For BAPS *satsaṅgīs*, it is contact with the personal and living form of *akṣara* and the constant maintenance of devotional attitudes to this form that allows for *mokṣa*. By recognizing *akṣara* in its manifest form, *jīva*, clothed in human form and impaired by bodily emotions and senses, can acquire the knowledge necessary for escaping the conditioning of *māyā*. In Swaminarayan devotionalism, *māyā* is understood, at the most general level, to be primordial matter (*prakṛti*) or that which conceals the knowledge required for *jīva* to attain *mokṣa*, the liberation from *saṃsāra*, the cycle of rebirth. Often translated as illusion, *māyā* is also associated with causing egoism, bodily desires, and worldly attachments, all barriers to achieving release. The *satsaṅgī*'s hope is to achieve this release in the current lifetime and thereafter to exist as *brahmarūpa*, in identification with *brahman*, in *akṣaradhāma*, alongside *puruṣottama* and *akṣara*. In Swaminarayan *viśiṣṭādvaita*, the ultimate reality, *puruṣottama*, never merges with *akṣara* or with lower existential entities.

BAPS followers do not follow the *ācāryas* and temples of the original *gāddīs* but have constructed temples to reflect their interpretation of Swaminarayan *viśiṣṭādvaita*. Also, a lineage of *akṣaragurus*, or living *gurus*, has been retroactively traced back to Gunatitanand Swami, a *sādhu* who lived during Sahajanand Swami's lifetime. The *guru* provides the template for ideal devotional behavior and through him devotees can achieve awareness of their eternal *jīva*. The most recent living *guru* is Pramukh Swami who, in 1971, became the "religious and spiritual" head of BAPS.

**ON DEVOTIONAL PRACTICES.** Membership in the Swaminarayan movement begins with a brief verbal initiation followed by the devotee's acceptance of the Swaminarayan *mantra*. The devotee then agrees to live a life according to specifications outlined in the core Swaminarayan texts.

The Swaminarayan ritual calendar as well as its ritual practices, vocabulary, and gestures are similar to those found

among the Vallabha Saṃpradāya and in Vaiṣṇavism in general. (Founded by Vallabha in the sixteenth century, the Vallabha Saṃpradāya is a Hindu devotional sect that remains influential in Gujarat and includes many wealthy merchants and other business-oriented caste groups among its followers.) *Satsaṅgīs* perform daily offerings (*pūjā*) to the iconic representation (*mūrti*) of Lord Swaminarayan kept in the home. For BAPS followers, *pūjā* includes the pictorial forms of the *guru* lineage and a reading selection from *Swami ni Vato*, a collection of brief sayings by Gunatitanand Swami. All *satsaṅgīs* must dress modestly, wear a double-stranded necklace of beads, and apply sectarian marks on their foreheads, with the women's mark differing from the men's. Besides regular participation at temple events, *satsaṅgīs* are also expected to contribute a portion of their annual income to the temple.

The *Vachanamritam* outlines four categories of action for helping devotees strengthen their devotionism. Much of temple-based discourse and many events revolve around assisting *satsaṅgīs* to reflect upon and act on these suggestions:

1. Remain within the expectations and rules for moral living.
2. Develop a deep attachment to Lord Swaminarayan and *sādhus*.
3. Control mental and physical senses.
4. Develop knowledge of Swaminarayan philosophy.

The most tangible means for attaining and expressing correct devotional postures is to perform *seva*, service and resources that are volunteered. "Doing *seva*," *satsaṅgīs* note, helps them to transcend bodily desires and focus more intensely on the glory of the highest existential reality, *puruṣottama*. Female followers are especially visible as *seva* volunteers and this has contributed to dramatic changes, particularly in the BAPS sect. In BAPS, women have parallel leadership positions and activities to men. Women manage their groups and sponsor their own events and publications. Though sometimes frustrated at the gender segregation and their inability to have direct contact with *guru* and *sādhus*, women consider theirs a privileged position, of having a god-realized *guru* who powerfully guides them from a distance.

**CONTEMPORARY ISSUES.** Coinciding with the migration of Gujarati peoples, the Swaminarayan movement has also expanded beyond India. Its religious and lay leaders are focused on the needs of Hindus in the diaspora who are creating permanent rather than temporary lives outside of India. BAPS, through its worldwide network of more than five hundred temples and a large "volunteer" base, is by far the most visible sect in the Swaminarayan movement. Since its founding, BAPS and its living *gurus* have traveled to wherever Gujaratis have gone, openly addressing immigrant-diaspora issues of resettlement, cultural loss, and community building. This has resulted in the creation of programs that were not needed in the Gujarat context, such as Gujarati language classes and

festivals to promote "Hinduism." BAPS Swaminarayan communities in the United States and Great Britain now have resident *sādhus* who teach and administer temple activities. North of London, a BAPS traditional-style marble and stone temple with an attached exhibition hall attracts upwards of ninety thousand visitors during Hindu new year celebrations. Similar "traditional" temple complexes were completed in Chicago, Illinois, and Houston, Texas. In Gandhinagar, Gujarat, an elaborate monument, exhibition, and research center known as Akshardham was the site of a terrorist attack in 2002. Swaminarayan sites and their polished presentation of "Hinduism" are clearly attracting notice, owing to a visibility reflective of the movement's diasporic wealth and organized management structure.

What is remarkable is the degree to which BAPS, and to a lesser extent the original Swaminarayan *gādis*, have translated the injunction for moral living and reform into a larger transnational project, one that positions Swaminarayan *bhakti* as synonymous with a reified sense of "Hinduism." This equation promotes a problematic conceptualization of religion, one that uncritically conflates it with culture, language, and geography and offers a seamless portrait of Hindu traditions. The contemporary Swaminarayan movement thus appears sympathetic to pro-Hindu fundamentalist sentiments. While this connection is disputed by its leaders, what is less refutable is the movement's growing base of immigrants who are attracted to representations of an essentialized Hinduism. The Swaminarayan movement has, in spite of its restrictive codes of behavior, endured for over two centuries: its newer communities demonstrate how politics of religious nationalism and the needs and desires brought on by diasporic living can spur accommodations to, rather than retreat from, external changes.

#### BIBLIOGRAPHY

- Brent, Peter. *Godmen of India*. London, 1972. Contains account of author's meeting with the English translator of the *Vachanamritam*, H. T. Dave, and Swami Jnanjivandas, the third living *guru* in the Bochasanwasi Shri Akshar Purushottam Swaminarayan Sanstha.
- Dave, H. T. *Shree Swaminarayan's Vachanamritam*. Bombay, 1977; reprint, Ahmedabad, India, 1989. First complete English translation of Sahajanand Swami's discourses from the BAPS perspective.
- Dwyer, Rachel. "Caste, Religion, and Sect in Gujarat: Followers of Vallabhacharya and Swaminarayan." In *Desh Pardesh: The South Asian Presence in Britain*, edited by Roger Ballard, pp. 165–190. London, 1994. A clear exposition of the caste composition of Gujarat and a comparative look at two Gujarati Vaiṣṇava religious sects, the Swaminarayan movement and Vallabha's Puṣṭimārga Saṃpradāya.
- Hardiman, David. "Class Base of Swaminarayan Sect." In *Economic and Political Weekly* (September 10, 1988): 1907–1912. Critical examination of the Ahmedabad *gāddī* of the original Swaminarayan movement. Argues that the activities and attitudes of this *gāddī* stem from its narrow caste base.

- Heber, Reginald. *Narrative of a Journey through the Upper Provinces of India, from Calcutta to Bombay, 1824–1825*, vol. 2. Philadelphia, 1828. A record of his diary, the second volume contains Bishop Heber's encounter with Sahajanand Swami in March 1825. The Bishop's conversation with the "Hindoo reformer" as well as his descriptions of the meeting have been deployed by the Swaminarayan movement as proof of its founder's impact on the colonial presence in Gujarat. As a historical record, this diary confirms the positive impression that the original Swaminarayan movement and its founder made on a Christian emissary and his countrymen.
- Kim, Hanna Hea-Sun. "Being Swaminarayan: The Ontology and Significance of Belief in the Construction of a Gujarati Diaspora." Ph.D. diss., Columbia University, New York, 2001. An ethnographic exploration of the Bochasanwasi Shri Akshar Purushottam Swaminarayan Sanstha based on fieldwork conducted in the United States, United Kingdom, and India. Looks at the ways in which followers think about and participate in Swaminarayan devotionism and draws closer attention to female followers and their engagement with Swaminarayan prescriptions of behavior. Provides comprehensive bibliography for BAPS publications.
- Monier-Williams, Monier. "The Vaishṇava Religion, with Special Reference to the *Śikshā-Pātrī* of the Modern Sect called Svāmi-Nārāyaṇa." *Journal of the Royal Asiatic Society of Great Britain and Ireland*, n.s., 14 (1882): 289–316. Written after Monier-Williams, Boden Professor of Sanskrit at Oxford, had toured the Gujarat region in 1875. Though its language and tone are reflective of the author's Orientalist perspective, this article does contain an early portrait of the Vadtal Swaminarayan *gāddī* during a Hindu new year celebration.
- Monier-Williams, Monier, ed. "Sanskrit Text of the *Śikshā-Pātrī* of the Svāmi-Nārāyaṇa Sect." *Journal of the Royal Asiatic Society of Great Britain and Ireland*, n.s., 14 (1882): 733–772. Includes the full Sanskrit text of the *Shikshapatri* given to Monier-Williams by the *ācārya* of the Vadtal *gāddī* in 1875. Also includes Monier-Williams's English translation, which, when compared to the English translations by the sects in the Swaminarayan movement, reveals striking elisions and differing transliterations.
- Mukta, Parita. "The Public Face of Hindu Nationalism." *Ethnic and Racial Studies* 23, no. 3 (May 2000): 442–466, argues that diasporic Hindus in the United Kingdom are fostering religious nationalism through temples and temple-sponsored activities. Polemical in tone, the article critiques the activities of the London BAPS temple.
- Pocock, David. *Mind, Body, and Wealth: A Study of Belief and Practice in an Indian Village*. Oxford, 1973. An incisive ethnographic look at various Hindu sects in Gujarat. Included is an introduction to the original Swaminarayan community, its founder, and its central texts. This book is notable for its early effort to refrain from using the word *religion* in order to avoid an artificial separation of Hindu practices from other areas of social life.
- Pocock, David. "Preservation of the Religious Life: Hindu Immigrants in England." *Contributions to Indian Sociology*, n.s., 10, no. 2 (1976): 341–365. An ethnographic encounter with the Bochasanwasi Shri Akshar Purushottam Swaminarayan Sanstha community in London, this is useful for its observations of BAPS in its early diasporic formation. Certain points are remarkably prescient and others, when combined with more recent data (cf. Kim, 2001), underscore the transformative capacity of this community, most notably reflected in profound changes in the role of women.
- Shukla, Sandhya. "Building Diaspora and Nation: The 1991 'Cultural Festival of India'." In *Cultural Studies* 11, no. 2 (1997): 296–315. Pointed critique of diasporic South Asians and their modes of identity and ethnicity-making. Article directs attention to the BAPS-sponsored "Cultural Festival of India," the first national event for the American Swaminarayan community.
- Williams, Raymond Brady. *Religion of Immigrants from India and Pakistan: New Threads in the American Tapestry*. Cambridge, U.K., 1988. Provides a closer look at Gujarati Swaminarayan communities in the United States, including the original Swaminarayan and Bochasanwasi Shree Akshar Purushottam Swaminarayan Sanstha sects.
- Williams, Raymond Brady. *An Introduction to Swaminarayan Hinduism*. Cambridge, U.K., 2001. A revised and updated version of an earlier text, *A New Face of Hinduism: The Swaminarayan Religion*, Cambridge, U.K., 1984. The most comprehensive and accessible English-language source by a non-Swaminarayan devotee on the history and religious philosophy of the Swaminarayan movement. Contains a wealth of details particularly with respect to the administration and organization of the dominant Swaminarayan sects. This focus, which is necessarily a male one owing to the gender segregation in the lay and religious hierarchy, is enriched by Williams's first-hand interviews with the male religious leadership in the major sects of the Swaminarayan movement.

#### Primary materials and websites

Texts and other printed materials by the founder, principal religious leaders, and followers of the Swaminarayan Movement are generally available outside of India at the larger temples connected to the different Swaminarayan sects. Though all sects use the same core texts (e.g., *Vachanamritam*, *Shikshapatri*), translations reflect their sectarian orientation. In addition to books and other published media, the web sites for the two largest Swaminarayan sects offer explanatory essays and updates on current temple and community activities. The web site for the original Swaminarayan *gāddīs* is [www.moksha.akshardham.org](http://www.moksha.akshardham.org). The web site for the Bochasanwasi Shri Akshar Purushottam Swaminarayan Sanstha is [www.swaminarayan.org](http://www.swaminarayan.org).

HANNA H. KIM (2005)

#### SWAMI VIVEKANANDA SEE VIVEKANANDA

**SWANS.** Related to the elements of both air and water, the swan is a symbol of breath, spirit, transcendence, and freedom. In many religious traditions it is interchangeable with the goose or duck in signifying the soul. Swans connote both death beneath the waters and rebirth, or victory over death, in the air. The complexity of the symbol is reflected in its alchemical representation as the union of opposites, the mystic center.

A prominent motif among origin myths is the cosmogonic dive, in which a swan or other aquatic bird is sent by God to the depths of the primordial waters to bring back the "seed of earth," from which God creates the world. This image existed in manifold versions among prehistoric populations of northern and eastern Europe and, from the third millennium BCE, among the peoples of America.

In Hindu iconography the swan personifies *brahman-ātman*, the transcendent yet immanent ground of being, the Self. Brahmā is often depicted borne on a swan, the divine bird that laid upon the waters the cosmic egg from which the god emerged. Variations of this image are common in Bali and Sri Lanka. The *paramahansa* ("supreme swan" or gander) represents freedom from bondage in the phenomenal sphere and is a term of honor addressed to mendicant ascetics. The *hansa* bird is carved on the ornamental bands of Kesava temple at Somnathpur, erected in 1268 and dedicated to Viṣṇu.

In ancient Egypt, swans were associated with the mystic journey to the otherworld, as they are in the shamanistic religions of North Asia. In ancient Greece, priests of the Eleusinian mysteries were regarded as descendants of the birds; after their immersion in the purifying waters they were called swans. Vase paintings of the fifth century BCE show the swan as their attribute. In its amatory aspect, the swan was sacred to Aphrodite and Venus and was the form assumed by Zeus as Leda's lover.

As a solar sign, the swan was the sun god's vehicle in Greece; it was assimilated to the *yang* principle in China and inscribed on one of the wings of Mithra, the Persian god of light. In Celtic myths, swan deities represent the beneficent, healing power of the sun. In the ancient religion of the Sioux Indians of the North American Plains, birds are reflections of divine principles, and the sacred white swan symbolizes the Great Spirit who controls all that moves and to whom prayers are addressed.

An ambivalent symbol in Judaism, the swan (or the duck or goose) is conspicuous on ceremonial objects although categorized as a bird of defilement in the Bible. In the Christian tradition, it symbolizes purity and grace and is emblematic of the Virgin. The belief that swans sing with their dying breath has linked them with martyrs.

Folklore is rich in legends of swan maidens and swan knights. Believed to have been totemistic figures and original founders of clans, the half-human, half-supernatural beings who metamorphosed into swans became images of spiritual power. The skiff that carried the archangelic grail knight Lohengrin, a savior sent by God to overcome evil, was drawn by a swan. The motif of the swan maiden or knight is widely disseminated in mythology and ritual throughout Europe, India, Persia, Japan, Oceania, Africa, and South America.

The bird's sweet song has made it a perennial metaphor in the arts. The Egyptians associated it with the harp; the Greeks, with the god of music; and the Celts deemed its song

magical. Shakespeare was known as the Swan of Avon; Homer, the Swan of Maeander; and Vergil, the Mantuan Swan. Ever since Plato had Socrates aver that swans "sing more merrily at the approach of death because of the joy they have in going to the god they serve," the term *swan song* has been an epithet for an artist's last work.

ANN DUNNIGAN (1987)

**SWAZI RELIGION.** The Swazi are part of the vast Bantu-speaking population of southern Africa, and their rich cultural heritage is a fusion of Nguni and Sotho elements. Prior to the incursion of colonial and Western influences they were Iron Age horticulturalists and cattle pastoralists, organized into centralized chieftancies. Polygyny and patrilineal descent characterize the kinship system.

The Swazi developed their particular national identity under a dual monarchy represented by a hereditary king of the Nkosi Dlamini clan and a queen mother (the mother of the king or, if she is dead, a surrogate). Unlike other African kingdoms that came under British colonial rule, the Swazi were never conquered by direct force, and much of their traditional culture survived and flourished under the leadership of King Sobhuza II (1899–1982). A direct lineal descendant of the founder of the royal Dlamini dynasty, Sobhuza was internationally acknowledged in 1968 as king and head of the newly created, independent state of Swaziland.

In 1982 approximately half a million Swazi lived in the Kingdom of Swaziland, an arbitrarily demarcated country of 6,705 square miles wedged between the Republic of South Africa and the People's Republic of Mozambique. This tiny kingdom, the heartland of traditional culture, is ecologically diverse and rich in natural resources. Its wealth includes fer-

tile soils, abundant perennial bush pasturage, forests alive with wondrous trees and wild animals, precious minerals, and four major rivers and several streams. Some 40 percent of all land, the legacy of colonial concessions, is owned by whites. Although few Swazi are able to support themselves with agriculture or pastoralism and most rely on wage labor, they remain deeply attached to their ancestral lands and to their cattle. The land is vested in the king as trustee for the nation, and its use is allocated by hereditary chiefs to heads of homesteads. Throughout the region, the king and queen mother are renowned for their knowledge of ritual “to work the rain,” the symbol of fertility and “the water of life.”

Swazi traditionalists perceive a majestic order in their universe, one alive with powers, *emandla* (a collective noun that has no singular). These powers continue through time and are not bound by space. They appear in diverse forms and operate with varying degrees of potency. They are *in* substance rather than *of* substance; in water, not of water; in earth, not of earth; in man, not of man. Among the Swazi, no rigid division is drawn between natural and supernatural. No substance is considered immutable. Sacred and secular are shifting dimensions of a total reality in which human behavior may influence the elements as much as the elements influence the human condition. Between them there is perpetual and dynamic interaction.

The Swazi have no elaborate myth of creation. The world is there, mysterious and wonderful. In the symbolic system of the Swazi, there is a diversified hierarchy of powers connecting humans to each other and to the cosmos. In the mythical distance is Mvelamqandi (“who-appeared-first”) generally described as a power “above,” unapproachable, unpredictable, of no specific sex. He/she is sometimes identified with, and sometimes distinguished from, Mkhulumqandi, the first *mkbulu*, a term applied to a grandfather, symbolic mediator between those living on the earth and those “below,” the ancestors, *emadloti*. Mvelamqandi occasionally sent as his messenger Mlengamunye, the “one-legged” (interpreted as oneness, unity), who descended in a thick mist and whose appearance, visible only to women and children, portended the coming of *fever*, a generic term for a variety of illnesses; thus Mlengamunye had to be propitiated with symbolic sacrifices. He was last seen in the reign of King Mbandzeni (1875–1889), during a period of early missionary activity. Although Mvelamqandi, Mkhulumqandi, and Mlengamunye are no longer mentioned in prayer or sacrifice, Swazi theologians, including Sobhuza, have referred to these three divinities, as well as to other powers in the pantheon—such as the rainbow, titled Inkosatana (“the princess”); the lightning, titled Inyoni (“the bird”); and a water serpent, titled Inyoka Yemakhandakhanaa (“the snake with many heads”)—to emphasize a sacred and hierarchical order of the cosmos.

The earth is seen as stationary; the calendar of religious events, both national and domestic, is regulated by the visible movements of the sun against fixed points on the horizon

and by its position in relation to the waxing and waning of the moon. The divinity of the king is associated with the sun—radiant, burning, source of both heat and light, journeying across the sky in a more or less regular path twice a year, controlling the seasons and the productive activities of nature. The moon has its own internal dialectic, associated with fertility, femininity and growth, decline and rebirth. Ceremonies to introduce a person into the fullness of a new status take place when the moon is growing or when it is full. A ceremony that temporarily isolates a man from his fellows is held in the period of the moon’s decline and darkness.

The earth, mother to the living and the dead, must be approached with reverence. When a person dies, all in the homestead are prohibited from digging, plowing, or planting, or in other ways “wounding” the earth until the body has been buried and the mourners purified. When Sobhuza died in late August 1982 (the time of the first rains), such prohibitions were imposed throughout the kingdom until the rising of the third moon. The fact that rain did not fall for several weeks afterward and that the country was threatened by drought and famine was interpreted as a reaction to this disturbance in the balance between human actions, the ancestors, and cosmic powers.

The king and the queen mother together represent the physical embodiment of sacred power, as indicated by their traditional titles, *ingwenyama* (“the lion”) and *indlovukah* (“the she-elephant”). These are two of the most powerful animals in nature: the lion—male, father of many cubs, aggressive, carnivorous; the she-elephant—maternal, matriarchal, stable, firm, herbivorous, mother of one calf after a long period of gestation. Together the two monarchs are spoken of as “a twin,” a mysterious, unequal double, united in a relationship riddled with ambivalence. Their everyday actions—eating, drinking, bathing, dressing—are circumscribed by taboos, and they receive unique treatment to endow them with the “shadow of sovereignty.”

At the observable, sociological level, the queen mother and king live in separate homesteads; hers is the sacred center, his is the administrative capital. Their duties are complementary; the balance of power is delicate, and tension between them is believed to endanger the physical condition of the country. The most sacred objects are in the care of the queen mother, and the king must come to the shrine of the nation to address his royal ancestors and offer sacrifices. The correct performance of rituals takes considerable time, concentration, and self-discipline. While the secrets of specific rituals are known to appointed representatives of historically associated clans, only the king is “owner” of all.

Swazi religion sanctions enjoyment of the material and physical: food, women, and dancing. It does not idealize poverty or place a value on suffering as a means to happiness or salvation. To deal with the hazards of life—failure of crops, unfaithfulness of women, illness and ultimate death—the culture provides a set of optimistic notions and positive,

stereotyped techniques that are especially expressed through the ancestral cult, the vital religion of the Swazi.

In the ancestral cult, the world of the living is projected into the world of spirits (*emadloti*), who continue the patterns of superiority and inferiority established by earthly experiences as man or woman, old or young, aristocrat or commoner.

Swazi believe that the spirit, or breath, has an existence distinct from that of the flesh. When a person dies, both flesh and spirit must be correctly treated to safeguard the living and show appropriate respect for the dead. Mortuary ritual varies according to both the status of the deceased and his or her relationship with different categories of mourners. The flesh is buried in a cattle kraal, hut, cave, or royal grove. The spirit, after a brief period of aimless wandering, is ritually "brought back" at a sacrificial feast to the family circle.

For conservatives, irrespective of rank or age, the ancestors are an integral part of the reality of routine daily life. Their presence is all-pervasive; their relationships to each category of members of the kinship circle—married, unmarried, agnates, and in-laws—affect the language, movements, and clothing of the living. This is particularly conspicuous in the laws of "respect" governing the behavior of a married woman, the outsider brought in to perpetuate the husband's lineage (e.g., she must avoid speaking any word containing the first syllable of the names of particular senior male in-laws; she must not walk in front of the entrance to the shrine or through the cattle kraal). Visitors, on entering a homestead, on receiving food or other hospitality, praise the headman, not as an individual, but by reciting the names of his clan; clan praises are ancestral commemorations.

It is through the ancestors that Swazi confront the universal issues of mortality and morality. *Emadloti* represent continuity through fertility. They may appear in dreams, or they may materialize temporarily as "snakes" (e.g., the king as a terrifying mamba, the queen mother as a beautiful lizard, a wife as a harmless green garden snake).

Illness and other misfortunes are frequently attributed to the ancestors, but Swazi believe that *emadloti* do not inflict sufferings through malice or wanton cruelty. The mean husband, the adulterous wife, the overambitious younger brother, the disobedient son may be dealt with directly or vicariously by the spirits, who thus act as custodians of correct behavior and social ethics. Ancestors punish, they do not kill; death is brought about by evildoers (*batsakatsi*), who are interested in destroying, not in perpetuating, the lineage or the state. If an illness originally divined as sent by the *emadloti* later becomes fatal, evildoers are assumed to have taken advantage of the patient's weakened condition. Ancestors have greater wisdom, foresight, and power than the rest of mankind, but they are not considered omnipotent.

Swazi have no class of ordained priests, and the privileged duty of appealing to the *emadloti* rests with the head of the family. The father acts on behalf of his sons; if he is

dead, the older brother acts on behalf of the younger. In this patrilineal society, ancestors of a married woman remain at her natal home, approachable only by her senior male kinsmen. Contact is usually made through the medium of "food" (meat, beer, or tobacco snuff); the dead, who are said to be often hungry, "lick" the essence of the offerings laid at dusk on an altar in the shrine hut and left overnight.

*Emadloti* are spoken of with respect and fear, and they are routinely addressed with the formality demanded by living elders. But they are not adored or worshiped. They are approached as practical beings, and appeals to them are sometimes spontaneous and conversational, interspersed with rebukes and generally devoid of gratitude. There is no conflict between the ethics of the ancestral cult and the mundane desires of life. Swazi desire the ends they say the *emadloti* desire for them.

Interpreting the messages of the ancestors is the task of diviners (*tangoma*), the main specialists in deep, esoteric knowledge. They are called upon to reveal the cause of illness or misfortune (the particular offense or the specific ancestor who must be "remembered" or appeased), and they indicate, but do not carry out, the cure (ritual sacrifice, purification, or medical treatment). *Tangoma* work in collaboration with specialists in medicines (*tinyanga temitsi*), but whereas the latter acquire their knowledge voluntarily and deliberately, each diviner is "entered," often against his or her will, by an ancestral spirit who takes control.

The training of diviners is lengthy and arduous. They suffer both mentally and physically, and when they finally qualify, "reborn like the new moon," their entire being has changed. Dressed in the strange costume of their new calling, they demonstrate their powers in a public séance, accompanying their performances with inspired songs and dances. Techniques of divination vary; some diviners use material objects (bones, shells, roots), while others rely on "feel" or verbal cues. There is no fixed hierarchy of diviners, and reputations fluctuate. Though some individual diviners are recognized as frauds and others are seen as fallible, perception through possession by the ancestors is never challenged.

Diviners, who are often of exceptional intelligence, perform within the legal framework of religion. In this capacity they practice against evildoers (witches and sorcerers) who act illegally, in secret and horrible ways, some through an innate propensity for evil, others through deliberate use of material substances, including poisons and parts of the human body. Political leaders and other aristocrats employ medicine men and diviners to bolster their positions, but are actively discouraged from becoming either medicine men or diviners themselves, since this would interfere with their administrative duties and does not fit into their ascribed status. The Ingwenyama is believed to have deeper knowledge than any of his subjects and to be able to detect and destroy evildoers by virtue of his royal blood reinforced by unique royal potions.

The king and his mother take the lead in the cycle of national rituals. The most dramatic and illuminating exam-

ple is the Ncwala, a ritual which grows in elaboration and potency as the king increases in power. If the king dies and his successor is a minor, a very attenuated ceremony, known as the Simemo, is performed. (On Sobhuza's death, the council selected as his heir a boy of fourteen years.) Traditionally, the first full Ncwala should be performed when the young king reaches full manhood and is married to two ritual queens.

Ncwala is divided into two parts, Little Ncwala and Big Ncwala. Little Ncwala, which opens when the sun reaches its resting place in the south and the moon has waned, lasts two days and symbolizes the break with the old year. Big Ncwala, which opens when the moon is full and lasts six days, symbolically revitalizes the king and fortifies the nation against evildoers within the country and enemies outside its borders. In the liminal period, sacred dances and songs are practiced throughout the country, ritual costumes are prepared, and sacred ingredients are collected by national priests. Swazi participants, as well as foreign analysts, interpret the complex ritual at various levels of meaning.

Ingwenyama is recognized as the "owner" of Ncwala. Anyone else who attempts to "dance Ncwala" is judged guilty of treason. Politically, Ncwala is a reflection of rank in which major social categories—princes, chiefs, queens, councillors, and warriors in age regiments—are visibly distinguished from each other by sacred costumes and perform distinctive roles in the service of Ingwenyama as symbol of the nation. At another level, Ingwenyama is mystically identified with the miraculous and ever-changing powers in nature—the sun and the moon, not as separate elements but in their interaction. The king's body is bathed with "waters of all the world" drawn from rivers and from the ocean by two groups of national priests, each group carrying a sacred gourd titled Inkosatana, "the princess," which is also the title of the rainbow. Ingwenyama "bites" of the green foods of the new year and also of the organs of a fierce black bull which has been thrown and pummeled to the rhythm of a lullaby by a regiment of "pure youths who have not yet spilled their strength in children."

The king appears in the ceremonies in a variety of unique clothing, whether it be a penis sheath of ivory on his naked body or, as at the climax of the main day, an indescribably elaborate costume of bright green, razor-edged grass and evergreen shoots. With his face half hidden by a cap of black plumes over a headband of lion skin, he is an awe-inspiring creature of the wild.

On the final day of the ritual, the day of purification, relics of the past year are burned on a pyre in the sibaya (cattle kraal) of the capital village, and rain, symbolizing the blessing of the ancestors, must fall to extinguish the flame and drench the rulers and their people.

A complementary and less elaborate women's ritual, Mhlanga (from the word for "reed," a symbol of fertility), centers on the queen mother. Each winter, unmarried girls

are sent on a pilgrimage to marshy areas to cut the long supple reeds needed to repair the fences surrounding the enclosures of the queen mother and the queens. The reeds must be golden ripe, not brittle, the tassles full, and the seeds not yet dispersed. The girls wear brief costumes to reveal their beauty and purity, and singing and dancing are essential for the performance. The king must be present; the girls are feasted and the ancestors offered their share.

Although early missionaries who preached the Protestant ethic condemned traditional Swazi beliefs and practices, Swazi rulers were interested in learning the new religion. From their point of view, the ancestral cult is not incompatible with the basic tenets of Christianity, only with the specific applications of the tenets that missionaries have made.

Sobhuza never identified himself with any specific denomination, but his role as priest-king of the entire country was increasingly recognized during his reign not only by independent African churches, but by some of the more conventional congregations as well. Queen mothers have retained their affiliation with individual churches while at the same time carrying out their traditional ritual duties. Priests of independent churches participate in Ncwala, and members of any denomination may hold services in the Lobamba National Church, an impressive structure completed in 1978 in the ambience of the ritual capital. The extent to which this symbiotic process will continue is unpredictable. As long as the myth of the Swazi divine kingship retains a political hold over the Swazi, this will be ritualized in the Ncwala. If the myth is abandoned and Swazi kingship ends or is made subordinate to other myths with different loyalties and interests (such as individual equality), both the ritual and the underlying political meaning of the Ncwala will be lost. But judging from the histories of other African societies, the Swazi will hold to their belief in the ancestors and in diviners.

#### BIBLIOGRAPHY

There is as yet no full-length study of Swazi religion, although a general monograph by Brian Allan Marwick, *The Swazi* (Cambridge, 1940), does include a chapter titled "Religion and Magic." A very rich store of information on Swazi beliefs, rituals, and symbols is contained in books and articles I have written: among them, *An African Aristocracy: Rank among the Swazi* (Oxford, 1947) is a detailed account of the traditional political system and its economic and religious institutions; *The Swazi: A South African Kingdom* (New York, 1963) is a case study with an interpretive chapter on religion; *So-bhuza II: Ngwenyama and King of Swaziland* (London, 1978) is a biography of a traditional king which illustrates the importance of religion as an attribute of modern Swazi kingship. The close relationship between Swazi kingship and the independent church movement is well documented by Bengt Sundkler in *Zulu Zion and Some Swazi Zionists* (Lund and Oxford, 1976).

My study "A Ritual of Kingship among the Swazi," *Africa* 14 (1944): 230–256, also included in *An African Aristocracy*, is a detailed ethnographic account of Ncwala based on participant observation and texts. The ritual has received different

interpretations by scholars with diverse theoretical approaches. The most significant of these studies are Max Gluckman's *Rituals of Rebellion in Southeast Africa* (Manchester, 1954), which emphasizes political and social functions; T. O. Beidelman's "Swazi Royal Ritual," *Africa* 36 (October 1966): 373–405, which interprets the cosmological system and makes use of Jungian psychology; and Luc de Heusch's *Mythes et rites bantous*, vol. 2, *Rois nés d'un coeur de vache* (Paris, 1982), which sets the Ncwala in a broad comparative framework built on a brilliant, Lévi-Straussian analysis of sacred kingship in Africa.

## SWEARING SEE VOWS AND OATHS

**SWEDENBORG, EMANUEL** (1688–1772), was a multifaceted genius, scientist, and visionary. He was born in Stockholm, Sweden, on January 29, and he died in London on March 29. Paradox surrounds Swedenborg's intellectual legacy. The scientific and philosophical works that brought him the acclaim of his contemporaries have largely been forgotten. The contributions that he made to the Swedish Board of Mines and the House of Nobles were significant, but like the efforts of most bureaucrats and politicians they were intended to have an immediate and practical impact on policy, not history. Thus, despite his genius, Swedenborg's exemplary life would attract scant notice, apart from his revelatory claims and his voluminous religious writings. He published his writings anonymously for almost twenty years and never attempted to gather a following. Nonetheless, after his death, followers devoted to his religious works appeared first in Europe and then around the world.

**EDUCATION OF SCIENTIST AND CIVIL SERVANT.** Swedenborg was born into wealth and privilege; both of his parents came from mine owning families. His father, Jesper Swedenborg (1653–1735), was ordained into the ministry of the Lutheran Church in 1682. In 1703 he was elevated to bishop and served in Skara until his death in 1735. His name was changed to Swedenborg upon ennoblement in 1719. Jesper Swedenborg had pietistical leanings, believed in the importance of works as well as faith, and had both a hymnbook and a translation of the Bible condemned by church censors.

Emanuel Swedenborg matriculated at the University of Uppsala, from which he graduated in 1709 with a degree in philosophy. From 1710 until 1715 he traveled in Europe

with a principle focus on studying mathematics and astronomy. On his trip abroad, he also learned various practical skills, including engraving and instrument making. In addition he wrote three volumes of poetry, and before returning home he wrote down descriptions of fourteen inventions, including a submarine, an air pump, and a fixed-wing aircraft.

Upon his return to Sweden in 1715, he began publishing *Daedalus Hyperboreus*, Sweden's first scientific journal. In addition, he became an assistant to the great inventor and mechanical genius Christopher Polhem (1668–1751). Together they served King Karl XII by working on various engineering projects. In recognition of Swedenborg's contributions to the realm, the king named him Extraordinary Assessor of the Board of Mines. The death of Karl XII in Fredrikshald in 1718 brought an end to Sweden's era as a great power. Swedenborg was ennobled in 1719 by Queen Ulrika Eleonora (1688–1741).

The death of Karl XII ushered in what is called in Sweden "the age of freedom" and the renunciation of the King's policies. The new political climate also put Swedenborg's commission as assessor in doubt. Determined to be seated, in 1720 Swedenborg traveled to Europe to study mining techniques. After his return to Sweden he took up his life as a noble and author, and after 1724 as a bureaucrat, having finally been granted a position as a regular assessor and given a salary. In this position he was one of seven men responsible for Sweden's important mining industry. The members of the Board of Mines set policies, inspected mines for safety, tested the metals produced for quality, set prices, and adjudicated law suits. Swedenborg served on the board for twenty-three years. Appointed president of the Board of Mines in 1747, he declined the appointment and resigned from the board in order to devote himself to his spiritual mission.

**NATURAL PHILOSOPHER.** With his career finally established, Swedenborg turned his mind to understanding scientifically the riddle of creation and the purpose of self-conscious life. In 1734 he took a leave of absence from the Board of Mines to publish his *Opera philosophica et mineralia* (*Philosophical and Mineralogical Works*) in Liepzig. Swedenborg's cosmology is indebted in part to the philosophy of René Descartes (1596–1650). In a series of studies culminating in *Principia rerum naturalium* (*The Principia; or the First Principles of Natural Things*, 1734) Swedenborg presented a theory about the origin of the universe. Starting from a mathematical point of departure, he envisioned the planetary system as developing a series of complicated particle combinations. Swedenborg tried to integrate the soul into this consistently mechanistic structure, and in *De infinito* (*The Infinite*, 1734) he presented his future research program "to prove the immortality of the soul to the very senses themselves."

This empirical intention led him into an extensive study of contemporary physiology and anatomy, as well as both ancient and modern philosophy. The first result of this effort was the publication of *Oeconomia regni animalis* (*The economy of the animal soul's kingdom*, 1740–1741). Dissatisfied

with his initial effort, believing that he had not been sufficiently thorough, he began again. He published three volumes of *Regnum animale* (The animal soul's kingdom, 1744–1745) before abandoning the project.

**RELIGIOUS CRISIS AND SPIRITUAL CALL.** It was during this publishing trip abroad that Swedenborg experienced a profound spiritual crisis during the 1743 to 1744 period. The crisis began in dreams that he recorded in a journal for his own personal use. Discovered in 1859, it is known today as *The Journal of Dreams*. In it, he not only recorded his dreams, he interpreted them. He discovered his sin of pride and arrogance, he prayed, he sought forgiveness, and he found himself held in the bosom of Christ. He recorded intense temptations that affected both his body and his spirit. Drawn deeply inward, he understood that he must follow Christ in all things. He put aside his scientific work, obeying a divine commission to write down and publish the true meaning of the scriptures, in order to make them universally available. Swedenborg's spiritual call can be viewed as either a disjunction in or a culmination of his own intellectual journey.

Returning to Sweden he focused on studying the Bible in Hebrew, searching for the key to its internal or spiritual meaning. Swedenborg had earlier developed a doctrine of correspondences, according to which all phenomena of the physical world have their spiritual correspondences. He wrestled with the meaning of the story of creation and the nature of God. He discovered that in the Bible, words used in one place correspond to words used in another place, and finally he grasped the idea that the garden in *Genesis* does not refer to the natural creation of the earth and the universe, but to the spiritual process of human regeneration. *Genesis* details this spiritual process through which every individual can return to and be conjoined with the one God, the Lord Jesus Christ, to eternity. Swedenborg documents this in the eight volumes of the *Arcana coelestia* (Secrets of heaven, 1749–1756). In this work Swedenborg states that what he writes about heaven and eternal life is true, because his eyes and spirit have been opened and “I have seen, I have heard and I have felt.”

**RELIGIOUS TEACHINGS, CONTROVERSY, AND IMPACT.** The focus of Swedenborg's religious teachings is not on the crucifixion and the sacrifice of Jesus, the only begotten son of God, to atone for the sins of humanity, but on the risen Lord Jesus Christ who overcame the world. According to Swedenborg, the Christian interpretation of the Trinity and redemption led over time to the complete separation of faith and charity, or belief and works, in the Christian churches. This necessitated the Last Judgment and the Second Coming. According to Swedenborg, the Last Judgment was a spiritual event that occurred in 1757. It made possible the Second Coming for everyone who is drawn to understand the spiritual meaning of the new heaven and the new earth, described in the *Book of Revelation* and spiritually opened by means of correspondences. Like the Last Judgment, the Second Coming was also a spiritual event for Swedenborg. It was an-

nounced in the spiritual world on June 19, 1770, by the twelve disciples who had followed Christ in the world. The record of the announcement was published in *True Christianity* (1771), thus making it an historical event, and it becomes an internal and personal event whenever its truth is accepted by an individual.

Swedenborg's religious writings, set down in eighteen different works, indicate that humanity now lives in a new age in which every one can freely choose his or her spiritual destiny. The spiritual world, which encompasses heaven, the world of spirits, and hell, is inhabited solely by men and women who have lived on this earth or other planets in the universe. In the sight of the Lord, the heavens appear as one “grand man.” Individuals find their place there by discovering their dominant affection or love. No one is cast down into hell or raised into heaven apart from the life they have led and chosen here on earth. However, it is not necessary to know about Swedenborg, his teachings, or the new church to achieve eternal salvation. It is only necessary to live a good and useful life within the framework of the many spiritual truths available around the globe.

For twenty-seven years Swedenborg attended to his call to write and publish his new revelation “fresh from heaven.” He never attempted to develop a following or organize a church. He initially published his works anonymously, but several clairvoyant experiences that occurred in public revealed his extraordinary powers. Soon Swedenborg and his books became a focus of discussion and conversation in Europe. Immanuel Kant (1724–1804) became so interested that he ordered a complete set of the *Arcana coelestia* (Heavenly secrets, 1749–1756). Although in private correspondence, Kant spoke in a positive tone about Swedenborg and his experiences, in 1766 he published *Dreams of a Spirit-Seer*, in which he ridiculed Swedenborg and his metaphysics. Kant's critique set the stage for the central controversy surrounding Swedenborg's religious writings, which concerns whether they are what Swedenborg claims they are. Were the works divinely revealed to him, or are they the product of an overactive imagination? Swedenborg's writings have inspired the founding of churches by those who believe that the divine had a hand in them, but they are derided as the product of a mentally unstable man by those who believe that they sprang from Swedenborg's own imagination. A third possible approach to them, particularly attractive to students of religion, is that Swedenborg drew on esoteric practices and traditions to shape his religious corpus.

Despite the controversy surrounding the precise nature of their inspiration, Swedenborg's religious writings have had a profound impact on Western literature and the arts, in large part because of the doctrine of correspondences. To cite one example, in 1972 Joshua C. Taylor, the director of the National Gallery in Washington, D.C., testified to the importance of Swedenborgianism in American art in the catalogue that accompanied an exhibit entitled *The Hand and the Spirit*, which took place at the University Art Museum

in Berkeley, California. In the catalogue Taylor identified several categories of religious art in America, but said that he found no sect or set of beliefs that provided an impulse toward art, particularly in the nineteenth century, with one exception—Swedenborgianism. Taylor wrote: “only Swedenborgian teaching had a direct impact on art, and this was through its link with a complex philosophical view of perception and aesthetic judgement which suggested not narrative themes but a spiritual context for artistic form” (Dillenberger, 1972, p. 14).

In 1908, and with great pomp and ceremony, Swedenborg's remains were brought back to Sweden and laid to rest in Uppsala Cathedral. The Swedish government, not without controversy, financed an elegant sarcophagus to hold the simple wooden coffin brought from London. The red granite memorial, approved by the Riksdag (the Swedish parliament), was carved to honor Swedenborg the scientist, despite the fact that his worldwide reputation, even then, rested on his revelations and religious writings. The parliament's decision notwithstanding, Swedenborg's religious writings continue to shape the human spirit around the world in prayer, poetry, paintings, story, and song.

#### BIBLIOGRAPHY

The Swedenborg Foundation in West Chester, Pa., is publishing the New Century Edition of the Works of Emanuel Swedenborg, with Jonathan Rose as series editor. The first title to be released in the series was *Heaven and Hell* (2000), translated by George F. Dole. Other series titles include a one-volume edition, also translated by Dole, of Swedenborg's *Divine Providence* and *Divine Love and Wisdom* (2003).

*Heaven and Hell* (2000). This book gives a detailed description of life after death. *Divine Providence and Divine Love and Wisdom* (2003). This book provides insight into the spiritual laws governing human life, and insight into the divine purpose and order of creation.

Benz, Ernst. *Emanuel Swedenborg: Visionary Savant in the Age of Reason*. Translated by Nicholas Goodrich-Clarke. West Chester, Pa., 1949; reprint, 2002. A biography that examines Swedenborg's place within the rational and esoteric currents of the eighteenth century.

Bergquist, Lars. *Swedenborg's Dream Diary*. Translated by Anders Hallengren. West Chester, Pa., 1989; reprint, 2001. The most recent examination of Swedenborg's dream diary with an attempt to connect his dreams to his social world and life.

Dillenberger, Jane, and Joshua C. Taylor. *The Hand and the Spirit: Religious Art in America 1700–1900*. Berkeley, Calif., 1972. An exhibit catalog exploring American religious art during the eighteenth and nineteenth centuries.

Dole, George F., and Robert H. Kirven. *Scientist Explores Spirit: A Biography of Emanuel Swedenborg*. West Chester, Pa., 1992. A highly readable and clear short biography of Swedenborg.

Hanegraaff, Wouter J. *New Age Religion and Western Culture: Esotericism in the Mirror of Secular Thought*. Leiden, 1996. An

innovative exploration of the esoteric roots of the New Age Movement with attention to Swedenborg's role in the transformation of perspective.

Johnson, Gregory, ed. *Kant on Swedenborg: Dreams of a Spirit-Seer and Other Writings*. Translated by Gregory R. Johnson and Glenn Alexander Magee. West Chester, Pa., 2002. A reassessment of Kant's view of Swedenborg suggesting Kant's indebtedness to and use of Swedenborg in his own philosophy.

Jonsson, Inge. *Emanuel Swedenborg*. Translated by Catherine Djurklou. New York, 1971. A modern intellectual history of Swedenborg's thought, connecting his thought to neo-Platonism and Descartes, as well as linking Swedenborg's philosophy and theology.

Lamm, Martin. *Swedenborg*. Stockholm, 1915. This work has been translated into German (Leipzig, 1922) and French (Paris, 1936); it was translated into English by Thomas Spicers and Anders Hallengren as *Emanuel Swedenborg: The Development of His Thought* (West Chester, Pa., 2000). A pioneering biography of Swedenborg that places his thought within the framework of Western literary and intellectual history.

Sigstedt, Cyriel. *The Swedenborg Epic: The Life and Works of Emanuel Swedenborg*. London, 1952; reprint, 1981. A detailed biography of Swedenborg that draws on the enormous document collection assembled by the Swedenborg Scientific Association during the first half of the twentieth century.

Williams-Hogan, Jane. “The Place of Emanuel Swedenborg in Modern Western Esoteric Tradition.” In *Western Esotericism and the Science of Religion*, edited by Antoine Faivre and Wouter J. Hanegraaff, pp. 201–252. Leuven, Belgium, 1998. An exploration of Swedenborg's religious system within the framework of the five characteristics of esotericism as defined by Antoine Faivre, as well as a response to Swedenborg's thought by important figures in modern Western Esotericism.

JANE WILLIAMS-HOGAN (2005)

**SWEDENBORGIANISM**, often referred to as the New Church or the Church of the New Jerusalem, is a global religious movement based upon the theological writings of Emanuel Swedenborg (1688–1772). When Swedenborg died in London on March 29, 1772, his spiritual legacy was to be found in the books and manuscripts he left behind. His spiritual journey as a revelator began in 1744 when, at the end of a profound personal spiritual crisis, he responded to what he believed was a call from Jesus Christ to serve him. As he began to study the Bible in Hebrew, Greek, and Latin, he concluded that the Bible was written in correspondences, and became convinced that he had been called to reveal its internal or spiritual sense. His biblical exegesis laid the foundation for a new, written revelation. By the time of his death he had published eighteen titles. His first theological work, *Arcana Coelestia* (1749–1756) or *Secrets of Heaven* was published in eight volumes. It presents the spiritual or internal sense of the biblical books of *Genesis* and *Exodus*. Also included in his corpus are works titled *Heaven and Hell* (1758),

*Last Judgment* (1758), *Divine Love and Wisdom* (1763), *Divine Providence* (1764), *Revelation Unveiled* (1766), *Love in Marriage* (1768), and *True Christian Religion* (1771).

Swedenborg's print runs were large for the eighteenth century. It is known that in 1758 he published five books with print runs of one thousand each. He also distributed them widely, sending them to church officials in several countries, as well as offering them for sale. Still, at the time of his death there were perhaps only a handful of individuals who accepted his teachings in Europe. No organizations existed, established by him or others, to promote his new Christianity. Swedenborg was one of the last authors to write exclusively in neo-Latin; his works, therefore, required translation into the vernacular to reach the growing number of newly literate individuals. Prior to 1800, some of his works had been translated into German (1765), English (1770s), French (1782), and Russian (1780s).

**ESTABLISHMENT OF THE NEW CHURCH.** Despite the obstacles to spreading Swedenborg's message, his religious writings had gained a sufficient following, particularly in England, by the end of the 1770s that organized reading circles developed among the artisans and industrial workers of Lancashire just as the cotton industry was taking off. By the mid 1770s copies of the translation of *Heaven and Hell* by William Cookworthy (1705–1780) and Thomas Hartley (1707–1784) began to circulate in the villages and hamlets surrounding Manchester. The development of the reading circles was due in part to the sensational claims made by Swedenborg in the book that he had “seen and heard” what lay beyond death's door. But as the sensationalism subsided, those who remained interested in the theology were supported by the efforts of John Clowes (1743–1831), rector of Saint John's Anglican Church in Manchester, an early believer in and translator of Swedenborg's writings.

According to Robert Hindmarsh (1759–1835), another early believer, Swedenborgian minister, historian, and author of *Rise and Progress of the New Jerusalem Church in England, America, and Other Parts* (1861), these small circles in Lancashire not only read and discussed what Swedenborg had written, but they soon began to worship together based on the new vision of Christianity found in Swedenborg's writings. Their focus was on worshipping the one divinely human God, the Lord Jesus Christ, who is considered to be a visible God who contains the invisible, as the physical human body contains within it the invisible soul. Swedenborg, in *True Christian Religion* (1771), acknowledges the trinity in God. He wrote, “These three, the Father, Son, and the Holy Spirit, are three essential components of one God. They are one the way our soul, our body, and the things we do are one.” In initiating worship, these early believers had grasped the central, indeed fundamental, teaching of Swedenborg's theology that God is one in essence and person and that the Lord Jesus Christ is that God. In addition, Swedenborg's teachings emphasize the following ideas: the reality of the spiritual world and the rationality of its operation; the spiritual nature of the

last judgment, which Swedenborg claimed took place in 1757; the essential spiritual nature of human beings; the correspondence between the spiritual world and the natural world; human freedom in spiritual things; the marriage of love and wisdom in the Lord and thus in all creation; the essential partnership of faith and charity found in a life of use; and the sacred nature of marriage.

John Clowes had ordered a copy of Swedenborg's *Vera Christiana Religio* (True Christian Religion) in 1773 upon the recommendation of his solicitor. Upon receiving it, he put it aside, only picking it up to read months later, just before he was to leave on an extended trip. He saw the words *Divinum Humanum* (divine human) and closed the book. Several days later his recollection of these words was accompanied by a deep sense of peace. This experience reoccurred daily. Finally, with a sense of urgency, he broke off his journey and returned home to read the book that seemed to be calling to him. Clowes wrote that after reading Swedenborg's book, all his theological questions had been answered. Clowes immediately became actively involved in the work of translation, as well as seeing to the publication and distribution of Swedenborg's writings. He also assumed the role of shepherd to the groups that began to emerge in Lancashire. He remained active in this work until his death, although he never separated from the Anglican Church in which he served as a pastor. In fact, Clowes lamented the move to form a separate “New Church” organization promoted by Robert Hindmarsh in London.

Hindmarsh, a printer by trade and a member of John Wesley's Methodist movement, had frequently heard Swedenborg's writings discussed in the circles in which he lived and worked. In 1782 he was given two of Swedenborg's writings, *Heaven and Hell* and *The Commerce between Soul and Body* (1769). Many years later, Hindmarsh wrote that after reading them, he was immediately convinced of their heavenly origins. Late in 1783 he circulated an advertisement calling for any interested readers of Swedenborg to meet on December 5. Four of the five men who came to the meeting formed the nucleus of the London Theosophical Society devoted to the study and publication of Swedenborg's writings.

The fifth man, James Glen (1749–1814), a plantation owner in South America, soon left for the New World carrying copies of Swedenborg's writings with him. He stopped in Boston and Philadelphia, giving lectures in both cities and leaving behind books for sale. Even though he was just passing through, Glen's efforts made a significant contribution to the development of Swedenborgianism in the newly formed United States.

By 1787, when the New Church (the name, from *Revelation* 21:2, often taken by Swedenborgian churches) was formally established in England, there were six groups in Lancashire and the founding society in London. One of the remarkable sociological facts of the establishment of this organization is that it was founded by individuals who had never personally known Swedenborg. Those who developed

the rituals for worship and the organizational structure were attracted to the message of the theology, rather than to the man who had written it.

The British Conference of the New Church, as it was officially named, was an offshoot of the London Theosophical Society, which by 1787 had approximately one hundred members drawn from various ranks in British society and including individuals from a variety of countries who resided in London. Their religious backgrounds were also diverse, coming from a wide range of Christian confessions, including Anglican, Methodist, Baptist, Calvinist, and Dissenters. Among them were also individuals who were mystics, Quakers, deists, or agnostics. This Theosophical Society, which predates the organization founded by H. P. Blavatsky and Henry Steel Olcott in 1875, was an organization whose membership had widely different interests in Swedenborg's religious writings. Some members believed that they were divinely given revelation from God and thus were to become over time the source of renewal for Christianity. Among this group, however, some believed that renewal first should be attempted within existing Christian confessions, while others felt that it was more in keeping with the message to form a new and separate organization. Other members were interested in Swedenborg's writings in order to learn the secrets through which spirits could be contacted.

Those who wished to form a separate organization asked that a vote be taken in order to proceed. Losing the vote by a small margin, these members decided to go ahead with plans to form a new church. Hindmarsh led this movement. Clowes hastened to London to dissuade them from making such a move. Unconvinced, the separatists went ahead with their plans and, on July 31, 1787, fourteen men and two women gathered to celebrate the sacraments of baptism and the holy supper in the name of the Lord Jesus Christ, and thereby established the New Church. According to Hindmarsh's record in *Rise and Progress*, "All those present declared themselves to be 'of the Lord's New Church in its outward and visible form on Earth.'" On June 1 the following year they completed the establishment of a new church when two men were ordained into the priesthood. Although other Swedenborgian or New Church organizations have developed in different countries around the world since 1788, all of them acknowledge some form of direct or indirect indebtedness to the actions taken by the men and women present at these foundational ceremonies.

The operational structure of this new organization was far from clear. In order to proceed, it was determined that a national conference of believers should be called to establish common beliefs, principles of association, and forms of worship. A circular was sent out that included forty-two resolutions of belief to be affirmed at a conference to be held at a chapel in London's East Cheap section in April 1789. On Easter Monday that year, approximately eighty men and women gathered at the chapel to attend the five-day conference, which ran from April 13 to 17. Among those present

was the poet William Blake (1757–1827) and his wife, Catharine. Both signed the conference minute book acknowledging their assent to the thirty-two propositions drawn from the religious writings of Swedenborg that had been discussed and affirmed during the conference. Among other things, the approved resolutions stated that "the Theological Writings of the Honorable Emanuel Swedenborg are perfectly consistent with the Holy Word; they also contain the Heavenly Doctrines of the New Church, which he [Swedenborg] was enabled by the Lord to draw from the Holy Word, while under the Inspiration and Illumination of his Holy Spirit."

The last of the resolutions called for the group to meet again in April of the following year. On the agenda for subsequent conferences was the need to approve a liturgy consistent with Swedenborg's teachings, as well as principles of organization that would likewise be drawn from Swedenborg's revelation. Harmony reigned during this first general conference of the New Church, but the same spirit did not prevail in the gatherings that followed. The underlying issue that developed among conference participants was the growing attachment of certain members to opposing models of church governance—congregational versus hierarchical.

**BRITISH CONFERENCE OF THE NEW CHURCH.** The issue was not resolved until the general conference of 1815, when the congregational model favored by the majority was no longer challenged. By that time there were three societies in London, thirty societies in Lancashire, and ten others in Great Britain. The British Conference has convened every year since that date with the various congregations and societies sending delegates. In 1815 the conference also adopted a presidential form of government with a one-year renewable term. This form of government persisted within the British Conference until 1970, when the length of the presidential term became five years. In 1900 the British Conference had seventy-three societies with a total membership of 6,337. They ran eleven day schools, which served 4,375 students, and they had over 7,000 children in attendance at their Sunday schools.

From its beginning until the middle of the twentieth century, the British Conference not only served the New Church in Great Britain, but also believers and congregations throughout the British colonies. It was a source of theological training, ministers, and hymnals and other printed material for groups in Australia, New Zealand, South Africa, and Nigeria. At the beginning of the twenty-first century these groups form independent associations, although history and tradition connect them to the British Conference. The largest of these groups (approximately 15,000 members) is the New Church of Southern Africa, founded by David Mooki (1876–1927) in 1911. It was run as a mission of the British Conference for many years, creating its own theological school in Orlando, Gauteng. The New Church of Southern Africa became independent in 1970, under the leadership of Obed S. D. Mooki (1919–1990), son of the elder Mooki. The president holding office in 2000 was Paul S. Kenene.

During the first half of the nineteenth century, the clergy of the British Conference were trained through a tutorial system. A theological school was established in London in 1865 in order to standardize training. It moved to Radcliffe, a suburb of Manchester, in 1984 to be closer to the geographical center of the membership. A congregational system of government had been chosen to enhance local control. A consequence of this system was that salaries of the clergy were paid by the local congregations without any assistance from the national body. As a result, recruiting men for the ministry was difficult, because in many locations with small congregations an adequate living could not be guaranteed. Thus, the British Conference throughout its history has had more congregations than ministers to serve them. This difficulty was at least technically addressed by opening the ministry to women in 1998. But the challenges of secularization and modernization could not be overcome simply by recruiting women into the ministry. Organizational and constitutional changes were initiated in 1999 in an attempt to meet these difficulties head on. The conference has thus become more centralized and more reliant on the Internet for all types of communication, including recruitment of new members and instruction in the theological school. According to its vision statement, the British Conference has also chosen to be inclusive and nonjudgmental, while at the same time it seeks to stimulate spiritual growth by applying the writings of Swedenborg to life.

From 2001 to 2002, the British Conference of the New Church had the following statistical profile: 1,148 members, 29 worshipping congregations, and 7 groups; there were 25 ministers, of whom 14 were retired or no longer in active service, and 44 lay worship leaders.

**THE SWEDENBORGIAN CHURCH OF NORTH AMERICA.** The Swedenborgian Church of North America was organized as the General Convention of the Church of the New Jerusalem in Philadelphia, Pennsylvania, in May 1817. At that time there were approximately 360 receivers of Swedenborg's teachings in the United States, located in seventeen different societies. The issues before the convention were to establish a permanent organization that could oversee the needs of the already existent congregations; to assist in the development of new ones; to regularize ordination; and to support missionary efforts. Delegates assembled in Philadelphia from five states: New York, Pennsylvania, Maryland, Virginia, and Ohio. Two foreigners also attended the Philadelphia convention, one from Scotland and one from Sweden.

The General Convention's adoption of a congregational form of government was natural, due to the democratic temper of early America, and because the congregations had existed prior to the central organizing body, as had also been the case in England. A proposal to consider a hierarchical form of government was placed on the agenda during the 1820s, but it was never actively considered. The General Convention organized itself into regional associations, and delegates from the associations attended the annual conven-

tion and conducted the business of the church. To oversee the work, officers were selected. At the first convention a president was chosen; the next year the position of vice president was also established, but it was not until the eleventh annual convention that a financial report was submitted for approval. This basic system of government still frames the work of the Swedenborgian Church of North America.

The doctrinal principles outlined by the General Convention emphasized "knowledge of the Lord in his Divine Humanity," because church members believed it is the fundamental principle of all true religion. These principles also emphasized sharing one's faith with others so that the Lord's kingdom might come through the practice of the divine teachings of charity, good works, and love for each other. Attention was paid to the recruiting of sincere men to the ministry, and a system of licensing and ordination was created that persisted until a theological school was established in Waltham, Massachusetts, in 1867.

Controversy emerged within the General Convention of the Church of the New Jerusalem when, after the American Civil War, some ministers and church members with a belief in a hierarchical form of government began to press their views. Rebuffed by the General Convention, they formed their own theological school in Philadelphia in 1876. The inability of the two groups to find a mutually acceptable solution led to a schism in 1890.

The high point of growth for the General Convention in the nineteenth century was in 1890. In that year the annual reports listed 154 societies, 119 ministers, and 7,095 members. During the nineteenth century the convention's doctrinal emphasis on inward and individual spiritual development fit well into the American spirit. The teachings were a particularly unique source to learn more about human psychology and motivation. There was a strong identification of the membership with the teachings of Swedenborgianism, and Swedenborgian thought and teachings were absorbed into the broader American culture, helping to create what John Humphrey Noyes (1811–1886), historian and founder of the Oneida Community, called "Swedenborg's century." Samson Reed's (1800–1880) *Observations on the Growth of the Mind* (1826), a book based on Swedenborg's principles, suggested that changing times originate in a changing mind. Reed's work had a far-reaching impact. It appealed to Ralph Waldo Emerson (1803–1882), and Emerson's good friend, the English author Thomas Carlyle (1795–1881). It inspired Emerson's masterwork *Nature* (1836), and Emerson included Swedenborg in his essay "Representative Men" (1850). Carlyle wrote that Swedenborg's new spiritual philosophy would soon leaven all religious thought.

Swedenborg was also an important source of inspiration for Edgar Allan Poe (1809–1849) and Walt Whitman (1819–1892). Both men broke important ground by bringing new psychological insights into the very structure of their art, as did the celebrated landscape artist George Inness (1825–1894), a member of the Swedenborgian Church and

a man who used Swedenborg's teachings on the correspondences of color and form to shape his spiritualized landscapes.

This convergence of psychology and Swedenborgianism was an obvious strength for the development of the General Convention in the nineteenth century. However, as psychology became an independent, nonreligious discipline, what had been a unique Swedenborgian contribution to American culture became more widely available in a secularized form. This affected the growth of the General Convention.

In the twentieth century, the General Convention of the Church of the New Jerusalem became the Swedenborgian Church of North America. It maintained its congregational structure, with a president (elected for a three-year term, eligible to serve one additional consecutive term), a vice president, recording secretary, and treasurer. Those who serve in the latter three offices are elected for one-year renewable terms. Together, these officers, plus three ministers and six laypeople, constitute the General Council that governs the church. In addition there is a Council of Ministers that supervises the pastoral and theological matters of the church.

The Swedenborgian Church of North America is known as the liberal "branch" of the New Church in North America. It is a member of the National Council of Churches, and it has attempted to meet the challenges of secularization by adapting to the enlightened values of Western post-modern society. It supports environmental causes and has policies that welcome diversity and inclusiveness. The Swedenborgian Church of North America has ordained women since 1975 and does not view a person's sexual orientation as an impediment to ordination.

In 1999 the Swedenborgian Church of North America closed its theological school, the Swedenborgian School of Religion in Newton, Massachusetts, and the property was sold. In 2001 the Swedenborg School of Religion formed a partnership with the Pacific School of Religion in Berkeley, California. The program, supervised by the Pacific School's Swedenborg House of Studies, offers a master of divinity degree, as well as a certificate of theological studies in conjunction with the Pacific School. Distance education is a feature of the program, and the holdings of the library have been integrated into the database of the Graduate Theological Union in Berkeley. This move has brought the theological education of the Swedenborgian Church of North America under the umbrella of one of the most progressive Christian theological schools in the United States.

Statistics for the Swedenborgian Church of North America reported in their journal, *The Messenger*, for the year 2001 are as follows: the church had a total membership of 1,926, of which 1,431 were listed as active. They had 40 churches, 34 active ministers, and congregations in the United States, Canada, and Guyana.

**THE GENERAL CHURCH OF THE NEW JERUSALEM.** The General Church of the New Jerusalem, unlike the British Confer-

ence and the Swedenborgian Church of North America, has an episcopal form of church government. It was legally established in 1897 after withdrawing from the General Convention in 1890. The principles of what was called the "Academy Movement" within the General Convention led to the schism and separation. The members of the Academy Movement believed that the theological writings of Emanuel Swedenborg constituted the third testament of the Christian Bible. That is, they believed that Swedenborg's writings were not merely divinely inspired revelation, but were, in fact, the word of God. Like the Old Testament and the New Testament, they were the third part of the divine word. Just as the sign on the cross calling Jesus "the king of the Jews" was written in Hebrew, Greek, and Latin, so, according to the General Church of the New Jerusalem, the Old Testament was written in Hebrew, the New Testament in Greek, and the third and final testament was produced in Latin. Secondly, they believed that the theological writings of Swedenborg prescribed a hierarchical form of church government with three degrees of the priesthood. And thirdly, they believed in the necessity of educating children based on principles drawn from these same theological works. Thus, even prior to separation from the General Convention, they had established schools from the primary grades through high school and college, culminating in a theological school for the training of priests.

The schism was based on principle, but it also came about as a result of the clash of strong personalities and political maneuvering within the organization of the General Convention of the Church of the New Jerusalem. Once separated from the convention, the dominance of Bishop William H. Benade (1816–1905) created new difficulties within the fledgling organization. Finally, the members of the Advent Church that Benade had formed withdrew from him and established a new organization in 1897—the General Church of the New Jerusalem. The scope of the organization was international from its inception. Congregations in Canada and Great Britain joined with those in the United States in support of the principles of the Academy Movement. These principles, developed by Benade, were maintained by the new organization, but his autocratic style of leadership was rejected. A group numbering 347 participated in the move to withdraw from the General Convention. In 1900, just three years after incorporation, the General Church of the New Jerusalem had an international membership of 560. Because it was founded on principle rather than propinquity or nationality, it competed with both the American General Convention and the British Conference for members.

The General Church of the New Jerusalem created an organization in which theological and ecclesiastical matters were separated from financial ones. The bishop was to supervise the spiritual life of the church but a lay board of directors was to supervise it financially. Furthermore, instead of adopting a binding constitution, the organization decided to write a document titled "The Order and Organization of the

General Church of the New Jerusalem.” Originally published in 1914, it has been revised six times since that date. The last revision occurred in 1999, when the language of the document was made gender inclusive. The decision not to write a constitution was made so that the organizational structure of the General Church of the New Jerusalem could be more responsive to the membership as it grew and developed. Furthermore, given the difficulties of its own foundation, those involved did not want any form of organization that would prevent future generations from making changes they might deem necessary for the life of the church.

Council and assembly are also important governmental principles for the General Church of the New Jerusalem. The bishop and the ministers all have lay councils that meet with them on a regular basis. In addition, every four or five years, all the members of the church get together at a general assembly to make important decisions. These councils and assemblies are governed by the principle of unanimity, with doubt signaling the need to delay decision making.

Education is a word that is synonymous with the Academy Movement and the General Church. This Swedenborgian organization has made education one of its highest priorities; however, in 1995 evangelization became an equivalent priority when an Office of Evangelization was established. Due to its origins in the Academy Movement, the General Church was a school before it became a church. The Academy Movement organized a theological school in 1876, when several ministers who were proponents of academy principles were no longer welcome to teach at the theological school in Waltham, Massachusetts. Soon the Academy Movement not only ran a theological school in Philadelphia, but also a college and high school. These institutions moved to Bryn Athyn, Pennsylvania, in the 1890s and were still in operation in 2003. The international character of the General Church of the New Jerusalem has helped to create an international student body at all of its schools, but particularly at the college. In 2000, students came from more than seventeen countries, including Brazil, Canada, France, Korea, Sri Lanka, Sweden, and the United Kingdom.

The General Church of the New Jerusalem is considered the most conservative of the New Church organizations. By 2003, for example, it still did not ordain women. Nonetheless, it is the most diverse both racially and nationally. An unpublished study by Jane Williams-Hogan in 1998 showed that the British Conference had a minority membership of 5 percent, the Swedenborgian Church of North America had a 1½ percent minority membership, and the General Church of the New Jerusalem had 11 percent.

Although nowhere is it mandated that members of this church live together in communities, in practice this is also a characteristic of the General Church of the New Jerusalem. Communities have developed around existing General Church schools, or individuals will band together to form a community and a school. In the year 2000 the General Church operated ten elementary schools, six of which are lo-

cated in New Church communities in the United States and Canada. In addition, there is a New Church elementary school in South Africa, and one was established in Ghana in 1999. Two preschools were established that same year in Denver, Colorado, and Ivyland, Pennsylvania.

A statistical profile of the General Church of the New Jerusalem in 2000 indicated a membership of 4,585, with a total international community of approximately 14,000, including minors, young adults, and adults who attend church services but who have not signed the rolls. The church had 92 public places of worship in 2000—57 in the United States, 8 in Canada, and 27 outside of North America. These groups were served by a total of 99 active and retired clergymen.

**THE SWEDENBORGIAN MOVEMENT WORLDWIDE.** Other Swedenborgian organizations exist in the world beyond the three discussed above. In 2003 independent New Church groups existed in Australia, France, Japan, Kenya, Nigeria, the Philippines, Russia, South Africa, Sri Lanka, and the Ukraine, among other places. It is interesting to note, however, that from its inception the Swedenborgian movement has developed organizationally primarily within the framework of English-speaking countries. The three organizations discussed in this article not only developed in Great Britain and the United States, but they also chose to establish theological schools. Although other theological schools have subsequently been established outside of the United States and England, these have all been developed through the missionary efforts of English-speaking organizations.

Many of these independent Swedenborgian organizations have been started as a result of an individual reading one of Swedenborg’s theological writings and discovering the divine within it. The reader has then determined to form a church or religious organization in response. This pattern occurred in Great Britain, France, Russia, and Sweden in the eighteenth century; in Australia, Canada, New Zealand, and the United States in the nineteenth century; in Brazil, Nigeria, South Africa, Japan, Korea, and Ghana in the twentieth century; and already in the twenty-first century in the Philippines and Sri Lanka. While the membership numbers are not large, these groups nonetheless represent a different mechanism of conversion than that of a personal encounter with believers, *gurus*, or some other religiously inspired charismatic person. Conversion occurs after reading a book, after which the individual often attempts to find other similarly interested people or organizations. Writing to book publishers is a common method by which these individuals find existing organizations and fellow believers. Thus, Swedenborg’s method of spreading his message by publishing and distributing books, although it is no longer the only method used to recruit new members, has been surprisingly effective.

**SYMBOL AND SYMBOLISM.** [*This entry presents a history of the study of symbolism: issues, theories, and approaches. For an explanation of symbols from various religious traditions, see Iconography.*]

Understanding symbolism as a particular mode of religious thought begins with some consideration of what one means by the term. Most generally, a symbol is thought of as something that stands for something else. However, it is not a simple matter to identify the particular mode of “standing for” that provokes an observer to call something a symbol, as opposed to any of the other terms we use to designate figurative devices, like *sign*, *figure*, *metaphor*, *image*, *receipt*, *token*, or *allegory*, to name just a few. Although different definitions have been used throughout the long history of semiotics, a certain consistency exists in the characteristics thought to be specific to “symbol” (Greek *symbolon*, late Latin *symbolum*, Italian *simbolo*, German *Symbol*, French *symbole*). These defining characteristics have consistently granted the idea a special relevance to religion. While various objects have been called symbols—including the purely arbitrary signifiers used in mathematical or scientific notation and, in the ancient period, the tokens of identity used in diplomacy and as markers of business agreement—a large subset of these appear in contexts that deal specifically with figuration of the

divine. In particular, a symbol, as opposed to other forms of signification, tends to be understood as a representational mechanism that renders transcendent realities into tangible forms.

This article surveys the general outlines of the study of symbolism by proceeding historically, highlighting certain key contributions relative to the study of religion and focusing attention on some of the main theoretical issues.

**POINTS OF ORIGIN.** Though the Romantics created the modern apotheosis of the symbol, they did not invent the idea. The symbol has a rich premodern history, which, while not determinative, renders comprehensible certain habits of thought that animate the concept’s later history. The term originated in Greek. The neuter noun, *symbolon*, is formed from the verb *sumballein* (prefix *sun* + the verb *ballein*), which can mean many things but whose least marked sense is “to put” things “together.” In 1931, Walter Müri disproved conclusively the notion that the noun is derived from the notion of a thing “put together” with something else. Philological considerations argue against this interpretation and also against the idea that symbol indicated, from its inception, an unspecific and general association between things. (This sense would have required *sumblēma*, which is uncommon and attested very late.) Neuter nouns in omicron formed from other *-ballein* verbs consistently mark the *instrument by which* the action of the verb is completed. Consequently, if the noun had actually been derived from the verbal sense of “put together,” it would have yielded the sense of a device used to put other things together, and this suggestion turns out to be awkward in the face of attested ancient usage.

The neuter noun in the classical period regularly designated one of the two halves of a deliberately broken piece of material (a terracotta shard, for example) that were distributed to the two parties to an agreement in order to provide a secure authentication, at some future date, of their original arrangement. One sense of the verb *sumballein* stands out clearly, given knowledge of the philological parallels, as the best explanation of the evidence for the noun. The verb has a well-attested sense of “to agree,” which positions the symbol as a device by which agreement is completed. Symbols seal the deal, so to speak. In the classical age, this context is by far the most common. Symbols appear as authenticating markers in many different fields, including in hospitality arrangements, in business, and in diplomacy. Although this background sets, at first glance, a kind of intuitively satisfying background for understanding the later history of a representational device, on closer inspection, it is too humble to have served as the origins for the master concept of figuration that appears later. A “receipt” and a “passport” are, after all, a far cry from a mode of representation that mediates between humans and the divine. Two other contexts need to be considered; these will explain the ways in which a narrow term of authentication gains a broader meaning and will show that symbols had, even in their earliest days, certain unique representational powers.

First, in the mystery religions and famously among adherents of the Pythagorean sects, the term *symbolon* designates a particularly significant kind of authentication. It is the secret password or short, enigmatic verbal formula that verifies membership in a particular cult. These symbols carried the added power to authenticate a cult member as he or she ascended a ladder of spiritual wisdom. Knowledge of the secret symbol allows a person to gain access to higher tiers of enlightenment. In the deepest expression of this aspect, the symbol can be used after death to give the deceased access to the regions of the blessed, where souls live in splendor after their separation from their bodies. These symbols are indeed passports but ones that facilitate the movement of humans toward the divine, and so set up conditions more congenial to the later development of the idea. This background underlies the early Christian usage of the Latin *symbolum* for the Apostle's Creed.

The second important context for understanding the symbol's later history is in the field of divination. A different Greek term, the masculine *symbolos*, which emerges from a different sense of the originating verb *sumballein*, applies here. In addition to the idea of agreement, the verb carries a meaning of "to meet." Again, on philological parallels, the masculine noun in omicron indicates a thing or person doing the action of meeting, and so comes to indicate that which one meets. In the field of divination, chance meetings of many kinds played an important role, and *symbolos* is the most general term for these. Because of the prominence of the neuter form (and of neuter forms in the language of divination more generally) the masculine term tends to become assimilated to the neuter. By the classical period, it had outgrown its specific use to describe an ominous chance meeting and had become a general term for a divine sign of any kind. The symbol as divine sign forms the second important background idea to the later development of the concept. In a kind of mirror image of the symbol in the Mysteries, the divine sign also facilitates movement of the divine toward the human. In both contexts, human aspirations for the divine are expressed in concrete form.

These early manifestations of the notion of the symbol contain two important aspects. First, a current of secrecy is present throughout. The symbol marks a form of sign that brings something to light, and yet it means something that is not apparent to the uninitiated. In other words, the symbol has an esoteric or "closing" function, as well as an exoteric or "disclosing" one. Later theories of the symbolic will tend to preserve this esoteric dimension and draw on the power that secrecy always bestows. In addition, the symbol in the mystery context points to a performative dimension to symbolic representation. It has the power to enact a change in the one who wields it.

On these bases, the term *symbol* came into slightly broader use around the Mediterranean in the wake of Alexandrian Hellenization after the third century BCE. In addition to divine omens of all kinds, as well as magico-religious

cultic formulas, the term designated allegorical representations of the divine in poetic texts, and cultic manifestations of divinities with their traditional accoutrements, such as accompanying birds or distinctive dress. These two developments show the newfound usefulness of the notion of the symbol in conceptualizing the ways in which divinities (which in a Hellenistic context could make increasingly extravagant claims to transcendence) might somehow be captured in more tangible forms. This use is an abrupt departure from the classical practice and is surely due to the influence of the usages in divination and in the mysteries. So the symbol began to describe that particular mode of representation through which, for example, Homer's all-too-corporeal gods or traditional cultic forms of anthropomorphic divinities might relate to a transcendent divine principle as it was beginning to be understood. It is perhaps not a surprise that a parallel (and pivotal) context emerged in the *Greek Magical Papyri*, in which a symbol meant a magical amulet or token. It marked a divinely charged material object that had some sort of numinous power to produce tangible effects here on earth. It was intended to describe a reproduction of the divine in material form rather than a representation per se.

**SYMBOLS IN LATE ANTIQUITY.** In late antiquity, the symbol took on a new life, one that marked a crucial stage in its development. The post-Plotinian Neoplatonists explicitly married the Pythagorean password to enlightenment, the omen, the material representation that renders the traditional god in tangible form, the allegorical representations of the divinities in poetic texts, and the amulet of the magicians in order to produce a systematic theory of the symbol as a master device of representation. The first stage in this development begins with the work of Iamblichus (c. 245–c. 325), who followed Plotinus' lead in making philosophy a soteriological pursuit. Drawing on the Pythagoreans for inspiration, he claimed that different levels of knowledge required different forms of discourse. Scientific knowledge might be reached adequately through likenesses and images, but esoteric wisdom of the divine superstructure of the cosmos required a secret language of symbols. In his *On the Mysteries*, Iamblichus further develops this idea in relation to what he saw as the secret symbolic language of the Egyptians. Knowledge of the hieroglyphs was spotty in late antiquity, and ignorance of this language contributed greatly to its perceived capacity to carry the most profound wisdom. Iamblichus also devoted a great deal of attention to justifying a form of ritual praxis, part of his comprehensive philosophical-religious discipline, in which symbols play a critical part. They are required to activate the rituals; more specifically, they are the material items or secret language that invokes the divine presence. This notion implies that symbolic figuration relies not on mimetic imitation but on the invocation of true presence.

These developments led to the work of the great follower of Iamblichus, Proclus (d. 485). Proclus created a highly developed symbol theory that played a central role in his metaphysics, his theory of ritual, and his views on figuration of the divine in language or in the arts. All the post-Plotinian

Neoplatonists understood that the transcendent principle of the universe, the One, radiated out from itself the whole of the universe, with each successive layer of reality imitating what had come immediately before it. This view made the cosmos a kind of cascading theophany. Yet they also tried to comprehend Plato's famous conundrum that representation is always and everywhere a movement away from, rather than closer to, the truth. The Neoplatonists had to work within two views: that the material world is a theophany and that it is a shadow world of hopelessly decayed imitation. More often than his predecessors, Proclus uses the "symbol" precisely to resolve this tension. In his theory, most clearly articulated in his *Commentary on the Republic*, symbolic figuration does not involve imitation based on resemblance—in other words, Plato's objections do not apply to it. Instead, the symbol reproduces the real presence of its referent; it operates according to invocation and not according to imitation. Drawing on an apothegm he knew from the *Chaldean Oracles*, a text of dubious provenance that became a holy book for the Neoplatonists, Proclus stated that as the higher orders create the cosmos through imitation, they sow "symbols" throughout it. Proclus thought these symbols were nodes of divine radiance nestled within our tragically decayed world of imitations. These secret symbols can be harnessed by the knowledgeable poet, philosopher, or ritual practitioner, in order to render the divine in a suitable material form. This theory allows him to construct a defense of Homer, construct a metaphysics that mediates between the divine source and its mundane effluxions, and develop an explanation for how the divine might actually be made present in ritual praxis.

While Proclus is not particularly well known in the wider contemporary history of ideas, his thought regarding the symbol has had a long-standing and definitive influence. Certain key Romantic philosophers recovered his corpus in the eighteenth century, and their theories will be discussed below. Proclus's ideas also greatly influenced a person who became the single most important authority on figuration of the divine for medieval readers of the Bible. Shortly after Proclus's death, a body of work emerged that came to be attributed to Dionysius the Areopagite, Paul's convert mentioned in *Acts* 17:34. This pseudepigraphical collection of texts reinvented Proclus's theories of symbolism to help the early Christians understand the representation of the divine in cult, in texts, and in Dionysius' emanationist metaphysics. Dionysius reworked Proclus's theories for an understanding of the Christian sacraments (in the *Ecclesiastical Hierarchy*), hierarchical tiers of beings (in the *Celestial Hierarchy*) and the places in Scripture where the divine is figured in physical and sometimes even entirely corporeal form (in the *Divine Names*). Dionysius's mystical hermeneutics applied to all aspects of the divinely infused world, from scripture to church to cosmos. When his corpus was translated by John Scotus Eriugena in the ninth century, it quickly became the authoritative guide for medieval clergy trying to understand how the Scriptures could assign tangible qualities to the transcendent

godhead. (The corpus also served as a guide for Christian mysticisms of many varieties across medieval Europe, both in the east and the west.) In his *Summa theologica*, Thomas Aquinas cites Dionysius some seventeen hundred times, more often than any other writer except Augustine of Hippo.

**THE ROMANTIC MOVEMENT.** The turning point for contemporary interest in symbolic theory, and the most convenient point at which to begin a brief account of its modern life, occurred around the middle of the eighteenth century, among a group of thinkers and literary figures who have come to be known collectively as the Romantic movement. Their concern with symbols—charged by their reading of the late-antique Neoplatonists, but less the outcome of any single current of symbolic theory than a constellation of ideas scattered throughout the disciplines of Western academia—was one aspect of their general spirit of resistance against what they perceived as the dangerous excesses of eighteenth-century rationalism. With the Romantics, the "symbol" grew in importance and became the most prominent vehicle for the view that figuration, now considered in its most general terms, is a root process defining the human being and, importantly, that figuration, considered as a mental process, resides in a position of priority over even rational thought itself.

One of these Romantics, Johann Georg Hamann (1730–1788) reflected the general mood, though not the academic rigor of the times, in arguing the merits of poetic discourse as the "mother tongue of humanity." In protest against Kant, this most difficult and oracular of Romantic authors saw the perfection of knowledge not in abstraction but in symbols, since symbols enable one to view all the phenomena of nature and history as revelations of a divine communication. His contemporary, Johann Gottfried Herder (1744–1803), who was taught by both Kant and Hamann, was more balanced in his approach to the Enlightenment and its representatives. For Herder, the task of aesthetics lay in the search for a universal logic of artistic symbolization; to this end, he developed his own theory of the evolution of language, giving a central role to folk poetry. His use of Jean-Jacques Rousseau's (1712–1778) model of human growth as an analogy for the course of history and its progress away from the childlike innocence of the "noble savage" was widespread in the Romantic movement. Similarly, Novalis (Friedrich von Hardenberg, 1772–1801) also defended the primacy of imagination and poetry as a means to produce the symbolism of a higher reality, and he drew special attention to the "magical" power of symbolic words. Among theorists of literature, Samuel Taylor Coleridge (1772–1834), influenced by F. W. J. Schelling (1775–1854) and the late-antique Neoplatonists, found the symbol to be a powerful representational tool that had the unique capacity to grasp the transcendent in physical, palpable form. The symbol, he thought, becomes "consubstantial" with its referent.

Together with Georg Christoph Lichtenberg (1742–1799), a physicist with a mystical bent who was actually anti-

Romantic, the self-avowed psychological novelist Karl Philip Moritz (1757–1793) merits mention for drawing attention to dreams as symbolic expressions of the inner self. The first major achievement in this area came after the turn of the century, with Gotthilf Heinrich Schubert (1780–1860), whose views of the dream as an abbreviated hieroglyphic language later earned him recognition by Freud as a forerunner of modern psychological dream interpretation. The work of Carl Gustav Carus (1789–1869) on dream interpretation has more immediate links to modern psychology, however, because of the extensive and systematic use he made of the notion of an unconscious mind, a notion that incidentally was widespread among the Romantics. Carus's distinction between relative and absolute layers of the unconscious, and his argument for a participation of the latter in a sort of universal, pantheistic life force reflected in dream symbols, were an inspiration to theories later developed by Jung after his break from Freud.

One side effect of the Romantic movement—perhaps the one that, more than any other, carried the attention to symbolism over into the nineteenth century—was the variety of opinion it sparked among classical mythologists, both among those sympathetic to the Romantics and those opposed. Scholars such as Samuel Clarke (1675–1729), Johann Ernesti (1707–1781), Christian Heyne (1729–1812), and Johann Hermann (1772–1848) reinterpreted the gods and heroes of ancient Greece as symbols expressing a primitive level of philosophy or psychology. The very tools of allegoresis that the medieval theologians—following a tradition going back to the Greek philosophers and literary critics—had used to reveal the hidden wisdom of the ancient myths were used to discredit its symbolic importance. Moritz, among others, objected to the reductionism in such interpretation and argued for the primacy of understanding the historical conditions of classical antiquity. The complaints of Jacques Antoine Dulare (1775–1835) against “symbolizing” what were basically pragmatic cults and beliefs typified the new and more empirical approach to the symbol that was gaining strength. This foment of opinion generated many later efforts to link a personal meaning of symbols to a general morphology of nature myths, such as are described in the work of Georg Ferdinand Frobenius (1849–1917) and Paul Ehrenreich (1855–1914).

One key figure, whose systematic treatment of symbols united the influences of the Romantic movement with the study of classical mythology, was Georg Friedrich Creuzer (1771–1858). Creuzer was steeped in late antique ideas about the symbol. He produced editions of Proclus and other key Neoplatonists which helped to re-awaken the Neoplatonic spirit of the symbol. Employing a comparative approach that used materials from Egypt, Greece, and Rome, as well as India and Persia, he tried to develop a theory of symbolism that would at once respect the pragmatic meaning of symbols as carriers of concrete tradition (including the scientific) and the religious meaning of symbols as the force

to unify (*sun-ballein*) spirit and matter. Objections to Creuzer's work, however, in particular to his attempt to show the influence of Oriental symbolism on Christian symbolism, arose on every side, the most devastating of them from the pen of the classicist Johann Heinrich Voss (1751–1826). Even scholars in the early twenty-first century often deny Creuzer the important place he deserves in the history of the study of symbolism.

Perhaps the best known of the Romantic students of symbolism is Johann Jakob Bachofen (1850–1887). A historian devoted to the non-literate ancient world, he turned to myth as a guide to understanding the distant past, and from there developed a highly particularized exegesis of symbols. While Bachofen appears to have carried on his work independently of Dulare and Creuzer, he shared their concern for developing a universal, abstract theory of the symbol rooted in the facts of history. For him, the fundamental theme of the ancient myths—and hence also the basis for the symbols that myths interpret—was that of gynococracy, or mother right. Although modern scholarship has since discredited this idea, along with most of his other historical arguments, the remarkable imagination and suggestiveness of Bachofen's work has kept it alive among those concerned with a general theory of the symbol.

**THE SYMBOLISTS.** The Symbolist movement was one of literary esotericism that formed among a group of French poets in the final two decades of the nineteenth century. The leading thinker was Stéphane Mallarmé (1842–1898); after his death, it virtually came to an end. Although its roots may be traced to the philosophies of Hegel and Schopenhauer, the Aesthetic movement in England, and the mystical writings of Swinburne, the movement took shape basically as a reaction against the impact of scientific realism on the literary arts.

Unlike the Romantics, who had been more concerned with the interpretation of specific symbols or the development of a general theory about symbolization processes, the Symbolists were preoccupied with creating symbols of ideal beauty appropriate to their age. While the Romantics were overtly political and public—the idea of the “noble savage” that was so dear to them provided part of the intellectual backdrop to the French Revolution—the Symbolists deliberately withdrew from the vulgar sentiments of public life. Theirs was a quasi-metaphysical, highly theoretical attempt to idealize absolute Beauty, to promote its contemplation, and at the same time to create it by restoring a musical sense to poetry and by using highly symbolic terms. Given to theorizing about symbols in esoteric terms, as these thinkers were, it is no surprise that their influence was restricted. In other respects, too, the major proponents of the movement seemed intentionally to flout existing traditions. Mallarmé used Christian ritual symbolism to erect a metaphysics designed to explain symbols. Charles Baudelaire (1821–1867), who may be credited as the first poet to exalt the value of symbols, did so by inverting the symbols of Christianity into a sort

of diabolism. Paul Verlaine (1844–1896) also gave more popular form to the principles of Mallarmé by locating them within a Christian context. In fact, however, all of the Symbolists stood firmly outside of the Christian frame in their search for an alternate center to their aesthetic-mystico-religious sensibility: ideal Beauty.

Although the Symbolist movement was short-lived, and its theories have long since fallen out of favor, it did have an impact on symbolism in literature by cross-fertilizing it with anthropology, classics, and religion. The American counterpart of the movement, represented by writers such as Edgar Allan Poe, Herman Melville, and Henry James, as well as European post-Symbolists such as Rainer Maria Rilke and William Butler Yeats, shared many of the Symbolists' instincts about the mystical dimension of symbolism. Despite the movement's lack of influence on the study of symbols then being undertaken by philosophers and anthropologists, its reorientation from the objective world of facts to the evocative, psychological power of symbols brought the symbolic process itself to the surface, thereby foreshadowing developments in the twentieth century.

**THE RISE OF MODERN ANTHROPOLOGY.** By Bachofen's time, the influence of the Romantic movement on the study of symbols had begun to wane. Ethnological data gathered directly from primitive societies was beginning to accumulate, and the empirical method for the study of symbols, including those of the ancient world, was becoming more disciplined. Important work was done by Lewis H. Morgan (1818–1881) on Native American sacrificial rites; by William Robertson Smith (1846–1894) on Semitic sacrifice; by Henry Clay Trumbull (1830–1903) on the comparative study of sacrifice in India, China, the Near East, Africa, and Central America; by John Ferguson McLennan (1827–1881) on marriage symbolism; and by N. D. Fustel de Coulanges (1830–1889) on the influence of religious symbols on ancient Greek and Roman civil institutions. These and other works of the period contained a new rigorous approach to analyzing the data, coupled with an attempt to translate the meaning of symbols into abstractions more suitable to the modern critical mind.

This new scientific approach did much to demystify the study of occult and secret symbolic traditions, as well as to open the way to a more objective study of sexual symbolism in primitive culture and religious rites. The censure that Creuzer and Dulare had encountered a century before began steadily to weaken.

No doubt the most important figure of this period is Edward Burnett Tylor (1832–1917), rightly credited as the founder of modern cultural anthropology. Tylor's contribution to the study of the symbol has no direct links to the Romantics. Drawing instead from mid-nineteenth-century British philosophy, which had been rocked by evolutionary theory, he formulated a rather rationalistic and often condescending view of symbols. The myth-making faculty of primitive peoples that F. Max Müller and the brothers Grimm

had helped to rediscover interested Tylor as a potential clue to the evolutionary development of mind, and led him to uncover a fundamental animism at the source of the symbolic process.

Another important influence on symbol theory at the time was James G. Frazer (1854–1941). His monumental study on the notion of the slain god, *The Golden Bough*, which had grown out of his work on nature symbolism and relied heavily on insights from Robertson Smith, not only influenced students in all fields of symbolism, but also affected scholars of literature. The sheer scope and wealth of Frazer's achievement, however, tended to overshadow the lack of development in his theory of symbols. And, as had Tylor, he bypassed important questions raised by the Romantics and the Symbolists.

At the start of the twentieth century, interest in symbolism continued to strengthen and to gain respectability among academics. Typical of this trend was Franz Boas (1858–1942), whose work on primitive art symbols led him to a number of interesting but controversial conclusions about the relationship between religious ideas and the literalization of natural symbols. The major influence at the time, however, came from the work of Émile Durkheim (1858–1917). Turning away from the nineteenth-century bias toward treating symbols as discrete entities with meanings in themselves—and thus turning his back on the Romantics and the Symbolists alike—Durkheim sought to uncover their social implications. He did not care very much about any inner reality in symbols, nor did he care where they came from; he was interested only in their effect on the society that used them. To this end, he proposed the revolutionary idea of viewing society as a system of forces conditioned by the symbolizing process: symbols were social because they preserved and expressed social sentiments. In assuming that non-empirical symbolic referents must be distorted representations of empirical reality, many critics later argued, Durkheim had viewed symbols too narrowly and failed to appreciate their polyvalent structure. While his concern with symbolic referents may have prevented him from exploring the wider reaches of symbolic significance, the boldness of his hypothesis laid a challenge before students of the symbol that retains its force in the early twenty-first century.

A. R. Radcliffe-Brown (1881–1955) owed much to Durkheim in the former's approach to symbols as meanings that give expression to sentiments in individuals in order to regulate collective needs or preserve relations and interests important to a particular society. Despite Radcliffe-Brown's numerous intuitions and descriptive distinctions, as well as a more scrupulous grounding in direct fieldwork than his predecessor, his work suffers from a certain lack of theoretical clarity by comparison.

Bronislaw Malinowski (1884–1942) shared many of Radcliffe-Brown's views, but Malinowski approached symbols with a keener sensitivity to their linguistic implications and a more complex theoretical understanding of them.

Rather than viewing words as having meaning in themselves, he saw them as entirely relative to their context, where they both communicate conventions and organize behavior. Like all symbols (of which they are the prototype), words modify the human organism in order to transform physiological drives into cultural values. Although Malinowski confused speech with language, and so was driven to generalizations that contemporary linguistic theory no longer accepts, his main concern was in classifying and interpreting symbolic forms to show how the process of symbolization affects the formation and function of culture. He succeeded in undoing the generalized symbolic interpretations of myths that some anthropologists had inherited from the Romantics.

R. R. Marett (1866–1943) attempted to trace the origins of religion to pre-animist beliefs in superhuman forces, but these efforts were armchair investigations from a scholar who preferred common sense to actual work in the field. Despite their limitations, however, his reports had high literary value and considerable influence on many other theoreticians working in symbolic theory. Lucien Lévy-Bruhl (1857–1939), most often remembered for his attempt to relate the origins of religion to a “prelogical” primitive mind that shared in the realities of nature by means of what he called participation mystique—a position that he retracted later in life—also deserves credit for highlighting the need to study symbolic thought and behavior.

Although the contributions of these pioneers continue to be recognized and supported by field studies, scholars hold many diverse opinions as a result of increased sensitivity to the complexities of symbol theory. Social scientists have become increasingly aware of the methodological assumptions underlying their own behavior and of the effects of psychological factors, the critical apparatus of philosophical hermeneutics, and advances in linguistic theory.

Victor Turner (1920–1983) developed an important theory of symbolism from his studies on ritual in the late twentieth century. Particular symbols can be understood, he argued, only by setting them in their wide “action-field context,” considering their immediate role in ritual, and observing the particular patterns of behavior associated with them. Turner saw this series of expanding contexts as giving meaning to the symbol; furthermore, he focused attention on the context of the interpreter. His approach helped to clarify the distinctions between exegetical meaning (given by indigenous informants), operational meaning (derived from observation of a symbol’s use), and positional meaning (deduced from its place in the totality of symbols). The psychological functions that Turner accorded symbols—to guard against excessive emotion and to serve as a catharsis to express feelings—initially were controversial but now have become commonplace.

Ever since Durkheim, anthropologists have emphasized the pivotal role of social structure (as both matrix and offspring) in the symbolic process, but the concrete forms of many symbols have caused scholars to investigate the ways

that these symbols reflect the visible world of nature. In his researches on Semitic religions, Robertson Smith suggested that symbols of divinity, even those clearly wrought by human hands, were originally drawn from earth symbols. Mary Douglas has taken a more developed and inventive approach to natural symbols, linking the origins of symbolization to the structure and processes of the human body. She reminds her colleagues that the modern study of symbols needs to consider symbols generated by social structures that may alienate people from themselves, from one another, and from the earth.

Modern anthropological theory owes much to Claude Lévi-Strauss and his research in linguistics and depth psychology, particularly in the realm of myth and symbol. Instead of the functional approach championed by Malinowski, or the more traditional symbolic approach that described symbols primarily in terms of their meanings, Lévi-Strauss’s structuralism resurrected interest in myths and symbols as phenomena more basic than the meanings they convey, the social functions they fulfill, or the social systems that give them shape. Symbols belong to their own systems, he asserted, within which they are subject to certain basic relationships and patterns of transformation. His attempt to locate a universal human nature in some common, relatively stable mental structures underlying all variations in behavioral expression has helped to revive the Romantics’ quest for a generalized theory and to preserve sensitivity to insights in symbolic theory developed in other disciplines.

**DEPTH PSYCHOLOGY.** Although some Romantics and others developed psychological theories of the symbol in the nineteenth century, these theories did not gain prominence until the twentieth century, notably in the work of Freud and Jung.

Sigmund Freud (1856–1939) founded his psychoanalytic movement on a theory of symbols whose refinement he pursued throughout his life. Freud used the dream symbols of the neurotically disturbed as fundamental data for his theories of how one’s perception of the past is distorted, displaced, condensed, and filtered according to the internal conscious and unconscious dynamics of the psyche. So startling and compelling were his ideas that by the early years of the twentieth century they had become essential lessons for students of symbolism. W. H. R. Rivers (1864–1922) and Charles Seligman (1873–1940), both British, were among the first anthropologists to incorporate his ideas into their ethnographic work. In 1935, Jackson Lincoln made a daring application of Freud’s method of dream interpretation to primitive culture; after him, Géza Róheim (1891–1953) used Freud’s ideas in his studies of myth and folklore. Freud’s concept of condensation, applied early on by Edward Sapir (1894–1939), has appeared in the work of such contemporaries as Victor Turner and Mary Douglas. Even those who, like Malinowski, were repelled by Freud’s neglect of social factors, or who, like Lévi-Strauss, rejected the primacy Freud gave to the sexual meaning and etiology of symbols,

have had to acknowledge the significance of unconscious factors in the formation of myths and symbols.

Carl Gustav Jung (1875–1961) had less influence than Freud on students of symbolism, but his research continues to stimulate interdisciplinary studies, and it has won respect in many depth psychology circles which are inimical to Freud. By seeing symbols not merely as private symptoms of unresolved repressions, but as expressions of the psyche's struggle for realization and individuation, Jung encouraged a more positive assessment of many neglected esoteric and mystical traditions from both East and West. His ideas affected the work of the Sinologist Richard Wilhelm (1873–1930) and the Indian scholar Heinrich Zimmer (1890–1943). In contrast to Freud, Jung has not attracted much attention from philosophers, but he has offered certain anthropologists, such as Paul Radin (1883–1959), a balance to Freud's excesses. Mythologists such as Joseph Campbell and Károly Kerényi (1897–1973), as well as numerous critics of art and literature such as Herbert Read (1893–1968) and Maud Bodkin, bear the stamp of Jung's symbolic theory clearly in their work. Although his methods of scholarship and use of data were controversial, both during his lifetime and afterward, Jung remains a testament to the power exerted by the study of symbolism over the inquiring intellect.

**PHILOSOPHY AND RELIGIOUS STUDIES.** Although philosophers and theologians have been interested in the problem of symbols since the time of the Neoplatonists, twentieth-century symbolic theory became something of a cottage industry among philosophers interested in or influenced by the field of semiotics.

Charles Sanders Peirce (1839–1914) took the first important step in this direction. His distinctions among the terms sign, symbol, index, and icon posed a number of fundamental questions that continue to intrigue many philosophers; in fact, his research provided a stimulus for anthropologists and historians to forge similar distinctions in their own work. In 1923, C. K. Ogden and I. A. Richards published *The Meaning of Meaning*, which disseminated Peirce's categories and stimulated interest in his ideas. American philosopher C. W. Morris also incorporated new insights from semantics and social psychology into the sphere of philosophical logic.

Ernst Cassirer's (1874–1945) work was much more ambitious in scope. He viewed the philosopher's task as the quest for the human spirit at work in culture, and coupled this outlook with his neo-Kantian leanings to produce a theory of "symbolic forms" as the basis to all human apprehension of the world. Although Cassirer's apparent neglect of criteria for verification has made him easy prey to later generations of scholars, his attempt to develop a consistent theory of mind grounded in the symbolic function represents a bold step beyond the purely logical frame of Peirce. His most notable successor in this regard has been Susanne Langer, best known for her aesthetic theory.

Among contemporary philosophers who have grappled impressively with the legacy of symbolic theory and with data from psychoanalysis, anthropology, and linguistics, the work of Paul Ricoeur stands out for the wide influence it has enjoyed among students of religion. For Ricoeur, "thought" needs something to "think about," and what it thinks about are symbols. The proper task of philosophy is hermeneutics, which he understands as the recovery of meaning through attention to the symbol-making function that begins with language and carries over into every person's attempt to be rational.

Religious studies in the twentieth century have become so closely bound to the study of symbols and the symbol-forming process that one is almost unthinkable without the other. The role that Mircea Eliade (1907–86) played in this chapter of Western intellectual history is hard to overestimate. In an impressive array of studies in the history of religions ranging from primitive societies to esoteric traditions, Eliade gradually constructed a comparative view of the phenomenon of symbolism that at once incorporates the gains of other disciplines and informs them with fresh insight.

The study of symbolism has also left its impression on modern theological studies. By introducing the philosophical hermeneutic tradition into biblical research, Rudolf Bultmann (1884–1976) redefined the domain of scriptural studies. In the area of systematic theology, Paul Tillich (1886–1965), whose dependence on existential hermeneutics is equally apparent, though at a more abstract level, argued throughout his work for the positive and indispensable role that symbolism plays in religious language. Conversely, he tried to show how the place of the symbol in human culture argues for the notion of an "Unconditioned" as a universal solvent of human consciousness.

**GENERAL SYMBOLIC THEORY.** A symbol usually is something concrete and particular that represents something else, usually abstract and generalized. The symbol often becomes a focal point for thoughts and emotions associated with its referent, or a trigger for associated habits. While the symbol itself is typically easily perceived, its referent may not be. Indeed, theorists commonly define a symbol in such a way that its referent is unclear, particularly with the powerful and lasting religious symbols, which generally resist direct connection to a single definable referent.

Theories of symbolism can be differentiated according to the factors that are judged to be formative in the symbolizing process (such as tradition and convention, biological needs and processes, the occurrence of natural phenomena, the structure of the human psyche, and divine hierophanies and revelations). A common, though largely tacit, assumption in most modern theories of symbolism is that the capacity to generate and use symbols is a core technology unique to the human species. This assumption exists as a prerequisite for, rather than an epiphenomenon of, the capacity for higher-order mental activity. Cassirer made this point forcefully in referring to symbolization as the root of all social

communication, calling human beings *homo symbolicus*. Susanne Langer extended the argument further, viewing symbolization as one of the most basic and primitive functions of mind. Symbols appear not only in rational, discursive thought and behavior but also in the arts, which Langer attempts to define as varieties of “virtual” behavior. Theorizing of the symbolic process, therefore, typically involves theorizing of the structure of the psyche itself in order to explain how meaning is created and handed down as humans reproduce. The British linguistic analysts and those of the Vienna Circle also contributed to symbolic theory: they were concerned with discovering the invariable patterns by which meaning enters into human communication and with disposing of the distorted patterns by which meaning is turned into nonsense. Moreover, Freud’s point of departure in the neurotic symptom and Jung’s search for archaic, archetypal patterns both represent attempts to describe the universal structure of mind in terms of symbol-making processes.

**THE MEANING OF RELIGIOUS SYMBOLS.** The problem of symbolic meaning introduces a consideration of hermeneutics and of semiotic logic. To the extent that they invoke a hermeneutics, religious symbols ask the scholar to consider what qualities—subjective, objective, or both—define a symbol as religious. Next, the researcher must determine whether a possible religious symbol is actually functioning as a living symbol or should instead be classified as some other form of communication. What works as a symbol in one age may, even within a given tradition, cease to be relevant in the next age. Naturally, the same precept applies to differences among various cultural settings, and even among individuals. Problems like these underlie the distinction between a synchronic study of symbols, which seeks to locate a symbol within a certain living context or fund of symbols, and a diachronic approach, which looks for invariable patterns in religious symbolism. While many anthropologists take the synchronic approach, Lévi-Strauss represents the diachronic approach. His work on patterns of binary opposition has tried to bracket the question of the concrete meaning of symbols in order to concentrate on the deep structure of the symbol-making mind. Most students of the religious symbol part from him on this point. Many, in fact, would say that Lévi-Strauss himself subsequently departed from this position by arguing that one cannot clarify the process of signification without beginning with the concrete meaning of concrete symbols.

Turning to semiotics, religious symbols raise equally fundamental questions. Early in the twentieth century, the Swiss linguistic theoretician Ferdinand de Saussure (1857–1913) set the tone for much of general symbolic theory. He had three objectives: to identify the signifier, to determine just what it is signifying, and to describe the mechanism by which the signifying process takes place. Yet another aspect, one that Saussure purposefully neglected in his own work, has proved to be essential to many of the most creative modern studies of religious symbolism: namely, the nature and extent of the relationship between signifier and signified, apart from the actual mechanism by which it is established.

Mircea Eliade made one of the boldest attempts to describe this relationship in terms appropriate to religious symbolism. Echoing the Symbolists and Romantics, Eliade contended that the symbol reveals certain dimensions of reality that would otherwise elude understanding. For him, these deeper dimensions are disclosed not only through the reflection of the interpreter of the symbols, but also in the “internal logic” of the symbols. This idea, however, depends on the premise that there is something contained “in” the symbol that is being disclosed. He and Rudolf Otto, call this embedded something “the sacred,” a reality of an order distinct from the natural and possessed of a power beyond humans’ comprehension and control. This shift away from the knowing subject does not deny the opening assertion that symbols are constituted as such subjectively, nor that they are basically cultural phenomena. Rather, it moves away from the anthropological approach to one that seeks to remove the arbitrariness from the symbol, through an assertion that the symbol reveals something *else*, something outside the closed system of human cultural production. This attitude opens a path to understanding “natural symbols” that goes beyond investigations into the natural capacity of mind, and establishes symbolic conventions in order to capture invariable patterns of meaning that those conventions communicate.

Jung’s research into “natural symbols” gradually deflected his mature work away from models of the psyche and questions of physiology toward a search for “archetypal” patterns of meaning by which symbols could be classified and interrelated. Although his early work with Freud had convinced him of the need to see the symbolic process at work in the psychic appropriation of physiological processes, Jung eventually placed greater emphasis on the religious and spiritual significance of universal patterns that appear in the individual experience of symbols.

Opinions vary widely regarding the general nature, classification of forms, and function of symbolism in culture and psyche, and the problems multiply when considering the actual interpretation of particular symbols. The topic is commonly divided into two areas: a general hermeneutics, or rules for interpreting symbols, and actual exegesis within a given hermeneutics. Many scholars have attempted to produce universally applicable lexicons of symbols purporting to decode the secrets of dreams, religious imagery, esoteric traditions, and the like. A philosophical approach to hermeneutics that is more congenial to scholarly endeavors and closer to the goal of the Romantics is Ricoeur’s restatement of one of the symbol’s oldest characteristics: that a symbol both reveals and conceals—that it possesses both a symptom-hiding and a truth-proclaiming dimension. In this view, meaning and the interpretation of meaning are essential and complementary moments in the general phenomenology of the symbol: interpretation involves refining the symbol and looking to the interpreter to reveal everything condensed in the symbol. The symptomatic dimension of the symbol, for Ricoeur, finds its clearest exponent in Freud, who attempted

to reduce all symbols to some repression of desire. (Ricoeur found Jung too obscure and difficult to follow.) To Freud's "hermeneutic of suspicion," which is basically a process of "demystification," Ricoeur adds a hermeneutic standpoint long preserved in the West through Christian interpreters of the words of the scriptures: opening oneself up to the inexhaustible "kerygmatic" (teaching) capacity of the symbol.

**THE ENDURANCE OF SYMBOLS.** The idea of the symbolic has proved compelling across the centuries and over many disparate cultures. This may have as much to do with what the symbol hides as with what it puts on display. Among the different types of figuration of which humans have conceived, symbols most consistently promise revelation—but they earn this capacity through an equal and opposite tendency to mystify. From the early passwords of the mystery religions, to the secret hermeneutics of Pseudo-Dionysius, to the Romantics' vehicles toward the transcendent, to Eliade's promise of divine disclosure, the symbol is a repository for the perennial desire of humans to see their gods. Since direct revelation lies out of reach, one settles for an image, a representation that is usually called a symbol. At the same time, the more this mode of figuration promises, the more it takes away. Clouds of mystery thicken around the signified to the precise degree that the signifier comes more clearly into view. At last, face-to-face always turns out to be not yet.

Although symbols are a human creation, they seem to have a life of their own, describing a dimension of human experience that stubbornly resists humans' control. Consequently, they have become especially relevant in a world that has developed increasingly elaborate conceptions of its own utter self-containment. Technological advances and expansion of knowledge—dizzying over the mere forty lifetimes that separate us from the classical Greeks—stand as impediments to even entertaining the idea of human limitation. But the symbol endures, ready to reassert, via a rich language of human imagination and through a process that operates at the root level of human experience, the infinite expanse against which humans' most magnificent achievements must always, in the end, be measured.

#### BIBLIOGRAPHY

Among the most extensive and readily accessible bibliographies on symbolism are those included in Juan Eduardo Circlot, *A Dictionary of Symbolism*, translated by Jack Sage (1962; 2d ed., New York, 1971), and Raymond Firth, *Symbols: Public and Private* (Ithaca, N.Y., 1973). Circlot's lengthy introductory essay offers a helpful overview of symbolic theory, particularly as it pertains to the interpretation of esoteric material. The first six chapters of Firth's masterful work constitute the perhaps most comprehensive treatment available of the rise and development of anthropological work on symbols; in addition, he covers the range of opinion regarding the relationship between symbol and myth. Other helpful sources

are the introduction of C. M. Bowra in *A Heritage of Symbolism* (1943; reprint, New York, 1961), which contains a brief but authoritative account of the French Symbolists; and Otto Gruppe, *Geschichte der klassischen Mythologie und Religionsgeschichte während des Mittelalters im Abendland und während der Neuzeit* (Leipzig, 1921) and Jean Pépin, *Mythe et allégorie: Les origines grecques et les contestations judéo-chrétiennes* (Paris, 1976), which contains detailed information on numerous thinkers in Western history who came to symbolic theory by way of classical mythology. For more information on the classical background, see Peter T. Struck, *Birth of the Symbol: Ancient Readers at the Limits of their Texts* (Princeton, N.J., 2004).

An important study of the religious-symbolic qualities attributed to the written word is Alfred Bertholet's *Die Macht der Schrift in Glauben und Aberglauben* (Berlin, 1949). Harold Bayley's *The Lost Language of Symbolism*, 2 vols. in 1 (1912; reprint, London, 1974), despite its age, remains a classic study of the origin of symbolic folklore surrounding the emblem, including much material of directly religious interest.

*Myth, Symbol, and Reality*, edited by Alan M. Olson (Notre Dame, Ind., 1980), presents a good overview of the range of current symbolic theory; Jacques Waardenburg's notes provide a good deal of useful bibliographical material. A study by John Skorupski, *Symbol and Theory: A Philosophical Study of Theories of Religion in Social Anthropology* (Cambridge, U.K., 1976), draws careful attention to the contribution that recent British philosophy has made to clarifying the conflicts in anthropological opinion. Philip Pettit, *The Concept of Structuralism* (Berkeley, Calif., 1975) and Peter Munz, *When the Golden Bough Breaks: Structuralism or Typology?* (London, 1973) are both short but extremely helpful guides to the debate surrounding the work of Lévi-Strauss and its relationship to linguistic theory. In the latter half of his book, Munz does a particularly noteworthy job of isolating the principal theoretical problems faced by psychology, metaphysics, and mythology in trying to explain the symbolic process. In a provocative little book, *Rethinking Symbolism*, translated by Alice L. Morton (Cambridge, U.K., 1975), Dan Sperber argues forcefully against the underlying assumption of much current theory about symbols' meaning—in particular the ideas of Freud, Lévi-Strauss, and Turner—on the grounds that they work without meaning at all.

The opening chapter of Mircea Eliade's *Images and Symbols: Studies in Religious Symbolism* (New York, 1961) is a helpful introduction to the basic philosophical position he has maintained rather consistently throughout his work; also see Eliade's "Methodological Remarks on the Study of Religious Symbolism" in *The History of Religions: Essays in Methodology*, ed. Mircea Eliade and Joseph M. Kitagawa (Chicago, 1959). In *Freud and Philosophy* (New Haven, Conn., 1970), Paul Ricoeur lays out in detail his own theory of symbolism, in contrast not only to Freud's psychoanalysis but also to other philosophical schools. A straightforward history of modern hermeneutics that aids in connecting symbolism with contemporary Christian theology and exegesis work has been done by Richard E. Palmer in *Hermeneutics: Interpretation Theory in Schleiermacher, Dilthey, Heidegger, and Gadamer* (Evanston, Ill., 1969). For a concise account of Paul Tillich's position and its major objections to psychological, sociological, and philosophical approaches to the symbol, see

his essay "The Religious Symbol," *Daedalus* 87 (1958): 321. Jacques Ellul's *The New Demons*, translated by C. Edward Hopkins (New York, 1975), offers a good taste of his long-standing campaign against the mindless absorption of the sacred symbols of religious tradition into technological modes of thought. Gabriel Vahanian's *God and Utopia* (New York, 1977) and David A. Martin's *The Breaking of the Image* (New York, 1980) present contrasting but more positive approaches to the question of the future of religious symbolism in a technological society.

For some recent trends among sociologists of religion who are interested in the subject of symbolism, see the *Proceedings of the Fourteenth International Conference on Sociology of Religion*, Strasbourg, 1977. Jolande Jacobi's *Complex, Archetype, Symbol in the Psychology of C. G. Jung*, translated by Ralph Manheim (Princeton, 1959), and a special issue of *Rivista di psicologia analitica* (no. 2, 1971) both provide handy introductions to the Jungian approach to the symbol. The volumes of the *Erano Jahrbuch* (Zurich, 1934–) and *Symbolon* (Basel, 1960–) are a good source of information for current interdisciplinary work going on in the interpretation of ancient and modern symbolism, both Eastern and Western.

PETER T. STRUCK (2005)

**SYMBOLIC TIME** is understood to be the temporal form that organizes the symbols of a religious system into an order of periodicity. The analysis of symbolic time extends the understanding of religion as a symbolic system, so that the major functions of time within the system may be taken into account: (1) the time intrinsic to the formation of religious symbols and to the ritual performance (i.e., the time that is internal to the sacred event), (2) the connection that symbolic time has with the history and dynamic of a religious social bond, and (3) the time that is specific to the intentional life of the individual.

**INTENTIONAL CHARACTER OF SYMBOLIC TIME.** Symbolic periodicity encompasses, in its temporal structure, both change and duration, implying a sheer sequence of symbolic events and also a type of internal correlation of events and symbols that reflects the functional unity of the interval of time and the continuity of its structure.

The calendrical structure of the symbolic system has a complexity that differs from that of a means of time reckoning or chronology. The temporal order of symbolic events is quite different from the abstract concept of time as a continuous quantity infinitely divisible into successive parts that are homogeneous and impenetrable (Hubert and Mauss, 1909, p. 190). When compared with the chronological succession of cosmological time units, the symbolic performative system of festivals within a given culture or historical religion appears to be discontinuous and to have an uneven distribution over the sequence of the year. An order of precedence among religious festivals emphasizes a single festival, or set of festivals, around which the entire calendrical performance of the symbolic system is organized and that is repli-

cated as the periodical structure of the religious year. Calendrical periodicity has an order that is temporally specific and reflects the dynamics of the symbolic function. It cannot be adequately analyzed by means of a descriptive model of the immediate empirical form of cyclic repetition.

The analysis of symbolic time may be pursued by linking the periodical structure of the religious symbols to the relational character of the symbol itself. It is possible to identify the dominant symbols that constitute the paradigmatic structure of a symbolic system and to identify their symbolic components and processual aspects, which define the dynamic movement of symbolic time.

A dominant symbol is a processual unity of word, semiotic transformation of an object of mediation, and action. It is structured as a relation that mediates a dynamic order of reality. Each symbolic feature is formed in such a way as to be a relational structure that binds two or more polarities to each other. As a unity, the religious symbol is generated within the dynamic of a relation between the subject and God, or an ultimate reality that has the capacity to condition the life of the subject. In their complex temporal features, symbols are the work of reason and the structures of perception, the dynamics of value, and the form of action in an intentional condition that comes into being when a constitutive relation between polar subjects appears as a new possibility or a new necessity.

In this sense, religious symbols are structures that are formed in the course of action and in the elaboration of experience. Symbol formation is present in the mental activity of the individual from the earliest stages; it is the way by which the relation with reality is established. But the temporal analysis of the type of processual structures that are differentiated by the religious symbol shows that the relation may not be defined simply in terms of subjectivity or in terms of intersubjective exchange. The central structure of a religious symbol defines the condition itself of "being in relation," the condition that shall be called *intentionality* or *intentional bond*; a symbol articulates the effective relation that conditions the life of the intentional subjects.

Symbols differentiate the direct expression and performance of the bond that relates the subject with the intentional object. The symbolic bond has a polar structure: It is constituted both by the orientation of the subject toward the object and by the way in which the object is determinant and active in the intentional life of the subject. The symbol is also performative because it elaborates the cognitive and dynamic structure of the intentional relation itself.

Symbolic time in its specifically religious form is the result of a temporal elaboration of the intentional exchange with an ultimate reality. This temporal elaboration represents a dynamic, generative process. In fact, symbols are temporally correlated in such a way as to constitute the nascent state of a bond with an intentional reality and to resolve unviable conditions in that relation. This article shall call the

temporal development and articulation of symbols within a symbolic system the *figura*.

As the specific modality of the bond, a religious “public” symbol and the *figura* have a temporally complex structure. The symbol does not define exclusively or simply a subjective or intersubjective perception of and orientation toward a significant reality. Nor does the symbol, as the synthesis of the intentional process of a bipolar dynamic, present merely the synthetic form of probability of a logical inference. Instead, being the structure that defines the dynamic of an effective relation of the intentional bond, the “public” symbol is a temporal relation of relations in the sense that it defines the transformation by which the subjective perception emerges into a form of reciprocity, which is constitutive of an intentional bond.

This process of transformation to public intentional form corresponds to the epigenesis of a new intentional and social reality and to the cultural creations that have produced, through time, a vital bond. The path from a subjective to a “public” symbol progresses through a symbolic innovation, differentiated by the *figura*. It traces into specific structures of dominant symbols and into their temporal correlation a sheer sequence from past to future of temporal symbolic modalities, from the original insight to a condition of vital presence to a new structural orientation of action that expresses the time and the creative character of the bond. The religious *figura*, itself, has an historical formation that has come about through the actions of founders, the creativity of individuals and collective movements that have produced innovation within a tradition of forms of religious relation. The temporal dimension is intrinsic to the public symbol because it corresponds to the dynamic structure of the intentional relation, to its unity and transformation.

Symbols are generated within the intentional relation and constitute necessary structures and functions by which the new reality becomes and remains intentional. Formed within the intentional exchange, symbols are complex facts that differentiate the generative force of relation. They elaborate the internal principle of causality, the order of necessity, and the temporal logic that is stated within an intentional reality.

Because the symbol is both temporal and intentional, it is possible to interpret the symbolic or religious system not primarily as a system of signification, as analogical representation, nor simply as a set of metaphors, but as a processual structure that elaborates the forms of the “condition of being in relation” and the dynamics of the nascent state that is created within the ultimate intentional relation. The connotative and denotative features of signification that the symbol clearly presents may, consequently, be seen to be functions of the primary structure of the symbol as intentional relation.

The temporal function indicates that the symbol is the constant empirical constituent of the intentional relation. The religious symbol is a temporal artifact specific to the dy-

namic generated in the intentional relation. It is not an independent object but the temporal creativity in which the actual intentional event has its passage to a public, new bond. This applies not only to the individual symbol but also to the symbolic system as it is shaped by the interrelation of sacred text, symbolic forms of intentional exchange, and symbolic action.

Three theoretical elements, therefore, define symbolic time, namely, *figura*, periodicity, and intentional epigenesis. The “*figura*” is the set of symbols that are temporally correlated into a periodical system, and it is the original central structure of time within the intentional event. For this reason, the *figura* is the minimal unit of analysis of the symbolic temporal function. Periodicity defines the correlation of the symbols within a temporal interval. Intentionality, as the relational character of the symbols, is the epigenetic process, the nascent state of an intentional bond.

The temporal function of the *figura* is the dynamic process of a presence that has an intentional character. In the development from the first insight to an intentional bond, the *figura* is directed toward the resolution of the tension between those factors that are generative of an intentional bond and those that move in a contrary direction and finally destroy the bond or reduce its vitality. The formation of a *figura* and its performance is the result of a sequence of historical choices and actions related to the formation and selection of symbolic institutional structures. The *figura* reflects the experience of long periods of trial and error in the historical formation of a religious tradition, a sacred history, and a people. The intentional character of the *figura* becomes most evident in the language and action of the sacrifice and in the formulation of the sacred bond.

By formalizing the “relational” aspect of the symbols and of the development of the *figura* and by correlating it with the symbolic, sequential, and performative movement of the *figura*, one may specify the intentional character of periodicity presented by symbolic time.

**INTENTIONAL EPIGENESIS AND FORMATION OF THE FIGURA.** The process of formation of the religious bond within a sacred history corresponds to the development of symbolic structures of a divine encounter and union. Defined in its relational character both of divinization and of incarnation, the development is a process of transcendence that has the temporal structure of a total object relation. The total object relation is an intentional action that transforms the bond from subjective to public. It is a nascent state within the intentional event that guides the passage from an inadequate modality of relation (in which the subject attempts to appropriate the value of life represented by the object and to negate the intentional value of the object and the constitutive and vital character of the relation) to a modality of the bond in which the object is restored to its original value as object of relation. With this epigenetic movement, both subject and object come to be recognized in their wholeness as

vital to the bond, and the bond becomes a creative condition of intentional life.

In theological or religious language, the epigenetic sequence is often expressed in terms of the transformation from death to life, from darkness to light, from slavery to freedom through a time and history of salvation.

A total object relation allows the recognition of the other as total object. This is achieved by means of a resolution of the dynamics and structural intentional modalities of a partial object relation that are destructive or appropriative of the object and therefore inadequate to the condition of reciprocity of an intentional bond. This occurs through a creative intentional initiative (gift, sacrifice) in which the intentional dynamics of the partial object relation are transformed from appropriative to reciprocal and through models of thought and action that sustain intentional reciprocity in the creation of sociocultural institutions that express the bond. It follows from this that the nascent state and the epigenesis of a total object relation, in its temporal symbolic structure, is a sequence of intentional positions that build a symbolic intentional bond. Each passage from one intentional position to another is guided, in its unity, by particular dominant symbols.

The temporal correlation of the dominant symbols is the order of successive creations of the intentional relation; this develops the nascent state into a vital form of life and corresponds to the sacred history of the bond.

The initial stages of the sequence are not merely incidental to the development of a vital cultural and institutional bond. They are, instead, the necessary elements, stages, and modalities of the temporal process of the bond itself.

Symbolic time is a generative symbolic form. It traces and differentiates a specific way by which human action, in a given intentional bond, both at the level of the individual and of the collectivity, becomes intentionally creative. The nascent state related to the *figura* is a process of formation of something new, the specific event of the coming into being of an intentional bond, a dynamic covenant that constitutes a new order of possibility and the creation of new cultural and institutional forms. The *figura* is the generative time of an intentional public bond that has been brought about by a transformation of the structure of intentional relations and by the symbolic and institutional elaboration of intentional existence.

The intentional character of the *figura* within the development of a sacred history is differentiated as the paradigmatic action, the symbolic agent (identified as founder, hero, or prophet), and the normative order of intentional life. Symbolic time is, therefore, interior to the intentional relation of the bond, and symbols are structures that both differentiate and connect the initial perception of reality to the elaboration of concrete forms of relation and to their articulation through time.

**RITUAL PERFORMANCE.** The *figura*, as it is represented by a calendrical order, makes use of three types of temporal pa-

rameters: time units, rules of symbolic performance, and sets of festivals or rituals. The “time units” are periodical intervals normally related to astronomic measurements of the solar and lunar year, the solstices and equinoxes, the month, the week, and the day. The set of performative rules defines the logic of interrelation of the symbolic features of word, action, and object in the form of intentional exchange and coordinates the different symbols in such a way as to express the intentional structure of the *figura* through its temporal periodical performance. Festivals are symbolic public actions that have a mythic and ritual structure.

The features of the three main temporal parameters are correlated so that a condition of time is created that is periodical. The temporal coordination of the dominant symbols is ritualized in a calendrical, repetitive form.

The different festivals and their distribution, which is, as has been seen, uneven and discontinuous through the year, correspond to the calendrical coordination of specific events of the epigenetic sequence. These events are correlated into a performative paradigm that has the pattern of a “fact coming into being” (*fait naissant*). This performative pattern, which structures the individual ritual and permeates the periodicity of the *figura*, has a tripartite structure consisting of a phase of separation and deconstruction, of *limen*, and of restructuration and organization into a new relationship (van Gennep, 1960; Turner, 1969). In the first phase the ritual subjects become detached from their former modalities of intentional relation and from their structural expression; in the last phase a new cultural and structural bond is created in which the individual and the collectivity express a new intentional modality. The celebration of the intentional bond occurs in the liminal phase of the ritual and is centered in the performance of the sacrifice. The central phase is liminal and transitional: The ritual actors are freed from structural or social definition while they acquire a new symbolic definition.

The performative paradigm of the *figura* elaborates the three main phases and conditions of the epigenetic sequence that are intrinsic to the formation of a bond: the originating occasion and condition of the fact coming into being, which carries with it the resolution of modalities that are contrary to the bond, the definition of the bond through the sacrifice, and the public and historical structures instituted by the bond. The whole corresponds to the nascent state and to the process of adaptation within the intentional bond.

Every festival, and indeed the *figura* as a whole, creates a confrontation between the new and the old, between viable and unviable modalities of the bond. Through the performative pattern, the *figura* roots the continuity of the cultural symbolic institution in a constant dynamic process.

**THE PERIODICITY OF THE FIGURA.** The *figura* is predicated on the correlation of the epigenetic and performative paradigms. In the case of the Christian tradition, the *figura* is centered on the three initiatory sacramental symbols of baptism, Eucharist, and confirmation. The epigenetic model is

defined in terms of transformation from a condition of death to one of life. The transformation is elaborated in a structural and dynamic sequence of active and passive exchanges between God and humanity. The line of action of God toward humans initiates the sequence and is coordinated—in a dialogical structure—with a complementary line of action of humans toward God. Initiated by gift, the sequence passes through a creative intentional crisis that is specified in the sacrifice and leads, at the end of the process of transformation, to a differentiation of a total object relation. The performative model of the festivals of Easter time (which articulates the three dominant sacramental symbols and which is central to the religious year) constitutes an order of relation between intentional events that have been differentiated through the “history of salvation” from creation and the original relation with God to the constitution of the covenant.

From the point of view of the epigenetic performative sequence, the order of “events” in a sacred history derives its significance and constitutive character not primarily from the chronological aspect of the sequence but from its relation to the dynamics and transformations of the intentional bond and from the conditions of continuity of that bond. Together the two complementary models, the epigenetic and the performative, constitute the periodical order of a religious figura which, in its temporal unity, sustains the dynamic continuity of the intentional relation. The three phases of the ritual process translate each of the three epigenetic positions and the sequence as a whole, which develops the institutional forms of the intentional relation into the performative pattern of a fact coming into being.

The sacrifice is at the center of the figura both in the epigenetic sequence and in the performative process. As the point of qualitative change in the creation of the bond, the sacrifice is the active resolution of what is contradictory to the bond and the affirmation of a new condition of total object relation. In the ritual process, the sacrifice specifies the structural differentiation of the intentional bond in its “coming into being.” The ritual process may be described as a performative sequence that has an epigenetic function.

The performative articulation of symbols and festivals creates the temporal order of the positions of epigenesis through the ritual sequence while maintaining the explicit connection of each festival and dominant symbol with the central symbolic position elaborated by the sacrifice. This results in a periodical correlation of the different symbols with the transformative structure of the sacrifice. While festivals mark the change related to the symbolic positions, the sacrifice renews the central dynamic of the nascent state of the bond. This periodical process of the figura creates a “dynamic state,” which corresponds to the complex intentional relation of the bond.

The calendrical system elaborates the periodical temporal order of the figura, which is ritually performed in the interval of the year through a set of festivals. Recurrent intervals of the year, like the week or the day, offer a rhythmic

movement of religious time repeating in ritual form the central paradigm of the figura.

The performance of the figura, which is the original central structure of time, is also the anamnesis and memorial of the foundation of the bond. The historical formation of the calendar shows a progressive differentiation of a set of festivals, which is correlated to the central structure of the figura and which celebrates the apotheosis of the historical founder, the unity of the people of the covenant, and the celebration of those events that have been most significant for the historical continuity and development of the bond. The two orders of time, the periodical symbolic structure of the bond and the celebration of the continuity and the tradition of the bond, are frequently positioned along two discrete temporal axes within the periodical interval of the year. For example, the epigenetic performance may be positioned on the lunar axis; the celebration of the historical formation of the tradition may be positioned on the solar axis. But the religious calendar expresses primarily the order of the temporal epigenetic symbols.

The intentional bond creates and sustains an objective order of relations that is linguistic, institutional, and normative. Although it may appear to be independent of the time of epigenetic performance, this symbolic institutional order has an inherently temporal structure and is ruled by the time-like order of the figura.

The figura is dynamic rather than static, synchronic as well as diachronic; it is related to the event but in such a way that the event may be understood as a nascent state and the creative element of history and continuity. The figura is not an ahistorical archetype, nor is it a rigid whole, obeying some closed formal principle. It is, instead, connected to the history of religious interpretation and ideas; it is internal to the process of formation of intentional action and to that of the social bond. The figura expresses a form of causality that is specific to the intentional character of the historical event.

The individual is directly active in forming and performing the figura but the figura is the way toward the bond for the individual. By defining the dynamic structure of the bond, the figura traces an initiatory path toward the public character of experience. The time of the figura becomes the time and depth of the religious structure of mind of the individual.

The symbolic time system within a culture may present a broad range of historical variation. By the way in which the polar aspects of the figura are emphasized, a tradition may differ in style and in institutional form. For example, Manichaeism and other forms of religious dualism explain the confrontation inherent in the intentional relation as a conflict between two opposite and independent systems of reality and two orders of time. Other religious systems, such as Judaism, connect the religious polarities into one order of relation and correlate the intentional confrontation with the time itself of the intentional bond.

Particular historical styles within one religion, while maintaining the temporal integrity of the figura, may differ in the interpretation and emphasis that they give to the epigenetic or to the performative orders of symbolic time or to one of the dominant symbols. But the religious figura is simultaneously a transformative nascent state and a living tradition. Symbolic time, by sustaining a system of religious reciprocity, an intentional vision, and a processual articulation of reality, is structured in its development and unity as an epiphany of intentional life.

*Revised Bibliography*

**SYMEON THE NEW THEOLOGIAN** (949–1022) was a Christian mystic. Symeon is called "the New Theologian," first because, like John the Evangelist, he speaks of mystical union with the Trinity, and, second, because Gregory of Nazianzus, known as "the Theologian," had also written passionately on the Trinity. Symeon's personal life and his writings reflect a good deal of the polemical,

because he considered himself a zealot battling the fossilized segments of the institutional church for a return to radical gospel Christianity. That he, as all mystics who articulated their experiences in writings, would be branded as a dangerous reformer walking the slender line between orthodoxy and heresy is not surprising. His ardent, passionate nature, plus the genuinely rare mystical graces that he had experienced, compounded to "force" him, as he confessed, to share his mystical experiences freely with others.

Symeon was born at Galatia in Paphlagonia (in Asia Minor) in 949. This was the time of the powerful Macedonian dynasty, which had given the Byzantine empire its greatest periods of peace and expanding prosperity. Symeon's parents, Basil and Theophano, belonged to the Byzantine provincial nobility, which had won favor with the administration and had acquired some modicum of wealth.

There are two main sources of knowledge about Symeon's life: the *Life* written by his disciple, Nicetas Stethatos, and the writings of Symeon himself. Symeon's uncle Basil brought him to the imperial court of Constantinople, where he continued his secondary education. Refusing to pursue higher studies, he was taken under direction by a holy monk of the Stoudion monastery in Constantinople, who allowed him to enter the monastery in his twenty-seventh year.

The fervent life of the novice under the guidance of his charismatic spiritual director caused jealousy among the monks, and Symeon transferred to the neighboring monastery of Saint Mamas. Here he made great progress in learning and in spiritual perfection, and within three years he was tonsured monk, ordained priest, and elected abbot. By his discourses (*catecheses*) to his monks, he strove to lead them into a greater consciousness of God's presence indwelling them, but not without stirring up great opposition, especially from Stephen, archbishop of Nicomedia and chief adviser to the patriarch of Constantinople. Stephen emphasized reason, philosophy, and rhetoric in his theology; Symeon's theology was charismatic and apophatic, stressing a mystical and interior way of negation that doubts the capacity of reason to comprehend mystery.

Under attack, and desirous of more solitude for prayer and writing, Symeon resigned as abbot in 1005. Four years later, the official circle of theologians headed by Stephen succeeded in having Symeon exiled to a small town called Paloukiton, near Chrysopolis on the Asiatic shore of the Bosphorus. There he passed thirteen years in the small monastery of Saint Marina in prayer and writing, dying in 1022.

Symeon, as one of the most "personal" writers in Byzantine spirituality, reveals himself in his writings in all his sinfulness and ecstatic joy in union with God. His central work can justly be considered his thirty-four discourses, *Catecheses*. As these were preached before a live audience of his fellow monks of Saint Mamas, usually during the morning office of matins, they represent a genre unique in Byzantine spirituality. Two characteristics shine forth in this writing. One sees

a most traditional presentation of classical themes common to all the Greek fathers who wrote on the spiritual life of asceticism and contemplation. But on the other hand, one finds a new and insistent accent on the operations of the Holy Spirit to effect the end of the spiritual life and of all Christian asceticism and contemplation, namely, greater mystical union with the indwelling Trinity.

Other writings of Symeon developed around key theological issues as he engaged in controversy with Stephen and other official "scholastic" Byzantine theologians. In these writings Symeon is not exhorting monks but is struggling to combat the heavy rational theology that he felt was destroying true Christianity. His writings collected in *Theological Treatises* form an integrated series focusing on the unity of the Trinity.

The fifteen writings collected in *Ethical Treatises* are much more uneven. The first two treatises deal with the economy of God's salvation; the following nine (numbers 3–11) form a fairly unified presentation of Symeon's doctrine on mysticism; the last four (numbers 12–15) deal with a variety of subjects of a more practical nature concerning the way in which ordinary people in the world can attain salvation.

Symeon's *Practical and Theological Chapters* is a collection of ideas about a variety of topics, probably notes gathered by him on points touching the ascetical and contemplative life of Christians. But it is Symeon's *Hymns of Divine Love*, which he completed shortly before his death in 1022, that will place him in the ranks of the greatest mystics of all time. These are fifty-eight hymns without any unifying theme or system of mystical theology, but they show clearly Symeon's own mystical experiences through the power of poetic rhythm. His mystical experiences and personal love toward Jesus Christ are expressed in a language rarely surpassed by other mystics except those who, like Symeon, had to resort to poetry, as did John of the Cross, to convey the intensity of such ecstatic mystical union. Each hymn is a poetic composition of great power and beauty that can ignite in the reader a desire to strive to attain such "endless light" as Symeon must have enjoyed.

In Symeon were combined the two predominant currents within Eastern Christianity of the earlier centuries. One was the mystical school of the Desert Fathers, which stressed the Semitic concept of a total experience of God and humanity in the *locus Dei*, the place of God in the person called in biblical language the "heart." The second approach was the intellectual mysticism of the Alexandrian school of Clement of Alexandria, Origen, and Evagrius of Pontus. The accent here was on the human mind, which, when purified of the hold of the sensible world of passions, was able to "see" God in an interior light. In addition to producing this synthesis, Symeon was an innovator in writing candidly of his own mystical experiences and in presenting these as normative for all Christians.

Symeon may be judged in the light of his unique, powerful, and affective personality as against the formalism that had suffocated much of the charismatic and mystical elements in the church of Constantinople. His works were rooted in the great traditions of the Eastern Christian fathers, both dogmatically and mystically and, as such, present a balanced Christian mystical theology.

#### BIBLIOGRAPHY

The critical Greek text with a French translation of Symeon's main works can be found in volumes 51, 96, 104, 113, 122, 129, 156, 174, and 196 of *Sources chrétiennes* (Paris, 1957–1973). An English translation of *Catéchèses* by C. J. de Cazanaro is available in *Symeon the New Theologian: The Discourses* (New York, 1980) in "The Classics of Western Spirituality." My translation of *Hymnes* is in *Hymns of Divine Love by St. Symeon the New Theologian* (Penville, N.J., 1975). Discussion of Symeon's life and thought can be found in my *The Mystic of Fire and Light: St. Symeon, the New Theologian* (Penville, N.J., 1975).

GEORGE A. MALONEY (1987)

**SYNAGOGUE.** The origins of the synagogue are obscure and will probably never be known. This is in part because the synagogue developed in a nonrevolutionary manner, its significance recognized only once it was a well-established institution of Jewish life. A hint of the original function of this institution may be found in its most prominent Greek and Hebrew names used in antiquity, *sunagogē* and *beit kneset*. Both refer to an assembly or house of assembly. Numerous theories have been propounded to explain the origins of this institution. The most venerable of these places the origins of the synagogue in Babylonia (modern Iraq) during the sixth century BCE. There, "by the waters of Babylon," this theory suggests, the exiled Judeans assembled to "sing the Lord's song in a strange land" (*Ps.* 137). *Ezekiel* 11:16, "Though I removed them far off among the nations, and though I scattered them among the countries, yet I have been a lesser sanctuary to them for a while in the countries where they have gone," has often been cited in support of this thesis. This approach has roots that go back at least to the medieval period in Babylonia (modern Iraq), and it was developed further by Christian Hebraists beginning in the seventeenth century in their attempt to find biblical antecedents for later Jewish practice. More recent theories place the origins of the synagogue in third-century BCE Egypt, asserting that Jewish "prayer places" (*proseuchē*) described in inscriptions were in fact the earliest synagogues, or elsewhere in the Western Diaspora. These approaches assert the priority of exile and hence distance from the Jerusalem Temple as a determining factor in the formation of the synagogue. In recent years the origins of the synagogue in biblical Israel have been asserted. According to this theory, the Second Temple-period synagogue was the descendant of the "gate of the city" of biblical times. None of these approaches is supported by sufficient data.

An approach that is more clearly supported by the available evidence suggests that the synagogue as a place for religious ritual was a development of the later Second Temple period. This approach begins with the fact that institutions known as “synagogues” are clearly evidenced in literary and archaeological sources from the first century CE, and it cautiously assumes a development that occurred before synagogues were mentioned in literary texts without asserting a specific moment when the first synagogue appeared. A long prehistory is assumed by *Acts of the Apostles* 15:21, by Josephus Flavius (*Against Apion* 2.175), and by the ancient rabbis (e.g., *t. Megillah* 2:12), all of whom assert the existence of synagogues in hoary biblical antiquity. The factors occasioning the earliest development of the synagogue were shared by other communities in the Greco-Roman world. The general trend toward smaller religious communities that existed side by side with the major cults of each city was adopted by Jews in Palestine and in Diaspora settings. This phenomenon may be evidenced in Egypt as early as the third century, if the “prayer places” (*proseuchē*) known from epigraphy were in any way similar to “prayer places” known from the writings of the first-century Egyptian scholar Philo of Alexandria. A Jewish “prayer place” from the second century BCE was discovered on the Greek island of Delos. We have no idea what kinds of “prayer” took place in these early “prayer places.” By the first century (and undoubtedly much earlier) the increasing significance of Scripture and its interpretation in Second Temple-period Judaism set the liturgical frame for these synagogues. This focus on Scripture and scriptural interpretation is expressed early on in the public ceremony of reading and interpreting the Pentateuch described in *Nebe-miah* 8, a Persian-period text that exercised a profound influence upon later synagogue practice.

The best evidence for synagogues during the first century is a monumental inscription found just south of the Temple Mount in Jerusalem by R. Weill in 1913–1914. This Greek inscription translates:

Theodotos, son of Vettanos the priest and synagogue leader (*archisynagogos*), son of a synagogue leader and grandson of a synagogue leader, built the synagogue for the reading of the Torah and studying of the commandments, and as a hostel with chambers and water installations to provide for the needs of itinerants from abroad, which his fathers, the elders and Simonides founded.

