an educational system that emphasizes liberal arts as opposed to science and engineering; 4) inadequate fiscal incentives for investment in R&D; 5) overvalued currencies that make it cheaper and easier to import technologies rather than developing them locally; and 6) the domination of LDC economies by the mining, quarrying, and service sectors. These sectors do not generate enough linkage effects that could result in technological development.

The following are some of the external factors that have retarded the technological development of the LDCs: restrictive policies imposed by multinational corporations on LDC firms, which have made it difficult for these firms to assimilate and adapt imported technologies; the tendency for multinational corporations to introduce complex technologies that are difficult for the LDCs to assimilate; and imperfections in the world market for technology—a market that is dominated by monopolistic and oligopolistic firms.

PROMOTING DEVELOPMENT

The following measures have been suggested as strategies for addressing the technological needs of LDCs:

Reduce the Excessive Focus on Research and Development (R&D). There has been an erroneous view in developing countries that R&D is the only source of innovation and technological change. Although the R&D function has become important as an institutional locus for technical change, there are also other important sources of technical change. The Japanese experience, for instance, has shown that shop-floor activities, such as reverse engineering, process engineering, project engineering, and design, are critical sources of technical change. There is the need to de-emphasize formal R&D in the LDCs and to focus more attention on developing firm-level and industry-wide institutional structures and programs for generating and managing technical change.

Discourage State Monopolization of R&D. R&D in the LDCs is conducted mainly by public institutions and specialized government agencies. By contrast, there is private-sector domination of R&D in DCs and the NICs. For instance, over two-thirds of R&D projects in Japan, the United States, and the United Kingdom, and over half in Germany and France, were funded by the private sector. One of the benefits of industry-funded R&D projects is that they are often focused on what firms perceive to be critical for their competitiveness and survival. Many industry-sponsored R&D projects originate from perceived problems in existing products or processes, and such problems range from minor difficulties, such as a spare part that fails earlier than its projected lifespan, to a major difficulty that completely compromises the function of the product. A new S&T policy is needed in the LDCs that recognizes the fact that those industrial enterprises, rather than specialized institutions, are more salient in the technological innovation process.

Develop the Science and Technology Infrastructure. a major precondition for technological development is the existence of high-quality public research institutes and higher institutions of learning.

Increase the Number of Scientists, Engineers, and Technicians. Technological development involves the ability to modify, improve, and adapt a given technology. These tasks cannot be accomplished without a large pool of local scientists, engineers, and technicians. Although the absolute size of this pool cannot be specified ex ante, there is a consensus that it should be comparable to those available in technologically advanced developing countries, such as the NICs.

Invest in Human Capital. The level of investment in human capital is also a determinant of the ability of a country to promote technological development. South Korea's transformation from an agrarian society to an exporter of high-tech products was preceded by a huge investment in human capital, particularly in the training of scientists, engineers, and technicians. Education is a major mechanism for creating, adapting, and spreading knowledge. Basic education increases people's capacity to learn and to interpret information. Higher education and technical training are also needed to build a labor force that can keep up with a constant stream of technological advances.

Do Not Overprotect Domestic Firms. Developing countries tend to offer a blanket protection to their "infant industries." While a temporary protection may be necessary to encourage infant industries to learn and assimilate foreign technologies, prolonged protection may also encourage them to be complacent in developing their technological capabilities. Unconditional and prolonged protection has resulted in the proliferation of perpetual infant industries in the LDCs—industries that have been unable to achieve international competitiveness as a result of their weak technological capability. Firms in the LDCs need to be exposed to international competition in order to strengthen their technological capability.

Temporary Assistance for Needy Families

IN 1996, CONGRESS enacted the Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA). PRWORA abolished the 61-year-old Aid to Families with Dependent Children (AFDC) program, which entitled families with children to receive cash as-

sistance as long so they met the criteria set by the federal government and state in which they resided, and replaced it with TANF, Temporary Assistance for Needy Families, widely heralded as the "end to welfare as we know it."

BLOCK GRANT

Under the TANF program, the federal government provides a block grant to the states, which use these funds in any manner reasonably calculated. States can use their TANF funds in ways designed to meet any of the following four purposes set out in federal law: 1) provide assistance to needy families so that children may be cared for in their own homes or in the homes of relatives; 2) end the dependence of needy parents on government benefits by promoting job preparation, work, and marriage; 3) prevent and reduce the incidence of out-of-wedlock pregnancies and establish annual numerical goals for preventing and reducing the incidence of these pregnancies; and 4) encourage the formation and maintenance of two-parent families. States have used TANF funds in a variety ways, including, but not restricted to, cash aid, emergency assistance, transportation, childcare, job training, education, and job subsidies.

Federal administrative oversight is dramatically restricted with expansion of state policy priorities. Congress specified the function of the federal Department of Health and Human Services (DHHS) to include only 1) reviewing state plans and operations; 2) monitoring state "maintenance of effort" levels; 3) conducting research and analysis; 4) providing technical assistance; and 5) disseminating information on "best practices."

States have established their own directions to determine who will be eligible for various TANF-funded benefits and services. States mainly use TANF funds to assist lower-income families with children. There are several critical elements to determine eligibility, such as moralistic personal responsibility, time limits, work requirements, and immigrant status:

Moralistic Personal Responsibility. TANF prohibited federal assistance to teen mothers living separately from their parents or not attending school, as well as to individuals convicted of significant drug offenses. It also demanded that states address out-of-wedlock pregnancies and statutory rape.

Time Limits. TANF has mandatory time limits, resulting in a maximum of five years of allowable TANF assistance over a person's lifetime (with exemptions possible for up to 20 percent of families). States may

choose to implement a shorter time limit, and more than 20 states have done so.

To take individual circumstances into consideration, many states have adopted policies to exempt families from the time limit during periods when they are not expected to work, such as when they are caring for a young child, dealing with a personal or family crisis, or fulfilling their work requirement through paid employment.

A significant percentage of immigrant children are ineligible for TANF.

Work Requirements. Adults in families receiving assistance under the TANF program must participate in work activities for at least 30 hours a week after receiving assistance. PRWORA defines the work activities that states must achieve and the activities that can count toward meeting those participation requirements, including 1) unsubsidized or subsidized private- or public-sector employment; 2) on-the-job training; 3) work experience; 4) job search and job readiness assistance for up to six weeks; 5) community service programs; 6) provision of childcare services to an individual participating in a community services program; 7) vocational education; 8) job skills training; 9) education related to employment; and 10) satisfactory school attendance for teen parents.

Participation in educational activities is limited to 12 months for any recipient, except for teens who are completing high school. The state must put adult recipients to work after two years of assistance (or less, at the state's option) and can place them in workfare programs if they have not found a job after two months.

Immigrant Status. Prior to the 1996 PRWORA, legal immigrants generally were eligible for most federally supported programs, although the income of an immigrant's sponsor was factored in for the first three years. PRWORA prohibits states from using federal TANF funds to assist most legal immigrants until they have been in the United States for at least five years; exceptions include refugees, those seeking asylum, and those on active military service or in possession of an honorable military discharge.

States can use state "maintenance of effort (MOE)" funds to provide benefits to recent immigrants, but fewer than half do so. Given these restrictions, a significant percentage of lower-income immigrant children are ineligible for TANF.

EFFECTS OF TANF

Since the PRWORA began, welfare caseloads have declined significantly. In the first five years, and overall, the number of single parents who now work has risen dramatically. Several states have found that about 50 to 70 percent of TANF leavers are employed immediately after exiting, although average earnings are usually below the poverty level. Both the economic boom that has accompanied and facilitated the first five years of this restructuring and the "halo effect" that infused new programs with excitement and motivated workers should be considered in long-term outcome evaluation.

Several studies reported that almost two-thirds of women who left welfare for work returned to welfare at least once for many reasons, such as earnings reductions with low-pay, along with several employment barriers, including lower education levels, mental health problems, and childcare and transportation difficulties. For instance, single mothers with low education levels are now seeking employment. As a result, they face several challenges, such as obtaining affordable childcare and low wages.

Such problems raise issues concerning lack of health insurance and related benefits for these families. Comprehensive approaches are critical for reducing welfare dependency, including individual employment plans; job training and education; supportive services such as work allowances, cash assistance for childcare, transportation, and food stamps; addressing health concerns and insurance; client assessments to identify co-occurring needs and problems; and interventions that target co-occurring problems.

Thailand

THAILAND IS THE MOST economically well-developed country in mainland southeast Asia, and an important regional leader in the struggle against poverty. It has a tropical climate that provides comparative advantages in various forms of agriculture and has also historically housed important trade centers that linked Mediterranean traders with those of India, Persia, China, and Japan. During the period of European colonization, successive kings of Thailand (named Siam until 1939) used diplomacy to avoid being overrun and, uniquely for southeast Asia, remained independent throughout history.

The revolution that ended the absolute monarchy in 1932 has been followed by decades of slow progress toward democratization, regularly punctuated with episodes of military dictatorship. This has been associated with gradually increasing industrialization, increased wealth, and gradually reduced levels of poverty. The kingdom now has a population of approximately 63 million. Most business and government activities are clustered in the capital city of Krungthep (Bangkok). There is some regional inequality between the capital and the regions, most of which rely upon agriculture, with the poorest region being the northeastern region of Isaan, which is the home to 20 million ethnic Lao people.

Historically, Thai society has been based on a form of feudalism that featured land and resource ownership by the king and control of the nation by various officials and members of the nobility. Ordinary people were liable to provide corvée labor for the state, either through military service or on civil engineering projects, up to as long as six months per year. Different classifications of slavery were also important features of the economy. Nevertheless, the fertility of the river valleys and the produce of the jungle meant that most people were able to enjoy a comparatively healthy standard of living. However, occasional problems with flooding and drought could upset this pattern, leading to widespread hunger, especially in the Isaan region, much of which is set on a huge saltpan, which significantly reduces the fertility of the land.

The 1997 financial crisis and the tsunami of 2004 both revealed the continued vulnerability of the country to external shocks. Both events led, in addition to the human misery involved, to serious economic results, particularly in specifically affected regions. In the case of the financial crisis, many people who had lost their jobs were able to return to their family homes in

the provinces to switch to part-time or underemployment and hence the overall effects were limited. In the case of the tsunami, those Thais affected were mostly those who earned their living from the sea or from tourist-related activities.

While some were internal migrants had the option to return home, many lost all of their possessions. Recent government policies have focused on regional development and the attempt to mitigate the possibility of sudden onset of poverty. The 30 baht (\$.75) healthcare program, for example, aims to provide a wide range of health services available throughout Thailand at low cost and this has successfully reduced the prevalence of illness-led poverty. It is intended to increase the range of services to include medication for those infected by HIV/AIDS. Thailand was a pioneer in reducing infection rates for HIV/AIDS through promotion of the use of condoms.

Problems persist with continued violence in the southern border region with Malaysia, where a minority of the Muslim ethnic Malay community practices terrorism in the desire for a return to the separate state of Pattani. The persistence of bird flu within the poultry and wildlife of the country demonstrates not just the importance of chicken meat export to Thailand, but also the low level of enforcement of regulations over a vital industrial sector. The small-scale agricultural sector has the most prevalent rate of household poverty, since a great deal is conducted on a subsistence basis and personal indebtedness is high among many farmers. This has arisen for a variety of reasons, principal among them perhaps the problem of crop failure, which leaves farmers needing to borrow money to buy food. The populist and very popular Thai Rak Thai Party of Prime Minister Thaksin Shinawatra has expended efforts in alleviating rural indebtedness, but with only limited success.

Recent migrants to Thailand, specifically those hill tribe people who have entered illegally, are frequently subject to harassment by local officials and find it difficult to obtain proper registration papers. This makes them more vulnerable to poverty, as they cannot easily access government services or welfare programs and may be prevented from accepting employment. Many of the more than one million migrant workers in Thailand face similar problems. They are also one of the groups most vulnerable to human trafficking and forced entry into prostitution or other unsafe activities.

Third Way

THE THIRD WAY IS A political philosophy most commonly associated with the work of Professor of Sociology Anthony Giddens, and given expression in office by Tony Blair's New Labour Party in the United Kingdom, Gerhard Schroeder's Social Democrats in Germany, and Bill Clinton's Democratic administration in the United States.

In essence, it seeks to reinvigorate the center ground of politics free from extremist market-first policies on the right, and state control policies on the left. In their place, the Third Way supports market-friendly policies, emphasis on technology, globalization, human capacity development, and public-private partnerships created and fostered in the managerialist search for solutions that work, whatever the provenance of their ideological foundations.

For several years, the Third Way and its proponents seemed to be leading an international electoral revolution, but more recently the term has somewhat fallen into abeyance as previously hoped-for successes have proved elusive, and the international political environment has turned towards the authoritarian as the result of external events. In any case, the Third Way has been held up for ridicule for a variety of standpoints by critics who believe it is vacuous, lacking in empirical rigor, and that it appropriates right-wing ideas and presents them as centrist.

ORIGINS

The concept of a middle way that has inherent in it some form of moderation, and which fearlessly adapts the best parts of either extreme while eschewing the undesirable parts, has been common and popular throughout history. Aristotle, Queen Elizabeth I, and the Lord Buddha are among those who have called for a middle path. The idea seems plainly attractive.

So many incidences of binary structures—that is, ideological alternatives—are presented as representing sterile opposition that it is only through fusing the two that any progress could be made. Both G.W.F. Hegel and Karl Marx followed this methodology. It is easy, therefore, to cast such a debate in terms of right and left, public and private, and globalization versus antiglobalization and fashion from these oppositions a synthesis. By claiming that the Third Way represented an evolution of the left to cope with a modern world, which the right refuses to manage, proponents have used it to claim the whole of society as their natural constituency.

The second stage of Tony Blair's project, after all, after modernizing the Labour Party, was to unite it with the Liberal Democrats in a system of proportional representation that, dressed in the clothes of the center left but speaking the language of the populist right, would appeal to such a majority of the electorate that it would hardly ever be threatened. The alliance and electoral reform of this second phase may have been avoided, but the ability to speak in one way while doing another was lacking.

The benefits of the minimum wage, tax credits to lift thousands of the poorest out of poverty and provision of childcare and assistance to single-parent families have been almost completely ignored in election campaigns, which have been fought on grounds of crime and economic competence long regarded as the province of the right. Faced with criticism of the Third Way, nearly all of which comes from the left, Giddens has been unable to come up with convincing rejoinders restating the genuine substance of the system.

THE THIRD WAY AND THE STATE

The seminal moment of Tony Blair's project to modernize, as he saw it, first the Labour Party and then the British political system was his announcement at the party conference of 1994 that he intended to remove clause four of the party's constitution. Staunch traditionalists of the party had long treasured this clause, even if it had for some decades become next to impossible to achieve, and it called for the adoption into state ownership of all means of production.

Blair's resolution in ending this commitment demonstrated the abandonment of any remnants of the socialist basis to the Labour Party and the subsequent embrace of policies and justifications from ideologies of all stripes. It was the role of Giddens in this process to assure Blair and his advisors not to be fearful of adopting Conservative Party policy or of being labeled a political conservative. Instead, they should recognize that there are inevitabilities about certain aspects of the modern international economy, and build policies on what is inevitable rather than what might be desired.

The movement from capitalism to socialism is a long-term transition.

Consequently, markets must be accepted as referable to government control in most cases, while the ability of capital to move from country to country freely constitutes a positive aspect of the modern world. Instead of trying to prevent the spread of globalization, it should be modified in comparatively small ways to try to avoid inequalities that could destabilize the social system.

Blair and his party took this message to heart and subsequently went out of their way to court the rich and influential and to pursue public-private partnerships as well as market government activities, despite the often extensive evidence that these solutions were disastrously expensive, as in the case of the Public Finance Initiative described by G. Monbiot.

This appears to be because adhering to the Third Way has become associated with reassuring market forces that no actions will be taken that damage their interests. At the same time, the jackdaw selection of policies to create a portfolio has become devoid of an underlying, unifying ideology that explains the purpose and nature of government other than simply to obtain power and maintain it.

Internationally, building alliances and partnerships that would support Third Way initiatives often required such precarious leaps of reasoning that there was little in the way of genuine connection between the individuals and their traditions, and hence little really in common on which to build a philosophy.

ELECTORAL SUCCESS

It is questionable whether Blair's New Labour Party achieved its first electoral success in 1997, a crushing victory over the discredited, scandal-ridden Conservative Party of John Major, as a result of the ideological underpinning of the Third Way, or whether that ideol-

ogy was later created to fill a perceived gap in ideology criticized by observers subsequently.

Nevertheless, the first years of the Labour government are closely associated with the concept, although this has lessened subsequently, partly as a result of the loss of influence of one of its key architects, Peter Mandelson. In the United States, the electoral victory of Bill Clinton on the New Democrat platform was also considered to be an inspiration. Clinton refers to the term in his autobiography as being suitable to describe the philosophy, and although he does not strictly define the term, he notes that the agenda for a particularly noteworthy international Third Way conference was "to articulate a progressive consensus for domestic and foreign policies in the 21st century, and for reforms in the international financial system to minimize financial crises and intensify our efforts to spread the benefits and reduce the burdens of globalization."

In other words, Clinton's view of the Third Way is one that is fundamentally internationalist in its approach and pluralistic in nature. An internationalist approach is liable to receive criticism from those ideologically opposed to it that it reflects a new form of colonialism, in which non-Third Way nations must sign up to the provisions of the philosophy in order to benefit from its provisions.

This problem is magnified by the implicit acceptance of the validity of international financial institutions (whether reformed or not) as the legitimate tools for both managing the global economy and recommending changes to the economic management of individual states. In any case, economic sovereignty is compromised under internationalist approaches.

Continental European leaders associated with the Third Way included Schroeder of Germany, Italy's Romano Prodi and Massimo D'Alema, Wim Kok of the Netherlands, and President Peter Stoyanov of Bulgaria, as well as French Foreign Minister Lionel Jospin. These individuals mostly derived their political philosophies from the tradition of centrist European social democracy. This ideology derives from philosophical beliefs similar to Marxism, but it rejects the militant or totalitarian element believed to be inherent in that system, and instead adopts an evolutionary approach to social change.

The movement from capitalism to socialism is, therefore, to be managed as a long-term transition in which the role of the state is to protect the vulnerable and to reduce inequalities to maintain social harmony. Concomitant with this is a commitment to the welfare state and to enterprise labor unions as part of a tripar-

tite approach to labor issues. The social democratic tradition is largely absent in the United States, where both major political parties occupy political ground to the right and generally eschew social bonds in favor of individualism. From a high point at around the turn of the century, the electoral success of the Third Way has declined. First, the Republican candidate George W. Bush was adjudged to have won the office of president in the United States, while some European Union states elected less centrist governments and, also, particularly in France, voters rejected the European Union constitution, largely on the basis that it represented in part the Anglo-American model of competitiveness, which slashed public services and job security in a manner alien to the European tradition.

Tensions surrounding immigration and multiculturalism have also been inflamed by various terrorist attacks, and some right-wing political leaders as pretexts to restrict personal liberties and human rights provisions have exploited this situation. The years 2001–05 have seen a withdrawal from the consensual belief in multilateral and sophisticated, pluralistic approaches to problem solving. Since few if any influential leaders still engage in the discourse of the Third Way in any positive manner, it seems fair to conclude that its time has passed.

FUTURE INFLUENCE

The recent international terrorist attacks and national disasters have demonstrated that only governments can provide a large-scale level of services through the massive redistribution of resources and even then, they are frequently hampered by underinvestment. The ludicrous Reaganite notion that shrinking the state to enable private-sector institutions to fill the space is a viable model has again been exposed. The Third Way may in itself have proved inadequate as a political philosophy uniting both private and public sectors, but it did help stimulate debate about new ways for states to mobilize resources and create a discourse and vocabulary for further thought and research in the future.

Third World

THE CONCEPT of the Third World is a product of two phenomena of the post-World War II period. The deepening Cold War between the United States and the Soviet Union resulted in the alignment of other nations within the spheres of influence of the two superpowers. At the same time, the dissolution of the European colonial empires led to a dramatic increase in independent states in the Caribbean, Africa, Asia, and the Pacific region.

The West and the East defined themselves largely against each other. In all regions of the world, the United States created alliances that were meant to check the spread of communism. Chief among these alliances was the North Atlantic Treaty Organization (NATO), which linked Anglo-American security with that of the western European states.

The Soviet sphere included its sometimes uneasy alliance with Mao Zedong's communist regime in China, as well as its support for a number of smaller client states scattered like strategic outposts across most regions of the world. But Soviet influence was centered in the Warsaw Pact through which it had formalized its domination of eastern Europe.

Although these two alignments of nations were seldom referred to as the First World and the Second World, the ostensibly nonaligned nations of the Caribbean, Latin America, Africa, Asia, and the Pacific region became known, almost by default, as the Third World. At first, the label was rather neutral, but as the nations of the Third World became increasingly politically unstable, socially fragmented, economically dysfunctional, and environmentally distressed, the term *Third World* began to carry a deepening stigma. It became synonymous not only with general backwardness, endemic malnourishment, and rampant disease, but also with ruthless kleptocracies, bitter internecine conflicts, and intransigent social and economic issues.

Although the states of Central and South America have been independent since the early decades of the 19th century, they and most Third World nations that have more recently achieved independence have experienced frequent changes of government that have not necessarily signaled a substantive change in manner of governance.

In fact, beyond the immediate destruction caused by the coup d'état, most of the population may remain minimally affected by any specific change in government. Yet the political instability that results from such frequent changes in government discourages foreign investment and prevents the steady accumulation and expansion of the country's assets that are the basis of economic prosperity.

THIRD WORLD INSTABILITY

Examples of this sort of political instability in the Third World are manifold. In March 1991, Nicephore Soglo defeated Mathieu Kerekou for the presidency of Benin (formerly Dahomey) in west Africa. Kerekou was the first president in 30 years of postcolonial African history to be removed from office by the electorate. Despite having had only two "presidents" between 1960 and 1982, the Central African Republic had five violent changes in government during that period. Between independence in 1960 and 1980, the Republic of the Congo experienced six violent military coups. Since Honduras achieved its independence in 1821, it has had more than 120 presidents, most installed and then removed from office by the military.

The military ruled Brazil from 1964 to 1985. Even with the proclaimed return to democratic elections, generals have continued to be among the leading candidates for the presidency. There is historical precedent for these recent events: between 1889 and 1930, the presidency was rotated among "governors" of states run by political bosses through highly controlled political organizations. Similarly, since the mid-1940s, power in Argentina has shifted violently nearly a dozen times between the Peronistas (essentially demagogic populists) and military regimes.

Moreover, most Third World nations face serious threats in the form of regional or internal racial, ethnic, tribal, religious, ideological, and economic conflicts. Despite the partitioning of Muslim Pakistan and Hindu India in the aftermath of independence from Great Britain, India is hardly a homogenous nation. Indians speak 15 major languages and 1,652 distinct dialects. The Sikh rebellion is only the most prominent of several dozen movements for ethnic and/or religious autonomy or independence.

At any given time, approximately 50,000 of the prisoners in India's jails are political prisoners. Moreover, despite the long-standing tensions between Hindus and Muslims, India has a sizable minority of more than 145 million Muslims who chose to remain in the more secular Indian state. Thus, India's Muslim population approaches that of Indonesia (242 million) and Pakistan (162 million), and it is equivalent to that of Bangladesh (144 million)—the most populous Islamic states in the world.

Since achieving independence from Great Britain in 1960, Nigeria has seemingly laid the foundation for long-term economic prosperity. It has great potential wealth agriculturally, minerally (especially in its significant oil reserves), and, increasingly, industrially. Yet, the country has been politically unstable, with the military almost regularly removing civilian governments by coups d'état. At the heart of Nigeria's problems are tensions among the four major ethnic groups in the country—the Yoruba, the Hausa, the Ibo, and the Fulani—particularly between the eastern, largely Christian Ibo and the northern, largely Muslim Hausa. Each ethnic group is represented by contending political parties and factions within the military.

In 1966, thousands of Ibo were killed by the Hausa and about a million more were driven from their homes in northern Nigeria. In 1967, the discovery of huge oil reserves in eastern Nigeria, or Biafra, led a small group of army officers to stage a coup and declare the region independent. Playing off the heightened tensions between the Ibo and Hausa, these officers, led by Lt. Col. Odumegwu Ojukwu, actually had great financial interests in the new oil fields. When Biafra became militarily isolated, Ojukwu refused to permit food relief to reach the people trapped behind his army. In effect, he hoped that the specter of starving millions would achieve what he could not achieve militarily. Tens of thousands starved before Ojukwu finally fled into exile.

REFORM ATTEMPTS

Often the attempt to enact fundamental reforms to moribund methods of governance under a succession of different governments has made an already volatile situation only worse. In Colombia, attempts at economic reform in the wake of the Great Depression led to ongoing political violence between liberals and conservatives that killed more than 200,000 people between 1948 and 1957.

Complicating the positions of most Third World nations is their continued economic and even political

dependence on their former colonizers—or in the western hemisphere, their continued subordination to the United States.

Despite the viciousness of the prolonged Algerian war of independence against France in the 1950s, today France remains one of Algeria's major trading partners, providing 25 percent of Algeria's imports. Though the Central African Republic achieved independence from France in 1960, 20 years later France bought 50 percent of the nation's exports and provided 58 percent of its imports. Similarly, 20 years after independence, Benin (formerly Dahomey) still depended on France to buy three-quarters of its exports.

Third World nations face serious threats in the form of regional or internal conflicts.

Niger not only is very dependent on its trade with France, but also employs annually some 250,000 French as administrators, teachers, and technicians. In Guinea, there was an immediate crisis when independence from France was achieved. When the French departed, the new country lost most of its administrators, technicians, doctors, teachers, and judges, and they took with them all of their records.

ECONOMIC DEPENDENCE

The foreign-owned facilities in Third World nations have often become symbolic of the consequences of their governments' failure to throw off the yoke of economic dependence. The most important industrial complex in Cameroon is the massive, U.S.-built and operated Alucam aluminum smelting plant. The U.S.-backed government in the Dominican Republic established four "free zones" where U.S. corporations could operate for 20 years without taxes. Falconbridge Nickel, Shell Oil, and Gulf & Western invested hundreds of millions of dollars in new Dominican facilities in the 1970s.

In 1984, over 2,000 people in Bhopal, India, died from the effects of a chemical leak at the Union Carbide plant. The incident became emblematic of the irresponsibility of foreign-owned industries in Third World nations.

In some instances, the World Bank and other organizations have exerted this sort of economic and political domination over ostensibly independent Third World nations. In 1989, the annual inflation rate in Ar-

gentina was 3,000 percent and the nation's foreign debt reached \$58 billion, or 70.13 percent of its Gross National Product.

In the aftermath of Indonesia's bloody war for independence from the Dutch and a decade-long, extremely violent, and free-ranging anticommunist campaign, the Indonesian economy became dominated by a consortium of Western conglomerates and banks called the IGGI or the Intergovernmental Group on Indonesia. This group fostered strong relations with the nation's powerful military. A group of U.S. economic policy planners, called the "Berkeley Mafia," was particularly influential in the 1970s.

In Bangladesh, government expenditures exceed revenues by more than 50 percent, and the government depends on foreign aid to make up the difference. In effect some commentators say the World Bank has as much control over the economy of the country as does the federal government.

MARTIN KICH WRIGHT STATE UNIVERSITY

Thompson, T. Phillips (1843–1933)

DURING THE LATE 19th century, Thomas Phillips Thompson was one of Canada's leading labor reform advocates and his writing represented one of the most influential critiques of capitalism within Canada. Thompson was born in Newcastle-upon-Tyne, England, on November 25, 1843, and his reformism was undoubtedly influenced by Quaker traditions concerning spirituality, self-worth, individualism, and personal and social education.

After immigrating to Canada at the age of 14 with his parents, Thompson studied law and graduated in 1865. However, he soon abandoned the legal profession and turned to a successful career in journalism, working in both Canada and the United States. While he initially wrote for mainstream publications, Thompson's social influence was principally seen in his writing for both the Palladium of Labor (Hamilton, 1883–86) and the Labor Advocate (Toronto, 1890–91). In 1887 he published The Politics of Labor, which combined much of his editorial work for the Palladium into a blueprint for social reform. This work was a serious economic examination of labor conditions in North America, focused primarily on labor and social conditions in the United States, where it was published with the assistance of Henry George.

Like many of his middle-class contemporaries, Thompson believed that the development of industrialism and monopoly capitalism had entrapped the worker. While industrialism undermined the traditional social position of many workers, the growth of monopolies eliminated economic opportunities, which had previously allowed workers to escape wage slavery. According to Thompson, fundamental changes in social philosophy were necessary before reform programs could succeed because the conditions of industrial soci-

ety inherently encouraged the development of negative traits such as greed, meanness, and dishonesty. Essentially, Thompson viewed human nature as inherently good, but warped by the pressure to survive under the capitalist system. This emphasis on environmentalism formed a predominant theme of social reform views during this period.

While both George and Edward Bellamy influenced Thompson, his work did not simply mimic the views of these writers. Thompson adapted George's single-tax concept to support his broader collectivist social views. While Bellamy focused on taxing the unearned profits from landownership, Thompson expanded this theory to include profits from all essential industries, from railroads to banks. Essentially, Thompson applied the fundamental principle of Georgeism, that wealth was produced only through social activity and that wealth therefore belonged to society as a whole, to all aspects of industrial society.

Thompson argued that the monopolistic process of corporate mergers would ultimately result in a public demand for nationalization. Rather than socialism, Thompson drew on capitalist analogies, arguing that this process would simply make government and society one immense joint stock company for carrying on the work of the country, with workers and managers simply being paid dividends from their share of the profits. Following the international success of Bellamy's utopian Looking Backward, Thompson incorporated many of the themes used by Bellamy into his own vision of collectivization. Thompson's adoption of Bellamy's nationalism as an analytical framework was illustrated in his Labor Advocate articles, which focused on issues of nationalization, municipalization, and the role of monopolies in creating the nationalist state.

TIP Curves

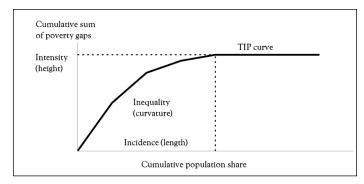

TIP CURVES ARE A GRAPHICAL method of representing multiple aspects of poverty and were developed by Stephen Jenkins and Peter Lambert in 1997. The term *TIP* stands for the "Three 'I's of Poverty," which include incidence, intensity, and inequality.

TIP curves are similar in nature to the more commonly used Lorenz curves. A Lorenz curve is a graphical representation of income inequality and is created by ordering up the entire population from poorest to richest and then graphing the cumulative percentage of the population against the cumulative percentage of the income earned by the population. In a hypothetical country where all persons have identical incomes, the Lorenz curve is a straight 45-degree line. As a country's income becomes progressively more unequal, the Lorenz curve gains curvature. The degree of curvature of the line displays the degree of income inequality that exists in the country.

To create a TIP curve, again the entire population is ordered up from poorest to richest, but then one graphs the cumulative percentage of the population against the cumulative poverty gap of the population, or the cumulative poverty gap per capita. The poverty gap is the difference between the poverty line and the actual income of each individual household. In other words, the poverty gap for a household is the amount of money that would be required to bring that household to the poverty line. Households with income levels above the poverty line are defined to have a poverty gap equal to zero.

The interesting feature of the TIP curve is that the shape of the curve has convenient interpretations. The length of the curve represents the incidence of poverty and is the percentage of the population that falls below the poverty line, otherwise known as the headcount index or poverty rate. The height of the curve represents the intensity of poverty and, depending on whether the y-axis is measured by the cumulative poverty gap or cumulative poverty gap per capita, is the amount of income that would be required to bring all of the poor up to the poverty level (known as the poverty gap), or the amount of income per capita that would be required to achieve the same goal (known as the poverty gap index). The curvature of the TIP curve represents the inequality of poverty and essentially behaves like an inverse Lorenz curve.

A country whose TIP curve has a more pronounced curvature is one where some of those households in poverty suffer from absolute destitution while others

The interesting feature of the TIP curve is that the shape of the curve has convenient interpretations.

are comparatively well-off. The "three 'I's of poverty" can be compared across countries using TIP curves so long as the cumulative poverty gap per capita model is used. When two TIP curves are graphed together, if the curves do not cross, the country whose TIP curve lies to the left of the other country's curve can unambiguously be said to suffer from more severe poverty. When two TIP curves cross, however, no such definitive statement can be made, as a tradeoff is being made among the intensity, incidence, and inequality of poverty in the two countries.

TOC-H

TOC-H IS A nondenominational Christian charity headquartered in the United Kingdom. The Reverend Philip "Tubby" Clayton founded the organization during World War I. In December 1915, while serving as a British army chaplain, Clayton set up a rest center for soldiers in Poperinge, Belgium, a small town just behind the front lines. The center was named Talbot House

after a fallen comrade, and it quickly became known by its initials, TOC-H, in the common radio signalers code of the time. Talbot House became a refuge from the horrors of war for thousands of British soldiers as well as those from other nations who traveled through the area. Clayton's center was open to men of all ranks and nationalities, which contributed to a sense of deep mutual understanding among those who visited the house and its famous upstairs chapel.

After the war, army veterans who wished to re-create the feeling of spirituality and camaraderie that existed at Talbot House began to set up similar facilities in England and elsewhere. Early in 1920, Clayton, along with Reverend Dick Sheppard and Sir Alexander Patterson, drew up the first formal mission statement for the organization that would grow to become the modern TOC-H society.

The written code, known as the "Four Points of the Compass," calls upon members to engage in the four ideals of "friendship, to provide members with opportunities to develop a spirit of understanding and reconciliation; service, to enable members, with their varying gifts, to serve their fellows; fairmindedness, to bring to members the knowledge and experience of others; and witness to God, to work for a better world through the example of friendship, service, and fairmindedness." The open nature of the original Talbot House also led to an emphasis in the modern organization on fighting prejudice, studying local and international conditions, and working to prevent conflict through understanding. Clayton served as the organization's unofficial ambassador, traveling the world promoting TOC-H and the ideals it espoused until his death in 1972.

TOC-H engages in a variety of charitable activities, including providing educational opportunities in inner cities, organizing activities for the elderly and disabled, and making outdoor and wilderness events available for disadvantaged youths. In addition, TOC-H operates a number of Talbot Centers that serve as conference centers and provide locations for other activities. TOC-H also serves as a source of funding and organizational expertise for newly formed community charities.

TOC-H has significant international activities, with operations primarily in British Commonwealth nations, including India, Bangladesh, Australia, New Zealand, Canada, South Africa, and Zimbabwe as well as several other countries with historical significance for the organization, including Belgium, France, and Germany.

VICTOR MATHESON, Ph.D. COLLEGE OF THE HOLY CROSS

Togo

BORDERING ON THE Bight of Benin in sub-Saharan Africa, the small Togolese republic covers six different geographic regions, which are home to some 37 African tribes. With an annual per capita income of \$1,600, Togo experiences an official poverty rate of 32 percent. Unofficial reports place the poverty rate at 72 percent, with 57.4 percent of the population classified as extremely poor. The fact that poverty affects women more than men has resulted in what is known around the world as the "feminization of poverty." One-third of the Togolese population is malnourished, as are one-fourth of all Togolese children.

The Togolese economy is based on a combination of subsistence and commercial agriculture, which employs some 65 percent of the labor force. Around 56.4 percent of all agricultural workers are women. Togo's most valuable asset is the arable land that covers 46.15 percent of the 54,385 square kilometers that make up the land area. However, only 2.21 percent of the arable land is allotted to permanent crops, and Togo imports much of its basic food requirements. Togo is subject to periodic droughts, and slash-and-burn tactics threaten much of the remaining forests. Major exports include cotton, cacao, and coffee. Fourth in the world in the production of phosphate, Togo lost almost 21 percent of that income in 2002 because of power shortages and the inability to keep up with development costs.

Because of ongoing political unrest, most foreign aid to Togo was frozen for a number of years. In 2004, the European Union resumed aid to Togo and began supporting new development programs. The Togolese government has initiated economic reforms along the guidelines established by the World Bank and the International Monetary Fund (IMF). However, Togo continues to face extreme poverty and high mortality and death rates that strip the country of both human and material resources.

The Togolese population of 5,681,519 experiences a life expectancy of 52.64 years and a median age of

17.78 years. Life expectancy has changed only slightly since 1980, when life expectancy was recorded at 48 and 51 years for males and females respectively. Some 43.2 percent of the population are under the age of 14, and only 2.6 percent of Togolese reach the age of 65. The Togolese have a 37.9 percent chance of dying before the age of 40.

Approximately 46 percent of Togolese lack access to safe water, and rampant water pollution is a constant threat to health. In 1992, Togo reported 10,000 cases of Guinea worm disease, a debilitating disease contracted through exposure to infected water. Through efforts by former president Jimmy Carter and Emory University's Carter Center, working in conjunction with locals to teach prevention methods, the incidence had plummeted to 601 in 2003. In some areas, the risk of developing malaria and yellow fever is also high. In addition to exposing the population to food- and waterborne diseases that are epidemic in much of sub-Saharan Africa, water pollution endangers the fishing industry, raising both health and economic concerns. Improper sanitation also creates major health problems in Togo, and 66 percent of the people have no proper access to this basic necessity.

General health is further threatened by the fact that Togo has only six physicians for every 100,000 residents, and roughly half of the population has no access to affordable essential drugs. The HIV/AIDS epidemic has also taken a heavy toll on Togo. By 2003 estimates, a prevalence rate of 4.1 percent had resulted in 110,000 reported cases of the disease and 10,000 deaths. In September 2001, Togo created the National Council to fight the spread of HIV/AIDS and other sexually transmitted diseases.

Infant mortality is high in Togo at a rate of 66.61 deaths per 1,000 live births. This is a marked decrease since 1980, when infant mortality was recorded at 128 deaths per 1,000 live births. Between 1980 and 2003, the mortality rate of children under the age of 5 declined from 216 deaths per 1,000 to 140 deaths per 1,000. One-fourth of all Togolese children under the age of 5 are malnourished. That number has remained stable since 1990. Seven percent of under-5s are severely undernourished. Approximately 22 percent suffer from moderate to severe stunting, and 12 percent suffer from moderate to severe wasting.

Between 1990 and 2002, infant immunizations dropped in all areas except those against tuberculosis, which increased from 73 to 84 percent. DPT immunizations dropped from 77 to 64 percent; polio immunizations decreased from 71 to 63 percent; and measles

immunizations declined from 65 to 58 percent. In 2003, 58 percent of children between the ages of 12 and 23 months were immunized against measles, and 64 percent were immunized against DPT3. At least 85 percent of Togolese children do not receive essential re-hydration therapy when they are ill.

Togolese women produce an average of 4.61 children each. This fertility rate has declined significantly from the 6.8 children per woman reported in 1980. The fertility rate of females between the ages of 15 and 19 is 80 out of 1,000. Some 26 percent of Togolese women use contraceptives, but that number has declined since the 34 percent rate recorded in 1990. Between 1990 and 2005, the number of professional medical staff attending births increased from 31 percent to 51 percent. Yet maternal mortality remains high. Between 1995 and 2000, model ratios indicated an increase in maternal deaths from 980 to 570 deaths per 100,000 live births. Because of entrenched tribal beliefs, Togo has a long history of discrimination and violence against women. In response to international pressure, the Personal and Family Code was revised to end legal discrimination, and in November 1998, Togo passed laws making female genital mutilation illegal.

Unofficial reports place the poverty rate at 72 percent.

While Togo has a literacy rate of 60 percent for all people over the age of 15, these figures are misleading. Three-quarters of Togolese males are able to read and write, but fewer than half (46.9 percent) of all women can do so. These numbers are best understood when compared to the 1980 female literacy rate of 82.2, indicating that declining female literacy poses a national problem for Togo.

On the average, Togolese children attend school for at least 10 years. With almost 40 percent of Togolese girls dropping out of school, the likelihood has been that girls would end up in domestic service or as the victims of child trafficking. To combat this probability, UNICEF, the United Nations' organization for children, launched a program to combine literacy, tuition assistance, and daycare for those who are mothers. Between 1995 and 2000, female school attendance rose from 32 to 42 percent. During the period covering 1990 to 2000, primary completion rates for males rose from 55 to 73 percent, and completion rates for females doubled from 26 to 52 percent.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Tonga

KNOWN FAMILIARLY AS "The Friendly Islands," Tonga is composed of 150 islands in the south Pacific Ocean. Of these islands, 36 are uninhabited. Tonga is the only monarchy in the Pacific. After 70 years as a British protectorate, it became a member of the Commonwealth of Nations in 1970. Tonga is a lower-mid-dle-income nation with an annual per capita income of \$2,300. Approximately 65 percent of the labor force are involved in agriculture. The islands export squash, coconuts, bananas, and vanilla beans, and these exports make up two-thirds of the total exports. Despite the abundance of agricultural products, Tonga imports most of its food supply from New Zealand.

Regular remittances from Tongans who work abroad and receipts from the tourist industry provide the largest share of government revenues. Unemployment stands at 13.3 percent on the islands and is particularly prevalent among the young. Without foreign aid, the Tongan economy would be unstable. With substantial aid, Tonga has a well-developed system of social services and has increased funding for health and education.

A recently published study by the Asian Development Bank revealed that poverty on Tonga is generally an issue of hardship rather than the kind of extreme poverty that plagues the poorest nations of the world. On this basis, 23 percent of Tongans lived below the poverty line of \$28.18 per person per week. This meant

that some individuals were forced to choose between buying food and paying school fees for their children's education.

Among the Tongan population of 112,422, life expectancy is 71.5 years. This is an increase of over 10 years since 1980. Females generally have a five-year advantage over males. The median age on Tonga is 20.46 years. Over 36 percent of the population are below the age of 14, and 4.2 percent have seen a 65th birthday. All of the people of Tonga have access to safe drinking water, and 97 percent of the population have access to improved sanitation. There are 35 physicians for every 100,000 residents on the island, and only five percent of Tongans lack access to affordable essential drugs.

Infant mortality is relatively low on Tonga. In 2005, it was estimated that 12.62 infants died out of every 1,000 live births. Female infants died at a rate of 12.2 per 1,000 as compared to males at 13.97 per 1,000. Between 1990 and 2003, infant mortality rates decreased from 25 deaths per 1,000 live births to 15 per 1,000. During that same period, the mortality rate of all children under 5 fell from 26 deaths per 1,000 to 19 deaths per 1,000. Two percent of Tongan infants are underweight at birth. Childhood immunization rates for children between the ages of birth and 23 months are all in the high 90 percent range. The entire Pacific region has been certified as polio-free, and no measles outbreaks have been reported for several years.

Currently, Tongan women bear an average of three children each. Between 1970 and 2003, the fertility rate dropped from 5.5 children per woman to 3.4 children per woman. The adolescent fertility rate is 23 out of 1,000 births. About 41 percent of all women use some method of contraception. Over 92 percent of all births in Tonga take place in the presence of trained medical staff.

Literacy in Tonga is based on whether an individual can read and write either Tongan or English. Among the total population, 98.5 percent meet this criterion. There is only a negligible gender difference in this ability. Most Tongan students attend school for at least 13 years, and all children complete primary school.

Totally Fuzzy and Relative Poverty Measures

THE MOST COMMON way to measure the prevalence of poverty in a region is to count the number of persons living in households that have incomes below a predetermined income level. This income threshold is known as a poverty line, and the percentage of the population that falls below this poverty line is referred to as the poverty rate or, in technical terms, the headcount index.

One criticism of measuring poverty in this way is the fact that all persons are designated as either "in poverty" or "not in poverty," with no gradations of any type. For example, a person whose annual income falls a mere \$1 below the poverty line would be considered poor while a person with just \$2 of additional income would be considered not poor. Some scholars have suggested that rather than thinking of poverty in such black-and-white terms, it would be preferable to think of poverty in a more continuous fashion.

To this end they devised a poverty measure with two different poverty thresholds known as the "totally fuzzy approach" (TFA) to poverty measurement. Under the TFA, all persons with incomes below the lower poverty line would definitely be considered poor while all persons with incomes above the higher poverty threshold would be considered not poor. People between the two lines would count as fractionally poor, depending on how close they were to either threshold.

For example, a person whose income fell exactly halfway between the two thresholds would be considered half poor while a person closer to the upper income line might be considered only one-quarter poor. Under the TFA method, the poverty rate is calculated by adding up all of the fully poor as well as the fractions

of the partially poor and dividing by the total population. Five years later, Bruno Cheli and Achille Lemmi expanded on the totally fuzzy approach by altering the way in which the poverty thresholds were calculated. They note that any poverty line is to some extent an arbitrary definition of poverty. Instead of using predetermined income levels as in the totally fuzzy approach, Cheli and Lemmi introduced the Totally Fuzzy and Relative (TFR) poverty measure, under which a person is considered poor or partially poor depending on how her income compares to the national distribution of income. In this way, the need to determine the income levels that define poverty is eliminated. The relative income level at which point a person starts to be considered poor, however, is still a subjective decision.

TFR measures can be modified to be multidimensional so that they combine standard-of-living indicators into a single statistic instead of simply using income as the sole measure of well being. One final advantage of the TFR measurement is that it can be used in the analysis of discrete data and not just continuous data. Discrete data are commonly found in surveys where respondents have a limited number of options from which to choose.

VICTOR MATHESON, Ph.D. COLLEGE OF THE HOLY CROSS

Traumatic Poverty

TRAUMA AND POVERTY—both are real scourges of mankind. During the last four decades or so, attention to the immediate and long-term consequences of terrible, extraordinarily stressful events has very much increased. The psychosocial aspects of such events have been conceptualized. In this context, a traumatic event

is defined as an extraordinary event or a series of events that is sudden, overwhelming, and often dangerous, either to one's self or to significant other(s). It can be added that it is an event that harms nearly everybody severely. So it is quite normal that people develop during such a catastrophe the so-called traumatic stress reaction, which can be defined as a set of conscious and unconscious actions and emotions associated with dealing with the stressors of the catastrophe and the period immediately afterward.

Currently, there are only short definitions of traumatic events and the normal human reactions during such events. Before speaking about the psychological disorders that may result from traumatic events, we must outline what poverty means today. Poverty in developed countries such as France or Germany means something else than poverty in the so-called Third World, where often the basic needs cannot be satisfied. In places such as Germany, the social network can solve problems like malnutrition and homelessness. So in the developed countries it is reasonable to use a relative concept of poverty. In this context, poverty means that a household gets half of the household-size adjusted median income of the society. At first sight, it is noticeable that poverty is defined only as lack of material goods, whereas in the context of development aid, usually poverty is regarded as a more extensive problem.

Tsunamis, earthquakes, and armed conflicts create psychological problems and poverty.

In this context, poverty is defined as a function of capability deprivation, a lack of capacity that inhibits participation in well-being. This includes an income above some artificial minimum, but also access to a healthcare system, to education, and to long-term security or satisfaction of the basic needs, like shelter and nutrition. This comprehension of poverty paves the way to recognizing a connection between a traumatic event and the creation of poverty.

It is obvious that world-renowned catastrophes like tsunamis, earthquakes, and armed conflicts create both psychological problems and poverty. The psychological problems can be conceptualized as posttraumatic stress disorder (PTSD), which is defined by R.M. Goldenson in the following way: "An anxiety disorder produced by an uncommon, extremely stressful event (e.g. assault, rape, military combat, flood, earthquake, death camp, torture, car-accident, head traumas and characterized by

a) reexperiencing the trauma in painful recollections or recurrent dreams or nightmares, b) diminished responsiveness (emotional anesthesia or numbing) with disinterest in significant activities and with such feelings of detachment and estrangement from others, and c) such symptoms as exaggerated startle response, disturbed sleep, difficulty in concentrating or remembering, guilt about surviving when others did not, and avoidance of activities that call the traumatic event to mind."

This generally accepted definition of PTSD shows that poverty may be part of the cause of the "extremely stressful event" when people lose everything in one sudden moment (earthquake, fire, flood); in this sense poverty is traumatic. Poverty can also be traumatic in the sense of being a result of both—namely of the traumatic event itself and the psychological disorder named PTSD too.

MENTAL ILLNESS

So, for instance, tsunamis and long-term armed conflicts often cause extreme poverty in a whole region, and they also cause PTSD or other mental illnesses for many people. Poverty itself inhibits participation in well-being, such as getting medical care. PTSD inhibits recovery as well: severely mentally ill people are not able to help themselves and to change their situation with their own efforts. So, both poverty and PTSD affect one another; therefore help for the victims of catastrophes must include both reducing poverty and treating mental illness.

This is a very important aspect of traumatic poverty. There is another one, too, which is no less important. It is that poverty itself can be traumatic. A child born in a situation of extreme poverty suffers from a series of traumatic events. Often, very poor mothers/parents are physically and mentally ill; they are busy with the search for basic needs (food, water), so the child suffers from a lack of adequate care. This lack can be extreme: lack of food, water, healthcare, and parental love and care. This chronic traumatizing poverty causes long-term complex physical and psychosocial problems. Children growing up under the condition of extreme poverty often are so severely traumatized that they have no real chance for well-being.

Widespread, extreme poverty in developing countries is severely and chronically traumatizing, but it must be mentioned that the kind of poverty existing in developed countries, namely a "mere" lack of material resources, is traumatizing too. Poor parents in developed countries are often also unable to take care of

their children in a suitable way. Such parents are very often discouraged and focused on their own problems. So poverty in this sense is a risk factor for mental and even physical illness even in developed countries. This affects especially children, who are much more vulnerable than adults.

Poor children, even in rich countries, also suffer from an inability to become self-confident adults who are able to experience well-being. In this sense, poverty is traumatic even in developed countries.

INDEPENDENT SCHOLAR

Trinidad and Tobago

SITUATED BETWEEN the Caribbean Sea and the north Atlantic Ocean, the islands of Trinidad and Tobago are economically prosperous as a result of a booming tourist business and the petroleum and natural gas industries. In the diverse economy of the islands, 64.1 percent of the labor force are involved in services, mostly tourism. Nearly 10 percent are employed in agriculture. Prosperity is enhanced by low inflation and a trade surplus. Nevertheless, government officials are faced with a myriad of social problems that include poverty, a rise in violent crime, and an expanding HIV/AIDS epidemic.

Some 21 percent of the population of Trinidad and Tobago live in poverty and 10.4 percent are unemployed. Approximately 13 percent of islanders are malnourished. Some 39 percent of the population live on less than \$2 a day, and 12.4 percent survive on less than

\$1 a day. Available resources are unevenly divided, with the richest 20 percent claiming 45.9 percent and the poorest 20 percent subsisting on 5.5 percent. Trinidad and Tobago is ranked 40.3 percent on the Gini Index of Human Inequality.

The current projected life span is 68.91 years among Trinidad and Tobago's population of 1,088,644. Women have an advantage over men of over five years on the average. In 1980, life expectancy on the islands was 66 years. The median age is 30.91 years. Some 21 percent of the population are under the age of 14, and 8.3 percent have lived to see the age of 65. Around nine percent of islanders will never see a 40th birthday. The 3.2 percent HIV/AIDS prevalence rate threatens both the health and economy of the islands. By 2003, 29,000 islanders were living with the disease, which had killed 1,900. Most islanders have access to safe drinking water, proper sanitation, and healthcare. However, nine percent of the population lacks access to safe water, and one percent have no access to proper sanitation. There are 75 physicians for every 100,000 residents, but 20 to 50 percent of the people cannot afford essential drugs.

According to estimates for 2005, infant mortality in Trinidad and Tobago occurs at the rate of 24.31 deaths per 1,000 live births. In the 1970s, infant mortality was over twice that figure, at 49 percent. Between 1970 and 2003, the mortality rate of children under the age of 5 was cut from 57 deaths per 1,000 to 17 per 1,000. Around six percent of island children are malnourished, and 23 percent of all babies are underweight at birth. Four percent of children under the age of 5 suffer from moderate to severe wasting, and five percent experience moderate to severe stunting. Infant immunization rates against DPT increased from 89 to 91 percent between 1992 and 2003. At the same time, polio vaccinations rose from 85 to 91 percent and measles vaccinations increased from 79 to 88 percent. Childhood immunizations range from 88 percent for measles vaccinations to 91 percent for DPT3 vaccinations among children between the ages of 12 and 23 months.

Fertility on Trinidad and Tobago is estimated at 1.75 children per woman. Among females aged 15 to 19, fertility stands at 42 per 1,000 births. Fertility has declined considerably on the islands since the 1970s, when the average rate was 3.5 children per woman. Approximately 38 percent of island women use some method of contraception. Trained medical staff attend 96 percent of all births. Estimates for 2000 place maternal mortality at 160 deaths per 100,000 live births.

Literacy is nearly universal on the islands, and only 0.9 percent of males and two percent of females over

the age of 15 cannot read and write. In 1980, 3.2 percent of males and 7.4 percent of females were illiterate. Education is universal on Trinidad and Tobago, and most students attend school for at least 12 years. However, primary school completion rates have fallen from 96 percent for males and 103 percent for females in 1990 to 94 and 93 percent for males and females respectively in 2000. Some 41 percent of students enrolled in colleges and universities are studying math, science, and engineering.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Truman, Harry (Administration)

HARRY S TRUMAN (1884–1972) was the 33rd president of the United States. He served as president from 1945 to 1953 and was influential in shaping postwar settlement in Europe and across the world. The only man ever to authorize the use of nuclear weapons, Truman presided over a period of international tension culminating in the Cold War and the Korean civil war. These matters drew his attention from domestic policies to some extent, and his 1949 Fair Deal policy package, which would have revolutionized life for millions of impoverished, was largely blocked by right-ing opponents.

The early years of the Truman administration were dominated by plans and policies drawn up during the concluding years of World War II, which Truman had largely spent heading the Senate War Investigating Committee and then as vice president. These plans included the formation of the Bretton Woods institutions—the International Monetary Fund and the World Bank, as well as the Marshall Plan, which is more properly known as the European Recovery Program.

It received its informal name because of the influence of its main creator and proponent, U.S. Secretary

of State George Marshall. This plan saw the disbursement of large amounts of American capital to European economies, which had been terribly damaged by the effects of the war. Disbursement was accompanied by market opening, free trade, and regional integration, which, whether by design or not, greatly benefited American industry, which had not been damaged by the war and thus was considerably more competitive than European firms. The Marshall Plan money was rejected by the Soviet bloc, which saw it as a form of American imperialism. At the same time, the Truman administration was negotiating around the world the end of European empires, as a continuation of the 1942 State Department "Declaration of National Independence for Colonies." This led to substantial opening of markets to American goods globally.

Truman had become president by virtue of the death of his predecessor, Franklin D. Roosevelt, some 12 weeks after taking power. He faced his first election in 1948, which he managed to win to considerable public surprise. In his January 5, 1949, State of the Union Address, Truman displayed his Democratic principles by outlining a package of policy measures that he termed the Fair Deal. This greatly developed the New Deal outlined by his predecessor, and was contrary to the prevailing public climate. Postwar America had witnessed consumer goods shortages and some social dislocation as women had been faced with returning to domestic employment.

Republican interests had reversed some provisions of the New Deal, notably the Taft-Hartley labor law, despite it being vetoed by the president. This act restricted labor rights significantly, including the banning of closed shops, secondary boycotts, and other hard-won rights.

Republicans and conservative Democrats, largely based in the southern states, also vehemently opposed the Fair Deal. Nevertheless, provisions that were involved included federal funding for education and housing, tax cuts for the poor, unemployment insurance, and a federal healthcare program. Very few of these provisions were ever enacted and this has led many to conclude that the Fair Deal was a failure. It would probably be more accurate to say that it represented an important statement that fairness and equity were not abandoned qualities in post-World War II America. Concrete benefits were felt by many of the disadvantaged.

Further, many women were appointed during Truman's administration, demonstrating his commitment to fairness. Even so, the inability to command a political

majority and the failure to control the banking and capitalist classes meant that fewer resources were available to help effect social change or support the subsequent War on Poverty.

Most of Truman's second term was engulfed in international tension. He shaped the Truman Doctrine in response to the British withdrawal of support from Greece. This policy of confrontation with the communist world led to hardening of the Iron Curtain across Europe and caused the United States to become involved in very bloody wars in Asia. The Cold War led to greatly increased expenditure on military goods and services and caused repression of various sorts in most countries of the world in which it was enacted. While some believe that Truman's response saved Western civilization, as Winston Churchill observed, others feel that a more conciliatory approach would have yielded greater benefits.

Truman declined to seek a second elected term and his successor was defeated by the wartime general Dwight Eisenhower. Truman had sought to emphasize civilian control of the military; President Eisenhower reversed the process.

John Walsh Shinawatra University

Tunisia

THE TUNISIAN republic, located in northern Africa along the Mediterranean Sea, is a middle-income, moderately indebted nation. Some 7.6 percent of the population live below the poverty line and 13.8 percent are unemployed. Other than young people, unemployment

has hit the textile industry hardest, and unions have organized hunger strikes to protest layoffs, which have left some employees without an adequate safety net. The Tunisian economy is diversified, and only 22 percent of the people are involved in agriculture. Other income-producing sectors include mining, energy, tourism, and manufacturing. The Tunisian government is focused on further economic liberalization and reduction of the trade deficit.

At present, Tunisia is experiencing increasing demands for political openness. As a result, progressive social policies have raised the standard of living, although differences exist among regions. Anti-poverty measures have been a major part of Tunisia's reforms. In the 1960s, the poverty rate hovered in the 40 percent range. The Program of Assistance to Needy Families (PANF) has been credited with assisting 121,000 families and has been particularly helpful to single-mother families, who make up 53 percent of the program. Since 1993, the National Solidarity Fund has also helped tens of thousands of families by renovating primitive housing, supplying electricity, and updating plumbing to improve the quality of drinking water.

Tunisia also provides free medical care and food aid to disadvantaged groups. Even though the government provides assistance to the most disadvantaged groups, 7.6 percent of the population live on less than \$2 a day. The poorest people live either in urban slums or in rural areas. Available resources are not distributed equally, and the poorest 20 percent live on 6 percent of income while the richest 20 percent claim 47.3 percent. Tunisia is ranked 39.8 on the Gini Index of Human Inequality.

The Tunisian population enjoys a life expectancy of 74.89 years and a median age of 27.29 years. Since 1980, life expectancy has increased by more than 12 years for males and by more than 13 years for females. Just over one-fourth of Tunisians are under the age of 14, and 6.6 percent have reached the age of 65. There is a 95.1 percent chance that a Tunisian will survive to the age of 40.

Tunisia's attention to stemming the spread of sexually transmitted diseases (STDs) has allowed the country to bypass the HIV/AIDS epidemic that is ravaging much of Africa. However, general health is threatened by improper disposal of toxic and hazardous waste. Tunisia has limited access to freshwater resources, and 20 percent of the population have no access to safe water. About 12 percent have no access to proper sanitation. In some areas, water may be polluted by raw sewage. As a result, Tunisians face a risk of contracting common diseases that are spread through contact with

infected water, food, and soil. Most of the population has access to medical care, and 80 percent are able to afford essential drugs.

The government has paid a good deal of attention to reducing infant mortality in recent years. Between 1970 and 2005, infant mortality decreased from 135 deaths per 1,000 live births to 24.77 per 1,000. During that same period, mortality rates for children under the age of 5 plummeted from 201 to 26. Overall, Tunisian children are healthy. Four percent of all children under 5 are malnourished, and only one percent are severely malnourished. Approximately 12 percent of under-5s suffer from moderate to severe stunting, and two percent experience moderate to severe wasting. The rate of childhood immunizations is high, with more than 90 percent of children from birth to 23 months old receiving essential vaccinations.

The Tunisian government has ended legal discrimination against women and girls and developed a number of programs designed to end sex discrimination by enhancing education, job, and credit opportunities for females. Through a well-developed family planning program, the number of women using contraceptives has steadily increased over the past decades. From 1980 to 2005, the fertility rate dropped from 5.2 to 1.75 children per woman. In 2003, the adolescent fertility rate was recorded at 15 per 1,000. Approximately 91.2 percent of all basic health centers offer family planning and basic health services. Between 1990 and 2005, the number of births attended by trained medical staff rose from 69 to 90 percent. High-risk pregnancies and infants born with health problems are directed to university hospitals, where they are treated by staff specifically trained in obstetrics/gynecology and pediatrics. The mortality of mothers delivered in hospitals dropped from 68.9 per 100,000 to 54 per 100,000 in 2002.

Nearly three-fourths of the Tunisian population over the age of 15 can read and write, but male literacy is higher at 84 percent than the rate of 64.4 percent for females. This pattern of marked gender differences in literacy has resulted from high illiteracy rates among females in rural areas. Consequently, the government has initiated literacy programs to deal with the problem. As a result, female illiteracy in rural areas declined from 68.8 percent in 1980 to 28 percent in 2004.

Education is free and compulsory in Tunisia, and average school attendance is 13 years. Between 1990 and 2002, the primary school completion rate for males increased from 80 to 101 percent, and the female completion rate rose from 70 to 102 percent. Concentrated efforts to increase the status of women have been so

successful that females now make up 56.4 percent of the entire student population.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Turkey

TURKEY IS A COUNTRY that links both Europe and Asia and the Christian and Islamic worlds. It has a territory of 301,000 square miles and occupies both Asia Minor and a small portion of mainland southeast Europe, on which is built the city of Istanbul, which in the past was an important center of European civilization, when it was known first as Byzantium and then Constantinople.

Turkey's history as the center of the Ottoman Empire was long and prestigious, but the empire fell into a long decline from which Kemal Ataturk (1881–1938) recreated it as a modern, secular, parliamentary democracy. In the early years of the 21st century, Turkey was pulled between conservative Islamic forces and liberal, secular forces who see the future of Turkey in Europe as a member of the European Union (EU). Currently, acceptance into the EU is dependent on improvements to the country's human rights record and the occupation of north Cyprus. Turkey is bordered on the western side in Europe by Bulgaria and Greece, and on the eastern and southern Asian side by Georgia, Armenia, Iran, Iraq, and Syria.

Much of the southeastern part of Turkey is home to ethnic Kurds, who represent around 20 percent of the total population of approximately 70 million, and who are part of the world's largest ethnic minority without a home country. The Kurdistan Worker's Party began a separatist insurgency in 1984 that continued into 2005 and has resulted in perhaps 30,000 deaths. Kurds complain of unequal access to economic opportunities and government services in the areas in which they live and, largely involved in agriculture, are generally poorer than the majority of the population.

A major earthquake in 1999 led to a banking crisis, which then triggered a more general economic crisis as years of inflation and resource misallocation brought about the near collapse of the country. An International Monetary Fund (IMF)-administered economic reform program has assisted in providing stability and a basis for future growth. However, the country continues to follow a form of dual development, with higher levels of growth and development in the generally western, secular areas than in the more conservative, religious, or ethnically Kurdish areas.

Turkey has comparatively low levels of absolute poverty but high levels of vulnerability. Approximately 1.8 percent of the population live in poverty and this has declined in the past decade. However, secondary levels of poverty have increased since the banking crisis in 2001.

The country's strategy report stresses the need to make the economy more resilient to minimize dangers from sudden external shocks and to plan for the sustainable economic development that will be necessary to bring people out of poverty. The strategy further emphasizes equitable access to health and education services and to economic opportunities, and points to reducing inequalities through regional development.

Inequality levels are high and are regionally based. Families with children are more vulnerable than the elderly, and some families have had to withdraw children from school or reduce their attendance. Rural-to-urban migration has represented an important method of alleviating poverty, but this has also had the effect of reducing family networks and support, as well as informal agricultural sector subemployment. Urban poverty has risen slightly in the aftermath of the crisis and is evident in such phenomena as increased risk and incidence of disease.

The fabric of Turkish society is reported to be fraying in areas of high levels of need, as people can no longer participate in reciprocal social events such as weddings and celebrations because of inability to meet their share of expenditure. This encourages indebtedness. The presence of religious charities is significant, but insufficient to meet all needs.

JOHN WALSH SHINAWATRA UNIVERSITY

Turkmenistan

SITUATED TO THE NORTH of Iran and Afghanistan and adjacent to the eastern shore of the Caspian Sea, Turkmenistan has a population of about five million and a landmass the size of Wyoming and Utah combined. Prior to independence from the Soviet Union in 1991, people enjoyed the benefits of socialism, including free and relatively good education and healthcare. Soon after independence, Turkmenistan attempted to increase its national income by focusing on maximizing its oil and gas exports and finding new clients besides Russia and Ukraine.

In an effort to become economically self-sufficient, the government also increased cotton production and revamped the agricultural sector, according to G. Gleason. Aiming to become rich and a "second Kuwait," the population of Turkmenistan is nevertheless struggling with serious socioeconomic problems and faces high unemployment and limited business opportunities.

The pervasiveness of poverty and its associated social ills is all the more ironic given that Turkmenistan's exports of oil and gas earned the government \$2.1 billion in 2003. Furthermore, the country's massive irrigation system has allowed for the production of large amounts of wheat—2.5 million tons in 2004 by Economic Intelligence Unit statistics. Similar to Uzbekistan, but more so to Belarus, Turkmenistan has kept much of its Soviet-era command system of production intact, with 80–90 percent of the economy being in the hands of the state, according to United Nations statistics.

At the same time, the government has the policy of providing oil and gas for local consumption substantially below international prices. Despite the fact that Turkmenistan's economy in 2005 had nearly caught up—sizewise—with that of its pre-independence era from massive investments in the oil and gas industries, anecdotal evidence points to an increasingly widening gap between the nouveau rich minority and the overwhelming poor majority.

Women have especially been vulnerable in the new economy. In spite of women's high representation in the parliament, a throwback to the quota policy of Soviet times, their share in industrial and managerial positions has been substantially reduced. The status of women remains important in the family as mothers and transmitters of traditions, but the man is considered the "head of the family." Poverty has also induced a widening sexual health crisis with high rates of maternal and infant mortality. Prostitution has risen among mostly young and poor females. There is also the associated drug abuse and a high degree of ignorance about sexually transmitted diseases (STDs) and HIV/AIDS.

Women's share in industrial and managerial positions has been substantially reduced.

Some blame the existing poverty on Turkmenistan's political system. The president, Saparmurat Niyazov, has been in power since 1985, also acting as the prime minister and the commander-in-chief. In 1999, Niyazov became president for life. The pro-government Democratic Party (former Communist Party) is the only major party on the Turkmen political scene. The president's book, *Ruhnama*, contains a nationalistic platform, and his views on religion, culture, and history are compulsory reading. Quotes from *Ruhnama* are inscribed side by side with verses from Koran in the largest mosque in central Asia, built in the president's native village of Kipcsak.

Tuvalu

LOCATED IN THE SOUTH Pacific just south of the equator, Tuvalu is composed of nine coral atolls, only eight of which are inhabited. The country was formed out of bitter ethnic differences within the British colony known as the Gilbert and Ellice Islands. The Polynesians of the Ellice Islands formed Tuvalu in 1975, leaving the Gilbert Islands to the Micronesians. Tuvalu attained independence in 1978. Any changes in sea level can potentially devastate the islands, and evacuation plans are in place to transfer Tuvaluans to Australia or New Zealand if the islands become flooded. Because of their vulnerability to sea changes, Tuvaluans have become concerned with global warming and its effect on the environment.

Tuvalu is relatively poor, with an annual per capita income of only \$1,100. None of the islands' land is considered arable because of its poor soil, so only subsistence agriculture exists, and that is unable to support the needs of the population of 11,366. Tuvalu's only major resource is fish, and most islanders earn a livelihood through exploiting the sea, reefs, and atolls.

With much insight, Tuvaluan officials have parlayed the country's internet domain into millions of dollars in royalties by leasing the name ".tv" in return for annual remittances that will expand the islands' revenues from 2000 to 2012. Additional income is derived from allowing Tuvalu's 900 area code to be purchased for business use. The government also depends heavily on regular remittances from Tuvaluans who work abroad, mostly as sailors or in the phosphate industry on Nauru. Tuvalu could not survive without foreign aid, including regular income from an international trust fund supported by Australia, New Zealand, the United Kingdom, Japan, and South Korea. Further income is derived from a fishing treaty with the United States. The government has recently instituted reforms designed to make the island more self-supporting and less dependent on foreign aid.

While data on many social indicators are unavailable for Tuvalu, it is evident that poverty on Tuvalu must be viewed in relation to the scarcity of opportunities to reach economic viability for individuals and for the nation as a whole. Limited government revenues have led to a weak infrastructure that is unable to provide adequate and accessible transportation, energy, health services, and quality education.

Life expectancy on Tuvalu is 68.01 years. Females have a projected life span of 70.33 years as compared to 65.79 years for males. The median age among islanders is 24.45 years. Approximately 31 percent are below the age of 14, and 5.1 percent of the population have lived to see the age of 65.

Since freshwater resources are not available on Tuvalu, most water needs are met through catchment facilities. Japan has already built one desalination plant on the islands, and plans to build another are in the works. As a result, all of the people on Tuvalu have access to safe drinking water. Improved sanitation is also universally available. There are 59 physicians on the islands, and 80 to 94 percent of the people have access to affordable essential drugs.

Infant mortality in 2005 was estimated at 20.03 deaths per 1,000 live births. At 17.02 deaths per 1,000 live births, female infants have a stronger chance of surviving than male infants at 22.9 deaths per 1,000 live births. Childhood mortality rates have decreased slightly on Tuvalu over the past few years. From 1990 to 2002, for instance, the mortality rate of children under 5 dropped from 56 to 52 deaths per 1,000. Five percent of all infants are underweight at birth. Infant immunizations have increased from the low 90s to 99 percent over the last few years.

The number of children attending primary school has also increased. Between 1996 and 2003, an average of 98 percent of Tuvaluan children attended primary school. By 2005, all children were doing so. Decreases in fertility have also been slight in Tuvalu. From 2003 to 2005, the total fertility rate of Tuvaluan women declined from 3 to 2.8children each. Trained medical staff attend 99 percent of all births on the island.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Tyler, John (Administration)

DURING THE JOHN TYLER administration, three notable events occurred that are germane to the issue of poverty. In 1841, Tyler signed the Preemption Act, which gave squatters on public lands the right of first-purchase to the land they occupied. This measure ensured that settlers living at a subsistence level could not be forced off land that they had begun to develop.

In 1844, Tyler's envoy to China, Caleb Cushing, negotiated the Treaty of Wanghia, which gave the United States commercial concessions in Chinese ports and ensured that American nationals would be held accountable to U.S., and not Chinese, laws and courts. This treaty permitted the United States to compete with the European powers in the economic exploitation of China at a time when the governance of China was becoming fragmentary. The increasing instability only increased the hardships suffered by the Chinese peasantry and urban poor.

Lastly, in 1845, the United States annexed Texas, creating the first significant Latino minority in the nation's population. Tellingly, there was more concern over whether slavery would be permitted in the new state than over the much-reduced economic, political, and cultural standing of the new Mexican-Americans.

John Tyler was born on March 29, 1790, in Virginia and studied law at the College of William and Mary. He was raised to believe in states' rights and strict adherence to the Constitution. Tyler served in the Virginia state legislature from 1811 to 1816, and as a Congressman from 1816 to 1821. In Congress he voted against nationalist legislation for internal improvement and protective tariffs. Tyler served as governor of Virginia for two years. He then held a seat in the Senate from 1827 to 1836. As a senator, Tyler reluctantly supported Andrew Jackson for the presidency. He then joined Daniel Webster and Henry Clay to oppose Jackson in the Whig Party.

Tyler lost a bid for the vice presidency in 1836. The Whigs nominated Tyler as vice president again in 1840. He and William Henry Harrison won that election. When Harrison died Tyler became the first vice president to ascend to the presidency. Initially there was some doubt about his legitimacy as president, but the House and Senate passed resolutions affirming his full authority.

Tyler soon came into conflict with his fellow Whigs. He vetoed two bills to establish a national bank. He also vetoed legislation to raise tariffs. The Whigs expelled him from the party and attempted to impeach him for misusing his veto powers. This attempt failed. Tyler later agreed to a more moderate tariff to protect northern industry from foreign competition, but for the most part his administration aligned with southern interests. John Calhoun joined his cabinet and the Tyler administration became strongly in favor of states rights. Congress later overrode his veto of a tariff increase.

Tyler retired to his plantation, but returned to politics when crisis arose. He attempted to avert the Civil War and served briefly in the provisional Confederate Congress. Tyler presided over relatively prosperous

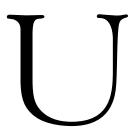

times. The issues of states' rights, tariffs, and slavery caused much controversy in these years. Tyler did not end controversy over these issues, but he did pursue the economically sound policy of free trade with great vigor. Tyler refused to allow party politics to sway his policies. This damaged his political career, but had positive results for the country.

