NITROGEN TRI-IODIDE (TOUCH EXPLOSIVE)

This is very shock sensitive, and will explode when agitated, moved, dropped, touched, breathed on, etc.

Take a medium glass and fill it up with ammonium hydroxide (household ammonia). Take some iodine crystals and pour in about a fourth of the glass full. Wait about 30 minutes to an hour then pour off the liquid remaining. Now, what you have in the glass it called nitrogen tri-iodide, which is very sensitive to touch. But, it is perfectly save when it is wet. That's why you do not let it dry until you want to use it. To detonate it just pour some of the wet stuff on an object and wait till something agitates it.

DANGER! ONCE THIS COMPOUND DRYS, IT CAN'T BE TOUCHED!