The *terminus ad quem* for the inscription is the destruction of Jerusalem by the Romans in 70 CE. It provides evidence of three generations of priestly synagogue leaders. The liturgical focal point for this, and for every other Second Temple-period text that has been recovered, is scriptural study. This is clearly the element that distinguished synagogue liturgy, both for Jews and non-Jews. Philo describes the Sabbath liturgy of an Essene “synagogue” in Palestine:

For that day has been set apart to be kept holy and on it they abstain from all other work and proceed to sacred places (*hierous*. . . *topous*) that they call synagogues

(*sunagogai*). There, arranged in rows according to their ages, the younger below the elder, they sit decorously as befits the occasion with attentive ears. Then one takes the books (*biblous*) and reads aloud and another of especial proficiency comes forward and expounds what is not understood. . . .

*Luke* 4:16–30 and the *Acts of the Apostles* 13:15–16 provide additional early illustrations of public Scripture reading and explication in synagogues. It is unknown whether other liturgical acts were performed in synagogues at this time, though ample numbers of later Second Temple-period Jewish prayer texts are extant.

It is likely that the earliest synagogue buildings (like many after them) were simply rooms within domestic structures with no special renovations, and hence are unidentifiable archaeologically. Five purpose-built or purpose-renovated buildings that might be identified as later Second Temple-period synagogues have been excavated in Israel. These were uncovered at Masada, Gamla, Herodian, Kiryat Sefer, and Modi'in. Other supposed synagogues, at Magdala, Capernaum, and Jericho, are far less likely. Gamla is the earliest synagogue. This large public building was built on the eastern side of Gamla, next to the city wall. Built of local basalt, this structure is rectangular (13.4 by 17 meters). The main entrance was on the west, with an exedra and an open court in front of it. The center of the hall was unpaved and surrounded (except for the main entrance) by stepped benches. The synagogue at Masada is a ten-meter-square room that was converted by the Jewish rebels who inhabited this desert fortress from 66 to 74 CE. The rebels added banks of benches on each wall, and a small room on the northwestern wall within which were found fragments of the books of *Deuteronomy* and *Ezekiel*. The literary definition of the first-century synagogue as a house of assembly where Scripture was studied is uniquely paralleled in this structure. At Herodian a room was converted by Jewish rebels with the addition of benches that were similar to those at Masada. The synagogues at Kiryat Sefer and Modi'in are small freestanding structures with benches lining the walls. It seems likely that these communal buildings served as synagogues as well, though there is no epigraphic evidence to support this identification.

**LATE ANTIQUITY: THE LATE ROMAN AND BYZANTINE PERIODS.** Evidence for synagogues during the second through the fourth centuries is mostly literary. Rabbinic literature from Palestine and from Sassanid Babylonia (modern Iraq) present synagogues as regular features of the Jewish communal landscape. Early rabbinic (Tannaitic) literature mentions a broad range of activities that took place within synagogues. These included the recitation of Aramaic translations of the Torah reading (*m. Megillah* 4:6,10), Torah blessings (*t. Kippurim* 3:18), sounding of the ram's horn (*shofar*) on the new year (*m. Rosh Hashanah* 3:7), use of the palm frond (*lulav*), myrtle, willow, and citron (*ethrog*) on the feast of Tabernacles (*m. Sukkah* 3:13; *t. Sukkah* 2:10), recitation of the *Book of Esther* reading on the Feast of Esther (Purim), possibly even by

women (*m. Megillah* 2:4), recitation of the *hallel* psalms (*t. Pesahim* 10:8), eulogies (*t. Megillah* 2:18), public oaths (*m. Shevuot* 4:10), local charity collection (*t. Shabbat* 16:22; *t. Terumah* 1:10; *t. Baba Batra* 8:4; *Matt.* 6:2), communal meals (*m. Zavim* 3:2; *m. Bekhorot* 5:5). By the third century they were also used as elementary schools (*y. Megillah* 3:4, 73a). Rabbinic literature suggests the development of an increasingly standardized public liturgical tradition, important elements of which were enacted within synagogues (e.g., *m. Berakhot* 7:3). Rabbinic public prayer (the “public” defined as a quorum of at least ten men) took place in formal thrice-daily sessions as well as in the context of communal meals. This format continues to this day. In liberal Jewish communities the quorum now includes women. In antiquity there was considerable variation in custom dependent on locality and scholar, modern scholars differing on the balance between variation and standardization. Rabbinic liturgy was built around the recitation of the “Shema (*Deut.* 6:4–9, 11:13–21; *Num.* 15:37–40) and its blessings” together with the Eighteen Benedictions (also known as the “Standing prayer,” the *Amidah*) morning and evening, and the Eighteen Benedictions with accompanying liturgy in afternoon prayers. Prayer times, though not the content of these rituals, were associated with the times of the Temple sacrifices. By the third century public prayer was described homiletically as being equivalent in efficacy to sacrifices in the Temple, although the notion of the rebuilding of the Jerusalem Temple was never questioned in liturgical terms until the advent of modern Reform Judaism. In rabbinic times synagogue prayer and the preexisting public reading of Scripture melded into a single liturgical structure. The Torah was publicly read, with attendant blessings, in the morning and afternoon services on the Sabbath and festivals and on Monday and Thursday mornings. A reading from the prophets (the *haftarah*) accompanied the Sabbath morning and festival Torah reading. Scripture reading was simultaneously translated into Aramaic (later concretized in *Targum* texts such those preserved in *Targum Neofiti* and *Targum Onkelos*), a tradition that was popular into the early Middle Ages and is still followed by Yemenite Jews. Various cycles for reading Torah existed in antiquity. Palestinians generally completed the entire Pentateuch in something more than three years, while Babylonians read on a yearly cycle. The Babylonian custom is followed in all traditional communities today.

The increase in synagogue functions was paralleled by the developing notion that synagogues were in some way holy. Mishnah *Megillah* 3:1–3 describes the centrality of Scripture within the synagogue, as well as the transient holiness ascribed to this institution by the early rabbis. At the focal point of the synagogue, this text suggests, was the Torah scroll, which stood at the top of a hierarchy:

The people of a town who sold their town square: They must buy a synagogue with its proceeds; If they sell a synagogue, they must acquire a (scroll) chest. If they sell a (scroll) chest, they must acquire cloths (to wrap sacred scrolls). If they sell cloths, they must acquire books (of

the Prophets and Writings). If they sell books, they must acquire a Pentateuch (scroll). But, if they sell a Pentateuch, they may not acquire books (of the Prophets and Writings). And if they sell books, they may not acquire cloths. And if they sell cloths, they may not acquire a chest, And if they sell a chest, they may not acquire a synagogue. And if they sell a synagogue, they may not acquire town square.

Tosefta *Sukkah* 4:6 projects a second-century Palestinian reality onto a great synagogue in Alexandria. This text focuses attention upon a large podium (*bimah*) upon which the biblical texts were read, with no mention of a Torah shrine. An ideal synagogue is described in Tosefta *Megillah* 21–23, which establishes categories that set the parameters of Jewish legal discussions of synagogue architecture for the next two millennia. At the same time it suggests a second focal point within synagogues: orientation toward Jerusalem.

The Community leader (*hazan ha-kneset*) arises to read, someone stands until the time when he reads. How do the elders sit? Facing the people, their backs to the *godesh*. When they set down the (Scroll) chest—its front is toward the people, its back to the *godesh*. The *hazan ha-kneset* faces the *godesh*. All the people face the *godesh*. For it is said: “and the congregation was assembled at the door of the tent of meeting (*Lev.* 8:4).” The doors of the synagogue are built on the eastern side, for thus we find in the Tabernacle, for it is said: “Before the Tabernacle toward the east, before the tent of meeting eastward (*Num.* 3:38).” It is only built at the highest point of the town, for it is written: “Above the bustling (streets) she (wisdom, i.e., Torah) calls out (*Prov.* 1:21).”

The location of the synagogue and some of its internal arrangement are articulated through reference to the biblical Tabernacle and the Temple of Jerusalem. Alignment toward Jerusalem as focused through a Torah cabinet became basic to synagogue architecture, as did the notion that the ideal synagogue should be higher than the surrounding structures (the latter having generally been kept in the breach). The identification of the synagogue with the Temple was a developing concept throughout antiquity and the medieval period. By the third century the cabinet (*teva*) was being called *aron* (cabinet, reminiscent of the Ark of the Covenant), and its curtain *parokhta*, reminiscent of the Temple curtain. There is no evidence for the physical separation of men and women in ancient synagogues, though a social distinction existed. Physical gender separation is known beginning during the early Middle Ages, when it was seen as an expression of the holiness of the synagogue due to its conceptual relationship with the Temple (where gender separation sometimes occurred).

The dual foci—the scrolls as local cult object along with a more subtle physical alignment in the direction of Jerusalem—became ideologically significant features of almost all synagogues until modern times. While the standard codes of Jewish law all legislate that the synagogue interior be aligned toward the Torah shrine on the Jerusalem wall of the syna-

gogue, local realities were far more complex even in the most rabbinically oriented medieval and early modern communities.

Archaeological evidence for purpose-built synagogues begins to appear during the late third or early fourth century, becoming quite common between the fifth and ninth centuries. Undoubtedly there were many other buildings that are archaeologically unidentifiable as synagogues. More than one hundred synagogues are known archaeologically from the Land of Israel, and another ten structures have been discovered that served Diaspora communities. At least 150 Diaspora synagogues are known from literary and archaeological sources. The earliest extant late-antique synagogue is also one of the most important. The synagogue discovered at Dura Europos, a city in the Syrian desert, is the earliest yet discovered, and among the most important. Excavated in 1932, the Dura synagogue was built as a renovated private dwelling. Sometime before 244–245 this dwelling was renovated as a synagogue. The largest room was renovated for this purpose, with a large Torah shrine built on the western (Jerusalem-aligned) wall and benches around the walls. The façade of the Torah shrine was decorated with the image of the Jerusalem Temple, flanked on the right by the Binding of Isaac (which according to *2 Chronicles* 3:1 took place on “Mt. Moriah,” the Temple Mount) and on the left by a seven-branched menorah, a palm frond (*lulav*), and citron (*ethrog*). There was some other painting, lost in a massive renovation of the synagogue that took place in 244–245. At that time the walls were completely covered with paintings drawn from the Hebrew Bible and read through the prism of Jewish biblical interpretation (midrash). Sixty percent of the paintings have been preserved. Themes are generally heroic, reflecting such themes as the Discovery of Moses by the Daughter of Pharaoh, the Crossing of the Red Sea, the Tribes encamped around the Tabernacle, Ezekiel’s Vision of the Dry Bones, and Esther before King Ahasveros. The paintings show profound parallels with traditions preserved in rabbinic literature, as do Aramaic and Persian inscriptions on the paintings and a Jewish liturgical parchment found near the synagogue. The Dura synagogue has been interpreted as a forerunner of Christian art and as evidence for a supposed late-antique “nonrabbinic Judaism.” The evidence is actually much closer to rabbinic tradition than most contemporary scholars have suggested.

Archaeological evidence for synagogues increases from the fourth century onward. Synagogues conforming to three main architectural types were constructed by Jews in late antique Palestine: the broadhouse (e.g., Horvat Shema, Eshtemoa), the “Galilean-type” basilica (e.g., Capernaum, Kefar Baram), and longhouse basilicas (e.g., Hammath Tiberias B, stratum 2a), which from the latter fifth or sixth century onward often were apsidal (Beth Alpha, Na’aran).

The interior space of most of these synagogues was aligned toward a permanent Torah shrine, which usually stood on the Jerusalem-aligned side of the synagogue. The

basilica form was used by both Jews and Christians beginning around the turn of the fourth century. “Broadhouse-type” synagogues have benches built around the interior walls, focusing attention upon the center of the room. The broadhouses from the Hebron Hills (e.g., Eshtemoa, Khirbet Susiya) form a regional type. The entrances of these halls were aligned toward the east. The eastward alignment is perhaps modeled upon the Temple, and parallels Tosefta Megillah 3:23. The interior of the synagogue hall was aligned toward the Torah shrine, which stood on the Jerusalem-aligned wall.

Galilean-type basilicas are architecturally related to the narrow gable churches of nearby Syria. Like these churches, most Galilean-type synagogues were entered through three portals. A unique feature of these synagogues is the arrangement of the interior columns. Columns were constructed on the northern, eastern, and western sides of the hall. This served to focus attention on the interior of the southern, Jerusalem wall with its three portals. Scholars have posited that Torah shrines were constructed between the doors on the Jerusalem wall at Capernaum, Chorazin, and Meiron. In an instructive parallel, S. D. Goitein notes that in synagogues in Yemen two entrances flank the Torah shrine on the Jerusalem wall and that this arrangement existed in a synagogue in medieval Hebron.

Basilical synagogues were constructed throughout the Land of Israel. In “basilica-type” synagogues the visitor might cross the expanse of the atrium, sometimes a narthex, and the nave, to reach the Jerusalem-aligned wall. At the center of this wall was the building’s focal point, the Torah shrine, which often stood upon a raised platform. Following contemporary church architecture, synagogues from the late fifth century onward often included an apse on the Jerusalem wall that housed the Torah shrine, and the platform was often surrounded by a low partition (called in Christian context a “chancel screen”) decorated with Jewish iconography.

The art of Palestinian synagogues, particularly decorated mosaics, is an integral part of the late Roman and Byzantine artistic tradition. The synagogue at Beth Alpha contains the most completely preserved Byzantine period mosaic and well exemplifies this tradition. It builds on iconography well known from the Hammath Tiberias B, 2a mosaic, with its images of the zodiac and a panel containing a Torah shrine flanked by two menorahs. The Beth Alpha mosaic is divided into three panels. As at Hammath Tiberias, closest to the Torah shrine of the synagogue is a panel containing the image of a shrine flanked by lighted menorahs. In the center is a zodiac wheel, personifications of the seasons in the corners, and unique to this building, closest to the entrance to the synagogue, the image of the Binding of Isaac (*Genesis* 22).

Zodiacs and some other images are often labeled in Hebrew, the language of Scripture and most liturgy, even as dedicatory inscriptions appear in Aramaic and Greek. At Beth Alpha the narrative of the scene is glossed with biblical

citations in Hebrew. Biblical themes in other synagogues include David (Gaza), Daniel in the Lion's Den (Na'aran and Khirbet Susiya), and Gerasa (Noah's Ark, labeled in Greek). Sepphoris contains the Angelic Visitation to Abraham (*Genesis* 18), the Binding of Isaac, Aaron before the Tabernacle, and other cultic imagery. Jews continued to use images of the zodiac long after Christians abandoned this imagery, owing to the significance of the heavens and constructions of time in Jewish thought and liturgy.

Archaeological remains of late-antique synagogues show important parallels to contemporaneous liturgical and rabbinic texts. This is particularly evident in inscriptions, where formulae show clear relationships with literary sources. A very significant example is the Rehov inscription, discovered in the narthex of a sixth-century synagogue. This twenty-nine-line inscription, which deals with local agricultural law, is the earliest extant physical evidence of a rabbinic text. Increased decoration of the physical environment of Palestinian synagogues paralleled the development of increasingly complex liturgical texts. Professional poets composed prayers for each Sabbath and festival according to the local reading cycles. These texts (*piyyutim*) were often quite complex. Named poets appear from the fourth century onward, beginning with Yosse ben Yosse, Yannai, Eleazar son of Rabbi Qallir, Yehuda, and Yohanan the Priest. These homiletic texts strongly parallel public homilies (*midrashim*) and traditions in Targumic literature. There is no theme in synagogue art that does not find important parallels in these literatures. The tradition of virtuoso poets preparing liturgical compositions for synagogue performance continued through the Middle Ages, particularly (though hardly exclusively) in areas of Italy and Northern Europe that continued elements of the Palestinian liturgical tradition.

Known Diaspora synagogues during this period conform to local architectural norms. What unifies them are the presence of a large Torah shrine and often images of menorahs. Other than Dura, the most impressive extant Diaspora synagogues were uncovered in Ostia Antica, the ancient port of Rome, and in Sardis in Asia Minor. The Ostia synagogue building was first constructed toward the end of the first century of the Common Era, though it is not known whether it served as a synagogue at this point. The use of the building as a synagogue went through two stages. It was enlarged during the second and third centuries, then enlarged further and partly rebuilt at the beginning of the fourth. The entrances in the façade of the basilica from the second through third centuries are aligned toward the east-southeast, perhaps in the direction of Jerusalem. A stepped podium stood on the wall opposite the main entrance. A Latin and Greek inscription from this phase makes mention of a shrine for the Torah:

For the well-being of the emperor! Mindus Faustus established and built (it) and set up the ark (*keiboton*) of the Holy Torah (*nomo hagio*).

During the fourth century the southernmost entrance portal on the eastern wall of the synagogue was sealed and replaced

with a large freestanding Torah shrine. This Torah shrine is structurally contiguous with images of shrines in wall paintings and gold glasses discovered in the Jewish catacombs of Rome and with images on oil lamps discovered in Ostia.

The Sardis synagogue is the largest and the grandest synagogue yet uncovered, its main hall measuring fifty-four by eighteen meters. It has been estimated that the synagogue could accommodate one thousand people. This impressive building, the largest synagogue known before the modern period, was part of the municipal center of Sardis and taken over by the Jewish community and remodeled as a synagogue during the fourth century. It formed the southern side of the civic center of Sardis. The remodeling included the installation of two aediculae on stepped podia on the eastern wall of the synagogue and the construction of a podium in the center of the hall. The significance of these aediculae is made clear both by their prominence and by an inscription found near them that reads "Find, open, read, observe." Another Greek inscription refers to the Torah shrine as the *nomophylakion*, "the place that protects the Torah." A molding from the synagogue contains both an inscribed menorah and the image of a Torah shrine with its doors open to show scrolls stacked horizontally within it.

We know little of the liturgies of Jews in the western Diaspora. John Chrysostom describes synagogue customs in fourth-century Antioch as part of his polemic *Against the Jews*, aimed against Judaizers within his community. These include blowing the ram's horn on Rosh Hashannah, walking barefooted and fasting on Yom Kippur (known from rabbinic literature), and incubation in synagogues. He also knows that Jews and non-Jews considered synagogues to be holy places, the sanctity of the place being construed as deriving from the presence of biblical scrolls. Chrysostom suggests that reading of *Psalms* was important to synagogue liturgy. Inscriptions, most notably a Greek rendition of *Psalms* 135:25 discovered in ancient Nicaea (today Iznik in Turkey) supports this. These characteristics (other than incubation) were also prevalent in synagogues in Palestine and in Sassanian Iraq that are described in the Babylonian Talmud. The great significance of Torah shrines and images of shrines full of scrolls suggests the centrality of Scripture within Diaspora communities, as it was for communities in the Land of Israel.

**MEDIEVAL AND MODERN SYNAGOGUES.** Liturgies during medieval and modern times were largely based upon models developed already in classical rabbinic literature. While significant differences exist between Ashkenazic (Central and Eastern European) rites, Sephardic (Spanish and Portuguese) rites, Italian, and the rites of Jews in the lands of Islam, the differences are far outweighed by the continuities. Modern liturgies maintain continuity to the extent that each movement sees itself as bound by Talmudic tradition. The interior furnishings of synagogues also follow ancient models as preserved in rabbinic sources. These include a large permanent Torah shrine (called *aron ha-godesh*, "Holy Ark" by Ashkenazim; *hekkhal*, "shrine," by Sephardim), generally on the

Jerusalem-aligned wall of the synagogue and a platform for reading Scripture.

In all periods of Jewish history, the physical structure of the purpose-built synagogue buildings generally followed the styles prevailing in contemporary non-Jewish architecture. Neither early rabbinic literature nor later medieval and modern rabbinic scholars focused on the architectural aspects of the synagogue. Architects, however, were confronted with a major liturgical problem. Since two major components of the synagogue were the Torah shrine and the platform (*bimah*) from which it was read, the spatial relationship between the two had to be resolved. The sixteenth-century Sephardic legalist Joseph Caro (1488–1575) reflects on this tension. Caro debates whether the platform must be placed in the center of the hall or whether it could be joined with the Torah shrine, usually on the Jerusalem-aligned side of the building. Caro writes: “the placement [of the *bimah*] in the center is not required, rather everything depends upon the locality and the time. . .” (*Kesef Mishneh* to Maimonides’ *Mishneh Torah* 11:3). Solutions (and nonsolutions) differed from community to community. In Central Europe, for example, the center of attention was the *almemor*, the reading podium, which dominated the entire space. In baroque and rococo Italy, however, a harmonious solution was found between the reading podium and the Torah shrine by placing them at opposite ends of the hall, connected by a broad and open central aisle. Seating was placed on the sides. In such a way neither dominated but both contributed to a sense of balance.

**MEDIEVAL AND PRE-EMANCIPATION SYNAGOGUES.** Much of what we know about synagogues in Byzantine Palestine and under medieval Islam is derived from the documents discovered in the repository of the medieval Ben Ezra Synagogue in old Cairo (Fostat), itself an exceptional example of synagogue architecture under Islam. Archaeological evidence for medieval European synagogues is widespread beginning near the turn of the first millennium. The famous Worms synagogue, built in 1175, is generally accepted by scholars as the oldest surviving medieval synagogue. Although the original was destroyed by the Nazis, a faithful reconstruction now stands in its place. Its double-nave building, patterned after Romanesque chapter houses of convents and monastic refectories suggest a model that is found in such later Ashkenazic synagogues as the famous late thirteenth-century Altneuschul of Prague, the old synagogue of Kraców (in the suburb of Kazimierz), and those of Regensburg, in Bavaria, and Buda (now part of the city of Budapest). The *almemor* (*bimah*) in these synagogues predominated: it stood in the center between two columns or piers.

There are two synagogues extant in Toledo, Spain, albeit transformed into churches after the expulsion in 1492: the five-aisled synagogue later known as Santa María la Blanca and the synagogue later known as El Tránsito. In style Santa María la Blanca resembles twelfth-century Moroccan mosques. El Tránsito was built around 1357 by Shemu’el ha-

Levi Abulafia, treasurer to King Pedro the Cruel of Castile. Its ornamental plasterwork with Hebrew inscriptions and Mudéjar designs is especially noteworthy. The Sephardic (Spanish-Portuguese) synagogue of Amsterdam, designed by the Dutch architect Elias Bouman around 1675, became the prototype for synagogues for the entire Sephardic world. The Amsterdam synagogue, a large, galleried basilican hall, was clearly inspired by neighboring Protestant churches.

The many rural wooden synagogues in Poland, Lithuania, and the Ukraine, most destroyed by the Nazis, are most interesting. Dating from the seventeenth to the nineteenth centuries, these wooden synagogues, probably constructed by anonymous Jewish craftsmen, had intricate multicolored painted interiors. In many of them, four wooden columns supported the interior domed *bimah*. Numerous synagogues are extant from this period from Islamic countries, India, and elsewhere in Asia and the Americas. Among the most exotic is a synagogue known only from drawings dated 1722 by a Jesuit missionary. The synagogue of Kaifeng, China, was built in a local vernacular architecture and furnishings. A raised *bimah* stood at the center of the prayer hall, with a Torah shine aligned toward Jerusalem on the western wall.

**MODERN SYNAGOGUE ARCHITECTURE.** During the nineteenth century, when Jews in Western Europe were emancipated and American Jews strove for full acceptance, prominent architects, some of whom were Jewish, built large and impressive synagogues as statements of the new status of Jews in Western society. These synagogues were often built in neo-Islamic and neo-Byzantine styles (although sometimes the Romanesque was employed), ostensibly to emphasize the Eastern origins of Judaism. Neoclassical synagogues were also constructed, especially in America at the turn of the twentieth century as an alternative to Christian and Moslem architecture and as a statement of a developing Jewish-American synthesis.

In the modern period, many innovations have been introduced to synagogue architecture, particularly within liberal communities. Separate seating for women has been eliminated in liberal synagogues, thus generally making balconies or separate rooms unnecessary. In America, Reform (and today, many Conservative) synagogues are referred to as “temples,” originally in an attempt to distance their communities from traditional beliefs in the messianic return to Zion and the rebuilding of the Jerusalem Temple and to avoid the term “synagogue,” which had negative connotations in Christian circles. Prayer services became far less participatory and hierarchical, following Protestant liturgical models. This was expressed architecturally through the construction of a single podium at the focal point of the synagogue, which housed a Torah shrine, a reading table (often turned toward the congregation rather than toward the shrine), and a speaking lectern. During the postwar years daring experimentation by such leading architects as Frank Lloyd Wright and Erich Mendelssohn employed a modernist aesthetic for American synagogue buildings. Synagogues were consciously integrat-

ed into their surroundings, and the maximum use of glass brings nature into the sanctuary. Recent years have seen a turning away from the monumentality of the nineteenth- and twentieth-century edifices. Synagogue architecture in America has become far less monumental, responding to a current the focus on “spirituality” and “community.” The central *bimah* has reappeared in liberal synagogues (and reasserted itself within Orthodox contexts), as more participatory and less hierarchical liturgical forms have emerged.

**SYNCRETISM [FIRST EDITION].** The term *syncretism* usually refers to connections of a special kind between languages, cultures, or religions. This term is most frequently used in the history of religions, where a special effort has been made to give it a more precise meaning.

**HISTORY AND USEFULNESS OF THE CONCEPT.** The term *sugkrētismos* first occurs in Plutarch (*Moralia* 490ab). It was probably based on *sugkrētos* (Ionian form of *sugkratos*, “mixed together”) and was explained by popular etymology or by Plutarch himself as referring to the behavior of the Cretans who, despite the discord habitual among them, closed ranks when an external enemy attacked them. Early interpretations, which reversed the relation between coinage and meaning, may be left aside. Discussions of the term in the *Suda* (4.451), the *Etymologicum magnum* (732.54f.), and Erasmus’s *Adagia* (27) and *Epistolae* (3.539) are based on Plutarch’s explanation, which was thus transmitted to the modern period. Efforts at reconciliation between Molinists and Thomists in the sixteenth century and between Lutherans and Calvinists in the seventeenth century can be criticized as syncretist. The first application of the term to a situation in the history of religions probably occurred in an anonymous review (of an edition of Minucius Felix) that appeared in Fraser’s *Magazine for Town and Country* (London, 1853, vol. 47, p. 294). Thereafter it appeared rather frequently in the science of religion and historical theology of the second half of the nineteenth century. Hermann Usener (*Götternamen*, 1896; 1928, pp. 337–340) rendered it as “mishmash of religions” (*Religionsmischerei*). In German, *Mischerei*, unlike *Mischung* (“mixture, blending”), has negative overtones, and in fact Usener regarded the phenomenon of syncretism as an unprincipled abandonment of the faith of the Fathers, even though it was at the same time a necessary transitional stage in the history of religions. Later on, the word came to be used mostly without negative overtones, but it continued to be applied in all sorts of ways.

**As an explanatory category.** Precise application makes it clear that no definition of syncretism is possible without a specific context and that the term cannot serve as an adequate description of homogeneous sets of phenomena. It is possible, nonetheless, to use the concept of syncretism as a category of historico-genetic explanation. It makes possible a critique of the Romantic ideological contrast between syncretism and pure national tradition or, as the case may be, uncontaminated popular religion. In addition, it is a useful heuristic tool for tracking down otherwise hidden antecedents of historical facts, as well as for identifying the phenomenon of syncretism itself as something (requiring later defini-

tion) that can in turn be an antecedent for subsequent factual situations. The concept also contributes to a sociopsychological clarification of a readiness for the balancing, subordination, superordination, and unification of truth.

**As a description of phenomena.** In the use of the concept of syncretism there is no *adaequatio intellectus et rei* ("correspondence of mind and object"). The concept is in principle a tool for interpretation and as such is in principle independent of the term inherited from antiquity. Agreement must be reached on what the term is to mean here and now. The parties to the agreement must see to it that the constituents of the concept are close enough to one another, despite the diversity in the phenomena, that a unity of type is preserved. An individual connection is not to be described as syncretist when taken in isolation but only when it is seen as an element in a complex unity.

**TYOLOGY OF PHENOMENA.** Since it is not possible to apply the concept of syncretism in a universal, univocal way, a typology is needed. For present purposes we may propose two main headings, as follows.

**Relations between complex wholes.** A complex unity or whole can be any coherence of mental elements and of actions, representations, or objects related to these elements, which has the function of giving human beings an irreducible explanation of their world, as well as norms that are likewise not further reducible. The coherence can take sociological form in an organization or institution, though it need not; in its intellectual expression it can be presented as a system but may also take some other doctrinal form.

**Relations between particular components.** Particular components of a religion (e.g., its gods) can also be linked to one another in various ways. They can be identified; new relations can be established between them; various shifts may occur within a pantheon due to encounters with another pantheon. Such particular relations, which are established quasi-organically (at least at the popular level) and anonymously, presuppose relations between complex units or wholes. But a particular component can also be the creation of a literary author. Here the establishment of particular relations can be undertaken by individuals and without any connection in principle with more comprehensive encounters between cultures and religions, even where the latter have occurred. Many an author has established his own syncretism (e.g., in the Hellenistic age of late antiquity certain Pythagoreans, astrologers, Orphics, Physikoi, the various compilers of the Hermetic corpus and the sibylline and Chaldean oracles, the Tübingen theosophists, alchemists, Lukianos of Samosata, Aelius Aristides, Numenius of Apamea, Porphyry, Iamblichus, and Sallust).

**THE LATE-TWENTIETH-CENTURY STATE OF SCHOLARSHIP.** When the concept of syncretism is used in describing phenomena, the application of the term is still not the result of an analysis; rather, it serves as a disparaging judgment on certain manifestations, a judgment assumed to be obvious. The adjective *syncretic*, used in this way, occurs in countless treatises

on religions, where it designates both simple and complex phenomena; its definition is taken for granted and various inferences are drawn from it. Only in the 1970s were initial efforts undertaken to distinguish between the concept and the array of phenomena.

Subsequent stages in scholarship are represented by the conferences on the problem that were held in Åbo (1966), Göttingen (Reinhausen) and Strasbourg (both in 1971), Santa Barbara (1972), and Besançon (1973). These have led to various consensuses. The present article attempts simply to advance the consensus, but it cannot promise any certain results.

**System and history.** The concept of syncretism can be used to describe either a state or a process. It is used in the first way if, for example, an entire religion—or its particular components or traits—are described as a syncretism or as syncretic. In this case the concept is applied statically to describe a state or condition in which the characteristics of the object are systematically correlated among themselves.

The concept is used processually when we speak of a syncretic tendency or development, or of a development that will end in syncretism. Syncretism is here understood as a process which extends through time and in which gradations or stages of development are to be distinguished. This may be called a dynamic concept of syncretism. An attempt has been made to capture this dimension of syncretism in neologisms like *syncretization*.

**SYNCRETISM IN HISTORY.** It follows from the above that a project for a "history of syncretism" would be inappropriate. All that can be done is to point out constellations in the general history of religions that have made possible what historians may, under certain conditions, call "syncretism." The syncretic results of these constellations as such are not initially cohesive in respect to content, although such cohesiveness may of course occur. The location of such results under the concept of syncretism depends on a genetic and typological analysis. At the present time such an analysis can only take the form of a classification. The present article is therefore organized along classificatory lines, but within the classes suggested the examples offered will be in chronological order.

**Presuppositions.** Religious entities that were originally separate can come together in such a way that a syncretism results. The first possible result is that what is superimposed predominates, while what is older survives. This happened, for example, in the Nabatean and Palmyrene religions of the Hellenistic period, and in the associations that arose as a result of Christian missionization in Africa. A second possibility is that the substratum continues to exercise dominance; for example, the Sumerian substratum in relation to the Akkadian superimposition, the Celtic substratum in relation to the Roman superimposition, and perhaps the Germanic eschatology in relation to a superimposed Oriental one. A third possibility is that a balance may be established between the

various components, as, for example, in Manichaeism or in some pseudo-Islamic sects (such as Ahl i Haqq, the Druze, the Yesids). In addition to a syncretism of what was originally separate, there is a syncretism of elements from related sources. Jewish, Christian, Islamic, and Marxist eschatologies, for example, are all related, yet each of them developed into something so independent of the others that the few attempts, mostly of a literary kind, which have been made to fuse them or reduce them to a common denominator can, with reservations, be called syncretist.

Syncretism in religion need not be accompanied by syncretism in other areas. In principle, the coincidence and non-coincidence of diverse syncretisms occur with equal frequency. Though it seems odd to speak of a "mixed" language or of a "mixed" culture, since any culture in principle always has heterogeneous precursors, there are nonetheless examples of such that will clarify what is meant. The mixed Jewish-German culture of the Middle Ages also used a mixed language, Yiddish. But a cultural syncretism need not be accompanied by a linguistic syncretism; for example, on the islands of Japan, continental Asian and oceanic insular cultures have mingled, but the Japanese language has remained homogeneous. Conversely, a linguistic syncretism need not be matched by a cultural one; thus a certain form of Persian-Turkish literary language is in the service solely of Islamic culture.

Analogous relations exist between cultural and religious syncretisms. An example of the coincidence of a syncretic culture with a syncretic religion can be seen in hellenized Egypt, especially in the cult of Serapis and possibly also in modern nativist movements in some regions that were colonized by Western societies. A cultural syncretism is to be found, to a certain measure, for some time after the migration of the Israelites into Canaan; yet there was no corresponding religious syncretism, and where such threatened to occur, the prophets resisted it.

A linguistic syncretism matched by a religious syncretism often occurs when a language is pidginized or creolized in a group in which tribal religion has to some extent been amalgamated with Christianity. On the other hand, a linguistic syncretism was not accompanied by a religious syncretism when a Hebrew-Aramaic language was used for discussion in Rabbinic Judaism; nor was a religious syncretism accompanied by a linguistic syncretism in the mystery religions of late antiquity with their *hieros logos* only in Greek.

**Symbiosis.** A social presupposition for the rise of a syncretism can be the coexistence of various groups. It may be hypothesized that there were coexistences like this even in prehistoric times, insofar as inferences regarding that period can be made from the nonliterate cultures of modern times. The matrilinear traits observable, until their recent disappearance, in many food-growing cultures were ascribed to groups possessing a developing economy in the Neolithic period; scholars even went so far as to regard the transition to

production through food cultivation as a cultural fact attributable to women.

Closer observation showed, however, that food-collecting and grain-harvesting peoples and early food cultivators exhibited a characteristic that was typical of hunters—namely, the relating of a group of people to a particular animal. There is thus the possibility that from the outset food was collected or was grown and harvested not only for human consumption but for animal consumption as well. The conclusion would be not that the relations of human groups to certain animals and their relations to certain plants were antecedently connected but rather that the two types of cultures and their modes of religious expression were fused.

The situation is clearer in cases where there is written evidence. In Asia Minor and Media in the first century CE worshippers of the Iranian goddess Anāhitā lived together with worshipers of the Greek goddess Artemis, and this symbiosis led to a limited syncretism. Other symbioses in the same part of the world did not, however, lead to any syncretism. Symbioses are to be presupposed prior to many other and varied linkings of divinities throughout the Hellenistic world. The doctrines espoused by modern messianic movements in Africa, Asia, and Latin America have demonstrably been shaped by the contacts of ethnic groups with representatives of Western civilization; the preaching of missionaries has played an important but by no means isolated role here.

**Acculturation.** If we locate the fact of symbiosis in the larger context of the systems in which those living together are socialized and to which a great many subsystems also belong, we may speak of acculturation. Once movements of conquest became imperial in scope (e.g., the Achaemenid dynasty and the empires of Alexander the Great, the Romans, the Spaniards, and the English), they brought diverse cultures into contact; the conflation of tradition that resulted for one of the two sides could repeatedly lead to syncretisms.

**Superposition.** The most extensive example of this was probably the migration of the Aryans into the Asiatic subcontinent, which was already inhabited by non-Indo-European peoples. Depending on local circumstances, we may speak of a sanskritization of the Dravidian part of India, of a hierarchization of castes, and so on. In any case, Hinduism—the Hinduism of the epic and Puranic period and thereafter—became a religion very different from that of the Vedas. The comprehensiveness of which its representatives boast is one aspect of its syncretist character.

**Parallel phenomena.** Not every symbiosis, acculturation, or superposition, however, has led to a syncretism. Other formations may have resulted, the names of which are often, and misleadingly, used as synonyms for *syncretism*.

**Synthesis.** Although J. D. Droysen and others have called Hellenism a mixed culture, it was not syncretic throughout. The ideas of Droysen and later scholars who speak of Hellenism as a reconciliation of cultures or an inte-

gration of cultures into a higher unity are better represented by the term *synthesis*, which in turn is to be understood as a complex of synthetic phenomena. This can correctly be taken to mean that there were as many kinds of Hellenism as there were cultures that established links of one or other kind with Greek culture. Egyptian, Babylonian, and Iranian Hellenism were the principal types, and most of the cults within each of the three were synthetic in character after the manner of Hellenistic Judaism or many of the city-state cults in the empires of the Seleucids and Antigonids. Syncretist formations in religion were special cases in these various Hellenisms.

**Evolution.** This term designates a process, internal to a system, that produces new elements and that is irreversible. The new elements can then become the center of a new unity and thus of a new system. The result of the process is a new religion, but this new religion is not syncretic. It was in this way that Buddhism arose out of the previous religious systems in India and not by way of a clash between Brahmanism and alien systems. The Bahā'ī religion and even its precursor, Babism, arose because their founders took over, from the Twelvers, the institution of the imam, or mediator of revelation; non-Islamic elements played no part in this process.

**Harmonization.** Theosophists in particular incline to the conviction that all religions are true and lead to union with God. Thus Ramakrishna (1834–1886) said that he had tried all religions (i.e., Hinduism, Islam, and Christianity) and had found that all were moving toward the same God in different ways. The founders and adherents of other neo-Hindu reform movements hold similar views. Comparable tenets are also found frequently in the broad stream of tradition flowing from ancient Gnosticism via the Neoplatonism of the Middle Ages and Renaissance (Neoplatonism was concerned to harmonize philosophy and religion rather than various religions) to modern anthroposophy. The claim is usually not made that all religions teach the same thing, nor are the lines of demarcation between them removed. But a harmony is established among them by the claim that they are all seeking the same goal. This assertion includes an emphasis on the unity of the goal (e.g., God), which is comparable to presuppositions of unity that can in other circumstances lead to a syncretism. In the cases mentioned here, however, no syncretism has resulted.

**Consequences.** When a religio-historical development has in fact reached a syncretistic stage, its syncretistic character is usually not communicated to the subsequent stages. To this extent it is correct to say that syncretism is always a transitional phase. Here again various kinds are to be distinguished.

**Transformation.** An example that was significant on the scene of world history because it accompanied the expansion of Islam was the dehellenization of the Orient. This process occurred not only in religion but also in the area of material culture, with which archaeology and aesthetics deal; in the institutions of government; and even in ideas. Once the lan-

guages spoken in Asia Minor and the Semitic, Iranian, and Egyptian languages spoken in various regions began to assert themselves again, after the spread of Greek culture in the cities of the East in approximately the second century CE, their revival did not bring a return to prehellenistic conditions but rather a transformation, or metamorphosis, of the synthetic and at times syncretistic character of Hellenism into a new unity. This unity operated in the direction of homogeneity, although analytically viewed it was itself not homogeneous and it did not, on that account, become uniform.

Earlier, a complex process of transformation had likewise given rise to the Christianity of the apostolic and postapostolic ages. Despite the multiform derivation of many of its basic concepts and views, this Christianity was not a syncretist religion (with, for example, rabbinic and Hellenistic Judaism as two of its chief components). The same must be said of Catholicism, which came into being after a further transformation, namely, a now non-Judaic Hellenization of Christianity. In a similar manner, various forms of Eastern Christianity developed that can no longer be described as Hellenistic and certainly not as syncretic; this development took place not only in the Nestorian and Monophysite churches, but in smaller churches as well.

Manichaeism and orthodox Zoroastrianism, among other religions, emerged in a region in which Baptist, Syrian Christian, and Zurvanite elements were in close but undefined proximity. Manichaeism was, in addition, syncretic, but the syncretism was held in check by systematization. Zoroastrianism was not syncretic. Even elements that from an analytical standpoint were not Iranian appeared in it as Iranized, although there was no question of “absorption.”

**Disintegration.** If the component parts that produced a syncretic formation had been independent for a sufficiently long time or if they continued to have an independent existence alongside the syncretism, they also tended to reassert themselves in a perceptible way within it. To the extent that this happened, the syncretist structure fell apart. Thus not only did the various Eastern Hellenistic societies undergo dehellenization, but there were also Greek reactions against them. From the eighth century onward in Japan there were syncretist unions of Shintō and Mahāyāna Buddhism, but people visited temples of each separate religion as well as temples shared by both; the result was a continuing awareness of the difference between the two. With the exception of Ryōbu Shintō, which did not break up until the fourteenth century and then did so for political reasons, these syncretisms did not last long, although the symbiosis of Shintō devotees and Buddhists continued.

**Absorption.** When a superimposed level does not ultimately lose out to the subordinate level—as frequently happens—but remains dominant, absorption occurs. Thus, for example, it is very likely that the sky god of the invading Greeks became heir to the many mountain gods of the pre-Greek period. In a way, faith in Yahveh, who rules from Sinai, absorbed the faith of nomads from the tribes of Abra-

ham, Isaac, and Jacob in the God of their fathers as well as belief in the Canaanite high god El.

**CONNECTIONS BETWEEN COMPLEX UNITIES.** Whole religions may be confronted with one another in processes of acculturation and superposition. This happened when the religion of the Greek city-state met local religions in Asia Minor, the Fertile Crescent, Iran, and Egypt. Ever since scholars began to pay closer attention to the consequences of Alexander's expedition, the "syncretism of antiquity" has been regarded as the classic instance of syncretism in the history of religions. It is to be noted, however, that the result of the confrontation was not simply new, limited syncretic religions along the whole line. Rather, the few institutionalized or organized religious systems of which this can be said already presupposed partial and more diffuse areas of syncretism. In many cases, the rise of such diffuse areas was promoted when the Greek conviction of the oneness of truth encountered a type of thinking that was imprecise in its concepts and tended to focus on the pictorial.

**Between religions.** In relations between the Sumerians and the Akkadians, only the process just described above occurred. On the other hand, the religio-political effort of Sargon of Akkad (r. c. 2350–2294 BCE) and his daughter to unite the Sumerian and Semitic religions was of a different nature. Its thrust was to remove the distinction between originally different religious systems, in order that, contrary to what happened in Israel, the opposition between the incoming Semitic and native Sumerian religions, and thus their latent or open competition, might disappear.

In tenth-century China, theological systems were created out of Confucianism, Daoism, and Buddhism. There already existed a widespread popular conviction, which impacted on everyday life, that these three religions complemented each other and even intended the same thing.

**Within religions.** In Egypt the systems and mythologies of the gods that were represented by originally different priesthoods underwent a variety of combinations when individual districts were united, although the combinatory process did not occur solely under these conditions. Theologians among the priests felt impelled by the universalist claims of their local gods to assimilate, for example, the cosmogonies of Heliopolis and Hermopolis, Heliopolis and Memphis, Hermopolis and Memphis, Memphis and Thebes. A similar process occurred in the formation of the imperial cult of Marduk at Babylon, but opportunities of this kind were far more numerous in Egypt and lasted far longer. The Egyptian-Hellenistic syncretism of the Ptolemaic period was therefore perhaps the richest of the syncretisms that arose in the confines of Alexander's empire.

The example of Egypt has led scholars to speak of syncretism also within Iranian and Greek religion. But the concept is not appropriate here. On the other hand, there were many instances of intrareligious syncretism in India: the myths of the gods Savitṛī, Indra, Vāyu, Aryaman, Rudra,

Agni, Sūrya, and Yama could be regarded as the same amid numerous variations, while both Vaiṣṇavism and Śaivism incorporated many other Hindu traditions.

**COMBINATION OF PARTICULAR ELEMENTS.** The reference here is to combinations established among, for example, rites, ideas, symbols, divinities, persons, writings, and so on. Either one element is enriched by other meanings or it continues to exist alongside other elements. But even this juxtaposition can take various forms and indicate either latent competition or reciprocal completion.

**Addition.** When the dividing line between diverse elements is removed (and with it the competition between them), but one element does not absorb the other, the result is a combination whose components not only are evident to the modern student but must also have been recognizable by the devotees of the time. That sort of thing happened both within individual religions and between religions. In Egypt, for example, one kind of eternity (*nbb*) was assigned to the god Re, another (*dt*) to the god Atum. The result was the god Re-Atum. Something comparable occurred frequently in Hellenism. The addition of Baal of Doliche to a Jupiter already assimilated with Zeus produced Jupiter Dolichenus, and so forth.

*Theocrasies*—combinations of gods—presuppose additions. They occur when for practical purposes one god is fused with another in the eyes of his worshipers, even though there may be no identification at the conceptual level. In the many half-theriomorphic gods of Egypt a tendency to blur the borderlines between forms and concepts is already recognizable. A number of the major Egyptian divinities arose in this manner, but the names of many lesser gods were also combined, and either kept their separate determinatives or were written with a common determinative.

Similar theocrasies occurred, though less frequently, among all the peoples of the ancient Near East. The demonstrable reason often was that polytheism caused difficulties for the faithful. But politics may also have been present in the background, especially in the encounter of different peoples. At the instigation of the Egyptian magnate the Uza-Hor-Resnet (a Persian collaborator) the Persian king Cambyses II (r. 528–522 BCE) prostrated himself before the image of Neith of Sais and had sacrifices offered to her in her temple as mother of Re (and therefore of the living pharaoh), as well as to Osiris (and therefore to the pharaoh after his death). One might assume that in honoring these divinities he actually intended to honor the corresponding Iranian divinities: the goddess later promoted by Artaxerxes II (r. 405–359 BCE) under the name *Anāhitā*, and the *fravashi* of the king. The Egyptian may also have composed the canal inscription in which Darius the Great (r. 521–486 BCE) describes himself as son of Neith and thus establishes a link with this goddess that the Iranian king did not have with *Anāhitā*. As a result, the character of *Anāhitā* likewise changed in the ensuing period.

This first instance of an international theocracy preceded the many theocrasies of the Hellenistic age. Among these, the Alexandrian triad of Sarapis, Isis, and Harpocrates calls for special attention. Sarapis developed out of Osiris, Apis, and probably a "Hades Jupiter Dis" of Asia Minor into the god of an imperial cult that Ptolemy I (r. 323–285 BCE), with the aid of priests, philosophers, and masters of ceremonies, established for the Egyptians and Greeks of his empire. Isis "of a thousand names," the "manifestation in a single form of goddesses and gods," could in principle absorb every form on her peaceful triumphal march. Harpocrates, her underage son, who was an aspect of Horus, was equated with many other youthful gods and finally with Herakles.

A new divinity, Hermes Trismegistos, arose through a fusion of Hermes, the Greek god of fortunate inventions, and Thoth, the divine scribe of the Egyptians. This new god became the focus of an entire corpus of writings and remained the master and guarantor of esoteric knowledge down to the Renaissance.

Philo Byblius tells us of Greco-Canaanite theocrasies. Greco-Aramaic-Iranian theocrasies were wide-spread in the East, while theocrasies in general were rarer in the West; the latter included ancient Spanish-Phoenician or Celtic-Roman.

**Forms of worship.** When one rite adopts components from another rite, forms of worship are combined. But because the basic stock of possible ritual actions is relatively small, external influence in this area is often indistinguishable from the action of factors already present in the tradition. This situation is clearest in the area of the Christian liturgy and, indeed, from the beginning as far as the sacraments are concerned. Because ablution rituals of all kinds were so widespread, it is often unclear whether baptism was an act that stood out—because of its initiatory nature—in a series of already-existing ablutions, or whether the ablutions represented secondary repetitions of an originally unique act of baptism.

Baptism thus provides a fundamental example of the difficulty of clearly establishing a connection between various rites. Jewish proselyte baptism, for example, probably originated within Judaism and was not taken from outside baptist movements of the kind that lived on in the rites of the Elkesites and the Mandaeans. Christian baptism, for its part, rather than having been derived from that same external environment, represented an acceptance and development of the baptism of John, which itself was part of the Jewish milieu, but had acquired an eschatological dimension.

On the other hand, baptism clearly entered the Mithra mystery cults from outside, probably from Christianity. The ceremonies of many African independent churches and of the cargo cults of Melanesia are fusions of Protestant liturgies and ethnic cults. The cult of Umbanda in Brazil is a combination of the liturgy of the Catholic Mass with West African rituals.

**Parallelization.** The paralleling of elements is most easily practiced when one is persuaded of the unity of truth. If truth is one, diverse names do not point to real differences but may be shown to be simply different names for the same thing. This is the path very clearly taken by Greek thinkers, and in this respect Roman thought followed Greek. Primary among the various modes of parallelization is that of interpretation.

**Interpretation.** *Interpretatio graeca* and *interpretatio romana* were long regarded as a principal presupposition, or even as a principal phase, of syncretism itself. This is understandable in view of the wide diffusion of both. Behind these two "interpretations," however, there was in most instances no real theocracy but only a tendency toward it. This tendency was most widespread in literature, so that we may speak first of all of a literary syncretism. In Porphyry, for example, the Arimanius Deus ("the god who apes") is learnedly interpreted as *antimimos daimon*. Apollo appears in place of Mithra (probably in order to show the harmony between Greeks and Persians) on votive tablets in the Fire Sanctuary of Persepolis during the time of Alexander. Helios stands for Mithra in Xenophon and probably also in Plutarch (unless he stands here for Ohrmazd), in relief sculptures of the Parthian period, and so on.

Greek interpretation claimed to be interested, though not exclusively, in those individual traits of the alien object that already seemed familiar. The Roman renaming of the Greek gods was also clearly a form of interpretation. But a new kind of *interpretationes Romanae* occurred once Rome had destroyed the Seleucid and Ptolemaic empires and conquered regions belonging to the Celts and the Germans. Thenceforth interpretations no longer simply established parallels, as they did among the Greeks; rather there was always present to some degree a subordination of the local god to the corresponding Roman god. The counterexample of the Hebrew Yahveh, who refused even to be interpreted as Jupiter, throws light on the exclusive character of Roman interpretation and the resultant tendency to theocracy. Interpretations of Yahveh occurred only on the fringes of Judaism, as, for example, in Elephantine (an island in the Nile), or among the Hysistarians where, characteristically, interpretation was rendered possible only by using the Greek equivalent of the biblical El 'Elyon (Hypsistos). Appropriative interpretations of other traditions reached their high point in gnosticism, where the conviction of the unity of truth had become a faith in the unity of redemption that would not allow any division. For this reason, gnostic systems also provide the most impressive instances of the various kinds of syncretism. These were always preceded by an *interpretatio gnostica*.

**Equivalence.** Clearly, equivalence is a presupposition in all forms of parallelization, in identification and theocracy, and in the syncretism of complex unities. But it acquires a special developmental significance when unities, or elements of them, are assigned different values and are conceived as ways to the same goal, with the stipulation that one of them

leads to the goal more effectively than the others. This type of valuation has found a place in the philosophy of religion, for example, in that of Śaṅkara (c. 738–822 CE), who speaks of a graduated way to God. The early Christian doctrine of a *praeparatio evangelica* (preparation for the gospel) among the Greeks and the Jews likewise belongs here to some extent, though it loses its syncretist character due to its apologetic function in relation to Judaism and paganism. On the other hand, a developmental or evolutionary equivalence is frequently admitted in the later stages of many religions (for example, post-Islamic, post-Christian, and post-Shintō), and, more generally, in numerous new entities of the present time, which, despite their claims to a higher truth, are forced to admit that the truth-claims of their predecessors have a relative validity.

**Amalgamation.** This term describes a fusion that is more irreversible than a simple *mingling*. The term mingling is more appropriate as a description of the phenomenon of syncretism. This is due to the origin of the term in ancient physics, in which there was much discussion of combinations, mixtures, and fusions, while the problem of the mass or quantity that an element may no longer have if it is truly part of a mixture remained ultimately unresolved. This is very much in keeping with the dissolubility of a syncretism, which can become operative at any time. *Amalgamation*, on the other hand, describes a borderline case of syncretism and to that extent is by and large equivalent to *synthesis*.

**Exchange of qualities.** First mention belongs here to the exchange of qualities between the *bodhisattvas* of Mahāyāna Buddhism and the spirits and demons (including the kami of Shintō) of the peoples proselytized by this version of Buddhism. It is not a matter of equivalent figures, so that we cannot speak of parallelization or addition. Nor is it a matter of gods on both sides though gods might arise from the process. The *bodhisattvas*, now outfitted with qualities derived from the relevant folklore, had the important function of showing that redemption, for which the redemption accomplished by the Buddha paves the way, is present in the traditions of the proselytized peoples. To this end the figures involved must resemble one another; on the other hand, they have no personal core, but rather their characteristics are interwoven as in a jigsaw puzzle.

**Identification.** Wherever there is no theocracy, identification, which in principle supposes the same degree of identity on both sides, exists. It is difficult, however, to see that the logical process represented by identification has actually been at work in the linking of religious traditions. At most it can be said that in literary syncretisms, the authors of which have been trained in logic, identifications do occur, for example, between central concepts of spirit, or between these and personifications.

**SYNCRETIST RELIGIONS.** These are the high points of syncretic processes inasmuch as they are not the first realizations of syncretism but already presuppose less organized syncretic

fields. Such religions are as it were “metasyncretisms” or “second-level” syncretisms.

**Mystery religions.** “Mystery” as a cult form did not as such have a syncretist character. This is clear from the so-called mysteries of the ancient world: the Eleusinian mysteries, the mysteries of the Cabiri of Samothrace, or, in the pre-Hellenistic period, those of Orpheus, Dionysos, and Cybele. Nonetheless, the kind of mystery worship in which the most important factor was the conformity in destiny between the initiate and his or her deity did foster the development of syncretic mystery religions in the Hellenistic period. The Isis mysteries of Egypt presupposed the faith in Osiris that had already acquired syncretic ties (though not related to the mysteries) in the Serapis cult of the Ptolemies. The Mithra mysteries of Asia Minor did not presuppose any ancient Iranian mystery but only the god Mithra as such, albeit a Mithra equated with Sol and Helios. In this instance, the second-level syncretism emerged through the addition of a further link with a mystery type of worship native to Asia Minor. Something similar is to be said of the mysteries of Sebazio, who had been an ancient Phrygian or Lydian god, and of Jupiter Dolichenus, who had been the Baal of Doliche. Once the basic idea of the mysteries of Cybele and Attis was integrated into the context provided by the idea of the so-called dying and rising gods, these mysteries acquired a different character than they had had before the introduction of agriculture into Asia Minor.

**Manichaeism.** Syncretisms that were part Babylonian, part Iranian, part Christian Hellenism were presupposed by Manichaeism. Its founder, Mani, effected a further syncretism by creating a unique system in which previously existing linkages were interrelated in an entirely new and original way. Manichaeism could therefore be described, depending on those being addressed, as true Christianity, true gnosis, true Zoroastrianism, true shamanism, true Buddhism, and even true Taoism. At times these missionary efforts gave rise to new syncretistic formations. There is doubt whether the latter repeat earlier syncretisms—for example, the part played by Buddhism in the rise of Manichaeism is disputed—or, on the contrary, that they represent “third-level” syncretisms. To a certain extent, therefore, Manichaeism was the supreme syncretism, and it is not surprising that, given its power of suggestion, people saw medieval Bogomilism and Catharism as revivals of it. The latter, however, represented something different, namely, transformations of Paulicianism that retained to some extent a dualistic character, but were not on this account to be classified as properly syncretist.

**Gnosticism.** Only Valentinianism and Sethianism can be compared with Manichaeism in their degree of systematic formulation. The other Gnostic doctrines were not systems but myths; all however, were syncretic in the same degree, despite differences in content. All were also preceded by Greco-Oriental syncretisms, though this does not mean that Greek teaching on spirit is to be understood as forming the

nucleus of the gnostic doctrine of redemption. Central to the Gnostic concept of redemption was the idea of a redeemer who himself needed redemption; around this spiritual nucleus the syncretic contents of the various Gnosticisms were organized in very diverse ways. Such phenomena could arise even on the fringes of Judaism, although Judaism by its nature provided the fewest necessary presuppositions. On the other hand, the process readily occurred in the Greco-Oriental religions. Second-level syncretisms made their appearance in the structure of the myths, in the peculiar character of the redeemer figures, and in the way history and the world were conceived. The result was a basic pattern that has recurred in the various Gnosticisms down to the modern period, although this does not mean that all the details of these later Gnosticisms derive from ancient Gnosticism.

**Middle Ages.** Here I mean to speak of “Middle Ages” in both the West and the East, despite the fact that the line of demarcation from the modern period, which alone makes the term meaningful, is not the same in the East as in the West. The unbroken transmission of the alchemy of late antiquity down to the Renaissance, the uninterrupted continuity of *heikhalot* mysticism and the Qabalah as a broad stream within the Jewish tradition, and the ever-possible revival of Neoplatonic thought meant that new syncretisms could constantly arise; these would be comparable to the ones that occurred in the period when alchemy, Jewish mysticism, and Neoplatonism first appeared. In many instances (for example, Ramón Lull (c. 1232–1315), related traditions from the Islamic world were added, although in Lull’s case any basically syncretist pattern disappeared due to the level of conceptual abstraction. The same is true of Agrippa (1486–1535) in relation to Jewish mysticism and of Paracelsus (1493–1541) in relation to Neoplatonism. In the milieu of these two men, however, there were popular forms of both white and black magic that can be described as syncretic. In the East, syncretisms of a new kind arose in various places. First mention belongs here to the connections between an already syncretic Hinduism and a nonsyncretic Islam, fostered in part by the religious policy of Akbar (1542–1605). This ranged from the so-called Muslim brahmans (via interactions between Muslims and Hindus at common festivals and common shrines in the Punjab and the Sultanates of Delhi) to the formation of a syncretistic organization, Sikhism. In the Near East, the continuance of ancient syncretisms despite the superposition of Islam led to syncretisms with the latter, as among the Druze, the Shamsīyah, the Yesid, the Ahl-i Ḥaqq, and in some Turkish orders of dervishes. In missionary Buddhism there arose the connections, mentioned earlier, between the *bodhisattvas* and the spirits (or demons) of Central Asiatic, Chinese, and Japanese folklore.

**Modern age.** The acculturation process of the nineteenth and twentieth centuries has likewise produced new syncretisms that focus either on a utopian future or on a present that is in need of improvement. Among the former type, the cargo cults of Melanesia, Micronesia, and Polynesia are

intelligible only against the background of Christian missionary activity. These cults materialize the objects of the Christian hope proclaimed by the missionaries and turn them into forms of tangible prosperity imported from outside; they thus produce numerous new interpretations of Christ and other biblical figures in the light of indigenous saviors. The equal or higher status that these cults give to their own mythical tradition as compared with the Bible leads inevitably to the development of new myths that retain only a formal likeness either to Christian legend or their own older myths.

A similar situation is discernible in the so-called African independent churches, especially when ancestor worship and initiation are combined with Christian veneration of the saints and with baptism. Further linkages lead to a mythical topography into which the biblical topography can be incorporated and to a parallel-structured eschatological geography.

Of the new supraregional institutions of the present time, some are less syncretistic, others more; the most syncretistic is the Unification Church, in which old Korean shamanistic, Mahāyāna Buddhist, and Presbyterian contributions are still recognizable.

Other modern syncretic movements focus on a present that is in need of improvement. In Brazil the Catholic ecclesial tradition, Pentecostalism, and African and Indian cults, as well as, in some cases, an academic formation in the mythology of European classical antiquity, all had to come in contact in order that the great syncretic religions—Candomblé, Macumba, and Umbanda—might arise. The syncretic teaching on spirits and gods found in these religions can be interpreted in terms of Christian veneration of the saints or of Indian, African, or even Greek mythology. A common orientation to a Buddhist king and a socialist party leader, whose charisma ensured the prosperity of the country, led to a Buddhist-Marxist syncretism in Burma. In Vietnam, contacts between Buddhism, Christianity, and popular religion led to the establishment of a new organized religion, Cao Dai.

**CONCLUSION.** It can be stated as a principle that syncretism, where verifiable, is a late stage in a particular epoch of the history of religions. It will therefore always contain truth-claims, inasmuch as insight gained at last into the relativity of all that has preceded makes it possible to compare, combine, and interchange elements from the tradition. A tolerant attitude to all that is of value in the world is thus a basic condition for the rise of any syncretism, as well as a basic virtue of the human being who is shaped by syncretism and in turn supports it. In addition, however, an enormous intellectual power is required in order to cement all the elements together into a new type of tradition and, further, to maintain the combination of the erudite and the popular.

## BIBLIOGRAPHY

Modern study of the topic was inaugurated by Richard Reitzenstein and H. H. Schaeder in their classic *Studien zum antiken Synkretismus aus Iran und Griechenland* (Leipzig, 1926). The investigation begun there has been continued in a series of symposia: *Syncretism: Based on Papers Read at the Symposium on Cultural Contact, Meeting on Religious Syncretism Held at Abo on the 8th–10th of September 1966*, edited by Sven S. Hartman (Stockholm, 1969); *Les syncrétismes dans les religions grecque et romaine: Colloque de Strasbourg, 9–11 juin 1971* (Paris, 1973); *Synkretismus im syrisch-persischen Kulturgebiet: Bericht über ein Symposium in Reinhausen bei Göttingen in der Zeit vom 4. bis 8. Oktober 1971*, edited by Albrecht Dietrich (Göttingen, 1975); *Les syncrétismes dans les religions de l'antiquité: Colloque de Besançon, 22–23 octobre 1973*, edited by Françoise Dunand and Pierre L. Lévêque (Leiden, 1975); and *Religious Syncretism in Antiquity: Essays in Conversation with Geo Widengren*, edited by Birger A. Pearson (Missoula, Mont., 1975). A recent approach to the topic can be found in Ulrich Berner's *Untersuchungen zur Verwendung des Synkretismus-Begriffes* (Wiesbaden, 1982). The historical situations in which syncretisms can arise are best described in Mircea Eliade's monumental *A History of Religious Ideas* (Chicago, 1978–1986).

Many volumes are devoted to the critical appraisal of syncretist materials in the series “Études préliminaires aux religions orientales dans l'Empire romain,” edited by Maarten J. Vermaseren (Leiden, 1967–1981). The theme was also the subject of a special research area undertaken from 1968 to 1981, the results of which were published in the series “Göttinger Orientforschungen”; see especially Joachim Spiegel's *Die Götter von Abydos: Studien zum ägyptischen Synkretismus* (Wiesbaden, 1971); Wolfgang Schenkel's *Kultmythos und Märtyrerlegende: Zur Kontinuität des ägyptischen Denkens* (Wiesbaden, 1977); Brigitte Altenmüller's *Synkretismus in den Sargtexten* (Wiesbaden, 1975); and Maria Theresia Derchain-Urtel's *Synkretismus in ägyptischer Ikonographie: Die Göttin Tjenener* (Wiesbaden, 1979). In addition to the works on Egypt, the series offers a general study: *Synkretismusforschung: Theorie und Praxis*, edited by Gernot Wiessner (Wiesbaden, 1978). The principle of syncretism is also discussed in Richard Merz's *Die numinose Mischgestalt* (Berlin, 1978).

Hypotheses regarding an ancient syncretism in Greece and Iran are defended by Otto Kern in *Die Religion der Griechen*, vol. 1, *Von den Anfängen bis Hesiod* (Berlin, 1926), and vol. 2, *Die Hochblüte bis zum Ausgang des fünften Jahrhunderts* (Berlin, 1935), and by Sven S. Hartman in *Gayomart: Étude sur le syncrétisme dans l'ancien Iran* (Uppsala, 1953). Descriptions of syncretism in India can be found in almost every study on the religions of India. On late antiquity, see, in addition to the symposia mentioned above, Christoph Elsas's *Neuplatonische und gnostische Weltablehnung in der Schule Plotins* (Berlin, 1973). On South America, see Lindolfo Weingärtner's *Umbanda: Synkretistische Kulte in Brasilien, eine Herausforderung für die christliche Kirche* (Erlangen, 1969); Ulrich Fischer's *Zur Liturgie des Umbandakultes* (Leiden, 1970); and Horst H. Figge's *Geisterkult: Besessenheit und Magie in der Umbanda-Religion Brasiliens* (Freiburg, 1973).

For a discussion on syncretism in Africa, see Raymond Rozier's *Le Burundi: Pays de la vache et du tambour* (Paris, 1973). On

Japan, see Joseph M. Kitagawa's *Religion in Japanese History* (New York, 1966) and J. H. Kamstra's *Encounter or Syncretism: The Initial Growth of Japanese Buddhism* (Leiden, 1967). On syncretism within a variety of Buddhist cultures, see *Buddhist Backgrounds of the Burmese Revolution*, by Emanuel Sarkisyanz (The Hague, 1965), and *Buddhism in Ceylon and Studies in Religious Syncretism in Buddhist Countries*, edited by Heinz Bechert (Göttingen, 1978).

On the Christian position regarding the problem, consult Willem Adolph Visser't Hooft's *No Other Name: The Choice between Syncretism and Christian Universalism* (London, 1963). On the dispute concerning syncretism within the Protestant church, see Otto Ritschl's *Die reformierte Theologie des 16. und 17. Jahrhunderts in ihrer Entstehung und Entwicklung* (Göttingen, 1926).

CARSTEN COLPE (1987)

Translated from German by Matthew J. O'Connell

**SYNCRETISM [FURTHER CONSIDERATIONS]**. *Syncretism* belongs with several other terms in the study of religions, such as *myth*, *magic*, or *religion*, that derive from Greek or Latin words but have a complex semantic history in which the meaning of the ancient Greek or Latin word is relatively unimportant when compared to the adoption and resemanticization of the term in modern scholarly discourse. In the case of syncretism, Erasmus's adaptation and Latinization of Greek *synkrētismós* (Plutarch, the *Suda* lexicon) into *syncretismus* paved the way for later usages. Erasmus adopted the term in its ancient meaning of “banding together of Cretans” as a proverbial term to designate an alliance of unlike partners based on usefulness, not on mutual attraction, and he applied it to the changing coalitions in the religious fights of his own time (*Adagia* 1.1.11) or to the necessity of humanist scholars to close ranks against their ideological enemies (*Letter* 947 to Melanchthon, from 1519). After Erasmus the term radically changed its meaning. When reused in Protestant sources in its French and English adaptations, it referred to the closing of ranks among different groups of reformed Christians, especially Lutherans and Calvinists, despite their considerable doctrinal differences and under the pressure of their common enemy, the papacy, and it was used to censure this closing of the ranks as bizarre and unacceptable. Although in these texts the intended meaning was “a behavior like that of Erasmus's beleaguered Cretans,” it was quickly understood as “unprincipled blending of theological and liturgical truth (ours) and falsehood (theirs) under outside pressure.” This negative use and meaning resurfaced in the nineteenth-century missionary polemics against native influences on Christianity, and it survives in contemporary Catholic discourse about ecumenism and any other “relativisms” (Joseph Cardinal Ratzinger). In a more descriptive sense, but still with negative connotations, the term became prominent in the scholarly language of historians of religion, philosophers, and linguists in the latter half of the nineteenth century. In the study of religions, it

was mainly used to describe the later stages of Greek and Roman religions, with their many imports from Near Eastern cultures (J. Réville, *La religion à Rome sous les Sévères*, 1886) or its identification of divinities such as Asclepius and Zeus (“*synkretismus oder religionsmischerei*,” H. Usener, *Götternamen*, 1895 [1949], p. 337); as a precursor, J. A. Hartung had described the reception of Greek elements into Roman religion as *Vermischung* (*Die Religion der Römer*, 1836, p. 249). But as early as in the 1880s it was used in other religions, such as Talmudic Judaism or Avestan religion (see *Journal of the American Oriental Society* 11 [1887]: 114, or 16 [1894]: 76). From the perspective of a church historian following the church’s traditional evaluation, Adolf von Harnack used the concept to characterize gnosticism (*Lehrbuch der Dogmengeschichte*, vol. 1, 1886; see A. Hilgenfeld, “Religionsmischung,” *Zeitschrift für wissenschaftliche Theologie* 33 [1890]: 1). Negative connotations are obvious, and “syncretistic” almost equals “heretical.” Thus, *syncretism* was and still is used as a normative term. Its scholarly use as a descriptive term creates the same complex problems as the use of the term *magic*: it has proved almost impossible to free it entirely from normative connotations.

Two assumptions underlie the descriptive usage: religions can be understood as autonomous entities, and purity is their early (“original”) stage; in a simple evolutionary concept, syncretism (impurity) is seen as a later phenomenon (lucid in G. van der Leeuw, *La religion dans son essence et ses manifestations*, 1948, pp. 167 ff., 589–593). This appropriation of elements from other, especially Asian religious cultures was often viewed as a sign of weakening (“effete times,” *Journal of the American Oriental Society* 11 [1887]: 114) and a result of the population mix in the great urban centers of later antiquity (“syncretism and cosmopolitanism,” *Journal of the American Oriental Society* 11 [1887]: 16, and [1894]: 76). Subtexts are the negative view of city life in an industrialized society whose ideals were still derived from a rapidly disappearing rural life, and the equally negative view of the Semitic East as a foil to Greekness, Romanness, or Christianity (e.g., M. Olender, *Les langues du paradis*, 1989, pp. 75–111 on Ernest Renan). Political implications are evident, and it would be interesting to compare the contemporary development of the terms *nation* and *nationalism*: the rise of two major European nation-states, Germany and Italy, falls into the same period as the rise of the term *syncretism*. In an interesting inversion, the term also characterized the religious imperialism of the Roman emperors who appropriated foreign cults as part of a strategy of homogenizing the empire (“all the varieties of mankind . . . restamped at the Caesarean mint,” *Frazer’s Magazine for Town and Country* 47 [1853]: 294): this prepared for its critical use in colonial history.

As a scholarly term, *syncretism* has been used for describing a wide variety of phenomena, such as the influence of one religion on another (Christian or Islamic influence on African religions), the interpenetration of two religious systems

(such as Sumerian and Assyrian religion), the mutual influence of local religions (as in ancient Egyptian religion), the appropriation of foreign divinities (such as Mithra in Rome), or the combination of different divinities into one entity (such as Zeus and Asclepius). Some of these phenomena were viewed as unconscious, others could be seen as a conscious blending of religious elements; usually, however, an evolutionary approach prevailed that had no interest in individual agents of syncretism. The usefulness of the term was debated well before Karsten Colpe’s above entry in this encyclopedia, and the debate continues, with good reasons. A successful scholarly term is an instrument that enables succinct comparison between phenomena that are viewed as related; in order to do so, it has to have a precise content and its meaning has to find wide agreement in the scholarly community. If the content is vague and fuzzy, comparison is impossible, and if the community does not agree on the definition, communication outside a narrow circle of initiates breaks down.

**RECENT APPROACHES.** In the years after Colpe’s entry (and already before that), the term underwent more and sometimes radical criticism; some of the critics rejected it in favor of another term.

**Redefinition.** A first approach insisted on the extreme fluidity of the concept and its lack of definition, which reduces its heuristic value. Instead of rejecting the term altogether, several critics paralleled Colpe’s own move to redefine the term. Perhaps the most interesting proposal is Ulrich Berner’s (1992, 2001). Using Niklaus Luhmann’s system theory, Berner differentiates between the religious system (such as Greek religion, or Christianity) and the elements of this system; he regards religions as systems whose elements—both their own form and their relationship to the overall system—are constantly changing. He defines *syncretism* not as the result of a process (as many earlier scholars had done) but as the process itself. This leads him to locate syncretism on both levels of the system: syncretism acts either between different religious systems (say between Shintoism and Christianity) or between single elements of the same system (say between two Greek divinities); for the latter process, he also proposed to use the term *rationalization*, leaving *syncretism* to designate processes between different religious systems. On both levels, he then introduced several other terms to deal with phenomena that traditionally were also called syncretism.

This approach to religious terminology shares its problems with many comparable approaches in which a traditional but vague term is retained with a new and specific definition: it has to find a consensus group that shares its meaning. In the case of syncretism, such a consensus has not been reached. In Colpe’s proposal the term remains so loose, despite the initial definition, as to comprise a large group of different phenomena; in Berner’s case, one might argue that it would be easier to replace *syncretism* with yet another new term than to retain it in its strictly confined meaning; in fact, Berner also uses *systematization* to denote processes that af-

fect entire religious systems. Berner's insistence on syncretism as a process, however, has become crucial; other scholars, as we shall see presently, shared this evaluation.

A similar development occurred in anthropology. Anthropologists were less susceptible to the notion of pure cultures than historians of religion, and early on they subscribed to a descriptive use of the term. But anthropologists also began to realize that such a description would make sense only when applied to a process, "syncretization," not to a state: syncretism as a state would call for its opposite, pure culture, but such a pure culture exists only at the end of an almost infinite regression towards hypothetical origins; all known past and present cultures are syncretistic (Stewart and Shaw, 1994, pp. 7–9; Johnston, 2002, pp. 71ff).

**Rejection.** More recently, scholars rejected the term altogether. Following the lead of recent cultural studies, especially Homi Bhabha (*The Location of Culture*, 1994) who in turn followed the pioneering work of the colonial historian Edward Said, these scholars reject the assumption that religions are autonomous entities or systems that can at some point react with each other; they rather focus on the constant interaction of single elements in a continuum where interaction takes place both at the zones of contact and at every possible other place as well; in Luhmann's sense, then, we would have to enlarge the system to global size. Boundaries are not the result of intrinsic processes but they are set from outside, usually through hierarchically superior and powerful agents that delineate national religions (versus foreign religions), orthodoxies (versus heresies), or correct religions (versus native distortions in a colonial setting). The discourse on syncretism is thus inevitably political, and the descriptive term "syncretism" is replaced by "hybridity" to express this acephalous interaction of elements in a potentially global system. Up to now, the term and its concomitant methodology have been applied to the question of gnosticism (King, 2003) or the formation of Christianity and rabbinic Judaism (Boyarin, 1999, p. 8).

This approach builds on the insight that religions are not autonomous entities (Joachim Wach, *Religionswissenschaft. Prolegomena zu ihrer wissenschaftlichen Grundlegung*, 1924, p. 86) and succeeds in taking the criticism against the term *syncretism* seriously; in a move that is similar to the rejection of the term *magic* as a "semantic trap" (M. Wax and R. Wax, *Current Anthropology* 4 [1963]: 495–513), the description makes use of a new term. Two problems will have to be addressed in future research. One is the simple fact that traditional terminology is surprisingly resistant and inert (or, perhaps less surprisingly, the scholarly community as such is conservative), as the case of *magic* demonstrates. The other, more serious question is whether a model that deals with culture can be transferred to religion without modifications and adaptations: is religion an integral and equal subsystem of culture, or do its elements behave in a different way?

**Middle ground.** In between these two opposing views lies a third approach that on the surface looks like a compro-

mise, although it is somewhat prior to the introduction of the term *hybridity*. It starts from the same discontent with *syncretism* as a very vague descriptive term with a normative life of its own and the view that there are no religions that would be entirely autonomous entities. All religious phenomena in a given society have always been open to interactions not only from inside the system (Berner's "rationalization") but from the outside, which lead to changes in single elements or in the entire system. Thus, as a descriptive category of religious or cultural phenomena, syncretism would be unnecessary, not the least because it is a category that is based on an evolutionary understanding of culture and religion: these phenomena are defined by their origin. Nevertheless, in this approach the concept is retained in two distinct ways: as describing processes of religious change and in a discourse of syncretism; these discourses necessarily involve the workings of power and of agency (Stewart and Shaw, 1994).

The first way became a focus of scholarly interest in the later quarter of the twentieth century, and it lacked a distinct vocabulary. Agreeing with Berner's restriction of "syncretism" to processes only, this approach opens itself to the same problem as the first, that is, to the necessity of defining the term in a rather specialized way, which therefore potentially reduces its communicative value. The second interest is a critical and historical one and reflects the self-reflexive state of contemporary religious studies that it shares with most other fields in cultural and social studies that also led to the rejection of the term. The two ways of dealing with the term and the underlying reality seem in a somewhat precarious combination; there is no self-evident path leading from syncretism as a process to syncretism as a discourse.

**EXEMPLIFICATION.** An example might highlight the advantages and problems in the different approaches. I shall not select one of the well-known areas of syncretism as outlined above by Colpe but deal with two very distinct phenomena, the creation of new religious movements and the formation of divine personalities.

**Invention of a new religion.** In the past, the term was applied with preference to new religious entities, either to define them or to characterize their creation. A case in point is the Roman mysteries of Mithra. A single actor, the anonymous inventor of Mithraism, created it in a conscious act of bricolage by taking over elements from what he regarded as an exotic religion (Persian) but acting inside his own cultural and religious matrix and reacting to concerns in this very society (Beck, 1998, pp. 115–128). One could call this creative process *syncretism* and agree that the term has to be confined to comparable processes, such as the formation of single gnostic bodies or even the creation of Mormonism, or one could define the term *hybridity* to denote these same processes. The decision is more one of political correctness than of scholarly gain, and in both cases, it involves the redefinition of a broader term from another field.

**Formation of a divine personality.** Another area that traditionally made use of the term *syncretism* is the formation

of divine personalities. A complex case is the Greek god Zeus. Linguistic and functional analysis has shown that Zeus has homologues outside Greece, in various other Indo-European religious cultures; whatever the exact mechanisms of the diffusion of Indo-European speakers were, Zeus's Indo-European ancestry is well established. The way in which Greek Zeus appeared in poetry and in the cults and images between 700 BCE and 400 BCE is considerably more complex. He presides over the present cosmic order in a succession of rulers since the beginning of cosmogony and theogony. In a story that depends on several Near Eastern succession myths, he fought a battle of wits with Prometheus, a member of the earlier generation of gods and protector of humans whose stories were influenced by those of Mesopotamian Ea/Enki. In order to secure his power, he fought a monster with snake features: this resonates with several Near Eastern foundation myths; the later story of how he was attacked and temporarily defeated by Typhon is connected with the Syrian Mount Kasios, where Baal Zaphon was worshiped. Like many Semitic Baalim and Anatolian weather gods, Zeus was the god of rain, storms, and lightning whose preferred place of worship was mountaintops. Thus, a considerable number of Near Eastern stories helped to shape the early Greek myths of Zeus, as Near Eastern mountain cults shaped the cult of Zeus on mountaintops. The transfer mechanism of stories is clear: through direct or indirect contact, a Near Eastern story was adapted and reshaped by an early Greek singer; the reshaping was conditioned by the singer's creativity, the specific circumstances of his performance, and the expectations of the audience. The mechanism of cult transfer is less clear, but presumably some of the stories in turn created cults. Furthermore, most early Greek communities worshiped Zeus, and their local stories legitimated and explained their cults. These local stories and cults interacted with those of their neighbors; the stories were sometimes picked up by itinerant singers and incorporated into their narrative. Early Greek images of Zeus in the shape of a walking god brandishing a thunderbolt resonated with Syrian or Anatolian images of local Baalim and with Egyptian monumental statues. In an inverse movement, gods in other language areas were read as Zeus: Baalim in Syria; local weather gods in Anatolia, who in Greek inscriptions appeared as Zeus, often with the local name as an epithet; Tinia in Etruria; Jupiter in Rome.

This narration assumes several processes of interaction to have taken place and several categories of agents to have been consciously or unconsciously active: the transfer of narrations from the ancient Near East to Greece, from Asian storytellers, scribes, priests, and ordinary people telling stories to Greek merchants, travelers and, finally, itinerant singers who diffused them to Greek audiences; the transfer of local Greek stories from one place to another by singers who made it part of their repertoire; the foundation of specific cults or the change of local rituals through the agency either of a singer's tale or a neighbor's cult; the manufacturing of images by Greek craftsmen after images seen by travelers and merchants

in the East or dedicated in a Greek sanctuary by Greek and Eastern merchants, travelers, and religious specialists; the identifications of a local god with Zeus by travelers such as Herodotus who wanted to understand and explain to their audience a foreign god by translating his name, by Greek settlers who wanted to worship a local god under a name they knew, by members of local elites in Anatolia, Etruria, and Rome who intended to enhance the prestige of their cult by adding stories and images from Greece, or by local craftsmen looking for pictorial traditions that they lacked in their local setting. These agents and interactions created the traditions of local and Panhellenic storytelling, iconography, and cult.

Using the language of syncretism, one would have to speak of two basic forms of syncretism, external and internal, between systems and within a system. But to do this would mean to drastically simplify the description of the various processes and thus to lose a rich heuristic and descriptive arsenal; it seems better to create new and more specific terms than to redefine *syncretism* to include just one type of process.

More problems arise when we try to define the boundaries of the systems: do we have to respect the boundaries set by the locals, or do we impose them from our point of view, and if so, what are the criteria used? The boundaries that Greeks themselves defined were shifting over the period we focused on, from the city (*polis*) to the tribe, to all Greeks as a unit; the shifts resulted from political developments inside Greece. Modern definitions of boundaries usually follow language or political structure, thus replicating the model of the modern nation-state: Greek religion as an autonomous entity was the religion of the people who spoke Greek or of the territory over which Greeks ruled; this expanded the system when, as a consequence of Alexander's conquests, Greek became the language of the entire Eastern Mediterranean world, whereas it would collapse when the Romans took over. More recently, scholars resignedly accepted the *polis* as the basic unit of religion and ended up with a vast plurality of Greek religions. This verges towards a *reductio ad absurdum*: any religious contact between two cities could be called syncretism.

**CONCLUSIONS.** Syncretism was heavily discussed in the 1970s and 1980s; then, the debate slowed down. Colpe's hope that scholars could agree on one meaning proved unfounded; and since the term still has its polemical meaning in present-day church language, it is unlikely that such an agreement is imminent. In this situation it might be more useful not to use the term at all, even though no replacement is in sight. As *hybridity* with its origin in the discourse of colonial history suggests, the underlying problems of cultural identity and autonomy are too sensitive to lend themselves to neutral descriptions and formalizations; it is likely that the coexistence of several scholarly communities with their own terminology will persist for some time.

FRITZ GRAF (2005)

## SYRIAC ORTHODOX CHURCH OF ANTIOCH.

The Syriac Orthodox Church and its dependency in India, along with the Coptic, Armenian, Ethiopian, Malankara, and Eritrean Orthodox Churches, make up a communion now called Oriental Orthodox, erroneously called "Monophysite" in the past. These churches did not accept the Council of Chalcedon (451 CE) and its Christological definition that proposed two natures in Christ and so fell out of communion with the rest of the Christian world. But they never accepted the classical Monophysite position of Eutyches, who affirmed that the humanity of Christ was absorbed into his single divine nature. They affirm the perfect human-

ity as well as the perfect divinity of Christ, inseparably and unconfusedly united in a single divine-human nature of Christ's person. In Christology these churches follow Severus of Antioch and also Cyril of Alexandria, who spoke of the "one incarnate nature of the Word of God." Long known as Syrian Orthodox, in April 2000 this church's Holy Synod changed its official name in English to the Syriac Orthodox Church of Antioch in order to avoid confusion with Syrian nationality.

**HISTORY.** Antioch was one of the largest cities in the ancient eastern Mediterranean and became an important political, military, cultural, and commercial center after it was incorporated into the Roman Empire in 64 BCE. It became the Greek-speaking capital of the Roman province of Syria, where most of the inhabitants in the countryside spoke Syriac, a dialect of Aramaic. A Christian community formed at Antioch early in the common era; according to *Acts* 11:26, it was here that the followers of Jesus were first called Christians, and a strong case has been made that the *Gospel of Matthew* was composed in the city. Both Peter and Paul spent time in Antioch; Paul and Barnabas later set out from the city on their missionary journeys after the local prophets and teachers agreed with the undertaking.

Ignatius of Antioch (c. 35–c. 107 CE) provided in his writings the first evidence of a monarchical episcopacy at Antioch, although the Antiochians themselves have traditionally viewed Peter as their first bishop. In the second and third centuries CE a number of heresies arose and caused unrest in the community, including Gnosticism, docetism, Montanism, and Novatianism. Yet these early centuries also saw great scholars and thinkers, such as Paul of Samosata (third century CE), Theodore of Mopsuestia (c. 350–428 CE), and Diodore of Tarsus (d. 394 CE), all three of whom the Syriac Orthodox now regard as heretics. John Chrysostom (c. 354–407 CE) came from the Greek-speaking city church.

The leadership of the Syriac Church was decimated by the persecution that broke out under Diocletian around 304 CE. But by the time of the Council of Nicaea (325 CE) the metropolitanate of Antioch had largely recovered, having six Roman provinces under its jurisdiction (Palestine, Phoenicia, Coele-Syria, Arabia, Mesopotamia, and Cilicia) with sixty-six bishops and ten rural bishops. Edessa, rather than Antioch, was now the center of Syriac Christianity, and its catechetical school, called the Athens of the Aramaic world, flourished until the Byzantine emperor Zeno destroyed it in 489 CE. The center then moved to Nisibis.

Increased efforts by the Byzantine emperors to Hellenize the Syriac-speaking population in the countryside—where the "one nature" Christological formula was widely accepted—met with stiff opposition there and also in Egypt. Resistance began in 449 CE with the Second Council of Ephesus (called the "Robber Council" in the West) and exploded after Chalcedon's adoption of the "two nature" formula in 451 CE. In spite of efforts by the Byzantine emperors to impose Chalcedonian orthodoxy, in the end only about half of

the faithful of the ancient Antiochian Patriarchate (located mostly in the Hellenized urban areas) accepted Chalcedon. They eventually adopted the Byzantine rite and become what is in the twenty-first century the Greek Orthodox Patriarchate of Antioch. The other half, more representative of the Syriac-speaking faithful of the interior, never accepted Chalcedon, retained their Syriac liturgical tradition, and evolved into the Syriac Orthodox Church.

By the end of the fifth century CE the Syro-Egyptian revolt found a great champion in Severus, patriarch of Antioch (c. 465–538 CE), under whose influence the Synod of Tyre (513–515 CE) formally rejected the Chalcedonian formula. Byzantium sought to crush the movement through ruthless persecution. In 518 CE the Second Council of Constantinople deposed and anathematized Severus, who then fled to Egypt.

In 521 CE Emperor Justin expelled all non-Chalcedonian monks and clergy and drove the Syriac Church into the wilderness. This contributed to a renaissance of Syriac monasticism, which was characterized by devotion to vigorous asceticism and solitude. One Syriac monastic, Saint Simeon Stylites (c. 389–459 CE), had spent years alone on top of a column, introducing a unique form of Syriac asceticism known as *stylitism*; this practice continued well into the Middle Ages.

In 544 CE the Syriac priest Jacob Baradeus was ordained bishop through the influence of Hārith ibn Jabalah, king of the Arabs (c. 529–569 CE), with the support of Empress Theodora (a Syrian) in Constantinople. Bishop Jacob Baradeus is credited with reviving the Syriac Orthodox hierarchy by ordaining some twenty-seven bishops and hundreds of priests and deacons. Because of Bishop Jacob's pivotal role in preserving the church for future generations, its detractors began much later to call the church "Jacobite." But this name was never accepted by the Syriac Orthodox themselves because of its suggestion that Jacob had been the founder of their church.

The Persian invasions began when Chosroes I (reigned 531–579 CE) sacked Antioch in 540 CE and were repeated in 614 CE; by 616 CE both Syria and Egypt had fallen to the Persian Sassanids. The Persians deported large numbers of Syriac Christians to Mesopotamia, where they were joined by Christians disaffected from the local (Nestorian) church of the East. The Syriac Church reorganized itself during this period, and great centers developed at Seleucia-Ctesiphon (Mesopotamia) and again at Edessa. In 629 CE the Byzantine emperor Heraclius, who was an Edessan, drove out the Persians and resumed persecution of the Syriac Orthodox.

In 636 CE the Arabs conquered Syria. The new Islamic Empire, cultured and tolerant, especially after Mu'āwiya, the first Umayyad caliph (661–680 CE), shifted its capital to Damascus, improved the legal status of the Syriac Orthodox, and allowed them to organize themselves separately in Mesopotamia with their own metropolitan with authority over all

the faithful east of the Euphrates. Marutha of Tagrit (629–649 CE) was the first bishop to hold this office, having received from the patriarch the title "maphrian of the East." These metropolitans were elected by the bishops of the area and enjoyed a high level of autonomy, even for a time ordaining the patriarchs. (The maphrians were nominated by the patriarchs after 793 CE, and the office became defunct in 1848.) The great center of the church's scholarship was now at the monastery of Kenneshre on the Euphrates. Perhaps its most famous graduate was Jacob of Edessa (633–708 CE), the ascetic scholar and exegete who revised the Syriac Old Testament and the Syriac liturgy.

The Umayyad caliphate of Syria was replaced in 750 CE by the Abbasid caliphate, and in 762 CE the capital was moved to the newly founded city of Baghdad. Under the Abbasids, and also from 969 to 1043 CE, when the Fatimid caliphate ruled Syria from Egypt, there was periodic persecution of Christians and some signs of corruption in the hierarchy and the monasteries. Many Christians converted to Islam. Seljuk Turks conquered Jerusalem and Damascus in the eleventh century. In 1092 the Turkish Empire collapsed, and from 1098 to 1124 the Latin Crusaders occupied Antioch and Jerusalem.

Nevertheless in the twelfth century the Syriac Church had 20 metropolitan sees, 103 bishops, and millions of believers in Syria and Mesopotamia. Sultan Ṣalāh al-Dīn (Saladin), who defeated the Crusaders and took over Palestine from them, was supportive of culture and encouraged learned Christians. An outstanding leader and scholar at this time was Patriarch Michael the Great (1126–1199), whose *Chronicle* remains an important source of Syriac Orthodox history. The turbulent thirteenth century, wracked by invasions of Latin Crusaders from the West as well as of Mamluk Turks and Mongols from the East, also produced a number of pivotal figures, including the chronicler and philosopher Gregory Bar Hebraeus (1226–1286), maphrian of the East. The Syriac Orthodox Church grew to more than two hundred dioceses at this time; decline set in around 1401 with the attack by Tamerlane, the Turkic conqueror.

In the seventeenth century a majority of the Thomas Christians of the Malabar Coast in India turned to the Syriac Orthodox Church and asked it to send them bishops in reaction to the reforms and Latin practices that the Portuguese had imposed on them at the Synod of Diamper in 1599. This had led to the Coonen Cross revolt in 1653 and an effort to receive pastoral oversight from a church that would allow them to maintain their ancient traditions. This new relationship was formalized during the visit of Mar Gregorios, Syriac metropolitan of Jerusalem, to India in 1664. The group then formed an autonomous church within the Syriac Patriarchate.

By this time the church in Syria had dwindled to about twenty bishops from probably more than two hundred in the thirteenth century. Capuchin and Jesuit missionaries began to work among the Syriac Orthodox and received many of

them into the Catholic Church. The Catholic group chose Bishop Andrew Akhijan as its patriarch in 1662, but he had no successor after his death in 1702. A Catholic patriarchate was permanently established only in 1782, when Syriac Patriarch Michael Jarweh declared himself Catholic and took refuge in Lebanon. The Orthodox then elected a new patriarch of their own, and the two lines have continued into the twenty-first century.

In the nineteenth century, in the Ottoman Turkish Empire, Kurds assaulted Syriac Christians with large-scale massacres in 1843, 1846, and 1860. In 1861 the Levant came under the protection of the French, who worked to strengthen the Catholics. During and immediately following World War I, as the Ottoman Empire was collapsing, tens of thousands of Syriac Orthodox died as a result of massacres and expulsions.

Protestant missionaries in the Middle East since 1819 have also drawn many Syriac Orthodox into their faith communities. Migrations to Europe and the Americas further depleted their numbers, with many of the émigrés joining other churches, Protestant or Catholic.

**MODERN TIMES.** The nineteenth and twentieth centuries were turbulent times for the Syriac Orthodox in the Middle East, and the struggle for survival became more and more intense. The headquarters of the Patriarchate, which had been in Antioch until 1034, at Mar Barsauma monastery until 1293, and at Der Zafaran monastery until 1933, moved to Homs in 1933 and then to Damascus in 1959. Headed in 2003 by Mar Ignatius Zakka I Iwas (b. 1933, elected 1980), the church has a total of 25 bishops and about 500,000 members. The Syriac Orthodox Church in the twenty-first century has an established hierarchy in Syria, Lebanon, Iraq, Jordan, Turkey, India, the United States, Canada, and Australia. There is also an Archdiocese of Central Europe and the Benelux countries based in the Netherlands, an archdiocese and patriarchal vicariate within the Metropolitanate of Sweden and Scandinavia based in Södertälje, Sweden, and an archdiocese in Germany.

Some theological education is still provided by the monasteries, but Saint Ephrem Syriac Orthodox Seminary is the Patriarchate's major theological school. It was founded in Zahle, Lebanon, but moved to Mosul, Iraq, in 1939. It moved back to Zahle in the 1960s and relocated to Atchaneh, near Beirut, in 1968. The outbreak of civil war in Lebanon forced the removal of the students to Damascus, Syria. New facilities for the seminary at Sayedniya, near Damascus, were consecrated by the Syriac patriarch on September 14, 1996.

The Syriac monastic tradition, nearly wiped out by the invasions of Tamerlane, survives in the Tur Abdin region of southeastern Turkey. There are two sizable complexes at Der Mar Gabriel and Der Zafaran with a total of about fifteen monks and four communities of nuns in the area. There are monasteries in Jerusalem, near Mosul in Iraq, in the Nether-

lands, in Germany, and in Switzerland. There is also a monastery with about sixty monks connected with the seminary in Sayedniya, Syria. The Syriac patriarch has also created a new order of nuns, the Virgins of Saint Jacob Baradeus, which has about fifteen members. The order's headquarters is in Atchaneh, Lebanon, and there are additional communities in Damascus and Baghdad.

The Syriac Church in India suffered a split in 1912, when a group composing about half of its members declared itself autocephalous (independent) of the Syriac Patriarchate and elected its own catholicos. They and those who had remained loyal to the Patriarchate were reconciled in 1958, when the Indian Supreme Court declared that only the catholicos subject to the Syriac patriarch and bishops in communion with him had legal standing. But in 1975, after the catholicos broke relations with Damascus, the Syriac Patriarchate excommunicated and deposed him and appointed a rival, causing the community to split again. In June 1996 the Supreme Court of India rendered a decision declaring that, whereas there is only one Orthodox Church in India whose spiritual head is the Syriac patriarch, the autocephalous catholicos alone has legal standing as the head of the church in India. Unfortunately this did not reconcile the two communities, whose dispute has become embittered. In 2003 the two sides were more or less evenly divided with about one million adherents each.

**ECUMENICAL ACTIVITY.** The Syriac Orthodox Church has been an active participant in the modern ecumenical movement; it has been a member of the World Council of Churches since 1960 and was a founding member of the Middle East Council of Churches. In most of the theological dialogues it has acted in concert with the other Oriental Orthodox Churches. It has had a long-standing relationship with the Anglican Communion in the Middle East and India; the Oriental Orthodox and Anglicans reached a Christological agreement in 2002.

The Syriac Orthodox Church also participated in unofficial consultations with the Eastern (Byzantine) Orthodox Churches from 1964 to 1971 and in an official joint commission from 1985 to 1993. In addition the Syriac Orthodox patriarch signed a joint statement with the Greek Orthodox patriarch of Antioch on November 12, 1991, that sanctions much closer relations between the two churches, including a substantial level of sacramental sharing.

Relations with the Catholic Church have improved dramatically, as was shown by the signing of common declarations by Pope Paul VI and Patriarch Ignatius Jacob III in 1971 and by Pope John Paul II and Patriarch Ignatius Zakka I Iwas in 1984. The second declaration states that past schisms and divisions concerning the doctrine of the incarnation "in no way affect or touch the substance of their faith." It also authorized their faithful to receive the sacraments of penance, Eucharist, and anointing of the sick in the other church when access to their own clergy is materially or morally impossible and outlined broad areas of pastoral coopera-

tion. In addition a direct bilateral theological dialogue between the Catholic Church and the Malankara Syrian Orthodox Church began in 1989. It issued an agreement on interchurch marriages in 1993.

**LITURGY.** The Syriac Orthodox liturgical tradition, often called West Syrian, drew upon translations of Greek texts from Jerusalem and Antioch and added Syriac-language material from Edessa, largely poetry and hymns. It is one of the richest ancient Christian liturgical traditions, with about one hundred Eucharistic prayers, three baptismal liturgies, and poetic sets of daily offices and festal liturgies now available in English (few of which are in use). The choir has not replaced the congregation in worship, as it has in the Byzantine tradition. The principal anaphora (Eucharistic prayer) is that of Saint James, which is rooted in the Jerusalem tradition and attained its present form at the end of the fourth century CE. Many of the hymns in use come from Ephraem the Syrian, the great fourth-century CE ascetic and poet.

RONALD G. ROBERSON (2005)

**SZOLD, HENRIETTA** (1860–1945), was a Zionist leader and a founding president of Hadassah, the leading women's Zionist organization in the United States. Born in Baltimore, Maryland, the eldest child of Benjamin Szold and Sophia (Schaar) Szold, she was educated by her father, a rabbi, and in local schools, graduating first in her high school

class. She subsequently taught, wrote articles in the Jewish press, and organized night classes for east European Jewish immigrants in Baltimore before leaving for Philadelphia in 1893 to work for the Jewish Publication Society of America (founded 1888). There, she edited and translated important volumes of Judaica, indexed Heinrich Graetz's *History of the Jews*, and for a time compiled the *American Jewish Year Book*. In 1903 she attended classes at Jewish Theological Seminary of America in New York. In 1909, after her first love, Louis Ginzberg, professor at the seminary, married another woman, she traveled to Palestine, where her Zionist commitments were renewed. In 1910, she became secretary of the Federation of American Zionists, and two years later joined with other women to found Hadassah on a nationwide basis. After 1916, she devoted her full attention to the organization and spent considerable time in Palestine involved in its medical and educational endeavors as well as broader Zionist affairs. She spent her last years directing the efforts of Youth Aliyah, the movement established to save Jewish youngsters in Nazi-occupied Europe by bringing them to Palestine.

Henrietta Szold espoused a Jewish way of life that was at once deeply religious, strongly ethical, and broadly tolerant. Her religious practices and outlook were shaped by Conservative Judaism, but she followed an independent course, evinced considerable interest in Jewish religious writings by women, and insisted on her right to recite the Qaddish prayer in memory of her mother, as well as to fulfill other Jewish religious obligations traditionally restricted to men. Impelled by her religious values as well as her lifelong pacifism, she associated during her last years with Jewish thinkers in Palestine who sought Arab-Jewish rapprochement and advocated a binational state. Her example of Jewish social activism coupled with her fostering of traditional Jewish ideals has inspired Jewish women throughout the world, particularly those associated with Hadassah.

#### BIBLIOGRAPHY

Henrietta Szold's writings and letters remain scattered; for a small selection, see Marvin Lowenthal's *Henrietta Szold: Life and Letters* (New York, 1942). A brief but penetrating overview of Szold's life and career by Arthur Hertzberg appears in *Notable American Women*, edited by Edward T. James et al. (Cambridge, Mass., 1971). Full-length studies include Alexandra Lee Levin's *The Szolds of Lombard Street: A Baltimore Family, 1859–1909* (Philadelphia, 1960), which covers her early life, and two critical biographies: Irving Fineman's *Woman of Valor: The Life of Henrietta Szold, 1860–1945* (New York, 1961) and Joan Dash's *Summoned to Jerusalem: The Life of Henrietta Szold* (New York, 1979).

T

**ṬABARĪ, AL-** (AH 224/5–310; 839–923 CE), fully Abū Jaʿfar Muḥammad ibn Jarīr al-Ṭabarī, was an Islamic religious scholar and historian. Born in Āmul in Ṭabaristān, northern Persia, just south of the Caspian Sea, al-Ṭabarī reports that by the age of seven he had learned the Qurʾān by heart, by the age of eight had qualified as a prayer leader (*imām*), and by the age of nine was studying traditions from Muḥammad. At the age of twelve he set off on the proverbial Muslim quest for knowledge, first by attending school in Rayy (in what is now Tehran) and then, in 855, setting off for Baghdad, likely in hopes of studying with the famous traditionist Aḥmad ibn Ḥanbal, who, however, died in that same year just before al-Ṭabarī's arrival. After a number of sojourns in other cities in Iraq, Syria, Palestine, and Egypt, he settled in Baghdad and devoted his life to scholarly pursuits involving teaching and writing. Al-Ṭabarī is reported to have written over twenty works, although differentiating individual books is sometimes problematic because of the suspicion that some works may be known under a variety of titles. According to various anecdotes, al-Ṭabarī avoided taking any positions of administrative responsibility, despite the urging of government officials and colleagues, and devoted his energies purely to his work. Stories are told of him writing forty pages a day for forty years, and while the accuracy of the numbers is doubtful given their symbolic value, his dedication to his work is apparent in the level of his output.

Al-Ṭabarī was an impressively prolific polymath. He wrote on such subjects as poetry, lexicography, grammar, ethics, mathematics, and medicine, although none of his works on these topics has survived. His fame today rests primarily upon his writings in the fields of history, the Qurʾanic sciences, and law. The scope of his accomplishments in the first two fields is especially significant given the unique value of his two main works, the world history entitled *Tāʾrīkh al-rusul wa-al-mulūk* (The history of the prophets and the kings) and the commentary (*tafsīr*) on the Qurʾān entitled *Jāmiʿ al-bayān ʿan tāʾwīl āy al-Qurʾān* (The gathering of the explanation of the interpretation of verses of the Qurʾān).

Al-Ṭabarī's *Jāmiʿ al-bayān ʿan tāʾwīl āy al-Qurʾān* is, at least superficially, a voluminous compendium of traditional matter concerned with the meaning of each verse of the

Qurʾān, presented in sequence following the text of scripture. Some 35,000 traditions (with a significant degree of duplication present in actual interpretational material) going back to the first Islamic century (seventh to eighth centuries CE) are cited. Al-Ṭabarī was also a creative scholar, however, and his editorial function in compiling this type of information cannot be ignored. Any reports of Qurʾanic interpretation attributed to Muqātil ibn Sulaymān (d. 767), for example, are omitted, presumably because of his tarnished reputation as a reliable source. In general, al-Ṭabarī omits any information that was rejected by the consensus of the community at his time. In addition, al-Ṭabarī virtually always notes which interpretation of a given verse he prefers, and he is given to supporting his contentions with philological analysis or poetical evidence not necessarily connected with any report from a traditional authority. He also discusses matters of dogmatics and law, in some instances in a detailed manner and on a sophisticated level. The theological outlook in his work is in keeping with the mainstream of Baghdad thought at the time, following in the legacy of Ibn Ḥanbal, although his opinions did, on occasion, evoke some protest among local rival scholars. His theological position is also evidenced in two independent works, *Ṣarīḥ al-sunnah* (The essence of correct practice), a brief profession of faith (*ʿaqīdah*) written in response to accusations of incorrect belief on al-Ṭabarī's part by his contemporaries; and a fragment of his work on the "principles of religion," *uṣūl al-dīn*, entitled *Tabṣīr fī maʿālim al-dīn* (An instruction concerning the characteristics of religion), which was directed to the inhabitants of his hometown of Āmul regarding sectarian opinions that were emerging in the area.

Each section of *Jāmiʿ al-bayān* commences with a quotation from the Qurʾān, generally a verse or a thematic unit. Traditions are then cited, complete with their chains of authority (*asānīd*; singular: *isnād*) substantiating the transmission of the report; the traditions are grouped according to different possibilities of interpretation for the passage in question. The citation of these groups of traditions is frequently preceded by a statement such as, "Interpreters differ concerning the meaning of God's having said that. . . ." Following the enumeration of all attested interpretations, al-Ṭabarī usually gives his own preference, saying, "In my opinion, the best of the statements is the following. . . ." and he argues the case on the basis of parallel Qurʾanic passages, grammar, poetry, theology, or whatever seems appropriate to make his point.

Al-Ṭabarī also appended a fairly extensive introduction to *Jāmiʿ al-bayān* entitled *Risālat al-tafsīr* (The epistle on interpretation), in which he sets forth some principles of interpretation along with a discussion of the standard disputed issues concerning the Qurʾān (the language of the Qurʾān, the notion of the seven readings of the text, and the collection of the Qurʾān). He argues for a concept of the "obvious" (*zāhir*) meaning of the Qurʾān, rather than metaphorical or figurative renderings, as the only legitimate mode of inter-

pretation. This "obvious" meaning of a text can be overridden only by a positive indication of the necessity to do so, as by a tradition that is fully authoritative and convincing. Otherwise the *zāhir* meaning, defined as "what predominates in practice," *al-ghālib fī al-istiʿmāl*, must be accepted. Al-Ṭabarī also compiled as a separate work a massive collection and evaluation of textual variants to the Qurʾān, *Kitāb fī al-qirāʾāt* (A book on the variant readings), which still exists today in manuscript form.

As a historian, al-Ṭabarī equaled his accomplishments as a Qurʾanic exegete. His *Tārīkh al-rusul wa-al-mulūk*, which exists today in fifteen printed volumes, is said to be a greatly abbreviated version of al-Ṭabarī's original plan. The work commences with the creation and the era of the biblical patriarchs, details some early rulers of Israel and Persia, and then moves on to Sassanid history. As might be expected, the text becomes far more detailed after this portion. For the life of Muḥammad, the first four caliphs of Islam, the Umayyad dynasty, and the Abbasid rulers up to 915, it is organized year by year. The aim of the work was to document world history leading up to Muḥammad, and then to trace the continuity of the experiences of the Muslim community in the following years. Like his Qurʾān commentary, this work is traditionally oriented in structure, although here al-Ṭabarī's editorial role is more clearly limited to selection, arrangement, and documentation of the material cited; rarely do the editor's own words intrude.

Al-Ṭabarī's respect for his method of simple presentation results in much duplication, such that historical records conveying similar material are found frequently. This results from the inclusion of reports that stem from different sources, all of which were judged by al-Ṭabarī to be trustworthy in the *isnād* of their transmission and thus intrinsically valuable. His history telling, therefore, is not linear but a conjunction of varying accounts. Al-Ṭabarī's editorial role does at least allow him to support his own regional and partisan positions within the broad scheme of Islamic history. *Tārīkh al-rusul wa-al-mulūk* quickly became famous in the Islamic world, with later writers using it as the basis for even more comprehensive works and others working at extending its chronological dimensions and also translating it into Persian and Turkish.

Al-Ṭabarī attempted to strike out on his own in the juristic field. He formed a school of law (called the Jarīriyah after his father), but it quickly fell into obscurity after his death, since it was not substantially different from the school of al-Shāfiʿī, to which al-Ṭabarī originally belonged. Fragments of a large work that al-Ṭabarī wrote on law, *Ikhṭilāf al-fuqahā* (The disagreement among the jurists), which details the opinions of great jurists of early Islam, as well as of a collection of *ḥadīth* entitled *Tabḥīb al-āthār* (The revised compilation of the traditions), still exist, but those works represent only a small portion of his overall scholarly output in the area.

Al-Ṭabarī is considered a master of historical writing and of *tafsīr*, and in subsequent generations he was seen as the most important intellect of his age, a *mujtahid*. He gained this stature not only because of his prodigious output but also because of his critical acumen, especially as displayed in *Jāmi' al-bayān*. The *tafsīr* is also the earliest complete and extensive work of its type available today (although other briefer but earlier works do still exist), and the history has been a major source for all reconstructions of events in early Islam, since it is, like the *tafsīr*, the earliest comprehensive compilation of historical reports for the Islamic period. Considering the importance and value of the works, it is somewhat surprising that few complete manuscript copies have survived to the present (scattered single volumes are available in numerous libraries, however) and that, until the end of the nineteenth century, the complete work of the *tafsīr* was believed lost. Perhaps because of the voluminous nature of the texts, they remained works suitable only for other scholars; later summaries and translations of the works became particularly important and, in some ways, eclipsed the original work, even though al-Ṭabarī's fame as a historian and religious scholar remained intact.

#### BIBLIOGRAPHY

*Tārīkh al-rusul wa-al-mulūk* was published under the general editorship of M. J. de Goeje with the title *Annales quos scripsit Abū Djaḥfar Moḥammed ibn Djarīr at-Ṭabarī*, 15 vols. (Leiden, 1879–1901). Other editions were printed in Cairo in 1909 and in 1960–1965. The entire work has been translated into English in thirty-nine volumes, *The History of al-Ṭabarī* (Albany, N.Y., 1985–1999), volume 1, *General Introduction, and From the Creation to the Flood*, translated and annotated by Franz Rosenthal (1989), provides a detailed survey of al-Ṭabarī's life, works, and accomplishments. For an understanding of the scope of al-Ṭabarī's history, see Claude Gilliot, "Récit, mythe, et histoire chez Tabari: Une vision mythique de l'histoire universelle," *Mélanges de l'institut dominicain d'études orientales du Caire* 21 (1993): 277–289; and Chase F. Robinson, *Islamic Historiography* (Cambridge, U.K., 2003). A full treatment of al-Ṭabarī's history and studies about it is found in Franz-Christoph Muth, *Die Annales von at-Ṭabarī im Spiegel der europäischen Bearbeitungen* (Frankfurt, 1983).

Al-Ṭabarī's commentary (*tafsīr*) on the Qur'ān, *Jāmi' al-bayān 'an tā wīl āy al-Qur'ān*, was first published in Cairo in 1903 and again in 1905; a new Cairo edition was begun in 1954. A summary translation has been published in French by Pierre Godé, *Commentaire du Coran* (Paris, 1983), in five volumes, and a portion, through *sūrah* 2, verse 103 (including the introduction), is available in English as *The Commentary on the Qur'ān, by Abū Ja'far Muḥammad b. Jarīr al-Ṭabarī, Being an Abridged Translation of Jāmi' al-bayān 'an tā wīl āy al-Qur'ān*, with an introduction and notes by J. Cooper, edited by Wilferd Madelung and Alan Jones (Oxford, 1987). A fundamental study on this work is Otto Loth, "Tabari's Korancommentar," *Zeitschrift der Deutsche morgenländischen Gesellschaft* 35 (1881): 588–628. Harris Birke-land, *The Lord Guideth: Studies on Primitive Islam* (Oslo, 1956), provides a detailed study of the structure of the tradi-

tions cited by al-Ṭabarī. Herbert Berg, *The Development of Exegesis in Early Islam: The Authenticity of Muslim Literature from the Formative Period* (Richmond, U.K., 2000), uses al-Ṭabarī's *tafsīr* as a source of data to discuss the issue of the reliability of the ascription of material to early authorities. Claude Gilliot, *Exégèse, langue, et théologie en Islam: L'exégèse coranique de Tabari (m. 311/923)* (Paris, 1990), is a masterful study of al-Ṭabarī's exegetical approach; it is supplemented by Gilliot's articles "Exégèse et sémantique institutionnelle dans le commentaire de Tabari," *Studia Islamica* 77 (1993): 41–94, and "Mythe, récit, histoire du salut dans le commentaire coranique de Tabari," *Journal Asiatique* 282 (1994): 237–270.

On al-Ṭabarī's *ḥadīth* work, see Claude Gilliot, "Le traitement du *Ḥadīth* dans le *Tahdīb al-āṭār* de Tabari," *Arabica* 41 (1994): 309–351. Al-Ṭabarī's creed is translated in Dominique Sourdel, "Une profession de foi de l'historien al-Ṭabarī," *Revue des études islamiques* 36 (1968): 177–199.

ANDREW RIPPIN (2005)

**TABĀTABĀ'Ī, 'ALLĀMA.** Muḥammad Ḥusayn Ṭabātabā'ī (1903–1981) was arguably one of the most prominent Shī'ī Muslim scholars of the twentieth century; he was given the honorific title 'Allāma, a testimony to the extent and depth of his knowledge in the Shī'ī tradition of Islamic scholarship.

Ṭabātabā'ī was born into a family of Shī'ī 'ulamā' (Islamic scholars) in Tabrīz, northwest of Iran, in 1903. In 1918, after finishing his primary education, he entered the field of religious studies and, until 1925, he studied Arabic grammar, logic, principles of Islamic jurisprudence, Islamic law, theology, and philosophy. In 1926 he settled in Najaf, the most famous Shī'ī seminary (*hawza*) in Iraq at that time, in order to complete his higher studies, attaining a license to perform *ijtihād*—independent reasoning and deduction based on the principles and sources of Islamic law.

He returned to Tabrīz, his birthplace, in 1934. In 1946, due to the political situation in the northwest of Iran, which at that time was under the influence of the Soviet Union, he went to the city of Qum, where he resumed his scholarly research. In Qum he taught Islamic philosophy and Qur'anic studies for the rest of his life and became one of the greatest contemporary masters in these two disciplines.

Ṭabātabā'ī was a prolific writer in both Arabic and Persian. His work had a profound impact on contemporary Shī'ī thought, principally through his contribution to four areas: Qur'anic commentary and interpretation, philosophy, mysticism, and sociocultural debate.

Ṭabātabā'ī successfully revitalized the discipline of Qur'anic exegesis (*tafsīr*), making this one of the core subjects of the curriculum within the seminary of Qum. His own monumental commentary on the Qur'ān, *al-Mīzān fī Tafsīr al-Qur'ān*, is ample evidence of his mastery of all the sciences required for in-depth Qur'anic interpretation.

*Al-Mizān* appeared at a time when standards of scholarship in Shī'ī seminaries were determined by the discipline of jurisprudence (*fiqh*). Those who were involved in other fields, such as *tafsīr*, were considered weak both in scholarly and social terms. The reason was that although in the seminaries the discipline of *fiqh* was dominated by Uṣūlī thought, *tafsīr* was still strongly influenced by the rival Akhbārī school, which places primary stress upon the narration of traditions (*aḥādīth* or *akhbār*, pl. of *khabar*, “report”). Thus, *tafsīr* was not given very much importance. Ṭabāṭabā'ī succeeded in radically changing this state of affairs, such that *tafsīr* is now considered one of the major disciplines within Shī'ī seminaries. The key interpretive principle applied by Ṭabāṭabā'ī in his commentary is that of interpreting verses of the Qur'ān through other verses of the Qur'ān. According to him, in order to obtain an understanding of the objective meaning of the Qur'ān, the interpreter must set aside all personal ideas and opinions and make an effort to understand and interpret the verses of the Qur'ān only in the light of other Qur'anic verses. Although this method was used in part by various schools of interpretation, it was Ṭabāṭabā'ī who articulated and employed this method most successfully, making it the very cornerstone of his interpretive hermeneutic. He wrote *al-Mizān* over a period of eighteen years, from 1954 to 1972. Originally written in Arabic in twenty volumes, it has been translated into Persian, and the first six volumes have been translated into English.

Ṭabāṭabā'ī also played a significant role in elevating the status of Islamic philosophy in Shī'ī circles, and particularly within Iran; he contributed to the process by which philosophy became once again a major focus of teaching and research. Although he was a master in Mullā Ṣadrā's philosophical school, *al-ḥikmah al-muta'aliyah* (transcendent theosophy), he avoided the mixing of philosophy with the traditional, transmitted sources, the Qur'ān and *ḥadīth*, that characterizes the works of Mullā Ṣadrā's school of philosophy. Ṭabāṭabā'ī insisted on maintaining a clear distinction between these two disciplines, as is clearly expressed in his philosophical works *Bidāyat al-ḥikma* (The beginning of philosophy) and *Nihāyat al-ḥikma* (The ultimate end/goal of philosophy).

His contribution to Islamic mysticism, known in its Shī'ī form as *irfān*, consisted in his teaching of one of the principal sources of this approach, that is, the school of Muḥyī al-Dīn Ibn al-'Arabī. He succeeded in his efforts, despite strong opposition from many exoteric Shī'ī scholars of his time. The emergence in the Shī'ī seminary of Qum of a new generation of scholars well-versed in the mysticism of Ibn 'Arabī is in large part due to his influence.

Ṭabāṭabā'ī was also actively involved in sociocultural debates about Islam. After World War II, the influence of modernism and Marxism on traditional Iranian society was increasing. Ṭabāṭabā'ī devoted several books and articles to discussing key issues arising out of these confrontations between modernism and tradition—such as the status of reli-

gion in the modern world, the rights of women, and the weakness of materialistic philosophy. Between 1958 and 1977 Ṭabāṭabā'ī had an important series of scholarly and philosophical debates with Henry Corbin, the renowned French scholar of Islamic thought. He also encouraged his students to participate in sociocultural debates; among those students, one should mention such figures as Murtaḍā Muṭahharī and Muḥammad Ḥusayn Bihishtī, who went on to play important roles in Iran's Islamic revolution in 1979.

The influence of Ṭabāṭabā'ī on Shī'ī thought generally remains very strong; at present most of the masters of Islamic philosophy, mysticism, and interpretation of the Qur'ān in the seminaries of Iran were his students. In addition to the above-named students, one should also mention such towering figures as S. J. Āshtiyānī, Ayatollah Javādī Āmulī, and Ayatollah Ḥasanzādih Āmulī, who are now known as the leading experts in Iran in interpretation of the Qur'ān, Islamic philosophy, and *irfān*. Seyyed Hossein Nasr was also one of Ṭabāṭabā'ī's students, and it was through Nasr that Ṭabāṭabā'ī was introduced to the English-speaking world, with his translation of Ṭabāṭabā'ī's *Shī'a dar Islam*, as *Shi'ite Islam*, in 1975. Ṭabāṭabā'ī died on November 15, 1981.

## TABERNACLES, FEAST OF SEE SUKKOT

**TABOO** is a social prohibition or restriction sanctioned by suprasocietal (innate) means or a socially sanctioned injunction alleged to have the force of such a prohibition. Taboo stands at the intersection of human affairs and the forces of the larger universe. Generally it is determined by divine or animistic mandates; but it may involve "punishment" by inherent circumstances as well, for instance, the real, but exaggerated, danger of genetic damage to the offspring of incestuous unions implied in the incest taboo of American folk culture.

The word *taboo* (from the Tongan *tabu*, a variant of the more general Polynesian term *tapu* and the Hawaiian *kapu*) reached the West through Captain James Cook's account of his third voyage. He was introduced to the term at Tongatapu, in the Tonga, or Friendly, Islands, and commented that the word had a very comprehensive meaning but generally signified a thing that is forbidden (Webster, 1942, p. 5). In fact, the general Polynesian usage implies that what is *tapu* is interdicted through its relation to the sacred, or its relation to cosmic forces. *Tapu*, then, relates the cosmic to human actions, and the realm of *tapu* amounts to a comprehensive system of religious mandate controlling individual and social life.

In Polynesian religion, *tapu* has the function of segregating persons, objects, or activities that are divine or sacred, or those that are corrupt or polluting, from the common, everyday realm. Thus chiefs, high-ranking persons, and their lineages were surrounded with *tapu*; the heads of all persons, and especially of chiefly persons, were *tapu*; but also the clothing and sleeping places of women in their menstrual periods were dangerous to men, who were *tapu* in relation to them (Best, 1905, p. 212). An "eating *tapu*" required men and women, and often all classes of persons of unequal status, to eat separately, or even to have their food prepared separately and with different utensils.

Consecrational *tapu* applied in circumstances of worship and labor performed for the gods and temples, and those involved entered a *tapu* state, which had to be neutralized later. Life-crises events (birth, marriage, illness, death) involving chiefly persons, wars, and fishing expeditions imposed community-wide restrictions on common activities, including the preparation and eating of food, movement, the lighting of fires, and noisemaking. *Tapu* could also be invoked through appealing to the gods to enforce a prohibition on some object, crop, or piece of land; in the Marquesas Islands a chief could taboo land in this way by calling it his "head." A temporary taboo laid on crops, trees, or fishing grounds was called a *rahui* (Handy, 1927, p. 46).

*Tapu*, as a state of sacred interdiction, stands in contrast to the neutral, or common, state, *noa* (whatever is free from *tapu* restriction). Fresh as well as salt water was used through-

out Polynesia for the removal and neutralizing of *tapu* and of polluting influences harmful to one's *tapu* (Handy, 1927, pp. 51–55). Fire and heat were also used ritually against baneful influences, especially spirits. Many communities maintained a "sacred water" or spring specifically for the removal of *tapu*.

The cosmic principle or force behind the restrictions and prohibitions of *tapu* is conveyed in the general Polynesian conception of *mana*. *Mana* is invisible and abstract, knowable only through its efficacy and through its manifestation in things, yet it is universal. Like the Arabic *barakah*, *mana* combines sacredness with the sense of "luck" or "power" in the most encompassing terms. Chiefs, chiefly persons and their possessions and doings, and rites involving the gods are *tapu* because they are suffused with *mana*. The danger of polluting influences is that they may discharge the *mana* of persons or objects that are more highly endowed; common persons, on the other hand, run the risk of being struck or overcome by *mana* greater than theirs. *Tapu* may be seen as the "insulator" between unequal degrees of *mana*. Thus Handy suggests that electricity may serve as a useful analogy in illustrating the nature of the concept of *mana* (*ibid.*, p. 28), though of course it is fundamentally a religious rather than a naturalistic concept.

Even modern curers and others who have recourse to its manipulation consider *mana* distinct in its operation from the world of ordinary life processes, exchanges, and human interaction. Curers who use *mana* may not accept compensation in money (MacKenzie, 1977). As a universal power, *mana* is evidenced in every kind of efficacy: a woodcarver manifests *mana* in his talents and in the tools and circumstances of his work, and canoe makers, gardeners, curers, sorcerers all have their *mana*, capable of being lost or dispersed unless the proper *tapu* are observed. Of these examples of *mana* the chiefly *mana* is the highest and most concentrated, and it poses a serious danger for the unprotected commoner.

As an abstract and generalized conception of power, *mana* is analogous to Lakota *wakan*, Iroquois *orenda*, and other concepts of power found among indigenous North American groups. The term is by no means universal among Austronesian-speaking peoples, though many have cognate notions. Among the major world religions *mana* has counterparts, perhaps, in the Islamic notion of *barakah*, the Hindu notion of *sakti*, and possibly in the Greco-Christian concept of *charisma*.

The notion of the "psychic unity of mankind," that is, that human cultures everywhere must pass through certain necessary stages of evolutionary growth, allowed speculative writers around the turn of the twentieth century to draw conspicuous examples of primitive religious concepts from particular ethnographic areas and universalize them. The Polynesian notions of *tapu* and *mana* lent themselves extraordinarily well to this search for the epitomizing evolutionary trait, for they were already quite abstract and, in Captain Cook's phrase, "very comprehensive" in their meanings.

Early anthropologists deemed taboo noteworthy, for it marked the point where a religious idea (*mana*) affected the norms and regulation of everyday life. Breach of a taboo meant divine or other suprasocietal sanctions; hence, taboos, or a system of taboos, outlined the spiritual mandate and boundaries for social existence.

In the evolutionary model for primitive religion that emerged in the decades immediately before and after 1900, taboo played the role of archetypal religious rule, or mandate; as *mana* did of generalized supernatural force, or power; and as totemism did of collective or individual identification with supernatural (or quasi-natural) entities. Thus emerged the alliterative formula “totem and taboo” as an encompassing rubric for primitive religion, to which Freud turned in seeking socially expressed equivalents for psychological states.

In the writings of Émile Durkheim, and among his followers in the schools of French and British social anthropology, *taboo* came to have the sense of a largely social restriction, or mandate, through the Durkheimian proposition that the religious and the supernatural were the means by which society took account of its own existence—worshiped itself. If, in other words, the suprasocietal forces of the world around us are nothing more than the reflection of society itself, then taboo, however it may be regarded by the members of a society, is ultimately social in its origin. Even in this understanding of it, however, *taboo* carries a somewhat stronger connotation than mere “law” or “rule,” for taboos are special instances in which social constraints are referred directly to the religious manifestation of the social rather than to a secular authority.

The modern sense of *taboo* has acquired a certain ambiguity through the widespread acceptance of a socio-centric interpretation. Thus, depending on whether one accepts a formal, cultural, or a sociological understanding of the prohibition, the sanctions upon it will be, respectively, divine and innate, or human and social.

But the issue of the sanctioning force behind a taboo involves only a partial appreciation of the distinctiveness of this kind of prohibition. Taboo differs from abstract, codified law in the degree to which the prohibited object or act is specified and developed into a symbol, or even a fetish, of the prohibition itself. Taboo is not so much a system of regulations as it is a scheme of negative differentiation, in which the fact of prohibition and the prohibited act or object itself obscure the reasons for a prohibition. In this regard, the early theorists who saw “totem and taboo” as interlinked bases of “primitive thought” drew attention to a significant relation between them. For taboo designates items in order to prohibit them, whereas totemic representation is based on affinities between social units and phenomenal entities. Yet the practice of exogamy (marrying outside of one’s totemic group), once felt to be an integral part of totemism, comprehends both of these at once, for it places a marriage taboo on those who share affinities with the same entity.

Thus taboos serve to control and channel human interaction and collective activity through a system of negative differentiation, marking out certain persons, objects, and occasions by specifying what may not be done to, with, or on them. Words used as names are sometimes tabooed when a person holding the name undergoes a change in status. In the Marquesas and Society islands, a common word included in the name of a king or heir apparent would be tabooed and also replaced in everyday language. When a king of Tahiti assumed the name *Pomare*, the word *po* (“night”) was replaced in common speech by *rui*, and *mare* (“cough”) was changed to *kare* (Webster, 1942, p. 301). Similar taboos are found among the Zulu and the Malagasy. Among the Tiwi of northern Australia, the name of a person who has died, together with the common-noun equivalent of that name, and all the names that the deceased had bestowed upon others, together with their equivalents, are tabooed for ordinary use and transferred to a sacred language (Lévi-Strauss, 1966, pp. 209–210).

Taboos on name use, and often on any sort of interaction, are frequently encountered in the norms for kin relationship. In Papua New Guinea these are so common that the Pidgin term for “relative by marriage” is simply *tambu* (“taboo”). The extreme case, widespread in Aboriginal Australia and New Guinea, is a taboo involving total avoidance between a man and his wife’s (or future wife’s) mother. A relationship is set up between them precisely by their not interacting, one that forces them to communicate solely through the bridal exchanges. Thus the tabooing or, in this case, the negative differentiation of relationship creates the basis for future relationships by creating a marriage. Further taboos of affinity control and direct the subsequent course of the relationship by restricting overfamiliarity among other kinspeople brought into contact by the marriage.

Taboos on specific kinds, classes, or styles of food and on food preparation are perhaps the most commonly encountered of all human prohibitions. Many peoples who have no general term for “taboo” have a word for “food taboo.” Food restrictions, probably universal in human cultures, often conceal (or initiate) preferences or are themselves disguised as health precautions. Well-known examples include the Hebraic prohibition against using the same utensils for preparing meat and dairy products, the Hebraic and Islamic restrictions against eating the meat of animals that have been incorrectly slaughtered and against eating pork, and the Hindu ritual distinction between *pakkā* foods, prepared in clarified butter, and *kaccā* foods, boiled in water. Among the Kaluli of Mount Bosavi in Papua New Guinea, an elaborate system of food taboos operates to prevent relationships among cultural domains that must not be mixed. Married men and women must not eat fresh meat, and smoked meat is available only through exchanges with in-laws; thus, bonds will form through marriage links rather than with single hunters (Schieffelin, 1976, p. 71).

Mourning restrictions most often take the form of taboos, ranging from prohibitions on speaking of, or using the

names of, the deceased, through those on the use of the house or property of the deceased, to severe injunctions of seclusion (for widows or widowers). In parts of the Pacific, there are restrictions against washing or self-adornment, and often the mourners must wear relics. In traditional China, specific degrees of mourning behavior were specified according to one's relationship to the deceased. Among the Yi people of Yunnan Province in China visitors are prohibited from entering a compound where there are newborn infants or piglets, where someone is gravely ill, or where someone has died. Immediately upon a person's death, among the Usen Barok of New Ireland, a taboo called the *lebe* goes into effect: no gardening can be done, no fires can be made, and no arguments will be tolerated until the conclusion of the final mourning feast, up to a week later. It is also forbidden to utter a cry of lament until the mourners hear the first squeals of the pigs being slaughtered for the first feast.

Taboos surrounding ritual or worship are often the severest of all, for they involve mediation with the very forces that are understood to mete out the sanctions. The major ritual of the Daribi of Papua New Guinea concerns the placating of an unmourned and angry ghost, who possesses the *habu* ritualists in the process. Any deviation from the prescribed format of the ritual results in the affliction of the offenders with the dread *habu* illness, a malign act of possession that is merely the intended therapeutic possession gone awry (Wagner, 1972, p. 156). Food taboos accompanying the Chihamba ritual among the Ndembu of Africa keep the participants from "eating Chihamba" or the characteristics associated with this spirit (Turner, 1975, pp. 71–72). The sense of ritual indiscretion as mediation gone wrong is conveyed by the Navajo belief that ghosts cause people to do the opposite of whatever has been decreed in taboos.

The emphasis of a taboo, however negatively it may be phrased, is always upon the thing, act, or word tabooed. We tend to contemplate the object of the taboo itself in a search for motives, or possibly origins, for the prohibition. Thus, for instance, pork is a potential carrier of trichinosis, mothers-in-law have many potential conflicts of interest with their sons-in-law, and interbreeding among close relatives may lead to the expression of deleterious recessive genes. The difficulty with this sort of literalistic thinking can be seen in these examples. Taboo is usually indirect; its real object is not so much what is forbidden as it is the cultural and social circumstances affected by the prohibition. The Kaluli do indeed say that the juices of fresh meat are unhealthy for women and that their husbands should avoid it out of compassion. But the taboo on the eating of fresh meat for married persons serves to force them into the painstaking and appropriate activity of preparing and exchanging smoked meat with relatives by marriage. It aligns with a number of other taboos to restrict interaction to culturally appropriate categories.

The Daribi, in another example, actually have no experience of disagreeable mothers-in-law, for a married person

is never allowed to see the mother-in-law, much less speak with her. But the taboo forces each party to be especially aware of the other and to funnel their efforts into organizing the exchanges that must pass between the two sides. An effective relationship is formed through the principle of "not relating"! Finally, what we know as the "incest taboo" is actually the summation of a number of particular kin relationships, which are of differing extent and content in different cultures. What may be considered to be incestuous, or a relative, or a relationship, varies from one culture to another. But the fact of kin regulation through restriction, or kin taboo, if you will, is common to all cultures, for it is the essence of kinship. Hence, whether its prohibitions are imposed by men or gods, taboo incorporates the regulatory imperative of culture itself.

ROY WAGNER (1987)

**TAFSĪR** is an Arabic word meaning "interpretation"; it is, more specifically, the general term used in reference to all genres of literature which are commentaries upon the Qur'ān.

**TAFSĪR AND RELATED TERMS.** The word *tafsīr* is used only once in the Qur'ān (25:33), but this is not overly surprising,

for most technical terms involved in Muslim exegesis have been derived and adapted either from the field of rhetoric or from the legal tradition. In the case of *tafsīr* the word appears to have evolved from a description of a poetic figure in which one hemistich contains an explanation of the preceding one.

There is much discussion in various Arabic sources concerning the precise meaning of the term *tafsīr* and its relationship to other technical words such as *maʿānī*, *taʿwīl*, and *sharḥ*, all of which connote “interpretation” in some way. Historically, *maʿānī*, literally “meanings,” appears to have been the earliest major term used for the title of works of interpretation; *taʿwīl*, literally related to the notion of “returning to the beginning,” was introduced perhaps late in the third century AH (early tenth century CE) as the general term for works of Qurʾānic interpretation, only to have been supplanted in the eleventh century CE by *tafsīr*. *Sharḥ* seems to have been reserved primarily for profane purposes such as commentaries on poetry, but it was also employed for Qurʾānic super-commentaries. The prime focus of a dispute which took place probably in the early tenth century and which involved such central figures of early exegesis as Abū Jaʿfar al-Ṭabarī (d. 923 CE) and al-Māturīdī (d. 944) was the differentiation of *tafsīr* from *taʿwīl*. Both of these major exegetes, note, used the word *taʿwīl* in the title of their commentaries upon the Qurʾān: *Jamīʿ al-bayān ʿan taʿwīl āy al-Qurʾān* (The gathering of the explanation of the interpretation of the verses of the Qurʾān) and *Taʿwīlāt al-Qurʾān* (The interpretations of the Qurʾān), respectively. The basic question at stake concerned the ways in which traditional material could be employed to provide exegetical data. *Taʿwīl*, in the understanding of some scholars, was interpretation which dispensed with tradition and was founded upon reason, personal opinion, individual research, or expertise, whereas *tafsīr* was based upon material (*ḥadīth*) transmitted through a chain of authorities from the earliest period of Islam, preferably from Muhammad himself or at least from one of his companions. However, the point was certainly never clear, because other proposed differentiations between *taʿwīl* and *tafsīr* glossed those simple edges. Muqātil ibn Sulaymān, an early exegete (d. 767), for example, implies a distinction between *tafsīr* as what is known on the human level and *taʿwīl* as what is known to God alone. According to a similar notion, *tafsīr* applies to passages with one interpretation and *taʿwīl* to those with multiple aspects. And, of course, a further complication is indicated by the very title of al-Ṭabarī’s *tafsīr*: that is, *taʿwīl* could be used for a work that was quite tradition-oriented, at least in basic form. A further suggestion is that the dispute over *tafsīr* and *taʿwīl* is to be traced back to the earliest sectarian disputes in Islam, between the general community and the followers of Muḥammad’s son-in-law and cousin, ʿAlī ibn Abī Ṭālib (d. 661), known as the Shīʿah, who wished to appropriate the word *taʿwīl* for reference to interpretation of “concealed” (i. e., esoteric) parts of the Qurʾān as demanded by Shīʿī doctrine.

It should also be noted that the terms *tafsīr* and *taʿwīl* were not in fact the exclusive property or concern of Muslims; Jews and Christians writing commentaries on the Bible in Arabic used both words. The Jewish theologian Saʿadyah Gaon (d. 942) titled his Arabic translation of the Pentateuch *Tafsīr basīṭ naṣṣ al-Tūrāh* (The simple interpretation of the text of the Torah), and the Copt Butrus al-Sadamanti in about the year 1260 wrote *Al-muqaddimah fī al-tafsīr* (Introduction to interpretation), which formed a part of his overall work on the interpretation of the New Testament Passion narratives. These are only two examples of use of the word *tafsīr* for scriptural interpretation outside Islam; many other similar instances could be cited.

**PURPOSE OF TAFSİR.** Interpretation aims to clarify a text. *Tafsīr* takes as its beginning point the text of the Qurʾān, paying full attention to the text itself in order to make its meaning clear. It also functions simultaneously to adapt the text to the present situation of the interpreter. In other words, most interpretation is not purely theoretical; it has a very practical aspect of making the text applicable to the faith and the way of life of the believers. The first of these two interpretive aspects is generally provoked by insoluble problems in meaning, by insufficient detail, by intratextual contradiction, or by unacceptable meanings. Interpretation that fits the text to the situation serves to align it with established social custom, legal positions, and doctrinal assertions.

Other practical reasons can also be cited for the initial creation of *tafsīr* as an entity. As Islam expanded, it was embraced by a large number of people who did not know Arabic; interpretation, sometimes in the form of translations (although this was officially frowned upon) and other times in a simple Arabic which did not contain the ambiguities and difficulties of the original scriptural text, fulfilled the purpose of allowing easier access to the book. In addition, there was the basic problem of the text itself and how it was to be read. The early Arabic script was defective in its differentiation of letters of the alphabet and in the vocalization of the text; although eventually there arose an official system of readings (*qirāʾāt*) which gave sanction to a basic seven sets of vocalizations of the text (with further set variations still possible to some extent), in the earliest period a greater freedom with regard to the text seems to have been enjoyed. This freedom extended to the consonantal structure of the text and was legitimized through the notion of the early existence of various codices of the Qurʾān, each with its own textual peculiarities. Differences between these versions and the later, official ʿUthmanic text (as far as theses could be cited by the exegetes), as well as the variations created by the different official vocalization systems, then demanded explanation and justification in order to establish claims that a particular reading provided the best textual sense. The end result was that *tafsīr* acted to establish a firm text of scripture within what became the set limits of the *qirāʾāt*.

**ORIGINS OF TAFSİR.** Traditionally it has been held that *tafsīr* arose as a natural practice, originating with Muḥammad and

then continuing organically from that point forward; the earliest material has thus become known as *tafsīr al-nabī* (“the interpretation of the Prophet”). Various companions of Muḥammad and some early believers are also seen as the major figures who started interpreting the Qurʾān and teaching people exactly what their understanding of the text was; central among them was ʿAbd Allāh ibn ʿAbbās (d. 687?), who gained the title *tarjumān al-Qurʾān*, “the interpreter of the Qurʾān.”

A debate rages in the scholarly literature on the nature of early *tafsīr*, most especially over the idea of opposition to the activity itself in the early Islamic period. This notion was first isolated by Ignác Goldziher in *Die Richtungen der islamischen Koranauslegung* (Leiden, 1920); on the basis of traditional Muslim reports concerning the caliph ʿUmar (d. 644) and his punishment of a certain person (variously identified) for interpreting unclear passages of the Qurʾān, Goldziher concluded that interpretation of Qurʾānic verses dealing with historical legends and eschatology was illegitimate. Harris Birkeland in *Old Muslim Opposition against Interpretation of the Koran* (Oslo, 1955) rejected this contention on the basis of his own evaluation of the traditional reports, which suggested to him certain contradictions, especially over the identity of the flogging victim and over whether such punishment was in keeping with ʿUmar’s character. Birkeland has argued that, rather than general opposition to *tafsīr*, there was no opposition at all in the first Muslim century, that strong opposition arose in the second century, and that thereafter the activity of *tafsīr* was brought into and under the sphere of orthodox doctrine and requirements. In particular, strict methods were introduced for the transmission of the information, which formed the core of interpretational procedure, and in this way, *tafsīr* gained total acceptance. Nabia Abbott, in an excursus to her *Studies in Arabic Literary Papyri II: Qurʾānic Commentary and Tradition* (Chicago, 1967), reasserted Goldziher’s isolation of early opposition on the basis of traditional information that the person in question certainly existed and that flogging was in keeping with the character of ʿUmar. For Abbott, however, the opposition was limited to the interpretation of a specific category of unclear verses (*mutashābihāt*), a claim that she based on the traditional biographical material, which indicates that those people who are mentioned as opponents of *tafsīr* in fact transmitted much material themselves. Therefore, for Abbott, the only opposition to *tafsīr* that ever existed was that connected with the ambiguous or unclear verses. Precisely what is to be understood by the “unclear verses,” however, is glossed over in this argument. Exegetes never have agreed and never will agree on which verses are unclear, or even on what that expression means. Some things are unclear to one person while they are perfectly clear to another, often because of a different (especially religious) perspective on the material.

The major problem with all of these discussions is the lack of substantial evidence, with the result that the entire

argument remains speculative. Manuscript evidence for *tafsīr* barely reaches back to the third century AH (ninth century CE), at which point several genres of commentary had already emerged. Much of the material found in these texts seems to have originated in a popular worship context (such as semiliturgical usage or sermons) or in the storyteller environment provided by wandering preachers (*quṣṣās*) and their didactic, homiletic sermonizing, which aimed to improve the religious sentiments of the uneducated majority of people. In other words, producing entertaining tales was a key to the development of *tafsīr*. From this point of view, the whole discussion of the origins of *tafsīr* as conducted by Goldziher, Birkeland, and Abbott is rendered rather redundant.

**LEGITIMATION OF TAFSĪR IN THE QURʾĀN.** While the Qurʾān does not explicitly state that it should be interpreted, commentators have been able to justify their profession over the centuries by reference to the text itself. The most famous and the most problematic passage applied in this way is *sūrah* 3:5–6, the terminology of which has been referred to several times in the preceding sections:

It is He who has sent down to you the book in which are clear verses [*muḥkamāt*] that are the essence of the book and others that are unclear [*mutashābihāt*]. As for those in whose hearts is a perversion, they follow the unclear part, desiring dissension and desiring its interpretation [*taʿwīl*]. But no one knows its interpretation [*taʿwīl*] except God. And those firm in knowledge say: “We believe in it; all is from our Lord.” Yet none remember except men who understand.

This passage establishes two categories of interpretation, perhaps most easily viewed as “clear” (*muḥkam*) versus “unclear” (*mutashābih*). Many different translations and identifications have been put forth for the latter, some of which render the category hermeneutically trivial (e.g., identification of the “mysterious letters” which precede various *sūrahs* as the *mutashābihāt*), while others prove more valuable (e.g., identification of all verses with more than one interpretive aspect as *mutashābihāt*). Even more crucial, however, was the punctuation of the verse. The original Arabic text provides no indication of where stops and pauses should be taken; as a result, it was also possible to render the latter part of the pericope:

But no one knows its interpretation except God and those firm in knowledge who say: “We believe in it; all is from our Lord.”