WORLD POVERTY

UBN-PL Method

THE UBN-PL METHOD is a way to measure poverty using dual criteria for defining poverty. One criterion is unmet basic needs (UBN). Under the UBN criterion, a household is considered poor if it lacks access to any number of basic necessities such as clean water and sanitation facilities, basic education, and adequate housing. The inclusion of goods and services into the UBN criteria often depends largely on the availability of data. One significant difficulty of the UBN method is that the poverty rate depends largely on the number of categories chosen to include as basic needs: the more basic the needs selected, the more likely it is for a household to fail to meet the minimum standards for at least some of these needs.

The other criterion is the poverty line (PL). Under the PL criterion a household is considered poor if its annual income falls below a predetermined level known as the poverty line. The poverty line can be determined either through the standard food or consumption basket variant, in which the poverty line is based on the cost of purchasing a designated bundle of goods and services, or by the relative income standard, whereby the poverty line is defined as a fraction of a country's average income. It can be difficult to compare poverty lines among countries because of differences in the composition or costs of each country's food or consumption basket. International agencies have attempted to correct for this deficiency in the poverty line by standardizing definitions of what constitutes poverty. The most commonly used standardized measure of poverty is the "\$1-a-day" level, which corresponds to an annual income of \$365 adjusted for inflation and international differences in costs of living (also known as purchasing power parity, or PPP).

It can be argued that neither criterion on its own is a comprehensive measure of poverty, as each criterion on its own may identify significantly different groups as poor. For example, a household above the poverty line may live in an area with inadequate infrastructure that cannot easily be purchased despite a high income. Similarly, it is hard to argue that a household with no income is not in poverty even if many of its basic needs are met through public expenditures. In fact, in empirical studies of urban households in Latin American countries, only between 25 percent and 40 percent of households considered poor by one criterion are considered poor by the other. The UBN-PL method uses both of these independent measures simultaneously to

measure poverty by counting any household whose income is below the poverty line and/or has one or more unmet basic needs as poor. In other words, under the UBN-PL method a household is considered in poverty if it fails either criterion. Of course, measuring poverty in this way must lead to a higher incidence of poverty than by using either single method on its own. Indeed, the UBN-PL method has been used primarily for examining poverty in Latin America and has found area-wide poverty rates of 56 percent in 2000, significantly higher than PL-alone rates of around 44 percent for the same period.

Even using a combined poverty statistic like the UBN-PL method is not without problems. If both indicators point in the same direction, then household can unambiguously be considered either in or out of poverty; if the two measures give different indications, then difficulties arise. For example, a household of retired wage earners with little current income but a high level of wealth might be considered poor by the PL method and therefore also by the UBN-PL method, but an examination of the family's standard of living would clearly show them to be above any reasonable standard of poverty.

VICTOR MATHESON, Ph.D. COLLEGE OF THE HOLY CROSS

Uganda

THE REPUBLIC OF Uganda is one of the poorest countries in the world. The percentage of the total population living below \$1 a day was 82.2 in 2001. Undernourished people comprised 21 percent of the total population in 2000, a decline from 29 percent 10 years earlier. Another improvement was seen from 1990 to 2001, when the literacy rate for youth (people aged 15 to 24) increased from 70.1 to 79.4 percent. Despite these

encouraging growth rates, a number of other measures indicate a generally low level of socioeconomic development for Uganda. For example, the probability at birth of surviving to age 40 is only 41 percent (2000–05 estimates). Also, nearly half the population of Uganda lacks access to a regulated freshwater supply. It is noteworthy as well that 23 percent of children less than 5 years of age are underweight. Uganda, like a number of other African countries, has experienced a high incidence of both AIDS/HIV. Current indications suggest that the country will continue to suffer from severe poverty for years to come.

Uganda is a landlocked country in east Africa bordering the Democratic Republic of the Congo, Kenya, Rwanda, Sudan, and Tanzania. The country gained independence from the United Kingdom on October 9, 1962, following more than 100 years in a colonial status. Uganda lies in a band of tropical climate and it receives ample rainfall. Natural resources within Uganda include copper, cobalt, limestone, and salt. In addition, large expanses of arable land (26 percent of total land area) are present and hydroelectric power is generated. Agriculture is the leading economic activity in Uganda and this sector employs over 80 percent of the labor force. Chief crops are coffee, tea, cotton, tobacco, a variety of grains, poultry, and milk.

The industrial sector employs five percent of the workforce and a growing service sector accounts for an estimated 13 percent. Uganda's import-export profile is indicative of its developing country status. Exports are primarily low-value-added commodities (with the exception of coffee), including fish and fish products, gold, cotton, and flowers. Conversely, imports represent high-value-added items like capital equipment, motorized vehicles, medical supplies, processed cereals, and petroleum. Uganda's main trading partner is Kenya. Fourteen percent of Uganda's exports go to Kenya and 29 percent of its imports are from that neighboring country.

The population of Uganda is approximately 27.3 million and its rate of natural increase (RNI) is 3.3 percent (2005 estimates). The country's RNI is nearly three times the world rate and is derived from the difference between the birthrate (47 births per 1,000 population) and the death rate (14 deaths per 1,000 population). If the current RNI were to hold steady for 23 years, Uganda's total population would double to 55 million people in 23 years. An increase of this proportion would only worsen the poverty conditions already seen within the country. Infant mortality rates as well are far above world average. In 2005, 68 of every 1,000 live

births did not survive their first year. Life expectancy at birth for the total population is 52 years and the total fertility rate for women in the childbearing years (ages 15 to 45) is 6.7 children, a rate far exceeding the world average.

Poverty in Uganda is especially prevalent in the rural areas. It is here that household sizes are the greatest, education levels are the lowest, and household income levels are far below the national average. In addition, the unfortunate combination of low expenditure for healthcare and the lowest probabilities of child survival are found in the rural areas of Uganda.

GERALD R. PITZL
NEW MEXICO PUBLIC EDUCATION DEPARTMENT

Ukraine

UKRAINE IS A COUNTRY located in eastern Europe and is the second-largest on the continent, with a population of approximately 48 million. It is bordered by Russia, Belarus, Moldova, Romania, Hungary, Slovakia and Poland, as well as the Sea of Azov and the Black Sea.

Historically, Ukraine has been dominated by external forces, particularly the Polish-Lithuanian state, and later Russia. Ukraine formed part of the Union of Soviet Socialist Republics until its breakup, and subsequently declared independence in 1991. Ukraine is categorized as a lower-middle-income country with an annual per capita Gross National Income of \$970 in 2004.

Independence necessarily coincided with the withering of Russian influence and this had an immediate and serious economic impact, including energy price shocks, decreased demand from the military sector, and worsened trade relationships. These problems coincided with political instability and misrule, and together the negative impacts on the economy were severe, with Gross Domestic Product (GDP) decreasing by as much as 25 percent per annum in the early to mid-1990s. Demand for labor declined as did real wage rates, while household savings were obliterated by a blast of hyperinflation, which reached 10,000 percent. Reductions in government budgets meant that social welfare was greatly reduced and was revealed, in any case, to have many inefficiencies in targeting.

This situation has subsequently improved, with strong economic growth that, nevertheless, brought the country to only 40 percent of its 1990 GDP. By the turn of the century, 27 percent of Ukrainians were living below the poverty line and three percent were living in extreme poverty. Prospects for future growth depend on a wide range of industrial activities. Agriculture, which accounts for 12 percent of total GDP, is likely to be a leader in driving economic growth, although considerable reorganization of farming after the end of collectivization has been required.

Privatization of previously government-owned assets has also been a notable feature of recent development and has been of the usual mixed effects. Although the informal sector has grown in size and scope in the past 15 years, it has not been sufficient to offset the problems caused by both open and hidden unemployment. A considerable and largely unquantified growth in the shadow economy has also been problematic, as it leads to less work security for workers and lower government revenue because of tax avoidance, among other issues.

Poverty is most commonly characterized by large households with few members able to earn sufficient income to meet the needs of all. The elderly are particularly susceptible to poverty because of their inability to work for high income and the loss of their savings. Rural poverty seems to be no worse than urban poverty and possibly a little better through easier access to food. A particular problem is that facing those affected by the nuclear reactor emissions at Chernobyl, since poor health and forced evacuation of the town have left them with few opportunities to earn sufficient income. The Chernobyl Fund is a 12 percent levy on labor wages that acts further to depress wage rates and does not provide adequate compensation in properly targeted transfers.

Successfully tackling poverty in Ukraine will require a high level of political commitment and reform, greater roles for civil society, and dramatic increases in

corporate and governmental capacity and governance. Improvements in the regulatory structure and its policing will be required before privatization of energy networks can properly be considered.

Institutions in all sectors of the economy need to be strengthened, and issues such as free media and open and informed debate will assist in ensuring governmental and private-sector accountability. Immediate requirements for poverty assistance will likely continue to be met by overseas donations and development assistance. The Polska Akcja Humanitarna (Polish Humanitarian Organization), for example, has sent three convoy missions to Ukraine to distribute emergency relief, although actual needs far outweigh what has so far been provided.

JOHN WALSH SHINAWATRA UNIVERSITY

Ultimate Poverty

POVERTY IS THE MAIN mistake of capital. Let us examine it from two angles: the relation between material and immaterial production, and the relation that poverty has to knowledge. When these two relations fail to be grasped, poverty is ultimate misery.

The first point we should consider is how material needs began to be expressed in the abstraction that is money. Since the birth of the market (10th to 8th centuries B.C.E.), things produced (a house, a bed, a shoe) have been compared for the purpose of exchange (one house equals five beds). The need for housing can be translated into the common value of the house that will make it possible to purchase it (or the amount of money needed to buy the house). The production of an object capable of being exchanged, that is, the produc-

tion of an object with value, is called material production. Another kind of production employs labor for ends that may be termed *immaterial*. Immaterial production produces an immaterial thing, something that, even if it has the capacity of being exchanged, is not entirely identified with value. What immaterial production fabricates and exchanges is called a service (all service of assistance can be an example).

So, apart from material production (the production of things), there is a kind of immaterial production, which consists of productions of service (for example communication services, caretaker services, personal assistance services). Even if, originally, immaterial production produced something that could not be measured as value (Karl Marx gives the example of the piano player who produces pleasure for the audience), immaterial production is measured with value and produces value.

Immaterial labor often creates the material situation that we understand as ultimate poverty: the wealth system produces ultimate poverty in that it bases its core productive mechanism on taking away the individual's time of life to convert it into a time of labor, which no longer serves the interest of the individual. Capitalist production disguises this stealing process by letting its productive mechanism remain abstract, that is, by setting ungraspable relations between its workers and their products.

The function of capital—if we assume its core mechanism to be the production of surplus, of that "occult quality of being able to add value to itself," as described by Marx; that part of production which is not absorbed but stored for the following process; that part of the production process on whose anticipation the entire engine rotates—is to let the capacity of the individual separate from his self-actualization. Ultimate poverty is the continuous production of lives, whereby the enjoyment of life is taken away to increase the time of labor reaped.

The abuse and misuse of individual self-actualization operated by capitalism are reflected in all the *a priori* forms of knowledge. A *priori* forms of knowledge are those forms of knowledge whereby the separation occurs between manual and intellectual labor. The first separation of manual from intellectual labor is marked by the birth of the slave, in turn connected to the birth of money (coinage). It is reflected in the first *a priori* forms of knowledge given birth by Western metaphysics in the 8th to 6th centuries B.C.E.

The origin of this separation and the establishment of *a priori* forms go together: the birth of money, as first general equivalent form (680 B.C.E.), also marks the

birth of abstract thought. This separation—of manual from intellectual labor, of mind from body, of abstraction from materiality—defines the space of an appropriation. This appropriation (for example, of the body of the slave by the mind of the master) goes together with exploitation.

It is exploitation because it sets unequal relations: the capacity of the slave for self-actualization is in the hands of the master. The slave, embodiment of money and cipher of the separation of intellectual from manual labor, expresses also the loss, on the part of labor, of its social character. The original social character of labor becomes single, an individual identity, and, as such, it can be appropriated. This single labor becomes a commodity, which can be appropriated by someone else. The expropriation of collective labor occurs thus for the appropriation of someone else's productive capacity. Aristotle defines the slave as the one whose capacity of self-actualization is the property of someone else.

Ultimate poverty is the fiercest decomposition of the collective mode.

The appropriation of someone else's capacity for self-actualization and his or her definition of life coincides with the breaking of collective labor into individual labor; this appropriation coincides with the separation between manual and intellectual labor, as well as with the separation of the material production of things from the knowledge of this process. Today's production casts us in a system of abstraction, whose main feature is the decomposition of modes of collectivity as a consequence of the exchange processes of commodities.

Ultimate poverty is the fiercest decomposition of the collective mode that belongs to us all. If capitalism's ultimate poverty is the decomposition of this collective mode, the new establishment of a body of slaves, the perpetual production of an abstract knowledge unable to express its source, we should empower the poor with forms of self-actualization, with the production of material knowledge made of bodies, minds, and lives.

Margherita Pascucci, Ph.D. New York University

Underclass

FIRST COINED BY the European economist Gunnar Myrdal to acknowledge the increasing polarization of American society and the marginalization of poor people, the classification *underclass* has since been used in a pejorative or favorable fashion to describe a subset of the urban poor. From a cultural or behavioral perspective, the term refers to a group whose norms of conduct are at odds with mainstream values of work and personal responsibility. It is incorporated into a structural thesis to describe the chronically disadvantaged who are socially and physically isolated in areas of concentrated poverty and who lack the skills or opportunities to be gainfully employed.

In the late 1970s and into the 1980s, academics on both sides of the ideological spectrum embraced the term and attempted to substantiate their claims with some forceful arguments. These theoretical and conceptual distinctions echoed similar considerations from earlier decades. Efforts to distinguish between the deserving and nondeserving poor have had a long and varied history in the United States and elsewhere.

In Great Britain, the Poor Law enacted in 1601 allocated alms based on distinctions between those who were able but unwilling to work and the sick, aged, or very young who were considered to be victims of their circumstances. In the United States, recent welfare debates, which began in the 1960s, have centered on how to make the poor more accountable. These kinds of distinctions began to cloud discussions of the underclass following reference to the concept in a *Time* magazine article published in 1977.

On the left, W.J. Wilson made use of the term to highlight the growing disparity between the working middle class and the chronically jobless, urban minority groups who were being permanently excluded from the labor market because of inferior marketable skills or lack of work experience. C. Murray and others epitomized the arguments on the right by referring to the underclass in terms of cultural inadequacies and a predilection for idleness and deviance.

The academic community remained divided on its interpretation and application of the term and few empirical efforts were advanced on either side to operationalize it. Increasingly, the concept became so charged that academics in the United States began to shy away from using it altogether. However, it did not fall out of favor. Journalistic interpretations of neighborhood decline, civil unrest, or deviant behavior in urban areas were often laced with the term, and throughout the 1980s and early 1990s, one can find many accounts of the underclass in the popular press. The vast majority of these accounts take a decidedly negative bent and the term became a catchall phrase for nearly anyone who was poor and lived in the inner city.

The vast majority of these accounts take a decidedly negative bent.

Whether or not the term will reappear in academic discourse is debatable. The economic boom of the 1990s and the U.S. federal government's efforts to revamp the welfare system contributed to a reduction in the jobless rate in high-poverty neighborhoods. Should we witness significant erosion in these numbers and a concomitant decrease in the quality of life in many inner cities, it might reappear. Maybe this time it will become better defined and more easily interpretable.

JIM QUANE HARVARD UNIVERSITY

UNDP Regional Project for Overcoming Poverty

THE REGIONAL Project for Overcoming Poverty, initiated in the late 1980s and administered by the United Nations Development Program (UNDP), is a project designed for improving the living conditions of the poor. It was first applied in various countries of Latin America and the Caribbean.

The distinguishing feature of this project is the practical application of the combined methods of poverty line (PL) and unsatisfied basic needs (UBN) for determination, measurement, and description of poverty. The poverty line method is used primarily to identify the poor and estimate poverty incidence and gaps, while the UBN indicators were used mainly for poverty profiling and targeting policies.

The poverty line means the income of an individual or group of individuals (household) is below the level where they cannot afford to purchase all the resources like food, goods, and services that they require to live. Based on the buying power of the individuals of a basket of basic food and nonfood needs, the PL approach in the project established parameters and constructed a poverty line.

Using the UBN method, the UNDP Regional Project for Overcoming Poverty measured poverty in terms of people's access to basic necessities, including food and nonfood goods, as well as basic social services such as health, education, water and sanitation, and housing. Under the unsatisfied basic needs approach, the project evaluated the presence of household variables such as school-age children (ages 6 to 12) who are not attending school, critical overcrowding (three to four persons per room), inadequate housing (type of housing), housing that lacks basic services, lack of a water closet (sanitary conditions), and high economic dependency.

In Latin America the UBN exercise found that a large number of people were sharing a room, people lived in improvised or inadequate housing, they had inadequate water supply and inadequate sewer systems, they had a low school attendance for children, and they exhibited low household capacity to generate sufficient income.

The UBN approach not only involved the selection of a certain number of needs, the definition of minimum criteria to satisfy for each need, and the combination into poverty indexes, but also it tried to examine other factors, such as lack of participation in collective decisions, social marginalization, and discouragement.

The unsatisfied basic needs approach enabled the UNDP Regional Project for Overcoming Poverty to analyze the long-term problems and create poverty maps. It was especially useful in the formulation of poverty-relief social policy.

Based on its findings, the project has defined poverty as a state that makes it impossible for an individual or a family to satisfy one or more basic needs and to participate fully in the life of society. Using the combined UBN-PL method of measuring poverty, the project tried to estimate the number of people living in poverty in Latin America and to forecast the state of poverty for 1986, 1990, 1995, and 2000.

In 1989, the UNDP Regional Project for Overcoming Poverty had published a three-volume set of reports with recommendations of appropriate technologies for developing societies, collected around the world by United Nations researchers. In particular, they included multiple components related to housing for the poor, social services, employment and income generation, community building, and local development programs, including agroforestry.

To efficiently implement these activities, the project organized and actively involved the local population. Through the project, local leaders and micro-producers were trained and provided with technical assistance, which enabled them to transform into entrepreneurs. The project also ensured appropriate financing for the production of commodities and services.

Unemployment

UNEMPLOYMENT IS A situation in which there are a greater number of people willing to work for a prevailing wage than there are jobs being offered. As such, un-

employment can be economically described as a surplus in the labor market. The size of unemployment is measured by unemployment rate, which is a ratio of total unemployment to the total labor force, where the latter is the sum of employed and unemployed. We typically count an individual who is 16 years of age or older, is not institutionalized (at school, in military service, retired), did not work a for particular period specified in national legislation (for example, one week), and seeks a new job as unemployed.

Since long-term mass unemployment had not existed prior to the Great Depression, economists treated the surplus in the labor market as one particular application of the general economic phenomenon—surplus of quantity supplied over quantity demanded. Only in the second half of the 20th century did unemployment policies, policies specifically designed to fight unemployment, reach the status of a major political and public concern, as the impossibility to find a job is indeed a reason for economic hardship among the masses of people.

The historically most widely used solution to unemployment cannot often be used today.

Unemployment rates in some industrialized countries of Europe are in the double digits, and some groups—youth, minorities, school dropouts—are hit severely, with unemployment rates within their groups reaching over 20 percent or more. This political and emotional aspect of the problem, however, does not change anything in the economic nature of the issue. Somebody is willing to work for an existing wage and there is no job available.

The surplus of labor exists because, for the existing supply of and demand for labor, the wage is too high. A crucial part of the problem is that some firms simply cannot afford to pay such a high wage and hence do not demand new employees. If the wage dropped, new jobs would become profitable for firms and the unemployment would disappear. Hence the most obvious recipe for elimination of unemployment is the decrease of the wage.

In today's reality, this solution may be quite difficult (labor unions and minimum wages are often mentioned as examples of these obstacles), and thus the most obvious and historically most widely used solution to unemployment cannot often be used today. In the past ,though, wages always declined during the time of high unemployment and economic crisis, which enabled firms to cut the cost, overcome economic problems, and create new jobs.

The Great Depression was the first major crisis in which wages in real terms increased as a deliberate objective of public policy that demonstrated a new situation in the labor market—the old remedies became impossible to be used anymore.

ELIMINATING UNEMPLOYMENT

If the wage cannot go down, is there any other way the problem of unemployment can be tackled? It is possible to identify two additional general sets of factors that could enable unemployment to be eliminated. The first is to increase the demand so that supply equals demand. How can this happen? We can generally point to the effects of a higher efficiency of production. However, this cannot easily be legislated. We can witness it though in every prosperous economy: entrepreneurs seek better efficiency to reap profits, and as a result demand for labor rises and wages go up.

The remaining factors capable of eliminating unemployment come from the supply side of the labor market. If supply of labor decreases so that it intersects the demand, quantity of labor supplied will correspond to the quantity of labor demanded. This reduction of the supply of labor can be caused by such factors as war, epidemics, net emigration, early retirement, and the raising of the age for compulsory school attendance.

There is no viable substitute for the old solution to unemployment.

Though unemployment can be reduced or eliminated in this way, such events can hardly help to elevate the standard of living. It is obvious that if fewer people work at any wage rate, less is produced, and consequently less can be consumed. The latter-mentioned supply-side factors, which make the labor force scarcer and would lead to an increase in wages (for those who remain in the labor force), can be controlled by governments or legislated.

As a result, fewer people work in those countries where governments are more active in this respect: only slightly more than 55 percent of the working-age population in Italy are employed (in France the corresponding number is 60 and in Germany 65), whereas in the United States it reaches more than 70 percent.

We can conclude by saying that there is no viable substitute for the old solution to unemployment—lowering of the existing wage to make employment of additional people cheaper.

It seems, therefore, that economic logic would call for flexibility of wage rates as the only existing means toward unemployment elimination. Empirically we can witness higher unemployment rates in those countries with more obstacles toward wage decreases—such as the European Union countries—and lower unemployment rates in those with more flexible labor markets, which is what mainstream economic logic would predict.

UNEMPLOYMENT BENEFITS

There is yet another major means of governmental involvement that is designed to tackle the issue of unemployment—unemployment benefits. They are put in place with the objective to help the unemployed to overcome economic hardship associated with unemployment but give birth to one unintended effect economists cannot overemphasize. As unemployment benefits change costs of unemployment—it is getting easier and cheaper to live without having a job—people do not try so hard to find a new job as before. A model of reservation wage depicts the situation.

Everybody without a job has a reservation wage—a minimum wage that she will take as a condition for accepting a new job. Typically, at the beginning of the unemployment period, one has very high expectations regarding the size of salary for which one would be willing to work again. As time passes, the reality of the job market and the financial pressure of the situation adjust expectations—reservation wage decreases with the passage of time.

At the same time, the longer one searches for a new job, the better job one can possibly find. Thus, these two considerations determine an optimal length of unemployment. With the addition of unemployment benefits the reservation wage changes—one becomes choosier. Paradoxically the government then attempts to help unemployed people, causing more people to be unemployed, which consequently leads governments to provide more unemployment benefits, which again causes more people to be unemployed, and so on.

We can thus witness a spiral that starts with government efforts to help the poor, for example, by preventing declines of wages or instituting minimum wages; this reduces the number of jobs firms can create and causes unemployment; governments respond by pro-

viding unemployment benefits; this prolongs and hence increases the number of unemployed people; this pushes up the size of public budgets; higher budgets typically lead to more government employees to administer the programs of relieving unemployment, developing new programs with the aim to fight unemployment, such as early retirement schemes; this increases the public sector and reduces the private sector, hence diminishing the number of people producing wealth and causing the standard of living to decline or not expand as much as it possibly could. A lower number of new jobs is created or new jobs in the private sector are not created at all. If one loses a job, it is becoming more and more difficult to find a new one.

LONG-TERM UNEMPLOYMENT

An illustration of this fact is provided by development in Europe during the last quarter of the last century. Long-term unemployment rapidly increased. In Italy some 60 percent of the unemployed were without a job for more than a year; in Germany it was about one-half; in France, it was more than 30 percent. If we add people who are unemployed for more than six months (but less than one year), the numbers increase still further. Long-term unemployment—defined typically as a share of unemployed people who remain unemployed for more than six months—reaches some 75 percent in Italy, 65 percent in Germany, and 55 percent in France.

If one loses a job, it is becoming more and more difficult to find a new one.

The corresponding figure for the United States would be some 20 percent during economic crises, but typically much lower, with decreasing real wages. There are obviously not only direct economic costs stemming from long-term unemployment. Besides not creating wealth when working, people's skills (much more today than in the past) become obsolete and future employment is more difficult; people affected by long-term unemployment suffer emotionally, losing social contacts and self-respect.

Thus, there is the danger that the unemployed would become permanently dependent on state give-aways and form a class of benefit consumers. It becomes in their best interest to cast a vote in democratic states for still more redistribution and more benefits. It may aggravate the problem of dependency and poverty.

EMPLOYMENT CLASSIFICATIONS

Economics textbooks often classify unemployment as frictional, structural, and cyclical. Frictional unemployment involves people who are temporarily between jobs, who quit or were fired, and are looking for a new job. This kind of unemployment is on the one hand reduced by better technologies, such as the internet, which provides easily accessible information, shortening the period needed to figure out what jobs are demanded by firms; on the other hand unemployment benefits cause this unemployment to lengthen, as explained by the reservation wage model above.

Unemployment becomes structural when there is no overall shortage of job openings but there is a mismatch between the skills required by employers and those possessed by people seeking work, or if there is a geographical mismatch. Though difficult for some people involved, such a situation is the result of economic dynamism that forces people to adjust, to improve their skills and qualifications, which consequently contributes to efficient production and a rising standard of living. One has to realize in this respect that the overall objective of economic life is not to work per se or have a stable job, but to participate in the production of useful and cheap goods that are demanded by consumers.

Production structure must respond to the changing structure of consumption. Only when resources including human labor are not wasted in the production of something nobody really wants—though produced by the old, well-mastered, modes of production—but satisfy consumer needs, then the standard of living can increase and more people can be lifted out of poverty. Only then can wages of employees continually go up, giving more people a chance to buy things they need to increase their well-being. No static society with "job security" ever worked as well for the masses of people as societies with structural unemployment—societies where people sometimes lose their jobs, find their skills obsolete, and have to retrain themselves—get new skills or acquire better education.

Cyclical unemployment refers to recurring increases of unemployment accompanying downturns in economic performance. To explain this phenomenon one would need to address the complicated and unsettled problem of causes of economic crisis. Marxists, for example, believe that economic crises—and thus cyclical unemployment—are necessary defects of capitalist economies emerging as a result of exploitation of laborers; Keynesians and many of their followers also believe that crises are necessary features of a capitalist econ-

Sometimes, for the unemployed, the longer one searches for a new job, the better job one can possibly find.

omy as a result of insufficient buying power in the hands of the population and have to be prevented by governmental countercyclical policies involving unemployment benefits, among other measures.

More and more scholars today would claim that most of the undesirable effects of crises are caused by governmental policies themselves and are simply unintended consequences of perhaps honest attempts to prevent unemployment and its hardship. A reservation wage model explaining why duration of unemployment increases is only one example of these effects. In any case, irrespective of the causes of cyclical unemployment, there are only three sets of factors that can eliminate it in any given situation—decrease of wage rate, shift of demand, or shift of supply. Unemployment is still a mere surplus of people willing to work for an existing wage. As explained above, dropping the wage rate seems to be the only viable short-term solution. With people back to work producing wealth, economic progress can then in the long term take care of the increase of their salaries and lift their standard of living.

Economists often refer to such a typical long-term unemployment rate, that is, a rate whereby people are not without jobs because of economic crises (cyclical unemployment is zero), as a natural rate of unemployment. Frictional and structural unemployment would then be two major components that would qualify as natural unemployment. A general consensus among economists is that mostly through governmental policies that make unemployment less costly more people are "naturally" unemployed, that is, the natural rate drifted in the 20th century upward in the United States and more in the European Union countries, such as Germany and France.

From this point of view, neither new technologies, computers and robots, nor globalization, neither free trade nor immigration, can cause a shortage of jobs. All these processes, like similarly important changes of economic structure in the past, such as new machinery, and factory production, merely change the structure of jobs. They free people from occupations that can today be performed better by somebody else or something else.

We would never have been able to live such prosperous lives in the West today if we still were mostly farmers as our ancestors were. Fortunately most of them lost their jobs. They became available for other useful jobs because technology and machines did the work in agriculture people had to do before. They did not end up as unemployed. They became industrial workers, service providers, bankers, doctors, or scientists, producing goods and services that as farmers they were not able to deliver.

The same process continues today. Some people have to lose their jobs because there are already cheaper ways to get the same goods and services. And again they are made available for other jobs to be done.

Unemployment Insurance

UNEMPLOYMENT insurance can provide a powerful way to fight poverty by providing income security to those who have involuntarily lost their jobs and face a precarious financial situation. Nonetheless, unemployment insurance can only be available for the formal job sector, and those working in informal sectors are more likely to experience poverty and not be covered by programs such as unemployment insurance. The International Labor Organization estimated in a 1998 report that about 150 million people are unemployed throughout the world, and only about 25 percent of these people benefit from unemployment insurance.

Unemployment insurance programs are most commonly found in Organization for Economic Cooperation and Development (OECD) countries, though the role of unemployment insurance is expanding in many middle-income developing countries as well. Striking the appropriate balance between income security and employment incentives is an important part of a poverty-fighting strategy.

Governments must consider many factors when designing unemployment insurance schemes. These include the level of unemployment benefits, which are typically defined in terms of the replacement rate of pre-unemployment income. Also, the duration of benefits must be decided, as well as the extent of coverage in terms of what percentage of unemployed people will qualify to receive benefits. Governments can also design employment protection legislation to make it more difficult for companies to fire their workers.

Economic theory points to several advantages from unemployment insurance. First, people are generally happier to experience consumption smoothing, in which the level of consumption they enjoy does not fluctuate too much from year to year. Unemployment insurance helps to provide this smoothing effect by replacing a certain amount of income lost due to involuntary unemployment, in exchange for the worker or employer paying small insurance premiums while the worker is employed.

Another important benefit of unemployment insurance is the potential for improved efficiency provided by the cushion of support to unemployed workers so that they have a greater opportunity to find the most suitable job match. The overall production of the economy is increased when workers can take the time to find a job that best matches their skills and talents, rather than be forced to accept the first available job opportunity.

However, there are also potential disadvantages to providing unemployment insurance, which result in decreased overall employment and work effort among the working-age population. As with many government programs designed to improve society's welfare, policymakers must strike the appropriate balance between efficiency and equity in their unemployment insurance scheme. The problems created by unemployment insurance relate to adverse selection and moral hazard, which result from the different information held by insurers and their clients about the likelihood of the client becoming unemployed. If unemployment insurance is voluntary, the people who buy insurance are those who realize they are more likely to become unemployed. This is adverse selection. Additionally, moral hazard results from insured people behaving in ways that make it more likely for them to lose their job, and it can be quite difficult for the insurance provider to determine whether their customer's job loss was voluntary or involuntary. In fact, private markets rarely provide unemployment insurance for these reasons.

Government provision of unemployment insurance can solve the adverse selection problem by requiring everyone to participate. But the government cannot fix the moral hazard problem, as any provider of insurance can only try to limit moral hazard by finding the appropriate balance of program parameters. The parameters most relevant for controlling the moral hazard problem include the level and duration of unemployment benefits.

MORAL HAZARD

As the replacement rate of unemployment benefits to employment earnings increases, recipients will be better able to endure unemployment without suffering from poverty. As the period of duration increases, then recipients will also have a longer period to collect benefits and find another job. But increased generosity for these parameters is what leads to a larger moral hazard problem and less overall work effort. Empirical studies of unemployment insurance are not entirely conclusive, but many studies have found evidence of moral hazard. As replacement rates and benefit duration increase, unemployment also tends to increase. Questions also remain as to whether more generous unemployment benefits can lead people to stay unemployed so long as to find it difficult to reenter the workforce, or whether unemployment benefits increase the natural level of unemployment associated with an economy producing at its full potential.

The results of such studies have convinced policy-makers in a number of countries to reduce the generosity of unemployment benefits in recent years, in terms of both the replacement rates and duration of benefits. Unemployment insurance can be an important tool for reducing poverty, but policymakers must work to strike the appropriate balance between efficiency and equity when designing schemes to meet the needs of their countries and to reduce poverty.

a richer appreciation of the needs of children and of ways to uphold their rights.

The early years of UNICEF's existence were primarily devoted to providing relief for children in Europe; so much of the continent had been destroyed or damaged during World War II (1939–45). This relief included food, clothing, and healthcare. In 1953, the success of the early operations persuaded the United Nations (UN) to extend UNICEF's mandate indefinitely so that it could become a permanent part of the UN. At the same time, UNICEF started a global campaign against yaws, a disease then affecting millions of children, but which can be treated with penicillin.

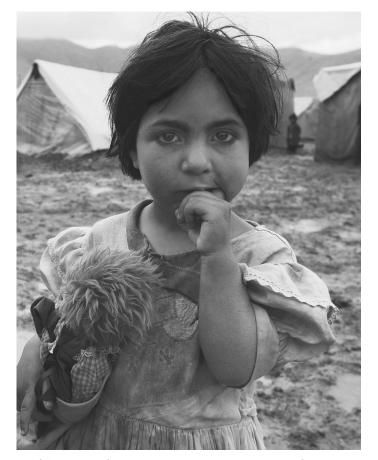

The following year, the movie star Danny Kaye became UNICEF's first ambassador at large, traveling the world to promote its message and assist in facilitating its work. The popularity of celebrities from different fields makes them well qualified to raise the profile of issues that UNICEF might wish to promote. Dozens of prominent celebrities have subsequently been appointed ambassadors at the international, regional, and

UNICEF

THE UNITED NATIONS International Children's Emergency Fund (UNICEF) is an international relief organization created as part of the United Nations in December 1946 to provide relief specifically for children around the world. It is currently active in 157 countries and territories around the world.

Its mission is to "defend children's rights, help meet their basic needs, ensure their survival and increase their opportunities to flourish; rally political will to invest in the well being of children; respond to emergencies and strengthen the ability of children and their families to handle crises, including armed conflict, natural disasters and HIV/AIDS; assist countries in transition to protect the rights of young people and to provide vital services to children and their families; advance equal rights for boys and girls and encourage their full participation in the development of their communities; and work toward the human development goals adopted by the world community and the peace, justice and social progress enshrined in the Charter of the United Nations."

This mission statement has broadened considerably as UNICEF has matured as an organization and come to

local levels. Whoopi Goldberg, Sir Roger Moore, David Beckham, Jackie Chan, Lucy Liu, and Manchester United Football Club are all among the diverse list of individuals and organizations who have been enlisted as UNICEF ambassadors. The position is held to be very prestigious and entails considerable responsibility for public behavior and image.

UNICEF was instrumental in framing and promulgating the 1959 Declaration of the Rights of the Child, which built on the 1924 Geneva Declaration of the Rights of the Child. This is based on 10 separate principles, which are justified because "the child, by reason of his physical and mental immaturity, needs special safeguards and care, including appropriate legal protection, before as well as after birth," and because "mankind owes to the child the best it has to give."

The principles include the right to a name and a nationality, the right to social welfare, the right to compulsory free education at least at the elementary level, the right to freedom from trafficking, and the right to be the first to receive relief. Enshrining human rights in this way lays a responsibility upon governments to ensure not only that they are upholding these rights for their own children but also that they do what they can to ensure rights are upheld. The responsibility also lies upon individual people, when they have the ability to choose their government, to choose a government that is able and willing to deliver appropriate social services and welfare to all children, irrespective of race, color, creed, status or any other demographic criterion.

In 1961, UNICEF broadened the scope of its actions from health services to a more holistic approach to the welfare of the child, including education in particular. This focused at first on teacher training and support and provision of classroom equipment in newly independent countries. The process of decolonization following World War II meant that many countries across Africa and Asia were coming to terms with supporting their own public services.

Cold War activities by the United States and the Soviet Union led to many countries being influenced to follow certain political ideologies in return for material support. UNICEF, as a member of the independent development community, had an important role in helping states provide educational services to children without having to abide by political conditionality. In 1965, UNICEF was awarded the Nobel Peace Prize for "the promotion of brotherhood among nations."

In his acceptance speech, Executive Director Henry Richardson Labouisse described the difficulties facing children in the 1960s: "The hard reality is that, in more

One of UNICEF's goals is to provide relief for children who are orphaned or made vulnerable by AIDS.

than 100 developing countries of the world, the odds that confront the average child today are still overwhelming. They are four-to-one against the child receiving any medical attention, at birth or afterwards. Even if he survives until school age, the chances are two-to-one that he will get no education at all; if he does get into school, the chances are about four-to-one that he will not complete the elementary grades. Almost certainly he will have to work for a living by the time he is 12.

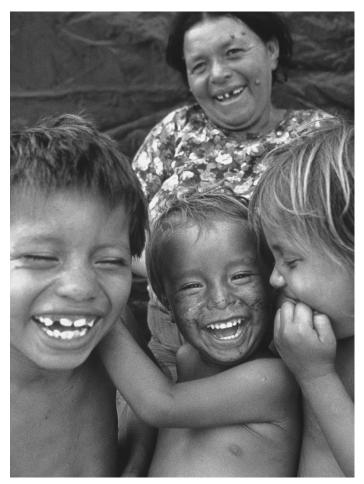

"He will work to eat, to eat badly and not enough. And his life will, on the average, end in about 40 years. Such statistics make us face the staggering waste of human energy and talent that drains, year in, year out, the very nations which need them the most."

The situation at the end of 2005 showed considerable improvement, and the Millennium Development Goals, if achieved, will show further progress. However, there are still countries where the treatment of children is very abusive and others in which warfare and violence are significantly worsening children's lives and opportunities.

The International Year of the Child in 1979 provided an opportunity around the world for individuals, organizations, and governments to reaffirm their commitment to children's rights and to celebrate children's lives and achievements.

The breastfeeding code that was adopted in 1981 brought UNICEF, as well as the code's sponsor, the World Health Organization, into some conflict with the corporate world. The International Code of Marketing of Breastmilk Substitutes brought to public attention the deaths that had resulted from improper use of prepared milk products in the developing world.

The following year, in 1982, UNICEF launched a new drive for children's health that focused on four main areas: growth monitoring, oral rehydration therapy, breastfeeding, and immunization. These are low-cost and comparatively low-technology techniques that nevertheless have saved many lives around the world. Five years later, the UNICEF study Adjustment with a

Part of the UNICEF mission around the world includes "advancing childhood, advancing humanity."

Human Face brought conflict with the International Monetary Fund and the World Bank, which were promoting their loan programs under the conditionality imposed by Structural Adjustment Programs. These were criticized by many for the unfairness of their provisions for the less well-off and also because of the inappropriate way in which the same solutions were applied in so many different countries, despite the very obvious differences in social and economic conditions. In the following years, UNICEF again broadened its scope for debate and advocacy in addition to its continued emergency relief, education, and outreach programs. This includes a focus on the impact of war on children and campaigns to focus and reenergize commitments to children's rights.

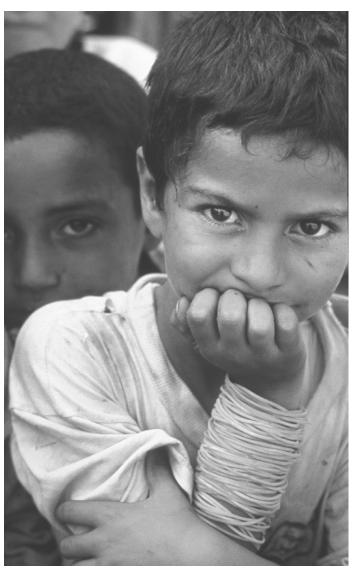

UNICEF FUNDING

In 2003, UNICEF received a total financial funding of \$1,968,539,227 from a variety of international governmental and organizational sources. Main areas of expenditure are early childhood development (34 percent), immunization (22 percent), girls' education (21 percent), and child protection (10 percent). In terms of geographical area, 24 percent of expenditures are dedicated to east and south Africa, 20 percent to west and central Africa, 18 percent to south Asia, and 16 percent to the Middle East and north Africa.

UNICEF is the world's leading children's organization and, with headquarters in New York, it mobilizes considerable amounts of resources and influence, and what some would call Soft Power. In May 2005, outgoing Executive Director Carol Bellamy was succeeded by Ann Veneman, who attracted some controversy because of her former role as secretary of agriculture in the United States, and because of a cluster of appointments to high-profile international organization leadership positions of right-wing Americans who have a track record of hostility to internationalism and to the stated aims and goals of those organizations.

United Arab Emirates

THE UNITED ARAB EMIRATES (UAE) is a country bordering Kuwait and Saudi Arabia, located on the

coast of the Persian Gulf. It consists of seven emirates, Abu Dhabi, Dubai, Sharjah, Ajman, Ras al-Kheimah, Umm al-Qawein, and Fujeirah. The national capital is located in Abu Dhabi, but the political and commercial center is in Dubai. Previously, the UAE consisted of a loose federation of mostly nomadic peoples whose desert lifestyle relied upon international trade routes passing through its territory. This changed with the discovery of oil, which inevitably changed the country's relations with the outside world, especially the United Kingdom, which had dominated it for many years. Independence was gained in 1971 and, under the vigorous leadership of Sheikh Zayed, the country embarked on a policy of rapid industrialization and social development, while maintaining the traditional conservative Islamic culture.

More than half of the UAE's population of less than four million consists of temporary migrant workers who undertake the great majority of low-paid and low-skilled work, as well as technical and professional tasks. Visa and residential qualifications are strictly handled and any migrant without appropriate sponsorship is quickly deported. This effectively prevents poverty among migrants. The citizens of the UAE enjoy an average income of \$25,300 (GNI method, 2003), primarily from oil and gas revenues.

The great bulk of petrochemical deposits lies in Abu Dhabi territory and a large proportion of the incoming funds are invested in a variety of offshore projects through the Abu Dhabi Investment Authority (ADIA). It is believed that the amount of investment made by ADIA is sufficient to ensure the continued standard of income of all UAE citizens irrespective of future oil revenues. Attempts to diversify the economy have met with only limited success, and parallel investment required of international firms wishing to participate in the petrochemical industry that creates manufacturing and service jobs is largely managed by overseas people. However, Dubai is seeking to position itself as the Arab media and technological center.

The northern emirates are not prosperous, and in the absence of oil would have remained in historical levels of poverty. However, the Abu Dhabi authorities subsidize all services, including electricity, telephone, education, and health, and also provide a high salary to anyone wishing to take an available public-sector job. The Private Loans Authority, established in 1991, provided low-cost loans to citizens wishing to finance new property. Other programs exist to ensure that poverty among UAE citizens has become completely eradicated. The only people at threat of poverty are those migrant

workers who are sponsored but in low-income posts in which freedom is limited, such as domestic workers. Islamic charities and organizations are powerful forces for redistribution in cases of need and are also significant in assisting people overseas, primarily in Islamic societies.

Human Development Index Rank: 41 Human Poverty Index Rank: Not included.

United for a Fair Economy

UNITED FOR A FAIR ECONOMY (UFE) is a U.S. nonprofit organization that is registered as nonpartisan and independent. The UFE aims to "raises awareness that concentrated wealth and power undermine the economy, corrupt democracy, deepen the racial divide, and tear communities apart. We support and help build social movements for greater equality." This is achieved through popular education, research, and dissemination of information. There are three main policy areas addressed.

The Tax Education Program aims to strengthen local and state level capacity in the struggle to maintain a progressive tax system. The Racial Wealth Divide Education Program is an outreach and educational program designed to promote knowledge about the differences in wealth among different ethnic groups in the United States. The Global Economy Program addresses the emergent issues arising from globalization and the global economy and seeks ways to help individuals and organizations have their voices heard.

The UFE has an explicit and specific belief that both the United States and the world more generally would be a better and fairer place if wealth were spread more equally and there were less financial inequality among people.

Proponents of free-market economics and certain religious beliefs contest this view, but research increasingly demonstrates the link between inequality and social ills. People who live in societies that have a higher level of equality tend to be happier and live longer than those in other societies, even other societies with higher average levels of income.

There is little common ground between the two positions.

Further, extreme levels of inequality nearly always lead to social unrest sooner or later. The UFE explains: "Our vision is of a global society where prosperity is better shared, where there is genuine equality of opportunity, where the power of concentrated money and corporations neither dominates the economy nor dictates the content of mass culture. We envision communities and nations that do not have dramatic disparities of income, wages, wealth, health, safety, respect, and opportunities for recreation and personal growth."

This belief is contested by many people who hold the position that those individuals and corporations who have power and influence do so because of their own abilities in an essentially fair marketplace. There is little common ground between the two positions.

The UFE hopes to achieve its goals through these measures: "To stop the march toward growing inequality, we must build a powerful fair economy movement that can contest the dominant economic policies and propose policies that ensure shared prosperity. There must be a stronger countervailing force to the power of concentrated corporate influence and wealth. Key elements of this movement include a revitalized labor movement and a stronger voice from religious communities and coalitions of civic organizations. We are at the early stage of such movement formation, laying the groundwork for future opportunities to promote broader political understanding and mass action."

Current campaigns involve educating about and advocating for policies to oppose the racial wealth divide, unfair tax cuts, corporate lack of accountability, reducing the level of social security, and implementing an estate tax.

United Kingdom

THE UNITED KINGDOM IS a relatively affluent country with a 2005 population of 60.5 million. It includes England, Scotland, Wales, and Northern Ireland. Its Gross Domestic Product (GDP) per capita of \$27,147 makes it the 18th wealthiest country of the 177 countries in the world, and puts it roughly in the middle of European Union countries. It originated some of the most important social, legal, and economic innovations of Western civilization. In spite of these advantages, and occasionally because of them, the United Kingdom has wrestled with poverty throughout its long history. Historically, poverty in the United Kingdom has been associated with social and political change, war, poor harvests, economic progress, and technological revolution. Different regions of the United Kingdom (England, Scotland, Wales, and Ireland) have suffered severe poverty at different times.

POVERTY IN THE MIDDLE AGES

In the first half of the 13th century, the English population grew rapidly. The increased supply of labor caused wages to fall. At the same time, the increased demand for food caused prices to rise. The poor were caught in the middle. In the decades after 1250, large segments of the poor population became "harvest-sensitive"—meaning "with each bad harvest, more of them died, either of starvation or of the diseases attendant upon malnutrition," as phrased by K.O. Morgan. Having land to work, either independently or as a tenant, gave at least some protection against the most abject poverty. Even so, some tenants were better off than others.

A study of one estate in the West Midlands area found that the poorer tenants had a life expectancy of 10 years less than tenants who had a more comfortable income. Workers on large estates were paid both in cash and with enough grain to feed their families. Other

landless workers, however, were often prey to starvation. Those who owned land, on the other hand, were in luck. The same factors that impoverished the laboring classes (lower wages combined with higher prices for food) tended to enrich the owners of large tracts of land.

By the early decades of the 14th century, however, the situation was starting to reverse itself. Bad harvests in 1315–16 and 1320–21 condemned many people to starvation. During that period, 15 percent of the population in some areas died either from famine or disease. Disease also decimated herds of sheep and cattle, especially in 1319 and 1321. Finally, several areas of England experienced catastrophic floods in 1324–26 that drowned both people and livestock. These harsh conditions, and the hardships of poverty in general, had caused people to have fewer children.

The final blow was the Black Death, a plague carried by fleas borne on the backs of rats from sailing ships. The plague came to England in 1348 and spread thence to Scotland, Wales, and Ireland, wiping out a third of the United Kingdom's population in a few years. Smaller outbreaks claimed even more lives in 1360–62, 1369, and 1375. As a result, the population growth of the previous century turned into a decline, causing a labor shortage—particularly of farming workers. At the same time that landowners had to pay more to their workers, food prices were declining and the landowners got less for their produce.

The hardships of hunger, want, and the Black Death were a terrible price to pay for a reduction in poverty, but in the end, the reduction did come and the state of the poorest Britons—at least the ones who survived—did improve in the last decades of the 14th century. Tenant farmers paid lower rents to landowners at the same time that they and other workers received higher wages, and lower food prices decreased their cost of living. Some members of the lower classes even had extra money to spare, which they used to lease more land from landowners, lend to other workers, and even build stone houses for themselves—a development that was unheard of in earlier centuries.

Just as before, the rich and poor experienced a see-saw effect. As the lot of the poor improved with higher wages, lower food prices, and lower rents, the lot of the rich worsened for the same reasons. The rich were not inclined to take such developments lying down. Then as now, "money talked." When wages began to rise after the Black Death plague of 1348, King Edward III issued a decree in 1349 "to curb the malice of servants who were idle and not willing to serve after the pestilence

without excessive wages," as quoted by Morgan. The decree mandated that wages return to their pre-plague levels and restricted the movement of workers. Parliament passed a corresponding law in 1351. However, simply passing laws could not thwart economic forces, and conditions continued to improve for the lower classes. The struggle was not over. New taxes in 1377, 1379, and 1381 sparked the Peasants' Revolt of 1381.

Lower classes in both the country and the towns rebelled by evading the taxes as well as by violently attacking tax collectors and judges. They went to London, where they demanded an end to serfdom and land reform. To make their point, they robbed the homes of government officials, broke into prisons and released the prisoners, and ransacked government buildings. Eventually, however, the revolt simply ran down and the rebels went home without achieving much except blowing off steam.

In the early 18th century, just before the dawn of the Industrial Revolution (1760–1830) in England, population growth had outstripped the land available for cultivation. The result was low wages and a dearth of jobs. Farming was still a mainstay of lower-class jobs, and its seasonal nature meant that many thousands of workers were idle for part of the year. At the same time, manufacturing work (usually textiles) was done on a small scale, with individual laborers doing piecework in their homes. Several hundred thousand workers, including many agricultural workers, were able to gain off-season income from this type of employment.

Textile work was the most common and employed about 200,000 workers, according to F. Engels: "Before the introduction of machinery, the spinning and weaving of raw materials was carried on in the working man's home. Wife and daughter spun the yarn that the father wove or that they sold, if he did not work it up himself. These weaver families lived in the country in the neighborhood of the towns, and could get on fairly well with their wages because the home market was the only one."

The 19th-century writers such as Engels tended to see the Industrial Revolution as a catastrophe for the poor, and therefore they tended to idealize the period that preceded it. Engels continued his description of the rural working class: "So the workers vegetated throughout a passably comfortable existence, leading a righteous and peaceful life in all piety and probity; and their material position was far better than that of their successors. They did not need to overwork; they did no more than they chose to do, and yet earned what they needed. They had leisure for healthful work in garden

or field, work which, in itself, was recreation for them." Engels's rosy account of rural poverty and his dark view of the Industrial Revolution—though hugely influential in the 19th and 20th centuries—were "based on the writings of the Reverend Philip Gaskell, whose earnestness and honesty are not in doubt, but whose mind had not been confused by any study of history," as phrased by T.S. Ashton. Though Engels was only 24 when he wrote *The Condition of the Working Class in England*, and he had not yet met Karl Marx, his description of life in the countryside bears an eerie resemblance to Marx's description of life under communism, except that Engels's farmers/weavers didn't also compose symphonies, do scientific research, and paint land-scapes in their spare time.

The Industrial Revolution brought poverty problems of its own.

In fact, many rural workers could not survive financially on the part-time work they were able to find, and they were chronically unable to find full-time employment. Depending on the year and the area of England, between 10 percent and 33 percent of the population needed charity or poor relief payments at some point. The problems of part-time employment were not the only factor that drove rural workers to the cities. In the early 18th century, Parliament passed laws supporting the "enclosure movement," which turned common lands and pastures over to nobles and other large landowners. Previously, these lands had been open to use by anyone. Many tenant farmers and other laborers had used them to earn extra income from farming or livestock. Once the lands became the private property of the wealthy (through a process similar to privatization in the late 20th century), lower-income classes were deprived of that income.

As a result, some small farmers had no way to earn a living except to go to the cities and seek factory work. Many rural workers at last despaired of finding work in the countryside and headed for the cities. London experienced a large influx of such workers, but high food prices drew spending away from other goods and reduced employment opportunities in urban areas as well. The beginning of the Industrial Revolution around 1760, combined with another slight decline in the population, reduced the severity of poverty and unemployment in the cities. However, the Industrial Revolution brought poverty problems of its own—new and,

in some ways, even worse than those that the poor had faced in the countryside.

THE INDUSTRIAL REVOLUTION

At the same time that workers were migrating to the cities, economic and technological developments made manufacturing labor more productive, thus lifting many people out of the worst levels of poverty. In particular, joint-stock companies (the precursors of modern corporations) allowed the concentration of capital needed to set up factories that produced more goods faster than was possible when workers toiled alone in their homes. New technologies made mass production more feasible. Finally, improvements in communication and transportation created larger markets for manufactured goods through foreign trade. These productivity improvements and wider markets created new jobs and more opportunities for the poor to avoid starvation.

The lot of the urban poor was far from sunny. Flooded with workers from the countryside, the cities became overcrowded and unsanitary, with open sewage often running alongside narrow streets. Factories were also crowded and often dangerous, hours were long; wages were low, and workers had few if any rights. "Everything which here arouses horror and indignation is of recent origin, belongs to the industrial epoch," wrote Engels, as horrified by the Industrial Revolution as he had been delighted by the lives of the rural poor. The London Times reported in 1843 that "within the most courtly precincts of the richest city of God's earth, there may be found, night after night, winter after winter, women—young in years, old in sin and suffering, outcasts from society, rotting from famine, filth, and disease. Let them remember this, and learn not to theorize but to act. God knows, there is much room for action nowadays."

On balance, however, the Industrial Revolution benefited most poor Britons. Work was hard, but factory laborers usually earned more than they could have if they had stayed in the countryside. Partly because writers such as Engels and newspapers such as the *Times* publicized them, the problems of overcrowding and sanitation were eventually worked out, even if imperfectly, by a combination of economic forces and legislation.

THE POOR LAWS

During the same centuries that the lot of low-income Britons waxed and waned, Parliament passed a series of laws to help the poorest citizens. In 1601, it passed the Act for the Relief of the Poor, which set the basic policies that England would follow until the 20th century. The law delegated a great deal of responsibility for poor relief to local parishes. Church officials collected taxes for poor relief and distributed help to those who needed it. In addition, the law provided ways that poor children could work and become apprentices, thus learning trades to sustain them later in life.

Help, however, was often mixed with cruelty. The worst of the abuses was the establishment in the 18th century of hundreds of workhouses where the poorest of the poor lived and labored long hours under harsh conditions. Workhouses simultaneously provided poor relief, punished the poor for their presumed sloth, and often enriched the workhouse operators. Workhouse operators charged a weekly fee to the local parish for the support of each inmate, and then kept any surplus between the fee and their actual cost of support. The operators also kept any profit from goods (usually textiles) produced by the inmates.

In 1834, the Poor Law Amendment Act set nation-wide standards for workhouses and aimed to eliminate all other kinds of poor relief. The standards did little to eliminate abuses and, instead, made the abuses into official policy. Over the next century, several laws tried to improve treatment of the poor, but workhouses and other abuses endured in various guises until the establishment of the British welfare state in the 20th century.

DAWN OF THE WELFARE STATE

Around the beginning of the 20th century, many writers and social reformers agitated for improvements in the United Kingdom government's help for the poor. Seebohm Rowntree, author of *Poverty: A Study of Town Life* (1901), found that more than 27 percent of the population of York, a large city, lived in poverty. This was a lower figure than he would have found 100 years earlier, and even those living in poverty in 1901 were materially better off than some nonpoor people of a century earlier, but that was irrelevant. Beyond the most abject inability to acquire food and shelter, poverty is a relative matter. The poor of 1901 were still in great difficulty, and their plight was more painful because they found themselves juxtaposed almost daily with other Britons, whose affluence was shocking by comparison.

The result of this agitation was a series of government initiatives that, for the first time, held out substantial help for the poor without adding a side dish of punishment for real or imagined laziness. In 1907, the

government began to provide free school meals to poor children; in 1908, old age pensions; in 1909, attempts to stimulate the economy to provide more jobs; and in 1911, the National Insurance Bill, which provided "last resort" benefits for workers who were sick or unemployed. The public, shocked by having been forced to look squarely at the poverty that had been right in front of them, generally gave its support to these measures.

The United Kingdom's welfare state advanced further in the 1940s, when the shared sacrifice of both rich and poor Britons created a sense of national unity that created support for more generous programs of poor relief. In 1942, the government commissioned the economist Sir William Beveridge to write a study of "Social Insurance and Allied Services."

Presented to Parliament in November 1942, the report argued for a National Health Service to provide free medical care, as well as expanded poor relief for families with children and government-funded housing programs, which created a million new dwellings from 1946 to 1952. The welfare state created in the 1940s remained the foundation of the United Kingdom's poor relief efforts through the early years of the 21st century.

THE EARLY 21ST CENTURY

At the end of the 20th century and the beginning of the 21st century, the United Kingdom still wrestled with poverty, but it was poverty of a different kind than had afflicted the country in previous centuries. The poorest Britons (as well as a large immigrant community living in the United Kingdom) were no longer in danger of starvation and, relative to their predecessors in the 17th century, were at very little risk of disease. The poverty rate (defined as households with less than 50 percent of the society's median income) hovered in the range of 12–15 percent, though the lot of the poor was ameliorated by the British welfare state.

Income inequality was not severe, with a Gini index of only 0.368. Average life expectancy at birth was 78.4 years, not as good as Japan's 82 years but light-years ahead of Swaziland's 32.5 years. In the early years of the 21st century, the United Kingdom finally had the luxury of trying to improve the lives of its poorest citizens instead of merely trying to keep them from dying.

United Methodist Church Initiatives

THE INITIATIVES of the United Methodist Church are numerous. Some deal with evangelism, some with social issues, while many others deal with issues of poverty. These initiatives may be started by the local congregation, by the area Conference of Methodist Churches nationally, or by United Methodist churches through their ecclesiastical connections on a continental or global basis. The United Methodist Church is a mainstream Protestant denomination that has successfully conducted mission work throughout its history. In the 20th century, the United Methodist Church has increasingly engaged in social ministries to aid the poor of the world. Charity is a long-standing practice among Christians, as is the freedom of the local congregation to take the initiative of meeting the needs of the poor locally without seeking permission.

Initiatives in effect have a spontaneous or entrepreneurial spirit that leads the members of local churches to see the deprivation of the poor and to rise to meet the challenge the poor present. Initiatives meet poverty problems with determination, energy, and a readiness to enter boldly into new ventures. Examples of initiatives at the local level occurred after the devastating Hurricanes Katrina and Rita in the Gulf Coast region of the United States in the summer of 2005. Millions of people were evacuated, and many suffered the loss of their homes, businesses, or jobs. To meet these needs for as many people as possible, local Methodist churches spontaneously organized mission actions.

For example, the First United Methodist Church of Coppell, Texas, first organized prayer meetings and then a collection of cleaning supplies along with "health kits" (that is, toothbrushes, wash cloths, and other personal hygiene items). These were then passed to locations where they were needed by floodwater victims. Some church members went to help clean up de-

bris. Examples of this relief-giving and relief work could be found in numerous other Methodist churches across the United States.

Examples of initiatives in response to Hurricanes Katrina and Rita that were at a regional level could be seen in the relief ministry organized by the West Florida Conference. In Methodist polity a conference is a group of local churches governed by a bishop, so when a conference acts there is the power of numbers applied to an initiative. The California-Nevada Conference, for example, has an emergency relief initiative ready to respond when needed. The vulnerability of children during the events of Hurricane Katrina prompted an initiative on children and poverty.

Examples of United Methodist initiatives at the national level can be found in the Bishops Initiative on Children and Poverty, efforts to address ethnic needs, or youth initiatives. Examples of the United Methodist Church's initiatives globally can be found in the General Board for Global Missions in its AIDS Ministries, Disabilities Concerns, and many more, such as the Health and Welfare Ministries, which helps Methodists to become involved globally in addressing the healthcare needs of children, youth, older persons, and mentally and physically challenged persons. It seeks to promote more than just individual healthcare. It seeks to organize community-centered primary health programs in foreign lands.

The Medicine Box is an initiative that provides 18 essential drugs and medical supplies that are likely to be needed in a community of 1,000 persons in a three-month period. The medicines are often the very basics that can make a critical difference in the survival of people in the poorest countries. Many of the supplies are donated by American pharmaceutical manufacturers and by the giving of local congregations through the encouragement of the leadership of the United Methodist Church.

Great numbers of Medicine Boxes were donated following the great tsunami on December 26, 2004. Other global initiatives include the Bishop's Appeal for the Children of Africa. The initiative provides relief and reconciliation to the many thousands of children and families who have been victimized by war. The spiritual and physical well-being of children is central in the initiative. African bishops have responded to the Bishop's Appeal for the Children of Africa with requests to pray and expressions of appreciation. Having firsthand experiences of the value of the aid, they encouraged individual American Methodists to become pen pals with Africans and encourage local congrega-

tions to continue to develop initiatives to aid the world's poor.

United Methodist Committee on Relief

THE UNITED METHODIST Committee on Relief (UMCOR) is a nonprofit humanitarian organization used by the United Methodist Church to achieve three primary missions: to provide disaster relief for natural events such as earthquake, storms, and floods; to provide refugee assistance caused by civil violence or war; and to promote and assist development that reduces homelessness, hunger, and poverty in the world.

To meet the needs of disaster victims UMCOR has a cadre of disaster relief specialists. These individuals are organized into a trained corps ready to support responses to disasters in the United States. UMCOR has the capability to rally disaster response specialists in many countries to meet disaster relief needs. This capability is a result of the global presence of the Methodist Church. UMCOR is constantly training disaster specialists from around the United States and the world. This training is a result of its partnership with the Methodist Church to be found around the world, and its cooperation with other international nongovernmental agencies. UMCOR maintains relief supplies in warehouses in various locations. These can be dispensed to locations around the globe in a relatively short period of time.

UMCOR began on April 26, 1940, when Bishop Herbert Welch called for the formation of an agency to meet wartime suffering and to serve as a "voice of conscience." The Methodist Committee for Overseas Relief (MCOR) was formed in response to his call. MCOR struggled with numerous mission issues in its

early years. However, by the late 1960s it was operating in an established manner and growing to meet the needs of impoverished people. UMCOR has expanded from its humble beginnings as a temporary relief agency into a global mission that is a permanent part of the United Methodist Church, with programs in nearly 100 countries in the world.

The organization's policies for operations are developed and supervised by a board of 18 directors who represent Methodist churches in countries around the world. It has a permanent staff to conduct operations and to handle the various monies it receives. Its main source of donations is the One Great Hour of Sharing. This offering allows it to minister to the poor in hundreds of projects in the United States and around the world. UMCOR is a legally tax-exempt nonprofit organization under section 501(c)(3) of the Internal Revenue Code of the United States.

Donations UMCOR receives from American citizens are eligible to be counted as charitable contributions. One hundred percent of all donations made to UMCOR go to the emergency project the giver designates. All revenues are audited in keeping with the accounting and auditing policies of the United Methodist Church. A special offering made to the One Great Hour of Sharing pays for the administrative costs of operating UMCOR.

UMCOR works with other agencies, including the National Council of Churches, the World Council of Churches, the Heifer Project International, and Habitat for Humanity. It promotes the development of financial independence in poor countries, especially among women, with its Credit with Education program. This program rewards women who successfully pass literacy training with financial credits that can be used to start a small business. It also addresses trade and international debt issues.

United Nations Development Program

WITH A HIGH-PRIORITY mandate to fight poverty, the United Nations Development Program (UNDP) works with people and governments in over 170 developing countries through a broad network of more than 130 offices, with the main office in New York City. UNDP was established in November 1965 when the United Nations (UN) General Assembly merged the UN Special Fund and the Program for Technical Assistance to create a new entity. Now it is the largest development organization in the world. It is governed by a 36-member Executive Board, representing both developing and developed countries, which meets annually. At the country level, the UNDP is headed by a resident representative who also serves as a resident coordinator of the United Nations System's activities for development.

A key organization in development, UNDP administers a number of special-purpose funds, including the UN Capital Development Fund (UNCDF), the Office to Combat Desertification and Drought (UNSO), the United Nations Volunteers (UNV), and the UN Development Fund for Women (UNIFEM) in addition to its regular programs. It also sponsors a global program on HIV/AIDS and takes the lead in the coordination of the United Nations Development Group.

Sometimes UNDP is described as the "United Nations' global development network" or as the "United Nations' principal provider of development advice, advocacy and grant support." Both these descriptions illustrate that UNDP is central to the achievement of international development goals and takes a holistic approach to development in general and to eradicating poverty in particular.

MULTIDIMENSIONAL CONCEPT

Poverty is viewed by UNDP as a multidimensional concept that derives from politics, geography, history, culture, and societal specificities and is linked to systems and structures of international trade, debt, and finance. Poverty has numerous complex and interlinked causal factors that make people powerless and vulnerable, such as gender discrimination, lack of employment opportunities, inadequate means of livelihood, and lack of access to healthcare, knowledge, and information. These factors are connected to power relations, policies, systems of government and structures, cultural traits, gen-

der issues, human rights, education, diet and nutrition, and health.

Through volumes of conducted studies UNDP generated new evidence of the causes and dimensions of poverty, which pushed the organization to call for a broader agenda to attack it. This agenda includes equity, social inclusion, women's empowerment, and respect for human rights, which matter very much for poverty reduction.

In order to fight poverty at its source, UNDP is now actively working with governments and civil society. It promotes partnership that involves people in planning, implementing, and sustaining activities to improve their lives. UNDP does it through helping countries to achieve sustainable human development by helping them to build their capacity to design and carry out development programs in poverty eradication, employment creation, and sustainable livelihoods, the empowerment of women, and the protection and restoration of the environment, giving first priority to poverty eradication.

MILLENNIUM DEVELOPMENT GOALS

This plan of action was charted in the Millennium Declaration signed by the leaders of 189 nations at the United Nations Millennium Summit in September 2000. They committed to a set of internationally agreed targets called the Millennium Development Goals (MDGs), which aim at reducing poverty, hunger, disease, illiteracy, and environmental degradation and combating HIV/AIDS and discrimination against women by 2015. Through the Millennium Declaration, UNDP plays a leading role by providing developing countries with consulting services and by building national, regional, and global coalitions for change.

To support this national, regional, and global coalition for change, UNDP uses many advocacy and promotional tools, including Global and Regional Poverty Reports, studies of basic social services prepared through participation in the 20/20 Initiative in partnership with UNICEF, and Human Development Reports (HDR) written by a team of independent specialists.

These advocacy tools stimulate international and national debate on key development issues, including poverty reduction, equity, gender empowerment, and human rights. At the field level UNDP produces published National Human Development Reports (NHDR) in consultation with governments, civil society organizations (CSO) and its development partners. NHDR drew attention to the national human development con-

cerns, advocated for a more people-centered approach to policymaking, and made a special effort to collect data on measures of human poverty as well as income poverty. The reports help to monitor progress and setbacks in human development and poverty at the national level.

UNDP supports making globalization work for poor people.

In many countries UNDP has been instrumental in formulating poverty reduction strategies (PRS) and Poverty Reduction Strategy Papers (PRSP), which are tools for bringing together governments, stakeholders, and development partners for a coordinated and consolidated effort to fight poverty. To make sure that the voices of the poor are heard and their needs are taken into account, the strategies have given considerable emphasis to participation by the poor in this process. This aspiration requires harmonization of the PRS and PRSP with the Common Country Assessment (CCA) and the UN Development Assistance Framework (UNDAF), which are intended to strengthen the consistency and effectiveness of the UN system's contribution to a country's development efforts.

As a part of development efforts, UNDP also participates in reforming trade, debt relief, and investment arrangements to better support national poverty reduction and make globalization work for poor people. In doing so, UNDP sponsors innovative pilot projects; connects countries to global best practices and resources; promotes the role of women in development; and brings governments, civil society, and external donors together to coordinate their consolidated efforts to fight poverty on micro- and macrolevels.

United States

SOME PEOPLE FIND it hard to understand or explain why people are poor in such a wealthy country as the United States. Poverty in the United States is a complicated subject. In order to observe it, one has to define it. Armed with a definition, one can designate which individuals in society experience it. A logical next question is, "Why are those people poor?" The level of complication rises enormously with this question. Where the poor are located is less complex, though it must rely on good data. As complicated as the question above is, the question of what should be done to reduce or eliminate poverty is even more challenging. How do genetics play in? What role should individual responsibility have? What should government involvement be? Where can an interested person read more?

WHAT IS POVERTY IN THE UNITED STATES?

According to the Merriam Webster online dictionary, poverty is "the state of one who lacks a usual or socially acceptable amount of money or material possessions"; destitution is "extreme poverty that threatens life itself through starvation or exposure." The astute reader will realize at the outset that *usual* or *socially acceptable* are rather vague terms. While these terms imply that poverty is a relative (that is, depends on the levels of other variables) concept, destitution causes one to think that it is an absolute (that is, it is fixed in terms of a known standard) measure.

The phrase, threatens life itself, leaves one little room to wonder about the levels of other variables. The 2005 Live Aid concerts from Philadelphia to Tokyo were staged to draw media attention to the absolute poverty in many parts of present-day Africa, as the Group of 8 industrialized nations' leaders met in Scotland to discuss world affairs. Absolute poverty will not disappear anytime soon. Relative poverty, by definition, can only go away if each individual has the same socioeconomic status. This also will not happen anytime soon.

If one is to do something about poverty, how does one operationalize the definition? There needs to be a statistical definition of poverty. A U.S. pioneer in that effort was Mollie Orshansky. For the most-accepted version of her poverty threshold, she used a U.S. Department of Agriculture (DOA) "economy" food plan designed for adequate nutrition with low available funds. From a previous survey by the DOA, she learned that the average family of three or more members spent about one-third of its income on food. Hence, she mul-

Size of Family Unit	Related Children under 18 years			
1 person	0	1	2	3
Under 65 years	9,827			
65 and over	9,060			
2 persons				
Under 65 years	12,649	13,020		
65 and over	11,418	12,971		
3 persons	14,776	15,205	15,219	
4 persons	19,484	19,803	19,157	19,223
5 persons	23,497	23,838	23,108	22,543
6 persons	27,025	27,133	26,573	26,037
7 persons	31,096	31,290	30,621	30,154
8 persons	34,778	35,086	34,454	33,901
9 persons or more	41,836	42,039	41,480	41,010

Table 1. 2004 Poverty Thresholds Source: US Census Bureau 2004

tiplied the cost of the food plan by three to get the income (after tax, in her view) that would be considered the poverty threshold for a family of that size. Orshansky made adjustments for different family sizes and other demographic attributes, and generated a table of 124 poverty thresholds expressed in 1963 dollars. For bureaucratic reasons, before-tax income was eventually used. A person (family) is considered poor if income falls below the threshold.

One might get the impression that "adequate diet" is related to avoiding starvation and destitution, and that the Orshansky thresholds reflect an absolute measure of poverty. If so, then does the threshold become relative as it moves through time? Some scholars argue that the answer is a definite "yes."

Economists compute inflation by comparing the money spent on a "market basket" of goods and services bought at prices in a given year and at prices in a base or reference year. The amount spent in the base year is divided into the amount spent in any given year, and the given year's price index value is computed. The amount of inflation that happens between two years is the difference in the values of the price index divided by its original value. Any amount stated in a given year's dollars (current dollars or nominal value) can be converted into base-year dollars (constant dollars or real value) by dividing by the value of the price index.

Gordon Fisher points out that the "standard budgets" at "minimum subsistence" that preceded Orshansky's thresholds, and the thresholds themselves, rose over time even though they were expressed in constant dollars. He writes, "These successive absolute-poverty lines rose in real terms as the income of the general population rose." This setting of higher absolute poverty lines over time has made the poverty line relative to the current standard of living.