With such a reading, the interpretive task was not limited to the rather trite exercise of making totally plain the already clear verses; the unclear verses, too, became targets for the commentators, and with that concept defined in some appropriate manner, the way was opened for the creation of a *tafsīr* on every verse of the Qurʾān.

**EMERGENCE OF TAFSĪR LITERATURE.** It seems fairly certain that written *tafsīr* works began to emerge in the second century AH at the latest. Documentation starts to proliferate toward the end of that period, and various modes of analysis

(e.g., attention to the convergent lines of transmission of a text) also suggest this as the earliest verifiable period. The emergent literature itself can be analyzed into various categories which not only display the distinctive literary qualities and differences of the texts but also suggest an overall relative historical ordering of them. The five sequential categories suggested by John Wansbrough in his *Quranic Studies: Sources and Methods of Scriptural Interpretation* (Oxford, 1977) are narrative (aggadic), legal (halakhic), textual (masoretic), rhetorical, and allegorical. While the historical sequence itself may be open to some debate, the categorization itself is, in true scientific fashion, functional, unified, and revealing.

**Narrative tafsīr.** Narrative *tafsīr* is exemplified in the text by Muqātil ibn Sulaymān, which has subsequently been given the title *Tafsīr al-Qurʾān* (Interpretation of the Qurʾān), although that is unlikely to have been the original name, and is also embodied in various sections of the work by Ibn Ishāq (d. 768), *Sīrat Rasūl Allāh* (The life of the messenger of God). The creation of an edifying narrative, generally enhanced by folklore from the entire Near Eastern world (including the heritages of Byzantium, Persia, and Egypt, but most especially that of the Judeo-Christian milieu) is the main feature of such commentaries. Adding detail to otherwise sketchy scripture and answering the rather mundane questions which the curious mind will raise when confronted by a contextless scriptural passage are the central concerns of this genre. In fact, the actual narrative seems to be of prime importance; the text of scripture remains underneath the story itself, often subordinated in order to construct a smoothly flowing narrative.

For the first part of *sūrah* 2:189 (“They are asking you about the new moons. Say: “They are appointed times for the people and the pilgrimage”), Muqātil tries to provide the answers for the curious reader. Just who is asking? Why did they ask? Precisely what did they ask? This type of approach is the essence of aggadic *tafsīr*. Muqātil provides the following comment on the verse:

Muʿādh ibn Jabl and Thaʿlabah ibn Ghanamah said: “O Messenger! Why is it that the new moon is just visible, then it appears small like a needle, then brightens until it is strong, then levels off and becomes a circle, only to start to decrease and get smaller, until it returns just as it was? Why does it not remain at a single level?” So God revealed the verse about the new moons.

The identification of the participants and the precise question being asked (provided in a marvelously naive and therefore entertaining manner) are specified. The overall interpretation of the verse becomes clear through this supplying of contextual material.

**Legal tafsīr.** Muqātil ibn Sulaymān once again is a focal point in the development of legal interpretation. Here, the arrangement of the material becomes the prime indicator of the genre; whereas in narrative interpretation the order of scripture for the most part serves as the basic framework, for

the legal material a topical arrangement is the definitive criterion. The fact that the actual content of Muqātil’s legal *tafsīr*, entitled *Tafsīr khams mīʾah āyah min al-Qurʾān* (The Interpretation of Five Hundred Verses of the Qurʾān), is probably derived from his narrative *tafsīr* reveals that the prime criterion is indeed the form of the work.

Muqātil’s text covers the following topics: faith, prayer, charity, fasting, pilgrimage, retaliation, inheritance, usury, wine, marriage, divorce, adultery, theft, debts, contracts, and holy war. This range of topics gives a fair indication of the nature of much of the material in the Qurʾān which was found to be of legal value.

**Textual tafsīr.** Activities centered on explanations of the lexicon of scripture, along with its grammar and variant readings, are the focus of textual commentaries. One of the earliest texts devoted to this type of analysis is that of the philologist al-Farrāʾ (d. 822) entitled *Maʿānī al-Qurʾān* (The meanings of the Qurʾān), a fairly technical work which primarily explains the difficult points of grammar and textual variants. The work of Abū ʿUbayd (d. 838), *Fadāʾil al-Qurʾān* (The merits of the Qurʾān), is similar, although it is divided by topic rather than following the Qurʾānic order, as does the work of al-Farrāʾ. Earlier simple texts also exist, including that by Muqātil ibn Sulaymān, *Kitāb al-wujūh wa-al-naẓāʾir* (The book of [word] senses and parallels), and al-Kisāʾī (d. 804), *Mushtabihāt al-Qurʾān* (The resemblances of the Qurʾān), both of which are devoted to semantic analysis of the text. Muqātil’s text compiles lists of word usages according to the number of senses of meaning (*wujūh*) of a given word; al-Kisāʾī’s work is similar but deals with phrases rather than individual words.

**Rhetorical tafsīr.** Concern for the literary excellencies of scripture is the focal point of works such as that by Abū ʿUbaydah (d. 824), *Majāz al-Qurʾān* (The literary expression of the Qurʾān), although the origin of this type of analysis may well be in textual exegesis (with a grammatical focus) rather than in a purely literary type. The impetus for its development as a separate genre, however, was the nascent notion of the miraculous character of the Qurʾān and the literary evidence for it. While this became a full doctrine only in the fourth century AH, its exegetical roots are to be found here. The work *Taʾwīl mushkil al-Qurʾān* (The interpretation of the difficulties in the Qurʾān), by Ibn Qutaybah (d. 889), proves to be an important transition point between this earliest rhetorical analysis based upon grammatical and exegetical niceties and that of the later doctrine of the miraculous character or inimitability of the Qurʾān (*iʾjāz*). In these texts attention is paid to the literary qualities of the Qurʾān which place it outside the norm of Arabic prose and poetry; various poetical figures are isolated, for example, are subjected to analysis for meaning, and, in many cases, are then compared with older Arabic poetry.

**Allegorical tafsīr.** Support for dissident opinion in Islam was generally found *ex post facto* through the expediency of allegorical interpretation. Supported through a termi-

nological differentiation of the *zāhir* as *historia*, “literal,” and the *bāṭin* as *allegoria*, “symbolic,” the Ṣūfī *tafsīr* of Sahl al-Tustarī (d. 896) exemplifies this trend in the earliest period. No attempt is made in this work, however, to provide an overall allegorical interpretation; rather, it takes isolated passages from the text of scripture and views them in light of mystical experience. The order of scripture is followed in al-Tustarī’s text as it now exists, although the initial compilation may not have followed any such order. About one thousand verses (out of some sixty-two hundred) in the Qur’ān are covered in this manner.

The commentary itself, which is structured piecemeal and reads in a disjointed fashion, contains much more than straightforward allegorical interpretation: legends of the ancient prophets, stories about Muḥammad, and even some about the author of the work himself also find their place. Nor is any overall pursuit of mystical themes to be found; indeed, its general nature is fragmentary. The esoteric portions of the text are formed around typically Ṣūfī meditations on the Qur’ān, each taking a key word from the text. Allegorical interpretation in this case becomes as much a process of thematic association as one of textual commentary.

**CONSOLIDATION OF CLASSICAL TAFSĪR.** It is with the fourth century AH (tenth century CE) that true works of *tafsīr* emerge, combining in various ways the five formative elements I have described above. The first landmark of this type of *tafsīr* is that of al-Ṭabarī, *Jāmi‘ al-bayān ‘an ta’wīl āy al-Qur’ān*, which gathers together in a compendium reports from earlier authorities dealing with most aspects of the Qur’ān. Verse-by-verse analysis is provided, each detailed with virtually every major interpretational trend (except sectarian). The material supplied in this manner is given in its full form, complete with the chains of transmitters for each item of information to lend the weight of tradition to each statement. This type of work is classically called *tafsīr bi-al-ma’tḥūr* (“interpretation by tradition”), as opposed to *tafsīr bi-al-ra’y* (“interpretation by opinion”), but the categories are misleading. Al-Ṭabarī provides his own personal interpretation, both implicitly by his editorial selection of material and explicitly by stating his opinion where different trends of interpretation exist, sometimes even going against the entire thrust of tradition and providing his own point of view; in this sense, this work, too, is *tafsīr bi-al-ra’y*.

In the centuries after al-Ṭabarī, *tafsīr* as an activity increased and became more and more sophisticated and, in some cases, reached voluminous quantities. Al-Māturīdī, Abū al-Layth al-Samarqandī (d. 983?), al-Tha’labī (d. 1035), and al-Wāḥidī (d. 1075) are all prominent people who in the fourth and fifth centuries AH produced volumes of *tafsīr*, sometimes, as in the case of al-Wāḥidī, in multiple editions.

Theological concerns begin to make a greater impact upon *tafsīr* in this period; it is a trend which culminates in the production of the most famous Qur’ān commentaries in the Muslim world, those of the rationalist Mu’tazilī

al-Zamakhsharī (d. 1144), the philosopher Fakhr al-Dīn al-Rāzī (d. 1209), and the Sunnī traditionalist al-Bayḍāwī (d. sometime between 1286 and 1316). Debates rage among these authors, and many others, over the central questions of Islamic theology and the various positions to be found in the Qur’ān. Topics covered include free will and predestination, the attributes of God, the nature of the Qur’ān, the imposition of the tasks of the law, the nature and extent of the hereafter, and so forth. The Mu’tazilī al-Zamakhsharī opts for interpretation based upon reason in his commentary *Al-kashshāf ‘an ḥaqā’iq ghawāmiḍ al-tanzīl* (The unveiler of the realities of the secrets of the revelation). Apparent contradiction between verses of the Qur’ān are resolved in favor of the Mu’tazilī doctrines of the unity and justice of God. Al-Bayḍāwī produced an edited version of the text by al-Zamakhsharī in his *Anwār al-tanzīl wa-asrār al-ta’wīl* (The lights of the revelation and the secrets of the interpretation), removing in the process most of the Mu’tazilī tendencies and compressing the material into an even more concise form. Al-Rāzī’s unfinished *tafsīr*, *Mafāṭīḥ al-ghayb* (The keys of the unknown), discusses the Qur’ān in terms of a rationalist philosophy which for the most part involved a rejection of the Mu’tazilī position and argued in support of orthodoxy. Humans, for al-Rāzī, are predetermined, and God’s freedom and power cannot be confined by human rationality.

Encyclopedist *tafsīr* works in the tradition of al-Ṭabarī also continue with writers such as Ibn Kathīr (d. 1373), al-Shawkānī (d. 1839), and al-Ālūsī (d. 1854). The opposite trend toward distillation reaches its peak, in popular terms, with the *Tafsīr al-Jalālayn* of Jalāl al-Dīn al-Suyūṭī (d. 1505) and Jalāl al-Dīn al-Maḥallī (d. 1459).

**SPECIALIZATIONS WITHIN CLASSICAL TAFSĪR.** While the all-encompassing commentary marks the highlight of exegetical activity in the classical period, the field of specialized Qur’ānic sciences was emerging at the same time, providing a number of subdisciplines within *tafsīr*. Some of these are continuations of the earliest developments; others arise under new impetuses. General compendia of information on these sciences arise in the discipline known as *‘ulūm al-Qur’ān* (“the sciences of the Qur’ān”), represented by such works as *Nukat al-intiṣār li-naql al-Qur’ān* (Gems of assistance in the transmission of the Qur’ān), by al-Bāqillānī (d. 1012); *Al-burbān fī ‘ulūm al-Qur’ān* (The criterion for the sciences of the Qur’ān), by al-Zarkashī (d. 1391); and *Al-ittiqān fī ‘ulūm al-Qur’ān* (The perfection about the sciences of the Qur’ān), by al-Suyūṭī. The topics gathered in these books are also subjects of separate monographs by a wide variety of writers; these topics include *naskh*, abrogation of legal passages of the Qur’ān; *asbāb al-nuzūl*, the occasions of revelation of individual verses and surahs of the Qur’ān; *tajwīd*, recitation of the Qur’ān; *al-waqf wa-al-ibtidā’*, pauses and starts in recitation of the Qur’ān; *qirā’āt*, variants to the text of the Qur’ān; *marṣūm al-khaṭṭ*, the writing of the Qur’ān; *ahkām*, the laws of the Qur’ān; *gharīb*, the strange or difficult words in the Qur’ān; *i’rāb*, the grammar of the

Qurʾān; *qīṣaṣ al-anbiyāʾ*, the stories of the prophets; and *iʿjāz*, the inimitability of the Qurʾān. As these topics indicate, it is indeed difficult to separate developed *tafsīr* from both legal concerns (*fiqh*) and grammar (*nahw*).

**SECTARIAN TAFSĪR.** Parallel to the development of mainstream Sunnī Muslim *tafsīr* in the classical period, works arose from various other Muslim groups, each pursuing its own particular sectarian aim and, once again, attempting to make the Qurʾān relevant to its own particular point of view and situation.

**Shiism.** For the Shīʿah in general, the authority of the imams who descended from ʿAlī ibn Abī Ṭālib was ultimate in matters of interpretation of the Qurʾān. While *ḥadīth* traditions circulated in Sunnī circles were generally accepted, this material was often supplemented or corrected on the authority of the imams. The category of the *mutashābihāt* was particularly useful to the Shīʿah, for a number of appropriate “unclear” verses could be understood as referring to ʿAlī and his family. Such verses were also useful for “discovering” stridently critical comments concerning the early leaders of the Muslim community, namely Abū Bakr (d. 634), ʿUmar, and ʿUthmān.

The earliest Ithnā ʿAshariyah or Twelver Shīʿī *tafsīr* in existence today appears to be the somewhat fragmentary commentary of ʿAlī ibn Ibrāhīm al-Qummī (d. tenth century) with the ascribed title *Tafsīr al-Qurʾān*; other prominent works include *Al-tibyān fī tafsīr al-Qurʾān* (The explanation in interpretation of the Qurʾān), by Muḥammad ibn al-Ḥasan al-Ṭūsī (d. 1067), and a major commentary which is a compendium of information comparable to that of al-Ṭabarī, *Majmaʿ al-bayān li-ʿulūm al-Qurʾān* (The collection of the explanation of the sciences of the Qurʾān), by Abū ʿAlī al-Ṭabarsī (d. 1153 or later).

Allegorical interpretation is favored in Shīʿī *tafsīr* as a process of looking for the “inner” meaning in many passages. The special way of applying this method is to find references to ʿAlī and his family, which, of course, serves to promote Shīʿī claims to power and legitimacy. For example, in al-Qummī’s *tafsīr*, the notion of Islam itself is defined not simply as submission to God but also as submission to the authority of the line of imams. The use of textual variation is also present in some works, although whenever the Shīʿah have been powerful in political affairs and fully institutionalized, such notions have generally been rejected as anti-status quo. This was already true to some extent in the eleventh century but became even more so with the rise of the Safavids in the sixteenth century. The specific argument occurred over whether some of the Qurʾān had been changed, or even omitted by ʿUthmān when he ordered its compilation, in order to undermine Shīʿī claims. Passages referring directly to ʿAlī had been erased, it was suggested. Al-Qummī argues, for example, that there are verses in the Qurʾān where “letters have been replaced by other letters,” and he says that there are places where “verses contradict what God has sent down” (that is, they contradict or at least do not support Shīʿī be-

liefs). Al-Ṭabarsī argues, however, that the only change that has occurred in the Qurʾān concerns the overall order of the text itself and not its contents. One common textual variant which does receive wide acceptance among Shīʿī commentators concerns the word *ummah* (“community”), which is believed to be properly read *aʿimmah* (“leaders”) or imams (*aʿimmah* being the plural of *imām* and having the same basic consonantal structure as *ummah*).

The Shīʿah, like the Muʿtazilah, looked to the Qurʾān for support of the rationalist theological doctrines that were a key element of their belief system: free will and the created Qurʾān. Their interpretational method, therefore, is similar to that employed by al-Zamakhsharī. The Ismāʿīliyah likewise employed the Qurʾān as a reference point for their theologizing; the group’s esoteric leanings, often characterized as extreme, are not witnessed in many texts but are found, for example, in the fragmentary *Mizāj al-tasnīm* (The condition of *tasnīm*) by Ismāʿīl ibn Hibat Allāh (d. 1760). In general, the Ismāʿīlī movement sees the outer meaning of the Qurʾān as only the symbol of the true inner meaning. The imam of the age, who has in him the true, full revelation, adapts the Qurʾān to the spiritual and mental condition of humanity through interpretation; eventually, people will be brought to the true and full meaning of the text, which is essentially the knowledge of the unity of God. Such is the presupposition with which all Ismāʿīlī *tafsīr* approaches the text.

The more recent Bahāʾī movement establishes its clear Islamic heritage through the existence of works of *tafsīr* written in Arabic by Sayyid ʿAlī Muḥammad al-Shīrāzī (1819–1850). Known as the Bāb, or “gate,” he claimed to have initiated a new prophetic cycle and became the focal point of the movement which developed later as the Bahāʾī. Among his works are commentaries on *sūrahs* 12, 108, and 113 of the Qurʾān. In general these are marked by a spiritualistic interpretation of eschatology, including the notions of paradise, hell, death, and resurrection, all of which are taken to refer to the end of the prophetic cycle as well as the end of the physical world (although the latter is recreated by God in each prophetic cycle).

**Sufism.** Directly related to Shīʿī *tafsīr* in general is Ṣūfī interpretation, which provides a mystical speculation upon the Qurʾān. This interpretation usually justifies itself through reference to mystical activities believed to have been practiced and supported by Muḥammad. Sahl al-Tustarī, mentioned above, probably represents the earliest example of this tendency. Abū ʿAbd al-Raḥmān al-Sulamī (d. 1012) compiled his *Ḥaqāʾiq al-tafsīr* (The truths of interpretation) from various Ṣūfī authorities and other important personalities. All of the material can be considered allegorical, since it is devoted to finding the inner meaning of each passage as it relates to the mystical quest. A typical example is found in the interpretation of sura 17:1, the classical reference to Muḥammad’s “night journey” to heaven, which is taken as a reference to each mystic’s ascent to the higher levels of con-

sciousness. Another prominent Ṣūfī, Abū Ḥamīd al-Ghazālī (d. 1111), did not write a commentary on the Qurʾān as such but found many occasions on which to record his approach to the text of scripture from the point of view of the intellectual Ṣūfī. For al-Ghazālī as for most other mystics, the Qurʾān works on two levels: the practical and the cognitive. The former applies to the inner self and its purification without neglect of the outer activities, while the latter is a meaning found through inner experience in light of mystical thought, and it can be reached only through firm knowledge of the practical or outer aspects. ʿAbd al-Razzāq al-Qāshānī (d. 1330?) compiled perhaps the most widely known Ṣūfī *tafsīr*, although it has often been mistakenly attributed directly to his teacher, the famous Muḥyī al-Dīn ibn al-ʿArabī (d. 1240), and thus is usually known under the title of *Tafsīr Ibn al-ʿArabī* (The interpretation of Ibn al-ʿArabī). As with al-Ghazālī, the outer principles of religion are not to be forgotten, although within the context of the *tafsīr* they certainly become submerged under allegorical interpretation, here seen in terms of the esoteric inner meaning as well as the symbolism of real events in the world.

**EMERGENCE OF MODERN TAFSĪR.** The rise of colonialism and the impact of Western thought in the eighteenth and nineteenth centuries certainly did not spell the end of *tafsīr* activity; in fact, at various times, the modern world has provoked more and more voluminous commentary upon the Qurʾān. Modern *tafsīr* is no different in basic impetus from its classical counterpart; it, too, desires to fit the text of scripture to the conditions of the era contemporary with the interpreter.

The impact of science has perhaps been the major factor in creating new demands and also the element of contemporary life to which much early modern *tafsīr* made its response. Muslims had not understood the true message of the Qurʾān, most modernists argued, and had therefore lost touch with the true scientific, rational spirit of the text. Out of this basic point several elements have emerged that unite all modernist interpretations: (1) the attempt is made to interpret the Qurʾān in the light of reason (“to interpret the Qurʾān by the Qurʾān,” as it is frequently phrased) rather than with all the extraneous material provided by tradition in the form of *ḥadīth* reports and earlier commentaries; “Back to the source” often becomes the motto of such approaches; (2) the attempt is made, through the expediency of interpretation, to strip the Qurʾān of all legendary traits, primitive ideas, fantastic stories, magic, fables, and superstition; symbolic interpretation is the primary means for such resolutions; (3) the attempt is made to rationalize doctrine as found in or as justified by reference to the Qurʾān.

The earliest focal point of modernist *tafsīr* activity arose in India. Shāh Walī Allāh (1703–1762) is often seen as the precursor of the Indian reformist movement, but that trend reached its true blossoming with the Indian civil servant and educator Sayyid Ahmad Khan (1817–1898), who wrote the first major explicitly modernist *tafsīr*, entitled simply *Tafsīr*

*al-Qurʾān*. His commentary was directed toward making all Muslims aware of the fact that Western influence in the world required a new vision of Islam, for Islam as it was actually practiced and believed in by most of its adherents would be seriously threatened by modern advances in thought and science. Where, therefore, was the true core of Islam to be found? How was its center to be defined? For Ahmad Khan, these questions were to be answered through reference to the Qurʾān, which, if it were properly understood through the use of the powers of reason, would provide the necessary answers. The basis of the required social and educational reforms, for example, were to be found in the Qurʾān. By returning to the source of Islam, the religion would be revitalized and the future would be secure.

In the Arab world, Muḥammad ʿAbduh (1849–1905), a vigorous champion of educational reform, also wrote a commentary on the Qurʾān, commonly called *Tafsīr al-Manār* (The interpretation of al-Manār), which was completed after his death by his pupil Rashīd Riḍā (1865–1935). Not overly modernistic in outlook, ʿAbduh’s *tafsīr* does, however, urge the moderate use of rationality in matters of theology and tries to demonstrate that the Qurʾān is to be read primarily as a source of moral guidance applicable to the modern situation. The spiritual aspect of the Qurʾān was most important to ʿAbduh, and he, like many commentators in the past, was quite prepared to leave certain matters in the Qurʾān unexplained and to concentrate on their mysteriousness rather than to suggest resolutions for interpretational difficulties.

This type of interpretation continues more recently in the Arab world, represented, for example, by the intellectual spokesman for the Egyptian Muslim Brotherhood, Sayyid Quṭb (1906–1959), who in his work *Fī zilāl al-Qurʾān* (In the shade of the Qurʾān) interprets the text according to his own particular ideological leanings. India, too, has produced many such commentaries; examples are Abū al-Kalām Azād (1888–1959), whose Urdu work *Tarjumān al-Qurʾān* (The interpretation [or translation] of the Qurʾān) emphasized the notion of the unity of humankind while its author faced the rising tide favoring the formation of Pakistan, and Abū al-ʿAlā Mawdūdī (1903–1979), the author of *Tafhīm al-Qurʾān* (The meaning of the Qurʾān), who uses the Qurʾān to establish a blueprint for a future Islamic society in Pakistan to be formed through his political party, Jamāʿat-i Islāmī.

The impact of Western science is perhaps the most notable aspect of modern commentaries. Both Ahmad Khan and ʿAbduh were intent on encouraging their compatriots to embrace the scientific outlook of the West in order to share in the progress of the modern world. Often this effort involved little more than simply stating that the Qurʾān enjoins its readers to seek and use rational knowledge, but at other times it also involved the historical claim that Islam had developed science in the first place and had then passed it on to Europe, so that in embracing the scientific outlook

in the present situation Muslims were only reclaiming what was truly Islamic. A more distinctive trend in *tafsir* emerges also, however, primarily in the person of Ṭanṭāwī Jawharī (1870–1940) and his twenty-six-volume work, *Al-jawāhir fī tafsīr al-Qurʾān* (Jewels in the interpretation of the Qurʾān). God would not have revealed the Qurʾān, so the argument goes, had he not included in it everything that people needed to know; science is obviously necessary in the modern world, so it should not be surprising to find all of science in the Qurʾān when that scripture is properly understood. Jawharī also makes reference to the classical notion of the miraculous character or inimitability of the Qurʾān (*iʿjāz*), which he takes to refer primarily to the content of the text in terms of its knowledge concerning matters which are only now becoming clear to humankind. Since the scientific knowledge contained in the text is proof of its miraculous character, references are found in the Qurʾān for numerous modern inventions (electricity, for example) and scientific discoveries (the fact that the earth revolves around the sun).

Western thought has also influenced *tafsir* in another way, although perhaps not so dramatically in terms of its popular acceptance as has “scientific” exegesis; the emergence of modern literary-philological-historical criticism has, thus far, played a fairly minor role but most certainly has found its supporters. ʿĀʾishah ʿAbd al-Raḥmān, a university professor in Morocco who writes under the name Bint al-Shāṭiʿ, represents a development of this line. This modern interpretation is not a resurrection of the philological type of commentary associated with al-Zamaksharī, for example, who, although he wrote with great critical acumen, is for most modernists too full of unnecessary material which is seen to be a hindrance to understanding in the modern world; rather, ʿAbd al-Raḥmān pursues a straightforward approach, searching for the “original meaning” of a given Arabic word or phrase in order to understand the Qurʾān in its totality. This process does not involve the use of material extraneous to the Qurʾān itself, except perhaps for the use of a small amount of ancient poetry, but rather it uses the context of a given textual passage to define a word in as many overall contexts as it occurs. Neither the history of the Arabs nor that of the biblical prophets nor scientific topics are to be found in the Qurʾān because providing such material is not seen to be the task of the text. The purpose of the narrative elements of the Qurʾān is to provide moral and spiritual guidance to the believers, not to provide history or “facts.” Within the Muslim world, the attempt to demythologize scripture—as in this approach—marks the beginnings of an incorporation of a type of modern critical scholarship developed in the context of biblical studies; its future at this point, however, remains uncertain.

#### BIBLIOGRAPHY

On the principles of interpretation there is little material available specifically for the Muslim context; works on Jewish *midrash*

are, however, most useful. Reference should be made to Géza Vermès’s “Bible and Midrash,” in volume 1 of *The Cambridge History of the Bible*, edited by Peter R. Ackroyd and C. F. Evans (Cambridge, 1970); this essay has been reprinted in Vermès’s *Post-Biblical Jewish Studies* (Leiden, 1975). Also see Renée Bloch’s “Midrash,” in volume 5 of the *Supplement au dictionnaire de la Bible*, edited by Louis Pirot and others (Paris, 1957); an English translation by Mary Howard Callaway has been published in *Approaches to Ancient Judaism*, edited by William S. Green (Missoula, Mont., 1978).

Four books are fundamental to the modern study of *tafsir*: *Die Richtungen der islamischen Koranlegung* (Leiden, 1920), a collection of Ignác Goldziher’s lectures delivered in 1913, has yet to be replaced as a general overview of the subject; Theodor Nöldeke’s *Geschichte des Qorāns*, vol. 2, *Die Sammlung des Qorāns*, 2d ed. (Leipzig, 1919), contains, especially on pages 123–192, much valuable and basic material; John Wansbrough’s *Quranic Studies: Sources and Methods of Scriptural Interpretation* (Oxford, 1977) is essential to the study of the formation and early development of *tafsir* and to all discussions of terminology and genres of exegetical literature; volume 1 of Fuat Sezgin’s *Geschichte des arabischen Schrifttums* (Leiden, 1967) records most of the known Arabic works of *tafsir* up to the fifth century AH.

Jane I. Smith’s *An Historical and Semantic Study of the Term “Islām” as Seen in a Sequence of Qurʾān Commentaries* (Missoula, Mont., 1975), discusses the works of seventeen exegetes on specific verses of the Qurʾān and at the same time provides useful introductions to the lives and works of the individuals. On Ṣūfī *tafsir* two excellent works exist: Paul Nwyia’s *Exégèse coranique et langage mystique* (Beirut, 1970) and Gerhard Böwering’s *The Mystical Vision of Existence in Classical Islam: The Qurʾānic Hermeneutics of the Ṣūfī Saḥl al-Tustarī, d. 283/896* (New York, 1980). The latter discusses both textual and thematic matters in exemplary fashion.

Modern *tafsir* has been analyzed by J. M. S. Baljon in *Modern Muslim Koran Interpretation, 1880–1960* (Leiden, 1961) and by J. J. G. Jansen in *The Interpretation of the Koran in Modern Egypt* (Leiden, 1974); both works provide basic yet informative overviews of the subject and bring Goldziher’s work up to the present day.

Not many works of *tafsir* have been translated, primarily because of their overly technical nature. Helmut Gätje has compiled extracts from various exegetes and arranged them thematically for the use of students in his *Koran und Koranexegese* (Zurich, 1971), translated by Alford T. Welch as *The Qurʾān and Its Exegesis* (Berkeley, 1976). Full works of *tafsir* which have been translated are very few: *The Tales of the Prophets of al-Kisāʾī*, translated by Wheeler M. Thackston (Boston, 1978), a book of the *qīṣaṣ al-anbiyāʾ* genre, and *The Recitation and Interpretation of the Qurʾān: Al-Ghazālī’s Theory*, translated by Muhammad A. Quasem (London, 1982), are two worthwhile texts. Attention should be paid to *The Life of Muhammad: A Translation of Ishaq’s “Sīrat Rasūl Allāh”* (1955; reprint, Lahore, 1967), by Alfred Guillaume for the passages of early *tafsir* which are contained in it; reference to these is, however, unfortunately not facilitated by an index of Qurʾānic verses in the translation. Translations of two chapters from the *Tafsir* of al-Bayḍāwī are available. These are primarily intended for students of Arabic, since the dis-

cussion frequently tends to revolve around the sense of a given Arabic word or grammatical construction; *Bayḍāwī's Commentary on Surah 12 of the Qur'ān*, edited by A. F. L. Beeston (Oxford, 1963), is the most accessible of such texts. Modern *tafsīr* has not been served well by translation either, although the following are available: *The Meaning of the Qur'ān*, 8 vols., translated by A. A. Maududi (Lahore, 1967–1979); Abū al-Kalām Āzād's *Tarjumān al-Qur'ān*, 2 vols., translated and edited by Syed Abdul Latif (New York, 1962–1967), and Sayyid Quṭb's *In the Shade of the Qur'ān*, translated by M. A. Salahi and A. A. Shamis (London, 1979).

Further bibliography on *tafsīr* can be found in my article "The Present Status of *Tafsīr* Studies," *Muslim World* 72 (July–December 1982): 224–238.

ANDREW RIPPIN (1987)

**TAFTĀZĀNĪ, AL-** (AH 722–791? / 1322–1389 CE), more fully Sa'd al-Dīn Mas'ūd ibn 'Umar al-Taftāzānī; master of a range of intellectual disciplines including theology, philosophy, metaphysics, logic, grammar, and rhetoric, as well as fundamental principles of jurisprudence and Qur'anic exegesis. Born in Taftāzān, Khorasan, he is renowned for the breadth and quality of his scholarship, though little is known about his personal life. His writing career started at the age of sixteen, and before his death his works were known and studied from the eastern part of the Muslim world to Egypt in the West. Al-Taftāzānī's eminence in scholarship was noticed and recognized in his lifetime by the Mongol rulers, especially the famous Timur Lenk (Tamerlane), by whom he was personally honored.

Al-Taftāzānī's best-known work is probably his commentary on the creed of al-Nasafī (d. 1142 CE), *Sharḥ al-'aqā'id al-Nasafīyah*, still studied in major Muslim seminaries. His work on the fundamental principles of Islamic law, *Sharḥ al-talwīḥ 'ala al-tawḥīd li-matn al-tanqīḥ fī uṣūl al-fiqh*, was published in Beirut in 1983. Because he wrote commentaries on Ḥanafī as well as Shāfi'ī works of jurisprudence his biographers differed as to which school of law he belonged to. The same was true in terms of his theological position. His commentary on al-Nasafī's *'Aqā'id* (written in 1367) led some to consider him a Matūrīdī in view of his apparent espousal of their doctrines: for example, he viewed creation (*takwīn*) as eternal and an essential attribute of God, accepted the doctrine of free will, viewed the Qur'ān as an expression of God's eternal self-speech (a position also adopted by the later Ash'arīyah), and rejected the possibility of actually seeing God in the afterlife. Despite these apparent Mātūrīdī leanings, his *Maqāsid* and *Sharḥ al-Maqāsid* (written in 1383) reveal him to be an Ash'arī. Clearly his was a mediating position in which he demonstrated independence of thought and a resistance to legal or doctrinal classification.

WADI Z. HADDAD (1987)

**TAGORE, RABINDRANATH** (1861–1941), poet, novelist, playwright, composer, and spiritual leader, is best known as the winner of the 1913 Nobel Prize for Literature and one of India's greatest modern poets. Yet he was also a complex figure who embodied many of the deepest religious and political tensions of late colonial India. As his friend E. J. Thompson described him, Tagore had a kind of dual soul, torn between his love of solitude, contemplation, and art and his commitment to social action (Thompson, 1921).

Born in Kolkata to a wealthy Bengali Brāhmaṇ family, Tagore was the son of Debendranath Tagore, a leader in the influential Hindu reform movement known as the Brāhma Samāj and a key figure in the "Bengal Renaissance" of the nineteenth century. Although he later became critical of the movement, the universalistic and humanistic ideals of the Brāhma Samāj had a lasting impact on Rabindranath Tagore's thought.

Tagore was a poet from an early age, composing his first piece at age eight. He was not, however, a spirit to be restrained by conventional educational institutions, and he left school at fourteen to study at home. Though a lover of the great Sanskrit poets like Kalidasa and the devotional lyrics of the Bengal Vaiṣṇavas, Tagore was also deeply influenced by nineteenth-century English poets, perhaps above all by the English romantics like John Keats and Percy Bysshe Shelley, whose reverence for nature and ideal of the creative artist can be seen throughout Tagore's work.

In 1890 Tagore took charge of the family estates in Shelidah (modern Bangladesh), where he came to admire the simple daily life, natural beauty, and folk culture of rural Bengal. Here he also first came into contact with the Baūls, a group of wandering spiritual "madmen" who reject the outward trappings of institutional religion and instead seek the indwelling "man of the heart," the elusive presence of the divine that dwells within every human body. The Baūls' iconoclastic "religion of man" (*manusher dharma*) had a lasting in-

fluence on Tagore's spiritual ideals. Called by some the "greatest of the Baūls," Tagore was a key figure in the popularization of Baūl music and spirituality as an icon of Bengali folk culture.

Tagore described his own spiritual vision as a "religion of the artist." Rejecting the rigidity and superficiality of institutional religions, including that of the Brāhmo Samāj, he based his "poet's religion" on a vision of the creative unity among God, humanity, and nature. Just as the One Divine Creator manifests himself in the infinite forms and beauty of nature, so too the individual artist reflects that diversity and returns it to divine unity through poetry, music, and art.

Tagore's literary output is astonishing in its breadth and diversity. In addition to poetry in various genres, he wrote novels, short stories, essays, political articles, and songs while also composing music and painting. He began translating his works into English, and his first attempt, *Gitanjali* (Song offerings; 1913), won the Noble Prize for Literature in 1913. Praised by W. B. Yeats as lyrics "expressing in thought a world I have dreamt of all my life," these songs helped give Tagore an international reputation and introduced Bengali literature to the world (Yeats 1913: xiii).

Unfortunately Tagore has so often been subject to hagiography and aesthetic idealization that it is often forgotten that he was, in his early life, also deeply involved in nationalist politics. As an active participant in the Swadeshi (Our Country) movement, he played an important role in the struggle for independence from British rule in the years up to 1907. He, however, grew disillusioned with the elitism and increasing violence of the movement and so gradually retreated from the political sphere into the inner domain of poetry, art, and spirituality.

This profound disillusionment with the violence of the nationalist movement and the retreat into an inner realm of spirituality is poignantly expressed in his novel *The Home and the World* (*Ghare-bāire*; 1919). One of Tagore's darkest works, it centers on the terrorist violence of 1907 and the ultimate failure of violent revolt as a means to independence. At the same time it also expresses Tagore's own ambivalent status, torn between home and world, between the inner realm of art and spirituality and the outward realm of public action.

Even after his withdrawal from political action Tagore continued to speak on social and political issues, if only in a sort of "antipolitical" way. In 1917, shocked by the horrors of World War I, Tagore also delivered a series of lectures in Japan and the United States that leveled a scathing attack on the "madness of nationalism" (Kopf 1979: 301). A monstrous and dehumanizing force spreading through the globe, nationalism had in Tagore's eyes only succeeded in stripping human beings of their individuality and ended in violent self-destruction.

In addition to his importance as a poet, artist, and political figure, Tagore was also deeply concerned with education.

He founded Shantiniketan (the "abode of peace"), one of India's most original examples of alternative pedagogy. Dis-mayed by the stifling structures of traditional education in British India, Tagore turned instead to the model of the *tapovanas* or forest hermitages. Classes at Shantiniketan were held outdoors, in the shade of trees, emphasized the arts, and fostered the ideal of creative unity central to Tagore's own philosophy.

Tagore's influence remains evident in contemporary India not only in his homeland, where he is a cultural icon, but throughout the country and beyond. The composer of the national anthems of both India and Bangladesh, he is also one of the most widely published authors of the twentieth and twenty-first centuries. However, perhaps his most lasting relevance lies in his encounters with religious violence and terrorism in colonial India. His reflections on the "madness of nationalism" are no less relevant for the twenty-first century, as religious violence has by no means ended but arguably only grown more intense and destructive. It is more than a little ironic that the same country that sings his lyrics in its national anthem should remain torn by the very religious nationalism that Tagore so deplored.

#### BIBLIOGRAPHY

Tagore's works exist in many editions and translations, among them the Oxford Tagore translations (Oxford, U.K., 2002–2004) and the Rabindranath Tagore Omnibus (New Delhi, 2003). A thorough biography of Tagore in English is Krishna Dutta and Andrew Robinson, *Rabindranath Tagore: The Myriad-Minded Man* (New York, 1995). Older works include Edward John Thompson, *Rabindranath Tagore: His Life and Work* (Calcutta, India, 1921); and Krishna Kripalani, *Rabindranath Tagore: A Biography* (Calcutta, India, 1980). Useful discussions of Tagore's role in modern Indian religion and politics include David Kopf, *The Brahmo Samaj and the Shaping of the Modern Indian Mind* (Princeton, N.J., 1979); Stephen N. Hay, *Asian Ideas of East and West: Tagore and His Critics in Japan, China, and India* (Cambridge, U.K., 1970); and Hugh B. Urban, *Tantra: Sex, Secrecy, Politics, and Power in the Study of Religion* (Berkeley, Calif., 2003), chap. 3.

HUGH B. URBAN (2005)

**ṬĀHIRAH** SEE QURRAT AL-'AYN ṬĀHIRAH

**TAI CHEN** SEE DAI ZHEN

**T'AI-CHI** SEE TAIJI

## T'AI-HSÜ SEE TAIJU

**TAIJI.** In the *Yi jing* (Book of Changes; a wisdom book in ancient China that is widely believed to have been a major source of inspiration for Confucianism and Daoism), the term *Taiji* (“great ultimate”) signifies the origin and ground of Heaven and earth and of all beings. It is the Great Ultimate that is said to engender or produce yin and yang, the twin cosmic forces, which in turn give rise to the symbols, patterns, and ideas that are, indeed, forms of yin and yang. The interaction of the two modalities of these cosmic forces bring about the eight trigrams that constitute the basis of the *Yi jing*. Combining any two of the eight trigrams, each of which contains three broken (yin) and three unbroken (yang) lines, forms one of the sixty-four hexagrams. These are taken as codes for all possible forms of change, transformation, existence, life, situations, and institutions both in nature and in culture. The Great Ultimate, then, is the highest and the most fundamental reality, and is said to generate and underlie all phenomena.

However, it is misleading to conceive of the Great Ultimate as the functional equivalent of either the Judeo-Christian concept of God or the Greek idea of Logos. The Great Ultimate is neither the willful creator nor pristine reason, but an integral part of an organic cosmic process. The inherent assumption of this interpretation is that the universe is in a dynamic process of transformation and, at the same time, has an organic unity and an underlying harmony. The universe, in Joseph Needham’s understanding, is well-coordinated and well-ordered but lacks an ordainer. The Great Ultimate, so conceived, is a source or root, and is thus inseparable from what issues from it.

It was the Song-dynasty neo-Confucian master Zhou Dunyi (Zhou Lianxi, 1017–1073) who significantly contributed to the philosophical elaboration of the notion. In his *Taijitu shuo* (Explanation of the diagram of the Great Ultimate), strongly influenced by the cosmology of the *Yi jing*, Zhou specifies the cosmic process as follows: the Great Ultimate through movement and tranquility generates the two primordial cosmic forces, which in turn transform and unite to give rise to the Five Agents or Five Phases (*wuxing*, water, fire, wood, metal, and earth). When the five vital forces (*qi*), corresponding to each of the five “elements” (agents or phases), interact among themselves and reach a harmonious order, the four seasons run their orderly course. This provides the proper environment for the Five Agents to come into “mysterious union.” Such a union embraces the two primordial cosmic forces, the female and the male, which interact with each other to engender and transform all things. The continuous production and reproduction of the myriad things make the universe an unending process of transformation. It is in this sense, Zhou Dunyi states, that “the Five Agents constitute a manifestation of *yin* and *yang*, and *yin* and *yang* constitute a manifestation of the Great Ultimate.”

This is the basis for the commonly accepted neo-Confucian assertion that the Great Ultimate is embodied both singly by each thing and collectively by all things.

It has been documented that Zhou’s *Taijitu shuo* grew out of a long Daoist tradition. Indeed, it is believed that Zhou received the diagram itself from a Daoist master: Daoist influences are evident even in his explanatory notes. His introduction of the term “the Non-Ultimate” or “the Ultimate of Non-being” (*wuji*) generated much controversy among Song and Ming dynasty Confucian thinkers because the notion “non-ultimate” or “non-being” seems closer to the Daoist idea of nothingness than the Confucian concept that the human world is real. However, by defining human spirituality in terms of the notion that it is “man alone who receives the cosmic forces and the Five Agents in their most refined essence, and who is therefore most sensitive,” Zhou clearly presents a philosophical anthropology in the tradition of Confucian humanism.

A similar attempt to read a humanist message into the seemingly naturalistic doctrine of the Great Ultimate is also found in the writings of Shao Yong (Shao Kangjie, 1011–1077), perhaps one of the most metaphysical Confucian masters of the Song dynasty. Shao’s cosmology is presented as the numerical progression of the one to the many: “The Great Ultimate is the One. It produces the two (*yin* and *yang*) without engaging in activity. The two (in their wonderful changes and transformations) constitute the spirit. Spirit engenders number, number engenders form, and form engenders concrete things” (Chan, 1969, pp. 492–493). Shao further maintains that the human mind in its original state is the Great Ultimate. If one’s mind can regain its original calm, tranquility, and enlightenment it has the capacity to investigate principle (*li*) to the utmost. The mind can then fully embody the Great Ultimate not only as the defining characteristic of its true nature but also as an experienced reality, a realized truth. This paradoxical conception that the Great Ultimate is part of the deep structure of our minds but that it can be fully realized only as a presence in our daily lives is widely shared among neo-Confucian thinkers.

Zhu Xi (1130–1200), in a rationalist attempt to provide an overall cosmological and metaphysical vision, defines the Great Ultimate as “nothing other than principle,” or, alternately, as “merely the principle of Heaven and earth and the myriad things.” Perhaps inadvertently, Zhu Xi restricted the Great Ultimate so as to acknowledge its function as the ground of all beings but not necessarily its role in the generation of the universe. However, there is fruitful ambiguity in Zhu Xi’s position. In response to the challenging question as to whether the Great Ultimate must split into parts to become the possession of each of the myriad things, Zhu Xi employed the famous Buddhist analogy of moonlight scattered upon rivers and lakes. That there is only one moon in the sky does not prevent its being seen everywhere without losing its singularity and wholeness. Zhu Xi further depicts the Great Ultimate as having neither space nor form. The

Great Ultimate, although symbolizing the principle of activity and tranquility, is not directly involved in the creative transformation of the universe. Nevertheless, like Zhou Dunyi and other neo-Confucian thinkers, Zhu Xi insisted that the truth of the Great Ultimate must be personally realized through moral self-cultivation: the truth of the Great Ultimate is not simply knowledge about some external reality but a personal knowledge rooted in self-awareness in the ethico-religious sense.

In the folk tradition, the symbol of the Great Ultimate carries a connotation of mysterious creativity. The spiritual and physical exercise known as *Taiji quan* (a form of traditional Chinese shadowboxing) is still widely practiced. This slow, firm, and rhythmic exercise disciplines the body and purifies the mind through coordinated movements and regulated breathing. It is a remarkable demonstration that cosmological thought can be translated into physical and mental instruction for practical living without losing its intellectual sophistication. After all, in the Chinese order of things, to know the highest truth is not simply to know about something but to know how to do it properly through personal knowledge.

TU WEI-MING (1987)

**TÁIN BÓ CUAILNGE** (The cattle raid of Cuailnge) is the longest and the most famous of the early Irish heroic tales. It exists in three recensions. The first of them is preserved in *Lebhor na hUídhre* (The book of the dun cow), dated circa 1100 CE, and in the Yellow Book of Lecan, a late fourteenth-century manuscript. The second is preserved in the Book of Leinster, written in the mid-twelfth century, and the third in two manuscripts of the fifteenth and sixteenth centuries. However, as with many other early Irish tales, the date of the earliest extant manuscript provides only a *terminus ante quem* for the first recording as well as for the composition of the text, and even in the first recension of *Táin Bó Cuailnge* there are several linguistic strata which make it possible to trace the earlier written history of the tale back to the seventh or eighth century. This recension seems to have

been compiled about the middle of the eleventh century from at least two variant written versions dating from about the ninth century, but may also have drawn upon sources in oral tradition. On linguistic and other grounds Rudolf Thurneysen (1921) concluded that the saga may have been recorded for the first time in the middle of the seventh century. Moreover, there is a poem composed not later than the seventh century in which the supernatural woman Scáthach addresses the principal hero of *Táin Bó Cuailnge*, Cú Chulainn, and foretells, cryptically and laconically, some of the main events of the tale; but whether the poet was drawing upon an oral tradition or a written version of the tale is uncertain.

In its extant form, the story tells of an attack on the province of Ulster organized by Ailill and Medhbh, king and queen of Connacht, and supported by the rest of Ireland. The object of the attack is to carry off the great bull of the Ulster people, the Donn Cuailnge (“the brown bull of Cuailnge”). Such was the prestige of *Táin Bó Cuailnge* in early medieval Ireland that it generated an extensive complex of ancillary tales and traditions and came to be accepted by native men of learning as the classic statement of the heroic ethos.

As it stands, the saga reflects something of Irish political conditions at the beginning of the historical period (fifth century) or earlier, but some scholars have suggested that its original theme was the rivalry of two bulls. The background to this rivalry is given in a separate tale: the bulls had formerly been magical swineherds who had quarreled and passed through a series of metamorphoses before reaching their actual form. Bruce Lincoln has argued that the account of the fight between the bulls at the end of *Táin Bó Cuailnge* is a reflex of an Indo-European cosmogonic myth: “a man . . . and a bull . . . are killed and dismembered, and from their bodies the world is constructed” (*Priests, Warriors, and Cattle*, Berkeley, 1981, pp. 86–92). However, several difficulties remain to be resolved before this attractive hypothesis can be accepted.

- O’Rahilly, Cecile, ed. *Táin Bó Cuailnge: Recension I*. Dublin, 1976. This and the preceding entry refer to the two main recensions of the saga. Both recensions provide an introduction and translation.
- Thurneysen, Rudolf. *Die irische Helden- und Königsage bis zum siebzehnten Jahrhundert*. 2 vols. (Halle, 1921). See pages 96ff. This is the classic study of *Táin Bó Cuailnge* and the Ulster cycle in general. The approach is predominantly textual and philological; the main shortcoming is its inadequate comprehension of the oral and mythological dimensions of early Irish literary tradition.

PROINSIAS MAC CANA (1987 AND 2005)

**TAIPING** (“great peace” or “great equity”) denotes a pan-Chinese social ideal and utopian slogan of rebels and dynasty founders. *Ping* (“level, balanced, just, harmonious”), *daping* (“great peace”), or *taiping* (“supreme peace”) first appear in Confucian texts of the pre-Han (pre-206 BCE) era. There these terms denoted the ideal state of the world that had existed in high antiquity and that could again be brought about by a sage ruler who practiced the proper rites and music (*Daxue, Li ji*). The term never implied social equality in a modern sense but rather referred to a society where, as Xunzi defined it, each individual occupies the place that he should and fulfills his task according to his capacities. At the same time, Great Peace was not limited to human society but denoted a cosmic harmony that resulted in a seasonal climate, plentiful harvests, and longevity of all living beings (*Chunqiu fanlu, Yantie lun*). It was a state in which all the concentric spheres of the organic Chinese universe, which contained nature as well as society, were perfectly attuned, communicated with each other in a balanced rhythm of timeliness, and brought maximum fulfillment to each living being.

During the Han dynasty (206 BCE–220 CE), Great Peace became the social ideal of the official Confucian state doctrine (which it remains to this day). However, when the Han declined, “Great Peace” became the slogan also of popular movements of revolt inspired by Daoism. Daoism had earlier found a place for the concept in its own philosophy. The Daoist philosopher Zhuangzi (fourth century BCE) had called a government that conformed to the order of nature *taiping*, an idea that was in no contradiction to the Confucian definition of the term. The Daoist popular movements were opposed not to the ideal of Great Peace but to the dynasty that subscribed to it and had failed to bring it about. Thus, *taiping* cannot be called a “revolutionary” ideal, although two of the greatest social upheavals in Chinese history are called Taiping rebellions.

Twice during the Han period, a group of *fangshi* (“masters of [esoteric] techniques”) presented at court a *Taiping jing* (Classic of Great Peace). It was rejected because of its Daoist tenor. This or a similar *Classic of Great Peace* became the sacred scripture of the first Taiping or “Yellow Turban” Rebellion (184 CE), which eventually brought down the Han empire. This scripture, still extant in a revised version (probably sixth century), elaborates the messianic element in the Taiping tradition: the Great Peace that the princes of high antiquity brought about through a Daoist government of “nonintervention” (*wuwei*) is a state that will be recreated in the near future as a result of revelations by a divine messenger called Celestial Master (Tianshi). The religious originality of this view lies in its substitution of the Confucian virtues and rites with Daoist spiritual exercises and other methods of longevity as the means by which to reach Taiping.

The rebellion of 184 was crushed, but it engendered a messianic ideology that flourished during the Period of Disunion (220–581), was rekindled in all subsequent periods of

upheaval, and formed the basis of Daoist as well as Buddhist messianism and eschatology in China. This Taiping ideology centered around the expectation that a divine or human sage ruler, the Perfect Lord of Great Peace (Taiping Zhenjun), emissary of Heaven, will appear on a prophesied date at the height of a period of cosmic chaos and human suffering. He will save the elect (*zhongmin*, the “seed people”) from the demonic forces sent to destroy all evildoers, and will usher in the reign of Great Peace (as related in the *Dongyuan shenzhou jing*). Even in this religious setting, the messianic kingdom is often no more and no less than a glorious new Chinese dynasty, although in some Daoist traditions it is developed into a paradisiacal utopia.

Dynasty founders, especially those of the Tang, 618–906, and the Ming, 1368–1644, tapped this messianic tradition by casting themselves in the role of the sage ruler of Taiping. Ten times in Chinese history Taiping was chosen as the name of a reign period (*nianhao*). Emperor Taiwu of the Northern Wei called both himself and a period of his reign (440–452) “Perfect Lord of Great Peace.”

The second Taiping rebellion (1850–1865) was the most powerful of several great uprisings toward the end of the Manchu dynasty. In 1851, the visionary rebel leader Hong Xiuquan (1813–1864) from Canton proclaimed the Heavenly Kingdom of Great Peace (Taiping Tianguo) with himself as Emperor of Great Peace (Taiping Tianzi). His religion was a combination of Chinese traditions with many elements from Protestant Christianity (monotheism, ten commandments, Sunday worship, iconoclasm, condemnation of “Chinese idol-worship”). Hong called himself the younger brother of Jesus Christ. God had endowed him with imperial legitimation (in the shape of a seal), with the (Daoist) power to kill demons (a sword), and with divine scriptures (revelation in Chinese religion is always in the form of writing). The Taiping theocracy established in Nanjing was destroyed in 1864, but the Taiping ideal lives on in Daoism and in most of the modern Chinese syncretist religions.

**TAIWANESE RELIGIONS.** The term *Taiwanese religions* is used here to describe the religious beliefs and practices of the people who inhabit Taiwan, regardless of their ethnic or sub-ethnic backgrounds. Taiwan has long been recognized for its diverse range of religious traditions. As different groups of Taiwanese have attempted to find meaningful ways to confront life crises, social disorder, natural disasters, and a sense of injustice, they have created a wide range of beliefs and practices, each with its own distinctive background and characteristics. This diversity befits Taiwan's historical development as an island situated in a key commercial and strategic location, and justifies the use of the plural form in considering its religious traditions.

**HISTORICAL OVERVIEW.** Taiwan was first settled by Aboriginal peoples of Austronesian (Malayo-Polynesian) origin, with significant immigration from the Chinese mainland only beginning by the seventeenth century. During the Qing dynasty (1644–1911), the island was largely a frontier region that never became fully integrated into the Chinese empire. However, Han Chinese migrants brought their gods over from China, and worshipped them in various compatriot, territorial, and commercial temples. Various Chinese sectarian movements, as well as Christianity, also began to spread in developed areas of Taiwan, but it appears that no eminent Buddhist or Daoist figures came to the island at this time.

During the colonial era (1895–1945), when Taiwan was ruled by Japan, the island enjoyed a prolonged period of urbanization and industrialization, which laid a firm foundation for its economic development. Taiwanese religious traditions flourished during most of this era, despite policy shifts from *laissez-faire* (1895–1915) to regulation (1915–1930s) to efforts to co-opt Buddhism and Christianity while suppressing sectarian movements and temple cults under a “temple-restructuring” campaign enacted during the “Japanization” movement (1930s–1940s).

Taiwan became a province of the Republic of China (ROC) in 1945, and the Nationalist (Guomindang) government relocated to Taiwan in 1949 after its defeat in the Chinese civil war. Many prominent religious specialists followed the Nationalists over from China during these chaotic years, including eminent Buddhist monks, the Daoist Celestial Master (Tianshi), leaders of sectarian traditions such as the Way of Unity (Yiguan Dao), and Christian missionaries. More recently, Tibetan Buddhists and members of new Japanese religions have begun to proselytize in Taiwan. While the

state kept a close watch on these movements during the early decades of the postwar era, the end of martial law in 1987 marked the beginning of a new era of religious development.

At the beginning of the twenty-first century, Taiwan boasts one of the most dynamic religious environments in East Asia. In contrast with China, where religion is only gradually emerging from the shadow of long-term oppression by a totalitarian regime, Taiwanese religions are thriving and even expanding. Freedom of religion has always been guaranteed under the ROC Constitution, Article 13 of which clearly states, “the people shall have freedom of religious beliefs.” However, now that Taiwan has developed into a democracy, people can practice the religious tradition of their choice without fear of state suppression. Members of any religious faith are free to congregate and introduce their belief systems to others, while previously outlawed sectarian movements now operate openly and continue to expand. The legitimacy of Taiwan's religious traditions can also be seen in the formation of the Taiwan Association of Religious Studies, which was founded on April 18, 1999, and has attracted the membership of dozens of students, faculty, and religious specialists from both Taiwan and other countries.

Another striking facet of religion in Taiwan is that economic growth and technological development have not resulted in the decline of religious practice; on the contrary, many educated men and women who surf the web on a daily basis apparently feel no qualms about practicing religion, and many large religious organizations and temples have their own websites.

**ABORIGINAL RELIGIONS.** Taiwan's most venerable religious traditions are those of its Aboriginal peoples, who are usually classified by place of residence as Plains Aborigines and Mountain Aborigines. Long-term processes of acculturation and even assimilation have diluted the aborigines' religious traditions, which generally centered on ancestor worship, lifecycle rituals, and annual festivals. Moreover, numerous aborigines have converted to Christianity, especially Presbyterianism. Some Aboriginal beliefs and practices have survived, however, and are gaining increasing recognition from scholars and government officials. These religious traditions continue to play important roles in Aboriginal life, and also serve as a vital force in the reformation of aborigine identity.

**BUDDHISM.** Historical evidence indicates that no eminent Buddhist monks came to Taiwan during the Qing dynasty, although some monks did make the journey across the Taiwan Straits from southern China in order to help manage temples in Taiwan that were constructed by the state or local communities. During the colonial era, lay Buddhists and members of the *sangha* attempted to evade state control by actively cooperating with Japanese Buddhists. Some subordinated their sacred sites administratively to Japanese Buddhist lineages. Others formed religious associations that pledged their loyalty to the colonial authorities, including the Patriotic Buddhist Association, the Buddhist Youth Association, the Taiwan Friends of the Buddhist Way, and largest and per-

haps most important of all, the South Seas Buddhist Association. Nevertheless, Chinese Buddhist monastics managed to preserve many of their core beliefs and practices, and did not copy their Japanese brethren to the extent of getting married, eating meat, and drinking wine.

The postwar era has witnessed the growth of four prominent Buddhist organizations: the Buddhist Association of the Republic of China, which until the 1960s served as the state-approved and sole representative of Buddhists in Taiwan; the monastic order known as the Buddha's Light Mountain (Foguangshan), which was founded by Venerable Master Xingyun (Hsing-yun; b. 1927) and promotes a form of humanistic Buddhism advocated by the reformer Taixu (1890–1947); the Compassionate Relief Merit Society (Ciji gongdehui), which was founded in 1966 by Master Zhengyan (Cheng-yen; b. 1937) and has gained renown worldwide for its charitable works; and Dharma Drum Mountain (Fagushan), which was founded by Venerable Master Shengyan (Sheng-yen; b. 1930) and emphasizes the importance of meditation and self-cultivation. The number of lay Buddhists in Taiwan has also increased since the 1960s, but since most Taiwanese tend to identify themselves as “Buddhists” regardless of whether or not they have been initiated into this religious tradition, the exact number of practicing Buddhists in Taiwan is nearly impossible to quantify. One new development has been the growing influence of exiled Tibetan monks of the Tantric Buddhist sect, who have attracted a sizeable following in Taiwan since the 1980s. The Dalai Lama visited the island in 1997 and 2001.

**DAOISM.** Daoist practice can be bifurcated into monastic and nonmonastic traditions, both of which have played important roles in the history of Chinese religions. In Taiwan, however, the former tradition has almost no presence. The nonmonastic tradition is far more influential, especially the Celestial Master movement, the leader of which has the authority to bestow ordination registers on Taiwanese Daoist masters. A number of Daoist traditions that arose in southern China are also prevalent in Taiwan, including the Lüshan, Pu'an, and Sannai movements. Hoklo and Hakka masters from China's southern provinces of Fujian and Guangdong transmitted these different forms of Daoism to Taiwan during the eighteenth and nineteenth centuries, and scholars are only beginning to fully appreciate the variation in distribution and practice among Daoist masters belonging to different sub-ethnic groups, particularly in terms of their liturgical traditions.

After the sixty-third Celestial Master Zhang Enpu followed the Nationalist government into exile in 1949, he attempted to restructure Taiwanese Daoism by founding the Daoist Association of the Province of Taiwan and the Daoist Assembly of the Republic of China. However, these organizations have exerted only a limited influence on the Daoist movements mentioned above. Their liturgical traditions, including exorcistic and healing rites as well as mortuary rituals, are still frequently performed today, and Daoist masters

continue to play key roles in communal festivals, particularly those involving Daoist offerings (*jiao*; often referred to as “rites of renewal”).

**CHRISTIANITY AND OTHER FOREIGN RELIGIONS.** The first Christian missionaries arrived in Taiwan during the early years of the seventeenth century. These included Spanish Catholics who proselytized in the north and Dutch Protestants who proselytized in the south. However, they do not appear to have attracted many converts, and ended up being driven out of Taiwan by Koxinga (1624–1662). No subsequent missionizing efforts took place until the second half of the nineteenth century. Spanish Dominicans attempted to preach the gospel among Plains Aborigines in the hills and mountains of southern Taiwan, and educate catechists by opening a seminary and training school, but these efforts were largely unsuccessful until the early twentieth century. English and Canadian Presbyterians exerted a far more significant influence throughout Taiwan. Among the most renowned Presbyterian missionaries of that era were Dr. James L. Maxwell (1836–1921) and Dr. George L. Mackay (1844–1901). Both combined proselytizing and healing: Maxwell was an unordained medical missionary, while Mackay pulled teeth and built hospitals. Like the Dominicans, the Presbyterians were most successful in attracting converts among Taiwan's Plains Aborigines, and were unable to make any inroads in Mountain Aborigine communities until the 1930s. Despite initial slow growth and cases of persecution, the Presbyterians were able to gain a significant following for a number of reasons, including having women accompany their missionary husbands (which allowed them to interact far more freely with Han Chinese and Aboriginal women), printing Bibles that used a romanized form of Southern Min (Taiwan's main local dialect), and publishing a journal entitled *The Church News* beginning in July 1885. Now named the *Taiwan Church News*, this journal is still being published today, and may be the oldest church newspaper in East Asia. Education also played an important role in Presbyterian missionizing efforts, with the Tainan Theological College being formally founded in 1880, and middle schools and girls' schools being set up during the late nineteenth century as well.

Christianity flourished during much of the colonial era, as the Japanese were initially tolerant of a religion that they saw as representing Western modernity. The Dominicans founded the Blessed Imelda School for Girls in 1917 in Taipei, and also established catechist schools in central and southern Taiwan, as well as the Santa Infancia of Holy Childhood Orphanage in the south. In addition, Methodist evangelists like Dr. John Sung (1901–1944), who converted thousands of followers throughout Asia, proselytized in Taiwan. Japanese Christians also came to Taiwan, including members of the Japanese Anglican (Episcopal), Congregational, Methodist, and Presbyterian churches. The colonial era also witnessed the development of two indigenous Christian churches: the Holiness and the True Jesus.

The Presbyterians continued to build and manage hospitals, as well as the Happy Mount Leprosy Colony (founded in northern Taiwan in 1934). Presbyterian theological colleges in northern and southern Taiwan also thrived, while the Reverend William Campbell (1841–1921) founded a school for the blind in southern Taiwan in 1900 to 1901. Missionary efforts to preach the gospel were further facilitated by the on-going translation and publishing of scriptures in romanized Southern Min. Other dedicated evangelists like Campbell N. Moody (1866–1940), who preached in over 900 of 1,100 villages in one county, also proved instrumental to the continuing growth of the Presbyterian movement. Presbyterian leaders made great efforts to develop their church's self-sufficiency by training local clergy and establishing a united Presbyterian church (the Presbyterian Church of Taiwan). This took the form of a synod, with presbyteries in the north and south of the island serving as equal partners. This self-sufficiency helped the Presbyterian Church of Taiwan survive the difficult years of the late colonial and early postwar era.

During the 1930s, Christian believers engaged in a series of tense confrontations with the colonial authorities over politically charged issues such as whether Christians should worship at Shintō shrines. Roman Catholics decided to attend, and English Presbyterians acquiesced as well, but Canadian Presbyterians were adamant in refusing to take part. All Christian movements eventually lost control of schools and other church properties by the 1940s. Many foreign missionaries left Taiwan, while others were expelled; local Christians were harassed, and some detained. In 1943, all local churches were absorbed into the Japanese-run Christian Church of Taiwan, and many churches suffered during the Allied bombing of Taiwan. By the end of World War II, however, English and Canadian Presbyterian missionaries had begun to make plans to return to the island.

Taiwan's churches kept a low profile during the early years of the postwar era, particularly after the February 28 incident of 1947, during which thousands of Taiwanese were massacred by Nationalist forces intent on suppressing a local uprising. From 1965 to 1985, however, the Presbyterian Church of Taiwan began to publicly criticize the cultural policies of Taiwan's Nationalist government, while also advocating Taiwanese identity. The Presbyterian Church of Taiwan resisted attempts to promote Mandarin as a national language at the expense of local dialects, and continued to publish Bibles using Southern Min romanization, even after thousands of copies were confiscated. Some leaders, such as the Reverend Kao Chun-min, went to prison for their beliefs. At the same time, however, the Presbyterian Church of Taiwan and other churches managed to survive and even grow due to the Nationalist policy of opening Taiwan's doors to Western missionaries, including Anglicans, Baptists, Catholics (Jesuits, Vincentians, and the Catholic Missionary Society of America, also known as the Maryknoll Order), Jehovah's Witnesses, Lutherans, Methodists, Mormons, Pente-

costals (mainly members of the Assemblies of God), and the Unification Church. However, most missionaries belonging to these churches did not speak Southern Min, and unlike the Presbyterian Church of Taiwan made little headway outside of Taiwan's major cities. Indigenous churches also grew during the postwar era, particularly Holy Spirit, which belongs to the Pentecostal movement.

Christianity in Taiwan is thriving at the beginning of the twenty-first century. Roman Catholicism made a remarkable comeback in Taiwan after 1949, when multitudes of Catholic clergy and believers followed the Nationalists to the island, thereby infusing local Catholicism with new strength and vigor. According to government statistics, as of June 2001 there were 1,135 Catholic churches, 677 clergymen, and 664 foreign missionaries in Taiwan serving nearly 300,000 believers. By that same date, the Protestant congregation had expanded to approximately 605,000 members, with 3,609 churches, 2,566 ministers, and 1,087 foreign ministers. Of these, over 220,000 were members of the Presbyterian Church of Taiwan, which has begun to focus its efforts on social welfare and environmental protection. The Presbyterian Church of Taiwan was active in organizing relief efforts after the devastating earthquake on September 21, 1999, and the church worked alongside other Christian organizations, such as the Chinese Christian Relief Association, to help local communities engage in reconstruction efforts.

Other foreign religions in Taiwan include Islam, Judaism, Bahā'ī, Tenrikyō, and Mahikariyō. The largest of these is Islam. Approximately twenty thousand Muslims accompanied the Nationalist government to Taiwan in 1949, the majority of whom were soldiers, civil servants, or food-service workers. As of June 2001 Taiwan was home to approximately 53,000 Muslims, as well as thirty-four mullahs and six mosques.

**SECTARIAN RELIGIONS.** By the eighteenth century, sectarian movements composed mostly of lay Buddhist believers had begun to make their presence felt in Taiwan. Subsequently labeled "vegetarian religions" (*zhaijiao*) by the Japanese colonial authorities, these sects featured a membership of men and women who identified themselves as adhering to a form of Buddhism that exists apart from and is superior to that of the ordained Buddhist clergy. In terms of practice, believers generally perform a variety of Buddhist rituals, but adopt a strict diet that requires abstaining from meat and five types of pungent roots (onions, chives, leeks, scallions, and garlic). Many vegetarian sects became popular due to their willingness to perform rites for the dead, often at rates cheaper than those charged by ordained Buddhist and Daoist specialists. Some sects also featured latent millenarian doctrines, an issue that gained the attention of the colonial authorities after a millenarian-inspired uprising in 1915 known as the Xilai An Incident. In order to survive the subsequent crackdown, some members of vegetarian sects organized the Taiwan Buddhist Dragon Flower Association (*Fojiao Longhua hui*) in order to demonstrate their allegiance to the island's Japa-

nese overlords. Today, although many Taiwanese have adopted different forms of vegetarian diets, the overall influence of vegetarian movements is declining due to the rapid growth of the Buddhist organizations mentioned above.

The latter half of the nineteenth century was a period of rapid growth for other sectarian groups that practiced spirit-writing, published morality books, and congregated at sacred sites often referred to as “phoenix halls” (*luan tang*). Some scholars refer to such sects as “Confucian,” while some groups have not hesitated to use this term as an autonym. The question of exactly how “Confucian” these movements really are is difficult to resolve because this term has long been used to describe a wide variety of phenomena, including temples founded by state or local elites that are dedicated to the worship of Confucius, secular organizations that stress Confucian teachings, such as the Confucius-Mencius Society, and a wide range of sectarian groups, such as the Divine Teachings of the Confucian Tradition (*Ruzong shenjiao*). Modern sects in China and Taiwan have not hesitated to use the term *Confucian* to describe their tenets and practices, but for these groups, Confucianism includes unique and syncretic interpretations of key Confucian philosophical texts, as well as a distinctive liturgical style that differentiates them from other similar and hence competing groups.

Many sects that practice spirit-writing or publish morality books remain highly popular in Taiwan today. Perhaps the largest and best-known movement is the Way of Unity, which spread to Taiwan from China during the postwar era and features an eclectic religious doctrine that draws upon both traditional Chinese religious teachings and other major world religions like Christianity, Islam, Judaism, and Hinduism. Outlawed during the first decades of the postwar era, it is now a flourishing movement. According to government statistics, as of June 2001 there were 3,218 large or medium-sized Yiguan Dao temples in Taiwan, with 2,326 temple priests serving approximately 887,000 believers. However, these numbers may be somewhat inflated, and the Way of Unity has undergone a series of schisms during the postwar era, meaning that this data should not be seen as reflecting a single coherent religious movement. Other popular sectarian groups include Li-ism (Doctrine of Order), which like the Way of Unity was transmitted from China to Taiwan after 1949, as well as a wide range of groups generally referred to as “new religions” (*xinxing zongjiao*) that arose during the postwar era, particularly following the lifting of martial law. One of the best known of these groups is the Religion of the Yellow Emperor (*Xuanyuan jiao*), which was formally founded in Taiwan in 1957 by a legislator named Wang Hansheng. This sect attempts to promote Chinese nationalism, and preaches a syncretic philosophy combining elements of Confucianism and Daoism. Other charismatic yet controversial leaders, including Lu Shengyan, Miaotian, Qinghai, and Song Qili, have formed sectarian associations that have attracted large numbers of dedicated followers but have yet to eclipse more established religions in terms of numbers of believers and overall influence.

**COMMUNAL RELIGIOUS TRADITIONS.** Of Taiwan’s many various beliefs and practices, communal religious traditions centering on temple cults and festivals remain the most popular and the most prevalent. Temples continue to play an integral role in individual, family, and community life, and temple cults have retained their importance as sites for daily worship, community service, and massive festivals. Membership in a temple cult is ascriptive, and does not require any form of initiation, so it is impossible to accurately calculate the exact number of men and women who belong to communal religious traditions. However, every year hundreds of thousands of Taiwanese (including many members of the religious traditions discussed above) donate money to local temples and take part in their festivals.

Most deities worshipped in temple cults in Taiwan were transmitted to the island from China, but there are also cults to indigenous deities, particularly local heroes and the unruly dead. Taiwan’s most ubiquitous deity is the Earth God (*Tudi gong*), whose temples dot every urban and rural community. Other popular deities include Mazu (originally the goddess of the sea, now worshipped as an all-powerful protective deity) and the Royal Lords (*wangye*; originally plague deities, but now invoked to counter all manner of calamities). These and other deities are worshipped for their ability to provide health and prosperity, while their temples and festivals contribute to the formation of local social structures and a sense of identity.

One particularly fascinating phenomenon of the postwar era has been the steady popularity of cults associated with the unruly dead or eccentric deities, such as the Buddhist monk Crazy Ji (*Jigong* or *Jidian*), who gained renown for his spiritual powers despite a distinct penchant for eating meat, drinking wine, and hanging out with prostitutes. Such cults were extremely active during the Everybody’s Happy (*Dajia le*) lottery craze of the 1980s. The inauguration of a Lotto lottery in January 2002 has prompted a new wave of worship of Taiwan’s unruly gods, although the current fervor has been somewhat tempered by the fact that more and more Taiwanese are choosing to rely on computer programs to try to predict winning numbers.

Another important development is that temples are no longer strictly local entities, but now play important roles on the national stage as well. The Nationalist government actively attempted to discourage temple cults during the 1960s and 1970s (for example, in 1968, the Ministry of the Interior promoted a series of guidelines to regulate local religion entitled “Promoting Frugality in Folk Sacrifices”), a policy that only began to change during the 1980s and has now been almost completely abandoned. Today’s political elites increasingly appreciate the constructive roles temples play in Taiwanese society, and now limit any state intervention to sponsoring local festivals while also attempting to regulate their contents. In addition, the modernization of Taiwan’s infrastructure and liberalization of the mass media has resulted in popular pilgrimage sites being able to exert an island-wide influence.

At the same time, since Taiwan began to democratize during the 1980s, temple cults have been more than passive observers of modernization and changing state policies; they now play activist roles in community life by building libraries and community centers, sponsoring cultural activities, such as chess tournaments and classes in traditional fine arts, and engaging in a wide range of charities. Presidential and legislative candidates network with local elites and strive to attract grassroots support by campaigning at temples to popular local deities, while some aspiring politicians have attempted use temple cults to advance their own interests against those of the state. One example of the intense and also complex links between religion, politics, and identity in contemporary Taiwan involves the abortive attempt by a prominent Mazu temple known as the Zhenlan Gong to undertake a direct pilgrimage to the goddess's ancestral temple in Fujian during the spring and summer of 2000, a move that challenged the policies of the then newly elected government of President Chen Shui-bian.

The flourishing of Taiwan's many religious traditions should come as no surprise to those who have studied the history of Chinese culture during the late imperial and modern eras. Religious associations and their sacred sites have long constituted one of the most important public spaces in Asian societies, and have been key arenas where elites and representatives of the state vied to assert or reinforce their dominance over local culture and society. In Taiwan today, democratization has further enhanced the importance of religion in community life, and prompted representatives of the state to be more proactive in terms of interacting with the island's religious traditions. A similar process may be beginning in China, where local communities are slowly beginning to reassert their autonomy and religious networks are once again functioning as a second government in the sense of providing services and mobilizing the population. The extent to which the growth of local religious traditions may have a long-term impact on modern Chinese society remains to be seen, but the outpouring of new ethnographic work on China, as well as the continuing efforts of scholars researching Taiwan and Hong Kong, should give us a more comprehensive perspective on this issue in the future.

#### BIBLIOGRAPHY

A massive corpus of Chinese-language scholarship on Taiwanese religions has been published since the mid-1980s. Good introductions to this subject may be found in Chang Hsun and Jiang Tsann-terng, eds., *Taiwan bentu zongjiao yanjiu daolun* (Taipei, 2001), and Chang Hsun and Jiang Tsann-terng, eds., *Taiwan bentu zongjiao yanjiu de xin shiye ban xin siwei* (Taipei, 2003). Some Western-language works also provide valuable introductions to Taiwan's religious traditions, including Philip Clart and Charles B. Jones, eds., *Religion in Modern Taiwan: Tradition and Innovation in a Changing So-*

*ciety* (Honolulu, 2003); Paul R. Katz and Murray A. Rubinstein, *Religion and the Formation of Taiwanese Identities* (New York, 2003); and Robert P. Weller, *Alternate Civilities: Democracy and Culture in China and Taiwan* (Boulder, Colo., 1999). See also a special issue of *The China Quarterly* 174 (June 2003), edited by Daniel L. Overmyer, entitled *Religion in China Today*. Scholars can also keep up with developments in the field by visiting the websites of the Taiwan Association of Religious Studies ([tars.org.tw/tars.htm](http://tars.org.tw/tars.htm)) and the Society for the Study of Chinese Religions ([www.indiana.edu/~sscr](http://www.indiana.edu/~sscr)).

Those who wish to learn more about Taiwan's historical development before exploring its religious traditions should begin by consulting Murray A. Rubinstein, ed., *Taiwan: A New History* (Armonk, N.Y., 1999), which provides a fine overview of the island's history. Stevan Harrell and Huang Chun-chieh, eds., *Cultural Change in Postwar Taiwan* (Boulder, Colo., 1994) treats the island's recent cultural development, while Melissa J. Brown, *Is Taiwan Chinese? The Impact of Culture, Power, and Migration on Changing Identities* (Berkeley, 2004) considers important issues of ethnicity and identity. Useful background information about Taiwan may also be found on the Formosa website prepared by the Reed Institute ([academic.reed.edu/formosa/formosa\\_index\\_page/formosa\\_index.html](http://academic.reed.edu/formosa/formosa_index_page/formosa_index.html)), as well as on Taiwan's Government Information Office website ([www.gio.gov.tw/taiwan-website/index.html](http://www.gio.gov.tw/taiwan-website/index.html)).

Those wishing to begin their research by reading relevant secondary literature should consult the following bibliographies: Laurence G. Thompson, *Chinese Religion in Western Languages: A Comprehensive and Classified Bibliography of Publications in English, French, and German through 1980* (Tucson, Ariz., 1985); Laurence G. Thompson and Gary Seaman, *Chinese Religions: Publications in Western Languages, Vol. 2: 1981–1990* (Ann Arbor, Mich., 1993); Thompson and Seaman, *Chinese Religions: Publications in Western Languages, Vol. 3: 1991–1995* (Ann Arbor, Mich., 1998); and Thompson, Seaman, and Zhifang Song, *Chinese Religions: Publications in Western Languages, Vol. 4: 1996–2000* (Ann Arbor, Mich., 2002). Another key source of information is the bibliography prepared by Philip Clart ([web.missouri.edu/~religpc/bibliography\\_CPR.html](http://web.missouri.edu/~religpc/bibliography_CPR.html)), which is updated on a regular basis. For a thorough bibliography of Chinese-language and Japanese-language scholarship, see Lin Meirong, ed., *Taiwan minjian xinyang yanjiu shumu (zengding ban)*, rev. ed. (Nankang, Taiwan, 1997).

A great deal of research has been done on Taiwan's Aboriginal peoples and their religious traditions, but relatively little has been published in English. A good place to start is John R. Shepherd's *Statecraft and Political Economy on the Taiwan Frontier, 1600–1800* (Stanford, Calif., 1993), which provides an excellent account of Taiwan's Plains Aborigines. Numerous scholars at the Institute of Ethnology, Academia Sinica, such as Huang Ying-kuei and Pan Ing-hai, have published extensively on Aboriginal religion in both Chinese and English, and scholars may keep track of their results by visiting the Institute of Ethnology website ([www.sinica.edu.tw/ioe/english/index.html](http://www.sinica.edu.tw/ioe/english/index.html)) and reading the Institute's *Taiwan Journal of Anthropology*. Useful background information may also be found in a special report on Taiwan's aborigines in *Cultural Survival Quarterly* 26, no. 2 (2002), available at

www.culturalsurvival.org/publications/csq/index.cfm?id=26.2. See also the Council of Indigenous Peoples website (www.apc.gov.tw/en/).

Taiwanese Buddhism has been extensively studied by local scholars, with numerous important books and articles by Jiang Tsann-terng and Lu Hui-hsing. For accounts in English, one should start with Charles B. Jones, *Buddhism in Taiwan: Religion and the State, 1660–1990* (Honolulu, 1999), as well as Julia C. Huang, “Recapturing Charisma: Emotion and Rationalization in a Globalizing Buddhist Movement from Taiwan,” Ph.D. diss. (Boston University, 2001).

Early research on Taiwan’s Daoist traditions was initially undertaken by scholars like Kristofer M. Schipper and Liu Chiwan, but now much of the most important work is being done by Lee Fong-mao. John Lagerwey’s *Taoist Ritual in Chinese Society and History* (New York, 1987) provides a detailed account of Taiwan’s liturgical Daoist traditions, while Kenneth Dean’s *Taoist Ritual and Popular Cults of Southeast China* (Princeton, 1993) contains invaluable information on their origins and links to communal religious traditions in the province of Fujian.

A sizeable group of Taiwanese scholars has published in Chinese on Taiwan’s sectarian movements, including Cheng Chih-ming, Chiu Hei-yuan, Li Shih-wei, Lin Pen-hsuan, Sung Kuang-yu, and Wang Chien-ch’uan. Among the most valuable studies published in English are David K. Jordan and Daniel L. Overmyer, *The Flying Phoenix: Aspects of Chinese Sectarianism in Taiwan* (Princeton, 1986), and Philip A. Clart, “The Ritual Context of Morality Books: A Case Study of a Taiwanese Spirit-writing Cult,” Ph.D. diss. (University of British Columbia, 1996). See also Clart’s “Confucius and the Mediums: Is there a ‘Popular Confucianism?’” *T’oung Pao* 89, nos. 1–3 (2003): 1–28. Barend ter Haar’s *The White Lotus Teachings in Chinese Religious History* (Leiden, 1992) contains a path-breaking analysis of the historical background of these movements.

Overviews of the history of Taiwanese Christianity include Holington K. Tong’s *Christianity in Taiwan: A History* (Taipei, 1961) and William Jerome Richardson’s “Christianity in Taiwan under Japanese Rule, 1895–1945,” Ph.D. diss. (Saint John’s University, New York, 1972), which also contains useful appendices listing the names of all missionary personnel in Taiwan during the colonial era, as well as an annotated bibliography of relevant primary sources. See also Murray A. Rubinstein’s classic study, *The Protestant Community on Modern Taiwan: Mission, Seminary, and Church* (Armonk, N.Y., 1991). Useful essays on Taiwanese Christianity may also be found in Daniel H. Bays, ed., *Christianity in China: From the Eighteenth Century to the Present* (Stanford, Calif., 1996), as well as Stephen Uhalley Jr. and Xiaoxin Wu, eds., *China and Christianity: Burdened Past, Hopeful Future* (Armonk, N.Y., 2001).

An impressive amount of research on Taiwan’s communal religious traditions has been published from the 1960s and 1970s to the present day. Some of the most important early scholarship was undertaken by Stephan Feuchtwang, David Jordan, Daniel Overmyer, and Wang Shih-ch’ing. Among the most representative works of that era are David K. Jordan’s *Gods, Ghosts, and Ancestors: Folk Religion in a Taiwanese Village* (Stanford, Calif., 1972), and P. Steven Sangren’s

*History and Magical Power in a Chinese Community* (Stanford, Calif., 1987). Important essays were also published in Arthur P. Wolf, ed., *Religion and Ritual in Chinese Society* (Stanford, Calif., 1974), and G. William Skinner, ed. *The City in Late Imperial China* (Stanford, Calif., 1977).

More recently, a new generation of researchers led by scholars like Chang Hsun, Lin Fu-shih, Lin Mei-rong, Mio Yuko, P. Steven Sangren, Donald Sutton, Robert Weller, and James Wilkerson has begun to shed additional light on Taiwan’s communal religious traditions. Some of the most important publications in English include Alessandro Dell’Orto, *Place and Spirit in Taiwan: Tudi Gong in the Stories, Strategies and Memories of Everyday Life* (London and New York, 2002); Marc L. Moskowitz, *The Haunting Fetus: Abortion, Sexuality, and the Spirit World in Taiwan* (Honolulu, 2001); Meir Shahr, *Crazy Ji: Chinese Religion and Popular Literature* (Cambridge, Mass., 1998); Meir Shahr and Robert Weller, eds., *Unruly Gods: Divinity and Society in China* (Honolulu, 1996); and Donald Sutton, *Steps of Perfection: Exorcistic Performers and Chinese Religion in Twentieth-Century Taiwan* (Cambridge, Mass., 2003).

PAUL R. KATZ (2005)

**TAIXU** (1890–1947), Chinese Buddhist reformer, founder of the Wuchang Buddhist Institute and the Buddhist journal *Haichaoyin*, and active participant in various Buddhist movements. Taixu’s lay name was Lü Peilin. Born in Haining in Zhejiang, he became a monk of the Linji school of Chan Buddhism at the age of sixteen. Buddhist scriptures as well as the radical political writings of Liang Qichao and others inspired him to act for the reformation of Chinese Buddhism. He tried to put his reform programs into practice by founding the Fojiao Xiejin Hui (Association for the Advancement of Buddhism) in 1912, but the association was short-lived owing to opposition from conservative Buddhists. In 1917 Taixu visited Taiwan and Japan. Later, he established the Enlightenment Society (Jueshe) at Shanghai with the help of some eminent Chinese. The society organized public lectures and disseminated knowledge of Buddhism through its own publications. Taixu next made a preaching tour of several cities in China and in Malaya. In 1920 he founded the Buddhist periodical *Haichaoyin*. He established the Wuchang Buddhist Institute in 1922, the first modern Buddhist seminary in China. In 1923, Taixu and a few followers founded the World Buddhist Federation, which included among its members Inada Eisai and K. L. Reichelt. Two years later he led the Chinese Buddhist delegation to the Tokyo Conference of East Asian Buddhists. In 1927 he became the head of the Minnan Buddhist Institute. During that year, he associated with the Chinese Nationalist leader Chiang Kai-shek, who financed Taixu’s world tour in 1928. The Chinese Buddhist Association was founded by Reverend Yuanying (1878–1953) at Shanghai in 1929, but Taixu’s early relation with it was not cordial, though he was on its standing committee. In 1930 he founded the Sino-Tibetan Buddhist Institute in Chongqing; this became the

headquarters of the Chinese Buddhist Association in the war years, 1937 to 1945. During the war, Taixu led a Chinese Buddhist mission of goodwill to Burma, India, Ceylon, and Malaya to win support and sympathy for China, and he was awarded a medal by the Chinese government for his contributions to the war effort. His influence on Nationalist leaders declined after the war, and he died on March 12, 1947. His writings were published posthumously in thirty-three volumes.

Since the late nineteenth century, Chinese Buddhism has been under constant pressure from the government and from intellectuals. In 1898 a high official proposed that 70 percent of monastic buildings and their income should be taken over to finance the public school system. Although this was not put into practice, and although the Buddhists managed at times to put off or soften anti-Buddhist threats, the idea of using Buddhist property to finance education arose again in 1928 and 1942. Taixu's suggestions for reform were part of the Buddhist reaction to public pressure. As a compromise, Taixu suggested in 1942 that 40 percent of monastic income be used for educational and charitable institutions run by the Buddhists in exchange for government protection of monastic property, but his suggestion had no effect on either side.

Taixu's attempts to reform and modernize Chinese Buddhism were to some extent successful. A number of prominent scholars and religious leaders were trained at the academies and libraries that he founded, and his lectures and writings helped create a more positive public attitude toward Buddhism. But his larger dream of a worldwide Buddhist movement, and his plan for reorganizing Buddhist institutions throughout China never materialized during his lifetime. His ideas were often viewed by the conservative Buddhist establishment as radical and unacceptable. They cooperated with him reluctantly in times of crisis but were always opposed to his ideas on monastic affairs. Yet, viewed from a historical perspective, his program of reform and modernization (the establishment of Buddhist academies, journals, foreign contacts, and so forth) can be seen to have created new patterns for Chinese Buddhism.

The religious thought of Taixu falls in the mainstream of Chinese Buddhism. It recognizes that all sentient beings possess the Buddha nature and are subject to the law of causation. The operation of cause and conditions is universal and incessant, and all worldly phenomena are based on that operation. If one follows the five Buddhist precepts, a happy life in this world is achievable. This happy life is, however, not lasting; it is subject to change. One must therefore strive for a higher wisdom and thus attain *nirvāṇa*. When one realizes that there is neither self nor object and that only the mind is universal and unlimited, one will work for the salvation of all sentient beings so that they too may become Buddhas. Taixu's contribution is his adoption of a new terminology and a modern style of writing, thus tuning the old philosophy to the new thought in China. He often used

words like *revolution, evolution, science, democracy, philosophy, and freedom*, as well as other concepts popular in his time. Although he may not always have used these terms with a clear understanding of their modern meaning, by incorporating them into the context of Buddhism he made the tradition continue to appeal to young people at the beginning of the twentieth century.

#### BIBLIOGRAPHY

The most complete and competent account of Taixu is the chronological biography compiled by Yinshun, *T'ai-hsü ta-shih nien-p'u* (1950; reprint, Taipei, 1973). Taixu's autobiographical writings, including *T'ai-hsü tsu-chuan* (rev. ed., 1945), can be found in the collection of his writings, *T'ai-hsü ta-shih ch'üan-shu*, vols. 29–30 (1953; reprint, Taipei, 1973). Holmes Welch's chapter on the monk in his *The Buddhist Revival in China* (Cambridge, Mass., 1968), pp. 51–57, is overly critical. See also Paul E. Callahan's "T'ai-hsü and the New Buddhist Movement," *Papers on China* 6 (March 1952): 149–188, and the entry on Taixu in the *Biographical Dictionary of Republican China, 1911–1949*, edited by Howard L. Boorman (New York, 1970). Selections from Taixu's writings in English translation can be found in his *Lectures in Buddhism* (Paris, 1928) and Chou Hsiang-kuang's *T'ai-hsü: His Life and Teachings* (Allahabad, India, 1957).

**TALIESIN.** The ninth-century *Historia Brittonum*, usually attributed to "Nennius," names Taliesin as one of a famed group of Welsh poets of the latter half of the sixth century. The thirteenth-century *Book of Taliesin* contains a body of poetry of diverse origins and different dates that the scribe presumably associated with Taliesin, but modern research has isolated some twelve poems that are regarded as his authentic work. These are heroic court poems sung to royal patrons and to Urien, Owain, and Gwallawg, kings of the sixth-century northern British kingdoms of Rheged and Elmet.

The early medieval Welsh poet was a complex persona, and Taliesin acquired the status of a vaticatory poet (perhaps conflated with the figure of Myrddin/Merlin) and purveyor of esoteric and learned lore, both bardic and Christian. Many of the poems in the *Book of Taliesin* reflect this role, which is given a specific context in the *Story of Taliesin (Hanes Taliesin)*. Although found in manuscript copies of the sixteenth century and later, this composite tale is certainly

earlier. The first part relates how the witch Ceridwen concentrated her learning in three drops of a brew which she prepared for her son. At the crucial moment of fulfillment they fell onto the hand of a serving lad, Gwion Bach, who sucked his scalded finger and acquired the knowledge and bardic power intended for the son. In the ensuing pursuit Gwion and Ceridwen undergo several metamorphoses until the lad is swallowed as a seed of corn by Ceridwen in the guise of a hen to be reborn nine months later. He is taken up by Elffin, named Taliesin, and soon reveals his precocity as poet and sage. The rest of the tale recounts his feats of learning at the court of the sixth-century king Maelgwn Gwynedd.

Poems of the *Story of Taliesin* are spoken by Taliesin, but those in the *Book of Taliesin*, though lacking this specific context, nevertheless refer to similar circumstances and are to be dated to the tenth century. One such poem alludes to Taliesin's creation by the wizards Math and Gwydion, characters found in the Four Branches of the *Mabinogi*; another relates his transforming of trees into warriors in the Battle of Goddau. The poem titled *The Spoils of Annwn* refers to the poet's return as one of the survivors of Arthur's disastrous attack on the otherworld, an episode underlying the Second Branch, which names Taliesin and a survivor. This early stratum of Taliesin's legend links him not with historical characters of the sixth century but with purely mythological figures and episodes. In later bardic tradition, Taliesin becomes the archetypal inspired poet.

#### BIBLIOGRAPHY

*Trioedd Ynys Prydein: The Welsh Triads*, 2d ed. (Cardiff, 1978), edited by Rachel Bromwich, gives a concise discussion of the sources and offers scholarly opinion, while Ifor Williams's *Chwedl Taliesin* (Cardiff, 1957) analyzes the development of the Taliesin legend. Patrick K. Ford edits the text of the legend, *Ystoria Taliesin* (Cardiff, 1992) and in his introduction he discusses its themes; he translates the story in his *The Mabinogi and Medieval Welsh Tales* (Berkeley, 1977). BRYNLEY F. ROBERTS (1987 AND 2005)

#### TALISMANS SEE AMULETS AND TALISMANS

**TALMUD.** In form, the Talmud is an extended, multi-volume elaboration of selected tractates of the Mishnah, but it must be emphasized that the contents of the Talmud go far beyond its ostensible base. No subject of interest to the ancient rabbis failed to find its way into this immense body of teaching, and for that reason no question arising in later centuries was deemed outside the range that Talmudic teaching might legitimately claim to resolve. A document that seemed merely to elucidate an older text eventually became the all-embracing constitution of medieval Jewish life.

The Mishnah supplied the overall format for the Talmud. Like the former, the Talmud is divided into tractates, which in turn are divided into chapters and then into paragraphs. Each phrase of the Mishnah is discussed, analyzed, and applied for as long as the editors of the Talmud have materials to supply; when such materials are exhausted (sometimes after very long and quite wide-ranging digressions), the discussion simply moves on to the next phrase or paragraph. The digressions can be such that one loses track of the Mishnaic passage under discussion for pages at a time, but the Talmud always picks up again from its base text when the next section begins.

**ORIGINS AND DEVELOPMENT.** Very soon after it began to circulate, the Mishnah of Yehudah ha-Nasi' (compiled c. 200 CE) assumed a central place in rabbinic study. As time went on, the structure and content of the Mishnah—the meaning and the sequence of its paragraphs—determined the manner in which the growing accumulation of rabbinic lore was organized. Non-Mishnaic legal materials (the so-called outside traditions; Aram., *baraitot*) were studied primarily in connection with their Mishnaic parallels, and an entire supplementary collection (Tosefta) that followed the Mishnah's own sequence of orders, tractates, and chapters was compiled. Similarly, post-Mishnaic rabbinic teachings—of law, morality, theology, and so forth—were remembered and discussed primarily as the consecutive study of Mishnaic tractates called them to mind, so that most such teachings eventually came to be linked with one or another specific passage (or, occasionally, several) in the earlier collection.

In this way, great compilations of rabbinic teaching, each in the form of a loose exposition of the Mishnah, came into being. Evidence suggests that various centers of rabbinic study developed their own such collections, though in the end only one overall collection was redacted for the Palestinian centers and one for Babylonia. For several generations, the collections remained fluid. Materials were added, revised, or shifted. Free association led to the production of extended discourses or sets of sayings that at times had little to do with the Mishnaic passages serving as points of departure. Early materials tended to be brief explanations of the Mishnah or citations of parallel texts, but later rabbis increasingly commented as well on remarks of their predecessors or other non-Mishnaic materials. Numerous scholars have seen in the developing tradition two sorts of material: brief, apodictic statements of law and much longer dialectical explanations

of the specific laws and their underlying principles. Such discussions in turn eventually gave rise to a new generation of legal dicta, and these in turn provoked new efforts at dialectical complication. Thus the Talmudic tradition grew.

The Hebrew word *talmud* and its Aramaic equivalent *gemara* both mean “study.” Each term had other meanings at various times, but in the end *gemara* came to be the name of the vast Mishnah commentary that had taken shape, and *talmud* the name of the combined text (Mishnah plus *gemara*) that eventually emerged. The rabbis of the immediate post-Mishnaic period (third to fifth centuries CE) are called *amora* from the Aramaic *mr*, “say, discuss”), because their characteristic contribution to the developing tradition was the extended discussion of the Mishnah they produced.

Through a process that can no longer be traced with certainty, the text of the *gemara* underwent periodic reshaping until finally the two Talmuds as we now know them came into being. It should be emphasized that early rabbinic Torah study was oral, so that the *gemara* was not so much a fixed text as a more-or-less accepted formulation of accumulated lore. There is therefore no reason to assume that there ever was an authorized “original text” of the Talmud, and there may have been parallel recensions of these collections from the earliest stages of their history preserved in different localities. There is still no altogether accepted standard text, and even the relatively uniform wording of recent centuries has much to do with the eventual predominance of European over Asian and North African Jewry and the standardization that inevitably followed the invention of printing.

**The Jerusalem, or Palestinian, Talmud.** The so-called Jerusalem Talmud (Heb., *Talmud Yerushalmi*) is really the work of the rabbinic academies of the Galilee; it was substantially completed by the middle of the fifth century. The Jerusalem Talmud covers the first four orders of the Mishnah with the exception of two tractates (*Avot* and *Eduyyot*); in the last two orders, only half of tractate *Niddah* has Palestinian *gemara*. The Jerusalem Talmud is characterized in general by brevity and an absence of editorial transitions and clarifications. Its discussions frequently seem laconic and elliptical and often take the form of terse remarks attributed to one or another *amora* with no connective phrasing at all between them. Occasionally, however, such comments are built up into a more integrated dialectical treatment, with objections raised and answered, contradictions cited and resolved, and biblical proof texts adduced as the editors see fit.

**The Babylonian Talmud.** According to tradition, the redaction of the Babylonian Talmud (Heb., *Talmud Bavli*) was completed by the *amoraim* Ashi and Ravina around the year 500. It is clear, however, that the distinctive features of this Talmud in contrast to the other are the work of several generations of mostly anonymous rabbis who came after these authorities and are collectively known as the *savoraim* (from the Aramaic root *svr*, “consider, hold an opinion”), that is, those who reconsidered the Talmudic text and estab-

lished its final version. Thanks to the labors of these latter revisers, the Babylonian Talmud is far more thoroughly worked out than the Palestinian. Its arguments are replete with a sophisticated technical terminology for introducing source materials, considering objections and counterobjections, offering refutations and defending against them, and so forth. In addition to their detailed contributions, the *savoraim* also composed entire sections of the Talmud; in particular, the extended discussion at the beginning of many tractates is attributed to them. In general, the literary superiority of the Babylonian Talmud, its far greater logical clarity, and its considerably larger bulk can be attributed to the *savoraim* of the sixth and seventh centuries. The Talmud in its current form did not exist until these had done their work.

While the Jerusalem Talmud treats the entire first order of the Mishnah, the Babylonian Talmud has *gemara* only for the first tractate (*Berakhot*), which deals with liturgy; the rest of the order treats agricultural rules that were not considered applicable outside the Holy Land. On the other hand, and harder to explain, the great bulk of the fifth order, which regulates the long-destroyed Temple cult and is not to be found in the Jerusalem Talmud, has very substantial Babylonian *gemara*. Otherwise, with minor exceptions, the two Talmuds cover the same parts of the Mishnah.

**LATER DEVELOPMENTS.** Over the several centuries following the appearance of the two Talmuds, the Babylonian Talmud gradually eclipsed the other. This predominance was rationalized by the claim that the Babylonian Talmud was the more recent, so that its editors already knew the Jerusalem Talmud and could include its acceptable teachings in their own work and suppress those portions for any reason found unworthy. In retrospect, however, it is clear that such a claim was part of the propaganda of the Babylonian geonim of the last centuries of the first millennium CE in favor of their own authority and against the rival authority of the rabbis of the Land of Israel. The eventual predominance of the Babylonian Talmud throughout the Diaspora and even in the Land of Israel probably is to be explained through reference to such factors as the relatively stronger ties of the rising communities of North Africa and Spain to Babylonian Jewry and the relatively more severe decline of Palestinian Jewry, especially under the onslaught of the Crusades. Those parts of Europe, especially Italy, that retained strong ties with the community in the Land of Israel apparently maintained a tradition of study of the Jerusalem Talmud, but by the beginning of the second millennium this process had run its course. From then on, “the Talmud” always meant the Babylonian. It was taken for granted that issues of Jewish law should be resolved by reference to the Babylonian Talmud, not the Palestinian, and that the latter could provide rulings only in cases where the Babylonian Talmud was silent or ambiguous.

Once the primacy of the Babylonian Talmud was established, this primacy was continually reinforced. The Babylonian Talmud received more attention. It was studied by

more scholars, it became the subject of more and of better commentaries; it was copied more often and more carefully by larger numbers of scribes. The result is that modern scholars have a more solidly established text of the Babylonian Talmud and a more fully developed exegetical tradition with which to work. Modern critical study of the Jerusalem Talmud has much more fundamental analytical and restorative work to accomplish before a reliable and comprehensible text becomes available.

It should be noted as well that the power of the medieval Christian church affected the development of the Talmud in two important ways. Periodic waves of seizure and destruction reduced the number of Talmud manuscripts available in certain parts of Europe. The most important of these waves took place in thirteenth-century France and in Italy at the time of the Counter-Reformation; the last burning of the Talmud occurred in Poland in 1757. Occasionally thousands of copies of the Talmud or of Talmudic digests and commentaries were destroyed at a time. In addition, Jewish efforts to avoid such destruction often led to voluntary or involuntary submission of the Talmud to censorship by church authorities. As a result, much early rabbinic discussion of Jesus or the Christian religion has been lost or must now be recovered from scattered manuscripts.

**TALMUDIC RELIGION.** Despite its vast size and scope, the Talmud is not without focus. Certain themes and certain styles of argument and discourse strongly predominate in its pages, and as a result both the religion of the Talmudic sages themselves and the forms of Judaism based on the Talmud that flourished during the Middle Ages are more compatible with certain types of spirituality than with others.

**The role of law.** Well more than half of the Babylonian Talmud and more than three quarters of the Jerusalem Talmud are devoted to questions of law. The Mishnah itself takes the form of a law code, and Talmudic discussions are chiefly concerned with clarifying, extending, and finding new applications for the provisions of Mishnaic law. This concentration on law is related to the ancient rabbis' role in their communities, where they usually served as judges, teachers, or public administrators. Rabbinic piety came to be organized around gratitude for the law and joy in its fulfillment. The law was understood to be a divine gift, and observance of its provisions was seen as the appropriate response to this generosity. To observe the law meant to strengthen one's link to its giver, and in developing the law into a huge accumulation of detailed regulations covering all aspects of day-to-day living, rabbinic teachers sought to multiply occasions for strengthening this link. Study of the law was both the highest intellectual activity in which a Jew might engage and also a practical activity designed to further this expansion of opportunity. Enlarging the scope of the law was not felt to be adding to an already heavy burden; on the contrary, it increased the portion of one's life that could be conducted in response to the voice of God.

**The role of study and intellect.** While the Mishnah looks like a law code, however, in fact it is probably something other; its numerous unresolved disputes, its sporadic use of biblical proof texts, and its occasional narratives all reflect the value of study as a religious ritual in its own right, and eventually the activity of studying God's law was as important in Talmudic religion as was the content of that study. Even before the Talmud was completed, this enhancement of study as religious rite had led to the creation of an elaborate set of legal corpora, most of which were identified by the name of the master to whom the discrete opinions in each corpus were attributed. The well-known Talmudic penchant for hair-splitting dialectics reflects the rabbis' concern that each of these sets of teachings be internally consistent on the one hand and significantly different from any other such set on the other. Hence the frequency with which the Talmud records the chains of transmission by which individual sayings were passed on. Hence the steadily growing integration of teachings from widely disparate fields of law into a single web, and the often forced effort to find unifying principles behind teachings that seem to have nothing to do with one another. Hence, as well, the relative lack of interest in the personalities of early masters, except, paradoxically, for those few who became the subject of frequently incredible legends.

This intellectual tendency had several important consequences for Talmudic religion. It gave rabbinic studiousness a scholastic tinge that continued to sharpen as later centuries wore on. It made text commentary an important genre of religious literature; a standard edition of the Talmud even today contains several classical commentaries on the page along with the text and many, many more at the back of the volume. Rabbinic intellectualism turned into disciplined argument; the interplay of proof and refutation became a holy activity. It also gave primacy to the correct formulation of sacred texts and recitations; this in turn had important effects on Talmudic and post-Talmudic conceptions of prayer, meditation, and inward spirituality.

**TALMUDIC LEARNING AND RELIGIOUS AUTHORITY.** In the ancient rabbis' view there was a connection between their emphasis on learning and the role of leadership to which they aspired. It was taken for granted that only the Torah, when properly and sufficiently studied and understood, could enable the people of Israel to become the "kingdom of priests and holy nation" (*Ex. 19:6*) that God intended them to be. This in turn meant that only those properly and sufficiently learned in Torah should be allowed to assume leadership over the community, since only such leaders could be trusted to guide the people in a divinely ordained direction.

Inherent in Talmudic and post-Talmudic Judaism is the assumption that Torah learning (once the Talmud was complete, this meant Talmudic learning) is the only proper criterion by which the leaders of the community should be selected. Whenever conditions permitted, rabbis sought to institutionalize their authority over the community. In the

early period, this meant reaching an accommodation with the real rulers of the community (e.g., the Roman empire or, in Babylonia, the allegedly Davidic dynasty of the exilarchs). Later, it meant assuring that internal Jewish courts should be dominated by rabbis and that Talmudic law should govern those aspects of life where Jews maintained internal autonomy (marriage and divorce, religious ritual, educational institutions). Although rabbinical authority was not without challengers, it was never overthrown in principle until the breakdown of Jewish self-government, which began in the late eighteenth century and continued into the nineteenth.

**TALMUD STUDY AS RELIGIOUS EXPERIENCE.** Rabbis saw their own teaching as “oral Torah.” They believed the contents of the Talmud represented a part of the revelation to Moses that had been kept oral but faithfully transmitted for centuries before its inclusion in the text of the Talmud. The name *Talmud*, in fact, can be understood as a short form of the common phrase *talmud Torah*, or “Torah study.” Thus to study Talmud was in fact to let oneself hear the word of God, and to add to the accumulation of commentaries, digests, codes, and the like was to make one’s own contribution to the spread of divine revelation in the world. To learn Torah was thus a kind of sober mysticism, a reliving of the events at Sinai, while to add to the growing body of “oral” law was to share in a divine activity. Already in the Talmud God is depicted as studying Torah several hours per day (B. T., ‘A. Z. 3b), but the kinship between the rabbi and God was felt to be even stronger. By increasing the amount of Torah in the world, the rabbi could do what previously only God had been held able to accomplish.

Thus the text of the Talmud became the center of an activity believed to be the most Godlike available to human experience. Everyone (in practice this meant every male) could study some Torah, and no one was considered incapable of adding a few original thoughts to a study session. Talmud study became a widespread activity among later Jewish communities. The degree of commitment to this activity might vary, from the ascetic twenty-hour-per-day devotion of the secluded scholar to one-hour-per-week popular learning on Sabbath afternoons. The climax of a boy’s education was the point at which he was ready to learn *gemara*. Such “learning” continues even in the present time, even after the functioning authority of Talmudic law has all but disappeared. It represents the most powerful and the most durable inheritance of classical Judaism.

#### BIBLIOGRAPHY

The history and current state of critical scholarship about the two Talmuds is comprehensively reviewed in two essays in *Aufstieg und Niedergang der römischen Welt*, vol. 2.19.2 (Berlin and New York, 1979): Baruch M. Bokser’s “An Annotated Bibliographical Guide to the Study of the Palestinian Talmud,” pp. 139–256, and David Goodblatt’s “The Babylonian Talmud,” pp. 257–336. Both have been reprinted in

*The Study of Ancient Judaism*, vol. 2, edited by Jacob Neusner (New York, 1981). Several of Neusner’s students also produced longer examinations of the work of particular modern scholars; he collected these in *The Formation of the Babylonian Talmud* (Leiden, 1970). Readers can also consult Strack-Stemberger, *Introduction to the Talmud and Midrash* (revised edition, Minneapolis, 1992).

Neusner has also investigated the religious implications of conceiving of Torah study as a holy activity and the theological implications of rabbinic intellectuality; see his concise *The Glory of God Is Intelligence* (Salt Lake City, Utah, 1978). A more popular effort of the same sort is Morris Adler’s *The World of the Talmud* (New York, 1958). See also my own “Talmud,” in *Back to the Sources*, edited by Barry W. Holtz (New York, 1984), pp. 129–175.

ROBERT GOLDENBERG (1987 AND 2005)

**TAM, YA'AQOV BEN ME'IR** (c. 1100–1171), leading Jewish halakhic scholar, known as Rabbenu (“our teacher”) Tam from the biblical description of the patriarch Jacob as *tam* (Gn. 25:27), a word often translated as “quiet,” with the connotation of a studious, scholarly person. The scion of a learned rabbinical family, he was the grandson of Rashi (Shelomoh ben Yitshaq, 1042–1105), the most prominent Talmudic commentator, and the brother of Shemu’el ben Me’ir, the Rashbam. He was himself the greatest of the founders of the Tosafist school of Talmudic commentators in the twelfth to fourteenth centuries.

In his commentaries Tam employed the method of comparative examination of the Talmudic texts, aiming to explain contradictions and inconsistencies while elucidating the passages. He was against making any corrections in the traditional text of the Talmud unless there was absolutely no other way of understanding a particular passage. His concerns encompassed practical legal and religious applications as well as a theoretical understanding of the Talmudic system. He generally opposed current usages that seemed contrary to Talmudic teachings and customs and also did not allow deviation from ancestral practices. His reasoned legal decisions were based on the Talmud itself and not on the varying needs of the time, although he sometimes resolved contradictions between the Talmud and the religious and legal practices of the day by reinterpreting the traditional texts.

Tam was accepted by his contemporaries as the greatest scholar of his generation. Many disciples flocked to study with him from France and Germany and even as far away as Italy, Bohemia, and Russia; through them, his teachings and opinions circulated throughout Europe, reaching even to Spain. Considered the central halakhic authority of the age, he received halakhic and Talmudic questions and problems from all parts of Europe. By virtue of his position he issued various regulations (*taanos*) for the Jewish communities of the time. Tam’s *responsa* (answers to questions posed) and comments on the Talmud were accepted as authoritative by later generations, especially among Western (Ashkenazic) orthodox Jewry.

His main work is *Sefer ha-yashar* (Vienna, 1811), which includes his halakhic *responsa* (annotated Berlin, 1898) and his *novellae*, or comments, on the Talmud (annotated Jerusalem, 1959). The book as we have it is a later unedited collection from the original with additions from other authors. However, the greater part of his teachings are not included in this work but are scattered throughout the *tosafot* and the collections of *responsa* and decisions of his time.

*Revised Bibliography*

**TAMIL RELIGIONS.** The term *Tamil religions* denotes the religious traditions and practices of Tamil-speaking people. Most Tamils originated and continue to live in India's southernmost area, now known as the state of Tamil Nadu; however, millions of Tamils have migrated to other parts of India, especially to its large cities, as well as abroad, particularly to Malaysia, Singapore, Sri Lanka, Madagascar, Australia, Great Britain and, more recently, to the United States and Canada. Many emigrant Tamils retain elements of a cultural, linguistic, and religious tradition that predates the Christian era and has experienced a complex interaction of influences from Dravidian, Sanskrit, and heterodox sources. At its apex between the eighth and fifteenth centuries, the Tamil region was the major center of Hindu civilization and, indeed, one of the major centers of civilization in the world. Today, while most Tamils remain essentially Hindu, some Tamils have embraced elements of Islam and Christianity.

**EARLY TAMIL RELIGION.** A Neolithic cattle-herding culture existed in South India several millennia prior to the Christian era. By the first century, a relatively well-developed civilization had emerged, still largely pre-Hindu and only marginally Sanskritized. It is described in some detail in Tamil texts such as the *Tolkāppiyam* (a grammar written around the start of the Christian era) and by the "Caṅkam" poets—an "academy" of poets who wrote in the first two centuries CE. This culture was essentially Dravidian in nature.

The origins of the Dravidians are still a matter of dispute, but the South Indian culture known to current re-

searchers by the first century was probably based largely on the Neolithic cultures that developed in the area. However, these cultures were influenced in prehistoric times to varying degrees by the filtering of some remnants of a Negroid culture originating in East Africa; by migrations from the eastern Mediterranean world refracted through the Elamite and Indus civilizations; by a megalithic culture that made its way into Southwest India by the eighth century BCE; and by a people sometimes called "Proto-Australoid" who came into the subcontinent by way of northeastern India from the Malay peninsula.

The religious life of the Tamil civilization of Cankam times gave evidence of no significant mythological or philosophical speculation nor of any sense of transcendence in a bifurcated universe. Rather, it was oriented by a fundamental veneration of land and a sense of the celebration of individual life. Colorful flora and fauna were extolled and ascribed a symbolic significance that bordered on the sacred; for example, peacocks, elephants, and the blossoms of various trees were used as images for the basic realities of individual and cosmos. Earth's color and fertility were affirmed. Indigenous deities were venerated in field and hill, reflecting the attributes of the people in that zone and presiding over functions typical to their respective areas; thus, the god Murukan presided over hill and hunt and battled the malevolent forces of the hills, while Vēntaṅg oversaw the pastoral region and afforded it rain.

"Possession" is one of the most common ways in which the gods were believed to manifest themselves—both in their priests and in young women. Worship of the gods sometimes occurred in a special place—in the clearing of a field or the bank of a river, for example, where a small pillar or *kantu* was set up to represent the deity. The cult of the hero was a common feature of this period as evidenced by the erection of numerous hero stones (*natukkals*) over the graves of fallen heroes, be they hunting warriors or tribal chieftains. Urn burial, a remnant of megalithic culture, was used occasionally, especially after the death of the chieftain or hero.

The city was not foreign to this early culture and by the third century CE, at least, religious imagery reflected an urban setting. Poets likened the urban chieftains and warriors to the gods and spoke of urban festivals. Some of the earlier gods were merged together in an urban setting, even while continuing their earlier functions in extra-urban contexts. Rituals, however, often continued to reflect a seasonal or folk character: In the hills, garlanded young women are said to have danced, intoxicated, with priests (*vēlans*) of Murukan (*Cilappatikāram* 24), while in the plain, at the onset of monsoons, after harvests and transplantings, bathers gambolled in the waters, were garlanded and smeared with sandal, often astride elephants or horses, and drank intoxicating beverages (*Paripāṭal* 6, 7, 10).

The early character of Tamil religion, in sum, was celebrative and relatively "democratic." It embodied an aura of sacral immanence, sensing the sacred in the vegetation, fertil-

ity, and color of the land. The *summum bonum* of the religious experience was expressed in terms of possession by the god, or ecstasy. Into this milieu there immigrated a sobering influence—a growing number of Jain and Buddhist communities and an increasing influx of *brahmins* and other northerners.

**THE HETERODOXIES.** By the third century BCE, pockets of Jains and Buddhists were settling in the deep South. Some may have migrated across the straits from Sri Lanka; others came southward during the reign of Aśoka, the Mauryan emperor. By the first century CE, both had established settlements and built small institutions and shrines known as *pallīs*. Although both Jain and Buddhist monks tended to live outside the cities for centuries—the Jains often in rock caves and the Buddhist monks in monastic communities—their impact on Tamil country increased, enhanced by the influx and influence of lay members. The politics and literature of Tamil country were influenced by Jain and Buddhist savants, especially between the fourth and seventh centuries CE. Consequently, the dominant mood of religion in Tamil country for some three centuries reflected Jain and Buddhist values. There was little emphasis on theism or indigenous sacred places. Sobriety and self-effacement became a respected way of life, especially for the elite.

**THE HINDUIZATION OF TAMIL COUNTRY.** Beginning in the third century CE, migrating *brahmins* and other persons influenced by Vedic and epic traditions were also becoming a part of the Tamil landscape. In the early cities, chieftains who sought to enhance their status employed *brahman* priests to perform Vedic rituals as had been the case in the north during the epic period. It was in the seventh century, however, that Hindu Sanskritic culture and religion merged with the indigenous Tamil society, leading to a pervasive hinduization of Tamil country and the emergence of a new and creative Hindu civilization.

The first significant feature of the “Hindu age” in Tamil India was the rise of devotional poetry (*bhakti*) in the vernacular language during the seventh, eighth, and ninth centuries. Poets who were followers of Śiva (Nāyaṅārs) and of Viṣṇu (Ālvārs: literally, those who are “immersed”) popularized these two deities throughout Tamil country. These poets were drawn from all walks of life, though over half of them were of *brahman* or of royal background. At first, their attacks on Jains and Buddhists tended to be virulent, especially in the case of the Śaiva Tiruṅānacambantaṅ. But by the mid-eighth century, Hindu devotionalism had taken a significant hold in Tamil country and the poets could afford to take a more accommodating attitude toward the declining Jain and Buddhist presence.

Between the years 650 and 940 the twelve Vaiṣṇava poet-saints (Ālvārs) wrote some four thousand verses, which were eventually canonized in the *Nālāyira-divyaprabandham* (The four thousand divine verses) edited in the tenth century by Nāthamuni, the first major *ācārya*, or sectarian teacher, of Vaiṣṇavism. Of the earlier Ālvārs, the most prolific was

Kalikaṅṛi (800–870), also known as Tirumaṅkai, who wrote 1,227 verses combining militant, heroic, and erotic imagery with the anguish of separation from his lord. The ninth- and tenth-century Ālvārs associated primarily with western Tamil country include Viṭṭuciṭṭaṅ, known as Periyālvār (“great Ālvār”), who wrote 473 verses largely from the standpoint of the deity’s mother expressing fondness for the child Kṛṣṇa. Periyālvār’s daughter Kōtai, popularly known as Āṅṅāl (“she who rules the lord”), wrote 173 verses. Often erotic, they focused on Kṛṣṇa as an adolescent from the viewpoint of a *gopī* who spends time with the Lord in his inner chamber. Finally, Caṭakōpaṅ or Ālvār Māraṅ (880–930), also known affectionately as Nammālvār (“our own devotee”), wrote 1,296 verses that combine passionate devotion for Kṛṣṇa with the metaphysics of Vedānta, the philosophical system of Vaiṣṇava *brahmins*. Nammālvār has come to be seen as the most authoritative of the Ālvārs for the Sri Vaiṣṇavas.

While tradition claims there were sixty-three Śaiva poet-saints (Nāyaṅārs)—perhaps in response to the traditional sixty-three saints of Jainism—there were in fact only eight who were poets of repute, while another Śaiva poet of the period, Māṅikkavācakar, who was important for the shaping of Śaiva devotionalism, was not accepted as a Nāyaṅār for several centuries. The earliest of the Nāyaṅārs was probably a woman, Kāraikkāl Ammaiṅār (seventh century CE), who renounced worldly pleasures for devotion to Śiva. Tirumūlar (eighth century CE) is noted for his 3,000-verse philosophical treatise, *Tirumantiram*, which interprets Sanskrit Agamic and Tantric material into Tamil. The best known and most prolific of the Nāyaṅār poets were the three whose poetry makes up the first seven sections of the *Tēvarām*, the Tamil Śaiva canon. Two of these are seventh-century figures: Tirunāvukkaracar, better known as “Appar,” or “Father,” and his younger contemporary, Campantar or Tiruṅānacampantar, who is generally believed to have been a child prodigy uttering all his poetry before the age of sixteen; the third poet is the ninth-century (?) Cuntaramūrtti. However, perhaps the best of all the Śaiva poets of these three centuries was the ninth-century Māṅikkavācakar, for whom the religious experience was like ecstasy and “madness” when one was possessed by Śiva. Māṅikkavācakar’s use of erotic imagery apparently was a major factor in keeping him from being accepted as a poet of the Śaiva canon until at least the twelfth century, when Cēkkiḷār included him in his *Periyapurāṇam*, the mythical hagiography of the Śaiva saints.

The religion propagated by the *bhakti* poets used epic and puranic mythology selectively and gave it a locus in Tamil India. A number of basic themes were stressed: (1) the supremacy, greatness, even terror of Śiva or Viṣṇu, coupled nonetheless by the deity’s grace and compassion for those who were devoted to him; (2) the concrete and available presence of the god in his specific sacred places and, hence, the desirability of pilgrimage, festival, and temple ritual; (3) the affirmation of the individual in the experience of *bhakti*

or devotion to god and the possibility of anyone's attaining the god's grace regardless of one's station; (4) the sense of community among the god's devotees and the merit in serving and being in such company; (5) the celebration of the experience of the god as the highest attainment of religion.

Tamil *bhakti* reflected many strands of religion at once. While it incorporated, on the one hand, certain aspects of Jain and Buddhist values (e.g., a sense of community among devotees; hospitality to fellow devotees; and the possibility of spiritual attainment irrespective of social or economic backgrounds); on the other hand, it directly confronted these heterodoxies with a vigorous theism; an affirmation of the phenomenal world as God's creation; and the importance of the devotional experience and of pilgrimage to the deity's special places. This *bhakti* movement reaffirmed elements of early Tamil religious perspectives: the emphasis on celebration, ecstasy, even possession by the god; the importance of the individual in religious experience; and the affirmation of the land and its special places. At the same time, Tamil *bhakti* illustrated the importance of a number of elements of post-Vedic orthodox, Sanskritic Hindu religion: the full-blown theism and mythology of the epics and Purāṇas, the spawning of temple-oriented ritual centered by *devapūjā* (worship through the icon), increased emphasis on liberation as the ultimate aim in religion, and others.

The centerpiece of Tamil *bhakti*, nonetheless, remained the personality of the god and his relationship with individual human beings. The god's exploits were recited selectively; his awesome and terror-inspiring character (as with Śiva) or his miracle-working one (as with Viṣṇu), was invoked. Yet at the same time, his grace (*arul*), love (*aṅṅu*), and wooing of devotees was variously portrayed. The devotee, for his part, learned to attain the god's grace. The relationship was variously described as that of lover to a beloved; friend to friend; parent to child. The relationship generally differed in Śaiva and Vaiṣṇava *bhaktias*: For the former, a certain individuality of the devotee was thought to be retained in the devotional relationship with the god—a relationship said to be that between sun and light or flower and fragrance. In Vaiṣṇava *bhakti*, on the other hand, the loss of the devotee's selfhood in relation to the divine was stressed and the surrender of the one to the other celebrated.

**RELIGION IN THE MEDIEVAL PERIOD.** From the eighth through the fifteenth century much of Hindu civilization was centered in Tamil India, where a prolific religious literature emerged in both Tamil and Sanskrit. In addition to the devotional literature, a number of ritual treatises were prepared in this region, including many of the Śaivāgamas, those texts used by Śaiva sects, as well as those of the Vaiṣṇava sects, the Pāñcarātrāgamas and Vaikhānasāgamas. Portions of several Purāṇas were authored by anonymous Tamil scholars and regional recensions of others prepared. Not least important of the literary corpus emerging after the twelfth century were the *Tālapurāṇas*, or mythological stories of temple sites throughout Tamil country.

In addition to the literature, Tamil India became the scene for an explosion of temple construction, incorporating an architecture that became characteristically Dravidian. There was also prolific sculpting in stone, and, during the years of the Cōla reign, in bronze. These architectural and sculpturing styles, together with the texts in which they were canonized, became the model for much of the architecture in city and temple building to be found in Southeast Asia from Burma to Cambodia. Another important achievement of the "medieval" centuries was the development of Hindu thought and of several philosophical schools. The religious history of this era is perhaps most easily divided into three periods: The Pallava (575–900); Cōla (900–1300); and Vijayanagar (1300–1700) periods.

**The Pallava period.** The Pallava period takes its name from the dynasty founded by Siṃhaviṣṇu and is best understood as a transitional or foundation era. In addition to the founding of *bhakti* sects devoted to Śiva and Viṣṇu, the period is characterized by the start of the South Indian tradition of temple-building in permanent stone. Canons for the building of these structures were developed and included the classical Dravidian forms of the *vimāna* or central tower and the *maṅṅapa* or main hallway. The temple assumed the symbolic character both of a microcosm and of the human form, and became the major focus for ritual events. Temple icons and the deities they represented were ascribed the attributes of kingship, while rituals addressed to the icon increasingly assumed the character of the giving of gifts to a king.

Another important development of this period was the growth of Brahmanic settlements in South India. These rural settlements, which came to be known as *brahmadeyas*, were granted by Tamil landowners as emblems of the alliances that had developed between the two communities. The *brahmadeyas* became major loci of Sanskrit learning and culture and radiated Sanskrit influence into virtually all of Tamil life even while its *brahman* residents were being tamilized.

It is this period also that marks the life and work of Śaṅkara (788–820) and Bhāskaran, his contemporary. The former was especially instrumental in making Advaita (monism) attractive to intellectuals, and in substantially grounding the speculative tradition in the Upaniṣads, thereby strengthening the Brahmanic option in its dispute with Buddhist thought.

**The Cōla period.** The Cōla period (900–1300) was characterized by the formalization and systematic Sanskritization of religion. Śaivism received special favor under the aegis of the Cōlas; hence, there was construction and enlargement of Śaiva temples. These temples were symbols of the official state cult that overwhelmed or incorporated into themselves many of the lesser village cults. (One of the few major "folk" deities to survive and increase in strength in this period was the Goddess, whose cultus and symbols were permitted to flourish and increase in popularity.) The temples were at first characterized by the tall *vimāna* or central tower, but eventually by the building of several ornate *gopuras* or

entranceways at each site. The temple, further, became a center for economic exchange, storage of land and goods, and social interaction, as well as a symbol of political liaison between kings, sectarian leaders, and landowners. A considerable literature known as *Talapurāṇas*, purporting to relate to the mythic history of temple sites, began to develop.

Another religious institution emerging to prominence in the Cōḷa period was the *maṭam* (Skt., *maṭha*) or monastic center. The *maṭam* became a center of spiritual learning especially for non-*brahmans*, though it often assumed economic and political power as well. The *brahmadeya* or *brahman* settlement continued to be the locus of much Sanskrit learning, radiating Brahmanic influence throughout the region.

Systematization in textual form continued in both Śaivism and Vaiṣṇavism. This was expressed in the continued formalization of ritual texts—the Śaivāgamas for Śaiva sects and the Pāñcarātrāgamas and Vaikhānasāgamas for Vaiṣṇavism—and in philosophical treatises. Śaiva Siddhānta proved to be the philosophical systematization of the Śaiva religious experience. It was formally expressed in forty terse Tamil verses by the thirteenth-century poet Meykaṅṭār (Meykaṅṭa Tēvar), and was known as the *Śivajñānabodham* (*Civañānapōtam*). A verse commentary, known as the *Śivajñānasiddhīyār*, was written by his disciple Aruṅanti Śivācariyar. Śaiva Siddhānta speaks of three realities—the lord (*patī*), the human soul (*pacu*; Skt., *paśu*), and the three bonds of human existence (*pāca*; Skt., *paśa*). In Śaiva Siddhānta the soul was to be freed from the bonds of *karman* (the law of cause and effect), *māyā* (the over-valuing of the phenomenal world), and *āṇava* (self-orientation) in order to become permanently attached to (and hence share the quality of) the lord Śiva.

Vaiṣṇava speculation, meanwhile, reached new heights during this period thanks largely to the work and thought of Yāmuna (918–1038), Rāmānuja (1017–1137), and Madhva (1199–1278). A central concern of these *ācāryas*, or preceptors, was that of affording a philosophical foundation for the devotional experience and hence in describing the relationship between the deity and the devotee, primarily in the form of surrender (*prapatti*). Yāmuna extolled the greatness of the lord and described the abject need of the devotee; Rāmānuja affirmed this theme but went on to argue for the “qualified” nature of supreme existence (*viśiṣṭādvaita*) in contradistinction to Śaṅkara’s more radical monism. Madhva, in contrast to the exponents of Śaṅkara’s system, argued for the reality and plurality of the world and the difference between the self and *brahman*. For each of these thinkers, *brahman* was perceived in terms of a personal deity.

The twelfth century was the period in which perhaps the greatest Tamil poet lived. Kampan, the “imperial poet,” master of style and form, is best known for his transcreation of Vālmiki’s *Rāmāyaṇa*. While borrowing extensively from the content and style of the Sanskrit epic, Kampan’s version, nonetheless, creatively adapts the finest of Tamil poetics, and locates the story in a distinctively Tamil landscape.

It was during the Cōḷa period that the influence of Hindu (and especially Śaiva) thought, which had started spreading into Southeast Asia under the Pallavas and Guptas, became more pronounced. *Brahmans*, now perceived as skilled and versatile advisers to kings, were to be found in such city-states as Polonnāruva (Sri Lanka), Pagan (Burma), Ayutthayā (Thailand), Angkor Wat and Angkor Thom (Cambodia) and Madjapahit (Java). These *brahmans* and other Hindu immigrants transported notions of divine kingship and cosmology; thus the architecture of capital cities, palaces, temples, and even the biers of dead kings, as well as some of the rituals in the courts of Southeast Asia, came to reflect motifs canonized in Śaivāgama texts of the Cōḷa period.

**The Vijayanagar period.** With the decline of the Cōḷa line and the rise of the Vijayanagar hegemony, whose capital was in Andhra Pradesh, shifts occurred in the character of religion in Tamil India. While the Vijayanagars, through political alliances, succeeded in keeping the expanding Islamic empire from making major political inroads in the South, there were nonetheless increasing Muslim influences. From the tenth century onward pockets of Muslims settled into small communities along the Tamil and Malabar coasts and radiated influence outward from these centers, and by the fourteenth and fifteenth centuries occasional military expeditions had led to brief periods of Muslim rule in several portions of Tamil country.

Another important political development of the Vijayanagar period, due in part to the increase in military capability, was the rise of local and supralocal rulers known as *nāyakkas*, who sustained pockets of political stability under suzerainty of the Telugu Vijayanagars. These *nāyakka* domains often led to the patronage of local Hindu institutions and the enhancement of local temples and festivals. The rise of the *nāyakka* system in Tamil country also led to change in the role of *brahmans* and temples in the region. The *brahmadeya* declined in power and *brahmans* were no longer given gifts to the degree that had been true in the Cōḷa period. Yet *brahmans*, especially Telugu *brahmans*, became important consultants in military and ritual affairs, and the temples, their deities, and their festivals came increasingly to express the reciprocities, including gift giving and the exchange of honors, that had been a part of the Cōḷa socio-political order.

The Cōḷa period was a time for the formalization and institutionalization of religion, especially of Śaivism, into temples and literary texts written primarily in Sanskrit. In the post-Cōḷa period the vernacular once again became the chief medium for religious expression, and thus the more popular forms of Hinduism found expression across the Tamil region. Tamil Hinduism during the Vijayanagar period thus was characterized by resurgent devotionalism and increased participation in temple rituals and festivals by a broader spectrum of people. One might speak of this new era as the “silver age” of Tamil *bhakti*.

The harbinger of this post-Cōḷa trend was Aruṅakirinātar (c. 1475–1550). His poetry was characterized by an ingenious use of meter and sound as an accompaniment to dance; by a skillful combination of Sanskrit and Tamil terms, albeit in a Tamil idiom that celebrated its very Tamilness; by lavish praise of Murukaṅ and that deity's consorts and sacred places; and by a call both to egalitarian issues and to a devotion to God. Aruṅakir likened the religious experience to a profound silence.

By the seventeenth and eighteenth centuries *bhakti* literature had mushroomed. Such poets as Tāyumaṅavar, Kacciyapaciva, and Kumārakurupara celebrated the mythology, sacred places, and devotionalism of Śaivism. Tamil *Tālapurāṇas*, or mythologies of temple sites, proliferated in the fifteen and sixteenth centuries, each purporting to describe the mythical history and grandeur of local temples by localizing and re-enforcing themes that had been part of the Tamil landscape for centuries, especially the sacrality and power of land and waters. The role of the Goddess was an important theme in these temple myths, especially her identity with the land and the necessity to channel her considerable power into the patterns of normative theism.

The late Vijayanagar period saw a resurgence of temple construction. The number of temples almost tripled in the two centuries between 1550 and 1750. While the construction of Śaiva temples was relatively moderate, particularly in eastern portions of the Tamil region, temples to Viṣṇu, the Goddess, and Śiva's sons Murukaṅ and Gaṇeśa proliferated much more rapidly than in earlier centuries, especially in western portions of the region. Further, these temples more frequently became the arena for public events, including marriages and festivals. Festivals such as the Cittarai festival (April–May) in Madurai and the Mahānavamī festival (September–October) in Vijayanagara were described by commentators in the fifteenth and sixteenth centuries as enormous celebrations and paradigmatic events. Such festivals came to express a wide range of social and religious realities; relationships between castes and sectarian groups; the role of the king as presiding presence, warrior *par excellence*, and agent of prosperity; celebration of harvest or significant seasonal transition; and the reenactment of the career of the deity and the extolling of him or her as celestial prototype of the king and cosmic ruler. Extant temples were enlarged, *gopuras*, or entranceways, were donated by numbers of wealthier families, and the temple environs took on the character of a miniature city.

These centuries were also a time when some Sanskrit Purāṇas and epic literature were transcreated into Tamil. In the seventeenth century, for example, the Tamil version of the *Skanda Purāṇa* appeared, giving to the epic deity a flavor that incorporated all his appropriate Tamil heritage.

Another form of *bhakti* literature that proliferated by the sixteenth and seventeenth centuries was a form of poetry known as *pillaitamil*, which worshiped the deity in the form of a child. While the Āḷvār Āṅṅāḷ was apparently the first

poet to celebrate in Tamil the childhood of Kṛṣṇa, there is increased use of this form of poetry in both Vaiṣṇava and Śaiva contexts. In this type of *bhakti* the poet often assumes the form of the deity's parent and equates the stages of childhood to rhythms of the cosmos and of the poetic medium.

However, there was also a religious countermovement to be found in Tamil country during much of this period. Primarily between the tenth and fifteenth centuries a cryptic “antiestablishment” form of religion found its expression in the poetry and lifestyle of persons known as *cittars* (Skt., *śiddhas*). Primarily Śaiva, the *cittars* were nonetheless committed to the notion that Śiva or Civan was not to be worshiped in iconic form but rather as the supreme limitless one who was virtually identifiable with individual life-forms (*jīvanātman*). Theirs was a lifestyle therefore given to *yoga*, bodily disciplines, meditation, and healing practices. Temple cults, iconic worship, caste, and Brahmanism were criticized, and such notions as *karman* and reincarnation deemphasized. Rather, the body was believed to be temple and microcosm, and internal power the noblest of virtues. In their poetry, natural objects became images of the individual's spiritual quest: The dancing snake, for example, could be seen as the individual's personhood or spirit, and the bee came to represent the life force. Pattiṅattar II (fourteenth–fifteenth centuries) and his disciple Pattirakiriyar, on the other hand, were more pessimistic: Life is tragic, the body filthy, and the beauty of women detestable. The human is a frustrated beggar who longs to be delivered and liberated by God. This is a mood that appears, to varying extents, in the writings of Aruṅakirinātar (fifteenth century), Tāyumaṅavar (1706–1744), and Rāmaliṅka Cuvāmikal (nineteenth century).

In summary, the Vijayanagar period was a time when religion subtly reaffirmed Hindu and Tamil identities in the wake of the extensive Sanskritization of the Cōḷa period and in the face of Muslim and Telugu influence throughout the period. Literary and architectural expressions of religion reflected a resurgence of devotionalism and participation. The cultus of the Goddess had become widespread and devotional Vaiṣṇavism and Śaivism were resurgent, most frequently expressing themselves in worship of the deity's childhood, the building of shrines, and the incorporation of aspects of popular religion. In the meanwhile the tradition had also produced a self-critical movement, focusing on the body as medium of worship and raising questions about the public cultus.

**PRE-MODERN PERIOD.** By the seventeenth century European influence had begun to leave its impact on Tamil culture and religion. As early as the fourth century Christians had inhabited areas along the southwest coast. Pockets of Jewish merchants settled in such western cities as Cochin where, by the eleventh century, they had negotiated extensive privileges and rights with local rulers. While these groups remained economically active in the area now known as Kerala, they tended to be socially insular and their impact on Tamil-

speaking peoples was marginal. By the late sixteenth century, however, Christian missionaries had begun to influence Tamil letters and lifestyle more actively: Enrique Enriquez, a Portuguese Jesuit who was in southwestern India from 1546 to 1600, sought to prepare catechisms and grammars in Tamil in such a way as to make a permanent impact on the development of Christian Tamil theological vocabulary and to create a Catholic fishing community. Roberto de Nobili, a Jesuit who spent much of his life in Madurai after arriving in Goa in 1605, sought to present Christian scriptures and thought as extensions and fulfillments of Tamil Brahmanism. Constantine Beschi, a Jesuit who was in Madurai from 1710 to 1747, made original contributions to Tamil literature.

The first of the Protestant missionaries was Bartholomaeus Ziegenbalg, who arrived in Tranquebar in 1706. He wrote relatively sympathetic manuscripts on the religious life of South India and continued the process of translating the Bible and Christian ideas into Tamil. Christian Schwartz, who arrived in 1750, served an important role as mediator between local rulers and British officials. Others, such as Johann Fabricius, who died in 1791, and the nineteenth century's Bishop Caldwell, were instrumental in developing a dictionary and comparative Dravidian grammar respectively, implements that increased the exchange of ideas between the English and Tamil worlds. In the nineteenth century G. U. Pope's translation of *Māṇikkavācakar* and Henry Whitehead's description of Tamil village religion helped make elements of the Tamil religious landscape better known to Tamils as well as to the English-speaking world, even though the work of neither was free of the Western/Christian bias of the authors. This sort of interpretive work continued into the twentieth century with the scholarship of C. G. Diehl and others.

An indigenous Tamil Christianity emerged during these centuries that included not only the conversion of large groups of people from the lower strata of the social order in specific villages or districts, but also the development of such articulate Tamil spokesmen for the "new" religion as H. A. Krisna Pillai, Vedanayagar Sastriar, and A. J. Appasamy. Christian hospitals, schools, colleges, orphanages, and presses dotted the Tamil landscape and influenced the shape of Tamil Hindu responses.

Quite apart from the attempts at Christianization that accompanied the European presence were other forms of westernization that influenced the shape of religion in Tamil country. On the one hand, there were those Westerners who romanticized the Hindu tradition. Most notable of these was Annie Besant (1847–1933; active in India between 1894 and 1920), who established the international headquarters of the Theosophical Society in Madras and became both an active defender of Hindu values and a crusader for reform. On the other hand, there were tendencies to criticize or undermine traditional patterns of life and religion in the area. These included a range of activities from the relatively virulent

"preaching missions" sponsored by missionaries to the more subtle acts of discrimination and exploitation associated with colonialism.

Still another dimension of religion evident in the pre-modern period that had an impact on current religious life was the continuing practice of indigenous village and folk forms of worship. Encouraged by the relative eclecticism of the Vijayanagar period, folk forms of religion became increasingly apparent and influential on the more literate forms of religion. Local deities designed to protect village and field and representing the social stratification of their worshipers have been an important part of the Tamil religious landscape even into the present century. These include such deities as Aiyānār, who has been a protector deity of Tamil villages since at least the eighth century; Karappacāmi, the black "servant" god, and various regional *virans* (hero-warriors). Such deities as these are sometimes ascribed exploits of resistance to British forces in local mythology. Local goddesses such as Mariammaṅ are considered personifications of the world's natural forces and hence are propitiated lest pestilence or national catastrophe befall. During the mid-twentieth century many such deities have become linked to the "great tradition" of Hinduism, particularly as those strata of society for whom these deities were paradigmatic have been integrated with the larger social order.

**THE PRESENT.** The Tamil religious response to the impact of the West has been expressed in a great variety of ways. Some of these have been characteristic of neo-Hinduism throughout India. There has been some adaptation of strategies (e.g., the use of preaching missions and the development of benevolent institutions) and of ideas from British and Christian sources. There has been the syncretistic combination of ideas drawn selectively both from within the tradition and from Christian or Western sources; most commonly, these "mosaics of religion" have been created by individuals and by certain *gurus* and their groups. Sarvepalli Radhakrishnan (1888–1975) may be the best known of those southern thinkers of the twentieth century who have reaffirmed elements of the Hindu tradition in ways that interweave Western ideas.

However, the last century and a half has been characterized by a rebirth of Tamil self-consciousness. The discovery, translation, and interpretation of Tamil languages and literature by Westerners has encouraged a resurgence of regional and ethnic pride among Tamils. Classical Tamil texts have been recovered and republished. Tamil devotional literature has been memorized and is invoked as the standard of ideal religion, albeit interpreted and used selectively. Shrines have been renovated and their mythical antiquity extolled. Often, regional traditions and myths assume precedence over national ones. Thus even though brahmanization continues to occur as folk and village cults are Hinduized, and although various Anglicizations have been accepted as normative, the Tamil and non-*brahman* roots of religious practice are perpetuated and practiced with fervor. As Tamils, especially

nonbrahmins, have migrated abroad in search of economic opportunities, they have taken with them to Malaysia, Sri Lanka, East Africa, Madagascar, and North America self-perceptions and religious lifestyles.

The character of much of this Tamil religion in the modern era is aptly described as neo-*bhakti*. Participation in festivals and pilgrimages at temple sites has increased geometrically. Renovation of some temples deemed significant began in the latter part of the nineteenth century; they began to welcome all spectra of society in the 1920s, and they have become more accessible by transportation systems since the 1930s. Deities such as Murukaṅ have attained enormous popularity throughout the region for a variety of reasons, among which are his appeal to all spectra of society; his presumed Tamil antiquity and identity; and his amalgamation of much of the religious symbolism that has been part of Tamil cultural history. In more recent decades, local goddesses such as Mariammaṅ have been increasingly brahmanized and made part of the great Hindu tradition even while retaining ties to local sites and folk culture. Aiyappan, whose prototypical shrine is in Kerala, has nonetheless attracted increasing numbers of Tamil worshipers who see in him Tamil roots, genuine power, and an invitation to a sense of community that transcends caste. Various forms of ancient ritual continue to be practiced in the homes of the orthodox even while accommodations are made to the exigencies of commerce and contemporary life. At the same time, public pressures to “streamline” and “democratize” religion have led to the de-brahmanization of ritual in some temples and the privatization of some religious practices. Yet in many respects, religion is as much a part of the contemporary Tamil consciousness as it has ever been.

FRED W. CLOTHEY (1987)

**TAMMUZ** SEE DUMUZI

**TANGAROA** is the most important of the “departmental” gods of Polynesia. In his many cognates, he was worshiped by most Polynesians as the chief god and creator of the world. His popularity, however, depended chiefly on his role as ruler over the ocean. Tangaroa stands as the origin and personification of all fish; his offspring are the creatures of the sea. Tangaroa was often appealed to by seafarers and fisherman, and, under the title Tangaroa-whakamautai, he was recognized by the Maori of New Zealand as the controller of the tides.

**MYTHOLOGICAL CONTEXT.** The souls of the Polynesian ancestors live on in the spirit land of Hawaiki, which is the symbolic place of origin of the Polynesian people. Ancestor deification was probably the original form of Polynesian religion. While some of the gods’ names were common throughout the Pacific islands, most Polynesian gods were strictly local deities. The Polynesian deities have been classified into four groups: supreme, “departmental,” tribal, and family. The departmental gods were classified according to the aspect of nature they ruled. The major departmental gods—Tane, Rongo, Tu, and Tangaroa—were often portrayed in eastern Polynesian mythology as the sons of Rangi (“sky”) and Papa (“earth”). Areas of authority were distributed among the four departmental gods, who, together with the tribal ancestors, constituted the pantheon of the earliest Polynesian mythology and who were shared by many island groups.

The parentage of these deities was often traced to ancestors: like the gods of Greek mythology, the Polynesian departmental deities had once been living persons with human desires and passions. The process of creating gods continued in Polynesia until the advent of Christianity in the Pacific islands during the early nineteenth century. In general, the study of Polynesian myths and religious beliefs has been dependent upon source materials from early missionaries, who were not free from prejudice. The religion and mythology of the Maori of New Zealand, however, were systematically studied and therefore constitute an important exception.

**TANGAROA’S ROLE.** In New Zealand, Tangaroa appears to have been venerated under several names, such as Tangaroa-nui, Tangaroa-ra-vaio, Tangaroa-mai-tu-rangi, Tangaroa-amua, Tangaroa-a-timu, and Tangaroa-a-roto. On other Polynesian islands, Tangaroa was known as Ta’aroa, Tangaloa, Tanaroa, and Kanaloa. Tangaroa’s role varied because major gods were often fused with local or family deities. Tangaroa did, however, continue to exist as an independent major god in most of the Polynesian myths, and a distinct Tangaroa cult developed in parallel to other common worship practices. This cult apparently flourished on the islands where there was an affinity between gods and eponymous ancestors. On some islands, there remains only scant informa-

tion about Tangaroa, but his former importance is proven by his appearance in many *fagu* (sacred) chants:

O Tangaroa in the immensity of space  
Clear away the clouds by day  
Clear away the clouds by night  
That Ru may see the stars of heaven  
To guide him in the land of his desire (Buck, 1938)

Tangaroa was portrayed as the supreme being in western and central Polynesia, but he was worshiped as the god of the sea. In the Samoan Islands, Tangaroa was essentially a creator—the being who formed the islands or who raised them up from the depths of the sea. In Tongan mythology, Tangaroa appeared as the sky god. Tui Tonga, the founder of the Tongan royal family, was respected as having descended from Tangaroa. He was therefore held to be sacred and to possess great powers that were attributed to semidivine chiefs. Though Tangaroa was also referred to as the supreme being and first cause in Samoa, the Society Islands, and Hawai’i, the complex was almost absent from the belief system of the Polynesian marginal islands according to E. S. Craighill Handy (1927).

In the Cook Islands, Tangaroa and Rongo are said to have been the twin children of the primal parents Papa and Atea (“heaven”). Tangaroa is said to have taken a wife, Hina, in the Cook Islands—a conjunction that was held throughout Polynesia. On Easter Island, the Ariki Mau (“great chief”) was the possessor of *mana* (“power”) that was transmitted down the genealogical line from the ancestral gods Tangaroa and Rongo. On Samoa, Rongo is said to be the offspring of Tangaroa and Hina. Thus the roles of the gods, as well as their names, frequently vary from region to region.

There is a striking contrast to the above in the interpretation given Tangaroa in the Marquesas Islands, where Tangaroa was elevated into a divinity who battled Atea for supremacy. A creation myth of the Marquesas, however, contains many references to Tangaroa as merely a god of the sea and winds. It is plausible that the status of Tangaroa declined under the growing influence of Christian missionaries on the islands. In Hawaii, where he is called Kaneloa, Tangaroa was less important than the other departmental gods. This lack of status may have been due to the fact that the people of Hawaii later arranged their pantheon to conform with the Christian triadic pattern, using Kane (Tane), Ku (Tu), and Lono (Rongo) to form a trinity.

**EFFECTS OF CHRISTIANIZATION.** As might be expected, the advent of the Europeans led to radical changes in Polynesian religions. In the Austral, Society, Tuamotu, and Gambier islands, the people still know Tangaroa as the god of the sea. Polynesian contact with Europeans, however, and the eventual conversion of many islanders to Christianity destroyed the old gods’ religious authority. Why, then, is Tangaroa the sole “survivor” among the many Polynesian gods? The answer is tied to the fact that for the Polynesians, descendants of great seafarers, the ocean is vitally important. The music-

loving Polynesians continue to sing their old chants even though they no longer fully understand the role that the texts had played in their religious traditions. The old *fagu* chants, still known in the extreme eastern end of the Tuamotu Islands, offer a sketch of the creation myths and of some of the religious concepts that existed before the advent of Christianity. These chants contain not only the name of Tangaroa but also the names of other gods; even ancestral gods often appear in parodies. But, in general, the gradual disintegration of traditional island society has coincided with the death of the Polynesian gods.

Radical change was enhanced by the modernization of island societies after World War II. In the 1960s, Tangaroa was mentioned in only one of the parody chants that was used on the occasion of welcoming visitors to the eastern Tuamotus:

We descend from Tangaroa Manini, we are ready for you  
We love you Manini, with blessings  
Has come to our land. (Hatanaka, 1976)

It may be that one day even the name of Tangaroa will no longer be known to the Polynesian people; then all of the gods will have returned to the land of Hawaiiki.

#### TĀNGRI SEE TENGRI

**TANG YONGTONG** (1893–1964) was an eminent scholar of the history of Chinese Buddhism. A native of Huangmei County in Hubei Province, China, Tang studied in Beijing and graduated from Qinghua University in 1917. In order to pursue his studies he went to the United States in the following year, where he specialized in philosophy, Sanskrit, and Pali at Harvard University. Tang received his master's degree in 1922 and returned to China, where he began a teaching career that spanned four decades.

By the 1940s, Tang was already well established in the philosophy department of Beijing University, becoming its chairman and eventually being named dean of the College of Humanities. In addition to his research on Buddhism and Indian philosophy, Tang was an expert on the school of thought known as *xuanxue* ("dark learning"), which flourished during the Wei and Jin dynasties (third and fourth centuries CE). He also lectured on such Western philosophical

traditions as rationalism and empiricism, having studied European philosophy during his years abroad. In 1947 Tang was named an academician of the Central Research Institute, and thereafter returned to the United States to give a series of lectures at the University of California.

Firmly rejecting suggestions that he go to Taiwan following the establishment of the People's Republic in 1949, Tang actively took part in academic affairs in the newly established People's Republic. He was appointed chairman of the Council for Academic Affairs and vice-president of Beijing University, and was elected a member of the Academic Society of the Chinese Academy of Sciences. In addition, Tang was a member of the Standing Committee of the first, second, and third National People's Congresses.

Consonant with both Marxist theory and contemporary scholarship in the social scientific study of religion, Tang focused more on the historical and social impact of Buddhist thought than on its religious influence. His principal works include *Hanwei liang jin Nanbeichao fojiao shi* (A history of Buddhism from the Han and Wei Dynasties to the Northern and Southern Dynasties), *Suitang fojiao shigao* (A history of Buddhism in the Sui and Tang Dynasties), and *Yindu zhexue shilue* (A concise history of Indian philosophy). Through his academic work and official posts Tang influenced an entire generation of Chinese students of Buddhism.

REN JIYU (1987 AND 2005)

**TANLUAN** (traditional dates 476–542, but more probably c. 488–554) was the author of the first known systematic work to be produced in China on Pure Land (Chin., Jingtū) Buddhism, that branch of the Buddhist tradition that emphasizes faith in the Buddha Amitābha (Buddha of Limitless Light; Chin., Emituofu; Jpn., Amida) and rebirth in Sukhāvātī ("land of bliss"), Amitābha's paradisiacal realm in the western quarter of the universe, as a means of attaining enlightenment. Tanluan's writings were a major textual source for the Japanese monk Shinran (1173–1262), the founder of the Jōdo Shinshū, which therefore regards Tanluan as one of its major patriarchal figures.

According to his biography in the *Xu gaoseng zhuan* (Further Biographies of Eminent Monks), Tanluan was born in the north, near Wutai Shan in Shansi Province, and studied Buddhism in his youth. Following a serious illness, however, he took up the pursuit of techniques of immortality recommended in various Daoist texts. His quest eventually led

him to a supposed encounter with Tao Hongjing (456–536), the eminent Six Dynasties alchemist and master of the Mao-shan Daoist tradition, who allegedly transmitted to him ten fascicles of “scriptures of the immortals” (*xian cǐng*). On his way north again Tanluan stopped in Luoyang, where the Indian monk and translator Bodhiruci is said to have introduced him to the *Guan wuliangshou jing* (Scripture on the Visualization of the Buddha Amitābha). Bodhiruci remarked to him at the time that Amitābha (known also by his alternate Sanskrit name, Amitāyus, Buddha of Limitless Life) was the “greatest immortal” (*da xian*), given his ability to lead beings out of the realm of rebirth altogether. This historically questionable episode is nonetheless suggestive of the close link that must have been popularly perceived between the soteriological goals of Daoism and some of the Buddhist traditions, a link that may have contributed to the rapid growth in popularity of the Amitābha cult in Tanluan’s time. In the aftermath of this encounter Tanluan devoted himself to the study of the Pure Land scriptures, eventually gathering around himself a group of devotees to Amitābha.

Many Daoist and Buddhist works are attributed to Tanluan, but only two, both of which are Buddhist, are unquestionably authentic. The first, a systematic treatise, is generally known by the abbreviated title *Wangsheng lun zhu* (Notes on the Treatise on Birth [in the Pure Land]; T. D. no. 1819). The second, the *Zan Emitofoji* (Canticles on Amitābha; T. D. no. 1978), is an apparently liturgical work. The *Lun zhu* is Tanluan’s commentary (*zhu*) to the so-called *Sukhāvativyūhopedśā\** (*Wuliangshou jing yu potishe yuansheng ji*), a collection of Buddhist-style hymns (Skt., *gāthā*), with autocommentary, attributed uncertainly to Vasubandhu. Tanluan’s commentary proceeds carefully *au pied de la lettre*, with only a few insertions external to the format of “Vasubandhu’s” text. His general intent is to show how one may achieve liberation by availing oneself of the pure *karman* of Amitābha, which is freely dispensed to all who seek it in accordance with a series of resolves (*pranidhana*) taken by this Buddha while still the *bodhisattva* Dharmākara.

Drawing on the *Larger Sukhāvativyūha Sūtra*, the *Smaller Sukhāvativyūha Sūtra*, and the *Guan wuliangshou jing*, Tanluan shows how the power of Amitābha is effective for all beings who call upon him in faith, even for laypersons who cannot meditate or for those sunk in immorality. Faith in, and worship of, Amitābha is accomplished through what Tanluan (imparting his own classification to “Vasubandhu’s” discussion) termed the “five gates of recollection” (*wu nianmen*): bodily worship (i. e., bowing, etc.); vocal praise (especially, but not exclusively the invocation of his name, i. e., *nianfo* practice); wholehearted resolve to be reborn in the Pure Land; visualization (*guan*) of the delights of the Pure Land; and “turning toward” (*huixiang*), a purposely ambiguous term that means both turning toward beings while the practitioner is still in *samsara*, so as to give them the religious merit gained through one’s own practice and, having been born in the Pure Land, turning back toward beings by being reborn in *samsara* in order to liberate others.

Tanluan’s demonstration of these simple practices is sophisticated and profound, being based heavily upon the *Mahāprajñāpāramitā Śāstra* (a commentary on the *Perfection of Wisdom Scripture* attributed to Nāgārjuna), but it is not necessary to understand the demonstration in order to use the practice. The *upāya* (skill in means) involved is that of the passionate longing for heavenly delights. The Pure Land is depicted *as if* it were a heaven of sensual delight (i. e., a *devaloka*, or realm of a deity), but in fact it is outside of the phenomenal world of *samsāra*. It is not a phantasm, however: “It exists extra-phenomenally,” says Tanluan, and is by its inner nature pure in every respect, even in respect of discursive thought. Thus, when one dies and, through Amitābha’s power, is reborn in the Pure Land and sees Amitābha there as its lord, one is actually “not born.” One’s desires take on the Pure Land’s nature of desirelessness as the water of rivers takes on the saltiness of the sea when it runs into it. One’s passionate longing for delight is extinguished “like ice mixed with fire: The fire [of the passions] goes out, and the ice [of the Pure Land’s delights] disappears.” Thus, one has effectively achieved *nirvāṇa* and one functions like a *bodhisattva* of the upper levels (i. e., a *bodhisattva* who has achieved the state of nonretrogression), ever remaining fixed in the *dharmakāya* (unmanifest Buddha nature) yet constantly manifesting bodies in all the worlds where Buddhist teachers are needed, “like the sun that remains in the sky yet is reflected in hundreds of rivers and pools.”

Tanluan was virtually ignored in China, but his influence in Japan has been considerable since Shinran’s time. Shinran used the *Lun zhu* as the major source of his *Kyōgyōshinshō*, a collection of proof texts on Pure Land Buddhism, and composed his own *San Amidabu-tsuge*, which was closely based on Tanluan’s *Zan Emitofoji*. Shinran built his even simpler practice of gratefully rejoicing in *already having been* liberated by the power of Amitābha on the intellectual foundation provided by Tanluan.

## BIBLIOGRAPHY

For an excellent introduction to Tanluan’s thought and its influence on the Pure Land tradition in China, see Mochizuki Shinkō’s *Chūgoku jōdo kyōrishi* (Kyoto, 1964). Fukuhara Ryōgon’s *Ōjō ronchū no kenkyū* (Kyoto, 1978) and Mikogami Eryū’s *Ōjō ronchū kaisetsu* (Kyoto, 1969) contain valuable analyses of the *Wangsheng lun zhu*, as does my own “Tanluan’s Commentary on the Pure Land Discourse: An Annotated Translation and Soteriological Analysis of the *Wangsheng lun zhu*” (Ph. D. diss., University of Wisconsin, 1973). For a discussion of the influence of Tanluan’s thought on Japanese Pure Land Buddhism, see Bandō Shōjun’s “Shinran’s Indebtedness to Tanluan,” *The Eastern Buddhist* n. s. 4 (May 1971): 72–87, and, more fully, my “Shinran’s Proofs of True Buddhism: Hermeneutics and Doctrinal Development in the *Kyōgyōshinshō*’s use of Tan-

luan's *Lunzhu*," in *Buddhist Hermeneutics*, edited by Donald S. Lopez, Jr. (Honolulu, forthcoming).

ROGER J. CORLESS (1987)

## T'AN-LUAN SEE TANLUAN

**TANNAIM.** The term *tanna* is used to refer to an authority of the Mishnah and its related works, in contradistinction to *amora*, referring to a sage of the *gemara*'. The word derives from the Aramaic *teni* ("to repeat") and by extension means "to learn" or "to teach."

The tannaim were the sages of rabbinic tradition who lived immediately before, and then during the century and a half following, the destruction of the Temple in Jerusalem (70 CE). This period is traditionally divided into five or six generations. The most prominent authorities of the period included Hillel, Gamli'el the Elder, Yoḥanan ben Zakk'ai, Gamli'el of Yavneh, Eli'ezer ben Hyrcanus, 'Aqiva' ben Yosef, Me'ir, and Yehuda ha-Nasi'. The period ends with the generation of Yehuda ha-Nasi', the editor of the Mishnah (c. 200 CE), although the following generation in Palestine is one of transition. The division in Babylonia is clearer, though the amora Rav is occasionally spoken of as having tannaic authority.

The texts that record the traditions of these sages are termed *tannaic*, and they include the Mishnah, the Tosefta, the halakhic *midrashim*, and a broad variety of traditions preserved in the Jerusalem and Babylonian Talmuds. Traditions that are ascribed tannaic authority are introduced, almost without exception in the Babylonian Talmud but with frequent exception in the Jerusalem Talmud, with a set of technical vocabulary that employs the root *tny*. Such traditions are termed *baraitot* (sg., *baraita'*), meaning "traditions outside, or excluded from, the Mishnah" (from Aramaic *bar*, "outside").

The tannaic texts, particularly the Mishnah but to a significant extent the *baraitot* as well, form the basis of later rabbinic legal deliberations. These texts were tested, interpreted, and sometimes emended by the amoraim, and they were in a very real sense accorded the authority of canon. The tannaim often became great legendary figures who were thought to have experienced, and sometimes even instigated, miracles.

The term *tanna*' is secondarily used to refer to the professional repeater or reciter of the rabbinic schools who functioned during both the tannaic and amoraic periods, even into the centuries that followed (the amoraic period ended c. 500 CE). The *tanna*' may also have been referred to as *roveh* ("repeater"), later confused with *rabbah* ("the great").

The official traditions of the rabbinic schools were oral. The functionaries who memorized the official texts were the

*tanna'im*, who were in all respects living books. The process of committing the official text to memory most likely occurred in the following way. First, the master would decide upon the version of the tradition to be taught. He would then call upon his *tanna*', who would be asked to recite the tradition a great many times until its memorization was secure. At that time other *tanna'im* might be called in, for whom the first *tanna*' would then recite the tradition. He would test their memorization, and in this way the version of the text would be secured in the mouths of increasing numbers of *tanna'im*.

Such a method constituted genuine publication. There are several accounts in Talmudic literature in which the *tanna*' is consulted to clarify the official version of a tradition. When the *tanna*' testified to the reading of a text, his testimony was deemed authoritative. Even the Mishnah's editor, Yehuda ha-Nasi', is reported to have consulted his *tanna*' for a proper reading, and this particular *tanna*' is spoken of as having a "tested" or "revised" version of the Mishnah.

Because the *tanna*' was depended upon to provide published traditions, without commentary and without emendation, the *tanna'im* were apparently chosen for their phenomenal memories, not their intelligence. An overly intelligent *tanna*'; might have been tempted to emend a text if he thought it to be problematic. One sage speaks of a *tanna*' as "a basket filled with books" (B.T., *Meg.* 28b), that is, filled with information but not able to do much with it. A popular saying declares that "the *tanna*' recites and doesn't know what he is saying" (B.T., *Soh.* 22a). Still, some of the greatest sages also acted as *tanna'im*. In addition, the potential fallibility of oral publication was widely recognized, and it is probably for this reason that *Avot* 3.7 warns strongly against any interruption during one's repetition exercises.

The traditions of certain schools were thought to be especially reliable. This was true of the schools of Hiyya' and Oshaya', Palestinian sages of the transitional generation following the compilation of the Mishnah. The former of these teachers is also spoken of as being a repeater for Yehuda ha-Nasi'.

**TANTRISM**

*This entry consists of the following articles:*

AN OVERVIEW  
HINDU TANTRISM

**TANTRISM: AN OVERVIEW**

The term *tantrism* is a nineteenth-century western invention, coined to refer to what were considered to be a body of heterodox religious teachings, first discovered by European scholars in Indian works called *Tantras*. Although there is no term in any Asian language for tantrism, it continues to be applied by scholars to a bewilderingly diverse array of esoteric precepts and practices attested across much of South, Inner, and East Asia from the sixth century CE down to the present day.

The most salient phenomena common to all tantrisms are the use of *maṇḍalas*, *mantras*, and ritual practices in order to map, organize, and control a universe of powerful beings, impulses, or forces in pandemonium. Here, it is important to note that the specifically tantric use of *maṇḍalas*, *mantras*, and initiations first emerged in India as a religious response to or reflection of a situation of anomie. With the fall of the imperial Guptas in about 550 CE, much of the Indian subcontinent was plunged into a centuries-long period of feudalism, in which multiple, shifting political “centers” were in constant flux, passing under the control of a series of often low-caste rulers whose claim to dominion over a territory was, from the standpoint of orthodox religious polity, illegitimate. In order to legitimate their power, these newly arisen rulers called on a variety of religious specialists to ritually consecrate them with tantric *mantras*, transforming them into divine kings, and their conquered territories into equally consecrated *maṇḍalas* of royal power. Ronald M. Davidson has encapsulated this feudal dynamic:

In the medieval military culture, the apotheosis of the king served his strategy of divine right to the assumption of power, irrespective of his actual lineage. However, the process of divine royalty conversely implied the royalty of divinity, so the apotheosis of rulers entailed the feudalization of the gods. . . . [T]he great and local deities of the period . . . occupied positions in metaphysical space analogous to the positions controlled by their devotees in terrestrial space, with all the attendant rights and responsibilities. At the same time, lesser divinities became understood as representatives of the imperial divinity, who protected them in a complex

exchange of divine services, just as the vassals owed allegiance and loyalty to the monarch through the exchanges of goods, services, land, and booty. (*Indian Esoteric Buddhism*, 2002, pp. 71–72.)

When one bears in mind the Indian feudal context within which tantrism emerged out of preexisting Hindu, Buddhist, and Jain religious systems, a number of specifically tantric terms and practices become comprehensible. These include the use of *mantras* (secret spells) as “weapons” (*śāstras*), “missiles” (*astras*), and “armor” (*kavaca*); ritual practices of “binding the directions” (*dig-bandhana*) as a means to securing a consecrated space from invasion by demonic forces; the construction of tantric *maṇḍalas* on the model of fortified palace-citadels; multiple associations of tantric goddesses with warfare; the bearing of royal weapons or scepters (*vajras*) by tantric initiates; the tantric “acts” (*karmas*) of pacification, subjugation, immobilization, enmity, eradication, and liquidation; and the narrative use of the language of conquest (both military and sexual) in tantric discourse in general. Here, the original tantric practitioner par excellence was not the traditional religious specialist—a Brāhmaṇ priest or a Buddhist or Jain monk—but rather the king, as exemplary member of the laity. Much of the early history of tantrism is intertwined with the emergence of a new type of lay religious specialist, “shamanic” ascetic practitioners who identified themselves, through their supernatural powers, with royal gods and divine kings. To these latter, they offered a variety of services and products, including spells and potions for the control of women, the attainment of wealth, and the annihilation of enemies; spirit possession; magical healing and manipulation of the dead, demons, and other entities; future-telling; and so on. In Hindu and Buddhist circles, these tantric supermen were called “Perfected Beings” (*Siddhas*, *Mahāsiddhas*) and “Virile Heroes” (*Vīras*); among Śvetāmbara Jains, the “Teachers” (*Sūris*) of the Kharatarā Gaccha sub-sect have played an analogous role.

**GEOGRAPHICAL SPREAD OF TANTRISM.** The origins of tantrism are Indian. All authentic tantric lineages—of deities, scriptures, oral teachings, and teachers—claim to extend back to Indian scriptures. The founders of every major tantric tradition, school, or sect either trace their guru-disciple lineages back to an Indian source, or are considered to be incarnations of bodhisattvas whose cults first arose in India. The exploded pantheons of tantrism—principal multi-headed and multi-armed deities proliferating into *maṇḍalas* of families or clans—are generally Indian, or at least traceable to Indian prototypes. The great bulk of tantric legends concerns Indian Siddhas and Mahāsiddhas. The hieratic language of tantrism generally remains the Sanskrit of medieval India, so that for any lineage-based tantric body of practice to be considered legitimate in Chinese, Japanese, Korean, or Tibetan tantric traditions, its translated root text has had to be traceable back to a Sanskrit original. In these translated sources, *mantras*—whose efficacy resides in their sound shape—will not be translated, but rather frozen (at least in theory) in the original Sanskrit. Furthermore, Sanskrit char-

acters form the basis of the hieratic *siddham* script employed in Chinese and Japanese tantric *maṇḍalas* and texts. The yogic practice that is so central to tantrism is also of Indian origin (albeit influenced by Daoist techniques).

Tantrism has persisted and quite often thrived across much of Asia since its Indian origins in the middle of the first millennium of the common era. Its practitioners have lived in India, China, Japan, Tibet, Nepal, Bhutan, Pakistan, Sri Lanka, Korea, and Mongolia, as well as in the “Greater India” of medieval Southeast Asia: Cambodia, Burma, and Indonesia. The medieval history of South Asian Hinduism, Buddhism, and Jainism is saturated with tantrism. In Hindu India, the Pāñcarātra, Gauḍīya Vaiṣṇava, Sahajiyā, Pāśupata, Kāpālika, Śaiva Siddhānta, Siddha Kaula, Yoginī Kaula, Krama, Trika, Śrīvidyā, Paścimāmnāya, Nāth Siddha, and Śākta movements, orders, and sects have all been tantric or heavily colored by tantrism since the medieval period. Medieval Jain tantric works such as the tenth-century *Jvālīnī Kalpa* resembled coeval Hindu and Buddhist Tantras in every way but for the names of the deities who were the objects of their ritual practice. Although Buddhism disappeared from the subcontinent in the thirteenth century, India (including present-day Pakistan) was the cradle of Buddhist tantrism in its Mahāyāna, Mantrayāna, and Vajrayāna forms, which were exported into Mongolia, Nepal, Bhutan, China, Korea, Japan, and Tibet. Certain of the Yoginī Tantras of early Buddhist tantrism originated in the Swat Valley of present-day Pakistan, and the tenth-century *Kālacakra Tantra*, an important Vajrayāna work, was likely written by an author living in the same region. Tibetan Buddhism is nearly entirely a Vajrayāna tradition: this applies to the four major existing schools (the Rnying ma [Nyingma] pas, Bka’ brgyud [Kagyū] pas, Sa skya [Sakya] pas, and Dge lugs [Geluk] pa), as well as to specific forms of practice, such as Rdzogs chen (the “Great Perfection” practice unique to Nyingma). The ritual of the medieval Chinese state was tantric, and China was the medieval changing-house for nearly every Buddhist tantric tradition transmitted to Japan, Korea, and Mongolia. In China, tantrism has persisted, since the twelfth century CE, within Daoist ritual practice. In Japan, all of the eight traditional schools of Buddhism have a tantric pedigree: of these, the Shingon and Tendai schools have persisted as Japan’s most successful exponents of “Pure Buddhist Esotericism.” In Southeast Asia, Cambodian inscriptions indicate the presence of Hindu tantric specialists there in the early medieval period; the medieval kings of Bali underwent Hindu tantric initiations, and present-day Balinese Hinduism continues to display its Indian tantric origins.

From 1642 until the exile of its Dge lugs (Geluk) pa leadership in 1950, Tibet was a tantric Buddhist theocracy. Today, the constitutional monarchies of Nepal and Bhutan are the world’s sole surviving “tantric kingdoms,” with their state ceremonial comprised of tantric liturgies and rituals and nearly all of their deities tantric. One of these, Bhairava, is a tantric god found in every part of Asia, and worshipped in

a tantric mode by Hindus, Jains, and Buddhists alike. Similarly, the originally Indian tantric gods Tārā, Ambikā, Akṣobhya, Mahākāla, Gaṇeśa, Avalokiteśvara, and Skanda, as well as numerous groups of multiple tantric deities, are found throughout much of Asia.

**FUNDAMENTALS OF TANTRIC PRACTICE.** Tantric practice consists of a set of ritual and meditative strategies for accessing and appropriating the energy or enlightened consciousness of the absolute godhead that, coursing through the universe, infuses its creatures with life and the potential for salvation. Humans in particular are empowered to realize this goal through strategies of embodiment—that is, of causing that supreme energy, essence of *nirvāṇa*, or quality of buddhahood to become concentrated in one or another sort of template or grid (a *maṇḍala* or *mantra*, the human body, or a ritual structure)—prior to its internalization in or identification with the individual microcosm. This they may do by appropriating elements of this world (which is real and not an illusion) such as words, images, bodies, and substances, into rituals that collapse subject and object, thereby projecting them into a realization of their inherent buddha nature or Śiva-self.

Drawing on its feudal Indian origins, tantrism also remains a body of practice with explicit this-worldly aims: the control of all of the beings located in the universal power grid, including lesser gods, living people, the dead, animals, and demons. While much of tantric practice has become sublimated into tame forms of “pure esotericism,” it must be recalled that the great volume of early tantric texts were devoted to sorcery—that is, to magical techniques for controlling other beings against their will. Such remains the primary goal of tantrism as it continues to be practiced on a popular level throughout much of Asia.

The key to understanding tantric practice is the *maṇḍala*, the energy grid that represents the constant flow of divine and demonic, human and animal impulses in the universe, as they interact in both constructive and destructive patterns. This grid is three-dimensional, in the sense that it locates the supreme deity (god, goddess, celestial buddha, bodhisattva, or enlightened *tīrthamkara*)—the source of that energy and ground of the grid itself—at the center and apex of a hierarchized cosmos. All other beings, including the practitioner, will be situated at lower levels of energy/consciousness/being, radiating downward and outward from the elevated center point. Because the deity is both transcendent and immanent, all of the beings located at the various energy levels on the grid participate in the outward flow of the godhead, and are in some way emanations or hypostases of the deity himself (or herself).

This is particularly the case with the tantric guru, the preceptor from whom a practitioner receives instruction and initiation, and with whom tantric practitioners frequently identify the godhead at the center of the *maṇḍala*. Here, the guru, as an already fully realized or empowered tantric being, plays a pivotal role, linking the human with the divine. In

certain tantric traditions, the male guru's female consort—variously called the Yoginī, Ḍākinī, “Action Seal,” or “Lotus Maiden”—is equally exalted as she is identified with the supreme female godhead. It is in this particular context that sexualized ritual may be brought to the fore in tantric initiation: the female consort, as the embodiment of the divine, transmits to the initiand the transformative energy and wisdom of the godhead through her sexual emissions, which are considered to be liquid gnosis. In this way, the initiand becomes a member of the divine family or clan of both his guru and the godhead at the center of the *maṇḍala*.

Crucial to the initiation process as well as to many other types of tantric practice is the notion that within the gross body of the human microcosm there is a subtle, yogic body that is the mesocosmic replica of the divine dyad, the supreme godhead in its male and female manifestations. This body, comprised of energy channels and centers, drops and winds, is itself a *maṇḍala*: viewed from above, the vertical central channel of the subtle body would appear as the center point of the *maṇḍala*, with the various energy centers aligned along that channel being so many concentric circles, wheels, or lotuses radiating outward. As such, initiation and all forms of yogic practice involve, once again, an effort on the part of the practitioner to return to the elevated center point of the emanated *maṇḍala*. Movement toward the center, effected through a combination of external ritual and internal meditative practices, basically entails harmonizing one's own energy or consciousness level with that of the (deities of the) circle in which one finds oneself. First encountered as obstacles, these divine, demonic, or animal impulses are eventually overcome, and transformed into positive sources of energy that carry one closer and closer to the deity at the center. Alternatively, one may, having overcome them, also coerce those same potentially destructive lower-level beings to do one's bidding, through various ritual technologies.

**THE INSTITUTIONALIZATION AND DOMESTICATION OF TANTRISM.** As its sociopolitical contexts have changed, so too has the content of tantrism, with persons from a broader range of society appropriating and adapting its rituals and their attendant metaphysics to their specific needs and aspirations. In general terms, this has taken the form of an institutionalization of tantrism by Hindu Brāhmaṇs and Buddhist monks on the one hand and, on the other, the domestication of its base from lay elites (kings, aristocrats, and Siddhas) to wider strata of householder society. In spite of periodic reformations or revivals of “primitive” tantrism in various parts of the Asian world, both of these trends have had the effect of draining tantrism of its original specificities, of making institutional forms of tantrism look more like the broader, conventional, or orthodox religious contexts in which they have been embedded.

Many of the original tantric masters understood speech to be a performative act, and intentionally subverted conventional language in their teachings and use of *mantras* as a means to effect a breakthrough in their disciples' perception

of reality. Among their disciples were members of the literati, who committed these speech acts into writing, writings that were in turn anthologized, codified, commented on, and systematized into texts and canons of texts. Tantric *mantras*, which were originally secret spells for coercing a wide range of supernatural entities into doing one's bidding, became “semanticized” into the phonematic manifestations of powerful gods and compassionate buddhas, who could be accessed through the *mantras'* proper pronunciation. The term *mūdra* (“seal”), which originally referred to the sealing together of male and female bodies in sexual union, came to refer to complex hand and finger positions to be maintained while meditating, or to the parched grain that Hindu practitioners consume as a tantric sacrament. The *homa* fire sacrifice rituals of early tantrism, which often involved the offering of human and animal blood and gore to ravening demonic entities, became sublimated into either yogic practice or the meditative burning away of impediments to liberation or salvation in the fire of gnosis. More fundamentally, the tantric ritual arena came to be sealed off from the powerful but dangerous entities and forces of the original tantric universe, with the pandemonium of the real world walled out from the quiet center or the monastic cell or household shrine.

Orthodox Hindu and Buddhist hermeneutical strategies neutralized the heterodox and heteroprax content of early tantrism by interpreting it in a variety of ways. On the one hand, much of what was objectionable in the externals of tantric practice was internalized into yogic, meditative, or imaginative techniques. On the other, such practices were marginalized into the purview of a limited elite—the Siddhas and Vīras of tantric legend and their emulators—with more conventional, devotional, salvation-oriented practice recommended for the religious mainstream of monks, priests, and householders. Here, there was a trade-off between danger and efficacy, purity and power in the world, in which circumspection was strongly advised to all but a select few. It was the dangerous content of the early tantric rituals that most distinguished them from those found in the orthodox Buddhist Sūtra literature and the Hindu Vedas: but for those who dared to undertake them, and transact in prohibited substances (sexual fluids, unclean or proscribed food) with problematic beings (outcaste women, minions of the spirit world) through heterodox practices (sexualized initiation rituals, sorcery), self-transformation could be instantaneous rather than the result of several lifetimes of practice.

DAVID GORDON WHITE (2005)

## TANTRISM: HINDU TANTRISM

Tantrism must certainly rank as among the most problematic and controversial categories in the study of religion generally and the study of Hinduism specifically. Virtually every proposition about Tantrism is disputed, ranging from its origins and distinctive traits to the evaluation of its place in the history of religions. Herbert Guenther, one of the last century's greatest scholars of the subject, once observed that Tantrism is "probably one of the haziest notions and misconceptions the Western mind has evolved." Often enough one encounters completely contradictory statements concerning Tantrism in the scholarly literature. As one modern observer puts it, the term is a sort of "floating signifier . . . gathering to itself a range of contradictory qualities." Because of this some have argued that there is no real referent to the words *Tantrism* or *Tantric* and therefore such terms should be abandoned entirely. Others choose to retain the terminology, albeit not without reservations.

We may start with the problematic nature of the name *Tantrism* itself. The term derives from the Sanskrit root *tan-*, "to extend, stretch, expand." *Tantra* thus can mean "succession," "unfolding," "continuous process," or "extension." The term appears already in the Vedic *Shrauta Sūtras* (c. fifth century BCE) in the sense of a "ritual framework" or "interweaving of rites," and *Tantrism* does indeed refer often enough to a certain type of ritual practice. The term is also used in the sense of an "extension" or "expansion of knowledge," or the "weaving" of various threads into a text; it can also be used as a synonym for a "system," or "system of thought," or a "compendium." Certain texts in the Hindu tradition are thus labeled *Tantras* (one common definition within the indigenous tradition is "a scripture by which

knowledge is spread"), although not all of these "Tantras" can be regarded as "Tantric," and other texts that may indeed be so regarded are called by different names (e.g., Āgamas, Nigamas, and Samhitas).

A practitioner of Tantra is known as a *tāntrika* or a *sādhaka*. The Tantric adept is termed a *siddha* or "accomplished one." The ritual and meditative method or path distinctive to Tantra is called a *sādhana* ("performance leading to a goal"), which is supposed to result in the attainment of certain "powers" (*siddhis*). As a path that often entails physical practices, Tantricism overlaps considerably with the Hindu traditions of yoga: one sometimes encounters the term *tantra-yoga* and a Tantric practitioner is frequently called *yogin* or *yoginī*.

Many scholars argue that there is, however, no indigenous Indian term that corresponds to *Tantrism*; that is to say, there was in the native tradition no recognition of a unified school or system or religious sect called *Tantrism*. Under this view, the word and conceptual apparatus that usually clings to it is entirely of foreign invention. David Gordon White has contended, however, that the term *Tantrism* does closely correspond to the scholastic tradition of ritual exegesis embodied in the textual corpus known as the *Tantrasāstra* (Theoretical treatises on Tantra), the most famous of which is the *Tantraloka* of Abhinavagupta (eleventh century CE).

One should also note, as we have above, that the adjective *tāntrika* ("Tantric") does appear in Sanskrit texts, in some cases to contrast a form of belief and practice to the more "orthodox" or "Vedic" (*vaidika*) forms of Hinduism. In some of the non-Tantric Sanskrit texts, *vaidika* refers to forms of practice suitable for *brahmins* and others of the higher classes, while the *tāntrika* rites are relegated to the lower castes. In the Tantric texts, unsurprisingly, the *tāntrika* path is defined very differently. Some contrast the wise *tāntrika*, whose knowledge penetrates to the true meaning of things, to the superficial *vaidika*. One text defines this form of practice in the following way: "He by whom the senses are conquered and whose mind is fixed . . . he whose intellect is still with regard to his own affairs or those of others . . . this, in short, is said to be the *tāntrika* method."

The origins of Tantricism are, like virtually everything else about the phenomenon, also contested. Some think Tantrism originated in Buddhist circles. Indeed, the oldest known "Tantric" texts are Buddhist; the *Guhyasamāja Tantra*, attributed to Asaṅga, dates back perhaps to the third century CE. Other scholars, however, presume Hindu origins for this form of religious belief and practice. Andre Padoux (1987) states unequivocally that "Tantrism is fundamentally a Hindu phenomenon."

Given the paucity of historical materials and the general uncertainty involved in the subject, the question of whether Tantrism was originally Hindu or Buddhist will probably never be resolved. What is sure is that Buddhist and Hindu Tantrism share much by way of doctrine, imagery, and prac-

tice, and they apparently cross-fertilized each other over the course of centuries. Within Hinduism per se, there are also Tantric strains within most of the major divisions of that tradition—Vaiṣṇava, Śaivite, and Śākta (the latter is often regarded in its entirety as “Tantric”).

The term *Tantrism* thus refers to a broad movement, probably originating in the middle centuries of the first millennium CE, which spread into Hindu, Buddhist, and (to a lesser extent) Jain traditions. This “movement” (some prefer to envisage Tantrism as simply an attitude) is usually conceptualized as encompassing activities (symbolically imagined or ritually enacted) normally prohibited in the bourgeois India of the time, including some form of sexual intercourse (although the sexual component is often minimal in such groups and is, in any event, to be understood within a larger symbolic and ritual contextual framework).

Tantrism in its origins was, then, fundamentally a set of reinterpretations of the various existing religious traditions of India. It was also often perceived—both in historical India and the modern West—as controversial if not dangerous and degenerate. As Hugh Urban (2003) has written, for most understandings of Tantrism (both popular and scholarly, Indian and Western), the key element is “the very *extremity* of Tantra, its radical Otherness.”

**HISTORY OF THE STUDY AND REPRESENTATION OF TANTRISM.** For many modern specialists, the category is now viewed as inextricably bound up in the prejudices and cultural psychodynamics of the Westerners who, it is argued, “invented” it in the nineteenth century. Some of the early Western scholars of Tantrism seemed aware of the constructionist nature of their label. Arthur Avalon (also known as John Woodroffe), one of the pioneers of Tantric studies, wrote in 1922 that “the adjective *tantric* is largely a Western term.” Once constructed, however, “Tantrism” took on a life of its own and often served as a screen onto which outsiders projected either their deepest anxieties and fears or their desires and hopes.

Tantrism for many was the most degenerate and peripheral form of Indian religion. When it was first “discovered” by Westerners at the end of the eighteenth century, it was almost universally regarded as the most horrifying example of the excesses of Indian religiosity. Otherwise put, *Tantrism* was the label placed on those practices Westerners regarded as most abhorrent. Such views were only strengthened in the Victorian era where Tantrism was all but equated with illicit sexuality. The “so-called Tantric religion,” writes one such Victorian, is essentially nothing more than a cult where “nudity is worshipped in Bacchanalian orgies which cannot be described.” Already by this time the standard stereotypes of “Tantrism”—and ones that have often endured to this day—were in place. What was definitive of this debased form of Hinduism was sexual licentiousness, as well as the consumption of prohibited substances, such as liquor, beef, and aphrodisiacs. In sum, as the nineteenth-century Indologist H. H.

Wilson would opine, Tantrism stood “for all that is abominable in the present state of Hindu religion.”

In the twentieth century some scholars arose to proclaim the exact opposite: that Tantrism was, in fact, both the root and crowning achievement of Indian religiosity. Avalon regarded Tantrism as both “orthodox” (meaning, for him, “Aryan” or “Vedic”) and in conformity to science. As for the sexual components of this form of Hinduism, Avalon would write that “There is nothing ‘foul’ in them except for people to whom all erotic phenomena are foul” (1975, p. 134). Other Western Indologists, including Heinrich Zimmer, would also champion the cause of Tantrism as the ideal religion for the modern age—creative, life-affirming, sensuous. For Mircea Eliade, Tantrism represented the “autochthonous heart of aboriginal India” and “reveals an experience that is no longer accessible in a desacralized society—the experience of a sanctified sexual life” (1959, p. 172; 1970, p. 201). It is, according to Eliade, in Tantrism that the opposition of the sacred and profane is finally resolved.

Such views, positive and negative, in the West were echoed in India. Many of the reformers of the so-called Neo-Hindu movement of the nineteenth and early twentieth centuries specifically targeted Tantrism as the prime example of how far Hindus have fallen from the purity of the golden age of Vedic origins. For many of the leaders of what is sometimes called the “Hindu renaissance,” Tantrism represented everything wrong with Hinduism and for all that was an embarrassment about India in relation to the West. Vivekananda, in his nationalistically inspired opposition to Tantra, claimed it was “un-Indian,” with origins in Central Asia and Tibet.

For other Indians, however, Tantricism represented the very best of the Indian religious heritage. Perhaps the greatest of all the modern Indian saints and mystics, Ramakrishna, seems to have been a Tantric practitioner. On the other end of the spectrum, Tantrism’s association with radicalism, subversion, and transgression made it appealing to Indian revolutionaries in the extreme wings of the nationalist movement of the late nineteenth and early twentieth centuries. For revolutionary nationalists like Aurobindo Ghose (in his early years), Tantric symbols and deities (especially the terrifying figure of the Tantric goddess Kālī) became sources of revolutionary inspiration. And for others, like the Marxist scholar N. N. Bhattacharyya, Tantrism represented evidence for an ancient classless society based on matriarchy and the worship of the Mother Goddess that was largely eclipsed by the patriarchal, caste-oriented Vedic culture and its legacy.

Among the many controversies regarding Tantra found in the scholarly literature, there is also dispute about whether Tantrism has been relegated to peripheral or tangential status vis-à-vis “real” Hinduism, or, conversely, whether the fascination with Tantricism—bordering on obsession—has blown out of all proportion its place in the study of that religion. Paul Muller-Ortega (1989) and Douglas Brooks (1990) both argue that, despite the apparent vogue and inter-

est in Tantrism, it is nevertheless the unwanted “stepchild” of Indology—a persistence source of shame and embarrassment, and thus neglected and poorly attended to. On the other hand, Hugh Urban contends that “Tantrism has in fact been central to both academic and popular discourse about India in the twentieth century. Indeed, it has in many cases clearly been exaggerated and exploited” (2003, p. 8).

**THE ORIGINS, HISTORY, AND TRADITIONS OF HINDU TANTRA.** Andre Padoux observed that “the history of Tantrism is impossible to write” due to the paucity of data (and, it could be said, by virtue of the definitional uncertainty as what counts as “Tantrism”). Such pessimism has not changed much. Urban has reiterated that “the historical origins of the vast body of traditions that we call Tantra are today lost in a mire of obscure Indian history and muddled scholarly conjecture” (2003, p. 23).

Scholars have nevertheless put forth two very different narratives to account for the possible sources of Tantrism. The first locates the earliest “Tantrism” in the Indus Valley civilization, here conceived as a matriarchal culture complete with goddess worship, fertility rites, and proto-yogic practices. When Aryan invaders destroyed the Indus Valley civilization, Tantrism supposedly went underground, where it survived among the tribal groups at the periphery of Indian culture but also as the “autochthonous substratum” of later Hinduism. According to this account, Tantrism then re-emerges a thousand years later in texts of the middle centuries of the first millennium, but only as the Sanskritized, elitist expression of a continuous and fundamentally popular form of Indian religion.

A quite different narrative assumes that Tantrism derives from the Aryan or Vedic religion itself. From this point of view, Tantrism is in essence the outgrowth of the intellectual and religious elite, and not based on a popular movement (let alone “autochthonous substratum”) within Hinduism. Scholars adhering to this position cite the fact that the texts in which the beliefs and practices of Tantrism are first encapsulated are written in Sanskrit, and not in any popular vernacular.

A third, and mediating, possibility for accounting for the origins of Tantrism is to see it as the combination of both autochthonous and Vedic roots, or perhaps a synthesis of shamanic and magical practices (possibly originating in Central Asia) and the mystical speculations characteristic of the *brahman* elite.

All such attempts at locating the temporal and cultural origins of Tantrism remain theoretical and speculative. The geographical origins of the Tantric movement of the middle centuries of the Common Era is no less fraught with uncertainty. Although many of the centers of the Tantric movement were located in the frontier or border areas of India (e.g., Kashmir and Assam), other equally important geographical locales for Tantric expressions include Andhra, Kerala, Madhya Pradesh, and Orissa. There does not seem to be one central place from which Tantrism sprung.

There is also no conclusive evidence of Hindu Tantras in the period before 800 CE, although most scholars agree that the classical form of Hindu Tantrism originated at least two or three centuries before that. Stone inscriptions indicate that Tantric deities were worshiped in the fifth century and many agree that Tantrism was well established by the sixth or seventh centuries CE. While there is little precisely dated evidence available, it seems that the period from the eighth or ninth century to the fourteenth century was one in which Tantrism flourished in India. Most of the texts regarded as “Tantric” (the Tantras, Samhitas, and Āgamas) date from this period, as do many temples and some of the greatest thinkers of the Tantric traditions (e.g., Abhinavagupta).

Already in the medieval period and then in subsequent centuries, the Tantric movement exerted influences on all forms of Hinduism. It has been noted that the pantheon of present-day Hinduism is largely comprised of Tantric deities. Tantrism also left its imprint on the temples, iconography, and rituals of the more “mainstream” Hinduism. Indeed, as we have seen, some scholars believe that the influence of Tantrism was so great that virtually all of Hinduism from medieval times forward can be understood as “Tantric.” Mainstream Hinduism, under this view, is more “Tantric” than not.

But despite the huge influence of Tantrism on the theology, arts, iconography, temples, and rituals of the orthodox or mainstream religion, most Hindus have not in the past and would not now regard themselves as *tāntrikas*. The esoteric nature of much of the practice together with the initiatory structure of many of the Tantric groups have insured that membership of self-identified Tantric practitioners would always be limited, even while “Tantric” influences on Hinduism have been pervasive. The secretive and esoteric nature of many Tantric groups has also, in India as in the West, helped to generate a dubious reputation for Tantrism. In much of today’s India, the label carries the same negative connotations it has borne for so long in the West. Brooks observes that “The word ‘Tantra’ in vernacular languages [of India] . . . is frequently used to conjure notions of black magic, illicit sexuality, and immoral behavior” (1990, p. 5).

“Tantrism,” writes Padoux, “is essentially sectarian.” The main division of sects in Hinduism as a whole consists of the worshipers of Viṣṇu (Vaiṣṇavas), the worshipers of Śiva (Śaivas or Śaivites), and those who worship the Goddess, in one or another of her many forms, as the supreme deity (the Śāktas). There are Tantric sects within each of these main divisions, although the Tantric groups within the Śaivite and Śākta groupings regard Śiva and Śakti as inseparable and therefore are not themselves clearly distinguishable according to these sectarian divisions. There is also considerable similarity between the terms *Tantrism* and *Śāktism*; while groups labeled in these two ways are not identical, they do intersect and often overlap.

Among the Vaiṣṇavas, the Pāñcarātra sect (with origins circa sixth century CE) was heavily influenced by the Tantric

movement, although today most members of this sect do not consider themselves as Tantric practitioners. The Vaiṣṇava-Sahajiyās of Bengal, however, remain close in spirit to other forms of Tantrism. The Sahajiyās, who flourished especially between the sixteenth and nineteenth centuries, worship Viṣṇu in the form of Kṛṣṇa and his lover Rādhā. The poems of the Sahajiyā Tantrics are replete in erotic imagery, and practitioners use devotional singing and dancing to try to induce a state of mystical ecstasy envisioned as the union of the god and his consort.

It is, however, most especially in certain of the Śaivite sects that we find the classical instantiations of what is called *Tantrism*. One of the earliest of the Śaivite groups, the Pāśupatas (dating to perhaps the second century CE), emphasized radical asceticism and bizarre or disreputable behavior (thought to be in imitation of the wild divine ascetic, Śiva) in the pursuit of supernatural powers or *siddhis*. Other early Śaivite sects that display Tantric tendencies include the Kāpālikas and the Kālāmukhas, about whom little is known because no texts from these groups survive. Contemporary reports about them, however, insist on their outrageous, scandalous behavior and socially abhorrent practices. As their name indicates, the Kāpālikas (“skull-bearers”) probably used human skulls as begging bowls, were said to frequently practice in cemeteries, and may have engaged in ritualized sex. While evidence is scanty, it seems that such early Śaivite Tantrics embraced practices that subverted conventional morality and embraced controversial methods in the service of power and liberation.

Another set of Śaivite Tantric practitioners were known as the Nātha Siddhas (also known as the Kānpḥatās, or “split-ears”). They were also called the Gorakhnāthis due to the name of their founder, Gorakhnāth or Gorakṣa, who was supposedly the author of many of the Tantric texts of the *haṭhayoga* tradition. The aim of these practitioners was that of many other Tantrics, the state of liberation in this lifetime known as *jīvanmukti*, here thought to be achievable through the distinctive practices of yoga entailing breath control and retention and the “regression” of sexual energy and fluids.

Special mention must be made of the great philosopher of the “non-dual” Śaivism of Kashmir, Abhinavagupta (born c. 950 CE), who is responsible for many philosophically sophisticated and systematic Tantric treatises written in Sanskrit. One of the most famous of these is entitled the *Tantrāloka* (Elucidation of the Tantras), a commentary or exegesis of the Tantras. David White has argued for the importance of Abhinavagupta in the systematization and rationalization of Tantra. In his exegesis of the esoteric rites of Tantric practice, Abhinavagupta “sublimates, cosmeticizes, and semanticizes many of its practices into a type of meditative asceticism whose aim it was to realize a transcendent subjectivity. In the process, he transforms ritual from a form of ‘doing’ to a form of ‘saying’” (2003, p. 16).

For some, then, Hindu “Tantrism” has been understood as referring to a particular kind of sect within Hindu-

ism. In recent years, however, there has also arisen a tendency to envision it as an extremely widespread, even ubiquitous, trait of Indian religions in general. Eliade, for example, writes that “from the fifth century CE onward Tantrism becomes a pan-Indian ‘fashion.’ One meets it everywhere in innumerable different forms” (1970, p. 200). If, however, Tantrism is found everywhere within Hinduism, “in innumerable different forms,” then what, if anything, constitutes its distinctiveness?

**A SURVEY OF DEFINITIONAL TRAITS.** It is generally agreed that there is no one body of doctrines and practices shared by all forms of Hindu Tantrism, and most scholars now also believe that a search for a unitary definition of *Tantrism* is futile. What we refer to as *Tantrism* is not so much a unified tradition but a loose grouping of particular texts, traditions, practices, and doctrines that differ in some regards from each other and overlap considerably with other “non-Tantric” currents within Hinduism. At best, then, there are elements that may be regarded only as characteristic, but not definitive, of Tantrism. Tantrism cannot be defined in terms of one or more standard traits but only in a “polythetic” manner in which any particular instance participates in one or more of a set of “family resemblances.”

As a way to familiarize readers with what scholars have meant by “Hindu Tantrism,” the following list of definitional traits may be useful. Many—indeed most—of these traits do not fit all instances of what has been called “*Tantrism*.” Some of them are hotly contested by scholars (as noted below), but each has appeared in the scholarly literature as at least partially definitive of the phenomenon.

**Non-Vedic or extra-Vedic in origin or scriptural authority.** The ritual practices and methods for attaining religious goals in Tantrism are often characterized as “non-Vedic” (by which is meant, to some extent, “unorthodox” or at least “new,” “unprecedented”). Tantric rituals and most of the distinctive worldview associated with Tantrism do not appear in Vedic texts nor in the strictly Brahmanic or “*smārta*” traditions that represent themselves as closely based on the Veda. Tantric texts, like the Vedas, do claim to be revealed from a transcendent source, but often enough there is no attempt to link the legitimating origin of Tantric practice back to the Vedas—as is indeed the case with the more orthodox traditions of Hinduism.

Tantrism, in other words, often represents its revelations as “new,” or rather “newly revealed.” This hitherto secret knowledge is said to have now become available because it is especially suitable for the *kali* age, the present era of degeneration when previously revealed methods and wisdom are no longer realizable by corrupt humans. As we have seen, the orthodox traditions themselves sometimes draw a distinction between *vaidika* and *tāntrika* rituals and practitioners and, in this way, the Tantric traditions agree.

This possible trait for what goes into constituting a group as “Tantric” does not preclude the claims sometimes

made in Tantric texts to Vedic legitimacy, which may have in some cases been introduced at a later date in order to facilitate acceptance of Tantrism by the more orthodox Hindus. Nor does it necessarily deny that certain features of Tantrism, especially the emphasis on correlations and connections between the body, seen as a microcosm, and the universe as a whole or the macrocosm, at least resemble (if not derive) from modes of thought that may be characterized as “Vedic” (see below). What the emphasis on the non- or extra-Vedic character of Tantrism does begin to point to is Tantrism’s controversial and “unorthodox” nature.

**Controversial or antinomian practices.** It is indeed the radical and transgressive methods prescribed by certain groups in the history of Indian religion that are often enough assumed, at least in part, by the label *Tantric*. For some groups, this has meant antisocial ascetic practices, such as eschewing clothing and ordinary hygiene, meditating in cemeteries, and carrying human skulls as begging bowls, as well as practices involving human corpses and the worship of deities in gruesome, terrifying forms. For others it has meant engaging in ritualized sex and the exchange of bodily fluids, or rituals that call for the ingestion of otherwise prohibited substances. In all cases, the purpose of such antinomian behavior seems to have been in one way or another to transcend the world of dualities (including “pure” and “impure,” “good” and “bad”).

Among the best known of these controversial practices is the ritual of indulging in what are called the five elements or principles (*pañcatattvas*) or the “five M’s” (referring to the Sanskrit letter with which each of the five begins). This practice forms the core of the so-called “left-handed” path (*vāmamārga*) of Tantrism. Members of the group form a circle of alternating males and females, which represents the cosmos or *maṇḍala*. Having ritually constituted each male as the god and each female as the goddess (and the embodiment of the female energy known as *śakti*), practitioners then make what are regarded as sacrificial offerings to the divine within. These offerings consist of substances normally forbidden in caste Hinduism: meat (*mamsa*), fish (*matsya*), alcohol (*madhu*), and parched grains (one of the meanings of term *mudrā*, and perhaps indicating some kind of aphrodisiac). The ceremony culminates in the “fifth M,” ritual intercourse or *maithuna*, which epitomizes the transcendental unification and resolution of all opposites. This kind of practice could also, however, be done entirely imaginatively with meditation, following the “right handed” path.

Esoteric Tantric groups thus claimed to be able to engage in practices that for the uninitiated would result in the most disastrous karmic ends. Such a path is termed “heroic” (*vira*) and dangerous in that it intentionally confronts head-on the most deep-seated desires and the most repulsive of aversions in the attempt to rise above both. Through various meditative and ritual techniques, the Tantric practitioner could “do whatever fools condemn” and rid himself “of passion by yet more passion”:

So, with all one’s might, one should do Whatever fools condemn, And, since one’s mind is pure, Dwell in union with one’s divinity. The mystics, pure of mind Dally with lovely girls, Infatuated with the poisonous flame of passion That they may be set free from desire. By his meditations the sage . . . draws out the venom (of snakebite) and drinks it. He makes his deity innocuous, And is not affected by the poison. . . . When he has developed a mind of wisdom And has set his heart on enlightenment There is nothing he may not do To uproot the world (from his mind). . . . Water in the ear is removed by more water, A thorn (in the skin) by another thorn. So wise men rid themselves of passion By yet more passion. (*Cittaviśuddhiprakaraṇa*, Embree, 1988, pp. 24–38)

**An anti-ascetic and anti-renunciatory attitude and a positive attitude toward the body.** Tantrism has often been viewed as a kind of reaction to the renunciatory and ascetic strains in Hinduism. From the time of the ancient Upaniṣads, asceticism and world renunciation were usually thought to be more or less essential in the quest for liberation or *mokṣa*. Such an attitude is accompanied by a fundamentally negative evaluation of the body and its desires.

The “first characteristic” of Tantrism, according to Eliade, is its anti-ascetic attitude. The body is “revalorized” in Tantric circles and “acquires an importance it had never before attained in the spiritual history of India . . . The Upanishadic and post-Upanishadic pessimism and asceticism are swept away. The body is no longer the source of pain, but the most reliable and effective instrument at man’s disposal for ‘conquering death’” (1970, p. 227).

In Tantrism, the physical body becomes the vehicle and microcosmic locus of powers that can be tapped and enjoyed as the means to liberation. As such, the body must be kept healthy and strong, and a very different understanding of desire emerges. Tantrism sometimes represents itself as the “easy” path in which desire is not renounced but utilized on the road to salvation. As one text puts it, “No one succeeds in attaining perfection by employing difficult and vexing operations; but perfection can be gained by satisfying all one’s desires.”

Madeleine Biardeau has summed up *Tantrism* as “an attempt to place *kama*, desire, in every meaning of the word, in the service of liberation . . . not to sacrifice this world for liberation’s sake, but to reinstate it, in varying ways, within the perspective of salvation” (cited in Padoux, 1987, p. 273) Thus *Tantrism* here means the use of desire to gain both worldly and supernatural “enjoyments” (*bhukti* or *bhoga*) as well as powers (*siddhis*) and to attain the state of liberation in this very lifetime and in the embodied state. The this-worldly is not renounced but rather reintegrated into the soteriological quest.

Such a view of the Tantric embrace of the body, desire, and sensuality must also be contextualized by the often equally characteristic trait of an emphasis on ritual and the use of yoga or mental and physical “discipline” in Tantric

groups. Desire—especially in its most powerful form, sexual desire—is not simply indulged in Tantric practice but rather is harnessed and “disciplined” by ritual or yogic methods. “The ‘easiness’ of the tantric path is more apparent than real,” writes Eliade. “The fact is that tantric road presupposes a long and difficult *sadhana*” (1970, p. 206).

**Religious use of sexual intercourse.** David White has stated that “sexual ritual practice is the sole truly distinctive feature of South Asian Tantric traditions. All of the other elements of Tantric practice . . . may be found elsewhere” (2003, p. 13). We have seen above how ritualized sex is integrated into the “left-handed” forms of Tantric practice and how “desire” is not to be avoided but utilized. The ritualized or even “yogic” sex of traditional Indian Tantric practice at least theoretically has nothing to do with simply indulging one’s desires, let alone with the orgiastic and lascivious. It rather takes place secretly under what might be called “laboratory conditions” and within a context where all the participants are advanced practitioners. The event is totally sacralized; the participants are all fully divinized beforehand and the act of intercourse is to be envisioned not as sex at all but as the unification of all polarities, and most especially the union of Śiva and Śakti, the passive and active principles of the cosmos. Such a union is thought to represent or indeed actualize absolute reality itself.

The purpose of the ritual is not climax in its conventional sense of self-gratification, and indeed sometimes orgasm is prohibited in this yogic form of sex. The goal is rather the experience of cosmic union, the highest and ultimate end of Tantric practice. As Georg Feuerstein (1998) notes, in opposition to the lurid notion of “Tantric sex” sometimes current among outsiders, “There is nothing glamorous about Tantric sexual intercourse.”

**Esotericism and secrecy.** Given the controversial nature of Tantric groups, a high premium was (and may very well still be) placed on secrecy. Many, if not most, of the practices characteristic of “Tantrism” were traditionally carried out privately, away from the gaze of the uninitiated. Practitioners were aware of the disapproval that would accompany public knowledge of certain of their rituals. Texts warn of the dire consequences that will befall those who reveal the secrets to outsiders. Tantric methods are also often said to be extremely dangerous to those who practice them without proper initiation and guidance, and therefore on these grounds too they should be kept from the awareness of the general public.

The esoteric nature of Tantrism was insured in part by its initiatory structure. Only those who had gained the permission of the Tantric master or *gurū* and who had undergone what can be very complex initiation or consecration (*dīkṣā*) ceremonies were eligible to learn the secrets of a particular sect. In opposition to the Vedic or Vedic-based orthodox groups, Tantric practice was typically open to initiates of all castes and both genders. “Initiation, secrecy, and the

necessity of a spiritual master are essential Tantric traits,” according to Padoux.

Another way in which the esoteric knowledge and practices of Tantrism were protected was through its elaborate system of symbols and especially by the utilization of an enigmatic and highly ambiguous form of language that renders many texts unintelligible to outsiders (and that provides endless difficulties for scholars trying to decipher such discourse). This form of writing is sometimes termed *sandhya bhasa* or “twilight speech” to indicate its capacity to convey within it two different meanings at once, and also to point to the paradoxical and ultimately indescribable qualities of esoteric realizations. Twilight speech may thus have as its original purpose not only to protect secrets but also to indicate that ordinary language is incapable of expressing the deep truths of Tantra.

**Homologies and correlations between the macrocosm and the body regarded as a microcosm.** The idea that the cosmos in its entirety, the macrocosm, is replicated or represented within the very body of the practitioner (conceived of as a microcosm) is frequently encountered in Tantrism and, indeed, is a necessary assumption for much of Tantric ritual and meditative practice. The positing of correlations between the body and the world, between the microcosm and macrocosm, between the human and the divine, and between the beings and actions involved in ritual and the cosmic entities, energies, and processes—all these are more or less necessary presuppositions for other elements of the worldview and practices of Tantrism.

In spirit, at least, if not in the specifics, this notion of a potentially discoverable nexus of resemblances linking the human, the ritual, and the cosmos is identical to that of Vedism, culminating in the Upaniṣadic equation of the Self (*ātman*) and the macrocosmic principle of unity (the *brahman*). As such, the idea that Tantrism is entirely or pervasively “non-Vedic” and “unorthodox” must be qualified.

**The positing of a mystical physiology or “subtle body” and the projection of divinities into the body.** An essential part of the idea of the body as a microcosm was the typically Tantric conceptualization of an “inner” or “subtle” body and an intricate science of veins, channels, winds or energies, and centers that comprise what one may call a mystical anatomy or physiology.

While there are vague correspondences between the structure and elements of this subtle body and the anatomical organs and endocrine system of the physical body, the two are not identical. Thus, for example, the various centers or chakras (“wheels,” so called because they are envisioned as whirling circles) of the mystical body (some traditions count five of these, others seven) are located near, but are not identified with, parts of the physical body: the crown of the head, between the eyebrows, at the areas of the throat, heart, navel, and sexual organ, and at the base of the spinal column. Each of these centers forms the locus of a complex set of im-

agery; each is said to contain lotuses of different colors and shapes, different Sanskrit letters or *mantras*, geometrical designs, deities, cosmological elements and entities, and so forth. Each chakra, in other words, is a tremendous potential source of cosmic power of a certain sort. Taken together these centers within the human body contain the universe as a whole.

Linking together and springing forth from these centers is a vast system of tens of thousands of *nadis*—veins, nerves, currents, or channels—the most important of which is a “central channel” (*sushumna*) surrounded on either side by two other *nadis* called the *ida* (on the left) and *pingala* (on the right), the latter of which, among other things, is correlated with the moon and the sun. Running through these channels are various “winds” or energies known as *prāṇas*.

Tantric practice, especially but not exclusively in its more meditative forms, consists of realizing the cosmic nature of this subtle body and then tapping into its transformative powers. This is done initially by imaginatively projecting divinities and powers into the body (the practice is called *nyāsa*), thereby homologizing it with the Tantric pantheon in order to realize and awaken these forces within. This process is often accompanied by the use of sacred and powerful syllables called “seed” or *bīja mantras* and the use of secret gestures called *mudrās*.

But the real centerpiece of such meditation is the awakening of the energy, force, or power within the practitioner’s being called *śakti* (the female and active principle of the universe) or *kuṇḍalinī* (envisioned as a snake coiled at the base of the spine). As one text puts it, “As a door is opened with a key, so the *yogi* opens the door of liberation by awakening the *kuṇḍalinī*.” This cosmic power, once aroused, is moved up through the central channel where it passes through, one by one, each of the chakras and invigorates the dormant powers within them. This results in the attainment of progressively higher states of consciousness and ability by the practitioner. When the *kuṇḍalinī* reaches the chakra at the crown of the head—the divine seat of the god Śiva—the female *śakti* is said to be reunited with the male principle. This is equated with liberation for the practitioner, a state that is said to be accompanied by “great bliss” and ecstasy.

Many scholars regard this mystical physiology as distinctive to Tantra, especially the notions that the active force in the universe (*śakti*, conceived as the Goddess) is present also in each individual in the form of *kuṇḍalinī*. The identification with and appropriation of the power of the Goddess, and the emphasis on tapping the *śakti/kuṇḍalinī* power within one’s body, forms what some would regard as an essential element in what we call *Tantra*.

**Distinctive goals: The attainment of *siddhis* and the realization of liberation in this lifetime (*jīvanmukti*).** While all forms of Hinduism seek the goal of liberation or release from the bonds of *samsāra*, one of the features shared by most Tantric groups is the urgency with which that quest

is imbued. Indeed, some scholars have focused on the “experiential” nature of Tantrism as its distinctive quality, its emphasis on practice over doctrine and on results above all. Tantric practitioners typically seek, in this very lifetime and in this very body, the experience of unity or oneness (“nonduality”), of “spontaneity” (*sabhaja*), or of “moving through the void” (*khecari*), which is most commonly known as “liberation in this life” (*jīvanmukti*). While there are, as we have seen, many and various methods for attaining this goal, the conceptualization of the goal itself in these terms is perhaps one of the most basic commonalities shared by Tantric groups.

The liberated Tantric practitioner, the “accomplished one” or *siddha*, is, according to one text, free from the “pairs of opposites” or all duality, no longer bound by the forces of *karma*, unconquerable, “without inhalation and exhalation,” invulnerable to all weapons, and immortal. Other extraordinary powers (the “accomplishments” or *siddhis*) are also sought and supposedly realized along the way to the ultimate goal. These include the ability to fly, to know the past and future, to decipher the languages of animals, realize one’s previous lives, read the thoughts of others, become invisible, and so on. In some texts, abilities such as these are summarized as the eight “great powers” (*mahāsiddhis*): miniaturization, magnification, levitation, extension, irresistible will, mastery, lordship over the universe, and fulfillment of all desires.

**MODERN WESTERN APPROPRIATIONS OF HINDU TANTRA.** The problems inherent in the study of Tantrism have been further compounded by the widespread interest in and appropriation of the term *Tantra* to identify certain modern and Western New Age beliefs and practices. This form of “Neo-Tantrism” may or, more often, may not have anything much in common with the Tantrism practiced traditionally in India. Neo-Tantrism is, however, often represented by its adherents and supporters as both “ancient” and “Indian,” perhaps in part as a means to legitimate its blend of spirituality and sexuality, sacred transcendence and materialistic indulgence. Furthermore, Tantrism has also appealed to, and been appropriated by, some modern Western feminists. Tantrism’s supposed matriarchal roots, its elevation of goddess figures, its emphasis on the female power or *śakti*, its “embodiedness” or valorization of the body and physicality, and the supposed equality of the genders in its ritual practices—all these traits have endeared Tantrism to a certain segment of modern feminist spirituality.

Neo-Tantrism first emerged as part of the spirituality associated with the counterculture of the 1960s. An important cross-culturally transitional figure was Bhagawan Shree Rajneesh (also known as Osho), an Indian *guru* who attracted a largely Western following with an eclectic philosophy revolving around his particular vision of “Tantra”: “Tantra does not believe in improving your character . . . Tantra says—if you are greedy, be greedy . . . If you are sexual, be sexual, don’t bother about it at all” (1974, p. 190). His teach-

ings, he claimed, were particularly suitable for modern Westerners, an “iconoclastic brand of spirituality” or a “religionless religion” that does not deny or repress life and the body but rather affirms and expresses sensuality and physicality.

Since Rajneesh, New Age groups claiming to be in one way or another Tantric have multiplied and spread. The internet is replete with sites offering “Tantric sex,” “sex magic,” “sacred sex,” “spiritual sex,” and so forth—all under the umbrella of Tantrism. Neo-Tantrism, it has been argued, represents the ideal religion for consumer society, embracing the most materialistic and hedonistic desires and repositioning them as “spiritual” and as the means for achieving transcendence.

This new twist in the already extremely complex history of the phenomena called *Tantric* has provoked yet more controversy among scholars of Tantrism. Most view the appearance of neo-Tantrism as a trivializing perversion of the “authentic” Tantric traditions. For these observers, neo-Tantrics have mistaken, among other things, the “sexualization of ritual” of traditional Tantrism for the “ritualization of sex.” Or, otherwise put, they have (intentionally or not) blurred the distinction made in the Indian tradition between the science of Tantra (*tantraśāstra*) and the science of erotics (*kāmaśāstra*)—the former entailing the use and transformation of desire in the service of liberation, whereas the latter’s goal is the fulfillment of desire as one of the “ends of life” of a householder. One scholar thus refers to the “pathetic hybrid of New Age ‘Tantric sex.’” For other observers, however, the neo-Tantrism of the modern West is just another incarnation of the infinitely protean, and always contestable, category of Tantrism.

BRIAN K. SMITH (2005)

**TANYAO** (mid-fifth century CE), Chinese Buddhist monk and central figure in the revival of Buddhism after its suppression by the Northern Wei dynasty (385–534). Little is known about the early life of Tanyao except that he was eminent monk in the non-Chinese Bei Liang kingdom (397–439, in what is now Gansu province) before it was conquered by another non-Chinese kingdom, the Northern Wei.

As was the case in many of the northern dynasties, Buddhism was popular among the rulers of the Northern Wei. Thus when Tanyao arrived in the Northern Wei capital of Pingzheng (modern Datong), he found allies among the many Buddhists at the imperial court, the most prominent of whom was Crown Prince Huang. But Huang’s father, the reigning emperor Taiwudi, came under the influence of an anti-Buddhist clique led by the Daoist adept Kou Qianzhi and the Daoist literatus Cui Hao, both openly hostile toward Buddhism. In 446 the emperor instituted a series of repressive measures against Buddhism, culminating in the issuance of an edict for its wholesale proscription.

The guiding hand behind the edict, which among other things ordered the execution of every monk in the realm, was Cui Hao, who effected it by taking advantage of the emperor’s fury upon discovering a cache of weapons in a monastery in the city of Chang’an, a fact that the emperor took to be evidence of Buddhist complicity in a rebellion he had only recently suppressed. Other officials at court, including Kou Qianzhi, presented memorials urging the amelioration of the harshest points of the edict, thus delaying its actual promulgation and allowing monks time to flee or return to lay life, Tanyao resisted giving up the robe until the concerned

crown prince convinced him of the prudence of this action, but he nevertheless maintained the sacerdotal paraphernalia in secret.

Kou Qianzhi died in 448, and in 450 Cui Hao was executed along with his entire clan for including unsavory aspects from the lives of the emperor's ancestors in the official history of the dynasty that he had been commissioned to write. With the passing of this duo, anti-Buddhist strictures began to relax. But full restoration occurred only after the assassination, by a eunuch, of Taiwudi in 454 and the accession of his grandson, Wenchengdi.

Buddhism had been subject to state control since the beginning of the dynasty, when Emperor Taizu granted the Chinese monk Faguo the official title of *daoren tong* (director of monks). In that capacity Faguo set a precedent in Chinese Buddhist history by identifying the emperor with the Tathāgata and requiring monks to bow down to him, an act in clear violation of monastic precedent. The *daoren tong*, which was abolished with the proscription of Buddhism, was revived with the restoration under a new name—the *jianfu cao* (office to oversee merits), a name later changed to *zhaoxuan si* (office to illumine the mysteries)—and presided over by a Kashmiri called Shixian. The new office was the center of a network, more finely woven than ever before, of governmental control over religious affairs.

Tanyao was Shixian's successor and held the post, now called the *shamen tong* (office of the *śramaṇa* superintendent), for more than twenty years. It was he who took advantage of the augmented interpenetration of government and religion to expand and glorify the Buddhist church.

One of his first important accomplishments was to persuade the new emperor, who was anxious to reverse the karmic effects of his grandfather's crimes, to undertake the costly project of chiseling into the walls of the Yungang caves (a few miles west of the capital) massive images of Buddhas and *bodhisattvas*, works still considered some of the greatest achievements of Chinese Buddhist art. The first group of caves (nos. 16–20 on modern charts) contains five Buddhas, one seventy feet tall, representing the first two emperors of the dynasty; the then-reigning emperor Wenchengdi; his father, Crown Prince Huang (who never reigned); and the infamous Taiwudi. The association of the imperial family with Buddhism could not have been represented in more intimate terms.

Another step taken by Tanyao to expand the influence of Buddhism was the establishment of Saṃgha Households (*sengji hu*) and Buddha Households (*fotu hu*). A Saṃgha Household was a voluntary association of a certain number of families responsible for paying sixty bushels of grain to the local branch of the *shamen tong*. That office then stored the grain for distribution to the poor in times of famine. Those Saṃgha Households faithfully fulfilling their responsibility were exempted from taxation.

Buddha Households consisted of a group chosen from among criminals or slaves who as bondsmen of the monas-

tery had the responsibility of cultivating its fields and maintaining its buildings and grounds. With numerous monasteries under construction under Tanyao's leadership, amnesty after amnesty was granted to provide them with Buddha Households.

The Saṃgha Households and the Buddha Households were important for other reasons as well. On the one hand, they served the state by opening up new lands for cultivation during the years when war-induced underpopulation left so much land uncultivated that there were frequent famines. They also lightened the government's burden of supporting prisoners. On the other hand, they provided the church with a source of revenue and a pool of potential converts.

In addition to his many administrative accomplishments, Tanyao also translated scripture. His translations of the *Samyuktaratnapitaka Sūtra* (*Za baocang jing*), completed with the assistance of Indian monks in 462, and the compilation *Fu facang yinyuan zhuan*, both containing many stories in the Jātaka and Avadāna genres, provided edifying themes for sculptors working in the Yungang caves.

T'AN-YAO SEE TANYAO

TAO-AN SEE DAO'AN

TAO AND RE SEE DAO AND DE

## TAO-CH'Ō SEE DAOCHUO

**TAO HONGJING** (456–536 CE), a polymath scholar of Daoism, was largely responsible for establishing the textual corpus of the Maoshan or Shangqing (Highest Clarity) lineage, of which he is recognized as the tenth patriarch. Tao's contributions to the study of pharmacology and alchemy in China are also of singular importance, and during his own lifetime he was recognized for his authoritative knowledge of calligraphy and astrological calculations. Born near the southern imperial capital of Jiankang (modern-day Nanjing), Tao was the scion of a leading family of gentry officials with a long history of service to the southern courts since the fall of the Han dynasty (206 BCE–220 CE).

The Tao family had marital links to some of the most important Daoist figures in Southern China, including the great scholar Ge Hong (283–343 CE), but Hongjing's mother and grandfather were both Buddhists. Despite these religious affiliations, Tao's early training was Confucian. He completed several commentaries on Confucian classics at an early age, and his dedication to scholarship soon earned him a reputation at court. By his early twenties he had achieved modest success in official service, being appointed "reader in attendance" to imperial princes. His intellectual and scholastic accomplishments garnered him much respect and allowed him to move freely in the elite social circles and literary salons of Jiankang.

During the period of mourning for his mother between 484 and 486, Tao began his formal initiation into Daoism. He became a disciple of Sun Youyue (398–489 CE), abbot of the Xingshi Temple in Jiankang. Sun had, in turn, been a disciple of Lu Xiujing (406–477 CE), the main systematizer of the Lingbao ritual liturgy. Sun possessed textual artifacts of the Maoshan revelations passed on by Lu, and he allowed Tao to view them. These texts had been produced between 364 and 370 CE by a visionary named Yang Xi (330–c. 386) living in the area of Maoshan (Mount Mao), southwest of the imperial capital. Yang claimed that he had received the texts from a number of "perfected immortals" (*zhenren*), residents of the Heaven of Highest Clarity (*Shangqing tian*). The message of the perfected was a synthesis of Celestial Master's Daoism, and elements of the southern occult traditions, such as represented in the work of Ge Hong. Alchemy and apotropaic ritual is much in evidence, but the texts pointed towards the future of Daoism with their tendency toward techniques of internal cultivation, such as visualization meditation.

The style and content of the Maoshan manuscripts, as well as their calligraphy, made a deep impression on Tao, and he began searching for more examples, making a trip in 490 to the eastern regions (present-day Zhejiang) for that purpose. Two years later, in 492, he renounced secular life altogether and retired to live at Maoshan. With the help of imperial sponsorship, Tao built a hermitage there, which he

named the Huayang Observatory (*Huayang guan*). He assembled some disciples, and began the work of reconstructing the Shangqing scriptural corpus.

Tao's first major project was the compilation of the *Dengzhen yinjue* (Secret formulae for ascending to perfection). Most of this work is now lost, but originally it was a large collection of technical material derived from Yang Xi's revelations. It was intended for Tao's disciples, for whom he added copious annotations. The two works for which Tao Hongjing is best known seem both to have been completed in the same year, 499. The *Zhengao* (Declarations of the perfected), is a compendium of the Maoshan revelations themselves. It includes correspondence between Yang Xi and his patrons, and records of conversations between Yang and his perfected guests, as well as information on the secret geography of the Maoshan area. The *Zhengao* also contains many poems, ostensibly composed by the perfected. The ecstatic style of these poems was to be influential, particularly during the later Tang dynasty (618–907 CE).

Continuing a tradition passed down from his father and grandfather, Tao also compiled his *Bencao jing jizhu* (Collected notes on the classic of pharmacopoeia). This was an expanded and annotated version of the oldest work of Chinese pharmacopoeia, *Shennong bencao jing* (Shen Nong's classic of pharmacopoeia). Tao doubled the number of entries in the earlier classic and also reorganized the material according to more rational criteria. Although this work comes down to us only in fragmentary form, it had an enormous impact on traditional Chinese medicine because it brought order and reason to a tradition in disarray. It also facilitated the systematic incorporation of *materia medica* into Chinese medical practice.

In 502 a new dynasty, the Liang, replaced the previous Qi dynasty (479–502 CE). Fortunately, Tao Hongjing enjoyed a close personal relationship with Wudi (464–549 CE), the first Liang emperor. This ensured continued imperial support for Tao's work, even when Wudi, a fervent Buddhist, proscribed Daoism in 504. It was in the same year, 504, that Wudi commissioned Tao to undertake alchemical experiments on his behalf. Tao expended a great amount of time and energy in his attempts to produce elixirs according to recipes described in the Shangqing scriptures. Tao's careful notes on his research are the earliest extant records of alchemical experimentation in China. His work also strengthened the relationship of alchemy to Daoism.

During the latter part of his life, Tao Hongjing remained based at Maoshan, but made an extended trip to the southeast, to the area of modern Fujian province. He continued his alchemical experiments on the trip, but it may be that he was also motivated by anticipation of a messianic apocalypse, such as predicted in certain Shangqing texts. While on that excursion, Tao made the acquaintance of Zhou Ziliang, a young man who became his disciple. Zhou was a visionary after the model of Yang Xi, and played host to some of the same perfected beings. In 515, at the age of only twenty,

Zhou committed ritual suicide in response to a divine summons received in the course of his visions. Tao submitted a textual record of Zhou's activities and visions, entitled *Zhoushi mingtongji* (The record of Master Zhou's communication with the unseen world), to the imperial court in 517.

Tao Hongjing's involvement with Buddhism is often overlooked. Tao had early exposure to the religion via his mother and grandfather. Throughout his lifetime he continued to befriend Buddhist priests, and was actively involved in debates over Buddhism's nature and significance. It is claimed that the founder of Chinese Pure Land Buddhism, Tanluan (476–542 CE), studied Daoist arts and herbalism with Tao. In 513 Tao formally took Buddhist vows and when he died, about a month before his eightieth birthday in 536 his disciples followed his instructions and arranged for an equal number of Daoist and Buddhist priests to attend his funeral.

Tao Hongjing's legacy is multifaceted. His work on pharmacopoeia and medicine was of great consequence for the later development of Chinese medical practice. His alchemical studies were also highly influential, due especially to the methodical and empirical spirit that he brought to them. In terms of the history of Chinese religions however, the institutional and textual foundation that he laid for the Maoshan or Shangqing school had the greatest lasting impact. The semimonastic community that he established at Maoshan was to provide the base upon which the success of the Shangqing school was built during the succeeding Tang dynasty, a time during which Daoism was favored with its greatest popularity among the Chinese elite.

**TAPAS.** The Sanskrit term *tapas*, from *tap* ("heat"), was in ancient India an expression of cosmic energy residing in heat, fervor, and ardor. Through anthropocosmic correspondences established in early Vedic sacrificial traditions *tapas* became one of the key concepts of South Asian religions and the accepted term in Sanskrit and other Indic languages for ascetic power, especially a severely disciplined self-mortification that produces both personal and cosmic results.

A wide range of religious expressions concerning *tapas* appears already in the *Rgveda*. The gods Agni, the sacrificial fire, and Sūrya, the sun, both possess heat inherently, whereas *tapas* is generated within the warrior deity Indra and his weapons as a concomitant of heroic fury in battle. Indra's heated rage may be connected to certain proto-Indo-European warrior-cult phenomena; Rgvedic references to ascetics who handle fire, as well as other references to sweating as an initiatory technique, may be connected with pre-Vedic ecstatic or shamanic experiences. *Tapas* can be a weapon itself, used by Indra, for example, to encircle Vṛtra, or employed, perhaps ritually, by enemies of priests who pray to Indra and Varuṇa for protection (*Rgveda* 10.167, 7.82). In Hymn 9.113 the ritual production of divine *soma* is accomplished by *tapas*, faith, order, and truth. But perhaps the most influential Rgvedic speculations on *tapas* occur in such late cosmogonic hymns as 10.129 and 10.190, where *tapas*, existing prior to both divine and human beings, is linked in the procreative process with primordial desire (*kāma*), mind,

order, and truth, a cosmic association that served as a template for late Vedic soteriologies as well as post-Vedic popular mythologies. Finally, the *R̥gveda* reveals that the ancient sages and godlike ancestors also embody this cosmic fervor, the *ṛ̥ṣis* sitting to perform *tapas* (10.109), and the *pitṛs* (“ancestors”) attaining their invincible places in the heavens by means of *tapas* (10.154).

It is in the *Yajurveda* recensions, the *Atharvaveda*, and the several Brāhmaṇas that *tapas* receives full recognition: the human body becomes a metaphor of sacrificial fire and *tapas* is simultaneously the means to and the experience of transformation. The Vedic student (*brahmacārin*), according to *Atharvaveda* 11.5, generates such powerful *tapas* that it fills his teacher, the gods, and the three worlds. *Tapas* is primal energy ready to be drawn upon by the knowledgeable, the adept, and the aggressively self-disciplined. Prajāpati, lord of creatures, continues, in the Brāhmaṇas, the older impersonal cosmogony involving *tapas* and blends with it the personal one of self-sacrificing Puruṣa (*R̥gveda* 10.90): overcome with desire (*kāma*), Prajāpati discharges in heated procreation, exhausting himself into the substance of the universe by repeated emission. That this striving to create by self-heating provided a ritual model is clear from the many correspondences defining the Vedic sacrificer, who maintains the created worlds by laborious ritual (*karman*); he is simultaneously identified with the sacrificial fire, Agni, and Puruṣa-Prajāpati, as he undergoes spiritual regeneration. The way is now clear for ascetic technique to replicate, and in some ways to replace, sacrificial technique. Both are performances on an exhaustive, even painful scale: procreative on a sexual model, yet requiring chastity; bearing personal cosmic fruits, results that can be stored; and burning away, by inner heat, those impurities that are hindrances to transcendent, immutable being. *Śatapatha Brāhmaṇa* 10.4.4 is an illustration of the Brahmanic bond between cosmogony through sacrifice, and transcendence (rebirth) through ascetic perseverance, all declared in Prajāpati’s thousand-year *tapas*.

The Upaniṣads further explore these mysterious connections in the heat of sexuality, hatching, ripening, digestion, strife, grief, rage, ecstasy, and mystical vision. The way is opened for a normative *tapas* practiced by every religious seeker in the third stage (*āśrama*) of life, and thus a modification or lay version of the extreme *tapas* professed by the ascetic bent upon world- and self-conquest. In the texts of the Jains and Buddhists, in various traditions of yoga and Tantra, and in popular myths and folklore collected in the Sanskrit epics and Purāṇas, a profile emerges of ascetic *tapas*. By degrees of fasting, chastity, silence, meditation, breath-control, and difficult postures, usually practiced in solitary vigil in forests and mountains, the yogin or *tapasvin* “heats the three worlds.” His techniques include a “five-fires” position (sitting naked between four fires beneath the midsummer sun), immersing himself in a river in midwinter, and remaining unsheltered in monsoon rains.

The ascetic, like the sacrificer, demonstrates his interior fire as a cosmic force capable of recreating, reordering, or dismissing the world. So powerful is this religious model that much of the dramatic tension of post-Vedic mythology is provided by world-threatening *tapas* produced from ascetic ardor. Gods, goddesses, demons, kings, heroes, married sages, celibate yogins, young children, even animals perform *tapas*. The god Brahmā produces by *tapas*; Śiva’s *tapas* and magical fire alternately create and destroy; Pārvatī maintains *tapas* for 36,000 years; a host of demons (*asuras* and *daityas*) concentrate on world domination by *tapas*; the Pāṇḍava heroes exercise *tapas* in forest exile. *Tapas* and *kāma* cooperate in keeping the created world together; erotic desire poses the strongest threat to ascetic world-transcendence, and therefore repression and lust together with self-control and self-abandon provide antiphonal parallels to the ancient Indra-Vṛtra cosmic opposition, a cooperative discord that threads the drama of creation and recreation.

Whereas Hinduism routinized *tapas* into ordinary observance of fasts, meditations, and yogalike practices, and Buddhism elected a middle path between austerity and indulgence, Jainism perfected *tapas* in both lay and monastic careers as a means of burning off old *karman* and blocking accretions of new *karman*. In Jainism and in some traditions of Tantric yoga *tapas* survives today as disciplined self-mortification and as an internal experience of transformation.

SEE ALSO Agni; Indra.

#### BIBLIOGRAPHY

The best contextual discussion of *tapas* in Brahmanic initiation, sacrifice, cosmogony, and eschatology is by Mircea Eliade in *A History of Religious Ideas*, vol. 1 (Chicago, 1978), esp. pp. 220–238. See also his *Yoga: Immortality and Freedom*, 2d ed. (Princeton, 1969), pp. 106–114, 330–341. Chauncey J. Blair’s *Heat in the Rig Veda and the Atharva Veda* (New Haven, 1961) has analyzed the root *tap*, its derivatives, and other words concerning “heat” in two Vedic texts. I discuss the religious significance of *tapas* as fire and heat in the Vedic tradition in my book *In the Image of Fire: Vedic Experiences of Heat* (Delhi, 1975), esp. chaps. 4–5. In *Asceticism and Eroticism in the Mythology of Śiva* (London, 1973) Wendy Doniger O’Flaherty provides penetrating analyses of some forty-five motifs, primarily in the Purāṇas, on creative and destructive *tapas* and so forth; see motifs 8, 10, 18, 25, 36, 39, 45. On *tapas* in Jain monastic traditions, see Padmanabh S. Jaini’s *The Jaina Path of Purification* (Berkeley, 1979), esp. pp. 250–251; for lay traditions, see R. H. B. Williams’s *Jaina Yoga: A Survey of the Mediaeval Śrāvākācāras* (London, 1963), pp. 238–239.

## TAPU SEE POLYNESIAN RELIGIONS; TABOO

**TAQĪYAH** (“safeguarding, protection”) and *kitmān* (“concealment”) are terms applied, primarily in the Shīʿī branches of Islam, to two broader types of religious phenomena: (1) the “prudential concealment” of one’s allegiance to a minority religious group in danger of persecution and (2) the esoteric “discipline of the arcane,” the restriction of a spiritual reality or mystery (or its symbolic form) only to those inwardly capable of grasping its truth.

**JURIDICAL AND ETHICAL DIMENSIONS.** The classical discussions found in all Islamic legal schools are based on various Qurʾānic verses (16:106, 3:28, 40:28, etc.) permitting the neglect of certain religious duties in situations of compulsion or necessity. In each school an elaborate casuistry was developed, detailing the special conditions for such exceptions. However, the crucial practical question for Shīʿī groups, given the endangered minority position of the Shīʿī imams and their followers from earliest Islamic times onward, was that of concealing the outward signs of their Shīʿī allegiance (for example, their distinctive forms of the ritual prayer and profession of faith) under threatening circumstances. Hence, Shīʿī legal discussions of *taqīyah* traditionally focused on this aspect, emphasizing, for example, surah 16:106, which was taken to describe the divine forgiveness of a companion of the Prophet, ʿAmmār ibn Yasīr, who had been forced to deny his faith by the idolators of Mecca.

Sunnī polemics against Shiism have traditionally stressed this narrowly prudential aspect of *taqīyah*, portraying it as a sign of moral or religious hypocrisy, passivity, and the like. However, neither that polemic (which overlooks the central theme of martyrdom and heroic resistance in Shīʿī piety and sacred history) nor the narrowly ethical reasonings of the legal schools (including those of the Shīʿah) accurately conveys the distinctively positive symbolic function of *taqīyah*: for the Shīʿah themselves, and like the martyrdom of so many imams and their supporters, it is a perennial and fundamental form of “witnessing” their essential role as the faithful spiritual elite of Islam, and not simply another communal sect or school.

**SPIRITUAL AND ESOTERIC DIMENSIONS.** This uniquely Shīʿī conception of *taqīyah* (or *kitmān*) as a high spiritual duty, rather than a pragmatic necessity, is grounded in a large body of reported sayings (*ḥadīth*) of the first Shīʿī imam, ʿAlī ibn Abī Ṭālib (d. AH 40/661 CE), and other early imams (notably Muḥammad al-Bāqir and Jaʿfar al-Ṣādiq) which repeatedly stress the positive, essential role of *taqīyah* as an integral part

of religion (*dīn*) and true piety (*taqwā*; see Qurʾan 49:13). In Shīʿī tradition, the concept of *taqīyah* is intimately bound up with the fundamental role of the imams, and their initiates, as the divinely instituted guardians of the esoteric wisdom or “hidden secret” (*sirr maknūn*) constituting the essential spiritual core and intention of the Qurʾānic revelation. In this context, *taqīyah* refers primarily to the initiate’s strict responsibility to divulge the forms of that spiritual knowledge only to those rare individuals capable of perceiving (and safeguarding) their inner truth.

Similar assumptions of esotericism—especially the basic distinction between a public level of formal “belief” and ritual practice, and a higher level of contemplative insight and perception accessible only to a spiritual or intellectual elite—were equally fundamental to such widespread (though by no means specifically Shīʿī) Islamic spiritual traditions as Sufism and the philosophic schools. Those assumptions, along with corresponding practices, came to be pervasive not only in the high literate culture (for example, Ṣūfī mystical poetry) but also in social domains not involving strictly “religious” activities. Moreover, the social and political conditions underlying *taqīyah* in Shīʿī circles, and such later offshoots as the Druze or Nuṣayrīyah, likewise encouraged similar precautionary developments among other minority religious groups or sects, whether Islamic (certain Ṣūfī *ṭarīqahs*, religio-political “brotherhoods,” and so forth) or non-Islamic. Hence, “*taqīyah*-like” phenomena—whether or not justified in specifically Shīʿī terms—have continued to form an essential, if still relatively unstudied, dimension of religious and social life in many regions of the Islamic world down to the present day.

## BIBLIOGRAPHY

For the classical Islamic legal sources, see R. Strothmann’s “Takīya,” in *The Shorter Encyclopedia of Islam* (Leiden, 1961), which includes non-Shīʿī treatments; Hamid Enayat’s *Modern Islamic Political Thought* (Austin, 1982), which touches on contemporary Shīʿī political reinterpretations; and especially Etan Kohlberg’s “Some Imāmī-Shīʿa Views on *Taqīyya*,” *Journal of the American Oriental Society* 95 (1975): 395–402, with extensive bibliographic references. Henry Corbin’s *En Islam iranien*, 4 vols. (Paris, 1971–1972; English translation in preparation), contains numerous translated canonical sayings of the Shīʿī imams concerning *taqīyah* and its esoteric underpinnings, as well as later developments; see index under *ketmān* and *taqīyeh*. For illustrations from later Shīʿī thought and references to parallel phenomena in other Islamic traditions such as philosophy and Sufism, see my work *The Wisdom of the Throne* (Princeton, 1981). References to the actual social manifestations of *taqīyah* at any period are usually fragmentary (given the very nature of the phenomenon) and must be gleaned from autobiographies, travelers’ reports, and so on. Excellent illustrations for nineteenth-century Iran may be found in Comte de Gobineau’s *Les religions et les philosophies dans l’Asie centrale*, 2d ed. (1863; reprint, Paris, 1971), and Edward Granville Browne’s *A Year amongst the Persians* (1893; reprint, Cambridge, 1959). For representative developments in the Indian

context, see Azim Nanji's *The Nizārī Ismā'īlī Tradition in the Indo-Pakistan Subcontinent* (Delmar, N. Y., 1978).

JAMES WINSTON MORRIS (1987)

**TĀRĀ** (Tib., Sgrol ma) is a Buddhist deity who represents the female counterpart of the *bodhisattva* Avalokiteśvara. She appears as the savior of the world whenever people are in distress and thus is known in Tibet, where she has gained great popularity, as the Great Savioress. By the time Mahāyāna and Vajrayāna Buddhism were firmly established in Tibet, Tārā had become one of the most important female deities, one whose influence was reflected back as the very source of the Tibetan people. One tradition has it that Avalokiteśvara and Tārā, in the semblance of a monkey and a rock demoness, had monkey offspring who gradually became humans, thus accounting for the origin of the Tibetans. As the *śakti* of the Buddha Amogasiddhi, Tārā also personifies “all-accomplishing wisdom.”

Tārā is said to represent the very essence of loving devotion, extending her loving care to the bad as well as the good. She always accompanies the faithful in their religious practices; hence, it is customary in monastic communities to meditate on the *maṇḍala* of Tārā (Sgrol ma Dkyil 'khor). However, it is difficult to determine whether, during the early spread of Buddhism, the influence of Tārā extended beyond the court or scholarly circles.

It is the opinion of some scholars that the cult of Tārā was brought to Tibet by Atīśa (982–1054). As evidence of this, they point to the tradition that holds that Atīśa's trip to Tibet and his meeting with 'Brom ston pa were predicted by a *yoginī* whom Atīśa met under the tutelage of Tārā, and to Tārā's alleged appearance before Atīśa at Mnga' ris, where he met 'Brom ston. However, tradition has it that when Srong bstan sgam po (d. 649) received the Nepalese princess Bhrikutī and the Chinese princess Wencheng as his brides, they brought Buddhist images and other objects with them. In later times, these two princesses were believed to have been incarnations of the green, or prosperous, and white, or helpful, Tārā. If this latter tradition is accepted then the introduction of Tārā into Tibet predates the arrival of Atīśa. However, it can scarcely be doubted that it was Atīśa who gave new emphasis to the cult of Tārā, to whom he was especially devoted.

It is difficult to determine exactly when and how the cult of Tārā emerged. Tārā shares many mythic parallels with Brahmanic deities. For example, Durgā and Tārā hold several names in common. Thus, although some scholars claim the priority of one over the other, it seems impossible to determine whether the cult of Tārā has a Brahmanical origin or a Buddhist origin. The early sculptural representations of Tārā seem to point to a sixth-century beginning for the image of the Buddhist Tārā. These early images, found in caves such as Ellora, Aurangabad, and others, depict a placid

form in contrast to the fierce representation of her corresponding Hindu goddess. Later, however, Tārā in her Mahāmāyāvījayavāhinī, or fierce, aspect is conceived as a war goddess in the manner similar to that of the Hindu Devī. The iconic representations seem to indicate that Tārā in her early and simple form is seated and possesses two arms and two hands. As time passes, her iconic representations became more complex: not only is there an increase in the numbers of heads, arms, and hands, but the number of accessory figures attending her gradually increases. Another feature of her iconic representation is her appearance with four—Amogasiddhi, Ratnasambhava, Amitābha, and Akṣobhya—of the Five Buddhas (the fifth being Vairocana). In these representations, Tārā usually, but not always, appears in colors corresponding to the colors of these Buddhas. The complexity of her iconic representation can be appreciated through a careful study of the *Sādhanamālā*, the *Niṣpanmayogāvalī*, and other texts.

Tārā is said to manifest herself in five forms for the benefit of her worshipers. She takes on the five forms of the protective goddesses—Mahāpratisarā, Mahāmāyūrī, Mahāsahasrapramardanī, Mahāsītavatī, and Mahāmantrānūsārīnī—in order to protect beings from all sorts of earthly troubles and miseries. Her protective power is categorized as defense against the “eight great terrors” (*aṣṭamahābhaya*), poetically expressed in verse by Candragomin. In time, the “eight great terrors,” the perils of elephants, lions, fire, serpents, robbers, fetters, sea monsters, and vampires, were each assigned their own Tārā, and the depiction of eight Tārās became a popular subject for artists.

Tārā has been propitiated and invoked in various ways, for various reasons, by various people. Many of her devotees hope for relief from a variety of worldly ills. For example, Candragomin, feeling sorry for a beggar woman who had no means to arrange for her daughter's marriage, is said to have prayed with tears in his eyes to a picture of Tārā. The image thereupon became a real Tārā who took off her ornaments made of various jewels and gave them to Candragomin, who in turn gave them to the beggar woman. Asvabhāva composed a long eulogy to Bhaṭṭārikā Ārya Tārā when his disciples were bitten by a poisonous snake, whereby the snake encountered great pain. He then sprinkled water charmed with a Tārā mantra on his disciples and the poison came out of their wounds.

The cult of Tārā that was reintroduced to Tibet during the second diffusion of Buddhism did not become the exclusive property of any one sect. Indeed, in the course of time the cult of Tārā found its way into most of the countries where Mahāyāna Buddhism spread.

LESLIE S. KAWAMURA (1987 AND 2005)

the major empires of pre-Conquest Mexico, rivaling and successfully repulsing the Aztec. Like the latter, they had a complex religious hierarchy, a priest-king, and a developed system of rites, myths, and religious legends. During and following the Spanish conquest in the sixteenth century, however, more than 90 percent of these people were destroyed in a holocaust of slaughter, disease, and slave labor. In the early twenty-first century about ninety thousand Indians (about two-thirds Tarascan speaking)—surrounded by non-Tarascons—live on in the high, cool, green Sierra Tarasca, where they subsist by various combinations of lumbering, arts and crafts, fishing, farming (mainly maize), and raising livestock. Immediate to moderately extended families are grouped into villages of several hundred to several thousand persons. Factional rivalries within the villages are exceeded by the nearly ubiquitous intervillage hostilities, and both, like the rivalries between families, are balanced by a strong ethic of familial and communal solidarity and the integrative function of religious ritual.

Tarascan history is still reflected in today's religious culture. Prehistoric ritual groups such as the "moon maidens" and mythical symbols such as deer masks and "the tigers" figure in the fiestas. But the main historic source of Tarascan religion is Spain of the sixteenth and seventeenth centuries—evident not only in "the Moors" and other ritual actors in Tarascan religious fiestas but also in the dogmatically simple focus on Saint Francis and the holy family brought to them by Franciscan missionaries, notably the great humanist Don Vasco de Quiroga. Tarascan religious practice, whatever its sources, is marked by aesthetic integration, perhaps above all in the music of its many bands, and the diagnostic Dance of the Little Old Men (hunched, red-masked figures who alternate between hobbling on canes and jiggling with adolescent energy).

A major axis of Tarascan religion lies in individual rites of passage. Baptism, ideally, takes place a week after birth: A man and a woman, usually spouses, become the child's godparents and, more important, the ritual co-parents (Span., *compadre*; Tarascan, *kúmpa*) of the child's parents. At two or three subsequent rites, notably that of confirmation, the parents acquire additional but less valued *compadres* who, in particular, help with obligations in religious ritual. The major individual rite, the wedding, includes a ceremony in a Roman Catholic church and a great deal of folk religious ritual—conspicuously the climactic and widespread *kúpera* dance between the couple and their siblings and cousins, who successively dance up to each other, exchange drinks, and lightly scratch each others' faces with rose thorns. This wedding also invokes and creates ties of ritual kinship (kinship and religious ritual are largely thought of and acted out in terms of each other). Death is celebrated by a night-long wake, with much drinking, and a funeral procession through the entire village. (If the deceased was an infant or a child, the body is borne on a table.)

The main way the Tarascan relates to the supernatural, however (aside from individual sorcery and witchcraft), is

**TARASCAN RELIGION.** The Tarascan Indians, speakers of a genetically unaffiliated language, created one of

through familial and communal ritual. Every town stages an annual fiesta for its patron saint; most towns organize four to six such affairs each year, each for a different saint; and at least one town, Ocumicho, puts on a fiesta every month—with a correspondingly great expenditure of time and energy. These fiestas are run by elected officials or *cargueros* (Span., “load bearers”), who, with the support of dozens or even scores of kin or ritual kin, may spend huge amounts of pesos on the bands, elaborate fireworks, alcohol, ceremonial dishes, Catholic masses, livestock for slaughter, and other elements of the fiesta. While these expenses are often said to be ruinous, the average person is quite ready to incur them, or at least resigned to them because of the social status they imply. Also, the debts can be a source of prestige that links the *carguero* into a larger human network. In some of the more conservative towns the offices of the different saints are ranked in terms of prestige, forming a sort of “ceremonial ladder,” in which the *carguero* who sponsors the associated fiestas gradually ascends a series of metaphorical rungs. Although most *cargueros* are men, women do most of the work of organizing and preparation. Some annual fiestas—for example, to Our Virgin of the Assumption—are purely religious, but the great majority involve commercial and market functions (these functions constitute the primary emphasis of some festivals).

Religious ritual is diagnostically regional. Some fiestas are essentially local—for example, that of Saint Cecilia in tiny San José, where many of the men actually are musicians. But people are aware of fiestas and practices in their entire region as well, and a large number of fiestas are pan-Tarascan, either because they attract many pilgrims or because the day is celebrated in the several villages where a given saint is patron, as in the cases of the popular San José and San Francisco. All Saints and All Souls days are observed in all towns by quiet vigils with flowers and bread figures at the graves of the recently deceased. In Janitzio, on the other hand, a thousand candle-bearing canoes hover around the island during the night of November 1. An individual whose personal saint coincides with that of a village often makes a pilgrimage, or at least says a special prayer. (Prayer generally focuses on help with practical, personal problems such as illness or jealousy and envy, and so is inextricably intertwined with the culture’s pervasive witchcraft and sorcery.)

A notable feature is the great variation in the religious autonomy of a village, which is reticulated closely with its political orientation and economic standing. At one extreme the annual and personal rituals (baptism, confirmation, marriage, and the wake) are managed by local societies and religious specialists (who, for example, may know an oration by heart). A priest may come to a village once a month (or even less often), or the person or persons concerned may go to the county seat for the priest’s ministrations. Some villages categorically refuse to allow a priest to participate in such sacred matters as the construction of a new church or the organization of a passion play because they realistically fear financial

loss. At the other extreme a local priest may be active and highly influential not only in religious ritual but also in local politics—to the extent of controlling the external relations of the village. The grass-roots role of the priest is so important because the Tarascan do not in general own or read the Bible or other religious literature (with the exception of a few thousand Protestants, limited to a few pueblos, who do have a superb Tarascan translation of both Testaments). The Tarascan concern is not with doctrine, argument, theology, or texts, but with a costly ritual and its economic, social, and political implications.

Nevertheless, the Tarascan share a network of explicit and implicit understandings, symbols, and attitudes that have been synthesized and transmitted largely by word of mouth. Every village, family, and individual holds to a different subset of these beliefs—pagan, local, Catholic, and secular—but there is cohesion in the area as a whole. This is in large part due to the fiestas. “Because of the fiestas,” modern industry has attracted few Tarascan; “because of the fiestas,” Protestant missionaries have made few converts; agrarian reform has had to compromise with the fiestas; and work and the family are strongly motivated by their roots in the fiestas. Fiestas, not as symbols or surface phenomena only, but as vivid, primary experiences, are the basis of Tarascan religion.

PAUL FRIEDRICH (1987 AND 2005)

**TARASIOS** (c. 730–806), patriarch of Constantinople from 784 to 806. Tarasios was born to a prominent family in Constantinople. His father, Georgios, had served as a judge and prefect (mayor) of the capital. Tarasios was excellently trained in theology and secular learning, which helped him to rise in both the civil and ecclesiastical ranks. During the reign of Leo IV and his wife Irene, Tarasios was chief secretary (*protoasikritis*) of the imperial court, perhaps from 775 to 784, when he was ordained and elevated to the patriarchal throne. His speedy elevation to the ranks of the priesthood was not unusual in the Byzantine church even though it was objected to by several iconophiles.

As patriarch, Tarasios became instrumental in the convocation of the Second Council of Nicaea in 787, which condemned iconoclasm. Not only was he the power behind the council, but it was on that occasion that the right of presiding over a council was transferred entirely to the patriarch. Tarasios, a prudent man, proved moderate in his policies toward both the problems of the imperial house and the iconoclastic controversy. His moderation was perceived as laxity, and Tarasios was attacked by the rigorous monastic party of Theodore of Studios.

Tarasios fostered the building of social welfare institutions, including a hospital and homes for the poor. He restored good relations with Rome and upon his death was honored by both the Greek and the Latin churches. Only a few of his letters and a sermon survive. His biography, which constitutes an important source for the period, was written by Deacon Ignatios.

DEMETRIOS J. CONSTANTELOS (1987)

**TARFON** (late first and early second centuries CE), Palestinian tanna. A Jewish resident of Lod, he was the teacher of Yehudah bar Il'ai and a prominent leader of the generation of rabbis active at the seaside town of Yavneh after the destruction in 70 CE of the Temple in Jerusalem.

There are two strands within the traditions associated with Tarfon. One group of traditions makes Tarfon subservient to his colleague 'Aqiva' ben Yosef and occasionally mocks Tarfon for foolishness in his behavior or opinions. A second group of traditions cites Tarfon's actions as prece-

dents for the rulings of Yehudah bar Il'ai and appears to have been formulated by Yehudah's disciples.

In establishing the criteria for legal decisions on the performance of religious obligations, Tarfon emphasized the importance of deed over intention, of formal action or objective fact over subjective thought. This posture differs sharply from that of 'Aqiva', who placed greater emphasis on the role of intention. In several instances Tarfon's view is included in the text as a foil for the authoritative opinion of 'Aqiva'.

Tarfon's major rulings frequently concern rituals performed by priests. In matters of dispute he consistently ruled in favor of the priestly families. He ruled, for instance, that a priest may receive gifts of heave-offerings of wine and oil from a householder throughout the year, an economic advantage for the priest. Tarfon's dicta emphasized that the priests could play a central role in the life of the Jews even after the destruction of the Temple.

TZVEE ZAHAVY (1987)  
*Revised Bibliography*

**TARİQAḤ.** The Arabic word *ṭarīqah*, meaning a road or path, also signifies a "mode" or "method" of action as well as a "way" or code of belief. In the context of Sufism, *ṭarīqah* refers to both the path of spirituality itself—"the way"—and the manner of traveling (*sulūk*) along this path as the wayfarer passes through various stages (*manāzil*) and stations (*maqāmāt*) in the quest to approach nearer to God.

More concretely, however, *ṭarīqah* (and its plural, *ṭurūq*) is used as a generic term for the various organized brotherhoods or Ṣūfī orders that direct this spiritual quest into a particular code of practices pursued in a communal setting. It is in this sense that the word *ṭarīqah* is most frequently used: a confraternity founded around the figure or the memory of a charismatic figure of spiritual authority. *Ṭarīqahs* are arranged hierarchically around loyalty and obedience to a living guide or master, following fixed rites of initiation, observing specific spiritual practices and a code of etiquette, typically centered in a physical structure other than a mosque (e.g., a shrine, lodge, hospice, retreat), and financed by pious endowments (*waqf*) of real property and income.

A number of these *ṭarīqah* brotherhoods date their development into formal institutions to the twelfth and thirteenth centuries; in the succeeding centuries they became geographically and culturally more pervasive and more structurally defined. These *ṭarīqahs*—some regional, others widely distributed, but few of them highly centralized—developed into a rich and diverse complex of religious associations throughout the Middle East, North and sub-Saharan Africa, Arabia, Central Asia, South and Southeast Asia, and China and in the twentieth century in Europe, North America, and Australia. They were influential not only in the popularization of Sufism but in the spread of Islam as a religion; sometimes they have also fostered resistance movements or developed into political forces in their own right.

Beyond this the influence of the *ṭarīqahs* has been manifold: they add an emotional, psychological, and spiritual dimension to devotional practice, in many cases by integrating poetry and music, the visual arts, and mystical contemplation into religious life; they contribute to the intimacy of social life; they are associated with trade and craft guilds; they have provided staging posts and hospices for travelers and merchants; and they maintain shrines and other facilities by means of charitable endowments. They have also served as credit and finance institutions, thus contributing to commerce and a stable network of trade throughout the Muslim world, especially along the great distances of the Silk Road across Central Asia to China and in the maritime trade of the Indian Ocean.

Though their influence as institutions waned somewhat over the nineteenth and twentieth centuries, a wide and vibrant variety of *ṭarīqah* institutions still exist in various forms in both urban and rural locales.

**ORIGINS AND EARLY DEVELOPMENT.** The use of the word *ṭarīqah* in the writings of al-Junayd (d. 910), al-Hallāj (d. 922), al-Sarrāj (d. 988), al-Hujwīrī (d. 1072), and al-Qushayrī (d. 1074) denotes a method of moral psychology for the guidance of individuals directing their lives toward a knowledge of God. In early Sufism the term *ṭarīqah* was thus understood as a method or path by which an individual passing through various psychological stages in the obedience to and practice of the law (*sharīʿah*) proceeds from one level of knowledge of God to a higher one with the ultimate reality of God (*ḥaqīqah*) as the goal. Although Sufism has been accused of advocating or permitting an antinomian path, the *ṭarīqah* orders for the most part held to the belief in the primacy of *sharīʿah* (which is itself etymologically related to another root for road or path). As Jalāl al-Dīn Rūmī's famous Persian mystical poem, *Mathnawī*, expresses it:

*Sharīʿah* is like a candle lighting the way. You must take this candle in hand before the way can be traveled. Having set out on the way, your walking is *ṭarīqah*, and when you arrive at your destination, that is truth (*ḥaqīqah*, the real, or God).

The institutional elaboration of this path derived from a spiritual impulse that established itself early in Islam. It origi-

nates in part from a mystical hermeneutic applied to the lexicon of the Qurʾān, investing particular verses and scenes with special significance, and from the intense, passionate spirituality evident in the *sīrah* of the Prophet and some of his companions. It was an impulse that grew stronger in the seventh and eighth centuries with the emergence of what Marshall Hodgson (1974) has described as “the piety-minded opposition” to the luxury, worldliness, and nepotism of the Umayyad caliphate and later dynasties. The mystical traditions of Sufism emerged from this piety-minded alternative to both the political and the religious establishments. Islamic spirituality has also reemerged at various historical junctures, especially the colonial period, in the form of counterculture, protest, or even militant resistance movements.

This religious quest for interior purity and control over the self (*nafs*), the slaying of which was described by later Ṣūfīs as the greatest of human struggles (*jihād-i akbar*), fell heir to the rich spiritual traditions of Hellenism and Christianity in the eastern Mediterranean. In the manner of the desert monks and other ascetics in Syria and Egypt, some Muslims began to wear a distinctive habit of coarse wool (*ṣūf*). The term *ṣūfī* was used as early as the eighth century CE to describe a man wearing such wool garments, and *ṣūfīyah* is attested in the following century in reference to groups or nascent communities of such Ṣūfīs.

**SPIRITUAL EXERCISES.** Early Islamic spirituality emphasized reliance upon God through the practice of poverty (*faqr*). Indeed two words for a “poor person,” dervish (Persian *darwīsh*) and fakir (Arabic *faqīr*), retain their association with Ṣūfī asceticism. Techniques of the Ṣūfī *via purgativa* included fasting, seclusion (*khalwah*), a daily calling oneself to account for one's behavior (*muḥāsibah*), and scrupulous introspection (*murāqabah*) with a view to weeding out impure intentions. Ṣūfīs also spent much time in personal devotions, performing vigils, litanies (*aḥzāb*), and intimate prayers (variously called *wird*, *munājāt*, *duʿā*) in addition to the prescribed ritual prayers (*ṣalāt*).

Some contemplative or ecstatic exercises came to be performed in groups, such as the ceremonial *dhikr*, or “remembrance” of God, involving the repeated and rhythmic recitation of words and phrases—usually attributes of God derived from the Qurʾān or forms of the Shahādah—often in combination with controlled breathing. Another group ceremony was the *majlis-i samāʿ* (listening session or concert). As early as 850 CE there were *samāʿ* houses in Baghdad in which the Ṣūfīs could listen to music and let themselves be drawn into mystical states. *Samāʿ* might also feature the chanting or singing of poetry on spiritual themes, accompanied by music, to which the listeners might respond with rhythmic movement. Although similar to dancing, such responses were conceived as either a deliberate form of motive meditation or as an uncontrollable response to an ecstatic state. Most of the *ʿulamāʿ* rejected *samāʿ* as an impious practice (in part because of the associations of music and dance with royal courts and dancing slave girls) and it was not universal-

ly accepted among the *ṭarīqahs*, though many Ṣūfī manuals defend it when properly regulated. Some orders also hold communal ceremonies involving the piercing of body parts with skewers or knives in trance-like states to induce or demonstrate the achievement of ecstatic states.

**COMMUNAL LIFE.** The nucleus from which the *ṭarīqahs* developed was the relationship established between master and adept. This mirrored the teacher-student relationship in the *madrasahs* or the master-apprentice relationship in the urban craft guilds (from whose ranks the *ṭarīqahs* drew much of their membership). A popular preacher or revivalist, a healer, a visionary mystic, an ascetic or other holy man might draw a number of devoted listeners to hear lectures or to experience the charisma and spiritual energy (*barakah*) of his presence. This might develop into a lasting relationship between a spiritual guide (*murshid*), or elder (Arabic, *shaykh*; Persian, *pīr*), directing his seeker (*murīd*). Prior to the twelfth century the relationship of such disciples to one another was typically unstructured, though they might travel together when accompanying the master on a journey and either do odd jobs or beg to support themselves. Some groups, such as the Karrāmīyah (based on the teachings of the ascetic preacher Ibn Karrām, d. 869), apparently evolved into more systematic movements.

Ṣūfī teachers who acquired a wider reputation were eventually able to set up hospices or lodges of their own to accommodate students. One of the earliest, a “small cloister” (*duwayrah*), was established by the ascetic ‘Abd al-Wāḥid ibn Zayd (d. c. 750) on the island of ‘Abbādān in the Persian Gulf and continued to operate after his death. Other similar institutions at about this time are described as existing in eastern Persia, in Damascus, on the Byzantine frontier, and in Alexandria and North Africa.

As a fraternity grew, it might move from the master’s private house or shop to a separate compound, which could include a hall for devotional exercises, a large kitchen for guests and disciples, a small mosque, and possibly a school. Larger centers included living quarters for some initiates, either individual cells or a larger dormitory. Often such centers grew up around the tomb of the founder of the *ṭarīqah* or a local shrine visited by pilgrims. The names of these centers or retreats varied according to location and function, typically *zāwīyah* and *ribāṭ* in the Maghreb; *tekke* in Anatolia and the Balkans; *khānaqāh*, a Persian word, throughout Iran and India (sometimes as *khānaqah*) as well as in Egypt and the Levant (as *khānaqāh*). The Persian word *dargāh* (literally “threshold” but used for the royal court or palace) is also found, particularly in India. The Chishtīyah *shaykhs* in India prefer to use their own personal residence, designated as a “community home” (*jama‘at-khānah*), to avoid the adepts becoming entangled in the mundane distractions of administering a large center and its endowments.

Some such *khānaqāh* centers kept open house, while others might be visited only by appointment. The *shaykh* lived with his family in one quarter, saw his disciples at fixed

hours, and led the five daily prayers. Some *khānaqāhs* were large and could accommodate both long- and short-term visitors. The Sa‘īd al-Su‘adā’ in Egypt, founded by Saladin (Ṣalāḥ al-Dīn) in 1173, accommodated three hundred dervishes, and contemporary chronicles record how every Friday people gathered round to gain blessings by watching them leave the compound for the Friday noon prayer.

The communal life of the *ṭarīqah* had obvious attractions. Congregational prayer gave strength and warmed faith, collective pursuit of spiritual exercises created an encouraging environment, and communal worship ceremonies like *dhikr* and *samā‘* fostered mystical experience. The communal setting of the *ṭarīqah* also led to greater formalization of the relationship between the *shaykh* and his disciples. Favored disciples enjoyed close companionship and conversation with the *shaykh*, pursued in some of the *ṭarīqahs* through the technique of *tawajjuh*, or total face-to-face concentration. This was practiced by the disciple concentrating on his *shaykh* as he performed the *dhikr* or by the *shaykh* who reciprocated by concentrating on his disciple, entering his heart and guiding him.

The spiritual authority of the *ṭarīqahs* and their *shaykhs* are certified by a *silsila*, or “chain” of transmission, which (in a parallel to the *isnād* of a *ḥadīth* report) certify the founder of the order’s link to a presumed oral tradition of interpretation handed down the generations from the Prophet. These *silsilas*, not all of them historically plausible, function as spiritual genealogies and naturally diverge according to the date, birthplace, and heritage claimed by the founder of the particular *ṭarīqah*. Most, however, converge on Ja‘far al-Ṣādiq (d. 765) and trace their way back to Muḥammad through his cousin and son-in-law ‘Alī, who thus holds a special mystical significance for both Sunnā and Shī‘ī Ṣūfis.

A master of outstanding spiritual authority and charisma might create so strong an impression on his followers that his method and the community of disciples attached to him continued after his death. His mantle, literally symbolized by the bestowal of a ceremonial patchwork cloak (*khirqah*), was passed to one or more of his chosen disciples, who inherited his authority and continued his work either in the home *khānaqāh* or in an ancillary one in another city. This new *shaykh*, who might be chosen from among the elder *shaykh*’s sons, appointed by the *shaykh*, or elected, was succeeded in turn by one of his disciples. In this way a line of transmission of authority and *barakah* was established, so that the spiritual power of the founding *shaykh* could be transmitted forward to future generations of disciples.

A new disciple then did not become simply the follower of a *shaykh*. He made his oath of allegiance both to his *shaykh* and to the founder of the line of transmission to which his *shaykh* was heir. By so doing he gained the right to have knowledge of the special *dhikr* formulas distinctive to the order and to share in the spiritual power of the entire line of transmission. Thus to the relationship between teacher and disciple (joined by their mutual desire to draw closer to

God) was added the component of initiation into a source of spiritual insight and power that extended over generations.

Most Ṣūfī orders insisted on the necessity of a living guide to follow the *ṭarīqah*, but there were exceptions. Some Ṣūfīs, calling themselves Uwaysīs after the example of Uways al-Qaranī (a contemporary of the Prophet who only met him in a dream), claimed to have been initiated or illuminated through a dream or vision of a past master rather than through the guidance and presence of a living master. Qalandarī dervishes underwent an initiation ritual that included shaving the face (including eyebrows) and head but normally practiced their wandering, mendicant, and antinomian lifestyle without direction from a *shaykh*.

**THE TĀRĪQAH AS AN ESTABLISHED INSTITUTION.** The *madrasah* system of education, by licensing professors, formalizing the curriculum, and subsidizing students, succeeded in professionalizing the legal discipline in the eleventh and twelfth centuries CE. In the thirteenth century the Abbasid caliph al-Nāṣir encouraged the spread of young men's chivalric societies (the *futūwwa* orders), establishing an interest in and conveying legitimacy on the idea of urban fraternal organizations. These institutional models must also have suggested themselves to the Ṣūfī communities. If the community of disciples of a particular Ṣūfī master survived and replicated itself for a generation or more after the death of the founder, it would often become known as the "method," or *ṭarīqah*, of its eponymous founder, as, for example, "the method of Najm al-Dīn Kubrā," or Ṭarīqat al-Kubrāwīyah. It has been supposed that the development of the *ṭarīqah* orders into formal religious institutions centered around a lodge or shrine, following a fixed rule, and projected to continue functioning indefinitely began in the twelfth century (as some of the orders' *Silsilabs* claim). Commonly, however it was the children or grandchildren of the founding *Shaykhs*, rather than the *Shaykhs* themselves, who organized the disciple communities into institutional orders, a process that can be clearly documented for the late thirteenth and fourteenth centuries. Later in the Ottoman period the *ṭarīqah* institutions become corporate entities with subbranches that were sometimes described by a different generic term, *ṭā'ifah* (plural, *ṭawā'if*) as "societies."

Despite the esoteric character of the theosophy they promulgated, the ideas and rituals of the *ṭarīqahs* attracted the masses with the hope of obtaining spiritual and temporal benefits from the sanctity and spiritual power of the great figures in the orders, from the tombs in which they were buried, and from the places and relics with which they were associated. Thus the *ṭarīqahs* became great communities, comprising all strata of society, offering something to the educated and uneducated alike, fostering devotional poetry and music, tolerating a wide range of folk practices, yet preserving and extending a great tradition of spirituality. They likewise played a major social role. Their hospices (*khānaqāhs*) offered lodging to travelers, medical treatment for the sick, and help for the poor. They also became centers for popular de-

votion. They extended their membership by granting associate tertiary status to individuals who, while living outside the community, practiced their normal trades, performed the daily prayers in the *ṭarīqah* environment under the direction of the *shaykh* and took part in *dhikr* exercises, litanies, or *samā'* sessions.

**INITIATION RITUALS.** Most of the *ṭarīqahs* have similar rituals of admission, although degrees of fervor, sincerity, and integrity have varied over time and place. An initiation, a great event in the life of both the initiate and the community, is marked by a day of festival. A model initiation ceremony described in one of the manuals for the Qādirīyah *ṭarīqah* is described as follows. The candidate first performs ritual ablutions; he then prays two *rak'ahs* and sits facing the *shaykh* with his knees pressed together. Clasping his *shaykh's* right hand, he recites the opening *sūrah* of the Qur'ān followed by a series of formulas invoking blessings upon the Prophet, and the various *silsilas*, especially those of the Qādirīyah line, by which his *shaykh* establishes his authority. Afterward the *shaykh* has him repeat, phrase by phrase, a formula containing various components: a prayer asking God's forgiveness; a testimony that the vow he is taking is that of God and his apostle; recognition that the hand of the *shaykh* is that of 'Abd al-Qādir, founder of the order; and a promise that he will recite the *dhikr* as the *shaykh* requires him to do. The *shaykh* then utters a prayer and recites the Qur'anic verse of allegiance: "Those who vow their allegiance to you, vow their allegiance to God; the hand of God is upon their hands. Thus whoever violates it, violates himself, but whoever fulfills what he has promised God he will undertake, God will give him a mighty reward" (48:10). Alternately verse 16:91 is used: "Fulfill the pact of God once you have made a pact with him."

**SOCIAL ETHICS AND ETIQUETTE.** The number of manuals filled with stories illustrating and enjoining delicate, tactful, and respectful behavior on the *ṭarīqah* initiates demonstrates a remarkable sensitivity to etiquette and propriety. One of the earliest treatises on the norms of proper behavior among members of a *ṭarīqah*, Abū al-Najīb al-Suhrawardī's *Adāb al-murīdīn* (The manners of the disciples) dates from the twelfth century CE. It is representative of practices in a number of orders and elaborates an etiquette of great sensitivity. Apart from its intrinsic interest, it demonstrates the primacy of human values and courtesy over rigorous ascetic practices and complex theosophical ideas in the brotherhoods. It also shows clearly that the *ṭarīqahs* did not see themselves as subsets outside the regular religious disciplines.

The work classifies religious scholars into three groups (in practice these were not fixed identities but points on a continuum of religious orientation with considerable overlap): traditionalists, jurists, and (Ṣūfī) 'ulamā'. The traditionalists are the watchmen of religion, who deal with the external meaning of *ḥadīth*. The jurists are the arbiters of religion, whose specialty is their ability to make legal inferences. The Ṣūfīs in turn base their lives and conduct on both

groups of specialists and refer to them in case of difficulties. Tradition and law are the basis for their lives, including both their inner modes of spirituality and their outward behavior. In the description of this outward behavior one sees an extraordinary concern for personal relations in both family and community life: patience with the ignorant, compassion with one's wife and family, agreement with brethren. Openness, modesty, and humility are the ideals. The movements of tongue, ear, eye, heart, hands, and feet are to be directed to charity.

Meticulous attention is given to the details of social behavior, personal cleanliness, modesty in dress, and restraint in eating. The brethren at any hospice should exercise great care in their treatment of guests. As host, the *shaykh* should encourage them to overcome their shyness at the table and offer them whatever food he is able to provide. The guest, for his part, should sit where he is directed, be pleased with what is given to him, and not leave without excusing himself. The host should then accompany the departing guest to the door of the house. In certain circumstances joking is permitted, provided that slandering, mimicry, and nonsense are avoided. This practice is supported by a tradition relating words attributed to 'Alī: "When the Prophet saw one of his friends distressed, he would cheer him up by joking."

**THE ROLE OF WOMEN.** 'Abd al-Raḥmān Al-Sulamī's (d. 1022) compilation of the lives of women Ṣūfīs attests to the involvement of many women besides the famous celibate saint Rābī'ah al-'Adawīyah (d. 801). Ibn 'Arabī (1165–1240) also writes about the miracles of Ṣūfī women, one of whom was his teacher. In Tunisia there is a shrine for a thirteenth-century woman saint, 'Ā'isha al-Mannūbīyah, whom oral tradition asserts to have been a disciple of al-Shādhilī, and Ṣūfī women healers in contemporary India or Uzbekistan attract many informal disciples.

Although outstanding exemplars of female chastity and purity in life or in literature have been upheld as saints and Ṣūfī heroines, in which role they become public figures as honorary "men" (*rijāl*), the wayfarer along the *ṭarīqah* is conventionally assumed to be male. A rather misogynistic attitude can be found in some Ṣūfī writings, including the view that women (as well as children and the entanglements of supporting a household) are distractions from the path of true spiritual struggle.

The *ṭarīqah* orders operate in the public sphere, which has historically been a male domain in most Muslim societies, whereas women's religious organizations tend to operate in the domestic sphere. In Saljūq Anatolia and probably elsewhere female members of ruling families cultivated relationships with Ṣūfī teachers, often financing the construction of their lodges, as dedicatory inscriptions attest. This probably gave aristocratic women considerable influence in the promotion of specific orders, but it would appear that, as in a mosque, women usually attended talks or other ceremonies at Ṣūfī lodges in a segregated gallery or behind a curtain or grille. There is also documentary evidence of the wives or fe-

male servants of *shaykhs* serving Ṣūfī brotherhoods in some capacity behind the scenes, and the daughters of various *shaykhs* were married into the families of political or community leaders, solidifying membership and backing for the *ṭarīqah*.

After World War II women *shaykhas* directing circles of exclusively female disciples were noted among established Ṣūfī orders in Soviet Central Asia and the Caucasus, including the Naqshbandīyah and Qādirīyah of Daghestan, though this development was condemned by the Muslim Spiritual Board of the North Caucasus. In the late 1970s western Ṣūfī women in northern California met with an elder Mevlevi initiate from Turkey who encouraged their efforts; as a result some Ṣūfī organizations in North America and in Turkey have begun not only accepting female disciples but even holding integrated ceremonies. However, in Turkey it is more common for women to participate in female-only *dhikr* ceremonies in the homes of individuals. The public participation of women in the *ṭarīqah* environment (or the *madrasah* system) is not well documented for the medieval period. In the absence of contrary evidence, it can be assumed that the integrated public participation of women in the *ṭarīqah* orders is a development of the late twentieth century.

The *ṭarīqahs* of the thirteenth through the fifteenth centuries are the culminating point in a shift from an individualistic, elitist, ascetic spirituality to a corporate, congregational organization with a place for individuals representing a whole range of spiritual attainment and every stratum of society. There may be an inclination to see in them a counterpart to the religious orders that developed in the Christian tradition from the fifth century onward and that also channeled a large part of the impulse for solitary asceticism into an institutional framework. The analogy is only partly valid, for the two types of organization were different. The *shaykh* of a *zāwīyah* did not have the administrative authority of an abbot, nor did the *ṭarīqahs* have the same centralized government and formal lines of communication that linked the houses of the Benedictine order, for example. While the *ṭarīqahs* were, in one meaning of the term, corporate, they did not become corporations in the Western sense.

**INDIVIDUAL TARĪQAHS.** There are over two hundred *ṭarīqahs*, and in fact many more if the numerous branches and subdivisions are counted. The selection presented here is intended to show aspects of their individuality as reflected in the social classes to which they made their appeal, their attitudes toward government authority, their spiritual exercises and theosophy, and the circumstances in which they flourished.

**Qādirīyah.** The Qādirīyah *ṭarīqah* is commonly viewed as the first of the brotherhoods to emerge in the form of a structured organization, and it is still operating in the early twenty-first century. It began in Baghdad but eventually established itself as far afield as Yemen, Egypt, Sudan, the Maghreb, West Africa, India, and Southeast Asia. It claims

‘Abd al-Qādir al-Jīlānī (1088–1166) from the region of Gīlān near the Caspian Sea in Iran as its founder, tracing its *silsila* through al-Junayd. ‘Abd al-Qādir was a Ḥanbalī legal scholar—a follower of the strictest, most literalist school of Islamic law—and was invested with the Ṣūfī habit by the founder of the first Ḥanbalī *madrasah*. Although he was a stern teacher, ‘Abd al-Qādir has become perhaps the most famous saint in the Islamic world, and stories of his miracles abound from Java to Morocco. His tomb in Baghdad has remained a place of pilgrimage for members of the brotherhood to the twenty-first century, with pilgrims—many of them from the Indo-Pakistan subcontinent, where the Qādirīyah was introduced in the late fourteenth century—remaining there for weeks, silently sweeping his sanctuary with little brooms. Old Sindhi songs tell how ‘Abd al-Qādir’s spiritual realm extends through every town and region between Istanbul and Delhi.

The Qādirīyah had a very catholic appeal; all strata of society from ruler to peasant found a place within it. In popular belief ‘Abd al-Qādir was a renewer of Islam, and among members of the order there is a well-known story that he discovered a man by the wayside on the point of death and revived him. The “man” then revealed that he was the religion of Islam. The order, it should be noted, was to play a particularly important role in the Islamization of West Africa.

**Rifā‘īyah.** Slightly later than the founding of the Qādirīyah, the establishment of the Rifā‘īyah order in southern Iraq is credited to Aḥmad al-Rifā‘ī (d. 1182). Although never as popular as the Qādirīyah, it was widespread in Anatolia by the fourteenth century and is still represented there and in Egypt. It is distinguished by one of its ritual practices, a particularly loud recitation of the *dhikr*, which led members to be known as the Howling Dervishes.

**Suhrawardīyah.** One of the oldest *ṭarīqahs* is the Suhrawardīyah, named after its founder, Abū al-Najīb ‘Abd al-Qādir al-Suhrawardī (d. 1168), author of the above-mentioned *Ādāb al-murīdīn*, and also a professor of Shāfi‘ī law at the Nizāmīyah college in Baghdad. Significantly he was a pupil of Aḥmad al-Ghazālī (d. 1126), younger brother of the great Abū Ḥāmid al-Ghazālī (d. 1111), who helped win acceptance for the Ṣūfī dimension of Islam within the wider Islamic community. The influence and scope of the order was extended and given its decisive character by ‘Abū al-Najīb’s fraternal nephew and student, Shihāb al-Dīn Abū Ḥafṣ ‘Umar al-Suhrawardī (1145–1234), whose treatise *‘Awārif al-ma‘ārif* (Masters of mystical insights) became a standard work on the theory of Ṣūfī devotion.

The Abbasid caliph al-Nāṣir built a *ribāṭ* for Shihāb al-Dīn and his disciples in 1203 and appointed him as the caliphal envoy to the Ayyūbid rulers of Egypt and Syria in 1208 and then to the Saljūqs of Asia Minor in 1221. Shihāb al-Dīn Suhrawardī’s disciples spread from Asia Minor and Syria through Persia and northern India, and it was they who established the Suhrawardīyah brotherhood on a permanent footing. Its origins, however, are credited to Abū al-Najīb

and his nephew, Shihāb al-Dīn, who also figure in the *silsila* of the Kubrawīyah brotherhood as teachers of its founding figures, Najm al-Dīn Kubrā (d. c. 1220) and Najm al-Dīn Rāzī (d. 1265). The Suhrawardīyah became one of the most prominent and influential brotherhoods, though it subdivided into numerous branches after the fourteenth century.

**Mawlawīyah.** The Mawlawīyah order, more commonly known by its Turkish adjectival form, Mevlevi, takes its name from the title Mawlawī (my master), by which the Persian mystic poet Jalāl al-Dīn Rūmī (1207–1273) was addressed. His community of disciples in Konya was systematized into an order by Sulṭān Walad (d. 1312), Rūmī’s son, who built a shrine dome (*türbe*) over Rūmī’s resting place. From this base Sulṭān Walad and his son, Ūlū ‘Arif Chalabī, established Mevlevi lodges throughout Anatolia, each with its own deputized *shaykh*.

As a boy Rumi had lived with his father, Bahā’ al-Dīn-i Walad (d. 1231), a visionary and mystically minded Ḥanafī preacher (*wā‘iz*), in the small town of Wakhs (in modern-day Tajikistan) and then in Samarqand before migrating to Anatolia. Though Bahā’ al-Dīn is seen as the seminal figure of the order, his importance has been exaggerated in the hagiographical accounts of his life (the Ṣūfī genre of biography typically casts its subjects in a miraculous light, emphasizing their importance and spiritual authority). Bahā’ al-Dīn apparently had a small handful of disciples in Khorasan but enjoyed no great reputation before accepting the patronage of the Saljūq sultan in Konya, who established a *madrasah* for him, which functioned more as a Ṣūfī center than a college of law. When Bahā’ al-Dīn died, one of his old disciples came from Khorasan to take charge of the Konya disciples, a role Rūmī eventually assumed after he had completed studies of law in Syria and a period of seclusion. Rūmī also cultivated relations with the Konya Saljūqs and developed a following of his own but temporarily abandoned this role late in 1244 after meeting Shams al-Dīn Tabrīzī, an itinerant and iconoclastic Ṣūfī with some training in Shāfi‘ī *fiqh*, with whom Rūmī spent an intense period of *ṣuḥbah* and seclusion. The encounter and the eventual disappearance of Shams from Konya led Rūmī to an ecstatic form of love mysticism expressed through poetry and *samā’*, extravagantly praising Shams, though subsequent figureheads of the disciple community, Ṣalāh al-Dīn Zarkūb (d. 1258) and Husām al-Dīn Chalabī (d. 1284), are also praised. Rūmī’s extraordinary output of Persian poetry in his *Mathnawī* and *Dīwān* has been recited widely, from Bosnia to Bengal and throughout Central Asia, inspiring many Ṣūfīs of various *ṭarīqah* affiliations to imitate or comment upon it.

The Mevlevi *ṭarīqah* operated primarily in the territories of the Ottoman Empire, where it became a wealthy corporation with close ties to the imperial court. It was a hereditary order and, thanks to its central organization, did not fragment, though its character did change somewhat in the mid–sixteenth century, when Dīwānah Muḥammad Chalabī and Yūsuf Sīnachāk introduced Shī‘ī influences

into the order. The Mevlevi order promoted calligraphy and Persian literature, though it operated almost exclusively in Turkish- or Arabic-speaking environments. In later years there seems to have been much overlap between Mevlevi membership and that of other Anatolian orders, such as the Bektāshīyah, founded around the same time, and the Khalwatīyah, founded in the fourteenth century, both of which appeared more active by the twentieth century than the Mevlevi.

After serving 1001 days in the kitchen of the Mevlevi lodge, initiates were permitted to participate in the characteristic “turning” ceremony, a meditative graceful spinning performed in distinctive robes and hats to the accompaniment of a musical ensemble, usually consisting of a singer/reciter and a variety of instruments, almost always including drums and a reed flute. Beginning in the late eighteenth century, a visit to one of the Mevlevi lodges to observe one of these so-called Whirling Dervish ceremonies became an important part of European tourists’ experience of Istanbul.

**Shādhilīyah.** Rather different in character is the Shādhilīyah, founded by Abū al-Ḥasan al-Shādhilī of Tunis (1196–1258), who traveled widely in the Maghreb and Spain, finally settling in Alexandria, where he died. In contrast to both the Rifā’īyah and the Mawlawīyah, this *ṭarīqah* practices internalized and silent devotions. Thus its appeal is individualistic, focusing on the development of private prayer. Nonetheless the emphasis of Abū al-Ḥasan’s teaching was against the solitary and the institutional life alike, and he urged his followers to realize their yearning for God through faithful attention to their daily responsibilities in society. They were not enjoined to beg or even to live in voluntary poverty; Egyptian sources refer to the Shādhilīs’ tidy attire, which distinguished them from many of the other Ṣūfīs thronging the streets of Cairo. The Shādhilīyah of Yemen are also credited with discovering the value of brewed coffee beans as a means of staying awake during periods of night prayer.

This order has no special theosophical ideas apart from the fact that members are held to have been predestined to join it from pre-eternity. Rather, the goal is a deep yet sober spirituality, drawing on al-Muḥāsibī, the teacher of al-Junayd, on al-Makkī and his *Qūt al-qulūb* (The nourishment of the heart), and on the spiritual teaching of al-Ghazālī in the fourth volume of *Ihyā’ ‘ulūm al-dīn* (The vivification of the religious sciences). Its teaching is subtle and not directed at the masses, as can be seen from the *Hikam* (Maxims), an enduring classic of Ṣūfī spirituality written by Abū al-Ḥasan’s immediate successor, Ibn ‘Atā’ Allāh al-Iskandarī (d. 1309). This work, a collection of 262 brief sayings followed by four short treatises and a number of prayers, has generated numerous commentaries in many of the languages of the Muslim world.

Like many of the orders, the Shādhilīyah produced a variety of local offshoots all over the Muslim world. Among them, the Ḥāmidīyah Shādhilīyah is one of the modern or-

ders that still attracts and provides a basic spiritual formation for many Egyptians. The appeal of the Shādhilīyah extends primarily to the officials and civil servants of the middle class, whose responsibilities, values, and attitudes are embodied in the order’s attention to detail. Even after the Atatürk government prohibited Ṣūfī orders in Turkey in 1925, the Shādhilīyah retained its attraction for the middle class. It has also gained a following among some European Muslims.