Size of Family Unit	48 Contiguous States and D.C.	Alaska	Hawaii
1	\$ 9,310	\$11,630	\$10,700
2	12,490	15,610	14,360
3	15,670	19,590	18,020
4	18,850	23,570	21,680
5	22,030	27,550	25,340
6	25,210	31,530	29,000
7	28,390	35,510	32,660
8	31,570	39,490	36,320
For each additional person, add	3,180	3,980	3,660

Table 2. HHS 2004 Poverty Guidelines Source: Federal Register 2004

Several changes in the poverty threshold occurred over time, and many debates about the details remained unresolved. In 1992, the National Research Council's Committee on National Statistics created a Panel on Poverty and Family Assistance. In its report, the panel proposed new guidelines for establishing an official poverty measure. Many of these guidelines are reflected in the U.S. Census Bureau's official poverty measure: income is before-tax income added up over family members, and includes money income from work, transfer payments and other sources, plus noncash benefits such as food stamps, excluding capital gains and losses; poverty thresholds are from the list of 48 according to family size and age; there is geographic variation in the thresholds; and thresholds are updated by the Consumer Price Index. Table 1 shows 2004 poverty thresholds for up to three related children under 18 years of age. The numbers increase as the number of persons increases, but decline as the number of those persons who are children increases. The interested reader may learn her or his family member income, and compute family income for comparison to the table values updated to the year of reading this. She or he may imagine living within those values.

Parallel to the Census Bureau thresholds are the poverty guidelines used by the U.S. Department of Health and Human Services (HHS). Table 2 shows some of the recent guidelines by which the less fortunate can qualify for various assistance programs. The reader can see variations from the census thresholds, but none are overwhelmingly different.

Once it is established what it means to be poor, one can look at which groups in society suffer from poverty more than others. Although there might be a relationship between a person's poverty status and where the person lives, the question "Who is poor?" might be answered appropriately using countrywide data. There-

Characteristic	No. (in 000)	Poverty Rate (%)

Table 3. Poverty in the US in 2003 Source: IRP 2004

fore, in this section, the data used to identify the poor will not be location-specific. In 2003, the Institute for Research on Poverty (IRP) published a table showing poverty among individuals by the Official Poverty Measure. According to Table 3, 12.5 percent of the total U.S. population lived in poverty in 2003. The numbers displayed in this table are estimated values and were based on the 2003 and 2004 Current Population Surveys (CPS). Table 3 shows the numbers and percentages of different characteristics of poverty. Each characteristic will be discussed separately later in this section.

In the late 1950s, 22 percent of the total U.S. population lived in poverty, representing 39.5 million people. The poverty rate declined between 1959 and 1969 to 12.1 percent, and increased slightly to 12.5 percent by 1971. After 1978 the rate rose steadily, reaching 15.2 percent in 1983. In 2000, 31 million people were poor (11.3 percent of the population). The rate rose to 12.5 percent in 2003. Chart 1 shows a time series for the poverty rate and the number in poverty from 1959 to 2003.

Poverty data according to different types of demographic characteristics tell a revealing story. All these data were based on income below the poverty threshold in 1999. Table 3 shows that 17.6 percent of the total U.S. population under 18 years, 10.8 percent of the age group of 18 to 64 years, and 10.2 percent of the 65-and-over group are poor. A detailed age-group distribution is shown in Chart 2. It is evident from this chart that

⁺Persons of Hispanic origin may be of any race.

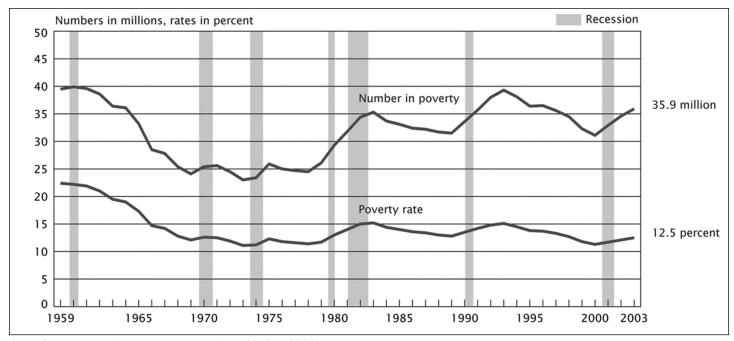

Chart 1. Number in Poverty and Poverty Rate: 1959 to 2003 Source: DeNavas-Walt et al., 2004/U.S. Census Bureau

people from age 18 to 24 years were the most highly represented among the poor. According to the U.S. Census Summary File 3, Table 89, households composed of people less than 65 years is the largest group (90 percent) that was below the poverty level in 1999. Chart 3 shows that even in that age group, households lead by a female were much larger in number (37 percent) than households led by a married couple. According to IRP, the percentage of blacks and Hispanics among the poor remained near 30 percent during the 1980s and mid-1990s, and thereafter began to fall. This

proportion dropped to 22.1 percent for blacks and 21.2 percent for Hispanics in 2000, which is the lowest rate for both groups since poverty was first measured in the United States. The percentages for the white and Asian races were 8.2 percent and 11.8 percent respectively.

Residence location is also a key dimension in characterizing the poor. The metropolitan-area poverty rate differs greatly between the people who live in a central city and those who live in the suburbs. The average central-city poverty rate was 15.7 percent in 1979 and 21.5 percent in 1993, its highest point. By 2003 it became

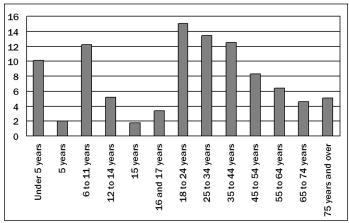

Chart 2. Percentages of Age Groups Among Poor People Source: U.S. Census Bureau 2005

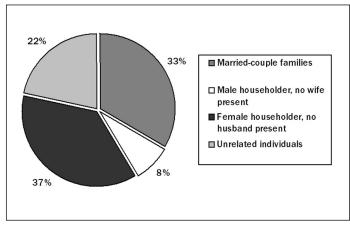

Chart 3. Poverty Among People Under 65 by Household Type Source: U.S. Census Bureau 2005

17.5 percent, almost twice the rate for the suburbs. Among the people living outside of metropolitan areas, 14.2 percent lived in poverty in 2003.

In 2003, 7.6 million families lived in poverty, and of all family types, poverty was highest among those headed by single women. According to IRP, 28 percent of all female-headed families were poor compared to only 5.4 percent of married-couple families. Again, in both categories the rate of families having related children less than 18 years old is much higher than in the other age groups.

Poverty status also varies according to the age of the householder. According to the 2000 U.S. Census Summary File 3, Table 92, for all types of family households, a significantly higher number of householders facing poverty are in the age group of 25 to 44 years. The U.S. Census 2000 Summary File 3, Table PCT51 shows poverty status in 1999 by place of birth and citizenship status. According to this table, among the people who are poor, 84 percent were U.S.-born and 16 percent were foreign-born. Among the foreign-born poor, 76 percent were not citizens while the remaining 24 percent were naturalized.

Poverty status is also linked to educational achievement. Based on 1995 census data, M.S. Litman has shown that people with a college degree faced less poverty than people with a high school diploma. People with a high school diploma faced less poverty than those without one. He also shows that people who worked full-time faced less poverty than those who worked less than year-round.

WHY ARE PEOPLE POOR?

Perhaps the least complicated division of the poor in the United States is voluntary versus involuntary. There are those who take a life-cycle approach to decisionmaking and sacrifice short-term income and wealth to invest in themselves. Economists call this incurring an opportunity cost (the value of the best foregone alternative) to invest in human capital (the composite of a person's mental and physical capabilities) for higher rewards in the future. The future costs and rewards can be compared to present costs and rewards when the choice is to be made, by computing the present value of the future amounts. Medical and other graduate students may be the most common examples in the United States. Aside from this type of investment, many individuals and families choose to forego the material benefits of higher income and wealth to adopt a lifestyle of "voluntary simplicity." For the purposes of this article, those who are poor through voluntary choice will not be considered as part of the poverty problem.

People whose resources place them involuntarily under the poverty threshold may be in that position because of biology, psychology, economic conditions, and/or the social environment. Those individuals whose mental and physical abilities are not sufficient for normal economic activity would generally have resources below the poverty threshold, if they were left to fend for themselves. Besides young children and the elderly, this group includes those who are mentally and/or physically disabled through genetics, armed, or accident. Perhaps this is the most obvious reason that some people are poor. Less obvious in explaining why a person is poor are psychological difficulties. While their brains may be anatomically intact, there may be behavioral abnormalities that prevent them from being productive members of society. Of course, among the nondisabled, there is a wide distribution of mental (including motivational) and physical abilities that have implications for earning income and accumulating wealth. There is also the prospect of receiving wealth from previous generations as inheritance.

The economic and social environments circumscribe the individual's (family's) ability to provide income resources that exceed poverty levels. Economic conditions include the general state of the economy, as represented by overall demand and supply for resources and for produced goods and services. As noted by M. Odekon, the poor find themselves continuously unable to break out of the cycle of poverty, as they cannot obtain the human capital to get and keep skilled jobs in an increasingly technological economy.

If they cannot get high-paying jobs, then they cannot escape from poor nutrition and inadequate housing coupled with inadequate school systems. Their children are virtually doomed to the same life, with little hope for their children as well. Economists note that unemployment generally falls into four categories: cyclical, frictional, seasonal, and structural. The first follows the ebbs and flows of the business cycle; the second reflects people between jobs; the third involves jobs that depend on weather, holidays, etc.; and the fourth depicts an economy that has changing demands for worker skill-sets. Those involuntarily poor who can get jobs (the working poor) are likely to be low-skilled workers who are laid off first in an economic slowdown, have seasonal jobs, or have skills that may not remain in demand in a globalized, high-tech economy. The "digital divide" has come to reflect the gap in technological skills that the poor are experiencing. As computer skills

Source: IRP 2004

become more and more necessary for employment, the indigent fall further and further behind. These conditions make it less likely that the working poor will retain jobs, and the jobless poor will find jobs that pay non-poverty-level wages. As noted below, these are exactly the demands that are increasingly being placed on them by assistance programs.

The globalized, high-tech economy has produced another effect germane to the position of the poor—the distribution of income seems until very recently to have become more unequal. The Gini coefficient, a measure of inequality in the distribution of some attribute over a certain population, takes on a value between 0 (perfect equality) and 1 (perfect inequality). The U.S. Gini coefficients of income distribution for years 1970, 1980, 1990, and 2000 were .394, .403, .428, and .462, showing increasing inequality. In 2004, however, it was .408. This is evidence that the upward trend may be reversing.

In comparison to other countries, however, even the lower number shows that the United States has a more unequal income distribution. For 2004, Germany, Japan, India, and the United Kingdom had Gini coefficients of .283, .325, .249, and .360.

The social environment may have a strong influence on individuals and families in poverty. Some may infer hopelessness from the fact that all or most of their friends and relatives cannot seem to break out of the cycle of poverty. Others may be affected by the availability of illegal drugs, or by the notion that crime is a way to obtain material rewards without building up le-

	Poverty Rate under 65 years

gitimate productive potential. Gender, ethnic, and racial groups may face explicit or implicit discrimination.

Discrimination against (for) a person is generally defined as the decision not to choose (to choose) a person, all other things being equal, based on gender, ethnicity, or race. Anticipating and/or experiencing discrimination against them can add to the frustration and hopelessness of those already in a disadvantaged position. Of course, this can be viewed as a chicken-egg problem: people who have been branded as "risky" cannot get jobs or social or political positions to show that they are competent and trustworthy. Their children have few or no role models, hence they are in this position as well, etc. Finally, one might argue that people are poor because society lets them be poor. In the United States' capitalist economic system, private property rules, and positive returns to labor and other factors depend on positive contributions by those factors. If left unfettered, this socioeconomic Darwinism will lead to the weeding out of the nonproductive and those who do not own capital and other factors. However, social philosophers such as John Locke believed that once born, people deserved some semblance of an adequate quality of life. The debate over whether the nondisabled poor should be supported will continue into the foreseeable future.

WHERE ARE THE POOR IN AMERICA?

The distribution of poor people in the United States is the result of several forces in American history. As some of these are treated in the next section, the discussion here will involve facts, not forces.

Poverty rates vary considerably within different geographic or political boundaries. They vary by state (from six percent in New Hampshire to over 17 percent in Alabama, Mississippi, New Mexico, and the District of Columbia) and by region (from 10.7 percent in the midwest to 14.1 percent in the south). Large variations can be observed among counties and municipalities. In this section, only poverty data at the state and census subdivision levels will be discussed.

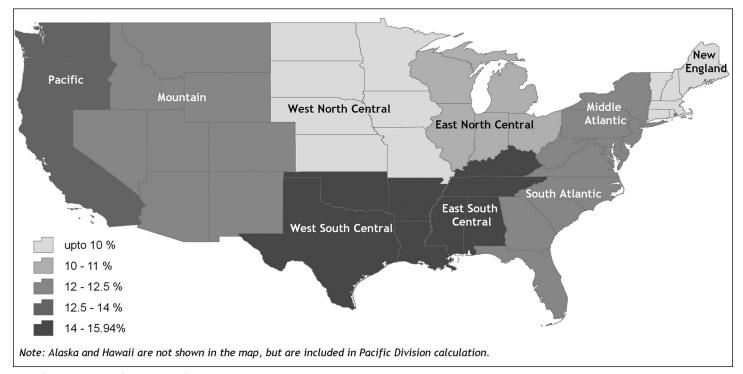

Over the years, interesting patterns of poverty rates can be observed in different states. However, state poverty rates in a single year are not very reliable. The IRP has published a table at the state level with selected three-year averages from 1991–93 through 2001–03. According to this table, the poverty rate was highest in Arkansas (18.5 percent) and lowest in New Hampshire (six percent) in the period 2001–03. In this period, the District of Columbia had the highest poverty rate six times; New Mexico had it six times; Mississippi, Louisiana, and West Virginia five times each; and Arizona, Montana, and Arkansas once each.

Sometimes, the poverty rates in adjoining states were distinctly different. For example, during the pe-

riod 2001–03, the poverty rate in the District of Columbia was 17.3 percent whereas it was only 7.7 percent in the adjacent state of Maryland.

As above, all poverty rates were calculated from the number of persons whose income fell below the poverty line in 1999. Among the census subdivisions, the poverty rate was the highest in the West South Central Division (15.94 percent) and the lowest in the New England Division (9.07 percent), based on Summary File 3–SF3. Map 1 displays five categories of poverty rates among the Census Subdivisions. Note: Alaska and Hawaii are not shown in the map, but are included in Pacific Division calculation.

Poverty data at the census subdivision level will be further discussed according to age, household type, race, and gender. The percentage of the poor is different for different age groups in the nine subdivisions. Poor people in the under-18 age group living in the West South Central Division have the highest percentage (37.5 percent) and people in the New England Division have the lowest (31.5 percent). In contrast, people 65 and over living in the New England Division comprise the highest proportion (12.4 percent) compared to the lowest (6.4 percent) in the Pacific Division. The age group of 18 to 64 makes up the highest proportion in

Map 1. Percentage of Poverty by Subdivision Source: U.S. Census Bureau 2005

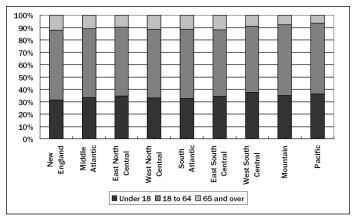

Chart 4. Percentage of Poor People by Age Source: U.S. Census Bureau 2005

all subdivisions, ranging from 53.7 in the West South Central Division to 57.3 in the Mountain Division. Chart 4 shows the percentage of poor by age in all Subdivisions.

According to the U.S. Census 2000 Summary File 3, Table 89, who makes up the poor varies by type of household in different subdivisions. Among poor people under 65 years, the percentage of poor who are in married-couple families is the highest in the Pacific Division (41.1. percent) and the lowest in the New England Division (24 percent). The percent poor that are in families with a female householder (with no husband present) is on average higher than that of other types of families. Female-headed households (with no husband present) make up the highest proportion of poor in the East South Central Division (41.9 percent) and the lowest in the Mountain Division (29.6 percent). Although the New England Division has married-couple families

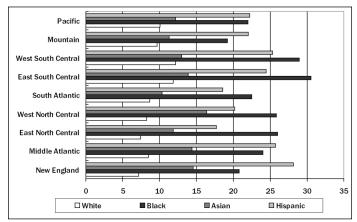

Chart 5. Percentage of Poor People by Race Source: U.S. Census Bureau 2005

as the lowest percentage of poor over the divisions, that statistic is high (40.3 percent) for families with a female householder (with no husband present). This situation is reversed in the Pacific Division, as shown in Table 5.

Percentages of the poor by race in 1999 are shown in Chart 5. From this chart, it is evident that blacks and Hispanics make up more of the poor in all the subdivisions. In the West South Central, East South Central, South Atlantic, West North Central, and East North Central Divisions the rate is higher for blacks; the rate is higher for Hispanics in the rest of the Subdivisions. Among the other races, the percentage of Asians among the poor is higher than that of whites in every division.

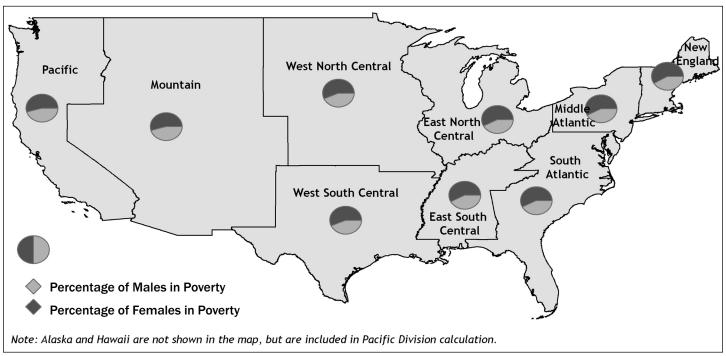

As components of the poor, the male and female genders have a distinct pattern in all the Subdivisions; females (total of all age groups) are more highly represented among the poor than males. The difference between these two percentages is the highest in the New England Division, where males make up 42 percent and females 58 percent. Map 2 shows a pie-chart distribution of percentage of poor for the male and female genders in all divisions. Note: Alaska and Hawaii are not shown in the map, but are included in the Pacific Division calculation.

It is clear that different parts of the United States face different issues when it comes to dealing with poor people. The common thread, however, is that all of these people need to eat, sleep, and think in the shortrun, while transforming themselves into productive members of society in the long run.

WHAT HELPS ALLEVIATE POVERTY?

Relative poverty, at some fraction of society's median income, will never be eliminated. However, society can virtually eliminate involuntary destitution if it has the will. Those who cannot mentally and/or physically sustain themselves will be supported throughout their lives, institutionalized or cared for in some other manner. Tackling the psychological reasons for poverty is a harder problem to overcome, as the problems are often difficult to pin down. In addition, it may not be easily determined whether the person truly has a problem or is strategically fabricating it.

Economic conditions and the social environment are difficult to separate in a discussion of the alleviation of poverty in the United States. The role of government in a free enterprise, capitalist economy is as much a social issue as it is an economic one. Economists have endless debates about whether to emphasize efficiency (maximum output for a given input) or social justice

Map 2. Percentage of Poverty by Gender Source: U.S. Census Bureau

(relatively equal well-being of different groups in society) in private-sector and public-sector affairs. Most U.S. economists would argue for efficiency in the private sector.

They base their argument on the evidence that the U.S. economy creates a lot of value for the resources it uses up. The efficiency argument dictates that people be hired and paid only if they contribute positive value to the production sector; if not, people need other means to survive. These same economists wonder about efficiency in the public sector, especially when it is intermingled with social justice. Minimum-wage legislation is just such a blending that nearly always generates heated controversy. Cost-benefit analysis (estimating the dollar-value of the outcomes achieved and of the resources sacrificed in order to maximize the difference) as a tool for policy guidance can only go so far in informing decisions that often involve nonmarket evaluation of people and of "public" goods and services for these people.

Social justice is a sticky wicket, as there is no general formula for it. It means different things to different people, and its appeal is highly dependent upon whether a person is generally a "have" or a "have not," and a political "liberal" or a "conservative." If you have a lot of wealth, you may or may not be so willing to share it with the less fortunate. If you are less fortunate, you are

very likely to support redistribution in your favor. Society must decide which value judgments will prevail. The poor fall squarely in the lap of social justice. Whose fault is it that they are poor? Who should pay? How much?

Solutions to the involuntary poverty problem among the nondisabled poor fall somewhere along the spectrum of allowing total dependency to demanding total self-sufficiency. Total dependency would involve supporting people completely with transfer payments (payments received for which no goods and services are expected in return) such as welfare checks. Total selfsufficiency means that the people use only their own resources to live. Total dependency is thought to be an inferior solution because nondisabled poor adults will, in general, have little or no motivation to develop marketable skills. Their children will see that it is possible to survive without having productive skills, and may then base their survival on "entitlements" and not work-for-pay. Total self-sufficiency is thought to be commendable with respect to the people being earnest workers. However, if they cannot muster the resources to stay healthy and/or to support and educate their offspring to allow them to raise themselves above the poverty level, then many nonpoor in society will believe that these working poor should be subsidized in their effort to become totally self-sufficient.

Finding the right mix of support for current physical and mental needs, and for education and training for potential future employment, is a difficult problem under ideal conditions. Within the milieu of declining inner-city school systems, the exporting of higher-paying manufacturing jobs, and the offshoring of higher-paying information-technology jobs as part of the process of globalization, the solution becomes more elusive.

Those poor willing to work find lower-paying service jobs with little or no hope for better pay and career advancement. Alcohol and illegal drugs, unwanted pregnancies, sexually transmitted diseases, and crime often find their way into the mix, driving the poor further and further from a reasonable solution.

Though the current situation has unique twists, the problem is not new. Early social attitudes and U.S. policy toward the poor were strongly influenced by the following aspects of the English Poor Laws: care for the poor is a public responsibility at the local level; public assistance is denied to those whose families can provide for them; and children of the poor could be apprenticed to farmers and artisans who would care for them in exchange for work. Since the 17th century, there were many people living on the land that became the United States who were barely able to survive. Local privileged folks in Boston set up an almshouse for the destitute as early as 1685.

HELPING THE DESERVING POOR

In the 1700s, it has been estimated that roughly one in four Caucasians and nearly all African-Americans were poor. Immigrants generally had a tougher time avoiding poverty than native-born people. While many farmers lived on the edge of subsistence, urban wage earners fell into poverty when local economic conditions were unfavorable. It is thought, however, that the social attitude toward poverty was that it was the inevitable result of nature and the way the economy worked. Apparently, pity and not blame was the prevailing mind-set. The 19th century brought agricultural and industrial expansion, but poverty persisted. A moralistic view of poverty evolved. The poor were poor because of their own failings, and those who were deemed "worthy" (not improvident, drunken, lazy, or financially promiscuous) should be helped.

Private charities began to develop careful screening techniques to remove the able-bodied and the "unworthy." In the second half of the century, society's help for the poor was to become more efficient, and large public poorhouses were created. It was also at this time that journalist and self-styled economist Henry George wrote his famous work on how poverty would always persist in a capitalist economy that allowed landowners to keep the location rent that he thought belonged to society. He proposed that a tax equal to that rent would solve the poverty problem.

Vocational education for the able-bodied, including the poor, got a boost in the early 20th century by President Woodrow Wilson's signing of the National Vocational Education Act (PL 64-347) of 1917. However, world war and economic boom and bust were waiting to happen in the years to follow. Many would argue that the beginning of big federal government in the United States came at the time of the Great Depression. Since roughly one out of four U.S. workers was without a job, poverty was widespread. Government policymakers adopted the suggestion of English economist John Maynard Keynes—insufficient private-sector economic activity can be supplemented by public spending on projects that help society in general. As part of President Franklin Roosevelt's New Deal, several "makework" programs were developed to provide income to workers and their families, and certain economic "cushions" were placed under people's economic lives. Social Security payments to provide for old age and payments when disabilities precluded work were examples.

These cushions set the stage for divorcing public payments from productivity and job training, and federal "entitlements" were born. During the 1940s, mechanized agriculture reduced the need for farmworkers. Many rural poor moved to urban areas. After World War II, many poor southerners moved to the northern United States. These migrations drastically changed the demographics of poverty in the United States as they have been shown above.

President Lyndon Johnson made the War on Poverty one of his major social thrusts in the 1960s. According to Bill Anderson, "The government's attack on poverty was to be three-pronged. First, Congress passed numerous transfer programs such as rent subsidies, increased welfare payments, college tuition grants, Medicare and food stamps. Payments ... were to go to those who most needed the funds: the elderly, poor minorities and dependent children. The second point of attack was to be centered in community action groups, which were to coordinate antipoverty plans with neighborhood self-help groups. To help spur such activity the Office of Economic Opportunity created the Job Corps, which was to provide jobs for unemployed youths, and Volunteers in Service to America (VISTA).

YEAR	PRESIDENT	NAME	MAJOR PROGRAMS
1972	Nixon	Social Security Amendments (PL 92-603)	Created the Supplemental Security Income (SSI) program which replaced a patchwork of state programs for the aged, blind, and disabled.
1975	Ford	Title XX Amendments of the Social Security Act (PL 94-120)	Gave maximum flexibility to the States by allowing them to use Federal funds to fill the gaps in funding for needed services.
1981	Reagan	Omnibus Budget Reconciliation Act (PL 97-35)	Amended Title XX to establish the Social Services Block Grant (SSBG) program for states to provide services to low-income people.
1993	Clinton	Department of HHS final rule implementing requirements for States to report on their use of SSBG funding	Encouraged achieving or maintaining economic self-support to prevent, reduce, or eliminate dependency.
1994	Clinton	Social Security Act Amendments (PL 103-432)	Developed means of tracking and predicting dependence on three means-tested programs: Aid to Families with Dependent Children (AFDC), Food Stamps, and Supplemental Security Income (SSI).
1996	Clinton	Personal Responsibility and Work Opportunity Reconciliation Act (PL 104-193)	Replaced the AFDC Program with a block grant to states called Temporary Assistance for Needy Families (TANF): assisting needy families so that children can be cared for in their own homes; reducing the dependency of needy parents by promoting job preparation, work and marriage; preventing out-of-wedlock pregnancies; and encouraging the formation and maintenance of two-parent families.
1998	Clinton	Child Support Performance and Incentive Act (PL 105-200)	Provides for an alternative penalty procedure for States that fail to meet Federal child support data processing requirements, and reforms Federal incentive payments for effective child support performance.
1999	G.W. Bush	Ticket To Work and Work Incentives Improvement Act (PL 106-170)	Added a new part to the Social Security SSI program whereby clients get a "ticket" and can receive employment services, vocational services or other services to help them go to work or to earn more money.
2004	G.W. Bush	Child Nutrition and Women, Infants and Children Reauthorization Act (PL 108-265)	Expands the availability of nutritious meals and snacks to more children in school; eases the process for low-income families that do submit school meal applications.
2005	G.W. Bush	Welfare Reform Extension Act (PL 109-4)	Amends TANF to extend through June 30, 2005, the TANF program, the national random sample study of child welfare, and child welfare waiver authority.

Table 6. A Sample of Laws and an Agency Ruling Influencing the Welfare of the Poor

Congress also appropriated more than one billion dollars for projects in the impoverished Appalachia region. ... The third leg of the antipoverty triad was the passage of numerous equal opportunity laws, including the Voting Rights Act, the Civil Rights Act and other laws that forbade racial discrimination in hopes that blacks and other groups would not be barred from jobs or homes."

However, many thought that welfare dependency became the social problem of the 1970s. Again according to Anderson, "Three and four generations of families dependent upon transfer payments like AFDC [Aid to Families with Dependent Children] and food stamps crowd into ... tax-supported slums where rates of crime, divorce and teenage pregnancy are at historic highs. On the outside restrictive government policies like minimum wage and licensing prevent many poor persons from moving into entry-level jobs that might

promise them a successful future. In short, the causes of poverty not only remain under the welfare system; they are nurtured by it as well."

A sample of federal laws and an agency ruling from the 1970s to today that impacted the plight of the poor are given in Table 6 with the goal of showing how different aspects of the poverty problem were addressed. During the administration of Richard Nixon, federal officials realized that blind, disabled, and elderly people needed support, but some could be encouraged to generate some income on their own. In 1972, the Supplemental Security Income program provided monetary support, incentives to work, and access to medical care through Medicaid to those groups.

The Social Security Act Title XX Amendments of 1975 and the Budget Reconciliation Act of 1981 streamlined the way states could obtain and use funds to provide social services to low-income individuals and

families, the latter creating the block grant system. Both laws continued the support of disadvantaged people, albeit with the expectation that the more able would seek employment.

The trend toward prompting those receiving public assistance to work was magnified in the ruling of the Department of Health and Human Services (HHS) that states needed to report their progress in getting their clients to become more self-sufficient. The 1994 law listed in the Clinton years contained means of getting hold of the "dependency" problem. The PRAWORA (Personal Responsibility and Work Opportunity Reconciliation Act) of 1996 ended federal entitlements to assistance with TANF. States now had the job of dealing with those receiving public assistance, and of reporting efforts of those recipients to obtain gainful employment and provide stable family relationships. Continuing on the theme of accountability and stable family relationships, the 1998 law mandated that states monitor and report child support delinquency. The 1999 law under George W. Bush pushed further in the direction of getting the blind, disabled, and elderly to work.

While the 2004 CNAWICRA (Child Nutrition and Women, Infants and Children Reauthorization Act) aimed at providing better nutrition for children in general, it made it easier for the children of poor families to receive meals without cost. The most recent act extends the TANF for a few months. It also extends funding for the HHS Secretary to conduct a national study based on random samples of children who are at risk of child abuse or neglect, or are determined by States to have been abused or neglected.

Finally, it extends the Child Welfare Waiver Demonstration authority, which provides States with an opportunity to use federal funds more flexibly in order to test innovative approaches to child welfare service delivery and financing.

United Way

UNITED WAY International is a global network of voluntary organizations that raises money, other donations, and volunteer services within communities and directs those resources to local charitable, nonprofit agencies and projects. It is active in 45 countries divided into five regions of the world: Africa; Asia-Pacific; Europe, central Asia, and Middle East; Latin America and Caribbean; and North America. The countries with participating United Ways include several of the newer European Union states, much of the British Commonwealth, and many developing countries in Latin America, Africa, and Asia.

United Way International sponsors a biennial World Assembly as well as regional conferences (What Is United Way? 2004). The international body was incorporated in 1974 as an organizational spinoff of United Way of America (UWA); however, the movement for federated funding began on the local level both in the United States and abroad.

United Way of America, the U.S. national association, describes itself as "a community-based national movement" made up of about 1,400 independent local organizations that in 2003–04 raised \$3.59 billion to ad-

dress local needs through support of nonprofit agencies and organizations. More than a million volunteers are mobilized annually. UWA supports local United Ways by providing "training, consultation, mediation, conferencing, national research, and assessment tools," as reported on its website, and UWA receives its support from dues paid by local United Ways, as well as from corporate and other grants.

UNITED WAY HISTORY

The United Way movement has a long history that began in 1873 in Liverpool, England, with the idea that charities might work cooperatively to raise funds. The U.S. history is traced to Denver in 1887, although the Cleveland Chamber of Commerce advanced the concept of coordination, first by approving agencies for funding and later by creating a Cleveland Federation of Charities and Philanthropies (later Welfare Council) to include almost all local charitable organizations. E.L. Brilliant and D.R. Young note, "The concept of coordinated fundraising is straightforward. By avoiding duplication and competition, charities can exploit economies of scale, and use resources more effectively," and they describe the first important role of the first federated funds as that of fiscal intermediary.

World War I gave impetus to the concept of combined fund drives, as War Chests became a popular way to raise money for causes that in some communities included the Red Cross, YMCAs, and other social agencies, as stated by E.L. Brilliant. In 1918, Rochester, New York, became the first community to use the name "Community Chest" for the concept of pooling money for charity. This early development took place in the context of Progressive-era social reforms and the Settlement House and Charity Organization Society movements that gave rise to the modern profession of social work. Brilliant traces aspects of each of these traditions in the burgeoning federated funds and their leaders, who in 1918 founded the American Association of Community Organizations.

By 1918, 14 federated funds had been established in the United States, and by 1950 the number had grown to 1,270. In many communities Welfare Councils of social agencies operated either within or in tandem with Community Chests. With growth and professionalism, the two types of organizations strengthened their roles in community problem-solving and social planning. Rapid growth of Community Chests also resulted from changes in federal tax policy. For example, in 1935, Congress passed legislation allowing tax-deductible

charitable contributions by corporations, and in 1943 withholding for taxes and union dues opened the door for charitable contributions to be deducted voluntarily from individual paychecks.

Community Chests also faced challenges during the period of growth before 1950. National health and welfare organizations, such as the Red Cross, American Cancer Society, and other foundations to fight specific diseases were multiplying, and they usually stayed outside of the Community Chest drives, which were designed to benefit local charities. Employers disliked multiple fund appeals in the workplace, and ultimately fund solicitations began to merge into a larger federated drive under the name United Fund. The national membership organization that had provided leadership for both funds and councils changed its name in 1956 to United Community Funds and Councils of America (UCFCA).

The central role of United Funds was challenged by increased federal funding.

During the late 1960s and early 1970s the UCFCA faced the first of two modern crises. The central role of United Funds was challenged by increased federal funding for social welfare, the proliferation of non-profit agencies eligible for new government funding, and the advent of public community planning through Community Action Agencies and Model Cities programs. In 1970, the UCFCA changed its name to United Way of America (UWA) and moved its national offices closer to Washington, D.C. It also adopted the report of a management study it had commissioned; one key recommendation of the report was that the United Way movement should not limit its activity to fundraising in the narrow sense of the term. Local funds and councils should be problem-solvers and need-meeters rather than just fundraisers and coordinators of existing services.

A second, broader report during the 1970s also had relevance for the UWA. The Commission on Private Philanthropy and Public Needs (commonly called the Filer Commission after its insurance executive chair, John H. Filer) was convened in 1973 at the initiative of John D. Rockefeller II and the Brookings Institution. The Filer Commission, embroiled in controversy from the start, ultimately was critical of aspects of the voluntary sector and its funding, including the role of the United Way.

One issue was that local United Ways frequently directed large shares of resources to established organizations with strong national offices and popular programming. As the decade advanced, new federated fund drives that targeted minority, women's, and other causes emerged and offered competition to the United Ways.

The second crisis the UWA faced in its modern history was one of leadership and public trust. In the early 1990s the longtime UWA president was criticized in the press for shortcomings in fiscal accountability, topheavy administration, high professional salaries and perks, questionable hiring of friends and family, and controversial expenditures, as related by J.S. Glaser. William Aramony, the president who had led the national association for 22 years, was forced to resign after intense media coverage led to public outrage based on perceptions of his use of funds donated for charity. Subsequently, Aramony was convicted on related charges. In the wake of the scandal, the UWA was restructured and worked to rebuild public trust.

CHANGING CONDITIONS

In the 21st century, the UWA is at the center of a highly successful federated funding, coordinating, and planning network, and is the largest such organization in the United States. However, longtime observers note that the UWA and local United Ways face continued challenges to adapt to changing conditions and retain their central position in American philanthropy.

When given the choice, many donors opt to designate agencies to receive their funds, and United Ways responded by offering areas of "community impact" for donor selection. Community Impact funds enable local United Ways to reemphasize the historic roles of community planner and change agent by initiating new programs. However, UWA and the local United Ways face continuing challenges, including competition from similar organizations.

Some, like United Jewish Communities, are virtually as old as the United Way, and others have emerged much more recently as alternative funds. In some communities, United Ways, other federated funds, and non-affiliated organizations have begun to cooperate in joint fund drives, giving rise to a new identity for the federations that Brilliant and Young identify as *charitable mutual funds*. This term suggests that funding federations offer donors and volunteers alternative, diversified groups of giving programs for their charitable contributions.

REBECCA L. HEGAR University of Texas, Arlington

Universal Healthcare

THE WORLD HEALTH Organization (WHO) defines universal healthcare coverage as "access to key promotive, preventive, curative and rehabilitative health interventions for all at an affordable cost, thereby achieving equity in access." Under this definition, a population is said to enjoy universal healthcare if every member of that population is able to obtain access to needed healthcare services. Ordinarily, such services include physicians' care (including preventive care), admission to hospitals, and supplies of medicine or medical devices. The universal healthcare principle does not necessarily preclude the payment of fees by users of needed healthcare services. However, it does require that such services be available to all, including those who lack the ability to pay.

Because healthcare services are costly, policymakers who seek to implement universal healthcare coverage must decide how to pay for, or finance, its cost. Moreover, in order to control that cost, policymakers also must specify the particular healthcare services that will be guaranteed to all. In its 2000 World Health Report, WHO stated that policymakers should strive "to make funding available, as well as to set the right financial incentives for providers, to ensure that all individuals have access to effective public health and personal healthcare."

Universal access to healthcare may be financed in many ways. Most often, where it exists, universal healthcare is financed through public social insurance, private health insurance, or some combination of the two. Under public social insurance plans, governments may provide healthcare services directly to their citizens, or may pay for health services that are provided by third-party caregivers in the private sector. Either way, governments must finance such plans through taxation, borrowing, or the receipt of international aid. If taxation is relied upon, then the form of taxation selected to finance universal healthcare coverage will determine the extent to which wealthier taxpayers will subsidize healthcare for the less fortunate.

Under a health coverage system financed by progressive income taxation, high-income taxpayers will cross-subsidize healthcare for the poor. A universal health coverage system financed by sales or consumption taxes, in contrast, would tend to be less redistributive because wealthy people tend to consume a smaller portion of their incomes than others. Private insurance plans, including group health plans purchased by employers for their employees, are not designed to redistribute wealth.

WESTERN COUNTRIES

In 1946, the United Kingdom became the first noncommunist nation to provide universal healthcare coverage to all residents. Implementing a proposal set forth by British economist William Beveridge in his 1942 report "Social Insurance and Allied Services" (the Beveridge Report), the United Kingdom established the taxpayer-financed National Health Service (NHS), a government agency that that employs healthcare professionals who provide service directly to British residents. Most western European nations followed suit. In 1957, Canada implemented a "single-payer" system, in which the government pays for—but does not directly provide—healthcare services to Canadian residents.

In Canada and western Europe, private health insurance plans remain available to supplement the basic universal health coverage provided by the government. In these countries, private insurance serves to cover certain healthcare services not paid for by the government, to reduce waiting time for services, and/or to cover additional costs of care.

A full 27 countries, including Germany, Austria, Belgium, Luxembourg, Israel, Costa Rica, and Japan, have achieved universal healthcare coverage by implementing Social Health Insurance (SHI). Under an SHI plan, every employed or self-employed person must contribute to an insurance fund based on one's salary or income, while the government pays for low-income workers and those not unemployed. Public and private

healthcare workers provide the program's healthcare services.

Not every country is capable of attaining universal healthcare coverage through adoption of an SHI plan. In addition to having sufficiently high national income to fund the plan, a nation seeking to implement SHI must be able to enforce collection of contributions from workers, including the self-employed. It also must have the administrative wherewithal to set up and run an SHI program, a legal system that can resolve coverage disputes, and a healthcare structure in place to provide covered services. In high-income countries that have adopted SHI programs, the length of time required to achieve universal healthcare has ranged from 20 to 127 years.

UNITED STATES

In the United States, government-funded healthcare coverage is provided for approximately 25 percent of the population: to the elderly through the federal Medicare program; to many children and adults living in extreme poverty, through Medicaid; to veterans through the Veterans' Administration; and to Native Americans through the Bureau of Indian Affairs. Working adults generally must obtain healthcare coverage from private insurance companies. Because some working adults are uninsurable or cannot afford to purchase coverage (or choose not to), approximately 44 million U.S. residents (about 16 percent of the population) went uninsured in 2001. Uninsured persons in the United States often receive emergency care in public hospitals, but preventive care and nonemergent situations frequently go unattended.

A large portion of the population remains at risk for catastrophic consequences.

In the 1940s and 1990s, U.S. Presidents Harry Truman (1945, 1947, and 1949) and William Clinton (1993) proposed the adoption of national health insurance programs in the United States. Their efforts, however, failed. Accordingly, unlike in western Europe, Israel, and Japan, universal healthcare coverage has not been achieved in America. Although the populations most vulnerable to health problems and poverty, the elderly and the poor, have access to healthcare, a large portion of the population remains at risk for the catastrophic consequences of a costly and disabling illness.

Among the poorest nations, universal healthcare focuses on basic preventive measures (vaccinations, immunizations), simple interventions (oral rehydration therapy, iodized salt), and the basic elements of public health, such as clean water, sanitation, and nutrition. These nations lack sufficient indigenous healthcare providers and often rely on international organizations, such as the WHO, and nongovernmental charitable organizations to achieve basic healthcare goals.

LINDA DYNAN Northern Kentucky University

University of Kentucky Center for Poverty Research

THE UNIVERSITY OF Kentucky Center for Poverty Research (UKCPR) is located in the Department of Economics at the University of Kentucky in Lexington, Kentucky. It is a research center for discovering the nature and solutions needed to overcome the problem of poverty. UKCPR is a nonprofit academic research center. It is independent and also nonpartisan in its research methods and goals.

UKCPR was established in October 2002 in a cooperative effort of the University of Kentucky and the U.S. Department of Health and Human Services. It was one of three federally designated Area Poverty Research Centers. The initial funding was provided by financial grants from the Office of the Assistant Secretary for Planning and Evaluation (ASPE).

The director of the center is the chief operational officer. An executive committee advises the director about matters involving the university campus. There

are five departmental liaisons who are responsible for promoting good relations between the center, and the individual units on campus. There is also a national advisory board composed of scholars from the south who are specialists on southern poverty. Their task is to advise the director about the center's research agenda. The University of Kentucky center is one of three area centers established at the same time.

The other two centers are the Institute for Research on Poverty at the University of Wisconsin in Madison and the Rural Policy Research Institute located at the University of Missouri in Columbia. Another companion center is the National Poverty Center, located at the University of Michigan in Ann Arbor.

All the centers have an area focus. The UKCPR's area of focus is the southern United States, comprising the 16 states that form the Southern Governor's Association and the Southern Legislative Conference. The association and the conference include the states of Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, Missouri, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia. The research mission mandate to UKCPR is to examine the causes, consequences, and correlates of poverty in the south. The research is conducted using a multidisciplinary approach. The great hope for the research is that it will aid policymakers in designing poverty programs and policies, and in addition market forces will find new opportunities for growth, which will promote prosperity.

The staff, faculty, and researchers have been drawn from a variety of disciplines. These include economics, political science, public health, public policy, social work, and sociology. The mix of various disciplines promotes a cross-disciplinary approach to the research agenda. The research activities of the center are partially funded by ASPE. The support goes to scholars who are focused on poverty studies of the south. The Internal Research Support Program aids faculty at the University of Kentucky.

A Regional Small Grants Program helps scholars who are not members of the University of Kentucky. The Young Investigator Development Grants Program supports young academics. The Emerging Scholars Program is designed to help new academics.

Grants go to historically black colleges and universities and to Native American tribal colleges and universities to support poverty research. Graduate students who will be future poverty researchers can get dissertation fellowships to support poverty research. UKCPR publishes a quarterly newsletter, *Insights on Southern*

Poverty. It also publishes a variety of discussion papers on key poverty issues.

Urban Antipoverty Programs

URBAN ANTIPOVERTY programs come in many different forms. By definition, exclusive of agriculturally based poverty alleviation programs, urban antipoverty policies attempt to address the phenomenon of urban poor—a rapidly growing category in the majority of countries across the world.

The main approaches used by governments against poverty can be classified as 1) direct aid to human capital, 2) economic development and urban regeneration, and 3) mass incarceration.

Direct aid to human capital, or cash and/or service transfers (such as job training) given directly to urban poor to lift them above a poverty line, is an approach utilized in western Europe, the United States, and other parts of the world, but is criticized by social conservatives as paternalistic and failing to distinguish between the "deserving poor" and the "undeserving poor."

Economic development and urban regeneration programs are by far the most popular form of urban antipoverty program across the world. From World Banksponsored urban regeneration in India to real estate development proposals in downtown Brooklyn, New York, policymakers believe that through urban redevelopment efforts that bring middle and upper classes back into the city, the economic success will trickle down to the benefit of original poor inhabitants. In reality, such regeneration programs involve a displacement of working-class residents from urban centers. Finally, the penalization of poverty is a phenomenon found increasingly in, but not limited to, the United States.

To fully understand the shift away from direct aid programs toward urban regeneration, it is useful to examine the history of United States federal urban poverty programs since the 1960s. Gary A. Dymski highlights a number of early antipoverty programs based on economic development. One example is the 1966 CAAP (Community Action Against Poverty) Program, which provided organized communities the opportunity to apply for community health centers and provided funds to start Community Development Corporations (CDCs), which in turn provide a host of social programs. At the same time, the federal government waged war on inner cities through urban renewal where governmentally appointed redevelopment authorities obtained rights of eminent domain over "blighted," largely minority neighborhoods.

This last point is key to understanding the relationship between renewal and social tranquility, since, as noted by John Mollenkopf in *Marxism and the Metropolis*, "virtually all of the riot areas (of the late 1960s) were sites of major renewal efforts; quite frequently struggles over the nature of renewal lurked behind the riots as an implicit issue." In 1969, the Richard Nixon administration replaced many of the existing urban antipoverty programs with the Model Cities Program (MCP). In 1974, the Nixon administration created the Community Development Block Grant (CDBG) program, which pooled various programs aimed at reducing poverty and redeveloping urban areas.

"One of the reasons they are out of work is that they do not know ... how to work."

CDBG signaled the last concerted effort to address urban poverty at a federal level. In the following decades, there was a redefinition of poverty itself. There was a concerted move from seeing poverty as a macroeconomic, structural, and demand-side problem to an individual problem. With Bill Clinton's 1996 Personal Responsibility and Work Opportunity Reconciliation Act (welfare reform), urban antipoverty programs reflected stereotypes that attributed poverty to personal failings rather than socioeconomic structures and systems. As J. Peck eloquently describes, "workfirst" antipoverty programs "presume a 'deficient model' of the unemployed: that one of the reasons they are out of work is that they do not know (or have somehow forgotten) how to work."

Thus with dwindling individual direct aid and past antipoverty programs with fledgling support, urban regeneration and renewal are "revitalizing" poorer neighborhoods across the globe. Yet more often than not these projects are fueled by global corporate real estate interests that systematically gentrify urban cores. The process of gentrification strategically appropriates urban space occupied by the working classes and greases the wheels of capitalist production rather than social reproduction.

In the United States, the rebirth of urban redevelopment efforts occurred almost simultaneously with deconcentration programs aimed at redeveloping public housing projects into mixed-income communities. Thus as an antipoverty project, deconcentration takes on a spatial emphasis under the notion that concentrated poverty is itself one of the main reasons the poor find themselves without economic opportunities. The most controversial deconcentration program, HOPE IV (Housing Opportunities for People Everywhere), known previously as the Urban Revitalization Demonstration, emerged from recommendations of the 1992 National Commission on Severely Distressed Public Housing to eradicate severely distressed public housing via physical and management improvements, in addition to social and community services.

Another widespread phenomenon that can be considered a *de facto* urban antipoverty program is the mass incarceration associated with the penalization of poverty. While in the United States, African Americans are disproportionately overrepresented among the nation's poor, they are also massively overrepresented in the country's jails and prisons: black men make up six percent of the national population but have accounted for over half of new admissions in state and federal prisons every year since 1989, according to sociologist Loic Wacquant.

Wacquant writes: "The invisible hand of the market and the iron fist of the state combine and complement each other to make the lower classes accept desocialized wage labor and the social instability it brings in its wake. After a long eclipse, the prison thus returns to the frontline of institutions entrusted with maintaining social order." Wacquant maintains that a similar, yet distinct, process is occurring in Europe. Using the case of France, Wacquant suggests that the French state is supplanting its increases in social intervention with increases in penal intervention.

On the one hand, the state provides a wide and relatively generous social safety net with government-sponsored work contracts for the unemployed that include training (Contrats Emploi-Solidarité), expands the government minimum income plan (RMI) and provides truly universal healthcare. On the other hand, riot

police routinely patrol suburban housing estates, criminal penalties are made harsher, and foreigners face swifter deportation (after serving their sentence in France). Thus while in the United States the penalization of poverty comes at a retrenchment of the social state, in Europe it appears to complement social programs.

KERIM ODEKON UNIVERSITY OF WISCONSIN, MADISON

Urbanization

IN THE COMING DECADES, perhaps the most significant challenge facing nations across the world will be the understanding and managing of an ever-increasing urban population. The world's population, already estimated at 6.1 billion, is expected to increase to 7.8 billion by 2025. Even more alarming is the fact that the majority of this growth will occur in urban areas, of which 90 percent will be in poorer, developing nations. While urbanization is not inherently detrimental to society, its most prevalent and troublesome consequence is the widespread poverty that often follows it.

The migration to and the inhabitation of cities is known as urbanization. This unique trend defies traditional human patterns because for most of recorded history, humanity has existed in a largely rural setting. It was not until the early to mid-1900s that the developed nations began seeing a considerable growth in the urban

areas and stability in rural ones. Undeveloped nations or Third World countries are now seeing the increase in urban growth that their more developed neighbors experienced more than 75 years ago.

Urbanization is a problem that exists in all nations across the world regardless of development. Although the challenges and solutions may differ among countries, urbanization and the poverty that often follows it are a problem that must be confronted and dealt with throughout the world.

By 2025, the majority of the world's urban population will be living in poverty.

Underdeveloped countries are predominantly located in Africa, Latin America, and Asia. It is in these places that urban growth and poverty will be at their worst. In the early 20th century, while the more developed countries were experiencing urbanization, the underdeveloped countries were still predominantly rural. In 1950, only 14 percent of the population in these countries resided in areas classified as rural. As of 2000, most of the countries had an urban population above 50 percent, and it is projected by the year 2025 that this percentage will reach as high as 82 percent. It is also projected that the rural population in many developing countries will stop growing, while the urban population will enhance significantly.

There are many possibilities for why urbanization is taking place in these countries, but the most supported and likely answer is globalization. Almost all countries are now linked through increasing trade in an ever-growing global economy. Those that are not, or that are to lesser degrees, are countries that are more likely to struggle economically. One way for underdeveloped countries to improve the economy is to entice foreign investments and compete in trade. However, the results of such efforts are usually negative and harmful for low-income citizens.

Most underdeveloped countries do not have any exports that would be valuable to the outside world. The lone exception is food. Unfortunately, most developing countries are forced to grow crops that are not traditionally grown in their country, and their success is dependent on foreign demand. This emphasis on export products places the small self-sufficient farmers in detrimental situations because they cannot afford the equipment or the new products that the market demands. In the event that the farmers can afford the costs

because the product is often not consumed nationally, their profit is largely dependent on international demand. If this lags, it is very difficult for the farmer to sustain his livelihood. Without these foreign sales, he has to look for other places to work and he turns to the city.

Another step most developing nations take in an attempt to integrate into the global economy is opening up to foreign investors. This investment usually takes the form of companies from more developed nations who set up factories for manufacturing purposes. These new factories are usually established in or very near to urban areas and they provide a large number of job opportunities. The possibility of employment, coupled with the majority of the rural population unable to survive in agriculture, leads to an influx of urban population. While it may seem that the jobs offered by foreign investors are a blessing to these needy people, it is in actuality an opportunity that often leads directly to worsened poverty.

The primary reason companies open factories in undeveloped countries is the cheap labor. By their very nature, developing countries do not have labor laws or unions to protect employees. It is not that the people of these countries do not want these groups, but they are at a stage comparable with the pre-union era of the United States.

What happens in countries where there is little work and a large population is that the companies with the jobs to offer can get employees very easily and for a fraction of what it would cost to pay them in more developed countries. A large urban population is not dangerous in itself, but when it is combined with poor job options, it leads to rampant poverty.

The level of poverty in many developing nations in Latin America, Asia, and Africa is devastating. The World Bank estimates that there are close to 600 million people living below the poverty line (about \$370 a year). This number is over 40 percent for developing countries' urban populations, and it is rising steadily. It is believed that by 2025, the majority of the world's urban population will be living in poverty, the worst of which will be in developing countries. The greatest threats to the poor urban population in these countries are unhealthy drinking water, malnutrition, improper living quarters, and a lack of basic healthcare needs. The people hit hardest by the cruel environment they live in are the urban youth.

The children who live in urban poverty in the developing countries have a mortality rate that dwarfs that of their neighbors. A study in Bangladesh in 1990 showed

that the mortality rate for low-income families was 152 children for every 1,000 born. This number is significant when compared to the wealthiest areas of the world where there are only five deaths for every 1,000. Poor countries generally suffer from poorer living conditions, but this problem only increases when large numbers of poor people are living in close quarters in very unsanitary environments.

The urban poor in undeveloped countries face three major categories of challenges. The first and most acknowledged is traditional disease and death that result from unfavorable living conditions. In cities where there is a large population, the vast majority of people live in slums that often do not provide even the basic living needs. In most situations, water is not readily available, and when it is, its quality is very poor.

Malnutrition is common among adults and children and diseases like measles, malaria, and HIV/AIDS are widespread. A new challenge that many individuals are faced with is physiological. The mental strain of living in degraded conditions, overcrowded with little hope of improvement, leads many of the urban poor to depression. The last challenge facing these people is reproduction, and it not only affects them but also helps to compound the poverty dilemma.

The homeless and those without jobs are most prevalent in urban settings.

When urbanization occurs in more developed countries, reproduction generally slows as potential parents practice safe sex and family planning. In fact, many developed nations expect to see a reduction of urban population over the coming years. This pattern is reversed in urbanizing poor countries, especially in the slums. In these places, family planning and safe sex are either not primary concerns or the population is not familiar with the concept. Regardless of why it happens, the birthrates of the urban poor in undeveloped countries are growing at an exponential rate. In addition to the population increase, promiscuity and prostitution are common, which helps facilitate the spread of disease—so much so that African countries comprise 80 percent of AIDS deaths annually and the likelihood of having AIDS is almost four times as great if one is living in an African city.

Poverty exists in both developed and undeveloped nations; however, poverty is measured and defined differently in each place. For example, the poor in developing nations would see the living conditions of the poor in North America as a luxury. In the United States, the poorest people in the country traditionally reside in urban settings. Population in cities is continually growing although not at a pace similar to that of developing countries.

In addition, the quality of life in countries like the United States means better health options and an infinitely superior water supply than those available to even the poorest residents. Jobs ensure a minimum wage and unions work to ensure worker rights. There are even welfare systems in place that supplement pay for those people unable to work. However, even though there are many benefits to living in a developed country, there is still a large population living below the poverty line.

Poverty is the worst in inner-city districts, and has become increasingly worse over the last few decades. These areas are the poorest, and most dangerous, and allow fewer opportunities for self-improvement than any other place in the United States. Paradoxically, this poverty originated because of the economic prosperity of the nation as a whole. As the economy became stronger and stronger, two things began to happen. The first is that the more financially secure people began migrating to the suburbs to live. The trend of working in the city and living in more spacious suburbs is a one that continues to this day. Second, rents were increasing at a rate exceeding the income of most of the poorer class. This price jump forced them into more dilapidated areas, reserving the costlier areas for those who were wealthy and still desired to live in the city.

One of the main reasons poverty is prevalent in many major cities is that the minimum wage has not increased at a rate proportional to inflation. The federal minimum wage was \$5.15 in 2005. If it had risen according to inflation, it would be closer to \$12 an hour. Since this is not the case, the poor urban citizens cannot afford many of the necessities of comfortable living and the number of people below the poverty line only increases.

Also, the homeless and those without jobs are most prevalent in urban settings. Approximately 95 percent of the homeless population live in cities and the fringing suburbs. The call for public housing is so high that many city agencies have ceased to accept requests because the list is already too long. One of the worst consequences of being poor and living in the cities is the lack of quality education.

The lack of quality educational facilities in cities not only perpetuates the poor continuing to be poor, but also acts as a deterrent for movement of wealthier people into the city. In city schools, nearly 75 percent of the student body are poor. The educational system is so substandard that the majority of the students who attend fail to achieve basic competency levels in reading and mathematics, and almost half fail to graduate from high school in four years. The education or lack thereof prevents most poor children from ever having the opportunity to improve their life and to escape poverty.

Urbanization leads to poverty in both developed and developing countries. The problem is most prevalent in the undeveloped countries and in the near future is only going to get worse. If the problems are not addressed in the near future, it is very likely that the majority of the world's population will be living in unsustainable and unhealthy living conditions.

ARTHUR HOLST WIDENER UNIVERSITY

Uruguay

INDIGENOUS PEOPLE originally inhabited what is now the Oriental Republic of Uruguay, but two centuries of Portuguese and Spanish rule virtually eliminated this population. In 1811, Uruguay rebelled against Spain but was conquered by the Brazilian Portuguese within six years. Assisted by Argentina, Uruguay finally achieved independence in 1825.

In the late 1960s, the Tupamaros, a violent Marxist urban guerrilla movement, forced the Uruguayan president to concede to military control of the government. Even though the rebellion was crushed fairly quickly, the military had become entrenched throughout the government. In 1985, Uruguay was restored to civilian rule. In the 21st century, Uruguay is known for having

one of the freest political and labor environments on the South American continent.

The Uruguayan economy is characterized by an export-oriented agricultural sector, a well-educated labor force, and high levels of social spending. During the late 20th century, Uruguay experienced an economic downturn as a consequence of economic problems in Argentina and Brazil. When Argentine banks withdrew huge sums from banks in Uruguay, the result was an unemployment rate of almost 20 percent and surging inflation. Uruguay's external debt doubled, but negotiations with the International Monetary Fund alleviated immediate problems. In 2004, the economy grew around 10 percent. Approximately 70 percent of Uruguay's labor force are engaged in services, and 16 percent are employed in industry. About 14 percent are involved in agriculture. The current unemployment rate is 13 percent.

Uruguay is an upper-middle-income nation with an annual per capita income of \$14,500. Despite relative affluence, one-fifth of the population lives in poverty. Almost four percent of the people live on less than \$2 a day. Most poor people live in rural areas and in migrant communities. Around 40 percent of children in Uruguay are born into the poorest families. Generally, these families are headed by females with little education. Many of them are teenage mothers. Efforts to break the cycle of poverty for young mothers have focused on state-sponsored childcare programs that allow poor mothers to pursue education and training. Preschool programs target poor children to prepare them for primary school. Uruguay has received World Bank funds to build kindergartens in the poorest areas.

Under the National Food Program, food is distributed to needy families. The poor also receive free healthcare and education. The social security system underwent a major overhaul. The program now covers unemployment benefits, family allowances, and noncontribution pensions. In 1989, a constitutional amendment mandated increases in the real value of pensions. As a result, 35 percent of the elderly were no longer poor. Incomes are fairly well distributed in Uruguay, and the country is ranked 44.6 on the Gini Index of Human Inequality.

Healthcare is widely available in Uruguay. There are 387 physicians for every 100,000 residents, and most people have access to affordable essential drugs. Only two percent of the population lack access to safe drinking water, and only six percent do not have access to improved sanitation. Uruguayans enjoy a life expectancy of 76.13 years. Females (79.45 years) outlive men by an

average of over seven years. Among the population of 3,415,920, the median age is 32.46 years. Around 23 percent of the population are below the age of 14, and 13.2 have reached the age of 65.

Infant mortality rates in Uruguay have been steadily declining. Between 1970 and 2005, infant mortality fell from 48 to 12 deaths per 1,000 live births. Among all children under the age of 5, the mortality rate dropped from 57 to 14 deaths per 1,000 during that period. Four percent of Uruguayan children under the age of 5 are malnourished, and eight percent of infants are underweight at birth. Eight percent of under-5s suffer from severe to moderate stunting. Childhood immunization rates are high for children from birth to 23 months old, ranging from 91 to 99 percent.

Fertility is low in Uruguay, and women have an average of 2.2 children each. The birthrate declined from three children per woman in the 1970s. Among adolescents, the fertility rate is 63 per 1,000 births. Trained medical staff attend 100 percent of all births. Maternal mortality is consequently low, occurring at a rate of 26 deaths per 100,000 live births.

Literacy is almost universal in Uruguay, and only two percent of the population over the age of 15 are unable to read and write. For several decades, education has been universally available. As a result, most students attend school for 15 years.

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

U.S. Catholic Conference

U.S. CATHOLIC Conference, Social Development and World Peace Department, the public policy arm of the United States Catholic Bishops, works to apply the principles of Catholic social teaching. When the United States Catholic Bishops organized to form the National Catholic Welfare Conference in 1919, they formed a Social Action Department to interpret and propagate the church's social teachings, especially in regard to industry, international relations, politics, and charitable work.

They based their activity on the teachings of the popes dealing with social issues as well as statements by the bishops in the United States. In 1967 the department was reorganized and renamed the Department of Social Development and World Peace to reflect an expanding role for the church in humanitarian efforts.

"How can hunger in the human family be overcome?"

The department's reorganization was largely prompted by the creation of the Pontifical Commission of Justice and Peace, an official and permanent office within the Catholic Church established by Pope Paul VI in 1967 to respond to the pressing issues of world poverty, justice, and peace. The creation of the commission was called for during the Second Vatican Council, a meeting of the world's Catholic bishops in Rome from 1963 to 1965, at which time over 70 speeches were made on the topic of world poverty.

Americans were among the chief supporters of the pontifical commission, including Joseph Gremillion, a parish priest from the diocese of Alexandria, Louisiana, who was then serving as the director of socioeconomic development for Catholic Relief Services; Luigi Ligutti, also a parish priest involved in rural ministry, who served as the director of the National Catholic Rural Life Conference; and James J. Norris, a layman then serving as president of the International Catholic Migration Commission and as assistant to the director of Catholic Relief Services. Along with other council participants and observers, they advocated for a permanent structure within the church to further the goals of justice and peace.

The conciliar document, Gaudium et Spes (Constitution on the Church in the Modern World, 1965), specifically called for the creation of "an organism of the universal Church" to promote "progress in needy regions and international social justice." Emphasizing concrete action, shared responsibility for world problems with other Christian churches, and an increased role for the laity, the goal of the new structure was "to arouse the people of God to full awareness of its mis-

sion at the present time, in order on the one hand, to promote the progress of poor nations and encourage international social justice, and on the other, to help underdeveloped nations to work for their own development." Two years later, Pope Paul VI's document on international development, Populorum Progressio (1967), was termed by the Vatican a "charter" for the Pontifical Commission of Justice and Peace. Consistent with the ideas presented in Populorum Progressio, one of the first priorities for the commission was to establish regional committees to engage as many as possible in their global work.

At least seven national committees had been founded by the end of 1967, including branches in Belgium, France, the United States, the Congo, Venezuela, Germany, England, and Wales. In the United States, the U.S. Conference of Catholic Bishops formed a committee for World Justice and Peace in April 1967, under the direction of a priest, Marvin Bordelon, and supervised by Bishop John J. Dougherty. The committee initially included seven American bishops. To the committee were also named 10 advisory experts, both clergy and laity, Catholic and non-Catholic.

The early work of the department for Social Development and World Peace focused on the United States' role in fostering international justice and emphasizing the role of the church as servant. Its first obstacle was convincing Americans to abandon their excessive nationalism and provincialism, which they believed, allowed many to ignore international concerns. Calling U.S. efforts at assisting other countries a "national disgrace," the department urged international monetary reform, reexamination of U.S. military programs, and elimination of tariffs.

Current priorities for the department include ending the use of the death penalty, welfare reform, universal healthcare, housing, trade reform, international debt relief, elimination of nuclear weapons, and agricultural issues. A recent statement of the office, "For I Was Hungry and You Gave Me Food" (2003), offers a Catholic reflection on food, agriculture, and farmworkers, asking such questions as "How can hunger in the human family be overcome?" and "How can we ensure that farmworkers and owners of small farms, in the United States and around the world, live and work with dignity?"

Another current initiative in conjunction with Catholic Relief Services is a campaign to ease international poverty by focusing on how U.S. economic policy can either aid or hinder relief for the poor. The campaign focuses on influencing U.S. trade policy to

highlight successful efforts to overcome poverty globally, promoting American aid that fosters long-term development and empowerment of the poor, and elimination of debt of the poorest countries in the world.

USDA Poverty Line

THE OFFICIAL measures of poverty for the United States are now compiled and reported by the U.S. Census Bureau. They originate from research conducted in the early 1960s by Mollie Orshansky, an economist at the Social Security Administration. Though Orshansky was not attempting to develop general poverty thresholds, her results appeared just as the government sought a way to measure poverty as a part of President Lyndon B. Johnson's War on Poverty in 1964. The poverty thresholds are based on the guidelines of the U.S. Department of Agriculture (USDA) for a minimal diet needed to obtain proper nutrients during times of emergency.

The purpose of the USDA poverty line is to determine whether or not a family's income is so low as to be inadequate. Income used in this determination includes job earnings, government welfare, social insurance programs, pensions, interest, dividends, rents, and other cash sources. Benefits that are provided in-kind by the government, such as food stamps or housing subsidies, are not counted. Capital gains or losses are also not included in the calculation.

On the other hand, taxes are not deducted from income, including payroll taxes, potential income taxes, and the possibility of an Earned-Income Tax Credit for those with low incomes. The incomes of all family members living together are then summed and compared with a poverty threshold.

Poverty thresholds vary according to the number of family members, the number of related children included in the family, and the age of the household head in one- or two-person households. Poverty thresholds do not grow as quickly as the number of people in a family, because it is thought that people living together can enjoy lower costs through shared housing and other benefits. For instance, in 2004, the poverty threshold for a single person under age 65 was \$9,827, while the threshold for a two-person household with no children and a household head under age 65 was only 29 percent larger at \$12,649. For comparison, the poverty threshold for a family of four, two of whom are children, was \$19,157 in 2004. Each year, the poverty thresholds are adjusted for inflation.

The poverty thresholds do not indicate how close or far people are from the poverty line.

Orshansky developed the methodology for these thresholds in the early 1960s. She used the USDA analysis of the nutritional requirements needed for minimal survival during times of duress in order to calculate the cost of such a food budget. Then, she used the USDA's 1955 Household Food Consumption Survey to determine the percentage of people's household budgets that is spent on food, which she calculated as about one-third. Thus, the poverty threshold is determined as three times the cost of the minimal food budget.

Criticisms of the USDA poverty lines include that they are too low, since people were not expected to be able to survive on the minimal food budget for an extended period. Also, these thresholds are still based on survey data from the 1950s and have not been updated to reflect changing diet or improved living standards. Because incomes have generally grown faster than prices, those with incomes equal to the poverty threshold are falling further behind the rest of the population. The poverty thresholds also do not indicate how close or far people are from the poverty line.

Utopian Socialists

UTOPIAN SOCIALISTS WERE a group of authors who were against the poverty of human societies; they lived from the end of the 18th century to the start of the 19th century. They believed the capitalist economy to be unjust, and conceived ideal social formulas based more on universal fraternal love than on the class struggle. F. Engels, in *Socialism: Utopian and Scientific*, proposed the name *Utopian Socialists* in 1880 to identify the French utopians Henri de Rouvroy, Count of Saint-Simon, and Charles Fourier, along with the English author Robert Owen, and to differentiate them from the scientific socialists defended by Karl Marx.

Henri de Rouvroy, Count of Saint-Simon (1760–1825), dreamed of a society based on science and governed by the most able (entrepreneurs and scientists), who would solve all conflicts and help man reach happiness. From 1814 on, he dedicated his work to extol the role of industrialism, the progress of which would reduce poverty and ignorance. According to this author, the working class was uppermost—laborers, farmers, craftsmen, manufacturers, bankers, and artists—as opposed to the idle (those of independent means). He also defended inequality, since each person should take benefit from his or her social contribution, there being differences based on capacity and work.

Saint-Simon also insisted that the social structure should raise the physical and moral welfare of "the most numerous and poorest class," and confirmed the thesis that "all men should work." In 1821, he wrote Henry Saint-Simon to the Working Men, in which he proposed to improve their situation by means of a project of grand labors. In his final work, New Christianity, he put forward a mystic creed based on the principle of fraternal love, by which man's goal on earth was to work in favor of the poorest and most numerous classes. His followers, P. Enfantin (1796–1864) and Saint-Amand Bazard (1791–1832), considered private property to be unjust and called for equal opportunities

("each man according to his capability and each capability according to his works"), rejecting inheritance as a random distribution of property. They also wanted the state to take control of the instruments of work and divide them out to the maximum social advantage (collectivism). Saint-Simonism also had a practical application, inspiring great firms involved in banking, industry, railways, roads, and the building of the Suez Canal.

The thesis of Charles Fourier (1772–1837) was based on a life of cooperation as a means to modify the surroundings and create a new man. He criticized the abuses of free competition, the power of the monopolies, the errors made in agriculture, the proletarianization of the masses, alienation in the factories, and political and moral corruption. In 1803 he proposed that a minimum wage be established.

According to Fourier, civilization moved in a vicious circle in which "poverty stems from abundance itself." His solution for this was to set up cooperative or "phalanstery" communities, where farming and crafts would be the main trades. Collective work would improve the situation and production would increase, meaning that working from the age of 18 to 28 would be enough for a person to live easily for the rest of his life.

In addition to this, those living in a phalanstery (the author's calculations were that 300 families could live on nine square miles of land) would also adopt a new form of life: the family and marriage would gradually disappear; all tasks were available to take on and would be varied and attractive; and workers would form groups according to what they wanted to do. The movement spread to the United States and the rest of Europe. Other published works by Fourier include Theory of the Four Movements (1808), Treatise on Domestic Agricultural Association (1822), and The New Industrial World (1829–30).

Robert Owen (1771–1858), a successful partner and manager of a spinning factory in New Lanark (Scotland, United Kingdom), believed man to be a product of the organization and circumstances that surrounded him during his growth. As a result of this deduction, he started to work on improving the living conditions of his industrial workers. His factory became a model colony of 2,500 people, with shops and healthcare for the workers.

Drinking was frowned upon, schools were built, and in a short period of time, poverty disappeared. As early as 1815, Owen defended the cooperative system ("communal villages"), whereby the benefit of one man would not mean the loss of another. The way of life he

designed meant that everyone would work together, combining the advantages of the city and the country. In 1824 he bought land in Indiana and set up New Harmony to put his project into practice. Engels considered this effort to be the antecedent of co-ops and workers' bazaars (the exchange of vouchers, whose value corresponded to the number of hours worked). Of his many writings, the most important include New View of Society, or Essays on the Formation of the Human Character (1813–14) and Report to the County of Lanark (1821).

The Utopian Socialists drew attention to the deterioration of workers' living conditions, defending the need to socialize the benefits of economic growth. They also believed that the system should be managed by those who were most capable—scientists and entrepreneurs—to explicitly do away with poverty. Another of their ideas was that a cooperative system would make a more equal and just society in which, if work was to be shared, then the benefits of production should also be given to all. Furthermore, they began a current of opinion that attempted to fight against the injustices of the new socioeconomic order, which would, in the end, bring about the reform of social legislation.

Donato Gómez-Díaz, Ph.D. Almeria University

Uzbekistan

UZBEKISTAN, A CENTRAL ASIAN country with around 27 million inhabitants, became independent in 1991 at the time of the disintegration of the Soviet

Union. Even during the Soviet era, Uzbekistan was known to be poor, with over 45 percent of its population having incomes lower than the then-standard minimum. At the end of the Soviet era, Uzbekistan had the second lowest per capita income among the 15 republics—the lowest was Tajikistan. Its level of income inequality, however, as measured by the Gini coefficient, was lower than the Soviet average.

In the post-Soviet era, the social assistance programs that were common under communism were no longer sustainable. Budgetary transfers from Moscow, once accounting for as much as one-fifth of the Gross Domestic Product (GDP), nearly vanished. And the cotton sector, a chief source of income, ran into diminishing yields in terms of output per hectare, according to R. Pomfret.

In 2001, the poverty rate in the country was 27.5 percent, or 6.8 million people. And based on 2002 and 2003 government surveys, it was concluded that poverty was decreasing, but with varying degrees depending on geography. For example, the decline in poverty was much more noticeable in the area surrounding the capital city, Tashkent, by World Bank standards. In 1999, 41 percent of the population were aged under 16 and 62 percent lived in rural areas, by Economic Intelligence Unit statistics. Over two-thirds (70 percent) of the poor live in rural areas, where the poverty rate in 2003 was estimated at 30.5 percent, versus 22.5 percent in urban areas. The highest concentration of the poor resides in the southern and northern regions of the country, with the poverty rate in the south being nearly four times that of Tashkent.

Diseases associated with poverty are on the rise, such as tuberculosis and HIV/AIDS. About 50 percent of children suffer from various degrees of vitamin A deficiency and 60 percent of women of fertile age suffer from anemia due to iron deficiency. The poor have been exposed to effects of environmental degradation. The diversion of water for intensive irrigation use through-

out central Asia has prevented sufficient flow of rivers into the Aral Sea (once the fourth largest body of water in the world), thus leading to a water level reduction of the lake by 21 meters and surface shrinkage to nearly one-third of its natural size.