**Chishtīyah.** India was particularly fertile ground for the development of the *ṭarīqahs*, and it is impossible to write the history of Islam in the subcontinent without a detailed study of them. Along with the Suhrawardīyah, the Chishtīyah was among the earliest *ṭarīqahs* operating in India, and the first to originate in the subcontinent. It was founded by Mu‘īn al-Dīn Chishtī (d. 1236), a native of Sīstān, who had been for a time a disciple of Abū Najīb al-Suhrawardī. He arrived in Delhi in 1193 and then moved to Ajmer, an important city in newly conquered Rajputana, where he founded a *khānaqāh*. Nizām al-Dīn Awliyā’ (d. 1325) spent fifty years extending the Chishtīyah throughout India by dispatching hundreds of his own disciples from his center in Delhi. The simplicity and ardor of Chishtī teaching, their extreme hospitality and charity, and their readiness to welcome guests without discrimination attracted many followers. In fact the Chishtīyah illustrates in an exemplary manner the extraordinary contribution of the *ṭarīqahs* to the Islamization of the subcontinent.

At first the adherents kept their distance from government, but later they developed a close association with the Mughal court. Salīm (later Jahāngīr), the heir apparent of Emperor Akbar (d. 1605), was born in the home of a Chishtī *shaykh*, and in gratitude Akbar commissioned a splendid *dargāh* for the Chishtīyah in Fatehpur Sikri. Jahāngīr himself decorated the Chishtī city of Ajmer with beautiful buildings of white marble, and Jahānārā Begum (d. 1681), daughter of Shāhjahān and Mumtāz Maḥall, wrote about the life of Mu‘īn al-Dīn Chishtī and requested to be buried in his shrine compound. The Chishtīyah, like other *ṭarīqahs* in India, contributed immensely to the development of literature in the vernacular languages, and a Chishtī, ‘Abd al-Raḥmān, who lived during the reign of Awrangzīb (1658–1707), is regarded as the greatest mystical poet in the Pashto language. This *ṭarīqah* was noted for its active encouragement of the practice of *samā’*, an example followed by various other orders in South Asia, where the genre of Ṣūfī music known as Qawwālī, which Fateh Ali Khan and other performers popularized around the world in the 1980s, developed.

**Naqshbandīyah.** Bahā’ al-Dīn-i Naqshband (1318–1388) traces his mystical heritage through Amīr Kulāl, a spiritual adviser to Tīmūr (Tamerlane), to the Persian-speaking Central Asian lineage of Ṣūfīs, the Khwājagān, initiated by Abū Yūsuf ‘Alī Hamadānī (d. 1140). Bahā’ al-Dīn founded the Naqshbandī *ṭarīqah* in Bukhara, which he left only three times: twice for pilgrimage to Mecca and once to

meet with the ruler of Herat, Mu'izz al-Dīn Ḥusayn, to whom he taught the Naqshbandī principles. His tomb, surrounded by a large shrine complex, is a place of pilgrimage. From here the *ṭarīqah* spread geographically, coming to rival the popularity and influence of the Qādirīyah. It was to have an important role in Central Asia and India and also developed branches in Afghanistan, Iraq, Turkey, China, Sumatra, the Riau archipelago, Java, and other Indonesian islands. The order still has a strong following scattered over the length and breadth of the Muslim world. In the late eighteenth century Ma Ming-Hsin, who had become a Naqshbandī-Jahrī while on pilgrimage to Mecca, returned to Kansu Province in China to found the politically important "New Teaching" movement. In the first Indonesian elections in 1955, a Sumatran Naqshbandī was elected to the national parliament as the sole representative of the Tāriqah political party.

Bahā' al-Dīn-i Naqshband rapidly established connections between his *ṭarīqah*, the trade and craft guilds, and the merchant houses, so that as his spiritual influence grew, so did his wealth. The order soon gained a position of power in the Timurid court and, assuming a custodial role over government, supervised the administration of religious law. Indeed under the leadership of Khwājah Aḥrār of Herat (1404–1490), the Naqshbandīyah virtually dominated political life in Central Asia. It was his conviction that "to serve the world, it is necessary to exercise political power"; in other words, it is necessary to maintain adequate control over rulers in order to ensure that they implement the divine law in every area of life.

Unlike the Chishtīyah and those who followed their example, the Naqshbandīyah recited their *dhikr* silently and banned music and rhythmic movements. They believed that through *dhikr* without words one could achieve a level of contemplation in which subject and object became indistinguishable and the individual soul returned to God as it had been before creation. Among their techniques of meditation was concentration on their *shaykh*; another practice was regular visitation of saints' tombs in the hope that, by concentrating on the spirit of the departed *shaykh*, they would increase their spiritual strength.

The Naqshbandīyah was a moderate order that did not demand heroic austerities; like the Shādhilīyah, it regarded spiritual purification and education of the heart as more productive than harsh mortification designed to conquer the lower soul. It taught a middle way, that the mean between excessive hunger and excessive eating was the safest. The true fast consists of keeping the mind free from the food of satanic suggestions. Despite its essential sobriety, this method proved congenial to the poets of the time, and by the beginning of the eighteenth century all the leading poets in the Indo-Persian style were either members of the Naqshbandī *ṭarīqah* or under its influence.

The order played an important role in the religious and political history of Mughal India as leaders of a movement

of reaction against the syncretist Dīn-i ilāhī (Divine Religion) of the emperor Akbar. An important figure in this reaction was Aḥmad Sirhindī (d. 1624), who was initiated into the order by its *shaykh*, Khwājah Bāqī Billāh, in 1600. The order remained involved in political developments, including a strong reaction against Hindu practices, up to 1740. The Naqshbandī Shāh Walī Allāh (1703–1762), enrolled concurrently in the Qādirīyah, became the greatest reformer of eighteenth-century Delhi and one of the leading figures in the renewal of Islam; his influence contributed to reform movements in the nineteenth century and beyond.

In Sulaymānīyah in Iraqī Kurdistan, Mawlānā Khālīd Baghdādī (d. 1827) established a subbranch of the Naqshbandī order, which developed an independent character as the Khālīdīyah. It absorbed most of the other Naqshbandī branches in the Middle East and displaced the Qādirīyah *ṭarīqah* in Kurdistan. It cultivated relations with the Ottoman elite and fought for the Turks in the Russo-Turkish War. Later implicated with opposition to the Turkish Republic, it was closed down with the rest of the Šūfī orders in Turkey in 1925. After the Iraqī revolution in 1958, the Khālīdīyah shifted its operations to Iranian Kurdistan until the Iranian Revolution of 1979.

The literature of the Naqshbandīyah *ṭarīqah* is written in Persian, and one of the great Persian mystical poets, 'Abd al-Rahmān Jāmī (d. 1492), was integrally involved in the order. Because of its Sunnī loyalties, however, the Naqshbandī inroads in Persia were uprooted in the sixteenth century by the Shī'ī Safavid dynasty, paradoxically itself tracing its lineage to a Sunnī Šūfī teacher, Šafī al-Dīn of Ardabīl (1252–1334). His descendants eventually converted the order to Shiism, built it into a militant movement, and ultimately conquered Iran in the late fifteenth century, establishing a long-lived dynasty during which the country was converted to Shiism.

**Nī'matullāhīyah.** Most of the Šūfī fraternities discussed here were founded and developed in a Sunnī environment. Shāh Nī'mat Allāh Walī (d. 1430), the eponymous founder of this *ṭarīqah*, was a Sunnī, though descended from the Prophet through the Shī'ī lineage of Ismā'īl, son of Ja'far al-Šādiq. He studied in Shiraz and traveled widely among Šūfī circles in the Arabic-speaking Middle East before establishing several lodges of his own in Central Asia, where he came into competition with the Naqshbandīs. After Timūr grew suspicious of his aims and banished him from Transoxania, Shāh Nī'mat Allāh moved to Herat and finally settled in Māhān, from where he promoted the theosophy of Ibn 'Arabī in his prolific and popular writings and poetry, winning many followers in the area of Shiraz and Kirmān. His son, Khalīl Allāh, was invited to South India by Aḥmad Shāh Bahmān in 1436, establishing a further Nī'matullāhī following among the Deccani aristocracy. Exactly how the order took on a Shī'ī character is obscure, but the Safavid ruler and ardent Shī'ī Shāh Ismā'īl appointed a Nī'matullāhī *shaykh*, Mīr Nizām al-Dīn, as the chief religious official of the Sa-

favid domain in 1512. Though the Safavid house intermarried with Ni‘matullāhīs, the order lost favor under Shāh ‘Abbās when it was implicated in a rebellion. It was only revived in the eighteenth century by help sent from the Decani branch of the *ṭarīqah* in the person of Ma‘šūm ‘Alī-Shāh, who had gained a large following throughout Central Iran. He was executed in 1797 at the behest of Shī‘ī scholars implacably opposed to Sufism.

In the nineteenth century the Ni‘matullāhīyah of Iran broke into several branches, represented in the early twenty-first century principally by the Ṣafī-‘Alīshāhīs and the Sultān-‘Alīshāhīs, both of which were encouraged under the Pahlavi dynasty. In 1974 the order was brought to the West, where it was represented by Javad Nurbakhsh as Khaniqahi-Nimatullahi.

**Tijānīyah and Sanūsīyah.** The eighteenth-century revival movements of Shāh Walī Allāh in India and Muḥammad ibn ‘Abd al-Wahhāb in Arabia had a counterpart in the *ṭarīqahs*. Sometimes this revival was expressed in the reform of existing orders, sometimes in the development of suborders, sometimes in the appearance of new ones. The generation of orders in fact never ceased. In North and West Africa, for example, between 1500 and 1900 at least twenty-eight *ṭarīqahs* emerged, one-third originating in Morocco. Here it is sufficient to draw attention to two that were to play an important role in Islamic revival movements in the Sudan, Egypt, and North and West Africa. The first was the Tijānīyah, based in what is now Algeria and Morocco, and the other the Sanūsīyah in Libya.

The founder of the Tijānīyah was Abū al-‘Abbās Aḥmad al-Tijānī (1737–1815). He spent several years studying in Fez, then he studied in Abyaḍ for five years, and in 1773 he went to Mecca and Medina and finally to Cairo, where he studied under various *shaykhs*, one of whom suggested that he found a *ṭarīqah*. He then returned to Fez, where, although he continued to travel extensively, he maintained his center.

The demands of the order are exclusive, and members may not join any other order. The Tijānīyah have their own formulas for *dhikr*, to be recited as many as a hundred times at particular points in the day. They are further distinguished from many of the other orders by their submission to established government, even where this has been non-Muslim. Thus throughout the French occupation of Algeria, they remained for the most part on good terms with the French authorities. When the emir ‘Abd el-Kader, a Qādirī named after the founder of the order, attempted to enlist them in a struggle against the French in 1836, the Tijānī chief refused, saying it was their purpose to live a religious life in peace. The emir then marched on their town and demanded that they submit to him, but they again refused and, although outnumbered, resisted a siege for eight months, took refuge in another town, and in the following year offered moral and material aid to the French.

This *ṭarīqah* won adherents in Egypt, Arabia, and other parts of Asia and still enjoys a strong following in parts of Africa formerly under French rule. In the first half of the nineteenth century it was propagated in French Guinea by ‘Umar Tal after his return to Dinguiray (which became one of the most important religious cities in the region), where it took over and displaced the Qādirīyah tradition.

Sīdī Muḥammad ibn ‘Alī al-Sanūsī was born in Algeria in 1791. From 1821 to 1828 he lived in Fez, where he studied Qur’anic exegesis, *ḥadīth*, and jurisprudence. Traveling for the pilgrimage, he remained in Mecca from 1830 to 1843, founding his first *zāwīyah* there in 1837. On leaving Mecca he settled in Cyrenaica, where he founded additional *zāwīyahs*. After his death in 1859 the order was continued by his two sons, Sīdī Muḥammad al-Mahdī (1844–1901), his successor, and Sīdī Muḥammad al-Sharīf (1846–1896). Al-Sanūsī left detailed instructions relating to initiation into his order, and his devotional writings became the basis of the Sanūsī routines. At the same time all his activities were imbued with a rigorous work ethic. He inspired his followers to work together to build roads, to form trade cooperatives, to undertake irrigation projects, and to establish agricultural communities.

In fact such activities were integral to the work of many *ṭarīqahs*, such as the Tijānīyah and its offshoot in Senegal, the Murīd movement. The discipline of the brethren had a counterpart in the discipline of a trade guild or corporation. Likewise the tremendous vitality of the nineteenth-century *ṭarīqahs* was also channeled into political activity, especially diplomatic negotiations with the European powers. Throughout this period it is clear that they operated as an invisible international network attempting to protect the cultural and religious identity of Islam against the European powers. The same Emir ‘Abd el-Kader who tried to involve the Tijānīyah in an uprising against the French had received an *ijāzah* (license) to found his own branch of the Qādirīyah when he led the 1832 revolt against the French in Algeria and proclaimed a *jihād*. Captured by the French in 1847, he wrote to Napoleon III in 1865, petitioning him to mediate with Czar Alexander II on behalf of the release from prison of a Naqshbandī-Khālīdī Ṣūfī *shaykh* in Daghestan, Imām Shāmīl (1796–1871), who had been imprisoned for taking part in a *jihād* movement against the Russian Empire in the northern Caucasus.

There are also grounds for seeing a Sanūsī inspiration in the late nineteenth-century Acehese war against the Dutch, just as there had been a strong international Naqshbandī movement behind resistance to the Dutch in West Sumatra and other parts of the Indonesian archipelago. These influences, inspirations, networks, and personalities thus ranged between Algeria and the Caucasus, Cyrenaica, Malaya, Indonesia, and East and West Africa, with the hub of the network at Mecca, where the *shaykhs* of the various regional establishments of the orders met and pooled information and ideas.

**TRADITION AND CHANGE.** In spite of this political vitality, the influence of the *ṭariqahs* was reduced to a minimum after the reformist movement inaugurated by Jamāl al-Dīn al-Afghānī and Muḥammad ‘Abdūh resulted in an intensive campaign against them. There had been movements against the *ṭariqahs* before, yet a relative balance between the strength of their supporters and their opponents had prevailed. In the early twentieth century, however, there was a qualitative change and a definite shift in balance as the convergence of various factors militated against the *ṭariqahs* in a special way.

The reform movement was inspired in part by nineteenth-century European secular rationalism and in part by a renewed emphasis upon the rationalist or puritanical understanding of Islam by movements such as Wahhabism (which led eventually to a ban on Ṣūfī orders in Saudi Arabia). As a result many of the practices of the order were seen not only as idolatrous innovations—such as the celebration of the birthdays of deceased saints, the honoring of their tombs, and certain forms of meditation—but also as harboring superstitions that disgraced Islam by making it appear contemptible to Europeans. Dervishes were also associated with the use of narcotics (to induce ecstasy) and with the practice of pederasty, a habit attested in Ṣūfī sources from the medieval period though not sanctioned by the official code of the *ṭariqahs*. Moreover since the reformists believed the *ṭariqahs* attracted people to otherworldliness and magic instead of challenging them to face reality, they considered it a root cause of the backwardness of Muslims. Muḥammad ‘Abdūh and Rashīd Riḍā, for example, while accepting the ethical and spiritual ideas of Sufism (as per al-Ghazālī), regarded every aspect of the *ṭariqahs* as degenerate, and in Turkey under Atatürk they were outlawed altogether.

Abuses were easy to find. Some *shaykhs* believed that holiness was hereditary; certain heads of orders regarded great wealth as a right, an outward manifestation of the spiritual favors they had received. *Barakah* (the blessing a *shaykh* and his *silsila* could give) was something to be bought and sold. Moreover despite the international networks so characteristic of the *ṭariqahs*, many individual *shaykhs* remained too attached to family clan and local traditions to respond to the rise of nationalism.

Modernization and secularization also undermined the social and economic foundations of the *ṭariqahs*. Employment now required training in public institutions created by the state rather than the parochial education offered by *ṭariqah* schools and “study circles” (*ḥalaqāt*). Clubs and associations took over the social role of the *ṭariqahs*, and industrialization weakened the trade and craft guilds with which they had been formerly associated. There were also rival religious organizations: for example, in Egypt, the Muslim Brotherhood, because of its dispersion into local groups, was able to offer the community individual guidance and service that had previously been the province of the *ṭariqahs*. Moreover the local orientation of many branches of the orders

made them appear irrelevant to communities increasingly related to the outside world.

If modernity has weakened the traditional membership base and structure of the *ṭariqahs* and governments have regulated or curtailed their functions, they nevertheless retain vitality and the potential to adapt to changed circumstances. It is striking that in Indonesia, for example, the reformist-oriented anti-*ṭariqah* party, the Masyumi, which during the 1950s appeared to reflect the dominant Islamic ethos, was eclipsed by the traditional, adaptive *ṭariqah*-tolerant group, the Nahdatul Ulama. Research on African *ṭariqahs* shows that they contribute to social stability and, in a very special way, to the work ethic. The Murīdīyah of Senegal, born in an African environment, is an example of the moral authority and social dedication of a modern *ṭariqah*. Equally important, various offshoots of the Naqshbandī order in former Soviet territories, such as Daghestan and Chechnya, have become numerous and influential.

The *ṭariqahs* still play an important social and political role in addition to the enrichment they bring to the spiritual lives of millions of people. Traditional celebrations like the *mawliids*, or saints’ birthdays, often sponsored by *ṭariqah* associations, remain extraordinary public events and displays of devotional fervor in India. This is also true in Egypt, where the Supreme Council of Ṣūfī Orders estimated in 1989 that between three and five million people belonged to one of the seventy-three registered orders. The interest in theosophical Sufism has also increased, largely because it jumped across confessional boundaries in the twentieth century as Western scholars engaged with the Ṣūfī tradition, first in the form of translations of Ṣūfī poetry, then as the object of metaphysical study (for example, in the Eranos seminars in Switzerland). In the West, Sufism was offered as the “perennial philosophy” and popularized as a method of spiritual psychology by Idries Shah and others.

Finally, Ṣūfī poetry found a broader commercial audience. Following the earlier example of Hazrat Inayat Khan, Meher Baba, and other teachers who came to the United States from India and elsewhere to establish disciple communities, the traditional *ṭariqah* orders have also responded to this “New Age” receptivity. Traditional orders have established branches or subbranches in Europe and the United States, including the Khaniqahi Nimatullahi, Shādhilīyah (counting René Guénon among its members), Naqshbandi-Haqqani, and Jerrahi Order of America. Previously interrupted traditions have also been successfully revived or recreated by Western devotees, as is the case of the Mevlevi Order of America and the Threshold Society, which do not, however, require their members to be Muslims. These Western *ṭariqah* branches purchase centers, appoint *shaykhs*, train disciples, teach classes, sponsor festivals and academic conferences, and maintain a presence on the internet. Meanwhile new orders, such as the MTO or Maktab-i ṭariqat-i Uwaysī, founded by Shah Maghsoud Angha (d. 1980), are actively promoted among diaspora communities and indigenous

Westerners. The International Association of Sufism, a non-profit organization founded by Nahid Angha and Ali Kianfar in 1983, attempts not only to promote Sufism but to foster dialogue among the various organizations and orders of Sufism and to undertake pan-*ṭarīqah* activities.

Of equal significance is the renewed interest upon the part of educated urbanites in the Middle East in Sufism as a tolerant and inner-directed expression of Islamic spirituality, in contrast to fundamentalist or Islamist formulations of religion. For example, there was a significant surge of interest in the teachings of Rūmī and the practices of the Mevlevis throughout the 1980s and 1990s among young people in Iran, who saw him as representative of an expansive and tolerant understanding of Islam. The Turkish Ministry of Culture also promotes Rūmī and the Mevlevis as representatives of the great cultural and spiritual heritage of that country.

The historical importance of the *ṭarīqahs* is profound. After the fall of Baghdad to the Mongols in 1258, they helped maintain communication and intellectual interchange across the Arabic-, Turkish-, and Persian-speaking regions. They had a stabilizing role in critical periods of change and political uncertainty, and as new political centers of power became established, notably the Mughal and Ottoman Empires, they either associated themselves with the ruling classes or became a significant element in the social fabric of the new polity. Far from being rivals to the *‘ulamā’*, the founders of the *ṭarīqahs* and their successors, the great *Ṣūfī shaykhs* were masters of the law, and their spiritual exercises were a further dimension of their competence in *fiqh*, not a substitute for it. In India in particular their contribution to a creative acceptance of Islam and faithful observance of the norms of Islamic law—the Naqshbandī-inspired reform movement in seventeenth-century Delhi is a notable example—is enormous.

The new centers of political authority both recognized them as the standard-bearers and exemplars of the norms of religious behavior and provided them with ample opportunities to gain wealth, power, and influence. Given such acceptance, they added a richness and color, a vitality, and an emotional intensity to every stratum of religious and social life. Their cultural significance as promoters of literature and music and their role in Islamizing the vernaculars of many regions of the Muslim world have likewise been enormous.

## BIBLIOGRAPHY

### General Works

Literature in English, German, French, Arabic, and Turkish on the *ṭarīqah* orders and Islamic sainthood is extensive and is

causing a significant reevaluation of views. The selective bibliography focuses on works in English. Spencer Trimingham’s *The Sufi Orders in Islam* (New York, 1971; reprint 1998), though now somewhat dated, remains the standard handbook on the subject. Readable scholarly overviews of the history and practices of the *ṭarīqahs* are in some general works on Sufism, including Carl Ernst’s *The Shambhala Guide to Sufism* (Boston, 1997) and William Chittick’s *Introduction to Sufism* (Oxford, 2000). Alexander Knysch’s *Islamic Mysticism: A Short History* (Leiden, 2000), conceived as a reference work, provides a detailed history of the theory and praxis of Sufism, including the orders, systematically presented. John Voll, “Sufism: Sufi Orders,” in *The Oxford Encyclopedia of the Modern Islamic World*, edited by John L. Esposito (Oxford, 1995), provides an excellent précis and is especially good on the role of the *ṭarīqahs* in resistance to colonialism. Specialist bibliographies are in the articles on the individual brotherhoods and their founding figures in Ehsan Yarshater, ed., *Encyclopaedia Iranica* (New York, 2001–), and H. A. R. Gibb et al., *The Encyclopaedia of Islam*, 2d ed. (Leiden, 1960–). The articles “Ṭarīqa” and “Ṭaṣawwuf” in the latter are especially important and comprehensive. Alan Godlas’s online article “Sufism—Sufis—Sufi Orders: Sufism’s Many Paths,” available from [www.arches.uga.edu/~godlas/Sufism.html](http://www.arches.uga.edu/~godlas/Sufism.html), contains extensive scholarly information about the *ṭarīqah* organizations, complete with links to *Ṣūfī* teachers, orders, and subbranches on the web.

## TATAR RELIGION SEE INNER ASIAN RELIGIONS

**TATHĀGATA.** In pre-Buddhist India, the term *tathāgata* designated a liberated sage. Unlike other titles for Gotama Buddha common in Pali scriptures such as *bhagavan* (blessed one) and *jina* (victorious one), the Buddha often used the term *tathāgata* to refer to himself. As George Bond has noted, three etymologies for it are prominent in Theravāda texts: (1) *tathā-gato*, meaning “one who has gone thus,” who has attained *nirvāṇa* like all prior buddhas, freed from the conditioned, distorted mentalities and sufferings of mundane existence; (2) *tatha-āgato*, meaning “one who has come thus,” who has reached the attainment achieved by all buddhas of prior ages, propelling him to come as the universal teacher for this age; and (3) *tatha-āgato*, meaning one who has come to the final truth of things and shows the way to that truth.

To call Gotama Buddha *tathāgata* was to identify him as a type, the latest in the line of perfect buddhas from past ages, highlighting his attainment as supreme for this age. All *tathāgatas* are said to be one in their essential attainments, including four peerless types of fearlessness, ten powers of pervasive knowing (such as knowledge of the causal order, of the capacities, dispositions and destinies of living beings, and of the methods of spiritual development appropriate for each one), six types of perfected supernormal awareness, unconditional compassion, thirty-two exemplary marks of physical perfection, and other excellences.

In line with the first and third etymologies of *tathāgata* above, to call Gotama *tathāgata* was to designate him the personification of the *dharma*, of the truths and attainments that he had realized. Thus, what made him a *tathāgata* was his *dharma-kāya* (Pali, *dhmma-kāya*), his body of *dharma* attainments, made manifest through the physical signs and charismatic powers of his material body, his *rūpa-kāya*.

In line with the second etymology of *tathāgata*, “one come thus as universal teacher,” to call Gotama *tathāgata* was also to designate him the most worthy and karmically weighty object of reverence and offerings. The Buddha, his community and teaching, were generously supported by the offerings of devotees during his lifetime. After physical death, the physical embodiment and presence of the Buddha (*rūpa-kāya*) was represented to the world in sacred reliquary mounds containing his relics (stupas), which became focal objects of offering and circumambulation, symbolically reen-

acting the ways that Gotama’s devotees had offered reverence to him as reported in scriptures. By ritually affirming the Buddha’s continuing presence in the world as symbolic container (*rūpa-kāya*) of his all-knowing mind (*dharma-kāya*), stupas, and later buddha images, symbolically affirmed the Buddha’s continuing power for this world, enabling devotees through the centuries to establish their own relationship to the Buddha at those sacred sites. Stupas and images provide physical supports both for rituals of offering and blessing and for meditations that vividly bring to mind the Buddha’s qualities and powers (*buddhānusmṛti*). Thus, in the early centuries after the Buddha’s final *nirvāṇa*, connotations of *tathāgata* informed the emerging two *kāya* paradigm of buddhahood and religious practices centered upon it.

In several Abhidharma schools prior to the rise of Mahāyāna Buddhist movements, *saṃsāra* and *nirvāṇa* were framed as a fundamental dualism, *nirvāṇa* understood as an unconditioned reality totally beyond the dependent origination of conditioned life, attained by cutting off the inmost causes for the five aggregates of conditioned life, for all components of mind and body, through long practice of the path. The pre-Mahāyāna etymologies of *tathāgata* noted above express that dualism: “thus gone” to *nirvāṇa* beyond the conditioned arising of *saṃsāra*, “thus come” from that transcendent attainment to reveal the path of liberation before passing totally beyond the world at final *nirvāṇa*.

But in the centuries after Gotama Buddha’s physical passing, within some Buddhist communities, the ritual and meditative practices mentioned above that symbolically affirmed the continuing presence and power of the Buddha’s *nirvāṇa* in this world, together with further developments in practice and philosophy, gradually shifted doctrinal formulation of a Buddha’s *nirvāṇa* toward non-dualism. A Buddha’s *nirvāṇa* was thus understood to be fundamentally undivided from this world in its pervasive awareness, spiritual power and liberating activity. This reformulating of a buddha’s *nirvāṇa* began to take doctrinal expression in Mahāsāṃghika schools a few centuries after the Buddha’s *pari nirvāṇa*, and was much further developed in Mahāyāna texts from the first century BCE onward, where it became formalized as the doctrine of the “unrestricted” (all-active) *nirvāṇa* of the buddhas (*apratīṣṭhīta-nirvāṇa*). In this formulation, a buddha’s *nirvāṇa* was said to far exceed that of his arhat disciples, because it comprised not only freedom from bondage to conditioned causes of suffering, but also freedom to unleash vast and endless liberating activity for living beings.

Several factors contributing to this reformulation of *nirvāṇa* took expression in Mahāyāna scriptures of the early centuries CE, including the emergence of a new Mahāyāna cosmology; a nondual ontology of emptiness; and further development in practices and doctrines of devotion, compassion, and nondual awareness.

Influenced in part by the new meeting of cultures and cosmologies in the Kuṣāṇa Empire of Central Asia of the early centuries CE, and in part by a new emphasis upon many

persons taking up the bodhisattva path (all of whom would generate their own realm of buddha activity as fruition of that path), Mahāyāna scriptures expressed a new Buddhist cosmology of numerous *tathāgatas* simultaneously inhabiting different universes in all directions, often in radiant pure realms attended by celestial bodhisattvas (not just appearing individually from age to age). In many Mahāyāna scriptures, the yogic powers of Buddha Gotama or advanced bodhisattvas opened devotees' perception to visions of cosmic *tathāgatas* such as Amitābha, Akṣobhya, and Vairocana, whom devotees ritually revered and praised, to whom they made manifold offerings, and from whom they received manifold radiant blessings. Scenes expressing this are prominent, for example, in the *Avatamsaka sūtra* collection, several *Prajñāpāramitā-sūtras*, *Vimalakīrti*, *Suramgamasamādhi*, *Samādhivajra*, and *Saddharmapuṇḍarīka*.

In such scriptures, visual or oral encounters with cosmic *tathāgatas* often precede or follow a bodhisattva's realization of transcendental wisdom (*prajñāpāramitā*), the nondual awareness of *tathāgatas* and advanced bodhisattvas that discern the emptiness of all phenomena (*śūnyatā*), their lack of substantial, independent existence. The empty nature of phenomena, because known by the *tathāgatas* just thus, is frequently referred to as "thusness" (*tathatā*). Although all conditioned phenomena continually change, their intrinsically empty nature never changes, is unconditioned and undivided, like space. Whereas pre-Mahāyāna Abhidharma schools taught penetrating insight (*vipassana*) to cut off the dependent origination of conditioned phenomena and thus attain the unconditioned peace of nirvāṇa beyond them, Mahāyāna texts taught that the very nature of conditioned phenomena was unconditioned emptiness (*śūnyatā*), thusness (*tathatā*), intrinsic peace. Hence, these texts proclaimed, to realize ordinary phenomena as empty, intrinsically quiescent, is to realize nirvāṇa as undivided from saṃsāra.

One way to express this Mahāyāna metaphysic of nondualism was through playful reinterpretation of previous Buddhist etymologies for *tathāgata*. Thus, the Buddha declares in the *Aṣṭasāhasrikā* (eight-thousand-verse) *Prajñāpāramitā sūtra*, "*Tathāgatas* (literally ones who have 'thus gone' or 'thus come') certainly do not come from anywhere, nor do they go anywhere. For indeed thusness (*tathatā*) is unmoving, and the *Tathāgata* is thusness" (Makransky, p. 32). *Tathāgatas* are those whose awareness has become nondual with thusness, who thereby abide in the ultimate, unmoving nature of all phenomenal comings and goings, the undivided, empty, nirvāṇic dimension of this world.

This implies that the awareness through which a buddha or bodhisattva transcends bondage to saṃsāra is also intimate with saṃsāra. To know all living beings nondually through undivided thusness is to sense all beings through boundless, unconditional compassion and love. The bodhisattva path to buddhahood is therefore described as a synergy of deepening wisdom of emptiness (*prajñāpāramitā*) and

compassionate activity for beings (*puṇya*, spiritual merit). Bodhisattvas, by thereby accumulating vast wisdom and merit, under the guidance and protection of the *tathāgatas*, generate luminous pure realms from which to enact their own salvific activity as they become *tathāgatas* upon completion of their path. Thus, the *tathāgatas*, viewed from above as celestial powers and from below as the fruition of the bodhisattva path, spontaneously radiate blessings and salvific activities and manifestations throughout their domains, making the liberating power of saṃsāra nirvāṇa available to beings in saṃsāra as the compassionate outflow of their knowledge that nirvāṇa and saṃsāra are ultimately undivided.

Because, Mahāyāna texts say, thusness (*tathatā*) as the empty nondual reality of all things is undivided, the term *tathāgata* now also connotes undividedness among the *tathāgatas* in their essential realization of it, referred to as *dharmakāya*. Likewise, in thusness, all living beings are undivided from the *tathāgatas* and possessed of a primordial purity of awareness that constitutes an innate potential for enlightenment, referred to as the *tathāgata essence* of beings (*tathāgata-garbha*), their intrinsic buddha nature. The ontological oneness of buddhas in nondual thusness supports a communion of *tathāgatas* and celestial bodhisattvas in their visionary manifestations (witnessed in Mahāyāna scriptures by interactions among visionary *tathāgatas*), which—when informed by the teaching of buddha nature—opens into a communion with all living beings. Reverent gestures of bowing and offering are given vivid ritual forms in liturgies such as the seven-part offering practice at the end of the *Gaṇḍavyūha sūtra*, which includes praise, offering, confession, ritual rejoicing, ritual requests, bodhisattva resolutions to attain enlightenment for beings, and dedication of merit to all, while receiving radiant blessings from all the holy beings. Such practices express deepening communion with and participation in the salvific activity of the *tathāgatas* and bodhisattvas in and through the luminous, empty ground of thusness in which all are ultimately undivided.

Elements of such liturgical materials were taken up by Buddhist practice communities of Central Asia, East Asia, and Tibet as means to collect merit and wisdom for the path, to receive blessings and inspiration from the *tathāgatas* and celestial bodhisattvas, and to mediate their power to surrounding communities for healing, protection, prosperity, auspiciousness, and well-being. In this way, practices mediating the power of *tathāgatas* and bodhisattvas became an important part of the activity of Mahāyāna monastic institutions of medieval India, East Asia, and Tibet, whose social, economic, and political support by local communities was motivated in part by communal desires for the application of such ritual power to meet social needs.

JOHN MAKRANSKY (2005)

**TATHĀGATA-GARBHA.** Early monastic Buddhism emphasized the reality of "selflessness" (*anātmatā*) as the essential nature of all beings. The "ignorance" (*avidyā*) at the root of suffering in the saṃsāric life cycle was said to be the misperception of a fixed and independent "self" (*ātman*) within a selfless, wholly relative person. The overcoming of the delusion of self was called "wisdom" (*prajñā*), and it was commonly explained as the "wisdom of selflessness." However, the earliest sermons of the Buddha are replete with such expressions as "mastery of the self is the real mastery," "he who conquers his own self is the supreme warrior," and so forth. Self-control was a prime goal of the early Buddhist monk or nun. Thus, the term *self* had two distinct connotations. In one, it referred to a fixed, independent, self-substance, and in the other, it referred to the living, empirical, continuum of the person; the former was denied and the latter, clearly presupposed.

With the rise of the messianic Buddhism of the "universal vehicle" (Mahāyāna), both sides of this ambiguity were developed in various ways. The "self" that was thought not to exist was equated with "intrinsic reality" (*svabhāva*), "intrinsic identity" (*svlakṣaṇa*), and "intrinsic objectivity" (*svarūpa*). Its systematic denial was expanded beyond "subjective selflessness" (*pudgala-nairātmya*) to encompass "objective selflessness" (*dharma nairātmyā*), which was understood as equivalent to "emptiness" (*śūnyatā*). Notions

concerning the other "self," the living, empirical personality that was acknowledged to exist, developed into two major concepts, "enlightenment-spirit" (*bodhicitta*), and "Buddha essence" (*tathāgata-* or *sugata-garbha*). The "spirit of enlightenment" concept dates from the earliest Mahāyāna scriptures (first century BCE); its systematization was begun by the scholastic master Nāgārjuna (c. second century CE). The second dates from the second and third centuries CE, with the emergence of the later Mahāyāna scriptures such as the *Laṅkāvatāra Sūtra*, the *Samḍhi-nirmocana Sūtra*, the *Tathāgatagarbha Sūtra*, the *Srī-māladevī Sūtra* and the *Mahāparinirvāṇa Sūtra*. It was systematized by the Yogācāra masters Maitreya-nātha, Asaṅga, and Vasubandhu during the fourth and fifth centuries CE.

The enlightenment-spirit (*bodhicitta*) theory eventually began to reflect the original ambiguity of the Buddha's use of *self*, by employing the scheme of "two realities" (*satya-dvaya*), the absolute and the relative. The absolute spirit was equated with the wisdom of selflessness, and the relative spirit with the loving mind seeking the welfare of all beings. The perfection of the absolute spirit was thought to result in the achievement of the *dharmakāya* ("truth body") of Buddhahood, and the perfection of the relative spirit in the achievement of the *rūpakāya* ("form body") of Buddhahood, with its heavenly *saṃbhoga* ("beatific") and earthly *nirmāṇa* ("emanation") bodies. An important point is that the duality between the two spirits, as between the two realities, only obtains from the relative perspective. In the enlightened view, the two are ultimately the same: wisdom and compassion are one, the absolute is no different from the relative, and truth is equivalent to form. This is summarized in Nāgārjuna's famous statement, "Emptiness [is] the essence of compassion" (*Śūnyatā-karuṇā-garbham*).

Against this background, we can understand the emergence of the Buddha-essence doctrine. The Absolute Truth Body (*dharmakāya*) of the Buddha is transcendent and eternal, yet omnipresent and immanent in every atom of infinity. Thus, from a Buddha's perspective, all beings are already immersed in the "truth-body realm" (*dharmakāyadhātu*) and persist in suffering only because they do not know their own actual situation. Each being's presence in the truth-realm is the *essence* of each; it is each one's essential participation in Buddhahood. Thus, each has an essence of Buddhahood, that is, a Buddha essence within him or her that is one's very selflessness or "natural ultimate freedom" (*prakṛti-parinirvāṇa*). One's critique, through *prajñā*, of the mis-knowledge of self and the resultant realization of selflessness amounts to the removal of the obscurations of the Buddha essence and the revelation of the natural luminosity of the Buddha realm.

To refer to the useful compendium of sources written by the Tibetan scholar Bu ston (1290–1364), the *Tathāgatagarbha Sūtra* gives nine similes of the Buddha essence: like a Buddha in a closed lotus, like the honey in the comb, like the grain in the husk, like gold in ore, like treasure

buried beneath a pauper's house, like a tree-seed in its sheath, like a Buddha-image wrapped in a filthy cloth, like a world monarch amid the impurities of the womb, and like a golden image contained within its clay mold. Of these nine similes, the first three are said to indicate the *dharmakāya* in its senses of "absolute" and "element" (*dhātu*), the simile of the golden image to indicate "suchness" (*tathatā*), and the remaining five to indicate the "spiritual gene" (*gotra*), an important equivalent concept in which one's inherent Buddhahood is conceived of as a genetic cause of the *dharmakāya*.

The *Mahāparinirvāṇa Sūtra* reveals the Buddha essence of all beings as permanent, happy, omnipresent, pure, and free, for this is how beings appear in a Buddha's vision. The *Avatamsaka Sūtra* extends its visionary theme of the mutual interpenetration of all things to illustrate how the Buddha wisdom exists in the mind of every being as each one's jewel-like essential perfection. The *Āṅgulimāliya Sūtra* states that "the Buddha essence is the reality, the absolute body, the permanent body, the inconceivable body of the transcendent Lord. . . . It is the self." The *Laṅkāvatāra Sūtra* mentions the Buddha essence and equates it with the "fundamental consciousness" (*ālaya-vijñāna*), the basic seat of ignorance underlying the six usual consciousnesses and the afflicted mentality (*kliṣṭamanas*) in the idealist psychology of that scripture. Finally, the *Śrīmāladevī Sūtra* mentions the Buddha essence as indispensable both to the process of enlightenment and to the afflicted world.

The apparent contradiction between these revelations and the earlier teachings that all beings are impermanent, miserable, selfless, and impure is addressed in the scriptures themselves by referring to the two realities and the two perspectives, using the hermeneutical concepts of "interpretable meaning" (*neyārtha*) and "definitive meaning" (*nītārtha*). The Buddha uses his "skill in liberative technique" (*upāyakauśalya*) to teach according to the abilities of his disciples. The notion of an "intention" (*abhiprāya* or *abhisam̐dhi*) underlying a teaching is introduced to explain the Buddha's various strategies. Busto extracts a number of such "intentions" from the texts. The *tathāgata-garbha* doctrine is taught in order to (1) eliminate despair and generate effort, giving the practitioner hope of attaining liberation; (2) eliminate pride and produce respect for others; (3) eliminate absolutistic reifications and nihilistic repudiations and produce wisdom.

In the *Laṅkāvatāra Sūtra*, Mahamati asks the Buddha how his Buddha-essence teaching differs from the "supreme-self" teaching of the *brahmins*. The Buddha replies:

The perfect Buddhas have taught the Buddha essence intending emptiness, reality-limit, *nirvāṇa*, non-creation, signlessness, and wishlessness. For the immature to be free of their terror of selflessness, they teach the realms of non-conceptuality and non-appearance by the gateway [i.e., teaching] of the Buddha essence. . . . They teach the essence to attract those heterodox persons who are too deeply attached to their "self" notions

to awaken to the profound enlightenment. (*Laṅkāvatāra Sūtra*, ed. P. L. Vaidya, Darbhanga, 1959, p. 33)

And in the *Mahāparinirvāṇa Sūtra* the Buddha tells a story about his meeting with five hundred ascetics who admired his beauty and inner composure and wanted to follow his teaching, but were afraid because they thought he was a nihilist; he reassured them that he was not a spiritual nihilist by teaching them the Buddha-essence doctrine.

Among the great Indian treatises, Maitreyanātha's *Ratnagotravibhāga* is the locus classicus of the systematic exposition of the Buddha-essence doctrine. It is elucidated by Asaṅga and Vasubandhu in great detail, without departing from the basic principles given in the scriptures above. On the basis of this treatise, the Jonāṅ order of Tibetan Buddhism developed an elaborate theory of the Buddha essence, connecting it to various Tantric ideas. In Tantrism as well, the Esoteric concept of the "indestructible drop" (*akṣayabindu*) as the basis of transmigration and Buddhahood and the life essence of a living being is extremely similar to the Buddha-essence doctrine. Philosophically, the Tibetans tended to the explanation given in the *Laṅkāvatāra Sūtra* that the *tathāgata-garbha* theory referred to selflessness in a manner soothing to those still unprepared for the more radical denial of self.

In East Asia, the notion of the *tathāgata-garbha* enjoyed great popularity. In a treatise attributed to the Indian Aśvaghōṣa, known in East Asia by the translated title *Das-heng qixin lun* (Awakening of faith in the Mahāyāna), the idealistic idea of mind as world-creator is wedded to the *tathāgata-garbha* doctrine to elevate the *tathāgata-garbha* to the status of a divine mind responsible for the creation of the world of transmigration as well as the attainment of liberation and enlightenment. The Chinese master Jing ying Huiyuan (523–592 CE) developed an elaborate idealistic (*vijñānavāda*) Buddhology on this basis. His theories were critiqued by the Centrist (Mādhyamika) master Jizang (549–623), who sought to avoid the theistic implications of doctrines such as Huiyuan's. Later systematizers such as Zhiyi of the Tiantai school, Fazang of the Huayen school, and many of the greatest Chan masters used the Buddha-essence doctrine in various ways, sometimes with an Idealist (Yogācāra) twist, at other times with a Centrist (Mādhyamika) twist. In modern East Asian Buddhism, the doctrine is again serving Buddhist popularizers and dialogists as a strategy for reassuring cultures where "soul" theories are traditional.

It is noteworthy that the English popularization "Buddha nature" comes from the East Asian writers, for the Chinese *hsing* can be read as "nature," whereas the Sanskrit *garbha*, *dhātu*, or *gotra* cannot be stretched without considerable effort from the meanings "essence," "element," or "gene," respectively, to that of "nature."

ROBERT A. F. THURMAN (1987)  
*Revised Bibliography*

**TATHATĀ.** According to the *Dasheng qixin lun* (The Awakening of Faith in Mahāyāna), "suchness" (Skt., *tathatā* or *bhūtatathatā*; Chin., *chen-ju*; Tib., *de bzin nyid*) denotes the totality of reality in both its transcendental and phenomenal aspects. It establishes the oneness and unity of the absolute and relative spheres and expresses the totality of all things (*dharmadhātu*). Suchness is held to exist in all beings and thus to undergo no changes either in its perfect or defiled state: its nature remains uncreated and eternal. All events and things of *samsāra* (i.e., all *dharma*s) make their appearance in the form of individualizations or mental constructions as a consequence of the beginningless continuity of the subconscious memory (*smṛti*) of past experiences acquired during previous existences. It is through the elimination of all mental projections that the world construed in the mind (*citta*) ceases to make its appearances. When seen in this radically transformed way, all things in their essential nature escape and defy any explanation or description because they are free and beyond distinction, remain unchanged, and are characterized by their absolute sameness (*samatā*), which precludes any transformation, destruction, or distinction. Since they cannot be explained in any way, their verbal or conceptual descriptions must be regarded as mere representations; they do not denote realities. All things remain ever as they are; they are such (*tathā*) as they are, and it is their Suchness (*tathatā*), free of all attributes, that expresses the nature of their oneness and totality.

Suchness can only be understood through the inner realization that the true nature of existence does not manifest itself through dichotomous appearances: knower-known, subject-object, perceiver and perceived. The notion of Suchness embraces two aspects, the immutability, purity, and totality of all things, on the one hand, and the activities that evolve within *samsāra*, on the other. However, these two aspects of Suchness denote fundamentally one and the same reality. They cannot be considered as two separate entities; rather, they are simply representations of Suchness "operating," as it were, in its transcendental and phenomenal spheres. When equated with *śūnyatā* ("emptiness"), *tathatā* represents the absolute negation of all phenomena and their attributes. Thus, in its metaphysical aspect it has nothing in common with the conditioned and defiled world. It stands beyond and above the impurity and relativity of *samsāra*. Suchness remains free and undefiled; it cannot be comprehended precisely because it comprises within itself the totality of things and because its nature escapes conceptual categorization.

*Samsāra*, the sphere of defilement and imperfection, has no beginning but it can be brought to an end. Suchness, which is eternal, pure, and perfect by nature, is present in *samsāra* but it remains obscured by defilements. Yet while it is in the sphere of phenomenal existence that Suchness and *samsāra* coincide, they are neither identical nor distinct from one another. *Samsāra* makes its appearance as a chain of dependently originating phenomena issuing from the *tathāgata-garbha* ("womb of the Tathāgata"), which represents, as it were, the personified principle that stands between the absolute sphere, which is transcendent to human thought, and the relative sphere, which is pervaded by imperfections. When absolute reality becomes manifest in the relative world it projects itself as, or is called, the store-consciousness (*ālaya-vijñāna*), which contains within itself two opposite principles. One is the principle of nonenlightenment and the inclination to perpetuate the cycle of samsaric existences; the other is the principle of enlightenment, which represents the highest quality and state of mind, free of all subjectivity.

When it is devoid of all attributes and conceptual projections, the mind may be compared to space insofar as it is ubiquitous and constitutive of the unity of all things. This universally perfect mind, enlightenment itself, constitutes the *dharmakāya* ("Dharma body, Dharma essence") of all the Tathāgatas. The mind aware of its perfect and pure nature abides in the state of enlightenment, yet so long as it is restricted and obscured by ignorance it remains in the state of nonenlightenment. In other words, perfect enlightenment is embedded in phenomenal existence through the presence of *prajñā* ("transcendental wisdom") and through the law of retribution (*karman*). By perfecting and unveiling *prajñā*, and through the performance of meritorious acts, the element of enlightenment within the mind becomes purified and freed from karmic residues and wisdom becomes mani-

fested in its fullness as the *dharmakāya*. The impurities and mental projections that obscure the mind in its nonenlightened state are produced under the influence of *avidyā* (“ignorance”). It is ignorance that induces the appearance of all mental constructs. When ignorance is subdued and eliminated it is merely the “reenlightened” wisdom that shines forth. Ignorance, although it is the cause of all mental states and projections that obscure the clarity of enlightenment, is nonetheless inherently present in enlightenment. Here again, the two are neither identical nor nonidentical. Just as waves are present on water stirred by the wind, so are mental projections stimulated by the “winds” of ignorance. Once ignorance is eliminated, the mental “waves” subside and the purity of the mind in its enlightenment-essence remains undisturbed.

The nature of perfect and timeless enlightenment is characterized as unattainable by any means within the relative sphere. When enlightenment is totally free of all hindrances (*kleśāvaraṇa* and *jñeyāvaraṇa*) and of the store-consciousness (*ālaya-vijñāna*), which becomes entangled in phenomenal events, it remains pure and immutable in its nature. Yet at the same time, this pure and unhindered enlightenment unfolds itself and becomes manifest as a *tathāgata* (i.e., a Buddha), or in some other form, in order to bring living beings to spiritual maturation. Pure and perfect enlightenment may be spoken of as being present and manifest in the phenomenal sphere precisely as nonenlightenment when, owing to the mind’s ignorance, the true nature of Suchness is not fully perceived. In this sense, the state of nonenlightenment has no true existence of its own; it can only be considered in relation to perfect enlightenment, which, as nonenlightenment, is obscured by ignorance. Thus, perfect enlightenment, which remains unchanged and unimpeded at all times, is not really produced (it is ever present within all things) but rather becomes manifested through and within the defiled world that has evolved under the influence of ignorance. A full understanding of the Suchness of all things depends on the degree of the mind’s purity and the mind’s ability to perceive it. Ordinary people, overwhelmed by defilements and hindrances, do not perceive the nature and presence of Suchness. On the other hand, the *Tathāgatas* understand it perfectly.

All beings are innerly endowed with Suchness and with all the innate impulses necessary to eradicate imperfections and defilements and to pursue the path of moral activities. From the moment that beings give rise to the thought of enlightenment (*bodhicitta*) until the moment they attain Buddhahood they are protected and guided by the *bodhisattvas* and *tathāgatas*, who assume various manifestations in order to guide them along the path. Suchness, although variously described as the effulgence of wisdom, as true knowledge or pure mind, as tranquil, pure, eternal, and immutable, nevertheless remains free of all distinctions and attributes precisely because all things are of “a single taste,” a single reality unaffected by any modes of particularization or dualism.

Sources of the *tathatā* theory include such canonical works as the *Laṅkāvatāra*, *Śrīmālādevīsīmhanāda*, and *Tathāgatagarbha Sūtras*, and several other Mahāyāna works including the *Dasheng qixin lun*. The theory of *tathatā*, although present within the writings of both the Mādhyamika and (especially) Vijñānavāda schools, has never been represented by a separate tradition. It has nonetheless exercised influence on philosophical and religious speculation and was particularly and predominantly present in the latest phases of Buddhist writings known as the Tantras.

#### BIBLIOGRAPHY

The authorship of the *Dasheng qixin lun* (*Mahāyānaśraddhotpāda Śāstra*) is one of the most vexed questions in the textual history of Mahāyāna Buddhism. Although the work is traditionally attributed to Aśvaghōṣa, the Indian Buddhist writer and poet of the first or second century CE, many scholars have doubted this attribution, and some believe the work to be of Chinese origin. See especially Paul Demiéville’s “Sur l’authenticité du *Ta tch’eng k’i sin louen*,” in *Bulletin de la Maison Franco-Japonaise* 2 (1929): 1–79, and Walter Liebenthal’s “New Light on the *Mahāyāna-Śraddhotpāda Śāstra*,” *T’oung pao* 46 (1958): 155–216. Regardless of this question, the text has exercised great influence on the development of Buddhism in China and continues to be studied to this day in Japan. Two translations of the work, which contains a full and readily comprehensible exposition of *tathatā*, are D. T. Suzuki’s *Aśvaghōṣa’s Discourse on the Awakening of Faith in the Mahāyāna* (Chicago, 1900) and Yoshito S. Hakeda’s *The Awakening of Faith, Attributed to Aśvaghōṣa* (New York, 1967).

Two studies of the *Ratnagotravibhāga mahāyāna-uttaratantra*, an important source for theories of *tathāgata-garbha* and *tathatā*, are Eugene Obermiller’s *The Sublime Science of the Great Vehicle to Salvation, Being a Manual of Buddhist Monism* (Leiden, 1931) and Takasaki Jikidō’s *A Study on the Ratnagotravibhāga (Uttaratantra)* (Rome, 1966). A highly technical discussion of these topics can be found in David Seyfort Rugg’s *La théorie du tathāgatagarbha et du gotra* (Paris, 1969). See also Alex and Hideko Wayman’s translation of the *Śrīmālā Sūtra, the Lion’s Roar of Queen Śrīmālā: A Buddhist Scripture on the Tathāgatagarbha Theory* (New York, 1974), which contains a concise doctrinal exposition in the introduction.

**TAUBES, JAKOB.** Jakob Taubes was born in Vienna on February 25, 1923. In 1937, as a result of the appointment of his father, Zwi Taubes, as chief rabbi to Zürich, he moved to Switzerland and survived the Nazi persecution. In 1943 he became a rabbi. In 1947 he completed his studies in philosophy at Zürich and published *Abendländische Eschatologie* (Western Eschatology).

In 1948 he moved to the United States, where he married Susan Anima Feldman. He obtained a post at the Jewish Theological Seminary in New York, where he worked with Louis Finkelstein, S. Libermann, and Lewis L. Strauss. In 1949 he met Gershom Scholem (1897–1982). However, his association with Scholem was not successful: personal and theoretical reasons led to a quick breakdown in their relations.

He returned to the United States in 1953 and after being awarded a Rockefeller scholarship he spent the next two years at Harvard University. In the academic year 1955–1956 he taught at Princeton University. In 1956 he was a professor of history and philosophy of religion at New York's Columbia University, where he remained for ten years. He met Peter Szondi (1893–) and Theodor Adorno (1903–1969). In 1966 he was appointed as the chair of Jewish studies at the Freie Universität Berlin, a post that he held until 1979, when he took charge of the new Department of Hermeneutics. During this same period he taught at the Maison des Sciences de l'Homme in Paris. In Berlin Taubes became an icon of the student movement.

Along with Jürgen Habermas (1925–) and Dieter Heinrich (1927–), he was editor of the *Theorie* series of Suhrkamp. In 1983 the first of the three-volume *Religionstheorie und Politische Theologie* was published and dedicated to Carl Schmitt (1888–1985), whom Taubes had met in 1978 and with whom he had remained in touch. The history of this working relationship was the subject of his book *Gegenstrebige Fügung*. In 1987 the Heidelberg Seminar on the *Letters to the Romans* took place and was eventually published under the title *Die politische Theologie des Paulus*. After being ill on a number of occasions and spending time in nursing homes, he died on March 21, 1987.

Taubes's work was based on identifying a link between religion and politics. Beginning in the early 1980s he prepared work that would lead to the three-volume *Religionstheorie und Politische Theologie*, an endeavor that had actually begun in the 1950s when, after producing a work on political philosophy and theology, he published two studies (*Theology and Political Theory* and *On the Symbolic Order of Modern Democracy*), the product of a detailed study of Schmitt's works; or earlier when, in *Abendländische Eschatologie*, the only book published during his life, he attempted to return to the problem of political theology, the source of which he

identified in the origins of Jewish theocracy. In this work, a year after the publication of *Lebendiges Judentum* (Living Judaism; the book by Zwi Taubes, in which the Zionist standpoint appears as the only means of escape for European Jewry), there is no reference to the *so'ha*; however, the whole work is based on the need to question the historical position reached without resorting to the solution proposed by his father. A forerunner of the debate that followed concerning modernity, despite being referred to by Karl Löwith (1897–1973) in *Meaning in History* (1949), *Abendländische Eschatologie* remained forgotten for a long time. The work is an attempt to examine the position in Western history of the need for fulfillment specific to apocalypics. It is divided into four parts: the first identifies in Jewish apocalypics and their Gnostic expression “the essence of eschatology”; the second is devoted to the “history of apocalypics”; and the third and fourth volumes are concerned with its definition, first theologically and then philosophically, in modernity.

The history of philosophy and political theology are the two pivotal themes of his work and they find full expression in Paul's (c. 3–c. 66) Messianism. At first Taubes attempted to redefine the idea of Messianism in a different way from Scholem; thus, in the seminar on the *Letters to the Romans*, in an answer to the views of Friedrich Nietzsche (1844–1900), Sigmund Freud (1856–1939), Karl Barth (1886–1968), Schmitt, Walter Benjamin (1892–1940), and Scholem himself, he returns Paul to his Jewish roots, believing that Paul's antinomic Messianism, first of all, was the only way to attain the fulfillment of the original apocalyptic requirement of the end of history, without thereby resorting to a dualist Gnostic or Marcionite solution, and also that it represented the most appropriate way of dealing with the question of Law, either the Torah or the Nomos, which nonetheless found its most complete expression in Schmitt's concept of sovereignty. In short, through Paul, Taubes produces a detailed Messianic account of the two main problems of the postmodern age: the end of history and the end of sovereignty. In his opinion, following in the footsteps of Benjamin, Pauline Messianism produced an upheaval of political theology and a radical reconsideration of the history of philosophy.

ELETTRA STIMILLI (2005)

**TAULER, JOHANNES** (c. 1300–1361), German Dominican and mystic. Born at Strasbourg, Tauler entered the convent of the Strasbourg Dominicans as a young man and was probably a student, and certainly a disciple, of Meister Eckhart. Living at a time of political upheaval, aggravated by the social excesses that came in the wake of the Black Death, Tauler was distinguished by a remarkable sobriety of language and thought, a refusal of extremism, and a profound understanding of human nature, which did not keep him from being a demanding spiritual guide. His surviving sermons, all in German, were preached to Dominican nuns, written down, copied, and sent to other convents eager for spiritual nourishment, then often in scarce supply.

Primarily a pedagogue and a “master of life,” Tauler takes as his starting point a carefully defined conception of “man as being really like three men (*Menschen*), though remaining one”: the sensible man, with sensations, perceptions, imagination, action, and sensible will; the rational or intellectual man, capable of abstract thought, conceptualization, and deduction; and the higher, or interior and essential man, the “depth” (*Grund*) from which the spark emerges and in which the birth of God takes place.

The spiritual life starts with sensible devotion (images of the life, death, and resurrection of Christ) and a love that is felt strongly at the time of the first “conversion” of the heart, often with a degree of exaltation that approaches intoxication. But such devotion and love, though useful, remain “in nature,” and there follows a lengthy period in which the person advances with difficulty, under the guidance of reason as it exercises discernment, often amid obscurity and aridity when reduced to its own powers and sustained by naked faith. If the person perseveres, this period brings a detachment that will do away with all obstacles to the unmediated encounter with God. In this process an experienced teacher is needed. If God wills it, the person will attain supernatural contemplation, a pure gift that cannot be merited.

In addition to Bernard of Clairvaux, William of Saint-Thierry, and Meister Eckhart, Tauler drew on Christian (Dionysius the Areopagite) and non-Christian (Proclus) Neoplatonism. Tauler exercised an extensive influence in the Germanic countries (as a young man, Luther read and reread him) and also—through Latin translations and complex channels—on Spanish and French spiritual writers.

#### BIBLIOGRAPHY

An exhaustive bibliography of works published before 1961 is in *Johannes Tauler: Ein Deutscher Mystiker*, edited by Ephrem

Filthaut (Essen, 1961), pp. 436–479. A bibliography of works from 1961 until 1969 is in *Bibliographisches Handbuch der Deutschen Literaturwissenschaft*, vol. 1, edited by Clemens Köttelwesch (Frankfurt, 1973). For 1969 through 1973 there is *Bibliographie der Deutschen Sprach- und Literaturwissenschaft*, edited by Hildegard Huttermann, Clemens Köttelwesch, and Heinz-Georg Halbe (Frankfurt, 1973). The original texts of Tauler's sermons are published as *Sermons de Tauler*, 2 vols., edited by A. L. Corin (Liège, 1924–1929). A critical edition was produced by Ferdinand Vetter as *Die Predigten Taulers*, “Deutsche Texte des Mittelalters,” vol. 11 (Berlin, 1910). A. L. Corin has translated the sermons into French in three volumes, *Sermons de Tauler* (Paris, 1927–1935), and Georg Hofmann has produced a German edition in two volumes, *Sämtliche Predigten* (Freiburg, 1983). An English translation by Maria Shady is available as *Johannes Tauler: Sermons* (New York, 1985). Selections from Tauler have been translated and edited by Eric Colledge and Sister M. Jane, O.P., as *Spiritual Conferences* (Saint Louis, 1961). A brief secondary source on Tauler is James M. Clark's *The Great German Mystics* (Oxford, 1949), pp. 36–54, with bibliography, pp. 114–117.

CLAIRE CHAMPOLLION (1987)

*Translated from French by Matthew J. O'Connell*

**TA'ZIYAH**, more fully known as *ta'ziyah-khvānī* or *shabāh-khvānī*, is the Shī'ī passion play, performed mainly in Iran. The word itself is derived from the Arabic *'azā*, “mourning,” and the *ta'ziyah* performance marks the death of Ḥusayn, the grandson of the prophet Muḥammad and the third imam of the Shī'ah, who was brutally murdered, along with the male members of his family and a group of followers, while he was contesting his hereditary right to the caliphate. The horrors of this hot and bloody scene, which took place on the plain of Karbala near the Euphrates on 'Āshūrā, the tenth day of the Muslim month of Muḥarram, in AH 61/680 CE, became the prototype of Shī'ī martyrdom.

Beginning in the middle of the tenth century, annual parades held in Baghdad during the month of Muḥarram vividly portrayed the fate of the martyrs, loudly lamented by attending crowds. When the Safavid monarch made Shiism the state religion of Iran in the sixteenth century, these demonstrations became highly elaborate, featuring men, on caparisoned horses and camels, acting the role of martyrs with bloody wounds and gruesome injuries. Floats were also constructed to depict the various events at Karbala, and the entire parade was accompanied by funerary music while bystanders wailed and beat their breasts. Contemporaneously, the lives, deeds, and sufferings of Ḥusayn and other Shī'ī martyrs were also treated in a book entitled *Rawḍat al-shuhadā'* (The Garden of the Martyrs), which in turn gave rise to readings called *rawḍah-khvānīs*, or “garden recitations” in Persian. It was from a combination of the Muḥarram parades and the *rawḍah-khvānī* that the *ta'ziyah* drama emerged in the middle of the eighteenth century.

Nowadays, *ta'ziyah* can be performed throughout the year, but originally it was staged only in the month of Muḥarram and the following month of Šafar. From the crossroads and public squares where they were first presented, *ta'ziyah* performances soon moved to caravansaries and private houses, and then to a special type of theater called *takīyah* or *Husaynīyah*. Over the next century and a half theaters of various sizes and constructions were built, reaching enormous proportions in the elaborate Takīyah Dawlat (State Theater) built by Nāšir al-Dīn Shāh in the 1870s.

In all these performance areas or playhouses the main action takes place on a raised circular or square platform around which the audience is seated on the ground, but the movement of the actors in and around the audience preserves the traditional interaction of performers and spectators in the Muḥarram celebrations. Audience participation is so intense that men and women weep and mourn as though the historical scenes before them were taking place in the immediate present.

The protagonists, dressed predominantly in green, sing their parts, while the villains, who wear red, speak their lines. Symbolic stage properties, such as a bowl of water to represent a river, are improvised according to need, particularly in the villages, where costumes are few. The director/producer is omnipresent on the stage as prompter, property man, and regulator of the actors, musicians, and viewers. Villagers and townsmen participate when professional actors are scarce, but troupes of actors travel from place to place, with men playing the women's roles. Parts are often passed from father to son in family groups: acting is a hereditary trade.

The Islamic Revolution of 1978–1979 utilized the Ḥusayn paradigm and was carried out in accordance with the Shi'ī calendar. The stationary rituals such as *ta'ziyah* and the *rawzah-khvānī* served as political rallies at which the assembled people were stimulated by speakers who mixed the Karbala mourning slogans with political ones. The digressions and the comparisons of the plight of Ḥusayn with the contemporary political, moral, and social situation have long been a tradition at these rituals and can evoke in the audience a particular social and religious climate which can move the audience to political action.

*Ta'ziyah* reached its peak in Iran in the second half of the nineteenth century. In the 1960s and 1970s, because of overt westernization and other social and political factors, the performances, which had been an urban creation, retreated to the rural areas. The fate of this original theater form in the world of Islam is now uncertain. The Shi'ah of the Caucasus (part of Iran until the early nineteenth century) and of Iraq and southern Lebanon know it on a more limited scale. Innovative Western theater directors and producers are now very much interested in the *ta'ziyah* as a means of breaking down the barriers that divide the audience from the actors in Western theater.

On the Indian subcontinent the name *ta'ziyah* is given to a symbolic miniature reproduction of Ḥusayn's tomb as

well as of the tombs of other Shi'ī martyrs. These *ta'ziyahs* are not literal facsimiles of any particular tomb but imaginary recreations. Usually made of bamboo and/or sticks covered with colorful paper and papier-mâché, these structures resemble Indian architecture more than the architecture of Western Asia, where the original tombs were built. The *ta'ziyahs* are carried in processions (during the months of Muḥarram and Šafar) and are housed in *imām-bārah*s and private houses, including those of Sunnī Muslims. They may be small enough for two men to carry or immense structures carried by many people. At the conclusion of the procession some of the *ta'ziyahs* may be buried in a local "Karbala ground." Other models, known as *zarīḥs*, are made of durable material, generally silver, and are not carried in processions or buried.

PETER CHELKOWSKI (1987)

**TEARS** have always played important roles as symbols and signs in religious life around the world, yet they have only recently begun to attract significant scholarly interest. From the tears shed in love and longing for the absent Kṛṣṇa by the *gopis* (milk maidens) in Brindavin to those shed by Shi'ī Muslims during the annual remembrance of the martyrdom of al-Husayn; from the tears of compunction of Christian mystics to "the welcome of tears" of the Tapirapé people of central Brazil (in which friends literally bathe each other when meeting), tears are ubiquitous in the world's religions. A general overview of tears in the history of religions based on a general phenomenology of tears enables us to appreciate many of symbolic associations tears have had in diverse religious traditions, as well as their many uses in religious rituals. No attempt is made here to exhaust the diverse examples of ritualized tears in the history of religions. Instead, what follows is a brief discussion of some of the central functions tears, or the acts of weeping, crying, and lamentation, have served in religious ritual activities, as well as in narrative, pictorial, and dramatic representations.

**THE PHENOMENOLOGICAL NATURE OF TEARS.** Defined in physical terms, tears are a transparent saline liquid secreted from the lachrymal ducts around the eyes. The physiological functions of tears are to keep the cornea moist, wash away irritants from the eyes, and, with the antibacteriological agents they contain, fight infection of the eyes. It is not these physiological functions but rather the symbolic import of tears, the various meanings that people have attributed to them, and the diverse ways that tears have been ritualized

that are important for the history of religions. In a pedantic sense, tears are a human universal, for all healthy persons have the ability to shed tears. Yet, in the study of tears in the history of religions, not all tears are identical; the meaning of specific tears is culturally and historically negotiated and renegotiated over time and space. The meaning attributed to specific tears depends upon a number of situational elements and specific sociocultural expectations. Local constructions of gender, class, age groupings, and occupational roles, for instance, can all affect the meaning of tears, as well as the value and appropriateness of specific acts of crying tears. For a supposedly dispassionate Buddhist monk, for instance, crying over a death might be considered inappropriate, whereas this would not bring any censure for a lay person.

The following basic phenomenological characteristics are worthy of note:

1. tears are a salty liquid;
2. tears flow from the eyes down the face;
3. tears are an extruded bodily product;
4. tears cross the bodily boundary of inside/outside;
5. tear-filled eyes produce blurred vision; and
6. tears are often, but not always, unwilling and uncontrolled.

Because they are liquid, tears often are associated with water, as well as with other bodily fluids such as blood and milk; because they flow downward, they are associated with streams, waterfalls, and rain; and because they are saline, sometimes they are associated with the sea or ocean. In this manner, tears are connected to broader symbolic complexes. Yet, it is difficult to imagine disembodied tears because of their immediate association with the human body and, more specifically, with the head and the body. Marcel Mauss (1872–1950), one of the leaders of the Durkheimian school of sociology, first pointed out that in societies and religions around the world, the human body is a primary site of symbolization and social control (Mauss, 1935, 1979). The human body as a whole, specific body parts (e.g., the head, arms, feet, stomach, genitals), body orifices, and bodily products often become religiously or ideologically overdetermined signs. That is, the names of body parts metaphorically come to refer to more than their physiological referents, while they also carry positive or negative connotations. As such, they are discursive sites of multiple, competing, and even contradictory ascriptions of meaning and valuations. In addition, the body is frequently a physical site of ritual work designed to transform it, enculturate it, or otherwise control it.

Tears are a bodily product that is extruded from the body, like blood, sweat, urine, feces, vomit, mucus, spittle, mother's milk, and seminal fluids. All of these are symbolically charged substances. However, the specific cultural and historical understanding of the human body as such, the dif-

ferences posited among specific kinds of bodies, and the cultural valuations that are attached to specific body parts and bodily products all help to determine how these symbolically charged things are viewed (positively or negatively) and how they are related to each other. Less often noticed are the ways these and related social factors affect how the human body and its products are subjectively experienced by individuals.

Mary Douglas famously argued that “the body can stand for any bounded system. Its boundaries can represent any boundaries which are threatened and precarious” (Douglas, 1966, p. 115). As an extruded liquid, tears cross the bodily boundary of inside and outside. They flow from the realm of the invisible to that of the visible, and from the hidden or private sphere to the public sphere. As Arnold van Gennep noted many years ago, liminal states, sites, and activities, including the crossing of boundaries, are ambivalent and inherently dangerous (Van Gennep, 1960). When the boundary is bodily, issues of purity and pollution arise almost inevitably. Thus, in an important sense, tears are liminal; they move and exist betwixt and between two distinct states or spaces, and therefore they are “natural symbols” of transitions or passages. These passages may be spatial or temporal, or both. Not surprisingly, ritual tears are often shed at important rites of passage, such as weddings and funerals, as well as on more common occasions of parting or reunion.

The liminal nature of tears enables them to serve as a symbolic means of mediation between persons (living or dead), between an individual and society, between the inner world and the outer world, and so forth. In this sense, tears play an important sociopolitical function in mediating (and potentially transforming) power relations between humans, divine and human beings, and the dead and the living. In crossing the boundary of the body, bodily products have a transgressive potential that often makes them dangerous, polluting, or disgusting. The ancient Indian text *The Laws of Manu* includes tears in a long list of bodily products that are polluting. In many cultures blood becomes polluting when it flows outside a body (e.g., as menstrual flow), but in other instances—or, better, in the case of other bodies—blood may be said to have positive power, as in the ritual bleedings the Aztec and Mayan kings performed on themselves in order to reinvigorate the cosmos. Unlike most other bodily products, though, tears are usually considered to be polluting. Indeed, perhaps because of the function they play in washing the eyes, they are widely believed to be purifying and even to possess healing powers.

In many cases, instead of becoming a polluting substance by transgressing the boundary of the individual human body, tears function as a sign of a problem with the social body. Seemingly uncontrolled weeping produces a disheveled body, which itself symbolizes a disordered or chaotic social body. Thus, tears may imply that proper social boundaries have been transgressed, or that a desired interpersonal relationship has been ruptured. At the same time, tears can function as an invitation to the other party to repair a

broken relationship, or as an appeal for rectification of a problem.

Another potential meaning of tears that is suggested by their crossing the bodily boundary of inside/outside bears mention: Tears may serve as a sign of ecstasy—an out-of-body state or psychosomatic experience. This is why tears are often associated with mystical experience in religions around the world, including Jewish Qabbalah, Christian mysticism, and Sufism. Alternatively, tears may be taken as a sign that a spirit or deity has entered a body and possessed it. In the religious services of Pentecostal Christians, for example, the descent of the Holy Spirit into the body of a believer is signaled by glossolalia (speaking in tongues), the loss of full consciousness, and frequently by copious tears flowing down the face. The absence of tears may also be a sign that a human body has been possessed. During the Spanish Inquisition in Europe, suspected witches were sometimes ordered to cry. Because the ability to cry tears was considered to be a mark of human nature, the inability to produce them on command signaled that a demonic nature inhabited the witch's body.

Healthy eyes bring light into the dark cavernous human body and the mind, providing crucial information about conditions in the exterior world. In the West, the eyes have long been called “windows to the soul.” Although this metaphor is culturally specific, reflecting on the phenomenology of windows enables us to appreciate the symbolic associations drawn in the West between windows, eyes, and tears. A transparent window provides outsiders with visual access to an interior space, while simultaneously providing insiders with visual access to the exterior. As such, windows are a passive medium for visual activity across a boundary demarcating an interior and an exterior space. Eyes are like windows insofar as they, too, provide visual access to both the interior and exterior of the human body. In sharp contrast, tears cross the bodily boundary of inside and outside in one direction only: Tears flow out of the eyes, not into them. The unidirectional nature of the flow of tears informs the widespread belief that tears carry information about the interior world of an individual (or, at times, of a group) out to the broader world. Tears are believed to be signs of interior and otherwise invisible states, most commonly affective or spiritual states. However, as noted earlier, the determination of the meaning of specific tears is also affected by the local religious and medical understanding of the body. For instance, in the Western humoral theory of the body, which held sway from the time of Galen in the second century CE until the Renaissance, tears were taken to be a symptom of the changing balance of the five humors in the body. Similarly, melancholy, which was characterized by uncontrollable bouts of crying, was considered to be the result of excess humidity in the body.

Unlike transparent windows and healthy eyes, which allow clear vision across boundaries, tearful eyes produce blurred vision. Phenomenologically, this blurred vision of the outside world suggests the blurring of boundaries and

differences. Thus, ritual tears shed in mourning over a deceased person may blur the boundary between the dead and the living. Similarly, ritual tears may dissolve other spatial and temporal boundaries. The participants in the annual Shi'i devotional rites of Muharram, for instance, weep in order to return to the time and the place of the martyrdom of al-Husayn at Karbala. Recalling this aspect of the phenomenology of tears also helps us to better understand the phrase “dissolve into tears.” When an individual dissolves into tears, verbal speech is no longer possible, but the entire body “speaks.” Collective weeping can produce a psychosomatic experience of communion.

Another aspect of the phenomenology of tears has long caused problems for students of religion. Tears are often seemingly spontaneous emotional responses to external stimuli or memories. When understood to be a spontaneous and unwilling affective response to joy, anger, frustration, and so on, crying appears to be a natural and universal human emotional response and therefore, precultural in nature. Although feelings or emotions have a subjective immediacy and reality, they have no observable or objective physical reality *per se*. Feelings have to be expressed—in a grimace, a smile, a frown, a cry, rolling of the eyes, and so on—in order to be communicated to others. Tears, though, are literally expressed in the sense that lachrymal fluid is squeezed out of the body. This characteristic allows actual tears to provide apparent objective evidence of subjective states and of otherwise hidden psychosomatic conditions.

The problem historians of religions faced was that ritualized weeping is clearly not spontaneous; it is choreographed. Ritual weepers, professional and nonprofessional as well, can often turn their tears on and off at will. Some Western scholars found this disconcerting; others found it to be confirmatory evidence of the presumed duplicitous and insincere nature of “primitives.” Yet others, perhaps influenced by the Protestant suspicion of the “empty” rituals of the Roman Catholic Church, sought to distinguish between “real” tears and artificial or false ones. A. R. Radcliffe-Brown in his famous anthropological study *The Andaman Islanders* (1922) noted that there were two types of weeping: (1) weeping as a spontaneous expression of feeling; and (2) weeping as “required by custom.” Following Durkheim's argument in *The Elementary Forms of the Religious Life* (1912), Radcliffe-Brown largely dissociated ritual weeping from individual emotions of grief, sadness, and so on. Functionalists followed Radcliffe-Brown in arguing that, rather than being provoked by a strong emotion such as grief, the tears shed in ritual contexts primarily served to evoke feelings of social solidarity. Here, too, they developed a claim made by Durkheim, who asserted that ritual weeping produced a collective sense of “effervescence” that helped to restore and strengthen proper social relations.

The functionalist interpretation of ritual weeping is not completely wrong; ritual tears serve multiple purposes, including creating a shared emotional state. However, insofar

as this line of argument suggests that spontaneous tears are “real,” whereas ritual tears are not, it is misleading. In effect, to distinguish true and false tears in this way is to universalize the Western bourgeois and Protestant privileging of the individual as the ultimate locus of value. Moreover, it prematurely forecloses serious inquiry into the distinct local discourses about tears and the body. Finally, to imply that “primitives” are hopelessly controlled by “custom” is to deny that they can willfully act for their own intents and purposes. It also ignores the ways in which people everywhere at times use the cultural expectations concerning emotional displays for specific purposes. Nevertheless, it is important to recognize that social and cultural “feeling rules” do inform ritualized weeping and other affective displays. Cultural capital is often gained by following such affective scripts, but we must also take account of those affective displays that challenge the status quo.

**TEARS AS SUBSTANCE, SIGN, AND SYMBOL.** Tears sometimes function as a powerful substance in religious ritual practices or in myths. That is, the actual physical tears themselves are believed to have specific powers. In the Middle East, for example, tears have been collected in tiny glass bottles for their healing qualities for thousands of years. Two examples illustrate how one aspect of the phenomenology of tears—their salinity—has been adapted to local ecological and agricultural conditions in symbolic form. During the annual dry season, as well as in periods of extended drought, the Aztecs performed rain rituals which incorporated sacrifice and ritual weeping. More than being mere expressions of grief, it was believed that the saline tears shed by participants produced rain by flowing down to the moist and rotting underworld where fresh water was trapped. Like the salt water of the sea, tears had the power to desiccate the land and to wither the crops. Just as Aztec agricultural practices required them to control and direct the salt water from the great Mexican basin in order to irrigate crops with fresh water, tears, too, were controlled and ritually directed. The ritual tears flowed down, causing the release and counter flow of fresh productive water from underworld springs.

These Aztec ritual tears recall those shed by Susano-o, a Japanese deity, in a myth recounted in the *Kojiki* (712 CE). Like the Aztec rituals, the Susano-o myth cycle is closely related to the local ecology, agricultural cycle, and irrigation practices. After the death of Izanami, the spouse of Susano-o’s father, and her descent to the underworld, Susano-o was appointed to rule the realm of the ocean (a variant found in the *Nihon shoki* [720 CE] says the underworld). Susano-o, however, refused: “He wept and howled until his beard extended down over his chest for a length of eight hands. His weeping was so violent that it caused the verdant mountains to wither and all the rivers and waters to dry up” (Philippi, 1968, p. 72) Here, too, salty tears shed over the dead threaten to destroy the fertility of the land.

Although tears are sometimes powerful substances, more often they function as highly charged symbols and

signs. As signs, ritual tears exaggerate human emotions and interpersonal relationships for dramatic effect. Mourning rites often include ritual weeping, with stylized performances of grief. Weeping here may be an expression of felt emotion, but it need not be. It may also help to create a sense of social solidarity, as Durkheim first suggested, but frequently ritual weeping publicly displays the social and moral status of the deceased and his or her family. One might say that in many cultures ritual tears are the measure of the man. The death of a great man (however that be defined) provokes intense and extensive weeping, whereas a dead man for whom few people weep risks being perceived to have been a “small” man in many ways. Similarly, weeping for the bride in marriage rites marks a rite of passage, a separation of a woman from her natal family, and her reincorporation into a new family. The sadness in parting may be real, but we must also note that the “worth” of a bride may also be measured in part by the depth of feelings of loss that are publicly displayed by relatives.

Ritualized tears also are used strategically or politically to “say” things by those who are powerless or who occupy a socially inferior position. In the ancient Near East, for example, a widow, orphan, or resident alien could get a hearing from the king by calling out to him, throwing herself prostrate before him, and crying. In II *Samuel* 14 is an example of this: Joab asks a woman to dress as a widow and approach King David to appeal for his mercy on Absalom. The ruse succeeds precisely because of the cultural expectation that a good king is one who protects the weak, the powerless, and the poor. Not to respond to the tearful pleas of a widow could open the king to whispered criticism and even his branding as a bad ruler. Significantly, in the Psalms and elsewhere King David himself reportedly shed copious tears of the same sort as this “widow”; that is, King David’s ritual tears participated in the same cultural politics of affective display. However, in this case, when David wept and appealed to Yahweh, he effectively placed himself in the inferior and debased position relative to God, whereas he was in the superior position relative to the widow. In other words, insofar as God was imagined as a king writ large, even human kings had to appeal to Him through the same sort of stylized affective display.

Scholars have only begun to investigate the ritual display of emotions and, alternatively, the control of them. We will fully appreciate such rituals, and understand the rich multitude of literary and artistic representations of tears, only by carefully noting how specific aspects of the phenomenological nature of tears have been exploited, adopted, and adapted by specifically situated persons in their own efforts to create religious and moral worlds of meaning. Medieval Japanese poets often equated tears with the dew, employing the poetic conceit of “dew on [one’s] sleeves,” for instance, to suggest the tears shed by a sensitive person. Although the Japanese poets stressed the ephemeral nature of the dew and tears (and, by extension, human feelings), the evidence of the his-

tory of religions speaks to the ubiquitous presence of tears over time and space.

GARY L. EBERSOLE (2005)

**TECUMSEH** (1768–1813) or Tecumtha ("Shooting Star," the celestial panther), a Kispoko Shawnee born near the Mad River in western Ohio, devoted his life to intertribal movements resisting American expansionism and its devastating effects on American Indian communities. Because he and his compatriots fought during a period when power shifted decisively toward the U.S. nation-state, historians have asserted that theirs was a lost cause. Of course during Tecumseh's lifetime no one could have known this. For many American Indians living in the interior, inter-tribal resistance not only made sense, it was a well-established political tradition energized by powerful spiritual and cultural values. This tradition influenced Tecumseh even as it enabled him to influence Indians from the Great Lakes to the Gulf Coast.

During the mid-eighteenth century, the Delaware prophet Neolin had called for a radical break with things Eu-

ropean. Based on his visions, Neolin urged Native Americans to regain their independence, to wean themselves from the worst aspects of the fur trade, and to regain the old arts of self-sufficiency. He influenced Pontiac, leader of a massive anti-British uprising in 1762 that involved Anishinaabes, Ottawas, Potawatomis, Menominees, Hurons, Delawares, Shawnees, Senecas, Mesquakies, Kickapoos, Macoutens, Weas, Sauk, and Miamis.

This movement, like many that followed, had emerged in a context already strongly shaped by extensive contact and trade with Europeans. In these contact-zones, diverse peoples moved across and depended upon multi-dimensional networks of cross-cultural ties to engage in reciprocal forms of exchange. New kinds of political figures, alliance chiefs, helped mediate between non-hierarchical Native American villages and imperial authorities. Over time, political, material, and cultural hybridity became the norm, not the anomaly. Tensions and conflicts abounded, but Indians had an essential place in this dynamic world and, most important, could compel non-Natives to come to terms with them.

When this balance shifted, as European settlement expanded and the population of non-Natives soared, Native Americans faced a serious crisis. In region after region, the newcomers became less interested in Indian trade or showing reciprocity within hybridized "middle grounds," and far more interested in acquiring Indian land, through any means necessary. On the so-called frontier new forms of Indian-hating spread along with calls for the extermination of Native Americans. Relations, always tense, became polarized and racialized. Facing this new situation, American Indian prophets like Neolin called for religiously motivated resistance.

A few decades later and further into the interior, a Mohawk prophetess named Coocoochee inspired Native Americans of the Ohio and Great Lakes region to fight to rid their lands of the intrusive American presence. Indeed, on November 4, 1791, in western Ohio, Miamis, Shawnees, Delawares, Potawatomis, Ottawas, Chippewas, Wyandots, Mingos, and Cherokees defeated a large army led by General Arthur St. Clair. Tecumseh certainly learned about this remarkable Indian victory over the Americans.

During his twenties, Tecumseh participated actively in the Chickamauga revolt in the Southeast. Like many Shawnees, Tecumseh had strong ties to the region. His mother was Creek and he had children with a Cherokee woman. The Chickamaugans comprised dissident Cherokees, Creeks, Shawnees, and ex-Tories. Disgusted with established tribal leaders and distressed by settler incursions onto Indian lands, they built new intertribal towns near the Tennessee River. In 1789, while fighting at their side in a Cumberland raid, Tecumseh saw his beloved older brother Cheeseekau (Pepquannakek, "Shawnee Warrior") killed. Subsequent setbacks brought an end to the Chickamauga revolt a few years later. The American opposition was simply too strong in the Southeast. The same was true in the Ohio country. In 1795

at the Treaty of Greenville, Shawnee leaders and others ceded about two-thirds of what is now Ohio to the Americans.

After 1795, in the Ohio country and in the Southeast, power continued to shift toward the Americans, but in an accelerated manner. During this period, the newly settled states of Kentucky (1792) and Tennessee (1796) acted like a great geopolitical wedge cutting into Indian country. On the one hand, this “wedge” acted as a barrier that made traditional intertribal diplomacy and exchange between northern and southern Indians more difficult and treacherous. On the other hand, Kentucky and Tennessee provided staging grounds for the next wave of invasion and settlement into regions that would eventually be known as the Old Northwest and Old Southwest. New cessions of tribal lands, north and south, chipped away at the remaining land base of interior Indians. By 1810, in the Old Northwest, settlers outnumbered Indians nearly four to one. As newcomers threatened to displace Indians and destroy all forms of reciprocal exchange (the so-called “middle ground”), a new prophetic movement emerged among the Shawnees. It was led by Tecumseh’s younger brother Lalawethika (The Rattle).

Lalawethika (1775–1836) realized his own prophetic destiny in 1804 when he awakened from a trance. He had received a revelation directly from the Creator. This experience transformed Lalawethika. He stopped drinking and took a new name, Tenskwatawa, the Open Door. Echoing the messages of previous prophets, Tenskwatawa spoke against dependency, alcohol consumption, and land cessions, and in favor of intertribal solidarity, temperance, and reform. He disliked the fact that missionaries and other agents of American culture encouraged Native men to work in the fields growing food crops. In his eyes, only women tended domestic crops full time. Real men shed blood in the forest. Tenskwatawa charged several people among the Delawares with complicity with evil spirits. This witch-hunt led to the execution of several people, including two annuity chiefs, who had close ties to the Americans or Christian missionaries.

Other modes of internal reform were less violent, but also revealed tensions within tribal communities, between accommodationists and rebels, and between Native Americans and Americans. Tenskwatawa and Tecumseh organized an intertribal village first at Greenville (now in Ohio), then at Prophetstown on the Upper Wabash river (now Indiana). These towns attracted men and women from a dozen or so tribes, including Potawatomis, Ottawas, Ojibwas, Menominees, Winnebagos, Kickapoos, Sacs, and Foxes. Inevitably, this gathering, no matter how peaceful its intent, excited fear and mistrust among white authorities and the chiefs closely allied to them.

Tensions increased still further with the 1809 signing of the Treaty of Fort Wayne, which ceded more than 2.5 million acres of Indian land. The Delaware, Potawatomi, Miami, and other Indian leaders who signed were condemned by Tecumseh and Tenskwatawa. The lands in the

western country were common property among all the tribes, and a sale was void unless made by all the Tribes. his brother concurred. Sounding an anti-colonial note that reflected increased racial consciousness, Tenskwatawa taught that whites were not created by God, but by a lesser spirit. Tenskwatawa and Tecumseh advocated Indian solidarity against the American invasion. As the War of 1812 approached, they also carefully considered allying with the British to gain military support. Eventually they did so, only to be gravely disappointed.

Tecumseh also sought support from southern tribes. In 1811, Tecumseh, accompanied by a Mequashake Shawnee prophet named Seekaboo, traveled among Chickasaws, Choctaws, and Creeks to promote pan-tribal cooperation and anti-American militancy. Their only success came among the Creeks, a strong nation increasingly vexed by trade debts, settler incursions, land cessions, internal class divisions, and meddling federal Indian agents. To show their solidarity with northern nations, rebel Creeks danced the Dance of the Indians of the Lakes. They also attacked leaders closely connected with U.S. government officials.

Within two years, the Creek anti-colonial movement attracted nine thousand participants, about half of the entire Creek nation. When a Creek civil war erupted between the rebel Redsticks and their accommodationist opponents, Americans in surrounding states and territories seized the conflict as an opportunity to invade Creek country, ostensibly in behalf of the “friendly” Indians. American armies and militias crushed the Redstick faction and, with the war’s close in 1814, exacted huge land cessions from the entire Creek nation, friend and foe alike.

By then Tecumseh himself was dead, killed in the Battle of the Thames, near Moraviantown in Canada, on October 5, 1813. Two years earlier, as Tecumseh recruited support in the South, an army led by William Henry Harrison had destroyed Prophetstown. With these and other defeats, Tecumseh’s and Tenskwatawa’s movement ended.

In some ways, however, the comprehensive religious-political challenge that their movement embodied continued to trouble Americans. Among other things, Americans who wrote about this movement and its leading figures found it much easier and popular to divide in their representations what had been united in practice. In novels, plays, histories, and speeches, white writers split religion and politics, divorced passion from reason, contrasted Tenskwatawa with Tecumseh. They demonized the prophet, who continued to live for more than two decades after the war, as the font of all of kinds of irrational excesses, the one who foolishly led his followers into the disastrous Battle of Tippecanoe (November 7, 1811). And they mythologized his brother Tecumseh, now safely dead, as a romantic, but doomed, warrior who thought strategically and fought nobly, all for nought. In sum, white writers celebrated Tecumseh as a singular genius, though one handicapped by his brother’s incompetence.

These simplistic stereotypes obscured the complex realities. In fact, some Native Americans in the South remembered Tecumseh as a prophet himself. And it is clear that he and Tenskwatawa both drew upon key ideas from previous intertribal resistance movements, movements that had fused prophetic teachings with political goals to rally Native communities facing new forms of domination. In other words, Tecumseh fought with everything he had to defend the cultural and political sovereignty of American Indians.

JOEL W. MARTIN (2005)

**TEHUELCHÉ RELIGION.** [*This entry discusses the religious system of the Aónikenk, or southern Tehuelche Indians.*] Known as the Aónikenk (“southerners”), the southern Tehuelche Indians inhabited the region of Argentine Patagonia, which extends east and west from the Atlantic Ocean to the foothills of the southern Andes and north and south from the Chubut River (43° south latitude) to the Strait of Magellan. The ethnographic data used in this essay come primarily from fieldwork done in the 1960s, when the surviving Aónikenk population was estimated to number about two hundred, although barely seventy were still speaking their own language, which is part of the Araucana-chon family.

Until their final biological, social, and cultural annihilation—due to pressures exerted by the Araucanian peoples to the north and to European conquest and colonization during the nineteenth century—they were nomadic hunters with set patterns of movement, encampments, and territories. Their displacements were subject to seasonal variations: summer hunting in the coastal region was accompanied by a certain social dispersion, whereas the western areas of Aónikenk territory were associated with more stable winter settlements and some degree of population concentration. The Aónikenk were subdivided into three groups, with a varying number of exogamous patrilineages; their residential pattern was patrilocal. There are numerous gaps in our knowledge of the religious system of the southern Tehuelche, but an imposing, if fragmentary, mythology stands out. By the time travelers began to be familiar with Aónikenk mythology, it had already begun to disintegrate, in part because it was forbidden to share it with outsiders.

**COSMOLOGY.** The mythic chronology speaks of four ages. The chaos of the first age is expressed in the image of a deep

sea (the Flood?) or of a thick, wet darkness. During the second era, the high god—known variously as Weq.on (“truthful one”), Kooch (“heaven”), the Old One, and the Everlasting One, among other paraphrases—creates and gives order to the cosmic elements. Third is the epoch of Elal, the young god who shapes the earth, performs the ontological schism between undifferentiated and differentiated reality, and makes possible present-day human life with his ordering of technoeconomic, social, ritual, and ethical phenomena. His actions cover the end of the mythic era and mark the transition to the fourth age, the present one.

The cosmology describes the world as a system of four superimposed strata: the celestial sky, the atmospheric sky, the earth, and the subterranean region. The first is considered to be the highest, the second and third are rated ambiguously, and the last stratum is ranked the lowest. The cardinal points are rated similarly: the east is the best, the north and south are ambiguous, and the west is very bad.

**RITUAL.** No form of cult to the high god is recorded. The women possessed a repertory of sacred songs, dedicated to Elal and to Moon and Sun and their daughter, that were transmitted matrilineally. The canonical and reduplicated form of periodic exhortations given before hunting expeditions, which were uttered loudly by the chief of the local group, suggests the transformation of an ancient prayer addressed to Elal, inventor of hunting weapons and techniques.

Moon is the feminine deity who rules over periodic and alternating processes: menstruation, gestation, the life cycle, and the tides. During the new moon and eclipses, the members of the community would assemble behind their tents looking to the east; the women intoned the song of the deity and addressed prayers to her, begging her to “return to illuminate the world,” to grant them health, longevity, and good luck.

The song to the daughter of Sun and Moon was included in a rite for regulating high tide. This rite is related to an episode of Elal’s cycle that associates the tides with the daughter’s animistic states. According to it the goddess was transformed into a siren; her excitement over the maternal apparition was linked to high tide during the first quarter of the moon, and her unhappiness during the last quarter to low tide. The life cycle was marked by rites of passage: birth, puberty initiation, marriage, and death were culturally meaningful milestones. The events of the life of Elal symbolically reflect these experiences, suggesting in both instances evolutionary stages of understanding, with special powers gained at each stage.

The ritually and mythically significant classification of colors is based on the white-red-black triad. The highest opposition sets up white and black as symbols of life and death (or concealment), respectively. Newborn babies were ritually painted white, while gravediggers (a strictly female role) were painted black. The lowest opposition, according to a hypothesis formulated by Carlos J. Gradin (1971, p. 113), contrast-

ed the attraction of favorable aspects, denoted by white, with the rejection of the malefic, indicated by red; in contextual terms, however, the two colors complemented each other through their shared protective nature. Gradin's hypothesis reaffirms the sequence of colors used in therapeutic and funerary rites, where red accompanies the segregative phase, staving off the dangers entailed by impurity, and white accompanies the reincorporative phase, capturing the virtues to which a renewed condition allows one to aspire.

**PANTHEON.** The Aónikenk deities' spheres of activity and their relationships of complementarity and exclusion present a confusing panorama, which I will attempt to clarify. Elsewhere, I have noted processes of superimposition and transposition of attributes from the high god to other deities (Sifredi, 1969–1970, p. 247): for example, Elal possesses omnipotence and creativity as well as characteristics of a culture hero, while atmospheric phenomena are assigned to Karuten ("thunder"), a being of the atmospheric sky who is subordinated to Elal. The role of judge of the dead is assigned to the dyadic deity High God/Seecho; the high god judges how well the ethical ideal has been realized by the deceased, while Seecho, the "old woman" goddess, seconds his judgment. She admits to the afterworld—the eastern celestial sky—those among the dead who have tattoos on their left forearms (formerly such tattoos were the mark of initiates) and throws into the ocean those who lack tattoos. The belief that the dead were reunited with Elal and the high god in the eastern celestial sky, a land that knows neither penury nor illness, was well established. Elal moved definitively there after finishing his acts on earth, mounted on the swan goddess Kukn, the young goddess who assists Elal in many of the cycle's most important events.

The dyad Elal/Kukn displays a similar structure to that of the dyad High God/Seecho. The connection and hierarchical relationship between both dyads appears in the fact that the genesis and permanence of Elal's and Kukn's powers are ascribed to the high god. The secondary role and the spatial liminality of both feminine deities—expressed by their placement in the atmospheric sky—symbolically confirms the social dominance of men. The resulting tetrad, articulated along the criteria of age and sex (Old God/Old Goddess-Young God/Young Goddess), suggestively resembles the composition of Araucanian divine tetrads.

A similar coincidence between Tehuelche and Araucanian belief can be seen in a dualism that goes back to the primary confrontation between high, portrayed by the high god, and low, represented either by darkness (*tons*) or by the deep sea (*xóno*); high and low are the foundations of Order and Chaos. This dialectic extends over a vast semantic field in which roles, states, orientations, luminosity, numerical properties, zoological and color classifications, and behavioral and cognitive qualities converge. One pole links the celestial deities, life, healing, shamans, the masculine, east, day, evenness, water birds, herbivores, white, red, temperance, and wisdom—all of which contrast with the chthonic beings,

death, illness, witches, the feminine, west, night, oddness, carrion birds, carnivores, animals that live in dens, fish and sea mammals, black, intemperance, and ignorance.

**MYTHOLOGY.** The southern Tehuelche anthropogony includes motifs that relate to the differentiation of the human species and to the origin of copulation, marriage, and death. The beginning of Aónikenk people is accounted for in two ways. One is that Elal modeled male and female genitals out of clay into which he then blew the breath of life; another is that a role reversal between sea and land animals converted the former into the Aónikenk. Since land creatures were turned into marine fauna, the Aónikenk attribute the taboo on eating fish to this second mythical account.

The cosmogony recounts that the high god abandons his typical inactivity to begin the work of creation, which results from acts that are not always deliberate or conscious. One version of Aónikenk cosmogony contrasts the high god with *xóno*, the aquatic chaos that covered almost all primordial space except for a small piece of land in the valley of the Senguer River, in which the high god, little by little, grew larger. This region, the true "cosmic center," contains the palpable signs of divine action (i.e., certain topographical features) and is also the setting for the fabulous birth of Elal and for his acts on earth.

Manuel Llaras Samitier's versions of Aónikenk cosmogony (in Wilbert, 1984, pp. 17–18) contrast Kooch with *tons*, ubiquitous darkness. Saddened by his overwhelming solitude, Kooch's tears generate the "bitter sea" and his breath creates the wind that dispels darkness. The creation of Sun and Moon also plays a part in the darkness's attenuation. The amorous coupling and uncoupling of Sun and Moon evoke the rhythmic succession of darkness and light. Such images express the establishment of a temporal ordering by means of the alteration of day and night and of spatial ordering through the regulation of the cosmic elements: light, wind, and clouds.

**THE CYCLE OF ELAL.** Elal is the fruit of the union of antinomial conditions: his father, one of the chthonic monsters engendered by *tons*, devours his pregnant mother, one of the clouds created by Kooch. Elal's maternal grandmother rescues and raises the newborn Elal. Two testimonies enlivened the Aónikenk's memories: a bottomless spring, risen from the corpse of the Cloud, Elal's mother, marks the spot where Elal was born, appropriately called Beautiful Water. The red dawns observed from high vantage points reaffirmed for the Aónikenk this primordial shedding of blood.

Elal symbolically represents a mediation between heavenly and chthonic, the mythical and the present era, nature and culture. His quasi-earthly condition is in harmony with the formation of a world on a human scale. His mediation of the chthonic realm, for purposes of giving it order, is evident in the battles against cannibalistic giants, whose peculiarity lay in the vulnerability of their heels, a complementary and converse trait to that shown by the solar people, whose mouths operate as anuses. Elal's slaying of the ogres, begin-

ning with his own father, culminates in their petrification. They can thus be observed by the Aónikenk in the immutable form of rocks or fossil remains.

The mediation of the high aspect is developed during Elal's celestial journey to the region of Sun and Moon, his future in-laws. The couple show their hostility by assigning him to perform deadly trials for a three-day period—not unlike the Aónikenk's shaman's apprentice, who was required to spend three days of initiation in caves—before giving him their daughter. Unlike other suitors, Elal is able to carry out all the trials with the help of Kukn, the swan goddess.

In sociological terms, Elal's unsuccessful marriage to the daughter of Sun expresses the risks of extreme exogamy. Conversely, the cycle's next episode, in which Elal's grandmother attempts to seduce him, highlights the Aónikenk's abomination of incest in that the grandmother is transformed into a mouse and condemned to live underground. The gravity and eschatological meaning of this is supported by one old Aónikenk woman's assertion: "My grandmother trod on the mouse whenever she saw it, because it was to blame for the departure of her powerful grandson, whom she had raised."

The transition between the mythical and present eras is understood as the passage from predifferentiated to clearly defined reality. The Aónikenk believed that the earth emerged from the unformed sea, which was forced to the east by Elal's unfailing arrows. Elal's comings and goings from west to east, resembling the Aónikenk's seasonal migrations, endowed their habitat with the contrasting topography of mountains, woods, plateaus, valleys, lakes, rivers, and islands. The image of an almost empty sky is opposed to that of one peopled with constellations representing earthly animals and objects, a tradition shared by many hunting peoples. Molded by Elal, the constellations constitute visible guides for human action.

The schism between animal, human, and divine natures is marked by the confinement of each to a defined sphere. Although there is room for mediation between these spheres through shamans and witches, easy communication disappears after the mythical era. A rock with the imprints of Sun's feet—probably a reference to the petroglyphs of the "footprint style" (2500 BCE) of southern Patagonian rupestrian art (Gradin, 1971, p. 114)—locates the site where Sun, exiled by Elal, was supposed to have helped himself up in order to climb to the sky.

Temporally, the homogeneity of the original, predifferentiated reality—eternal life, continuing winter, and the unformed sea—is contrasted with the periodicity and alternation suggested by the appearance of the driving forces of the cycle of death and reproduction, of seasonality (and each season's specific activities), and the movements of the tides. In ontological terms, the lack of differentiation between the many primordial beings and things—indicated by their shared humanoid condition—is set against the delineation

of specific identities. On a sociological plane, the antisocial and incestuous nature—or the "meanness"—of the primordial humanoids is contrasted with human sociability based on the adequate sharing of goods, collaboration in hunting, sexual division of labor based on complementarity, prohibition of incest, and the exogamy of the local group. On an ethical plane, the formation of an Aónikenk ideal focused on courage, industriousness, tolerance, hospitality, respect for the property of others, and reserve in front of outsiders.

**CONCLUSION.** We are now witnessing the deplorable annihilation of this ethical ideal, extending throughout the southern Tehuelche religious system. Although in mythical terms the Aónikenk recognized the shock of the changes wrought by Europeans and their own consequent frustration, they did so merely by becoming aware of, and not by actively resolving, the conflict.

The absence of revivalist or revitalizing reactions would have been compensated for, at the very least, by mythical reflection on the meanings of alcoholism, of being deprived of their hunting lands, and of having to submit to foreign power. Incorporated as part of the cycle of Elal, the Aónikenk's great penury is reflected in the final impotence of the once-powerful deity. Thus one sees a religiosity that, since it is unable to form new relationships, is signaling the demise of its foundations as a rationale for cultural practice.

I hope in this article to have begun to fulfill, in at least a limited fashion, the mission entrusted by the last of the Aónikenk: that of revealing and spreading their "Word," which they knew would outlast their own lifetime and that of their gods, annihilated by history.

#### BIBLIOGRAPHY

The most complete compilation of Tehuelche mythic texts and narratives can be found in *Folk Literature of the Tehuelche Indians*, edited by Johannes Wilbert and Karin Simoneau, "UCLA Latin American Studies," no. 59 (Los Angeles, 1984). Johannes Wilbert's introduction (pp. 1–13) provides a rigorous history of Tehuelche folk literature studies. Among the versions contributed by authors to the compilation can be recommended those obtained by Tomás Harrington (text 49), Rodolfo M. Casamiquela (texts 4, 69, 80, 95, and 104), and Marcelo Bórmida and me (texts 5, 11, 22–24, 28–44, 46–48, 50–56, 58–60, 62–64, 66–68, 70–73, 75, 78, 79, 83, 85–94, 96–102, and 105–110); these versions meet the appropriate heuristic requirements in regard to collection, transcription, identification of informants, and genealogical proofs. Undoubtedly, the versions contributed by Manuel Llaras Samitier (texts 1–3, 8–10, 12–14, 25, 45, 65, and 74), especially the cosmogonic ones, are the richest, although unfortunately they do not always meet the above requirements.

The cultural links between certain southern Tehuelche, northern Tehuelche, and Selk'nam (Ona) mythic themes are outlined by Marcelo Bórmida and me in "Mitología de los Tehuelches meridionales," *Runa: Archivo para las ciencias del hombre*

(Buenos Aires) 12 (1969–1970): 199–245. For a comparison of these elements with those contained in the anthropogonies of the Gran Chaco, see Edgardo J. Cordeu's and my "En torno a algunas coherencias formales de las antropogonías del Chaco y Patagonia," *Relaciones de la Sociedad Argentina de Antropología* 5 (1970): 3–10. An interesting literary analysis that excerpts an episode from the cycle of Elal and reformulates it in its context was done by Juan Adolfo Vázquez in "Nacimiento e infancia de Elal: Mitoanálisis de un texto Tehuelche meridional," *Revista iberoamericana* (Pittsburgh) 95 (April–June 1976): 201–216. For a typological-comparative analysis of the deities and hierophanies and a summary exposition of the rites of passage and shamanistic and witchcraft conceptions and practices, see my "Hierofanías y concepciones mítico-religiosas de los Tehuelches meridionales," *Runa: Archivo para las ciencias del hombre* 12 (1969–1970): 247–271. Carlos J. Gradin makes many valid suggestions on the magico-religious meaning of southern Patagonian rupaestrian art in "A propósito del arte rupertre en Patagonia meridional," *Anales de arqueología y etnología* (Cuyo, Argentina) 26 (1971): 111–116. A reconstruction of the mythico-religious components of the Aónikenk habitat can be found in my own "Aspectos mítico-religiosos de los Tehuelches meridionales (Aonik'enk): El Habitat," *Boletín del Centro Argentino de Estudios Americanos* (Buenos Aires) 1 (January–April 1968): 49–54.

ALEJANDRA SIFFREDI (1987)  
Translated from Spanish by Erica Meltzer  
Revised Bibliography

**TEILHARD DE CHARDIN, PIERRE.** Pierre Teilhard de Chardin (1881–1955), a French Jesuit, was a distinguished scientist of human origins, a Christian mystic, and a prolific religious writer. Prohibited by his church from publishing any nonscientific works, his philosophical and theological writings were printed only after his death, though they circulated clandestinely before. His major opus, *Le Phénomène humain*, appeared in 1955 and was an immediate best-seller. The English translation, introduced by Julian Huxley, was titled *The Phenomenon of Man* (1959), later more accurately retranslated as *The Human Phenomenon* (1999). Throughout his life, Teilhard de Chardin reflected

on the meaning of Christianity in the light of modern science, especially in relation to evolution. He was concerned with the social, cultural, and spiritual evolution of humankind, as well as the place of religion, spirituality, and mysticism in an increasingly global society marked by pluralism and convergence. Some of his thoughts parallel those of the Hindu evolutionary thinker Sri Aurobindo.

**BIOGRAPHY.** Born on May 1, 1881, in Sarcenat near Clermont-Ferrand, France, Pierre Teilhard de Chardin was the fourth of eleven children of an ancient aristocratic family of the Auvergne. His father was a gentleman farmer with scientific and literary interests; his mother was a great-grandniece of Voltaire. Brought up in a traditional Catholic milieu marked by a vibrant faith, Teilhard's pantheistic and mystical leanings were already evident in childhood. His devout mother shared his interest in mysticism, whereas his father encouraged the collection of fossils, stones, and other specimens, laying the foundations for his son's future scientific career.

After an excellent education at a Jesuit boarding school, Teilhard entered the Jesuit novitiate at the age of eighteen. Deeply torn between an equally passionate love for God and the natural world, he resolved his crisis of faith by realizing that the search for spiritual perfection could be combined with that for scientific understanding. When the Jesuits were exiled from France, he continued his theological studies at Hastings in the South of England (1902–1905; 1908–1912), where he was ordained in 1911. From 1905 to 1908 he taught physics and chemistry to mainly Muslim pupils at a Jesuit school in Cairo. There he first discovered his great attraction to the desert and the East, leading him later to write with great lyrical beauty about cosmic and mystical life, culminating in his spiritual classics "Mass on the World" (1923) and *The Divine Milieu* (1927).

Henri Bergson's *Creative Evolution* (1907), which saw the world immersed in an immense stream of evolutionary creation, revealed to Teilhard the meaning of evolution for the Christian faith. Overflowing with the presence of the divine, the living world was experienced by Teilhard as an all-encompassing cosmic, mystical, and "divine milieu." These deeply mystical experiences were followed by scientific studies in Paris, interrupted by World War I, during which Teilhard served as a stretcher-bearer in a North African regiment at the Western Front. Living through the fiercest battles, miraculously never wounded, he found himself part of a pluralistic "human milieu," which led him to speculate about the growing oneness of humanity. These reflections grew later into the new idea of the "noosphere" (sphere of mind), an immense web of inter-thinking and interaction that connects people around the globe, hailing a new stage in human evolution. Almost daily encounters with death moved Teilhard to leave an "intellectual testament," communicating his vision of the world, which in spite of its turmoil he saw as animated by and drawn towards God. He began to write a series of stirring essays, published posthu-

mously as *Writings in Time of War* (1968). Little known, these were seminal for his later work and provide one of the best introductions to his thought.

Teilhard completed his studies in geology and paleontology after the war. Following the brilliant defense of his doctorate in 1922, he was elected president of the French Geological Society and appointed to the chair in geology at the Institut Catholique in Paris, where he could publicly expound his ideas about evolution and Christianity. This soon led to difficulties with his church, which continued throughout his life. Because of these difficulties, he was glad to join a fossil expedition in China in 1923, where he traversed much of the Mongolian Desert. China soon became a place of almost permanent exile, and he spent most of his scientific career there (1926–1946) after his license to teach at the Institut Catholique was revoked in 1925 as a result of a paper he wrote on evolution and original sin. Teilhard first worked with Jesuit fellow scientists in Tianjin, and he then became a member of the Chinese Geological Survey in Beijing, where he collaborated in the discovery of the skull of the 200,000-year-old Peking Man at Zhoukoudian. His scientific work brought him into contact with leading paleontologists of his time and involved numerous expeditions across Asia, including trips to India, Indonesia, Myanmar, Sri Lanka, Vietnam, and Japan, as well as regular travels between East and West.

The unforgettable experience of World War I was followed by the equally formative discovery of the vast continent of Asia with its variety of peoples and cultures. Many of Teilhard's essays were written in China, as were his two main books, a practical treatise on spirituality, *The Divine Milieu*, and his best known, though most difficult work, *The Human Phenomenon*, which he wrote from 1938 to 1940. Teilhard met some of his best friends in China among American and European scientific colleagues; he also first encountered the American sculptor Lucile Swan in Beijing, with whom he formed a deep, intimate friendship that lasted until the end of his life.

Teilhard returned to Paris after World War II and attracted a considerable following for his ideas. In 1948 he was invited as a candidate for the chair of paleontology at the Collège de France, but fearing further difficulties with the Vatican, his order refused permission. Not being allowed to lecture in public or publish his writings, he accepted a research post at the Wenner-Gren Foundation for Anthropological Research in New York in 1951, and made two trips to fossil sites in South Africa. Lonely and suffering, he spent the last years of his life mostly in New York, where he died in 1955 on Easter Sunday (April 10), as had been his wish. He is buried in the Jesuit cemetery at Saint Andrews on the Hudson.

The posthumous publication of his works raised much interest and controversy due to the exploratory nature, complexity, and unfamiliar terminology of his new ideas, but also due to the challenge of his unifying global vision. Although

harshly dealt with by church authorities, Teilhard gained loyal support from several members of his order, especially Henri de Lubac and René d'Ouince, his longtime superior, who described him as "a prophet on trial" in the church of his time.

**THE HUMAN BEING, THE WORLD, AND GOD.** Teilhard's method is based on a particular kind of phenomenology, different from that of other disciplines. It emphasizes the study of all phenomena by relating outer to inner "seeing." Such seeing involves the correlation of scientific knowledge of the outer world with a unifying inner vision, whereby the world is seen as held together by "Spirit." This holistic approach leads to a profound transformation of the seeing person and the world as seen, for seeing more implies being more.

Teilhard's thought is profoundly ecological—he saw human beings as an integral part of cosmos and nature, humankind as part of life, and life as part of the universe. In this dynamic and organic perspective the human being is not a static center, but "the axis and leading shoot of evolution." The rise of evolution is an immense movement through time, from the development of the atom to the molecule and cell, to different forms of life, to human beings with their great diversity. This evolutionary rise toward greater complexity leads in turn to a greater "within" of things, an increase in consciousness and reflection. The idea of greater interiority emerging within more complex organic structures is described as the "law of complexity-consciousness," sometimes called "Teilhardian law," and it is recognized as one of Teilhard's master ideas.

Cosmic, human, and divine dimensions are closely interwoven. Each is involved in a process of becoming, or genesis, and all are centered in Christ. Whereas *cosmogogenesis* refers to the birth of the cosmos, *anthropogenesis* and *noogenesis* refer specifically to the emergence of human beings and the birth of thought. These are closely studied by modern science, whereas *Christogenesis*, or the birth of God in Christ as an event of cosmic significance, can be seen only through the eyes of faith. Cosmic and human evolution are moving onward to a fuller disclosure of Spirit, culminating in "Christ-Omega." The outcome of this forward and upward process cannot be taken for granted but involves human responsibility and co-creativity. For this reason, Teilhard was much concerned with moral and ethical choices, with the hope and energy needed for creating the right future for humanity and the planet, as expressed in *The Future of Man* (1964). Working for the future and helping in "building the earth" is an important educational task that entails a change of mind and heart in people. Teilhard inquired into the resources of spiritual energy needed to create a better quality of life, greater human integration, and a more peaceful and just world. Although there are thousands of engineers calculating the material energy reserves of the planet, Teilhard inquired about "technicians of the Spirit" who can supply the necessary spiritual energy to sustain the life of individuals and the entire human community.

Here, the spiritual heritage of world faiths and philosophies is most important, providing some of the most valuable spiritual energy resources. Human beings are responsible for their further self-evolution and a greater unification of the human community, but these goals need ultimately spiritual, rather than merely material, resources, and the greatest of these spiritual resources is love. The noosphere as a sphere of thought—surrounding the globe like the atmosphere as a layer of air or the biosphere as layer of life—can also be interpreted as an active sphere of love through which greater bonds of unity, of “amorization,” are created between human beings. Teilhard was convinced that people must study the phenomenon of love as the most sacred spiritual energy resource in the same way that they study all other phenomena in the world. Love is so central in his thinking that Teilhard’s entire corpus can be interpreted as a metaphysics of love. Yet he also called for a rigorously scientific approach to the energies of love, just as the sociologist Pitirim Sorokin proposed a scientific analysis of the production of “love-energy” in the human community, so necessary for its self-transformation.

Teilhard’s dynamic understanding of God is sometimes compared to that of process philosophy and is best described as panentheism. His deeply mystical approach to God is expressed in his spiritual writings, such as *The Divine Milieu* and *The Heart of Matter* (1978). It centers above all in the person of Christ, whom Teilhard experienced as a cosmic and universal reality. He spoke of the “three natures” of Christ: human, divine, and cosmic. His numerous reflections on the universal, cosmic Christ contain important suggestions for a new Christology, never systematically developed. Teilhard spoke of the ever-present, ever-greater Christ, expressing a strongly Christocentric vision of faith that was grounded in a pan-Christic mysticism. As he often used the image of fire and heart, drawn from the Bible and the Christian mystics, Teilhard’s spirituality can also be described as a fire-and-heart mysticism, at once profoundly modern and ancient. In its affirmation of the world as God’s creation, it belongs to the kataphatic rather than apophatic type of Christian mysticism, expressing a strong affinity with contemporary creation spirituality.

Mircea Eliade saw Teilhard de Chardin’s specific genius in celebrating the sacredness of the cosmos. However, the cosmos cannot be seen in isolation from the social and spiritual bonds of humanity, animated by the powers of all-transforming love and seeking a higher form of union. Scattered across Teilhard’s writings exists a general theory about religion as the driving force in human evolution. Central to the phenomenon of religion and spirituality is the phenomenon of mysticism, experienced in a variety of forms across different religious traditions and culminating in a mysticism of love and action.

Teilhard’s vision of the world represents a unique blend of science, religion, and mysticism. Central to it are the ideas of the noosphere and the divine milieu—the first belonging more to a secular context, the second to a deeply religious

context—as well as ideas about spiritual energy, and the transformative powers of love. The essayistic, fragmentary nature of Teilhard’s work, with its profusion of ideas and fluidity of language, marks him more as a postmodern than a traditional thinker. Insufficiently well known, and often cited out of context, his work contains challenging reflections on God, the world, humanity, science and religion, ecological responsibilities, interfaith encounter, and the convergence of religions. Teilhard’s work also explores a greater unification, or “planetization,” of humanity; the place of the feminine and love in creating greater unity; and the central importance of spirituality and mysticism. Some of his thoughts are insufficiently developed and opaquely expressed; others must be criticized for certain elements of exclusiveness and Eurocentrism. Yet his ideas are said to have influenced the founding debates of the United Nations, several documents of the Second Vatican Council, Christian-Marxist dialogue, discussions on futurology, and discussions concerning the World Wide Web, whose patron he is sometimes said to be. Others have called Teilhard a New Age prophet, yet such a description ignores the profoundly Christian core of his vision.

Teilhard’s mysticism of action is directed towards the creative transformation of the outer and inner world, and it is based on the deepest communion with God, intimately present throughout creation. Teilhard’s powerful affirmation of the incarnation and his brilliant vision of the universal, cosmic Christ within an evolutionary perspective provide inspiring ideas for a reinterpretation of the Christian faith in the modern world, governed by an ongoing scientific and spiritual quest. Theologians will be interested in his understanding of God, Christ, and creation; scholars of religion will gain from his reflections on the place of religion, especially mysticism, in human evolution; and scientists are attracted to the newly emerging possibilities of the noosphere and the as yet unexplored energies of love for achieving profound personal and social transformation.

#### BIBLIOGRAPHY

Pierre Teilhard de Chardin’s religious and philosophical works were published posthumously in French between 1955 and 1976 in thirteen volumes entitled *Oeuvres* (Éditions du Seuil, Paris). Their English translations appeared between 1959 and 1978. Also published were numerous volumes of letters, extracts from his diaries, and the collection of his previously published scientific papers, *L’Oeuvre scientifique*, edited by Nicole and Karl Schmitz-Moormann, 11 vols. (Olten, Switzerland, 1971).

Teilhard presents his evolutionary system in its most complete form in *The Phenomenon of Man* (London and New York, 1959), now available in a much-improved translation by Sarah Appleton-Weber, *The Human Phenomenon* (Brighton, U.K., and Portland, Ore., 1999). To understand the full intent of this work, one should first read Teilhard’s classic treatment of Christian spirituality in *The Divine Milieu* (London and New York, 1960; reprint, translated by Siôn Cowell, Brighton, UK, 2004), followed by the theological es-

says in *Science and Christ* (London and New York, 1968) and *The Heart of Matter* (London and New York, 1978). Many readers find the easiest entry into Teilhard's thought through his vivid letters, especially *Letters from a Traveller*, edited by Claude Arragonès (London, 1966), or through his early, very lyrical work *Writings in Time of War* (London, 1968) and the selected essays in *Hymn of the Universe* (London and New York, 1965). This also contains his famous "The Mass on the World," originally written in 1923. Of particular appeal among his other works are *The Future of Man* (London and New York, 1964), *Human Energy* (London and New York, 1969), and *Christianity and Evolution* (London and New York, 1971).

A helpful reference work has been provided by Siôn Cowell, *The Teilhard Lexicon* (Brighton, UK, and Portland, Ore., 2001), the first English-language dictionary of Teilhard de Chardin's writings and vocabulary. Claude Cuénot's biography, *Teilhard de Chardin* (London and Baltimore, 1965), with its rich documentation and detailed bibliography of Teilhard's publications, is an indispensable resource, but not as readable as the shorter life by Mary Lukas and Ellen Lukas, *Teilhard* (New York and London, 1977), or the illustrated biography by Ursula King, *Spirit of Fire: The Life and Vision of Teilhard de Chardin* (Maryknoll, N.Y., 1996). The vicissitudes of Teilhard's life, especially the censure of his writings, have been amply documented by his Jesuit superior, René d'Ouinçin, in *Un prophète en procès*, vol. 1, *Teilhard de Chardin dans l'église de son temps* (Paris, 1970). Among numerous commentators the Jesuit Henri de Lubac must rank as one of the best; his early study *The Religion of Teilhard de Chardin* (London, 1967) is especially helpful. Another Jesuit, Thomas M. King, offers a searching analysis of Teilhard's mystical experience in *Teilhard's Mysticism of Knowing* (New York, 1981), undertaken from a different perspective by Ursula King in *Towards a New Mysticism: Teilhard de Chardin and Eastern Religions* (London and New York, 1980), which examines Teilhard's views on Eastern and Western religions in a converging world, including his new mysticism of action. R. C. Zaehner's *Evolution in Religion: A Study in Sri Aurobindo and Pierre Teilhard de Chardin* (Oxford, 1971) provides an insightful comparison between a Hindu and Christian approach to the evolutionary reinterpretation of two different religious traditions; see also Ursula King, "Teilhard de Chardin and the Comparative Study of Religions" in Christopher Lamb and Dan Cohn-Sherbok, eds., *The Future of Religion: Postmodern Perspectives, Essays in Honour of Ninian Smart* (London, 1999), pp. 54–76. J. A. Lyons's *The Cosmic Christ in Origen and Teilhard de Chardin* (Oxford, 1982) analyzes Teilhard's innovative passages on Christ's "three natures" and his traditional roots in Greek patristics. An earlier overall theological synthesis was undertaken by Christopher F. Mooney, *Teilhard de Chardin and the Mystery of Christ* (New York, 1966).

Well worth studying are *The Letters of Teilhard de Chardin and Lucile Swan*, edited by Thomas M. King and Mary Wood Gilbert (Washington, D.C., 1993), especially for their detailed coverage of his China years and his friendship with Swan. Mathias Trennert-Hellwig, *Die Urkraft des Kosmos: Dimensionen der Liebe im Werk Pierre Teilhard de Chardins* (Freiburg, Germany, 1993) provides the most comprehensive study of Teilhard's dynamic vision of love. A comparison

with Pitirim Sorokin's ideas on love is found in Ursula King, "Love – A Higher Form of Human Energy in the Work of Teilhard de Chardin and Sorokin," *Zygon* 39, no. 1 (2004): pp. 77–102.

The diffusion and critical reception of *The Divine Milieu*, especially in France, has been closely examined by Hai-Yan Wang, *Le phénomène Teilhard: L'aventure du livre Le Milieu Divin* (Paris, 1999). A wide-ranging discussion of Teilhard de Chardin's spirituality is found in Pierre Noir's "Teilhard de Chardin," *Dictionnaire de spiritualité: Ascétique et mystique, doctrine et histoire*, vol. 15, pp. 115–126 (Paris, 1991); selected texts on spirituality have been thematically grouped in *Pierre Teilhard de Chardin: Writings, Selected, with an Introduction by Ursula King* (Maryknoll, N.Y., 1999). The background, semantic context, and importance of Teilhard de Chardin's noosphere concept in relation to contemporary scientific discussions are extensively documented in *The Biosphere and Noosphere Reader: Global Environment, Society, and Change*, edited by Paul R. Samson and David Pitt (London, 1999). The relevance of Teilhard de Chardin's work, especially in relation to contemporary cosmology and ecology, is evident from the essays in *Teilhard in the 21st Century: The Emerging Spirit of Earth*, edited by Arthur Fabel and Donald St. John (Maryknoll, N.Y., 2003).

URSULA KING (2005)

**TEKAKWITHA, KATERI** (c. 1656–1680), native American convert to Christianity. Tekakwitha was born in the Iroquoian town of Gandahouhague, near present-day Fonda, New York. Her father was Mohawk, and her mother Algonquin, a captive adopted into the Turtle clan after a raid. When she was four years old Tekakwitha survived an attack of smallpox that killed her immediate family. The disease weakened her eyesight, and she afterward exhibited a general tendency to withdraw from social contact. By 1667, when Tekakwitha first encountered Jesuit missionaries, she was already inclined to a way of life that Christianity sanctioned. Indian townspeople exerted strong pressure to make her conform to native ways, but she persisted in her new interest. This determination culminated on Easter Day, 1676, when she was baptized by Jacques de Lamberville, S.J. The following year, local opposition to her Catholicism mounted, and she fled the region to take refuge with other Catholic Indians living along the Saint Lawrence River in Upper Canada.

Tekakwitha settled at Caughnawaga, or La Prairie de la Madeleine, an intertribal village of Christian Indians bound together more by religious allegiance than by tribal heritage. There she quickly established a reputation for austere self-denial and pious virtue. From her First Communion at Christmas 1677, until her death less than three years later, the maiden impressed all about her with her modest fervor and ardent prayers. Beset with a frail constitution, she worked as best she could in village gardens, fasted two days per week, administered flagellations, and kept a private vow of chastity. In 1678 she began a quasi-convent patterned

after the Hospital Sisters of Montreal, but such rigors hastened her own end. Her death enhanced local stories about her exemplary conduct, and Indian as well as French neighbors made a shrine of her gravesite. Many were inspired by her extraordinary life, and in 1932 she was nominated for sainthood. On October 22, 1980, John Paul II pronounced her blessed, thus acknowledging her as an example of Catholic piety in colonial New France.

HENRY WARNER BOWDEN (1987 AND 2005)

**TEKHINES.** Tekhines, a Yiddish word from the Hebrew *Tehinnot*, “supplications,” are Jewish private devotions and paraliturgical prayers in Yiddish written by both women and men but recited primarily by women. As texts in the vernacular, tekhines are important sources for the history of popular Judaism in the seventeenth, eighteenth, and nineteenth centuries, and they are particularly useful in studying the history of women’s religion.

Most Jewish men of the period attained basic literacy in Hebrew, and a few elite went on to full mastery of the classic literary tradition. Only a small number of women, however, learned more than the rudiments of Hebrew, and those central and eastern European Jewish women who could read usually were literate only in the vernacular Yiddish. Jewish liturgy and other devotional and scholarly works were written by men and were almost always in Hebrew, making them inaccessible to most women. Furthermore because women were excluded from most areas of public religious leadership and participation (they could not serve as rabbis, cantors, judges, or advanced teachers and did not count in a quorum for public prayer), they left behind a scant literary legacy. Tekhines therefore, as an enormously popular devotional genre, allows scholars a valuable window into women’s religious lives.

In books of tekhines each individual prayer begins with a heading that describes when and sometimes how it should be recited: “A pretty tekhine to say on the Sabbath with great devotion”; “A tekhine that the woman should pray for herself and her husband and children”; “A confession to say with devotion, not too quickly; it is good for the soul”; “When she comes out of the ritual bath”; “What one says on the Eve of Yom Kippur in the cemetery”; “When the shofar is blown on Rosh Hashanah, say this.” Scholars are divided as to whether these prayers were meant for women as a substitute

for the Hebrew liturgy or as a supplement, recited as occasional and voluntary prayers. Although some tekhines were intended to be recited in the synagogue and a few were written for male worshippers (“A lovely prayer for good livelihood to be said every day by a business man”), the majority were associated with women’s spiritual lives in the home: prayers to be recited privately on each day of the week and on Sabbaths, festivals, fasts, and new moons; for the three so-called “women’s commandments” (namely lighting Sabbath candles, removing a small portion of bread dough with a prayer recalling the priestly tithes in the ancient Temple in Jerusalem, and observing menstrual avoidances and purification); for pregnancy and childbirth; for visiting the cemetery; for private grief such as childlessness and widowhood; for recovery from illness; for sustenance and livelihood; and for confession of sins. Tekhines framed women’s domestic lives and roles as sacred, and they also connected them with the grander themes of Jewish thought, especially the hope for the messianic redemption and the end of exile.

**BACKGROUND.** During the sixteenth and seventeenth centuries new rituals and genres of religious literature emerged whose audience was a sort of intellectual middle class. This development parallels the emergence of similar literature in Christian Europe, enabled in part by the rise of publishing after the invention of the printing press. Guides to the ethical life, books of pious practices, and new liturgies and rituals, often in abridged and simplified form, were published both in Hebrew, for an audience of men with a basic education in classical Jewish texts, and in Yiddish, the vernacular, for women and nonscholarly men. Many of these new publications (including the Hebrew *tehinnot*, or supplemental prayers for men) developed out of and popularized a mystical pietism that had originated among the sixteenth-century qabbalists of Safed in Palestine. Tekhines allowed women to participate in this pietistic revival and its popular literature. By contrast, however, tekhines published in the eighteenth and nineteenth century show little evidence of influence from Hasidism, the great eastern European Jewish religious revival movement that originated in the mid-eighteenth century.

**HISTORY OF THE GENRE.** Although there are some handwritten tekhines, most of them were professionally printed. The earliest versions—a few small, anonymous collections—appeared in the late sixteenth century in Prague. Two main groups of tekhines exist, however: those that were printed in western Europe in the seventeenth and eighteenth centuries, which, although published anonymously, were probably written or compiled by men for women, and those that appeared in eastern Europe in the seventeenth, eighteenth, and early nineteenth centuries, often with named authors, some of which were written or compiled by women.

Most western European tekhines were published in collections addressing many topics, either in small books or as appendices to Hebrew prayer books. The first major collection (containing thirty-six prayers), titled simply *Tekhines*,

was published in Amsterdam in 1648; reprints, expansions, and additional collections followed. In the mid-eighteenth century a comprehensive collection containing 123 prayers emerged, titled *Seyder tkhines u-vakoshes* (Order of supplications and petitions, 1762), although there may be one or two earlier editions. This tekhine was reprinted many times, with alterations, over the next 150 years, first in western and later in eastern Europe. The western European texts not only depict the holiness to be found in the domestic and mundane activities of a wife and mother, but they also describe for women the angels, the patriarchs, the heroes of Jewish history, and the ancient Temple that stood in Jerusalem.

The earliest eastern European tekhines were published in Prague. *Eyn Gor Sheyne Tkhine* (A very beautiful tekhine, c. 1600) is one of the first to claim female authorship: it is attributed to “a group of pious women.” Two other Prague imprints, one from the beginning of the eighteenth century and the other from 1705, are also attributed to women: Rachel, daughter of Mordecai Sofer of Pinczow, and Beila, daughter of Ber Horowitz. Like many other eastern European texts, all three of these Prague tekhines were quite short, and each of them dealt with a single subject, such as a tekhine “to be recited with devotion every day.” One notable work, however, *Seyder Tkhines* (Prague, 1718), was written by a man—Matthias ben Meir, the former rabbi of Sobota, Slovakia—explicitly for a female audience. “My dear women,” he writes, “. . . I have made this tekhine for you in Yiddish, in order to honor God and . . . to honor all the pious women. For there are many women who would gladly awaken their hearts by saying many tkhines.” This work contains thirty-five prayers addressing a variety of topics.

Except for the Prague imprints, the eastern European tekhines were usually small pamphlets printed on bad paper with crabbed type, often with no imprint, making their bibliographic history difficult to trace. Books of tekhines originating in eighteenth-century eastern Europe, especially in Galicia, Volhynia, and Podolia (now parts of Poland, Belarus, and the Ukraine), tended to deal with a smaller number of subjects (such as the high holidays and the penitential season), were often written by a single author, and were usually fewer than twenty pages. Because a significant number of these authors were women, these texts capture women’s voices directly. Important examples include: *Tkhine imohes* (Tekhine of the [biblical] matriarchs), for the Sabbath before the new moon, by Leah Horowitz (eighteenth century), which argues for the power of women’s prayer and quotes from rabbinic and qabbalistic sources; *Tkhine imohes fun rosh khoydesh elul* (Tekhine of the matriarchs for the new moon of Elul [and the entire penitential season], n.d.) by Serl, daughter of Jacob ben Wolf Kranz (the famed Preacher of Dubno, 1741–1804), which calls on the four biblical matriarchs (Sarah, Rebecca, Rachel, and Leah) to come to the aid of the worshipper and plead her case before the heavenly court; and *Shloyshe sheorim* (The three gates), attributed to the legendary Sarah bas Tovim (who probably lived in Podolia

in the eighteenth century), which contains three sections: one for the three “women’s commandments,” one for the high holidays, and one for the Sabbath before the new moon. In contrast to the western European texts, some eastern European tekhines suggest that women should take part—in some fashion—in such traditionally male activities as synagogue prayer and Torah study.

By the mid-nineteenth century the genre had undergone significant changes. Jews in central and western Europe had largely abandoned Yiddish; books comparable to tekhines were published first in Germanized Yiddish, then in German in Yiddish characters, and finally in German. These texts expressed an entirely new sensibility, however, influenced by the rising ideal of the bourgeois family, with its stress on sentiment and emotional family ties and its new definition of gender roles. Similarly in eastern Europe the ideal of the bourgeois family came into play but in a rather different fashion. *Maskilim*, “enlighteners,” or men who wished to reform eastern European Jewish life, wrote tekhines to reach the “benighted” traditional women with their reform program. Unlike earlier tekhine authors, female or male, they scorned their audience and the genre. Often because they thought they could sell more books, they attributed their works to female authors, either those who had actually written tekhines a century earlier or to creations of their own imagination. (Because the maskilic practice of using female pseudonyms was well known, earlier scholars were skeptical of any attributions to female authorship. Many seventeenth- and eighteenth-century women authors have been authenticated, however.) In addition to these newer maskilic tekhines, older texts and collections—both those that were originally published in western Europe and those printed in eastern Europe—continued to be reprinted in eastern Europe in numerous editions, although they are often revised or garbled by the printers.

**SIGNIFICANCE.** The tekhines reveal a whole world of women’s religious lives, concerns, customs, and settings for prayer. These texts are deeply spiritual, no less than the complex and esoteric works produced by qabbalists and Hasidic masters. The women (and men) who composed these prayers for women addressed the spiritual issues of their day, whether on the level of domestic piety or national redemption. The tekhines themselves are at home in the literature produced for the intellectual middle class of this period; they fit well among the guides to the upright life, books of customs, condensed guides to pious practices, and digests of mystical teachings that were read by householders and artisans. Indeed the tekhines show how much women belonged to this intellectual and spiritual world. Finally, the tekhines provide worshipers with a direct experience of passionately emotional individual prayer that is mostly absent from the more collective and formalized male worship experience.

**MODERN DEVELOPMENTS.** As the use of Yiddish declined among emigrants from eastern Europe in the late nineteenth century and the twentieth century and the Yiddish-speaking

heartland was destroyed by the Holocaust, the genre of tekhnines nearly disappeared, except among Hasidim and other isolated traditional, Yiddish-speaking populations. After the 1980s, however, the tekhnines aroused new interest among both scholars and members of the Jewish public. Jewish women in particular have sought to find a usable past in which to root themselves. Orthodox women have turned to the traditional tekhnines as a direct expression of their predecessors' spirituality. This movement has occurred despite the fact that, unlike their European ancestors, many young Orthodox women in the United States in the early twenty-first century are well-educated in the Hebrew prayer book and classical sources in Hebrew and may not speak or read Yiddish at all. Liberal Jewish feminists have also sought role models in the historical tekhnines uncovered by scholars, and many of them have also written and published new tekhnines, some of which have been incorporated into new editions of Conservative and Reconstructionist prayer books.

#### TEMPLE: HINDU TEMPLES

"The Indian temple, an exuberant growth of seemingly haphazard and numberless forms," wrote Stella Kramrisch in 1922, "never loses control over its extravagant wealth. Their organic structure is neither derived from any example seen

in nature, nor does it merely do justice to aesthetic consideration, but it visualizes the cosmic force which creates innumerable forms, and these are one whole, and without the least of them the universal harmony would lack completeness" ("The Expressiveness of Indian Art," *Journal of the Department of Letters*, University of Calcutta, 9, 1923, p. 67). This intuitive understanding of the temple's structure and significance has been fleshed out and confirmed by Kramrisch and others in the years since those words were penned.

**AXIS, ALTAR, AND ENCLOSURE.** Hindu temples are built to shelter images that focus worship; they also shelter the worshiper and provide space for a controlled ritual. Between the fifth and the fifteenth century CE, Hindu worshipers constructed stone temples throughout India, but sacred enclosures of another sort had been built centuries before. Tree shrines and similar structures that enclose an object for worship (tree, snake, *linga*, pillar, standing *yakṣa*, all marked by a vertical axis) within a square railing, or later within more complicated hypaethral structures, have been illustrated in narrative relief-sculptures from the first few centuries BCE and CE. Whatever the variations, these structures mark a nodal point of manifestation, as does Viṣṇu in reliefs from the fifth century CE that show him lying on the cosmic ocean, with a lotus that springs from his navel supporting Brahmā, who proceeds to generate the universe.

In creation myths and in the imagery of the lotus, as in the structure of Mauryan monolithic pillars (from the third century BCE), the cosmic axis separates heaven from the waters. Creation flows from this nodal point toward the cardinal directions, producing a universe that is square, marked by the railing-enclosure of these early shrines, by the *harmikā* (upper platform) of the Buddhist stupa, and by the edges of the brick altar used for sacrifice. The *Āpastamba Śulbasūtra*, a text probably of the fourth century BCE, comments that "though all the earth is *vedi* [altar], yet selecting a particular part of it and measuring it they should perform the *yajña* ['sacrifice'] there" (6.2.4). The identity of the altar and the entirety of creation is thus established quite early, and this configuration of vertical axis, square altar, and enclosure persists in Indian architecture to demonstrate the participation of each monument in the cosmogonic process.

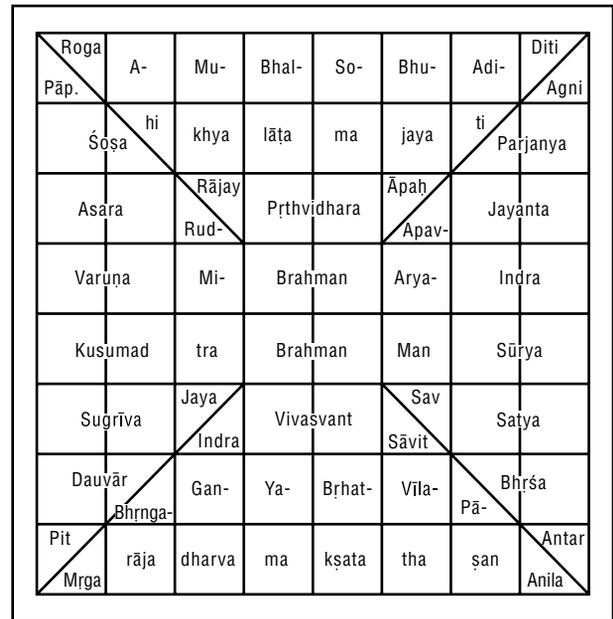

**DIAGRAM OF CONSTRUCTION.** The Vāstupuruṣa Maṇḍala—the square diagram on which the altar, temples, houses, palaces, and cities are founded—also outlines creation (see figure 1). The myth of the *vāstupuruṣa* portrays the first sacrifice, in which a demon is flayed and his skin held down by divinities who ring the diagram (*padadevatās*; lit., "feet deities"). In the center is the "place for *brahman*"—the formless, ultimate, "supreme reality." The use of this diagram for the construction of houses and the laying out of cities on a grid of eighty-one squares (nine by nine) is recorded in a chapter on architecture in Varāhamihira's sixth-century CE text, the *Br̥hat Saṃhitā*; the use of a grid of sixty-four squares (eight by eight) as a special case for the construction of temples (figure 1) is recorded in a separate chapter.

**CAVE, MOUNTAIN, AND SHELTER.** By the early centuries CE the use of anthropomorphic images to focus worship had moved from “substratum” cults into mainstream Hinduism and into Buddhism. Early Hindu images often represented cosmic parturition—the coming into present existence of a divine reality that otherwise remains without form—as well as “meditational constructs,” to use T. S. Maxwell’s phrase. The representation of the Buddha became permissible with the emergence of two new conceptions: the Buddha in cosmic form, replacing or supplementing the stupa as focus for meditation, and the *bodhisattvas*, figures who mediate between the aspirant and the ultimate reality of nonexistence. Behind anthropomorphic imagery in India, however, is always an ultimate reality without form.

Early shelters for anthropomorphic images were of several types: apsidal brick structures resembling the *caitya-grhas* of the Buddhists, elliptical structures perhaps suggesting the “cosmic egg,” open altars and hypaethral structures (both extending earlier aniconic formulas), small stone *chatrīs* (umbrellas or pavilions), cave shrines, and eventually temples with towers. Rock-cut shrines of the early fifth century CE (particularly those at Udayagiri, near Vidiśa, in central India), present two imperative metaphors for the temple: the sanctum as womb (*garbha*) in which the seed of divinity can be made manifest, and the temple as mountain. As the cave opens up the earth, so the sanctum opens up the temple.

If existing cave shrines emphasize the cave metaphor, an inscription dated 423/4 CE from Gaṅgadhāra in western India already compares a temple there to “the lofty peak (*śikhara*) of the mountain Kailāśa,” and the so-called Pārvatī Temple at Nachna of about 465 CE ornamentally rusticates its exterior walls to suggest Kailāśa’s piled rocks and animal-filled grottoes. The metaphors of cave and mountain for sanctum and temple are explicit in inscriptions and texts, but it is the concept of divinity made manifest and the practice of devotional worship (*bhakti*) that make the temple possible. The cosmic mountain and its womb/cave ultimately shelter a tender divinity, in the form of an image, and must open out to include and give shelter to the worshiper, who approaches the central point of cosmic manifestation along a longitudinal axis.

**ICONICITY OF ARCHITECTURAL FORM.** In North India, the fifth century CE saw experimentation in the means by which architecture could supply shelter to images. Small cave shelters were excavated (Udayagiri), cavelike cells were constructed (Sāñcī), structures with towers were built in impermanent materials (Gaṅgadhāra), and stone “mountains” were built (as at Nachna) with cavelike sanctums. Some temples began to show multiple and variant images of the central divinity on the walls (Maḍhia), and others became complexes by adding subsidiary shrines to shelter other deities (Bhumara, Deogarh). Such a proliferation of images can be seen as a product of the Hindu conception of cosmic parturition: if divine reality is formless, through the process of creation it takes an infinity of forms in this (created) world; though the

**FIGURE 1.** Vāstupuruṣa Maṅḍala. Ritual diagram for temple construction as described in Varāhamihira’s *Bṛhat Saṃhitā*; sixth century CE.

individual may choose one divinity as “trunk” for worship, others take up appropriate positions as “branches.”

Only in the sixth century did such experiments lead to a North Indian temple form that was complete in its symbolism and architectural definition. On plan, the North Indian temple grows from the Vāstupuruṣa Maṅḍala (see figure 1): its corners are those of the square *vedi*; its walls are half the width of the sanctum in thickness (as prescribed in the *Bṛhat Saṃhitā*); at its center is the *brahmasthāna*. The outer walls begin to acquire projecting planes that measure the dimensions of the interior sanctum and the “place for *brahman*.” The central projections on the wall now and then show closed doorways but most often frame secondary images (*parśvadevatās*) that extend and differentiate the form of the divinity within. In elevation, these planes continue up through the superstructure as bands that curve in to meet a square slab at the top of the temple, from which a circular necking projects. The necking supports a large, circular, ribbed stone (*āmalaka*) that takes the form of an *āmala* fruit and normally is crowned by a stone waterpot (*kalaśa*) from which leaves sometimes sprout.

The imagery (and its iconicity) is explicit. Just as the block of the temple’s walls projects planes outward in order to display the images that make its sacred content manifest, so too the temple “grows” in altitude, marking the process of cosmic parturition by its form. The womb of the temple, its sanctum (*garbhagrha*), provides the dimension for an *utaravedi* (“upper altar”) that terminates the tower (some seventh-century shrines show this altar as a shallow, pillared

platform at the top of the curvilinear superstructure). Extending the dimensions of the *brahmasthāna*, the necking above this *vedi* takes the form of the emerging “world pillar” (*axis mundi*), which passes symbolically through the sanctum with the body of the temple as its sheath.

As North Indian architecture evolves between the sixth and the thirteenth centuries, the plan of the temple shows more and more offsets, the walls gain more images, and the central tower of the temple becomes clustered by other, miniature towers, increasingly giving the effect of a mountain peak through specifically architectural means. If this variety of constructional forms, buttresses, and images “body” forth reality in the manifest world, the ribbed *āmala* stone at the top of the temple, much like the staff that sprouts in *Tannhåuser*, presents the ripening seed’s potentiality for fruition. Both the pot with germinating seeds that is buried under the foundation and the vase finial placed on top of the temple as an act of final consecration ritually help to perpetuate cycles of cosmic growth and fruition.

**PALACE, HUT, AND FORTRESS.** The temple thus combines physically the pillar that marks the axis of cosmic parturition, the altar of sacrifice taking the shape of the created universe, and the need for shelter of the tender divinity and the human worshiper; it unites the cosmic mountain and potent cave. South Indian temples, built in stone from the seventh century CE, give emphasis to the temple’s role as shelter for anthropomorphic divinities by retaining throughout their evolution a terraced, palatial form crowned by a domed *sikhara* that has the shape of the ascetic’s hut. As early as the Ājīvika caves in the Barabār Hills of Bihar, dating from the third century BCE, the hut of the living ascetic had been an architectural form appropriate for presenting the concept of sacred potentiality.

The temple is called *prāsāda* (“palace”) in North India, and the architectural veneer of its superstructure, in both north and south, allude to forms of palace architecture. In the north, these have been completely subordinated to the temple’s vertical ascent, becoming body for the altar that still presents itself at the top of the temple, open to the sky. In the south, deities sheltered within the temple’s compact, palace-like structure increasingly took on the accoutrements of a secular ruler, through ritual and the cycle of festivals. While divinity in the form of images (*mūrtis*) could take on qualities of royalty, and kings did validate their role by patronage of temples, the king was considered a reflection of divine order principally through the quality of his actions and the nature of his responsibilities, not by divine right.

If the temple is palace for divinity, it also is fortress, protecting the world from disorder and chaos. Corners are “attended with evils” according to the *Bṛhat Saṃhitā* (53.84), and “the householder, if he is anxious to be happy, should carefully preserve Brahman, who is stationed in the center of the dwelling, from injury” (53.66). In the puranic legend of Śiva conquering the three worlds, he frees three “cities” of demons, making them his devotees and transforming

the cities into his temples. In fact, images of Guardians of the Quarters (*dikpālas*) are placed on the corners of temples from about the seventh century, and a number of geometric experiments with plans based on the rotation of squares seem to play on the fort as a form for temple architecture.

Large temples in South India often enclose the sanctum in a series of ambulatory paths and walls that simulate rings of fortification around a walled city, and in fact use the eighty-one-square *maṇḍala* appropriate for the city, with a single square at the center surrounded by concentric rings of squares, to define the temple’s plan. If practice in South India increasingly emphasized the royal personality of the divinity and his relation to his subjects and kingdom by use of great festival processions, it also began to surround temples and contiguous sections of the city with walls pierced by gateways (*gopuras*) that became the focus of patronage themselves.

**ACCESS AND ASPIRANT.** The Hindu temple must also act as access and approach for aspirants and worshipers. This role changes the temple from a centralized, bilaterally symmetrical structure (reflecting the nature of the cosmogonic process) to one with a defined longitudinal axis. On that axis the worshipers approach their personal divinity within the sanctum; but also on that axis the aspirants increasingly can place themselves, in halls built for that purpose, as if under the umbrella of the sacrificer, positioning themselves for ascent. “The whole intention of the Vedic tradition and of the sacrifice is to define the Way (*mārga*) by which the aspirant . . . can ascend [the three] worlds,” wrote Ananda K. Coomaraswamy. “Earth, Air, and Sky . . . compose the vertical Axis of the Universe. . . . [These are] the Way by which the Devas first strode up and down these worlds . . . and the Way for the Sacrificer now to do likewise” (“*Svayamātrīṇṇā: Janua Coeli*,” in *Coomaraswamy*, vol. 1, *Selected Papers: Traditional Art and Symbolism*, ed. Roger Lipsey, Princeton, 1977, pp. 465–467, 470). The temple is as much a monument to the procession of time as it is a static model of the cosmos or a marker of its origin. *Padadevatās* ringing the *vāstumāṇḍala* (grid) are identified with the asterisms (*nakṣatras*) of the lunar calendar, and the temple both helps generate and acts as a focus for the ritual time of the festival calendar. Personal ritual within the temple involves both approach and circumambulation, and movement by the aspirant through time toward release had to be a recognized part of the architect’s program for the temple.

All sides of the temple allow access to the divinity through imagery, but the entry that pierces and makes ritual approach possible, most frequently on the east, is given increasing importance and architectural definition as temples evolve. Halls for ritual and assembly are added along this axis and sometimes used for dance or music to entertain the divinity, but often they serve simply as shelters for approach. One common and potent configuration places the sanctum (sometimes surrounded by an enclosed ambulatory path) behind a closed hall that may also be fronted by an open hall and an entry pavilion.

In the Kaṇḍariya Mahādeva Temple at Khajuraho (c. 1025–1050), for example, space for the worshiper within the closed hall takes the same dimensions as the sanctum, with parallel rings of the *maṇḍala* defining walls of the sanctum, the space within the hall, ambulatory walls, and the outer enclosure. Ceilings in such halls imitate the canopy over the ritual sacrificer; this intention is made architecturally clear in some cases by having a separately defined pavilion within the hall over the central platform, as at Sinnar in Maharashtra or at the great Jain temple at Ranakpur. The ritual fire can be placed in this position, and worshipers gather there as much to carry out ritual as to face the image of the deity.

**THE TEMPLE IN THE HUMAN IMAGE.** In such an architectural context, *yogin* and god are equal participants: the place of divine manifestation and the path of the aspirant have been given consubstantiality along the temple's longitudinal axis; sanctum and sacrificer's space both have become altars manifesting supreme reality in human form. In the Hindu temple, the axis of cosmic creation and the ritual path for release of the aspirant/worshiper/sacrificer (*yajamāna*) meet; the temple shares in the image of the "Supernal Man" (Puruṣa). As Kramrisch has written, "Puruṣa, which is beyond form, is the impulse towards manifestation" ("The Temple as Puruṣa," in *Studies in Indian Temple Architecture*, ed. Pramod Chandra, New Delhi, 1975, p. 40). This is true whether that manifestation is of the cosmos, of divine forms, or of human potential.

#### TEMPLE: BUDDHIST TEMPLE COMPOUNDS IN SOUTH ASIA

During the life of the Buddha (sixth to fifth century BCE), he and his disciples were sheltered by lay followers near various urban centers in North India. After his death, according to Buddhist tradition, his body was given royal cremation, and relics were distributed among eight city-states, which then established royal burial mounds (stupas) incorporating these relics in order to memorialize him. Two centuries later the Mauryan emperor Aśoka (r. c. 270–230 BCE) is said to have reopened these stupas to distribute the relics more widely in his attempt to spread the Buddha's teachings; Buddhist tradition relates that Aśoka established 84,000 stupas throughout the empire.

**COMPOUNDS IN SOUTH ASIA.** Though shelters for the monks and stupas as monuments to memorialize the Buddha and his teaching defined the physical requirements of Buddhist architecture for many centuries, symbolic and ritual requirements gradually transformed such elements into what properly can be called Buddhist temple compounds.

**Stupas and stupa-shrines.** A stupa originally was used to mark the relics of the Buddha or one of his principal disciples, as well as significant objects (such as the Buddha's begging bowl) or places related to his life or sanctified by his presence. At the same time, however, the structure of such a memorial stupa incorporated cosmogonic and cosmological references relating to a point or place of cosmic origination (the egg, *aṇḍa*), to a vertical axis marking cosmic parturition, and to the cardinal orientation of the created universe. Rituals related to such cosmogonic and cosmological beliefs must have been carried out around large stupas such as those constructed at Sāñcī, Taxila, or Amarāvātī. Small stupas, set up by laity as well as by members of the Buddha's order (*samgha*), were often used as votive markers of a follower's devotion. A major complex such as that at Sāñcī grew to include large stupas, monastic establishments, clusters of votive monuments, and eventually temples enshrining objects in-

tended for devotional worship. Large free-standing stupas as ritual centers continue to mark major Buddhist sites in South Asia, as well as in Myanmar, Nepal, Tibet, and Sri Lanka.

Initially, the Buddha himself, as a great teacher who had transcended the cycle of birth and rebirth through his teachings, was not the focus of devotional practice. The stupa, however, standing both for his presence and for a Buddhist and Indian conception of universal order, took on its own devotional aspect; shelters were constructed for the stupa and its worshipers, as in the structural stupa-shrine at Bairat or the excavated (rock-carved) stupa-houses (*caityagrha*) at Guntupalli and Junnar.

From these early enclosed stupas evolved a major type of Buddhist structure, the *caitya* hall, housing an object used as a focus for worship (*caitya*). These *caitya* halls are typically apsidal structures with a central nave and side aisles; a stupa is placed prominently (and mysteriously) within the apse. The structural examples are known only from their foundations, but a number of rock-carved *caitya* halls survive in the Western Ghat mountains.

The earliest of these, at Bhājā, Bedsa, and Kondane date from the second or first centuries BCE; the largest, at Kārī, from the first century CE; the latest, at Ellora, from perhaps the early seventh century CE. Located on trade routes and patronized by merchants and others from nearby urban centers, these large establishments also provided monastic cells for wandering monks and abbots, and sheltered pilgrims and travelers. At Bhājā, the abbot's cave has a veranda guarded by large images of the sun and rain gods, Sūrya and Indra; the individual monastic cells at Kaṇherī, scattered across a hillside outside of Mumbai, have stone beds and pillows, verandas, and grilled windows, each carefully located to take advantage of views through the neighboring hills to the harbor beyond. Both nuns and monks inhabited these cells, and helped to sponsor them, forming a community of followers who served the site and eventually might die and be memorialized there.

In the early centuries of the Common Era, much sectarian debate occurred within Buddhism over the role of the stupa—whether its function was primarily votive, memorial, or cultic. The concept of the transcendent Buddha with emissaries (*bodhisattvas*) to assist the devotee led to the introduction of images of the Buddha for worship; at the site of Nāgārjunikoṇḍa (third to fourth century CE) excavations have revealed a complex that combines a large, freestanding stupa, a monastic dormitory (*vihāra*), and a pair of apsidal *caitya* halls facing each other, with a stupa in one apse and an image of the Buddha in the other. In fifth-century *caitya* halls excavated at the great Buddhist cave site of Ajantā, an image of the Buddha, placed against the apse-stupa as if emerging from it, is a standard part of the complex. In cave 29, a gigantic image of the Buddha, reclining at the moment of his death and transcendence, fills the left wall of the cave as well, his feet placed toward the apse and his head toward daylight at the entrance.

Ajantā has more than thirty-two rock-cut Buddhist caves placed along the face of a horseshoe-shaped gorge; several date between the first century BCE and the first century CE. Two of these early caves and two dating from the fifth century CE are *caitya* halls; the remainder take a *vihāra* form. The concept of a cosmic Buddha, still accessible to his monastic aspirants, led to a significant change in the nature of such a Buddhist establishment, however.

**The Buddha's body.** That the Buddha in his cosmic body could both be visible to worshipers and live among the members of his *samgha* is the mystery of later Buddhism. Friar Bala, the high-status monk who set up the earliest images and inscribed images at both Sārnāth and Śrāvastī late in the first century CE, called them *bodhisattvas*—the Buddha returned to the worshiper, his “body made of mind” (*manomaya*). A third image, at Kauśāmbī, was dedicated by Buddhāmitrā, a nun. Such images were set up under umbrellas marked with cosmological signs, on thrones at the base of trees, within railings as were other open-air *caityas*, in association with previously built stupas or those in *caitya* halls, and ultimately in temple-shelters of their own.

**Monasteries and monastic shrines.** For many centuries after the death of the Buddha, monastic retreats were provided principally for the assembly of monks during the rainy season, but such places took on other functions over time, becoming retreats for lay travelers and eventually centers for learning. Foundations at Taxila in the northwest and at the important Buddhist university of Nālandā in Bihar show monastic complexes in the shape of rectilinear compounds with cells enclosing a central shared court. Monks lived in these cells much as students live in a Banaras Hindu University dormitory today.

Early monastic caves, carved in conjunction with major *caitya* halls (as at Bhājā and Kārī), show cells arranged along verandas set into the surface of the rock. Gradually such rock-carved sites began to mimic constructed monastic compounds, with cells surrounding an “open” court encased in the rock (the actual cave ceilings over these courts were painted to resemble cloth coverings hung as shelters from sun and rain).

At Ajantā, side-by-side with fifth-century CE apsidal *caitya* halls, members of the royal Vākāṭaka court had similar monastic caves excavated but added to them an enlarged hall on axis with the cave entrance, in which an image of the cosmic Buddha was enshrined. These *vihāra* caves thus served as votive “temples,” donated by the Vākāṭaka kings and their ministers, as well as residences for high members of the *samgha*.

**BUDDHIST EXPANSION.** In the region of Gandhāra in the northwest, through which Buddhism spread toward Central Asia, large monastic compounds also had associated stupas, sometimes placed in the center of the court, as well as a *gandhakuṭī* (sweet-smelling chamber) among the monks' rooms assigned as the residence of the Buddha. Gandhāran

sculptural reliefs also show thatch-domed structures with arched entrances, which shelter small stupas or relic containers as if for worship. These “vernacular” wooden or wattle-and-daub *caitya* shrines are sometimes depicted built on large platforms with a long central flight of steps and corner pillars marking the compound as if equivalent to the large ritual stupas built in this region, as that at Saidu Sharif. Clusters of votive stupas, as at Bhājā and Kaṇherī, sometimes have inscriptions assigning each to a particular deceased member of the monastic community.

**Relic shrines and Buddhist retreats.** As Buddhism spread to the northwest and south in the first centuries BCE, relic shrines became a significant component of monastic and ritual compounds. In Gandhāra in the northwest, these could be simple shed-shelters placed in association with large ritual stupas, or they could take the form of relic stupas with enclosed chambers giving access to relic caskets. In South India, carved reliefs also sometimes depict circular thatch-domed shelters that frame reliquary urns. The cult of relics—of the Buddha and of his monastic followers—gave a major impetus to the process of conversion and the spread of Buddhism in both regions.

One first-century BCE relief from an early Buddhist stupa site in Karnataka, Kanganhalli, uniquely depicts a stepped embankment with pilgrims, much like the steps of the *ghāt* (tank) excavated at the important Buddhist center of Nāgārjunakoṇḍa. Four sacred structures shown lined up at the top consist of a solid stupa, a stupa set on a circular platform that has a visible reliquary shrine within, a sacred tree shrine, and what seems to be a large stepped altar.

Other fragmentary reliefs from Kanganhalli represent the model for all Buddhist compounds, the *vihāra* and “sweet-smelling” huts of the Jetavana garden into which the Buddha and his followers took retreat. More detailed than similar narrative depictions from Barhut, these reliefs from Kanganhalli show simple gates and compound walls, an ox-cart bringing coins to be spread out in payment, simple ascetics’ huts (presumably the *gandhakuṭī* and *kosambakuṭī* hut for monks from Kosambī), a tree shrine, an altar marked with footprints, a “walking path” for the Buddha, and a large tapering multistoried central assembly hall (*vihāra*).

**Landscape, statehood, and pilgrimage.** The siting of Buddhist compounds was of utmost importance. Located along trade and pilgrimage routes from an early period, Buddhist establishments served merchants and coreligionists as way stations in the wilderness, retreats in proximity to urban centers, and markers at sites (*tirthas*) sacred to other groups. If the Jetavana garden was one model, the miracle at Śrāvastī where the Buddha manifest himself in a multitude of forms provided a rationale. Stupas, monasteries, *caitya* halls, and relic shrines all formed part of a natural landscape mapped by pilgrims, merchants, monks, and nuns. The stupas on Sāñcī hill; *caitya* halls and monasteries in Ajantā’s horseshoe gorge; retreats carved into the Western Ghat mountains; the manmade embankment (*ghāt*), tanks, and shrines laid out

along a river at Nāgārjunakoṇḍa; monasteries marching up the valleys through Swat; all intentionally partake of nature and integrate themselves within a landscape. That we are largely unable to reconstruct initial principles of Buddhist planning should not detract us from understanding that the result was intended to be what one scholar has described as a *mesocosm*—a sacred landscape in the living world.

A pilgrimage and political complex such as that at Bamiyan, Afghanistan—as famous for its frescoes as for the two giant Buddha statues destroyed in 2001 by the Taliban—can well exemplify the extent to which a Buddhist compound could incorporate and model the world. Long before the explicit rendering of buildings as cosmic maps (*maṇḍalas*), as in Tibet, was common, Buddhist sites in South Asia less formally “centered” nature to bring the universe alive. At Bamiyan, a long cliff with mountains looming behind is honeycombed with pilgrim’s caves. Two gigantic standing Buddha statues were carved into the cliff some distance apart by the seventh century CE; a third reclining image of the Buddha’s *mahāparinirvāṇa* was also recorded by pilgrim accounts. The cliff’s facade was a single canvas, dwarfed by the landscape of the valley, but to visit these images in ritual order according to one scholar was to retrace the spiritual career of the historical Buddha Śākyamuni. Bamiyan’s valley became the “compound” within which ambulation and pilgrimage occurred, as by extension did the kingdom of Bamiyan and the human-occupied Jambudvīpa continent cited so frequently in early Buddhist inscriptions and texts. Also in this valley in front of these images, according to the seventh-century CE Chinese visitor Xuanzang, the king performed a state ritual (the Pañcavārṣika) in which he gives up his wealth and “body” and then has them restored. By doing so each year he guaranteed the well-being of the assembled community.

**BUDDHIST TEMPLES.** Bodhi Gayā, the site in Eastern India at which the historical Buddha is said to have achieved enlightenment, reflects successive changes in Buddhist belief and practice. Under the present *bodhi* tree rests a stone altar set up in the time of Aśoka Maurya to mark the place of the Buddha’s enlightenment. The tree and altar are surrounded by a modern railing mimicking the form of an ancient tree shrine, but railing pieces from the Śunga period (second to first centuries BCE) remain nearby. Such open enclosures set around objects of worship (trees, pillars, images of nature spirits, stupas) represent pre-Buddhist practices that were absorbed into the iconography of popular Buddhism. Set next to the tree shrine is a large and restored brick temple of the seventh century CE, pyramidal in shape, its surface ornamented to suggest a multi-terraced palatial structure not unlike the *vihāra* represented in the Kanganhalli relief. A large image of the Buddha is enshrined within the present structure for worship. A relief on a second- to third-century CE terra-cotta plaque from Kumrāhār demonstrates that an earlier shrine in much the same form was already there by that period. Though such a Buddhist temple structure was based exclusively on Indian palatial forms, its conceptualization already suggests a model for the later pagoda temples that

range from Nepal through East Asia, although these draw on a different architectural language for their sheltering roofs. The distinctive importance of Bodh Gayā is attested by numerous votive miniature representations of this temple from along trade and pilgrimage routes into southeast Asia.

Terraced “temples” of a different sort were built across North India, most notably at Kumrāhār, Paharpur, and Lauṛīya Nandangaṛh. These structures, suggesting temple-mountains, featured cruciform bases with reentrant angles, on which stood either stupas or temple structures. The temples, and sometimes the stupas, had shrines facing the cardinal directions. The great terraced temple at Paharpur was also set within an enormous monastic court.

The most extensive representation of such terraced temple structures is found among the monuments scattered across the vast plains of Burma, particularly at Pagan. The Ananda temple there has a cruciform plan, interior ambulatories, and a central temple-like superstructure dating originally from the early eleventh century.

**Cosmological compounds.** The grandest expression of such an architectural conception within the Buddhist tradition, and one that reflects an increasingly perceived relationship between a manifest cosmic order and the responsibilities of Buddhism to provide visible aids to the aspirant struggling toward release, was the monument at Borobudur in Java, begun in the eighth century, but undoubtedly with South Asian prototypes. Though we are told that the compound underwent four periods of construction, with changing, possibly even conflicting, conceptions of its final design, one overriding metaphysical interpretation seems ultimately to emerge. In the opinion of most scholars, its five square terraced galleries covered by sculpture and its three upper circular terraces set with seventy-two perforated stupas and crowned by a solid stupa (with two empty chambers) were meant to incorporate and represent a Buddhist metaphysics, both cosmological and ontological, through which aspirants could ultimately find their way to release. In Cambodia as well, where Khmer rulers patronized both Hindu and Buddhist structures, the association of the king with the *bodhisattva* Lokeśvara reflected the former’s role as representative of such a cosmic order on earth.

From their simple beginnings as shelters for aspiring monks to memorialize a past teacher, Buddhist compounds became cosmogonic and cosmological monuments, accommodating both state structures and lay rituals, and eventually restoring the Buddha to his worshipers as a cosmic presence, accessible to monks and laity for devotion as well as instruction. Indeed, they became institutions to mold human aspiration as permanent in form as the urban society the Buddha once had renounced. This transformation reflected the strength, pragmatism, and flexibility of the Buddha’s teachings and provides some explanation for the success of Buddhism’s great missionary expansion from India into other parts of the Asian world.

## TEMPLE: BUDDHIST TEMPLE COMPOUNDS IN EAST ASIA

Symbols of the Buddha and precursors of Buddhist monuments appeared in China in the Western Han dynasty (206 BCE–9 CE). During the Eastern Han (23–220 CE), Buddhist images and places to worship them had made their way to the Chinese capital and many provincial regions. By the fourth century CE multicultural monastic communities practiced Buddhism in China's westernmost regions, including oasis towns in what are today Xinjiang Uighur Autonomous Region and Gansu province. By the next century, temple compounds had sprung up in cities, towns, and secluded, mountainous areas in every part of China, and Buddhism and its architecture had reached the Korean peninsula. By the end of the sixth century, the religion flourished in all three East Asian countries—China, Korea, and Japan.

In general, the movement of Buddhism and the temple compound was eastward, initially from India to Central Asia, to China, to Korea, to Japan, but occasionally transmission of architecture and ideas occurred via alternate routes that bypassed Central Asia or Korea, for instance. Wherever Buddhism went, the temple compound was the core of both monastic and religious communal life. Its size and complexity increased with time, such that new sects gave rise to new architectural forms and building arrangements. Patronage often was a direct reflection of imperial interest in the faith. Constructed almost exclusively with local materials, the architecture of temple compounds was adapted to every climate and region of East Asia. Yet through two millennia of history, the core structure and the primary purposes of the Buddhist temple compound as a setting for Buddhist worship and education have remained constant.

**TEMPLE COMPOUNDS IN CHINA.** Buddhist temple compounds presented the first serious challenge to the highly developed, coherent, codified, and even rigid Chinese architectural system. For more than two thousand years prior to the appearance of Buddhism, individual Chinese structures had been supported by timber frames made of primarily straight pieces of wood. By the time Buddhism entered China, cantilevers in the form of bracket sets had been introduced to help support the weight of large, prominent roof eaves, and ceramic tile had become the primary material for roof coverings. The system was employed for emperors and commoners alike, in palaces and ritual halls of the sovereign, humble dwellings, and altars that were built by both groups. Ground plans of all these structures were almost invariably four-sided, the one exception being ritual halls that excavations suggest had circular and octagonal rooms. Principles of axial-

ity and four-sided enclosure dominated Chinese construction; the latter was so important that it was almost impossible to find a structure without an arcade-enclosed courtyard adjoining or in front of it. Buildings and space multiplied along orthogonal lines, sometimes joined by arcades, in either direction. Except for watchtowers or gate-towers, before the entry of Buddhism, Chinese buildings were one-story high. These principles of Chinese construction and space would influence and usually govern imperial and religious building across East Asia until the twentieth century.

### Construction in China's first Buddhist centuries.

Three fundamental architectural forms of early Indian Buddhist construction—*stupa*, *caitya*, and *vihāra*—had to be accommodated by the Chinese system in order for Buddhist temple compounds to exist. All three were achieved during the centuries of disunion between the fall of the Han dynasty in 220 and reunification under the Sui in 581. During this period, many of the non-Chinese rulers of small and short-lived dynasties and kingdoms were eager patrons of a religion whose origins were as foreign on Chinese soil as were they. By the end of the sixth century, Buddhism had become the dominant religion in every region of China and its borders.

The most striking symbol of Buddhism on the Chinese landscape was the tower-like structure known as a *pagoda*, the Western name of the East Asian version of the *stupa*. The *stupa* had already undergone transformation along the route eastward across Central Asia from its initial Indian form of a circular plan with an egg-shaped dome capped by a balustrade-enclosed *harmikā* to a taller, occasionally four-sided monument. Its primary purposes as a relic mound, either for the remains of a Buddhist or other sacred relics or to mark a sacred place or event in the history of the faith, remained the same. At least five versions of the pagoda stood as parts of Chinese temple compounds before the beginning of the Tang dynasty (618–907). Three examples of pagodas with four-sided plans are represented by the single-story, nearly square Four-Entry Pagoda at Shentong Monastery in Licheng, Shandong, restored in 611; the multistory pillar-pagoda whose perimeter decreases story by story from base to top; and the multistory pillar-pagoda of uniform perimeter dimensions from first story to last. The latter two are found near centers of Buddhism in China that included major clusters of Buddhist worship caves. Both forms of pillar-pagoda had roof eaves marking each story. The fourth and fifth pagoda types taper in size from base to roof. One has an octagonal and the other a dodecagonal ground plan. Numerous octagonal pagodas survive from every period of Chinese history, but the only surviving, and only known, twelve-sided pagoda was built at Songyue Monastery on Mount Song, Henan, in 523. All pagodas of the early period have replicas on their exterior facades of the doors, windows, and corbel bracketing found on contemporary Chinese wooden architecture. Those that survive are brick or stone masonry.

Joining the pagoda as a focal point of worship in an early Chinese temple compound was the Buddha hall, in which

were enshrined the main devotional images of the worship complex. Worshipers could enter Buddha halls, in contrast to pagodas, which sometimes could be entered but in other instances had imagery carved on the exterior and were circumambulated during worship. The earliest extant wooden Chinese Buddha halls are from the eighth and ninth centuries. From excavated remains and written descriptions we know that Buddha halls of the sixth and seventh centuries were rectangular in plan and of one story.

The site of Yongning Monastery in the Northern Wei (493–534) capital at Luoyang in Henan province is one of the most extensively excavated and described temple compounds of the early period of Buddhist architecture in China. Its rectangular wooden pagoda soared 161 meters in nine stories. Each side of each story was supported by ten pillars and had three doors and six windows. The doors were vermilion lacquer, held in place with golden nails. Golden bells hung from each corner of each level. The Great Buddha hall directly to its north was fashioned after the main hall of audience of Luoyang palace. It contained a three-meter-tall golden Buddha. Also following imperial architecture, Yongning Monastery was enclosed by a 212-by-301-meter mud-earth wall, 3.3 meters thick, with a gate on each side. Its main gate, seven bays across the front, was 66 meters high and rose three stories. The others were two stories high. Records inform us that Yongning Monastery had a thousand bays of rooms, among which were monks' quarters, towers, pavilions, and the main Buddha hall and pagoda behind one another at the center. Yongningsi (temple compound) was just one of 1,367 Buddhist structures or temple compounds in the Northern Wei capital during its forty-year history. The main southern capital in Jiankang (present-day Nanjing) had 480 monasteries during the third through sixth centuries. Although not all received the kind of imperial patronage lavished on Yongning Monastery, whether converted from residences, built anew, or expanded from earlier structures, every temple compound had a pagoda and Buddha hall, and usually at least an entry gate and one enclosing corridor joined to the gate or surrounding the two main structures. All were Chinese versions of the *vihāra*, the second Buddhist structural type imported from India. Like their Indian predecessors, most contained residential architecture for monks, and, even more so than in India, the Chinese Buddhist temple compound was a group of courtyard-enclosed spaces. Unlike many Indian *vihāra*, pagodas projected above the low walls of temple compounds, and were sometimes the only feature that made it possible to distinguish a Chinese temple compound from a palace complex.

The last architectural form inherited from Indian Buddhist temple compounds was the *caitya*. In China, the *caitya* took the form of a rock-carved worship cave. The Chinese had occasionally carved tombs into natural rock prior to the entry of Buddhism. In at least one instance—the panorama of rock-carved imagery from the Han dynasty at Lianyungang in Jiansu province—Buddhist deities are believed to

have been carved into the face of rock. The concept of worship in a cave-temple, however, was inherited from India by way of Central Asia. Cave-temples with relief sculptures and paintings decorating their interiors, along with freestanding temples in oases along the Silk Routes, were seen by Chinese merchants before the fall of the Han dynasty. By the end of the fourth century, cave-temples in the vicinity of Dunhuang in Gansu province showed a unique blending of Chinese and South Asian structure and iconography. Structural and decorative features of cave-temples in Xinjiang and Gansu continued to bear signs of the native communities of monks and merchants from every part of Asia as late as the tenth century. Most famous among cave-temple monasteries are, from west to east, Kizil, Kumtura, and Bezeklik in Xinjiang; the Mogao and other cave-temple groups in the Dunhuang region, and Maijishan in Gansu province; and Yun'gang, Tianlongshan, Xiangtangshan, Longmen, and Gongxian in the north central Chinese provinces of Shanxi, Hebei, and Henan. Additional cave-temples studied in the twentieth century Gansu, the Ningxia Hui Autonomous Region, southeastern China, and Liaoning in the Northeast is giving way to the redating and refinement of chronologies for all of China's cave-temples.

The transmission of Buddhism and the rock-carved temple compound never followed a clear or direct path from South to East Asia during the five centuries (fifth to tenth) during which the architectural form flourished in Central Asia and China. Features of Chinese architecture, notably the ceramic tile roof and pillar-supported structure raised on a high platform with bracket sets, appeared in the murals and in reliefs at each of the sites named above by the fifth or sixth century. Often these indicators that Buddhism had entered the Chinese sphere existed alongside worshipers whose non-Chinese ethnicity was emphasized in the paintings or sculpture. Even after the facial features of figures that decorated the walls of Chinese *caitya* halls had become Sinified, elements of South Asian architecture persisted. One of the most common decorative features in Chinese cave-temples is the pointed, horseshoe-shaped arch called a *caitya* arch.

**Temple compounds after 800 CE.** The impermanence of wooden architecture has meant that rock-carved cave-temples, paintings of temple compounds on the walls of cave-temples, and excavated remains provide the most reliable evidence of comprehensive Buddhist worship space before the tenth century. Eight individual Buddha halls have been identified from the period 782 to 966, most with original images and some with wall paintings. Six are in Shanxi province, one is in Hebei, and one in Fujian. All but one are of the humble variety, with three or five bays across the front, indicating that their temple compounds either were not recipients of imperial patronage or were constructed in times of political and budgetary turmoil.

In China, the most important temple compounds, including rock-carved worship caves, were commissioned by the emperor or empress, often in or near national capitals,

sometimes near their burial sites and other times on sacred Buddhist peaks. Second-grade temple compounds often were commissioned by prefectural governments. Third-grade monasteries would be founded by princes and princesses, high-ranking nobility, or wealthy merchants. The same groups patronized temple compounds in Korea and Japan. The least distinguished temple compounds were built by local funds of private individuals.

The greatest temple compounds of the Sui dynasty (581–618) dominated their capital city Daxing (Chang'an under the Tang dynasty, today Xian). Daxing Mountain Monastery spanned an area 525 by 562 meters. Dachangding Monastery was three times as large, with eastern and western divisions and a pagoda that soared more than 97 meters. It was still common at this time and in the subsequent Tang dynasty for imperial residential architecture to be transformed into Buddhist temple compounds. The residence of the prince of Wei, son of the second Tang emperor, was transformed in 658 into a monastery with more than four thousand bays of rooms and thirteen major Buddhist halls arranged around ten courtyards.

By the Tang dynasty, it is possible to associate building plans with Buddhist ceremonies. Halls used for ordination of Zhenyan (Jpn., Shingon) monks were divided into front and back spaces; the private back space was used for the initiation rite in which the Womb and Diamond World *mandalas* were removed from the wall and placed on a low central table or on the floor. Other halls had a central altar with images where the pagoda-pillar had stood in cave-temples, and an enclosing ambulatory defined by pillars. Both hall types and full-scale monasteries are depicted in Buddhist murals and paintings on silk of the period.

From the Song, Liao, and Jin dynasties of the mid-tenth through mid-thirteenth centuries, monasteries with numerous types of buildings survive all over China. A pagoda or multistory pavilion and main Buddha hall remained the most important structures in most Chinese temple compounds from this period. Sometimes the two were on a building line that dominated the temple compound. Temple compounds of the period with pagodas or pavilions at their focus include Dule Monastery in Yi county, Hebei, whose pavilion and front gate are dated 984; Fogong Monastery in Ying county, Shanxi, whose 67-meter pagoda, the tallest wooden pagoda in China today, dates to 1056; and Fengguo Monastery in Yi county, Liaoning, whose main hall was built in 1013. At Fengguo Monastery, a law (*dharmā*) hall for expounding the Buddhist scriptures stood on the main building line with the 48.2-by-25.13-meter main hall and pavilion behind the front gate. East and west of the central line were pavilions to the Three Vehicles (*triyāna*) and Amitābha Buddha. A covered, pillar-supported arcade of 120 bays enclosed Fengguo Monastery. Longxing Monastery in Zhengding, Hebei, which was begun by imperial Song patronage shortly after the establishment of the dynasty in 960 and whose buildings were repaired or restored during the next century,

included an even longer line of main structures: a hall to the Sixth Patriarch, a hall to Śākyamuni Buddha, an ordination platform, and a pavilion to Avalokiteśvara known as Dabei or Foxiang Pavilion, which stood on the main axial line behind the front gate. In addition, pairs of side halls, pavilions, and towers framed each major courtyard in front of one of the axially-positioned structures.

The pairing of pagodas and pavilions on either side in front of a main hall became standard in tenth- to thirteenth-century Chinese Buddhist temple compounds. Shanhua Monastery in Datong, Shanxi, consisted of a front gate, a hall of the three deities, and a main hall along its main building line, along with two pairs of halls and a pair of pavilions joined to the covered arcade that enclosed it. One of the pavilions at both Shanhua and Longxing monasteries contained the temple compound's sūtra collection. A standard feature in Chinese monasteries of this middle period, the sūtra hall was often a pavilion or other multistory structure.

By the Southern Song dynasty (1127–1279), the majority of temple compounds were dedicated to the Chan sect. The major monasteries of this meditational form of Buddhism were dominated by seven halls arranged along a north-south line: a front gate, a Buddha hall, a Vairocana hall, a law hall, front abbot's quarters, abbot's quarters, and a room for seated meditation. Buildings for mundane affairs, such as storage halls and dormitories, filled the space on either side of the main building line. Monks' quarters sometimes contained a single huge bed on which monks meditated and slept. Other monasteries of the period had a hall dedicated to the five hundred arhats (*luohan*). In addition to accounts by Chinese pilgrims and records kept at the monasteries, knowledge of Southern Song monasteries such as Tiantongsi is preserved in accounts of Japanese Buddhist pilgrims to south China. An important account is the illustrated record of Gikai, who visited the five headquarters of Chan Buddhism in Zhejiang and Jiangsu provinces, including Ayuwang (King Aśoka) Monastery in Mingzhou, in 1259.

By the thirteenth century, great variety was found in monastery architecture in China. When a monastery contained three main buildings, for instance, the most important Buddha hall could be right behind the main gate or last in line. The lack of consistency can in part be explained by the presence in China of numerous Buddhist sects and by an increasing syncretism in Buddhist and Daoist worship that gave rise to new sects. Often a twelfth- or thirteenth-century Buddhist temple compound was architecturally indistinguishable from a Daoist temple compound on the exterior; upon entering, however, statues and paintings confirmed the temple's affiliation. In addition, Daoist precincts could be constructed at Buddhist monasteries and Buddhist precincts at Daoist temple compounds. Guangsheng Monastery in Hongdong, Shanxi, contains a Buddhist and a Daoist hall constructed in the first quarter of the fourteenth century.

By the fourteenth century, Lamaist Buddhism had pervaded the Chinese landscape. The most representative struc-

ture of a Lamaist Buddhist temple compound in China is the bulb-shaped pagoda known as a *dagoda*, often painted white. The Lamaist pagoda of Miaoying Monastery, built in 1279, and the one in Beihai Park, built in 1651, still rise above much of the rest of Beijing's architecture. Lamaist temple compounds dominated the regions of China adjacent to Tibet, in particular areas of Sichuan, Ningxia Hui, and Qinghai, as well as Inner Mongolia. Patronized by the Manchu rulers of the last Chinese dynasty, Qing (1644–1911), some of the most creative architecture of China's last three imperial centuries stands at Lamaist temple compounds.

Traditional Buddhist monasteries never disappeared from China. Chan monasteries continued to be built and restored into the last Qing century, especially at sacred locations, such as the Four Great Peaks; Wutai in Shanxi province, dedicated to Mañjuśrī; Putuo, the island off the coast of Ningbo, dedicated to Avalokiteśvara; Emei in Sichuan, dedicated to Samantabhadra; and Jiuhua in Anhui, dedicated to Kṣitigarbha. The later temple compounds of traditional sects retained axial arrangements and often were larger than their pre-fourteenth-century predecessors. These temple compounds included two new hall types, the diamond hall and the hall of divine kings, both of which also were incorporated into Lamaist construction in China. Also new in fourteenth-century temple compounds were brick "beamless" halls that were a sharp contrast to the ubiquitous wooden buildings of Chinese construction.

**TEMPLE COMPOUNDS IN KOREA.** Buddhism entered Korea from China officially in 372. Although not every Chinese Buddhist sect became popular in Korea, most were known there. Thus Korean Buddhist temple compounds contained the standard structures of Chinese monasteries. A standard plan in a Korean Buddhist temple compound, a plan that is equally common in China, includes an entry gate with a pair of divine kings on each side, followed by a law hall and main hall, and often additional halls behind or on the sides of this core group. As in China, almost all Korean temple compounds have Buddha halls and pagodas. Rock-carved cave-temples also are found in Korea, but are much rarer than in China.

Korea's best-known Buddhist temple compounds are Pulguksa and Sökkuram, both outside Kyōngju, capital of the united Silla kingdom (668–935). Pulguksa consists of a front gate with two halls directly behind it, and smaller halls dedicated to buddhas or *bodhisattvas* in their own precincts. The entry and most of the enclosing corridors of the monastery are elevated on stone foundations. Pulguksa's twin pagodas, similarly, are made of stone, the predominant Korean material of early pagodas. Sökkuram is Korea's most famous rock-carved Buddhist cave-chapel. The site with the greatest concentration of Buddhist rock-carved niches and worship spaces in Korea is Namsan (southern mountain), also in the vicinity of Kyōngju. In addition to thousands of images, Namsan has a pair of stone pagodas. The largest temple compound in Korea is T'ongdo, located between Kyōngju and

Pusan. One of the most noteworthy is Haein Monastery, which has been destroyed and rebuilt seven times; Haein Monastery houses an extensive set of woodblocks for the printing of Buddhist scriptures and the *Tripitaka Koreana*.

**TEMPLE COMPOUNDS IN JAPAN.** Although rock-carved cave-temples were never constructed in Japan, more pre-ninth-century wooden architecture from Buddhist temple compounds survives there than in any other East Asian country. Among remains from the Asuka and Nara periods (552–784 CE) are main Buddha image halls known in Japanese as *kondō* (literally, "golden hall"), octagonal halls that commemorate men important in a temple compound's history; multistory pagodas, including two miniature pagodas; lecture halls for teaching the scriptures; and gates, enclosing corridors, a sūtra repository, a monks' dormitory, and a refectory. Through these structures, as well as excavated remains and literary descriptions, temple compounds of the first Buddhist centuries in Japan, as well as China and Korea, have been reconstructed. It is known, for example, that three arrangements dominated temple compounds in Japan in the first Buddhist centuries. At Shitennōji in Osaka, the pagoda and hall are on an axial line, the arrangement implemented in China at Yongning Monastery, as well as in the temple compounds at Miruksa (early seventh century) of the Silla kingdom and Gumgangsā (sixth century) of the Paekche kingdom of Korea. At Japan's Hōryūji, whose four oldest buildings date to around 700, and at Kawaharadera, the pagoda and main Buddha hall were placed side by side. At sixth-century Asukadera, south of Nara in Asuka, three main Buddha halls enclosed a dominant central pagoda on all but the south side. Yet another Nara-period plan included twin pagodas on either side in front of the main hall. Each of these plans is suggested by excavated remains in Korean kingdoms of the sixth and seventh centuries; they are also seen in murals dating from the seventh and eighth centuries on the walls of cave-temples in China after Dunhuang. Expansive temple compounds of eighth-century Japan, including Hōryūji and Tōdaiji, inform us of yet more kinds of structures that survive in rebuilt versions—bell and drum towers used to keep time and call monks to prayer, halls for ceremonies of certain moons of the lunar year, ordination halls, and treasure repositories. Temple compounds could also include shrines to monks or monk-founders, halls to individual buddhas or *bodhisattvas*, gardens, bathhouses, and anything else that offered full-service life and education to the monastic and sometimes lay community.

Coincident with the move of the main capital to Heian (Kyoto) at the end of the eighth century, esoteric Buddhist sects, particularly Tendai and Shigon, both transmitted by monks who had traveled to China to study their teachings, rose in Japan. In contrast to the temple compounds of the seventh and eighth centuries that dominated Japan's capital cities, early Heian-period monasteries had smaller buildings located in remote, often mountainous settings. Thereby, the clergy were kept distant from court affairs. Muroji in Nara prefecture, Daigoji and Jingoji on the outskirts of Kyoto, and

many of the monasteries of the sacred Buddhist peak Koya, trace their origins to this period. So does the Eastern Monastery, Tōji, in Kyoto. Although buildings of temple compounds in the middle part of the Heian period remained small in comparison to their Nara counterparts, decoration became lavish. The change corresponded to the surge in Pure Land Buddhism, whose monasteries often included a recreation of the Buddha's paradise, or Pure Land, in the form of a hall with a lotus pond in front of it. The Phoenix Hall of the Byōdōin in Uji, once the residence of one of Japan's wealthiest families, and the Golden Hall of Chūsonji in Hiraizumi are typical Fujiwara-period (951–1086) monastery buildings. By the end of the Heian period, however, much less ornate temple compounds became popular: one-bay square halls dedicated to Amitābha Buddha of the Western Paradise were common.

Austere construction characterized temple compounds of the next period of Japanese history, named Kamakura (1185–1333) after the location of its capital, when the power of government lay in the hands of the military ruler known as the *shogun*. Austerities suited to a militaristic age were compatible with Zen Buddhism, a meditational sect, which became popular across Japan beginning in the thirteenth century. Like Esoteric and Pure Land Buddhism, Zen was transmitted from China. Yet even from the twelfth, thirteenth, and fourteenth centuries, when Chan (Jpn., Zen) flourished in South China, few temple compounds survive intact, in contrast to the scores of Zen temple compounds with original structures in Japan. Zen temple compounds are known for two-story entry gates where portrait statues of the sixteen arhats were installed on the second floor. The main Buddha hall of a Zen temple compound, where public ceremonies were enacted, was known as *butsuden*. Other assemblages of monks took place in the law hall. Both in Kamakura and later in Kyoto in the fourteenth through sixteenth centuries, Zen temple compounds consisted of public reception space, used chiefly by the main abbot; abbot's quarters; halls for study and meditation; a hall for sūtra recitation; a hall dedicated to the monastery founder; and usually gardens. The abbot's quarters traced its origins to a humble one-bay square hut (*hōjō*), the kind of dwelling used by the earliest Indian Buddhists, but these became increasingly important and lavish by the end of the twelfth century. Yet another hall type of Zen temple compounds was the *shariden*, the relic hall. Examples of all these structures remain in Kamakura and most survive at one of the best examples of a Zen temple compound, the Tōfukuji in Kyoto. Two styles of Kamakura temple compounds originated on China's southeastern coast. They were differentiated by the names Indian style and Tang (or Chinese) style, even though their buildings used Chinese components from base to roof. Other temple architecture of the period and as late as the fifteenth century was designated Japanese (native) style and mixed style.

The return of the shogunate to the Japanese capital in Kyoto ushered in the Muromachi age (1338–1573), a period

of luxurious living represented by the Silver Pavilion and the Golden Pavilion. Each was a devotional-meditational-reception hall for the private use of the shogun at his residential-religious building complexes. The in-town shogunate residences also included tea huts and Zen meditational gardens, sometimes made largely of rocks. The Muromachi period was the last age of great innovation in Buddhist temple architecture in Japan.

Temple compounds survive, are restored, and built anew in China, Korea, and Japan today. After a millennium-and-a-half of history, they are still centers of Buddhist education, worship, and communal life.

#### TEMPLE: BUDDHIST TEMPLE COMPOUNDS IN TIBET

The area covered by Tibetan Buddhist culture—which extends from the Tibetan Autonomous Region of China into neighboring Chinese provinces and into adjacent parts of India, Nepal, Bhutan, and Burma (Myanmar)—shares a common architectural tradition. The basic units are the temple and the stupa. Temples may stand alone either in open countryside or in a village or town, or more commonly they may, singly or in a group, form the core of a monastic community, or sometimes of a fortified palace complex. Stupas, usually modest in size, are ubiquitous features of the landscape. Occasionally a stupa of massive proportions will dominate a monastery or temple site.

The architectural style of Tibetan Buddhism is distinctive and as such has been exported to Mongolia and parts of China, and to Tibetan refugee communities around the world. The style has been created over some fourteen centuries as an eclectic mix from a variety of sources. Basic design concepts of plan and elevation—*vihāra*, *maṇḍala*, multisto-

ried construction—derive largely from India, often via Nepal. The main inspiration for building materials and techniques, as well as some of the decoration, has been the domestic farmhouse architecture of Tibet itself, with its many regional variations. Economic conditions dictate the use of native labor—essentially drawn from the local peasant farming population—for erecting and maintaining the main structure of religious buildings, which follow the local farmhouses in their reliance on heavy load-bearing outer walls of layered mud, mud brick, or rough stone. Internally the ceilings and flat roofs are supported by wooden columns, beams, and joists, the timbers for which may have to be imported from a distance. These factors in turn determine the form, finish, and size of walls, room spaces, and other architectural elements of temples, which from the constructional point of view can be regarded as oversized farmhouses. Temples are however distinguished from farmhouses by decorative embellishments that have originated in India, Nepal, Kashmir, China, and Mongolia and have often been executed by craftspeople imported from those countries.

**THE FIRST SPREADING OF BUDDHISM: JO KHANG (JOKHANG) AND BSAM YAS (SAMYE).** Buddhism is traditionally held to have been introduced into Tibet in the early seventh century. A major landmark in the process was the foundation of the still extant Jo khang temple in Lhasa by the Nepalese wife of King Srong btsan sgam po (Songtsen gampo, r. c. 618–641). While the story is heavily obscured by legend its essentials are plausible. The Jo khang, built on a level site and facing in the direction of Nepal, follows the *vihāra* layout so common in the architecture of the Kathmandu Valley. A three-storied range of chambers faces inward toward a rectangular inner courtyard, which, unlike its Nepalese prototypes, is covered with a flat roof. Light is admitted through a skylight onto the main image of the Buddha, which occupies a chamber in one of the shorter sides opposite the entrance porch.

While the outer walls and much of the present woodwork are entirely of the farmhouse-derived Tibetan type, the older columns, brackets, and door frames are compatible with the seventh-century Nepalese style, suggesting the participation of craft workers from Nepal. The four small-pitched roofs perched on the flat top of the building, with their complex wooden bracketing and gilded metal covering are instantly recognizable as of Chinese inspiration, almost certainly executed by Chinese artisans. At least one of them is known to have been added in the fourteenth century.

The inward-looking chambers of the Jo khang are occupied by chapels containing images of Buddhist divinities and a variety of mural paintings, both iconic and narrative in subject matter. An additional circumambulation corridor was later added round the whole building, and further concentric circumambulation routes lead round the streets outside and toward the outskirts of the city of Lhasa, reinforcing the supreme position of the Jo khang at the center of Tibetan religious life.

The other major religious complex founded in Tibet during the first spreading of Buddhism is Bsam yas, some 120 kilometers southeast of Lhasa, built by King Khri Srong lde btsan (Trisong detsen, ruled c. 755–797) in about 770 as the home of the country's first monastic community. Its layout, based on the *maṇḍala* with explicit cosmic symbolism, is strikingly different from that of the Jo khang. A central building of three superimposed temple chambers containing images of buddhas and divinities (the stories were originally built or decorated in Tibetan, Indian, and Chinese style respectively) represents Mount Meru at the center of the universe in Indian cosmology, looking outwards across a low surrounding wall representing concentric rings of mountains and lakes. Outside this, symmetrically placed at the quarters and intermediate directions, are four directional stupas and variously shaped small temples representing the sun and moon and the four earthly continents. The whole is surrounded by a quasi-circular wall. Living quarters for monks and other ancillary buildings are not part of the symbolic plan, as is normally the case in later buildings. The foundation of Bsam yas marks the inauguration of Buddhism as the state religion of Tibet under the King as a kind of cosmocrat. Its plan was allegedly inspired by the monastery of Odantapuri in Bihar, India, and may also owe something to the example of a temple at Wutaishan in China; there are also interesting parallels with the roughly contemporary palace-city of Baghdad. While the main structures of the present buildings at Bsam yas are original, the complex, like the Jo khang, has suffered periods of damage and neglect, most recently in the Cultural Revolution (1966–1976), and much of the woodwork and decoration dates from later periods.

**THE SECOND SPREADING OF BUDDHISM: TABO AND ALCHI.** After the collapse of the early Tibetan empire in the years after 842 CE, Buddhism was on the defensive in a politically fragmented country and little is known of architectural activity except for the mention of a few temples which, if genuine, must have been very small. Datable building programs begin again in 996 with the Western Tibetan complexes of Tabo and Mtho lding (Tholing, the latter largely destroyed in the Cultural Revolution). Generally, individual temples of this period are much smaller than the Jo khang or Bsam yas, and are built in small groups within walled compounds. While the details of a number of temple compounds from this period are known, by far the best preserved are those at Tabo and Alchi, both now in India.

The main temple at Tabo (Himachal Pradesh, India) is externally an unprepossessing single-story mud-brick chamber with no windows or external decoration. Internally however it displays a sophisticated arrangement of the deities of the Vajradhātu *Maṇḍala*, crafted in stucco and fixed part way up the internal walls of the single chamber. The image of the central buddha, Vairocana, is moved along the axis from the entrance porch toward the rear of the chamber, and in a small space behind it is the image of Amitābha, of whom Vairocana is an emanation. Thus the use of height to convey symbolically a progression to more supramundane levels at

Bsam yas is replaced by movement along an axis. Height is however used to differentiate the mural paintings of the internal walls, which cover historical and narrative themes lower down and iconic subjects higher up. The flat roof of the chamber is supported in the usual fashion by wooden columns to leave a central space suitable for the communal rituals of the monks. This practical requirement henceforth very commonly dictates the form of the Tibetan temple chamber. Conceptually it can be seen as both a *maṇḍala*, housing a conventional set of divine images, and as a *vihāra*, with the images represented as statues or paintings looking into a central space from the sides, and the main image at the far end opposite the entrance. Both types of plan are sanctioned in the Tibetan Buddhist scriptures: the *vihāra* mainly in the Vinaya texts of monastic discipline, and the *maṇḍala* in the Tantras. Details of the carpentry recall styles from lower down the Himalayan valleys, from whence most of the timber probably came.

While the assembly hall at Alchi in present-day Ladakh (India) resembles the main temple of Tabo, the Sumtsek or temple of three diminishing stories there reworks some of the themes touched upon above. Of uncertain date, perhaps eleventh to twelfth century, it is of *maṇḍala*-like plan with four projections, one of them occupied by the entrance porch and the other three- by four-meter high stucco images of *bodhisattvas* whose heads project above the ceiling into the gallery of the next story. The small central space is occupied by a stupa: too small for communal worship it was used like a few others of its type for individual Tantric initiations. Just as remarkable as the plan and elevation of the temple are its paintings, which cover the entire inner surface in luxuriant profusion. As at Bsam yas and Tabo, symbolic use is made of height, with more mundane scenes and subjects below, more transcendental ones above. Carpentry details at Alchi strongly resemble those in the architecture of the Kashmir Valley (now surviving only in stone), whence some of the craftsmen are known to have traveled.

**TRANSITION: SHALU.** The temple compound of Shalu near Shigatse in south-central Tibet illustrates the transition from the style of the second spreading of Buddhism to the mature style, sometimes called the Dge lugs (Gelug) pa style, which had evolved by the fifteenth to sixteenth century and continues to this day.

The original temples at Shalu, from the early eleventh century, comprised a pair of single windowless chambers sharing a party wall and known as the “twin chapels,” whose ceilings are each supported by four wooden columns remarkable in this period for their height, about six meters. They faced across what was presumably an open space toward a two-story temple, nowadays made up of a chamber traversed by the main entrance passage, with a chapel devoted to the goddess of wisdom (Prajñāpāramitā). The capitals and bracketing between the columns and ceilings of all these early temples show interesting experiments that bring together elements of both Chinese- and Indian-derived carpentry.

In the late thirteenth century, additional single-story temples were constructed along the sides of the compound to create an enclosed central courtyard. This paved the way for a complete transformation of the complex in the early fourteenth century, made possible by the connections of the local princes with the hierarchs of the nearby principality of Sa skya (Sakya), who had been appointed viceroys of Tibet by the Yuan (Mongol) dynasty of China. Lavish patronage was available in the form of financing and the services of mural painters, carpenters, and tile-makers sent from China. The painters were from an imperial atelier set up some decades earlier by the famous Nepalese artist and sculptor Aniko. Thus the construction of this phase of Shalu was a true international effort, as has frequently been the case in Tibetan architecture. Raw materials for tile glazing and painting must have been imported from China, while timber was transported from across the Himalayas.

The central courtyard was roofed over to create a columned assembly hall lit by a central skylight. Over the chapels on each of the four sides was erected a Chinese pavilion of traditional wooden construction with a pitched roof of green glazed tiles, looking onto the central roof terrace in the fashion of the Jo khang. The whole was surrounded by a two-story circumambulation corridor. Internal surfaces not already painted were covered with mural paintings, where some of the earliest Chinese influence within Indo/Nepalese-derived Tibetan art can be seen.

By this time the distinctive Tibetan wooden entablature of column, bracket, beam, and joist had evolved and was used in the lower parts of the building. In the upper Chinese pavilions, however, Chinese bracketing and other carpentry details are exactly those found in contemporary Chinese architecture.

**THE DGE LUGS PA STYLE.** The basic temple layout exemplified at Shalu was much utilized after the government was taken over by the Dalai Lamas of the Dge lugs pa or Yellow Hat order of Tibetan Buddhism in the mid-seventeenth century. There was however a strong tendency to move the sites of temples and monasteries away from the river plains of earlier times to defensive hilltop positions. From there they could dominate the surrounding landscape not only visually and symbolically, but in some cases also militarily, in times when armed conflict between Buddhist monastic orders and their backers was not unknown. In some cases the temple and monastery merged with the fortified palace, so strong was the interconnection between religion and politics. The most outstanding examples of this process are the Potala palace of Lhasa and the *dzongs* of Bhutan, though there have been many others.

The Potala was begun by King Srong btsan sgam po in 637. In a development of the basic *vihāra* layout, a rectangular ground-floor assembly hall is surrounded by inward-looking cells over which are superimposed stories of further cells to leave a galleried and open central inner terrace over the hall. The internal spaces are mostly dedicated as chapels,

monastic rooms, and Dalai Lama's living apartments or funerary stupas. The adjoining Red Palace to the east was erected by the last regent of the fifth Dalai Lama from 1690 to 1694 to incorporate the latter's mausoleum. Courtyards, monastic living quarters, access ramps, and defensive end bastions completed the complex. While it is defensible and has indeed been besieged a number of times, it is doubtful whether its main purpose was defense so much as a visual symbol of the religio-political center of the Tibetan polity.

The *dzongs* of Bhutan (the main ones located at Ha, Thimphu, Punakha, and Tongsa, and dating from the seventeenth to the twentieth centuries), while built around a monastic core, had defense as a principal purpose. Each was intended as a center of civil, military, and religious administration for its surrounding valley complex. Within a mighty enclosing and elongated rampart are typically two courtyards: a public courtyard near the single entrance, separated by a towering central temple of three to five stories from an inner monastic courtyard.

The external appearance of religious buildings has been largely standardized, with outer walls tapering inward toward the top, and whitewashed to contrast with black-framed windows. The style closely resembles that of the local farmhouses, even to the extent of incorporating the roof parapets of stacked brushwood or other fuel and animal fodder as a fossilized element in religious buildings usually painted red. There are local variations—for instance in Bhutan the window frames are more elaborate and brightly painted and the temples are provided with overhanging pitched wooden roofs, but even here the red horizontal band is present in painted form. Stylized banners and standards of textile or, more commonly, gilded metal, of Indian, Nepalese, or Mongolian derivation adorn the roofs of temples, the more important of which may still be marked with small Chinese-style gilded pavilions. Internally the tapering wooden columns that support beams via elongated voluted brackets, all brightly painted, have also been largely standardized.

**THE STUPA: RGYAL RTSE (GYANTSE).** Tibetans conventionally recognize eight designs of stupa, relating them to episodes in the life of the Buddha. In practice all but the type commemorating the enlightenment are rare. However there are a few examples of the “stupa of many doors,” the most remarkable being that in the town of Rgyal rtse, the so-called Kumbum, which dominates its temple complex. Built from 1427 to 1439 by the local princes, it is unusual in that all five stories of the stepped base, the dome, and the spire are hollowed out into chapels containing a rich variety of images and wall paintings. Thus the form of the stupa is fused with that of an elaborate Tantric *maṇḍala*.

#### TEMPLE: BUDDHIST TEMPLE COMPOUNDS IN SOUTHEAST ASIA

Buddhists in Southeast Asia have established temple compounds of importance since ancient times. In Java, significant complexes were built in the eighth and ninth centuries (in Central Java) and in the eleventh to fifteenth centuries (in East Java), prior to the spread of Islam. In mainland Southeast Asia, where Theravāda Buddhism is practiced today, the development of Buddhist temples can be traced from early historical times through the present.

Because so many temple compounds have included dwelling places for monks, it is sometimes held that it is preferable to speak of monasteries, rather than temples. Since, however, monastic establishments are in general places of public worship, either term is acceptable. Temple compounds can include the same elements found in India: the stupa, which need not contain an actual relic of the Buddha; a sanctuary or a hall holding a principal Buddha image; and housing for monks. In the living traditions of Burma (Myanmar) and Thailand (together with Laos and Cambodia), special importance is attached to halls that can accommodate public worship and to those that provide for monastic ceremonies a space that is necessarily demarcated by ritual boundary stones. Sometimes these halls are distinct, sometimes one in the same.

In this entry, a survey of developments in Southeast Asia follows descriptions of three complexes of particular distinction and ambition: Borobudur in Central Java (eighth to ninth centuries); the Nagayon in Pagan, Burma (eleventh century); and Wat Phra Chettuphon in Bangkok, Thailand (eighteenth to nineteenth centuries).

**BOROBUDUR.** Borobudur, or Chandi Borobudur, is a unique monument, the profundity of which has been widely ac-

knowledge, even in the absence of general agreement about its interpretation. It may be regarded as a stupa elevated upon a sequence of terraces, as in such later structures as the twelfth-century Dhammayazika at Pagan (where the terraces bear reliefs depicting Buddhist birth stories) and the Kumbum in Gyantse, Tibet (where niches on the terraces hold images of deities in the Vajrayāna pantheon). Its Indian antecedents are obscure. In complexity, quality of workmanship, and expressiveness, Borobudur surpasses these later buildings and perhaps all other Buddhist monuments.

The original 160 relief panels encircling the lowest quadrangular story were covered with stone blocks, apparently before the monument reached its ultimate shape, as a result of a need to prevent subsidence. These reliefs depict scenes of cause and effect, such as appropriate punishments for evil deeds. Above are four stories generally referred to as galleries. Each of these can be circumambulated by a visitor entering from one of the four axial stairs, and each contains a major series of narrative reliefs on the inner wall, with reliefs of lesser importance on the outer wall. The height of the outer wall prevents views out to the landscape. In the first gallery, the primary 120 panels depict the life of the Buddha through his enlightenment; directly below, the reliefs depict Buddhist tales, both *jātakas* and *avadānas*. On the second and third galleries, the primary reliefs depict the *Gaṇḍavyūha Sūtra*, specifically the visits of the pilgrim Sudhana to “good friends,” who provide instruction in Mahāyāna Buddhist doctrine according to Avataṃsaka tenets, and Sudhana’s arrival at the Tower of Maitreya, characterized in the text as a fantastic architectural structure that provides a visualization of the nature of the *dharmadhātu*, the “truth realm” or phenomenal world as perceived by buddhas. The reliefs of the fourth and topmost gallery are devoted to the Samantabhadra vows, a text describing miraculous visions and committing the pilgrim to the *bodhisattva* path, and to the vow to remain in the world, aiding suffering creatures until all beings can enter *nirvāṇa* together. Overlooking each of these four galleries are life-sized buddha images in niches (in all, 368 images); these are differentiated according to direction on the first three galleries; over the fourth gallery, all the buddhas execute a teaching gesture.

After the fourth gallery, the visitor enters a “plateau,” above which rise three concentric terraces, which hold a total of seventy-two (thirty-two, twenty-four, and sixteen) perforated stupas with diamond-shaped and square openings, through which is visible a life-sized sculpture of the Buddha performing the teaching gesture known as *dharmacakra mudrā*. Crowning the monument is a much larger central stupa, which is solid. From these terraces the visitor has a view over the landscape.

The reliefs of the covered base and the four galleries present a straightforward pilgrimage along the *bodhisattva* path of Mahāyāna Buddhism. The significance of the upper terraces, on the other hand, is less clear. Older interpretations draw conclusions from points of connection with Buddhist

cosmology, seeing in the half-hidden buddhas of the perforated stupas a move toward the invisibility of the topmost “formless realm” of the Buddhist cosmos. One recent interpretation argues that the upper terraces represent an ideal world, contrasting with and paralleling the real world of the galleries, and that the perforated stupas convey higher meditational experience in two ways. The openings in the stupas are actually the shapes of the breaths of the meditator, who is paying visits on the terraces to the planets and stars, the moon, and the sun. Secondly, if the stupas were gilded and reflected each other and the visitor, they would have conveyed the nature of the *dharmadhātu*, in which enlightened ones perceive phenomena as resembling a hall of mirrors. It may be that originally Borobudur was to be crowned with a sanctuary that would have stood for the Tower of Maitreya as illustrated in the third-gallery reliefs. A change of plan resulted in the terraces with perforated stupas, unique in the Buddhist world, but paralleling chakras (“circles,” psychic centers within the human trunk) of lotuses with thirty-two, twenty-four, and sixteen petals, like those found in the Tantric texts that were soon to dominate Indian monastic centers.

**THE NAGAYON.** The Nagayon, a relatively small temple constructed in the late eleventh century, is one of the oldest buildings in the ancient capital of Pagan, Burma. Constructed of brick and stucco, it reflects older traditions of northern India and Bangladesh, and its spire takes the form of the *sikhara* of the northern Indian Hindu shrine. There are three interior spaces: a hall, an ambulatory, and a sanctuary. Ten niches in the hall hold sculptures depicting important events in the life of the Buddha. On the inner and outer walls of the ambulatory, which encircles the sanctuary, beside murals (originally) illustrating the Buddha’s life and birth stories, are sixty niches with sculptures. Twenty-eight of these niches hold a sequence of images of buddhas, representing the historical Buddha Gautama and his twenty-seven predecessors in the distant past. In a panel below each buddha of the past appears a small-scale figure who represents the contemporary incarnation of Gautama hearing a prediction regarding future buddhahood. For instance, the Buddha Dipankara informed the hermit Sumedha that he would become a buddha after innumerable eons. From the darkened ambulatory, the visitor enters the sanctuary, in height nearly double that of the ambulatory; it has small clerestory windows through which, under the right conditions, light falls upon the head of the tall standing central Buddha image, with magical effect.

A passage found in Sanskrit *avadāna* texts describes a miracle of the Buddha: the Buddha smiles, rays of light emerge from his eyeteeth, ascend to the higher heavens and descend to the earth, and then return to the Buddha’s mouth. This passage is found also in an inscription of the reigning Burmese king, Kyanzittha (1084–1111). The Buddha smiled because he was about to predict to his disciple Ānanda the reign of Kyanzittha himself. Therefore the visitor to the Nagayon, having pondered the giving of predictions

in the sculptures of the ambulatory, enters the sanctuary to find dramatically re-created the Buddha's smile, the miracle of the light rays, and, it is implied, a prediction.

**WAT PHRA CHETTUPHON.** The Holy Chettuphon Monastery, which occupies an extensive compound adjacent to the royal palace in Bangkok, does not aspire to present the sort of ultimate experiences a pilgrim can find at both Borobudur and the Nagayon. It is, on the other hand, an encyclopedic monastery, constructed in such a way as to encompass all Buddhist thought, as well as history and the learned sciences. Chettuphon is the Thai pronunciation of Jetavana, a compound presented to the Buddha by one of his patrons, where the Buddha spent nineteen rainy seasons. The monastery is commonly known as Wat Pho, a memory of its pre-1791 name, the Bodh-ārāma, "Enlightenment Park." The monastery is divided into two main walled sections, one consisting of dwelling places for the abbot and for hundreds of monks, the other, which will be briefly described here, of dozens of buildings, some commemorative in nature, some for public worship, and some for instruction, all either aligned or hierarchically arranged. Nearly all the structures in the monastery were constructed in the course of building campaigns by two monarchs, Rama I (r. 1782–1809) and Rama III (r. 1824–1851).

The primary structure is the *uposatha* (sabbath) hall (in Thai, the *bōt*), a massive rectangular building (the exterior measures 51 by 29 meters; the interior, 31 by 19 meters) entered from the east, and housing a large image of the Buddha at the western end. A *bōt* is a structure necessarily surrounded by a set of eight ritual boundary stones (*sīmā*) that permanently set aside a sacred space. Only in the *bōt* may the monks recite the 227 rules of the discipline, which they must do twice a month, and only in the *bōt* may ordinations be held.

Second in importance to the *bōt* is a group of four stupas to the west, uncharacteristically set slightly askew from the *bōt* axis but still positioned in such a way that the worshiper in the *bōt* who pays homage to the main image is also honoring the stupas that lie beyond. The main stupa holds the remains of a Buddha image dedicated in 1503 at the principal royal monastery in the former capital of Ayutthaya (abandoned in 1767 following a war with Burma); the three other stupas commemorate kings Rama II, III, and IV. Further west stands the library.

Themes of royal commemoration and of the heritage of the former capital of Ayutthaya (1351–1767) number among the many layers of meaning at Wat Phra Chettuphon. Rama I's ashes were installed by Rama IV under the pedestal of the main image in the *bōt*. Encircling the outer wall of the *bōt* are 152 marble narrative relief panels depicting the Indian epic the *Rāmāyana*, beginning with the abduction of Prince Rāma's beloved Sītā by the demon king and ending with some of the victory battles by Rāma's forces in Lanka. These reliefs spread the message that righteous kings make Buddhist monasticism possible, and they may also have had

an esoteric content, alluding to stages of meditation. (They also reinforced the monastery's position as a center of learning and literary culture in the reign of Rama III.) The image placed inside the main stupa is not the only old image at Wat Phra Chettuphon; in fact, in the primary and secondary galleries that surround the *bōt* there are rows of hundreds of bronze seated buddha images brought from Ayutthaya and cities further north by Rama I.

Other layers of meaning involve specifically Buddhist messages. Easily explicable systematic intent is found in at least some of the four *vihāra* (Thai, *wihān*; image hall) that surround the *bōt* and are connected by the primary and secondary galleries. The main image in the northern *wihān*, for instance, shows the Buddha seated in a forest as an elephant and a monkey bring him offerings, while the original murals and inscriptions were devoted to the thirteen ascetic practices, solitary forest pursuits that contrast with the communal activities of the urban monastery, which are apparently connoted in the southern *wihān*. The western *wihān*, lying between the *bōt* and the stupas, originally held murals depicting the stories of the Buddha's hair relic and of his footprints—that is, of the tangible legacies he bequeathed. The subject matter of these murals is out of the ordinary; in the most common schemes, as found in image halls, the Buddha's defeat of the army of the devil is depicted on the eastern (or entrance) wall, Buddhist cosmology on the western wall (behind the principal image), and the life of the Buddha or the stories of the last ten of his previous existences on the side walls.

Wat Phra Chettuphon, unlike Borobudur or the Nagayon, provides no single climactic experience. It has been argued, however (by Chot Kanlayanamit, a twentieth-century traditional Thai architect), that the ornamental elements of Thai image halls and stupas are characterized by quietude, lightness, and levitation, three qualities that themselves convey the character of Buddhist meditation and spiritual ascent.

**HISTORICAL OVERVIEW.** The history of Buddhist temples in Southeast Asia can to some degree be reduced to the history of elements mentioned so far: the stupa, the sanctuary, and the image hall, which may or may not also be an *uposatha* hall. Additional elements include the library and dwelling places for monks. The history is greatly complicated, however, by variations and changes in the relative importance of these elements and by the fact that for the earlier periods no evidence survives of wooden structures, either free-standing or erected upon brick platforms.

In Java, aside from the exceptional Borobudur, stone sanctuaries dominate surviving temple sites. In Central Java, sanctuaries, including single-chambered, triple-chambered, and cruciform types, held various configurations of buddhas and *bodhisattvas*. During the East Javanese period, stone sanctuaries accommodated deities seen as participating in a Buddhist-Hindu syncretism, and they frequently bore narrative relief sculptures on the exterior, illustrating Javanese

texts. The situation in classical Cambodia was somewhat similar; in form, Buddhist sanctuaries were indistinguishable from Hindu ones until the construction at Angkor of the Bayon (c. 1200), which has giant faces on its towers. Scholars still debate the original meaning of these faces, but traditional Cambodian thought connects them with the Brahmā gods of the higher levels of the Buddhist cosmos.

In Pagan, Burma (eleventh to thirteenth centuries and later), many of the temples have configurations similar to the one seen at the Nagayon. The much larger Ananda (c. 1100) takes the form of four Nagayon-like temples back-to-back, emanating from a solid brick core. Sculptures depicting the life of the Buddha are placed in niches in interior corridors, where the play of light has a role somewhat like that found at the Nagayon. The exterior is encircled by glazed terracotta panels at ground level depicting the army of the devil and worshiping gods in a giant reenactment of the events of the night of the Buddha's enlightenment; on the tiered roof, hundreds of panels illustrate the Buddha's previous lives. At Pagan subsequently, the interest in interior light disappeared, and the massive two-storied temple developed. There were also brick monastic dwellings in the city, arranged as cells around a court (as in northern India), as well as giant stupas functioning as focal points for worship. The most important great stupa surviving today in Burma is the Shwedagon in Rangoon, which houses the Buddha's hair relic.

The brick-and-stucco temple traditions of Pagan did not last into modern times. Instead, the characteristic Burmese monastic building, a long rectangular structure raised on stilts, has its roots in the indigenous wooden architecture of Southeast Asia. It has an exterior platform and three main sections, each surmounted with pyramidal roofs: the sanctuary, which is a room beneath a tiered spire (*pyathat*; Skt., *prāsāda*); a multipurpose room, or reception hall; and a store-room. The east-west orientation is the opposite of older (and elsewhere, standard) practice; the sanctuary is at the eastern end, and the Buddha image faces west. In the multipurpose room (20 by 15 meters in some cases), which has a dais of its own for Buddha images, monks gather for chanting in the morning, instruction is given to novices, the public may attend twice-monthly holy day services, and monks and novices sleep on bedrolls stored away during the day. The *uposatha* hall, which generally has a masonry foundation, is called a *thein* (*sīmā*). Since most monasteries lack a *thein*, monks attend a neighboring establishment for services twice a month.

As a rectilinear masonry image hall spacious enough for congregational worship, the *bōt* (*uposatha* hall) at Wat Phra Chettuphon has many antecedents, not only in Thailand but also in Cambodia and Vietnam. What was new at the time of construction was the designation of the principal hall as the *bōt*. In earlier practice, the *bōt* was a secondary structure of more modest dimensions, primarily for the use of monks (and traditionally, in northern Thailand, access was denied to women). Over the past two hundred years, the Wat Phra

Chettuphon pattern has become standard. In the older pattern, the main hall (*wihān*) is the place where the twice monthly holy day services are held; at these, monks chant, lay people may take a vow to follow the behavioral precepts, and a sermon is given. (Ordinarily, older women form the major portion of the audience at these services.) Public services can also be held, however, in a *sālā*, sometimes a wooden building on stilts, sometimes an open-air pavilion.

An early rectilinear hall from the seventh to ninth century was excavated in central Thailand at U Thong. A simple brick platform, 28 by 5 meters, it evidently had a wooden superstructure. A much more elaborate prototype for the independent but aligned structures of later times can be seen at the Buddhist temple site of Dong-duong in Vietnam (c. 900), where an image hall (37 by 15 meters) lies directly in front of other buildings further west, including a sanctuary. The early Sukhothai *wihān* (north-central Thailand) had dimensions more square; the *wihān* at Wat Saphan Hin (late thirteenth century) measures 25 by 20 meters, was hardly raised off the ground, and housed a giant stucco standing Buddha. By the early fifteenth century this type of *wihān* had been replaced by a more longitudinal one with high plinth. In central and north-central Thailand, the principal *wihān* tended to be aligned with a stupa or, frequently, with a tower called a *prāng*, an adaptation of the Cambodian sanctuary tower (but having no enterable sanctuary).

### TEMPLE: DAOIST TEMPLE COMPOUNDS

It is difficult to say what was the first Daoist structure in China or when or where it was built. It seems certain that large Daoist temple complexes were not erected during the age of the philosophers Laozi in the sixth century BCE or Zhuangzi in the fourth to early third century BCE. By the early centuries of the Common Era, Daoist architecture was constructed in China, although even then it may not have been explicitly associated with a codified doctrine or what we today think of as religious practices. The ambiguity is inherent in attempts to define Daoism itself. Certainly Daoist temple compounds are groups of buildings that contain images of identifiable Daoist deities and are backdrops for Daoist rituals and worship. Yet sacred mountains and other elements of the landscape or natural settings, with little or no architecture, may provide equally fervent settings for worship of Daoist deities or may be worshipped themselves. Rustic retreats and grottoes may offer architectural environments for an ascetic's meditation or an alchemist's practice, and they may be structural appendages to more traditional temple compounds.

Although worship of native or popular deities or natural elements or spirits that come to be part of the Daoist pantheon predates the arrival of Buddhism in China in the Han dynasty (206 BCE–220 CE), it was the presence of monumental Buddhist architecture and its imagery that gave the greatest impetus to the Daoist temple compound. After the Han dynasty, the forms and functions of Daoist architecture in China directly reflected the styles and purposes of Chinese Buddhist buildings and the interior images they were designed to house. Male and female Daoist clergy came to be trained and reside in monastic settings. As a result, from the outside, the pillar-supported halls with ceramic tile roofs arranged in lines, the covered arcades that connect and enclose them, and the plaster walls that surround them are usually indistinguishable from those of a Buddhist temple compound. In addition, beyond the main, central image halls are libraries, stele pavilions, dining halls, dormitories, and shrines and tombs to lay leaders and reknowned transcendents associated with the temple compound, features also found in a Buddhist monastic setting. Occasionally, a temple compound includes halls for both Buddhist and Daoist worship.

The name is one of the first clues that a temple compound is Daoist. Among religious architecture in China, two suffixes almost invariably define Daoist structures. The first is *guan*, often translated as "abbey." *Guan* is the third character in the name of Beijing's most famous Daoist temple compound, Baiyun guan (White Cloud Abbey). A Daoist temple compound of higher status takes *gong*, a term borrowed from imperial architecture and meaning "palace," as its last character. Yongle Gong, the Palace of Eternal Joy, is Daoism's most famous *gong*. Both *guan* and *gong* are basically equivalent to the Buddhist *si* (monastery or temple compound). Other terms are shared with Buddhist and Confucian temple architecture in China. *Miao*, for example, is an individual temple in either a Buddhist or a Daoist temple compound, but *miao* is also used to refer to a Confucian temple compound (Kong-[zi]miao). *An* can be both a Daoist or Buddhist nunnery or, when it refers to a small religious complex, it may be translated as "hermitage." *Ci*, or "shrine," is a veneration temple and may be part of a larger Buddhist, Daoist, or Confucian compound, or it can refer to the compound itself, such as Jinci, the Daoist Jin Shrine complex.

In all likelihood, Daoist masters conducted ceremonies and rituals in temple compounds in the Han dynasty, but no archaeological evidence of them has been found. The best architectural evidence of Daoist practice in the early centuries of the Common Era survives in Sichuan and a few regions of adjacent provinces. Cliff tombs, particularly in Pengshan and Leshan, both in Sichuan province, are replete with images in relief sculpture of one of early Daoism's most popular deities, the Queen Mother of the West, said to be capable of bestowing the elixir of immortality. Textual records inform us that Daoist rites took place in *zhi*—a term borrowed from the secular tradition in which it means a place where governing occurs—and in *jingshi*, or "chambers of quietude." Other terms, *dong* (caves or grottoes), *dongtian* (literally, "cavern heavens"), and *fudi* (blessed plots), are also found in historical texts and religious writings, but none is described. The assumption that Daoist temple compounds existed is based primarily on the large numbers of their Buddhist counterparts—1,367, in the capital city Luoyang at the end of the fifth century—and countless cave-temples in cities and at pilgrimage sites in the centuries following Han.

Only by the Sui-Tang period (581–907) is it certain that Daoist temple compounds were present in China's cities and the countryside. The capital city of Sui and Tang—Daxing, and then Chang'an—housed ten Daoist abbeys at the end of the sixth century and sixteen in the middle of the eighth century. At least four Daoist temple compounds stood within the walls of Tang Chang'an's two palace complexes. Both the Great Ultimate palace complex and the Great Luminous palace complex had a hall dedicated to the Three Purities, Daoism's most popular trinity, and auxiliary structures. In 741, Tang emperor Xuanzong (Minghuang) (r. 712–756), established a temple (*miao*) to Laozi in Chang'an, in the secondary capital Luoyang, and in each pre-

fectural capital. Later the same year, he built a hall for the worship of Laozi in his Flourishing Celebration palace complex. Following this precedent, even the non-Chinese ruler Abaoji (r. 907–926), whose successor would found the Liao dynasty (947–1125), built at least one Daoist abbey in his first capital in Inner Mongolia. Under the non-Chinese dynasty Jin (1115–1234), important construction took place at Tianchang Abbey (today White Cloud Abbey in Beijing), where building had begun during the Tang dynasty. The oldest extant wooden building from a Daoist temple complex survives at Five Dragons Temple in Ruicheng, Shanxi province. It is dated by inscription to the year 831.

More than a dozen buildings from the eleventh through thirteenth centuries, a period of syncretism among the three faiths, survive at Daoist temple compounds. Premier among them is Sage Mother Hall at the Jin Shrines in Taiyuan, Shanxi province, built between 1023 and 1032. Today a complex of more than thirty buildings, in the Zhou dynasty (1150–256 BCE) a shrine to Prince Shu Yu, son of Zhou King Wu, stood there. The shrine to Shu Yu's mother, the Sage Mother, is marked by beams that span eight rafter lengths (the greatest span of the period), gilt dragons that wind around the front columns, and a fish pond covered by a cruciform bridge in front. All are examples of the most eminent building standards of eleventh-century China. Although clearly having ties to China's imperial tradition, the Daoist context is underscored by the worshippers who come to the shrine to pray for help from the Sage Mother and to pray for rain from the nearby springs. Further associations between the shrines and Daoism are the presence of grottoes to Laozi, the Three Purities, the Three Heavens, and Yellow Emperor; shrines to the Three Purities, the Eastern Peak, Three Sages, and Lu Ban, the Chinese patron deity-hero of architects; pavilions to the Daoist immortal Lü Dongbin, the Three Officials, and Zhenwu, the Supreme Emperor of Dark Heaven; temples (*miao*) to the god of wealth, Dragon King, spirits of the mountains, god of war, and god of the earth; and a palace complex to the god of literature.

The Temple to the Earth God (Houtumiao) in Wanrong, Shanxi province, focused on a Daoist deity but heavily patronized by the imperial family, was a similar temple compound of the Song dynasty (960–1279). Built in 1006 but destroyed by flood waters in the sixteenth century, its nine-bay, multistoried main hall, the central focus of five courtyards of architecture, is believed to have resembled an imperial palace of Song times. Its plan is believed to have been nearly identical to that of the Daoist Temple to the Earth God compound in Dengfeng, Shanxi, that survives in a post-Song version. Halls to the Three Purities, dated 1016 and 1176, stand at abbeys known as Xuanmiaoquan in Putian, Fujian province, and Suzhou, Jiangsu province, respectively. Both possessing the broadly sloping roof eaves of southeastern Chinese buildings of the Song dynasty, the former is today a middle school and the latter a tourist site. Jade Emperor Temple and Two Immortals Abbey are also among the

Daoist temple compounds in Shanxi province where both architecture and sculpture survive in their eleventh- and twelfth-century forms. Two Song emperors were intimately involved with Daoism and Daoist construction. Zhenzong (r. 998–1023) ordered the construction of Abbeys to Celebrate the Heavens (Tianqingguan) throughout his empire. The equally prolific patron Huizong (r. 1101–1125) had Genyue (Northeast Peak), an artificial Daoist paradise of mountains, streams, and landmasses, built at his capital city, in addition to numerous Daoist temple complexes there and throughout China. More than thirty Daoist temple complexes were built in the Southern Song (1127–1279) capital city, today Hangzhou.

Several of China's most important premodern buildings remain at Daoist monasteries from the period of Mongolian rule (1267–1368). Three superlative halls and a gate stand at the Yongle Palace in southern Shanxi, a building complex dedicated to the popular twelfth- and thirteenth-century Daoist sect, Quanzhen. Paintings of the Three Purities and their entourages, the immortal Lü Dongbin, and the twelfth-century founder of Quanzhen Daoism, Wang Zhe (1113–1170), cover the interior walls of the three main halls, making this site the largest repository of Daoist painting in China. An even more splendid building, the Hall of Virtuous Tranquility, was built by imperial order at the Temple to the Northern Peak in Quyang, Hebei province, in 1270. Its white marble approach and balustrade, as well as its roof eaves and bracketing, are believed to be the closest extant examples of China's imperial building tradition of the thirteenth century. The Temple to the Water God, alternately known as the Dragon King, is an example of humbler Daoist architecture but with equally extraordinary murals. Among them are paintings of the Dragon King and his court and an itinerant dramatic troop that performed there in the fourteenth century.

Post-fourteenth-century Daoist temple complexes survive in every city and town of China today and across the Chinese countryside. Some of the most impressive Daoist temple compounds are on sacred peaks, among which Mount Tai and Mount Wudang are probably the most famous. Located in Shantung province, Taishan, the Eastern Peak, was considered the abode of life-giving forces, including those that controlled the fate of the Chinese emperor, as well as the site to which dead souls return. In imperial times more than 250 temple compounds stood on the mountain, with Dai Temple, dedicated to the god of the mountain itself, the most austere. Inside Dai Temple, the god of Mount Tai is enthroned in the yellow robes of a Chinese emperor, and the emperor's journey from his capital to Taishan is painted on the interior walls. Wudangshan, in Hubei province, is where Daoists believed Zhenwu, the Perfected Warrior, attained immortality. Because the Yongle emperor (r. 1403–1424) believed Zhenwu had come north to help him attain the Chinese throne from his uncle, he patronized enormous temple complexes across the mountain. With

time, many of the palaces and abbeys have burned or otherwise been destroyed, including the Golden Hall. Many consider the Purple Empyrean Palace, dedicated to the Jade Emperor, whose buildings rise step by step along the ascent to the top of the peak, the most dramatic temple complex on Mount Wudang.

Among urban temple compounds, Azure Ox (Qingyang) Palace in Chengdu, Sichuan province, is exemplary. Founded at the site where Laozi is said to have transcended to immortality, the Tang emperor Xuanzong stopped there to worship Laozi in 751. In addition to Laozi, civil and military officials, the Eight Daoist Immortals, the Three Purities, and Tang rulers are all focal deities in Azure Ox Palace's halls. The recipient of several later imperial visits, the temple compound was destroyed and rebuilt in every successive dynasty.

Today, Daoist temple compounds are especially active in Taiwan. The Pointing Southward Palace (Zhinangong), dedicated to Lü Dongbin and Quanzhen Daoism, floats on a mountain above the village of Mucha. Yet in spite of the large numbers of Daoist temple compounds throughout China, individually they are more reflective of the architectural concerns of their times of origin and locations than specifically Daoist features. Except for the occasional placement of images such as the Three Purities on a roof ridge, little of the exterior marks a temple compound as Daoist. Only upon entering its halls and identifying deities such as the Three Purities, the Perfected Warrior, Jade Emperor and his entourage, Eight Immortals, or Dragon King can one be certain of the Daoist affiliation of a temple compound that in most ways blends into the framework of traditional Chinese architectural space.

NANCY SHATZMAN STEINHARDT (1987 AND 2005)

#### TEMPLE: CONFUCIAN TEMPLE COMPOUNDS

The architecture of Confucianism is built in honor of men. It is dedicated to Confucius (551–479 BCE), sage, moral leader, and philosopher of the ancient state of Lü in Shandong province, or his disciples and their teachings. Confucian monuments are distinct from other Chinese religious structures in their avoidance of images. Images may be enshrined in a Confucian temple, and over time, the influence of other religions in which deities are worshiped has led to limited use of Confucian statues as icons. In the purest form of the religion, however, tablets on which the name of the Confucian is inscribed serve as the focus of veneration and Confucius, his relatives, or other Confucians are honored by a visit to the site or by participation in a ceremony. Confucian temple compounds can be dedicated to civil (in contrast to military) officials in general, as well as to individual paragons of moral or state virtue.

During his lifetime, Confucius (Kongzi [Master Kong] or Kong Qiu [family name Kong, personal name Qiu] in Chinese) established a school for the teaching of his principles of good government in Qufu, capital of his home state of Lü. In 478 BCE, a year after his death, disciples built a temple in Qufu to honor their teacher. The few records about this temple inform us that it was a three-part structure containing Confucius's clothes, instruments, carriage, and books. For the next 2,500 years, Qufu would be the location of many of China's most important Confucian temple compounds. Even today, it is difficult to walk down a street of Qufu without coming upon architecture dedicated to Confucius or his disciples, or commemorating an important spot in Confucian history.

By traditional Chinese calculation, Qufu traces its association with the principles of Confucianism to the so-called Yellow Emperor who lived in the twenty-seventh century BCE. Legend records that the Yellow Emperor was born about four kilometers east of Qufu. In the twenty-sixth century BCE, the son of the Yellow Emperor made Qufu his capital. In the twelfth century BCE, the duke of Zhou, brother of the emperor and the highest-ranking state official, was considered a paragon of governance by moral virtue. His principles of good government were highly regarded by Confucius. A temple dedicated to the duke of Zhou has stood in Qufu since the first millennium BCE.

In the second century BCE, the Chinese emperor offered animal sacrifices at the temple built by Confucius's disciples

when passing through the state of Lü. The following century, the emperor conferred posthumous titles on Confucius. In the second century CE, the relation between emperor and temple was further strengthened when government officials were appointed to maintain it.

By the Tang dynasty (618–907), imperial rites were conducted at a memorial service for Confucius. This extraordinary reverence for someone who was not a member of the imperial family was unprecedented in Chinese history. Beginning in the late fourteenth century, after the Mongol regime fell and China was returned to native hands, memorial services to Confucius were conducted biannually at Qufu's Confucian temple compound. As had been the case in ancient times, the fortunes of the empire were linked to recognition of the ideal relation between ruler and subject described in Confucian texts. Thus until the rule of the Manchus beginning in the mid-seventeenth century, a Confucian temple could be erected only through explicit imperial decree. During the Manchu (Qing) dynasty (1644–1911), temples honoring Confucius, his teachings, and civil officials came to be built in every province and in most major cities.

The first statue of Confucius is said to have been placed in a hall of the Qufu temple compound during repairs of 539. The date is logical, for the sixth century in China was one of widespread patronage of Buddhist architecture and its accompanying imagery. Still, until the ninth century the Confucian Temple was modest in comparison to Buddhist temple compounds or the emperor's palace. The ninth-century temple complex in Qufu consisted of a front gate, main hall, two side halls, and a residential hall behind them.

The most major changes in the status of the temple compound in Qufu were coincident with the further elevated status of the Kong family in the Song dynasty (960–1279). Already in the first century BCE, a descendant of Confucius had received the title of marquis and a fief at Qufu. In 1055, amid a wave of renewed interest in Confucius's writings known as neo-Confucianism, the emperor enfeoffed a forty-sixth-generation descendant of Confucius as the duke of Yansheng and awarded him and his descendants fourteen hectares of land. Like honors bestowed on the temple, this hereditary succession of a duke has no parallel in Chinese history. Before the end of the Song dynasty, the Confucian temple compound consisted of three courtyards of buildings enclosed by a covered arcade of 316 bays.

In premodern times, the main south gate of the temple was the south gate of the city of Qufu. The temple complex today consists of nine courtyards of architecture. Among them are three main halls, one main pavilion, an altar, three shrines, two side halls, two minor halls, and two studies, for a total of 446 bays of buildings. Stretching more than a kilometer from south to north, the space is punctuated by fifty-two archways. The names of structures often are references to Confucius or Confucian writings. Striking Metal and Vibrating Jade Gate, built in 1538, recalls a line in Mencius's writings comparing the completion of a musical performance

to the view that Confucius's thought is a summation of all philosophies of sages that came before him. The Gate of the Great Mean, in the fourth courtyard and surviving in its Qing dynasty form, is named for the Confucian text, *Doctrine of the Mean*. Lingxing Gate is a reference to a star in the constellation Ursa Major and thus a symbol that Confucius was a star who had come down to earth. Other gates are named Augmenting Truth and Harmony of the Written Language.

The two most impressive halls of the Confucian temple compound in Qufu stand near the center of the main building axis. Star of Literature Pavilion, a name intended to link Confucius with the constellation of the god of literature. The 23-meter high, multistory library with three sets of roof eaves towers above the rest of the temple compound in the fifth courtyard. When the emperor visited Qufu, he fasted and bathed in courtyards east and west of Star of Literature Pavilion in preparation for sacrifices to honor the sage. Behind Star of Literature Pavilion is a wide courtyard with thirteen stele pavilions arranged in two rows. They were built to house fifty-three tablets presented to the temple compound by emperors from each period from Tang through Qing.

The second focal building, Dacheng (Great Achievement) Hall, dominates the seventh courtyard. Measuring 45.8 by 24.9 meters at the base and 24.8 meters in height, the size, double set of yellow ceramic tile roof eaves, and dragons entwined on the front columns compare only with the Hall of Great Harmony of the Beijing Forbidden City or the Hall of Heavenly Favors at the tomb of the first Ming emperor. East of the Great Achievement Hall courtyard is a building where offerings were made to five generations of Confucius's ancestors; to the west is a hall for paying homage to Confucius's parents. Also in this courtyard is the Apricot Altar, erected in 1018 at a spot where Confucius is said to have taught.

Directly behind the Great Achievement courtyard is a smaller but similar building dedicated to Confucius's wife Qiguan. At one time she was revered together with her husband in the same building, but in 1018 a Song emperor erected a separate shrine for her. The position of the husband's hall in front of his wife's follows the pattern for imperial residential architecture in the Forbidden City. The focus of the last courtyard is the Hall of Relics of the Sage. It contains 120 stone stelae depicting events in Confucius's life.

From the exterior, the individual buildings and their arrangement around courtyards are difficult to distinguish from the architecture of other prominent imperial and religious complexes. Names of gates and halls, the prevalence of tablets with names of those revered in contrast to statues, and associations with literate Chinese culture or remembered events are signs that the temple compound is Confucian. An unobtrusive wall, for example, is a revered spot because in the third century BCE when the ninth generation of Confucius's descendants lived in Qufu, books were hidden inside

the wall when troops of the First Emperor came to the city to burn classical writings.

In one important way, architecture of the Qufu Confucian temple is unique. Since the ninth-generation descendants of Confucius, the temple has been adjacent to the mansion of the Kong family. Descendants of Confucius resided in the mansion for seventy-seven generations, until the founding of the People's Republic of China. Through the centuries, the rank and influence of the chief resident of the Kong family mansion rose to the equivalent of prime minister. He was the leader of all *wen*, or civil officials, and was allowed to ride his horse inside the Forbidden City. He owned tax-exempt "sacred fields" from which income was used in Confucian ceremonies. He was even allowed to sell official titles.

Confucius's tomb and those of his parents are also in Qufu. So is the academy where Confucius taught and temples to Confucius's disciples Mencius, Yanzi, and Zengzi. Mencius's residence and tomb, and his parents' tomb, are there as well.

The most famous Confucian temple compound outside Qufu is in Beijing. One of the few Confucian temples constructed during the period of Mongolian rule in China, in the late thirteenth century, the majority of buildings date from the Qing dynasty. A stone tablet at the entrance orders civil and military officials to descend from their horses or sedan chairs as a sign of respect for the sage. Consisting of two parallel building lines, passage through the central gate was a privilege allowed only to the Chinese emperor. The eastern side of the compound is occupied by six successive courtyards, the back two parallel, which contain a shrine to Confucius; tablets recounting the 700-year history of scholars who achieved success in the national exams; the Great Achievement Gate; the multi-roofed Great Achievement Hall containing a central wooden tablet whose Chinese and Manchu inscriptions glorify Confucius, a pair of flanking tablets on either side of it dedicated to Confucius's four most important disciples, and eight more tablets for less eminent sages lower and behind them; the Hall for Reverence to Confucius's Ancestors with tablets for members of five generations who preceded him; a library; and a shrine to officials. The western sector has only three courtyards, all focused on the central one that houses the imperial academy. Built by the Mongols for the education of imperial and other select children, in the eighteenth century the structure was rebuilt and named Biyong Palace to recall the name of the place where princes and official sons were educated in the Chinese capital at the time of Confucius. The multi-eaved, elevated structure is enclosed by a circular moat and further surrounded by a marble balustrade, following the pattern of the imperial academy in Confucius's day and of the Temple to Heaven complex where the emperor performed annual sacrifices in the name of the state in Ming and Qing times. Originally all structures had gray roof tiles but they were replaced with golden ones in the eighteenth century.

Today, some of the most active Confucian temple compounds are in Taiwan. The best-known one is in the capital, Taipei, but two others have older buildings of greater architectural importance. The Confucian temple compound in the southern city of Tainan was built by the son of Zheng Chenggong (Koxinga, 1624–1662), a Japanese-born, anti-Manchu commander who retreated to the southern island after the Manchus overthrew the Ming dynasty in 1644 and who subsequently led the resistance that chased the Dutch away in 1661. Its most important building, Great Achievement Hall, contains a wooden tablet honoring Confucius and sixteen tablets dedicated to famous sages. The Confucian Temple in Zhanghua, in central Taiwan, first built in 1716, was carefully restored in the 1970s and is today a premier example of eighteenth-century southeastern Chinese architecture.

The most important event at a Confucian temple is the celebration of Confucius's birthday, which usually occurs on September 28. Wearing the costumes of civil officials, attendants carrying ax-shaped weapons, fans, umbrellas, and instruments in the style of those from Confucius's day perform music and dances.

Confucian temples survive in many other major Chinese cities. Many have been used as schools throughout history and a few are educational institutions today. Some towns have a corresponding temple complex for military officials, or *wu*, the most famous of which is in Yuncheng, Shanxi province.

## TEMPLE: ANCIENT NEAR EASTERN AND MEDITERRANEAN TEMPLES

Modern writers use the term *temple* in different ways. Applied to Near Eastern religion, it refers to a complete architectural complex, including a shrine with the cult statue. Applied to Greek, Etruscan, and Roman architecture, *temple* refers to the equivalent of this shrine, and the whole complex is termed *sanctuary*.

**EGYPT.** Modern scholars have traditionally divided Egyptian temples into several types, according to their functions. The two principal are “divine” temples, the residence of a god or gods, and “mortuary” temples, the place for rituals, offerings, and sacrifices for a deceased king. Ancient Egyptians, however, did not see the functions, plans, symbols, and rituals of their temples quite so separately and distinctly as modern taxonomies would suggest. Thus, “divine” temples could also serve for the worship of the king, while “mortuary” temples were often used for a joint cult of the king and the god. Accordingly, these modern divisions are currently being questioned.

Recent excavations show that the earliest temples date back to the Early Dynastic period (c. 3185–2630 BCE). These temples were still quite simple in their plan, generally consisting of an open court followed by a shrine made of mud-brick, which contained the cult statue. During the Old Kingdom (c. 2630–2160 BCE) stone was introduced as a building material, especially for royal cult complexes. In contrast, shrines for the gods remained modest in scale and materials. During the Middle Kingdom (c. 2040–1650) the state took an unprecedented interest in temples, which were erected for the gods in all the major cult places of Egypt. Stone was regularly used as a building material, and there was a particular emphasis on figural decoration. During that period, the plan that became characteristic of the divine cult complexes of the New Kingdom (c. 1550–1075 BCE) appeared. This is the plan that we now usually associate with the Egyptian temple, mainly because in no other period of Egyptian history has the construction of monumental temples been more intensive than it was during the New Kingdom.

The Egyptian temple of the New Kingdom was set apart from the outside world by a massive enclosure wall made of mud-brick and without decoration. This wall was a boundary between order and disorder; it transformed the temple into a fortress against chaos. Within this enclosure was the pylon (a modern term derived from the ancient Greek word for “gateway”), a monumental entrance built of stone which consisted of a gateway flanked by two towers. This pylon was decorated on the outside with reliefs representing the king hunting or defeating his enemies in battle. Only the king, the priests, and, on some ritual occasions, representative commoners, were admitted beyond this gateway, and then only after having performed a ritual of purification. After the pylon was a large open-air court surrounded by columns. This court led to the most sacred part of the temple, where access was restricted to the king and certain selected priests.

The first room of this part of the temple was the hypostyle hall, an enclosed, basilica-like space whose roof rested on numerous rows of close-set columns. This hall was like a vestibule, which gave access to a series of chambers with different functions. One contained small tables and stands for offerings and sacrifices. Another had the sacred boat of the god, installed atop a platform. One housed the cult statue, closed in a shrine. Because the statue was the very being of god, its shrine was the heart of the temple, the holy of holies. In the inner area of the temple there could be also shrines for divinities associated with the principal god, storerooms for the paraphernalia of ritual, and rooms with administrative purposes.

What is characteristic about this architecture is that rooms and unroofed spaces, which were always rectangular, were disposed in exact sequence according to an axial alignment from the entrance pylon to the inner chambers. The courts were unroofed, though often surrounded by a colonnade; the inner parts were completely roofed and increasingly in shadow. The roof level decreased as the floor level rose. All these solutions enhanced a sense of mystery that culminated in the heart of the temple.

The precise arrangement of this plan varied from temple to temple, with some larger and more complex than others. As time went on, temples could be greatly expanded with additional sections (most frequently, a new pylon, followed by an additional open-air court). This was the result of the desire for personal display of individual kings, who by transforming famous temples reasserted their primary role in Egyptian religion and society. The degree of complexity possible for an Egyptian temple can be illustrated by the Temple of Amun at Karnak, one of the most important, which has been added to and altered over millennia. Elements go back to the Middle Kingdom (presumably obliterating even earlier construction) and extended down to the Ptolemaic and Roman periods (Figure 1 shows a portion of the final arrangement). Complex though it is, in principle it is the same as the smaller temples which share its twenty-five-hectare precinct.

Both texts and images give us an idea about the rituals performed in these temples. The daily ritual consisted in tending the cult statue, which was cleaned and provided with clothes, food, drink, and other offerings. This daily ritual in essence provided the god with the needs of life, which were thought to be the same as those of humans. In theory, it was the king who performed this daily ritual, because he was, in theory, the sole priest; for this reason, only the king is depicted in the wall decorations performing the appropriate actions. In fact, the daily ritual was performed by the priests, the vicars of the sacerdotal power of the king, who thus acted on his behalf. Another ritual that took place in temples, and which was performed on the occasion of many religious festivals, was the procession of the god from the inner part to the open-air court. The cult statue, closed in a shrine, was mounted on a barque borne on the shoulders of the priests, or sometimes carried on a sledge. It was enveloped in incense

and accompanied by dancers, singers, and instrumentalists to the open-air court. Here the god met visiting gods, while the assembled worshipers, including common people, could glimpse the shrine and ask the god within for oracular responses.

**MESOPOTAMIA.** Our knowledge of Mesopotamian temples is seriously limited by the fact that they were built in mud-brick. For this reason, only a few of them have been preserved above the level of the foundations, and none in its entire elevation.

Temples from the fourth millennium BCE have been documented. They could be very large, and they had generally a tripartite plan, consisting of a *cella* (the space that contains the cult statue) at the center and subsidiary rooms off either side. The *cella* included altars and offering-tables, and it could be entered from different sides of the building. Very often, multiple recesses and buttresses were used to add some variety to the exterior (and sometime even to the interior) of the building, by creating contrasts in light and shadow.

In plan, the temples of the third millennium BCE are characterized by their continuity with the preceding period. There was, however, a marked tendency to set them apart from the rest of the settlement. They were constructed on top of high platforms and enclosed with high walls. Sometimes there was an outer enclosure that included, along with the temple and the inner enclosure, other shrines and probably offices for the temple administration. In the inner court around the temple there were stores and workshops: their location gives clues about the part played by temples in the economy of this region. In these temples the gods were believed to be present in their cult statues, which stood in front of a niche at one end of the *cella*. Near the niche were an altar and an offering-table, and along the walls stood the statues of the worshipers, represented with their hands clasped.

Near the end of the third millennium, the habit of setting the temples apart, in a high position, culminated in the placing of some of them at the top level of ziggurats, the most conspicuous landmarks of Mesopotamian towns. Whether all ziggurats had temples at their top level, however, remains unclear, because of the poor state of preservation of these monuments. For the same reason, we know nothing of the architecture of these “high temples”—as in the case of the ziggurat built by Urnammu at Ur, which is generally restored with a single room, but incorrectly so. In the absence of specific texts, it is also difficult to have an idea of the rituals performed in these “high temples,” or to understand what correlation they might have had with the buildings found at the base of the ziggurats in the same sacred enclosure. From Herodotus, the Greek historian of the fifth century BCE, we are informed that in the ziggurat at Babylon one of the rituals was a sacred marriage between a priestess and the god, which took place at night. Yet, this was clearly not the only ritual performed in the temple, but only the one that captured the attention of the historian.

After the fall of Ur, a temple of Ishtar-Kititum was built at Ishchali (nineteenth to the eighteenth century BCE). The large structure (about 100 by 65 meters) stood on a platform and had a rectangular plan articulated around two open courts. Three entrances framed by towers gave access to the interior: two on the south side, leading into the open courts, and one on the east side, in relation to a secondary temple located to the north of the main complex. The main shrine was located at the western end and was elevated with respect to the rest of the temple. This shrine was accessible from the smaller court, and consisted of an ante-*cella*, a broad, shallow *cella* with a niche for the cult statue, and a treasury on the back. This building condensed the previous, Mesopotamian tradition, but it also introduced features that would be characteristic of temples built in Mesopotamia during the Assyrian (c. 1350–612 BCE) and Neo-Babylonian periods (c. 612–539 BCE).

**AEGEAN IN THE BRONZE AGE.** Places set aside for the cult of the divinity can be recognized in the material remains of the Bronze Age, in Crete as well as on the Greek mainland. The Cretans worshiped at shrines of various types. Natural caves were used for the deposit of offerings. The peaks of certain mountains were also sites of sanctuaries—some simply defined by enclosure walls, others given a number of rooms, usually rectangular—in which large stones served as altars. Thick layers of ash show that bonfires were lit, which would have been visible from sanctuary to sanctuary. The use of these sanctuaries ended abruptly, perhaps as a consequence of the cataclysmic eruption of the volcano of Thera in the fifteenth century BCE. Finally, there were sanctuaries in the palaces of the Cretan kings, shrine rooms marked by central pillars, with the symbolic double ax. These rooms were small and shallow, functioning as a focus for offerings rather than for any form of congregational ritual. It is likely that other parts of the palace complexes served ritual functions, including the bull-leaping depicted in Cretan art, but here the interaction of religion and architecture is, at best, uncertain: clearly none of it constitutes a temple in the normal sense.

Sanctuaries on the Greek mainland were probably influenced by Cretan practice. One at Mycenae consisted of a set of small, irregularly shaped rooms containing benches on which offerings could be placed, along with terracotta figurines apparently intended as representations of the deity, a goddess. There was also a mural painting of her. Such shrines are found in the fortified sites close to the walls and gateways; they seem to have had a special role in the protection of the community. The possibility of religious functions in the palaces cannot be excluded.

**GREECE.** There are few remaining traces of religious practice during the Protogeometric period (1050–900 BCE), when cult buildings were generally small. An exception is the large building with apsidal plan surrounded by wooden posts at Lefkandi, in Euboea (1000 BCE). The function of this short-lived building was funerary, for in the main space were buried a warrior, a woman, and a number of horses.

Temples built during the Geometric period (900–700 BCE) were generally modest in scale and simple in plan. The temple of Apollo at Dreros (c. 700), in Crete, consisted of a rectangular room preceded by a shallow porch. In the middle of the *cella* two posts flanked a central hearth, and against the back wall was a bench with three bronze statues, the cult images of Apollo, Leto, and Artemis. What is remarkable about this temple, and other buildings of the same period, is that sacrifices took place inside, near the cult image. The arrangement of the interior with a central hearth flanked by posts is reminiscent of the halls in Mycaean palaces.

In the Orientalizing period (700–600 BCE) temples were monumentalized. Their size was significantly increased, durable materials were introduced, and the *cella* (*naos*) was often surrounded by a row of columns, the peristyle. This feature, according to recent excavations in the temple of Artemis at Ephesus, was introduced in the second half of the eighth century. Most likely, the inspiration came from Egypt, where columns played a prominent role in the design of temples.

The use of stone instead of wood for columns and entablature led to the establishment of distinctive orders. In the Archaic period (600–480 BCE) the Doric order was characteristic of mainland Greece, south Italy, and Sicily, and the Ionic was characteristic of the Aegean and Asia Minor; however, geographical distinctions were not completely rigid, and whether these orders had an ethnic connotation remains a question. During the same period, the erection of monumental temples was particularly intense in Asia Minor and the west. In both areas the Greeks were surrounded by other cultures, and monumental temples might have been a means to reassert the cultural identity of the communities responsible for their erection. Among the temples in Asia Minor, three stand out for their colossal size: the temples of Hera at Samos (c. 560 BCE, rebuilt c. 530 BCE), of Artemis at Ephesus (c. 560–470 BCE), and of Apollo at Didyma (c. 550–520 BCE). These temples were surrounded by two, even three rows of columns, and must have seemed like a forest of stone. The temples at Ephesus and Didyma are also characteristic because their core was not the *cella* with the cult statue, but an open-air court (*sekos*), which at Didyma included the shrine with the cult statue and a spring sacred to Apollo. The most interesting feature of temples built in the Greek West was a special room called the *adytum*, placed at the end of the *cella* and separated from it by a wall with a doorway. This special room apparently served to house the cult statue. The need for this innermost sacred chamber has been explained by the possibility that the rest of the *cella* was regularly used for the performance of collective rituals, but there is no evidence to support this view.

The main monumental temples of the fifth century BCE were built in mainland Greece. One was the temple of Zeus at Olympia (472–456 BCE), and the other was the Parthenon (447–438 BCE), erected along with other religious buildings on the Athenian Acropolis according to a comprehensive site plan.

The Parthenon, dedicated to Athena, is probably the most famous, certainly the most lavishly decorated, but not the largest of Greek temples (see Figure 3). The temple, built upon the remains of an unfinished predecessor destroyed by the Persians in 480 BCE, has seventeen Doric columns on each long side and eight at both short ends, and it measures overall some 31 by 70 meters. It has two rooms, the eastern *cella*, which housed the chryselephantine statue of Athena made by Pheidias, and the western “rear room,” which held the valuable offerings. Between these two rooms and the peristyle there are two shallow porches, the *pronaos* and *optisthodomos*, compressed here to the advantage of the *cella*. The traditional interpretation of the Parthenon as a temple has been recently called into question, for it had very little cult associated with it, and no connection with the major public festivals. However, this building was clearly designed as and regarded as a temple in Classical Antiquity.

During the Late Classical period (400–323 BCE), the building of temples lost much of its appeal in mainland Greece and the Greek West. Only a few were built on a monumental scale, and the majority were reduced in size. Asia Minor is an exception: parallel to a renaissance of the Greek cities of the region there was a revival of Ionic architecture. The Artemision at Ephesus was rebuilt on the same colossal scale as its archaic predecessor. Meanwhile, new cities, such as Priene, strained their energies and economic resources to have temples that would leave a mark on the cityscape.

Temples built during the Hellenistic period (323–31 BCE) were essentially similar to those of the Classical period, though they might have been constructed in regions conquered by Alexander the Great that were not Greek in origin. The more florid Corinthian order was occasionally used. In these areas the traditional, non-Greek religious practice had to be respected. In Egypt, for example, the ruling Macedonian Greek dynasty of the Ptolemies assiduously built temples in the traditional Egyptian manner described above, with only a few innovations.

The Greek temple was the house of the god, because it served to shelter the cult statue. It was not a congregational building, for the congregation (which at the chief festivals of major cults was very large) gathered round the open-air altar for prayers and sacrifices. Like the crowds, the cult statue overlooked these performances at the altar. Temples were normally oriented to face the point at which the sun rose on the day of the festival. Though some cult statues were large and valuable, the rooms in which they stood did not have to be particularly spacious. Even in the largest temples a surprising portion of the total area was taken up by external embellishment. This emphasis on the exterior of temples does not mean that access to them was reserved for a privileged few. Literary evidence suggests that even if specific restrictions existed (based on days, ethnicity, and gender), entry by ordinary people into the *cella* was not unusual, especially for the purpose of praying, which was considered more effective when done before the cult statue. Temples also served as

storerooms for objects, particularly those of value, offered to the gods.

**ETRURIA.** In the beginning, cult practice was performed in the open air. The earliest shrines, dating back to the seventh century BCE, had the same plan as residential houses, and they could also be incorporated into a larger palace. By the end of the seventh century BCE, temples consisted of a simple, rectangular *cella* with the opening on a short side. This new plan was still similar to contemporary domestic architecture. The traditional Etruscan temple was defined in the second half of the sixth century BCE. The building was set on a high podium and was accessible only by flights of steps or ramps on the main front. It had a quadrangular or rectangular plan and was always articulated in two areas: a deep open *pronaos* with two or three rows of widely spaced columns (front), and one or three *cellas*—depending on the number of divinities worshipped—which were generally flanked by outer passages. The rear of the temple was closed, and there was no peristyle on all four sides, as in Greek temples. Again, the houses of the elite provided the model for this plan. Temples were differentiated from residential architecture by their position on top of high podia. For the columns a new order was introduced, called Tuscanic after Vitruvius: the shaft was unfluted, but the capital was similar to the Doric. The elevation of these temples looked sturdy to later, Roman writers, and this impression was certainly suggested by the short columns, the wide eaves of the roof, and the heavy external terracotta decoration. Ancient literary sources link the definition of the Etruscan temple with the monumentalization of Rome under the rule of the Etruscan family of the Tarquinii. In fact, the largest Etruscan temple known to us is the three-*cella* temple dedicated in 509 BCE, under Tarquinius Superbus, to the triad Jupiter Optimus Maximus, Juno, and Minerva on the Capitoline Hill in Rome. Other monumental temples were built in Etruria between the end of the sixth and the beginning of fifth century BCE, and they all conformed to the same basic type. The same can be said of temples built in the first half of the fifth century BCE, when the erection of temples was most intense in the history of Etruscan cities, and of temples built or rebuilt during the fourth century BCE.

What is characteristic of the Etruscan temple is the deep *pronaos*, the podium, and the great emphasis on the front. This strict frontality also dictated the axial planning of the areas and altars in front of the temples, and would remain characteristic of Roman religious architecture. Most likely, this disposition, as well as the orientation of the temples—generally to the south—strongly depended on cult practice and religious beliefs. We know that the Etruscans had rules for the placing of altars and sacred areas, and that the augurs played a significant role. This might have also been the case for the temple. The *cella* of the Etruscan temple housed the cult statue of the god, and most likely, in this culture, as in Greece and in the ancient Near East, the temple served as his or her house. However, in consideration of the positioning of the temple on a high podium, and of the restriction

of the access to the stairs on the front, admission to the temple must have been very limited, unlike in Greek temples.

**ROME.** Roman temples inherited the strictly frontal emphasis and high bases of Etruscan temples. Early Roman temples were built in the Etruscan manner, but little survives from this period. It is unlikely, however, that there were any significant improvements in design or construction before the Second Punic War at the end of the third century BCE, when the first temples made entirely of stone were erected. Thereafter, Rome was increasingly involved in the affairs of the Hellenistic East, and Roman buildings were influenced by Hellenistic forms, particularly the Corinthian order, though temples still retained the essential Etruscan arrangement with high bases and steps only at the facade. Plans were conservative, with columns across the facade only, or, if extended along the sides, terminating in front of a wall across the back. Occasionally the Romans adopted the full surrounding colonnades of Greek temples. Although temples were commissioned by a variety of individuals during the republic, under the empire, patronage was mainly under the imperial family. Under Augustus and the Julio-Claudian emperors (27 BCE–68 CE), temples in Rome changed their appearance. Marbles of various types were introduced for the internal and external decoration, and the Corinthian order became canonical for both columns and entablature. In the years immediately after the Julio-Claudian dynasty, temples did not play a primary role in the general layout of sanctuaries, and were also scaled down. However, a revival of temple architecture took place in the period at the end of the second and the beginning of the third century CE. To this period date major enterprises in the city of Rome, such as the Pantheon (see below); the construction of many new temples in North Africa, such as the one in the honor of the Severan family in Leptis Magna (216 CE); and, finally, the completion of ambitious projects in the Roman East, such as the sanctuary at Baalbek (see below). By contrast, between the second half of the third and the beginning of the fourth century CE, the temple endured a crisis that culminated with the erection of the new Christian basilicas during the Constantinian period (306–337 CE).

In essence, the Roman temple functioned like the Greek as the house of the god and the storeroom of his or her offerings. It could also serve for the cult of the emperor and his family. Burnt sacrifices were made at an altar, which was usually placed immediately in front of the temple at the bottom of the steps so that worshipers faced the altar (and the temple) rather than surrounding it. Where possible, the temple stood in a colonnaded precinct, which also emphasized the axial symmetry. Roman temples, however, showed greater concern than the Greek for the use of the *cella* as a room. The Roman *cella* often occupied a greater portion of the total area, was wider, and was invariably freed from encumbering internal supports for the roof, a consequence of better carpentry techniques and the availability of better timber. This enhancement of the *cella* does not signify congregational use in the full sense, but the temples were certainly used for gath-

erings, which might have been political rather than fully religious in character—meetings of the senate, for example.

These developments culminated in the best preserved of all Roman temples, the Pantheon in Rome, built by the emperor Hadrian (117–138 CE) to replace an earlier building of Augustus' time (see Figure 4). Dedicated to all the gods, it is circular rather than rectangular. It had a conventional precinct and porch, but the *cella*, 150 Roman feet in diameter, was roofed with a concrete dome. Light was admitted, for deliberate effect, through an opening in the center of the dome.

In the provinces of the empire, temples sponsored by the authorities usually imitated those of Rome. They most often employed local building techniques and, usually, local materials, but they were essentially similar to Roman prototypes. Local tradition, however, often influenced form. This is very clear in Egypt, where Egyptian-style temples were still being built under the Romans. In Greece and part of the east the relationship was different, because Roman temples themselves were already influenced by Greek form and served similar religious concepts. Here the local tradition was architectural rather than religious, and was not insisted upon. Roman temples on high bases were built, some distinctly frontal, but there was a more ready tendency towards fully colonnaded arrangements, when money was available. The Roman East was wealthy—Asia Minor and Syria in particular—and some temples of the Roman period were quite splendid. The major Greek cities were already well provided for—Artemis of Ephesus (Diana of the Ephesians) still had the temple last rebuilt for her in the fourth century BCE—and new building was mostly concerned with the political cult of Rome and with individual emperors (Trajan, for example, at Pergamum). Pergamum also possesses, in the sanctuary of Asklepios patronized by the emperor Caracalla, a unique example of a temple based on the Pantheon at Rome.

The most splendid of these temples in the Roman East is that dedicated to Jupiter at Heliopolis, the Roman military colony at Baalbek in Lebanon. A huge temple stands on a high podium in the Roman tradition. On the podium is a Greek-type stepped base. The surrounding Corinthian colonnade is arranged in the East Greek (Ionic) manner with a wider central spacing at each end. In the *cella* (now ruined) was a shrine structure with a cult crypt underneath (better preserved in the neighboring so-called Temple of Bacchus) serving local religious ritual. Outside was a tall tower altar of eastern type. Eastern influences can be detected in the architectural decoration, such as Persian-style bulls on the frieze. Finally, the temple was given a precinct (never completed) and forecourt with a gateway building flanked by towers which derives from local, not Roman, concepts.

## TEMPLE: MESOAMERICAN TEMPLES

The most common form of sanctuary in Mesoamerica is the temple-pyramid-plaza, that is, the peculiar combination of an elevated foundation, almost always artificially built, with a temple on the upper platform. Usually adjoining this unit at the base of the access staircase is a series of open spaces (plaza, esplanade, altar platform). This basic combination was perpetuated for over twenty-five centuries, with several constants that gave it relative coherence within an extremely varied panorama and allowed it to be integrated into larger and more complex architectural clusters.

**STRUCTURES.** The embryonic form of this temple combination can be found in the principal mounds built from compressed soil or from *adobe* (sun-dried brick) by the Olmec in areas around the Gulf of Mexico, such as San Lorenzo (in the present-day Mexican state of Veracruz) and La Venta (in Tabasco) between 1200 and 900 BCE. Associated with a thrust toward monumentality that reflected the cultural vigor in Mesoamerica at the end of the Preclassic period (600 BCE–200 CE), the temple-pyramid-plaza soon spread to other

regions. Thus, in the central plateau of Mexico we find, as antecedents to the Pyramids of the Sun and the Moon in Teotihuacan, the large, elongated mounds of Totimehuacan (Puebla) and the superimposed circular platforms (150 meters in diameter) in Cuicuilco, in the southeast corner of the Valley of Mexico. In the northern part of Petén (Guatemala), in the heart of the Maya area, the massive pyramids of El Mirador, with their apexes emerging from the dense forest, foreshadow the great Maya temples of Tikal in the same region.

Together with this tendency toward monumental building there was a great preoccupation with architectural permanence. This concern was reflected in the emergence of large retaining walls for the compressed fill of earth and rubble. These walls constituted the solid nucleus of the pyramid, and their taluses tended to follow the natural sloping angle of the fill. The access staircase, generally the only one placed on the axis of the temple, was initially incorporated into the general mass of the pyramid itself. With the passing of time it tended to project outward, frequently bordered by two *alfardas*, or flat ramps, which in turn often projected slightly beyond the steps or, according to local or regional style, assumed more complex shapes. In the same manner, the sides of the pyramid could be decorated with large masks or other sculptures or ornamented rhythmically with moldings, notably variations on the talus panel (*tablero-talud* or *talud-tablero*, a panel, or *tablero*, usually framed with moldings, that projected from the slope). These architectural elements, together with the proportions, divisions, and other formal characteristics of the foundation, define the principal masses of the structure and highlight their respective horizontal or vertical features.

Finally, the temple itself, which usually occupies the upper platform of the pyramid, evolved from a simple hut to a more elaborate building made of masonry. Depending on the region, it was covered with a flat roof supported by wooden timbers and surrounded by low parapets or, as can be observed among the Maya, with vaulting made up of different types of projecting (corbeled) arches. Various types of panels, moldings, and sculptures enrich the temple silhouettes, which could be crowned with more or less massive roof combs, as in the case of Classical Maya architecture, or with sculptured finials distributed at regular intervals on the outside perimeter of the parapet in the style of a battlement. Such finials can be observed in the architectural tradition of Mexico's central plateau from the period of Teotihuacán until the Spanish conquest.

**INTERPRETATIONS.** From the Spanish chroniclers of the sixteenth century we learn that in spite of the staircases, which were usually wide and well proportioned in relation to the whole (and independent of the scale, large or small, of the rooms inside), the sanctuary that usually topped each pyramid for the most part remained closed to the common mortal. This observation seems to indicate that, at least in its community aspects, worship was conducted outdoors, either

on the upper platform of the pyramid in front of the main entrance to the sanctuary or, if there was one, on the altar platform in the center of the plaza located at the foot of the pyramid, where the congregation gathered.

Naturally, there are a few exceptional cases in which the pyramid was conceived without a temple. If in fact worship was essentially an outdoor activity, the interior space of the sanctuaries, relatively large in Mexico's central plateau, Oaxaca, and other regions of Mesoamerica, could be reduced to very small dimensions, apparently without undermining its sacred character. This is particularly evident in the Maya area, where the width of the interior spaces fluctuates on the average between three meters and seventy-five centimeters, as we can see when we compare, for example, a temple in Palenque, in southern Mexico, with one in Tikal. There are, however, extreme cases, such as Building A in Nakum (Petén), where the narrow chambers measure only fifty and forty-two centimeters in width (perhaps to function as a "loudspeaker" that dramatically amplified the voice of the priest). Such considerations likewise help to explain those full-scale simulated temples in the Rio Bec region of Campeche, which are sometimes crowned by two or three solid "towers." These towers, incorporated into the mass of a low, functional building, in turn constitute versions of compressed pyramids, complete with simulated staircases. This imitation of the temple-pyramid was not detrimental to the symbolic meaning of certain privileged parts of the building, such as the staircase, the sides of the tower, the main doorway (or its upper frieze alone), and the roof comb.

The primary function of the Mesoamerican pyramid was to elevate the temple; occasionally it served as a ruler's mausoleum (as in the outstanding example of Palenque). However, the pyramid could lack a temple altogether (as in the twin-pyramid complexes of Tikal), or it could have twin staircases leading to two clearly differentiated temples (as occurs during the last three centuries before the Spanish conquest).

The Mesoamerican tradition of not razing buildings to the foundation before undertaking new construction is fortunate for archaeology. As a result of much remodeling, expansion, and superimposing, which on occasion generated artificial acropolises (the particularly high and compact clusters of buildings that resulted from centuries of adding new layers of construction, as found at the North Acropolis of Tikal), the remains of temples, dismantled only to a certain height to become part of the fill for a new building, reappear bit by bit from their burial ground to tell us the history of their city, their gods, and their rulers. While the effigies of deities (as well as the sacrificial stone) speak to us about a place designed for rituals, other features, particularly among the Maya (where we find so many roof combs, stelae, and other dynastic records), suggest the self-glorification of a ruling prince.

**TEMPLE SOLAIRE.** The Order of the Solar Temple, a European esoteric movement, shocked European public opinion with its mass suicides and homicides of 1994, 1995, and 1997, and it had a crucial effect on subsequent anticult activity by various European governments.

**THE ARGINY MOVEMENT.** A whole group of new religious movements flourish with foundational mythologies connected to the medieval Knights Templars. Most trace their origin to the Order of the Temple founded in 1805 by Bernard-Raymond Fabré-Palaprat (1777–1838), a French physician and Freemason. After Palaprat's death, the movement went through a number of schisms, and by 1950 more than one hundred small neo-Templar bodies were in existence throughout the world. New groups emerged during the 1950s, some of them claiming mystical experiences in which their founders were directly initiated as Knights Templars from the spirit world by ascended "Masters of the Temple."

Jacques Breyer (1922–1996), a prolific French esoteric author, claimed to have had such an experience with two companions on June 12, 1952, in the ruins of Arginy Castle in France. These events led to the establishment of the Sovereign Order of the Solar Temple (Ordre Souverain du Temple Solaire, or OSTs). In the 1960s Julien Origas (1920–1983), an interpreter who had served four years in jail for his wartime activities as a Nazi collaborator, became associated with the Arginy movement, and established the Renewed Order of the Temple (Ordre Rénové du Temple, or ORT) as an independent but related branch of the OSTs. On March 21, 1981, the leaders of OSTs and ORT converged in a mystical ceremony in Geneva on the premises of a third organization, also recognized by Breyer as part of the Arginy movement: the Golden Way Foundation, established by Joseph Di Mambro (1924–1994). The ceremony was—according to Di Mambro—at least as important as the Arginy experience, and was later cited as the founding date of the Order of the Solar Temple.

**THE ORDER OF THE SOLAR TEMPLE.** Di Mambro was born in Pont-Saint-Esprit (Gard, France) in 1924. A jeweler by trade, in 1956 he joined AMORC, the Ancient and Mystical Order of the Rosy Cross. He left it around 1970, joined the Arginy movement, and—after a minor skirmish with French justice in 1971 for writing bad checks—moved to Annemasse, near the Swiss border. He later moved to Switzerland, where in 1973 he started a full-time career as teacher of yoga and occult philosophy. He also became the founder of several

occult societies. In 1982 Di Mambro's Golden Way Foundation was joined by Luc Jouret (1947–1994), a popular Belgian homeopathic doctor who had established a practice in Annemasse. The Amenta Club (later renamed Atlanta), a circle established by Jouret for his clients and friends, became a vehicle for disseminating Di Mambro's ideas. Di Mambro also introduced Jouret to Origas, and the Belgian doctor quickly ascended to a leadership position in the ORT.

When Origas died in 1983, Jouret claimed to have been designated as his heir and as leader of the ORT, but his claims were challenged by the Origas family. Jouret and Di Mambro eventually left the ORT and established the International Order of Chivalry-Solar Tradition, more commonly known as the Order of the Solar Temple (Ordre du Temple Solaire, or OTS). By this time they operated a system of Chinese boxes. People initially attended Jouret's speeches organized by the Amenta and Atlanta Clubs. Those most interested were invited to join the Arcadia Clubs. The most dedicated members of the Arcadia Clubs were eventually invited to join the true secret organization, the OTS. By 1989 (possibly the year of its maximum success) the OTS had 442 members, most of them in French-speaking countries (only sixteen in the United States). Jouret had considerable success in Quebec as a motivational speaker, especially at Hydro-Québec, the public hydroelectric utility of the province, where he recruited fifteen executives and managers for the OTS between 1987 and 1989.

By this time, the theme of an imminent end of the world (originating from certain ideas of Breyer, but including new elements about UFOs and extraterrestrials) was a central part of OTS teaching. When the OTS apocalyptic worldview was discovered behind the facade of Jouret's motivational speeches, the group started to experience strong and organized opposition.

**THE TRAGEDY.** In 1991 the Martinique branch of ADFI (Association pour la défense des familles et de l'individu, the largest French anticult organization) denounced the conversion of wealthy Martinicans to the OTS and their eventual move to Quebec. ADFI-Martinique was able to join forces with Rose-Marie Klaus, a disgruntled Swiss OTS ex-member whose husband Bruno had left her within the frame of new "cosmic" marriage rearrangements introduced by Di Mambro and allegedly dictated by the ascended Masters. Eventually, Klaus's determined opposition made inroads: Jouret found it increasingly difficult to be invited as a motivational speaker, and in February 1993 the Canadian police started investigating the Solar Temple. On March 8, 1993, two OTS members, Jean-Pierre Vinet and Hermann Delorme, were arrested as they were attempting to buy semiautomatic guns with silencers, illegal weapons in Quebec. A warrant for arrest was also issued against Luc Jouret, at that time in Europe. In fact, the arms deal had been arranged by a police informant engaged in a sting operation. The prosecution ended with a "suspended acquittal" and a minor fine for Jouret, Vinet, and Delorme (with the latter leaving the OTS fol-

lowing the incident). Rose-Marie Klaus managed to have lurid accounts of the “cult of the end of the world” published in the media. Vinet was fired from his position at Hydro-Québec, and police investigations were launched in France and Australia, where Di Mambro had some financial interests, later grossly exaggerated by sensationalist accounts in the press.

It is not easy to determine whether the preparation for a “transit” of the core members of the OTS to another planet (through suicide) was started before or after the first Canadian police actions in 1993. The first versions of the texts about the transit (proclaiming that the end of the world was near, and that it was eminently reasonable to leave planet Earth in search of salvation on the star Sirius or on another faraway planet) were probably written at about the time the Canadian investigation was started in February 1993. That same year the OTS was confronted by two major factors of internal stress. In Quebec, dissension about Jouret’s leadership erupted, and Robert Falardeau, an officer with the Quebec Ministry of Finances, replaced him as Grand Master (with Jouret remaining an important international leader). In Europe, Di Mambro had serious health problems. A number of French and Swiss members had left the OTS in 1993, wondering whether their money had not mostly been spent to support the leader’s luxurious lifestyle. Worst of all, rumors began circulating in 1990 that the most secret and sacred experience of the OTS—visible manifestations of the Masters of the Temple—were, in fact, holographic and electronic tricks stage-managed on behalf of Di Mambro by a loyal member, Antonio (Tony) Dutoit. These rumors led Di Mambro’s son, Elie, to quit the OTS. Dutoit and his wife eventually confirmed the rumors, distanced themselves from Di Mambro, and in 1994 named their newborn baby Christopher Emmanuel. This was particularly intolerable for Di Mambro, who considered the name Emmanuel to be reserved for his own daughter, who was named Emmanuelle, but was addressed in the OTS as “Emmanuel,” as if she were male. Emmanuelle—allegedly conceived by Dominique Bellaton, Di Mambro’s mistress, through cosmic intercourse with an ascended Master—was regarded as the embodiment of the cosmic Christ. As a consequence, Di Mambro became persuaded that the infant Christopher Emmanuel Dutoit was the antichrist and another omen of the imminent end of the world.

Within this climate, Di Mambro had a paranoid reaction to the police investigations, and set in motion the chain of events eventually leading to the “departure.” It is unclear when exactly messages from the Masters and from a “Heavenly Lady” channeled by Di Mambro and by Camille Pilet (1926–1994)—the most prominent and wealthy businessman in the OTS and the alleged reincarnation of Joseph of Arimathea—started preparing the Templars for a “transit” out of this world, but preparations probably began around 1990. It is also unclear when (probably in 1993) an inner core of members learned that the transit would not involve

a spaceship or other extraterrestrial vehicle, but would be a mystical suicide. At any rate, on October 4, 1994, fire destroyed Joseph Di Mambro’s villa in Morin Heights, Quebec. Among the ruins, the police found five charred bodies. Three of these people—the Dutoits and their infant son—had been stabbed to death before the fire. Having perpetrated or at least supervised the killings in Morin Heights, which probably took place on September 30, Joël Egger and Dominique Bellaton (the mother of the “genuine” cosmic child) joined forty-six other OTS members and children of members in Switzerland. In the early morning of October 5, the police found all of them dead in two OTS centers in Cheiry (canton of Fribourg) and Granges-sur-Salvan (canton Valais). Twenty-three bodies were found in Cheiry and twenty-five in Granges-sur-Salvan, along with the remains of the devices programmed to start the fires that almost destroyed both OTS centers. From the lengthy investigation of the Swiss police and judiciary, it seems that most of those dead in Cheiry were murdered, while at least half of those found in Granges-sur-Salvan committed suicide. But the dichotomy between suicide and murder is only part of the story. Documents left by the Temple suggest that along with murdered traitors and core members strong enough to understand the full implications of the transit, there were also weaker Templars. The latter did not oppose the idea of the transit (although they may have understood it as something different from a suicide), but they needed “help” to accomplish it.

Interestingly, after the murders and suicides few former members reinterpreted the OTS from the anticult perspective, and the majority continued to express sympathy for the organization. It seems that Di Mambro had explicitly planned the survival of some “witnesses” by establishing the ARC (Association for Cultural Research for the external world, but in fact the Association Rosy-Cross) in Avignon on September 24, 1994. One of the speakers at the Avignon meeting was a well-known French conductor, Michel Tabachnik, who had joined the OTS some years earlier and had been an occasional speaker with Jouret in Quebec. The only public figure to survive the 1994 tragedy, he was accused by a sensationalist press of being the secret leader of the OTS or at least Di Mambro’s successor. Although he was acquitted in a criminal trial in France in 2001, Tabachnik’s musical career was compromised.

Notwithstanding the continued police interest in what was left of the OTS, a second “transit” happened on December 23, 1995, when sixteen OTS members and three of their children were found dead in the Vercors mountains, near Grenoble, France. In a third incident, discovered on May 23, 1997, in Saint-Casimir, Quebec, another five members of the OTS—including Bruno Klaus, the former husband of vocal apostate Rose-Marie Klaus—committed suicide. While only a handful of persons who regard themselves as members of the OTS or the ARC remain alive in Europe or Quebec after the third incident, further suicides cannot be ruled out

as long as some people continue to share the OTS ideology and regard the “transit” as both reasonable and desirable.

MASSIMO INTROVIGNE (2005)

**TEMPTATION.** Approaches to the complex phenomenon of temptation are as diversified as are cultures, world-views, the self-understanding of men and women, the concept of sin, and so on. But behind all the astonishing differences there might well be discovered agreement on one point: that the center of human temptation is egocentricity, and genuine love is its victor. In the Judeo-Christian tradition, reflection on temptation arises in the quest for the sources of evil, which leads to a questioning of both God’s nature and the nature of humankind. However, for the Hebrews, these questions were further complicated because of their own negative reactions to earlier solutions put forth by their neighbors. A continuing theme in Israel’s history is the belief that their neighbors were tempting them to abandon faith in Yahveh and the law of Moses. Consequently, they must destroy those who were or could become such a temptation. This sad pattern reappears in Christianity as a motive for the crusades, inquisitions, and the burning of so-called witches. Christians were thus diverted from the actual, horrifying temptations that drew them away from humanness, love of neighbor, and even from the true image of God as a merciful Father of all.

The problem of temptation seems to resist a rational, conceptual approach. Perhaps the most adequate approach

to its historical study is by way of its symbols. The prototype of these symbols and myths is the *Genesis* story of Adam and Eve. Similar symbols are to be found in most African cultures. It seems that with these stories there is not yet the question of original sin but, rather, the more basic question: what is the response of humanity when confronted with evil?

The Fall of Adam and Eve—of humanity in general—and its consequences are presented in the first twelve chapters of *Genesis*. There we see Cain tempted to do violence, a temptation to which he yields, killing his brother. The increase in violence finds its symbol in Lamech, whose warlike attitude is reflected also in his relationship with women. Finally, the world is so flooded with sin that Noah can withstand it only with utmost difficulty.

However, while a one-sided, legalistic understanding of faith and morality warned against the temptation of disobedience, it remained blind to the temptation to disown the prophetic tradition and blind to unjust structures and the unjust exercise of authority, which today’s Christians sharply denounce as “institutionalized temptations.”

All too often in Christendom the tendency prevailed to condemn any form of doubt about religious and moral doctrines and traditions, while today many Christians pray that God may grace them with the courage to doubt at the right point and, thus, to be preserved from the disgraceful temptation of choosing a false security over the sincere search for truth. Some Christians seem not to care much about the existential question of whether they are truly on the road to salvation, but for Martin Luther and many other Christians of all denominations, it has been a matter of faith to fight desperately against such a temptation.

In Western religions there have always been conflicting trends between those who gave primacy to the fight against temptations arising from one’s own heart and those who gave first place to fighting unjust and dehumanizing structures as the main sources of temptation. There were and still are those who are overly optimistic about the individual’s battle against temptation and, at the same time, pessimistic about changing immoral society. Today many who call for renewal of church institutions fall into the temptation of overlooking the interwovenness of persons and society and the difficulty of achieving simultaneously the ongoing individual conversion and the changing and healing of public life, including church structures.

For many religious people in the West it is still difficult to recognize the enormous temptation involved in renouncing one’s own responsibility and yielding to anguish instead of making clear decisions about the Christian’s mission to be salt to the earth. One aspect of this all-pervasive temptation is easy conformity to a culture of greed, consumerism, and a wasteful style of life.

Christians are awakening only gradually to the temptation to waste our human and ecological resources. Many are struggling with the temptation to render indiscriminate mili-

tary service and grant one's own government a blind presumption of righteousness in respect to armaments, arms sales, and military actions. Perhaps here, however, we are beginning to perceive a major shift in Western Christianity's approach to the theme of temptation.

**DEFINITION OF TEMPTATION.** For Immanuel Kant, temptation is the paradoxical expression of the human person, destined by nature for the good yet inclined to do evil. He defines temptation as a challenge to live one's freedom for good in the purest way.

In the Septuagint, and consequently in Christian tradition, the Greek word *peirasmos* indicates quite different concepts in different contexts. Often it refers to sinful people "tempting God," murmuring against him and challenging him in unbelief and distrust (cf. *Ex.* 17:1–7). The New Testament, too, warns against this temptation of humans "to tempt God," to challenge him (*1 Cor.* 10:9), to defy him in disobedience (*Heb.* 3:8), to request from him miraculous interventions at a whim or for purposes of self-exaltation (cf. *Mt.* 4:7: "You are not to put the Lord your God to the test").

Most frequently, however, the word *temptation* is used to describe humans being tempted in various ways. Two forms of *peirasmos* have to be distinguished carefully. One concerns the various troubles and trials seen as an opportunity, or *kairos*, for the believer to strengthen his faith, his endurance, and, finally, his capacity to share in Christ's redemptive suffering. *James* 1:2–3 describes this kind of *peirasmos*: "Whenever you have to face trials of many kinds, count yourselves supremely happy in the knowledge that such testing of your faith breeds fortitude, and if you give fortitude full play you will go on to complete a balanced character." Sometimes only the victorious conclusion of such a trial allows the positive evaluation of the event, as in *James* or, even more evidently, in the beatitudes (*Mt.* 5:11–12, *Lk.* 6:21–23).