What is left of most of the Aral Sea is a salt and sand desert covering an area of 3.8 million hectares. Because of soil salinity, what used to be an area of sustainable agricultural activity, cattle breeding, and fishery for communities near the lake has nearly come to a halt. Increases in morbidity rates, particularly among women of fertile age in the same region, are also common, according to the World Bank.

Poverty and income disparity, coupled with authoritarian governance, are thought to be behind recent turmoil in the country. Opposition to the government is regularly and brutally suppressed. The government labels dissidents protesting unjust economic conditions and widespread poverty as extremists and terrorists. Many are accused, justly or unjustly, of being members of the Islamic Movement of Uzbekistan or Hizb ut-Tahrir, both fundamentalist groups bent on overthrowing the government.

Vagrancy

VAGRANCY IS THE LEGAL TERM for people who do not have an established home and who drift from place to place and who lack any visible or lawful means of support. Many governments have ordinances against vagrancy. The customary meaning of vagrant was someone who was able to work, but who preferred to be idle and to live by begging.

Poor people drifting from place to place in search of work, lacking provisions and shelter, is a condition of human life that has occurred at many times and in many places. A variety of terms have been used to describe people in this condition. The terms for vagrant include vagabond, tramp, skid rower, drifter, beggar, hobo, bag lady, homeless person, itinerant, bum, urban nomad, and others. Sometimes the terms used to describe vagrants may indicate sympathy. Most of the terms used are pejorative.

Laws have often been passed to suppress vagrancy. Sometimes vagrancy is treated legally as a misdemeanor or minor crime with light punishment attached. At other times it has been treated as a serious crime (felony). The penalties used to punish vagrancy have included branding, whipping, conscription into military

service, and commitment to a workhouse, farm, or some other place. Vagrancy is not a crime per se. That is, it is not a crime to be penniless and without a permanent residence. Vagrancy statutes, municipal regulations, and ordinances interpret vagrancy as a breach of the peace. It is a threat to public order. The intention of vagrancy laws is to prevent crimes. Vagrants are engaged in a way of life that is much more likely to lead to a life of crime. Therefore, the state has a right to protect the public from potential criminals.

Before the Industrial Revolution vagrancy was often a rural problem. Farmworkers and other agrarian laborers would drift from place to place, seeking employment. These drifters were vagrants who violated the laws against internal migration even if they were only seeking better wages. Many were displaced tenant farmers who had been driven off their land by the enclosure movement. These older vagrant types had been forced to stay at home if they were unable to work. The "ablebodied" poor were sent to work parishes or workhouses. Some were sent back to their home parishes.

The changing economics of the Industrial Revolution and its aftermath forced changes in the vagrancy laws. As people were crowded into factories, the unemployed vagrants came to be seen as potential criminals

or as a potential burden to the community. As potential criminals they were seen as engaging in disorderly conduct.

In the Articles of Confederation, the first American national constitution, vagrancy or pauperism was viewed as legally outlawed. Efforts were made to jail or restrict the movements of indolent drifters.

In hard times people treat each other hard. This was the case during the Great Depression. Vagrancy laws were used to justify the burning of "Hoovervilles" (makeshift housing) and to justify the erection of blockades to stop migrants from moving about the land to search for work.

As the Civil Rights movement of the 1960s progressed, vagrancy laws were examined by the courts. In *Papachristou v. City of Jacksonville* (1972) the U.S. Supreme Court invalidated a Florida vagrancy law. The Court found the law too vague to be enforced. In addition the Court held that the law condemned otherwise innocent behavior. A theme of court decisions on vagrancy is the difference between status and actions. Vagrancy outlaws the status or condition of being a vagrant rather than the commission of a specific criminal act. The *Papachristou* ruling overturned similar laws in many other states. However, most state vagrancy laws were rewritten to conform to the Model Penal Code. The Model Code does not mention idleness.

Since the late 1970s, homelessness has become a major urban and sometimes rural problem. It is usually viewed as a problem that cannot be solved with the traditional vagrancy laws. Civil rights proponents have claimed that the Model Penal Code covertly condemn vagrants because it does have provisions against loitering and prowling. The concerns have not been able to prevent attempts at restoring vagrancy laws because of the high crime rates prevailing in many areas.

The Supreme Court in Ward v. Rock Against Racism has upheld laws that are narrowly drawn that regulate vagrancy. Many people have been frightened or intimidated by large numbers of homeless people or street people engaging in aggressive panhandling, a behavior that can be regulated. Included in aggressive pan-handling are being threatening or obscene, engaging in abusive language, blocking sidewalks, and following people. Regulations also cover unauthorized solicitation, whether on public or private property, and other like behaviors.

Other ordinances prohibit camping in public parks or beside city facilities, or loitering at transit transportation stops or at bank machines. Still other ordinances prohibit "quality of life" crimes in order to safeguard the public from frightening contacts with the homeless. The terms have changed, but the issues remain.

Van Buren, Martin (Administration)

MARTIN VAN BUREN WAS born in Kinderhook, New York, near Albany. His father ran a tavern where people often discussed politics. Van Buren became a lawyer and entered politics as a minor county official. He then became a New York state senator and attorney general. His success in these posts led to being elected to the U.S. Senate. As a supporter of Jeffersonian policies Van Buren objected to the direction that President John Quincy Adams wanted to take the nation. Van Buren voted for the tariff of 1824, but opposed other measures to expand the federal government, and gradually came to support free trade.

Van Buren aligned himself with Andrew Jackson. He served as Jackson's secretary of state and as ambassador to England for a short while. Though he dealt with foreign affairs, Van Buren's talent as a party builder enabled him to build a political organization that would become the Democratic Party. Jackson trusted Van Buren, perhaps more than any other member of his administration. Consequently, Van Buren became vice president for Jackson's second term.

Van Buren won the election of 1836. He entered office intent upon continuing the policies of the Jackson administration. There was a major financial panic and a depression in 1837. The prosperity of the early and mid-1830s gave way to unemployment, destitution, and widespread poverty. This brought about calls for increased federal powers to intervene in the economy. Van Buren resisted these calls. Some claim that the de-

mise of the Second Bank of the United States during the Jackson administration caused the depression. There was considerable support for a new national bank to manage the financial system and stabilize the economy. Van Buren opposed this measure in favor of an independent treasury. Congress passed a bill for an independent treasury in 1840. He blamed the panic and depression on credit overexpansion. There is much evidence to support this explanation of the depression.

International factors affected the American banking system at this time. During the early 1830s there was an influx of silver from Mexico, large capital inflows from English investors, and an end to the outflow of silver from the United States to China. These factors caused an inflationary boom. This changed in 1837. Capital inflows dried up and overseas demand for cotton fell. These factors brought an end to the boom. Bank loans went from \$201 million in 1830 to \$324 million in 1833, and to \$525 million in 1837. Bank deposits rose from \$55 million in 1830 to \$76 million in 1833, and then to \$127 million in 1837.

The price level went up 53 percent from 1830 to 1833 and 64 percent from 1833 to 1837. In 1837 bank loans fell by 7 percent, bank deposits fell by 33 percent, and the price level fell 30 percent. Consequently, the depression cannot be attributed to the policies of either Van Buren or his predecessor. There was a partial recovery in 1838, but hard times continued during the rest of the Van Buren administration.

Van Buren opposed annexation of Texas because it would enter the Union as a slave state. He also resisted pressure to confront the English over the U.S.-Canadian border. These actions helped to avoid wars with Mexico and England. Van Buren also ordered the enforcement of the Treaty of Echota, which relocated 90,000 Native Americans. This resulted in the infamous Trail of Tears, which became a symbol of Native American deprivation and poverty.

Public discontent limited the Van Buren administration to one term. Historians have tended to denigrate the Van Buren administration. Many blame him for financial and economic events that were out of his control. His administration did avoid international conflict, yet the Trail of Tears remains as a black mark.

Vanuatu

THE REPUBLIC OF Vanuatu is an archipelago of 83 islands located in the south Pacific Ocean. The largest islands are Espiritu Santo, Efate, Malekula, Malo, Pentecost, and Tanna. As the New Hebrides, the islands were administered by an Anglo-French condominium until 1980. Upon achieving independence, the islands became known as Vanuatu.

Approximately 65 percent of the labor force on Vanuatu are engaged in small-scale agriculture. Vanuatu is subject to tropical cyclones and typhoons from January to April, and volcanoes, earthquakes, and tsunamis pose threats throughout the year. Fishing and offshore financial services are also major revenue producers for the islands. With several thousand visitors each year, the country's tourism industry is continually expanding. Around five percent of the labor force are involved in light industries that service local markets and those of neighboring islands. The Vanuatu economy depends on Australia and New Zealand to supply both foreign aid and tourists.

Vanuatu is a lower-middle-income nation with an annual per-capita income of \$2,900. There are no people without food or housing on the islands. However, women, rural residents of remote areas, and the poorest urbanites may experience hardships. These hardships include a lack of access to employment, healthcare, education, clean water, hygiene facilities, roads, and shipping services.

The Vanuatu population is relatively young. Between 1980 and 2005, life expectancy increased from 58 to 61 years for males and from 62 to 64.05 years for females. The median age is 22.64 years. One-third of the population is under the age of 14, and 3.6 percent have reached the age of 65. While all islanders have access to proper sanitation, only 88 percent of residents have access to safe drinking water. There are 12 physicians for every 100,000 residents on the islands, so access to healthcare is limited.

While childhood mortality continues to be higher than is acceptable, mortality rates have declined dramatically in Vanuatu over the last several decades. Between 1970 and 2003, the infant mortality rate fell from 107 deaths per 1,000 live births to 31 deaths per 1,000. The mortality rate of children under the age of 5 plunged from 160 deaths per 1,000 in 1970 to 38 deaths per 1,000 in 2003.

Children in Vanuatu die for a variety of reasons, which include malnutrition, preventable diseases, acute respiratory infections, diarrhea, and malaria. About 20 percent of all children under the age of 5 are malnourished, and six percent of all infants are underweight at birth. Around 19 percent of all children under the age of 5 are moderately to severely stunted. Childhood immunization rates in Vanuatu have declined over the past decade. Currently, immunization rates for children between birth and 23 months old vary from 44 percent against measles to 54 percent against DPT. The only exception is the 90 percent immunization rate against tuberculosis.

Very few women use birth control; however, fertility rates have declined. The fertility rate of women of childbearing age dropped from 6.3 children per woman in 1980 to 4.1 children in 2005. The fertility rate among adolescents stands at 53 births per 1,000. Just over 89 percent of all births occur in the presence of trained medical staff. According to modeled estimates for 2000, maternal mortality on Vanuatu occurs at a rate of 130 deaths per 100,000 live births.

Literacy rates are low on Vanuatu, and only 53 percent of the population over the age of 15 can read and write. Approximately 57 percent of males are literate, but only 48 percent of females are so classified. Most children attend school for at least nine years. In 2000, 90 percent of all males and 89 percent of all females in the relevant group were enrolled in primary school. Among those enrolled in primary school between 1990 and 2000, the completion rate for males dropped from 92 to 72 percent. All females completed primary school in 2000, a rise from 81 percent in 1990. Many children drop out of school because their parents cannot pay school fees.

Venezuela

VENEZUELA IS A resource-rich country in South America. Because of large deposits of petroleum and other minerals, the country is among the wealthiest in the region. From the 1920s through the 1970s, Venezuela enjoyed great prosperity. Like much of Latin America, the country suffered economically through the "lost decade" of the 1980s and into the 1990s.

Indeed, by 1995, the Venezuelan economy was on the verge of collapse. By 2005, high world oil prices again led to economic growth in the South American nation. Despite this overall wealth, however, much of the country's population has not benefited economically or socially. Economic and social development in Venezuela has been uneven, and poverty and inequality are widespread. Historically, wealthy Venezuelans and foreign companies have profited most from the country's natural wealth.

In a 2002 report, the World Bank claimed that Venezuela had suffered through a "vicious circle" for at least 30 years of weak governance, inefficient public-sector expenditures, and economic mismanagement that have led to poor economic performance and growing poverty. Statistics for the 1990s and early 2000s demonstrate the extent to which poverty and inequality have grown in Venezuela because of the decline in economic growth. Between 1990 and 2002, real wages in the country fell by 25 percent. Unemployment grew by four percent to a rate of around 14 percent. The rate would be even higher if it were not for the fact that many Venezuelans participate in the informal economy.

The number of poor Venezuelans who earned less than \$2 per day increased from 32 percent of the population in 1991 to 49 percent in 2000. The number of those living in extreme poverty and earning less than \$1 per day grew in the same period from 12 to 24 percent. By 2000, the richest 20 percent of Venezuelans earned 55 percent of the national income, while the poorest 20

percent earned only three percent. Several characteristics can be found among the poor in Venezuela. The majority of the poor live in urban areas, although poverty can actually be more intense in rural areas. Households headed by females are more likely to be poor than those headed by men. Many poor Venezuelans are old. At the same time, poor families on average have twice as many children as the middle and upper classes. Poor Venezuelans tend to be those with the least education. Furthermore, Venezuelans of African or Native American descent are more likely to be poor than the rest of the population.

One concrete illustration of poverty in Venezuela is the widespread presence of shantytowns, known as ranchos, in the country's cities. In particular, the hillsides surrounding the capital city of Caracas are lined with the often makeshift houses of the poorest Venezuelans. Housing in the ranchos often features poorly constructed homes made of low-quality materials. Conditions in the overcrowded ranchos are poor, lacking such basic services as water and sewers. Residents sometimes "pirate" electricity and water, while sewage collects on the ground. In recent years conditions in some of Venezuela's ranchos have improved, with residents receiving certain basic services and building sturdier homes. However, progress has been uneven, as the ranchos are still marked by unemployment and crime.

Many poor Venezuelans were literally buried in the mudslides or washed out to sea.

One catastrophic result of poverty in Venezuela was the December 1999 natural disaster in which heavy rains led to flooding and mudslides that swept through the shantytowns on the mountainsides in and around Caracas. Several days of heavy rains devastated the *ranchos*, killing up to 30,000 or more people, leaving hundreds of thousands of Venezuelans homeless, and causing billions of dollars in damage.

The true cost of the disaster may never be known, as many poor Venezuelans were literally buried in the mudslides or washed out to sea. Some criticized the Venezuelan government for ignoring signs of a potential disaster and failing to issue an evacuation order. However, the government of new president Hugo Chavez responded by blaming previous administrations for ignoring the poverty issue and allowing so many people in and around the capital city to construct and inhabit so many shantytowns.

Widespread poverty has had a significant influence on politics in Venezuela. In 1998, Chavez won the country's presidential election. Chavez's main base of support was Venezuela's poorest citizens. Many poor Venezuelans viewed the former military officer, who had led a coup attempt in 1992, as a savior. Chavez called for socioeconomic reforms and a focus on the reduction of poverty and inequality. Since taking office, Chavez has increased government spending on health and education programs for the poor. He has also implemented land reform policies.

Nevertheless, poverty continued to grow during Chavez's first several years in power because of extreme political polarization and a negative investment climate. However, by 2005 there were signs of change. The Venezuelan National Institute of Statistics reported that poverty fell from 47 percent in 2004 to 35 percent in 2005, below the poverty rate of 1999 when Chavez took office.

RONALD YOUNG
CANTERBURY SCHOOL

Vietnam

IN DECEMBER 1986, at the sixth National Congress of the Vietnamese Communist Party (VCP), the VCP started the economic reform program of *doi moi*, or renovation. This program was designed to reform the planned economy. The planned economic model had been applied to North Vietnam in 1954 and was expanded with much difficulty and against southern popular opposition after reunification in 1976. *Doi moi* was triggered by several intertwined domestic and international conditions: Vietnam's economy had been deteriorating since its reunification of 1976, and by the end of

the 1970s, Vietnam was facing economic collapse. The damage produced by the Vietnam War and a northern economy that was adjusted to wartime conditions posed worsening economic problems. In particular, Vietnam could not grow enough rice under the conditions of collectivization. Starvation became prevalent and Vietnam had to start rice imports. International problems exacerbated the domestic economic crisis: Vietnam's occupation of Cambodia from 1978 or 1979 until 1989 enforced the need for the government to finance an occupation force. This produced a diversion of funds to the military.

Vietnam follows China in the idea of economic restructuring before privatization.

The international isolation resulting from the occupation meant the end of Western aid programs, and an economic dependence on the Soviet Union and its satellite states in the Council for Mutual Economic Assistance (COMECON, established 1949, disbanded 1991). In 1978, Vietnam concluded a friendship treaty with the Soviet Union (November) and became a member of the COMECON (June). Relations between Vietnam and China had already been on the decline since the beginnings of a U.S.-China rapprochement at the start of the 1970s (ping-pong diplomacy), which was targeted against the Soviet Union, and Vietnam's reunification. The short border war with China between February and March 1979 and China's military presence at the northern border since then diverted further funds to the military.

Mikhail Gorbachev's reform programs of perestroika and glasnost in the mid-1980s and the disintegration of the Soviet Union and the COMECON brought down Vietnam's economic and political support. As a result, Vietnam had to withdraw from Cambodia (by 1989) and seek rapprochement with China and the United States, and it embarked on a reform from the planned economy to the "market socialism" of doi moi. The model for Vietnam in the reform process is China.

In particular, Vietnam follows China in the idea of economic restructuring before privatization. This also means that political reform toward democratization makes only little steps at the local grassroots level but is absent in the national context.

In 1988, the government moved to recognize the household farm as the basic socioeconomic unit in rural areas. This meant to reinstate the responsibility of

farmers and abandon the idea of agricultural cooperatives.

Particular emphasis is also placed on foreign direct investment and economic integration of the economy both in regional cooperation programs, such as the Asia-Pacific Economic Cooperation (APEC) and the ASEAN Free Trade Area (AFTA), and in the global economy through membership in the World Trade Organization (WTO). Vietnam endeavored to join the WTO by the end of 2005.

According to the United Nations Development Program, between 1990 and 2002, Vietnam reduced poverty from 60 percent to 32 percent of the population, largely through an annual growth of eight to nine percent. However, Vietnam's first National Human Development Report of November 2001 showed an uneven distribution of growth in different regions between the economically well-off southeast and the Red River Delta, on the one hand, and the northeast, northwest, and central highlands, on the other.

More narrowly, the regional disparities also show differences between urban and rural areas. Among ethnic minorities, the poverty rate is especially high. According to Vietnam's General Statistics Office (GSO), unemployment among ethnic minorities stood at 75 percent in 1998. Ethnic minorities constitute 14 percent of the population but account for 29 percent of the poor. As ethnic minorities live mainly in the mountainous areas, they are isolated from the economically well-off river deltas and urban areas of Hanoi and Ho Chi Minh City, and the government has found it difficult to diversify economic growth to these difficult-to-access areas.

Poverty reduction measures comprise the national, sectoral, and provincial, including the 10-Year Socio-Economic Development Strategy (2001–2010), which deals with an array of problems such as healthcare, rural clean water supply and sanitation, nutrition, children, public administrative reform, women, education, technology, and environmental protection; the Five-Year Socio-Economic Development Plan (2001–2005); the Annual Socio-Economic Development Plan; and specialized plans for the central highlands, Mekong Delta provinces, and northern mountain areas.

Urban poverty reduction measures focus on employment, income, housing, social security, and healthcare as well as on access for rural migrants to urban public services. The centerpiece of the government's efforts to alleviate poverty is the Comprehensive Poverty Reduction and Growth Strategy (CPRGS), which has been developed in successive steps since 1999. The

function of the CPRGS is to streamline the arrangements of the above plans, to draw up plans for their implementation, and to translate them into concrete measures. The leading agency in carrying out the implementation of CPRGS is the Ministry of Planning and Investment.

OLIVER HENSENGERTH UNIVERSITY OF LEEDS

Voluntary Poverty

THERE IS NO UNIVERSAL definition of voluntary poverty. Poverty is often seen as a social problem. As a social problem it is considered an undesirable condition. It is assumed that no one wants to live in poverty. Poverty is forced on people. It is involuntary. The poor are victims of structural, social, and cultural conditions beyond their power to change.

An example of a structural condition that creates poverty is unemployment. When factories lay off workers, and the educated and the skilled do not have jobs, people become poor because they are unable to meet their needs. Even when there are plenty of jobs available, a few may remain poor because they do not want to work. When this happens, poverty is seen as resulting from personality flaws. Cultural anthropologists have argued that poverty, like culture, can be transmitted from one generation to the next. Not only is poverty transferable from generation to generation, there is also the Matthew effect—the poor get poorer.

At the social level, strict definitions of poverty are needed when poverty is to be remedied through charity or public assistance programs. These definitions enable policymakers, welfare organizations, and others to help those considered poor to overcome poverty. Most welfare programs have elaborate methods of means testing to determine if an individual is poor or not.

When poverty is voluntarily practiced, individual-level definitions apply. In particular, when individuals who practice voluntary poverty live together in a community, they develop their own norms with respect to the consumption of various material goods and services. These norms are often shaped by the concept of simplicity. Voluntary simplicity involves the notion that in order to improve quality of life, one needs to shift from a consumption-oriented lifestyle toward a simple lifestyle. This lifestyle often involves working the land for subsistence in an ecologically friendly manner.

At times, groups and communities who have led a life of voluntary simplicity have had to face barriers and restraints that limited their ability to practice voluntary simplicity. Occasionally, such restraints have been met with collective action against imposers of such restrictions. For example, during the early 19th century, when the livelihood of several skilled cloth finishers was threatened by the introduction of shearing frames in the cloth mills of Yorkshire, they attacked and destroyed the mills. Similar attacks became commonplace and developed into the well-known Luddism movement.

Voluntary simplicity is an essential component of voluntary poverty. It is possible to have a few luxuries even when people practice voluntary simplicity as a guiding principle in their lives. However, many groups may consider possession of small excesses over what is needed as undesirable. They may choose to move from simplicity to poverty. Thus, in many instances voluntary poverty is seen as an extreme form of voluntary simplicity.

The notion of voluntary poverty is contained in ancient religions such as Buddhism and Jainism. Even today, several communities, such as the Amish, Mennonites, and Quakers in North America, practice voluntary poverty. The members of the Catholic Worker Movement founded by Dorothy Day and Peter Maurin at the start of the Great Depression strongly observed voluntary poverty as a lifestyle. Today, over 185 Catholic Worker communities in the United States remain committed to the practice of voluntary poverty.

The idea of voluntary poverty is the guiding principle of the Catholic Worker movement in America. The Catholic Worker movement in the United States combines anarchism with Roman Catholic teachings. The movement attempts to reveal the negative effects of consumerism promoted by capitalist markets on physical and mental well being. Consumer markets perpetu-

ate the illusion that unlimited material consumption is necessary for gaining happiness. The Catholic Worker movement views this illusion as dangerous and attempts to show instead that voluntary withdrawal from excess material consumption brings happiness and meaning to one's life. This path of voluntary poverty, they argue, enables us to live with dignity and empowers us to follow our conscience. The ability to listen to our inner voice and to make decisions accordingly is referred to as the "primacy of conscience" within the Catholic Worker movement.

The emphasis on voluntary poverty within the Catholic Worker movement is associated with other key values, such as Christian personalism and the principle of subsidiarity. It is easier to know, value, establish relationships, and care for others when one is disengaged from amassing property and material goods. Furthermore, by remaining poor, helping each other, and forming communities, it is possible to limit the influence of state and bureaucratic hierarchies in our daily lives. This belief is called "principle of subsidiarity" within the Catholic Worker movement. Thus within the Catholic Worker movement, the idea of voluntary poverty plays a crucial role in living a Christian life.

Voluntary poverty is outwardly simple and inwardly rich. In most religions such as Buddhism and Jainism, voluntary poverty is seen as liberating, enriching, and empowering. Voluntary poverty is seldom experienced alone. Advocates of voluntary poverty often oppose rugged individualism. Voluntary poverty is practiced in the company of others. The objective of simple living is service. One practices voluntary poverty to better serve the poor. It therefore frees one to work freely and tirelessly.

HINDUISM

Hinduism views voluntary poverty only as one among the many strategies for realizing God, attaining Moksha, or liberation from Samsara. The ultimate aim is to achieve Moksha. Hinduism recommends four paths toward the attainment of Moksha. They are love of God (Bhakti), meditation (Raja Yoga), accumulating knowledge (Jnana Yoga), and through selfless action (Karma). Having chosen a path, one has to instruct him or herself in pursuing the chosen path of Moksha. This provides opportunities for individuals to innovate, perfect, and create their own techniques. The goal is to become adept at Kaushal, or the art of pursuit of Moksha. The focus is on becoming Kaushal, and the practice of voluntary poverty is believed to aid the learning process.

Thus, voluntary poverty is recommended at various stages of life. The Hindu life is divided into several stages. At the very first stage past childhood, *Brahmacharya ashrama*, one lives the life of a disciplined student. During this stage, voluntary poverty is essential for disciplining oneself. The second stage is *Grihastha Ashrama*, when one is supposed to marry and lead a family life. Toward the end of family life, as one ages, one enters the stage of *Vanaprastha Ashrama* (forest dweller). Voluntary poverty is to be practiced to enable the elderly person to prepare for the final journey, where material possessions have no meaning. Thus, voluntary poverty is seen as a strategy, one among many others, to attain spiritual realization, the liberation from *Samsara*.

Gandhi attempted to politicize the notion of voluntary poverty.

Hinduism is not averse to acquiring wealth. Amassing wealth and power (*Artha*) can be a goal, especially during the stage of family life. *Artha* is one of the three prescribed goals in life. The other two are *Kama* (seeking pleasure) and attaining *Moksha*. However, both *Artha* and *Kama* are restricted to the second stage of life. The most important goal is to attain *Moksha*; the foundation for it is laid in the first stage of *Brahmacharya*, when one practices voluntary poverty.

OTHER RELIGIOUS TEACHINGS

Some Muslim subgroups, such as the Sufis, advocate voluntary poverty. Many Muslims and non-Muslims believe that Sufis are not Muslims. Regardless of their religious identity, Sufism upholds a life of voluntary poverty. It discourages its followers from owning material possessions and asks them not to be possessed by material things. Even in modern religions such as Tenrikyo, founded by Nakayama Miki (1789–1887), the practice of voluntary poverty is seen as essential for achieving salvation and to relieve human suffering.

The notion of voluntary poverty is central to biblical teaching. However, it has been interpreted in different ways. The meaning and understanding of the term *poverty* vary more than the meaning and interpretation of the term *voluntary*. Among the Franciscans, for example, the term *poverty* meant denial of all possessions, total nonpossession. Poverty is to be visible; working and begging were two aspects of poverty.

Among the Dominicans (the Order of Preachers) the vow of poverty does not call for a life of austerity and sacrifice. Instead, they emphasize the importance of sharing and friendship with the poor. Voluntary poverty here implies a willingness and openness to the experience of the poor in order to enter into solidarity with them.

The notion of voluntary poverty is not merely economic and social but also political. Mahatma Gandhi launched a political movement heavily influenced by the notion of voluntary poverty. Mahatma Gandhi borrowed the concept of "bread labor" from Leo Tolstoy, one of Russia's greatest authors. The concept of "bread labor" implies that individuals must earn their living by laboring with their own hands, tilling the soil. As laborers, all enjoy equal status and can come together as a community. He envisioned armies of nonviolent workers living together in rural surroundings in some form of cooperative commonwealth living a simple life in harmony with one another. He gave shape to his vision in organizing the Tolstoy Farm in Johannesburg, South Africa.

Gandhi attempted to politicize the notion of voluntary poverty. Gandhi's approach to voluntary poverty called for renunciation of modern technology in favor of a manual-labor-oriented economy. The basis of his economics, now known as Gandhian economics, was to protect the village economy and community against capitalistic penetration by empowering villagers to limit their wants by practicing voluntary poverty.

For Gandhi, individuals who accumulate goods not necessary for immediate use have stolen from the goods necessary for immediate consumption by others. He urged people to be mindful of greed and give up their longing for material possessions. He saw worldly goods being a hindrance to the enjoyment of happiness. Gandhi practiced voluntary poverty. He believed that he had no right to be fully clothed so long as millions of Indians could not afford the bare minimum of clothing. In order to emphasize the inherent virtue of serving the poor, he drew parallels between God and the poor. He called the poor in India "Daridra Narayan," the "God who is poor." For him, practicing voluntary poverty was godly.

MODERN MOVEMENTS

Following Gandhi, several movements have advocated the downshifting of consumption. In particular, the Small Is Beautiful movement that was launched in the 1970s focused on voluntary limitation of consumption, decentralization of production, and use of intermediate technologies—technology that can easily be purchased and used by ordinary citizens.

The Green Party, another ecologically friendly movement in the United States, is founded on 10 key values, including social justice, ecological wisdom, and community-based economics. These movements appeal to people's conscience to reduce consumption and practice voluntary poverty for preserving the environment and to ensure that the current generation leaves behind a livable environment for the ensuing generations.

In sum, the notion of voluntary poverty has deep roots in ancient religions such as Hinduism, Christianity, and Buddhism. Voluntary poverty is proposed as a desirable state of living. The practice of voluntary poverty is often endowed with moral righteousness whereas involuntary poverty is looked upon as a social and economic problem to be solved.

The meaning of the term varies widely with the variations in the definition of poverty. In some cases, the expected level of poverty is high and in other instances it is not. The idea of voluntary poverty has been politicized. Voluntary poverty is emerging as a necessary strategy to address modern issues of centralization of production, power, and disorganization of community life.

Vulnerability

PEOPLE WHO ARE vulnerable are those who, while not facing immediate problems, may do so on very short notice. Examples of vulnerable people include those reliant upon obtaining casual daily employment who, if they cannot find work, cannot afford food or housing; or who are reliant on a single, variable source of income, such as market vendors of commodities. The New Poor include many people who found themselves to be unexpectedly vulnerable to an external shock, such as divorce or redundancy.

In addition to considering vulnerability on the individual level, it is possible to consider vulnerability at the community, regional, and national levels. It is applied in this article to contexts such as environmental change, disease, and globalization.

ENVIRONMENTAL CHANGE

Vulnerability may also be considered in environmental terms. As climate change degrades the environment in which many people live, they find themselves required to migrate to other areas in which their traditional ways of life can no longer be sustained. On Banks Island in the Canadian Arctic, the Inuvialuit people are faced with the very rapid melting of the ice, which has been the basis of their landscape for all of their known history. New species of animals and insects are migrating farther north as temperatures increase, and buildings and roads are subsiding as foundations crumble.

The Inuvialuit people have been obliged to make rapid changes to their food-gathering strategies and to their forms of living. It is not yet known whether a newly constituted food chain will provide a sustainable source of protein sufficient to maintain human communities.

Combined with the process of desertification, millions of people across India and Pakistan have, in accordance with this trend, found themselves vulnerable to loss of livelihood and habitat. Places where they will be obliged to move will also be required to adapt to bear-

ing a much higher population, and so services and facilities will be placed under pressure and food security lessened. The population of this area will also become vulnerable.

Climate change will produce a variety of complex and difficult-to-predict phenomena. A report considering changes that might affect Australia discusses not just increased temperature but also changes in the nature of sea currents, patterns of winds, increasing numbers of storms and bush fires, as well as reduced rainfall. Some combination of these changes will occur in the next 25 years, based on current use of carbon-emitting technologies. The severity of the changes will determine whether existing coastal settlements, including the largest cities, Sydney and Melbourne, will still be inhabitable. Almost all of the population of Australia, which is predominantly concentrated in a few small coastal urban areas, has therefore become vulnerable to potential poverty.

Clearly, the less wealth people have before vulnerability strikes, the less likely it is that they will be able to avoid the health- or life-threatening problems that may affect them. The aftermath of Hurricane Katrina, which struck parts of the southern United States in September 2005, demonstrated clearly that the urban poor of New Orleans, who were predominantly black, were much more severely affected than other sectors of society, because their housing was located in the most atrisk areas and because they did not have the ability to leave their homes and survive for an unknown period of time in a remote location. Around the world, therefore, the poor and those with low incomes are most vulnerable to environmental change and will suffer most from it.

VULNER ABILITY TO DISEASE

Vulnerability to disease is not always subject to the income-based assessment, as environmental-change vulnerability is, but the ability to obtain necessary healthcare certainly is subject to income. SARS (severe acute respiratory syndrome), which emerged in November 2002 and led to the deaths of nearly 800 people, was transmitted through proximity, and so those who traveled widely were more vulnerable than those in isolated communities.

However, if people in rural or other isolated areas did become infected, they were much less likely to find suitable healthcare or even to have symptoms identified. Avian influenza, also known as bird flu, has until November 2005 primarily affected people who have

Those who are vulnerable to natural disasters, such as Hurricane Isabel in 2003, above, are also vulnerable to poverty.

been in close and lengthy proximity to infected poultry, which are mainly those who are poultry farmers or market vendors, often in rural areas. The majority of the people who have been killed by this disease have, therefore, been among the poor, who are vulnerable to the disease because of the occupations they pursue.

Diseases such as HIV/AIDS, which are commonly but not exclusively transmitted through sexual contact with an infected person, make all sexually active people vulnerable to infection, but those with higher incomes are more likely to be able to afford and use effective forms of protection.

They are also the ones who have had health education that would be applicable. Should infection be confirmed, the necessary medications to delay onset of the full condition and improve quality of life are very expensive and customarily available only to people in industrialized countries.

However, a campaign by both governments of less developed countries and powerful nongovernmental organizations aimed at legalizing the manufacture of generic, low-cost medical drugs has had some success in specific circumstances. With the potential large-scale need for flu vaccinations and the currently limited supply, some states have announced they will make their own versions of ostensibly copyrighted medications, and it is possible the entire intellectual property system with respect to pharmaceuticals will fall into desuetude, thereby reducing global vulnerability to disease.

VULNERABILITY TO GLOBALIZATION

Globalization represents, among other things, the ability of corporations to conduct production and market-

ing operations in most countries of the world. Since there are unequal distributions of comparative and competitive advantages geographically, some corporations are more able to compete than others. When a market is opened to global competition, therefore, some corporations or production units are able to thrive in competition with international competitors and others cannot compete. In those cases, all stakeholders in the failed corporations will suffer and the most affected are usually the workers whose jobs have been lost.

Some states are able to manage the globalization process such that the retrenched workers are offered retraining and assistance to enable them to find alternative employment. This is the case in the Nordic states, which have proved over the long term to provide the world's best governmental services and overall standards of living for all members of society. In countries that do not provide this sort of care, displaced workers can enter long-term unemployment and, where the failed industry was concentrated in a particular location, communities can suffer long-term blight.

Displaced workers can enter unemployment and communities can suffer blight.

The stopping of government support for the British coal industry by the policies of then Prime Minister Margaret Thatcher led to the impoverishment of the communities that had previously been dedicated almost entirely to the mines. In the face of a newly globalized economy or industrial sector, consequently, workers and other stakeholders are vulnerable to poverty or other negative impacts.

Strong labor rights and unions can help in palliating the worst effects but are unlikely to prevent them altogether. In less developed countries—and even in some of the more highly developed countries—labor rights are few and unions seriously impaired from taking effective action. Democratization of the workplace, just as much as democratization of the political system, is required to minimize vulnerability.

Countries that are among the poorest, such as many in sub-Saharan Africa, have very few if any industries that are internationally competitive, although they may have some natural resources that international corporations wish to exploit. These countries are under pressure to join international conventions or organizations such as the World Trade Organization or the New Eco-

1142 Vulnerability

nomic Partnership for African Development, or else to accept the conditionalities attached to World Bank or International Monetary Fund loans. Additionally, more powerful countries also wish to enter into bilateral free trade agreements with them in some cases. These agreements all have the effect of increasing the vulnerability of those involved in what will become uncompetitive industries.

Workers in some underregulated industries also suffer from hazardous workplaces and may suffer from predation by employers. This is the case for Chinese mine workers in private, unregulated mines, where hundreds of miners have been killed. Illegal migrant Burmese workers in Thailand are among those who suffer from the cruel treatment of some of their employers. In common with single women, children, and the physically disadvantaged, their lack of power over the actions that affect them make them vulnerable not just

to minor levels of abuse but also to sexual assault, human trafficking, and slavery.

WORLD POVERTY

Wage Slavery

SLAVERY IS A POWERFUL word that conjures up vivid and emotional images of intense social, economic, and political conflict. Slavery gives rise to a world in which the desperate and woeful existence of those bound up as slaves include with cruelty, violence, and economic exploitation. By and large, being a slave has come to mean that the person has lost his or her social identity, and thus that person can be regarded as mere property and compelled to compulsory labor.

However, slavery need not be strictly defined in terms of chattel slavery through the literal ownership of one human being by another, but rather can take account of other forms of economic subordination and dependency. Wage slavery refers to a situation whereby workers, though freed from the actual chains of chattel slavery, may nonetheless be held in virtual chains by their absolute reliance upon wages. With limited economic and social opportunities, wages turn out to be a laborers' one and only means of support, and if those wages are barely enough to maintain a subsistence existence, then in effect a worker is trapped into a form of involuntary labor. Theoretically, a person is free to choose not to work under unacceptable conditions, but

given limited opportunities and the necessity for one's own or one's family's economic survival, the worker in essence becomes a *de facto* slave since the ability to choose has for all practical purposes been removed. The lack of adequate income absolutely diminishes the ability of a worker to both save and invest and hence makes that person, and other family members, more vulnerable to poverty now and in the future. Higher incidences of poverty also tend to severely constrain the social, political, and economic opportunities of workers and thereby puts them at greater risk of being trapped in a low-wage, dead-end job.

Since slavery remains such a compelling metaphor, with roots dating back through thousands of years of human history, the use of the image of slavery in critically analyzing the plight of labor is apparent, even if not universally accepted as appropriate. In the mid-19th century there were a number of political writers and social reformers who questioned the progress of capitalism and used analogies to the institution of slavery to support their arguments. The philosopher and political economist Karl Marx relied on the image of slavery in a number of his writings. Indeed, one of the most oftquoted expressions from Marx's writings makes clear use of this graphic image of oppression when he as-

serted, "workers have nothing to lose, but their chains." In *Kapital*, Marx contends that the working class is treated as an appendage in the production process and analogous to Roman slaves held in chains in the days of antiquity, while wage laborers in capitalistic societies are bound to owners by "invisible threads." In Marx's analysis the relationship between employer and wage-laborer was clearly not purely voluntary nor was it mutually beneficial. The owners of capital and the employers of the working class used the structure and influence of capitalistic forces to maintain their control over wage laborers. According to Marx, in "former times" owners had relied on political control and legislation to impose and secure control, but could now rely upon the institutions of capitalism to subordinate the working class.

Determining an efficient and equitable wage rate remains a matter of some debate.

The economist and journalist Henry George also wrote about the association among the rise of capitalism, the incidence of poverty, and wage slavery. In his best-selling *Progress and Poverty*, George argued that while capitalism certainly produced wealth, most of that wealth accumulated in the pockets of landowners and monopolists. In his travels across 19th-century America, George observed that the working class and those living in poverty in the more established eastern states were relatively worse off than laborers in the more recently settled American west. In George's analysis, if the working class had access to natural resources, there would be a more equitable distribution of wealth and consequently less poverty.

The relationship between free and slave labor, as well as the determination of wage rates in either a free-market or a more socialistic economy, indicates a lot about how a society is organized. Wages represent the payments to workers from employers, and in a free market are established by the relative interaction of supply and demand in the labor market. The association between wages and a market-based economy in general, and capitalism in specific, seems fairly self-evident.

Determining an efficient and equitable wage rate, on the other hand, remains a matter of some debate among social scientists, public policymakers, advocacy groups, and social reformers. The more complicated relationship between slavery and the development of marketbased capitalism is relevant, but less evident. Even the direction of causality can remain a matter of some debate. For example, is it more appropriate to argue that slavery fundamentally contributes to the development of capitalism or did capitalism fundamentally contribute to the development of slavery? And there are other questions—such as the role that expanding markets, whether they are markets for slaves or markets for wage employment, play in the process of technological innovation and economic growth.

By the mid-19th century, capitalistic economies had only just begun to count a majority of the labor force as wage earners. Labor, of course, has been part of the process of production since the dawn of time, but wage employment in its modern sense of being paid an hourly wage as determined by a labor market is itself a development of modern capitalism. It was the rise of the working class in the context of rising levels of urbanization, industrialization, and factories that led many of the social writers of the mid-19th century to brand the subordination and regimentation of the working class as a form of slavery.

Wage employment is now the dominant form of the labor market in capitalistic societies, but this form of labor comes after the once familiar self-employment model and the indentured servitude and slave models of labor. A fully functioning competitive market implies that participants have choices, access to information, mobility, and thus economic opportunity. Under those circumstances one would expect that wage slavery would be difficult to sustain.

However, in a situation where there are limited choices, asymmetric information, immobility, and thus little economic opportunity, wage slavery can flourish. The sad fact remains that the economic exploitation of people, while not a very pleasant public relations image, can be quite materially profitable. But the image of a wage slave remains a potent and dramatic symbol for the plight of the working class. It may be even more ominous for those trapped in slavelike working conditions in the sense that employers may not even have to consider these workers as a long-term investment, but merely as a short-term and disposable resource that is easily replaced. In the most crass sense, an owner could decide that if any worker dies or is maimed on the job, he or she would simply get another worker. If this sort of horrifying attitude prevails among employers, then the level of degradation and violence directed toward the working class increases, and wage slavery becomes more commonplace.

But there are a number of economic and political consequences to a society that tolerates or even embraces a coercive labor system. Still, it seems reasonable to conclude that with limited economic opportunities and subsistence wages, the incidence of poverty will be greater, and as a result the rates of economic progress will likely remain unevenly distributed.

Based on the standard of legislative sanction, formal slavery no longer exists in the world. But based on a more matter-of-fact definition, along with the acknowledgment of the practical consequence of low wage workers with little or no choice, slavery can be thought of as a thriving and continuing business. By various measures there are still untold millions of people who can be thought of as wage slaves. Most remain untold because a number of these workers are less visible and thus often underreported in any census of laborers.

Kevin Bales, in *Disposable People*, estimates that there are likely 27 million slaves in the world today, although by other estimates this number could be adjusted upward toward 200 million. These laborers can toil in a variety of occupations and in a variety of locations. In sweatshops or other factory settings, in agricultural fields, on urban streets, as domestic servants, and in brothels around the world you can find men, women, and children employed in situations that could categorize them as wage slaves.

The connotation of slavery and slave labor is at its heart one of exploitation.

A particularly cruel aspect of all of this may be that some of these workers have lost their economic freedom because of either generational debt passed on to them or their own pursuit of economic opportunity that ultimately put them in a vulnerable economic and political position. For example, on the northern Mariana Island of Saipan, a U.S. Commonwealth in the west Pacific Ocean, young girls have been recruited to work in factories with the prospect of ultimately gaining access to the United States. Regrettably, many of these young girls instead get caught in a system of debt that denies them opportunity and too often forces them into undesirable and dangerous situations. In most cases, undocumented workers are denied the opportunity to seek better jobs and thus are at greater risk of exploitation.

The concept of wage slavery was more commonly used in earlier periods, and has generally become less commonly used by economists and social reformers in the late 20th and early 21st centuries. But given the ex-

tensive relative disparity in wages between rich and impoverished regions, the idea of wage slavery and a growing number of the working class caught up in a form of involuntary labor may sadly yet make this a more commonly discussed concept. Limited opportunities and subsistence wages are a compelling means to evaluate not only some of the causes of poverty, but also some of the implications of the reliance upon a market-based labor process.

Wage slavery exists when laborers feel confined in their employment choices and when their economic and social existence is utterly dependent on their earned incomes from those jobs. In most conventional interpretations, the connotation of slavery and slave labor is at its heart one of exploitation. And in those circumstances where the working class receives subsistence wages, it is not hard to imagine that the incidence and duration of poverty will continue to be a problem.

However, it is also possible to define wage slavery in terms of those who earn relatively high levels of income but feel compelled nevertheless to work and in essence are chained to their jobs. Workers who are so oriented toward work can in some extreme cases literally work themselves to death (or suffer job-related health problems) or figuratively so isolate themselves in their employment that they lose all other personal and social interactions outside of the job.

Wages

WAGES ARE COMPENSATION for a worker's time and effort on behalf of an employer. Wages are often specified as a rate of pay, which falls into two categories: time rates and piece rates. Under a time rate, workers are paid per unit of time, usually hourly. Under a piece rate, workers are paid according to the quantity they produce. Alternatively, many workers are paid an annual salary, regardless of the number of hours they work. Some pay schemes combine multiple methods.

For example, many sales representatives receive a base salary and a commission, which is equal to some prespecified percentage of the value of their sales. A worker's total compensation is composed of two main categories: money wages and benefits. Wages comprise the majority of a worker's total compensation, equal to over 70 percent of total compensation in the United States. Some benefits, such as health insurance, are generally not specified according to time worked or output produced, but provided to workers so long as they meet some minimum hours requirement. Other benefits, such as contributions to retirement plans, are tied to a workers' total monetary wages.

The wage rate is a price, and like any price, the wage rate provides a signal to both employers and employees. Holding all other factors constant, workers will supply more labor when the wage rate increases. Conversely, employers respond to increasing wages by decreasing their demand for labor.

In practice, workers take their total compensation into account when deciding what jobs to take and how many hours to work. Likewise, employers take the total hourly cost of employing labor, which includes total compensation and certain government taxes, when deciding how much labor to employ. Thus, money wages are only part of the story.

TIME RATES AND PIECE RATES

Both time and piece rates are common in the United States, with great variation in their use across industries. Generally, employers are more likely to use piece rates when they can easily identify individual workers' output. This will be more difficult when the production process is characterized by significant amounts of teamwork or when the speed of production is out of an individual worker's control, as with an assembly line. Unlike time rates, piece rates give workers an incentive to expend more effort in order to increase output. Piece rates can also improve the quality of an employer's ap-

plicant pool since piece rates tend to attract the most productive workers. One potential drawback of piece rates is that they may also cause workers to sacrifice quality in order to increase the quantity they produce.

Additionally, some workers may fear the possibility that managers will interpret the high level of productivity achieved under a piece rate system as evidence that the job is not as difficult as first believed. In this case the managers may lower the piece rate to match their new expectations. This is known as the ratchet effect. In practice, many firms have experienced increases in productivity and profitability when moving from a time rate to a piece rate.

WAGES AND HUMAN CAPITAL

Wages are tied to a worker's productivity, which depends on the level of technology, the amount of capital used in the production process, and the worker's level of human capital. Human capital refers to the set of skills, knowledge, and ability a worker possesses. Workers can increase their stock of human capital either through education or on-the-job training. Gary Becker was the first economist to formalize the theory of human capital. In his well-known work, Human Capital, Becker showed that an individual will invest in human capital if the net return to that investment is positive. For example, a person will attend college if the returns to education, measured by the increase in future income, are greater than the direct costs of attending college (tuition, books, and other supplies) and the foregone income from hours the student would have worked if he did not attend school.

Building from these basic insights, Jacob Mincer developed an equation that describes the determinants of an individual's wage. Empirical economists have used the Mincerian wage equation to estimate the economic returns to a college education. In addition to the years of schooling, a worker's age and work experience are important, since the latter give some indication of how much human capital the individual may have accumulated through on-the-job training. In addition to these observable characteristics, a worker's unobserved ability is an important determinant of his wage earnings. Membership in a union is also associated with higher wages.

WAGE DIFFERENTIALS, EFFICIENCY WAGES

Workers with the same characteristics may earn higher wages in some industries or occupations than in others

because of working conditions or undesirable aspects of the work environment. For example, workers in industries with high injury and fatality rates earn higher wages than workers with the same level of education and experience in safer occupations. These differences are called compensating wage differentials.

Alternatively, some firms may offer higher wages in order to extract greater effort from their employees. Workers have the incentive to provide greater effort in order to hold on to their high-paying jobs. Otherwise, workers who lose these jobs will either go to work for firms paying the normal wage or become unemployed. This increased wage is known as an efficiency wage.

VASILIOS D. KOSTEAS CLEVELAND STATE UNIVERSITY

Wallerstein, Immanuel (1930-)

IMMANUEL WALLERSTEIN is an American sociologist who has achieved fame as a result of his copious research and publications, particularly with respect to the concept of world system theory. In recent years, he has become more involved with issues relating to antiglobalization and the postdevelopmentalist world. He lectured at a number of universities and also served as president of the International Sociological Association and director of the Fernand Braudel Center. His work is in controversial areas and has often been contested. It clusters in the following areas: the historical development of the modern world system, the contemporary crisis of the modern capitalist system, and the structures of knowledge.

Wallerstein's influences include Karl Marx and the French philosopher Fernand Braudel. These influences may be traced to Wallerstein's creation of world system theory, which takes as its unit of analysis the world system rather than a nation-state, civilization, or other smaller unit. This implies that all of human society and economics is thoroughly interrelated and so it makes no sense to try to analyze it at less than the global level. There is, therefore, no Third World or developing world, just a single world that may be divided into core and periphery. There is a strict division between economic activities that take place in the core, which occupies a privileged position, and those in the periphery (also the semi-periphery), which relies more on commodity extraction and exchange. This is similar in some respects to structural dependency theory, especially in terms of the static nature of core and periphery.

Further, the creation of the system was initiated in the early modern period as a result of the creation of capitalism in northwestern Europe, a development that Wallerstein believes has been generally destructive to human development. He described the system in The Modern World-System in the following terms: "A worldsystem is a social system, one that has boundaries, structures, member groups, rules of legitimation, and coherence. Its life is made up of the conflicting forces which hold it together by tension and tear it apart as each group seeks eternally to remold it to its advantage. It has the characteristics of an organism, in that it has a life-span over which its characteristics change in some respects and remain stable in others. One can define its structures as being at different times strong or weak in terms of the internal logic of its functioning." Such a system is, consequently, nonquantifiable and in some important ways nonmeasurable.

Other scholars in this field, including Andre Gunder Frank, have taken different views in terms of the number and role of various systems. World system ideas have been criticized on a number of fronts, including the quality of data collection and analysis, the treatment of capitalism as a negative development, and the lack of ability within the method to conceptualize and integrate change.

Wallerstein's recent work has focused on the globalized world and its future, as well as possible postcapitalist futures. In a 2005 paper, he challenged both developmentalism and globalization and argued that the times of both had passed: "The whole discussion from 1945 to today has indeed been one long effort to take seriously the reality that the world-system is not only polarized but polarizing, and that this reality is both morally and politically intolerable. For the countries at the bottom, there seemed nothing more urgent than figuring out how to improve their situation, and first of all economically. After all, all these people had to do was see a movie and they would know that there were other

people and places in the world that were better off, far better off, than they were. As for the countries at the top, they realized, however dimly, that the 'huddled masses yearning to breathe free' represented a permanent danger to world order and their own prosperity, and that therefore something, somehow had to be done to dampen the tinderbox." His views encompass, therefore, not just philosophical inquiry but the need for direct political involvement in the support of the poor.

Wants

WANTS ARE THINGS that people desire to get. They are usually more than the needs of people. All humans need water, food, shelter, education, transportation, healthcare, companionship, and other basics just to survive. The psychologist Abraham Maslow established a hierarchy of needs (1943). His hierarchy of needs includes physiological satisfaction of needs, security needs, love, belonging/esteem, and actualization. Without the satisfaction of these needs a person will likely become stunted, crippled, immature, or a spiritually unhealthy human being.

The most basic of needs are the physiological needs for food, drink, shelter, and more. These are the needs for sheer physical survival. However, it would be rare to find people who want no more than mere survival. It was the case during the days of communism in the Soviet Union that political prisoners in Siberian salt mines were alive, but this form of existence would be very unsatisfactory to most people. It would in effect frustrate them in their fulfillment of their drive toward self-actualization. Wants are more than needs. A person needs a certain amount of protein in order to build

muscles and to be healthy. However, the protein can be acquired by soybeans when the person wants sirloin steak.

The Buddhist religion is based on rejecting the desire for material goods. The desires that people have are endless and often bring more problems than satisfaction. For Buddhists the best thing in life is to eliminate all desires. While this may be the religion of millions of people in the world, most people are much more world affirming and therefore seek material goods. Most religions have stressed control of the desire for material goods. Greed is usually denounced as an evil that is destructive. The virtuous life is to recognize that there is a limit to the wants that can demand attention and satisfaction.

Philosophers have also noted the problem of satisfaction of wants. The Stoic philosopher Epictetus, who was a slave and a teacher, believed that the goal of life is not to be found in supplying endless goods to satisfy material wants. He rejected the hedonistic idea that the goal of life is to maximize personal pleasure by satisfying in abundance the desire for gross bodily pleasures (as taught by the Cyrenaics) through large quantities of food, drink, and sex. Rather he taught that the goal of life is happiness as a form of contented living. This would be gained by living as a wise person who kept desires for material things to a bare minimum. The ancient Roman Stoic Lucius Annaeus Seneca said that the poor want some thing, luxury wants many things, but greed wants all things.

Samuel Johnson, the author of the first English dictionary, notes that people are poor only when there are necessities that are lacking. However, he was of the opinion that society gives the name of poverty to the want of superfluities. The harsh reality for at least a billion people living in absolute poverty is that they are often lacking in necessities and have no way to improve upon their situation.

Economics is a form of ethical philosophy. Adam Smith, the author of *The Wealth of Nations*, was concerned with the economic well-being of the producers in England. His philosophy has supplied great insight into the study of the satisfying of wants by economic means. Economists stress economic wants above needs. Markets are used to supply the wants that people have. Economic wants are the desires that people have for goods, services, leisure activities, or other things. The goods may be any number of things, such as furs, cars, rich meals, fine wines, jewelry, or other luxuries. The services can also be more than those used to supply basic needs. They can be access to entertainment, such

as ball games, plays, musical performances, art, or even illegal services such as prostitution.

The need for quality diamonds to wear does not exist. The desire to wear diamonds as a symbol or as a sign of wealth or ostentatious display is the result of manufactured desires. For all practical purposes, men buy them for women. The need for a rock with no utility is aimed at satisfying an artificial desire that is a socially manufactured need. Yet this is the way that wants are often created—by successfully marketing an idea that diamonds are symbols of love.

A great deal of marketing in the capitalist world is concerned with the creation of wants. Goods are manufactured, but in many cases people may not have an interest in the product, so advertising is used to create wants. The selling of many products and services is often associated with persuasive techniques that are designed to stimulate a desire in people who had previously been uninterested in the very existence of the product.

The creation of numerous new products is the creation of numerous new wants.

Much of the profit to be gained from most of the things produced or the services sold is associated with the creation of desires for things that people find useful, or entertaining or delightful, but could also live very well without. The desire for a product may be associated with price and not with the utility of the product. The marketing is the activity of creating and supplying desires for the product. Contemporary capitalist economies have invented credit cards as a way to finance the purchase of goods and services. The use of credit by the poor is risky because the result is likely to be indebtedness for the purchasing of goods that are not to supply needs, but to satisfy wants.

The creation of numerous new products is virtually the creation of numerous new wants. In earlier times only the rich lived well and could afford luxuries to satisfy desires. However, with the advent of industrialization, the mass production of goods and services has not only created vast new collective desires for goods, otherwise known as markets, but industrialization has also so lowered the cost of goods that great numbers of people in the world today, even if classed as "poor," live better than kings and queens of earlier centuries.

Along with industrialization has come the invention of numerous communication devices. Those that are

used in mass communications reach people by the millions. Radio, television, movies, music recordings, newspapers, magazines, and the internet allow information to flow around the world. The information flow allows people to see new products. It also encourages innovation that will aid product design to fill unmet needs. The channels of mass communication were not only instruments for mass marketing but for mass propaganda. What is often not recognized by people who stress the satisfaction of material wants is that markets cannot supply all of the wants of people. Many people want political security, which is a good that government can supply; markets really cannot supply it. It is the same for the desire for justice or for satisfying the wants of the poor.

Markets can create wants among the poor. The simple transistor that came into widespread use in the 1960s made radios cheaper and more portable. It made it possible for larges number of people in the developing regions of South America, Africa, and Asia to experience a "revolution of rising expectations." Their transistor radios captured information that fed their visions of a different style of life. The same phenomenon also has occurred with television. The images of how people live create desires for goods and services in the hearts and minds of many people, but images alone cannot supply them. Markets cannot deal with the wants of the poor in the sense of supplying them with purchasing power. This requires a welfare system supported by either taxes or charity, or it requires jobs for earning income. Modern governments controlled by democratic political parties and influenced by morally concerned interest groups that are advocates for the poor have adopted policies that provide at least a minimum of welfare for the poor. The goal is more than the supplying of needs. Policy goals usually include supplying income and services at a level that is considered sufficient for the satisfaction of many wants as well as necessities.

The politics of the distribution of welfare transfer payments is such that it involves using the desires and the wants of the poor as a means to political power. Many politicians address voters, including those in want, with plans for distributing income that will satisfy the wants of the poor.

War and Poverty

THE 2004 YEARBOOK OF the Stockholm International Peace Research Institute reported that 377 major armed conflicts occurred worldwide in the years from 1990 through 2003. The average number of conflicts during this 14-year period was 27 per year. The number of conflicts reached a high point in 1991 at 33 and the low point occurred in 1997 at 18. Of the major armed conflicts that occurred in 2003, only two were fought between states, the war in Iraq and the ongoing struggle between India and Pakistan over control of Kashmir. The remaining conflicts in 2003 were intra-state or so-called civil wars.

Since the end of the Cold War, the intrastate conflict has clearly been the most prominent and in many ways the most difficult to resolve. Long-standing conflict has defied solution in Colombia and Israel for years. However, there has been some progress made in ending intrastate wars. In 2003, the peaceful end to conflict was reached in Liberia and Sudan. The most significant factor in these resolutions has been the concerted efforts of other countries and international organizations providing mediation to end the conflict and support of all types to ensure the rebuilding of infrastructure and the alleviation of poverty.

Intrastate wars are of primary concern to virtually all organizations devoted to socioeconomic development. The World Bank, for instance, considers civil war to be development in reverse and a significant part of the enormous global poverty problem. There in an inextricable connection between major armed conflict and the advance of poverty in all its forms. War impacts the civilian population within a country far more than it does the initiators. It is true as well that socioeconomic development, if it is allowed to happen and if it is sustained, can act as a preventative to war. A recent World Bank research report concluded that "Civil war ... reflects not just a problem for development, but a failure of development."

A number of proposals have been made in recent years directed at finding ways to alleviate poverty and, as a consequence, to curtail the incidence of debilitating civil war. In the economic area, proposals have been made to eliminate the high debt that developing countries owe to their affluent urban-industrialized counterparts. In many cases, the amounts owed far exceed the ability of the poor country to perhaps ever make repayment. In addition, international terms of trade work against poor countries and they are not able to compete on the world market and find consumers for their products. Increases in monetary support have also been proposed if significant progress is to be made in alleviating poverty and rebuilding countries that have experienced civil war and the ravages of environmental degradation.

It is clear that the degree of redevelopment needed to bring these countries up to a self-sustaining level is far beyond their capability. A June 2000 article by Professor C.G. Jacobsen in *The Online Journal of Peace and Conflict Resolution* makes this conclusion evident: "The poorer countries (average per capita income of \$400) clearly do not have the means to fund the programs required. The rich countries (average per capita income of \$24,000) clearly do not have the will." The last point about will is well taken.

Other writers have drawn attention to the blatant indifference that most urban-industrial countries have to the plight of the poor. This unfortunate attitude mirrors those of the factory owners during the heyday of the Industrial Revolution in England, when thoughtlessness and apathy about the working and living conditions of the poor ruled the day.

The UNICEF annual report *The State of the World's Children 2005* provides in-depth discussions on three salient issues facing the developing world: poverty, conflict, and HIV/AIDS. The report estimates that more than half of all children in the world are deprived as a result of one or more of these three maladies. In addition, the report goes on to claim that poverty is a civil rights issue and that children and their families are faced with far more than just material deprivation. During armed conflict, their lives are routinely upset from relocation, lack of education, and separation through family and other support structures. It is true as well that 90 percent of all lives lost during armed conflict are non-combatants and 80 percent of those lost are women and children.

The UNICEF report concludes that the political climate in the world actually contributes to the persistence of poverty through a seemingly unending discourse on the use of war to resolve problems. A mindset that entertains the use of conflict whenever regional or global problems arise essentially guarantees the perpetuation of poverty and political unrest. It has

been estimated that during the decade of the 1990s one million children worldwide were separated from their families because of armed conflict. In addition, an estimated 300,000 children were combatants in international and intranational wars in 2003.

Africa and Asia accounted for 12 of the 19 intrastate armed conflicts in 2003. These regions also had the greatest number of children actively involved in these wars. The Ivory Coast, Liberia, and the Democratic Republic of the Congo saw a decided increase in the number of children taken into the military. Once children are members of a military organization in these countries, they become the targets of a variety of atrocities, including rape, mutilation, exploitation, and beatings. Conscription means the end of a normal family life for children and their families. Once driven from their homes, children are particularly vulnerable to continued abuse because they lack the strength and skills to ward off assaults. They also have their education interrupted and are forced to leave their homes. UNICEF estimates that 40 million people, including 20 million children, have been forced out of their homes by armed conflict and one-third of these refugees have been forced to find refuge in another country.

Becoming a refugee in another country opens the door to additional peril. There have been numerous reports of young girls in conflict regions being forced into prostitution and sexual slavery. Refugee camps that have been set up during armed conflict can be dangerous places, and this is especially true for children. Reports from war-ravaged Colombia indicate that girls as young as 12 were forced to submit sexually to armed forces members to ensure the safety of their family members.

The statement that war undermines the rule of law and the dictates of human rights is eminently valid. The civilian population is in danger even after the end of an armed conflict. Unexposed explosive devices and land mines have claimed the lives of thousands of noncombatants. Their homes may have been destroyed in the conflict, forcing them to start life anew in a potentially hostile setting. Those returning to their original communities may find their homes destroyed, schools closed, and community infrastructure impaired. The costs to rebuild a war-torn community in a developing country will most likely be far beyond the capability of the local populace.

During the years of internal strife in Ethiopia, the numbers of people in poverty rose dramatically. Many families disintegrated because of the stresses of conflict and continual relocation. Unemployment and prostitution flourished in the country and the spread of HIV/AIDS continued at high rates because of interrupted health care delivery. Poverty and war in Liberia had driven over half of the country's children out of school in 2002. In that year, the World Bank estimated that 80 percent of the population of that country were living below the extreme poverty level, set at \$1 per day. Of the 2,400 schools in Liberia prior to the war (1989–97), 80 percent were destroyed. About half of them were rebuilt after the end of armed conflict with funds from a number of nongovernmental organizations (NGOs) and through self-help programs.

Research reports by the World Bank, the International Monetary Fund, and the organization Christian Aid all point out that developing countries with oil reserves have a higher incidence of four negative conditions: 1) poverty, 2) internal corruption, 3) likelihood of civil war, and 4) a governmental leadership that is both dictatorial and unrepresentative of its people. Oil, it turns out, is the "lethal cocktail" in this unsavory mixture.

In Angola, oil revenues have fueled 30 years of civil strife. Government revenues come almost exclusively from the sale of oil, yet over 60 percent of Angolans do not have access to safe drinking water, a condition that seems endemic in the developing world. Sudan suffered a similar fate. Inability to resolve the issue of oil revenue sharing in the country led to years of civil war. Kazakhstan, a former republic of the Soviet Union, is the recipient of enormous oil revenues and the site of a crumbling infrastructure. An added irony is that one-third of the population lives below the extreme poverty level of \$1 per day.

An estimate by the Human Development Foundation suggests that upwards of 12 million people would die if a nuclear war broke out between India and Pakistan, the two countries that have vied for years for control of Kashmir. In addition to the loss of human life, the anticipated loss of homes, hospitals, schools, water supplies, and lingering lethal radiation is beyond monetary estimate. The report goes on to suggest that the real war India and Pakistan should fight is the one against poverty. Within the region of south Asia, 45 percent of the population live below the \$1-per-day level. In 2003, eight of the reported 19 civil wars occurred in Asia. Another estimate pointed out that Pakistan's military spending is roughly 25 percent higher than its combined budget for health and education.

What is needed, it seems, is a systematic way of dealing sternly with the prospect of both international and intranational war. To allow the arbitrary initiation of armed conflict to be the sole pathway to resolving serious issues will perpetuate and aggravate the insidious poverty that grips the majority of the world's population. In addition, the indifference that seems to guide the actions of the urban-industrial countries must also be eliminated. The rebuilding of the war-torn countries of the developing world and their elevation to livable socioeconomic levels will require the concerted and collective efforts of all countries in the world that can render assistance.

War on Poverty

THE WAR ON POVERTY (1964–68) was a campaign of legislation aimed at reducing poverty in the United States. Nearly 40 million, or just over 22 percent of Americans were considered as living in poverty in 1960, according to the Census Bureau. The term was first introduced by Lyndon B. Johnson during his first State of the Union address on January 8, 1964: "This administration today, here and now, declares unconditional war on poverty in America."

The War on Poverty is often tied to Johnson's *Great Society*, a term he used in a May 1964 speech in Michigan to motivate his domestic policies. Many of these policies have roots in the John F. Kennedy administration, though it was Johnson who publicized and signed them into law. Great Society legislation included the

Civil Rights Act of 1964, the Voting Rights Act of 1965, and the creation of the Department of Housing and Urban Development.

Michael Harrington's book *The Other America* (1962) often receives credit as a catalyst for this movement. *The Other America* consists of statistics, analysis, and anecdotes of impoverished Americans who, Harrington argued, were largely ignored by the media and government. The book enjoyed widespread popularity, and it is believed a copy was given to Kennedy in 1963, though it is not certain whether he read it.

The major pieces of War on Poverty legislation include the following:

Economic Opportunity Act (EOA) of 1964. The EOA represented a unique approach by the federal government; it combated poverty by federally funding local programs tailored toward a given community. The EOA termed these programs Community Action Agencies (CAAs). Examples of CAA programs and initiatives are Volunteers in Service to America (VISTA, later amended to Americorps during the Bill Clinton administration), Job Corps, Head Start, adult basic education, senior centers, food pantries, homeless shelters, job training, Meals on Wheels, various youth programs, and family planning. By 1968, CAAs serviced nearly two-thirds of all American counties.

The EOA also established the Office of Economic Opportunity (OEO) to administer its many sections. The first head of OEO was Sargent Shriver, who was the director of the task force called to design the EOA and later the Democratic vice presidential candidate in 1972. Many states would later create their own OEOs in order to improve the welfare of their state and also to have a say in funding matters. After a myriad of changes and redefinitions during the Nixon administration, the federal OEO was terminated in 1974 and replaced by the Community Services Administration (CSA). The CSA was abolished in 1981, though many of the community programs remained. Many of the state-level OEOs remain in existence today.

Although many of the original CAA programs were changed substantially or cut during the Richard Nixon and Ronald Reagan administrations, some notable programs still exist in close to their original form. Head Start is a child development program for low-income children ages 5 and under (including prenatal care), funding a variety of efforts, including immunization, preparing children for school, and nutrition information. A second program remaining close to its original form is Job Corps, which provides vocational training for young adults between 16 and 24 years old.

Social Security Act of 1965. Though the EOA was Johnson's signature War on Poverty legislation, the Social Security Act of 1965 had more significance in the long run. The Social Security Act of 1965 created two of the largest government programs, Medicare and Medicaid. Medicare is a health insurance program for those aged 65 and older, the disabled, and those with end-stage renal disease. A 2.9 percent income tax equally split by employees and employers partially funds Medicare, with the remaining covered by a trust fund (the Supplemental Medical Insurance Trust Fund). Medicaid is a health insurance program for the poor. Medicaid is funded jointly by the states and federal government, but it is run primarily at the state level.

Social Security Act Amendments of 1965 and Social Security Act Amendments of 1967. These two acts increased Social Security benefits at a time prior to inflation-indexed benefits.

Appalachian Regional Development Act (ARDA, 1964). The intent of the ARDA was to improve economic growth in the Appalachian region, which has a history of high unemployment, low wages, and belowaverage educational attainment. The ARDA established the Appalachian Regional Commission (ARC), which consists of the governors from all 13 states with an Appalachian portion and a presidential appointee. The ARC determines policy for the region using money appropriated by Congress. The act also drew boundaries for the region to dictate where federal outlays given to ARC could be spent. The ARC still exists today and continues to receive annual federal money, though the amount has varied depending on the administration. Nearly two-thirds of the roughly \$9 billion appropriated to ARC since its inception has been devoted to road construction in order to improve accessibility to the region, according to the ARC annual report for 2002.

Higher Education Act (HEA) of 1965. The HEA provides federal money in the form of loans, grants, and scholarships to increase access to higher education, particularly for those with low income.

Elementary and Secondary Education Act (ESA) of 1965. The ESEA provides federal money to schools with high concentrations of low-income children.

Revenue Act of 1964. The Revenue Act of 1964 reduces both individual and corporate income tax rates. The Revenue Act also creates a minimum standard deduction for individual income taxes.

Johnson's War on Poverty required a definition of the poor to evaluate the programs and also determine where to spend the money. Mollie Orshansky, an economist working for the Social Security Administration, developed and published an index in two articles for the Social Security Bulletin in 1963 and 1965. Though Orshanksy did not intend the line to be a strict measure of poverty, the federal Office of Economic Opportunity adopted Orshansky's measurement for its formal definition of poverty. Orshansky's line is simple: she multiplied the cost of a family's minimum nutritional needs by three, because at the time households spent about one-third of their budget on food. Using food expenses to define poverty was not an arbitrary decision. Food remains one of the few, if not the only, household expenses with a commonly accepted standard of minimum need. This line, adjusted for inflation, remains in use today by the Census Bureau with only minor alterations.

POVERTY LINE

The poverty line received many criticisms. Even the Census Bureau, which currently compiles poverty statistics, concedes the poverty line is not completely descriptive of basic needs. One problem is that the budget share devoted to food is lower today than in the 1960s because improved technology has decreased the price of food. In addition, the percentage of household budgets devoted to childcare, housing, and healthcare increased during this same period.

The War on Poverty ended with Johnson's administration in 1968.

However, there is value in a uniform measure as a means of comparison across years, which is why the Census Bureau continues to use Orshansky's measure today. Further, other attempts at defining poverty have not established an upward or downward bias of Orshansky's poverty line. Notable attempts at defining poverty include the National Academy of Sciences, which developed a measure that included net taxes (paid minus credits) and cost-of-living differences, and other economists, who calculated the poverty level on consumption.

Though the War on Poverty was not necessarily won or lost, most agree it ended with Johnson's administration in 1968. Johnson decided not to run for reelection in the spring of 1968. Hubert H. Humphrey, the vice president under Johnson, won the Democratic nomination but lost the 1968 presidential election to

Richard Nixon. Once in office, Nixon substantially changed the face of the OEO, transferring many of its programs to other departments and attempting to abolish it in his second term. While Nixon scaled back some of Johnson's programs, he did not entirely undermine the effort to combat poverty.

For example, Nixon oversaw indexing Social Security benefits to inflation and the creation of Supplemental Security Income during his presidency. The Vietnam War was probably more influential than the 1968 election on the War on Poverty. As conflict escalated in the mid-1960s, Johnson's Great Society policies lost much of their early momentum and media attention. Budgets for the war effort increased each year during this period, leaving many of the CAAs with considerably lower operating budgets.

Whether the War on Poverty was successful or not is a matter of debate. According to census data, over 18 percent of American families lived below the poverty line in 1960, and by 1968 this figure dropped to 10 percent. Despite progress in the 1960s, the poverty rate has remained relatively stable since 1970.

MACROECONOMICS AND POVERTY

Many researchers often point to the connection between macroeconomic fluctuations and the poverty rate. The logic connects employment and poverty. Many adults living in poverty are also unemployed. Since macroeconomic expansions often create jobs, this decreases both unemployment and poverty. Alternatively, macroeconomic expansions also raise real wages, which pulls some of the employed above the poverty line. However, the negative relationship between economic growth and poverty does not always hold.

Rebecca Blank (2000) argues that the expansion in the mid-1980s did not lower poverty as much as earlier expansions because of real wage declines for low-skilled workers. War on Poverty legislation came during an economic expansion that began prior to Johnson's presidency. Because of the timing of the expansion and its link to poverty, it is difficult to determine how much War on Poverty programs contributed to the decline in poverty rates. For this reason, there is no clear consensus on the overall success of Johnson's War on Poverty legislation.

Some researchers have focused on specific demographic groups to determine the impact of War on Poverty legislation. For example, most agree that the elderly benefited from this legislation. The poverty rate for those aged 65 and older fell from 35 to 10 percent

between 1960 and 1995, according to the National Bureau of Economic Research, largely through increases in Social Security benefits and lower healthcare costs via Medicare. For blacks, the story is not as clear.

J. Smith and F. Welch claim that the percentage of poor blacks decreased from 38 in 1960 to 21 by 1980. However, black poverty rates provided by the census begin in 1974, so the effect of the War on Poverty for blacks is unclear. After 1974, black poverty rates loosely follow macroeconomic fluctuations, peaking during the early 1980s recession at 29 percent, and falling to 18 percent by the end of the 1990s expansion. It is likely that black poverty rates are more sensitive to macroeconomic fluctuations than white poverty rates because more blacks earn wages close to the poverty line than do whites.

ROBERT BAUMANN
COLLEGE OF THE HOLY CROSS

Washington, George (Administration)

GEORGE WASHINGTON (1732–99) was the commander in chief of the rebel armies during the Ameri-

can Revolution and, subsequently, the first president of the United States, serving from 1789 to 1797. Born into an aristocratic elite, Washington was awarded positions of authority at early ages, and without experience. However, he proved his worth in the French and Indian Wars and subsequently rose to supreme commander of the army. This also enabled him to pursue his interests in the western expansion of the colony into the lands of the Native Americans. As a slave owner, he was forced to confront inequity and poverty. When, during the War of American Independence, the British offered freedom to slaves, thousands attempted to escape and flee to British-held areas. Subsequently, many hundreds were massacred on the orders of the white American military forces.

After the revolutionary forces and allied French defeated the British, Washington intended to retire, but was drawn back to politics because of the political failure of the early states operating under the Articles of Confederation. He was then instrumental in creating the Constitution at the Constitutional Convention in 1787 and was subsequently elected president.

As president, Washington attempted to balance, with customary aristocratic grace and manners, competing sides in the struggle between states and federal government, having been reluctant to accept the position of president; he was determined to avoid partisan squabbling. Nevertheless, he personally favored strengthening the national government, for example by deeming constitutional the foundation of the Bank of America and the federal assumption of state debts. To try to elevate the presidency above partisan politics, he toured both the north and south of the country. Still, conflict between the Democratic-Republican faction adhering to Secretary of State Thomas Jefferson and Secretary of the Treasury Alexander Hamilton widened and, as Washington favored the latter, members of the former issued various attacks on his character and policies.

Washington appears to have had a patrician approach to his people and religion, believing in the need to develop the religious nature of the American people, and appointing chaplains to police the morals and behavior of the people. He also believed that members of the state must bend their personal beliefs to join with those of the state and the majority. He was very conscious of the fact that all of his acts as president, as well as those of all members of his administration, were creating precedents and believed that all people should be mindful of this. Unfortunately, this attitude has led to a sense of considerable overreverence for the acts of the early independent state in modern America.

In terms of foreign policy, Washington preferred to maintain a neutral and isolationist stance until the country could grow stronger. Under his administration, the making of foreign policy became largely a function of the presidential office. In his farewell speech, he stressed the twin goals of union at home and independence internationally.

Water

IN THE DEVELOPED WORLD, there are certain luxuries that are taken for granted every day. These simple luxuries are inaccessible to many who live in developing nations, primarily in Africa, Asia, and Latin America, where the poverty-stricken deal with problems such as famine, hunger, and disease. The roots of these problems have a direct correlation to lack of access to clean water.

Poor or corrupt governments in the developing nations do not have the funds to provide quality water for their large populations. Water quality and security issues plague these areas, which leads to an increase in poverty. Not having an adequate water supply and quality level has limited opportunities for development. The people cannot advance because of all the health issues that arise. It is not only having good drinking water, it is water for everyday functions and uses, that can lead to a safer lifestyle.

The first misconception is that many do not have enough water. The truth is that many do not have access to any clean water at all. The difference is that many of these nations do not have proper plumbing and drainage systems in individual homes or even villages. Many have to travel miles on foot to reach a clean water tap that three or four other villages may also use. The

A hand water pump in Debipur Camp, Jammu, India, serves the needs of the local community. Projections are that in the first quarter of the 21st century, 2.7 billion people will experience water shortage.

water scarcity issue refers to water that is not easily accessible or attainable. The number of people who do not have access to basic sanitation is estimated at 2.4 billion throughout the world. About 80 percent of disease in two-thirds of the world is related to or caused by poor water.

IRRIGATION AND WELLS

Improvements to irrigation systems are necessary for alleviating the problem, helping protect the population from famine and hunger by making sure agricultural development expands. Agricultural growth is essential in economic development, especially in countries such as Pakistan, India, and those of sub-Saharan Africa. These problems reflect directly on water issues in terms of health and scarcity. By modernizing infrastructure and

providing access to all communities, governments are ensuring that their people have the ability to reach a substantial supply of quality water.

Having the proper water resources can boost the economic development and increase the purchasing power of the poor. Expanding farms provide more employment opportunities for any village throughout the developing world. Canal irrigation is a key contributor to poverty alleviation because many villages in the same district can utilize one source of water for farming. Tube-well technologies have also improved the quality of life in eastern India and Bangladesh. This system is publicly financed and is run by command areas that reach out to many villages.

However, as these systems expanded, they began to favor only the elite or those who could afford them. Small farmers and the poor have had to depend on other water markets and treadle pumps. Using treadle pumps does not require as much funding as is needed for tube-well systems, so farmers with less than an acre of land can use water efficiently. Treadle pumps, on average, require only one investment of \$18 and the only real task after installation is management of the pumps. A sufficient water supply is necessary for hydropower; therefore industry and energy are taking a hit. Developing countries need energy to boost their standard of living. Energy resources allow a country to develop and to expand, including surrounding nations and territories.

Major problems seem to be worsening in the developing world. Water shortage, it is said, will be a more serious issue in the future. The projections are that in the first quarter of the 21st century 2.7 billion people will experience water shortage. This number is close to a third of the world's population. Food production will be greatly affected by the overuse of groundwater. This production loss is projected to hurt the Punjab region of the subcontinent and northern China, which are two of the major breadbaskets of Asia. Without remedy, it will quickly deteriorate an already devastated region of the world. If the major areas where food is produced suffer, it will make the surrounding regions suffer. All their economies are based on agriculture, and the water shortage situation exacerbates all problems. In such densely populated areas as sub-Saharan Africa and south Asia, people carry heavy pots of water for their village, walking kilometers to the closest source, needing quality nourishment to fulfill daily tasks.

DISEASES

The deterioration of wetlands caused by upstream water depletion spreads the risk of waterborne diseases. Water pollution is the leading cause of death in the developing world. In urban households, water is used for drinking and sanitation. This utilization is very different from that in the rural areas, which need water for irrigation, livestock, and other agricultural duties. Children in the urban areas are more susceptible to fatal illness in such heavily populated areas.

Six children die each minute from waterborne diseases. Illnesses keep children away from school because they are too ill. Clean drinking water is almost nonexistent because of the lack of funding and the governments' inability to manage water issues. There are no water treatment plants that can effectively filter out harmful chemicals. Even if they do, pipes used to transport water are made of lead, which is detrimental to humans because it causes brain damage. The majority of

these people who live in Africa and Asia are poor and have no choice but to drink water that is known to be unsuitable for consumption. They tend to get many skin diseases and other fatal health disorders. Some diseases that can be contracted simply by drinking the water are ascariasis, campylobacteriosis, cholera, cynobacteria toxins diarrhea, dysentery, hepatitis, trachoma, and typhoid.

The question is how the tap water has become so unsafe and what elements within that water cause all the problems that have driven populations to poverty? When microbes are found in the drinking water, human or animal excreta, among other harmful agents, have contaminated it. The microbes are pathogenic bacteria, viruses, and parasites such as protozoa. When drinking water is contaminated by these microbial elements, it can lead to infectious diseases that turn into outbreaks. Contamination by all of these pathogens makes water unfit for human consumption. Humans can become sick by three methods of transmission: ingestion, inhalation, and contact. It is difficult to avoid contracting a disease if the most abundant and necessary resource of life is polluted with it. Microbial water quality levels vary in certain areas.

Often, there are water treatment facilities and reservoirs, but they are poorly operated. Although water can be drinkable if the population is immune to it, it is nevertheless unhealthy for the human body. For example, warm climates and low residual chlorine concentrations can alter the water treatment and spawn harmful organisms such as legionella.

SANITATION

A lot of people throughout the world live without another basic necessity for health conditions that is also taken for granted in the West. Approximately 40 percent of the world's population live without access to basic sanitation. Apart from the poor quality of water that has caused the spread of many deadly diseases, wastewater has also been a contributing factor. Poverty-stricken areas are often faced with infectious disease caused by contaminated water.

With no sanitation or waste removal, all these germs and diseases build up and are left on the street. Large populations produce ever-increasing amounts of waste, which quickly builds up, leaving living situations worse as each week passes. There is no proper plumbing to keep these areas clean and refreshed. Many of these areas are villages that are far away from cities, so the quality of life remains low. With no sanitation, every-

Children drink at a community tap water source in Yemen; tap water may or may not be safe.

thing that is left behind enters the water supply. In the developed world, governments can afford to establish treatment plants to take care of wastewater. But in the developing nations, the lack of water treatment facilities contributes to the increase in poverty levels. Daily exposure to wastewater has caused serious illness to the very young and the elderly. The spread of disease continues to decimate populations through overexposure to wastewater.

The means by which wastewater deteriorates health is primarily through drinking water. When it enters the water supply that is used for consumption, it is deadly for a community. Diseases will spread and continue to plague everyone. Contamination in rivers or lakes is equally hazardous. Fish consumed from these water sources are engulfed in wastewater, so the diseases enter the food chain. It can contaminate vegetation, especially fruits, because of their high water content. Humans are always at risk of any form of contact with polluted water. The spawning of disease-carrying insects is also very detrimental. It can damage food stocks and agricul-

ture, and breed in places and spread illnesses. As a result of the water scarcity, many people have reverted to using polluted water for irrigation and planting.

Scarcity in itself is a hazardous situation; it becomes even worse with the use of wastewater. Although treated wastewater is not always detrimental, it is the mismanagement of treatment or lack of treatment that makes it unfit. Those areas that are forced to use wastewater are poor and farmers are not properly educated in using treated wastewater for agriculture.

Six children die each minute from waterborne diseases.

Poor water management has allowed these water issues to continue and to gradually worsen. The main problem is that in the developing nations, there is a great lack of resources; however, if they are available, they are often utilized inefficiently. There is no funding from the governments of these countries, usually as a result of political instability. In countries where corruption is persistent within the governing body, poverty is rampant. It is a common indicator of a poverty-stricken nation when the government officials are pocketing money. The countries need the resources to create sanitation systems. In addition, water treatment facilities should be created to provide healthy and safe drinking water. These two necessities of infrastructure will help alleviate the poverty situation and mismanagement of resources.

ARRESTED DEVELOPMENT

Those who live in poverty continue to do so as a result of the contaminated water that harms them daily. In heavily populated urban settings or in rural farmlands by a river, negative effects result from poor water quality. The water issue is one of the reasons that the developing world is unable to develop efficiently. It is a key contributor to poverty, causing many to die from preventable illnesses. The presence of these diseases has caused many children to die through daily use and exposure to polluted water. In poor countries, there is no funding to set up treatment and sanitation systems. Attempts have been made but with limited success in the reduction of poverty in these regions of the world.

However, there are many organizations that work with these governments, providing help to get these countries on the right development track. They donate

monetary aid packages to build modern water infrastructure to attack poverty at its roots. The Third World Water Forum coordinated various organizations to discuss aid packages to help the situation. The meetings consist of policy- and decision-makers, along with funding agencies, that come up with various solutions to the related problems of water and poverty. The media gets involved to spread awareness of the issues and to keep everyone well informed.

The World Health Organization provides monetary aid to those countries that are suffering and also helps to develop the right policies to stunt the growth of poverty. Not even all the money in the world can help the situation. The most important action that must be taken is policy change. So long as funding is allocated properly, the country can develop economically. Water is essential and it is a necessity in life, but too many people have difficulty getting water, let alone potable water. It is such a simple aspect of life that is taken for granted, but it is a problem that has destroyed populations and kept them from advancing.

ARTHUR HOLST WIDENER UNIVERSITY

Wealth Inequality

WEALTH INEQUALITY refers to disparities in levels of income among different members of society. Wealth inequality has serious social implications including increased health and law-and-order issues, and in extreme cases can lead to disorder and revolution. People who live in comparatively equitable societies generally live healthier, happier, longer lives, even if their absolute level of income is lower than in other societies. This is

because of the constant stress involved for those at the lower end of the social scale who are continually made to feel disempowered and unvalued, which in turn leads to conditions such as heart disease and depression. Historical evidence shows that slaves become congenitally smaller and less healthy than free people within as little as a single generation.

Inequality is frequently related to issues of class, caste, gender, location, ethnicity, or a combination of these factors. For example, newly arrived migrants often cluster into particular industries that have demand for low-cost labor. These industries are organized geographically, creating low-income communities with little political power to attract superior health and education services.

STRUCTURAL INEQUALITY

Inequality that results from laws and their application is known as structural inequality. Only by changing laws can structural inequality be changed. For example, in societies in which women are treated by law as the possession of men, structural gender-based inequality will exist so long as the laws do, and these will not be changed and effectively policed until there is a consensus in society to do so.

Statistics show that inequality rose through the 1990s and early years of the 21st century in a number of different countries, notably the United States. One important cause of this inequality has been the delinking of executive pay from corporate performance, which has led to very high and unjustifiable increases in executive compensation. At the same time, unskilled labor migration has been encouraged to a sufficient extent to depress wage rates at the lower end. Corporations have also used outsourcing for their own benefit, thereby increasing inequality.

In China, meanwhile, inequality has resulted from the growth of incomes for executives and businesspeople in the coastal areas, where economic growth is high, while change is very slow in rural areas. As in other countries, this has led to extensive amounts of internal migration that results in overcrowding of cities, in which public health and safety services are inadequate. Internal migration is associated with family breakdown, risk-taking behavior, and lower levels of educational achievement for the children of migrants.

Regional inequality may be addressed, therefore, through programs of regional economic development. A progressive taxation system helps to redistribute wealth to the less well-off sections of society and helps

to reduce inequality. Regressive tax systems or reductions in taxes for the wealthy increase inequality and can reduce the health of society as a whole.

THE GINI COEFFICIENT

There are various methods for calculating wealth inequality, and of these perhaps the most well-known and commonly used is the Gini coefficient, named after the Italian statistician Corrado Gini (1884–1965). The Gini coefficient ranges from 0, which would determine a theoretical state of perfect equality, to 1, which would represent a state of theoretical perfect inequality. Studies of Gini coefficients across states and through time suggest a positive correlation between inequality and civil war, poor health, or family breakdown, among other undesirable effects.

In developed countries, the Gini coefficient is generally measured at between 0.3 and 0.5 and is often higher in less well-developed countries. Alternatives to the Gini coefficient include Theil's and Atkinson's measures. Whichever measure is used, the lack of reliable and timely data frequently prevents accurate calculations in many of the lesser developed nations.

Wealth Tax

A WEALTH TAX IS a tax that is based on all assets and income owned by individuals. It is a progressive tax in that the more that individuals own, the more they contribute to the government to provide essential and non-essential services.

Taxable assets include income, stock and share holdings, property, and valuable items; some of these may have been inherited. Generally, there is a minimum threshold of wealth that an individual must possess before being required to pay taxes. There is an incentive for individuals to seek to minimize their tax liability by nominally redistributing assets to family members or associates, so that each can claim the reduction for the minimum threshold.

Wealth taxes include periodic or sporadic net wealth taxes, transferor taxes (such as gift tax), and recipient taxes (such as inheritance taxes). The degree of efficiency of these taxes varies from country to country and over the course of time. Most developed states have wealth taxes of some sort, while transfer taxes are generally more common than net taxes. These are among the oldest forms of financial redistribution, and examples occur throughout history.

In Islam, for example, individuals are expected to pay the *zakat*, which is a religiously mandated wealth tax, so long as their wealth exceeds the minimum threshold or *nisab*. The *zakat* is intended to support the poor and needy. Many Christian churches encourage members to contribute a tithe or one-tenth of income or wealth.

Progressive taxes are generally considered fairer or more equitable than regressive taxes in which poor people have to pay proportionately more than richer people, as for example with value-added taxes on basic goods. Nevertheless, no tax system will be entirely fair, and under wealth taxation there may be, for example, people with illiquid assets and little cash income required to pay high levels of tax. This includes old people with a large house but modest personal income, and churches too often fall into this category.

The perception of fairness is important in ensuring sufficient popular support that people observe the laws and favor prosecution of those who do not observe them. In countries where the popular media is dominated by a small number of wealthy individuals with the power to control broadcast content, atypical examples can be seized upon to try to create a climate of opposition to wealth taxes, including intergenerational taxes and other forms of unearned income.

The demand for many government services is highly elastic with respect to income and thus enjoyed much more by the wealthy than by the poor. Such services, including public parks, museums, and cultural institutions, should therefore be more fairly paid for by the wealthy.

Weber, Max (1864-1920)

MAX WEBER WAS A German political economist who is considered the founder of modern sociology. His most popular work is the essay "The Protestant Ethic and the Spirit of Capitalism" (1904), which found the roots of capitalism in the Protestant work ethic. Weber's interests were not limited to the sphere of the sociology of religion, but encompassed such diverse fields as public administration, political science, and economics. His research on the Protestant work ethic shed light on the way poverty came to be associated with vice and sin.

The son of Max Weber, Sr., a prominent politician, Weber was born in Erfurt, Germany, and grew up in an atmosphere pervaded with politics and leading intellectuals. He was a quick and precocious student and he had acquired a firm cultural background even before starting university. In 1882, he enrolled as a law student at Heidelberg, although he also attended lectures on history, economics, and theology. After two years, he decided to continue his studies at the University of Berlin, where he remained for the following eight years, apart for a brief period spent at Göttingen.

Weber continued to study history even after graduating and passing the examination for the bar. He earned his doctorate in legal history in 1889. Weber was also increasingly active in political economy, advocating economic reforms that could solve the wide social problems of his country at the turn of the 20th century. In the 1890s, Weber became professor of economics first at Freiburg Univeristy (1894) and then at Heidelberg (1897). The same year of his appointment at Heidelberg, however, his father died only two months after Weber had had a serious quarrel with him. The impossibility of resolving the conflict finally provoked a nervous breakdown, which rendered him unable to lecture or to produce any type of research.

In 1903, he resigned his professorship at Heidelberg, but became associate editor of the *Archives for So-*

cial Science and Social Welfare. He soon started to publish his most important papers in the journal, including "The Protestant Ethic and the Spirit of Capitalism." His attempts to bring together social democrats and liberals in a new political entity collapsed because of liberal fears over the possible revolutionary hopes of social democrats.

During World War I, Weber served as director of the army hospitals in Heidelberg and was later a advisor to the German Armistice Commission at the Treaty of Versailles and to the commission responsible for drafting the Weimar Constitution. In 1919, Weber resumed teaching at the University of Munich, just a year before his sudden death of pneumonia. In the midst of rightwing riots of 1919 and 1920, he was challenged by his students for his left-wing opinions. Only "The Protestant Ethic and the Spirit of Capitalism" was published in book form during his lifetime; all his other works were collected and published posthumously.

Weber details the shift from a value-oriented society to a goal-oriented organization.

Weber found that the main feature of his society was an increasing rationalization and bureaucratization. This process was brought about by the Protestant work ethic, which Weber faults for depriving people of any sense of spontaneous enjoyment of life and driving them to consider the accumulation of wealth an end in itself. In *Economy and Society* (1922), Weber details the shift from a value-oriented society, based upon traditional and charismatic authority, to a goal-oriented organization, based on legal authority. This made Weber focus on the concept of domination.

According to him, domination of one social group over another is one of the most important elements in society: "Without exception every sphere of social action is profoundly influenced by structures of dominancy. ... Domination constitutes a special case of power." He identified two different forms of domination, namely "domination by virtue of a constellation of interests and domination by virtue of authority, that is, power to command and duty to obey." This latter type of dominance he identifies with patriarchal, magisterial, or princely power. Such domination rests upon one's alleged absolute duty to obey, regardless of personal motives or interests.

Within traditional forms of domination, Weber distinguished between patriarchal and patrimonial vari-

eties: "In simple patriarchalism domination, even though it is an inherent traditional right of the master, must definitely be exercised as a joint right in the interest of all members and is thus not freely appropriated by the incumbent." Patrimonial authority is rooted in the household administration of the ruler, and the dominated is the property of the ruler and completely subjected to the dominant party.

Welfare

IN THE CONTEXT OF EFFORTS to combat poverty, welfare refers to government-administered programs that provide money, food, housing, social services, and other resources to help individuals and families who are unable to support themselves. Welfare is a specific type of poor relief. Poor relief may be administered either by government or by private groups and has existed in almost all societies throughout history.

Modern welfare programs date from the 1930s and 1940s, when comprehensive government programs of poor relief and social inclusion were introduced in the United States, Great Britain, and western European countries. Such welfare programs typically have four characteristics: they provide a "last resort" for people who have no other source of support; every citizen who qualifies is legally entitled to the benefits; qualification for benefits is based on a means test, and the law specifies benefit rates; and benefit levels guarantee at least a minimum subsistence and are adjusted for the cost of living.

HISTORICAL DEVELOPMENT OF WELFARE

From the 1st to 4th centuries C.E., the government of the Roman Empire administered welfare programs that provided food for Roman citizens; noncitizens were ineligible. The main program (the *annona*) issued tokens called *tesserae*, which citizens could redeem at government warehouses for bread and other foods—though typically not for meat, which was reserved for special occasions. A separate program provided food for the children of poor families.

In addition to government welfare programs, wealthy Roman citizens were expected to contribute to the upkeep of their communities, mostly by the construction of public works (such as baths and aqueducts), but also by providing food and other resources for poor relief.

Thus, both in its earlier pagan period and its later Christian period, the Roman Empire anticipated many of the features of later welfare systems. Eligibility for benefits was limited; tokens similar to modern food stamps served as a substitute currency; a separate program served the needs of children; and wealthy individuals were expected rather than compelled to help support the poor.

CHRISTIAN ROOTS

During the Middle Ages, most responsibility for poor relief fell to religious institutions. In Western countries, modern welfare programs have been inspired mainly by the Christian tradition. Divergences within this tradition account for the vastly different ways in which different countries have implemented their welfare programs, according to Sigrun Kahl.

The Catholic tradition views poverty as an inevitable social problem to be remedied by private charity. Because it saw poverty as unfortunate but unavoidable, the Catholic tradition did not stigmatize the poor as less virtuous than the well-off. The Reformed Protestant and Calvinist traditions tended to see poverty as a sign of sinfulness, while they saw wealth as a sign of God's favor. On the other hand, Reformed Protestant and Calvinist branches of Christianity were more supportive than Catholicism of government antipoverty efforts. Those differences affected welfare policies depending on the relative influence of the different Christian traditions in each country.

Some countries (Denmark, Sweden, Norway, Finland, and Germany) have a single, national welfare pro-

gram. Other countries (France, Italy, the United States, the United Kingdom, and Ireland) have a patchwork of national and regional programs.

Most European countries view aid recipients as victims of social exclusion, while the United States and United Kingdom typically view them as an underclass of "loafers" who could work but choose not to do so. As a result, the latter countries' welfare programs have often included measures to punish people for being poor.

The United States, United Kingdom, and Scandinavian countries place great emphasis on requiring aid recipients to perform some kind of work in exchange for aid, but France and Italy see it as irrelevant.

ENGLISH POOR LAWS

As the Middle Ages waned, the government of England passed a series of laws that influenced later Western welfare programs. In 1601, the Act for the Relief of the Poor set the basic policies that England would follow until the 20th century. The act had these main features:

It had local parishes administer poor relief. Church officials collected taxes for poor relief and distributed benefits; it provided raw materials (such as flax and wool) for the poor to work. Any able-bodied poor person who refused such work could be imprisoned; it provided aid to poor people who were unable to work, such as the elderly and the infirm. However, it specified that if such people had family members who could support them, then it was the legal responsibility of the family members to do so; it provided for poor children to work and become apprentices.

As was often the case, aid was combined with shame and punishment, especially for poor people judged "undeserving." A 1494 law provided that ablebodied beggars could be branded and enslaved. A 1697 law required aid recipients to wear a badge with the letter "P" (for poor) and the letter of their parish.

Most egregious of the abuses inflicted on the poor was the establishment in the 18th century of hundreds of workhouses, though this abuse was not unique to England. Workhouses simultaneously provided poor relief, punished the poor for accepting it, and often enriched the workhouse operators through a practice called "farming the poor," which is similar to some modern poverty policies. Workhouse operators charged a weekly fee to the local parish for the support of each inmate, and then kept any surplus between the fee and their actual cost of support. The operators also kept any profit from goods (usually textiles) produced

by the inmates. A Latin inscription gave the guiding philosophy of the workhouse movement, found over the entrance to a workhouse in Hamburg, Germany: "Labore nutrior, labore plector" ("With labor I am fed, with labor I am punished").

In 1834, the Poor Law Amendment Act set nation-wide standards for workhouses and aimed to eliminate all other kinds of poor relief. The standards did little to eliminate abuses. Instead, they made the abuses into official policy, on the theory that making poverty even more unpleasant would encourage people to work harder to escape it.

One of the drafters of the new law, Nassau Senior, "believed that the best way to abolish poverty was never to help the poor. With serene, unwitting cruelty, he argued that if the poor know they must either work or starve, they will work. Wherefore, no help should be given except to those who really have no family or means of existence. ... The workhouse became 'the Bastille of the poor,' a loathed and dreaded place," as quoted by André Maurois.

The welfare state created in the 1940s remained a foundation of British society.

Over the next century, several laws attempted to soften the cruelty of the workhouse system, but the workhouses endured under various guises until the establishment of the British welfare state in the 1940s.

In the late 1930s and early 1940s, both rich and poor suffered under German bombing raids against the British homeland. All classes of society came together and made common sacrifices to defeat their common enemy in World War II. As both rich and poor were evacuated from cities to the countryside, many of the well-off came to understand for the first time both the humanity of the poor and the nature of their plight, as noted by Kenneth O. Morgan. This led the government to commission a study of "Social Insurance and Allied Services," written by the economist Sir William Beveridge and presented to Parliament in November 1942. The report argued that:

"Organization of social insurance should be treated as one part only of a comprehensive policy of social progress. Social insurance fully developed may provide income security; it is an attack upon Want. But Want is one only of five giants on the road of reconstruction and in some ways the easiest to attack. The others are Disease, Ignorance, Squalor, and Idleness." After the war ended in 1945, Britain began to implement the recommendations of the Beveridge report. In 1946, the government enacted a law establishing the National Health Service, which aimed (though it did not fully succeed) to provide free medical care to all Britons. Other measures included income security programs and additional financial support for poor children, as well as government-funded housing, which created a million new dwellings from 1946 to 1952.

Though its political support waxed and waned with the electoral tides, the welfare state created in the 1940s remained a foundation of British society through the end of the 20th and into the 21st century.

AMERICAN POOR RELIEF AND WELFARE

The United States, which at its founding consisted largely of English immigrants, carried over both the legal practices and the social attitudes of its mother country. Most poor relief and other welfare programs were (as they still are) administered at the state and local level. In the 19th century, workhouses were common and the poor were stigmatized just as they had been in England. Echoing the views embodied in the English Poor Laws of 1834, American writer Josephine Lowell argued that poor relief should be provided only in workhouses and only under conditions so unpleasant as to discourage anyone from taking it:

"We have already accepted the postulate that the community should save every one of its members from starvation, no matter how low or depraved such member may be, but we contend that the necessary relief should be surrounded by circumstances that shall not only repel everyone not in extremity from accepting it, but [that] ... discipline and education should be inseparably associated with any system of public relief."

In the late 19th and early 20th centuries, local governments began to employ caseworkers to teach aid recipients self-reliance and encourage them to work. Various relief programs continued, especially for widows with children, whose role in the home as mothers was considered more important than paid employment. However, it was not until the Great Depression of 1929–41 that Americans accepted welfare as a legitimate function of government.

During the Great Depression, almost a third of the American workforce became unemployed. Like the British during World War II, Americans were suddenly exposed to new ideas, in particular that poverty was not necessarily the result of laziness or sin. As a result, President Franklin Delano Roosevelt could persuade Con-

gress to enact an array of programs that formed the foundation of the American welfare state: the Social Security Act (1935), which together with amendments passed in 1939, provided aid for several different groups, including retirees (old-age and survivors' insurance) and children (Aid to Dependent Children, later renamed Aid to Families with Dependent Children); unemployment compensation to help individuals who lost their jobs; subsidies for medical care of poor families; public works jobs through the Public Works Administration (1933), Civilian Conservation Corps, and other agencies; direct cash grants to states for poor relief under the Federal Emergency Relief Act (1933); and construction of public housing for the poor under the National Housing Act (1937).

After World War II, the Great Depression faded from memory and Americans once again became ambivalent about welfare programs. Social Security remained the linchpin of the welfare state, thus becoming a target of those who saw welfare as illegitimate.

American attitudes seemed to be swinging back toward 19th-century preoccupations.

From the 1950s to the 1990s, the basic outlines of American welfare programs followed the pattern set up in the Roosevelt years: Social Security, unemployment insurance, aid to families with children, public housing, public works jobs, and subsidies of medical care. Consistent with the decentralized American system, most welfare administration was done at the state level, even though some funding came from the federal government. Important milestones were:

The Medicare and Medicaid Amendments to the Social Security Act (1965). Medicare provided health insurance for the elderly, while Medicaid provided it for the poor.

The Personal Responsibility and Work Opportunity Reconciliation Act (1996), which abolished Aid to Families with Dependent Children and replaced it with a time-limited, work-for-welfare program called Temporary Assistance for Needy Families. The law required that at least half of aid recipients be in "work related activities" for at least 30 hours per week, including employment, job search, or vocational training. It also established a lifetime limit of 60 months of aid.

In the late 20th and early 21st centuries, American attitudes toward welfare seemed to be swinging back toward 19th-century preoccupations with the sinfulness

of the poor and the harmful effects of poor relief on society. As economist George Gilder put it: "In the welfare culture, money becomes not something earned by men through hard work, but a right conferred on women by the state. Protest and complaint replace diligence and discipline as the sources of pay. Boys grow up seeking support from women, while they find manhood in the macho circles of the street and the bar, or in the irresponsible fathering of random progeny."

SCOTT PALMER, Ph.D. RGMS ECONOMICS

Welfare Dependence

WELFARE PAYMENTS are transfers made by government agencies to people eligible to receive them, either as part of universal provision or through means-tested schemes. When the welfare payments act to deter recipients from seeking work or to alleviate the need for the payment, then this is welfare dependence—the individual prefers or feels no option but to rely on the welfare payment when other options might be possible. This is a subject that has aroused a great deal of controversy, as many people, for reasons of either political ideology or expediency in reducing government payments, have claimed that welfare dependence is a very significant problem and that payments should be withheld or canceled altogether.

As an American presidential candidate, for example, Ronald Reagan launched a campaign against "welfare queens" who supposedly defrauded the system to receive multiple streams of income and were, conse-

quently wealthy enough to drive around in high-performance cars and avoid all forms of work. No credible evidence has ever been produced to support Reagan's claim that such people existed. Indeed, accurate statistics and understanding of the issue are difficult to obtain because of the political controversy, but those data that do exist indicate a complex relationship among welfare, dependence, and desire to work.

It is more likely, for example, that those who receive welfare payments do so only temporarily and in response to comparatively short-term need. The quite widely held idea that young women deliberately have children out of wedlock so that they can obtain welfare payments, governmental housing, and similar benefits is also unsupported by any real evidence. In these cases, it is frequently ideological conviction that drives many people to believe that others are out to cheat the system because of indolence and mendacity and, indeed, to cheat them out of their tax payments. It is women, especially unmarried mothers, and foreign migrants who are most commonly accused of behaving in this way and, again, the evidence to support these contentious claims on a wide scale is difficult to find.

There are examples of welfare benefits being set at a very high level, more than can easily be matched by available income. However, these benefits are customarily associated with conditions such as serious illness or incapacity that necessitate considerable levels of expense and which, anecdotal evidence notwithstanding, are very difficult to forge on a long-term basis. In a number of Western countries, women are hampered from entering or reentering the active workforce because of the very high cost of childcare and only sporadic provision of low-cost governmental alternatives. Similarly, asylum seekers and migrant workers are forced to rely on welfare payments in some countries because the law forbids them to work.

In recent years, more sophisticated approaches to welfare payments have enabled governments more effectively to cause people to return to work, through tax credits, child support programs, and encouraging labor market flexibility in terms of job-sharing, working at home, and telecommuting.

Welfare Housing

SHELTER IS CLEARLY an important component of a household's economic well-being. Consequently, governments around the world have long been concerned with a range of housing policies, the purpose of which is to advance various efficiency and equity goals. Key goals include the efficient supply of housing and the provision of housing of a good basic standard to all income groups. A major policy in this respect has been some form of government-subsidized housing.

The size of the public housing sector, however, varies tremendously across countries. In the socialist centrally planned economies of the former Soviet Union and eastern Europe, the public housing stock as a proportion of the total housing stock was approximately 90 percent.

In contrast, the share of public housing has been much lower in more market-oriented economies. In the capitalist welfare states of northern Europe, the share of public housing has generally been in the range of 15 to 30 percent. In developing countries, the share of public housing is seldom more than 10 percent. In the United States, the share of public housing is less than two percent.

THE RATIONALE FOR PUBLIC HOUSING

In recent decades a greatly improved understanding of the functioning of real-world housing systems has significantly undermined the rationale for government supply of housing. The basic justification for direct provision of housing is the belief that market-oriented housing systems fail to efficiently supply housing. However, there are some scholars who suggest that this belief is not well founded.

For example, in the market-oriented United States, the quality of the housing stock has increased closely in line with the rising American standard of living and the concomitant increase in the demand for good-quality housing, as predicted by economic theory. America's high standard of living is reflected in perhaps the world's highest housing standard.

It needs to be stressed here that dramatic qualitative improvements have occurred in all segments of the U.S. housing market, even the lowest. Specifically, the share of substandard housing fell from about 50 percent of the total housing stock in 1940 to six percent by 1980 and has continued to improve. Major improvements have occurred in all regions and urban areas. Improvements were particularly large during the 1960s, a period of rapid economic growth and rising incomes for the poor. Between 1960 and 1970, the number of occupied substandard dwellings fell by 43 percent in the United States as a whole, and by over 54 percent in central cities within metropolitan areas. Major declines were recorded for the 50 largest American cities without exception.

Studies show huge variations in housing costs and housing standards.

A related argument supporting government housing is that public, not-for-profit producers will be more efficient at constructing and managing housing than private, profit-motivated developers. However, the vast housing literature reveals that in neither the planned housing sectors of eastern nor of Western Europe has the promotion of public housing producers resulted in supplying housing at low economic cost.

For example, the World Bank in about 1990 undertook a major cross-country study of housing construction costs. This study revealed that some of the highest construction costs were to be found in the tightly planned housing sectors of the European welfare states. For example, construction cost per square meter for Finland was \$1,734; for Sweden, \$1,527; for Norway, \$1,426; for Germany, \$1,305; for Austria, \$1,215; for the Netherlands, \$997; and for France, \$990. In contrast, the corresponding figure for the market-oriented United States was \$500.

Moreover, recent cross-country studies show huge variations in housing costs and housing standards even for countries at roughly the same level of economic development. For example, a recent study by the World Bank finds that a major influence on housing construction costs around the world is the presence of inefficient urban development regulations. In relatively efficient housing markets such as the United States and Canada, the cost of an average single-family house is three to four times average annual household income. In contrast, in countries with highly regulated economic systems for housing, the cost of housing is often more than 10 times average household incomes. Such outcomes arise from the large differences in the responses of housing supply to changes in price and profits. For example, with respect to Korea and Malaysia, two countries with highly regulated urban development, housing supply barely responds to rising housing demand, even in the long run. In contrast, the response of housing supply in Thailand, a country with a liberal regulatory regime, is more than 100 times higher. Consequently, the Thai housing standard far exceeds those of Korea and Malaysia.

Moreover, some argue government housing may undermine key equity goals. Specifically, the provision of highly subsidized housing often tends to concentrate the poor on large housing estates. Much empirical evidence indicates that the spatial concentration of poor households greatly exacerbates the socioeconomic problems they face. These housing estates often become a sea of crime, high unemployment, drug use, school dropouts, teenage pregnancy, and other problems that feed on each other and make it virtually impossible to break the poverty cycle. Consequently, a strong case can be made for housing policies that deconcentrate the poor into more economically viable neighborhoods.

ASSESSING PUBLIC HOUSING

Government-subsidized housing is one means for providing housing of a good basic standard to low-income households. Clearly, the question of efficient housing supply is not simply one of government versus profit-motivated housing suppliers. The broad alternative to government-subsidized housing is demand-side policies that improve the ability of households to afford better housing. As noted, economic growth policies that raise the standard of living of low-income groups can be a powerful demand-side force in raising housing standards.

In addition, governments can target poor house-holds and/or large families with cash or in-kind transfers (such as housing allowances) to further improve the ability of the poor to secure improved housing. For demand-side policies to be effective, however, it is necessary for governments to implement policies that result in an efficient supply of housing.

However, in many developing countries such policies are neglected. Instead, given the extreme scarcity of resources, governments tend to focus on building a relatively few showcase housing projects in key cities with little done to improve housing conditions more broadly.

Welfare Rights

WELFARE RIGHTS ARE natural or civil rights to particular services and material goods. These entitlements are understood to potentially and typically go beyond what individuals own within a strict private property order. In theorizing welfare rights, some standard is employed to determine what constitutes the core-material supports for individual flourishing. Such supports may be conceived of as universal or as specific to a given historical context.

Additional sets of judgments are then made concerning what can practically be achieved in ensuring that individuals receive these supports. For example, a given conception of welfare rights may include the notion that all individuals require an extensive bevy of healthcare services to support their flourishing. At the same, it might be judged by the proponents of this conception that the material resources available are not ad-

equate to the provision of the full set of health services, so that the rightful authorities in the community ought to aim to provide a more limited set of services. As such, there is typically an inherent ambiguity in what is meant by welfare rights: a bifurcation between what we might call "ideal rights" and "real rights."

One might think that this ambiguity could be resolved by casting the ideal rights as natural rights—that is, rights coming out of physics that are, as such, universally applicable to all members of the human species—and real rights as civil rights. And this certainly is one way to approach the issue. However, many theorists are wary of the notion of natural rights or otherwise wish to turn to a communicatively derived set of rights that are other than those that could practically be guaranteed at the present time.

Another approach here would be to deny that there are any natural welfare rights or any ideal welfare rights, and cast welfare rights as pure civil rights, totally the creature of government. But, again, many theorists resist this notion, on the grounds that it impoverishes rights-based moral theory and attending notions of justice.

John Rawls's A Theory of Justice provides the most important theoretical grounding for conceptions of welfare rights, with its "difference principle" account of the need for socioeconomic equalities to be abolished if they do not serve the interests of the lesser party in the unequal relation. More solidly Marxist-inspired thinking has also turned to the notion of "rights" in attempting to flesh out the conception of socioeconomic justice seen in Marx's works.

In recent years, both Marxists and others have offered severe criticism of the Rawlsian approach on the grounds that it does not adequately address the material supports of social recognition and identity-formation in pluralistic and multicultural societies. At the same time, a growing body of republican theory has emerged that understands welfare rights as reducible to negative freedoms, such as freedom from "domination," as phrased by Philip Pettit. Also, "real libertarian" theory has sought to reduce welfare rights to the right to a basic income.

Welfare State

THE PROBLEM OF THE welfare state has been of paramount importance over the last decades, both in political and scientific debates. What the welfare state really is, what it should have ideally been, how and why it is changing in the frame of globalization of the economy and of the resulting denationalization of politics, are the main questions in the analysis of the modern welfare state and the political management of poverty.

Although there are several ways of understanding the welfare state, there is no fixed definition of its nature and functions, for these are not consistent characteristics. They are rather subjected to more general economic conditions and needs, to which the welfare state is called to respond. Welfare state and economy cannot be separated and discussed autonomously. In the history of capitalism there has always been a need to adjust politics to economy, to avoid social crises caused by the economy, and to achieve an equilibrium that would not harm the general social cohesion. But the special means with which the society adjusts to the needs and priorities of the economy, the means with which the welfare state regulates phenomena such as poverty and social inequality, are not stable but rather historically defined.

It is therefore safer to understand the welfare state in its historical context. The term *modern welfare state* is usually used in order to describe the specific postwar state in the economies of Atlantic Fordism, namely the United States and Canada, northwestern Europe, Australia, and New Zealand. This postwar period until the mid-1960s and in some countries until the early 1970s has been characterized by the Keynesian economic model of poverty management.

The economic model of John Maynard Keynes (1883–1946), the economist who inspired a monetary policy based on public investments and social benefits, characterized the early welfare state. Keynesianism was called to face poverty through a monetary policy basically based on the provision of benefits and on the creation of an appropriate infrastructure for the support

of mass production and consumption. In an age when mass production was, on the one hand, accompanied by a series of unprecedented technological revolutions and innovations and by enormous social inequalities on the other hand, the Keynesian welfare state was focusing on full employment and the management of demand.

In the Keynesian welfare state the social stratification and the poverty of unprivileged social groups caused by the capitalist mode of production would not be challenged by a radical change inside this specific mode of production.

On the contrary, the state was interested in generalizing the norms of mass consumption of the advanced industrial society. Through the provision of public infrastructure, welfare rights, benefits, and social services in the fields of health, education, work, and insurance, the state was supporting the "mixed economy." At the same time, the state was compensating for several market failures, like unemployment, poverty, and social inequality caused by the diverse access of social groups and individuals to consumption and the work or labor market.

Poverty is being deregulated and subjected to market rules.

Although the welfare state did not have a unified form in all countries (for instance, the liberal type of the United States and Great Britain, the cooperative model of continental Europe, the social democratic Scandinavian model, or the familial model of southern Europe), the fiscal and economic crisis that it underwent from the 1970s onward was more or less common in most of these countries.

The reduction of domestic production in favor of the growing internationalization of capital, the growing stagflationary tendency, and a decline in the rate and mass of profits have all been the structural reasons for the progressive exhaustion of the Keynesian welfare state.

At the same time, because the full-employment welfare state could not deal effectively with the globalization of the market economy, because it was based on nationally oriented economies that were less concerned with international competitiveness; or because it could not handle the growing dissatisfaction caused by the expansion of state interventions and bureaucracy, but most importantly because the neoliberal economy demanded a more flexible kind of state, the welfare state

could no longer regulate poverty and keep it harmless so that the general economy could stand.

The postwelfare, postnational state stopped dealing with poverty as a collective social problem. Denationalization of economy, deregulation of social policy tasks, destatization, and neoliberalization processes have had over the last decades the consequence that poverty concerns less and less the state's official agenda. As a socioeconomic problem it is being transferred to private actors and market forces. Just like the welfare nation state, poverty is being deregulated and subjected to market rules.

Western Monasticism

MONASTIC POVERTY must be understood within the context of the evangelical counsels of poverty, chastity, and obedience. Although all Christians are called to live the counsels in a manner appropriate to their state in life, the clergy are distinct in that they make a public profession of worship. This profession frees them from the concerns of everyday life so that, consecrated entirely to divine service, they can follow Christ more fully and freely and imitate him more clearly and faithfully. They are able to live for Christ and his body, the church, growing in love of God and neighbor. The goods that they forgo in renouncing the world are highly esteemed, but can become an obstacle in their pursuit of the perfection of charity.

This renunciation does not stifle their human development. The Vatican Council II fathers pointed out that embracing of the counsels by a Christian appropriate to state of life results in purification of heart, spiritual liberty, and the fervor of charity. They continue,

"they are able to more fully mold the Christian man to that type of chaste and detached life, which Christ the Lord chose for Himself and which His Mother also embraced."

That renunciation professed by the clergy is beyond the requirements of the commandments. In his *Apostolic Exhortation on the Renewal of Religious Life* in 1971, Pope Paul VI said, "It is precisely for the sake of the kingdom of heaven that you have vowed to Christ, generously and without reservation, that capacity to love, that need to possess and that freedom to regulate one's own life, which are so precious to man."

EXAMPLE OF CHRIST IN POVERTY

In his vow of poverty, the clergy follows the example of Christ in his self-emptying, in his lack of anxiety about material goods, and in his use of material goods.

Christ's entire life on earth was characterized by poverty. He was born in a stable of a poor family; he was a political refugee in Egypt; he worked at his foster father's trade as a carpenter (he was a member of the working poor); he was an itinerant preacher with a message to, and a love of, the poor; he was publicly executed as a common criminal; and he was buried in another man's grave. Second Corinthians 8:9 articulates this well: "...that though he was rich, yet for your sake he became poor, so that by his poverty you might become rich." The clergy strive to follow his example of self-emptying by living a life of poverty.

Christ lived a simple life of detachment and freedom with respect to material goods. He used them appropriately according to the situation—he enjoyed them and enabled others to enjoy them, but he did not obsess about them. Two accounts found in scripture point to this attitude: the story of the wedding at Cana, in which he changes water into the best of wine (John 2:1-10) and the story of the woman who anoints his feet with costly oil, in which he reproaches those who criticize her (Mark 14:3-9). The clergy make every effort to follow Christ's example of appropriate enjoyment of, and detachment from, material goods.

In his public ministry, Christ and his apostles had a common purse (for example, John 13:29), which provided for both the basic needs of the group and for alms to the poor. In scripture, he used the widow's mite (Mark 14:41-44) as an example for the proper use of goods. While others gave from their abundance to the temple treasury, she gave all of her money. Throughout his ministry, he compassionately alleviated the misery of the poor through alms, healings, companionship,

and solidarity. The clergy, in their vow of poverty, strive to follow Christ's example by continuing his work with, and love of, the poor in his works of mercy.

THE TEACHING OF CHRIST

Scripture records Christ's most famous teachings on material goods in the story of the rich young man (Matthew 19:16-22) and the lesson he drew from it for his disciples (Matthew 19:23-30), and in the recording of the Sermon on the Mount (Matthew 5:3). The rich young man kept all the commandments yet asked Christ how he could live a more perfect life. Christ looked upon him with love and told him to sell his possessions, give the money to the poor, and follow him. The young man was sad to hear this, and would not follow Christ's instructions. From this story, Christ explained to the disciples that it is very difficult for a rich man to enter heaven. The wealthy are too attached to their material goods to follow God. In the Sermon on the Mount, Christ preaches on the beatitude of the poor in spirit saying, "theirs is the kingdom of heaven." Poverty, then, does not refer only to material goods, but to an interior disposition.

Material goods, as can be seen from the first creation account in Genesis, are good. Christ's teaching articulates this. While material goods in themselves are good, the excessive accumulation of, obsessive attachment to, and use of them can be evil. Evil also is the denial of access to the goods meant for the use of all men. Both lead away from God.

Those with too many goods often put their trust and security in them rather than in God, and are too preoccupied with them to detect God's will or be concerned with the plight of the poor. Those with too few goods often turn to a life of sin to procure the necessities of life, or become so obsessed with that pursuit or with their own misery that they also cannot detect God's will and do not care about others in the same situation. Both too many and too few goods lead to social injustice, class hatred, violence, and crime. In their vow of poverty, the clergy attempt to follow Christ's teachings concerning material goods.

A LIVING SIGN

The clergyman who lives the counsels is a living sign, that the things of God are existent in this world, and of the life that follows death. By his example the clergy can educate Christians in other states of life, illuminating to them how to fully live their respective vocations. The

fact that the clergyman is a sign places a great responsibility on him to be a good example. He must diligently practice his vow of poverty in his external and internal life. In fact and in appearance he must not live a life of material comfort and luxury; his poverty must be unquestioned and undoubted.

The example of the clergy is extremely important in a world that is increasingly divided into those in the developed world who live a lavish lifestyle of consumption and those in the developing world who live a life of material want and desperation. As Paul VI says in the Apostolic Exhortation on the Renewal of Religious Life of the importance of witness, "at a time when there is an increased danger for many of being enticed by the alluring security of possessions, knowledge and power, the call of God places you at the pinnacle of the Christian conscience."

The excessive accumulation of, obsessive attachment to, and use of goods can be evil.

This information is summarized by the Sacred Congregation for Religious and Secular Institutes in its 1978 Directives for Mutual Relations Between Bishops and Religious in the Church. In a section entitled "The 'ecclesial' nature of Religious Institutes," it says, "The religious state ... consists in the following of Christ, by publicly professing the evangelical counsels of chastity, poverty and obedience, and by assuming the commitment of removing all obstacles which could detract from the fervor of charity and from the perfection of divine worship." A clergyman, in fact, "dedicates himself wholly to God, his supreme love. The consecration of those professing religious vows is especially ordained to this purpose, namely of offering to the world visible proof of the unfathomable mystery of Christ."

The example of the clergy also includes the human meaning of work, called the common law of work. By pooling all goods, including pay earned for work, the clergy shows the communion that unites the members of the group. He shows that work is to be engaged in to procure what is necessary for the existence of the community as a whole, as well as its individual members, and to help the poor; its purpose is not solely profit and consumption. This example simultaneously shows the wealthy the true meaning of work and material goods and assists the poor. Paul VI said to the clergy in the *Apostolic Exhortation on the Renewal of Religious Life*, "The legitimate desire of exercising personal responsi-

bility will not find expression in enjoyment of one's own income but in fraternal sharing in the common good."

Ultimately the point the clergy makes to both the wealthy and the poor is to trust in God's care rather than in possessions. Further, since God created the good things of the earth for all people, all must be enabled to share in them, at least to the extent that they have the necessities of life.

A STABLE LIFE

All Christians are called upon to live the evangelical counsels according to state of life, and thus matters of interpretation of the counsels and the actual lifestyle involved in living them must be carried out. This is particularly important in communal religious life. The Vatican II Council fathers, in *Lumen Gentium*, say, "The evangelical counsels of chastity dedicated to God, poverty and obedience are based upon the words and examples of the Lord. ... The counsels are a divine gift, which the church received from its Lord and which it always safeguards with the help of his grace. Church authority has the duty, under the inspiration of the Holy Spirit, of interpreting these evangelical counsels, of regulating their practice and finally to build on them stable forms of living."

Further, many religious families have grown and developed under church authority. The fathers continue, "These religious families give their members the support of a more firm stability in their way of life and a proven doctrine of acquiring perfection. They further offer their members the support of fraternal association in the militia of Christ and of liberty strengthened by obedience. Thus these religious are able to tranquilly fulfill and faithfully observe their religious profession and so spiritually rejoicing make progress on the road of charity."

CYNTHIA TOOLIN, Ph.D. HOLY APOSTLES COLLEGE AND SEMINARY

Wilson, Woodrow (Administration)

HISTORIES OF WOODROW Wilson's presidency (1913–21) often focus on Wilson's internationalism, and particularly his role in bringing the United States into World War I. However, during the first of his two terms in office, Wilson undertook significant domestic action that served the interests of the poor.

In 1910, while serving as president of Princeton University, Wilson was elected governor of New Jersey. He ran as a strong Progressive, surprising state Democratic Party leaders who had nominated him based on his reputation as a moderate. During his brief tenure as governor, Wilson succeeded in creating a state Public Utilities Commission, establishing a statewide accident insurance program, and enacting massive electoral reform, including the introduction of party primary elections in New Jersey.

In 1912, Wilson was elected president of the United States with 42 percent of the popular vote in a four-way race. (He received 82 percent of the electoral vote.) In the campaign, Wilson's New Freedom platform espoused states' rights and individualism, but also called for federal action on specific issues, including tariff reduction, child labor, monetary policy, and the elimination of special corporate privileges. With Wilson's fellow Democrats in control of Congress, Wilson was able to advance much of his agenda into law.

First, shortly after taking office in 1913, Wilson signed into law the Underwood-Simmons Tariff Act. In order to curb the cost of living for American consumers, this legislation reduced or eliminated numerous import tariffs that had earlier been erected to protect U.S. business interests against foreign competition. In addition to lowering average tariff rates from 40 percent to 26 percent, the act eliminated all import tariffs on wool, consumer goods, iron, steel, and steel prod-

ucts. Lost tariff revenues were replaced by a modest federal income tax.

Also in 1913, the enactment of the Federal Reserve Act resolved a heated controversy over who would control the issuance and supply of U.S. currency: private financial institutions or the U.S. government. Under the compromise legislation, public control over currency supply and interest rates would be exercised by the Board of Governors of the Federal Reserve System, a newly created federal agency.

This board, in turn, would regulate and supervise 12 privately operated regional Federal Reserve Banks that would move currency and coin into and out of circulation, and process millions of checks each day. Wilson stated that this bifurcated system would ensure "that the banks may be the instruments, not the masters, of business and of individual enterprise and initiative," as related by Arthur S. Link.

In 1914, Congress moved to strengthen existing antitrust laws in order to combat the power of monopolies and curtail anticompetitive business practices. To those ends, the Clayton Antitrust Act prohibited anticompetitive corporate mergers, acquisitions, and tying arrangements. The act also prohibited corporations that were supposed to be competing against one another from sharing interlocking directorates. Although the Clayton Act generally prohibited collusive economic behavior, standard tools of organized labor such as secondary boycotts, strikes, and peaceful picketing remained lawful. In a separate but related statute, Congress in 1914 also created the Federal Trade Commission, which was charged with enforcing the Clayton Act and several other competition statutes.

Moreover, several statutes enacted in 1915–16 improved the working conditions of specific classes of workers. The Seaman Act improved the occupational safety of seamen. The Adamson Act limited the workday to eight hours for railway workers, and improved farmers' access to loans. The Keating-Owen Child Labor Act sought to prohibit the interstate sale of goods produced by children. (In a 1918 decision that was overruled in 1941, the U.S. Supreme Court initially held the act unconstitutional.) The Workmen's Compensation Act provided financial assistance for federal workers injured on the job.

Despite these incremental progressive legislative successes, however, Wilson remained reluctant to promote social justice through broader initiatives. Many of Wilson's progressive activities were mitigated through compromise appointments and legislation. Most notoriously, Wilson turned his back on African Ameri-

cans—who generally had supported his election—by approving the racial segregation of federal offices, the downgrading of African-American federal employees, and the discharge of those who complained. As president, Wilson also signed into law a statute that made interracial marriage a felony in the District of Columbia. Although he had courted the support of women, Wilson subsequently disregarded his own party's platform by refusing to support suffrage rights for them. On domestic issues, Wilson was a reformer but not a revolutionary.

During Wilson's first term in office, he promoted the enactment of progressive legislation that improved the lot of the poor incrementally, but did not substantially redistribute the nation's wealth or transform the American political or economic system. By Wilson's second term in office, the exigencies of World War I drowned out any further progress on a progressive domestic agenda. After Wilson's first term, issues of poverty and social justice would lie dormant for over a decade before reengaging the attention of the White House during the subsequent administration of President Franklin D. Roosevelt.

LINDA DYNAN NORTHERN KENTUCKY UNIVERSITY

Women and Poverty

POVERTY IS A GLOBAL problem that is receiving a lot of attention in the media and in scholarly circles. Often the focus of analysis is on Third World countries, and rightly so, because the majority of the world's poor live in Third World countries. But when we shift the focus and examine the incidence of poverty from a gender perspective, we are confronted with what has be-

come known as the feminization of poverty. Whether in First or Third World countries, rural or urban areas, literate or illiterate, women are generally poorer than men. According to United Nations figures, 70 percent of the poor people in the world are women.

There is no common ground on which to make generalizations about women because of the diversity and complexity of women's lives worldwide. And when this problem is compounded with the fluidity in the definition and interpretation of poverty, it becomes even more difficult to make generalizations about women and poverty. Thus, generalizations in this article should be understood in what Ruth Sivard characterizes as "simplifications of a variety that is virtually infinite."

Some experts have examined the problem of universal female poverty through the lens of the resources that are available to women in various countries, and there is a consensus that women do not have the same access to resources as men do. Women live in a patriarchal world where men define values, actions, and expectations and women act within those definitions. Women do not participate equally with men in major areas of decision-making.

The types of work that women do, the education they receive, their access to medical care, and their participation in social and political life reflect social prescriptions and expectations that do not necessarily apply to men. Since these indicators also define the level of well-being, lack of access or limited access to them makes women poor. Female poverty can thus be seen as the consequence of sociocultural and political practices that define women as second-rate citizens. Simply put, society makes women poor. Benazir Bhutto, former prime minister of Pakistan, expressed this notion at the United Nations' Conference on Women in Beijing in 1995. She said that social prejudice, not religion, denies women their rightful place in society. Of course in an Islamic country such as Pakistan, drawing a line between social prescription and religious practice can be a tricky exercise. The Beijing Conference was a defining moment in understanding the constraints that society puts on women to make them poor.

We can examine female poverty from many different perspectives, but work is a pathway to money and things that people can do with money. Under normal circumstances, people with money can feed, accommodate, and clothe themselves and their dependents; they can educate children, have access to quality medical care, and not live in fear of deprivation. The good news is that women have always worked. Whether in forag-

ing, agricultural, or industrial-technological societies, women have performed tasks that have ensured the survival and progress of their communities. The bad news is that women's work has not given them access to the kind of money that will keep them out of poverty.

In both developed and developing countries, women have been responsible for domestic chores for which they receive no remuneration. They organize the household as wives, mothers, daughters, or sisters. They cook, clean, wash, and take care of children, the elderly, and the sick. In rural areas of the Third World where women do not have access to labor saving devices, they put in more hours performing these chores.

DOMESTIC LABOR

Irene Dankelman and Joan Davis quoted research done in 1985 that estimated that on average, women in Tanzania worked 3,069 hours a year while men worked only 1,829 hours. In India, they noted that rural agricultural women worked up to 18 hours a day. A World Bank Group report on poverty in Ghana estimated that women in rural areas in the northern section of the country spent an average of 70 minutes every day fetching water. That translates to about 426 hours per year fetching water alone. The United Nations states that women do 67 percent of the world's work but earn only 10 percent of the world's total income. Because men do not spend as much time on reproductive labor, they have "release time" to work for wages, which partly explains the disparities in income between men and women.

Yet if women were remunerated for domestic chores, they would stay out of poverty because, as R.L. Sivard wrote in 1995, the domestic labor of women would add \$8 trillion to the world's yearly economic output if such labor were remunerated. If this amount were spread among the 800 million poor people in the world today regardless of sex, each would get \$10,000. In most countries, that is enough to start small businesses and launch women on the path of well-being. But women continue to lose out because society does not attach economic value to their domestic labor.

When we move from the domestic sphere to the public realm where women work for wages, the situation becomes more complex. The social prescription grounding work for wages defines men as breadwinners and women as dependents. Consequently, in some societies women are not allowed to work for wages; in others they are restricted in what they can do, and where there are no restrictions, they earn less than men earn

even when they perform work of equal value. In rural areas of most Third World agricultural countries, as in west African countries, the gender division of labor is delineated along cash crop and food crop lines. Men dominate cash crop production and women cultivate food crops, but women are also expected to work on men's cash crop farms to help raise money.

Among the Akan of Ghana, for example, a cacao farmer who appreciates the thousands of hours of labor that a wife puts in on his farm may apportion a section of the farm as a gift for the woman. The wife in turn has to formally thank him with drinks for the deed to be acceptable. Men do not thank women in these ways for ensuring that there is food for the family. Although women may be lucky to get their own cash crops, the farms are small and do not yield as much income as husbands get from theirs.

Concurrent with work on men's plots, women produce food for the household. In Kenya, Embu women organize the cultivation and storage of corn so that families will not starve during the lean season. In Tanzania, rural women have formed cooperatives to help each other clear enough land for cultivation. South Asian women are largely responsible for the provision of food for the family. In these places, women sell foodstuffs to buy basic necessities such as kerosene, salt, and soap. The trend is now changing. Rural women are increasingly buying land or getting land through government intervention to cultivate crops for sale. Unfortunately, this effort has not been enough to alleviate rural women's poverty. On the one hand, they work relatively smaller plots and on the other, they generally do not have access to government loans or machinery to enable them to increase output. In the end, we find the people who work the hardest are also the poorest in their societies.

URBAN POVERTY

In urban areas the challenges are different but the end results are the same. People in urban areas spend money on things that rural dwellers either get for free or do not get at all. For example, city dwellers buy food, pay rent or mortgage, pay for transportation, electricity, water, school, and medical expenses. Women need money to be able to enjoy these facilities and services, yet they are confronted with a competitive job market that requires literacy and skills that they generally lack. Thus female poverty in Third World countries is often the cause and consequence of women's low levels of education. An alternative for urban women to generate income has

Whether in First or Third World countries, rural or urban areas, literate or illiterate, women are generally poorer than men. According to United Nations figures, approximately 70 percent of the poor people in the world are women.

been self-employment. In west Africa, women dominate the retail trade. They can be seen hawking anything from charcoal to European manufactured goods. The sheer number of women engaged in trading in west African cities has led some foreign observers to conclude that women are economically well-off. The reality, though, is that the majority of the women sell perishable and seasonal goods. Few women are importers or wholesalers, and fewer still have access to credit to enable them to expand their businesses. So they live an urban existence without the trappings of urban luxury.

Favorable working conditions in developed countries have not translated into relative well-being for women. In developed countries women are generally as highly educated and competitive as men in the job market. But because they are women they are subject to the same gender conventions that govern women's lives elsewhere.

WORKING MOTHERS

Interestingly, First World women play themselves into these conventions by "claiming ownership of motherhood," which hurts their work in the public realm. Being a mother or "nonmother" (married or single) largely decides whether or not a woman works. If a mother decides to work, as many do presently, she still has to decide to work part- or full-time. In the United States, for example, the Department of Labor states that there were 64.7 million women in the labor force in 2004, of whom 74 percent worked full-time and 26 percent part-time. Working part- or full-time as a mother or "non-mother" has its own dynamic that contributes to women's poverty in both the long and short term.

A married working mother may work part-time so that she can have sufficient time to organize the household. While working part-time she can rely on the wages of her working husband to make up for her lost wages. In the short term, part-time work can benefit such a woman if her husband stays permanently employed. However, part-time work has long-term implications for female poverty. Devoting part of one's working years to taking care of the home can be a bad investment for women, especially when government pays pensions based on deductions made over a person's working years.

Women who work part-time lose wages and other benefits that eventually shrink their pensionable income and launch them on the path to poverty. The situation is worse for full-time homemakers, who would have to depend solely on their husbands' pensions when they grow old. How much comfort such women would enjoy in the future would depend on the type of jobs their husbands had, and if they lived with their husbands into pension. Thus, if a husband had a well-paying job, his "never worked" wife could live comfortably in her old age on his pensionable income. The flip side is that a woman whose husband never found his place in the job market would face an uncertain future in her old age. Old-age poverty is a serious problem and it is more pronounced for women than it is for men.

On the other hand, a single working mother who works part-time in order to have time for her children runs the risk of both short- and long-term poverty. Unless she works in a high-wage job, she may not earn enough to take care of herself and children. If she works full-time, as many do, she still has to apportion a significant percentage of her income to childcare. Single mothers who work two jobs to be able to adequately care for themselves and their children may end up alienating children or having children with behavioral problems, a situation that defeats the purpose for which they take on two jobs in the first place.

When women are poor, society itself is impoverished.

Working women who are not mothers, whether married or single, are not necessarily faced with these tough options. They may decide to juggle jobs and may not feel as overwhelmed. But if they live in societies where childlessness is seen as a social stigma, they may be suffering another kind of poverty, one that cannot be quantified but that is devastating nonetheless.

Moving beyond these tough choices, women face discriminatory practices in hiring, wages, and promotion that ultimately affect their level of well-being. These practices reflect male attitudes that are in turn a reflection of the value that society puts on women and the work they do. First World women, like their sisters in the Third World, face multiple and daunting challenges that make them poor.

It is clear that work or lack thereof is the single most important determinant of female poverty. The value that society attaches to women's work is not the same as that applying to men's work. Until total social transformation is achieved, women's work will continue to be marginalized and women will continue to be poor. And when women are poor, society itself is impoverished.

Workers' Compensation

WORKERS' COMPENSATION is the oldest type of social insurance. It is a "no fault" system for offering financial benefits and medical services for those suffering from work-related injuries in an industrialized society where such injuries regularly occur. Unlike tort or negligence law, the goal of workers' compensation is assistance to injured workers and prevention of poverty, instead of resolving disputes or placing blame. The cost of the program is eventually passed on to consumers through insurance premiums included in the cost of production or of doing business.

Modern workers' compensation statutes in the United States have eight common elements: 1) an injured worker is entitled to benefits when suffering from an accidental personal injury "arising out of and in the course of employment" or occupational disease; 2) fault or negligence of the worker does not reduce or impede the right to recover benefits, and the employer's absence of fault or negligence does not reduce employer liability; 3) benefits are available only to employees, not independent contractors; 4) employee wage benefits are normally one-half to one-third the worker's average weekly wage. Additional benefits are medical and rehabilitation expenses and death benefits to dependents with maximum and minimum limits. Only injury causing disability, and thereby reducing earning capacity, is compensable. Accordingly, pain and suffering are not compensated. Therefore, the amount of wage and death benefits is normally much lower than a

court might award in a traditional lawsuit, but workers' compensation is more certain, predictable, and swift; 5) when receiving workers' compensation, a worker and dependents lose their common-law right to sue employers for injuries falling under the statute; 6) a worker may still sue third parties causing the injury, but any financial recovery is first used to reimburse the employer for workers' compensation costs; 7) the state administers the workers' compensation system, and, as opposed to traditional judicial settings, the rules of procedure and evidence are designed to favor awarding benefits; and 8) the employer is required to obtain private or statefunded insurance or meet self-insurance requirements to fund the system without government contribution. In other nations, such as Great Britain, workers' compensation is fully funded by government.

The principle of fixed compensation for certain injuries is found in early Teutonic and medieval English custom. Even pirates on the seas agreed to codes or "articles" whereby crew members received extra payment from captured treasure in predetermined amounts for the loss of specified body parts in furtherance of their plundering. However, the real roots of workers' compensation are traceable to Germany during the Industrial Revolution.

As early as 1838, Prussia enacted measures providing aid to injured railroad workers and passengers. In 1854, the Prussian government mandated that certain industrial employers had to give to local funds to assist ill employees. And in 1884, Chancellor Otto von Bismarck's program won adoption of the first modern workers' compensation program that became a model for other countries. Unlike later American programs, however, Bismarck's program provided more expansive coverage, required worker contributions, and provided old-age benefits. But like the subsequent British compensation plans, the German system was administered jointly by workers and employers with government oversight.

With the advent of the Industrial Revolution in Great Britain and the United States, industrial injuries increased rapidly, but courts were reluctant to provide remedies for workers. Moreover, reflecting the dominant laissez-faire economic philosophy of the day, British and American judges often strove to provide greater protections to factory owners to encourage economic development. Therefore, judges forged pro-business exceptions to the common law. These novel judicial rules included the "fellow-servant" doctrine, which was a shield to employer liability for injuries caused to a worker by a fellow worker. Also crafted was

a doctrine that a worker had assumed the risk by agreeing to work in a hazard situation. Furthermore, financial recovery was denied if the employee was contributorily negligent in any manner or degree. Sometimes, judges even held that injury resulted from an act of God and thus was not the responsibility of the employer.

All states had some form of workers' compensation by 1948.

Although some courts attempted to provide workers with relief from harsh legal barriers, the reform effort was spearheaded by more progressive state legislatures. For example, measures were enacted preventing the application of the fellow-servant doctrine when the employee causing the injury worked in a supervisory capacity, and making the doctrine inapplicable when an employee was injured while fulfilling the legal obligations of the employer. Legislatures also passed laws mandating that there was no assumption of risk by a worker when the employer failed to adhere to safety regulations.

But the real impetus for reform came as American states were influenced by the example of the first British Compensation Act of 1897. An interest in the states eventually became a national movement as legislatures, beginning with Massachusetts in 1904, formed commissions to investigate proposals. In 1910, a Uniform Workmen's Compensation Law was drafted by representatives from various state commissions to serve as a model for legislatures to follow.

Massachusetts enacted a law authorizing the creation of a private workers' compensation plan in 1908. The same year, at the insistence of President Theodore Roosevelt, Congress passed the Federal Employer's Liability Act. This act covered federal employees in dangerous occupations and workers of common carriers operating in interstate and foreign commerce. Other federal laws targeting certain industries and activities in interstate commerce followed.

In 1910, New York's assembly approved a workers' compensation act requiring participation by hazardous industries, but this measure was declared unconstitutional by the state's highest appellate court in 1911 as a violation of due process. Wisconsin became the first state to approve the first comprehensive workmen's compensation program in 1911. In 1904, 10 other states enacted similar plans, as did four more in 1912 and

eight in 1913. All states had some form of workers' compensation by 1948. In recent times, many legislatures have greatly modified their programs to reduce benefits in order to please and attract business and industry.

Workfare

STARTING WITH THE 1980s conservative administrations of President Ronald Reagan and British Prime Minister Margaret Thatcher, neoliberalism experienced ascendancy in Western economies. Steeped in the laissez-faire market principles of capitalism, neoliberalism embraces enterprise, individualism, and economic rationalism over statist economic interventions. In this political economy, standards of living and welfare are the bane of the individual, not the state. A core belief of neoliberals is that labor force participation in an economic market unfettered by government control is key to elevated levels of well-being, first for the individual and then for society. This is not to say neoliberals covet self-sacrifice for the common good. Rather, self-interested self-investment motivated by personal growth is the accepted norm. In the true Adam Smith perspective, competition in this manner will generate efficiency of the market, which is the cornerstone of capitalism.

It is under neoliberalism that current Western welfare policies have taken shape. In particular, the United States, and to a lesser extent Great Britain, has reformed governmental welfare programs because of concerns that they are generous in universalistic entitlement of cash aid, and thereby remove the competitive drive of recipients to participate fully in the labor market. Further, some neoliberals distrust welfare recipients, viewing them as lacking a work ethic and failing to adhere to societal norms of civility and decency. Such failures, it

is argued, stem from idleness bred of entitlement to cash aid with no reciprocal obligation to contribute to the betterment of self or society. In the reformation, work has been emphasized over welfare. Benefits are exchanged for adherence to behavioral mandates. Recipients of governmental aid are expected to take employment, regardless of its nature or its limited remunerative pay. The term coined for labor force participation as a welfare mandate is *workfare*. Workfare theory posits that if recipients are employed, they will both obtain a work ethic and be too busy carving out a living to maintain delinquency. More importantly, their children will learn the importance of work from their parents.

In the United States, the current cash aid program for impoverished families is entitled Temporary Assistance to Needy Families (TANF). The program requires single parents to work or participate in work activities (such as job searches and job skills workshops) 35 hours per week. Married participants are required to work 40 hours per week. Generally, for every dollar parents earn, allotment of aid is reduced a dollar. Failure to comply with workfare in TANF results in punitive sanctions in the form of loss of cash aid. States may choose whether to reduce just the adult portion of aid or remove aid from the entire family. It appears from current studies of state welfare programs that about 93 percent of families on aid comply with workfare mandates.

While neoliberals base the argument for workfare on assumptions about the character of welfare clients, opponents of workfare point to numerous methodologically sound studies showing that welfare clients do work hard prior to and during receipt of aid. Further, such studies also reveal that welfare clients are not very different from the rest of society, fully embracing norms of civility and decency. It follows that, if welfare clients possess a work ethic and do not reject notions of civility, then workfare with its coercive, paternalistic, and punitive approach to enforcing work will not bring about major changes in levels of poverty.

It is noteworthy that welfare rolls have dropped dramatically in the United States. However, such a drop is predicated on the very design of workfare. If failure to comply with work mandates results in sanctions, a drop in participation will occur. Further, time limits prevent participants from remaining on the rolls. Finally, access to the program is stringent, with pressure on would-be recipients to obtain work instead of entering dependency on governmental aid. Yet it is not the case that workfare is by itself causing the drop in participation.

Rather a combination of workfare, sanctions, time limits, and the economic context within which the drop took place are the causes.

While the notion of workfare as a remedy for welfare dependency is being debated and examined by academics, its application in policy continues unabated. Amendments to TANF have been considered by the Bush administration, with calls for increased work hour requirements, more restrictions on what may be counted as work (limited educational activities have been accepted as work in the past), and more severe sanctions for failure to comply with workfare.

Yet even as workfare expands, the hallmarks of poverty in the United States continue to grow. Childhood poverty, hunger, homelessness, and lack of access to healthcare all increased under workfare policies since the inception of TANF in 1996. In the final analysis, it may be found that rates of dependency on such programs as TANF are reduced, but reliance on other forms of governmental and quasi-governmental programs (such as child protection agencies and community organizations) may actually increase.