The other kind of *peirasmos* refers to temptation in the sense of endangering salvation, that is, when the person is assaulted from within and/or from without by godless powers aimed at his downfall. The Lord exhorts us to pray that we may not be brought to such dangerous tests: "And lead us not into temptation" (*Mt.* 6:13, *Lk.* 11:4). Christ warns his disciples that his own terrible trial can become for them a dangerous test: "Stay awake, all of you; and pray that you may be spared, that you may not enter into temptation" (*Mk.* 14:38).

Martin Luther is particularly anxious that we do not confuse those tests in which God guides us through the trial from beginning to end with those temptations into which we walk self-confidently from the start and thus expose ourselves to the danger of downfall.

**TEMPTATION AND THE TEMPTER.** While the scripture warns us against the tempter in his various disguises, the main emphasis is on our own "heart," our personal response to temptations. The Bible calls on Christians to take responsibility

by consistently rebuking the sinner who wants to exculpate himself by inculpating others.

**Temptation arises from within.** *James* is most explicit: "Temptation arises when a man is enticed and lured away by his own lust" (1:14). Here the author of *James* follows the main line of the synoptic Gospels, as when Jesus calls for change of heart, for purification of one's inmost thoughts and desires: "It is from within men's hearts that evil intentions emerge" (*Mk.* 7:20). *James* speaks of *epithumia* ("desire"), which in the Jewish thought of the time referred to the ambivalent impulses and inclinations (or *yets'er*) assigned to Adam and Eve in rabbinic literature to explain their capacity for being tempted. Augustine's term *concupiscence* does not correspond exactly to *yets'er*. While the Hebrew scriptures and rabbinic literature try to understand human vulnerability to temptation as *epithumia*, Augustine believes temptation to be based on our heritage of sin from Adam. We may understand *concupiscence* as that inner inclination for temptation and sin, the intensity of which depends on unrepented sins, the weakness or lack of a fundamental option for God and for the good, and the attraction to sin that comes from a sinful world around us, where the sins of the past continue to poison the human environment.

This same idea is present also in thought about the struggle that exists in our inmost being between *sarx* and *pneuma* (or "body" and "spirit"). For Paul, temptation manifests in our lower nature, the body, and is supported by the collective selfishness and arrogance present in all humanity. The *sarx*—and with it, temptation—loses power to the degree that we are renewed and guided by the *pneuma*.

**God does not tempt anyone.** *James's* great concern that "God is untouched by evil" (1:14) already existed in Jewish wisdom literature. The main concern of the oldest Israelite tradition, however, was the absolute rejection of any kind of dualism: God has absolute sovereignty. The distinction found in this tradition between being "put to the test" by dangerous temptation or by trials destined to purify or refine had not yet been neatly elaborated.

A striking example is in a comparison of the story of David's temptation regarding a census, as told in *2 Samuel* with the later story in *1 Chronicles*. The first account says, "The anger of Yahveh once again blazed out against the Israelites, and he incited David against them. 'Go,' he said, 'take a census of Israel and Judah'" (*2 Sm.* 24:1). In those days a census was considered an attack on God's prerogative to give increase to his people. Hence David was punished by a pestilence that diminished the nation. The author of *1 Chronicles* is more careful about the image of God as one of absolute goodness; he gives another version: "Satan rose against David to take a census of the Israelites" (*1 Chr.* 21). In this later tradition monotheism had become so firmly established that the introduction of a tempter inimical to God's people was not to be feared.

The wisdom literature provided helpful distinctions and directions of thought. The authors were careful not to allow

the sinner any exoneration and to avoid any contamination by dualism. Their greatest care was to show God's wisdom in the sovereign government of world and history.

Temptation, uncomfortable as it may be, is an ingredient of life. Those who put their trust in God will overcome it, and it serves moral growth in their life. God does not incite to evil, but he allows both suffering and temptation as tests for the virtuous. "God has put them to the test and proved them worthy to be with him; he has tested them like gold in a furnace, and accepted them as holocausts" (*Wis.* 3:5). The sinner has no excuse, since he falls because of lack of love and fear of God. Those who truly adhere to God will make good use of freedom.

This is succinctly expressed by Jesus, son of Sirach: "Do not say, 'the Lord is responsible for my sinning,' for he is never the cause of what he hates. Do not say, 'it was he who led me astray,' for he has no use for a sinner. The Lord hates all that is foul, and no one who fears him will love it either. He himself made him in the beginning, and left him free to make his own decisions. . . . To behave faithfully is within your power" (*Sir.* 15:11–16).

**The serpent and the woman in *Genesis* 3.** The narrative of the fall is an anthropological myth of great depth and complexity. Its symbols express ancient Israelite reflections on the origin of evil. It depicts in a lively way the diversionary rhetoric of the sinner, who always needs a scapegoat for his own vindication. Adam attempts to use Eve as his scapegoat, while Eve blames the serpent. Some see in the role attributed to Eve a deeply ingrained misogyny in the Yahvistic authors. Paul Ricoeur may come closer to the intention of the narrative when he writes in his *La symbolique du mal* (Paris, 1960) that the woman here is not so much the "second sex" as, rather, an expression of the human being's frailty, man's as well as woman's (vol. 2, p. 239). The story exposes the sin of Adam more than that of Eve, because it unmasks Adam's domineering attitude toward the woman (*Gn.* 3:16). In the fall, man too must confess: "This is flesh of my flesh." There is a solidarity in both salvation and perdition.

Why is the serpent introduced to allow man to exonerate himself? We can respond that the very mechanism of exculpation is part of sinful man, since when he confesses his sin humbly before the merciful God, he finds no need to accuse others. Yet there is still more in this anthropological metaphor. The serpent is also a creature, one that is "the most subtle of all the wild beasts God has made" (*Gn.* 3:1). It becomes a metaphoric presentation of man's subtle pursuit of his egotism and his no less subtle self-defense and self-belying mechanisms (cf. Philbert Avril, *Délivre-nous du mal*, Paris, 1981, p. 23).

Ricoeur thinks that this is also the way James's epistle explains the self-deceptive concupiscence. The serpent is a part of ourselves as long as we have not the strength of truth to unmask the shrewdness of our exonerating maneuvers. It might also symbolize "the chaotic disorder in myself, among

us and around us" (*La symbolique du mal*, vol. 2, p. 242). That would bring into the whole vision of the first twelve chapters of *Genesis* a sharper awareness of the various dimensions of solidarity in either good or evil, including the cosmic dimension and the need for humans to decide one way or the other.

While theologians and preachers during the last centuries frequently identified the serpent of *Genesis* with Satan or the devil, there seems to be a growing consensus among biblical scholars and theologians that in the early tradition reflected in *Genesis* 3, nobody thought or spoke of Satan, the personified Evil One. In his 1937–1938 work *Creation and Fall: A Theological Interpretation of Genesis 1–3 and Temptation*, Dietrich Bonhoeffer was insisting already that this narrative has no need of *diaboli ex machina*. The serpent symbolizes the ambiguity of people, their human relationships, and their environment.

**Satan and his helpers.** Satan interests us here only in relation to temptation. What does the tempter add to the understanding of temptation? In the older tradition, Satan never appears; it is God who tests man and calls him to decision (Seesemann, 1968, p. 25). In the *Book of Job*, we find God testing man in much the same way as he tested Abraham. The successful end is decisive: the person who counts on God will overcome temptation. What is new in *Job* is that God acts through intermediary forces.

The nebulous Satan here has nothing to do with the super-Satan of the Persian religion or with the apocalyptic and threatening "prince of darkness" of later writings in Judaism and Christianity. This Satan is a not very effective literary effort meant to exonerate God from appearing as the source of evil. Such a Satan becomes a real threat to the sufferer through those "friends" who, having a false image of God, judge the sufferer to be one who deserves such punishment. For the sufferer, these friends are indeed Satan's cruellest helpers. Even Christ on the cross was exposed to them: the pseudo-religious people who insulted him. Job's victory over this temptation occurs because of his trustful adoration of the ever greater God.

The shrewd Satan who tempts Jesus in the desert embodies the insidious temptation put to Christianity in the first and following centuries. The misuse of the Bible by cleverly twisting its words to create false meanings tempted people away from the faith.

Satan represents also the terrible temptation of a too earthly understanding of the messianic hope of Israel and the mission of Christ. This is seen strikingly when Jesus rebukes Peter for refusing to believe in a suffering and humble servant-Messiah: "Away with you, Satan; you are a stumbling-block to me, because the way you think is not God's but man's" (*Mt.* 16:23).

Satan at his most shameless—asking Jesus to adore him—mirrors the vain self-glorification of the earthly powers of the time, particularly in the divinization of the Roman

emperors. The figure of Satan should not turn attention away from these perennial temptations but should emphasize the superhuman dimension. It is a sharp warning against belittling any situation of temptation.

As we saw in *Genesis 3*, for the believer there is no way of denying guilt by pointing to a tempter or to the devil. Aware of the powers of darkness in their mysterious solidarity of perdition, the followers of Christ put their trust in God and make the wholehearted decision for his reign, a reign of justice, peace, and love. They put on “all the armor which God provides to stand firm against the devices of the devil” (*Eph. 6:10*). They will not only avoid being tempters in any way, helpers of the powers of darkness, but will commit themselves to active and generous membership in a solidarity of salvation.

This was the mind of the early church in an integrated discourse on the Christian’s decision for Christ and for battle against temptations arising from the gnostic and Manichaean trend toward speculations on angelic and demonic hierarchies. We find this sobriety still in Thomas Aquinas. But in the following centuries great parts of Western Christianity indulged in fantastic speculations about witches and a slavish fear of devils as well as ritual exorcisms of them, while lacking trust in God and making no firm decision for an all-embracing solidarity.

Today there is a strong reaction, partially in favor of the original sobriety and partially in indifference to the figure of Satan, whereby the vast dimensions and blinding powers of evil are lost to sight. Referring to Ernst Bloch, Leszek Kolakowski, in his *Gespräche mit dem Teufel* (3d ed., Munich, 1977), wonders whether some Christians realize the depth and cosmic dimensions of evil. Reading Kolakowski one thinks of the devilish temptation to expect a paradise of peace in the midst of ever increasing conflict and hatred.

The Christian discourse on the tempter points to the great temptations arising from bad example and evil “friends” who initiate the inexperienced into the skills of crime and corruption. The diabolic temptation seeks directly the moral corruption of others. It is masterfully described in the famous novel *Les liaisons dangereuses* (1782) by Choderlos de Laclos. Laclos exposes both the superficial optimism of the Enlightenment and the libertinism of the time preceding the French Revolution. The book aroused much anger in its time, since it disclosed the truth of fallen humans, who can go to the limits of malice and cunning in tempting others, especially those devoted to virtue. But even to those most skilled and aggressive tempters there come moments when humanness somehow shines through, insinuating “that malice does not constitute a hopeless and irrevocable fact in human existence” (Knufmann, 1965, p. 202).

This idea was theologized by Origen, who wanted to leave open the hope that after a long duration of “eternity” even the devil and his helpers might be converted and saved by the divine power of *apokatastasis*. Origen’s thought, prob-

lematic as it may be, opposed tenaciously the dualism of Manichaeism. Sinners—even the tempter and his helpers—because they are God’s creatures, keep, somehow, a remnant of goodness. The theory also intended to emphasize that no sinner on earth should be considered a hopeless case.

For many contemporary Christians this thought is unacceptable in view of the diabolical crimes in our times. Mohandas Gandhi, however, thought that the coherent and thorough spirituality of *satyāgraha* (“doing the truth in love”) could hope to change even persons like Adolf Hitler and Joseph Stalin into *satyāgrahins*. For Gandhi, “it is an article of faith that no man has fallen so low that he cannot be redeemed by love” (quoted by Pie-Raymond Reagmey in *Non-violence and the Christian Conscience*, London, 1966, p. 199). This optimism is not a blindness to the horrifying evil present in humans but a recognition of the power of their spirit, enkindled and guided by the universal spirit to overcome such evil at all costs. It may be one of the most diabolic temptations of Western people not to consider this opportunity and be willing to pay its price in order to overcome the diabolically vicious circle of nuclear madness.

**PSYCHOLOGICAL PERSPECTIVES.** Psychoanalysis and psychotherapy have made major contributions to a better understanding of the mechanisms of various temptations. We note especially the ego-defense mechanism of repression (unconscious forgetting or prevention of consciousness) of what is too difficult to face consciously. It could be, for instance, a call to a more truthful search for life’s deeper meaning. Repression usually works through a security complex which refuses to let reality challenge it.

Karl Menninger notes that temptations and sins arise from the “huge world of the unmanifest” (1973, p. 221). The “unmanifest” includes not only whatever the filter of repression is hiding but also unconfessed guilt feelings which often become confused with real guilt. On this point, Menninger refers to the Bible: “If we say we have no sin, we deceive ourselves, and the truth is not in us” (*1 Jn. 1:8*).

The result of the individual and collective temptation to deny sin and guilt is frequently undefinable anguish, feelings of senselessness, and/or despair about human freedom and dignity. The deeper source of these temptations is an unwillingness “to do the truth in love,” thereby hindering truth from setting us free (cf. *Jn. 8:31–41*).

Another ego-defense is the tendency to project one’s own evil inclinations on another, on some villain. In her work with children, psychotherapist Christine Lutz found that the healing and growth of moral sense progressed when the children realized that what they saw in others was, to a great extent, a projection of their own shortcomings (*Kinder und das Böse: Konfrontation und Geborgenheit*, Stuttgart, 1980).

Depth psychology has studied the mechanism of aggression. On the one hand, there is the danger of trying to repress it instead of channeling it wisely. On the other hand, there

is the uncontrolled and mutually contagious mechanism that leads to the vicious circle of aggressive challenges and aggressive reactions. Although psychology suggests that it is sometimes liberating to allow one's anger an honest expression, Menninger rightly warns: "But there is always a temptation to use it as a whip, and what begins as a device for relief continues as a weapon for aggression" (1973, p. 144).

**SOCIOLOGICAL PERSPECTIVES.** The broad theological expression "sin of the world" is given sharper contours in modern studies on "institutionalized temptation." In his book *Our Criminal Society* (Englewood Cliffs, N.J., 1969), Edwin M. Shur has an apt formulation: "In a sense, existing patterns of crime represent a price we pay for structuring society as we have structured it" (p. 9). In a society and culture that emphasize "having" over "being," with an educational system oriented to personal success and a whole economic system that encourages increasing consumption, people yield thoughtlessly to temptations, and nobody feels guilty. "No one thinks sin was involved" (Menninger, 1973, p. 120). The "respectable crimes" of the wealthy and powerful, their unpunished corruption, and their clever manipulations are constant incitement for others to further injustice and dishonesty in smaller matters. The little thief is caught and condemned to a prison system in which massive temptations are forced upon inexperienced transgressors of the law.

The people of wealthy countries have adopted lifestyles inseparably connected with the predatory exploitation of the earth's resources and pollution of the environment. Here we see temptations of planetary dimensions that increase the tensions between countries of free enterprise and those of massive state capitalism. How many horrifying temptations are involved in the arms race, the arms trade, and, above all, the nuclear threat! One source of the massive "institutionalized temptations" is the lack of prophetic voices; another is the unwillingness to pay earnest attention to those voices that might be heard.

**THEOLOGICAL PERSPECTIVES.** In a brief synthesis of theological perspectives that recur continuously, the point of departure for the Christian is Jesus having been tempted as we are: "Since he himself has passed through the test of suffering, he is able to help those who are meeting their test now" (*Heb.* 2:18). The church fathers stressed the point that it was after his baptism that Jesus underwent the temptation, and they connect this with the final test of his passion. Similarly, those baptized in Christ can best face temptation and suffering by putting their trust in Christ and holding fast to their baptismal commitment.

Jesus overcame temptation not just by enduring the suffering it brought but by making this very suffering the supreme sign of God's love and saving solidarity. That this love is the goal of all Christians is revealed by gospels that unmask the temptations involved in clinging to laws while betraying the covenant, now understood as the supreme law of self-interest, all-embracing love between God and humankind.

Another biblical direction is to combat evil by doing good, to overcome violent injustice by doing the truth of love in nonviolent commitment (cf. *Rom.* 12:21; *1 Thes.* 5:15; *1 Pt.* 3:9; and above all, *Mt.* 5). For believers, all temptations—but particularly those arising from the vicious circle of violence—are a challenge to sanctity, to redemptive love. An unrenounceable perspective grows out of Paul's understanding of the combat between *sarx* and *pneuma*, whereby false images of love and freedom are exposed by searching wholeheartedly for true love aided by the promptings of the spirit (cf. *Gal.* 5:13, 6:2).

#### BIBLIOGRAPHY

There are innumerable books and articles concerning the temptation of Jesus and, in that light, temptation in general. The following books merit special attention: Ernest Best's *The Temptation and the Passion: The Markan Soteriology* (Cambridge, 1965) and Jacques Dupont's *Les tentations de Jésus au désert* (Paris, 1968). Both books contain excellent bibliographies. A comprehensive presentation of the church fathers' explanation of the biblical texts and their application to the understanding of Christian life is found in Santino Raponi's *Tentazione ed Esistenza Cristiana* (Rome, 1974). On the biblical use of the term *peirasmós*, see Heinrich Seesemann's *Theological Dictionary of the New Testament*, edited by Gerhard Friedrich (Grand Rapids, 1968), vol. 6, pp. 23–36. See Horst Beintker's study *Die Überwindung der Anfechtung bei Luther* (Berlin, 1954) for an overview of Martin Luther's approach to temptation from the perspective of the doctrine of justification by faith. Helmut Thielicke's *Theologie der Anfechtung* (Tübingen, 1949) is representative of a good part of Protestant theology's discussion of the issue. Also important is Dietrich Bonhoeffer's *Creation and Fall: A Theological Interpretation of Genesis 1–3 and Temptation* (1937–1938; New York, 1965). While at times emphasizing the power of Satan, Bonhoeffer never allows for man's exculpation. His ideas seem to reflect the time of great affliction for the church in Germany.

Of the numerous studies about the impact of a poisoned environment and a defective culture and society on temptation, Reinhold Niebuhr's *Moral Man and Immoral Society* (New York, 1932) and Edwin M. Shur's *Our Criminal Society* (Englewood Cliffs, N. J., 1969) are noteworthy. In his much-read book, *Whatever Became of Sin?* (New York, 1973), Karl Menninger points to the mechanisms and temptations of denying sin and thus, also, human freedom and responsibility. C. S. Lewis attempts to unmask real temptation in his widely known book *The Screwtape Letters* (New York, 1946). Helmut Knufmann reflects on novelists' treatment of temptation as a theme in his book *Das Böse in den Liaisons Dangereuses de Choderlos de Laclos* (Munich, 1965).

**TEN COMMANDMENTS.** The Ten Commandments (or the Decalogue) appear twice in the Hebrew scriptures, at *Exodus* 20:1–17 and at *Deuteronomy* 5:6–21. There are differences between the two listings, but the order and the general contents are substantially identical. The commandments may be grouped as follows:

- *Commandments 1–3*: God’s self-identification, followed by commandments against the worship of other gods, idolatry, and misuse of the divine name (*Ex.* 20:1–7, *Dt.* 5:6–11).
- *Commandments 4–5*: Positive commands to observe the Sabbath and to honor parents (*Ex.* 20:8–12, *Dt.* 5:12–16).
- *Commandments 6–7*: Prohibitions of violent acts against neighbors, namely, killing and adultery (*Ex.* 20:13–14, *Dt.* 5:17–18).
- *Commandments 8–10*: Prohibitions of crimes against community life, namely, stealing, testifying falsely, and hankering after the life and goods of neighbors (*Ex.* 20:15–17, *Dt.* 5:19–21).

In the Jewish and Christian communities the order has occasionally varied, and the numbering has varied considerably, especially in the different Christian communions. Tables listing the various enumerations can be found in works by Harrelson (1980) and Nielsen (1968). The prologue with which the list opens, both in *Exodus* and in *Deuteronomy*, belongs to the Ten Commandments: “I am the Lord your God, who brought you out of the land of Egypt, out of the house of bondage.” In the oldest listing of the “Ten Words” (*Ex.* 34:28), the prologue may not have appeared, but it became attached to the list early in Israel’s history, setting the demands of God into the context of divine grace and mercy.

The origin of the Ten Commandments is traditionally traced to Moses. There is no adequate reason to doubt the accuracy of the tradition, even though the present form of the Ten Commandments is considerably later than Moses’ time. None of the individual commandments, which were probably originally brief, pithy prohibitions of actions ruled out in principle, requires a dating later than the time of Moses. The grouping of the ten may belong to the time when the tribes of Israel had settled in Canaan and maintained ties across tribal lines; some scholars would assign the collection to a later time, perhaps to the ninth century BCE. The closest analogies to the Ten Commandments in the Hebrew scriptures appear in the curse ritual of *Deuteronomy*

27:15–16 and in portions of the section of the Torah sometimes called the “Book of the Covenant” (*Ex.* 20:23–23:33). See, for example, *Exodus* 21:15–17, where short, categorical legal pronouncements appear.

The Ten Commandments are alluded to in a number of places in the Hebrew scriptures, in the Qumran literature, and in the New Testament, although they are rarely quoted exactly and do not appear at all in a complete listing outside of *Exodus* and *Deuteronomy*. The prologue is found in a number of places (*Hos.* 13:4, *Ps.* 81:10/11), and there are lists of some of the prohibitions in several places (*Hos.* 4:2, *Mk.* 10:17–22 and parallels). But the fundamental outlook of the Ten Commandments is characteristic for the Jewish and Christian communities through the centuries. God will not have the divine name and selfhood profaned, for the Creator remains free and sovereign over against the creation. God demands rest from labor as well as labor, and he will not tolerate the mistreatment of elderly parents by adult children. God claims authority over human life and demands respect for life on the part of all. God will not permit the violation of the extended life of human beings in their social and institutional relations.

The Ten Commandments became a fixed part of Christian catechetical practice and worship. Less prominent in Islam, they are implicit in much that Muḥammad taught. In the course of Christian history they have frequently contributed to narrowness of vision and legalism. Yet it seems likely that they have contributed much more by way of positive guidance to the community. Negatively put categorical statements of this sort provide moral orientation of the community, the defining characteristics of a people, showing what is simply not allowed. The Ten Commandments require positive statements of what idolatry means, what murder is, how the Sabbath is to be observed, and the like. They constitute not so much a constriction of human freedom as an invitation to the community to claim its proper freedom within the confines of what would be ruinous for it.

WALTER HARRELSON (1987)

**TENDAISHŪ.** The Japanese Tendai School takes its name from the Tiantai (Japanese, Tendai) School in China, which was located on Mount Tiantai. Japanese monks care-

fully studied the Tiantai texts they obtained in China, but after the ninth century CE relatively little exchange occurred between the Chinese and Japanese schools. As a result, Japanese Tendai developed in ways that were frequently distinct from its Chinese antecedent. In the following paragraphs the institutional development of the school is discussed, followed by some of its doctrinal developments.

**INSTITUTIONAL HISTORY.** Tendai was initially based on writings by the Tiantai exegetes Zhiyi (538–597 CE) and Zhanran (711–782 CE) that had been brought to Japan by Jianzhen (Japanese, Ganjin, 688–763 CE). The de facto founder of the school, Saichō (767–822 CE, also known by his posthumous title Dengyō daishi) was able to obtain these texts while he was practicing on Mount Hiei and was so impressed by them that he traveled to China to obtain better copies. When Saichō returned from China in 805 CE, he found that the court was more interested in the Esoteric Buddhist (*mikkyō*) doctrines he brought back than in Tiantai doctrine. As a reward for performing Esoteric rituals to heal the emperor's illness, Saichō was awarded two yearly ordinances by the court; this marks the establishment of the school. Saichō's understanding of Esoteric Buddhism did not equal that of Kūkai (774–835 CE), founder of the Shingon school, who returned to Japan in 806 CE. As a result the Tendai monks Ennin (794–864 CE) and Enchin (814–891 CE) traveled to China, where they spent more time studying Esoteric Buddhism than Kūkai, brought back more texts than Kūkai, and introduced new rituals that appealed to patrons from the imperial family and the noble classes. Consequently, the school flourished and successfully competed with Shingon.

Still a small group of monks 120 years after Saichō's death, the Tendai school was significantly less influential than its long-time rival, the Hossō school. Although it had enjoyed sporadic successes, particularly under Ennin and Enchin, the school had sunk into a period of decline. Tendai was revived and came to dominate the Japanese Buddhist world during the administration of Ryōgen (912–985 CE). When many of the buildings on Mount Hiei burned down in 966 CE, shortly after he had assumed the leadership of the school as *zasu*, Ryōgen obtained funding to rebuild them from Fujiwara Morosuke (908–960 CE), the power behind the throne. In return for Morosuke's support, Ryōgen ordained Morosuke's son Jinzen (943–990 CE) and designated him as the next Tendai *zasu*. Jinzen's relatives later assumed many leadership positions in the Tendai school and controlled many of the lands that Morosuke had given to Tendai; they performed Esoteric rituals to insure their clan's continuing domination of the Japanese political scene.

Ryōgen also renovated Tendai education through a system of debate. Tendai scholar-monks were expected to memorize vast amounts of literature, to be able to recite passages relevant to doctrinal problems, and then to resolve any contradictions between the texts. Monks who excelled at this were given high appointments by the court. As a result Ten-

dai finally came to dominate Hossō and Shingon. Ryōgen was also responsible for improvements to Tendai Esoteric rituals, making them more elaborate or using them in new ways to attract the patronage of the nobility.

The introduction of the nobility into the governance of Tendai resulted in a number of significant changes in Tendai. Noble lineages came to control a number of cloisters, called *monzeki*, thereby limiting access for commoners to the positions of authority in Tendai. The transmission of special Esoteric rituals and secret doctrines within such lineages contributed to increasing factional tendencies within Tendai. Separate lineages representing both Esoteric and Exoteric teaching formed. In addition, the lands controlled by Tendai institutions had to be administered and protected, resulting in special classes of monks who performed these functions.

Tendai monks had engaged in factional disputes with Hossō and Shingon monks from early in Tendai history. These factional tendencies eventually turned inward, partially because of competition among lineages for patronage and control of the Esoteric rituals that appealed to the nobility. The origins of this particularly virulent dispute began with a debate over who should succeed Saichō's disciple Gishin (781–833 CE) as *zasu*. The factions eventually coalesced around those who traced their lineages back to two of the great figures of Tendai Esoteric Buddhism, Ennin and Enchin. The connection with Esoteric Buddhism was not accidental, because this tradition valued the integrity of ritual lineages that preserved secrets connected with the performance of rituals. Because the rituals were conducted for the nobility, considerable economic advantages accrued to those who could preserve the secrecy of their lineage. Arguments continued to revolve around appointments as *zasu* and abbots of major temples until the monks in Enchin's lineage were forced to withdraw from Mount Hiei and make Onjōji (also known as Miidera), located at the foot of Mount Hiei, their base late in the tenth century, near the end of Ryōgen's tenure as *zasu*. The tensions between the two groups continued to erupt sporadically in subsequent centuries, occasionally resulting in bloodshed and the burning of each other's temples. Both groups were further subdivided into ritual and doctrinal lineages that used oral transmissions (*kuden*) to propagate their teachings and ritual practices.

The Tendai educational system was so influential during the medieval period that virtually all of the founders of the Kamakura schools of Buddhism received their early training in Tendai institutions. Several, such as Hōnen (1133–1212) and Eisai (1141–1215), remained Tendai monks for most of their lives.

The end of much of Mount Hiei's secular power came in 1571 as part of Oda Nobunaga's (1534–1582) efforts to reunify Japan. To do so he had to eliminate rival political and military powers. Because Tendai had long been involved in Japanese politics through the many monks with noble lineages, Oda ordered his troops to make an example of Mount Hiei. They burned all of the mountain's monasteries and

killed as many monks, women, and children as they could find. Tendai influence was eventually reestablished, though never to the extent it had enjoyed earlier, by Tenkai (1536?–1643), who obtained the support of Tokugawa Ieyasu (1542–1616), the first military ruler of the Tokugawa period. Tenkai gathered many of the surviving Tendai texts, re-instituted the Tendai educational system and its associated rituals, established Nikkō as a mausoleum for Ieyasu and his descendants, and founded Kan'ei as the equivalent of Mount Hiei in the new capital, Tokyo.

During the middle of the Tokugawa period, a movement to reform the Tendai school by changing the ordination system was begun by Myōryū (1637–1690), a monk who had first been ordained in the Rinzai Zen tradition and then converted to Tendai after reading through the Buddhist canon. Myōryū noted that Saichō had stated that *bodhisattva* monks should first be ordained with the Mahāyāna *bodhisattva* precepts from the *Brahmā's Net Sūtra* (*Fanwangjing*), a Chinese Buddhist apocryphal text. According to Saichō, monks were then to be ordained with the 250 precepts used by all monks in East Asia from *Four-Part Vinaya* (*Sifenlu*) after they had finished twelve years of practice on Mount Hiei. Until that point almost all Tendai monks had rejected the *Sifenlu* precepts. Myōryū and his disciple Reikū (1652–1739) gained the patronage of ordained members of the imperial family and the military government to advance their case. Another monk, Shinryū (b. 1711), eventually criticized the reform movement, and the military government ordered that all Tendai monks were to be ordained with only the *bodhisattva* precepts. Even though the effort to reinstitute Hīnayāna ordinations failed, other parts of the reform movement succeeded, including a 1689 prohibition on an Esoteric ritual and oral transmission that affirmed that all desire, just as it is, was ultimate truth (homage to the profound tenet, *genshi kimyōdan*). The decline of *hongaku* thought and a renewed emphasis on Chinese Tiantai doctrine followed.

Following World War II and the installation of laws allowing more freedom to religion, Tendai split into approximately twenty groups, largely because of institutional and economic reasons, the most important of which is still called Tendaishū. It maintains two colleges that contribute to the training of its monks, Taishō University in Tokyo and Eizan gakuin at the foot of Mount Hiei. In addition, a few monks still practice assiduously on Mount Hiei, with an occasional monk undergoing twelve years of seclusion at the Pure Land Chapel (Jōdoin), the site of Saichō's mausoleum. Others circumambulate Mount Hiei (*kaihōgyō*), treating it like a *maṇḍala*, for periods ranging up to seven years. Those who complete the seven-year practice (an average of one person a decade) are lionized as living buddhas. The Tendai constantly walking meditation, a continuous ninety-day circumambulation of Amida Buddha, has also been revived. Since the 1990s, women have been playing a more significant role, receiving training and occasionally becoming abbesses of temples. On a more popular level, the school has instituted

a campaign with the slogan "Light up your corner," based on a quotation from one of Saichō's works. It also sponsored a number of interfaith peace conferences while Yamada Etai (1895–1994) was head of the school.

Like other schools of Japanese Buddhism, modern Tendai is beset by a number of basic problems. The school must figure out a means to educate and inspire young monks, many of whom become monks because they come from temple families, not because they are excited about Buddhism. Poor temples in the country need better support and are short of monks. The role of women, both temple wives and nuns, is not clear. Tendai needs to find better ways of reaching out to both current and potential parishioners. Tendai programs in social welfare are not clearly defined. Such problems are not unique to Tendai, but their solutions will certainly affect the future of the school.

**DOCTRINAL ISSUES.** After Saichō returned from China, he wrote a document describing the lineages of the teachings he received in China: Tendai, Esoteric Buddhism, *bodhisattva* precepts, and Chan. Besides these, several other doctrinal movements came to play important roles within Tendai, including Pure Land, Shinto (Sannō Shintō), and an extension of Tendai doctrine that is referred to by twentieth-century scholars as "original enlightenment thought" (*hongaku shisō*). In the following discussion these are surveyed under the rubrics of Tendai and original enlightenment, Esoteric Buddhism, *bodhisattva* precepts, and Pure Land.

**Tendai doctrine.** Chinese Tiantai doctrine regarded the *Lotus Sūtra* as the Buddha's highest teaching. In fact, the school was sometimes called the Tendai Hokkeshū (Tendai Lotus school). This sūtra was used to harmonize the various teachings within Buddhism (*kaie*), demonstrating that all other forms of Buddhism were expedient means leading up to the universal teaching of One-vehicle to salvation. However, the *Lotus Sūtra* could also be used to reject expedient teachings in favor of the ultimate teaching (*haigon ryūjitsu*). Much of later Tendai doctrinal history consists of how monastic scholars combined other Buddhist teachings with those of the *Lotus Sūtra*, using both the inclusive and the exclusive approaches to expedient teachings.

The majority of Saichō's writings were polemical, defending his position against the claims of Hossō monks. When he died at the comparatively young age of fifty-five, he had not systematized his views on a variety of issues, including the interpretation of the *bodhisattva* precepts and how Esoteric and Exoteric Buddhism had the same purport. His successor, Gishin, who had accompanied Saichō to China, did not even mention these issues in a handbook of Tendai doctrine he submitted to the court. Some of Saichō's disciples tried to remedy these deficiencies by writing sets of questions to their Chinese counterparts (Tōketsu), but in many cases the two sides seemed to be talking past each other. The unfinished quality of Saichō's positions turned out to work in Tendai's favor. The ninth century was marked

by remarkable creativity as Tendai monks traveled to China in search of new teachings and clarification.

Although much of Japanese Tendai doctrine is based on the three major works by Zhiyi and their commentaries by Zhanran, Japanese monks did much more than simply write commentaries that reflected Chinese concerns and interpretations. Instead, they had their own concerns in reading and interpreting Chinese texts, sometimes taking passages out of context and pushing them in new directions. Most of Saichō's writings had been polemical attacks on Hossō and defenses of Tendai in which he sometimes took terms from Chinese texts and gave them a new emphasis. Occasionally he used terms that had not appeared before. For example, terms such as *sokushin jōbutsu* (the realization of buddhahood with this very body), *jikidō* (direct path), and *sōmoku jōbutsu* (the realization of buddhahood by trees and grasses) were found in Chinese Tiantai texts, but in Japanese Tendai they received a new emphasis. At first Japanese monks attempted to enlist Chinese help in clarifying these teachings, writing letters to China in which they asked about doctrine, but eventually Japanese Tendai doctrine developed in unique ways, helped by the paucity of direct contact between Chinese Tiantai and Japanese Tendai after Enchin's travels. Japanese monks explored these issues through a debate system in which they might take issues out of context and develop them in new ways.

From the late Heian period to the middle of the Edo period, much of Tendai thought was concerned with a movement that has been called *hongaku* thought by twentieth-century scholars. The locus classicus of the term *hongaku*, often translated as "original enlightenment," is in a Chinese apocryphal text, the *Dasheng qixin lun* (Awakening of faith in the Mahāyāna), where it is found with two other terms, *shikaku* (realized enlightenment) and *fukaku* (nonenlightenment). *Hongaku* referred to the concept that all sentient beings had an intrinsic quality of enlightenment that provided the bases for both realized enlightenment and nonenlightenment. Through assiduous practice a person could realize enlightenment and leave nonenlightenment. The term *hongaku thought* is a modern term used to refer to Japanese Tendai texts that discuss the implications of original enlightenment, often adopting a position that affirms this world just as it is without any need for practice. The dissociation of original enlightenment and realized enlightenment is epitomized by the mythical claim that Ryōgen bestowed *hongaku* teachings on his student Genshin (942–1017) and teachings about realized enlightenment on his student Kakuun (953–1007), thereby suggesting that *hongaku* could be interpreted as an independent term instead of in association with practice.

The development of *hongaku* thought has often been characterized as a degenerate phase of Tendai because it is characterized by the flagrant disregard of historical precedent, the production of texts attributed to major Tendai figures of the past, and a seeming disregard for traditional (and

sometimes for all) forms of practice. However, *hongaku* texts exhibited a wide variety of attitudes toward traditional doctrine and practice. Some, such as those written by Kōen (1263–1317) of the Kurodani lineage (discussed below) advocated the reestablishment of Saichō's twelve-year period of seclusion. Other texts, such as the *Shinnyokan* (Discernment of suchness) required little more than a firm belief that one was already a buddha. A number of strategies were employed in *hongaku* texts to justify creative doctrinal positions, including the creation of sources, secret oral transmissions, word play, and associations of unrelated terms. These innovative teachings were justified by regarding subjective interpretations (often called mind discernment or *kanjin*) above doctrines that relied on Scripture.

More traditional forms of Tendai scholarship continued to survive during this period. Figures such as Hōchibō Shōshin (1131?–1215?) and Jitsudō Ninkū (1307–1388) wrote commentaries, essays, and debate manuals that displayed meticulous care with historical sources. Shōshin in particular was known for his careful differentiation of Chinese and Japanese doctrinal views.

**Tendai Esoteric Buddhism.** Tendai's most immediate problem after Saichō's death was competing with the Esoteric Buddhist tradition represented by Kūkai's Shingon school. The Tendai school occasionally used the term *Shingon school* to refer to its Esoteric teachings. The two Esoteric traditions are sometimes differentiated by calling Tendai Esoteric Buddhism "Taimitsu" and Kūkai's school "Tōmitsu"; however, Tōmitsu is usually referred to as the Shingon school. Much about the Esoteric traditions Saichō received in China and his understanding of them remains obscure; in fact, the texts Saichō is said to have received in China may have been written by Annen (841–889? CE) to bolster Tendai claims to Esoteric lineages. However, Saichō's insistence on the agreement of the purport of the Perfect Teaching and Esoteric Buddhism has been a hallmark of Taimitsu. The inferiority of Saichō's transmission of Esoteric Buddhist ritual led to Tendai monks such as Ennin traveling to China, where he studied for nine years, from 838 to 847 CE. He collected 508 texts in 802 fascicles, more than Kūkai, studied the Sanskrit *siddham* script, and brought back new rituals. He also established a Dhāraṇī Hall in which the ritual of Abundant Flames (*shijōkōhō*) was to be performed to protect the emperor and the state, thus giving Tendai the ritual apparatus to compete successfully with Tōmitsu at court. Ennin also wrote the first major commentaries on the *Vajraśekhara Sūtra* and the *Susiddhikara Sūtra*. Along with the *Mahāvairocana Sūtra*, these three major texts form the basis of the threefold system of Esoteric Buddhism upon which Taimitsu was based. Enchin studied in China from 853 to 858 CE under the Chinese Esoteric Buddhist master Fazhuan, the same master Ennin had trained under, and also brought back a large number of texts and ritual traditions. Enchin was the author of a number of texts that explained the connection between Esoteric Buddhism and Tendai. For

example, he argued that the *Mahāvairocana Sūtra* should be classified with the *Lotus Sūtra* in the Tendai system of five periods.

Esoteric Buddhism was eventually systematized by Annen. Although he did not travel to China, Annen collected all of the texts and practices he could and strove to explain and reconcile the differences he encountered. In addition, he was acutely aware of Kūkai's tradition and defended Tendai interpretations against criticisms from Tōmitsu sources, even as he borrowed elements of Kūkai's teachings.

Tendai Esoteric Buddhism is marked by several factors that differentiate it from Shingon. While Shingon argues for the nonduality of the Womb and Diamond-realm *maṇḍalas*, Tendai added another tradition, that found in the *Susiddhikara Sūtra* (*Soshitsuikyō*). This gave Taimitsu added elements of practice that helped it compete with Tōmitsu. Saichō had argued that the *Lotus Sūtra* and Esoteric Buddhism had the same import; in contrast, Kūkai had given Tendai and the *Lotus Sūtra* relatively low rankings in his classification of doctrine. Later Tendai monks had striven to clarify the Tendai view. Saichō's student Kōjō (779–858 CE) developed an Esoteric ritual for the *Lotus Sūtra*. Ennin argued that all of Buddhism could be encompassed in "One Great Perfect Teaching" (*ichidai engyō*), a classification that identified the essence of all teachings. However, he also needed to differentiate teachings in a hierarchical manner. Because the *Lotus Sūtra* claimed that it was a hidden teaching revealed only as the end of Śākyamuni's life, it could be interpreted as a hidden or Esoteric teaching. At the same time, because the *Lotus Sūtra* did not have the ritual elements found in Esoteric texts, Ennin argued that, although both the *Mahāvairocana Sūtra* and the *Lotus Sūtra* were doctrinally the highest teaching, only the *Mahāvairocana Sūtra* included the most superior practices.

Annen further refined these teachings with a classification called the "four ones": one Buddha, one time, one place, and one teaching. Like Ennin's One Great Perfect Teaching, Annen stressed the unity of Buddhist teachings. This teaching was based on the identity of the *dharmakāya* with the entire cosmos and the teaching that the *dharmakāya* preached. Annen also had to explain how Buddhism could be classified in a hierarchical fashion, which he did by adding a fifth category—Esoteric teachings—to the traditional fourfold Tendai doctrinal system: Hīnayāna, shared, distinct, and Perfect teachings. Esoteric teachings were thus given the highest position. Annen so identified Tendai with Esoteric teachings that he used the term *Shingon* (mantra) to refer to his teachings.

The agreement of the *Lotus Sūtra* and Esoteric Buddhism can be seen in Tendai discussions of several doctrines. Saichō based his argument on the realization of buddhahood with this very body (*sokushin jōbutsu*) on the story of the realization of the eight-year-old Nāga girl in the *Lotus Sūtra*. In discussions by later Tendai monks, the definition of this rapid realization changed to become more radically sudden,

with Esoteric elements sometimes added. Tendai discussions of the preaching of the *dharmabody* (*hosshin seppō*) emphasized how the various bodies of the Buddha were ultimately combined; thus the preachings of Śākyamuni could be included as aspects of the preaching of the *dharmabody*. In both of these doctrines the Tendai position differed from that found in the Shingon school. Although Annen's work marks the high point of the systematization of Taimitsu thought and practice, later monks continued to refine it, and a number of separate ritual lineages emerged.

The most important text for Taimitsu has been the commentary of Yixing (683–727 CE) on the *Mahāvairocana Sūtra*. Tendai used a different recension of the text, the fourteen-fascicle *Darijing yishi*, than the Shingon school, which used the twenty-fascicle *Darijing shu*. Although the two recensions did not differ significantly doctrinally, ritual differences were evident.

Esoteric Buddhism also decisively influenced two other traditions: the practice of circumambulating mountain peaks (*kaihōgyō*) and the Sannō tradition of Shinto. *Kaihōgyō* is said to have begun with the monk Sōō (831–918 CE), who established a temple called Mudōji on Mount Hiei as the base for the practice. In its fully developed form a practitioner (only men perform this practice) takes a vow to travel on set courses for one thousand days spread over seven years. Traveling the course is compared to traveling through a *maṇḍala*, with the practitioner paying homage to deities at around three hundred sites. After seven hundred days of circumambulation, the practitioner undergoes a nine-day period without food, water, sleep, or lying down. He then completes the practice, extending his circumambulation down to Kyoto. Upon completing the practice, he is received by the emperor. Once a practitioner has taken a vow to begin the practice, he is not permitted to end his austerities early. In fact he carries a knife to end his life if he cannot finish the practice.

The Tiantai school in China honored a deity who protected its headquarters. In a similar manner, Hie taisha was established at the foot of Mount Hiei as the focal point of a cult to honor the deities that protected the Tendai school on Mount Hiei. As time passed the numbers of shrines and deities increased. By the Kamakura period deities were considered manifestations of various buddhas and *bodhisattvas*. Tendai doctrine was used to give the system more coherence. The term *Sannō* (mountain king) by which this form of Shintō was known consisted of two characters, the first made up of three vertical strokes joined by a single horizontal stroke and the second consisting of three horizontal strokes and one vertical stroke. The very name of the cult called to mind the unity of the three truths. The separation of Shintō and Buddhism during the Meiji Restoration resulted in the independence of the Sannō cult from Tendai.

**Precepts and monastic discipline.** Near the end of his life, Saichō proposed that the *Four-Part Vinaya* ordination traditionally used throughout East Asia be abandoned as inferior Hīnayāna and that a Mahāyāna ordination based on

the Mahāyāna *bodhisattva* precepts found in the *Brahmā's Net Sūtra* and *Lotus Sūtra* be substituted for it. Neither source had been compiled with the objective of serving as the basis of monastic discipline. Perhaps in recognition of this, Saichō had proposed that his monks receive a “provisional Hīnayāna ordination” after spending twelve years on Mount Hiei. This would have enabled the monks to participate in monastic assemblies with monks from other schools. One week after his death the court approved Saichō's proposal, but his premature death had prevented him from specifying how this change was to be implemented.

During the subsequent centuries the precepts were interpreted in a variety of ways based on these sources. For example, *Questions and Answers on the Rules for Students* (*Gakushōshiki mondō*), a later text attributed to Saichō, claimed that the precepts were primarily based on the *Lotus Sūtra*, a text that actually contained little in the way of explicit instructions concerning monastic discipline. Monks could violate the precepts as long as they adhered to the *Lotus Sūtra*, a vague requirement. During the late Heian period and the Kamakura period a number of monks attempted to introduce stricter interpretations of the precepts. Shunjō (1166–1227) traveled to China, learned that Tiantai monks were still ordained with the precepts from the *Four-Part Vinaya*, and returned to Japan to introduce the practice to Tendai. He was criticized by other Tendai monks for deviating from Saichō's plan and had to make his headquarters at Sennyūji in Kyōto.

The monks in the Kurodani lineage of Tendai combined the *Lotus Sūtra* with the precepts of the *Brahmā's Net Sūtra*. Ejū (d. 1289) and Kōen revived monastic discipline by following Saichō's instructions for a twelve-year period of sequestration on Mount Hiei. At the end of that period a monk received a “consecrated” ordination (*kaikanjō*), which was based on *hongaku* thought. Sitting side by side with his teacher in a scene reminiscent of the two buddhas that appeared together in the *Lotus Sūtra*, the student was told that he had realized buddhahood with his current body. The tradition, however, carried the seeds of its own degeneration because the new “buddha” was told that he could create new precepts and teachings as needed.

Ninkū, who was active in both the Tendai and Seizan sect of the Jōdo School, relied on a commentary on the *Brahmā's Net Sūtra* by Zhiyi and detailed sets of temple rules to restore monastic discipline. A key part of his agenda was identifying the *Brahmā's Net* precepts as a Perfect teaching and thus as profound as the *Lotus Sūtra*. He also argued that the *Brahmā's Net* precepts should not be interpreted in terms of Esoteric Buddhism and Pure Land, thereby preserving the integrity of the precepts. When they had been interpreted in terms of these other traditions, the argument could be made that the recitation of the Buddha's name (*nembutsu*) or a magical incantation (*dhāraṇī*) would vanquish huge amounts of bad karma.

Finally, as mentioned above, during the Tokugawa period several monks from the Anrakuritsuin on Mount Hiei attempted to require all Tendai monks to undergo ordinations based on the *Four-Part Vinaya* but were eventually defeated. Thus Saichō's reform of monastic discipline led to a wide variety of interpretations of the precepts, many of which contributed to the lax observance of monastic rules.

**Pure Land.** The ninety-day constantly walking meditation, one of the four meditations described by Zhiyi, focuses on the circumambulation of an image of Amida (Amitābha) accompanied by the recitation of Amida's name, progresses to a visualization of the Buddha, and concludes with a contemplation on emptiness. This meditation provided the ritual basis of Tendai Pure Land but was performed only infrequently according to Zhiyi's directions on Mount Hiei. Although Saichō had specified that all four of Zhiyi's types of meditation be practiced on Mount Hiei, he did not live long enough to put the constantly walking meditation into effect. Ennin brought the first Pure Land practices used on Mount Hiei when he returned from China, a practice called the Uninterrupted Recitation of the Buddha's Name (*fudan nembutsu*) from Wutai Shan, China, that was based on rituals instituted by Fazhao (d. 820? CE). These practices consisted of the recitation of the *Omituojing* (Sūtra on Amitābha) rather than the much simpler recitation of the Buddha's name mentioned in the constantly walking meditation. The practice generally lasted only seven days, shorter than the ninety days required by Zhiyi, and became popular in Japan. It was more concerned with extinguishing the karmic effects of wrongdoing and being reborn in the Pure Land than with the discernment of emptiness. Thus from the beginning Tendai Pure Land ranged over a variety of possible practices and goals, from meditations that focused on a realization of emptiness or the Pure Land in this life and world to oral recitations that resulted in rebirth into a paradisiacal Pure Land when one died. This ambiguity was reflected in the term *nembutsu*, which could refer to either a meditation on the Buddha or the recitation of his name.

Genshin, the most able Tendai exegete of the tenth century, systematized Tendai Pure Land thought. Although he was skilled in doctrinal topics, including Hossō and logic, he is primarily remembered for his authorship of the *Ōjō yōshū* (Essentials of rebirth in the Pure Land), a text that included many of the ambiguities in practice and goal mentioned above because the practices could be used by a variety of people. The text included vivid descriptions of the hells and Pure Land that influenced many. Temples such as the Byōdōin reflected efforts to create architectural images of the Pure Land. Genshin's text also included discussions of deathbed rites and doctrinal issues connected with Pure Land. It had an immediate effect leading to the formation of several organizations devoted to Pure Land practice, including the Assembly for the Advancement of Learning (Kangaku-e) and the Assembly for the Concentration on the Twenty-five Bodhisattvas (Nijūgo zanmai-e), groups that included both lay

and monastic practitioners. Pure Land practices were later spread by a variety of men with Tendai affiliations, including Kōya (903–972 CE) and Ryōnin (1072–1132), founder of the Yūzū nembutsushū. Hōnen, founder of the Jōdoshū, spent most of his life as a Tendai monk, and Shinran (1173–1263), founder of the Jōdo Shinshū, was trained on Mount Hiei.

Some Tendai practitioners considered Pure Land practices easier because the recitation of the Buddha's name could be done by anyone and vanquished large amounts of bad karma. For other practitioners, Pure Land practice was difficult. Uncertainty about whether one's rebirth into the Pure Land was assured led some to focus incessantly on the purification of their thoughts. Salvation was only ensured at death when the practitioner died comfortably with a mind focused on the Buddha. Such fervent practice sometimes led to vivid dreams and visions of the Pure Land, events that were often recorded in the biographies of those reborn in the Pure Land (*Ōjōden*).

Pure Land practices in Tendai were not conducted separately from other practices. A popular saying, "Recitation of the *Lotus Sūtra* in the morning and the recitation of the Buddha's name (*nembutsu*) at night," reflects the typical Tendai attitude. Esoteric Buddhist practices were sometimes mixed with Pure Land rituals because Amida was found in various maṇḍalas. Moreover when Tendai followers stressed the oral recitation of the *nembutsu*, the contemplative aspect was also present. The emphasis on creating a Pure Land in this world coexisted with beliefs in rebirth in a Pure Land located far from this one. In addition, Tendai monks such as Ninkū and Shinzei (1443–1495) emphasized that the precepts must be observed while the *nembutsu* is chanted. Tendai views of Pure Land thus differed in important ways from Jōdo and Jōdo Shin traditions, which argued that the recitation of the Buddha's name was the only way to salvation.

PAUL GRONER (2005)

**TENGRI.** The earliest attested occurrence of a word in an Altaic language is the transcription into Chinese of the word *tengri* in the *Qian Han shu* (juan 94). It has kept this or a related form (*tenggeri*, *tanara*, *tāngri*, *tanri*, *tari*, et al.) down to the present day. Etymologically, the word appears to be linked with a verb that means "to turn." It has been used continuously, not only by the "shamanistic" or "animistic" Turco-Mongols but also by those who have adopted universal religions. I shall concern myself here only with its meaning in the former case.

The original use of the word *tengri* was in designating the physical sky, as in such statements as "The sun is in the sky" or "The clouds darken the sky." This long-held meaning eventually was lost. With the deification of the sky, the word took on two other interpretations as well, either that of sky god or the more vague sense of "god," "deity," and, adjectivally, "celestial" and "divine." It is not always possible to determine whether *tengri* is being used as an adjective or a noun.

**DEITIES NAMED TENGRI.** At the same time that Tengri the sky god emerges (second half of the first millennium CE), Old Turkic inscriptions mention various deities named Tengri, but little information is available on these. Yol Tengri is the “god of roads or paths” or “god of luck” (*yol* has these two meanings), Öd Tengri is the “god of weather”; there is a Tengri who lies among the reeds as well. No evidence indicates the nature of the relationship between these characters and the sky god. Any attempt to make such a determination is complicated by the fact that the same inscriptions more often refer to much greater divine powers that were never called *tengri*. “Venerated” or “worshiped” celestial bodies also were never called *tengri*.

From toponymy and foreign sources, we know that in certain cases mountains are called *tengri* (for example, Tengri Tag, “celestial mountain”; Chin., Tianshan), as are some lakes (for example, Tengri Nor, “celestial lake,” in Mongolia). To add to the confusion, an eleventh-century observer, Maḥmūd al-Kāshgharī, remarked that the word *tengri* applies to everything that appears enormous—a huge tree, for instance. Knowing this, it is no surprise today to see the sky god, who has a greatly attenuated reality, gradually replaced by great deities who are often called Tengri. Even if one has every reason to believe that the word is an adjective, does this usage not make a god out of a divine being or object? Such is the case with certain shamans, like the one who enthroned Chinggis Khan, Teb Tenggeri (“very celestial”); certain sorcerers (“a holy old woman”); the nation (“my sacred nation”); and most of the khans (“my holy khan”). In fact, there was a Türk sovereign who had no name but Tengri Khan (r. 734–741). Finally, scholars are unsure to what extent something called “blue” (in Turkic languages, *kök*; Mong., *köke*), in the sense of an attribute of the sky, is to be identified with God. Examples of this usage are found among the Turkic peoples and among the Mongols; as, for instance, in the case of the Mongol emperor Möngke: Köke Möngke (“blue eternal”).

**THE SKY GOD.** The modern Turco-Mongol peoples who have preserved their ancient religion have less of an interest in the sky god than previously. Most often, the sky is the abode of a celestial god, sometimes anthropomorphized, who has numerous assistants—his sons and daughters, his wife, and many others. The sky is divided into levels, generally seven according to the supposed number of planets. Even in areas where Russian Orthodoxy or Buddhism has had little influence, there are many unstable *tengris*, a fact that corresponds perfectly to the traditional ideology. All attempts to classify them are wholly imposed from without and lack foundation in the tradition. As for the sky god, in areas where belief in him persists, he is nonetheless considered to be very distant. The Altaic tribes call him Tengere Kaira Khan (“merciful lord sky”), but his sons and assistants hold the real power, notably the power of creation: they are Bai Ülgen alone or together with Kysogan Tengere and Mergen Tengere. The great god of the Yakuts is Iuriung Aïyy Toïon (“white lord creator”) or Aïyy Toïon. It is believed that he

gradually became a *deus otiosus*. In fact, it appears that he has always been such for the masses. As early as the tenth century, Balik Bayat, “supreme old one” or “supreme wealthy one,” is regarded as the creator. I must point out, however, that the ancient cosmogonies are inconsistent and that the problem of origins has only recently been addressed. When creation was later attributed to the sky god, it seems likely that it was in response to questions posed by Muslims or Christians.

The active sky god is an imperial creation that concerns only the imperial religion: the people devoted attention to him only in times when imperial power was sufficient to command widespread obedience to the deity. Occasionally, sincere devotees of the sky god would appear. Such mystics were claimed to be “slaves of Tengri,” but no Islamic influence can be discerned in this appellation. The sky god appears already before the common era among the Xiongnu, then later, continually, in all the great political formations up to the fourteenth century. Under the Türk (sixth to eighth century) and under the Mongols (thirteenth to fourteenth century), he is particularly visible. The former call him “blue,” “elevated” or “above,” and “endowed with power”; the latter add to these qualities that he is “eternal,” a characteristic supposedly long implied.

It is not an exaggeration to say that no other deity has responded so much to the needs of his loyal followers. The Turco-Mongol emperor first wanted to gather all those of his race, then the entire world. His god was national (the Tengri of the Türks and Mongols), then universal and unique. There is but one god in the sky and one sole sovereign on earth: such is the ideology. It represents a desperate but unsuccessful effort to promote monotheism; the other deities remained alive in the minds of the people and were more or less associated with the sky god. Even so, the sky god is as predominant as the emperor himself, who “comes from him,” “resembles him” (and is sometimes his son), conducts privileged conversations with him, receives and transmits his orders, conquers in his name, names dignitaries in his name, rewards and punishes with death (the only punishment of Tengri, used often against those who revolt), distributes to everyone, man or beast, *kut*, a vitality that brings happiness, and *ülüg*, luck. Nevertheless, the sky god can do without the emperor when he is weakening or has lost his divine mandate. In such a case he “applies pressure,” or sends his messengers: an eagle, an enigmatic angel, some rays of light often accompanied by “dazzling daughters,” or the animal guides, particularly the wolf, who are none other than the imperial ancestors. Anyone can talk to the sky god, but shamans are forbidden to have closer relationships with him than the prince does: any pretension of having such a relationship will lead to the shaman’s destruction. In contrast, great respect is shown to all those who are specialists in spirituality, notably to foreign priests who are protected and exempted from taxes on the condition that they pray for the emperor’s longevity.

It appears that in ancient times the Tengri cult thrived for only short periods; nevertheless, it developed rapidly. Sacrifices of white horses or other animals were offered to Tengri annually or daily, usually on fixed dates or during special events. Prayer itself spread and became an essential element in the Tengri cult in the thirteenth century. Great orisons were conducted by the sovereign from an elevation where, over a period of time lasting from one to three days, he continually bowed in prayer to the sky with bare head and loosened belt. It has always been common practice to go around in a circle on horseback: this is called “going around the sky.”

It is a common belief among practitioners of the Tengri cult that souls reside in Tengri before their incarnation and that the souls of the deceased return to him. In fact, when a death is announced, one says “He flew off” or “He became a gyrfalcon.” The destination is specified: “He climbed to the sky with his body” and “In the sky you will be as among the living.” However, beliefs probably concern particularly great personages and those who will be needed in the beyond to serve them.

#### BIBLIOGRAPHY

For the most part, the sky god of the Altaic peoples has been studied in works relative to their religion, particularly contemporary beliefs. Wilhelm Schmidt, in his perspective of primitive monotheism, accords Tengri an eminent place in *Der Ursprung der Gottesidee*, vols. 9–12 (Münster, 1949–1955). Paul Pelliot has written primarily a linguistic work: “Tängrim> Tärin,” *T'oung pao* 37 (1944): 165–185. The only monograph is my “Tängri: Essai sur le ciel-dieu des peuples altaïques,” which appeared in four parts plus additional notes in *Revue de l'histoire des religions* 149 (January–March 1956): 49–82, (April–June 1956): 197–230; 150 (July–September 1956): 27–54; (October–December 1956): 173–212; and 154 (July–September 1958): 32–66.

*Translated from French by Sherri L. Granka*  
*Revised Bibliography*

**TENRIKYŌ.** A monotheistic Japanese religion established in 1838, Tenrikyō preaches a doctrine of world renewal and individual salvation. Its founder, Nakayama Miki (1798–1887), received a revelation from Tenri Ō no Mikoto (also known as Oyagami, or “God the parent”), and became Kami no Yashiro (“the living shrine of God”). According to

Tenrikyō church tradition, God revealed himself through Nakayama in order to deliver people from individual sufferings and social evils, and to prepare the way for the *kanrodai sekai* (“perfect divine kingdom”), in which humankind will enjoy *yōkigurashi* (“joyous and blissful life”) in union with God the Parent. Tenrikyō spread rapidly throughout Japan during the tumultuous eclipse of the Edo period (1600–1868).

**HISTORY.** The eldest daughter of Maekawa Masanobu and his wife Kinu, Maekawa Miki (later, Nakayama Miki) became a pious devotee of Pure Land Buddhism early in life. Although she wished to become a nun, in obedience to her parents’ wishes she married Nakayama Zembei in 1810. In her marriage she affirmed the values of worldly life through moral compassion toward others and devotion to Shintō deities. The revelation she experienced in her forty-first year resulted in a dedication to almsgiving, leading her family into extreme poverty. She affirmed her credibility by working miracles, teaching that divine protection was attainable only through a life of sincere piety. Her mission to achieve the new world order of *kanrodai sekai* was misunderstood by many, and she and her followers were persecuted for many years, she herself being imprisoned several times.

Despite intensifying persecution, Nakayama wrote two books, the *Mikagurauta* and the *Ofudesaki*, taught her disciples the movements for the Kagura Zutome (“salvation dance service”), the essential rite in Tenrikyō, and determined the location of the *jiba*, the sacred spot that is believed to be the original birthplace of humans. On the morning of January 26, 1887, she urged her disciples to perform the Kagura Zutome (which had been prohibited by the police), asking them to decide for themselves whether the laws of humankind or those of God are supreme. As they performed the service around the Kanrodai, a symbolic monument erected at the *jiba*, Nakayama died. Her followers believed that she had passed from a corporeal to a spiritual state, remaining in her sanctuary and helping them to realize God’s kingdom in this world. Nakayama’s ascension to this new state, together with the *hinagata* (“model life”) she exemplified, became the focal point of the Tenrikyō faith.

After her passing, God spoke through Iburi Izō (1833–1907), Nakayama’s most trusted disciple. The *Osashizu* was compiled from revelations made to him and fostered the emergence of a structured Tenrikyō church system. Tenrikyō was sanctioned by the government and officially classified as one of the sects of Sect Shintō in 1888. The church was then forced to alter its teachings and activities to conform to government policies. Nevertheless, Nakayama’s teachings were retained intact and spread throughout Japan by 1895. Missions were established in the United States in 1896, in Taiwan in 1897, in Korea in 1898, and in China in 1901. After World War II, with the guarantee of religious freedom under the 1947 Constitution, the Fukugen (“restoration of the original teachings”) movement was carried out to purify Tenrikyō teachings, which had been distorted by the influ-

ences of Shintō and state nationalism. This movement marked a step toward a redefinition of Tenrikyō as distinct from Sect Shintō. By the 1980s, Tenrikyō had approximately three million followers, with 16,664 churches and 20,039 mission stations scattered worldwide. Tenrikyō also operates social and cultural institutions, including a university, a library, a museum, a publishing house, a hospital, and an orphanage.

**DOCTRINE.** Tenri Ō no Mikoto (“lord of heavenly reason”), as revealed through Nakayama, is the creator of the world, and is also defined as the *moto no kami* (“original god”) and the *jitsu no kami* (“true god”). God has ten attributes, which are manifested symbolically as *tobashira no kami* (“ten deities”), each representing a particular aspect of God working in the physical world. God is further posited as Tsukihi (“sun and moon”) and finally as Oyagami (“God the parent”), revealing his pantheistic and immanent nature as well as his transcendental and personal existence. He is the god of parental love, who created the world in order to enjoy seeing the harmonious life of human beings. Believing in neither original sin nor the fall of man, Tenrikyō holds that the revelation was necessary to rectify human selfishness, which is contrary to God’s original intent. The revelation occurred through three preordinations—the soul, the place, and the time—which are historically manifested in the soul of Nakayama, the *jiba* (the place of the original creation), and the time of revelation. This triad comprises the core of the Tenrikyō doctrine, and emphasizes the historical inevitability of the revelation.

Tenrikyō defines human physical existence as a *kashi-mono-karimono* (“something lent or borrowed,” i.e., from God) and death as a *denaoshi* (“restart”). The progressive purification of the human heart is recognized through the process of reincarnation. Its ethical teaching is founded upon the doctrine of *yatsu no bokori* (“eight dusts”), consisting of *oshii* (“grudge”), *boshii* (“covetousness”), *nikui* (“hatred”), *kawaii* (“selfish love”), *urami* (“enmity”), *haradachi* (“fury”), *yoku* (“greed”), and *kōman* (“arrogance”). These are defined as pollutants to be cleansed in order to uncover one’s true nature and attain a state of *makoto-shinjitsu* (“sincere piety”). Salvation requires three activities. Receiving *osazuke* (“the holy grant”) is the most important rite; it enables one to be reborn at the *jiba* and to become an agent of God to help others through prayers. Performing *hinokishin* (“daily service”) in one’s given social position is another means to achieving personal maturity. Last, frequent pilgrimages to the *jiba* are urged to renew one’s faith and to enjoy a blissful and joyous life in union with God.

**SCRIPTURES.** The essential Tenrikyō canonical texts are the *Mikagurauta* (Songs for the sacred dance), the *Ofudesaki* (Tip of the divine writing brush), and the *Osashizu* (Divine directions), the first two personally written by Nakayama under divine inspiration and the third revealed through Ihuri. Written between 1866 and 1875, the *Mikagurauta* consists of five sections. The first three comprise the verses

for the Kagura Zutome service. The fourth, containing eight verses, and the fifth, consisting of twelve stanzas of ten verses each, are the songs for the Teodori (Sacred Dance) service. Revealed to Nakayama between 1869 and 1882, the *Ofudesaki* is composed of seventeen parts comprising 1,711 verses written in the 5-7-5-7-7-syllable *waka* style. This scripture introduces the basic creed of Tenrikyō and elucidates the creation of the world, the nature of God, the significance of the *jiba* and the Kanrodai, and the importance of the Kagura Zutome.

The *Osashizu*, a large collection of directions revealed to Ihuri from 1887 to 1907 after Nakayama’s passing, is divided into two categories: *kokugen* (prophesies and directions to meet the exigencies of salvation) and *ukagai no sashizu* (directions in response to individual inquiries). The *Osashizu* contains concrete and detailed instructions concerning church organization and personal conduct, and offers Tenrikyō adherents guidance for solving the problems of daily life.

*Revised Bibliography*

**TERESA OF ÁVILA** (1515–1582), epithet of Teresa de Ahumada y Cepeda, Christian saint, Spanish mystic, reli-

gious reformer, and author of religious classics. Teresa was born at Ávila in the Castilian region of Spain on March 28, 1515, the third child of Don Alonso Cepeda, a moderately wealthy merchant. She was a spirited child, and early in life she began to manifest deep religious feelings. When she was seven she and her eleven-year-old brother ran away from home, intending to go to the country of the Moors and offer themselves for martyrdom. Later, writing about the episode in her *Life*, she said that she had done this because she “wanted to see God.” However, the adventure ended abruptly a few meters outside the walled city of Ávila when the two children met their uncle, who promptly took them home.

In her early teens Teresa took a great interest in clothes, read romantic stories, and apparently had a romance with a cousin. When she was fifteen her mother died at the age of thirty-three, having produced nine children, and her father sent Teresa to board at Our Lady of Grace Convent, a kind of finishing school for girls from comfortable families. She remained there for a year and a half, and during that period her contact with the Augustinian nuns prompted her to start thinking about a religious vocation.

Illness forced Teresa to leave the school, and she went to live with a sister to recuperate. She began to visit the Carmelite Convent of the Incarnation in Ávila to talk about becoming a nun. One of the nuns later recalled the charm and beauty of the nineteen-year-old Teresa. In 1535, at the age of twenty, Teresa entered the Convent of the Incarnation, where she remained for twenty-eight years until she left to found her own reformed Carmelite convent. At the time of Teresa’s entrance the convent had 140 nuns, and although the reform movement was to emanate from it, there was nothing scandalous about life there; it was simply a comfortable and not particularly demanding existence. The nuns, especially those from affluent families, lived in a suite of rooms, often attended by a servant. They were able to visit freely outside the convent, and they spent long hours each day in the parlor visiting with outsiders. Teresa lived this type of life until she was about forty, when she experienced what she called her “conversion” while reading the *Confessions* of Augustine. From that point until the end of her life, she followed a rigorous personal program of discipline and prayer that culminated in frequent religious experiences in which she saw the Lord and heard him speak. Teresa herself described these experiences as “intellectual visions and locutions.”

For seven years after her “conversion” Teresa continued to live at the Incarnation, but she began to plan the establishment of a small Carmelite convent that would follow the original Carmelite rule of 1209, which had been mitigated by Eugenius IV in 1435. She claimed that she had been encouraged to do this in her visions, but at first, there was much opposition from the nuns in the convent and other ecclesiastics. She finally obtained permission from Rome, and on August 24, 1562, along with four other nuns, she established in Ávila a convent of discalced Carmelite nuns. The

word *discalced* (lit., “without shoes”) referred, in the religious parlance of the time, to a reformed group that usually went barefoot or in sandals. Teresa’s reformed convent in Ávila was dedicated to Saint Joseph, and the nuns who lived there followed the original Carmelite rule, rather than the mitigated one observed at the Incarnation. This meant a much stricter observance of such conventual disciplines as fasting, silence, and restriction of contact with outsiders.

Teresa, who now called herself of Teresa of Jesus, remained at that first convent for just over four years, a time later described as “the most restful years of my life.” Her original intention had been to establish only that single reformed convent, but in 1567 the Carmelite general, Giovanni Rossi, on a visitation from Rome, approved Teresa’s work and commanded her to establish other convents. During the next fifteen years she would personally found about one convent per year in Spain, and after her death similar reformed Carmelite convents were established all over the world.

While she was still a nun at the Incarnation, Teresa began writing an account of her life, a task she completed during the first years of her reform. She always called it her *libro grande*, but it was only the first effort in an impressive body of Christian literature. These works, never originally intended for general publication, were written at odd moments during a busy career of religious administration. She wrote four major prose works, a series of shorter works, poems, and numerous letters, of which 445 are extant. Principal among these works are *Foundations*, which describes her adventures in founding convents, *Way of Perfection*, which explains prayer, and *Interior Mansions*, which describes the dimensions of spiritual and mystical growth. Her works are considered Christian masterpieces, and she is undoubtedly one of history’s great authorities on mysticism.

Teresa also developed the idea of establishing religious houses of reformed Carmelite men. She obtained permission from the general in Rome and in 1568 opened the first monastery of reformed Carmelite friars at Duruelo, twenty-five miles from Ávila. One of those original friars was Juan de Yepes y Alvarez, who was to be known to history as John of the Cross. Soon there were reformed Carmelite monasteries all over Spain, and eventually they spread around the world.

In 1582 Teresa founded the last of her fifteen convents, at Burgos. On her return trip to Ávila she was taken ill and stopped at her convent at Alba de Tormes. At sixty-seven, suffering from uterine cancer, she died there on October 4, 1582. Paul V beatified her in 1614; Gregory XV canonized her in 1622; and Paul VI, who called her “the light of the universal church,” declared her a doctor of the church in 1970.

#### BIBLIOGRAPHY

Teresa’s own writings constitute the fundamental source for her life and doctrine. The standard editions are *The Complete Works of Saint Teresa of Jesus*, 3 vols. (New York, 1946), and *The Letters of Saint Teresa of Jesus* (Westminster, Md., 1949),

both translated and edited by E. Allison Peers from the critical Spanish edition of Silverio of Saint Teresa. *Saint Teresa of Avila* (Milwaukee, 1943), by William T. Walsh, is a full and standard biography of her life, while Marcelle Auclair's *Saint Teresa of Avila* (New York, 1953) combines splendid scholarship with excellent literary style. John Beevers's *Saint Teresa of Avila* (Garden City, N. Y., 1961) is a fine and insightful short study of her life. E. Allison Peers's *Handbook to the Life and Times of Saint Teresa and Saint John of the Cross* (Westminster, Md., 1954) provides invaluable information about the social and religious milieu in which Teresa lived.

PETER T. ROHRBACH (1987)

**TERTULLIAN** (160?–225?), Quintus Septimius Florens, first Christian theologian to write extensively in Latin. An African, Tertullian laid the foundations for Western theology through the range of issues he addressed and his precise formulations. Although he became an adherent of the Montanist sect, his thought exerted much influence on Cyprian, bishop of Carthage (248–258), and later Latin authors.

**LIFE.** Little is known of Tertullian's life. Data supplied by Jerome in his *Lives of Famous Men* (392–393) were apparently inferred from remarks in Tertullian's own writings and are now generally discounted by scholars. Probably born and reared in Carthage, he received an excellent education and was considered one of the luminaries of his day. Although he employed considerable legal jargon and argument in his writing, he probably cannot be identified with the jurist Tertullianus whose opinions were cited in the *Digest* and *Codex Justinianus*. His extensive legal knowledge would have come from classical education.

Tertullian converted to Christianity around 193 to 195, doubtless attracted by the discipline of Christians, especially their willingness for martyrdom. His unusual gifts, education, and commitment quickly propelled him into a position of leadership, but, contrary to Jerome's assumption, he was never ordained a presbyter or elder in the Carthaginian church, identifying himself several times in his writings as a member of the laity. He did, however, preach or teach, for several of his writings are sermons.

Sympathetic by inclination with the rigorous views of discipline held by the Montanists, a charismatic sect that originated in Phrygia about CE 170, Tertullian veered toward that sect as the catholic church in North Africa moved away from it. For him this entailed no radical shift in views, but rather a hardening of certain ones held earlier on remarriage, flight to avoid persecution, and repentance for serious sins—all of which, as a Montanist, he prohibited absolutely. His new affiliation notwithstanding, he continued as the chief spokesman against gnosticism and Marcionism and as the major theologian in the West until Augustine.

After several years in the Montanist camp Tertullian separated from them and formed a sect of his own called Ter-

tullianists, which still existed in Augustine's heyday (c. 400–430). This schism could well have resulted from the growing tendency of Montanists to make exaggerated claims for their founder Montanus, as Tertullian was horrified by any ideas that were not thoroughly orthodox.

Throughout his career Tertullian belonged to the literary circles in Carthage. In his writings he cited numerous classics, perhaps drawn in part from anthologies but certainly also from works he knew in depth. As a stylist, he surpassed both Jerome and Augustine. He was a creative and passionate debater whose erudition and technique place him in the second Sophistic movement. The exact date of his death is unknown.

**WRITINGS.** Tertullian's writings, thirty-one of which are extant, are notoriously difficult to date. They were once neatly divided into pre-Montanist, or catholic, and Montanist, according to "Montanistic" allusions. Recent studies, however, have demonstrated Montanist leanings not only in Tertullian but in early North African Christianity, hence this method has been discarded and the dating of many works revised.

The writings range across a wide spectrum, but they can be conveniently grouped under the headings of apologies for Christianity, treatises on the Christian life, and antiheretical works. In the summer of 197, Tertullian drafted two apologies, *To the Nations* and *Against the Jews*, the latter intended for Christian readers but never completed. Shortly thereafter, he revised *To the Nations* and published it as the finely argued and highly stylized *Apology*, his best-known work. In *On the Testimony of the Soul* he departed from his custom of citing scriptures and elaborated a purely psychological argument set out briefly in chapter 17 of the *Apology*. Years later, in 212, he reiterated in summary form arguments of the *Apology* in an appeal addressed to Scapula, proconsul of Africa, to halt the persecution of Christians.

Tertullian reflected a characteristic rigorist bent in the sermons and treatises on Christian life he composed throughout his brief career; his tone merely became sterner in Montanist days. In what is probably his earliest writing, *On the Shows*, dated 196 or early 197, he explained why Christians should not attend pagan games, theatrical productions, or contests. He saw no hope for the person who attended, for "he openly 'denies,' who gets rid of the distinctive mark by which he is known." To go from church to the shows is to go "from sky to sty." In *On Idolatry* he widened his prohibitions. Christians had to live with pagans, he said, but they did not have to sin with them. In *On the Dress of Women*, at least part of which was composed in his catholic years, he urged Christian women to set themselves apart from pagan women in clothing, adornment, hair style, and even in the way they walked. About the same time he exhorted Christians in *The Martyrs* to view prison as a place of withdrawal from the corrupt world and their imprisonment as discipline for heavenly citizenship.

In other treatises titled *On Baptism*, *On Prayer*, *On Repentance*, *On Patience*, and *To His Wife*—now dated between

198 and 203—Tertullian exhibited similar tendencies to distinguish Christian from pagan life. Those being baptized should come not to have sins forgiven, he insisted, but “because they have *ceased* sinning.” For those who sin after baptism martyrdom is “a second baptism.” In some contrast to his later stance in *On Modesty*, written about 210 or 211, Tertullian reluctantly followed the *Shepherd of Hermas* (c. 140) in permitting repentance for serious sins following baptism, but he openly expressed admiration for the Montanist prohibition of second marriages and refusal to grant forgiveness to fornicators or adulterers. In *To His Wife* he urged her, first, not to remarry if he should die, but then, if she should nevertheless marry again, not to marry a pagan. *On Modesty* classified second marriages, whether after the death of a spouse or not, “the same as adultery” and labeled Hermas “the shepherd of adulterers.” In *On Patience* Tertullian lauded patience as the Christian virtue *par excellence*, especially in the face of death and martyrdom.

During his Montanist years, Tertullian sharpened the lines separating Christian and pagan. In *On the Wearing of the Laurel Wreath* he set forth the rule that whatever scriptures do not explicitly permit is forbidden. Since wearing the laurel was of pagan origins, it was idolatrous and thus prohibited for Christians, as was military service. In *On Flight in Persecution* Tertullian negated the more humane view presented in *To His Wife* and *On Patience* and sternly forbade escape. Persecution is God’s, not the devil’s, will, thus no Christian should flee. He saved his harshest words, however, for the Valentinian gnostics who encouraged the faithful to flee persecution. Their teaching he called the “scorpion’s sting” in a work bearing that title. In *On Exhortation to Chastity* and *On Monogamy* the formidable rigorist stoutly defended the Montanist insistence on a single marriage and preference for celibacy. Christian perfection, he argued, descended from virginity from birth, to virginity from the new birth, to continence within marriage. Against the Marcionites, however, Tertullian did affirm the sanctity of marriage. In *On Fasting* he commended also the zeal of Montanists for more fasts. In *On the Veiling of Virgins* he urged virgins to take the veil and flee the temptations of the world.

Apart from his curious defense of his wearing the pallium as an appropriate Christian “philosopher’s” dress, the remaining writings of Tertullian are antiheretical. Here, too, Tertullian manifested his separatist inclinations. “What has Jerusalem to do with Athens, the church with the academy, the Christian with the heretic?” he demanded to know. Like Irenaeus, he proceeded to set forth the “prescription” that heresy represented a departure from the truth that Christ delivered to the apostles and they to apostolic churches. He reiterated the point in the polemic *Against Hermogenes*, in which he countered the view that God created the soul from preexistent matter. In a more extensive work, *On the Soul*, Tertullian again took up his cudgels against the philosophers, “those patriarchs of the heretics.” Although grudgingly admitting that some philosophers had happened on the truth,

he himself insisted on obtaining truth from revelation, including that obtained through Montanist seers. A prophetess, for instance, confirmed his (and the Stoics’) concept of a corporeal soul. In his five books *Against Marcion*, the longest of his writings, and in the treatises *On the Flesh of Christ* and *On the Resurrection of the Flesh* he repudiated Marcionite and Valentinian views as being of pagan origin. Similarly, the polemic *Against the Valentinians* ridiculed the Valentinian system for inconsistencies and contradictions characteristic of pagan philosophies. Finally, in *Against Praxeas* he rejected modalism in godhead on the grounds of inconsistency and its conflict with “the rule of truth.”

**THOUGHT.** Tertullian labored assiduously to defend Christianity from the culture of his day. With that end in view he accentuated the authority of the rule of truth, a summary of the faith, and of the Bible interpreted more or less literally but with careful reference to context and his own situation. He also invented ecclesiastical Latin. These factors notwithstanding, he in no way equaled Irenaeus, whose treatise *Against Heresies* he invoked often, in development of a biblical theology. On the contrary, he drew many of his basic presuppositions from Stoicism and thus laid the ground for a distinctive Latin theology. His enduring contribution lay in his gift for finding apt formulas to state particular truths of faith.

Stoicism influenced Tertullian’s concept both of God and of the soul as corporeal. He asserted that nothing can exist without a body. Thus, even though God is spirit, God is also body. So also is the soul corporeal. If it were not corporeal, it could not desert the body.

From this important assumption Tertullian deduced another: the transmission of sin through generation. Every human soul is a branch of Adam’s soul; therefore, every soul inherits characteristics of Adam’s soul, including sin. Tertullian, however, did not add to this a conclusion Augustine reached, that is, that guilt is also inherited.

In his refutation of modalism Tertullian won a victory for the Logos Christology of the apologists and Irenaeus. The first to use the term *Trinitas* (“trinity”), he argued that one God is simultaneously Father, Son, and Holy Spirit, not successively, as Praxeas held. Simultaneity is possible if the Trinity is “one substance in three persons”: “three, however, not in unchangeable condition, but in rank; not in substance, but in attitude; not in office, but in appearance;—but of one nature and of one reality and of one power, because there is one God from whom those ranks and attitudes and appearances are derived in the name of Father and Son and Holy Spirit.” At the same time Tertullian recognized that to say the Son is “of one substance” with the Father poses a problem for his humanity and might lead, as it did later, to confusion as to the Son’s personhood. Anticipating later debate, he repudiated the idea of a mixing or confusion of natures in some *tertium quid*.

On some matters of doctrine Tertullian’s Montanism left a mark, although it is difficult to say exactly what the

mark was, since both Montanism and Tertullian adhered rather closely to primitive Christian views. Most significant was his acceptance of the eschatological framework of Montanist thought. According to this, the age of the Paraclete promised in *John* 14:16 was inaugurated by Montanus and the prophets Priscilla and Maximilla. The dawning of this dispensation signaled a time of new prophetic revelations and of greater Christian discipline—fasting, prohibition of second marriages, and willingness to suffer martyrdom. Christ was expected to return soon and set up his millennial kingdom with headquarters at Pepuza in Phrygia, Montanus's hometown. In the interim the church would be divided. On the one side were the psychics, on the other the pneumatics. The former, catholics, would not accept the discipline of the new prophecy; the latter, Montanists, would. In line with this understanding of the church, the Montanist Tertullian shifted his views of ministry so as to give a greater weight to prophecy.

Given his allegiance to Montanism, a sect increasingly regarded as heretical, it is remarkable that Tertullian had so great an impact on later Christian theology. This must have been due not to his personality but to his unquestioned orthodoxy on most matters and his genius for coining just the right phrase.

SEE ALSO Montanism.

#### BIBLIOGRAPHY

An excellent critical edition of the whole corpus of Tertullian's writings now exists in the *Corpus Christianorum*, Series Latina, vols. 1 & 2 (Turnhout, Belgium, 1954). A complete translation can be found in *The Ante-Nicene Fathers*, vols. 3 & 4 (Grand Rapids, Mich., 1956). Numerous recent works have debated critical problems regarding Tertullian's life and thought. A searching examination of biographical and literary matters is to be found in Timothy D. Barnes's *Tertullian: A Historical and Literary Study* (Oxford, 1971). A valuable older work, by James Morgan, *The Importance of Tertullian in the Development of Christian Dogma* (London, 1928), is in need of updating. Most recent studies have focused on particular aspects of Tertullian's theology, but Gerald L. Bray's *Holiness and the Will of God: Perspectives on the Theology of Tertullian* (Atlanta, 1979) has attempted a more comprehensive treatment. T. P. O'Malley's *Tertullian and the Bible: Language-Imagery-Exegesis* (Utrecht, 1967) also supplies helpful insight into this important aspect of Tertullian's writings.

E. GLENN HINSON (1987)

**TESHUB** was the Hurrian god of the storm. His name, also spelled *Teshshub*, *Te*, and *Teya*, is attested in theophoric Hurrian personal names in documents from Mesopotamia, Syro-Palestine, and Anatolia. Since the few Hurrian religious texts from outside the Hittite sphere are still somewhat poorly understood, most of what we know about the god, his mythological roles, and his cult is from Hittite Anatolia.

During the last two centuries of the Hittite kingdom (c. 1400–1200 BCE) Teshub was the chief god of the pantheon, with his cult center at Kummiya. He was the son of Anu (An), the sky god. His wife was the goddess Hebat. He had four brothers: Aranzakh (the Tigris River), Tashmishu, and two others whose names are unknown, and a sister, Shuwshka, who was the goddess of love and war. Teshub and Hebat had a son, Sharruma, and a daughter, Allanzu.

Teshub is represented anthropomorphically in low relief on the rock walls of the sanctuary of Yazilikaya, near Bogazköy (Bittel, 1975, pp. 167–169), standing upon two unnamed anthropomorphic mountain gods and holding a club in his right hand. At the head of a procession of male deities, he meets and faces his wife, Hebat, the principal goddess of the pantheon, who heads a procession of goddesses. Around Teshub are represented other members of his immediate family. His size and position on the relief are in keeping with his rank as the chief god of the Hittite empire, but otherwise his dress and complements are those of a normal Hittite storm god.

In the mythological texts Teshub is always referred to by one of the two cuneiform signs for “storm god,” not by the name Teshub. In the first myth of the so-called Kumarbi cycle, usually titled *Kingship in Heaven* (English trans. in Pritchard, 1969, pp. 120f.), Anu, who had usurped the throne of kingship over the gods from Alalu, is driven from his throne by Alalu's son Kumarbi. During the struggle Kumarbi bites off Anu's penis and swallows it. Anu curses Kumarbi and promises that from the seed thus implanted in Kumarbi five gods will be born, to defeat and depose him. The first one mentioned (and therefore the eldest) is Teshub.

In the sequel, called the *Song of Ullikummi* (ibid., pp. 121ff.; Güterbock, 1951–1952), the god Kumarbi, whom Teshub has displaced as head of the pantheon, seeks to overthrow him by means of a stone monster named Ullikummi, whom Kumarbi had engendered through having sexual intercourse with a huge boulder. Thus the pattern of the offspring of a former king of the gods overthrowing his father's successor, which was set in *Kingship in Heaven*, continues. Teshub is first defeated by the monster and must hide, but he eventually triumphs with the help of the god Ea (Enki).

A prayer of King Muwatallis is addressed principally to Teshub, called the Storm God of Kummanni. Although this is the only prayer in the Hittite archives addressed primarily to Teshub, other Hittite prayers contain sections in which subordinate deities—Teshub and Hebat's children or grandchildren, and once even Teshub's bull, Seri—are asked to intercede with Teshub or Hebat for the person praying. The Hittite archives also contain descriptions of religious festivals in honor of Teshub and Hebat (Laroche, 1971, pp. 123ff.).

**TEXTILES.** Processing fiber into thread and transforming those threads into fabrics, possibly the oldest human technology, first appear on the cultural horizon during the Neolithic period, between twelve and fifteen thousand years ago. Not until the sixth millennium BCE, however, do fragments of textiles excavated at sites in central Europe and the Middle East provide evidence for their inclusion in ritual or religious contexts. These grave furnishings and occasional finds from refuse dumps suggest purpose and intent; however, the archaeological record is far from complete. The documentation of the actual meanings of many ritual practices involving fabric is, in most cases, relatively recent. Despite differences in time and space and the fact that few causal links exist among the cultures discussed here, the practices involving textiles in religious rites and ceremonies can be considered in three broad categories: (1) symbolic meanings associated with textiles, (2) ritual functions for textiles within religious practices, and (3) links between the sacred and the profane realms.

**TEXTILES AS SYMBOLS.** In most societies that developed textile technologies, cloth and its production served as metaphors for life. In Greek mythology, for example, three goddesses known as the Moirai controlled the lives of mortals. The Fates, as they are more commonly known, include Clotho the spinner, who creates the web of life; Lachesis, who measures its length; and Atropos, who cuts it. The physical act of interlacing prepared threads on a frame to create textiles is a powerful symbol. The spinning of thread, its winding onto bobbins, and the warping of the loom symbolize conception, gestation, and birth. The process of weaving evokes the vicissitudes of life, growth, and maturity. Cutting the cloth from the loom can symbolize death, but more frequently it symbolizes rebirth and renewal because the process creates an object that can then be used.

In parts of South Asia and the South Pacific the physical form of a newly woven cloth is tubular because the warp yarns are continuous and form an uninterrupted circle between the two beams of the loom. When the cloth is finished only a small section of the warp yarns remains unwoven. For normal use the textile is cut open across this area. The rich metaphorical potential of the continuous yarns in the uncut cloth became obvious to diverse groups within the Indonesian archipelago. Among the Sasak tribes on the island of Lombok in eastern Indonesia, three sacred tubular cloths are made for a child at birth by the eldest woman weaver in the family. These are stored in a sacred area of the house until needed. In the course of the hair-cutting, circumcision, and marriage rites, the warps of these textiles are cut. Although deceptively modest in appearance, these red, yellow, black, and white striped cotton textiles are endowed with significance affecting the general well-being of individuals. Farther west, on the island of Bali, the more elaborate *geringsing*, decorated with double ikat-patterns, have similar metaphorical significance. *Geringsing* also have a circular warp that must be cut to form a cloth. A single cloth, which may take over a year to produce, accompanies an individual throughout each life-crisis ceremony; ultimately it serves as a funeral pall for the corpse.

The associations with female textile "producers" reflect other, more nuanced cultural meanings. Across the ages dowries have involved fine textiles and the presumption that these specialized fabrics embodied a bride's skills to provide for and clothe the family. Entire industries in many parts of the world, like those still flourishing in Morocco, cater to the wedding trade and, despite their patriarchal commercialization, are evidence of the link between textiles and life processes. The productive and fructifying qualities associated with women are transferred to dowry textiles, which in turn function as fertility symbols. When juxtaposed with male symbols in metal or agricultural products, textiles evoke a complementary polarity, a polarity well illustrated in the archaeological and ethnographic record. The second-century CE graves of Dian nobles excavated in Southwest China at the sites of Shizaishan and Lijaishan, for example, contained bronze models of looms, other weaving tools, and sewing boxes in female graves; comparable male burials were furnished with bronze weapons and models of agricultural tools.

Together, tools or weapons and textiles symbolized completion and ideals of cosmic harmony. Echoes of this notion are found in legends of the ancient Mediterranean and Asian worlds that personified the annual conjunction of two stars within the Milky Way as the weaving maiden and the herdsman.

**RITUAL USES FOR TEXTILES.** In Jewish tradition the tassel or tzitzit at each corner of a man's tallith, which is worn as an undergarment, consists of eight strings and five knots wrapped in specific ways to equal the numerical value of one of the names of god. The numerical value of the word *tzitzit* (together with the eight strings and five knots on each cor-

ner) adds up to 613, the number of mitzvot, or obligations, in the Torah.

**Binding.** Present-day Hindu practice continues to use a thread or cord as the symbol of renewal, creating a closed circle that ties the worshiper to the principles of the faith. During *Upanayana*, a rite-of-passage ceremony, sacred cords are placed over the shoulders of adolescent boys to signify their eligibility for education within the caste tradition. For the brahman caste the thread is cotton; for the *kṣatriya* (warrior or ruler) caste the cord is hemp; for the *vaiśya* (artisan or merchant) caste the cord is wool. Women also use the sacred thread within rituals. For example, at the annual festival of the goddess Gauri, a cotton thread sixteen times the woman's height is wound into a skein and laid before images of the goddess. Later the skein is worn around the neck, then buried or burned.

Ritual bonding frequently uses textiles. The priest's stole that drapes the joined hands of a couple during the marriage ceremony in the Western and Eastern Christian Church in effect becomes the tie that binds man to woman and the couple to the church, reinforcing the sanctity of marriage. In many Muslim societies ritual bonding occurs when the bridal couple is invited to sit on a shared mat or textile. Among the Batak tribes of northern Sumatra the climax of the traditional marriage ceremony is the enveloping of the couple in a single textile by the bride's father. Other members of the immediate family are also wrapped in shawls during the course of the ceremony, further emphasizing the bonds this event celebrates.

**Offering.** Literally hundreds of blankets, bolts of cloth, and other utilitarian textiles, as well as great quantities of nontextile domestic and ritual goods, were amassed by extended family groups among the tribes of the northwest coast of North America for potlatch feasts. They were presented to guests or burned in extravagant demonstrations of exchange. In contemporary revivals, commercial cloth and clothing are exchanged. Although less dramatic, the imported Chinese white silk scarves patterned with Buddhist symbols and the simple Indian white cotton gauze scarves used by Tibetan Buddhists convey a similar sense of offering and sacrifice. In the wool-producing regions of the Tibetan Plateau these exotic imports were tokens of exchange between individuals upon meeting and offerings to images. Tibetans also offer rectangles of cotton cloth block-printed with prayers to the elements as acts of devotion. Flown from poles, suspended on lines, or tied to the roofs of temples and shrines, these textiles are literally destroyed by the winds that activate intercessions with the gods.

Funeral customs provide other insights into textile-offering practices. Although knowledge of the actual practice is far from complete, the archaeological record for pharaonic Egypt and pre-Columbian Peru is spectacular. The dry climates of the Egyptian desert and of coastal Peru have preserved vast quantities of textiles used in burial. Egyptians wrapped mummies of the dead in fine linen. Complete ward-

robes of clothes and household linens, reflecting the status and means of the individual in life, were also interred to provide the comforts of this earth in the next world. Along the dry south coast of Peru, pre-Columbian mummy bundles of aristocrats contain numerous finely woven and embroidered sets of wool and cotton clothes as well as large quantities of other fine textiles.

In China, where silk was a principal trade commodity as well as the imperial standard for the payment and collection of taxes, silk textiles played a major role in life and death. Throughout the centuries the number and quality of burial clothes reflected the status of the individual in life. The remarkably well-preserved chambered tomb of the Lady Dai at Mawangdui, Changsha, which dates from about 160 BCE, contained over twenty-seven items of silk apparel, including some twelve coats, forty-six rolls of uncut silk, and numerous silk wrappers and bags. During the later imperial period the custom of preparing clothes especially decorated with characters meaning "long life" (the so-called *shufu*, or "longevity" coats) arose, but burial clothes mainly copied an individual's official wardrobe, which designated rank at court. Archaeology has also revealed abuses of the rules of entitlement, such as the garments recovered from the tombs of Xu Fan (1463–1530) and his wife from Taizhou, Jiangsu province, in which the wife's robes outranked those of her husband by two ranks.

Although there are instances of funeral textiles recycled from life, such as the bridal garments used for the burials of Chinese women, which reflected a most exalted status in the rigid patriarchal society that largely ignored women, most were specially acquired for burial. The obligation and expense for a Confucian funeral were borne by the next generation of the family. By contrast, nineteenth-century aristocrats on the island of Timor in eastern Indonesia devoted considerable amounts of time and money to amassing quantities of prestige textiles for their own burials.

Sacrifices do not always involve fabrics of the greatest economic or aesthetic value. For some cultures specific textiles are produced for shrouds. The traditional burial clothing of Jews is a set of simple, untailed linen garments. In Bali the sacred cloths called *bebali* are in effect token textiles made only for offering. Loosely woven, they are too fragile for use; most are too small to function as clothing for the living. During the late imperial period in China and continuing into the twenty-first century, sets of paper clothes and models of bolts of silk are as offerings to the dead for the next life.

Textile offerings were important in rituals honoring personified deities. In pharaonic Egypt images of gods within cult temples were centers of elaborate ceremonies that imitated human life. Gods were awakened in the morning, fed, bathed, and clothed, taken on festive outings, and put to bed at night, not unlike the pharaoh, the living manifestation of god on earth. Aqlawasi (House of Chosen Women), often referred to as Virgins of the Sun, was a cloistered community

of Quechua noble women devoted to the cult of the Sun God. Among their duties was the weaving of clothing for the ruler or Inka, the embodiment of the Sun God on earth. Perhaps the most celebrated textile offering of antiquity was the annual Panathenaia in Athens, an event commemorated on the inner frieze of the Parthenon. The climax of the festival was a procession carrying the costly new peplos made by the women of Athens to the Acropolis and the presentation of this garment to the cult image of Pallas Athena.

Offerings of clothing to temple images were frequent occurrences throughout Buddhist, Hindu, Daoist, and Confucian Asia. In late imperial China, for example, where the giving of prestige cloths marked the New Year as well as birthday celebrations, many of the city gods were presented on these occasions with new robes, cut especially large and often without side seams, a fact frequently recorded in pious inscriptions by donors.

**Icons.** In some cultures textiles themselves are venerated. The effigies of the hearth deities worshiped by nomadic Mongols were made entirely of felt. These special effigies, called *ongot*, one identified as male, the other female, were kept inside the yurt. In Buddhism, before the development of a rich figural iconography following the second century CE, images of the Buddha's attributes, including his mantle and his throne with its textile-covered cushion, served the faithful as a symbolic focus for worship. The legend and the numerous illustrations of Veronica's veil or the much-celebrated linen shroud preserved in the cathedral at Turin, which bears a human image said to be that of the crucified Christ, are two examples of venerable textiles from the Christian tradition. Among Muslims the presentation of the cloth cover from a saint's tomb is a means of conveying blessings on an honored visitor.

Among the Toraja tribes of central Sulawesi, a group of sacred textiles called *ma'a* and *sarita* embody spiritual power. These textiles are heirlooms handed down through families; they are used for display on many ritual and ceremonial occasions. Some of these textiles are of local manufacture, but many are made of imported Indian cotton cloth that has been painted with Torajan symbols.

In Tibet, *maṅḍalas* depicting various deities in the Buddhist pantheon were constructed in the appliqué technique from Chinese silks and other exotic fabrics donated to monasteries. The most impressive examples were the gigantic *maṅḍalas* measuring over twenty meters in length that were displayed once a year against the facade of the Potala in Lhasa.

**Creation of a sacred place.** The place where a ritual or ceremony is performed may have a temporal as well as a spatial dimension. The suspension of normal time to create a temporal framework in which humans can commune with the supernatural can be aided by textiles in several ways. For example, the repeated use of textiles or sets of textiles, such as the red vestments and altar furnishings employed in the

Western Christian Church within the same context over time (e.g., for feast days of martyrs), emphasizes a sense of ritual cycle that is permanent despite the passage of real time. The use of the same textile within a sequence of events, as is done with the *geringsing* cloths from the island of Bali, achieves for the participant a sense of suspended animation. A third sense of ritual time is embodied in the notion of transformation: special furnishings or clothing can dramatize the transformation of a place into the presence of a god or of the individual into a servant or intermediary of the god.

Textiles also have spatial functions, creating a sacred precinct within a larger profane context. On the most fundamental level, textiles can provide a focus for ritual. The act of spreading a cloth, whether it is the simple linen textile that covers the top of the Christian altar or the elaborately patterned silk covers for the Buddhist incense tables, transforms a table into an altar.

The *kiswah*, the most important textile in Islam, covers the Ka'bah in Mecca, a square granite structure that immures the Black Stone. The stone itself predates the founding of Islam, but it became the most sacred relic of the religion and the focus of Muslim pilgrimage to Mecca. The *kiswah* is made of black silk with Qur'anic inscriptions woven or embroidered in gold. Covering a cubical structure roughly twelve meters high, the *kiswah* is a dramatic indicator of a sacred precinct. It is replaced annually, and the older textile is cut into pieces that are sold as relics.

Textiles suspended over a ritual area transform the space beneath to offer real or symbolic protection. Some are portable, like the wedding canopies common to many faiths. In effect they transform any space beneath them into a ritual area and are reused as occasion demands. Other canopies convey cosmological meaning. Those placed over altars or above images in Christian or Buddhist buildings, for example, serve as metaphors for heaven, contrasting the visual universe or firmament with the larger perceived but invisible heaven beyond.

The pierced quatrefoil canopy called *yunjian* in Chinese, meaning "cloud collar," which is placed on the apex of Mongol felt yurts, is of central Asian or southern Siberian origin. Its four pendant points promote spatial orientation with the cardinal points of the compass; the hole at the top is called a sky door and symbolizes the gate to heaven, through which the earth axis passes. The application of this shape around the necks of garments, which also arose on the steppe, conferred a notion of cosmic orientation to the wearer.

Fabric may also cover the area on which ritual occurs. Mats and carpets indicate places for prayer and meditation in most Asian cultures, which did not develop elaborate furniture for sitting but lived primarily on the floor. For example, small square woolen carpets decorated with Buddhist symbols were commonly used by Buddhist monks in Tibet. High-ranking clergy, however, often sat on silk-covered cushions.

Some floor coverings promote ideas of spatial orientation. Within many of the powerful agrarian empires across the world, the precise arrangement of specific floor coverings and other furnishings within a ritual area ensured the success of the ceremony. A fourth-century BCE text, the *Shujing* (Book of history), describes the proper procedure for setting up the offerings for the burial of a prince, with detailed instructions concerning the appropriate carpet, offering table, and sacrifice for each of the cardinal points within the tomb area. In other instances single textiles function as spatial indicators: the organization of motifs in certain Mongol, Turkish, and Chinese carpets within the rectilinear confines of the textile imply a correct alignment.

The most famed ritual floor covering, the so-called Muslim prayer carpet, is traditionally decorated with an arch at one end echoing the *mihṛāb* niche in the mosque, which orients prayer toward Mecca. However, the function of these carpets is independent of decoration, since they provide a spatial substitute for worship within a mosque to assist the faithful in discharging the obligation of prayer five times a day. No specific carpets are prescribed for the mosque floor. If anything were to be considered the first religiously prescribed floor covering, it would be the simple plaited palm-leaf mat used by nomadic Arabs. But once Islam came into contact with the artistically sophisticated cultures of western Asia, custom and taste dictated design. Historically, many carpets were merely decorative; however, some were undoubtedly used for prayer within the home.

Textiles have served as portable shrines for nomadic peoples, and some of these textile environments survive among settled populations. The *mahmal* tents used during the Muslim pilgrimage to Mecca are one example.

Textile curtains act as screens shielding sacred ritual areas and guarding access to them. Although a distancing device, these textiles afford the celebrants a ritual dramatic effect when they are suddenly parted to reveal mystery. The ark curtain or *parochet* (Hebrew, *parokhet*) is the main ritual textile within Jewish practice. Its precedents can be found in the tabernacle described in chapter 26 of *Exodus*. This record of one of the most celebrated of the portable ritual-textile environments profoundly influenced the ritual trappings of later Jewish and Christian practice. Within Ashkenazic tradition the standard *parochet* consists of a prestige cloth framed between two pillars and a lintel, a device previously thought to relate to sixteenth-century title pages from printed books. The form may well have more ancient precedents, however, recalling times when practice demanded large curtains hung between architectural bays to subdivide areas of worship. Archaeological evidence from the third-century CE synagogue at Dura-Europos in Syria reveals that a large curtain divided the area in front of the Torah shrine from the congregation. This custom of using curtains to subdivide spaces within religious and secular architecture was widespread in the Near East and the Mediterranean during classical times.

This pattern influenced early Christian worship as well. In the early centuries of the Christian era, large curtains were used to articulate space within the church or meeting room to accommodate different audiences. Part of the building was accessible to nonbelievers, and other provisions were made for those under instruction but not yet baptized. The faithful were divided into groups, with men and women occupying different areas; the clergy had an area around the altar. In the West large curtains disappeared from the interiors of religious buildings with the rise of the Romanesque architectural style around the year 1000. The *parochet* and the tabernacle veils of the Western Christian Church are humble reminders of times when interiors were lavishly decorated with textiles.

Large curtains remained in use in the Eastern Christian Church for a time, but the development of the iconostasis on which icons were displayed gradually replaced the portable curtains separating the sanctuary from the nave. The amphithyron, a smaller curtain that hung behind the central doors of the iconostasis, is all that remains of the more elaborate curtaining systems. Only in Ethiopian churches practicing Coptic rites do large dividing curtains survive.

The notion of concealment is present at other levels as well, particularly in practices that shield sacred paraphernalia from the eyes of the uninitiated or from direct contact with the profane hand. In the Christian Church the chalice and the Host, as well as many of the accoutrements used in the service, are only revealed at the appropriate moment in the ritual; at other times they are veiled from sight. The Torah mantles, made of the most costly silk and gold-enriched fabrics, the simple tie-dyed silk curtains that hang in front of the painted images of Tibetan Buddhist *maṅḍalas*, and the elaborately embroidered *epitaphios sindon* of the Greek Orthodox rite, which veils the chalice and paten, serve identical functions.

**TEXTILE LINKS BETWEEN THE SACRED AND THE PROFANE REALMS.** Throughout history textiles have conveyed both symbolic and economic meaning. Before the industrial age reduced most textiles to the realm of disposable consumer goods, all textiles possessed real value as the product of the labor invested in cultivating, spinning, dyeing, and weaving. These labor factors, as well as the materials, skills, and ritual meanings, conferred prestige that could be transferred. Many religious organizations relied on cloistered workshops to produce liturgical textiles. These establishments were often managed by women, whose textile production calls to mind specialized dowry manufacture. Some particularly time-consuming specialized techniques associated with these workshops are like pious acts of devotion embodying repetitive invocations and blessings. During the seventeenth and eighteenth centuries, secular schools for young noble women—like the Smol'nyi Institute founded by Catherine the Great and the Maison royale de Saint-Cyr established by Madame de Maintenon—were modeled on cloistered ateliers. These schools produced fine textiles for the church as well as for aristocratic households, as evidenced by the sur-

living fabrics dating from the late Medieval period. The largest number of textiles used within religious ceremony have neither ritual function nor meaning as religious symbols. Rather, their purpose is self-consciously decorative. Whether temporary or permanent, these textiles enhance ritual through splendid display. These decorations often featured fabrics that had been transformed from secular uses for the purpose. Many churches encouraged the donation of secular prestige textiles by the faithful as a meritorious deed, and this cache of prestige goods was available for recycling. Particularly valuable textiles were often used to wrap relics and other sacred items before placing them in reliquaries for storage. In the West many examples of the medieval silks survive only from these contexts.

Banners and hangings announce the special character of ritual space. They can be carried in procession or used for interior display. Most of these objects are showy and made of lightweight materials; some, such as the banners used in Buddhist temples, have long streamers that add movement as well as color to ritual space. Banners bearing images of deities convey popular iconography and may serve an informal educative function, but in general they are difficult to distinguish from comparable secular decoration.

Textiles that adorn the interior walls of worship halls, like the wall paintings many of them replaced, are commonly didactic. The painted cotton temple hangings from northern India, for example, often depict stories from Hindu mythology. Many of the tapestry sets woven for religious institutions in medieval Europe illustrate the lives of the saints or depict apocalyptic visions. In the West the popularity of such monumental textiles lapsed with the rise of the Gothic architectural style. The Graham Sutherland tapestry at Coventry Cathedral is an outstanding example of the twentieth-century revival of tapestry weaving that has affected contemporary Western Christian Church decoration.

Carpets may cover the floors, cushioning bare feet as in the mosques of Islam, decorate the space before the altar as in Christian practice, or wrap the pillars of the worship hall as in Tibet and China. In most cases these lavish displays are more apt to result from pious donation of secular goods than from ritual requirements.

A vast range of covers for lecterns, reading desks, books, scrolls, cushions, kneelers, and furniture utilize fine textiles. Textile valances enhance architectural settings. The *kapporet* (cover) placed over the Torah curtain transforms the Torah shrine into the mercy seat of the Ark of the Tabernacle. In East Asian religious contexts, elaborately embroidered valances were often added to the niches in which image shrines were placed. Some of these were special commissions donated to the temples. One popular Chinese Buddhist valance type was made as a patchwork by members of the congregation from personal textiles or from temple supplies of donated textiles.

In the same way that most vestments used by religions throughout the world were derived from secular clothing,

many of the decorative textiles that have become associated with ritual also have secular origins. One group of textiles in particular, however, remains virtually unchanged from its secular usage. Cloths of state, throne covers, footstool covers, umbrellas, and baldachins are statements of secular political power. They designate rank and position within the clergy (of Western Christian traditions, Judaism and Buddhism) for purposes of prestige and control rather than ritual.

#### BIBLIOGRAPHY

In the absence of a comprehensive investigation of textiles used in ritual and ceremony, information is scattered in many sources, and data are inconsistent from culture to culture. General references to the roles textiles play in ritual are in Michael V. Angrosino's *The Culture of the Sacred* (Prospect Heights, Ill., 2004), and Catherine M. Bell's *Ritual Theory, Ritual Practice* (New York and Oxford, 1992). A number of papers that cover the aspects of ritual textiles are in Lynne Milgram and Penny Van Esterik, eds., *The Transformative Power of Cloth in Southeast Asia* (Toronto, 1994), and Textile Society of America, *Sacred and Ceremonial Textiles, Proceedings of the Fifth Biennial Symposium of the Textile Society of America, Chicago, Illinois, 1996* (Minneapolis, 1997).

For the Christian Church, scholarship has focused largely on vestments. Identification of nonvestment textiles used in Christian ritual is in J. Wickham Legg's *Notes on the History of the Liturgical Colours*, Transactions of the St. Paul's Ecclesiological Society (London, 1882), and in Legg's *Church Ornaments and Their Civil Antecedents* (Cambridge, U.K., 1917). Among the best explanations of the origins and uses of textiles in Jewish ritual is Barbara Kirshenblatt-Gimblett's *Fabric of Jewish Life* (New York, 1977). This exhibition catalog to the collection of ritual and ceremonial textiles in the Jewish Museum collection is well illustrated and contains a good bibliography.

Specific aspects of the use of textiles within ancient and historical Western religious contexts are in Elizabeth Grace Crowfoot, "The Clothing of a Fourteenth-Century Nubian Bishop," pp. 43–51; Veronika Gervers, "An Early Christian Curtain in the Royal Ontario Museum," pp. 56–81; and Donald King, "How Many Apocalypse Tapestries?," pp. 160–167; all of which are in *Studies in Textile History: In Memory of Harold B. Burnham*, edited by Veronika Gervers (Toronto, 1977). In addition, this Festschrift contains Rita Bolland, "Weaving the *Pinatikan*, a Warp-Patterned *Kain Bentenan* from North Celebes," pp. 1–17, and John E. Vollmer, "Archaeological and Ethnographical Considerations of the Foot-Braced Body-Tension Loom," pp. 343–354, both of which discuss non-Western textiles. R. B. Serjeant's *Islamic Textiles: Material for a History up to the Mongol Conquest* (Beirut, 1972), which was originally published serially in *Ars Islamica* 9–14 (1942–1951), is the basic reference for Islamic textiles. A good source for both Islamic and East Asian carpets is M. S. Dimand's *Oriental Rugs in the Metropolitan Museum of Art* (New York, 1973). In addition to the catalog to the Metropolitan Museum's considerable collection, this volume includes a series of essays documenting the use of carpets in Asia as well as their earliest appearances in the West.

One of the best references for the East Asian region in English is J. J. M. de Groot's *The Religious System of China: Its Ancient Forms, Evolution, History, and Present Aspect, Manners, Customs, and Social Institutions Connected Therewith* (Leiden, 1892–1910). This six-volume study remains one of the best standard references on traditional religious practices in China. Leonardo Olschki's *The Myth of Felt* (Berkeley, Calif., 1949) contains a perceptive essay on the significance of this material in traditional Mongol society. Articles by international scholars documenting ritual use of textiles throughout the Indonesian Archipelago are in Mattibelle Gittinger, ed., *Indonesian Textiles: Irene Emery Roundtable on Museum Textiles, 1979 Proceedings* (Washington, D.C., 1980). Other Asian practices are discussed in Alice Beck Kehoe's *Shamans and Religion* (Prospect Heights, Ill., 2000); and Rosemary Crill, Steven Cohen, and Ruth Barnes, *Court, Temple, and Trade: Indian Textiles in the Tapi Collection* (Mumbai, India, 2002). References to textiles within the Tibetan context are in the five-volume catalog by the Newark Museum, *Catalogue of the Tibetan Collection and Other Lamaist Articles in the Newark Museum* (Newark, N.J., 1950–1971).

References to New World practices are in Laurie Adelson and Arthur Tracht, *Aymara Weavings: Ceremonial Textiles of Colonial and Nineteenth-Century Bolivia* (Washington, D.C., 1983), and Ann Pollard Rowe and John Cohen, *Hidden Threads of Peru: Q'ero Textiles* (Washington, D.C., 2002).

JOHN E. VOLLMER (1987 AND 2005)

**TEZCATLIPOCA** (“the smoking mirror”) was one of the four Aztec creator gods who arranged the universe and set the cosmic ages in motion through periodic celestial battles. Tezcatlipoca was sometimes cast as the supernatural antagonist of Quetzalcoatl, the deity associated with cultural creativity, urban order, and priestly wisdom. Yet Tezcatlipoca has the most overwhelming power and protean personality of any Aztec deity. Among his aspects were Itztli, a calendar god; Tepeyotl, an ancient jaguar-earth god; Ixquimilli-Itztla-coaliuhqui, a god of punishment; and Omacatl, the spirit of revelry. His many forms reflect the omnipotent character of numinous forces in Aztec religion. The range of Tezcatlipoca's power is perhaps best represented in his designation as “the enemy on both sides.”

As in all pictorial representations of Mesoamerican deities, Tezcatlipoca's costume contains elements crucial to his identification. His primary emblem, a smoking mirror made of obsidian, is often depicted as a circular disk with a shaft through it and two curling forms representing smoke attached to the edges. The mirror emblem is located either in the deity's headdress or in place of one foot. According to one source, his foot was bitten off by an earth monster during the struggle for the creation of the world. On the social level, this emblem of the smoking mirror was intimately associated with the divine power of the Aztec *tlatoani* (king).

Tezcatlipoca's specific ritual significance was expressed in the great annual festival of Toxcatl. In book 2 of Fray Ber-

nardino de Sahagún's *Historia general de las cosas de la Nueva España* (compiled 1569–1582; also known as the Florentine Codex), we learn that for a full year prior to Toxcatl, Tezcatlipoca's *ixiptla* (deity impersonator) lived in the Aztec capital in complete splendor and honor, treated as a great lord. Usually a captive warrior, the *ixiptla* had to be physically perfect in size, proportion, skin color, and beauty. By women he was called “tall one, head nodder, handful of stars.” He moved regally about the capital dressed in flower headdresses and luxurious ornaments, carrying his smoking pipe and flute and speaking graciously to all who greeted him. Twenty days prior to his sacrifice at the height of Toxcatl, the *ixiptla* was given four beautiful maidens in marriage. Following his heart sacrifice to the Sun, his head was strung on the public skull rack in the main ceremonial center of Tenochtitlán. Of the dramatic turnabout in the life of Tezcatlipoca's impersonator, the Florentine Codex states: “And this betokeneth our life on earth. For he who rejoiceth, who possesseth riches, who seeketh and coveteth our lord's sweetness, his gentleness—riches and property—thus endeth in great misery. For it is said, ‘None come to an end here upon earth with happiness, riches and wealth’” (trans. Anderson and Dibble, vol. 2, p. 69).

According to the sacred historical traditions of the Aztec, which trace back to the paradigmatic kingdom of Tollan (900–1100 CE), Tezcatlipoca, a great sorcerer, drew uncanny powers from his obsidian mirror in a struggle against the Toltec priest-king Topiltzin Quetzalcoatl (“our young prince the feathered serpent”). Topiltzin Quetzalcoatl was tricked into drunkenness and sexual incontinence, which led to the utter collapse of his well-ordered city-state. Several primary sources suggest that the conflict between the great king and his magical antagonist was centered on Tezcatlipoca's desire to replace animal and insect sacrifice with human sacrifice.

**THAI RELIGION.** Thailand must be counted as one of the preeminent Buddhist countries in the world. Official figures place the percentage of Buddhists in a population of 47 million in 1980 as more than 95 percent. If those, mainly of Chinese and Vietnamese extraction, who follow Mahāyāna and Confucian traditions are excluded from the census category of Buddhists, wherein they are officially subsumed, still well over 90 percent of the populace of Thailand can be counted as adherents of Theravāda Buddhism. Despite the apparent uniformity of religion that such a characterization suggests, there are many facets of Thai religion. As different sectors of the Thai populace have attempted to find meaningful ways to confront fundamental problems of disease and death, threats of social disorder, and experienced or perceived injustices, they have turned to different types of religious practice, each with its own distinctive history. Although these different types can be said in some basic sense to belong to an encompassing tradition of Thai Theravāda Buddhism, they are still sometimes in tension with each other.

**TRADITIONAL THAI RELIGION.** In 1292, Ramkhamhaeng (Rāma Khamhaeng), the king of the principality of Sukhōthai in what is today north-central Thailand, put up a stele on which was recorded the first known text in any Tai language—that is, in any of the languages spoken by the ancestors of such modern-day peoples as the Lao, the Yuan (Northern Thai), and the Siamese (Central Thai). The inscription is notable for being the first historical evidence that Tai-speaking peoples had become adherents of Theravāda Buddhism. Prior to the thirteenth century, Tai-speaking peoples living in northern mainland Southeast Asia and in southern China had followed animistic traditions based on beliefs in a realm of spirits (*phī*) and deities (*thāēn*) and in a vital essence (*khwan*) that made human beings, rice, and certain animals more than mere physical organisms. Some Tai-speaking peoples such as the Red Tai, or Tho living in northern Vietnam and northeastern Laos, remained animistic until at least the middle of the twentieth century. Others, such as the Siamese, the Yuan of northern Thailand, the Lao of Laos and northeastern Thailand, the Shan of Burma, and the Lue of southern China and northwestern Laos, while retaining beliefs in spirits and a vital essence, also came to understand the world in terms of the Buddhism of the Pali tradition.

Initially, Buddhism among the Tai, as among other peoples in mainland Southeast Asia, appears to have centered primarily on the cult of relics. The enshrinement of such rel-

ics in stupas and the placement of images and other reminders of the Buddha served to establish the presence of the Buddha in the domains (*muang*) of the Tai. Having accepted the Buddha, the Tai were open to the teachings of missionary monks belonging to what has been termed the “forest monastery” tradition who traveled from domain to domain in the fourteenth and fifteenth centuries. One of the most important consequences of the work of these monks was the establishment of *wats* (temple-monasteries) in villages as well as in court centers. The members of the *sangha* (Skt., *sangha*), or order of monks, who lived in these monasteries popularized the Dhamma, the doctrines of Buddhism, by using texts written in the vernacular rather than in Pali, the canonical language of the Theravāda tradition. Among the most influential were the *Sermon on the Three Worlds*, written by a prince of Sukhōthai in the middle of the fourteenth century, and sermons in the form of *suttas*, written probably in northern Thailand in the fifteenth century, that tell of the “blessings” (*ānisaṃsa*) acquired through ritual acts.

In the Buddhist worldview adopted by the Tai, all sentient beings—human, animal, demonic, and divine—are understood to be situated along a continuum of relative suffering, the place they occupy on the continuum being determined by the consequences of *kamma* (Skt., *karman*; Thai, *kam*)—that is, consequences of actions performed in previous existences. The differences among human beings—male and female, ruler and peasant, rich and poor, beautiful and ugly, healthy and sickly—can also be interpreted with reference to the theory of *kamma*. Tai continued to believe in a personal vital essence (*khwan*), in spirits (*phī*), in gods—now construed in Hindu-Buddhist terms as *devatā* (Thai, *thē-wadā*), as well as in “fate” or cosmic influence—notions adapted from Indian thought and conceived of as *khro?* (from Skt., *gṛha*, astrological mansion or the place of a planet in the zodiac) or *chatā* (from Skt., *jāta*, “born”). These beliefs, however, related to proximate, not ultimate, causes of fortune and misfortune. One’s *kamma* ultimately determined whether one could be successful in securing one’s wandering vital essence, in propitiating spirits, in worshiping the deities, or in dispelling cosmic influences.

A significant change of one’s position along the continuum of suffering could only be accomplished through accumulating merit (*puñña*; Thai, *bun*) and not acquiring demerit (*pāpa*; Thai, *bāp*). To “make merit” (*tham bun*) as a layperson one was to offer alms (*dāna*; Thai, *thān*) to the *sangha*. A male could also make significant merit through becoming a member of the *sangha* and subjecting himself to the monastic “discipline” (*vinaya*; Thai, *winai*). To avoid demerit one was to observe a code of morality (*sīla*; Thai, *sīn*) that ensured that one would transcend ignorance and resist the temptation to act so as to fulfill one’s lust, greed, or anger. The consequences of immoral behavior—such as punishment in hell (*naraka*; Thai, *narok*)—as well as of moral and meritorious action—such as rebirth in heaven (*sagga*; Thai, *sawan* from Skt. *svarga*) and eventual rebirth on earth

at the time of the next Buddha, Śrī Ariya Maitreya (Thai, Phra Sī Ān)—were detailed graphically in such sermons as the popular tale of the travels of the monk Mālaya to hell and heaven.

These Buddhist ideas, as well as the articulation of these beliefs with notions deriving from the pre-Buddhist past of the Tai, were organized into three major popular religious traditions followed by Tai-speaking peoples living in what is today Thailand. To this day, the ritual practices of the Siamese of central Thailand, the Yuan of northern Thailand, and the Lao of northeastern Thailand, while sharing some basic similarities, remain distinctive.

The Buddhist worldview adopted by Tai peoples shaped their orientation toward society. Fundamental to this order was the division between the sexes. The ideal Buddhist man should become a member of the *sangha* in order to pursue the Path. In practice, very few Tai men ever became members of the *sangha* for life, but it became the norm among all peoples living in premodern Thailand for young men to spend at least a *lenten* period of three months as either a novice or a monk. For women, a connection was made between the secular role of woman as mother and woman as nurturer for the religion. The hierarchical order of traditional society was understood in terms of differences in the karmic legacies that each person was assumed to have been born with.

Most monks in premodern Thailand acted primarily to preserve and transmit the local religious traditions of the communities where they lived. Although they traced their lineage to the “forest monastery” monks of the fifteenth century, there is no evidence to suggest that monks during the period between the fifteenth and nineteenth centuries were known for withdrawing from the world to devote their lives to meditation. Some monks, however, lived in monasteries that served as centers of study of the Dhamma. It was these monks who kept alive a tradition of Pali scholarship as well as of composition of vernacular religious texts. These centers were supported mainly by rulers of the traditional kingdoms or by lords of domains subordinate to the kings.

Kings and lords of premodern Tai realms and domains were held in popular belief to have the right to rule because they “had merit” (*mī bun*); that is, they had inherited at birth a large store of positive consequences of *kamma* from previous incarnations. They were expected to display their meritoriousness in their conspicuous support of the religion and in ensuring the peace and order of the worlds over which they held sway. This concept of merit can be seen to be similar to the Mahāyāna notion of compassion shown by *bodhisattvas* toward the world. Some Tai kings did claim to be *bodhisattvas*, but such a claim was far less common in Tai kingdoms than in those of premodern Burma.

In the major premodern Tai kingdom, the Siamese kingdom of Ayutthayā (1350–1767), court traditions, especially after the fifteenth century, showed strong Brahmanic influences, influences introduced from Angkor, which the

Siamese had conquered. When the new Siamese kingdom with its capital at Bangkok was founded in 1782, its first rulers downplayed the Brahmanic state cult in favor of such Buddhist activities as unifying the *sangha*, restoring the scriptures, and sponsoring public almsgiving. At the end of the nineteenth century, King Chulalongkorn (c. 1868–1910) restored many Brahmanic state rites in an effort to enhance the image of the monarchy. The observance of some of these rites persisted even after a coup in 1932 transformed Siam into a constitutional monarchy, but by the second half of the twentieth century they had assumed a more dramaturgical than religious significance.

**CONTEMPORARY RELIGION IN THAILAND.** Religion as practiced by the peoples living in what was to become modern Thailand was rarely rendered problematic to its adherents. Only when the world collapsed, as it did following the destruction of Ayutthaya by the Burmese in 1767, did people question the efficacy of traditional practice for making sense of their lives. The period between the fall of Ayutthaya and the founding of Bangkok in 1782 is notable for the appeal that Buddhist millennialism held for many. Millennial experimentation was brought to an end, however, when in 1782 General Cakkṛī deposed the then-reigning monarch, Taksin, who claimed to be a *bodhisattva*. Cakkṛī, as Rama I (1782–1809), the founding ruler of the present dynasty, laid the foundations for a new order by restoring peace throughout the kingdom and, indeed, by extending his political control even farther than his predecessors. He moved to purify the religion by purging the *sangha* of monks who were deemed not to be observing the Vinaya (disciplinary code), by convening a Buddhist council to ensure that the Tipiṭaka (Skt., Tripiṭaka), the Buddhist scriptures, were available in an error-free Pali form, and by promoting the study of both the scriptures and commentarial literature written in Pali.

The new order established by Rama I proved to be fertile ground for the development of a major reform movement led by a man who would become King Rama IV, better known as Mongkut. Mongkut, who served as a monk between 1824 and 1851, was stimulated by his conversations with Christian missionaries and other Westerners who had begun to come to Siam to search for what could be taken as the essential elements of Buddhist practice. He became the leader of a small coterie of monks who spurned what they considered to be “superstitious” accretions in traditional practice and turned to Pali scriptures and commentaries to find the basis for “true” Buddhism. When Mongkut became king (r. 1851–1868), his associates in the *sangha* became the vanguard of a new fraternity, one called the Dhammayuttika-nikāya (“the fraternity of those who adhere to the Dhamma”), in contrast to the larger fraternity, the Mahānikāya (Mahanikai), of monks who continued to follow traditional practice.

Under King Chulalongkorn, Mongkut’s son and successor, leading Dhammayuttika monks, and especially Prince Wachirayān (Vajirañāvararasa), another of Mongkut’s

sons and the head of the Dhammayuttika fraternity, were given effective authority over the whole of the *sangha* in Chulalongkorn's domains. Prince Wachirayān, even before he became prince patriarch (*sangharāja*) in 1910, was able with the backing of the king to bring monks from the several different local Theravāda traditions into a single national order. Prince Wachirayān also instituted reforms throughout the *sangha* on the basis of Mongkut's and his own interpretations of Pali texts. The religious reforms instituted by Prince Wachirayān became the basis for what might be termed officially sanctioned orthodoxy in contemporary Thai Buddhism.

Under King Chulalongkorn, Siam began a transformation into a modern state. To meet the threat of colonial expansion by the British and the French, Chulalongkorn instituted administrative reforms that entailed the replacement of local lords by centrally appointed officials who adhered to common bureaucratic norms. So long as Siam was ruled by absolute monarchs, however, it still retained an important characteristic of the traditional state; that is, order depended upon the personal efficacy of the monarch. This traditional characteristic was eliminated in the "revolution" of 1932, during which a group of nonroyal "promoters" forced King Prajadhipok (r. 1925–1935) to accept a constitution that proclaimed Thai sovereignty to rest not in the monarch but with the people as a nation.

Although the name Siam persisted for a time after 1932, modern Thailand can be said to have begun in this year. The revolution of 1932 focused attention on the question of who made up the national community of Thai, a question that emerged in the wake of large-scale migration of Chinese to Thailand, the integration of peoples of different traditions into a single state, and the drawing of clear territorial boundaries around the state as a consequence of pressures from neighboring colonial powers. Since 1932, successive governments have made use of a unified *sangha* and a statewide system of compulsory education to inculcate in the populace the idea that Thai nationalism is rooted in what is taken to be a common Buddhist heritage.

Both the reformation of Buddhism led by the Dhammayuttika fraternity and the emergence of state-sponsored Thai Buddhist nationalism served to stimulate a self-consciousness in many Thai about their religion. This self-consciousness, in turn, stimulated yet further changes in Thai religion. While the refiguration of Theravāda thought begun by Mongkut early in the nineteenth century reached a climax in the works of Prince Wachirayān, works that still today form the basis of religious studies carried out by most monks, a number of monks have continued to pursue significant theological inquiries. By far the most influential of contemporary Buddhist thinkers is Phutthathāt Phikkhu (Buddhadāsa Bhikkhu), who lives at a center called Sūan Mōk ("garden of liberation") in southern Thailand. Phutthathāt (b. 1906) has sought in lectures and writings to interpret the Dhamma with reference to the theologies of

other religions, most notably Zen Buddhism, and with reference to the experiences of Thai living in a much more secularized world than did their forebears. Writing for a more learned audience, the monk known under the title of Phra Rāṭhawaramunī (Rājavaramunī)—given name Prayut (b. 1941)—has sought also to make the Buddhist message relevant to modern life. His *Phutthatham* (*Buddhadhamma*), published in 1982, has been acclaimed as one of the most significant works on Theravāda ethics ever written.

The radical reformulation of Buddhist practice also begun by Mongkut and the founders of the Dhammayuttika fraternity has been carried yet farther by some monks. Ācān Man Phūritthatta (Bhūridatto Thera), a Lao-speaking Dhammayuttika monk from northeastern Thailand who died in 1949 at the age of 78, concluded early in his life that to follow the Path to ultimate salvation, one must withdraw from the world and devote one's life to meditation. His life as a *dhūtaṅga*, or wandering ascetic, became the model for many other monks. A number of his disciples, and the disciples of his disciples, known in Thai and Lao as *ācān* (Skt., *ācārya*), or teachers, have achieved fame as meditation masters and strict followers of the Dhamma. A new interest in the significance of meditation for Buddhist practice has also been strongly encouraged by a number of non-Dhammayuttika monks and lay masters. Phutthathāt's center, Sūan Mōk, and satellite centers elsewhere, like the forest retreats of the *ācān*, attract many laypersons as well as monks who wish to learn to meditate. In the 1950s Phra Phimonlatham (Vimaladhamma Thera; given name Āsatha), a high-ranking monk from Wat Mahāthāt, a major temple-monastery in Bangkok, introduced and worked to popularize a form of *vipassanā* ("insight") meditation that he had learned from a master in Burma.

Prior to the death of Prime Minister Sarit Thanarat in 1963, Thai governments considered the burgeoning popularity of meditation monks as potentially, if not actually, threatening to establishment Buddhism. Since the mid-1960s, however, the disciples of Ācān Man in particular have been accorded increasing official support, and the king and queen have been conspicuous in their patronage of these monks and in their attendance at the funerals of Ācān Man's major disciples. Forest monasteries today are popular retreats for urban laypersons who seek to temper their active involvement in the world with a detachment that comes from meditation practice. Meditation centers have also been established in Bangkok and other cities, not only by monks but also by the laity. Among the most famous lay masters is Ācān Nāēp, a woman. Since the late 1970s, Phimonlatham has also undertaken a program to stimulate the popularity of insight meditation in rural communities as well as in the cities and towns.

Although what might be termed the "meditation movement" has been accommodated to establishment Buddhism in Thailand, other movements have emerged in reaction to official orthodoxy and to government-sponsored Thai Bud-

dhist nationalism. Millennial uprisings in northeastern Thailand in 1901–1902 and resistance in the 1920s and 1930s by Khrübā Sīwichai (Siri-vijoyo Thera), a highly revered popular northern Thai monk, to the authority of the state-appointed *sangha* hierarchy were precursors to contemporary religious dissent in Thailand. In the mid-1950s and especially in the 1970s, a number of monks emerged as conspicuous critics of government policies. While most of these “political monks” could be considered leftists, there were also a number associated with right-wing causes. Of particular note is Kittiwutthō Phikkhu (Kittivuḍḍho Bhikkhu), who gained notoriety in the mid-1970s for arguing that killing communists was not murder as understood in Buddhist terms and thus did not produce demerit. Although only a few monks have taken active roles in Thai politics, there are many lay Buddhist leaders who have contributed to a widening discourse on the salience of religious values for public life. Among the best known of what might be termed “social gospel” Buddhists is Sulak Sivarksa, who has exerted significant influence through his numerous essays and the organizations he has helped to create.

Members of the laity have also assumed leadership roles in the many cults that have emerged and continue to emerge in contemporary Thailand. The typical cult is one in which a spirit medium (who typically would be a woman) is believed able to gain the assistance of her control spirit to aid a client who is ill or otherwise in distress. Some cults have assumed a wider significance; the most famous of recent years is one known under the name Samnak Pū Sawan (Center of the Heavenly Ancients). The male leader of this cult claimed to be the vehicle for the spirits of a number of famous men in Thai history, including a former patriarch of the *sangha*. As it developed, the belief system of the cult became increasingly syncretic, uniting Christian, Muslim, and Chinese elements with magico-Buddhist ones. In the late 1970s, the cult, which had gained thousands of followers, including several high-ranking military officers, took on a distinctly political cast as its leader sought to use it for promoting an international peace center that he would head. In 1981 the government attempted to arrest him, but he disappeared before the arrest was effected.

Although the ecumenicalism of the Samnak Pū Sawan movement was idiosyncratic, more significant connections between Thai Buddhism and other religions in Thailand have evolved in recent years. A number of Protestant and Catholic leaders have joined with Buddhist leaders in religious dialogue and in human rights activities. The smallness of the Christian population (about 0.6 percent of the total) has perhaps helped to encourage relatively good relations between Christians and Buddhists. In contrast, Muslims (who account for about 4 percent of the population) have found it much more difficult to relate to Buddhists. A Muslim-Buddhist dialogue may, nonetheless, prove to be a means leading to a reconstrual of Thai civil religion in other than strictly Buddhist terms.

Life in Thailand in the twentieth century has become increasingly secularized and rationalized as more and more aspects of experience are interpreted with reference to bureaucratic regulations, market transactions, technological processes, and scientific medicine. While these processes of change have led many Thai to turn away from traditional religious practices as being no longer significant to their lives, they have also served to make people aware of those experiences that do not make sense in terms of secular, rational meanings. It is the awareness of those illnesses that do not respond to modern medicine, of increasing disparities in wealth and power, of the potential collapse of order as occurred in Kampuchea, that leads many Thai to consider what ritual and ethical practices are most meaningful to them. This religious consciousness is what gives contemporary Thai religion its dynamic character.

#### BIBLIOGRAPHY

The collection *Religion and Legitimation of Power in Thailand, Laos, and Burma*, edited by Bardwell L. Smith (Chambersburg, Pa., 1978), contains several essays that trace the history of Thai religion and discuss the relationship between Buddhism and power in both traditional and contemporary Thailand. A. Thomas Kirsch's “Complexity in the Thai Religious System: An Interpretation,” *Journal of Asian Studies* 36 (February 1977): 241–266, provides a good introduction to traditional Thai religion. Stanley J. Tambiah's *World Conqueror and World Renouncer* (Cambridge, 1976) traces the history of Thai religion with reference to *sangha*-policy relations and his *Buddhism and the Spirit Cults in North-East Thailand* (Cambridge, 1970) details the elements of traditional religious practice as still found in a Lao-speaking community in northeastern Thailand.

A major source for traditional Buddhist cosmology as understood by the Thai is *Three Worlds According to King Ruang: A Thai Buddhist Cosmology*, translated with an introduction and notes by Frank E. Reynolds and Mani B. Reynolds (Berkeley, 1982). Lucien M. Hanks, Jr., considers the implications of Buddhist cosmological beliefs for Thai society in his “Merit and Power in the Thai Social Order,” *American Anthropologist* 64 (1962): 1247–1262. For discussions of gender ideas as shaped by the traditional Buddhist worldview of Tai peoples, see my essays “Mother or Mistress but Never Monk: Buddhist Notions of Female Gender in Rural Thailand,” *American Ethnologist* 11 (May 1984): 223–241, and “Ambiguous Gender: Male Initiation in A Buddhist Society,” in *Gender and Religions: On the Complexity of Symbols*, edited by Caroline Bynum, Stevan Harrell, and Paula Richman (Boston, 1956). The best study of the religious reforms of the nineteenth century is Craig J. Reynolds's “The Buddhist Monkhood in Nineteenth Century Thailand” (Ph. D. diss., Cornell University, 1973). See also Reynolds's “Buddhist Cosmography in Thai History, with Special Reference to

Nineteenth-Century Culture Change," *Journal of Asian Studies* 35 (February 1976): 203–220, and A. Thomas Kirsch's "Modernizing Implications of Nineteenth Century Reforms in the Thai Sangha," *Contributions to Asian Studies* 8 (1975): 8–23.

The structure and ritual practices of established Thai Buddhism are discussed in Kenneth E. Wells's *Thai Buddhism: Its Rites and Activities* (1939; reprint, Bangkok, 1960). Jane Bunnag's *Buddhist Monk, Buddhist Layman: A Study of Urban Monastic Organization in Central Thailand* (Cambridge, 1973) describes establishment Buddhism as she observed it in the old capital of Ayutthayā. On the government's control and use of the Thai *sangha* in the twentieth century, see Yoneo Ishii's "Church and State in Thailand," *Asian Survey* 8 (October 1968): 864–871; my "Buddhism and National Integration in Thailand," *Journal of Asian Studies* 30 (May 1971): 551–567; J. A. Niels Mulder's *Monks, Merit and Motivation*, 2d rev. ed. (DeKalb, Ill., 1973); Somboon Suksamran's *Political Buddhism in Southeast Asia: The Role of the Sangha in the Modernization of Thailand*, edited by Trevor O. Ling (London, 1977); and Tambiah's *World Conqueror and World Renouncer*.

The theology of Phutthathāt is examined at some length by Louis Gabaude in "Introduction à l'herméneutique de Buddhadasa Bhikku" (Ph. D. diss., Sorbonne, 1979); also see Buddhadasa's *Toward the Truth*, edited by Donald K. Swearer (Philadelphia, 1971). Phra Rāṭchawaramunī's *Phutthatham* (Bangkok, 1982) has been reviewed at some length by Sulak Sivaraksa in the *Journal of the Siam Society* 70 (1982): 164–170. The role of Ācān Man, his disciples, and other meditation masters in Thailand have been analyzed by Stanley J. Tambiah in *The Buddhist Saints of the Forest and the Cult of Amulets* (Cambridge, 1984). Also see Jack Kornfield's *Living Buddhist Masters* (Santa Cruz, Calif., 1977).

My article "Millennialism, Theravāda Buddhism, and Thai Society," *Journal of Asian Studies* 36 (February 1977): 283–302, discusses the major millennial uprising in modern Thai history. Somboon Suksamran in *Buddhism and Politics in Thailand* (Singapore, 1982), as well as in his earlier *Political Buddhism in Southeast Asia*, Tambiah in *World Conqueror and World Renouncer*, and several of the essays in *Religion and Legitimation of Power in Thailand, Laos and Burma* (all cited above), discuss political monks. Sulak Sivaraksa's *A Buddhist Vision for Renewing Society* (Bangkok, 1981) brings together several of the author's essays written in English. On religious and ethical self-consciousness of some Thai in the context of political-economic change, see also my article "Economic Action and Buddhist Morality in a Thai Village," *Journal of Asian Studies* 42 (August 1983): 851–868.

**THEALOGY.** In 1979 Naomi Goldenberg first used the word *thealogy* to denote feminist discourse on the Goddess (*thea*) rather than God (*theo*), proclaiming in her book *Changing of the Gods* (1979) that "we are about to learn what happens when father-gods die for a whole generation" (p. 37). Although father-gods are, in fact, alive and well in the world's religions, thealogy has become widely known to scholars of religion and gender and of emergent religion as a provocation to a spiritual and political shift away from the androcentric (male-centered) theological paradigm. Instead, thealogy offers a group of largely participant, experientially grounded texts that explore the many dimensions of female becoming: that of the Goddess, of women, and of nature as encompassing both of these.

Although thealogy is a product, at least in part, of the neo-romantic hippie movement of the 1960s and 1970s, it is also and more immediately a feminist project. Like Christian and Jewish feminist theology, thealogy developed from both the nineteenth-century proto-feminist vision of the feminine as a redemptive locus of moral and spiritual value and the sexual egalitarianism of the second wave secular women's movement. Rejecting the wholesale secularism of early second wave feminism, but drawing on the separatist elements of radical feminism, thealogy developed the feminist criticism of religion as the divinization of masculinity (patriarchy having, as Kate Millet once put it, "God on its side") not to relinquish the divine as such, but to repudiate exclusively masculine models of the divine.

Insofar as it serves the contemporary Goddess movement, thealogy might be said to be the discourse of a new women's religion (one of the very few living women's religions in the world today). Thealogy has emerged from a network of groups and journals, and from a small but growing academic literature with a predominantly North American, British, German, and Australasian readership. Although thealogy can now be studied in universities up to the doctoral level, it is itself resistant to the reintroduction of any totalizing monotheism or to any merely feminized conception of God. Rather, it is derived from feminist reflection on women's experience and on the sacral power of femaleness. There is no authoritative tradition or corpus to which the theologian must defer. It is a nonprofessional, non-normative

discourse both producing and produced by spiritual feminist ritual practice and celebration.

Thealogy's focus on female moral, spiritual, symbolic, and biological difference and its privileging of the divine and human bond between mothers and daughters have made it hospitable to lesbians and any who protest the erasure of the Goddess and her replacement by an exclusively male God styled as king, lord, father, or as a nonpersonal power whose transcendental otherness empties the natural, embodied world of its value. It is notable, however, that thealogy is not without its male adherents and sympathizers. These are especially to be found in the pagan elements of the men's spirituality movement and in modern Witchcraft, or Wicca—arguably the only Western religion that honors the female as an embodiment of the divine. Indeed, thealogy is often, but not invariably, a function of feminist Wicca, where women ritually align their energies with those natural and biological forces whose “Goddess-power” can be channeled or “drawn down” to the purposes of creative change.