WILLIAM RAINFORD BOISE STATE UNIVERSITY

Working Poor

REFERRING TO A diverse and complex economic state, the term *working poor* encapsulates the experience of working individuals who, over a designated period of employment, persist in their inability to apply earned income to hoist themselves and dependent family members out of poverty. The definitions of working poverty

are determined by the context and parameters of individual studies; however, the general consensus is that this emerging class was created by the socioeconomic circumstances it inherited from industrialism—a phenomenon that began in 17th-century Britain and spread to western Europe and North America in the 1800s.

Originating from the tradition of British concepts of class, the tiered categories of working class and poor have two historically contrasting definitions. These were most pronounced during the rise of industrialism in England starting as early as the late 18th century. Class categories had the function of showing the relationship between a citizen's personal income and the extent to which that income might establish meaningful participation in a consumer-based, capitalist society. In contrast to the substantially lower economic reputation of the poor—those who were living in a state of destitution or absolute want and depended on other people's charity as the primary means of survival—the working class often had the means to afford a more privileged or potentially comfortable lifestyle than the "deprived" underclass, providing them with a stronger voice for collective dissent and revolution.

Over the past 20 years, the increasing use of the term *working poor* has yielded a fusion between these two imagined classes (laborers and the poor). This hybrid concept thus began to question the belief that labor alone could secure independent self-sufficiency in a growing economy, while also signaling a crisis of labor faced by the working class of developed nations.

The modern use of the catchphrase, working poor, conveys several sociopolitical functions in a postindustrial world: first, it firmly evokes the contradiction inherent within the idea that people who work can also experience poverty, despite their attempts to acquire self-sufficiency through employment; second, it dethrones the biased myths that the poor are not laboring citizens and the poor lack success because they lack a work ethic; and third, it evokes a response among the populous, its government, and its policymakers to ensure justice for the working poor, that is, laborers struggling are given the tools needed to afford a decent livelihood. Despite its controversial political currency, as a community in need, the working poor carry on as a largely ignored, marginalized, and low-priority topic of national and worldwide debates on poverty.

The argument that more and more working people on the planet are living in poverty is still an item of minimal importance to the media and a vast number of its audiences, especially when this thesis exposes disturbing socioeconomic contradictions. The most distressing of these is the paradox surrounding the rapid, global economic victory of the world market, which is nevertheless accompanied by the equally rapid reduction of income and wealth among the world's population.

This irony makes even more obvious the unequal distribution of resources between the world's rich and poor, both within and between nations, and has worked to further separate these upper and lower thresholds. In addition, the casualization, global division, and competitive outsourcing of labor, as well as the sinking real value of wages, fuels the persistent poverty among laborers in developing and already developed countries.

A PERSONA OF THE WORKING POOR

Some studies cautiously separate the working poor (those working but poor on a consistent basis) from the nonworking poor (those not working and poor); this provision compensates for incidences of fluid mobility between these economic states, expanding the scope and possibility of discussion around issues like welfare and the fate of postindustrial labor. This means that, depending on circumstance, workers can sometimes slide in and out of poverty—a pattern that might seem to complicate any effective definition of working poverty.

Still, the laboring poor can be differentiated from citizens who depend exclusively on assistance from the government (welfare, unemployment, retirement, medical), especially since those who work cannot legally access such social benefits, as is the case in Canada and the United States.

Case studies are sensitive to historical, economic, and geographical contexts, and are effective to learn about and illustrate the distinctiveness of the working poor from other income groupings. Certain parameters or quantifiable variables help to determine a concrete threshold for gauging which and how many working members of society are affected by poverty. Such variables often include income type (minimum to low wage), duration of work (in weeks), type of work (parttime or full-time), rates of consumption, educational background and transferable skills, access to housing, amount of family members, and so on.

This process of social categorization via the measurement of wealth generates a specific median locating an average citizen's socioeconomic status. The poverty threshold often sits somewhere below the median, a number that changes from country to country. For instance, the United States uses an absolute poverty line

that fluctuates with the rise and fall of inflation; Great Britain calculates poverty using a relative index based on 60 percent of median income; and Canada uses a Low Income Cut-Off (LICO) as the standard to determine poverty thresholds for working and nonworking people.

A variety of external and internal conditions shape the unique face of poverty lived by those working in developed countries, including basics such as decent and affordable housing, food for healthy nourishment, access to proper medical care, education, and the real value of wages to subsidize these living costs. In rich nations, workers living in poverty still struggle to cope with the expenses of being employed in civil society (transportation costs, higher education and training, insurance, childcare).

HOUSING AND HEALTH

Unfortunately, some working poor are too familiar with substandard living conditions, consisting of deteriorated housing that can often affect personal health. If less expensive urban apartments for rent are found, they are usually in more deprived, dangerous, and dilapidated neighborhoods. Also, cities without rent-control caps make working poor vulnerable to less sophisticated housing options, such as trailer-life, shelters, and homelessness, when insubstantial paychecks and/or uninhibited spending patterns lead to lodger eviction.

As a consequence, more communities and social justice groups have pressured governments from the grassroots level to implement genuine and innovative solutions to the immense housing crisis faced in the 21st century. Even so, with the slow growth of government-subsidized housing, charitable and nonprofit organizations cannot keepup with the growing number of working people in need of an affordable living space.

The working poor are also at higher risk of being undernourished and lacking in proper medical attention, which can affect ability to properly perform daily and after-work routines. The power to afford and/or make quality food choices that can prolong individual and family health is a luxury that a number of working poor live without. In cities, especially where the cost of living is very high, some working poor depend on food subsidies like food stamps or handouts from food banks when such options are offered.

Furthermore, while some working poor sometimes refuse to use such programs unless absolutely necessary, others are ignorant of their right to access them. This reality forces some working families to choose between

buying food and paying for a long list of costly, often interest-stacking bills: rent, heating, electricity, water, insurance, childcare, student loans, clothing, credit card charges, car payments, late payment fees, cable, telephone, and school supplies.

The working poor are also at higher risk of being undernourished.

In such cases, children of many working poor will go to school hungry and unable to concentrate, becoming even more vulnerable to sickness. When illness does arise, the working poor may access free healthcare in most industrialized countries like Canada or Great Britain because of government assistance plans.

In the United States, however—where the child poverty rate was the highest among 19 industrialized countries in 2004, with 21.9 percent of children living in financially distressed households—Medicare and Medicaid are available only to those whose applications are approved, for low-income children, the blind, the elderly over 65, people with disabilities, and pregnant women.

This list excludes many working poor who do not qualify and frustrates those who cannot afford insurance premiums for private healthcare insurance; thus, the problem of maintaining physical and mental health continues to be a large source of distress for a growing number of working poor.

LIMITED OPPORTUNITIES

Without close communal, educational, workplace, or family networks to boost and foster employment possibilities, most unskilled, low-educated members of the working poor will always be vulnerable to the trap of static, minimum- to low-wage, or poorly rewarded jobs. At the same time, hope for technical and/or professional improvement and growth can be particularly hindered, especially with: 1) the continued erosion of low-skilled yet secure wage jobs; 2) the increasing cost of higher education that is a requirement for upward mobility in the workforce; 3) the decline of welfare recipients forced to find a job, as well as the increased competition in the job market that results; 4) unpredictable layoffs and diminishing security in the workplace, even for those with college or university degrees; and 5) the declining number of workers protected by collective bargaining agreements.

Industrialized countries arguably have the most abundant means to slow down and even prevent the occurrence of working poverty by addressing some of these problems. Still, the soaring cost of living, the saturation of the labor market, the growth of global corporate competition, the replacement of labor with technology, the continued realities of discrimination, and decreased government spending on education and social welfare programs have all contributed, in one way or another, to marginalizing the working poor from better options.

While North America generally boasts an excess of wealth and food, multiple opportunities for education and labor, advanced technology, unlimited goods, and government and charitable services, individuals who face poverty most frequently, even while gaining steady yet low earnings, include people with less training, competitive skills, or advanced education, workers who have families with children—especially single parents, women, youth, and racial minorities.

Studies have revealed these realities, increasing discussions about the rooting of poverty in factors such as age, race, gender, and class and the related social determinants of health. This debate is most heated in developed countries throughout Europe, and especially in the United States and Canada, where the 20th-century movements for civil democratic rights and justice (minority rights, women's rights, gay rights) were able to be forged by radical civic activism and popularized by conventional media outlets.

SOLUTIONS TO WORKING POVERTY

The myth that low and minimum wage employment can provide working individuals with the basic needs for living is highly contested. Some analysts argue that the earnings of the working poor sit far below the statistical threshold of living income standards. Critics of the United States, the most advanced capitalist system in the world, claim that the buying power of minimum wage has substantially declined and hardly increased since its 1968 peak in real value.

According to the Economic Policy Institute, the Consumer Price Index (CPI)—a measure of the average change in prices paid by urban consumers for a market basket of goods and services—further confirms the deterioration of real wages for workers in the United States

The inclination of annual wage growth to fall behind price increases has been explained by some economists who emphasize the way minimum wage does not

always account for inflation; this anomaly decreases minimum-wage purchasing power year after year.

In response to the realities of slow wage growth and the argument that minimum-wage jobs are no longer able to finance safe and sustainable living conditions for the working poor, grassroots efforts in the United States have toiled to install living wage laws at the municipal and/or state level of government, resulting in the rise of minimum wage to an hourly living wage that will ensure that cost of living can be afforded in the city of employment. Some analysts believe this poverty-reducing strategy combats the low, real value of minimum wage.

However, the living wage movement has other economic analysts concerned: they claim that there are many other factors being ignored that also prevent the reduction of poverty, even when the minimum wage is increased. Economic think tanks such as the Employment Policies Institute are skeptical about this move to justify income hikes on needs-based rather than skills-based grounds, claiming that there is no statistical or historical evidence that wage increases reduce poverty.

THE CYCLE OF POVERTY

The extent of an individual's ability to participate on the economic map cannot be understood by statistics alone; rather, it is enhanced by a three-dimensional understanding, often found in case studies that further examine the causes of poverty among workers. The rise of many sociological texts concerning labor and the working poor has begun to fill this gap. These descriptions help to humanize through testimonials a wider social grasp of poverty. Able to portray the confining cycle of poverty, recent accounts show that, although the working poor are highly participatory members of society, they are too often marginalized from the economic, political, and cultural mainstream. Accounts and studies of the working poor, along with literary ones in the form of novels and short stories, serve to minister to a broadening of the overall discussion about the roots of poverty.

Work-Welfare Programs

FOR NEARLY 60 YEARS, the United States provided its low-income families with cash aid, albeit in limited amounts insufficient to lift them out of poverty. In order to qualify for aid, parents merely had to pass an income means test. Some documentation was required and a few behavioral mandates were enforced (such as children had to be immunized), but no other reciprocal compliance with welfare obligations was expected. Cash aid programs were thus called "entitlement" programs. Aid to Families with Dependent Children (AFDC) was the chief cash aid program.

From the 1950s to 1970s, state welfare caseloads in the United States experienced dramatic increases, despite relative prosperity and increasing governmental supportive services (such as counseling, job training, and investments in employment opportunities). The typical welfare client was depicted in the media and by politicians as a lazy, criminally minded, amorally lascivious, single African-American woman with multiple children who was a threat to social order. From this unfair, racially discriminatory portrayal of welfare clients, policy evolved requiring clients to demonstrate commitment to mainstream norms of social civility coupled with a willingness to work.

In the 1980s, theory developed around the need to place welfare clients in employment in exchange for aid. The Theory of Labor Force Attachment, or more commonly, the work-first model, argues that welfare clients are dependent on cash aid and therefore lack any ability to become economically self-sufficient. In their dependency, welfare clients become, at best, apathetically non-employed. At worst, they become criminal. In order to protect social order, welfare clients must be forced to work, since they will no longer actively seek

employment. Work must be made a priority, with punitive sanctions a real threat in cases where the client fails to participate in employment activities. Time limits must be set to ensure that clients do not maintain long-term dependency on welfare. Because welfare clients under the work-first model would be too busy working or seeking work, they would no longer be able to choose complacent non-work or criminal behavior.

Children of working welfare clients would benefit from the employment of their parents simply because they would learn the value of hard work, as other children do. Finally, the work-first model of welfare is posited on the belief that no real barriers to employment exist for the welfare client other than the internal belief of the client that jobs do not exist or existing jobs do not benefit the client sufficiently for the client to take the job.

The work-first model of welfare was pilot-tested under several state welfare demonstration programs. One such program was in Riverside, California, in the early 1990s. While welfare clients who were required to participate in the work-first model originally seemed to do better than clients in a normal AFDC program in finding employment and leaving welfare, six months later, those clients fared no better than the AFDC clients in maintaining employment or avoiding welfare dependency. Other studies of welfare clients disprove the central tenets of the work-first model, namely that welfare clients are deviant from the norms of society. For instance, no study to date has provided reliable evidence that welfare clients are criminally inclined, sexually promiscuous, or otherwise threatening to social order. Further, studies of welfare employment trends show that welfare clients work when able to and turn to cash aid only when necessary, belying the notion that clients inappropriately depend on cash aid in lieu of employment.

Despite lack of evidence that the work-first model worked, or that it was necessary because of client deviancy and threats to social order, President Bill Clinton signed into law the Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA), promising to end entitlement welfare programs. Under the PRWORA, the Temporary Assistance to Needy Families (TANF) program was created. TANF replaced AFDC as the primary cash aid program for low-income families. It required clients to work or participate in work-generating activities such as job skills workshops in exchange for cash aid. Further, the program allowed clients to receive cash aid only for a total of 24 consecutive months, and 60 months in a lifetime. TANF pro-

vided clients with limited support for childcare and transportation, as well as job searches and employment referral services. Currently, clients must complete 35 hours per week of work-related activities in exchange for aid. Failure to comply with behavioral mandates results in punitive sanctions in the form of loss of cash aid and supportive services. States may opt to reduce only the adult portion of aid or remove the entire family from aid until conformity occurs.

World Bank

THE WORLD BANK AND International Monetary Fund (IMF), the organizations often referred to as Bretton Woods twins, were conceived at the international conference that took place at Bretton Woods, New Hampshire, between July 1 and 22, 1944.

The Bretton Woods agreements were ratified on December 27, 1945, the date considered as the formal beginning of the bank. However, the bank operations commenced on June 25, 1946, and the first loan of \$250 million was extended to France for postwar reconstruction on May 9, 1947. This was, in real terms, the most substantial loan ever issued by the bank. The bank's primary focus was reconstruction of European countries after World War II. The initial membership consisted of 45 countries, compared to 184 today.

The World Bank's member countries elect a representative and alternate to the Board of Governors, to

serve a five-year term. The board meets once a year at the bank's annual meetings, where it sets the overall policies of the institution and reviews country membership. A board of 24 executive directors oversees the work of the bank on a daily basis. They meet twice a week in Washington, D.C., to approve new loans and review bank operations and policies. Governments can elect directors every two years. Five of these directors represent the member countries that have the largest number of shares: France, Germany, Japan, the United Kingdom, and the United States.

By an informal agreement, the bank president has always been a U.S. citizen.

The remaining 19 executive directors represent constituencies; a country or group of countries elects each every two years. The election rules ensure that a geographical balance is maintained. The executive directors and the president of the World Bank, who serves as chairman of the board, are responsible for the conduct of the bank's general operations and perform their duties under powers delegated by the Board of Governors. The president in 2006 was Paul Wolfowitz, a former U.S. deputy secretary of defense, who was appointed on June 1, 2005. By an informal agreement, the bank president has always been a U.S. citizen, while the managing director of the IMF has been a European.

In the beginning, in the 1950s and 1960s, the bank's financing was directed and limited to infrastructure projects. In the mid-1960s, more than 75 percent of all bank lending was directed to electric power and transportation. The lending heavily rested on the assumption that transportation, communication, and power facilities, ports, and public utilities are necessary conditions for the development of the rest of the economy.

The 1970s oil shock and the appointment of Robert McNamara as the bank's president brought about profound changes to operations. The magnitude of loans jumped from \$1 billion per year to \$12.4 billion from 1968 to 1981 (more than five times when adjusted for inflation). The number of professionals employed by the bank increased from 767 in 1968 to 2,522 in 1981, and to 3,776 in 1991. In addition to the size, the composition of spending changed.

The lending to the rural sector increased dramatically, and health, population, and nutritional lending projects commenced. In addition, new departments were established and a formal research program started.

The major publication World Development Report was initiated, which led to the increased visibility of the bank.

These developments resulted in the bank being bigger and broader than ever today. It has become a group, encompassing five closely associated development institutions: International Bank for Reconstruction and Development (IBRD), International Development Association (IDA) and three other agencies, the International Finance Corporation (IFC), the Multilateral Investment Guarantee Agency (MIGA), and the International Centre for Settlement of Investment Disputes (ICSID).

The IBRD provides loans, policy advice, and technical assistance to the governments of creditworthy lowand middle-income countries. It charges interest rates well below those offered by commercial lenders. The IDA was created on September 24, 1960, with the primary purpose of providing grants and interest-free loans to the world's poorest countries for a variety of poverty reduction activities. These activities included measures to ensure effective governance, encourage private investment, and boost the education and health services available to the poor.

The IFC was created on July 20, 1956, in order to invest in viable private enterprises in countries where access to capital is limited. The MIGA was created on April 12, 1988, with the primary aim to encourage direct foreign investment in developing countries by providing guarantees to foreign investors against losses caused by noncommercial risks like war, civil disturbance, and an inconvertibility of the local currency. The ICSID was created on October 14, 1966. It encourages foreign investment by providing a forum for the conciliation and arbitration of international investment disputes.

While reconstruction is still an important focus of the bank's work, especially given the natural disasters, humanitarian emergencies, and postconflict rehabilitation needs that affect developing and transition economies, the primary focus shifted toward poverty reduction.

Today, the mission of the bank is to fight poverty and improve the living standards of people in the developing world. As such, the bank's financing focuses on the reform of the health and education sector and environmental and infrastructure projects. Nevertheless, World Bank Group projects are frequently criticized by nongovernmental organizations (NGOs) for alleged environmental and social damage and for failing to achieve poverty reduction.

The primary criticism comes from the opponents of neocolonial globalization. The bank is viewed as an instrument for undermining the national sovereignty of recipient countries through various structural adjustment programs that pursue economic liberalization and relativize the role of the state. Similarly, critics underscore the fact that the bank favors neoliberal principles, which are hardly applicable in the countries strained by ethnic conflicts or wars, or that have a long history of dictatorial regimes and colonial subjugation. In addition, both the World Bank and the IMF are often seen as principal instruments of the United States, which is using them to advance its own economic and political interests. This is particularly apparent, according to the critics, in the situations when the bank intervenes in order to salvage imprudent loans made by private banks to irresponsible regimes in developing countries. While acknowledging the valid criticism, the bank claims that a substantial progress has been made:

Over the past 40 years, life expectancy in developing countries has risen by 20 years—about as much as was achieved in all of human history prior to the mid-20th century. Over the past 30 years, adult illiteracy in the developing world has been nearly halved to 25 percent.

Over the past 20 years, the absolute number of people living on less than \$1 a day has, for the first time, begun to fall, even as the world's population has grown by 1.6 billion.

Over the last decade, growth in the developing world has outpaced the developed countries, helping to provide jobs and boost revenues that governments need to provide essential services.

Nevertheless, both the bank and the critics agree on one important thing: that the progress, while undeniable, is far from sufficient. The resilience of the bank will hinge primarily on its ability to address the basic needs of the large number of its membership, not only the historical decision-makers.

World Bank Poverty Lines

FROM 1996 TO 1999, the Policy Research and Poverty and Social Policy Departments of the World Bank joined forces to publish *Poverty Lines*, a newsletter designed to summarize the ongoing research on poverty by the World Bank and others. *Poverty Lines*, a brief two-page publication, translated the often technical, statistical, and economic theory-oriented language found in many of the studies on poverty into reader-friendly informational articles for noneconomists and working professionals interested in poverty studies and for those working toward the alleviation of poverty. *Poverty Lines* summarized articles written for the Living Standards Measurement Study (LSMS) Working Paper Series.

The LSMS is an instrument designed to systematically collect information on consumption patterns and income at the household level. The LSMS was established by the World Bank in 1980 in order to improve methods of data collection and the type and quality of household data collected by government statistical offices in developing countries. The objectives of the LSMS were to develop new means for monitoring progress in the fight against poverty and the struggle to raise standards of living, to identify the economic impact and other consequences on households of current and proposed government policies, and to improve communications among survey statisticians, analysts, and policymakers. The LSMS provides accurate measures of variables common to a broad cross-section of the population (such as poverty, malnutrition, and employment rates).

Households are asked to answer detailed questions on their spending habits and sources of income. The resulting data allow analysts to evaluate current living standards, track changes over time, and provide timely input into policy formation.

The surveys are designed to be repeated on a regular basis, tracking conditions as they change over time. Using the survey results, analysts can produce a comprehensive measure of household welfare and evaluate its distribution across the population and over time; evaluate patterns in access to social services, such as schools, healthcare, or welfare programs; identify the determinants of socioeconomic outcomes (such as how women's education affects fertility decisions or how health status affects workers' labor supply); and examine household responses to changes in economic conditions or government programs (such as how price subsidies influence consumption patterns, or how healthcare choices are affected by clinic user fees). The surveys are conducted more or less regularly in most countries.

LSMS household surveys are an important tool in measuring and understanding poverty in developing countries. Surveys with several, if not all, of the hallmarks of the Living Standards Measurement Study have been conducted in dozens of countries around the world. Although the first few LSMS surveys followed a very similar format, as time passed and countries with different circumstances were added, substantial variety arose in the surveys across the different countries. Problems in comparing year-to-year poverty surveys demonstrated that researchers needed to make changes in survey design. These sample survey data collection methods are increasingly being complemented by participatory methods whereby people are asked what their basic needs are and what poverty means for them. Interestingly, new research shows a high degree of concordance between poverty lines based on objective and subjective assessments of needs.

The articles that appeared in *Poverty Lines* briefly described results from various country studies. They served to focus the results from these surveys and addressed the methodology of data collection and statistical analysis. Articles attempted to educate readers on the importance of using standardized measurements and using comparable data when researching poverty. When not discussing methodological issues, the newsletter focused articles on the description or analysis of household behavior or the effects of government policies. For example, topical articles on population policy in sub-Saharan Africa, the importance of investing in education, protecting the poor during times of economic transition, and designing effective safety net programs all appeared in the publication.

In order to take advantage of rapidly changing technology, better utilize existing resources, and make information more readily available, the publication of *Poverty Lines* was halted in 1999. It was replaced by an online web resource center known as PovertyNet that was launched in October 1998. PovertyNet is a site for people who work on poverty, created by the Poverty

Group in the Poverty Reduction and Economic Management Network of the World Bank. The PovertyNet website provides up-to-date resources about understanding and alleviating poverty. The website provides an introduction to key issues as well as in-depth information poverty measurement, monitoring, analysis, and on poverty reduction strategies for researchers and practitioners. The goal of the website is to share information on what works and what does not work in the struggle to help alleviate poverty. The website is navigable in a way that allows nonexperts access to basic information and that provides in-depth resources for policymakers and researchers.

World Concern

WORLD CONCERN IS A nondenominational international Christian humanitarian organization. It is a ministry of CRISTA, a Seattle-based group of related ministries. World Concern provides emergency relief and community development services to the poorest in many places in the world, including some of the most neglected, without regard to race or creed.

Dr. Wilbert Saunders and Jim McCoy, a pharmacist, founded World Concern in 1955. In the beginning it was focused on medical missions and had the name Medicine for Missions. Its primary concern at first was sending medical supplies overseas to mission workers. In 1973 Medicine for Missions was reorganized, renamed, and reoriented in the focus of its mission.

Like many other nonprofit corporations, this legal status encourages giving because donors receive a tax benefit for their donations. In addition, World Concern is a charter member of the Evangelical Council for Financial Accountability (ECFA), which is a publicly operated agency for certifying the fair and responsible use

of charitable donations. ECFA uses seven Standards of Responsible Stewardship in order to satisfy public trust, standards that World Concern also follows.

World Concern currently serves families in 32 countries. Its mission goal is the reduction of human misery of the poor both physically and spiritually by means of relief for acute suffering and development programs to end chronic suffering. Moreover, it seeks to give hope for a life lived in a right relationship with God. World Concern's operations are conducted by a staff of 900 professionals and by over 1,300 volunteers. The volunteers are teachers, veterinarians, and other professionals, many of whom travel to impoverished areas to work on poverty projects. Sometimes World Concern acts as an agency for relief or development in cooperation with other nongovernmental organizations and with government sources of aid.

World Concern's development services teach self-development behaviors to the poor. This mission strategy rests on its belief that people are the best agents for solving their own problems. World Concern believes that the family is the cornerstone of every community. Therefore it seeks to serve the poorest families on a global basis with food and meaningful work. At the same time it seeks to share love of Christ in culturally sensitive ways. World Concern uses the World Concern Strategic Index each year to rank countries for degree of suffering, from the greatest to the least. It then uses prayer and the suffering index scores to decide where to direct its resources to meet the most severely neglected needs. Most of the projects and operations are in Asia, Africa, and Latin America.

World Concern's program has continued to expand, as its budget for 2006 was estimated to be \$88 million. It uses four percent of its budget for administrative costs, with the remaining 96 percent going to its programs and projects. In 2006 it had 60 projects in 18 countries. Recent relief projects included service to tsunami victims following the great tsunami of December 26, 2004, in the Indian Ocean.

World Economic Forum

KLAUS SCHWAB, Swiss philanthropist and recently retired professor of business, founded the World Economic Forum (WEF) as a nonprofit organization in 1971. This informal forum brings together political, business, and media leaders annually in the mountain resort of Davos, a southeastern Swiss town near the Austrian border. With the exception of the 2002 meeting in New York City, the WEF regularly meets in Davos, usually early in the year, and hence it is also referred to simply as Davos. In addition to annual Davos meetings, the WEF organizes regional gatherings in Asia, Europe, and Africa on a regular basis.

The mission of the WEF is to provide world leaders in politics, business, and media with an opportunity to discuss contemporary world affairs and to set the economic and political agenda for the year. In its founder's words: "Today, no one government or company or group, working alone, can solve a major issue. They all have to work together."

The Davos meetings serve this ideal by laying down the foundation for a global corporate governance system. Not surprisingly, leading global megacompanies—Texaco, Exxon Mobil, Royal Dutch/ Shell Group, Boots Company, Pfizer Inc., Roche Holding Ltd., McDonald's, Nabisco, Nestle, and Unilever to name few—have a prominent role in shaping the WEF agenda, particularly on globalization and liberalization.

Recently the WEF has broadened its membership to include selective representation from academe, from non-governmental organizations and the arts, and even from labor, to curb criticisms of its legitimacy. Nevertheless, the pro-business orientation of the WEF is not hidden and is further reinforced by the following two initiatives. The International Business Council (IBC), established in 2001 as an advisory body to the WEF, is made up of 100 chief executives of leading global companies. And the Global Institute for Partnership promotes public-private partnership as a method of privatization of public economic enterprises in industrial and developing countries.

Topics typically discussed at Davos meetings have been economics, environment, business and management, science, medicine, and technology. Subtopics within economics have run a wide range, from competitiveness, financial policies, and foreign investment to public policy, foreign trade, and exchange rate policies. Across the board there has been an emphasis on the expansion of globalization and economic liberalization in the name of economic democracy, defined in terms of a

free-market system. Since 2002, the WEF has explicitly focused on issues related to world poverty, and especially poverty in Africa. World leaders presumably have realized that the neoliberal world economic order of recent decades has contributed to persistent global poverty, which in turn fueled economic and social uncertainty.

At the 2002 meeting in New York City, the WEF focused on the economic, social, political, and ethical causes and consequences of poverty. Led by Professor Jeffrey Sachs, current director of Columbia University's Earth Institute, and by Bono, the lead singer of the popular rock band U2, the WEF discussed aspects of poverty and HIV/AIDS, hunger, malaria, TB, and other diseases in Africa—specifically in sub-Saharan Africa, where about 300 million people (over 40 percent of the total population) live in extreme poverty, on less than \$1 per day at Purchasing Power Parity, according to Sachs. The 2002 meeting ended with a verbal commitment by world leaders to use foreign aid to curb world hunger and poverty, a commitment that had to be repeated at the 2005 G-8 meeting in Gleneagles, Scotland. The commitment was to some extent also a response to results of a 2004 Gallup Poll survey, carried out for the WEF, which showed that 44 percent of those surveyed agreed that poverty and hunger eradication should be the most important global priority.

This trickle-down-based strategy calls for economic growth.

So-called communities play an important role in WEF's organizational strategy. These are smaller and more focused forums that provide opportunities for indepth interaction and discussion among members. They also help disseminate WEB information among members. The Young Global Leaders (YGLs), also formed by Schwab in 2004, is one of more important community initiatives of the WEF. It is a forum that gathers young people from different countries who have the potential for future effective global leadership. Participants are below 40 years of age and are willing to commit themselves to the WEF mission.

The YGLs are involved in WEF's 2020 Initiative, which is a program aimed at a hypothetical exploration of the economic, social, and political global environment in 2020. The first 238 YGLs, selected by 28 media leaders from a pool of 8,000 nominees, held their first Inaugural Summit in Zermatt, Switzerland, in June

2005. According to a WEF press release, among the 238 selected YGLs, 56 come from politics. They are young heads of state, cabinet ministers, and parliamentarians. Another 99 of them are from businesses, successful young CEOs and entrepreneurs. The remaining YGLs come from the media or other venues of intellectual life. The YGL provides the WEF with an opportunity to pass the WEF free-market ideals to prominent young world leaders, who help perpetuate them.

A major annual undertaking by the WEF since 1979 is the publication of the Competitiveness Report, recently renamed the Global Competitiveness Report. A comparative study of the economies of over 100 countries, it also includes the perceptions and observations of local business leaders on their respective economies. The WEF claims that the report monitors competitive conditions in these countries and thereby assists in global investment decisions much needed for sustained economic growth. At the turn of the new millennium, the WEF constructed a Global Competitiveness Index (GCI) and used it for the first time in its 2001–02 Global Competitiveness Report as an indicator of economies' ability to achieve sustained growth, which it claimed is essential to raise the poor out of poverty.

This trickle-down-based strategy calls for economic growth, which most efficiently is provided by the private sector. Sustained growth in incomes is supposed to raise investment and employment and therefore eventually reduce poverty. The competitiveness index would be used as a gauge of the economy's ability and readiness for the free-market-based sustained growth strategy. The GCI is a composite index that measures the quality of the macroeconomic environment, the state of public institutions, and the level of technological endowment. The aggregate GCI is a weighted average of these three individual indexes. In addition to the aggregate GCI, the report ranks countries in terms of the individual Macroeconomic Environment Index, Public Institutions Index, and Technology Index.

Given the importance of the potential use of the GCI, it is important to know its limitations. Sanjaya Lall, for example, has criticized the index for its deficiencies, which range from biased and flawed methodology to its too broad and general definitions of important concepts.

The power and the prominent role of global business in shaping the WEF agenda have been strongly criticized as undemocratic, lacking transparency and accountability. It is seen as one of the informal pillars on which neoliberal globalization has relied heavily in carrying out private-sector-led economic growth and

development. In recent years, antiglobalization activists have challenged the legitimacy of the WEF by organizing massive anti-WEF demonstrations at Davos meetings (and in New York City in 2002), as well as at its various regional meetings. The efforts of these antiglobalization groups—students; church, antiwar, and labor organizations; and intellectuals among them—led to the cancellation of the WEF's 2003 Dublin regional meeting. Anti-WEF demonstrations have caused the WEF meetings to take place under tight security, leading to further criticisms of its transparency and legitimacy. Along with the G-7 and G-8 Summits and other informal gatherings, the WEF has served well the hegemony of global capital by providing the leading corporate elite an opportunity to control global economic, social, and political decision-making.

The World Economic Forum has been successful in bringing together the world's elite political and economic leaders and establishing an effective and powerful communication channel between these two groups. Jean-Christophe Graz refers to the WEF as the most exclusive and powerful transnational elite club. Like similar gatherings and institutions, Graz also argues, the World Economic Forum lacks legitimacy. Unless it evolves into a democratic, transparent, and accountable institution, it will continue to distance itself from the larger society it claims to help and will remain an exclusive private club.

M. Odekon General Editor

World Food Program

AMID CONTROVERSY AND competing ideas, the World Food Program (WFP) was established by parallel resolutions of the United Nations Food and Agriculture Organization (FAO) and the United Nations' (UN) General Assembly in 1961. It began as a recommendation of Senator George McGovern at a time when John F. Kennedy, then president of the United States, was revamping U.S. foreign aid assistance programs. McGovern convinced the president that the need for food aid was so great that the United States could support a multilateral approach to food aid that utilized agricultural commodities as a supplement to other bilateral arrangements. Kennedy agreed and the United States supported the UN General Assembly resolution.

Located in Rome, Italy, the World Food Program was started as a three-year experimental program to provide food to poverty-ridden, malnourished, hungry people around the world. In 1963, the WFP undertook its first field operations by responding to multiple disasters. An earthquake in Iran in September 1962 necessitated the transfer of 1,500 tons of wheat in order to feed people, plus 27 tons of tea and sugar from India. This disaster was followed by a hurricane in Thailand in October 1962, which left 10,000 people without food. WFP arranged donations and transferred supplies from Australia and the Netherlands.

Finally, the newly independent African nation of Algeria was resettling five million refugees, and the WFP supplied much-needed food. Among the original WFP mandates were to use food aid to support economic and social development, provide food and associated logistics support in times of emergency, and generally promote world food security. From an initial three-year experimental program (1963–65) with under \$100 million in resources, WFP has grown to become the world's most prominent multilateral food aid organization, responsible for more than 90 percent of multilateral food aid allocated and about 30 percent of all food aid worldwide. WFP food aid reached 113 million people in 80 countries in 2004.

The primary goal of WFP aid was to save lives in refugee and other emergency situations; to enhance the nutrition and quality of life of the most vulnerable people at critical times in their lives; and to help build assets and promote the self-reliance of poor people and communities, largely through labor-intensive work programs. In emergency situations food aid was essential for social and humanitarian protection. The provision of food aid, when possible, was coordinated with the re-

lief assistance provided by other humanitarian organizations. In nonemergency situations, feeding the poor with food aid was considered a pre-investment in human capital and resource building; it was used to help build capacity among the very poor. WFP designed projects to serve long-term development needs as well as mitigate short-term disasters.

EMPLOYMENT AND INCOME

To the extent possible, WFP attempted to help poor people utilize their most abundant resource, their own labor power; to this end WFP projects created employment and income opportunities and helped to build the infrastructure necessary for sustained development in poor communities. The WFP operated on a continuum around the dual functions of providing development aid and relief assistance. Development aid through food aid was intended to increase the levels of consumption, investment, employment, and income beyond what would have been possible without food aid.

The WFP made extensive use of creative means for securing food aid.

The main goal was to provide food aid in ways that actively promoted development in the poor developing countries, rather than merely to get rid of unwanted agricultural surpluses. The plan was to stimulate rather than discourage agricultural production in food aid recipient countries. As part of an ongoing effort to eradicate hunger and poverty, the WFP supported disaster prevention, preparedness, mitigation, and postdisaster reconstruction and rehabilitation activities as part of its development programs.

The WFP's prominent role in the distribution of emergency food aid came about because of the belief that multilateral assistance was more effective in reaching the needy population in a timely and cost-effective manner, because needs assessments and the calculation of allocations were made according to recipients' needs rather than the donors' needs. The WFP made extensive use of creative means for securing food aid and utilized distribution networks, including triangular transactions involving one donor providing resources that could then be used to purchase food in a second country, for distribution in a third country near to the recipient. The WFP also utilized local food production, where possible, to help reduce transportation costs and

delays in getting food to hungry people, and to provide demand stimulus to food producers in developing countries. The advantages of channeling food aid multilaterally through a UN organization enabled food to be provided with no political or commercial strings attached.

During the first 30 years of operation, WFP was well-known for its very visible, unambiguous role in organizing and delivering relief assistance. WFP provided over \$13 billion of aid involving more than 40 million tons of food. The agency was less known in those three decades for its primary role in development work.

Its main focus of attention for most of the first 30 years of its operations was on using food aid in support of economic and social development projects. From 1961 to 1991, WFP assisted more than 1,600 development projects and supplied humanitarian aid through more than 1,200 emergency and relief operations, providing food to poor and food-insecure people in most of the developing countries. Many people benefited directly and indirectly from this investment through the work and income generated, the infrastructure built or repaired, and the many lives improved.

In the process, WFP became the largest supporter of development projects involving and benefiting poor women in developing countries, the largest provider of grant aid for environmental protection and improvement activities in developing countries, and the largest purchaser of food and services in developing countries and a major supporter of south-south trade within the United Nations organization. At the same time, WFP established the largest global network in food aid, with staff deployed in more than 80 country offices serving more than 90 developing countries.

POLITICS

Politics are not absent from the WFP. There are a number of good ideas for hunger relief, but the problem is that there is now little international agreement about how the relief should be funded, or provided to those in need. WFP underwent dramatic changes in the composition and size of its assistance programs and its share of total world food aid in the 1990s. WFP moved away from its role in development and took on a larger role in crisis intervention and responding to emergency situations.

Since the mid-1990s, the majority of assistance provided by the WFP has been distributed for relief and emergency operations. Previously, only about one-third of its operations were for this purpose. In addition, the

bulk of relief and emergency assistance is now provided to the victims of man-made disasters within developing countries, rather than disasters caused by nature. Ironically, the presence of WFP development activity in poor countries has often enabled the organization to provide targeted relief interventions quickly and effectively through preexisting networks, established institutional relationships, and an active awareness of local resources, capacities, and vulnerabilities.

This overall shift in the WFP places the solution to hunger on providing more food aid for people in unstable situations, rather than increasing a stable indigenous food supply. The fundamental shift required aid to be reexamined in both the context in which it could make a difference to vulnerable people's lives and the context in which food aid could have a comparative advantage to the donor country.

The food production capacity of the world is able to provide for every citizen.

The WFP is funded by voluntary contributions from governments and individuals to finance its humanitarian development programs. Governments are the principal source of funding for the WFP, and 60 member states of the UN make contributions to this program. The WFP receives no dues or portions of the UN-assessed contributions. The voluntary nature of donations is intended to spread the burden of feeding the poor among the advanced industrialized nations; to enable contributions that could complement each other facilitating resource management; and to make food deliveries more cost-effective. Growing needs, declining government support, and an increasing global economy have encouraged the WFP to turn to corporations to broaden its donor base. Through donations of cash or goods, such as food, vehicles, computer equipment, and information technology, corporate donors are enabling the WFP to free up scarce cash resources to feed more hungry people.

Additionally, through donations of services, WFP may leverage a company's expertise in key areas to enhance its operations. Corporate employee programs are also helping to raise millions of dollars for the WFP. Walk the World and Coins4kids are two examples. WFP also seeks donations from individuals for some of its emergency programs. Emergency programs account for eight percent of the world's hunger victims. These programs include the distribution of food commodities

to long-term refugees and displaced persons, and provide emergency food assistance during natural and manmade disasters.

With the establishment of the WFP, McGovern recognized that the solution to world hunger depended upon political goodwill, compromise, and above all, peace. Millions of people worldwide are afflicted because of wartime disruptions in food production and distribution. Indeed, bad politics, poor policies, and corruption have served to increase the vicious cycle of poverty in many nations. It does not really matter that a typical food ration of cornmeal, vegetable oil, beans, peas, and lentils can be delivered for only 12.5 cents a day.

The problem is one of matching supply with demand when governments crumble, shells are launched across the countryside, and corruption reigns. In the 21st century, WFP convoys have come under increasing fire, and food intended for innocent civilians and victims of war has been hijacked to feed armies and rebel militias. Long-standing principles of neutrality and impartiality have given way to the realities of military convoys to protect aid workers and resources, to negotiated payments to gain access to suffering communities, and to awareness that food aid is most often necessary as a result of human aggression and atrocity.

The food production capacity of the world is able to provide every citizen with an adequate diet to lead a healthy, active, and productive life. Yet the hungry-poor (those earning less than the equivalent of \$1 a day, or those who spend most of their income on food), comprising one-fifth of the developing world's population, lack access to sufficient food to maintain good health.

The coexistence of hunger with the capacity to end it is one of the gravest paradoxes of the modern world. Food aid is intended to remedy at least partly this distributional problem, by making food available to those countries that prove unable to produce or purchase enough on their own.

Food is the critical ingredient to saving lives; however, programs in agriculture, economic recovery, education, health, protection, human rights, water, and sanitation must all simultaneously be supported if recovery is to take hold.

World Health Organization

CONSIDERING THAT POVERTY and ill health are tightly interlinked, the World Health Organization (WHO) plays an important role in reducing poverty as a part of the United Nations Development Group. The World Health Organization emerged in the international arena on April 7, 1948, to promote international cooperation in improving public health and to achieve "the highest possible level of health" by all people.

Governed by 192 countries, WHO operates from administrative headquarters in Geneva through three principal organs: the World Health Assembly, which meets annually as the general policymaking body; an Executive Board of health specialists elected for threeyear terms by the assembly; and a Secretariat, which has regional offices and 3,500 health and other experts and support staff on fixed-term appointments throughout the world. There are regional organizations in Africa, the eastern Mediterranean, southeast Asia, Europe, the west Pacific, and the Americas. The organization is financed primarily by annual contributions made by member governments on the basis of relative ability to pay, resources from the expanded technical-assistance program of the United Nations, and private foundations and industry.

Under the WHO constitution, health is defined as "a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity." Therefore, WHO considers health a multifaceted issue closely related to poverty, equity, human development, and collaborative partnerships. WHO works in many directions to reduce poverty and improve health through its immunization programs by developing and distributing vaccines; promoting more transparent, equitable, and accountable health systems; building community and family health; combating hunger; advancing health technology and pharmaceuticals; and contributing to sustainable development and improvement of

WHO's relationship with other organizations. In collaboration with national governments and international aid agencies, WHO not only works to reduce human diseases and fund medical research, but it also provides emergency aid during disasters, and aims to improve nutrition, housing, sanitation, and working conditions in developing countries.

In essence, WHO's work falls into three categories: information on health, funding of programs for disease control, and capacity development of public health administration. It provides a clearinghouse for information on developments in disease and healthcare and establishes international sanitary standards and quarantine measures. It sponsors measures for the control of epidemic and endemic disease (including immunization campaigns and assistance in providing sources of pure water).

Finally, it encourages the strengthening of public health programs in member nations. The World Health Organization is perhaps best known for its successful campaign to eradicate smallpox in 1980. Besides eradication of smallpox, the organization's first programs were directed at fighting plague, yellow fever, cholera, and malaria. The programs also included immunizations for measles, diphtheria, tuberculosis, and polio. Along with UNICEF, the U.S. Centers for Disease Control and Prevention, and Rotary International, the organization is committed to eradicating poliomyelitis by 2008.

Evidence suggests that ill health is obstructing economic development.

In its documents, WHO calls these "diseases of poverty," and there is in fact a two-way relationship between poverty and ill health: poverty induces ill health and diseases often further impoverish the poor. In the report "Poverty and Health," WHO positioned basic principles for action on health and poverty to guide the work of the WHO secretariat and member states. It also provides a platform for collaboration with development partners and considers the ways of improvement and protection of the health of the poor and reduction of the health gaps between rich and poor.

A growing body of evidence suggests that the burden of ill health is obstructing social and economic development. For example, HIV prevalence rates of 10 to 15 percent can lead to a reduction in per capita Gross Domestic Product growth of one percent per year. It is

known that the high cost of seeking medical care, combined with a loss of work and income, can quickly create a spiral of poverty. Poor people are least able to access healthcare. Illness prevents people from working or affects their productivity, lowering their income. The costs of obtaining healthcare can also be substantial, both in terms of time off from work (clinics are often a long distance from the household) and in terms of money spent on services. Sick people often cannot work and require assistance from family members. They may also have to pay for medical care. Many poor people do not have insurance against serious illness and have great difficulty in borrowing money, sometimes selling assets to cope with major illness. This reduces their ability to deal with future crises. Prolonged illness and major epidemics can affect communities and entire countries.

Besides, there is an increasing amount of evidence that ill health and access to health services are unequally distributed among social groups, regions, sex, and so forth within countries. The definition of vulnerable groups varies among countries, but amongst the most important defining characteristics are age, sex, ethnicity, and residence in remote locations. In areas facing war or civil conflicts, displaced people and refugees form an important vulnerable group.

To answer these challenges, WHO, in collaboration with governments, local stakeholders, and development partners, formulated measures to improve health, which are reflected in poverty reduction strategies (PRSPs). Pro-poor health strategies give priority to problems for which cost-effective interventions exist.

In its regular meetings, publications, and communications with the world leaders, WHO stresses that in order to meet the Millennium Development Goals, health systems must address the needs of poor people. This involves formulating and implementing development strategies that give priority to the common health problems for which cost-effective interventions are available. Many poor people live in localities where government administrative systems are weak and there are serious governance problems. This raises special challenges for managers and policymakers. Policymakers can learn from a number of innovative efforts to overcome these problems.

World Relief

WORLD RELIEF PERTAINS to the easing of a burden or distress such as economic insecurity, hunger, disease, anxiety, or economic and political oppression for the world and its inhabitants. World relief efforts are directed at overcoming the causes of poverty and the indignity and sense of poor self-worth that it causes, both locally and globally. Efforts include the provision of food security, medicine and healthcare, economic development and infrastructure supports, civil and social development including adequate labor and manpower for development, and coordinated disaster response and relief. Providing global assistance to the world's most needy inhabitants requires the cooperation and goodwill of wealthier and more secure inhabitants and the intentional and well-conceived redistribution of wealth, goods, and services.

Conceptually, world relief is composed of responses by private, corporate, volunteer, religious, and governmental organizations to provide humanitarian aid and recovery efforts to people affected by disruption of normal living, dislocation from geographic area of residence, disaster, disease, extreme poverty and hunger, political upheaval, political persecution, and the effects of war. Relief responses are affected by public awareness of the magnitude and degree of need; the relative importance of the affected area or population to those most capable of rendering aid or services; and the competing numbers of regional or world events that may be classified as disasters or crises, which compete for world relief providers' available resources over time.

Differences in the type of aid or donations of goods and services and the needs experienced by the affected population may serve to limit the effectiveness of the relief effort. For example, food or medical supplies may be appropriated in sufficient abundance to meet the need of the relief effort. However, transportation resources, sheltering materials, sanitation supplies, and agricultural products such as seed or fertilizers may be in short supply or not sufficiently donated so as to serve to limit the effectiveness of the relief effort or prolong the crisis.

World relief organizations include several major economic, service-, and relief-oriented institutions of sufficient global reach that they are consistently engaged in international relief efforts. These include the United Nations and the Office of the High Commissioner for Refugees; the American Red Cross (ARC) and the International Committee of the Red Cross and Red Crescent Organizations (ICRC); Doctors Without Borders, also known as Médecins Sans Frontières (MSF); and the United Nations Children Fund (UNICEF); as well as numerous others, of which many are internationally, government-, or state-sponsored, such as the Australian Aid, the Swiss Disaster Relief Unit, the United Nations World Food Program, USAID (United States Aid), and the World Health Organization.

Social and philanthropically sponsored organizations include CARE International; International Save the Children Alliance; OXFAM America; Send Hope; and numerous faith-based relief organizations, such as Catholic Relief Services, Islamic Relief Worldwide, Knightsbridge International, Mazon: Jewish Response to Hunger, and World Vision. However, during major environmental disasters of scale, multiple governments mobilize resources to provide logistical support, manpower, technological expertise, and funding supports for disaster recovery efforts, as occurred in the 2004 Asian tsunami, as well as historically during postwar recovery and reconstruction efforts.

CHARACTERISTICS OF WORLD RELIEF

The reestablishment of economic and health equilibrium or stability of affected groups of people during or following a crisis, conflict, or disaster is a hallmark characteristic of world relief. There is an emphasis on preparedness and secondary prevention of health and disease complications, hunger, and prevention or cessation of violence, based on available objective demographic and epidemiological data where possible.

World relief relies on existing and emerging technologies associated with the distribution of goods and services. These technologies are economically, logistically, and transportation-, and information-, and com-

munications-oriented. Distributed goods and services occur through churches, faith-based and non-faithbased organizations, communities, governments, and service organizations, to include humanitarian aid, manpower and volunteer services, medical assistance for preventing and treating disease or trauma, economic supports, social development, infrastructure development, food and nutritional services, social services, and political security and safety for affected populations.

World relief efforts, however, are historically more responsive to acute or transitional and time-limited conditions of upheaval and disparity than to more chronic and unchanging conditions of upheaval and disparity. Highly professionalized and highly trained personnel are needed to assess and provide decision support to well-trained, field-based volunteers or service providers. Philanthropic funding or charitable donation funding heavily subsidizes world relief efforts. Volunteers must have an understanding of both the political and social climate of the affected area as well as the appropriate linguistic skills to effectively provide relief services. World relief organizations are characterized by their emphases on preparedness, preplanning, and prepositioning of essential supplies where possible.

EFFECTS OF WORLD RELIEF

The more enduring and characteristic positive effects of world relief are to foster global cooperation, improve global financial stability, forge relationships that contribute to the development of affected regions, and foster self-sufficiency. World relief also contributes overall to reduced global poverty and in general to sustainable economic growth and improved quality of life in affected relief-served areas. Scrutiny by relief organizations also serves to encourage equitable and fair government.

World relief organizations additionally provide programs and training for local residents in improved healthcare, construction methods, supports for improvements to education and employment opportunities, knowledge on improving agricultural variety and productivity, establishment of safe havens for various political refugees, as well as improved knowledge or skills in creating export, and marketing and managing locally developed trade and manufactured products. Subsequent trade raises incomes and cuts associated relative costs of living.

These conditions serve to promote peace, improve the variety and quality of available consumer products, and thereby stimulate economic growth. Labor becomes more efficient and health status and quality of life improve, creating conditions whereby disputes can be handled more constructively.

Paradoxically, when world relief efforts are targeted to provide excessive or nonrelevant supports sufficient to prohibit regional economic self-sufficiency or to prevent economic, industrial, and agricultural growth in an affected relief region of the world, the affected population may over time tend to become dependent on external services and goods and subsequently become more impoverished, indebted, and potentially conflicted. World relief has the dual capacity to be used as a tool for oppression by denying local inhabitants the resources needed for productive self-governance and as an opportunity to strive toward economic equity as compared to other developed regions of the world.

WORLD RELIEF AND WORLD POVERTY

International programs directed at improving world trade, forgiving international debt, and providing aid to affected populations during times of instability, uncertainty, or scarcity serve to reduce the conditions that create world poverty. The subsequent improvements to disenfranchised and struggling economies and populations serve to increase positive aspects of world health, productivity, international trade, and global standards of living and to reduce conditions of conflict that lead to regional or world adversity or war.

Aid to improve infrastructure and social capital serve to stabilize and strengthen impoverished and underdeveloped regions of the world. Impoverished economies can thereafter improve self-reliance and preparedness for periods of economic deficit, pandemic or regional disease, and local or regional natural disasters. Stable and growing economies and governments tend to include greater levels of overall citizen participation and tend to reduce the conditions that lead to political oppression and the marginalization of the economically or politically disenfranchised.

RANDALL E. BASHAM, Ph.D. UNIVERSITY OF TEXAS, ARLINGTON

World Social Forum

THE WORLD SOCIAL Forum (WSF) provides an opportunity for different civil groups that oppose neoliberalism and globalization to strengthen their struggles and to formulate alternatives to the contemporary world economic order.

According to its Charter of Principles, the World Social Forum is an open meeting space "for reflective thinking, democratic debate of ideas, formulation of proposals, free exchange of experiences and interlinking for effective action, by groups and movements of civil society that are opposed to neoliberalism and to domination of the world by capital and any form of imperialism."

The WSF met for the first time in 2001 in Porto Alegre, an industrial town in southern Brazil, and since then the WSF meeting has become an annual event attracting grassroots, social, and civil society organizations from all over the world in search of an alternative to the neoliberal economic order, following the dictum "Another World Is Possible." Typically, the WSF meets annually at the same time as the World Economic Forum in Davos, where the leaders of the industrial world discreetly discuss their political and economic agendas for the year.

The WSF meetings draw large crowds (around 155,000 registered participants from 151 countries in 2005) representing nongovernmental organizations, labor organizations, youth organizations, academic institutions, government leaders, and presidents (for example in 2005, Lula da Silva and Hugo Chavez, presidents of Brazil and Venezuela, respectively) and are organized by the WSF Secretariat. The following nine organizations form the Secretariat: ABONG (Brazilian

Association of Non-Governmental Organizations), ATTAC (Association for the Taxation of Financial Transactions for the Aid of Citizens), CBJB (Brazilian Committee on Justice and Peace), CIVES (Brazilian Association of Entrepreneurs for Citizenship), CUT (Central United Workers), IBASE (Brazilian Institute of Socio-Economic Analysis), CJG (Global Justice Center), MST (Landless Rural Workers Movement), and since 2004, IOC, the Indian Organizing Committee, which organized the 2004 WSF in Mumbai, India.

WSF meetings hardly conclude with any concrete results.

The Secretariat, in coordination with the International Council, proposes the structure and the topics to be discussed at the annual WSF meetings. Themes cover a wide range, among them poverty, hunger, solidarity economy, Tobin's tax on international financial transactions, debt relief, foreign trade, environmental sustainability, a call for action against neoliberalism, debt relief, disarmament, Free-Trade Agreement of the Americas (FTAA), and human rights.

At the 2005 meeting, Brazilian President da Silva announced the launching of the so-called Global Call to Action Against Poverty (GCAP), a grassroots movement that targets global poverty and demands that industrial countries eliminate their farm subsidies, cancel the foreign debt of the poorest developing countries, and pledge 0.7 percent of their Gross Domestic Product for foreign aid. Since the WSF meetings are open deliberative forums, they hardly conclude with any concrete results. At the 2005 meeting, a document titled "Consensus of Porto Alegre" circulated unsuccessfully for approval by the 155,000 participants, reports J. Smith. Several regional and thematic social forums are part of the World Social Forum and are supported by the WSF International Council.

The aim of these complementary meetings is to spread the ideals of the WSF to a wide geographic area. Regional Social Forums have been held in Europe (European Social Forums in 2002 in Italy, in 2003 in France, in 2004 in London, and in 2005 in Spain as the Mediterranean Social Forum), in South America (in 2004 in Venezuela and Ecuador), and in 2003 in Asia and Africa. Another regional social forum is slated for the Caribbean in July 2006. Thematic social forums on democracy, human rights, war, and drug trafficking were held in Colombia in 2003, and in Palestine and Ar-

gentina in 2002, according to the World Social Forum website.

M. Odekon General Editor

World Trade Organization

THE WORLD TRADE Organization (WTO) is an international organization where member nations can discuss issues and settle disputes related to international trade as well as negotiate trade agreements. The WTO was formed on January 1, 1995, as an offshoot of the General Agreement on Tariffs and Trade (GATT) and currently has 148 member nations. Its headquarters are located in Geneva, Switzerland. While the WTO seeks primarily to lower barriers to international trade and investment, it recognizes the need, under certain circumstances, to restrict trade in order to protect consumers and prevent the spread of disease.

One of the key principles of the WTO is the most favored nation (MFN) treatment, which means that a member cannot discriminate among other member nations. If a country offers lower tariffs to one country, then it must offer equally favorable tariffs to all WTO member nations. Reciprocity is another key principle of the WTO framework. Under reciprocity, when one country proposes to reduce one of its tariffs, another country responds by proposing to reduce one of its own tariffs. Reciprocity and nondiscrimination help to expedite the lowering of trade barriers.

The WTO's main functions are to administer WTO trade agreements, provide a forum for trade negotiations, handle trade disputes, monitor national

trade policies, provide technical assistance and training for developing countries, and cooperate with other international organizations.

TRADE NEGOTIATIONS

The WTO provides a forum for multilateral trade negotiation, which is bolstered by its principles of nondiscrimination and reciprocity. Nondiscrimination hastens trade liberalization by eliminating the need to negotiate the same tariff agreement with each individual country. Nondiscrimination also improves economic efficiency by eliminating the prospects of trade diversion and trade rerouting.

Trade diversion occurs when a country does not import from the lowest-cost exporter because it has high tariffs on exports from that country. For example, say the United States can import portable stereos from Singapore for \$70 or from Japan for \$80. If the United States has a \$25 tariff on all imported stereos, then Americans will buy stereos made in Singapore. However, if the United States eliminates the tariff only on the Japanese-made stereos, then Americans will buy Japanese stereos (because they cost \$80 relative to the \$95 U.S. consumers must pay for the Singaporean stereos). Americans are no longer buying their stereos from the lowest-cost (most efficient) producers. This is known as the trade diversion effect.

Now suppose that the Singaporean stereo components can be imported into Japan for final assembly and then shipped to the United States. These stereos now cost \$75. Since the final product comes from Japan, it is not subject to the tariff on Singaporean stereos. These stereos are cheaper than the purely Japanese-produced stereos, but are more costly to produce than those made completely in Singapore. This process is known as trade rerouting.

Both trade diversion and trade rerouting make international trade less efficient. Nondiscrimination eliminates these possibilities by forcing a member nation to offer the same tariff or quota to all other member nations. In our example, if the United States eliminates the tariff on Japanese stereos, it must do the same for Singaporean stereos. Thus, Americans will import stereos from Singapore, the most efficient stereo producer.

TRADE DISPUTES

Any member nation can dispute another nation's trade policy through the WTO. Without this option many

countries might be less willing to enter trade negotiations since there is no other way to enforce the agreement. The WTO attempts to settle disputes through negotiation. However, if negotiations fail, a panel is appointed to make a preliminary judgment. That judgment is either accepted or rejected by the WTO membership. This process can take upwards of one year. The country losing the dispute then has the option to appeal the decision, which could extend the process by another three months.

Both sides have the right to rebut each other's claims both in writing and through oral arguments. The dispute panel may make use of expert witnesses if either side presents scientific or technical arguments (such as health or environmental concerns over certain imports). According to the WTO, only about one-third of all cases reach the full panel process, indicating that countries prefer to settle their disputes through negotiation when possible.

FREE TRADE AND NONDISCRIMINATION

The WTO does make a few exceptions to its commitment to free trade and the MFN principle. Countries can temporarily raise tariffs above the negotiated maximum when faced with a surge of imports. This provision may make it easier for members to negotiate more ambitious trade liberalization by allowing them to temporarily opt out of the agreement when it becomes politically difficult to maintain. The WTO also allows members to restrict certain imports if they can prove that these imports present a health or environmental risk.

For example, a country can refuse to import beef from a country if there is evidence the cattle supply has been exposed to "mad cow disease." There are many cases where countries abuse this exception by using it as an excuse to protect domestic producers without solid scientific evidence that the imports pose any threat.

The WTO also allows members to enter into free trade agreements (FTA) with other countries. Members of an FTA eliminate all trade barriers amongst themselves, but maintain barriers to trade with respect to other countries. These FTAs go against the nondiscrimination principle; however, the WTO does not dispute them so long as the member countries do not raise their external barriers to trade when forming the FTA. The WTO allows this exception with the expectation that regional trade agreements will lower the overall level of trade barriers and lead to an increase in international trade.

VASILIOS D. KOSTEAS CLEVELAND STATE UNIVERSITY

World Vision International

WORLD VISION International is a Christian relief and development agency, one of the largest of the Christian relief and development international nongovernmental organizations (INGOs). It is currently serving 100 million people on every continent except Antarctica. It has ministries in 96 countries. World Vision's goal is to minister to the material, emotional, spiritual, and social needs of people, and especially to children. It offers its services of relief and development without regard to race or creed. World Vision's emergency relief work seeks to aid people immediately after a disaster such as an earthquake, hurricane, cyclone, or tsunami. It seeks to be at the scene of a natural disaster immediately after the event with food, potable water, medical aid, and other necessities. In contrast, World Vision's development work is longer-term, and seeks to end poverty and injustice.

An American evangelist, Reverend Robert "Bob" Pierce, founded World Vision in 1950. As he saw the death and destruction inflicted upon the Koreans by the Korean War, he was especially moved by the plight of the orphans. To save the lives and the hope for the future of numerous Korean orphans, Pierce developed several new mission strategies. The first was the use of movies about the plight of Korean orphans. Pierce visited numerous American churches in an appeal for money to relieve orphans' needs for food, shelter, clothing, and education.

The second idea he implemented was a program of child sponsorship. A third idea was to hold pastors' conferences in Korea. These visits by pastors were usually transformative and resulted in a growing cadre of ministerial leadership supportive of World Vision's ministry. Later in the 1950s Pierce expanded World Vi-

sion's work to other countries in Asia besides Korea. In the 1960s, the work of development was expanded to Latin America, and in the 1970s to Africa. The continued use of pastors' conferences has enabled World Vision to continue to grow.

In the 1970s, television was used to present the message of World Vision's work. It proved to be a powerful fundraising technique. Originally most of the fund-raising was done in Canada and the United States. In 1978, World Vision International, led by W. Stanley Mooneyham and Ted W. Engstrom, was reorganized into an international partnership. The central coordinating office coordinated and raised funds. The field offices conducted relief and development operations and projects. There is an International Board who coordinates the Partnership Offices. As much as practical, the work is conducted by local groups coordinating with a national office.

World Vision has many development projects that are conducted at the local level. These projects are very practical. One recent project was to provide families with tools and seed for home gardens. A package of carrot seed costs little but can produce 40 pounds of carrots. For a small sum of money a family in a rural village can produce a great quantity of food. Other projects include AIDS prevention and treatment, peacemaking in war-torn communities, trade justice, education, community development, and advocacy for the global poor.

World War I

WORLD WAR I, ALSO known as the First World War and the Great War, was a conflict occurring from

1914 to 1918. It was by far the largest war in history until the advent of World War II.

World War I radically changed the face of Europe. The German, the Austro-Hungarian, the Ottoman, and the Russian Empires along with their four dynasties, whose roots went back to the days of the Crusades, all fell during or after the war. The collapse of the existing world order precipitated deep political, social, and economic changes. The communist revolutions spread throughout Europe and led to the establishment of the first communist state, the Soviet Union, in 1922. From the ravages of absolutist monarchies, several new states emerged or were re-created, including Czechoslovakia, Yugoslavia, and Poland.

The war losses were tremendous. The casualties dwarfed those of previous wars. A conservative estimate is that more than nine million people died and more than 20 million were wounded. Widespread poverty, starvation, and epidemics raised the total in the immediate postwar years by another 20 million people.

TENSIONS AND WAR

The outbreak of World War I emerged as an interplay of the long-term tendencies and impulsive reactions among the imperialistic powers, particularly Great Britain, Germany, France, Russia, and Austria-Hungary.

The struggle for national liberation and emancipation mounted tensions within the multinational yet heavily Germanized Austro-Hungarian Empire. Numerous Slavic populations within the empire were anxious to break from the Austrian and Hungarian domination. The situation was particularly tense in Bosnia and Herzegovina, where the majority of the population was Serb and openly advocated unification with neighboring Serbia.

The legacy of the Franco-Prussian War (1870–71), in which France was humiliated and lost regions of Alsace and Lorraine, left France with a nationalist fervor seeking revenge against Germany. The decline of the Ottoman Empire created the so-called Eastern Question and intensified the rivalry among the Great Powers. Furthermore, rapid industrialization and economic growth, prompted an aggressive colonial expansion of imperial Germany, which intensified friction with France and Great Britain over colonial possessions in Africa. The growing friction among the Great Powers led to an arms race and strengthening hostile alliances known as the Triple Entente and the Triple Alliance.

Despite these complex real origins of the war, the assassination of the Austro-Hungarian Archduke Franz

Ferdinand in Sarajevo has often been cited as the direct trigger for World War I.

The relationship between Serbia and Austria-Hungary deteriorated continuously after the dynastic change in Serbia in 1903. The Tariff War (1906–11) and the Austrian annexation of Bosnia and Herzegovina (1908), and Serbian victories in the Balkan Wars further incited nationalist feelings among millions of Serbs living in Austria-Hungary. Anxious to settle accounts with Serbia, the Austrian "war party" headed by Count Berchtold was poised to use the first opportunity to attack Serbia.

At the same time, Serbian nationalist organizations, and in particular the secret society Unification or Death, continued subversive activity against Austria-Hungary. Supported and encouraged by Unification or Death, a group of young people, mostly Serbs, members of the revolutionary organization Mlada Bosna (Young Bosnia), assassinated Archduke Ferdinand on June 28, 1914, in Sarajevo.

On July 25, Austria-Hungary presented to Serbia an intimidating ultimatum, to which Serbia responded favorably, except that two provisions would violate international law and the Serbian constitution. Austria-Hungary, supported by Germany, rejected the British proposal for mediation and declared war on Serbia on July 28.

A German ultimatum to Russia regarding its mass mobilization on July 31 was ignored, and led to the declaration of war on Russia on August 1. On August 3, Germany declared war on France and sent troops through Belgium and Luxembourg. This gave the British government the pretext and popular support necessary for entry into the war. In the following weeks, Montenegro and Japan joined Great Britain, France, Russia, Serbia, and Belgium; the Ottoman Empire joined Germany and Austria-Hungary; and the war spread out across the continents.

The German military strategy rested on the Schlieffen-Moltke plan, which called for an attack on the weak left flank of the French army by a massive German force approaching through Belgium. Germany, according to this plan, would maintain a defensive posture toward Russia, whose forces would require months to mobilize. The victory in France, according to the plan, would liberate substantial German forces who would meet the Russians on the eastern front.

The beauty of the plan was its simplicity. However, the plan was undermined by a peculiar set of circumstances. In order to minimize the overall risk for the German army, von Moltke adjusted the original von Schliefen plan and weakened the right flank of the German army by reinforcing the rest of the lines. This severely impeded the attacking ability of the bulk of the German forces and eventually led to a standstill after the first battle of the Marne and the first battle of Ypres in autumn 1914.

The Russian offensive in East Prussia and developments on the Serbian front additionally impeded Germany's deep penetration into France and intended capture of Paris. Russia, still unprepared for major operations, attacked German forces in East Prussia in order to alleviate pressure on the western front. The Russian army was decisively defeated at the battles of Tannenbereg and Masurian Lakes. Nevertheless, the costly Russian offensive diverted German forces intended for the western front and helped Allied efforts to quell the initial German onslaught.

Austria-Hungary entered into the war with the expectation of an easy and quick victory over Serbia. On August 12, 1914, Austria-Hungary invaded Serbia with an overwhelming force. The Battle of Cer ensued and the Serbian army forced the Austrians to retreat. Apart from being the first major victory for the Allies, the battle for Serbia confirmed the weakness of the main German ally and proved that Germany would need to fight on multiple fronts.

The period from 1915 to 1918 brought about the Brusilov offensive, the subsequent collapse of the Russian front because of the Bolshevik Revolution, the occupation of Serbia and Montenegro by Austro-German and Bulgarian forces, and Italy, Portugal, and Greece joining the Allies. More than any particular battle or offensive, the main feature of the war was trench warfare, with hundreds of thousands of troops confined to trenches because of the enemies' strong defense lines and fortifications. This was particularly true on the western front, where many of the bloody battles were fought. German attempts to break the deadlock by mounting assaults on Verdun and along the Somme River were met by French defenses and counterattacks and many dead soldiers.

Following the indecisive Battle of Jutland (1916) and Germany's decision to launch unrestricted submarine warfare, the United States entered the war on April 6, 1917. America's vast resources strategically improved the Allied position. Despite the fact that the war continued, the Allies assumed the initiative on all fronts, with the exception of the Russian front, which culminated with the signing of the Brest-Litovsk Peace Agreement between German armed forces and the Bolshevik government.

The last German offensive, known as the second Battle of the Marne, was stopped in August 1918. Combined French, British, and American counterattacks broke the German defense line (so-called Hindenburg Line). At the same time, the revitalized Serbian army and French Expeditionary Corps broke the Austro-Hungarian and Bulgarian defenses. Bulgaria capitulated on September 30, Turkey on October 30, and Austria-Hungary on November 4.

During the first half of October 1918, the German High Command pressured the newly appointed chancellor, Maximilian von Baden, to conclude an armistice with the Allies. However, when it became clear that Allied piercing of the Hindenburg Line was less dramatic than initially perceived, the High Command changed its position. Then the revolution broke out all over Germany and a republic was proclaimed on November 9. The next day the kaiser fled to the Netherlands, which granted him political asylum, and on November 11, an armistice was signed in a railroad car at Compiègne in France.

Paradoxically, the war ended without a decisive Allied victory, and with German troops still occupying substantial territory throughout Europe. That fact became a battle cry for fervent German nationalists who blamed the domestic "traitors, defeatists, and back stabbers" for the outcome of the war.

In many respects, the outbreak, conduct, and epilogue of the World War I set up the fertile ground for another wider and bloodier conflict.

World War II

ALSO KNOWN AS the Second World War, World War II was a worldwide conflict from 1939 until 1945, involving every major power in the world, and is generally considered the largest and deadliest continuous war

in human history. The outbreak of the second global conflict can be attributed to the conditions created by the peace settlements (1919–20) following World War I, the Great Depression (1930s), and the rise of totalitarian, militaristic regimes in Germany, Italy, and Japan (1922–33).

The peacemaking process that opened at the Paris Peace Conference on January 18, 1919, dictated settlements that contained the seeds of the future conflict on a global scale. The Treaty of Versailles was particularly rich in articles that were both offensive to German national honor and unduly oppressive and vindictive. Numerous territorial adjustments and provisions appeared to be more of a German containment and punishment than a genuine attempt to bring a lasting solution to long-standing points of contention among major European powers.

The amount of reparations that Germany was required to pay to the victorious Allies was assessed at 132 billion gold marks, payable in fixed annuities of 2 billion and variable annuities equal to 26 percent of the value of Germany's exports. Germany's inability to service such a heavy reparations burden led to the Franco-Belgian occupation of the Ruhr Valley in January 1923.

The carving up of Austria-Hungary by the peace-makers of Paris created several inter-Allied disputes, among which were bitter disputes between Italy and the Kingdom of Serbs, Croats, and Slovenes (future Yugoslavia) over Dalmatia and the city of Rijeka (Fiume), and wrangling between Poland and Czechoslovakia over the Teschen area.

Japan's annexation of Manchuria in 1931, or the Manchurian Incident, and the inability of the League of Nations to address legitimate Chinese grievances highlighted the impotence of the post- World War I institutions to secure long-lasting peace.

The collapse of the New York stock market in October 1929 marked the beginning of the world economic depression, known as the Great Depression. The depression spread throughout every vital part of the world economy and caused massive unemployment and widespread poverty. In Germany the number of unemployed soared to two million in the winter of 1930, and to six million in 1932.

The democratic institutions of the West, with the exception of the United States, proved unable to solve the puzzle of the deep, prolonged economic depression. Communism in the Soviet Union, Fascism in Italy, aggressive militarism and nationalism in Japan, and National Socialism in Germany established themselves as

working models for fighting economic depression and political volatility. Dictatorships, public works, rearmament, and military conscription appeared to be a viable and preferred alternative to the two decades of dissatisfaction, fruitless political squabbles, economic insecurity, and a meager future.

The interplay of economic downturn and the wide-spread popularity of nationalism was particularly visible in Germany. The National Socialist German (Workers) Party (Nazi Party), an ultranationalist political organization, had only 12 seats in the Reichstag in 1928. In 1930, the party won 107 seats, and 230 in July 1932. In January 1933, following the November 1932 elections in which his party won 196 seats, Adolf Hitler, the leader of the Nazi Party, was appointed German chancellor.

World War II brought about unprecedented losses and suffering to humankind.

His appointment marked the beginning of the new era in German history. In less than six months following his appointment, Hitler effectively disbanded Germany's Communist Party, suspended all constitutional guarantees of individual freedom, suppressed or dissolved all political parties, and thus obtained dictatorial powers.

Rapid rearmament, in clear violation of the Treaty of Versailles, re-created the German army and prepared it for a war of conquest, and in 1936 Hitler remilitarized the Rhineland. Following Italian occupation of Ethiopia (1935–36) and the outbreak of the Spanish Civil War (1936–39), Germany and Japan (1936) concluded the Anti-Comintern Pact in November 1936, primarily aimed against the Communist International and the Soviet Union. Italy joined in 1937, thus forming a bloc known as the Axis powers.

In March 1938, Germany annexed Austria, and in September 1938, Czechoslovakia was forced to cede the Sudeten region to Germany because of the appeasement policy of Great Britain and France. In March 1939, following the secession of Slovakia, German forces occupied Bohemia-Moravia and a German protectorate was proclaimed over the rump Czech territories. Italy seized Albania, which prompted France and Great Britain to abandon their policy of appeasement.

On September 1, 1939, Germany invaded Poland and France and Great Britain responded by declaring war on Germany on September 3. These events are con-

sidered the beginning of World War II, despite the fact that Japan invaded China in July 1937. Overextended Polish forces were quickly overrun by the German armor. The fate of the Polish defense was sealed when the Soviet forces entered Poland from the east on September 17.

The next day the Polish government crossed the Romanian border and went into exile. The failure of Western powers to prevent the German conquest of Poland was followed by a period of inactivity of both German and Allied forces that was called the "Phony War" and lasted until the spring of 1940. The main engagements in that period of time took place at sea and included the Soviet-Finnish War (1939–40).

At the end of the war, millions of refugees were homeless.

In April 1940, Hitler's army attacked and overran Norway and Denmark, and on May 10, the bulk of German forces moved against the Allies in the Netherlands and Belgium. Cunningly avoiding France's impressive chain of fortifications known as the Maginot Line, the Germans advanced with their armor through the wooded Ardennes. Caught by complete surprise, French defenses collapsed in six weeks and an armistice was signed on June 22. However, contrary to Hitler's expectations, the British continued to fight, eventually forcing Germany to fight the war on two fronts.

The sudden collapse of France prompted the Balkan countries to join the Tripartite Pact, which Germany, Italy, and Japan concluded in September 1940. Following the path of its neighbors, Hungary, Romania, Bulgaria, and Yugoslavia finally succumbed to German pressure and joined the pact on March 25, 1941. However, the group of pro-British officers of the Yugoslav army seized the momentum created by the outburst of anti-Axis sentiment and overthrew the Yugoslav government. In order to secure its southern flank, Germany invaded Yugoslavia and Greece on April 6. While the military operations lasted less than a month, the Balkan campaign forced Hitler to postpone the imminent attack on the Soviet Union, a decision that had a lasting effect on the course of the war.

On June 22, Germany attacked the Soviet Union despite the fact that the two countries had signed a non-aggression pact on August 23, 1939. German forces, led by mobile panzer armies, took the Soviets by surprise and destroyed much of their western units, capturing or

killing hundreds of thousands of men. Despite the heavy losses during the summer and fall, Soviet forces, aided by the harsh winter conditions, successfully repulsed the German onslaught and launched a counteroffensive in December.

On December 7, the Japanese Imperial Air Force carried out a surprise air raid on Pearl Harbor, the largest U.S. naval base in the Pacific. Despite the surprise effect and serious damage to the U.S. Pacific Fleet, the Japanese attack did not achieve the desired objective: annihilation of the U.S. fleet in the Pacific. As the U.S. declared the war on Japan, Hitler declared the war on the United States on December 11, hoping that Japan would respond accordingly by attacking the Soviet Union. Japan, however, did not attack the Soviet Union, while the United States joined the fight in Europe, thus forming a power bloc popularly known as the Allies.

In the spring of 1942, the Germans launched an offensive toward the Caucasus to secure oil fields and breach Soviet supply lines that ran along the Don and Volga Rivers. By summer, German armies reached the Volga and commenced the siege of Stalingrad that continued for many months, with vicious urban warfare and high casualties on both sides. Unable to uproot the stubborn Soviet defenses, overexposed German forces became vulnerable to swift Soviet counterattack in December 1942. Completely encircled, outgunned and outmanned, the German forces at Stalingrad surrendered to the Soviet Red Army on February 2. The German defeat at Stalingrad is often cited as the turning point of World War II.

The German offensive in northern Africa also ran out of steam toward the end of 1942. Unable to breach Allied defensive lines around Alexandria, Egypt, in November 1942 the Germans had begun a series of strategic withdrawals that culminated in a mass surrender of the elite Afrika Corps in May 1943. Another turning point was an American victory over the Japanese navy at the Battle of Midway in the Pacific in the beginning of June.

The last two years of the war were marked by a continuous Allied offensive on all fronts. In July 1943, Soviet forces defeated the Germans in the biggest tank battle in history, known as the Battle of Kursk. Following the collapse of the Afrika Corps, the Allies landed in Sicily and in September 1943, Italy capitulated. By early 1944, the Red Army had reached the border of Poland and on June 6, 1944, Allied forces opened the second front against Germany by landing in Normandy, France. German defenses collapsed in the spring of

1945, following the Soviet capture of Berlin. Hitler committed suicide on April 30, and German forces surrendered unconditionally on May 8, 1945.

After the completion of the campaigns in the Solomon Islands (late 1943) and New Guinea (1944), the Allied advance moved closer to Japan, the Philippines, the Mariana Islands, Okinawa, and Iwo Jima. Japan, with most of its navy sunk, unconditionally surrendered on August 15, 1945, after the United States dropped two atomic bombs on Hiroshima (August 6) and Nagasaki (August 9), and the Soviet Union declared war on Japan on August 8. Japan's capitulation marked the end of World War II.

World War II brought about unprecedented losses and suffering to humankind. At least 50 million people died as a result of the war, about 20 million soldiers and 30 million civilians. The Soviet Union suffered by far the largest death toll—about 20 to 28 million Soviets died in total, of which 13 to 20 million were civilians. It is estimated that of the total deaths in World War II, approximately 84 percent were on the Allied side and 16 percent on the Axis side. At the end of the war, millions of refugees were homeless, the European economy had collapsed, and 70 percent of the European industrial infrastructure was destroyed.

The war saw large-scale atrocities committed against civilian populations, including the Holocaust, Nazi-run death camps, and crimes against noncombatants. In addition, bombing raids against nonmilitary targets became the rule rather than the exception during World War II and resulted in the deaths of millions of civilians. The Nuremburg Trials, the Tokyo War Crime Trial, as well as other war crime trials in the Asia-Pacific region, attempted to address these issues.

The Allied leaders made arrangements for postwar Europe at the Yalta Conference in February 1945. Yalta set the foundation of the postwar European partition into Western and Soviet spheres of influence. The countries that came under the Western sphere of influence embraced democracy and joined the North Atlantic Treaty Organization (NATO), while the countries under the Soviet sphere of influence became communist states and joined the Warsaw Pact.

For humanitarian reasons and to stop the potential spread of communism westward, the United States launched a massive aid package to war-devastated European economies. Named after Secretary of State George C. Marshall, the aid package became widely known as the Marshall Plan. Initially the United States offered up

to \$20 billion for relief, but only if the European nations could get together and draw up a rational plan on how they would use the aid. The plan called for close cooperation among Europeans. Aid was also offered to the Soviet Union and its allies in eastern Europe, but Joseph Stalin denounced the program and refused to participate.

By 1953 the United States had provided \$13 billion to western Europe, substantially alleviating poverty, rebuilding war-devastated economies and reintegrating West Germany into the European community. The plan benefited the American economy as well since the money was used to buy goods from the United States, and the goods had to be shipped across the Atlantic on American merchant vessels.

The Marshall Plan led to the Schuman Plan, which in turn led to Euratom, then the Coal and Iron Community and the Common Market, and pointed to what may yet evolve into an economically and politically united Europe under the European Union. Thus the Marshall Plan helped reduce poverty by feeding the starving and sheltering the homeless, and at the same time stopped the spread of communism and put the European economy back on its feet.

The end of World War II brought about a fundamental shift in power from western Europe to the new superpowers, the United States and the Soviet Union, giving rise to yet a new conflict known as the Cold War. In addition to the growing rivalry between the East and West, the end of World War II amplified the unsustainability of the old colonial structure. The liberation of the colonies, however, amplified the magnitude of poverty on a global scale.

WORLD POVERTY

Y-Z

Yemen

IN ANCIENT ROME, the land now known as Yemen was called Arabia Felix. Since that time, the country has had a divisive and rocky history. North Yemen, which became part of the Ottoman Empire, attained independence in 1918. South Yemen achieved independence in 1967 after decades as a British protectorate. South Yemen's turn toward Marxism in 1970 signaled an exodus of hundreds of thousands of Yemenis to the north and increased tensions between the two countries. In 1990, North and South Yemen united as the Republic of Yemen.

The majority of the Yemeni labor force is engaged in agriculture and herding. Since 2000, officials have reported strong growth, in large part because of oil production. Working with the International Monetary Fund (IMF), Yemen has reduced its foreign debts and begun to modernize and streamline its economy, with the result that industry now provides 44.7 percent of the Yemeni Gross Domestic Product, followed by services at 39.7 percent. Plans are also under way to expand the tourist industry. Severe water shortages and excessive population growth present the greatest threats to future prosperity.

At present, however, Yemen is one of the poorest countries in the world, with an annual per capita income of only \$800. Yemen has a poverty rate of 45.2 percent and an unemployment rate of 35 percent. Over 45 percent of the people survive on less than \$2 a day, and 15.7 percent live on less than \$1 a day. Government data indicate that 45 percent of the poor live in rural areas, and 30.8 percent reside in urban areas. One-third of the population is undernourished, and 17.5 percent of the population suffer from severe food shortages. Some 41 percent have inadequate access to education, healthcare, and clothing. Among female-headed families, 13 percent live in poverty, and 7.6 percent live in acute poverty. Resources in Yemen are unevenly divided, with the poorest 20 percent subsisting on 7.4 percent of resources, while the richest 20 percent lay claim to 41.2 percent. Yemen is ranked 33.4 percent on the Gini Index of Human Inequality.

Approximately 31 percent of Yemenis do not have access to safe drinking water, and 63 percent do not have access to proper sanitation. This lack of basic sanitation, coupled with water shortages and low levels of education, has left Yemenis susceptible to the same waterborne diseases that plague much of Africa. Through the efforts of Emory University's Carter Center, founded

by former president Jimmy Carter, programs have been successfully instituted to teach locals how to prevent those diseases. There are only 22 physicians for every 100,000 residents in Yemen, and 20 to 50 percent of the people lack access to affordable essential drugs. Healthcare is over three times as accessible in urban areas as in rural areas. Yemen has made considerable progress on a number of social indicators. Life expectancy for males increased from 47 years in 1980 to 59.89 years in 2005. The projected life span for females rose from 50 to 57 years during the same period. The median age in Yemen is 16.54 years. Among the population of 20,727,063, 46.5 percent are under the age of 14, and only 2.7 percent have reached the age of 65.

Childhood mortality rates have declined dramatically over the last decades. Between 1970 and 2003, infant mortality dropped from 194 deaths per 1,000 live births to 58 per 1,000. During that same period, mortality rates for children under 5 plunged from 303 per 1,000 to 113 per 1,000. While these changes are dramatic, childhood mortality rates remain unacceptably high.

Nearly half of all children under the age of 5 are malnourished, and 26 percent of all babies are underweight at birth. Over half of all children under the age of 5 are moderately to severely stunted and 12 percent are moderately to severely wasted. The rate of child-hood immunizations is dismally low, ranging from 65 to 74 percent among children from birth to 23 months old. Only 69 percent of infants and 66 percent of tod-dlers have been vaccinated against polio, even though cases of polio have been reported in Yemen in recent years.

At a rate of 6.67 children per woman, fertility is much higher than the social and economic structures can support. Teenage pregnancy is also excessive at 95 per 1,000 births. However, fertility rates have steadily decreased since the 1970s, when women produced an average of 8.4 children each. Less than a quarter of Yemeni women use birth control of any sort, but that number has more than doubled since the 1990s. Family and friends provide the only assistance in half of Yemeni births, and less than a quarter of Yemeni births occur in the presence of trained medical staff. Current data suggest that declines in maternal mortality have resulted in a maternal mortality rate of 366 deaths per 100,000 live births.

Barely half the population over the age of 15 can read and write; however, illiteracy has been greatly reduced in the last decades. From 1980 to 2005, male illiteracy fell from 61.8 to 29.5 percent. Although the

decrease in female illiteracy has been less dramatic, it has been more significant. In 1980, approximately five percent of Yemeni women were literate. By 2005, one-third of Yemeni females could read and write. Most Yemeni children attend school for eight years. In 2000, primary school completion data revealed that 91 percent of males completed primary school but only 37 percent of females did so.

Human Development Index Rank: 151 Human Poverty Index Rank: 77

ELIZABETH PURDY, PH.D. INDEPENDENT SCHOLAR

YMCA and YWCA

THE YOUNG MEN'S Christian Association (YMCA) and the Young Women's Christian Association (YWCA) are both nondenominational community service organizations. They were formed separately in the 19th century to minister to the needs of young men and women in the urban conditions created by the Industrial Revolution. Despite strong similarities, neither the YMCA nor the YWCA has ever been related to the other.

The YMCA movement began in London in 1844 when George Williams gathered together a dozen young men to create a club that would provide a wholesome alternative to London's slums, saloons, and brothels. When Williams, a young draper, came to work in London, he was horrified by the living conditions that many were compelled to endure. His club began providing assistance to members in locating good lodging, and club meeting rooms where Christian companions could find appropriate reading materials, join Bible classes, and engage in service opportunities. The movement Williams founded spread quickly in England and be-

yond. The first YMCA in Australia was founded in 1850 and the first in Montreal in 1851. Also in 1851 the first YMCA in the United States was founded in Boston. During the Civil War the YMCA began its service to military personnel. This service in war relief has been continued ever since. Evangelical preachers and workers like Dwight L. Moody and John Mott dominated the movement in the United States in the late 19th and early 20th centuries.

As the YMCAs spread they adapted themselves to the needs of the young men they were serving. From almost the beginning, exercise programs became a major part of the services provided by YMCAs. In 1856 the first swimming pool was opened in New York City. The YMCA also began to develop its own schools, colleges, and education programs, such as night school.

In 1891 James Naismith was a physical education teacher at the School for Christian Workers, which had been formed at the Amory Hill YMCA in Springfield, Massachusetts. Now called Springfield College, it became a historic site when Naismith invented basketball as an indoor winter exercise. In 1895 W.G. Morgan, the physical education director at the Mount Holyoke, Massachusetts, YMCA, invented volleyball. Morgan offered it as a less strenuous alternative to basketball that would benefit older businessmen. The YMCA was also instrumental in aiding the formation of other volunteer service groups. The Boy Scouts, Camp Fire, Toastmasters International, Gideons International, United Service Organization (USO), and other groups were all originally formed with the encouragement and assistance of YMCA workers.

The YMCAs are organized as a confederation. The national YMCA, the YMCA of the United States, is headquartered in Chicago. It is the national resource center for the local YMCAs. Each local "Y" is autonomous, but adheres to the national constitution and pays annual dues as part of its support of the mission of all YMCAs. The staff of the local Ys makes the decisions for local organizations and operations.

Today the YMCA is a Christian ecumenical organization that has spread to over 120 countries. The World Alliance of YMCAs is an international organization of YMCAs. It has its headquarters in Geneva, Switzerland. Together all the YMCAs around the world serve 45 million people. In the United States the 2,500 YMCAs serve 19 million people. All YMCAs work for social justice for all peoples.

The services of the YMCA are open to all ages, races, religions, and incomes. The goals of the YMCA movement are based on Judeo-Christian values and

seek to promote health, to strengthen the modern family, to develop leadership qualities in youth, to increase international understanding, and to aid community development. The movement seeks to share the Christian ideal of a human community of justice with love, peace, and reconciliation. Around the world the YMCA has numerous projects for meeting the needs of the poor, whether it is making small loans in Bangladesh, opposing drugs and alcohol, or promoting education to end poverty. Many of its programs in poor countries aim to create sustainable communities.

The YWCA movement began in London in 1855. Emma Robarts organized a young women's association to find housing for the nurses who were returning from the Crimean War (1853–56). In another part of London another group of women were organizing prayer circles. The two groups joined together in 1876 to form the Young Women's Christian Association. The first YWCA in the United States was organized in Boston in 1866. In 1870 the first YWCA in Canada was organized at Saint John, New Brunswick. In 1873 the first college YWCA was opened on the campus of Illinois State Normal University in Normal, Illinois.

The YWCA has been very active with many programs. Youth programs have included the Y-Teens. Other programs have included childcare centers, classes on various subjects, leadership training, counseling, job placement services, recreational programs, and residential facilities.

The YWCA now is in 110 countries and serves about 25 million people. In poorer countries many of its programs are aimed at education to reduce poverty. In 1906 the several groups joined together as the Young Women's Christian Association of the United States. YWCA USA is headquartered in Washington, D.C. The World Young Women's Christian Association has its headquarters in Geneva, Switzerland.

Zambia

LOCATED IN southern Africa, the Republic of Zambia is one of the poorest nations in the world, with a poverty rate of 86 percent and an unemployment rate of 50 percent. The average annual per capita income is \$320, and poverty is particularly prevalent in rural areas and among women. Approximately 87.4 percent of Zambians live on less than \$2 a day, and 63.7 percent live on less than \$1 a day. Income is unevenly distributed, and the poorest 20 percent of Zambians possess only 3.3 percent of income, as compared to 56.6 percent for the richest 20 percent.

Half of Zambia's population is malnourished, and the status of nutrition and health has decreased markedly since the 1980s because of poverty, food insecurity, a poor economy, droughts, and low expenditures on basic services. Around 2.3 million people have needed emergency food in recent years. Some 61 percent of all female-headed households experience food shortages, which last longer than those in male-headed households.

In response to the widespread poverty, the Zambian government has instituted the Public Welfare Assistance Scheme to provide health and education benefits to needy families, and food packages are distributed under an anti-malnutrition program. The Zambian population has been compared to those in war-torn countries, and human rights groups have accused the government of failing to follow through on antipoverty initiatives.

Formerly known as Northern Rhodesia, Zambia has had a troubled political history of corruption and mismanagement. Economically, 85 percent of Zambians are involved in subsistence agriculture, and crops are threatened by periodic droughts. In response to efforts by the Carter Center of Emory University, maize production is currently on the upswing, and agricultural prospects are somewhat brighter. Copper mining, which has proved to be a major resource for Zambia in

the past, has improved since privatization was instituted. Zambia's other natural resources include cobalt, zinc, lead, coal, emeralds, gold, silver, uranium, and hydropower, but all of the assets need to be developed.

Life expectancy in Zambia is low, with a projected life span of 39.7 years. The median age is 16.46 years. Almost half of the population is under the age of 14, and only 2.4 percent of Zambians reach the age of 65. The 16.5 percent prevalence rate for HIV/AIDS is a major reason for low life expectancy. In 2005, it was estimated that 920,000 people were living with this disease, which had already caused 89,000 deaths. Because 36 percent of the population lack access to safe water and 22 percent lack access to proper sanitation, Zambians are at very high risk for developing food- and waterborne diseases that are common in Africa. Malaria and plague are not unusual in some areas of the country. There are only seven physicians for every 100,000 residents, and 21 to 50 percent of the population cannot afford essential drugs.

Childhood mortality is high in Zambia. Between 1970 and 2005, infant mortality decreased from 109 to 88.29 deaths out of every 1,000 live births. During that same period, the mortality rate of children under the age of 5 remained stable, with more than 180 deaths per 1,000. Some 28 percent of all Zambian children under the age of 5 are malnourished, and seven percent are severely underweight. Approximately 47 percent of under-5s suffer from moderate to severe stunting, and five percent experience moderate to severe wasting. Rates of infant immunizations have been uneven over the past decade, with DPT immunizations increasing from 71 to 78 percent and measles vaccinations rising from 68 to 85 percent. At the same time, infant polio immunizations dropped from 88 to 79 percent and infant tuberculosis vaccinations declined from 100 to 92 percent.

In 2003, 84 percent of children between the ages of 12 and 23 months were immunized against measles, and 80 percent were vaccinated against DPT3.

Zambia's fertility rate is high at 5.47 children per woman. However, rates have declined steadily since 1980, when a 7-children-per-woman fertility rate was reported. Adolescent fertility is estimated at 156 out of 1,000 births. Just over one-third of Zambian women use contraception to prevent pregnancy, and that number has more than doubled since 1990. Some 43 percent of all births take place in hospitals or clinics, and antenatal care has become widely available. Nevertheless, maternal mortality is excessively high in Zambia, with an estimated rate of 750 deaths per 100,000 live births. These

deaths occur for many reasons, which include age, repeated pregnancies, disease, poor health, home deliveries, and a general lack of knowledge about the proper care of pregnant women.

Literacy rates are relatively high in Zambia. Approximately 86.8 percent of males over the age of 15 can read and write, as can 74.8 percent of all females in this group. On the average, Zambian children attend school for at least seven years; however, poverty and disease have affected school attendance and completion rates. Between 1990 and 2003, completion rates for primary school decreased from 90 to 63 percent for males and from 75 to 54 percent for females. A recent study conducted by UNICEF, the United Nations' organization for children, revealed that orphaned girls are more likely than other girls to be withdrawn from school, and the number of orphans is growing because of HIV/AIDS.

ELIZABETH PURDY, Ph.D. INDEPENDENT SCHOLAR

Zimbabwe

FORMERLY KNOWN AS Southern Rhodesia, the sub-Saharan nation of Zimbabwe is currently experiencing 70 percent poverty and high unemployment rates. Throughout the 1990s, as unemployment rates increased, so did incidences of extreme poverty, particularly among women. Approximately 64.2 percent of the population live on less than \$2 a day, and 36 percent

subsist on less than \$1 per day. Almost 40 percent of the population are malnourished. Income is unevenly distributed in Zimbabwe. The poorest 20 percent possess only 1.8 percent of available resources, while the richest 20 percent claim 55.7 percent. Zimbabwe is ranked 56.8 on the Gini Index of Human Inequality.

Approximately 64.2 percent of the population live on less than \$2 a day.

Zimbabwe experienced a period of white power in the 1960s that was ended only by United Nations sanctions and a guerrilla uprising. Since 1987, Zimbabwe has had only one president. After President Robert Mugabe initiated a widespread land distribution scheme in 2000, the country was plunged into chaos, experiencing a crippled economy, food and commodities shortages, and an exodus of white farmers. Zimbabwe's current economic woes are partially derived from its involvement in the war in the Democratic Republic of the Congo from 1998 to 2002. The International Monetary Fund (IMF) has suspended aid to Zimbabwe because the government has failed to meet the required budgetary goals.

The Mugabe government has been accused of using brutal repression to stamp out opposition to its policies. In the spring of 2005, in an alleged effort to subdue political unrest and opposition to its policies, the Zimbabwean government "detained" some 30,000 urban residents. The so-called scorched-earth policy led to the burning of homes and street kiosks and mass evictions from shantytowns and other temporary dwellings. Human rights advocates believe that Mugabe is determined to relocate 1.5 million of Zimbabwe's poorest residents to rural areas, where they pose fewer threats to his power.

Some 66 percent of the Zimbabwean population are engaged in subsistence farming, and periodic droughts and the exodus of white farmers have damaged the agricultural sector and curtailed income traditionally derived from the export of agricultural products. Some 400,000 jobs have been lost as a result. Zimbabwe's abundance of natural resources, which include coal, chromium ore, asbestos, gold, nickel, copper, iron ore, and platinum metals, is insufficiently developed to support the floundering economy. Health as well as economic security has been threatened by poor mining practices that have led to toxic waste and heavy metal pollution.

Life expectancy in Zimbabwe is 36.67 years, with a median age of 19.26 years. Nearly 40 percent of the people are under the age of 14, and 3.7 percent have reached the age of 65. Almost three-quarters of Zimbabweans will never see a 40th birthday. Roughly onequarter of the Zimbabwean population has HIV/AIDS, which means that close to two million people are living with the disease. The World Health Organization (WHO) estimates that 2,600 adults and 690 children in Zimbabwe died each week during 2003, bringing the total of HIV/AIDS victims to 73,000. Approximately 800,000 Zimbabwean children have been orphaned by this epidemic. Zimbabweans are also at high risk of developing food- and waterborne diseases that are common to the area. Some 17 percent are without access to safe water, and 38 percent lack access to proper sanitation. Malaria is also a major cause of death. Zimbabwe's healthcare system, which was once considered a model for the region, has essentially collapsed. Zimbabwe has only six physicians per 100,000 residents, and 20 to 80 percent of the people are unable to afford essential drugs.

In recent years, Zimbabwe has experienced the world's fastest increase in child mortality. Between 1990 and 2003, the number of deaths for children under the age of 5 increased from 80 to 123 deaths per 1,000, an increase of more than 50 percent. Before poverty increased and health services declined, childhood mortality was steadily declining. In 2003, infant mortality was estimated at 67.69 deaths per 1,000 live births. Approximately 13 percent of children under 5 are malnourished and two percent are severely underweight. Some 27 percent of under-5s experience moderate to severe stunting, and six percent suffer from moderate to severe wasting.

As part of a general lack of healthcare, childhood immunizations have declined in Zimbabwe. According to reports in 2002, 80 percent of infants received immunizations against tuberculosis; 58 percent were inoculated against measles and DPT; and 74 percent were immunized against polio. In 2003, 80 percent of Zimbabwean children between the ages of 12 and 23 months were immunized against measles and DPT3. Half of Zimbabwean children do not receive essential oral rehydration therapy when they are ill.

The fertility rate of Zimbabwean women is 3.54 children per woman, and adolescent fertility is estimated at 81 per 1,000. This number has declined significantly since the 6.4 children per woman recorded in 1980. More than half of women of childbearing age use

contraceptives to prevent pregnancy. Professional medical staff attend 72.5 percent of all births. While only 69 percent of births take place in hospitals or clinics, antenatal care is technically available to 93 percent of Zimbabwean women. In reality, some 42 percent of all women in rural areas find healthcare inaccessible. Zimbabwean maternal mortality continues to be excessively high at 1,100 deaths per 100,000 live births.

Literacy is relatively high in Zimbabwe. Between 1980 and 2003, male literacy rates rose from 77.9 to 94.2 percent and female literacy increased from 62.6 to 87.2 percent. Most Zimbabweans attend school for at least nine years; however, completion rates have declined in recent years. A study conducted by UNICEF, the United Nations' organization for children, revealed that orphaned girls are more likely than other girls to contract AIDS, and the high prevalence of HIV/AIDS in Zimbabwe has led to higher absence and dropout rates among this group. From 1990 to 2002, primary school completion rates for males decreased from 100 to 81 percent and from 94 to 78 percent for females. Approximately half the children in primary school are receiving some sort of welfare assistance to help defray educational costs.

WORLD POVERTY

Glossary

absolute poverty: Objective measurement of poverty level, including diet and health factors, income, and education level.

accumulation: Gathering or amassing of currency and goods in large amounts over a significant period of time.

African Development Bank: Established in Abidjan, Côte d'Ivoire, in 1964, the ADB borrows funds from the international money market in order to provide assistance to member countries for economic development.

Aid to Families with Dependant Children (AFDC): American federal program that entitles funding to single mothers so that they may stay home with young children. Replaced in 1996 by Temporary Assistance for Needy Families (TANF) in response to calls to drastically decrease welfare roles.

almshouse: Shelters and houses maintained by private organizations in order to assist the poor. A function of 18th century British philanthropy that was brought over in limited amounts to the United States.

allocation: Process of distributing resources for production and distributing goods and services for consumption by the public. Allocation is a significant problem in the developing world, when non-governmental organizations have difficulty providing aid through authoritarian governments or ineffective bureaucracies.

area deprivation: Also known as neighborhood socioe-conomic deprivation, extreme poverty and ill health in an area such as a neighborhood in a city or a village in more rural areas. Common in some areas of the developed world as well as large areas of the developing world.

Asian Development Bank: Established in Manila, Philippines, in 1966. The bank was established to work against rising poverty levels in Asian nations and the Pacific Rim by providing public development funds for infra structural needs.

balance of payments: The difference between funds received and payments by country. This balance includes merchandise and service exchange, transfer, gift payments.

balanced budget: Equality of revenue and expenditure in governmental budgets. In many countries, there is a wide gulf between the ability of local, state, and federal governments to balance annual budgets.

bankruptcy: Declaration initiated either by debtors (voluntary) or creditors (involuntary) when a consumer, corporation, or other economic entity has more liabilities than assets and is incapable of paying bills.

barrier to entry: Governmental, economic, or technological restrictions on a business entering a particular market or industry. These barriers include intellectual property and other legal restrictions and prohibitive start up costs.

barter economy: Economy based on exchange of goods and services by trade rather than by currency. Such economies have decreased significantly with the emergence of a more complex currency drive market, though barter economies still exist in the developing world and in times of lacking consumer confidence.

bilateral aid: Economic aid provided from one country, via appropriate agency, to another country.

black market: An illegal business or the act of selling goods and exchanging currency in violation of laws protecting price and supply levels.

capitalism: Economic structure with characteristics such as a relatively free marketplace, private ownership of most goods and services within political boundaries, and the ability to purchase goods and services with relative ease.

central planning: Planning of production and allocation by government agencies in lieu of competitive markets or free exchange of goods. Central planning is commonly found in communist nations.

charity: Institution that is established to distribute aid to the poor and needy or the act of individual assistance to the poor and needy.

child mortality: The rate of children per 1,000 that die between birth and age five, typically one measure of economic prosperity or demise.

Children's Defense Fund: Organization that works to increase minimum wage and create better jobs and ben-

efits, especially educational and child care benefits, for workers with children.

Church World Services (CWS): Relief division of the National Council of Churches that provides emergency and relief aid to developing nations.

colonialism: Policy that a nation maintains or extends its control over foreign dependencies, typically divided into colonies used primarily for natural resources and colonies used primarily for political gain.

communism: Economy with foundation in common ownership, disappearance of government and needs based allocation to the public. Based on the works of Karl Marx, though it is mostly theory and has rarely been emulated as laid out by Marx.

competition: Economic actions between two or more individuals or companies in pursuit of higher profits and greater market shares. The less competition that exists within a market, the more control over the market for those few competitors that exist.

conditionality: Trade agreements between borrowing nations and international lending agencies that require conditions such as lower tariffs and price controls or changes to general trade policy.

Consumer Price Index: Index of prices on goods and services common to many consumers within a nation, typically characterized by a hypothetical "basket of goods." Wide recognition in the United States as an indication of inflation and allows public a real indicator of the strength of an economy.

consumption: Satisfaction of consumer wants and needs by goods and services. Consumption is seen as part of gross domestic product and as a measure of demand.

Cost of Living: Income and funds needed to achieve certain standard of living based on measures of poverty, the middle class, and the upper class. This measure is tied to inflation and the purchasing power of consumers.

country-owned: Policies to improve domestic and international trade that are created and implemented by developing governments and not by outside governments or agencies.

credit: Promise between consumers and creditors in which consumers receive goods and services in exchange for future payments plus interest. Credit is integral to the modern economy, given the need of businesses to purchase assets and build a customer base in the short term to stay viable.

currency: Paper bills or metal coins issued by national government to act as medium for exchange of goods and services between consumers and businesses.

culture of poverty: Culture created among the poor which is characterized by feelings of inferiority, marginalization, and a sense that no amount of work or effort will improve the status of the individual beyond poverty.

cyclical poverty: Poverty based on decline in macroeconomic indicators which improve and worsen on a regular basis. This cycle occurs when a recession occurs, bringing down demand, wages, and increasing unemployment.

Darwinism: Theory of biological evolution promoted by naturalist Charles Darwin, which states that all living beings arise through a selection of particularly favorable traits to natural and man-made environments. This is known in short as survival of the fittest and it was a popular notion (social Darwinism) in the late 19th and early 20th century in colonial empires.

debtor nation: Nation whose exports are less than imports and whom owe more to foreign governments than receive in trade from partners. Many of the world's debtor nations reside within the developing world, though the trend toward easy credit and poor savings has added some developed countries to the ranks.

debt relief: Relief of debts by creditor nations, either in part or in full, by decreasing interest on loans or the easing of preconditions on repayment of a loan.

debt service: Total payments, on both interest and principal totals, made by a country annually. A major issue for developing nations because interest alone typically expends any funds incoming from foreign trade sources.

deflation: Extended decline in the average level of prices. This condition is more likely in a stagnate market, but usually only in depressed economies.

demand: The motivation and capability to purchase a range of goods along a wide spectrum of prices.

demographics: Characteristics of human populations and population segments especially when used to study and analyze consumer markets.

dependency: territory under the jurisdiction of a state of which it does not form an integral part.

depreciation: Long term to permanent decrease in the value of a good, typically real estate and higher priced consumer goods. Depreciation based on the production cost, because of the need to replace depreciated goods with available capital.

deprivation: The state of extreme poverty including the removal or abstention of physical necessities (food) and social relationships (family).

deprivation index: Analytical tool composed of social and economic indicators to determine the significance of deprivation in the indexed area.

deserving poor: The distinction by government of those in poverty who are deserving of aid, due to many different educational, health, or social considerations.

destitution: Also known as complete poverty, an extreme want of resources or means of subsistence.

developed country: A nation considered wealthy because of industrial infrastructure, educational value, low child mortality, and high gross domestic product. Developed nations have been active in the last 50 years in the modernization of developing nations.

developing country: A nation considered poor because they lack sufficient industrial infrastructure, have high child mortality and poor health care. Developing nations are typically nations with young democratic governments or histories of authoritarian governments.

development economics: Subfield of economic study that attempts to determine how developing economies evolve into developed economies.

Development Gateway Foundation (DGF): Established in 2001, DGF is a collection of 100 plus public and private organizations worldwide that use information and emerging communication technologies to alleviate

poverty in the developing world and promote sustainable development.

disability insurance: Insurance managed by government or employers and paid into by workers for short term or long term debilitation, typically in the commission of a job task.

disequilibrium: The imbalance between supply (surplus) and demand (shortage) which requires market forces to change methods in order to reach equilibrium.

duopoly: Theoretical market condition in which two corporations dominate a particular industry with little to no competition. One noticeable example of a duopoly is in aeronautics, with Airbus and Boeing competing largely for the market share in Europe and North America.

economic growth: An increase in per capita income and production on a consistent basis that contributes to poverty reduction. Factors that prevent economic growth from eliminating poverty include imbalanced budget priorities and an uneven distribution of money to the upper class.

economic inequality: Disproportionate income attainment or asset ownership between one group of people and other groups of people in a particular market.

economic insecurity: Individual or familial economic precariousness due to economic downturn, temporary or underemployment, and poor health, among other considerations.

economic insufficiency: Economic states for individuals or families in which working members are underemployed or incapable of fulfilling basic needs with wages earned or have opportunity for economic advancement.

economics of scale: An average cost decrease when business increase market entry points and increase production. This happens within the realm of small business in transition into medium to large-size businesses.

economics of scope: Production process by which two or more products can be created from one resource. This allows businesses to market and sell more products but can also cost companies in quality by decreasing focus on popular products, as well as public favor when unusable waste materials are produced.

educational vouchers: Government aid given to lower income families with the intention of sending children to private schools, typically with smaller class sizes and better resources, in order to gain a better education than in public schools.

efficiency: The attainment of the highest level of fulfillment in consumer desires and needs with the least amount of resources used.

elasticity: Relative change in one economic variable to another variable. This includes price elasticity of demand applied to the percentage change in the price of products.

employment rate: Ratio of employed individuals in a nation to the entire population of that nation which is over 16 and not institutionalized.

employment: An economic state in which people and resources are activated for production in exchange for wages and other incentives.

endemic poverty: Poverty that is prevalent in or peculiar to a particular region or people.

entitlement: A government program that guarantees and provides benefit to a particular group or for certain economic and social preconditions.

equity: A term referring to relative fairness in income and ownership.

exploitation: An economic state in which business owners and leaders are seen "taking advantage" of employees by withholding proper wages and remuneration.

externalities: The costs left out of the price of goods in the marketplace because of their absence in the supply and demand pricing process. One external benefit in the marketplace is education, which is implied in the quality of goods and services provided by a company. One external cost to consumers is pollution, which is not included in the price paid by consumers of a good.

extreme poverty: Level of poverty where individuals are unable to afford the necessities of living, including food, shelter, and medicine.

faith-based antipoverty programs: Programs established by churches and religious groups to remedy the symptoms of poverty while attempting to effect larger social change through religious practice.

famine: Drastic, widespread food shortage, typical to developing nations and accompanied by malnutrition, disease, and economic difficulties.

feminization of poverty: The increase in the poverty rate among single women and single mothers because of underemployment, lack of education, and poor social welfare systems.

feudalism: Political and economic system popular in 9th to 15th century Europe based on the relationship of lords, whom own land and employed vassals. Vassals worked the land, engaged in military service, and paid homage to the lord in order to have a piece of land for themselves and a home.

fiat money: The medium of exchange useful in trade but with no material value. This term includes currency and checking accounts, which are based on the acceptance of fiat money by everyone in the marketplace and the confidence of its worth in trade.

food stamps: Government program that provides food credit to lower income families in order to ensure sufficient nourishment.

foreign direct investment: Investment in foreign companies to gain greater control over the marketplace, as well as construction of buildings and factories for domestic businesses on foreign soil.

foreign exchange market: Virtual market which is managed by various financial institutions that deals with global exchange in currency and stocks.

foreign exchange rate: The price of one nation's currency when compared to another nation's currency, measured by the amount of currency traded compared to a unit of another currency.

fraud: Deception deliberately practiced in order to secure unfair or unlawful gain in a market while harming another party physically or economically.

free market: Economic market that is competitive because of relatively unrestrained trade, with long term equilibrium ideally achieved by the macroeconomic forces of supply and demand. The downfalls of the free

market come with decreased competition, devalued currency, and the involvement of external markets with different market limitations.

free trade: The unhindered trade of goods and services worldwide. Free trade provides lower prices to consumers through lowered tariffs, but can also lead to lower quality of goods, labor issues, and environmental concerns in the various marketplaces worldwide.

Free Trade Area of the Americas: Created in December 1994 during the Summit of the Americas, a single economic area in North and South America where barriers to trade are decreased with the goal of free trade in the near future.

G-8: Eight leading developed nations that meet on a regular basis to deal with economic issues. Members of the G-8 are Canada, France, Germany, Great Britain, Italy, Japan, Russia, and the United States.

gender discrimination: Determinate by a person or people in power of one gender to withhold economic or social opportunities to another gender. Most conspicuous in employment, but present throughout developed and developing societies.

gender equality: Standards set by nations and international organizations to ensure equal rights and opportunities in education, the workforce, and the law for both men and women.

gender gap: Measure of the difference between male and female achievement in areas such as income and education.

Gini Coefficient: Simple measure of income distribution, whereby the higher income is on a given range (between 0 and 1) equals a higher inequality in income distribution in the measured area.

global commons: An idea born in the development of environmental law that considers all environs (such as the atmosphere and oceans) as part of global well being. The most recent and controversial global commons argument is over the Kyoto Protocol, which would decrease global air emissions but to some would damage industry and the economy.

globalization: Long term international development involving decreasing barriers to trade, increased global

communications, and increased involvement of developed countries into the affairs of the developing world.

gold standard: The use of gold in determining the value of currency. This standard is either used directly, by the use of gold coins as currency, or indirectly, by the assurance that fiat money is backed by a stable amount of gold in a national reserve.

Great Society programs: Social programs created between 1965 and 1968 by President Lyndon Johnson in order to improve American culture and education. Programs included in the Great Society programs include Head Start, work-study programs for college, the National Endowment for the Arts, and the Corporation for Public Broadcasting.

Gross Domestic Product (GDP): Popular measure of economic progress, encompassing all goods and services produced for export, private and public sector, and capital goods minus imported products. Also can be divided by population to determine the productivity of an average person within a nation (called gross domestic product per capita).

Head Start: Federal preschool program for kids from lower income families, created during the Great Society.

hierarchy of needs: Psychologist Abraham Maslow's theory that people satisfy basic physical needs before fulfilling more complex psychological needs and social obligations. An explanation for the progress or regress of nations and societies, typically because of the prevailing political system and resource management.

homelessness: The state or condition of having no home or shelter, typically leaving an individual to live on the streets or in other public places.

Human Development Index: Measure of individual well being, combining economic and social factors such as income and life expectancy, updated yearly by the United Nations Development Program.

Human Poverty Index: Measure of individual poverty based on educational, environmental, and health factors contributing to deprivation. This index is updated yearly by United Nations Development Program.

hunger: Condition common among those in poverty where individuals are unable to afford sufficient food to

fulfill basic nutrient needs. It is widespread among a majority of people in the developing world and the lower classes of developed countries.

immigration: The movement of people from one country to another, whether individually or in groups. The positives of immigration is a more diverse society, more competition for employment, and the decreased cost of production from the fulfillment of most production needs. The negatives of immigration have included increased taxes for social services, housing issues, and language barriers.

imperialism: Policy of extending a nation's authority by acquisition of new territories or holding economic and political hegemony over other nations. One example of imperialism would be the maintenance of French hegemony over former French colonies in Africa.

incentives: Benefit that motivates consumers or corporations to participate in economic or social activities. For example, price incentives influence the motivation to purchase goods or services, with higher prices decreasing the likelihood of a purchase and vice versa.

indentured servitude: Service by one person to another person or family for a prolonged period of time in exchange for food, money, shelter and/or land.

indigence: State of extreme poverty and neediness.

industrialization: The development of industry and infrastructure on an extensive scale for long term economic development.

inelasticity: An economic relationship in which major changes in one economic variable have minimal effects upon one or more other variables.

infant mortality rate: The rate of death among infants from birth to age one, measured in amount per one thousand births.

inflation: Consistent increase in the average price levels of goods and services in the economy, which is a common phenomenon in the global economy.

infrastructure: Capital used to improve telecommunications, electrical services and other structures needed to advance businesses, industries, and governments toward efficient production of goods and services.

insolvency: Economic condition where liabilities exceed assets over a sustained period of time, typically leading to the declaration of bankruptcy.

interdependence: Psychological principle of macroeconomics where one company's decisions are influenced by or influence the decisions of other businesses.

InterAmerican Development Bank: Created in 1959 to aid in the regional development of the Bank's 46 Latin American and Caribbean nations. This aid comes in the form of development loans to businesses and governments along with technical assistance.

International Monetary Fund (IMF): Created in 1944 as a counterpart to the World Bank, the IMF offers short term loans to developing nations in order to stabilize currency and fledgling banking systems.

international poverty line: Income level at which a person in any area of the world is incapable of acquiring basic necessities, such as food and clothing.

Islamic Development Bank: Headquartered in Saudi Arabia, the IDB has 54 member countries worldwide, defined typically as nations with Muslim governments or large Muslim populations. The Bank participates in equity capital grants and loans for businesses and enterprises to its members.

Jubilee 2000: Also known as Drop the Debt, this 1990s campaign sought to relieve developing nations most harmed by debt.

Keynesian economics: Based on the book *The General Theory of Employment, Interest, and Money* by economist John Maynard Keyes, this economic outlook determines that aggregate demand is the culprit for most economic problems. As opposed to the supply side economics of the 1980s, Keynesian economics seeks to provide the bulk of services and economic prosperity to the lower and middle income in a nation in order to stimulate higher demand for goods. Popular in the Roosevelt administration and credited for fixing the problems of the Great Depression.

Laffer curve: Created by economist Arthur Laffer, a justification for the supply side economics of the 1980s. It states that at zero percent and 100 percent of tax rate, there is no revenue taken in by the government because at maximum taxation there is no motivation to work.

This curve also shows that with decreased taxation, there is the possibility for greater revenues to be produced for the government.

Laissez-Faire: The theory that markets on their own can achieve efficient allocation of resources. This is in opposition to the idea of central planning and governmental paternalism and is becoming more popular in the modern form of free trade agreements and globalization.

Least Developed Countries (LDC): A group of 49 developing nations that meet certain criteria for low economic output, poor infrastructure, and ineffective government. A majority of LDC are African nations.

liberation theology: A response to structural conditions of poverty which includes breaking down social, economic, and political barriers and promoting a life satisfied by sufficient resources and the ability to practice religion, speech, and other liberties. Practiced extensively in Latin America and other developing areas.

Low-Income Cut-Offs (LICOs): Social indicator that measures relative income distribution. Measured by taking the percentage of income spent on necessities (preestablished by studying agency), which gives the relative place of an individual in the economy.

lumpenproletariat: Lowest, most degraded level of the working class (proletariat). Referenced by Karl Marx in his works, the lumpenproletariat typically included the unemployed, the criminal, and the mentally ill.

macroeconomics: The branch of economic study that analyzes the entire economy and its large components, including production, inflation, and general business cycles.

malnutrition: Health condition brought on by inadequate consumption of protein, calories, and vital nutrients. Experienced by many in the developing world due to inadequate aid or poor distribution of resources.

market adjustment: The study of market equilibrium caused by supply and demand determinants.

market efficiency: The idea that market competition automatically adjusts for efficient distribution of resources by equating demand and supply levels with price and quantity levels.

market failure: The inefficient allocation of resources resulting in consumer dissatisfaction, whether by externalities, imperfect information to consumers, or other causes.

mass production: The production of large amounts of identical goods by the use of large scale machinery and production methods. A consequence of the Industrial Revolution resulting in mass goods by mass means.

maternal mortality: Rate of mortality for pregnant women or women during childbirth compared to the total number of births per year. One indicator of the strength of a nation's health care system and general quality of life.

means testing: Determination of the needs of people in need of government aid programs, such as education vouchers, food stamps, and financial aid for college.

Medicaid: Program initiated in 1965 by the United States government to provide health coverage to the poor, governed by individual states under federal regulations.

Medicare: Program initiated in 1965 by the United States government to provide health coverage to those who were over 65 years of age.

mercantilism: Predominant economic system of 16th, 17th, and 18th century Europe characterized by increased exports, the exploitation of raw resources, increased tariffs, and state control of most economic functions.

microcredit: Small loans given to farmers, small business owners, and factory workers whom are typically incapable of receiving a regular bank loan.

microeconomics: The branch of economic study that analyzes lower level economic activity, including demand and supply at the individual and business levels.

minimum wage: The legal price floor for labor wages, established in the United States in 1938 and exists in many industrialized nations. This wage was established to ensure a certain minimum level of fair wages for all jobs.

misery index: The sum of the unemployment level and inflation rate in a nation. Created in the United States

during the 1970s, in a particularly stagnate economic period.

monopoly: Economic structure with one seller of a particular good without substantial competition. Monopolies essentially run the market on a particular good, including pricing and supply, but also are limited by consumer demand.

most-favored nation: Diplomatic and economic status established by trade agreements, whereby one nation receives least restrictive trade barriers in trade with another nation.

multilateral aid: Aid from multiple international sources channeled through appropriate organizations (i.e., the World Bank) to developing countries.

natural unemployment: Condition of unemployment existing when employment level is full, as well as when resources of demand and supply are equal and price levels are stable.

neoliberalism: Predominant economic belief in Western nations at present, which includes decreasing taxes, creating smaller domestic governments, embracing globalization and encouraging free trade principles.

New Partnership for Africa's Development (NEPAD): Initiative of African nations (OAU) promoted by South African President Thabo Mbeki, which would use the collective power of African states to create economic prosperity and promote future and sustainable development.

nongovernmental organization (NGO): Nonprofit organizations not associated with any level of government that attempt to provide aid to developing nations. non-income poverty

nonworking poor: Those in poverty whom are chronically poor and unemployed, typically because of a lack of education, incapability of entering the workforce or physical limitations to work.

normative economics: Division of economic study in which ideal standards of economy are prescribed.

North American Free Trade Agreement (NAFTA): Established in 1994, NAFTA is an agreement between Canada, the United States, and Mexico to eliminate

trade barriers between nations within a decade of inception. Free trade agreements such as this can create efficient trade and lower prices for goods but is also detrimental to labor and the environment.

odious debt: Debt accrued by nations under undemocratic leadership, with profit typically going to government officials and patrons.

oligopoly: Condition where a small number of major corporations involved in selling similar products dominate the market by obstructing other corporations from entering into competition.

Organization of American States (OAS): Created in 1948 with 35 member nations in North, Central, and South America, the OAS is the hemisphere's main conduit for political discussion. Issues dealt with by the OAS include human rights, the drug war, and the spread of democratic government.

Organization of Petroleum Exporting Countries (OPEC):

An economic organization of over a dozen African, South American, and Middle Eastern states that produce oil and act to control a major market share of petroleum. OPEC has acted as a source of economic power for some nations that would otherwise have little influence in the global economy.

outsourcing: To sent out work or services to an outside provider or manufacturer in order to cut costs and make goods more readily available to world markets.

pension programs: Programs typically provided employers to insure post-employment or disability financial security for workers.

poverty gap: Measurement that determines the place of individuals or families in relation to the poverty line. A high poverty gap, for example, show that most people in poverty live well below the poverty line.

poverty line: The official measurement of the income needed by a household to stay out of poverty, according to several tangible requirements. The poverty line is a relative measure by nation, based on measures like income and family size as well as education and geographic location.

poverty rate: Ratio of those under the poverty line to the rest of a nation's population.

poverty threshold: The income threshold at which a family is in poverty for administrative and statistical purposes.

poverty trap: Large scale situation that forces those in poverty to remain poor despite efforts at money management. This is possible because of low incomes, trade deficits, and major infra structural gaps.

price ceiling: The legal maximum price for a good, with apartment and rental prices as one common example. Ceilings help control pricing but can create a shortage created by a restricted price range.

price floor: The legal minimum price for a good, with farm goods as one common example. Farmers, whom create a large amount of goods and typically are in debt due to the prohibitive costs of running a farm and owning land, benefit from price floors and subsidies that create competition for goods.

privatization: The transfer of government responsibilities to the private sector, for the purpose of decreased bureaucratic costs and more efficient management.

progressive tax: A type of income tax whereby an increase in income level means an increased tax rate. As opposed to a flat tax, where everyone that pays taxes pays the same rate, or a regressive tax, where higher incomes meet with lower tax rates.

pro-poor growth: Economic development and growth, particularly in developing countries, that favor the poor.

public good: A good or service usable by both payers and nonpayers, usable by many people at one time, and reusable for sustained periods of time. Examples of a public good are public parks, libraries, and the protection of the military.

racial discrimination: Discrimination by a person or group of one race against a person or group of another race, in terms of employment and public services.

rationing: The allocation of commodities by prescribed standards, typically based on the needs of the public.

recession: A general period of economic contraction, lasting at least two consecutive business quarters, with a decrease in gross domestic product and an increase in unemployment.

redistribution: Economic theory that promotes reducing inequality in the distribution of wealth by reorganizing capital more evenly.

regressive tax: Tax system whereby higher income levels pay a increasingly lower tax percentages of income. Favorable to upper income levels and considered by some scholars to be effective in putting more money into the economy.

relative deprivation: Theory which compares the objective nature of an individual's work and home life with the subjective ideas on fairness, entitlement, or success by this same individual.

relative poverty: A definition of poverty that compares one individual or family to the poverty of others within the same area of measure.

right to work law: Legal restrictions on employers who want union membership as a prerequisite to employment. Employers are not able to force employees to join unions. Right to work laws allow the freedom of workers to participate in unions at every level, but also conflict with the public benefits of unionization, which are able to protect workers and provide benefits not available in nonlabor work.

rural deprivation: Extreme poverty on farm lands and other rural areas, made common by difficult agricultural markets, high farming costs, and the drastic increase in urbanization.

scarcity: Continuing condition in society because of the imbalance between an unlimited amount of wants and needs and limited resources. Scarcity is the major underlying theme of economics.

segregation: Practice of separating people of different racial, economic, and ethnic groups in public areas as a form of discrimination.

slavery: State of one individual bound to serve another individual and act as property in economic exchanges.

social democracy: Theory advocating the use of democratic means to achieve an eased transition from capitalism and socialism.

social insurance: Programs, popular largely in Europe and North America that allow workers to pay into pen-

sion and insurance programs for retirement, disability, and unemployment funding.

social mobility: The ability of individuals or groups to move within a social hierarchy with changes in economic and social indicators.

Social Security: A system providing economic assistance to the elderly, poor, and disabled whom participate in a system of taxation. In the United States, Social Security was established in 1935 during the Great Depression and has continued to the present, with similar programs in many Western nations.

social stratification: Condition of being arranged in social strata or classes within a group.

socialism: The government ownership of resources, workers control the production of goods and the distribution of products based on need. Socialism is considered the middle ground between capitalism and communism.

solidarity: The rallying cry for organized labor and the general labor movement to utilize a "us versus them" mentality across all industries in order to gain mutual benefits

squatting: To settle an unoccupied land without legal claim.

stabilization: Government policies to act against economic fluctuations and prevent short term effects such as unemployment and inflation. One important stabilization method is the adjustment of interest rates on loans.

standard of living: The average real gross domestic product or the economy's ability to fulfill consumer needs.

starvation: State of extreme hunger from lack of essential nutrients over a prolonged period of time.

stigmatization: To be characterized as disgraceful or as a pariah, typically because of involvement in entitlement programs, prolonged poverty, or involvement in the culture of poverty.

subsistence: Minimal resources for living, often times associated with farmers and those in rural areas.

Supplemental Security Income (SSI): American program created in 1974, providing a singular safety net under the Social Security Administration from several former programs providing assistance to the disabled, the blind, and the elderly.

supply: The ability and momentum by owners and producers to sell quantities of a good at a range of prices during a certain period of time.

supply-side economics: Emphasis on the production capability of available resources in national economic policy. Promoted vigorously by the Reagan administration during the 1980s as a counter to Keynesian economics, which was blamed for the stagnate economy of the 1970s.

sustainable development: Economic and social development that utilizes natural resources in an ecologically efficient manner, to ensure consistent development.

tariff: Typically a tax on imports which form a barrier to trade meant to protect domestic markets and generate revenue for the federal government.

Temporary Assistance for Needy Families (TANF): Replaced AFDC in 1996, TANF is a state administered block grant program designed to assist mothers off of welfare into the work force.

Third World: Term used for developing nations, made obsolete by the end of the Cold War. The First World refers to Western nations and the United States and the Second World refers to the Soviet Union and its satellite countries.

tied aid: Economic aid made available to developing nations contingent upon narrowly prescribed usage, typically on trade with donor nations.

trade deficit: Situation when a nation's imports are greater than a nation's exports. Deficits are remedied by trade barriers and the reduction of exchange rates on currency.

trade surplus: Situation when a nation's export are greater than a nation's imports, or when foreign markets purchase more than they sell to domestic markets.

trading bloc: Loose organization of nations that are economically intertwined, common in culture and

proximity. Nations in a trading bloc coordinate foreign trade policies, including the North American bloc and the European bloc.

underclass: Lowest social strata, composed of the poor, needy, and underprivileged.

undeserving poor: The distinction of government officials of those in poverty whom are not deserving of aid, either because of their longevity in poverty or seeming inability to find work.

unfair competition: Deceptive or dishonest trade practices meant to hamper competitors and gain greater market share. Such practices include false advertisement, bribery, and industrial sabotage.

universal healthcare: Theory of national health care system that would provided health insurance to every person within a nation. Universal health care has been adopted in many Western European nations as well as Canada and has been a small part of the health care reform debate in the United States.

United States Agency for International Development (USAID): An organization run by the United States government that transfers technical and economic aid to developing nations.

urbanization: Social process in which cities experience increased growth and cultures become more urban and cosmopolitan.

Uruguay Round: Round of meetings between 1986 and 1994 that replaced the General Agreement of Tariff and Trade (GATT) with the World Trade Organization. These meetings also attempted a reduction of trade restrictions on member countries.

vagrancy laws: Laws at the local and state level that prevent loitering or other activities of those in poverty whom are trying to survive on the streets. The rationale for vagrancy laws is to protect tourism, public health, and to prevent crime. In some areas, vagrancy laws have been required to accompany the creation of shelters.

voluntary poverty: Choice made by individuals to go into poverty for personal, spiritual, or religious reasons.

wages: Payment to laborers for utilization of labor resources in the production of goods and services.

War on Poverty: Series of government programs under President Lyndon Johnson between 1965 and 1968 to combat conditions of poverty, crime, and urban education standards.

welfare dependence: Condition cited by many conservatives that consists of welfare recipients not working or searching for work in order to stay in welfare programs.

welfare-to-work programs: Government programs that attempt to move individuals off of welfare assistance into one or more jobs to provide sufficient income. Popularized in several American states and nationally during the Bill Clinton administration.

working poor: Individual or groups that are at or below the poverty line whom work one or more jobs which do not provide sufficient income.

World Bank: Financial institution created in at the Btretton Woods conference 1944 to aid in the reduction of poverty worldwide, as well as attempt to address the issue of foreign debt of developing nations around the world.

World Trade Organization (WTO): Organization that mediates disputes in global trade such as tariff and intellectual property issues. The WTO also holds negotiations on increasing globalized trade and investment in developing nations.

highest 10%: NA%

Inflation rate (consumer prices): 6.1% (2004 est.) Investment (gross fixed): 18.3% of GDP (2004 est.)

Budget: revenues: \$29.15 billion

expenditures: \$26.84 billion, including capital expenditures of NA (2004 est.)

Public debt: 118% of GDP (June 2004 est.)

Agriculture: products: sunflower seeds, lemons, soybeans, grapes, corn, tobacco, peanuts, tea, wheat; livestock Industries: food processing, motor vehicles, consumer durables, textiles, chemicals and petrochemicals, printing, metric.

allurgy, steel

Industrial production growth rate: 12% (2004 est.)

Exports: \$33.78 billion f.o.b. (2004 est.)

Exports: commodities: edible oils, fuels and energy, cereals, feed, motor vehicles

Exports: partners: Brazil 16.5%, Chile 10.9%, US 10.2%, China 8.5%, Spain 4.5% (2004)

Imports: \$22.06 billion f.o.b. (2004 est.)

Imports: commodities: machinery and equipment, motor vehicles, chemicals, metal manufactures, plastics Imports: partners: Brazil 27%, US 20%, Germany 6.6%, China 4.6%, France 4.2%, Italy 4.1% (2004)

Reserves of foreign exchange and gold: \$19.47 billion (2004 est.)

Debt: external: \$157.7 billion (2004 est.) Economic aid: recipient: \$10 billion (2001 est.)

ARMENIA

GDP: purchasing power parity: \$13.65 billion (2004 est.)

GDP: real growth rate: 9% (2004 est.)

GDP: per capita: purchasing power parity: \$4,600 (2004 est.)

GDP: composition by sector: agriculture: 22.9%

industry: 36.1%

services: 41.1% (2004 est.) Labor force: 1.4 million (2001)

Labor force: by occupation: agriculture 45%, industry 25%, services 30% (2002 est.)

Unemployment rate: 30% (2003 est.)

Population below poverty line: 50% (2002 est.)

Household income or consumption by percentage share: lowest 10%: 2.3%

highest 10%: 46.2% (1999)

Distribution of family income: Gini index: 44.4 (1996) Inflation rate (consumer prices): 3.5% (2004 est.) Investment (gross fixed): 19.8% of GDP (2004 est.)

Budget: revenues: \$428.1 million

expenditures: \$491.2 million, including capital expenditures of NA (2004 est.)

Agriculture: products: fruit (especially grapes), vegetables; livestock

Industries: diamond-processing, metal-cutting machine tools, forging-pressing machines, electric motors, tires, knitted wear, hosiery, shoes, silk fabric, chemicals, trucks, instruments, microelectronics, jewelry manufacturing, software

development, food processing, brandy

Industrial production growth rate: 15% (2002 est.)

Exports: \$850 million f.o.b. (2004 est.)

Exports: commodities: diamonds, mineral products, foodstuffs, energy

Exports: partners: Belgium 16.8%, Israel 14.3%, Russia 14.2%, Germany 11.4%, Iran 9.9%, US 7.8%, Netherlands

5.8% (2004)

Imports: \$1.3 billion f.o.b. (2004 est.)

Imports: commodities: natural gas, petroleum, tobacco products, foodstuffs, diamonds

Imports: partners: Belgium 10.3%, Iran 10.2%, Russia 9.8%, Israel 8.6%, US 7.7%, UAE 6.2%, Italy 5.4%, Ger-

many 5%, France 4.6%, Ukraine 4.5% (2004)

Reserves of foreign exchange and gold: \$555 million (2004 est.)

Debt: external: \$905 million (June 2001)

Economic aid: recipient: ODA \$170 million (2000)

AUSTRALIA

GDP: purchasing power parity: \$611.7 billion (2004 est.)

GDP: real growth rate: 3.5% (2004 est.)

GDP: per capita: purchasing power parity: \$30,700 (2004 est.)

GDP: composition by sector: agriculture: 3.4%

industry: 28.2%

services: 68.4% (2004 est.)

Labor force: 10.35 million (2004 est.)

Labor force: by occupation: agriculture 3.6%, industry 26.4%, services 70% (2004 est.)

Unemployment rate: 5.1% (December 2004 est.)

Population below poverty line: NA

Household income or consumption by percentage share: lowest 10%: 2%

highest 10%: 25.4% (1994)

Distribution of family income: Gini index: 35.2 (1994)

Inflation rate (consumer prices): 2.3% (2004 est.) Investment (gross fixed): 25.3% of GDP (2004 est.)

Budget: revenues: \$222.7 billion

expenditures: \$221.7 billion, including capital expenditures of NA (2004 est.)

Public debt: 17.4% of GDP (2004 est.)

Agriculture: products: wheat, barley, sugarcane, fruits; cattle, sheep, poultry

Industries: mining, industrial and transportation equipment, food processing, chemicals, steel

Industrial production growth rate: 1.9% (2004 est.)

Exports: \$86.89 billion (2004 est.)

Exports: commodities: coal, gold, meat, wool, alumina, iron ore, wheat, machinery and transport equipment

Exports: partners: Japan 18.6%, China 9.2%, US 8.1%, South Korea 7.7%, New Zealand 7.4%, India 4.6%, UK

4.2% (2004)

Imports: \$98.1 billion (2004 est.)

Imports: commodities: machinery and transport equipment, computers and office machines, telecommunication

equipment and parts; crude oil and petroleum products

Imports: partners: US 14.8%, China 12.7%, Japan 11.8%, Germany 5.8%, Singapore 4.4%, UK 4.1% (2004)

Reserves of foreign exchange and gold: \$35.14 billion (2004 est.)

Debt: external: \$308.7 billion (3rd quarter, 2004 est.) Economic aid: donor: ODA, \$894 million (FY99/00)

AUSTRIA

GDP: purchasing power parity: \$255.9 billion (2004 est.)

GDP: real growth rate: 1.9% (2004 est.)

GDP: per capita: purchasing power parity: \$31,300 (2004 est.)

GDP: composition by sector: agriculture: 2.3%

industry: 30.8%

services: 66.9% (2004 est.)

Labor force: 3.45 million (2004 est.)

Labor force: by occupation: agriculture and forestry 4%, industry and crafts 29%, services 67% (2001 est.)

Unemployment rate: 4.4% (2004 est.) Population below poverty line: 3.9% (1999)

Household income or consumption by percentage share: lowest 10%: 2.5%

highest 10%: 22.5% (1995)

Distribution of family income: Gini index: 31 (1995) Inflation rate (consumer prices): 1.8% (2004 est.) Investment (gross fixed): 22.6% of GDP (2004 est.)

Budget: revenues: \$142.5 billion

expenditures: \$146.4 billion, including capital expenditures of NA (2004 est.)

Public debt: 64.2% of GDP (2004 est.)

Agriculture: products: grains, potatoes, sugar beets, wine, fruit; dairy products, cattle, pigs, poultry; lumber

Industries: construction, machinery, vehicles and parts, food, metals, chemicals, lumber and wood processing, paper and paperboard, communications equipment, tourism

Industrial production growth rate: 3.3% (2004 est.)

Exports: \$102.7 billion f.o.b. (2004 est.)

Exports: commodities: machinery and equipment, motor vehicles and parts, paper and paperboard, metal goods, chemicals, iron and steel; textiles, foodstuffs

Exports: partners: Germany 31.4%, Italy 9%, US 6%, Switzerland 4.8%, UK 4.4%, France 4.2% (2004)

Imports: \$101.2 billion f.o.b. (2004 est.)

Imports: commodities: machinery and equipment, motor vehicles, chemicals, metal goods, oil and oil products; foodstuffs

Imports: partners: Germany 45.9%, Italy 6.7%, Switzerland 4.3% (2004)

Reserves of foreign exchange and gold: \$12.73 billion (2003)

Debt: external: \$15.5 billion (2003 est.)

Economic aid: donor: ODA, \$520 million (2002)

AZERBAIJAN

GDP: composition by sector: agriculture: 14.1%

industry: 45.7%

services: 40.2% (2002 est.)

Industrial production growth rate: 9.3% (1996 est.)

Exports: \$154 million f.o.b. (2000 est.)

Exports: commodities: electricity (to India), cardamom, gypsum, timber, handicrafts, cement, fruit, precious stones, spices

Exports: partners: India 87.9%, Bangladesh 4.6%, Philippines 2% (2004)

Imports: \$196 million c.i.f. (2000 est.)

Imports: commodities: fuel and lubricants, grain, machinery and parts, vehicles, fabrics, rice

Imports: partners: India 71.3%, Japan 7.8%, Austria 3% (2004)

Debt: external: \$245 million (2000)

Economic aid: recipient: substantial aid from India and other nations

BOLIVIA

GDP: real growth rate: 3.7% (2004 est.)

GDP: per capita: purchasing power parity: \$2,600 (2004 est.)

GDP: composition by sector: agriculture: 13%

industry: 28%

services: 59% (2004 est.)

Labor force: 3.8 million (2004 est.)

Labor force: by occupation: agriculture NA%, industry NA%, services NA%

Unemployment rate: 9.2% in urban areas note: widespread underemployment (2003 est.) Population below poverty line: 64% (2004 est.)

Household income or consumption by percentage share: lowest 10%: 1.3%

highest 10%: 32% (1999)

Distribution of family income: Gini index: 44.7 (1999) Inflation rate (consumer prices): 4.9% (2004 est.) Investment (gross fixed): 10.4% of GDP (2003 est.)

Budget: revenues: \$2.264 billion

expenditures: \$2.769 billion, including capital expenditures of \$741 million (2004 est.)
Agriculture: products: soybeans, coffee, coca, cotton, corn, sugarcane, rice, potatoes; timber Industries: mining, smelting, petroleum, food and beverages, tobacco, handicrafts, clothing

Industrial production growth rate: 5.7% (2004 est.)

Exports: \$1.986 billion f.o.b. (2004 est.)

Exports: commodities: natural gas, soybeans and soy products, crude petroleum, zinc ore, tin

Exports: partners: Brazil 33.9%, US 12.7%, Colombia 11.8%, Venezuela 11.6%, Peru 5.1%, Japan 4.2% (2004)

Imports: \$1.595 billion f.o.b. (2004 est.)

Imports: commodities: petroleum products, plastics, paper, aircraft and aircraft parts, prepared foods, automobiles,

insecticides, soybeans

Imports: partners: Brazil 25.3%, Argentina 17%, US 13.1%, Chile 9.2%, Peru 7.2% (2004)

Reserves of foreign exchange and gold: \$1.214 billion (2004 est.)

Debt: external: \$5.439 billion (June 2004 est.)

BOSNIA AND HERZEGOVINA

GDP: purchasing power parity: \$26.21 billion (2004 est.)

GDP: real growth rate: 5% (2004 est.)

GDP: per capita: purchasing power parity: \$6,500 (2004 est.)

GDP: composition by sector: agriculture: 14.2%

industry: 30.8% services: 55% (2002)

Labor force: 1.026 million (2001)

Labor force: by occupation: agriculture NA, industry NA, services NA

Unemployment rate: 44% officially; however, grey economy may reduce actual unemployment to near 20% (2004 est.)

Population below poverty line: 25% (2004 est.)

Household income or consumption by percentage share: lowest 10%: NA%

highest 10%: NA%

Inflation rate (consumer prices): 1.1% (2004 est.)

Budget: revenues: \$3.618 billion

expenditures: \$3.642 billion, including capital expenditures of NA (2004 est.)

Agriculture: products: wheat, corn, fruits, vegetables; livestock

Industries: steel, coal, iron ore, lead, zinc, manganese, bauxite, vehicle assembly, textiles, tobacco products, wooden

furniture, tank and aircraft assembly, domestic appliances, oil refining (2001)

Industrial production growth rate: 5.5% (2003 est.)

Exports: \$1.7 billion f.o.b. (2004 est.)

Exports: commodities: metals, clothing, wood products

Exports: partners: Italy 22.9%, Croatia 22.1%, Germany 20.3%, Austria 7.5%, Slovenia 6.9%, Hungary 4.9%

(2004)

Imports: \$5.2 billion f.o.b. (2004 est.)

Imports: commodities: machinery and equipment, chemicals, fuels, foodstuffs

Imports: partners: Croatia 26.4%, Germany 14.9%, Slovenia 13.4%, Italy 12%, Austria 6.9%, Hungary 6.4% (2004)

Reserves of foreign exchange and gold: \$2 billion (2004 est.)

Debt: external: \$3 billion (2004 est.)

BOTSWANA

GDP: purchasing power parity: \$15.05 billion (2004 est.)

GDP: real growth rate: 3.5% (2004 est.)

GDP: per capita: purchasing power parity: \$9,200 (2004 est.)

GDP: composition by sector: agriculture: 4% industry: 44% (including 36% mining)

services: 52% (2003 est.)

Labor force: 264,000 formal sector employees (2000)

Labor force: by occupation: NA Unemployment rate: 23.8% (2004 est.) Population below poverty line: 47% (2002 est.)

Household income or consumption by percentage share: lowest 10%: NA

highest 10%: NA

Inflation rate (consumer prices): 7% (2004 est.) Investment (gross fixed): 25.5% of GDP (2004 est.)

Budget: revenues: \$3.735 billion

expenditures: \$3.743 billion, including capital expenditures of NA (2004 est.)

Public debt: 8.6% of GDP (2004 est.)

Agriculture: products: livestock, sorghum, maize, millet, beans, sunflowers, groundnuts Industries: diamonds, copper, nickel, salt, soda ash, potash; livestock processing; textiles

Industrial production growth rate: 4.4% (2004 est.)

Exports: \$2.94 billion f.o.b. (2004 est.)

Exports: commodities: diamonds, copper, nickel, soda ash, meat, textiles

Exports: partners: European Free Trade Association (EFTA) 87%, Southern African Customs Union (SACU) 7%,

Zimbabwe 4% (2000)

Imports: \$2.255 billion f.o.b. (2004 est.)

Imports: commodities: foodstuffs, machinery, electrical goods, transport equipment, textiles, fuel and petroleum

products, wood and paper products, metal and metal products

Imports: partners: Southern African Customs Union (SACU) 74%, EFTA 17%, Zimbabwe 4% (2000)

Reserves of foreign exchange and gold: \$5.7 billion (2004 est.)

Debt: external: \$531 million (2004 est.) Economic aid: recipient: \$73 million (1995)

BRAZIL

GDP: purchasing power parity: \$1.492 trillion (2004 est.)

GDP: real growth rate: 5.1% (2004 est.)

GDP: per capita: purchasing power parity: \$8,100 (2004 est.)

GDP: composition by sector: agriculture: 10.1%

industry: 38.6%

services: 51.3% (2004 est.)

Labor force: 89 million (2004 est.)

Labor force: by occupation: agriculture 20%, industry 14%, services 66% (2003 est.)

Unemployment rate: 11.5% (2004 est.)

Population below poverty line: 22% (1998 est.)

Household income or consumption by percentage share: lowest 10%: 0.7%, highest 10%: 48% (1998)

Distribution of family income: Gini index: 60.7 (1998) Inflation rate (consumer prices): 7.6% (2004 est.) Investment (gross fixed): 19.8% of GDP (2004 est.)

Budget: revenues: \$140.6 billion

expenditures: \$172.4 billion, including capital expenditures of NA (2004)

Public debt: 52% of GDP (2004 est.)

Agriculture: products: coffee, soybeans, wheat, rice, corn, sugarcane, cocoa, citrus; beef

Industries: textiles, shoes, chemicals, cement, lumber, iron ore, tin, steel, aircraft, motor vehicles and parts, other ma-

chinery and equipment

Industrial production growth rate: 6% (2004 est.)

Exports: \$95 billion f.o.b. (2004 est.)

Exports: commodities: transport equipment, iron ore, soybeans, footwear, coffee, autos

Exports: partners: US 21.2%, China 7.8%, Argentina 6%, Germany 5.1%, Netherlands 4.8% (2004)

Imports: \$61 billion f.o.b. (2004 est.)

Imports: commodities: machinery, electrical and transport equipment, chemical products, oil

Imports: partners: US 22.4%, Germany 9.2%, Argentina 8.1%, China 5.5% (2004)

Reserves of foreign exchange and gold: \$52.94 billion (2004 est.)

Debt: external: \$219.8 billion (2004 est.) Economic aid: recipient: \$30 billion (2002)

BRUNEI

GDP: composition by sector: agriculture: 5%

industry: 45%

services: 50% (2001 est.)

Labor force: 158,000 note: includes foreign workers and military personnel; temporary residents make up about 40%

of labor force (2002 est.)

Labor force: by occupation: agriculture, forestry, and fishing 10%, production of oil, natural gas, services, and con-

struction 42%, government 48% (1999 est.) Unemployment rate: 3.2% (2002 est.)

Population below poverty line: NA

Household income or consumption by percentage share: lowest 10%: NA

highest 10%: NA

Inflation rate (consumer prices): 0.3% (2003 est.)

Budget: revenues: \$4.9 billion

expenditures: \$4.2 billion, including capital expenditures of \$1.35 billion (2003 est.)

Agriculture: products: rice, vegetables, fruits, chickens, water buffalo

Industries: petroleum, petroleum refining, liquefied natural gas, construction

Industrial production growth rate: 5% (2002 est.)

Exports: \$7.7 billion f.o.b. (2003 est.)

Exports: commodities: crude oil, natural gas, refined products

Exports: partners: Japan 37.8%, South Korea 13.6%, Australia 11.1%, US 9%, Thailand 7.9%, China 5.9% (2004)

Imports: \$5.2 billion c.i.f. (2003)

Imports: commodities: machinery and transport equipment, manufactured goods, food, chemicals

Imports: partners: Singapore 33.1%, Malaysia 21.5%, Japan 7.3%, UK 6.8% (2004)

Debt: external: \$0

Economic aid: recipient: NA

BULGARIA

GDP: purchasing power parity: \$61.63 billion (2004 est.)

GDP: real growth rate: 5.3% (2004 est.)

GDP: per capita: purchasing power parity: \$8,200 (2004 est.)

GDP: composition by sector: agriculture: 11.5%

industry: 30.1%

services: 58.4% (2004 est.)

Labor force: 3.398 million (2004 est.)

Labor force: by occupation: agriculture 11%, industry 32.7%, services 56.3% (3rd quarter 2004 est.)

Unemployment rate: 12.7% (2004 est.)

Population below poverty line: 13.4% (2002 est.)

Household income or consumption by percentage share: lowest 10%: 4.5%

highest 10%: 22.8% (1997)

Distribution of family income: Gini index: 26.4 (2001) Inflation rate (consumer prices): 6.1% (2004 est.) Investment (gross fixed): 18.6% of GDP (2004 est.)

Budget: revenues: \$9.67 billion

expenditures: \$9.619 billion, including capital expenditures of NA (2004 est.)

Public debt: 41.9% of GDP (2004 est.)

Agriculture: products: vegetables, fruits, tobacco, livestock, wine, wheat, barley, sunflowers, sugar beets

Industries: electricity, gas and water; food, beverages and tobacco; machinery and equipment, base metals, chemical

products, coke, refined petroleum, nuclear fuel

Industrial production growth rate: 5.2% (2004 est.)

Exports: \$9.134 billion f.o.b. (2004 est.)

Exports: commodities: clothing, footwear, iron and steel, machinery and equipment, fuels

Exports: partners: Italy 13.2%, Germany 11.5%, Turkey 9.7%, Belgium 6.4%, Greece 6.1%, US 5.6%, France 5.1%

(2004)

Imports: \$12.23 billion f.o.b. (2004 est.)

Imports: commodities: machinery and equipment; metals and ores; chemicals and plastics; fuels, minerals, and raw

materials

Imports: partners: Germany 15.7%, Italy 10.9%, Russia 9%, Greece 8%, Turkey 7.5%, France 4.7%, Austria 4%

(2004)

Reserves of foreign exchange and gold: \$7.526 billion (2004 est.)

Debt: external: \$16.1 billion (November 2004 est.) Economic aid: recipient: \$300 million (2000 est.)

BURKINA FASO

GDP: purchasing power parity: \$15.74 billion (2004 est.)

GDP: real growth rate: 4.8% (2004 est.)

GDP: per capita: purchasing power parity: \$1,200 (2004 est.)

GDP: composition by sector: agriculture: 39.5%

industry: 19.3%

services: 41.3% (2004 est.) Labor force: 5 million

note: a large part of the male labor force migrates annually to neighboring countries

for seasonal employment (2003)

Labor force: by occupation: agriculture 90% (2000 est.)

Unemployment rate: NA%

Population below poverty line: 45% (2003 est.)

Household income or consumption by percentage share: lowest 10%: 2%

highest 10%: 46.8% (1994)

Distribution of family income: Gini index: 48.2 (1994) Inflation rate (consumer prices): 2.4% (2004 est.) Investment (gross fixed): 29.1% of GDP (2004 est.)

Budget: revenues: \$695.2 million

expenditures: \$876.3 million, including capital expenditures of NA (2004 est.)

Agriculture: products: cotton, peanuts, shea nuts, sesame,

sorghum, millet, corn, rice; livestock

Industries: cotton lint, beverages, agricultural processing, soap, cigarettes, textiles, gold

Industrial production growth rate: 14% (2001 est.)

Exports: \$418.6 million f.o.b. (2004 est.)

Exports: commodities: cotton, livestock, gold

Exports: partners: China 32.3%, Singapore 10.7%, Bangladesh 4.5%,

Ghana 4.4%, Colombia 4.4% (2004)

Imports: \$866.3 million f.o.b. (2004 est.)

Imports: commodities: capital goods, foodstuffs, petroleum

Imports: partners: France 31.5%, Cote d'Ivoire 13.9%, Togo 8.5% (2004)

Reserves of foreign exchange and gold: \$474.9 million (2004 est.)

Debt: external: \$1.3 billion (2000) Economic aid: recipient: NA

BURMA

GDP: purchasing power parity: \$74.3 billion (2004 est.)

GDP: real growth rate: -1.3% (2004 est.)

GDP: per capita: purchasing power parity: \$1,700 (2004 est.)

GDP: composition by sector: agriculture: 56.6%

industry: 8.8%

services: 34.5% (2004 est.)

Labor force: 27.01 million (2004 est.)

Labor force: by occupation: agriculture 70%, industry 7%, services 23% (2001 est.)

Unemployment rate: 5.2% (2004 est.)

Population below poverty line: 25% (2000 est.)

Household income or consumption by percentage share: lowest 10%: 2.8%

highest 10%: 32.4% (1998)

Inflation rate (consumer prices): 17.2% (2004 est.) Investment (gross fixed): 10.2% of GDP (2004 est.)

Budget: revenues: \$474.9 million

expenditures: \$955.5 million, including capital expenditures of \$5.7 billion (2004 est.)

Agriculture: products: rice, pulses, beans, sesame, groundnuts, sugarcane; hardwood; fish and fish products

Industries: agricultural processing; knit and woven apparel; wood and wood products; copper, tin, tungsten, iron;

construction materials; pharmaceuticals; fertilizer; cement

Industrial production growth rate: NA

Exports: \$2.137 billion f.o.b.

note: official export figures are grossly underestimated due to the value of timber, gems, narcotics, rice, and other products smuggled to Thailand, China, and Bangladesh (2004 est.)

Exports: commodities: clothing, gas, wood products, pulses, beans, fish, rice

Exports: partners: Thailand 37%, India 14%, China 6.2%, Japan 5.1%, UK 4% (2004)

Imports: \$1.754 billion f.o.b.

note: import figures are grossly underestimated due to the value of consumer goods, diesel fuel, and other products smuggled in from Thailand, China, Malaysia, and India (2004 est.)

Imports: commodities: fabric, petroleum products, plastics, machinery, transport equipment, construction materi-

als, crude oil; food products

Imports: partners: China 28.3%, Singapore 20.6%, Thailand 19.1%, South Korea 6.2%, Malaysia 4.7% (2004)

Reserves of foreign exchange and gold: \$590 million (2004 est.)

Debt: external: \$6.752 billion (2004 est.)

Economic aid: recipient: \$127 million (2001 est.)

BURUNDI

industry: 38.2%

services: 55.5% (2004 est.)

Labor force: 6.2 million (2004 est.)

Labor force: by occupation: agriculture 13.6%, industry 23.4%, services 63% (2003)

Unemployment rate: 8.5% (2004 est.) Population below poverty line: 20.6% (2000)

Household income or consumption by percentage share: lowest 10%: 1.2%

highest 10%: 47% (2000)

Distribution of family income: Gini index: 57.1 (2000) Inflation rate (consumer prices): 2.4% (2004 est.) Investment (gross fixed): 23.9% of GDP (2004 est.)

Budget: revenues: \$21.53 billion

expenditures: \$19.95 billion, including capital expenditures of \$3.33 billion (2004 est.)

Public debt: 12.8% of GDP (2004 est.)

Agriculture: products: grapes, apples, pears, onions, wheat, corn, oats, peaches, garlic, asparagus, beans, beef, poultry,

wool; fish; timber

Industries: copper, other minerals, foodstuffs, fish processing, iron and steel, wood and wood products, transport

equipment, cement, textiles

Industrial production growth rate: 7.8% (2004 est.)

Exports: \$29.2 billion f.o.b. (2004 est.)

Exports: commodities: copper, fruit, fish products, paper and pulp, chemicals, wine

Exports: partners: US 14%, Japan 11.4%, China 9.9%, South Korea 5.5%, Netherlands 5.1%, Brazil 4.3%, Italy

4.1%, Mexico 4% (2004)

Imports: \$22.53 billion f.o.b. (2004 est.)

Imports: commodities: petroleum and petroleum products, chemicals, electrical and telecommunications equip-

ment, industrial machinery, vehicles, natural gas

Imports: partners: Argentina 17%, US 14.1%, Brazil 11.1%, China 7.1% (2004)

Reserves of foreign exchange and gold: \$16.02 billion (2004)

Debt: external: \$44.6 billion (2004 est.) Economic aid: recipient: ODA, \$0 (2002)

CHINA

GDP: purchasing power parity: \$7.262 trillion (2004 est.)

GDP: real growth rate: 9.1% (official data) (2004 est.)

GDP: per capita: purchasing power parity: \$5,600 (2004 est.)

GDP: composition by sector: agriculture: 13.8%

industry and construction: 52.9%

services: 33.3% (2004 est.) Labor force: 760.8 million (2003)

Labor force: by occupation: agriculture 49%, industry 22%, services 29% (2003 est.)

Unemployment rate: 9.8% in urban areas; substantial unemployment and underemployment in rural areas; an offi-

cial Chinese journal estimated overall unemployment (including rural areas) for 2003 at 20% (2004 est.)

Population below poverty line: 10% (2001 est.)

Household income or consumption by percentage share: lowest 10%: 2.4%

highest 10%: 30.4% (1998)

Distribution of family income: Gini index: 44 (2002) Inflation rate (consumer prices): 4.1% (2004 est.) Investment (gross fixed): 46% of GDP (2004 est.)

Budget: revenues: \$317.9 billion

expenditures: \$348.9 billion, including capital expenditures of NA (2004 est.)

Public debt: 31.4% of GDP (2004 est.)

Agriculture: products: rice, wheat, potatoes, corn, peanuts, tea, millet, barley, apples, cotton, oilseed, pork, fish Industries: mining and ore processing, iron, steel, aluminum, and other metals; coal; machine building; armaments; textiles and apparel; petroleum; cement; chemicals; fertilizers; consumer products, including footwear, toys, and electronics; food processing; transportation equipment, including automobiles, rail cars and locomotives, ships, and aircraft; telecommunications equipment, commercial space launch vehicles and satellites

Industrial production growth rate: 17.1% (2004 est.) Exports: \$583.1 billion f.o.b. (2004 est.)

Exports: commodities: machinery and equipment, plastics, optical and medical equipment, iron and steel Exports: partners: US 22.8%, Hong Kong 16.2%, Japan 12.4%, South Korea 4.4%, Germany 4% (2004)

Imports: \$552.4 billion f.o.b. (2004 est.)

Imports: commodities: machinery and equipment, oil and mineral fuels, plastics, optical and medical equipment, organic chemicals, iron and steel

Imports: partners: Japan 16.1%, Taiwan 10.9%, South Korea 10.4%, US 7.7%, Hong Kong 7.4%, Germany 5.4% (2004)

Reserves of foreign exchange and gold: \$609.9 billion (2004 est.)

Debt: external: \$233.3 billion (3rd quarter 2004 est.)

Economic aid: recipient: NA

highest 10%: 29.8% (1997)

Distribution of family income: Gini index: 36.4 (1997) Inflation rate (consumer prices): 3.2% (2004 est.) Investment (gross fixed): 11.6% of GDP (2004 est.)

Budget: revenues: \$3.483 billion

expenditures: \$3.616 billion, including capital expenditures of \$782 million (2004 est.)

Public debt: 85.8% of GDP (2004 est.)

Agriculture: products: wheat, barley, citrus, tomatoes, melons, olives; sheep, goats, poultry

Industries: phosphate mining, pharmaceuticals, petroleum refining, cement, potash, inorganic chemicals, light man-

ufacturing, tourism

Industrial production growth rate: 5% (2004 est.)

Exports: \$3.2 billion f.o.b. (2004 est.)

Exports: commodities: clothing, phosphates, fertilizers, potash, vegetables,

manufactures, pharmaceuticals

Exports: partners: US 25.8%, Iraq 18.4%, India 6.4%,

Saudi Arabia 5.2% (2004)

Imports: \$7.6 billion f.o.b. (2004 est.)

Imports: commodities: crude oil, textile fabrics, machinery, transport equipment,

manufactured goods

Imports: partners: Saudi Arabia 19.9%, China 8.4%, Germany 6.8%, US 6.7% (2004)

Reserves of foreign exchange and gold: \$5.457 billion (2004 est.)

Debt: external: \$7.32 billion (2004 est.)

Economic aid: recipient: ODA, \$500 million (2004 est.)

KAZAKHSTAN

GDP: purchasing power parity: \$118.4 billion (2004 est.)

GDP: real growth rate: 9.1% (2004 est.)

GDP: per capita: purchasing power parity: \$7,800 (2004 est.)

GDP: composition by sector: agriculture: 7.4%

industry: 37.8%

services: 54.8% (2004 est.)

Labor force: 7.95 million (2004 est.)

Labor force: by occupation: agriculture 20%, industry 30%, services 50% (2002 est.)

Unemployment rate: 8% (2004 est.)

Population below poverty line: 19% (2004 est.)

Household income or consumption by percentage share: lowest 10%: 3.3%

highest 10%: 26.5% (2004 est.)

Distribution of family income: Gini index: 31.5 (2003) Inflation rate (consumer prices): 6.9% (2004 est.) Investment (gross fixed): 23.9% of GDP (2004 est.)

Budget: revenues: \$8.67 billion

expenditures: \$8.968 billion, including capital expenditures of NA (2004 est.)

Public debt: 13.7% of GDP (2004 est.)

Agriculture: products: grain (mostly spring wheat), cotton; livestock

Industries: oil, coal, iron ore, manganese, chromite, lead, zinc, copper, titanium, bauxite, gold, silver, phosphates, sul-

fur, iron and steel; tractors and other agricultural machinery, electric motors, construction materials

Industrial production growth rate: 10.6% (2004 est.)

Exports: \$18.47 billion f.o.b. (2004 est.)

Exports: commodities: oil and oil products 58%, ferrous metals 24%, chemicals 5%, machinery 3%, grain, wool,

meat, coal (2001)

Exports: partners: Russia 13.5%, Bermuda 13.4%, China 10.4%, Germany 9.2%, Switzerland 9.1%, France 6.7%

(2004)

Imports: \$13.07 billion f.o.b. (2004 est.)

Imports: commodities: machinery and equipment 41%, metal products 28%, foodstuffs 8% (2001)

Imports: partners: Russia 33.9%, China 13.6%, Germany 9.6%, France 6.8% (2004)

Reserves of foreign exchange and gold: \$14.35 billion (2004 est.)

Debt: external: \$26.03 billion (2004 est.)

Economic aid: recipient: \$74.2 million in US assistance programs, 1992-2000 (FY2004)

KENYA

GDP: purchasing power parity: \$34.68 billion (2004 est.)

GDP: real growth rate: 2.2% (2004 est.)

Exports: partners: US 81%, Canada 5.9%, Japan 1.1% (2004)

Imports: \$190.8 billion f.o.b. (2004 est.)

Imports: commodities: metalworking machines, steel mill products, agricultural machinery, electrical equipment, car

parts for assembly, repair parts for motor vehicles, aircraft, and aircraft parts

Imports: partners: US 65.8%, Germany 3.8%, China 3.7% (2004) Reserves of foreign exchange and gold: \$60.67 billion (2004 est.)

Debt: external: \$149.9 billion (2004 est.) Economic aid: recipient: \$1.166 billion (1995)

MICRONESIA. FEDERATED STATES OF

GDP: purchasing power parity: \$277 million

note: GDP is supplemented by grant aid, averaging perhaps \$100 million annually (2002 est.)

GDP: real growth rate: 1% (2002 est.)

GDP: per capita: purchasing power parity: \$2,000 (2002 est.)

GDP: composition by sector: agriculture: 50%

industry: 4%

services: 46% (2000 est.)

Labor force: NA

Labor force: by occupation: two-thirds are government employees

Unemployment rate: 16% (1999 est.) Population below poverty line: 26.7%

Household income or consumption by percentage share: lowest 10%: NA

highest 10%: NA

Inflation rate (consumer prices): 1% (2002 est.)

Budget: revenues: \$161 million (\$69 million less grants)

expenditures: \$160 million, including capital expenditures of NA (1998 est.)

Agriculture: products: black pepper, tropical fruits and vegetables, coconuts, cassava (tapioca), betel nuts, sweet po-

tatoes; pigs, chickens

Industries: tourism, construction, fish processing, specialized aquaculture, craft items from shell, wood, and pearls

Industrial production growth rate: NA Exports: \$22 million (f.o.b.) (FY99/00 est.)

Exports: commodities: fish, garments, bananas, black pepper

Exports: partners: Japan, US, Guam (2000) Imports: \$149 million f.o.b. (FY99/00 est.)

Imports: commodities: food, manufactured goods, machinery and equipment, beverages

Imports: partners: US, Australia, Japan (2000) Debt: external: \$53.1 million (FY02/03 est.)

Economic aid: recipient: under terms of the Compact of Free Association, the US pledged \$1.3 billion in grant aid

during the period 1986-2001; the level of aid has been subsequently reduced

MOLDOVA

GDP: purchasing power parity: \$8.581 billion (2004 est.)

GDP: real growth rate: 6.8% (2004 est.)

GDP: per capita: purchasing power parity: \$1,900 (2004 est.)

GDP: composition by sector: agriculture: 22.4%, industry: 24.8%, services: 52.8% (2004 est.)

Labor force: 1.36 million (2004 est.)

Labor force: by occupation: agriculture 40%, industry 14%, services 46% (1998)

Unemployment rate: 8% (roughly 25% of working age Moldovans are employed abroad) (2002 est.)

Population below poverty line: 80% (2001 est.)

Household income or consumption by percentage share: lowest 10%: 2.2%

highest 10%: 30.7% (1997)

Distribution of family income: Gini index: 40.6 (1997) Inflation rate (consumer prices): 11.5% (2004 est.) Investment (gross fixed): 17.1% of GDP (2004 est.)

Budget: revenues: \$648.1 million

expenditures: \$634.8 million, including capital expenditures of NA (2004 est.)

Public debt: 63.4% of GDP (2004 est.)

Agriculture: products: vegetables, fruits, wine, grain, sugar beets, sunflower seed, tobacco; beef, milk

Industries: food processing, agricultural machinery, foundry equipment, refrigerators and freezers, washing ma-

chines, hosiery, sugar, vegetable oil, shoes, textiles Industrial production growth rate: 17% (2003 est.)

Exports: \$1.03 billion f.o.b. (2004 est.)

Exports: commodities: foodstuffs, textiles, machinery

Exports: partners: Russia 31.4%, Italy 10.7%, Germany 9.5%, Romania 9.4%, France 6.9%, Ukraine 5.8% (2004)

Imports: \$1.83 billion f.o.b. (2004 est.)

Imports: commodities: mineral products and fuel, machinery and equipment, chemicals, textiles (2000)

Imports: partners: Ukraine 16.8%, Russia 14.7%, Germany 12.5%, France 9.9%, Italy 8%, Romania 5.3% (2004)

Reserves of foreign exchange and gold: \$390 million (2004 est.)

Debt: external: \$1.4 billion (2004 est.) Economic aid: recipient: \$100 million (2000)

MONACO

GDP: purchasing power parity: \$870 million (2000 est.)

Unemployment rate: 13.1% (31 December 2004 est.)

Population below poverty line: NA

Household income or consumption by percentage share: lowest 10%: 5.1%

highest 10%: 18.2% (1992)

Distribution of family income: Gini index: 26.3 (1996)

Inflation rate (consumer prices): 7.5% (2004 est.)

Investment (gross fixed): 24% of GDP (2004 est.)

Budget: revenues: \$15.44 billion

expenditures: \$16.7 billion, including capital expenditures of NA (2004 est.)

Public debt: 46.6% of GDP (2004 est.)

Agriculture: products: grains, potatoes, sugar beets, hops, fruit; pigs, cattle, poultry; forest products

Industries: metal and metal products; food and beverages; electricity, gas, coke, oil, nuclear fuel; chemicals and manmade fibers; machinery; paper and printing; earthenware and ceramics; transport vehicles; textiles; electrical and optical apparatus; rubber products

Industrial production growth rate: 5.1% (2004 est.)

Exports: \$29.24 billion f.o.b. (2004 est.)

Exports: commodities: vehicles 25.9%, machinery and electrical equipment 21.3%, base metals 14.6%, chemicals and minerals 10.1%, plastics 5.4%% (2004 est.)

Exports: partners: Germany 35.7%, Czech Republic 13.4%, Austria 8.6%, Italy 5.6%, US 4.8%, Poland 4.8%, Hungary 4.3% (2004)

Imports: \$29.67 billion f.o.b. (2004 est.)

Imports: commodities: machinery and transport equipment 41.1%, intermediate manufactured goods 19.3%, fuels

12.3%, chemicals 9.8%, miscellaneous manufactured goods 10.2% (2003)

Imports: partners: Germany 29.6%, Czech Republic 17.1%, Russia 9.5%, Austria 7.1%, Italy 5.4%, Hungary 4.3%

(2004)

Reserves of foreign exchange and gold: \$14.91 billion (2004 est.)

Debt: external: \$19.54 billion (2004 est.)

SLOVENIA

GDP: purchasing power parity: \$39.41 billion (2004 est.)

GDP: real growth rate: 3.9% (2004 est.)

GDP: per capita: purchasing power parity: \$19,600 (2004 est.)

GDP: composition by sector: agriculture: 3%

industry: 36%

services: 60% (2004 est.) Labor force: 870,000 (2004 est.)

Labor force: by occupation: agriculture 6%, industry 40%, services 55% (2002)

Unemployment rate: 6.4% (2004 est.) Population below poverty line: NA

Household income or consumption by percentage share: lowest 10%: 3.9%

highest 10%: 23% (1998)

Distribution of family income: Gini index: 28.4 (1998) Inflation rate (consumer prices): 3.3% (2004 est.) Investment (gross fixed): 24.9% of GDP (2004 est.)

Budget: revenues: \$13.36 billion

expenditures: \$13.99 billion, including capital expenditures of NA (2004 est.)

Public debt: 31.5% of GDP (2004 est.)

Agriculture: products: potatoes, hops, wheat, sugar beets, corn, grapes; cattle, sheep, poultry

Industries: ferrous metallurgy and aluminum products, lead and zinc smelting, electronics (including military elec-

tronics), trucks, electric power equipment, wood products, textiles, chemicals, machine tools

Industrial production growth rate: 3.9% (2004 est.)

Exports: commodities: manufactured goods, machinery and transport equipment, chemicals, food

Exports: partners: Germany 18.4%, Austria 11.4%, Italy 11.1%, Croatia 7.6%, France 7.5%, Bosnia and Herzegov-

ina 4.6% (2004)

Imports: \$16.07 billion f.o.b. (2004 est.)

Imports: commodities: machinery and transport equipment, manufactured goods, chemicals, fuels and lubricants,

food

Imports: partners: Germany 20.1%, Italy 17%, Austria 14.1%, France 10.4% (2004)

Reserves of foreign exchange and gold: \$8.493 billion (2004 est.)

Debt: external: \$14.65 billion (2004 est.)

Economic aid: recipient: ODA, \$62 million (2000 est.)

SOLOMON ISLANDS

GDP: purchasing power parity: \$800 million (2002 est.)

GDP: real growth rate: 5.8% (2003 est.)

GDP: per capita: purchasing power parity: \$1,700 (2002 est.)

GDP: composition by sector: agriculture: 42%

industry: 11%

services: 47% (2000 est.) Labor force: 26,840 (1999)

Labor force: by occupation: agriculture 75%, industry 5%, services 20% (2000 est.)

Unemployment rate: NA%
Population below poverty line: NA

Household income or consumption by percentage share: lowest 10%: NA

highest 10%: NA

Inflation rate (consumer prices): 10% (2003 est.)

Budget: revenues: \$49.7 million

expenditures: \$75.1 million, including capital expenditures of \$0 (2003)

Agriculture: products: cocoa beans, coconuts, palm kernels, rice, potatoes, vegetables, fruit; cattle, pigs; timber; fish

Industries: fish (tuna), mining, timber Industrial production growth rate: NA Exports: \$74 million f.o.b. (2003 est.)

Exports: commodities: timber, fish, copra, palm oil, cocoa

Exports: partners: China 28.2%, Thailand 15.7%, South Korea 15.7%, Japan 9.7%, Philippines 5.1% (2004)

Imports: \$67 million f.o.b. (2003)

Imports: commodities: food, plant and equipment, manufactured goods, fuels, chemicals Imports: partners: Australia 25.3%, Singapore 23.8%, New Zealand 5.3%, India 4.8% (2004)

Debt: external: \$180.4 million (2002)

Economic aid: recipient: \$28 million annually, mainly from Australia (2003 est.)

SOMALIA

GDP: purchasing power parity: \$4.597 billion (2004 est.)

GDP: real growth rate: 2.8% (2004 est.)

GDP: per capita: purchasing power parity: \$600 (2004 est.)

GDP: composition by sector: agriculture: 65%

industry: 10%

services: 25% (2000 est.)

Labor force: 3.7 million (very few are skilled laborers)

Labor force: by occupation: agriculture (mostly pastoral nomadism) 71%, industry and services 29%

Unemployment rate: NA

Population below poverty line: NA

Household income or consumption by percentage share: lowest 10%: NA

highest 10%: NA

Inflation rate (consumer prices): note: businesses print their own money, so inflation rates cannot be sensibly deter-

mined (2004 est.)

Budget: revenues: NA

expenditures: NA, including capital expenditures of NA

Agriculture: products: cattle, sheep, goats; bananas, sorghum, corn, coconuts, rice, sugarcane, mangoes, sesame seeds,

beans; fish

Industries: a few light industries, including sugar refining, textiles, wireless communication

Industrial production growth rate: NA

Exports: \$79 million f.o.b. (2002 est.)

Exports: commodities: livestock, bananas, hides, fish, charcoal, scrap metal

Exports: partners: Thailand 31.3%, UAE 22.8%, Yemen 14.9%, India 8.5%, Oman 5.4%, China 4.1% (2004)

Imports: \$344 million f.o.b. (2002 est.)

Imports: commodities: manufactures, petroleum products, foodstuffs, construction materials, gat

Imports: partners: Djibouti 28.8%, Kenya 13.1%, India 9.3%, Brazil 5.4%, Oman 5.2%, UAE 5.1% (2004)

Debt: external: \$3 billion (2001 est.)

Economic aid: recipient: \$60 million (1999 est.)

SOUTH AFRICA

GDP: purchasing power parity: \$491.4 billion (2004 est.)

GDP: real growth rate: 3.5% (2004 est.)

GDP: per capita: purchasing power parity: \$11,100 (2004 est.)

GDP: composition by sector: agriculture: 3.6%, industry: 31.2%, services: 65.2% (2004 est.)

Labor force: 16.63 million economically active (2004 est.)

Labor force: by occupation: agriculture 30%, industry 25%, services 45% (1999 est.)

Unemployment rate: 26.2% (includes workers no longer looking for employment) (2004 est.)

Population below poverty line: 50% (2000 est.)

Household income or consumption by percentage share: lowest 10%: 1.1%, highest 10%: 45.9% (1994)

Distribution of family income: Gini index: 59.3 (1993-94)

Inflation rate (consumer prices): 4.5% (2004 est.)

Investment (gross fixed): 16.7% of GDP (2004 est.)

Budget: revenues: \$47.43 billion, expenditures: \$52.54 billion, including capital expenditures of NA (2004 est.)

Public debt: 45.9% of GDP (2004 est.)

Agriculture: products: corn, wheat, sugarcane, fruits, vegetables; beef, poultry, mutton, wool, dairy products Industries: mining (world's largest producer of platinum, gold, chromium), automobile assembly, metalworking, machinery, textile, iron and steel, chemicals, fertilizer, foodstuffs, commercial ship repair

Industrial production growth rate: 5.5% (2004 est.)

Exports: \$41.97 billion f.o.b. (2004 est.)

Exports: commodities: gold, diamonds, platinum, other metals and minerals, machinery and equipment (1998 est.)

Exports: partners: US 10.2%, UK 9.2%, Japan 9%, Germany 7.1%, Netherlands 4% (2004)

Imports: \$39.42 billion f.o.b. (2004 est.)

Imports: commodities: machinery and equipment, chemicals, petroleum products, scientific instruments, foodstuffs (2000 est.)

Imports: partners: Germany 14.2%, US 8.5%, China 7.5%, Japan 6.9%, UK 6.9%, France 6%, Saudi Arabia 5.6%,

Iran 5% (2004)

Reserves of foreign exchange and gold: \$11.68 billion (2004 est.)

Debt: external: \$27.01 billion (2004 est.) Economic aid: recipient: \$487.5 million (2000)

SPAIN

GDP: purchasing power parity: \$937.6 billion (2004 est.)

GDP: real growth rate: 2.6% (2004 est.)

GDP: purchasing power parity: \$576.2 billion (2004 est.)

GDP: real growth rate: 6% (2004 est.)

GDP: per capita: purchasing power parity: \$25,300 (2004 est.)

GDP: composition by sector: agriculture: 1.7%

industry: 30.9%

services: 67.4% (2004 est.)

Labor force: 10.22 million (2004 est.)

Labor force: by occupation: agriculture 8%, industry 35%, services 57% (2001 est.)

Unemployment rate: 4.5% (2004 est.)

Population below poverty line: 1% (2000 est.)

Household income or consumption by percentage share: lowest 10%: 6.7%

highest 10%: 41.1% (2002 est.)

Inflation rate (consumer prices): 1.7% (2004 est.) Investment (gross fixed): 18% of GDP (2004 est.)

Budget: revenues: \$67.41 billion

expenditures: \$76.7 billion, including capital expenditures of \$14.4 billion (2004 est.)

Public debt: 32.4% of GDP (2004 est.)

Agriculture: products: rice, corn, vegetables, fruit, tea; pigs, poultry, beef, milk; fish

Industries: electronics, petroleum refining, armaments, chemicals, textiles, iron and steel, machinery, cement, food

processing, vehicles, consumer products, pharmaceuticals Industrial production growth rate: 12.2% (2004 est.)

Exports: \$170.5 billion f.o.b. (2004 est.)

Exports: commodities: computer products and electrical equipment, metals, textiles, plastics and rubber products,

chemicals (2002)

Exports: partners: China, including Hong Kong 37%, US 16%, Japan 7.7% (2004)

Imports: \$165.4 billion f.o.b. (2004 est.)

Imports: commodities: machinery and electrical equipment 44.5%, minerals, precision instruments (2002)

Imports: partners: Japan 26%, US 13%, China, including Hong Kong 11%, South Korea 6.9% (2004)

Reserves of foreign exchange and gold: \$246.5 billion (2004 est.)

Debt: external: \$55.5 billion (2004 est.)

TAJIKISTAN

GDP: purchasing power parity: \$7.95 billion (2004 est.)

GDP: real growth rate: 10.5% (2004 est.)

GDP: per capita: purchasing power parity: \$1,100 (2004 est.)

GDP: composition by sector: agriculture: 23.7%

industry: 24.3%

services: 52% (2004 est.)

Labor force: 3.187 million (2000)

Labor force: by occupation: agriculture 67.2%, industry 7.5%, services 25.3% (2000 est.)

Unemployment rate: 40% (2002 est.)

Population below poverty line: 60% (2004 est.)

Household income or consumption by percentage share: lowest 10%: 3.2%

highest 10%: 25.2% (1998)

Distribution of family income: Gini index: 34.7 (1998)

Inflation rate (consumer prices): 8% (2004 est.) Investment (gross fixed): 22% of GDP (2004 est.)

Budget: revenues: \$311.2 million

expenditures: \$321.5 million, including capital expenditures of \$86 million (2004 est.)

Agriculture: products: cotton, grain, fruits, grapes, vegetables; cattle, sheep, goats

Industries: aluminum, zinc, lead, chemicals and fertilizers, cement, vegetable oil, metal-cutting machine tools, refrig-

erators and freezers

Industrial production growth rate: 8.2% (2002 est.)

Exports: \$1.13 billion f.o.b. (2004 est.)

Exports: commodities: aluminum, electricity, cotton, fruits, vegetable oil, textiles

Exports: partners: Latvia 13.1%, Switzerland 11.5%, Uzbekistan 11.3%, Norway 9.9%, Russia 8.2%, Iran 7.9%,

Turkey 7.7%, Italy 6.6%, Hungary 4.4% (2004)

Imports: \$1.3 billion f.o.b. (2004 est.)

Imports: commodities: electricity, petroleum products, aluminum oxide, machinery and equipment, foodstuffs

Imports: partners: Russia 17.8%, Uzbekistan 13.4%, Kazakhstan 9.7%, Ukraine 6.3%, Azerbaijan 6.3%, US 5.8%,

Turkey 4.3% (2004)

Reserves of foreign exchange and gold: \$145.3 million (2004 est.)

Debt: external: \$888 million (2004 est.)

Economic aid: recipient: \$60.7 million from US (2001)

TANZANIA

GDP: purchasing power parity: \$23.71 billion (2004 est.)

GDP: real growth rate: 5.8% (2004 est.)

GDP: per capita: purchasing power parity: \$700 (2004 est.)

GDP: composition by sector: agriculture: 43.2%

industry: 17.2%

services: 39.6% (2004 est.)

Labor force: 19 million (2004 est.)

Labor force: by occupation: agriculture 80%, industry and services 20% (2002 est.)

Unemployment rate: NA

Population below poverty line: 36% (2002 est.)

Household income or consumption by percentage share: lowest 10%: 2.8%

highest 10%: 30.1% (1993)

Distribution of family income: Gini index: 38.2 (1993) Inflation rate (consumer prices): 5.4% (2004 est.) Investment (gross fixed): 16.2% of GDP (2004 est.)

Budget:

revenues: \$1.985 billion

expenditures: \$2.074 billion, including capital expenditures of NA (2004 est.)

Public debt: 5% of GDP (2004 est.)

Agriculture: products: coffee, sisal, tea, cotton, pyrethrum (insecticide made from chrysanthemums), cashew nuts, tobacco, cloves, corn, wheat, cassava (tapioca), bananas, fruits, vegetables; cattle, sheep, goats

Industries: agricultural processing (sugar, beer, cigarettes, sisal twine), diamond, gold and iron mining, soda ash, oil refining, shoes, cement, apparel, wood products, fertilizer, salt

Industrial production growth rate: 8.4% (1999 est.)

Exports: \$1.248 billion f.o.b. (2004 est.)

Exports: commodities: gold, coffee, cashew nuts, manufactures, cotton

Exports: partners: India 10.2%, Netherlands 6.8%, Japan 6.1%, UK 5.3%, China 5.2%, Kenya 4.8%, Germany 4.4% (2004)

Imports: \$1.972 billion f.o.b. (2004 est.)

Imports: commodities: consumer goods, machinery and transportation equipment, industrial raw materials, crude

Imports: partners: South Africa 13.1%, China 8.8%, India 6.6%, Zambia 5.4%, UAE 5.4%, US 4.8%, UK 4.8%,

Kenya 4.3% (2004)

Reserves of foreign exchange and gold: \$2.175 billion (2004 est.)

Debt: external: \$7.321 billion (2004 est.) Economic aid: recipient: \$1.2 billion (2001)

THAILAND

GDP: purchasing power parity: \$524.8 billion (2004 est.)

GDP: real growth rate: 6.1% (2004 est.)

GDP: per capita: purchasing power parity: \$8,100 (2004 est.)

GDP: composition by sector: agriculture: 9%

industry: 44.3%

services: 46.7% (2004 est.)

Labor force: 36.43 million (November 2004 est.)

Labor force: by occupation: agriculture 49%, industry 14%, services 37% (2000 est.)

Unemployment rate: 1.5% (November 2004 est.) Population below poverty line: 10% (2004 est.)

Household income or consumption by percentage share: lowest 10%: 2.8%, highest 10%: 32.4% (1998)

Distribution of family income: Gini index: 51.1 (2002) Inflation rate (consumer prices): 2.8% (2004 est.)

Investment (gross fixed): 22.5% of GDP (Jan: Sep 2004 est.)

Budget: revenues: \$30.86 billion

expenditures: \$31.94 billion, including capital expenditures of \$5 billion (2004 est.)

Public debt: 47.6% of GDP (November 2004 est.)

Agriculture: products: rice, cassava (tapioca), rubber, corn, sugarcane, coconuts, soybeans

Industries: tourism, textiles and garments, agricultural processing, beverages, tobacco, cement, light manufacturing such as jewelry, electric appliances and components, computers and parts, integrated circuits, furniture, plastics, world's second-largest tungsten producer, and third-largest tin producer

Industrial production growth rate: 8.5% (2004 est.)

Exports: \$87.91 billion f.o.b. (2004 est.)

Exports: commodities: textiles and footwear, fishery products, rice, rubber, jewelry, automobiles, computers and electrical appliances

Exports: partners: US 15.9%, Japan 13.9%, China 7.3%, Singapore 7.2%, Malaysia 5.4%, Hong Kong 5.1% (2004)

Imports: \$80.84 billion f.o.b. (2004 est.)

Imports: commodities: capital goods, intermediate goods and raw materials, consumer goods, fuels

Imports: partners: Japan 23.6%, China 8.6%, US 7.6%, Malaysia 5.8%, Singapore 4.4%, Taiwan 4.1% (2004)

Reserves of foreign exchange and gold: \$48.3 billion (2004)

Debt: external: \$50.59 billion (2004 est.) Economic aid: recipient: \$72 million (2002)

TOGO

GDP: purchasing power parity: \$8.684 billion (2004 est.)

GDP: real growth rate: 3% (2004 est.)

GDP: per capita: purchasing power parity: \$1,600 (2004 est.)

GDP: composition by sector: agriculture: 39.5%

industry: 20.4%

services: 40.1% (2003 est.) Labor force: 1.74 million (1996)

Labor force: by occupation: agriculture 65%, industry 5%, services 30% (1998 est.)

Unemployment rate: NA (2003 est.)

Population below poverty line: 32% (1989 est.)

Household income or consumption by percentage share: lowest 10%: NA

highest 10%: NA

Inflation rate (consumer prices): 1% (2004 est.) Investment (gross fixed): 19.1% of GDP (2004 est.)

Budget: revenues: \$239.2 million

expenditures: \$273.3 million, including capital expenditures of NA (2004 est.)

Agriculture: products: coffee, cocoa, cotton, yams, cassava (tapioca), corn, beans, rice, millet, sorghum; livestock; fish

Industries: phosphate mining, agricultural processing, cement; handicrafts, textiles, beverages

Industrial production growth rate: NA Exports: \$663.1 million f.o.b. (2004 est.)

Exports: commodities: reexports, cotton, phosphates, coffee, cocoa

Exports: partners: Burkina Faso 16%, Ghana 14.7%, Benin 9.2%, China 8.1%, Mali 7.5%, Netherlands 6.6%, Tai-

wan 4.2% (2004)

Imports: \$824.9 million f.o.b. (2004 est.)

Imports: commodities: machinery and equipment, foodstuffs, petroleum products

Imports: partners: China 24.7%, France 16.1%, Malaysia 5.3%, Italy 4.6%, Germany 4.6%, UK 4.3%, Netherlands

4.2%, Thailand 4.2%, Belgium 4.2% (2004)

Reserves of foreign exchange and gold: \$267.4 million (2004 est.)

Debt: external: \$1.4 billion (2000)

Economic aid: recipient: ODA \$80 million (2000 est.)

TRINIDAD AND TOBAGO

GDP: purchasing power parity: \$11.48 billion (2004 est.)

GDP: real growth rate: 5.7% (2004 est.)

GDP: per capita: purchasing power parity: \$10,500 (2004 est.)

GDP: composition by sector: agriculture: 2.7%

industry: 47%

services: 50.3% (2004 est.) Labor force: 590,000 (2004 est.)

Labor force: by occupation: agriculture 9.5%, manufacturing, mining, and quarrying 14%, construction and utilities

12.4%, services 64.1% (1997 est.) Unemployment rate: 10.4% (2004 est.) Population below poverty line: 21% (1992 est.)

highest 10%: NA

Inflation rate (consumer prices): 3.3% (2004 est.) Investment (gross fixed): 19.4% of GDP (2004 est.)

Budget: revenues: \$3.25 billion

expenditures: \$3.193 billion, including capital expenditures of \$117.3 million (2004 est.)

Public debt: 54.4% of GDP (2004 est.)

Agriculture: products: cocoa, sugarcane, rice, citrus, coffee, vegetables; poultry

Industries: petroleum, chemicals, tourism, food processing, cement, beverage, cotton textiles

Industrial production growth rate: 7.2% (2004 est.)

Exports: \$6.671 billion f.o.b. (2004 est.)

Exports: commodities: petroleum and petroleum products, chemicals, steel products, fertilizer, sugar, cocoa, coffee,

citrus, flowers

Exports: partners: US 66.7%, Jamaica 5.7%, France 3.5% (2004)

Imports: \$4.65 billion f.o.b. (2004 est.)

Imports: commodities: machinery, transportation equipment, manufactured goods, food, live animals Imports: partners: US 24.6%, Venezuela 12%, Germany 10.8%, Spain 7%, Italy 5.5%, Brazil 5% (2004)

Reserves of foreign exchange and gold: \$2.927 billion (2004 est.)

Debt: external: \$2.94 billion (2004 est.)

Economic aid: recipient: \$24 million (1999 est.)

TUNISIA

GDP: purchasing power parity: \$70.88 billion (2004 est.)

GDP: real growth rate: 5.1% (2004 est.)

GDP: per capita: purchasing power parity: \$7,100 (2004 est.)

GDP: composition by sector: agriculture: 13.8%

industry: 31.8%

services: 54.4% (2004 est.) Labor force: 3.55 million

note: shortage of skilled labor (2004 est.)

Labor force: by occupation: services 55%, industry 23%, agriculture 22% (1995 est.)

Unemployment rate: 13.8% (2004 est.)

Population below poverty line: 7.6% (2001 est.)

Household income or consumption by percentage share: lowest 10%: 2.3%

highest 10%: 31.8% (1995)

Distribution of family income: Gini index: 41.7 (1995) Inflation rate (consumer prices): 4.1% (2004 est.) Investment (gross fixed): 24.5% of GDP (2004 est.)

Budget:

revenues: \$6.799 billion

expenditures: \$7.573 billion, including capital expenditures of \$1.6 billion (2004 est.)

Public debt: 59.2% of GDP (2004 est.)

Agriculture: products: olives, olive oil, grain, dairy products, tomatoes, citrus fruit, beef, sugar beets, dates, almonds Industries: petroleum, mining (particularly phosphate and iron ore), tourism, textiles, footwear, agribusiness, beverages

Industrial production growth rate: 4.4% (2004 est.)

Exports: \$9.926 billion f.o.b. (2004 est.)

Exports: commodities: textiles, mechanical goods, phosphates and chemicals, agricultural products, hydrocarbons

Exports: partners: France 30%, Italy 23.3%, Germany 9.3%, Spain 5.3%,

Belgium 4.3%, Libya 4.2% (2004) Imports: \$11.52 billion f.o.b. (2004 est.)

Imports: commodities: textiles, machinery and equipment, hydrocarbons, chemicals, food

Imports: partners: France 27.5%, Italy 20.8%, Germany 9.2%, Spain 5.7% (2004)

Reserves of foreign exchange and gold: \$3.509 billion (2004 est.)

Debt: external: \$14.71 billion (2004 est.) Economic aid: recipient: \$114.6 million (2002)

TURKEY

GDP: purchasing power parity: \$508.7 billion (2004 est.)

GDP: real growth rate: 8.2% (2004 est.)

GDP: per capita: purchasing power parity: \$7,400 (2004 est.)

GDP: composition by sector: agriculture: 11.7%

industry: 29.8%

services: 58.5% (2003 est.) Labor force: 25.3 million

note: about 1.2 million Turks work abroad (2003 est.)

Labor force: by occupation: agriculture 35.9%, industry 22.8%, services 41.2% (3rd quarter, 2004)

Unemployment rate: 9.3% (plus underemployment of 4.0%) (2004 est.)

Population below poverty line: 20% (2002)

Household income or consumption by percentage share: lowest 10%: 2.3%

highest 10%: 30.7% (2000)

Distribution of family income: Gini index: 42 (2003) Inflation rate (consumer prices): 9.3% (2004 est.) Investment (gross fixed): 17.3% of GDP (2004 est.)

Budget: revenues: \$78.53 billion

expenditures: \$110.9 billion, including capital expenditures of NA (2004 est.)

Public debt: 74.3% of GDP (2004 est.)

Agriculture: products: tobacco, cotton, grain, olives, sugar beets, pulse, citrus; livestock

Industries: textiles, food processing, autos, mining (coal, chromite, copper, boron), steel, petroleum, construction,

lumber, paper

Industrial production growth rate: 16.5% (2004 est.)

Exports: \$69.46 billion f.o.b. (2004 est.)

Exports: commodities: apparel, foodstuffs, textiles, metal manufactures, transport equipment

Exports: partners: Germany 13.9%, UK 8.8%, US 7.7%, Italy 7.4%, France 5.8%, Spain 4.2% (2004)

Imports: \$94.5 billion f.o.b. (2004 est.)

Imports: commodities: machinery, chemicals, semi-finished goods, fuels, transport equipment

Imports: partners: Germany 12.9%, Russia 9.3%, Italy 7.1%, France 6.4%, US 4.8%, China 4.6%, UK 4.4% (2004)

Reserves of foreign exchange and gold: \$37.1 billion (2004 est.)

Debt: external: \$16.9 billion (2004 est.)

Economic aid: recipient: ODA, \$635.8 million (2002)

TURKMENISTAN

GDP: purchasing power parity: \$27.6 billion (2004 est.)

GDP: real growth rate: IMF estimate: 7.5%

note: official government statistics show 21.4% growth, but these estimates are notoriously unreliable (2004 est.)

GDP: per capita: purchasing power parity: \$5,700 (2004 est.)

GDP: composition by sector: agriculture: 28.5%

industry: 42.7%

services: 28.8% (2004 est.)

Labor force: 2.32 million (2003 est.)

Labor force: by occupation: agriculture 48.2%, industry 13.8%, services 37% (2003 est.)

Unemployment rate: 60% (2004 est.)

Population below poverty line: 58% (2003 est.)

Household income or consumption by percentage share: lowest 10%: 2.6%

highest 10%: 31.7% (1998)

Distribution of family income: Gini index: 40.8 (1998)

Inflation rate (consumer prices): 9% (2004 est.) Investment (gross fixed): 29% of GDP (2004 est.)

Budget: revenues: \$3.05 billion

expenditures: \$3.05 billion, including capital expenditures of NA (2004 est.)

Agriculture: products: cotton, grain; livestock

Industries: natural gas, oil, petroleum products, textiles, food processing

Industrial production growth rate: official government estimate: 22% (2003 est.)

Exports: \$4 billion f.o.b. (2004 est.)

Exports: commodities: gas, crude oil, petrochemicals, cotton fiber, textiles Exports: partners: Ukraine 49.8%, Iran 17.2%, Italy 5.3%, Turkey 4.7% (2004)

Imports: \$2.85 billion f.o.b. (2004 est.)

Imports: commodities: machinery and equipment, chemicals, foodstuffs

Imports: partners: Russia 14%, Ukraine 13.8%, US 11.1%, UAE 8.1%, Turkey 8%, Germany 6.8% (2004)

Reserves of foreign exchange and gold: \$3.034 billion (2004 est.)

Debt: external: \$2.4 billion to \$5 billion (2001 est.) Economic aid: recipient: \$16 million from the US (2001)

UGANDA

GDP: purchasing power parity: \$39.39 billion (2004 est.)

GDP: real growth rate: 5% (2004 est.)

GDP: per capita: purchasing power parity: \$1,500 (2004 est.)

GDP: composition by sector: agriculture: 35.8%

industry: 20.8%

services: 43.6% (2004 est.)

Labor force: 12.41 million (2004 est.)

Labor force: by occupation: agriculture 82%, industry 5%, services 13% (1999 est.)

Unemployment rate: NA (2002 est.)

Population below poverty line: 35% (2001 est.)

Household income or consumption by percentage share: lowest 10%: 4%

highest 10%: 21% (2000)

Distribution of family income: Gini index: 37.4 (1996) Inflation rate (consumer prices): 3.5% (2004 est.)

Investment (gross fixed): 22.4% of GDP (2004 est.)

Budget: revenues: \$1.491 billion

expenditures: \$1.727 billion, including capital expenditures of NA (2004 est.)

Public debt: 73.9% of GDP (2004 est.)

Agriculture: products: coffee, tea, cotton, tobacco, cassava (tapioca), potatoes, corn, millet, pulses; beef, goat meat,

milk, poultry, cut flowers

Industries: sugar, brewing, tobacco, cotton textiles, cement, steel production

Industrial production growth rate: 5.6% (2004 est.)

Exports: \$621.7 million f.o.b. (2004 est.)

Exports: commodities: coffee, fish and fish products, tea; gold, cotton, flowers, horticultural products

Exports: partners: Kenya 13.6%, Switzerland 11.2%, Netherlands 9.8%, Belgium 8.6%, France 4.2% (2004)

Imports: \$1.306 billion f.o.b. (2004 est.)

Imports: commodities: capital equipment, vehicles,

petroleum, medical supplies; cereals

Imports: partners: Kenya 27.9%, India 8%, UAE 7.4%, South Africa 6.9%,

UK 5.9%, China 5.6%, Japan 5.1%, US 4.6% (2004)

Reserves of foreign exchange and gold: \$1.2 billion (2004 est.)

Debt: external: \$3.865 billion (2004 est.) Economic aid: recipient: \$1.4 billion (2000)

UKRAINE

GDP: purchasing power parity: \$299.1 billion (2004 est.)

GDP: real growth rate: 12% (2004 est.)

GDP: per capita: purchasing power parity: \$6,300 (2004 est.)

GDP: composition by sector: agriculture: 18%

industry: 45.1%

services: 36.9% (2004 est.)

Labor force: 21.11 million (2004 est.)

Labor force: by occupation: agriculture 24%, industry 32%, services 44% (1996)

Unemployment rate: 3.5% officially registered; large number of unregistered or underemployed workers; the International Labor Organization calculates that Ukraine's real unemployment level is around 9-10 percent (2004 est.)

Population below poverty line: 29% (2003 est.)

Household income or consumption by percentage share: lowest 10%: 3.7%

highest 10%: 23.2% (1999)

Distribution of family income: Gini index: 29 (1999) Inflation rate (consumer prices): 12% (2004 est.) Investment (gross fixed): 18.8% of GDP (2004 est.)

Budget:

revenues: \$13.57 billion

expenditures: \$12.26 billion, including capital expenditures of NA; note: these estimates probably do not include the

government's doubling of pensions in September of 2004 (2004 est.)

Public debt: 24.7% of GDP (2004 est.)

Agriculture: products: grain, sugar beets, sunflower seeds, vegetables; beef, milk

Industries: coal, electric power, ferrous and nonferrous metals, machinery and transport equipment, chemicals, food processing (especially sugar)

Industrial production growth rate: 16.5% (2004 est.)

Exports: \$32.91 billion (2004 est.)

Exports: commodities: ferrous and nonferrous metals, fuel and petroleum products, chemicals, machinery and trans-

port equipment, food products

Exports: partners: Russia 17.4%, Turkey 7.1%, Italy 5.7% (2004)

Imports: \$31.45 billion (2004 est.)

Imports: commodities:

energy, machinery and equipment, chemicals

Imports: partners:

Russia 31.9%, Germany 11.9%, Turkmenistan 5.8%, Italy 4.5% (2004)

Reserves of foreign exchange and gold: \$11.33 billion (2004 est.)

Debt: external: \$16.37 billion (2004 est.) Economic aid: recipient: \$637.7 million (1995); IMF Extended Funds Facility \$2.2 billion (1998)

UNITED ARAB EMIRATES

GDP: purchasing power parity: \$63.67 billion (2004 est.)

GDP: real growth rate: 5.7% (2004 est.)

GDP: per capita: purchasing power parity: \$25,200 (2004 est.)

GDP: composition by sector: agriculture: 4%

industry: 58.5%

services: 37.5% (2002 est.) Labor force: 2.36 million

note: 73.9% of the population in the 15-64 age group is non-national (2004 est.) Labor force: by occupation: agriculture 7%, industry 15%, services 78% (2000 est.)

Unemployment rate: 2.4% (2001) Population below poverty line: NA

Household income or consumption by percentage share: lowest 10%: NA

highest 10%: NA

Inflation rate (consumer prices): 3.2% (2004 est.) Investment (gross fixed): 20.8% of GDP (2004 est.)

Budget: revenues: \$23.68 billion

expenditures: \$25.45 billion, including capital expenditures of \$3.4 billion (2004 est.)

Public debt: 17.6% of GDP (2004 est.)

Agriculture: products: dates, vegetables, watermelons; poultry, eggs, dairy products; fish

Industries: petroleum, fishing, aluminum, cement, fertilizers, commercial ship repair, petrochemicals, construction

materials, some boat building, handicrafts, textiles Industrial production growth rate: 4% (2000) Exports: \$69.48 billion f.o.b. (2004 est.)

Exports: commodities: crude oil 45%, natural gas, reexports, dried fish, dates Exports: partners: Japan 28.5%, South Korea 9.5%, Thailand 5.9% (2004)

Imports: \$45.66 billion f.o.b. (2004 est.)

Imports: commodities: machinery and transport equipment, chemicals, food

Imports: partners: China 10.4%, India 8.3%, Japan 7.2%, Germany 6.6%, France 6.4%, UK 6.2%, US 6%, Italy 4.1% (2004)

Reserves of foreign exchange and gold: \$18.64 billion (2004 est.)

Debt: external: \$5.9 billion (2004 est.)

Economic aid: donor: since its founding in 1971, the Abu Dhabi Fund for Development has given about \$5.2 billion

in aid to 56 countries (2004)

UNITED KINGDOM

GDP: purchasing power parity: \$1.782 trillion (2004 est.)

Unemployment rate: 4.8% (2004 est.)

Population below poverty line: 17% (2002 est.)

Household income or consumption by percentage share: lowest 10%: 2.1%

highest 10%: 28.5% (1999)

Distribution of family income: Gini index: 36.8 (1999) Inflation rate (consumer prices): 1.4% (2004 est.) Investment (gross fixed): 16.2% of GDP (2004 est.)

Budget: revenues: \$834.9 billion

expenditures: \$896.7 billion, including capital expenditures of NA (2004 est.)

Public debt: 39.6% of GDP (2004 est.)

Agriculture: products: cereals, oilseed, potatoes, vegetables; cattle, sheep, poultry; fish

Industries: machine tools, electric power equipment, automation equipment, railroad equipment, shipbuilding, aircraft, motor vehicles and parts, electronics and communications equipment, metals, chemicals, coal, petroleum,

paper and paper products, food processing, textiles, clothing, and other consumer goods

Industrial production growth rate: 0.9% (2004 est.)

Exports: commodities: manufactured goods, fuels, chemicals; food, beverages, tobacco

Exports: partners: US 15%, Germany 10.7%, France 9.2%, Ireland 6.8%, Netherlands 6.1%, Belgium 5.2%, Spain

4.5%, Italy 4.2% (2004)

Imports: \$439.4 billion f.o.b. (2004 est.)

Imports: commodities: manufactured goods, machinery, fuels; foodstuffs

Imports: partners: Germany 13%, US 9.2%, France 7.5%, Netherlands 6.6%, Belgium 5%, Italy 4.3%, China 4.2%

(2004)

Reserves of foreign exchange and gold: \$48.73 billion (2004)

Debt: external: \$4.71 trillion (2003)

Economic aid: donor: ODA, \$4.2 billion (2004)

UNITED STATES

GDP: purchasing power parity: \$11.75 trillion (2004 est.)

GDP: real growth rate: 4.4% (2004 est.)

GDP: per capita: purchasing power parity: \$40,100 (2004 est.)

GDP: composition by sector: agriculture: 0.9%

industry: 19.7%

services: 79.4% (2004 est.)

Labor force: 147.4 million (includes unemployed) (2004 est.)

Labor force: by occupation: farming, forestry, and fishing 0.7%, manufacturing, extraction, transportation, and crafts

22.7%, managerial, professional, and technical 34.9%, sales and office 25.5%, other services 16.3%

note: figures exclude the unemployed (2004)

Unemployment rate: 5.5% (2004 est.)

Population below poverty line: 12% (2004 est.)

Household income or consumption by percentage share: lowest 10%: 1.8%

highest 10%: 30.5% (1997)

Distribution of family income: Gini index: 45 (2004) Inflation rate (consumer prices): 2.5% (2004 est.) Investment (gross fixed): 15.7% of GDP (2004 est.)

Budget: revenues: \$1.862 trillion

expenditures: \$2.338 trillion, including capital expenditures of NA (2004 est.)

Public debt: 65% of GDP (2004 est.)

Agriculture: products: wheat, corn, other grains, fruits, vegetables, cotton; beef, pork, poultry, dairy products; for-

est products; fish

Industries: leading industrial power in the world, highly diversified and technologically advanced; petroleum, steel, motor vehicles, aerospace, telecommunications, chemicals, electronics, food processing, consumer goods, lumber, mining

Industrial production growth rate: 4.4% (2004 est.)

Exports: \$795 billion f.o.b. (2004 est.)

Exports: commodities: agricultural products (soybeans, fruit, corn) 9.2%, industrial supplies (organic chemicals) 26.8%, capital goods (transistors, aircraft, motor vehicle parts, computers, telecommunications equipment) 49.0%, consumer goods (automobiles, medicines) 15.0% (2003)

Exports: partners: Canada 23%, Mexico 13.6%, Japan 6.7%, UK 4.4%, China 4.3% (2004)

Imports: \$1.476 trillion f.o.b. (2004 est.)

Imports: commodities: agricultural products 4.9%, industrial supplies 32.9% (crude oil 8.2%), capital goods 30.4% (computers, telecommunications equipment, motor vehicle parts, office machines, electric power machinery), consumer goods 31.8% (automobiles, clothing, medicines, furniture, toys) (2003)

Imports: partners: Canada 17.1%, China 13.7%, Mexico 10.4%, Japan 8.8%, Germany 5.2% (2004)

Reserves of foreign exchange and gold: \$85.94 billion (2003)

Debt: external: \$1.4 trillion (2001 est.)

Economic aid: donor: ODA, \$6.9 billion (1997)

URUGUAY

GDP: purchasing power parity: \$49.27 billion (2004 est.)

GDP: real growth rate: 10.2% (2004 est.)

GDP: per capita: purchasing power parity: \$14,500 (2004 est.)

GDP: composition by sector: agriculture: 38%

industry: 26.3%

services: 35.7% (2003 est.)

Labor force: 14.64 million (2004 est.)

Labor force: by occupation: agriculture 44%, industry 20%, services 36% (1995) Unemployment rate: 0.6% officially, plus another 20% underemployed (2004 est.)

Population below poverty line: 28% (2004 est.)

Household income or consumption by percentage share: lowest 10%: 3.6%, highest 10%: 22% (2000)

Distribution of family income: Gini index: 44.7 (1998)

Inflation rate (consumer prices): 3% (2004 est.)

Budget: revenues: \$2.457 billion

expenditures: \$2.482 billion, including capital expenditures of NA (2004 est.)

Public debt: 41.5% of GDP (2004 est.)

Agriculture: products: cotton, vegetables, fruits, grain; livestock

Industries: textiles, food processing, machine building, metallurgy, gold petroleum, natural gas, chemicals

Industrial production growth rate: 6.2% (2003 est.)

Exports: \$3.7 billion f.o.b. (2004 est.)

Exports: commodities: cotton 41.5%, gold 9.6%, energy products 9.6%, mineral fertilizers, ferrous metals, textiles, food products, automobiles (1998 est.)

Exports: partners: Russia 21.2%, China 14%, Ukraine 7%, Turkey 6.3%, Tajikistan 5.8%, Bangladesh 4.2% (2004)

Imports: \$2.82 billion f.o.b. (2004 est.)

Imports: commodities: machinery and equipment 49.8%, foodstuffs 16.4%, chemicals, metals (1998 est.) Imports: partners: Russia 26.4%, South Korea 10.8%, Germany 9.4%, China 8.3%, Kazakhstan 6%(2004)

Reserves of foreign exchange and gold: \$1.603 billion (2004 est.)

Debt: external: \$4.351 billion (2004 est.)

Economic aid: recipient: \$87.4 million from the US (2003)

VENEZUELA

GDP: purchasing power parity: \$145.2 billion (2004 est.)

GDP: real growth rate: 16.8% (2004 est.)

GDP: per capita: purchasing power parity: \$5,800 (2004 est.)

GDP: composition by sector: agriculture: 0.1%

industry: 46.5%

services: 53.4% (2004 est.)

Labor force: 12.25 million (2004 est.)

Labor force: by occupation: agriculture 13%, industry 23%, services 64% (1997 est.)

Unemployment rate: 17.1% (2004 est.)

Population below poverty line: 47% (1998 est.)

Household income or consumption by percentage share: lowest 10%: 0.8%

highest 10%: 36.5% (1998)

Distribution of family income: Gini index: 49.5 (1998) Inflation rate (consumer prices): 22.4% (2004 est.) Investment (gross fixed): 12.9% of GDP (2004 est.)

Budget: revenues: \$26.91 billion

expenditures: \$30.7 billion, including capital expenditures of \$2.6 billion (2004 est.)

Public debt: 43.1% of GDP (2004 est.)

Agriculture: products: corn, sorghum, sugarcane, rice, bananas, vegetables, coffee; beef, pork, milk, eggs; fish Industries: petroleum, iron ore mining, construction materials, food processing, textiles, steel, aluminum, motor vehicle assembly

Industrial production growth rate: 12.3% (2004 est.)

Exports: \$35.84 billion f.o.b. (2004 est.)

Exports: commodities: petroleum, bauxite and aluminum, steel, chemicals, agricultural products, basic manufactures

Exports: partners: US 58.7%, Netherlands Antilles 4.1%, Canada 2.5% (2004)

Imports: \$14.98 billion f.o.b. (2004 est.)

Imports: commodities: raw materials, machinery and equipment, transport equipment, construction materials

Imports: partners: US 33.2%, Colombia 5.7%, Brazil 5%, Germany 4% (2004)

Reserves of foreign exchange and gold: \$25.75 billion (2004 est.)

Debt: external: \$33.29 billion (2004 est.)

VIETNAM

GDP: purchasing power parity: \$227.2 billion (2004 est.)

GDP: real growth rate: 7.7% (2004 est.)

GDP: per capita: purchasing power parity: \$2,700 (2004 est.)

GDP: composition by sector: agriculture: 21.8%

industry: 40.1%

services: 38.1% (2004 est.)

Labor force: 42.98 million (2004 est.)

Labor force: by occupation: agriculture 63%, industry and services 37% (2000 est.)

Unemployment rate: 1.9% (2004 est.)

Population below poverty line: 28.9% (2002 est.)

Household income or consumption by percentage share: lowest 10%: 3.6%

highest 10%: 29.9% (1998)

Distribution of family income: Gini index: 36.1 (1998) Inflation rate (consumer prices): 9.5% (2004 est.) Investment (gross fixed): 36.6% of GDP (2004 est.)

Budget: revenues: \$10.66 billion

expenditures: \$13.09 billion, including capital expenditures of \$1.8 billion (2004 est.)

Public debt: 65.9% of GDP (2004 est.)

Agriculture: products: paddy rice, coffee, fish and seafood, rubber, cotton, tea, pepper, soybeans, cashews, sugar cane,

peanuts, bananas, poultry

Industries: food processing, garments, shoes, machine-building, mining, cement, chemical fertilizer, glass, tires, oil,

coal, steel, paper

Industrial production growth rate: 16% (2004 est.)

Exports: \$23.72 billion f.o.b. (2004 est.)

Exports: commodities: crude oil, marine products, rice, coffee, rubber, tea, garments, shoes

Exports: partners: US 19.8%, Japan 13.7%, China 8.4%, Australia 7%, Germany 5.7%, Singapore 4.8%, UK 4.6%

(2004)

Imports: \$26.31 billion f.o.b. (2004 est.)

Imports: commodities: machinery and equipment, petroleum products, fertilizer, steel products, raw cotton, grain,

cement, motorcycles

Imports: partners: China 13.6%, Japan 11.5%, Singapore 11.5%, Taiwan 10.2%, South Korea 9.8%, Thailand 6.7%,

Hong Kong 4.4%, US 4.1%, Malaysia 4.1% (2004)

Reserves of foreign exchange and gold: \$6.51 billion (2004 est.)

Debt: external: \$16.55 billion (2004 est.)

Economic aid: recipient: \$2.8 billion in credits and grants pledged by international donors for 2000 (2004)

YEMEN

GDP: purchasing power parity: \$16.25 billion (2004 est.)

GDP: real growth rate: 1.9% (2004 est.)

GDP: per capita: purchasing power parity: \$800 (2004 est.)

GDP: composition by sector: agriculture: 15.5%

industry: 44.7%

services: 39.7% (2004 est.)

Labor force: 5.98 million (2004 est.)

Labor force: by occupation: most people are employed in agriculture and herding; services, construction, industry,

and commerce account for less than one-fourth of the labor force

Unemployment rate: 35% (2003 est.)

Population below poverty line: 45.2% (2003)

Household income or consumption by percentage share: lowest 10%: 3%

highest 10%: 25.9% (2003)

Distribution of family income: Gini index: 33.4 (1998) Inflation rate (consumer prices): 12.2% (2004 est.) Investment (gross fixed): 16.1% of GDP (2004 est.)

Budget: revenues: \$4.251 billion

expenditures: \$4.568 billion, including capital expenditures of NA (2004 est.)

Public debt: 46.4% of GDP (2004 est.)

Agriculture: products: grain, fruits, vegetables, pulses, qat (mildly narcotic shrub), coffee, cotton; dairy products, live-stock (sheep, goats, cattle, camels), poultry; fish

Industries: crude oil production and petroleum refining; small-scale production of cotton textiles and leather goods; food processing; handicrafts; small aluminum products factory; cement; commercial ship repair

Industrial production growth rate: 3% (2003 est.)

Exports: \$4.468 billion f.o.b. (2004 est.)

Exports: commodities: crude oil, coffee, dried and salted fish

Exports: partners: China 33.5%, Thailand 31.4%, Singapore 7.2%,

South Korea 6.1% (2004)

Imports: \$3.734 billion f.o.b. (2004 est.)

Imports: commodities: food and live animals, machinery and equipment, chemicals

Imports: partners: UAE 12.8%, Saudi Arabia 10.2%, China 9%,

France 7.9%, Kuwait 4.4%, US 4.4%, India 4.3%, Turkey 4.1% (2004)

Reserves of foreign exchange and gold: \$5.3 billion (2004 est.)

Debt: external: \$5.4 billion (2004 est.)

Economic aid: recipient: \$2.3 billion (2003-07 disbursements) (2003-07 disbursements)

ZAMBIA

GDP: purchasing power parity: \$9.409 billion (2004 est.)

GDP: real growth rate: 4.6% (2004 est.)

GDP: per capita: purchasing power parity: \$900 (2004 est.)

GDP: composition by sector: agriculture: 14.9%

industry: 28.9%

services: 56.1% (2004 est.)

Labor force: 4.63 million (2004 est.)

Labor force: by occupation: agriculture 85%, industry 6%, services 9%

Unemployment rate: 50% (2000 est.)
Population below poverty line: 86% (1993)

Household income or consumption by percentage share: lowest 10%: 1.1%

highest 10%: 41% (1998)

Distribution of family income: Gini index: 52.6 (1998) Inflation rate (consumer prices): 18.3% (2004 est.) Investment (gross fixed): 41.4% of GDP (2004 est.)

Budget: revenues: \$1.129 billion

expenditures: \$1.307 billion, including capital expenditures of NA (2004 est.)

Public debt: 127.5% of GDP (2004 est.)

Agriculture: products: corn, sorghum, rice, peanuts, sunflower seed, vegetables, flowers, tobacco, cotton, sugarcane, cassava (tapioca); cattle, goats, pigs, poultry, milk, eggs, hides; coffee

Industries: copper mining and processing, construction, foodstuffs, beverages, chemicals, textiles, fertilizer, horticul-

Industrial production growth rate: 6.9% (2004 est.)

Exports: \$1.548 billion f.o.b. (2004 est.)

Exports: commodities: copper/cobalt 64%, cobalt, electricity, tobacco, flowers, cotton

Exports: partners: Tanzania 14.1%, South Africa 13.2%, China 9.1%, Japan 7.9%, Thailand 7.9%, Switzerland

7.3%, Belgium 6.7%, Malaysia 4% (2004) Imports: \$1.519 billion f.o.b. (2004 est.)

Imports: commodities: machinery, transportation equipment, petroleum products, electricity, fertilizer; foodstuffs,

clothing

Imports: partners: South Africa 50.3%, Zimbabwe 13.2%, UAE 5.3% (2004)

Reserves of foreign exchange and gold: \$345 million (2004 est.)

Debt: external: \$5.353 billion (2004 est.)

Economic aid: recipient: \$651 million (2000 est.)

ZIMBABWE

GDP: purchasing power parity: \$24.37 billion (2004 est.)

GDP: real growth rate: -8.2% (2004 est.)

GDP: per capita: purchasing power parity: \$1,900 (2004 est.)

GDP: composition by sector: agriculture: 18.1%

industry: 24.3%

services: 57.7% (2004 est.)

Labor force: 4.23 million (2004 est.)

Labor force: by occupation: agriculture 66%, industry 10%, services 24% (1996)

Unemployment rate: 70% (2002 est.)

Population below poverty line: 70% (2002 est.)

Household income or consumption by percentage share: lowest 10%: 1.97%

highest 10%: 40.42% (1995)

Distribution of family income: Gini index: 50.1 (1995) Inflation rate (consumer prices): 133% (2004 est.) Investment (gross fixed): 9.9% of GDP (2004 est.)

Budget:

revenues: \$1.325 billion

expenditures: \$1.593 billion, including capital expenditures of NA (2004 est.)

Public debt: 52.3% of GDP (2004 est.)

Agriculture: products: corn, cotton, tobacco, wheat, coffee, sugarcane, peanuts; sheep, goats, pigs

Industries: mining (coal, gold, platinum, copper, nickel, tin, clay, numerous metallic and nonmetallic ores), steel,

wood products, cement, chemicals, fertilizer, clothing and footwear, foodstuffs, beverages

Industrial production growth rate: -7.8% (2004 est.)

Exports: \$1.409 billion f.o.b. (2004 est.)

Exports: commodities: cotton, tobacco, gold, ferroalloys, textiles/clothing Exports: partners: South Africa 11.9%, Zambia 6.3%, China 3.4% (2004)

Imports: \$1.599 billion f.o.b. (2004 est.)

Imports: commodities: machinery and transport equipment, other manufactures, chemicals, fuels Imports: partners: South Africa 47.2%, Democratic Republic of the Congo 6.2%, China 4.4% (2004)

Reserves of foreign exchange and gold: \$57 million (2004 est.)

Debt: external: \$4.086 billion (2004 est.)

Economic aid: recipient: \$178 million; note: the EU and the US provide food aid on humanitarian grounds (2000

est.)