However, not everyone in the Goddess movement is willing to espouse a thealogy. There is little doubt that a significant proportion of Goddess feminists would regard thealogy as the arrogation of their experience by an elite minority of feminist academics. Precisely because it is a discourse, thealogy might also seem epistemically superfluous—women already find and know the Goddess in the processes of their own embodiment and in the very fabric and energies of the natural world immediately around them.

**THE DISTINCTION BETWEEN THEALOGY AND FEMINIST THEOLOGY.** Thealogy is something of a boundary discourse. There are those on the gynocentric or woman-centered left of Jewish and Christian feminism who would want to term themselves *theo/alogians* because they find the vestiges of the Goddess or “God-She” within their own traditions as Hochmah, Shekhinah, Sophia, and other “female faces” of the divine. Others would consider thealogy to be inherently pagan in that paganism already honors a female natural/divine principle (albeit one whose powers are balanced by a male generative principle). Paganism also celebrates the transformatory power of female sacrality and repudiates the monotheistic (masculine) legal dispensation of salvation and (masculine) saviors offering redemption from the sin that is so often premised on a redemption from female sexuality.

While it shares much of paganism's religious orientation, thealogy and late-twentieth-century feminist theology have in common an original political impetus and an ecofeminist, relational, inclusivist attempt to reclaim women's history and female experience—especially that of mothers. Both thealogy and feminist theology are in sharp opposition to patriarchal conflict and economics. There is, however, a long-standing and regrettable mutual hostility between some Goddess feminists and Christian feminists. The latter are critical of thealogy's supposed accommodation of goddesses who represent patriarchal constructs of the feminine that are subordinate to male deities. Christian and other

feminists are also critical of what they consider to be thealogy's escapist historiography and its tendentious interpretation of traces of goddess worship in texts and landscapes. Thealogy's supposed ethical polarization of the masculine and the feminine is also rejected as unduly essentialist. For feminists in the biblical traditions, God may be like a mother, but is not herself the Mother. Likewise, thealogy's celebration of a divinity whose will is located in and mediated by natural forces, as well as its apparent detachment of women from the history of thought and culture, is widely considered by other feminists (both secular and religious) to be unhelpful to the cause of women. An ecological account of femaleness and of change seems to confirm the traditional patriarchal derogation of women as subrational and properly marginal to the political and historical process.

Christian and Jewish feminist theology countermands the gynophobia and misogyny of its traditions, persevering with faiths considered originally or essentially liberative. Thealogy, by contrast, argues that these traditions cannot make sense of or do justice to a woman's personal and collective experience; patriarchal religion is not merely inhospitable to women but also spiritually and politically harmful.

**CONCEPTS OF THE GODDESS.** Thealogy can be monotheistic, polytheistic, or nontheistic in character. The nonsystematic, nondogmatic fluidity of its conception of the Goddess allows it to move freely between technical distinctions considered, in any case, to be artificial. Most thealogy, however, postulates a single Goddess—“the Goddess”—in whom all the female divinities named in the world's past and present religions inhere. She is one who might be petitioned and who might reveal herself to the subject in dreams, visions, and the imagination.

The Triple Goddess invoked by feminist Wicca is probably the most characteristic of popular thealogy. Here the Goddess wears three aspects: maiden, mother, and crone. Considered the first of the world's religious trinities, the Triple Goddess hypostatizes the three aspects or stages of women's lives as they pass through girlhood into maturity and motherhood and on into postmenopausal old age. The Triple Goddess exemplifies how all change—both creative and destructive—is part of a cyclic and interdependent natural/divine economy. Incorporating all possibilities, she is not omniscient, morally perfect, or omnipotent.

For others—especially the theological avant-garde of the late 1970s and 1980s—the Goddess is not a real external divinity but a psychologically and politically liberating archetype offering women a new sense of self-worth. A variation on this theme is the view that the Goddess—the power and dance of being—is inseparable from the fullness of a woman's own becoming. Mary Daly, for example, uses the word *Goddess* as a metaphor or “verb” naming women's post-patriarchal self-realization and active participation in the powers of female being. Since thealogy can be contingent upon its author's shifting emotions and stage of life, thealo-

gians are generally content to subscribe to a fluid combination of all of these views.

Carol P. Christ and Starhawk are the world's most influential theologians. While Starhawk's thealogy informs and emerges from the communal political context of San Francisco's Reclaiming Network, Carol Christ's work offers the most focused theological discussion. Like many other Goddess feminists, Christ disowns goddesses who are or have been revered in patriarchal religions as mere aspects or attributes (sometimes violent or death-dealing) of a supreme male deity or who are subordinate to other male gods. Instead, in *Rebirth of the Goddess* (1997, pp. xv–xvi), she experiences and theorizes the Goddess as the reconnective power of intelligent embodied love that is the ground of all being: a source of hope and political and ecological healing that will reunite the world and the divine. Her foundational article “Why Women Need the Goddess” (1979) enumerates the reasons why women realize their spiritual and political power from celebration of the Goddess. However, for Carol Christ, the Goddess is also one to whom one might pray and who cares about the individual. Most recently, her book *She Who Changes* (2003) offers a relational thealogy that draws on the process philosophy of Charles Hartshorne to reimagine the changing world as the body of Goddess/God.

**THEOLOGICAL HISTORY AND ETHICS.** Thealogy construes the historical process as belonging to the nonlinear history of nature, which is itself a natural history of the Goddess and therefore of each female body. The female body—whether that of a woman or the earth itself—is a generative site of the transformative power of which time itself is a part. But since patriarchy is founded upon the continual historical and psychological “murder” of the Goddess and the appropriation of her power, history also has a temporal sequence: a history of erasure and suppression, whose knowing is mediated not so much through textual evidence as by one's ontological and physical situation in the landscape and sites associated with the Goddess. Theological history tells an archaeological, political, and ecological story of which the subject's own story is an inalienable part.

Although thealogical time is primarily and essentially nonlinear, its periodizations are derived from the work of feminist scholars such as Marija Gimbutas, Merlin Stone, Barbara Walker, and others who claim, on largely archaeological grounds, that the female divine was originally universally revered in apparently peace-loving matrifocal cultures dating from about 30,000 BCE. By about 2000 BCE invasions of Indo-European warriors were destroying the cult of the Great Mother, which went underground by the fifth century CE with the ascendancy of early Christianity, only to re-emerge in the priestesses and individuals who have discovered the Goddess in the late twentieth century. This temporal scheme has a narrative and psychological function in helping women to “remember” a time when their sacral, biological, and cultural power was revered.

Yet not all theologians are persuaded that this historiography is a necessary condition of thealogy; even those inclined to support the thesis of a primary and universal cult of the Goddess also allow that its value may be less historical than inspirational. It may be that a primary function of theological historiography is to offer a mythography that relativizes patriarchal religion and politics as neither original nor necessary to the world order, but rather an ecologically and spiritually unsustainable aberration.

It is arguable that thealogy's organicist conception of life is inimical to the establishment of ordinary ethical obligations and norms. The thealogical construal of creation and destruction as a single natural/divine process organically regulated by change rather than law can appear to weaken the distinction between good and evil. Traditional religious notions of human transcendence and perfectibility become, at best, otiose. Nonetheless, evil is not entirely naturalized by thealogy. The ecological connections between all living things and the meta-intelligence of nature impose a consequentialist practical ethic of restraint, generosity, and care. Cast as patriarchy itself, evil is politicized and prophetically named in ritualized direct action as the domination and exploitation of the Goddess/earth that tears the life-giving connections of her web and all that depends on it.

## THEATER SEE DANCE; DRAMA

**THECLA** was the most popular female saint after Mary in early Christianity. Thecla was widely remembered as a disciple of the apostle Paul in Asia Minor (modern Turkey). The original source for the Thecla legend was the second-

century *Acts of Paul and Thecla*, which reports her story as follows: When Paul comes to Thecla's hometown of Iconium preaching a gospel that emphasized the virtue of celibacy, Thecla abandons her plans for marriage and follows the apostle. This countercultural action provokes the anger of her fiancé, her family, and the local governor, who together conspire to have her burned at the stake. Thecla is saved only when a miraculous thunderstorm quenches the flames. Later, after being reunited with Paul, she is sexually assaulted on the road to Antioch by a prominent citizen of that city. She manages to rebuff her attacker, but he arranges to have her thrown to the beasts in the local arena. While in custody she receives support from a rich female patron, and in the arena she is defended by a lioness and survives the attacks of lions, bears, and bulls. She finally throws herself into a pool filled with ravenous seals, which are struck dead by a flash of lightning, and she baptizes herself in the water. After the awestruck governor releases her, she dresses herself in male clothes and begins to travel and teach the gospel after the fashion of Paul. Ultimately, Thecla takes her final rest at the town of Seleucia (modern Silifke, Turkey).

The North African writer Tertullian (*On Baptism* 17, c. 200 CE) provides the first external reference to the *Acts of Paul and Thecla*. He reports that it was composed by an Asian presbyter, but certain details in Thecla's story have prompted speculation about the folkloric origins of her legend. The prominence of female characters and the details of their social relations have led some scholars to argue further that the *Acts of Paul and Thecla* may have had roots in the storytelling practices of ascetic women. While such origins ultimately remain uncertain, Tertullian gives evidence that early Christian women appealed to Thecla's example to "defend the liberty of women to teach and to baptize" (*On Baptism* 17).

By the fourth and fifth centuries, devotion to Thecla as a saint and ascetic exemplar had become a widespread phenomenon in the Mediterranean world. The focal point of this devotion was her pilgrimage shrine, Hagia Thekla at Seleucia. Ancient sources describe large numbers of monks who lived in the vicinity and managed the shrine, including a community of female virgins in residence within the sanctuary area. Modern excavations at the site have uncovered the remains of three basilicas, a large public bath, and a number of cisterns. A flurry of architectural adaptation at the site in the late fifth century attests its rapidly growing popularity among Christian pilgrims.

Thecla's shrine was also the recipient of literary patronage. Later writers produced expanded versions of her legend, including accounts of her "martyrdom" at Seleucia—specifically, how she finally escaped her persecutors by disappearing into a large rock while still alive. The story was meant to validate the local veneration of Thecla as a true martyr, despite the absence of her bodily relics. The rock into which she sank became a local cultic marker, the site of the altar in her church. Finally, collections of miracle stories also doc-

umented the experiences of pilgrims who came to the shrine in search of healing, among them women from a wide range of social backgrounds.

The cult of Saint Thecla—that is, the social practices, institutions, and material artifacts that marked the lives of actual devotees—was not limited to Hagia Thekla at Seleucia. From Gaul to Palestine, devotion to Thecla was expressed through literature and art: her visual image appears on wall paintings, clay flasks, oil lamps, bronze crosses, wooden combs, stone reliefs, golden glass medallions, and textile curtains.

One region for which there is wide-ranging evidence of Thecla devotion is Egypt. Athanasius of Alexandria (c. 300–373 CE) refers to Thecla extensively in his writings to Alexandrian virgins, and his rhetoric presupposes that his female ascetic readers were already intimately familiar with Thecla's example. During the theological controversies of the fourth century, this community of women was exiled to the distant Kharga Oasis in the Western Desert of Egypt. Ancient wall paintings of Thecla that still survive in local cemetery chapels may provide evidence for the funerary practices of those ascetic women at the oasis. Alexandrian devotion to Thecla is also witnessed by the production of monastic *Lives* modeled after her example—among them, a series of legends about early Christian transvestite saints (monastic women who disguised themselves as men). Near Alexandria, a satellite shrine to Saint Thecla was established near the pilgrimage center dedicated to the Egyptian Saint Menas. Numerous pilgrim flasks with the image of Thecla paired with Menas survive from that site. Finally, the cult of Thecla was thoroughly “Egyptianized” in late antiquity with the production of new namesake martyr legends connected with locales in the Nile Valley.

Other regions have provided more scattered material evidence for Thecla devotion. Fourth-century golden-glass medallions with the image of Thecla among the beasts have been discovered at a cemetery in Köln, Germany. A church and catacomb in Rome are named after Saint Thecla, but no specific images or artifacts survive that might give information about her local cult in late antiquity. In Syriac Christianity, despite a lack of nontextual artifacts from antiquity, a rich literary tradition has been preserved, including a homily given by Severus of Antioch (c. 465–538 CE) on the feast day of Saint Thecla, and at least eleven manuscripts of the *Acts of Paul and Thecla*, the oldest dating to the sixth century CE. Finally, in North Africa, red ceramic pottery from the late fourth or early fifth century portrays the anonymous image of a female martyr, stripped to the waist and praying with arms outstretched between two lions. The details of the iconography have led some to argue that the figure is Thecla; however, it could just as easily be the representation of a namesake African martyr. A similar case appears on the gravestone of an Egyptian woman named Thecla, where the deceased is portrayed in the image of her patron saint.

The evidence for namesakes of Saint Thecla is fairly abundant in late antiquity, and the practice of naming one's child after the saint provides yet another window into the religiosity of her devotees. This religiosity was ultimately grounded in an ethic of imitation. Whether they were mothers or virgins, early Christian women who participated in Thecla's cult commonly saw themselves as striving to imitate her virtues as a female saint and martyr.

STEPHEN J. DAVIS (2005)

**THEISM** is the philosophical worldview that perceives the orders of existence (physical things, organisms, persons) as dependent for their being and continuance on one self-existent God, who alone is worthy of worship. Theists differ among themselves about the nature of God and the relation of God to these orders, but they close ranks against deists, who, in principle, exclude revelation and divine intervention in world order, and against pantheists, who identify God with these orders. Theists hold that God, transcendent creator of the orders, remains an indivisible unity as he sustains them in accordance with their capacities and his ultimate purposes.

In formulating their views, philosophical theists remind themselves of the many obstacles that impede the human

search for the true, the good, the beautiful, and the holy. They distinguish between the ultimate mystery of being and mysteries that vanish as human understanding increases. Aware that the last word on the mystery of being is beyond their grasp, they pursue the best clues to the relation of the ultimate reality to themselves and the quality of their existence. In the history of theism and of monism, it is almost invariably claimed that immediate experiences of the divine are the most authentic, inspiring sources of truth about the ultimately real, and that these religious experiences take priority over claims based on rational, moral, and aesthetic experience.

However, since religious experiences, including seasoned mystics, make conflicting claims about what is revealed, most philosophical theists (hereafter referred to simply as “theists”) will take into account the claims based on religious insight but will not grant them arbitrary priority over other interpretations of experience. Broadly speaking, the drift in theistic thinking is toward improving insight into the nature of God and the attributes that are essential for conveying his transcendence and immanence. This essay, in the main, stresses the drift of these reflections without expounding paradigm arguments as such, even as they have been articulated by great theists.

**ONTOLOGICAL ARGUMENT.** When Anselm, archbishop of Canterbury (1093–1109), formulated the ontological argument for God, he was expressing an invincible conviction: the human intellect is, in fact, gripped by at least one idea that, clearly understood, proves the knower’s kinship with the ultimate reality as inherently one and good. Anselm’s fascinating proposal is that every mind has the idea of a perfect being, namely, of “that than which nothing greater can be conceived” (*Proslogium*, chap. 2). The uniqueness of this idea is missed by any opponent who counters that to argue thus is like deducing the existence of an island from the idea of a perfect island; after all, any island, to be an island, must be perfect. But the idea of a perfect island is not “that than which nothing greater can be conceived,” namely, a self-existent being.

Proponents deduce that this one self-existent being is intrinsically immutable, omnipotent, omniscient, and good. These attributes dominate their interpretations of the perfection of this transcendent God’s immanence in the world orders. The conclusion of the ontological argument is not grounded in interpretations of human experiences of sense and of value. Indeed, the mind’s awareness of perfection is the guiding norm for evaluating claims based on these dimensions of human experience. Nevertheless, theists, whether or not they are sufficiently impressed by the ontological proof, usually explore the family of ideas associated with perfect being in order to help resolve conflicts that do originate in experiences of sense and of value.

**COSMOLOGICAL ARGUMENT.** The cosmological argument for God centers attention on the explanation of the dependable regularity of changes among the countless beings that

make up the spatiotemporal world and constitute it an orderly whole (a cosmos). The cosmological theist emphasizes that the cause-and-effect connections (and other relations) in this world are contingent and not self-existent, that they cannot of themselves ground the cosmic order assumed in so much theory and practice. The Theist therefore proposes that this, or any, cosmic order is the product of a self-existent cause. For without such a cause, the successions of beings and events, having no reliable frameworks of their own, are in fact happenstance. Moreover, the cosmos is a collective whole whose unity is actually contingent, unless the succession of beings and events is grounded in the activity of a self-existent cause. Such a cause is not one supreme being alongside other beings, and it cannot be conceived adequately on the model of any dependent being.

The argument thus far presented allows all contingent beings to be modes of the One, which is consistent with forms of monism. But, for reasons to be noted, the theist holds that the cause, although immanent in all orders, must not be conceived as absorbing them, as in panentheism, nor identified with them, as in pantheism.

While some theists regard such cosmological conclusions as logically demonstrative, most theists regard them as more reasonably probable than alternative explanations of the cosmos. “More reasonably probable” does not mean statistically probable, however. Because there can be no observation of a series of world orders (as there can be of, say, repeated throwings of dice), there can be no calculation of mathematically probable trends. After all, cosmological theists seek the explanatory ground for trusting connections (including statistical calculations) that underlie the uniformity of nature.

Some critics of cosmological theists charge that they commit the fallacy of composition in affirming that a whole of contingent parts must itself be contingent. For example, they contend that a whole of overlapping, contingent beings and events may logically be an everlasting cosmos. To this a cosmological theist replies that to explain cosmos by self-existent cause is, in fact, not to commit the fallacy of composition. Surely, there is no fallacy in concluding that a group composed of blind members is never more than a totality of blind individuals. Similarly, a whole composed of intrinsically contingent beings and relations cannot be other than contingent. Moreover, the theist points out that a continuous, everlasting contingency is still contingency and certainly no substitute for a whole, unified by a self-existent cause.

Theists and monists agree that the self-existent cause (the One) is indivisible and immutable. Were it composite or changing in any way, we would be back seeking an adequate ground for dependable change. Other philosophical considerations influence the theist’s and monist’s differing conceptions about the immanence of the transcendent One. But they agree, in principle, that analogical inferences from the dependent orders can serve as pointers to the nature of the One. They both discourage the mythological mode of

anthropomorphism in depicting the One. And it is on the foundation of the self-existent, immutable One as the essence of perfection that they proceed to refine conceptions of the transcendent One in itself and in its immanence within the dependent orders.

Thus, both theists and monists agree that the self-existent One is incorporeal, since corporeal being is limited by its spatial nature. But is this incorporeal One to be conceived as a person? For example, is its nature compatible with the influential, first formal definition of a person as proposed by Boethius (c. 480–525): “an individual substance of a rational nature” (*Against Eutyches* 6)? The line of reasoning that favors belief in the personhood of the One is fundamental also to the cosmological argument for the self-existent, immutable cause: any successive change cannot be a succession independent of an unchanging, unifying agent. Furthermore, a succession cannot be known as a succession apart from a nonsuccessive experience of succession. In the last analysis, reasoning itself is not possible without a time-transcending unity, free from limitations of corporeal composition. The self-existent cause is best conceived, therefore, as an unchanging, indivisible Person.

However, monists in the West (e.g., Plotinus, Spinoza, Hegel, F. H. Bradley) and in the East (especially Indian exponents of Advaita Vedānta, from Śaṅkara in the ninth century CE to Sarvepalli Radhakrishnan in the twentieth century) developed the concept of incorporeal unity, but they considered the attribution of any concept of a person to the suprapersonal One as misleading. The theist, nevertheless, contends that an infinite Person, inherently and fully rational, is the least misleading view of the contemporaneous One. Can the adherent of the suprapersonal One intelligibly deny that the One is self-aware and aware of all that is (omniscient)? Moreover, can we avoid theoretical shipwreck if the very insistence on the fathomless depths of the One leads to the conclusion that the finite person’s ideals of logic and of truth, goodness, and beauty bear, in principle, no trustworthy clue to the nature of suprapersonal unity?

Nor does the theist stop here. The spearhead of the theist’s rejection of an all-absorbing One is the conviction that the individual person experiences free will to choose between alternatives within his powers. The theist stresses that without free will it makes no sense to refer to conclusions as true or false. For a conclusion that cannot be drawn from a relatively free, impartial weighing of evidence for and against hypothesis is nothing but the outcome of the regnant play of factors in the knower. Such an outcome is one event among other events and is neither true nor false.

Furthermore, if personal free will is nullified, so is the difference between moral good and moral evil, since each depends on a person’s having the free will to choose between alternative courses of action deemed to be good or evil. It is such freedom of will that is vital to the theist’s conception of a person’s responsibility to other persons and to his inter-

pretation of a person’s relation to the physical, the subpersonal orders of being, and to God himself.

Hence, when the theist is told that the orders of being are ultimately machinelike and indifferent to the values of persons, or that the whole framework of things is a logical network that allows for no (supposedly capricious) free will, or when mystical union with the One is taken as indubitable evidence that a person is in fact only a particular center of God’s being, the theist will stand by a person’s experience of limited free will while pointing out the theoretical and moral consequences of its denial. This stand is basic to his conception of the Creator as person.

Although theists are not of one mind as to the self-existent Person’s relation to the order of physical things and of subpersonal living beings, they concur that God creates persons out of nothingness (*creatio ex nihilo*). This concept, unthinkable to any Greek or Indian philosopher, is admittedly mysterious, but what is posited must be understood in its context. *Creatio ex nihilo* does not mean that God, as it were, takes nothing and makes what he creates therefrom. Rather, he creates what did not exist prior to his creative act. God does not create from being(s) independent of him, nor does he create from his own being; the created orders do not emanate from his being. God creates persons to be free within their potential and in relation to the other orders. The Indian philosopher Rāmānuja (c. 1017–1173) argued against the absorption of persons in the distinctionless One (*brāhman*), as held in the prevailing *advaita* (nondualist) philosophy of Śaṅkara—although, in the end, he, too, insisted on their ultimate union with the suprapersonal One.

Does the creation of persons, free to develop their own potential and, within limits, their own environments, not conflict with the attribute of God’s omnipotent will? No, since God’s creating of free persons is self-imposed and is, therefore, an instance of God’s omnipotence.

But may not a person’s use of freedom influence the fulfillment of God’s purposes? On this, theists disagree, depending, in good part, on their conception of God’s other attributes. It is worth noting that often, when it seems that God’s attributes in effect conflict with each other, theists warn that God’s attributes must not be isolated from each other, since this would violate the indivisibility of God’s being. The application of this doctrine here supports the view that God’s self-imposed creating of persons as free and not as puppets will not issue in the thwarting of his purposes.

But, if the attribute of God’s omniscience is defined as God’s knowing all that is, has been, and will be, must not God’s foreknowledge be limited (and his power affected) by a person’s freedom? What can it mean to affirm human freedom of choice if God knows in every instance and in every detail what any person will choose? Some theists take omniscience to mean that the Creator knows all there is to know (including all the options possible and available). They cannot understand how the freedom of persons at the point of

choice is compatible with foreknowledge of what the choice will be, let alone compatible with the necessary fulfillment of the omnipotent God's will. Their theistic opponents, however, urge that the creation of free persons should not be interpreted as curtailing either God's power or his knowledge in any way that would limit his control of all there is and will be. They argue that we should not impose on the perfect, timeless Person the conditions of temporal succession to which finite persons are limited in knowing. They suggest that something like human intuitive knowing "all at once," which differs markedly from discursive inference "from one meaning to the other," provides a more helpful clue to God's knowing.

It is plain that the self-existent Creator, whose immutable transcendence is contemporaneous with his immanence in the temporal world, leaves theists with theoretical tensions. But they find these tensions more acceptable than the identification of all that exists with the One.

**TELEOLOGICAL ARGUMENT.** In advancing the concept of the contemporaneous cause as Creator-Person, the theist implies his conviction that causal order is best understood in terms of some goal. Such teleological thinking examines composite things and series of events that strongly suggest design, namely, the cooperation of parts that produce one kind of goal and not another. The spring of a watch is best understood in terms of its relation to the other parts that, along with it, effect the purpose of the watch. So, also, although every animate cell has its own order, understanding of that cell is increased once its contribution to the orderly function of the whole organism is specified.

Accordingly, the teleological argument for God does not arbitrarily add purposeful goal seeking to nonpurposeful causes. It centers attention on the designs that can be reasonably inferred as causal patterns when they are viewed in the context of unifying goals. For theists moving from cosmological considerations to teleological understanding, the controlling conviction is that the physical, the organic, and the human orders are most reasonably understood as fitting together within the comprehensive purpose of the Creator. Moreover, teleological theists hold that the inanimate and subhuman orders are so created as to provide for the good of persons, persons who can and should realize that they live in God's world, a training ground for the life to come.

Insofar as theists expound and defend a teleological argument that calls to mind a Creator-Architect-Carpenter who provides the specific physical environment for specific biological species and who does so to suit the created endowments of persons, they continue to encounter strong opposition from scholars who draw on scientific data to support their conviction that no such planned creation and no such Creator is tenable. Charles Darwin's *On the Origin of Species* (1859) spurred on the explanation of present organic structures as consequences of gradual modifications that favored the survival of the fittest. Other scientific discoveries relevant to the theory of evolution and scientific and philosophical

interpretations of pertinent new data have enlarged the area of confrontation between teleologist and nonteleologist.

The teleological theist argues, however, that, even granting explanation of evolution in terms of the survival of the fittest, it is the arrival of the fit that still calls for teleological explanation. Nonetheless, the Darwinian theory of evolution led many theists to emphasize the demands of moral consciousness and religious consciousness as independent sources of belief in God.

**WIDER TELEOLOGICAL ARGUMENT.** All the more significant is the comprehensive rethinking of teleological theism that has produced a "wider teleological argument," a position that has developed systematically in the context of historical philosophic issues. The outstanding statement of this position is in the two volumes of *Philosophical Theology* (1928–1930) by Frederick R. Tennant. Tennant defends the irreducible unity of the person and explores the cognitive limits of knowledge based on a person's sensory and nonsensory capacities; he concludes that no dimension of personal experience can arrive at logically coercive beliefs.

Tennant does not assume that a nonteleological view of the universe is already established. Nor is our world, as known, more reasonably explained as the product of ultimate, random variations or chance happenings. Rather, such knowledge as we guide ourselves by is the joint product of continuing human interaction with an amenable framework of things. Accordingly, to postulate planning in the ultimate collocation of things is to understand better what the human search for truth and values presupposes, namely, the basic relevance of cognitive activities to the order of things. Thus, "If Nature evinces wisdom, the wisdom is Another's" (Tennant, 1930, p. 107).

This wider teleology is articulated when Tennant points out that the nonbiological, physical order does not itself require either the existence or the progressive evolution of species. Yet, the drift of subhuman evolution allows for the arrival of the new order of conscious-self-conscious persons, for whom "survival of the fittest" does not adequately account. Persons, in turn, cannot exist unless their comprehensive reasoning with regard to the other orders guides their moral efforts to improve the quality of their individual and communal survival.

Tennant does not exclude the inspirational value of religious experiences from the chain of evidence for the Creator-Person. But, in his analysis of the varieties of religious experience, he does not find the immediate, uninterpreted knowledge of God to warrant the conclusion that religious experience should be independent of criticism grounded in the rational and moral dimensions of experience. Religious experience with all its suggestiveness is not given cognitive priority, but it does serve as an important confirmatory link in the chain of evidence, reasonably interpreted.

All in all, then, the claims to reasonably probable knowledge are the more reliable insofar as they can be viewed as

joint products of persons interacting with each other in their ongoing interchange with their total environment. No one link in this chain of evidence for cosmic teleology is, by itself, strong enough to justify the conclusion that the Creator-Person is immanent in the orders of being. Consequently, the wider teleological argument is to be judged for its reasonableness as a cumulative whole. But this is no cause for alarm, since, to take an example from the scientific realm, the hypothesis of biological evolution is accepted as a cumulative whole despite weaker and missing links of evidence. Accordingly, the theoretical backbone of the broader teleological theism is its more reasonable interpretation of human experience cumulatively viewed.

**MORAL ARGUMENT.** There are theists sympathetic with Tennant's wider teleology who hold that his view of the ethical link simply does not do justice to the experience of the moral consciousness. Their crucial contention is that the value judgments of persons, although related to their desires and feelings, are not experienced as originating in them. Rather, the irreducible moral consciousness becomes increasingly aware of an objective order of values that exerts imperative authority over persons' lives. This unique, normative order, not dependent on human desiring and not descriptive of actual processes in the natural world, is most coherently interpreted as expressive of the Creator's goodness.

In sum, according to this moral argument for God, an unconditional, universal order of values is gradually revealed not only as morally imperative for persons but necessary in their struggle for fulfillment. Most reasonably understood as rooted in God's nature, it is this objective order of values that is the strongest link in any argument for a God worthy of worship. Indeed, without this independent source of normative values, the cosmological and teleological arguments do not suffice to assure the goodness of God.

Tennant, however, provides an elaborate critique of this account of the moral consciousness and the objectivity of value judgments. He argues that to root value-experience in desires and feelings does not, of itself, justify the charge that value judgments are relativistic. He interprets the objectivity and universality of value-experiences and value judgments as joint products of each person's interaction with at least the natural and social orders. It is the most coherent organization of such value judgments that is, indeed, the capstone of the wider teleological argument. For now, persons, experiencing and organizing their values as joint products of their interaction with orderly trends not of their own making, can better interpret the immanent direction of the collocation of things. Hence, the progressive appreciation of the conditions of the qualitative range of value-experiences remains the normative insight into what kind of personal growth this kind of world fosters.

**THEORETICAL PROBLEMS.** Whichever of the above approaches to God is most acceptable to the traditional theist, central to his vision remains the perfection of the self-existent, transcendent Creator, immanent in his creations

and, especially, in the optimum development of morally autonomous persons. This vision of "absolute" perfection poses obstinate theoretical problems for the theist himself, as he tries to clarify the dynamics of the perfection of an immutable Creator-Person who is immanent in his temporal, changing creation. This article confines itself to three questions of especial concern to theists. Adequate discussion of these alone would require analysis of other knotty metaphysical issues (such as the ultimate nature of space and time or the specific nature of God's relation to the spatiotemporal world).

The first question is "How can God be immutable and yet immanent in a changing world, let alone in the kind of changing relations that obtain between him and developing moral agents?" The theist invariably does not flinch as he grants that this theoretical conflict is intrinsic to the theistic transcendent-immanent situation. For a perfect Creator cannot create without creating dependent, imperfect beings; and he will not annul the will of persons free to choose changes within their power. Nevertheless, while thus holding that there is no intelligible bridge from the changing created realms to the immutable Creator, the theist urges that God's immutability is not to be conceived in rigid and timeless mathematical fashion. He does suggest analogies within human experience that render the impasse less stark, such as those concentrated moments in which the past and future seem to fuse with a timeless, transcendent unity.

The second question moves the first into perhaps the most sensitive area of the theist's belief: the passibility of God, that is, God's responsiveness to human need. If God's immutable perfection is appropriately responsive to the created orders in their kind, how can he be unchanged and unchangeable? If he is unchanged and unchangeable, how can he be anything but impassive to the moral struggle of persons? What can it mean to say that he appropriately responds to their situations (that he "knows," "suffers," "redeems," or "liberates") without enduring any change himself? Here the theist, avoiding anthropomorphism, urges us to realize that the Creator-Person will not, in the nature of the case, undergo the psychic states of persons and suffer as we do.

Nevertheless, the moral-religious thrust of the theist's resistance to both deism and monism is at stake, for he defends the concept of a morally free person who is ultimately responsible to God, a God who "knows" and is appropriately responsive to the ranges of human striving. Can this person-to-Person relation be honored by a God who, in his immutability, does not change at all in response to even the worthy appeals of his repentant creatures? In the face of this impasse, some theists hold that God's immutability is compatible with his passibility, if his responses to need are conceived as the overflow of his essence and, hence, neither diminish nor improve it.

The third question is "In view of the amount and quality of evils, how can one reasonably believe in a Creator who, omniscient and limited by nothing beyond or within him-

self, is perfect in purpose and accomplishment?" The response of the theist depends to some extent upon what he claims to be the pearl of great price in the human ideal of the good. There are differences among theists on this matter, but the exposition here takes as vital to all theistic views of the ideal good the freedom of persons to choose, within limits, their own destiny. Such freedom does not exist in a vacuum; indeed, it would be powerless without a network of order that helps a person to know the good and evil consequences of his actions. Without such freedom a person would not experience the profound satisfaction of building the character so essential to the conservation and increase of values available to him as he develops.

So important is this pearl that the theist, never unaware of the maldistribution of values and disvalues, is poignantly mindful of the undeserved and vicious evils inflicted by man's inhumanity to man and by natural forces beyond human control. He is not given to holding that evil is illusory, or that it exists as a privation of goodness. But neither will he minimize a fact that becomes the foundation of his thinking about evil. Evil, in the last analysis, has no independent power of its own; it lives parasitically on the good. The theist's trust in the goodness of the Creator-Person is, therefore, grounded in this priority in the very nature of things. This fact also fortifies his belief in a personal immortality that is not an external addition to life in this imperfect world but is, rather, the extension of the creative goodness of God.

Even if all this be granted, serious concerns persist. Can it be conceded, even to so acute a theist as Tennant, that a Creator-Person, both omnipotent and omniscient, cannot, in the collocation and governance of things, create water that quenches thirst but does not drown? Again, it may be granted that, without the possibility of evil, persons would not experience the qualities of creativity resulting from their developing virtues. Nevertheless, would a Creator who is all-good, omnipotent, and omniscient create a world in which so much "nondisciplinary evil" occurs? Nondisciplinary evils are evils that, as far as we can see, are not instrumental to the realization of other values. They are those evils that undermine even the most heroic moral effort; they finally fell the oak that has weathered many storms. They, too, are parasites upon the good, but whatever the source, they are the irreducible evils that defy being classified as means to some good.

The traditional theist now reminds us of our keyhole vision in this life. To other theists, this appeal to ignorance is unavailing. After all, it is open to opponent and exponent alike. These "finitistic" theists, determined to explain the evidence at hand as reasonably as possible, reexamine the concept of perfection presupposed by traditional theists. They suggest that the impasses of transcendence-immanence ultimately hinge on the assumption that perfection necessarily excludes all temporality and change in the self-existent Creator. Why must we hold, finitists ask, that self-existence necessitates God's immutability in every respect? Why cannot

perfection characterize a transcendent, self-existent Creator who expresses his purposes in the temporal orders without danger of becoming the victim of the changes required? Indeed, why suppose that only immutable perfection is worthy of worship?

In any case, finitistic theists contend that the actual course of natural and human history is more reasonably explained if the Creator-God's omnipotence and immutability are limited in the interest of his creative goodness. And his moral perfection consists in God's conservation and renewal of value realization despite recalcitrant conditions within his own being. This Creator-Person, thus limited in power by uncreated conditions within himself, creates and recreates situations most consistent with his purposes.

The specific way in which the morally perfect Creator-Person is limited in power depends upon the particular theist's conception of God's immanence in the inorganic, organic, and personal orders and, especially, on that theist's view of God's relation to persons as individuals and in community. Finitistic theists, however, cannot tolerate, theoretically, the conception of a self-existent Creator limited by any being(s) completely independent of his own will. Such theists vary in their description of the recalcitrant factor(s) that are inherent in the self-existent Creator. But the basic thrust of their views inspires the worship of a God who, dealing creatively with recalcitrance, continues to create, in accordance with his concern that the conditions for creativity be preserved and increased at every level possible.

Such finitistic theism saves transcendence from the pantheistic absorption of persons. At the same time, it is free from the dangers of a theism that, in the name of immutable perfection, sets up impasses that encourage the conception of a deistic Creator who knows not the quality of continuing, creative caring.

#### BIBLIOGRAPHY

The books in this highly select bibliography contain, each in its own scope, the needed expansion, significant particularity, and helpful context for explication of the condensed discussion of central topics in this article. The suggestions in the next paragraph include comprehensive cultural and religious background for the theistic themes focused on in the main presentation. Elaboration on these themes, with an eye to the variety of interpretations, is provided in the remaining suggestions.

Arthur O. Lovejoy's *The Great Chain of Being: A Study of the History of an Idea* (Cambridge, Mass., 1942) is a fascinating study of the historical roots and the growth of ideas involved in this article. Alfred E. Taylor's "Theism," in the *Encyclopaedia of Religion and Ethics*, edited by James Hastings, vol. 12 (Edinburgh, 1921), is a classic historical analysis of theistic philosophy in the West up to the early decades of the twentieth century. Étienne Gilson's *L'esprit de la philosophie*

*médiévale*, 2 vols., 2d ed. (Paris, 1944), translated by A. H. C. Downes as *The Spirit of Medieval Philosophy* (New York, 1936), emphasizes the assimilation of Greek philosophical ideas by formative Christian thinkers such as Augustine, Aquinas, Bonaventura, and Duns Scotus. James D. Collins's *God in Modern Philosophy* (1959; reprint, Westport, Conn., 1978) examines critically much of the modern debate. In chapter 8 of *Indian Philosophy*, 2d ed., vol. 2 (London, 1927, 1931), Sarvepalli Radhakrishnan expounds the main tenets in the monistic system of Śaṅkara, and, in chapter 9, he contrasts these with the theism of Rāmānuja. Annemarie Schimmel's *Gabriel's Wing: A Study into the Religious Ideas of Sir Muḥammad Iqbal* (Leiden, 1963) gives a vivid account both of Islamic thought and culture and of the reevaluation of the essential tenets of Islam by the poet-philosopher Iqbal; further, it provides a comprehensive bibliography.

See H. P. Owen's *Concepts of Deity* (New York, 1971) for discriminating definitions of attributes of the traditional theistic God and for contrasts with dominant themes in the work of six twentieth-century thinkers; this book includes a select bibliography. The studies by Eric L. Mascall, *He Who Is*, rev. ed. (London, 1966), and *Existence and Analogy: A Sequel to "He Who Is"* (1949; reprint, New York, 1967), are standby expositions of theistic issues. Milton K. Munitz's *The Mystery of Existence: An Essay in Philosophical Cosmology* (New York, 1965) is included here for its searching critique of theistic approaches to mystery.

John Hick's "Ontological Argument for the Existence of God," in *The Encyclopedia of Philosophy*, edited by Paul Edwards, vol. 5 (New York, 1967), is an able exposition of the argument (with solid bibliography). The specific analyses in *The Ontological Argument*, edited by Alvin Plantinga (London, 1940), provide welcome context. John Laird's *Theism and Cosmology* (1940; reprint, Freeport, N.Y., 1969) examines metaphysical issues relevant to the God of theism. *The Cosmological Arguments: A Spectrum of Opinion*, compiled and edited by Donald R. Burrill (Garden City, N.Y., 1967), includes noteworthy excerpts from classical discussions of both the cosmological and the teleological arguments as well as commentary by recent and contemporary philosophers. *Natural Theology: Selections*, edited with an introduction by Frederick Ferré (Indianapolis, 1963), is an abridged version of William Paley's *Natural Theology, or Evidences of the Existence and Attributes of the Deity Collected from the Appearances of Nature* (London, 1802). The judicious introduction frees Paley's underlying teleology from shallow stereotypes. Frederick R. Tennant's *Philosophical Theology*, vol. 1, *The Soul and Its Faculties* (Cambridge, 1928), and vol. 2, *The World, the Soul, and God* (Cambridge, 1930), is probably the most broadly based, yet closely reasoned, study, to date, issuing in a teleological theism. The most systematic critique of it is Delton L. Scudder's *Tennant's Philosophical Theology* (New Haven, 1940).

For systematic presentation of ethical ideas and their objectivity in relation to other arguments for God and his attributes, there are few works that equal William R. Sorley's *Moral Values and the Idea of God*, 3d rev. ed. (Cambridge, 1918). Herbert J. Paton's *The Modern Predicament* (London, 1955) is lucid in its exposition and evaluation of the issues evoked by a moral approach to God's nature and attributes. Edward H. Madden and Peter H. Hare's *Evil and the Concept of God*

(Springfield, Ill., 1968) finds both traditional and finitistic theistic explanations of evil inadequate. Edgar S. Brightman's *A Philosophy of Religion* (1940; reprint, Westport, Conn., 1969) includes a comprehensive survey of philosophic issues, a brief historical exposition of absolutistic and finitistic theism, and his defense of a "finite-infinite" God. It also provides an extensive bibliography and a helpful lexicon. John Hick's *Evil and the God of Love*, 2d ed. (London, 1977), explores traditional and recent accounts of evil and defends an Irenaean view. S. Paul Schilling's *God and Human Anguish* (Nashville, 1977) stands out for its well-annotated account of various historical and recent explanations of excess evil as well as for his own temporalistic theism.

*Revised Bibliography*

**THEOCRACY** means "rule by God" and refers to a type of government in which God or gods are thought to have sovereignty, or to any state so governed. The concept has been widely applied to such varied cases as pharaonic Egypt, ancient Israel, medieval Christendom, Calvinism, Islam, and Tibetan Buddhism.

The word was first coined in the Greek language (*theokratia*) by the Jewish historian Josephus Flavius around 100 CE. Josephus noted that while the nations of the world were variously governed by monarchies, oligarchies, and democracies, the polity of the Jews was theocracy. This, he thought, went back to Moses, who was not attracted by the model of these other polities and therefore "designated his government a theocracy—as someone might say, forcing an expression—thus attributing the rule and dominion to God" (*Against Apion* 2.165).

From Josephus's coinage the term found its way into modern languages, though most early uses were references to the government of ancient Israel, and thus faithful to the original context. The poet John Donne, in a sermon of 1622, stated that the Jews had been under a theocracy, and the An-

glican bishop William Warburton, in his *Divine Legation of Moses Demonstrated* (1737–1741), engaged in a long discussion of Israelite theocracy.

Impetus for wider use of the word came from G. W. F. Hegel's *Philosophy of History*, where the term was employed to describe that early phase of ancient oriental civilization in which there was no distinction between religion and the state. In the later nineteenth and early twentieth centuries, the term became what Karl Mannheim called a *Kampfbegriff*, by which "enlightened" contempt for "priest-ridden" societies could be expressed. It was with something of this force that it was used by W. E. H. Lecky in his *History of Rationalism* (1865) and by Brooks Adams in *The Emancipation of Massachusetts* (1887).

Theocracy has not become a rigorously defined concept in either social science or the history of religions, although the term is frequently used in historical writing. This is probably because it does not name a governmental system or structure, parallel to monarchy or democracy, but designates a certain kind of placement of the ultimate source of state authority, regardless of the form of government. In biblical studies, where the notion of theocracy has had its longest currency, it has probably also been used with the greatest consistency and fruitfulness.

This article deals with the various meanings that the term theocracy may be usefully given, with examples relevant to each meaning: hierocracy, or rule by religious functionaries; royal theocracy, or rule by a sacred king; general theocracy, or rule in a more general sense by a divine will or law; and eschatological theocracy, or future rule by the divine.

**HIEROCRACY.** *Theocracy* has often been used as a term to describe societies where the clergy or priests rule, but this is not the exact denotation of the word, and another word, hierocracy, is available for such situations. Some have called this "pure" theocracy. Among such theocracies, a distinction can be made between those in which the religious functionaries who exercise rule are priestly in character and those in which they are more prophetic-charismatic.

Theocracies of this type have not been very numerous. Several of the stages in the history of ancient Israel exemplify it: the early period, beginning with the Sinai covenant and continuing with the leadership of Moses and Aaron; the religious confederation of the tribal amphictyony; and the charismatic (though occasional) leadership of the Judges down to the time of Samuel. Thus, Israel had strongly theocratic elements, in the sense of rule by religious functionaries. Centuries later, after the return from exile in the late sixth century BCE, a theocracy emerged with the priestly leadership of the generations after Ezra. The priestly theocratic pattern became so important among the Jews at this time that the later Hasmoneans legitimated their rule by claiming the high priesthood. This was the case until the end of the rule of Alexander Yannai over the small Jewish state in 67 BCE.

This kind of theocracy has been rare in Christianity, which grew up as a clandestine religion at odds with a hostile

state. Nonetheless, a kind of theocracy in the sense of priestly rule appeared in the Papal States of central Italy and lasted for over a millennium (756–1870). However, this situation was not usually thought of as a prototype of the ideal but, rather more pragmatically, as a way of securing the independence of church authority, centered in Rome, from interference and control by secular powers. Another Christian example of pure theocracy can be found in the early years of the Latter-Day Saints, or Mormons, in the United States, where the prophetic leaders (first Joseph Smith and then Brigham Young) exercised religious and temporal authority in the life of the community, both in earlier settlements and then in Salt Lake City.

The early years of Islam, under the prophet Muḥammad and his first successors, the caliphs, were also theocratic in the sense that there was rule by the religious leadership, though it was not a priestly but a prophetic-charismatic leadership. It is, however, difficult to say at exactly what point the caliphate ceased to be a primarily religious institution.

Tibetan Buddhism has often been cited as an example of priestly theocracy. After the thirteenth century, Tibet was ruled by various elements of the Buddhist priesthood; in the seventeenth century, the Dge lugs pa sect gained the temporal rule of the land and governed through the Dalai and Panchen lamas, as successive incarnations of Avalokiteśvara and Amitābha Buddha, respectively, until the Chinese Communist invasion destroyed this pattern in 1959. The Dalai Lama was the principal ruler from his capital at Lhasa, and administration was exercised by him (or by a regent ruling in his name when a new Dalai Lama was being sought) through a cabinet composed partly of monks.

Many short-lived communal and revolutionary movements inspired by religion have functioned as pure theocracies. Examples of this include the Taiping Rebellion in China in 1858; the seizure of Khartoum in the Sudan by a claimant to the role of the Mahdi in 1885; and the People's Temple of Jim Jones, which was established in Guyana in 1977, only to end in mass suicide.

**ROYAL THEOCRACY.** Rule by a king thought to possess divine status or power, or to be entrusted by God with authority over the earth, is a second kind of theocracy. Such sacred kingship has many ramifications beyond what can be considered in relation to the concept of theocracy. Traditional Japan was ruled by such a royal theocracy, the emperors being regarded as descendants of the sun goddess Amaterasu. Some societies of the ancient world were theocratic in this sense: the ancient Mesopotamian kings were regarded as chosen servants and regents of the gods, and the Egyptian pharaohs were thought to be directly descended from the sun god, who had created the earth and had at first ruled it personally, later ruling it through them. In both Egypt and Mesopotamia, as well as among other ancient peoples, kings also fulfilled many important roles in ritual, thus acting as intermediaries between men and the gods. Analogies have frequently been drawn between ancient Near Eastern sacred

monarchy and Israelite kingship, but such inferences should be drawn with caution, especially since Israel's monarchy had been established within the time of Israel's historical memory and had been opposed by a school of thought that felt that Yahveh alone should be recognized as king (1 *Sm.* 8:6–22, *Hos.* 8:4, 13:10–11). However, Israelite monarchy borrowed some of the theocratic features of its Near Eastern predecessors, especially elements of court ritual. Still, Israel under the monarchy was a royal theocracy, for the kings were considered to be the anointed and chosen servants of Yahveh and the earthly representatives of Yahveh's theocratic authority.

Monarchy as the fulfillment of a sacred role of divine regency also appeared in Christianity. The most obvious examples have been in Eastern Christianity, both Byzantine and Russian, in which the imperial office was regarded as God-given, and the emperor regarded as God's representative on earth in all temporal matters, as well as in the external affairs of the church. In Byzantium, the distinction between the religious and the secular was not as sharply drawn as it usually was in the West, and the Byzantine emperor had certain liturgical prerogatives that were closed to the layperson. Such sacred kingship also appeared in Western Christianity among the early Germanic kings who ruled after the dissolution of the Roman empire, and especially in the rule of Charlemagne. It reappeared with some of the Holy Roman emperors who sought to counter the claims of papal theocracy after the eleventh-century Gregorian reform, and at the courts of Henry VIII and Louis XIV.

**GENERAL THEOCRACY.** A third type of theocracy, by far the most common, is that more general type wherein ultimate authority is considered to be vested in a divine law or revelation, mediated through a variety of structures or polities. In a sense, both priestly and royal theocracies may be of this sort: for example, in Israelite monarchy the Law stood as an authority beyond that of the king at the time of the Josianic reform; Byzantine emperors in spite of their choice by God were subordinate to the principles of revealed truth; and even the Egyptian god-kings were supposed to rule according to the eternal principles of *maat*, or justice. Theocracy in this third sense has been quite common as a conception in such universalizing religions as Christianity and Islam, where there has often been a thrust toward bringing the whole human sphere under the aegis of the divine will; but it has also appeared in some ancient and tribal societies where the laws and customs of the people are understood to be revealed by the gods, as in some of the ancient Greek city-states.

Historical conditions have made this type of theocracy less common in Christianity than might otherwise have been the case; in earliest Christianity, theocracy was ruled out by the sharp dichotomy between the church and a hostile world that prevailed in Christian thinking, and in modern times, secularization has rendered otiose any program for the rule of Christian norms over all of society. Furthermore, some kinds of Christian thinking about society—for example, the two-kingdom theory of Lutheranism; Christian Aristotelian-

ism, which grants to the state a basis in its own right; and the modern acceptance of the separation of church and state—have weakened the theocratic impulse.

In Christianity, the two most commonly cited examples of this kind of theocracy have been medieval Roman Catholicism and some of the Calvinist societies of the sixteenth and seventeenth centuries.

Earlier medieval thought looked upon the spiritual and the temporal as two coordinate powers under God, with their own separate structures of rule. After the Gregorian reform of the eleventh century, however, papal theorists sought to divest the temporal overlord of his sacred character and promoted the view that the church, through the pope, was sovereign in all temporal affairs, even if this sovereignty were not exercised directly but through secular rulers whom the church had the authority to direct, judge, or remove. This papal theocracy reached its height in the early thirteenth-century pontificate of Innocent III, who made good his claim to have the authority to dispose earthly powers when he disciplined various European monarchs, including King John of England. Defenders of papal theocracy, however, made even more far-reaching claims in the next century, asserting that the popes, as vicars of Christ on earth, exercised all the prerogatives of Christ's heavenly kingship, which was both royal and priestly, and were, theoretically, not only the possessors of all earthly political sovereignty but the ultimate owners of all property. Late medieval developments, including the papal captivity and schism, the rise of conciliarism, and nationalism, led to the decline of effective papal theocracy.

Theocracy has often been attributed to the government of certain Reformed or Calvinist states, whether Zurich under Huldrych Zwingli, Geneva under John Calvin, England under Oliver Cromwell, or Puritan Massachusetts. In none of these cases was there a hierocratic theocracy, since in most of them the clergy were less likely to hold public office than they had been previously—for example, Cromwellian England abolished church courts and the House of Lords with its bishops, and the Massachusetts Bay Colony forbade the clergy to serve as magistrates. Even in Geneva, the clergy had only an advisory role in checking and balancing the civil government. But all of these societies had an ideal, well expressed by the Strasbourg theologian Martin Bucer in his *De regno Christi*, of a holy community on earth in which the sovereignty was God's and in which the actual law should reflect the divine will and the government seek to promote the divine glory. In the Puritan examples of Cromwellian England in the 1650s and Massachusetts Bay in the first generations of its settlement, there was both a hearkening after Old Testament theocratic patterns and a sense of the importance of government entrusted to truly regenerate persons—or the saints—in an effort to create a holy commonwealth. In fact, however, rule was exercised in both cases more through a godly laity than through the clergy, and in both Cromwellian England and Puritan Massachusetts the state had considerable power in church affairs.

It is also in this general sense of theocracy that Islam ought to be considered theocratic. Islam grew up as a religious community that was its own state, and thus from the beginning there was no distinction of church and state; rather, there was a unitary society under God's revealed rule and law. Islam was much less a church than a theocratic state, but as a theocracy, it was laical and egalitarian, with traditions neither of sacred kings nor of a powerful priesthood. The basis of this divine rule is to be found in *shari'ah*, or law, which provides for a pattern of life uniting all the aspects of human existence—political, social, religious, domestic—into a grand whole under divine rule. Such rule has been variously exercised in Islamic history, but the *'ulama'* as well as the caliphs and, in Shiism, the imams have been important in its application. Many modern Islamic revival movements, reacting against Western aggression and internal decline, have tended toward the repristination of the theocratic elements in Islam; this was true of the *Wāhhābīyah* in the eighteenth and nineteenth centuries and has been true of many contemporary movements.

**ESCHATOLOGICAL THEOCRACY.** A fourth kind of theocracy is eschatological, centering on visions of an ideal future in which God will rule. Restoration eschatology and messianic ideas in ancient Israel were of this type. In Christianity, such eschatological theocracy appeared in the beliefs of the medieval followers of Joachim of Fiore, who anticipated the emergence of a third age in which all would be perfect, and in the beliefs of the sectarians of seventeenth-century England, such as the Seekers, Quakers, or Fifth Monarchists, who dreamed of a coming millennial age when Christ would rule. Such modern offshoots of Christianity as the Jehovah's Witnesses and the Unification Church of Sun Myung Moon present recent examples of groups anticipating an earthly reign of Christ. Islamic eschatology centering on the figure of the Mahdi has occasionally begotten similar hopes.

#### BIBLIOGRAPHY

There is no single, synoptic account of the whole range of theocratic phenomena. Among general studies of religion, Gustav Mensching's *Soziologie der grossen Religionen* (Bonn, 1966) and *Soziologie der Religion*, 2d ed. (Bonn, 1968), pp. 79f., 112, and 155–158, take interest in the notion of theocracy. Among the many studies of sacred kingship in the ancient world, Henri Frankfort's now classic text *Kingship and the Gods: A Study of Ancient Near Eastern Religion* (1948; reprint, Chicago, 1978) is a good place to begin. Thomas L. Brauch, "The Emperor Julian's Theocratic Vocation," *Society of Biblical Literature Seminar Papers* 25 (1986): 291–300, examines theocracy in the late Roman pagan revival. For a general account of theocracy and ancient Israel, see John W. Wevers's "Theocracy" in the *Interpreter's Dictionary of the Bible*, vol. 4 (Nashville, 1962), pp. 617–619. D. Otto Plöger deals with Daniel, Joel, and other examples of late Israelite eschatology in *Theokratie und Eschatologie* (Neukirchen,

West Germany, 1959). For the concept of theocracy in Philo, Maimonides, traditional Rabbinic thought, and modern Israel, see Gershon Weiler, *Jewish Theocracy* (Leiden, 1988). For Tibetan theocracy, see Franz Michael and Eugene Knez's *Rule by Incarnation: Tibetan Buddhism and Its Role in Society and State* (Boulder, Colo., 1982). Dieter Georgi, *Theocracy in Paul's Praxis and Theology* (Minneapolis, 1991), uses theocracy as a conceptual tool for interpreting the apostle Paul. For royal theocracy in Byzantium, see Deno John Geanakoplos's *Byzantine East and Latin West* (Oxford, 1966), especially chapter 2. Among many treatments of medieval papal thought, the following deal extensively with the theme of theocracy: *La théocratie: L'église et le pouvoir au moyen âge* by Marcel Pacaut (Paris, 1957); *L'idée de la royauté du Christ au moyen âge* by Jean Le Clercq (Paris, 1959), especially chapters 1, 7, and 8; and *Church State and Christian Society at the Time of the Investiture Contest* by Gerd Tellenbach (1959; reprint, New York, 1979).

A number of authors investigate Reformation and Puritan theocracy: Robert C. Walton in Zwingli's *Theocracy* (Toronto, 1967); E. William Monter in *Calvin's Geneva* (New York, 1967), especially chapter 6; Harro Höpfl in *The Christian Polity of John Calvin* (Cambridge, 1982); George L. Hunt in *Calvinism and the Political Order* (Philadelphia, 1965); Rene Paquin in "Calvin and Theocracy in Geneva," *ARC, The Journal of the Faculty of Religious Studies, McGill* 28 (2000): 91–113; Aaron B. Seidman in "Church and State in the Early Years of the Massachusetts Bay Colony," *New England Quarterly* 18 (1945): 211–233, which seeks to set the record straight on theocracy in the colony; Avihu Zakai, in "Theocracy in New England: The Nature and Meaning of the Holy Experiment in the Wilderness," *Journal of Religious History* 14 (1986): 131–151; and Jerald C. Brauer in "The Rule of the Saints in American Politics," *Church History* 27 (September 1958): 240–255, which also discusses theocratic impulses in later American history. For a study of the Quakers and theocracy, see Thomas G. Sanders's *Protestant Concepts of Church and State* (New York, 1964), pp. 125–178. The theocratic aspects of Islam are variously alluded to in Ruben Levy's *The Social Structure of Islam*, 2d ed. (Cambridge, 1957), and E. I. J. Rosenthal's *Political Thought in Medieval Islam* (1958; reprint, Cambridge, 1968); Majid Fakhry deals with some modern revivals of theocratic thinking in "The Theocratic Idea of the Islamic State in Recent Controversies," *International Affairs* 30 (October 1954): 450–462. Modern Iran is examined in Mehran Kamrava, *The Political History of Modern Iran: From Tribalism to Theocracy* (Westport, 1992). Legal and ethical issues are explored in Lucas A. Swaine, "How Ought Liberal Democracies to Treat Theocratic Communities," *Ethics* 111 (January 2001): 302–343.

DEWEY D. WALLACE, JR. (1987 AND 2005)

**THEODICY.** Why do the righteous suffer? Why do the wicked prosper? Why do innocent children experience illness and death? These are ancient questions, but they have been given new poignancy in our day by the events of the European Holocaust. The fact that many who died in the Holocaust were devout Jews or Christians also poses a special problem

for the faiths to which these victims belonged. Traditionally, Jews and Christians have affirmed God's goodness and his absolute sovereignty over history. But how can this faith be reconciled with suffering on the scale for which Auschwitz is the symbol?

**THEORETICAL POSITIONS.** The effort to answer questions of this sort is commonly referred to as *theodicy*. The term was apparently coined by the philosopher Gottfried Leibniz (1646–1716) and is a compound of the Greek words for God (*theos*) and justice (*dikē*). Theodicy may thus be thought of as the effort to defend God's justice and power in the face of suffering. Theodicies result from this effort: they are specific explanations or justifications of suffering in a world believed to be ruled by a morally good God.

**The theodicy problem.** The "problem of theodicy" arises when the experienced reality of suffering is juxtaposed with two sets of beliefs traditionally associated with ethical monotheism. One is the belief that God is absolutely good and compassionate. The other is the belief that he controls all events in history, that he is both all-powerful (omnipotent) and all-knowing (omniscient). When combined with some other implicit beliefs—for example, the belief that a good being would try to prevent suffering insofar as he is able—these various ideas seem contradictory. They appear to form a logical "trilemma," in the sense that, while any two of these sets of ideas can be accepted, the addition of the third renders the whole logically inconsistent. Thus, it seems that it can be affirmed that God is all-good and all-powerful, but not also that there is suffering in the world. Similarly, the fact of suffering can be affirmed along with God's goodness, but the insistence on God's omnipotence appears to render the whole ensemble of beliefs untenable. Theodicy may be thought of as the effort to resist the conclusion that such a logical trilemma exists. It aims to show that traditional claims about God's power and goodness are compatible with the fact of suffering.

**Alternative definitions.** Some writers have tried to expand the term *theodicy* beyond its classical Western philosophical and theological usage. The sociologist Max Weber, for example, sought to redefine the term in order to render it applicable to religious traditions that do not involve belief in one just, all-powerful deity. In Weber's usage, *the theodicy problem* referred to any situation of inexplicable or unmerited suffering, and *theodicy* itself referred to any rationale for explaining suffering. This wider definition has value for the comparative study of religion. Nevertheless, without neglecting other religious responses to suffering, I shall here be using the term *theodicy* in its classical sense, as the effort to defend God's justice and power in a world marred by suffering.

**Dissolutions of the theodicy problem.** One reason for holding to the narrower definition of theodicy is that it allows us to see that theodicy in its classical sense is very much a feature of ethical monotheism. Theodicy in this sense does not arise in traditions that fundamentally deny or reject any one of the three major sets of ideas that form the theodicy

problem: the belief in God's goodness, the belief in his power, or the belief in the real occurrence of suffering. Religious positions that fundamentally dissolve the problem may be classified according to which of the three basic beliefs they do not accept.

**Denials of God's justice.** Some religious positions avoid theodicy by denying that God (or the gods) is morally good. Very few religious traditions openly hold God to be evil, although Wendy Doniger O'Flaherty, in her book *The Origins of Evil in Hindu Mythology* (Berkeley, 1976), has argued that at least one important motif in Hindu mythology traces suffering to the gods' pettiness and fear of human power. More common than an outright denial of the deity's justice, however, is the claim that God's justice is somehow qualitatively different from our ordinary human ideas of right and wrong. Words like *justice* or *goodness* when applied to God have no relation to their meaning when applied to human beings. What would be regarded as wickedness on the part of a human being—for example, the slaughter of children—may not be unjust where God is concerned. We shall see that this view has had some currency in Islam and in Calvinist Christianity.

**Denials of God's omnipotence.** Rather than compromise the divine goodness, some religious traditions have avoided theodicy by qualifying the divine power. This view is especially characteristic of religious dualisms, which explain the fact of suffering by positing a power or principle of disorder that wars incessantly with God for control of the world. In Zoroastrianism, for example, imperfections and suffering in this world are traced to an ongoing cosmic struggle between the good deity, Ahura Mazda (Ohrmazd), and his evil antagonist, Angra Mainyu (Ahriman). Similarly, the gnostic religion Manichaeism explained suffering in terms of a struggle between a "spiritual" god of goodness and light and an evil "creator" demon associated with darkness and matter.

Apart from dualism there are other ways by which religions can deny God's omnipotence. One of the most important of these is found in Buddhism, where suffering is traced to the automatic operation of the moral law of retribution known as *karman*. I shall return to *karman* in connection with Buddhist teaching as a whole, but for now it may be noted that *karman* eliminates the need to justify God (or the gods) in a world of suffering because it places that suffering almost wholly beyond divine control.

**Denials of the reality of suffering.** The final major way by which to avoid the problem of theodicy is to deny the third component in the trilemma, that is, that there really is suffering in the world. This position may seem impossible since unhappiness, illness, and death are all around us. Yet in various ways, religious thinkers and religious traditions have sometimes denied the ultimate reality or significance of suffering. The philosopher Spinoza, for example, affirmed that the world seems filled with evil only because it is regarded from a narrow and erroneous human point of view. From the divine perspective, however, the world forms a necessary

and perfect whole. Some Hindu thinkers have also denied the reality of suffering by advocating adoption of the divine point of view. According to the Vedantic tradition, what we call evil or suffering is really an aspect of *māyā*, the cosmic principle of dynamism and individuation. This principle is not ultimate, and the sage who attains the divine perspective sees *māyā* as an illusory process that does not really affect the eternal soul. This teaching renders the world of suffering inconsequential.

**Classical theodicies.** Those familiar with the Western religious traditions may be unpersuaded by these various dissolutions of the theodicy problem. They may find that some of these positions, such as the denial that God is just in humanly understandable terms, seriously jeopardize a religious faith based on belief in God's goodness. Other dissolutions may seem to ignore the importance of the evil that God seeks to overcome or may erode confidence in God's ability to master that evil. Yet we have seen that the alternative position—affirmation of God's absolute goodness and power in a world of serious suffering—appears to be illogical. Defenders of ethical monotheism, however, have usually refused to accept this apparent illogicality. With varying degrees of self-consciousness, they have maintained that the alleged contradiction between monotheism and suffering does not exist. This view underlies the specific theodicies that have been elaborated to defend belief in a just and all-powerful God.

The key to these positions is an understanding of what it means to say that God is omnipotent. Typically, it is argued that while God can do anything he wills himself to do and anything that is capable of being done, he cannot do what is logically impossible. This is not because his power is limited but only because what is logically impossible cannot really be thought or conceived. Thus, God cannot make a "square circle," and we cannot ask or desire him to do so, because the very idea of a square circle is nonsense. Only the accident of language that makes a "square circle" seem as possible as a "seedless apple" leads us to think that God's inability here represents some limit to his power.

With this as a basis, it is further argued that the claim that God's goodness and power are logically incompatible with suffering is not correct, because it is not true that an all-good, all-powerful being would necessarily eliminate all suffering from the world. What is true is that such a being would want to bring about the greatest state of goodness in the world. But creating such a state may involve the creation of some specific goods whose existence logically entails the possibility of certain evils, and these evils may be the source of the suffering we see around us.

The enterprise of theodicy, therefore, essentially involves the identification of those eminently valuable goods whose existence may entail certain states of suffering or evil. Proponents of specific theodicies usually contend that a world without these goods would be of lesser value than one that contains them, and so God is morally justified in having

created a world in which these goods, with their attendant evils, exist.

While those involved in the enterprise of theodicy frequently focus on one good or the other in their defense of God, theodicy is inherently an eclectic activity. A variety of distinct values and arguments are commonly advanced to defend God's goodness. Some of the major theodicies listed here are not even theodicies in the most precise sense since they involve less the identification of specific values whose existence justifies suffering than the assertion that such values might exist. In any case, none of these classical theodicies is necessarily exclusive of the others, and adherents of ethical monotheism usually hold several of the following positions.

*The free-will theodicy.* One of the most powerful and most frequently adduced explanations of suffering is the free-will theodicy. Those who hold this position maintain that a world containing creatures who freely perform good actions and who freely respond to their creator's goodness is far better than a world of automatons who always do what is right because they cannot do what is wrong. Now, while God can create free creatures, if they are truly free he cannot causally determine what they do. To create a creature freely capable of doing what is morally right, therefore, God must create a creature who is also capable of doing what is morally wrong. As it turned out, some of the free creatures God created have exercised their freedom to do wrong, and this is the source of the suffering we see around us. Some of this suffering is directly caused by these wicked beings, while some results when they are justly punished by God for their conduct.

As easily stated as this theodicy is, it has many complexities, and it has frequently been challenged. Recent debate has been especially vigorous. Philosophers such as Antony Flew and J. L. Mackie, for example, have questioned the link in this argument between free will and the possibility of wrongdoing. Since the conduct of free beings is not unshaped by causal factors, they contend, God might have molded human nature and the physical environment in such a way that free beings never do wrong. Or, they argue, since it is logically possible for any free being never to do wrong, there is nothing illogical in God's having created a whole race of free beings none of whom ever does wrong. However, other philosophers, notably Nelson Pike and Alvin Plantinga, have rejected these arguments, claiming either that they run counter to our commonsense understanding of freedom, which involves essentially an idea of nondetermination by causal forces, or that they mistakenly derive from ambiguities in what it means to say that God can create free beings who never do wrong. While it is true, they would say, that God can create a race of free beings none of whom ever happens to do wrong, it is not true that God can create free beings and bring about their never doing wrong. Whether wrong is done depends on the beings themselves. This leads these philosophers to the conclusion that God must expose the world to the possibility of suffering and evil if he chooses to create beings who are genuinely free.

A more traditional and long-standing objection to the free-will theodicy is that it does not apparently handle the problem of natural (or physical) evil as opposed to moral evil. Moral evil may be thought of as states of suffering traceable to the agency of free beings, such as war, racism, or genocide. Natural evil is that evil or suffering that is not traceable to acts or volitions of free beings, including such things as earthquakes, floods, and pestilence. Even if it is granted that this distinction is not sharp (some of the damage wrought by earthquakes, for example, is the result of shoddy construction techniques and other forms of human ignorance or avarice), clearly there are instances of suffering utterly beyond human control. Because this suffering is not traceable to human abuse of freedom, these critics contend, God must ultimately be held responsible for its existence.

Defenders of the free-will theodicy have responded to this objection in various ways. They have sometimes traced natural evil to the agency of demonic beings (fallen angels or Satan) whose own malevolence results from a perverse exercise of free will. They have also sometimes argued that natural evils are ongoing punishments for wrongful acts by humankind's first parents, so that suffering is a result of Original Sin. Despite occasional efforts at their revival, these responses have little currency today. As a result, many proponents of the free-will theodicy find themselves forced to turn elsewhere to supplement their defense of God. They frequently resort to one of the educative theodicies.

*Educative theodicies.* The force of the educative theodicies lies in their ability to justify at least some of the suffering experienced by innocent persons. This suffering exists, it is argued, because it serves to enrich human experience, to build moral character, or to develop human capacities.

Within the broad assertion that suffering has educative value, at least several distinct claims can be identified. It is sometimes maintained, for example, that modest suffering enhances our appreciation of life's satisfactions (as separation from loved ones can enrich moments spent with them). On a far deeper level, it is argued that even very serious suffering can toughen us to adversity and can help us develop depth of character, compassion, or new capabilities. Finally, it is common in this connection to stress the value of a world based upon regular laws of nature. Certainly, much suffering results from the operation of natural laws. Had God wished to, he might have created a world in which no regular laws existed—a world in which the flames threatening a sleeping family suddenly turned cool. But such a world, it is argued, would be a magical garden with little opportunity for growth in human knowledge. The human race would forever remain in intellectual infancy. This explanation in terms of natural laws is also sometimes advanced to explain the puzzling problem of animal suffering.

These educative theodicies are important, but their limits are apparent. Many of life's satisfactions do not require suffering to be enjoyed. Good health can be appreciated without the experience of disease. It is true, and perhaps pro-

foundly true, that serious suffering can stimulate the development of our capacities and character. But this is not always so. Sometimes suffering embitters, diminishes, or destroys people. Finally, while growth in our understanding of nature's laws is valuable, we must ask whether this knowledge can be justified if its price has been the wasting of lives down through countless generations. What kind of education is it, some ask, that kills so many of the students?

*Eschatological (or recompense) theodicies.* Many of the difficulties of the educative theodicies derive from the brevity of human life. If an individual's existence were to continue beyond death, some of these problems might be overcome. Then, unmerited or unproductive suffering might be placed in a larger context of experience and meaning. Eschatological theodicies are based on the conviction that human life transcends personal death and that the righteous eventually receive their full reward. (It is also frequently maintained that the wicked receive appropriate punishment.) These theodicies differ from one another on the question of just when or how such recompense occurs. The *eschaton* ("last thing") can be envisioned as a historical epoch that begins at the end of history, a time when the righteous are resurrected in renewed bodies. Or it can be understood as an eternal heavenly realm that one enters after death. In either case, eschatological theodicies assume that the blissful future life more than compensates for present suffering.

Eschatological theodicies clearly play an important part in reconciling many religious believers to the fact of suffering. Nevertheless, this kind of theodicy faces many difficulties today. Some persons regard the idea of an afterlife as incredible. Others reject the idea that future bliss can compensate for present misery. They point out that while suffering may come to an end, the painful memory of suffering endures. Such novelists as Dostoevskii, Camus, and Elie Wiesel have also asked whether anything can compensate for the massive suffering inflicted on children during the persecutions of recent times.

*Theodicy deferred: The mystery of suffering.* Long before Auschwitz, religious believers recognized that any effort to justify severe suffering in terms of identifiable values risks trivializing the enormity of human anguish. Rather than renounce their faith in God's justice and power, however, some of these believers have chosen to deny that the mystery of suffering can be fully understood. They have preferred to defer comprehension and to trust in God's ultimate goodness and sovereignty. Frequently they have connected this with their eschatological expectations and have looked forward, not just to recompense but to a final understanding of God's purposes in the world.

Very often, those who stress the mystery of suffering also emphasize the limited nature of human understanding and the enormous differences that exist between God and humans. This position should not be confused, however, with the view that God's justice is somehow qualitatively different from our own. The latter perspective dissolves the problem

of theodicy by placing God beyond moral accountability, whereas the view discussed here insists that God's justice will ultimately be vindicated. Faith is not the belief in a God beyond justice but the belief that God's justice will finally be upheld.

**Communion theodicies.** Emphasis on the mystery of suffering and the need to defer our understanding of it may help to sustain religious faith in the face of evil; but it also imposes new burdens on that faith, because human beings may come to regard themselves as pawns in a cosmic game, and God may come to be viewed as distant and indifferent. To offset this, religious traditions have sometimes presented suffering itself as an occasion for direct relationship, collaboration, and even communion with God.

Several related positions may be identified here. One refuses to accept the seeming distance of God in the mystery of suffering by insisting on God's presence with the sufferer in the midst of anguish. God is a *compassionate* God, who *suffers with* his creatures and who is most intensely present when he seems farthest away. This position may not explain why God allows suffering in the first place, but it comforts and sustains the believer in the moment of trial. Moreover, since God is a suffering God, suffering also affords the believer a unique opportunity to obey and to imitate his creator. Those who suffer for a righteous purpose do God's will and make known his presence in the world. Suffering thus provides the most intense opportunity for collaboration and communion between God and humankind.

With this emphasis on communion, the enterprise of theodicy comes full circle. That which first threw open to question God's goodness and power, the bitter suffering of innocent persons, now becomes the supreme expression of love between God and humans. Unlike the mystical dissolutions of the theodicy problem that were looked at earlier, the fact of suffering is not here denied. Instead, the reality of suffering and its importance in human life are heightened. But suffering itself is transvalued: what is usually viewed as an experience to be avoided is now seen as an opportunity for intense religious fulfillment.

#### TEACHINGS ON THEODICY IN THE HISTORY OF RELIGIONS.

These theoretical positions on suffering and theodicy are not just abstract logical possibilities. They find concrete expression in the life and teachings of historical religious communities. Religions may even be characterized in terms of which of these theoretical positions they favor. While all of these positions may have some presence in a tradition, one or another is usually emphasized and serves as a distinguishing trait. Even closely related traditions like Judaism and Christianity evidence their uniqueness by subtle preferences among these different theodicies.

**Judaism.** In Jewish tradition, the theodicy problem is addressed not only in Hebrew scriptures but in rabbinic teachings.

**Biblical foundations.** The Hebrew scriptures provide the basis for both Jewish and Christian theodicies. With va-

rying degrees of emphasis, they contain many of the positions we have reviewed. However, the free-will theodicy is probably to the fore. This view is firmly anchored in the account of history given in *Genesis*, where a world created as "good" or "very good" by God is viewed as corrupted by human sinfulness. From the first deliberate but unnecessary transgression of the divine commandment by Adam and Eve, we follow a process of recurrent and accelerating wrongdoing that vitiates the goodness of nature and that pits person against person. While the account in *Genesis* does not answer all the questions that troubled later thinkers (why, for example, God chose to create human beings in the first place), it does place primary blame for both natural and moral evil on humankind's abuse of freedom.

Much the same view is conveyed in the portions of the Bible that were influenced by the Deuteronomic writer and the early prophets. Here, suffering is explained in simple retributive terms: loyalty to the moral and religious conditions of the covenant brings prosperity and peace; wickedness brings plague, famine, and war. Since the prophetic literature often aims to summon the sinful nation to covenantal obedience, it is recognized that the connection between conduct and its consequences is not always immediate. The result is an immanent eschatological theodicy based on confidence in a prompt, future balancing of moral accounts. Thus said Isaiah (*Is.* 3:10–11):

Tell the righteous that it shall be well with them, for they shall eat the fruit of their deeds. Woe to the wicked! It shall be ill with him, for what his hands have done shall be done to him.

This simple equation between suffering and punishment was not unchallenged in biblical thinking, and the disasters of the period from the Babylonian exile onward, when the Israelites were often most intensely loyal to the covenant, forced an explanation of seemingly innocent suffering. In wisdom literature, especially the *Book of Job*, the older theodicy is rejected. Job is an innocent man, blameless and righteous in every way; yet he suffers (*Jb.* 1–2). The prose epilogue, apparently appended at a later date, seeks to maintain the retributive schema by suggesting that Job is eventually more than compensated for his trials (42:10–17), but the book's most decisive response to suffering borders on a radical dissolution of the theodicy problem. Answering Job out of a whirlwind, God asks, "Where were you when I laid the foundations of the earth?" (38:4). A litany of God's mighty deeds in nature and history follows, with the suggestion that man is too puny a creature to question his maker's justice. Job repents his presumption: "I have uttered what I did not understand, things too wonderful for me, which I did not know" (42:3).

The *Book of Job* may be read as an abandonment of the very effort to comprehend God's justice, as an assertion that a creature cannot ask its maker to render account. Or, less radically, it may be read as a deferred theodicy—not the claim that God is unjust or beyond justice but that we are unprepared here and now to fathom God's righteous ways.

The repeated assertions of God's control of the wicked support this interpretation. In any case, the more radical stance, amounting to a dissolution of the theodicy problem, finds expression elsewhere in the wisdom literature. *Ecclesiastes*, for example, repeatedly emphasizes the obscurity of God's ways in dealing with humans. Occasionally the text despairs of there being any justice in the world: "one fate comes to all, to the righteous and the wicked, to the good and the evil" (*Ecl.* 9:2).

These dramatic responses of the wisdom tradition are not the only positions of the exilic and postexilic period. In some of the later prophetic writings, especially in "Second Isaiah," a complex, new theodicy appears: the idea of the suffering servant. This is the innocent "man of sorrows," an "offering for sin" who bears the sins of others and is "wounded for our transgressions" (*Is.* 53:3–10). Just who this figure is remains unclear. Is he the prophet himself or some other charismatic figure? Is he the nation as a whole or a righteous remnant? Whatever the answer, this idea embodies a new theodicy, combining the free-will theodicy with elements of the educative and communion theodicies. Suffering is still produced by sin, but the servant suffers vicariously. He bears his stripes to absorb the punishment of others, to highlight and communicate the consequence of sin and God's wrath against it. His suffering teaches others and is also a unique form of service to God. Finally, in a bid to the eschatological theodicy, it is promised that this servant will ultimately have his reward. He will be given a "portion with the great" and will "divide the spoil with the strong" (*Is.* 53:12).

In the latest texts of the Hebrew Bible, as well as in many writings of the intertestamental period, these eschatological and recompense themes move to the fore with the appearance of apocalyptic writings, such as the *Book of Daniel*. In these, history is viewed as moving toward a final cosmic resolution, when God will smash the empires of the wicked and raise the righteous dead to "everlasting life" (*Dn.* 12:2). The Hebrew scriptures thus draw to a close with a reassertion of the ultimate connection between suffering and sin.

**Rabbinic teaching.** Many of the motifs found in the Hebrew scriptures are continued in rabbinic thinking. Foremost once again is the free-will theodicy and the link between suffering and sin: "If a man sees that painful suffering visits him," says the Talmud, "let him examine his conduct" (B.T., *Ber.* 5a). Or again, more radically, "There is no suffering without sin" (B.T., *Shab.* 55a). It follows from this that any apparent discrepancy between conduct and its reward must be overcome or denied. Eschatology becomes acutely important. The righteous may look forward to the world to come (*'olam ha-ba'*), where all inequities will be overcome and the wicked must fear hell (Gehenna). Whatever observable suffering one experiences may be regarded as expiation of those inevitable sins that all human beings commit. Suffering thus prepares one for final reward: "Beloved are sufferings, for as sacrifices are atoning so is suffering atoning" (*Mekilta' de Rabbi Yishma'e'l* 2. 280).

This stress on the positive value of suffering is emphasized in a series of rabbinic teachings that go beyond the view of suffering as retribution and emphasize its educative dimensions or the opportunity it provides for obedience to God and communion with him. Sometimes, for example, suffering is seen as having disciplinary value. Frequently alluded to is *Proverbs* 3:11, which teaches that God is like a father who chastises a well-loved son. 'Aqiva' ben Yosef, martyred by the Romans in the Bar Kokhba Revolt, is said to have laughed during his torture. When asked by his tormentor why he did this, 'Aqiva' replied that all his life he had been reciting the Shema', the ritual formula in which the pious Jew is commanded to love God with all his heart, soul, and might, and now, amidst his tortures, he realized that he had finally been given the opportunity to fulfill this commandment. For 'Aqiva', as well as for many Jews who looked to him, suffering becomes an occasion for divine grace. Amidst suffering, these Jews came to see the presence of a God whose purpose, at a price in suffering to himself and to his people, was to render Israel a holy community.

**Christianity.** The crucifixion of Jesus clearly forms the focal point for all Christian thinking about suffering. But the interpretation of this event varies widely in Christian thinking, as do the theodicies that it brings forth.

**The New Testament.** Although the problem of suffering is everywhere present in the earliest Christian writings, what theodicies we can identify in the New Testament writings are largely implicit. Expectedly, many of the theodicies we examined in the context of biblical and rabbinic thought are clearly assumed. Particular emphasis, for example, is given to aspects of the free-will theodicy. It is true that the crucifixion provides for Christians decisive evidence that not all who suffer are guilty. Nevertheless, the death of Jesus is also the result of almost every form of human wickedness. Factionalism, nationalism, militarism, religious hypocrisy, greed, personal disloyalty, and pride all conspire here to effect the death of an innocent man.

The fact that Christ is clearly blameless provokes the further question of why he should be allowed to suffer at all. At least several answers appear throughout the New Testament, some of which are also applicable to other innocent victims. On one level, in many New Testament texts a qualified dualism makes its appearance. Evil and suffering are traced to the agency of demonic forces or to Satan (e.g., *Mk.* 5:1–13; *Mt.* 9:32–34, 12:22–24). On another level, the eschatological theodicy is vigorously reasserted, with Christ's resurrection furnishing proof that the righteous are able to vanquish all the forces of wickedness and to surmount suffering and death. The apostle Paul typically insists that the Resurrection is a source of personal hope and confidence for all who follow Christ (*1 Cor.* 5:15–19; *2 Cor.* 4:14). Side by side with this, and found everywhere from the Gospels to *Revelation*, is a vivid apocalyptic expectation. Christ is the "Son of man" whose life (and death) will usher in the kingdom of God. In this kingdom, worldly hierarchies of reward will be

overturned: “Many that are first will be last and the last will be first” (*Mk.* 10:31; *Mt.* 5:19).

Also running through many texts are elements of the educative theodicy. The letter to the Hebrews and the letter of James sound the note that suffering is sent by God as a test and a discipline of those he loves (*Heb.* 12:3–13; *Jas.* 1:2–4, 12). Paul continues this theme, adding to it elements of a communion theodicy. Christians should rejoice in suffering because it produces endurance, character, and hope (*Rom.* 5:3–5). Suffering also presents the opportunity to imitate Christ (*1 Cor.* 11:1), who has shown that power is made perfect not in strength but in weakness (*2 Cor.* 12:9). This emphasis on Christ’s fellow-suffering is a constant theme in Paul’s letters.

Finally, in Paul’s writings we find an important extrapolation from the free-will theodicy: emphasis on the universality of sin and the universal deservedness of suffering. This theme is not altogether new—it has deep roots in biblical and Jewish thought—but it is radicalized by Paul, especially in his *Letter to the Romans* (3:9–10, 23). The implications of this teaching for the theodicy problem are dramatic. Since all are sinners, what is extraordinary is not that some suffer in a world ruled by God, but that anyone is spared the divine wrath (*Rom.* 9:22–24). The fact that not all are punished is explained in terms of God’s grace being manifest in Christ’s vicarious suffering and in God’s willingness to suspend the punishment for sin (*Rom.* 3:24). This teaching clearly builds on dimensions of theodicy encountered in the Hebrew scriptures, including the suffering servant motif (now applied singularly to Christ). Nevertheless, it has the effect of revolutionizing Christian thinking about theodicy by converting the mystery of suffering into the mystery of divine grace.

**Subsequent developments.** It is impossible to review briefly all the contributions of later Christian thinking to theodicy. Suffice it to say that the major lines of thought build upon those established in the New Testament. Paul’s ideas, especially, play a major role. Augustine (354–430) developed Paul’s suggestions into a fully elaborated doctrine of original sin. According to Augustine, Adam and Eve’s transgression and punishment, “sin and its penalty,” are to be viewed as passed on to their descendants through sexual reproduction. Because everyone thus “merits” punishment, emphasis is on God’s grace and his election of those who are spared a just fate. Election itself is explained in terms of divine predestination, in accordance with which God has eternally decreed who shall be spared the punishment merited by all.

This position clearly does not solve the theodicy problem entirely, and in some respects the problem is sharpened in a new way. The question becomes not why human beings have incurred suffering but why God, in his foreknowledge and power, should have allowed the whole disastrous course of events proceeding from the Fall to have occurred in the first place. Sometimes the legitimacy of this question is denied. In Calvinism, for example, Paul’s admonitions against

questioning the creator (*Rom.* 9:19–21) are expanded to a doctrine that places God altogether beyond measurement by human justice. With this denial of God’s accountability, the theodicy problem is dissolved. Not all Christians, however, have accepted this extreme view, and repeated efforts have been made to explain and to justify God’s creation of beings capable of sin.

In his book *Evil and the God of Love* (London, 1977), John Hick argues that at least two major responses to this question may be identified in the Christian tradition. One is traceable to Augustine and constitutes the historically dominant line of thinking about the problem. (A similar view, for example, is taken by Thomas Aquinas and many other Catholic theologians.) It begins by explaining evil in creation not as a substantial reality in itself (as the Manichaeans had contended) but as an aspect of nonbeing. Thus, evil does not stem from God but represents the unavoidable and nonculpable absence of his goodness or presence in mere “created” things (the doctrine of evil as a *privatio boni*). Why God should have created free human beings is explained aesthetically in terms of the desirability of his creating a graded hierarchy of being. Once created and given every inducement for obedience, however, human beings nevertheless inexplicably turned away from God toward nonbeing. As a result, they have been justly punished, and the suffering that results (within a retributive theory of punishment) is fitting, as is the eternal damnation of those not rescued by God’s grace. Indeed, the whole outcome is sometimes justified by Augustine in terms of its overall moral balance and aesthetic perfection.

Contrasted with this view is a position that Hick associates with Irenaeus (c. 130–202) but that also has resonance in the writings of Friedrich Schleiermacher (1768–1834) and F. R. Tennant (1866–1957). It, too, traces suffering to the abuse of freedom. But its explanation of the place of both freedom and transgression in the divine plan is quite different from that of the Augustinian tradition. Here the Fall is fully within God’s intention. God has knowingly created imperfect beings who are distanced from the divine splendor and destined to fall, but he is justified in doing this because he has the moral purpose of affording these beings the opportunity for growth and free development so that they may establish a mature personal relationship with him. In this view, the world is a “vale of soul making” and it is possible to apply to the Fall the words of the Easter liturgy: “O felix Culpa quae talem ac tantum meruit habere redemptorem” (“O fortunate crime, which merited such and so great a redeemer!”). A further implication of the Irenaean theodicy, in Hick’s view, is that it casts doubt on older retributive theories of punishment that may justify the consignment of some persons to eternal suffering in hell. The Irenaean theodicy suggests a more generous “universalist” eschatology, which sees all who have lived as eventually becoming “children of God.”

Hick himself expresses a strong preference for this view. While not all contemporary Christian thinkers share this

preference, it is reasonable to say that there exists among contemporary Christian theologians a predilection to stress God's moral purpose in creating free beings and to see God himself as personally involved in the venture and risk of human freedom.

**Islam.** In his book *The House of Islam* (1975), Kenneth Cragg observes that because of its emphasis on God's transcendence, Islam "does not find a theodicy necessary either for its theology or its worship" (p. 16). With one or two important qualifications, this is a reasonably accurate assessment of the state of theodicy in a tradition that insists on surrender to the divine will (one meaning of *islām*) and finds it blasphemous to hold that God is accountable to human moral judgments. Nevertheless, while theodicy has not been a major preoccupation of Muslims, there are, especially in the earliest texts, implicit efforts to understand the sources of suffering and why God might allow it to exist.

*The Qur'ān.* We know that one of the most persistent explanations and justifications of human suffering traces that suffering to free creatures' abuse of their freedom. At first sight, this free-will theodicy seems to have little footing in the Qur'ān because of its repeated emphasis on God's sovereignty and his absolute control over human behavior. In *sūrah* 6:125, for example, we read:

Whomsoever God desires to guide, He expands his breast to Islam; whomsoever he desires to lead astray, He makes his breast narrow, tight. . . .

Or again, in 61:5:

When they swerved, God caused their hearts to swerve; and God guides never the people of the ungodly.

Although passages like these shape the later emphasis on predestination in Islamic thought, they may not have this meaning in the Qur'ān. For one thing, these utterances are frequently used to explain the recalcitrance of Muḥammad's opponents, and thus are more properly understood as affirmations of God's ultimate control of the wicked than as philosophical disquisitions on freedom. In addition, these passages are offset by many others in which a substantial measure of human freedom, initiative, and accountability is assumed. "He leads none astray save the ungodly," says *sūrah* 2:24, while *sūrah* 4:80 makes what seems to be an explicit statement of the free-will theodicy:

Whatever good visits thee, it is of God; whatever evil visits thee is of thyself.

In addition, the Qur'ān displays two other themes associated with the free-will theodicy. One is a view of suffering as a test of righteousness. More than once the question is asked, "Do the people reckon that they will be left to say 'We believe,' and will not be tried?" (29:1; 3:135; cf. 14:6; 2:46). Because such testing can sometimes lead to martyrdom and death, the Qur'ān also supports a vivid eschatological expectation. Those who withstand the test shall have their reward. All human deeds are said to be recorded in books kept by

the angels. These will be opened following the general resurrection on the day of judgment (*yaum al-dīn*). Those whose record is wanting shall descend to the Fire, while the righteous shall dwell in the Garden (*al-jannah*) where their bliss is depicted in spiritual as well as vividly material terms (*sūrah* 9:74; 75:23; 52:24; 56:17f.; 76:11–21).

*Later developments.* If the Qur'ān's perspective on suffering and its implicit theodicy display substantial similarity to some familiar positions in the Hebrew Bible and New Testament, subsequent Islamic thought strikes off on a path of its own. From the eighth century CE onward, the free-will position becomes involved in a series of bitter disputes between the Mu'tazilī school of "rationalists," or "humanists," and more orthodox defenders of God's sovereignty (including his role as sole creator of human acts). Entangled in extraneous political conflicts, this debate continued for several centuries, until the victory of the orthodox position through the work of Abū al-Ḥasan al-Ash'arī (d. 935 CE) and others. What emerged was an extreme predestinarian position, according to which not only suffering or blessedness but the acts and volitions that lead to them are totally in the hands of God. Al-Ash'arī himself tried to secure some limited room for human responsibility through a doctrine of "acquisition," according to which acts proceed from God but attach themselves to the will of the individual. Nevertheless, this teaching remains overwhelmingly deterministic. An oft-quoted tale presenting an imaginary conversation in heaven between God, an adult, and a child captures the resulting orthodox view. The child asks God, "Why did you give that man a higher place than myself?" God replies, "He has done many good works." The child then asks, "Why did you let me die so young that I was prevented from doing good?" God responds, "I knew that you would grow up to be a sinner; therefore, it was better that you should die a child." At that instant a cry arises from all those condemned to the depths of hell, "Why, O Lord! did you not let us die before we became sinners."

In the context of such determinism, all responsibility for good and evil devolves upon God himself. Lest it be thought, however, that God may legitimately be accused of injustice, Islamic orthodoxy hastens to add that in his sovereignty, God may not be subjected to human moral judgment. God's command is itself the defining feature of right, and what God wills can never be morally impugned. The great medieval theologian Abū Ḥāmid al-Ghazālī (d. 1111) affirms that "there is no analogy between his justice and the justice of creatures. . . . He never encounters any right in another besides himself so that his dealing with it might be a doing of any wrong."

This emphasis on God's omnipotence does not mean that Muslims (any more than Calvinists) view God as a capricious despot. On the contrary, their constant affirmation is that God is "merciful and compassionate." Yet in the encounter with suffering, a human's response must not be to complain, to question, or even to try to defend God. Hence,

for Islamic orthodoxy at least, theodicy remains an undeveloped dimension of the religious life. Its place is taken by the sentiment conveyed by the Qur'anic formula "Ḥasbunā Allāh" ("God is sufficient unto us").

**Hinduism and Buddhism.** It would ordinarily not be advisable to lump together any treatment of such complex traditions as Hinduism and Buddhism. But where the issue of theodicy is concerned, this approach has much to recommend it since it emphasizes the fact, already mentioned, that both traditions share a common perspective on suffering. This is the view that suffering derives from the operation of the automatic law of moral retribution known as *karman* working in conjunction with a process of reincarnation. In his *Sociology of Religion* (Boston, 1963), Max Weber characterized *karman* as "the most radical solution of the problem of theodicy" (p. 147), but this reflects Weber's own broader use of the term *theodicy* to cover any explanation of suffering. In fact, because *karman* traces suffering to one's own thoughts and deeds, and because it denies the gods any involvement in or control over the process of suffering, it is not a theodicy in our sense at all. Rather, it is a fundamental dissolution of the theodicy problem as we encounter it in ethical monotheism.

How decisive a resolution of the problem of suffering are the combined teachings of *karman* and reincarnation may be illustrated by a famous tale concerning the assassination of Mahāmoggallāna, a respected disciple of the Buddha. When the Buddha was asked to explain Moggallāna's brutal death, he replied that, while undeserved in terms of his present life, it was altogether suited to his conduct in a previous existence. In that life, said the Buddha, Moggallāna had been guilty of cruelly killing his elderly parents. (This tale is reprinted in Henry Clarke Warren's *Buddhism in Translation*, New York, 1963, pp. 221–226.) The implication of this tale is that in a world ruled by *karman* there is no such thing as "innocent suffering." All suffering (even animal suffering) is deserved. We have seen that the free-will theodicy has sometimes tended toward this same conclusion, but in all the Western traditions where this theodicy has been espoused, there have always been voices affirming the reality of innocent suffering. In Hinduism and Buddhism, however, these voices have been silenced by a drive toward the total and lucid explanation of worldly suffering afforded by *karman*.

A further implication of this teaching is that the gods may be neither blamed nor appealed to when suffering occurs. In Buddhism, belief in *karman* helps explain the subordinate place of God or the gods in the schema of salvation. Not only may divinity be attained by any righteous individual, but the gods themselves, through sins that create bad *karman*, may plunge from their lofty state. As a result, it makes no sense to look to the gods for release from suffering, since they are as subject to suffering as anyone else. Nor can they be held responsible for what suffering occurs.

Hinduism appears somewhat less certain about these conclusions. In the earlier Vedic texts, the gods are some-

times presented as powerful, righteous figures who reward and punish human beings and to whose compassion one may appeal. Varuṇa, in particular, bears many of the marks of a supreme deity, and it is possible to see here an implicit free-will theodicy with human suffering traced to transgression of God's righteous law. Nevertheless, these lines of thought are not developed in later Hindu thinking, and in the post-Vedic period, when *karman* moves to the fore, even the gods are subordinated to it. According to one tradition of Hindu mythology, for example, the god Indra slays a wicked brahman, but, in so doing, he becomes subject to the moral penalty for brahmanicide. In an effort to free himself of this burden, Indra ends by inflicting suffering on human beings. Thus, even the goodness of the gods is compromised as they find themselves powerless before the operation of this moral law of cause and effect. It is true that in popular and mythological traditions the gods are frequently seen as able to free themselves from the effects of *karman*. They are also viewed as able to benefit their devotees. But what power they have in this regard does not usually extend, within the world of *karman*, to helping human beings escape automatic punishment for serious sin.

Neither can the gods be held responsible in these traditions for the shape of reality. Buddhism explicitly denies the gods any role in creation. The universe is conceived of as an ongoing, eternal, and cyclical process of becoming, and only an error on the part of the first-born god Brahma allows him to think himself its creator. Hinduism gives a more active role to the gods in this cyclic process of evolution and devolution. The world proceeds from Viṣṇu and is actively brought forth by Brahmā. But this process is not understood in moral terms. Instead, creation is a process whereby every potentiality within the great God is allowed to manifest itself in the world of differentiation. This means that everything in creation, blessings and suffering, the gods and the demons, all good and all evil, represent the working out of the divine plenitude. If creation is conceived in anthropomorphic terms at all, it is not a morally intentioned act for which God is accountable but an expression of the deity's spontaneous creativity or play (*līlā*).

There is, therefore, in neither of these traditions any question of morally justifying the gods, and there is no real theodicy. Instead, the paramount religious questions become how (in popular Hinduism especially) one can procure some favor from the gods, how one can produce good *karman*, and how, finally, one can altogether escape *samsāra*, the world of karmically determined becoming. This latter question becomes particularly important when it is realized that within *samsāra* suffering is virtually inescapable. While deeds that generate good *karman* may lead to prosperity or bliss in some future life, it is almost certain that such a state will not endure. Because every transgression brings its penalty, and because those who are spiritually or materially well placed are more likely to transgress, existence in *samsāra* is an endless shuttle between momentary respite and prolonged misery.

We need not review in detail here the various Hindu and Buddhist answers to the question of how one may escape *samsāra*. These answers constitute the core teachings of their traditions. They range from Hinduism's stress on the profound recognition that one's soul (*ātman*) is identical with Being-itself (*brahman*), and hence basically unaffected by the flux of becoming, to Buddhism's opposing insistence that there is no eternal soul capable of being affected by *samsāra* (the doctrine of *anātman*). Despite the enormous differences between these teachings, they have much in common: suffering is viewed as endemic to the world process, and the goal is extrication from this process. Suffering is not a reason for praising or blaming God. The legacy of *karman* thus colors Indian thought from beginning to end, from its conception of the problem of suffering to that problem's resolution. Within this intellectual context, theodicy in its classic sense finds little room for development.

**CONCLUSION.** Along with the corrosive effect of modern scientific knowledge, the problem of innocent suffering poses one of the greatest challenges to ethical monotheism in our day. In the wake of the mass suffering of this epoch, some have rejected such monotheism, agreeing with the remark by Stendahl that "the only excuse for God is that he does not exist." Others have been drawn to various dissolutions of the theodicy problem, ranging from the Eastern stress on *karman* to an extreme fideism that abandons the insistence on God's justice.

Before rejecting ethical monotheism or the theodicies it has stimulated, however, it is worth keeping in mind that both spring from a profound moral intentionality. Ethical monotheism expresses the conviction that a supreme power guides reality and that this power is characterized by righteousness and love. Theodicy is the effort to sustain this conviction in the face of innocent suffering. Theodicy, therefore, is often less an effort to provide an account of the immediate facts of experience than an expression of hope and confidence that despite worldly reverses or human resistance, goodness and righteousness will triumph. Theodicy may not violate the requirements of logic, nor may it ignore the experienced reality of suffering. Theodicy's deepest impulse, however, is not to report the bitter facts of life but to overcome and transform them.

This essentially moral motivation should be kept in mind as we evaluate theodicies and their alternatives. Various dissolutions of the theodicy problem, from denials of God's power or justice to denials of the reality of suffering, may seem intellectually satisfying, but they may have moral implications we hesitate to accept. Theodicies, too, are subject to a moral test. If some older theodicies, such as reliance on the harsh idea of original sin, are no longer widely held, this may reflect their moral inadequacy. Conversely, theodicies that still attract attention are those that draw upon and deepen our moral self-understanding. The idea that God is committed to the perilous enterprise of creating free, mature human beings exemplifies this approach. This theodicy draws on

certain aspects of our deepest moral experience—for example, the experienced relationship between parents and children—and uses these to illuminate the relationship between God and his creatures. Unless this ultimate moral basis and intention is kept in mind, neither theodicy's purpose nor its persistence will be well understood.

#### BIBLIOGRAPHY

Useful surveys of classic Western philosophical and theological discussions of theodicy can be found in John Hick's *Evil and the God of Love*, 2d ed. (London, 1977), S. Paul Schilling's *God and Human Anguish* (Nashville, 1977), and David Ray Griffin's *God, Power, and Evil: A Process Theodicy* (Philadelphia, 1976).

Some of the most important classic discussions of this problem include Augustine's treatment of the issue in his *Confessions*, bk. 7, chaps. 3–5 and 12–16, in his *Enchiridion*, chaps. 3–5, and in *The City of God*, bk. 11, chaps. 16–18, and bk. 12, chaps. 1–9. Thomas Aquinas has a very similar discussion in his *Summa theologiae*, first part, questions 47–49, as does John Calvin in his *Institutes of the Christian Religion*, bk. 1, chaps. 1–5 and 14–18, bk. 2, chaps. 1–5, and bk. 3, chaps. 21–25. The great medieval Jewish philosopher Moshe ben Maimon (Maimonides) also advances a theodicy in his *Guide of the Perplexed*, pt. 3, chaps. 11 and 12, which relies heavily on the connection between wrongdoing and suffering.

Modern philosophical discussion of theodicy has its start with Leibniz's *Essais de théodicée sur la bonté de Dieu, la liberté de l'homme, et l'origine du mal* (1710), translated by E. M. Hugard as *Theodicy: Essays on the Goodness of God, the Freedom of Man, and the Origin of Evil* (London, 1952). On the other side, penetrating criticisms of theism and theodicy are offered by David Hume in his *Dialogues Concerning Natural Religion* (1779) and by John Stuart Mill in his *Three Essays on Religion* (1874).

In this century, debate in this area has been especially vigorous. Important theological discussions include Nels Ferré's *Evil and the Christian Faith* (New York, 1947), Austin Farrer's *Love Almighty and Ills Unlimited* (Garden City, N. Y., 1961), and the works by Hick, Schilling, and Griffin mentioned above. A critique of these and other efforts at theodicy is offered by Edward H. Madden and Peter H. Hare in their *Evil and the Concept of God* (Springfield, Ill., 1968).

Influential criticisms of theism and the free-will theodicy have been advanced by Antony Flew in his essays "Theology and Falsification" and "Divine Omnipotence and Human Freedom," in *New Essays in Philosophical Theology*, edited by Antony Flew and Alasdair MacIntyre (London, 1955), and by J. L. Mackie in his article "Evil and Omnipotence," *Mind*, n. s. 64 (1955): 200–212. This last essay is reprinted along with rejoinders by Nelson Pike and Ninian Smart in *God and Evil* (Englewood Cliffs, N. J., 1964), edited by Pike. Responding to these discussions, Alvin Plantinga provides a powerful defense of theodicy in general and of the free-will theodicy in particular in his *God and Other Minds* (Ithaca, N. Y., 1967), chaps. 5 and 6, and in his *God, Freedom and Evil* (London, 1975).

The problem of evil and the issue of theodicy has also had an important place in fictional writing during the modern period. Particularly noteworthy are Fedor Dostoevskii's *The Brothers Karamazov*, translated by David Magarshack (London, 1964), esp. bk. 5, chap. 4; Albert Camus's *The Plague*, translated by Stuart Gilbert (New York, 1948); and Elie Wiesel's *Night*, translated by Stella Rodway (London, 1960).

A sign of how much the problem of theodicy is a Western concern is that no comparable body of literature exists on the theodicy problem in Islam, Hinduism, or Buddhism. Nevertheless, there are some discussions worth noting. Max Weber's treatment of theodicy in his *Religionssoziologie* (Tübingen, 1922) is a pioneering effort to look at the problem of suffering and theodicy in a comparative context. This essay is translated as "Theodicy, Salvation, and Rebirth" in Weber's *Sociology of Religion*, translated by Ephraim Fischhoff (Boston, 1963). Weber's view is critically examined and developed by Gananath Obeyesekere in his article "Theodicy, Sin, and Salvation in a Sociology of Buddhism," in *Dialectic in Practical Religion*, edited by E. R. Leach (Cambridge, 1968).

A good survey of the problem of suffering in diverse religious traditions (and in Marxism) is provided by John Bowker's *Problems of Suffering in Religions of the World* (Cambridge, 1970). Both Arthur L. Herman's *The Problem of Evil and Indian Thought* (Delhi, 1976) and Wendy Doniger O'Flaherty's *The Origins of Evil in Hindu Mythology* (Berkeley, 1976) contain useful information on the diversity of responses to suffering in Indian religious traditions.

Unfortunately, there is less explicit discussion of this issue in Islamic writings or in writings about Islam, and what sources do exist are largely in Arabic. The best available review of this issue is the doctoral dissertation of Eric Lynn Ormsby, *An Islamic Version of Theodicy: The Dispute over Al-Ghazālī's "Best of All Possible Worlds"* (Princeton University, 1981). Brief mentions of this problem may also be found in Kenneth Cragg's *The House of Islam*, 2d ed. (Encino, Calif., 1975) and W. Montgomery Watt's *What Is Islam* (London, 1968). Watt's *Free Will and Predestination in Early Islam* (London, 1948) is an influential discussion of the deterministic themes that have tended to minimize the presence of theodicy in this tradition. On the other side of the issue, Jane I. Smith and Yvonne Haddad's *The Islamic Understanding of Death and Resurrection* (Albany, N. Y., 1981) provides a useful review of the themes of accountability and recompense that form an implicit theodicy in this tradition.

RONALD M. GREEN (1987)  
*Revised Bibliography*

**THEODORE OF MOPSUESTIA** (350–428), Christian biblical exegete and theologian. Theodore was born in Antioch about the same time as John Chrysostom, who became his friend and fellow student. Since Theodore belonged to the noble class, he attended courses given by the most renowned professor of rhetoric at that time, Libanius. He was later admitted to the Asketerion, the famous school near Antioch, of Diodore (later bishop of Tarsus) and Karterios. Even after his ordination as bishop of Mopsuestia, in Cilicia, he occasionally lectured at the school, where his reputation as a teacher attracted such distinguished pupils as Rufinus, Theodoret of Cyrillus, and Nestorius. His work in uprooting the remnants of polytheism in his province was very successful.

Theodore wrote widely on various subjects, but only a part of his literary production has been preserved. A pioneer in biblical exegesis, he basically followed the hermeneutic principles of his teacher Diodore, although he diverged from them in some important points. He showed greater confidence in his personal understanding than in the authority of traditional hermeneutics, with the result that he rejected the canonicity of many books of scripture.

Only four of his commentaries have been preserved: *On the Twelve Prophets*, parts of *On the Psalms*, *On John*, and *On the Epistles of Paul*. In all of these he uses critical, philological, and historical methods and rejects the Alexandrian method of allegorical interpretation. Also of great importance are his *Catechetical Homilies*, which were discovered in a Syriac translation.

As an indefatigable combatant against the heresies of his time, Theodore's attention was particularly directed toward Apollinaris of Laodicea. Theodore's dogmatic fragments that have been preserved, especially *On the Incarnation*, are directed against him. Theodore's extreme position on the two natures of Christ is largely a response to Apollinaris's teaching about the mutilation of Christ's human nature. Following the Antiochene line of thought, which combined the spiritual element with the material in such a way that they are not confused, Theodore admitted that the two natures of Christ are perfect and also remain two. His only concession on this subject was to conceive a single person only in reference to the union of the two natures; in this case the being of the person is not in essence, but in God's will, and the union is not natural but moral. Accordingly, Mary, the mother of Christ, is only nominally *theotokos*, mother of God.

As an Antiochene, Theodore stressed the great importance of the human contribution to salvation, which he developed beyond the position of the Antiochene school. He ascribed all human achievements to free will, thus destroying the meaning and the importance of original sin. He also attributed free will to Jesus Christ, who, according to this understanding, is subject to sin, believing thereby that Christ's perfection would be worthy of greater estimation. In this area he was a forerunner and probably a teacher of Pelagius.

Because of these doctrines, and especially because of his position as a forerunner of Nestorianism, Theodore was the posthumous victim of strong polemics. Some of his writings together with his doctrine on the incarnation were condemned by Justinian and by the Second Council of Constantinople (533).

#### BIBLIOGRAPHY

The edition of Theodore's texts in *Patrologia Graeca*, edited by J.-P. Migne, vol. 66 (Paris, 1847), is incomplete. Editions of individual works with better, although fragmentary, texts are his commentary on *Psalms*, *Le commentaire de Théodore de Mopsueste sur les Psaumes, I–LXXX*, edited by Robert Devreesse (Vatican City, 1939); his commentary on the Prophets, *Theodori Mopsuesteni commentarius in XII prophetas*, edited by Hans Norbert Sprenger (Wiesbaden, 1977); the Syriac text of his commentary on the *Gospel of John* with a Latin translation, *Comentarius in Evangelium Ioannis Apostoli*, 2 vols., edited by J.-M. Vosté, *Corpus Scriptorum Christianorum Orientalium*, vol. 115 (in Syriac) and vol. 116 (in Latin) (Louvain, 1940); his commentary on the epistles of Paul, *In epistolas B. Pauli commentarii*, 2 vols., edited by Henry B. Swete (1880–1882; reprint, Farnborough, 1969); and the commentaries *On the Nicene Creed* and *On the Lord's Prayer and on the Sacraments of Baptism and the Eucharist*, "Woodbrooke Studies," vols. 5 and 6 (Cambridge, 1932–1933), which include the Syriac texts and English translations edited by Alphonse Mingana.

Theodore's life and work is discussed in Leonard Patterson's *Theodore of Mopsuestia and Modern Thought* (New York, 1926); Robert Devreesse's *Essai sur Théodore de Mopsueste*, "Studi e testi," vol. 141 (Vatican City, 1948); and Rowan A. Greer's *Theodore of Mopsuestia, Exegete and Theologian* (London, 1961). A recommended study of his theology is Richard A. Norris's *Manhood and Christ: A Study in the Christology of Theodore of Mopsuestia* (Oxford, 1963).

PANAGIOTIS C. CHRISTOU (1987)

**THEODORE OF STUDIOS** (759–826), theologian and monastic reformer of the Byzantine church. Born to an aristocratic family in Constantinople, Theodore received an excellent secular and religious education under the close supervision of his mother, Theoktiste, and his mother's brother, the abbot Platon.

Eighth-century Byzantine society was greatly disturbed by the Iconoclastic Controversy. Theodore's family had sided with the Iconophiles, those who favored the use of

icons in Christian worship. His uncle Platon was a leader against the Iconoclasts, and Theodore followed in his footsteps, as a result of which he suffered persecution and was sent into exile three times.

When the persecution of the Iconophiles ceased under Emperor Leo IV, many monks, including Platon, returned to Constantinople. Under his influence, Theodore's family moved in 780 to Bithynia, where they established a monastic community on their estate of Fotinou, not far from the village of Sakkoudion. Here Theodore was ordained a priest in 787 or 788 and his monastic career began. In 794 Platon resigned as abbot in Theodore's favor. When Theodore became abbot, he reorganized the monastery according to the rule of Basil of Caesarea (c. 329–379), and the Sakkoudion community prospered for a while with a hundred monks. Because of Saracen raids in Bithynia, Theodore and most of his community were allowed by the patriarch in 798 or 799 to move to the monastery of Studios in Constantinople.

Under Theodore's leadership, the Studios monastery underwent a period of renaissance and exerted great influence on Byzantine society. It had more than seven hundred monks and perhaps as many as a thousand. Theodore became one of the most powerful men in Constantinople and found himself in conflict with both emperors and patriarchs. He tried to integrate monasticism and society and engage monks not only in spiritual matters but in social welfare activity, in hospitals, in *xenones* (hospices), and in work among the needy.

Theodore was a prolific author of doctrinal, apologetic, canonical, and ascetic theology. He also wrote poetry, homilies, and letters. His doctrinal and apologetic works defend the use of icons as part of the christological teachings of the church and stress that the event of the Incarnation fully justifies the use of iconography. His canonical and ascetic works aimed at the improvement of monasticism's image and discipline. His poetry includes many church hymns and liturgical services which remain in use, as well as iambic epigrams for different nonreligious occasions. His homilies delivered on various feast days and ecclesiastical occasions display style and logic. Theodore's letters, addressed to private persons, monks, emperors, other state dignitaries, popes, and patriarchs, are an important biographical source. More than 550 of them survive.

Theodore's significance is twofold. First, his writings constitute a mirror of eighth- and early ninth-century Byzantium. Second, his life reveals agonistic efforts to free the church from imperial influence. In this he was more concerned with an orderly and moral society than with mystical theology, more attuned to the legalisms characteristic of Roman theology than to the spiritual aspirations of the Christian East.

DEMETRIOS J. CONSTANTELOS (1987)  
*Revised Bibliography*

**THEODORET OF CYRRHUS** (c. 393–c. 458), bishop, theologian, and church historian. Theodoret was born in Antioch to wealthy Christian parents. From early childhood he devoted himself to learning and study. After the death of his parents, he entered the monastery at Apamea. In 423, against his will, he was elected bishop of Cyrrhus, east of Antioch. The young, successful bishop was imbued with an apostolic zeal for christianization. In an attempt to show the superiority of Christianity, he wrote at this time *The Healing of the Greek Passions*, which was directed toward pagan intellectuals.

As an Antiochene, at the outbreak of the Nestorian dispute, Theodoret sided with Nestorius (who accepted two distinct natures in Christ) and refused to condemn him at the Council of Ephesus (431). Theodoret’s *Pentalagion* and *A Refutation of Twelve Chapters of Cyril*, neither of which is fully extant, reflect his criticisms of Cyril of Alexandria’s attack on Nestorius. Theodoret contributed decisively to the compromise of 443 and probably wrote the declaration of faith of that union, but the peace move did not last long. Theodoret wrote his *Eranistes* in 447 in opposition to Eutyches (who taught one nature in Christ). The Robber Synod of 449, which affirmed Eutyches’ position, deposed Theodoret, who retreated from his see until the new rulers, Marcian and Pulcheria, restored him in 450.

Theodoret’s condemnation of Nestorianism before the Council of Chalcedon (451) prompted the council to acknowledge him as orthodox. Theodoret, like the council, rejected both those who sought to distinguish the existence of

two persons in Christ and those who maintained, as Eutyches did, that the divinity and humanity of Christ became one nature (see Theodoret’s *Epistle* 119). Theodoret’s activities after 451 are unknown, and it is likely that he died around 458. The Second Council of Constantinople (553), convened to settle the dispute that became known as the Three Chapters Controversy, condemned Theodoret’s writings against Cyril, but Theodoret himself was not condemned as a heretic.

Theodoret’s literary output covers important areas of the life and activity of the church. In addition to the works already mentioned, Theodoret wrote the apologetic *On Providence* (c. 436), ten discourses delivered at Antioch, and *On Chrysostom* (incomplete). Along with the several dogmatic writings referred to above, *On the Holy and Undivided Trinity* and *On the Incarnation of the Lord*—which have been falsely attributed to Cyril of Alexandria—were actually composed by Theodoret, as were *An Exposition of the True Faith* and *Questions and Answers for the Orthodox*, both wrongly attributed to Justin Martyr. *Libellus against Nestorius* is falsely attributed to Theodoret.

Along with Theodore of Mopsuestia, Theodoret is regarded as the principal exegete of the theological school of Antioch and as one of the most important interpreters of scripture. His *Ecclesiastical History* (449–450) continues Eusebius’s work of the same title and covers the period from 323 to 428. *History of Divine Love* (or *Ascetic Citizenship*) presents the lives of male and female ascetics in Syria. *Summary of Heretical Slander* (c. 453) presents in its first four discourses all the heresies up to the time of Eutyches, and, in the second part, the exceptional *Summary of Divine Dogmas*. Some 230 letters written by Theodoret are preserved, and they are an important source of the history and dogma of Christianity in the fifth century.

### BIBLIOGRAPHY

The collected works of Theodoret, edited by J. L. Schulze and J. A. Noesselt, are available in *Patrologia Graeca*, edited by J.-P. Migne, vols. 80–84 (Paris, 1859–1864). Available in English is Theodoret’s *A History of the Monks of Syria*, translated by R. M. Price (Kalamazoo, 1985). See also M. Richard’s “L’activité littéraire de Théodore avant le Concile d’Éphèse” and “Notes sur l’évolution doctrinale de Theodoret,” *Revue des sciences philosophiques et théologiques* 24 (1935): 83–106 and 25 (1936): 459–481. G. Bardy’s article on Theodoret in the *Dictionnaire de théologie catholique*, edited by A. Vacant et al. (Paris, 1946), is a valuable secondary source.

THEODORE ZISSIS (1987)  
*Translated from Greek by Philip M. McGhee*

**THEODOSIUS** (c. 347–395), Roman emperor (379–395). In the worst disaster since the days of Hannibal the Roman army and the emperor Valens were wiped out near Hadrianopolis by the Goths in August 378. The senior surviving emperor, the young Gratian, summoned from his

Spanish homeland a certain Theodosius who was elevated as emperor in January 379 at the age of 33. His first task was to come to terms with the barbarian invaders. He allowed them to settle and used them as federated troops. He dealt with the other military threat, Persia, by establishing a policy of coexistence that yielded a century of peace.

Since religious stability was accepted as the architectonic element through which the empire was held together, it occupied Theodosius's continuous attention. It is not easy to tell exactly how much of subsequent imperial policy was initiated by the emperor himself. It may be supposed that his influence on the laws was direct and strong; on the councils and church affairs generally it was indirect and deeply affected by practical politics as well as by those around him. These included women of the household, episcopal politicians, and court officials.

In 380 Theodosius was baptized (possibly in connection with a serious illness), despite the fact that people of his class ordinarily postponed baptism until they were beyond the occasions for sin inherent in public office. Accordingly, he was the first emperor brought up in a Christian family who was a fully initiated and believing Christian for the greatest part of a long reign. As a full member of the church, it was his duty to assist in church affairs. Further, the theory was beginning to take shape of the pious Christian monarch who, as *persona* ("personification") of the laity and of the body politic, prepared and made possible the oblation offered by the priests; he also, in some sense, represented the mind and heart of the body of Christ. (This idea was taken over not only by the Byzantine monarchies but may be detected in monarchical thinking in France, Britain, and Russia.)

In February 380, possibly even before his baptism, Theodosius issued an edict (Theodosian Code 16.1.2) commanding all people to walk in the way of the religion given by Peter to the Romans, and more recently exemplified by Damasus of Rome (d. 384) and Peter of Alexandria (d. 381). Those who hold the Father, Son, and Holy Spirit to be one godhead in equal majesty are catholic Christians. Others are heretics who will be struck by the divine vengeance as well as by the imperial action undertaken according to heaven's arbitration. In January 381 Theodosius followed this up with a law stating that everywhere the name of the one supreme God was to be celebrated and the Nicene faith observed (16.5.6). A person of Nicene faith and a true catholic is one who confesses the omnipotent God, and Christ his son, God under one name, and who does not violate the Holy Spirit by denial. The law quotes parts of the creed promulgated by the Council of Nicaea (325) and then interprets it in accordance with the teachings of the Cappadocian fathers, one of whom, Gregory of Nazianzus, had been ratified in his position as bishop of Constantinople by Theodosius.

In May 381 a council of 150 bishops met at Constantinople. (A sister council met at Aquileia in Italy, but it is not possible to determine the exact interrelationship of the two.) The creed associated with Constantinople took up and reaffirmed

the teaching of the Council of Nicaea with modifications in keeping with the teachings of Athanasius and other Fathers, who had upheld the Nicene faith during a half century of civil war inside the church. Without the *filioque* clause (which says that the Holy Spirit proceeds "also from the Son" and is a later Western addition), it remains one of the great central affirmations of faith acceptable to most Christians. The canons of the council give precedence to Rome as the see of Peter but insist that Constantinople, as the new Rome, must have appropriate standing. No doubt the decisions were made by the council itself, but the emperor and his ecclesiastical policymakers had largely determined who was to be present and what issues were on the agenda.

The beliefs adumbrated by the laws and the council had immediate implications. Trinitarian heretics, like the various followers of Arius, were cajoled and coerced. People who in the minds of the legislators insulted God by apostatizing from Christianity or following the teachings of Mani were fiercely attacked. A mere decade was to pass before pagans (a contemporary word designating followers of the old Greco-Roman ways of worship) also became the object of this zeal for conformity. During this reign the independent status of the Jews was maintained despite mob and demagogic attacks, but later they, too, met the Theodosian logic.

During these years of policy-making, Theodosius had made Constantinople the definitive capital of his empire and, since the murder in 383 of Gratian, his senior colleague, had permitted Maximus, a staunch Nicene Christian, to govern the far western end of the empire. Italy was nominally under the rule of the young Valentinian II, whose powerful mother, Justina, was friendly to the Arians and earned the title "Jezebel" from Ambrose. In 387, Maximus invaded Italy and Justina's family fled to Thessalonica. Theodosius, whose wife Flaccilla had died in 385, visited them there and married the daughter Galla, thereby absorbing the claims of the dynasty of Valentinian. Obviously, much else became subsumed in his ambition to found a lasting dynasty with control of the whole Roman world. In an easy victory, he defeated Maximus and sent his pagan barbarian general Arbogast over the Alps to govern the far west on behalf of Valentinian.

Late 388 found Theodosius in Italy, the last person to rule de facto from the Atlantic to the Euphrates. It was not long before he came into collision with Ambrose, the bishop of Milan. At Callinicum, on the Persian border, a Christian mob had destroyed a synagogue, and Theodosius, as became a Roman magistrate, ordered the bishop to rebuild it. Ambrose forced the emperor to rescind the order. Then, in the latter part of 390, Ambrose imposed excommunication and public penance on the emperor for ordering a blood bath at Thessalonica that had resulted in the deaths of ten to fifteen thousand people. During mass on Christmas Day 390, the emperor was reconciled.

These events had a tremendous effect on the emperor. He seems to have determined, as his laws express, to cooperate with zealous Christian leaders to prevent further insult

to heaven by barring the pagan cults. Until now, legislation had not worsened the pagan position, and the commando raids by Christian monks and mobs had been kept in some check. In 391 and 392, Theodosius caused surviving pagan sacrifices at Alexandria and Rome to cease and proscribed domestic cults (16.10.10–11). The world-renowned Temple of Serapis at Alexandria was destroyed by monks led on by the local bishop, while Roman officials stood by. Riots by the Christian mobs, fueled by the promise of spoils, spread like wildfire. Alarmed, the pagan aristocrats in the west looked for allies.

In May 392 Valentinian II died mysteriously. Arbogast elevated a certain Eugenius to the position of emperor and in 393 invaded Italy. The western pagans offered their help and were enthusiastically received. The struggle was likened by both sides to that of Jupiter and Hercules versus Christ. As Theodosius tried to enter Italy through the valley of the Frigidus River in September 394 his enemies gave battle. He was facing defeat when the bora, a violent Adriatic wind, sprang up from behind him. Both sides took this as showing that God was on Theodosius's side. The panic-stricken pagans died at their posts or fled.

At the time of his triumph in January 395, gout and death overtook Theodosius. He was survived by his son Arcadius in the East where the East Roman (Byzantine) Empire lived on until the Turks struck down the last Christian emperor in the gateway of Constantinople in 1453. In the West, his young and feeble son Honorius sat enthroned. The Goths sacked Rome in 410; within the century the Western Empire had collapsed and the medieval papacy had emerged.

Despite his title, Theodosius the Great was a mediocre man who completed the work of Diocletian and Constantine and put together a scheme of survival for the East Roman Empire. Behind its fortifications, Western civilization gained time to take shape. Thanks to the religious policy of Theodosius, his predecessors back to Constantine, and his successors down to his redoubtable granddaughter Pulcheria (399–453), certain features of the Greek, Hellenistic, Roman, African, and ancient Near Eastern heritages that might otherwise have been excluded were decisively imbibed by Christianity. This process created and presented a face of Christianity that for centuries has obscured its innate affinity with the powerless, the underprivileged, and the non-Western, as well as its heritage of detestation of coercion, violence, and triumphalism.

#### BIBLIOGRAPHY

The text of the Theodosian Code can be found in *Theodosiani Libri XVI*, 3 vols. in 2, edited by Theodor Mommsen and Paul M. Meyer (Berlin, 1905), and translated into English by Clyde Pharr, in *The Theodosian Code* (Princeton, N.J., 1952). See also Jill Harries and Ian Wood, eds., *The Theodosian Code* (Ithaca, N.Y., 1993), and John F. Matthews, *Laying Down the Law: A Study of the Theodosian Code* (New Haven, Conn., 2000). On the Emperor himself, Adolf Lipold's *Theodosius der Grosse, und seine Zeit*, 2d ed., enl. (Mu-

nich, 1980), is a thoroughly researched study of most aspects of Theodosius's policies. See also Wilhelm Ensslin, *Die Religionspolitik des Kaisers Theodosius d. Gr* (Munich, 1953), and Stephen Williams and Gerrard Friell, *Theodosius: The Empire at Bay* (New Haven, Conn., 1995).

A monograph in English central to the question of Theodosius's role in Christianity is my *The Emperor Theodosius and the Establishment of Christianity* (Philadelphia, 1960). Jörg Ernesti's *Princeps Christianus und Kaiser aller Römer: Theodosius der Grosse im Lichte zeitgenössischer Quellen* (Schöningh, 1998) is a highly detailed and full discussion of the literature as a whole. Important related discussions can also be found in Kenneth G. Holm's *Theodosian Empresses* (Berkeley, Calif., 1982) and J. F. Matthews's *Western Aristocracies and Imperial Court, A. D. 364–425* (Oxford, 1975). Related themes are taken up in Tony Honoré, *Law in the Crisis of Empire, 379–455 AD: The Theodosian Dynasty and its Quaestors with a Palingenesia of Laws of the Dynasty* (Oxford, 1998), and Bente Kiilerich, *Late Fourth Century Classicism in the Plastic Arts: Studies in the So-Called Theodosian Renaissance* (Oxford, 1993).

This reign saw the beginning of the effulgence of intellect, holiness and charity, associated with such names as the Cappadocians, the Bethlehem women and Jerome, the desert Mothers and Fathers, Augustine and Monica, Ambrose, the Priscillians, Martin of Tours, and the Pelagians. Each has an extensive bibliography that interlinks with that of the Emperor. See also Incontro di studiosi dell'antichità cristiana, *Vescovi e Pastori in Epoca Teodosiana* (Rome, 1996). A good visual aid is also offered in the film "Trials and Triumphs in Rome: Christianity in the 3rd and 4th Centuries," directed by Bob Bee (Princeton, N. J., 1999).

NOEL Q. KING (1987 AND 2005)

## THEOLOGY

*This entry consists of the following articles:*

COMPARATIVE THEOLOGY  
CHRISTIAN THEOLOGY

### THEOLOGY: COMPARATIVE THEOLOGY

Historically, the term *comparative theology* has been used in a variety of ways. First, it sometimes refers to a subsection of the discipline called "comparative religion" wherein the historian of religions analyzes the "theologies" of different religions. Second, within the discipline variously named "the science of religion," *Religionswissenschaft*, or "history of religions," some scholars have used the term *comparative theology* to indicate one aspect of the discipline. F. Max Müller, for example, in his *Introduction to the Science of Religion*, used the term to refer to that part of the "science of religion" that analyzes "historical" forms of religion, in contrast to *theoretic theology*, which refers to analysis of the philosophical conditions of possibility for any religion. As a second example, in 1871 James Freeman Clarke published a work entitled *Ten Great Religions: An Essay in Comparative Theology*, which concentrated on the history of religious doctrines in different traditions.

**PROBLEMS AND POSSIBILITIES.** On the whole, contemporary scholars in history of religions or religious studies do not use the term *comparative theology* in Müller's or Clarke's senses, and these earlier usages are therefore now of more historical than current disciplinary interest. In the contemporary scholarly world, the term can be understood in two distinct ways. First, it may continue to refer to a comparative enterprise within the secular study of history of religions in which different "theologies" from different traditions are compared by means of some comparative method developed in the discipline. Usually, however, *comparative theology* refers to a more strictly theological enterprise (sometimes named "world theology" or "global theology"), which ordinarily studies not one tradition alone but two or more, compared on theological grounds. Thus one may find Christian (or Buddhist or Hindu, etc.) comparative theologies in which the theologian's own tradition is critically and theologically related to other traditions. More rarely, comparative theology may be the theological study of two or more religious traditions without a particular theological commitment to any one tradition. In either theological model, the fact of religious pluralism is explicitly addressed, so that every theology in every tradition becomes, in effect, a comparative theology.

In principle, the two main approaches are complementary and mutually illuminating: any comparative enterprise within history of religions (or comparative religion)—that is, a secular or scientific study—will interpret theologies as material to be further analyzed from the perspective of, and by means of, the comparativist criteria of that discipline. Any theological attempt at comparative theology—that is, from within the context of belief—will interpret the results of history of religion's comparisons of various theologies by means of its own strictly theological criteria.

The fact that theology itself is now widely considered one discipline within the multidisciplinary field of religious studies impels contemporary theology, in whatever tradition, to become a comparative theology. More exactly, from a theological point of view, history of religions, in its comparativism, has helped academic theology to recognize a crucial insight: that on strictly theological grounds, the fact of religious pluralism should enter all theological assessment and self-analysis in any tradition at the very beginning of its task. Any contemporary theology that accords theological significance (positive or negative) to the fact of religious pluralism in its examination of a particular tradition functions as a comparative theology, whether it so names itself or not. The history and nature of this new, emerging discipline of comparative theology as theology bears close analysis.

A difficulty with the phrase *comparative theology* is that *theology* may be taken to describe a discipline in Western religions but not necessarily in other traditions. Indeed, the term *theology* has its origins in Greek religious thought. Historically, theology has functioned as a major factor within the religious discourse of Christianity that has been influenced by Hellenistic models—and, to a lesser extent, within that of

Islam and Judaism. Any enterprise that is named "comparative theology," therefore, must establish that the very enterprise of theology is not necessarily a Greco-Christian one.

To assure this, two factors need clarification. First, to speak of "theology" is a perhaps inadequate but historically useful way to indicate the more strictly intellectual interpretations of any religious tradition, whether that tradition is theistic or not. Second, to use *theo logia* in the literal sense of "talk or reflection on God or the gods" suggests that even nontheistic traditions (such as some Hindu, Confucian, Taoist, or archaic traditions) may be described as having theologies in the broad sense. Most religious traditions do possess a more strictly intellectual self-understanding.

The term *theology* as used here does not necessarily imply a belief in "God." Indeed, it does not even necessarily imply a belief in the "high gods" of some archaic traditions, nor the multiple gods of the Greeks and Romans, nor the radically monotheistic God of Judaism, Christianity, and Islam. Whatever the appropriate term used to designate ultimate reality may be, that term is subject to explicitly intellectual reflection (e.g., the term *sacred*, as in the "dialectic of the sacred and the profane" in the great archaic traditions, as analyzed by Mircea Eliade; the term *the holy*, suggested as the more encompassing term, in distinct ways, by Nathan Söderblom and Rudolf Otto; the term *the eternal*, as suggested by Anders Nygren; the term *emptiness*, as used in many Buddhist traditions; or the term *the One*, as in Plotinus; etc.). Insofar as such explicitly intellectual reflection occurs within a religious tradition, one may speak of the presence of a theology in the broad sense (i.e., without necessarily assuming theistic belief). However useful it may be for the purposes of intellectual analysis, the term *theology* should not be allowed to suggest that the tradition in question names ultimate reality as "God"; or that the tradition necessarily considers systematic reflection on ultimate reality important for its religious way. (Indeed, in the case of many Buddhist ways, "systematic" reflection of any kind may be suspect.) "Theology," thus construed, will always be intellectual, but need not be systematic. With these important qualifications, it is nonetheless helpful to speak of "comparative theology" as any explicitly intellectual interpretation of a religious tradition that affords a central place to the fact of religious pluralism in the tradition's self-interpretation.

Among the theological questions addressed by a comparative theology may be the following. (1) How does this religion address the human problem (e.g., suffering, ignorance, sin), and how does that understanding relate to other interpretations of the human situation? (2) What is the way of ultimate transformation (enlightenment, emancipation, salvation, liberation) that this religion offers, and how is it related to other ways? (3) What is the understanding of the nature of ultimate reality (nature, emptiness, the holy, the sacred, the divine, God, the gods) that this religion possesses, and how does this understanding relate to that of other traditions?

Such comparative theological questions may be considered intrinsic to the intellectual self-understanding of any religious tradition or way, and one may thus speak of the implicit or explicit reality of a “comparative theology.” More specific proposals will result from particular comparative theological analyses; for example, the suggestions of a radical unity among many religions (Frithjof Schuon, Huston Smith, Henry Corbin), or suggestions that one may have a Christian or Hindu or Buddhist or Jewish or Islamic comparative theology (Wilfred Cantwell Smith, Raimundo Panikkar, Masao Abe, Ananda Coomaraswamy, S. H. Nasr, Franz Rosenzweig, et al.). All these more particular proposals, however, are based on theological conclusions that have followed an individual theologian’s comparative assessment of his or her own religious tradition and other traditions. Prior to all such specific theological proposals, however, is the question of the nature of any comparative theology from within any religious tradition.

In general terms, therefore, comparative theology always accords explicit theological attention to religious pluralism, despite radical differences in theological conclusions. In methodological terms, contemporary comparative theology provides an intellectual self-understanding of a particular religious tradition from within the horizon of many religious traditions. It is a hermeneutical and theological discipline that establishes mutually critical correlations between two distinct but related interpretations: on the one hand, the theological interpretation of the principal religious questions given a context of religious pluralism in an emerging global culture; on the other, an interpretation of the responses of a particular religious tradition to that pluralism.

As this general methodological model clarifies, the comparative theologian cannot determine before the analysis itself what ultimate conclusions will occur, for example, that all religious traditions are either finally one or irreversibly diverse, or that a particular tradition must radically change or transform its traditional self-understanding as the result of pluralism. It is clear that to start with an explicit (and usually, but not necessarily, positive) assessment of religious pluralism challenges the position of traditional theology, which argued, implicitly or explicitly, that the fact of religious pluralism (and therefore of a comparative hermeneutical element as intrinsic to the theological task) was of no intrinsic importance for theological interpretation. A contemporary Christian comparative theology, for example, will inevitably be different from a Hindu or Jewish or Islamic or Buddhist comparative theology. But, just as important, each of these emerging comparative theologies will be different from all those traditional theologies which disallowed a comparative hermeneutics within the theological task, either explicitly (through claims to exclusivism) or implicitly (by denying its usefulness). There is as yet no firm consensus on the results of “comparative theology,” but it is possible that those engaged in this increasingly important task may come to agree on a model for the general method all comparative theologians employ.

The further need, therefore, is to reflect on this method. First, however, it is necessary to review the historical precedents for this emerging discipline.

**HISTORY: PREMODERN DEVELOPMENTS.** For reasons of clarification and space, this historical survey will be largely confined to Western traditions where strictly theological issues have been especially acute. Westerners should not forget, however, that other traditions (especially those of India) have struggled for a far longer period and with great philosophical sophistication with the question of religious pluralism. (See Surendranath Dasgupta, *A History of Indian Philosophy*, 5 vols., Cambridge, 1922–1955, and Eric J. Sharpe, *Comparative Religion: A History*, London, 1975.)

**Monotheistic religions until early modernity.** Although the term *comparative theology* is not employed in discussions of the premodern period, comparative elements in traditional Western philosophies and theologies were present, in positive and negative ways, in the premodern period. In the Jewish, Christian, and Islamic traditions, the insistence upon the exclusivity of divine revelation led, on the whole, to a relative lack of interest in analyzing other religions, save for polemical or apologetic purposes. This lack of interest was based (especially in the prophetic trajectories of those religions) on an explicitly and systematically negative assessment of other religions or ways from the viewpoint of scriptural revelation. Attacks on the ancient Canaanite religions by the prophets of Israel in the Hebrew scriptures are the clearest among many examples of this “exclusivist” development. Still, as modern scholarship has shown, the borrowings by ancient Israel from other religious traditions, or those by early Islam from Jews, Christians, and “pagans,” suggest a more complex scenario than traditional Jewish, Christian, and Islamic exclusivist theological interpretations suggest. Moreover, there are elements (especially in the wisdom tradition) that suggest more positive appraisals of other religious traditions (e.g., the covenant with Noah, the *Book of Ecclesiastes*, universalist tendencies in the New Testament, as in *1 Timothy* 3–5). Other exceptions are found in the Logos tradition of Philo Judaeus in Judaism and the distinct but related Logos traditions of three Christian theologies (Justin Martyr, Clement of Alexandria, Origen). The esoteric and gnostic strands in all three monotheistic traditions challenged orthodox biblical theologies through more syncretic theologies, which were sometimes based on a belief in an original (and shared) revelation. The use of ancient Greek and Roman philosophical sources in the theologies of all these traditions also provides some partial exceptions to exclusivist emphases.

Yet even the use of Plato, Aristotle, the Stoics, and the Neoplatonists in Jewish, Christian, and Islamic theologies was strongly conditioned by the framework of the received traditions, especially traditional theological interpretations of the subsidiary position of philosophical reason to revelation (Ibn Sīnā, Maimonides, Thomas Aquinas). Inevitably, the use of the “pagan” philosophies of ancient Greece in Jewish,

Christian, and Islamic theological self-understanding generated some comparativist interests in all these monotheistic theologies—but these were usually colored by traditional apologetic and polemical concerns. The greatest exception to this general rule may be found among Islamic thinkers, especially al-Sharastānī (d. 1153), whose treatise *The Book of Sects and Creeds* provides a comparative theological analysis from an Islamic perspective of most of the major religions of the then-contemporary world. Most Christian theologies, for example, did not agree with Tertullian's implied negative response to his famous rhetorical question, "What has Athens to do with Jerusalem?"

The most common understanding on the part of Christian theology was that the use of philosophical resources did not necessitate any assessment of the religions to which these "pagan" philosophers may have held. For example, the use of Middle Platonism and Neoplatonism by Christian theologians emerged at those locations (e.g., Alexandria) where the relationship of Neoplatonism to the mystery religions and occult practices was weakest in the ancient world. Hence theologians like Origen and Clement could appeal to Middle Platonic philosophy without comparativist analyses of the explicitly cultic practices sometimes associated with Middle Platonism and Neoplatonism. The dominant comparative question for Christian theology (and, in their distinct but related ways, for Jewish and Islamic theologies) was the relationship of theology to philosophy, of revelation to reason. There was little explicit theological interest in comparativist religious analyses—again save for the traditional apologetic and polemical treatises on the "pagans."

**Ancient Greece and Rome.** Provided that a particular religion did not interfere with civic order, the ancient Greeks and especially the Romans were generally more tolerant of religious differences than were the monotheistic religions. This tolerance, in certain somewhat exceptional circumstances, gave rise to some interest in the fact of religious diversity. Among the classical Greeks, the major writer with an interest in comparativism is undoubtedly the great historian Herodotus. His work demonstrates remarkable concern with non-Greek religions (especially the religions of the Egyptians, Persians, and Babylonians), as well as with the religious diversity within the Greek world itself. As a "comparativist," his "syncretist" sympathies are equally clear. His most notable successor in these interests (especially as regards Egyptian religion) is Plutarch.

The Stoics were the first in the West to attempt to establish the existence of common beliefs within the diversity of beliefs in the ancient world. They did so through their invention of the term *religio naturalis* ("natural religion"). The most famous work of what might be called comparative theology in the ancient world remains Cicero's famous dialogue *De natura deorum*, in which the theologies and philosophies of the Stoics, Epicureans, and Academics are discussed. (Cicero's great dialogues encouraged comparativist interest in later ages as well—witness David Hume's use of him as a

model for his *Dialogues Concerning Natural Religion*.) The Stoics also developed allegorical methods of interpreting the ancient myths and gods (e.g., Zeus interpreted as the sky, Demeter as the earth). These methods were later employed by some Jewish (e.g., Philo) and many Christian theologians as an implicitly comparativist, hermeneutic method of scriptural interpretation. Comparativist interests may also be noted in the writings of Varro and comparative elements are evident in texts with other major interests—for example, Strabo's *Geography* and Tacitus's *Germania*. In the medieval period, the outstanding figure with comparativist interests was the Christian philosopher-theologian Nicholas of Cusa.

**Early Western modernity.** The Renaissance, of course, occasioned new interest in the works of antiquity, including the classical mythologies. The most remarkable expression of this interest can be found in the speculations on the existence of an original revelation in all religions, in the texts of the Christian thinkers Marsilio Ficino, Giovanni Pico della Mirandola, Giordano Bruno, and others. These men not only revived the ancient myths for Christian theological purposes but also argued for the "esoteric tradition" as the common stream present in all the known religions of both antiquity and the modern world.

The age of Western exploration in the fifteenth, sixteenth, and seventeenth centuries stimulated new interest not only in the religions of antiquity but also in the newly observed religions of the Americas and those of Asia. The most remarkable example of an exercise in "comparative theology" during this period remains the work of a Jesuit missionary to China, Matteo Ricci, whose positive assessment, on Christian theological grounds, of Confucianism is unique. Indeed, Ricci's letters and reports, although unsuccessful with authorities at Rome, were, in the eighteenth century, deeply influential upon the interest in Chinese religion among such thinkers as Leibniz, Voltaire, Christian Wolff, and Goethe. The comparative theological interests of the Enlightenment were characteristically addressed to classical Confucianism (somewhat bizarrely interpreted as eighteenth-century "natural religion"), rarely to Daoism or Chinese Buddhism.

With the advent of historico-critical methods, the comparative theological interests of Western thinkers shifted in both their approach and in the areas of their dominant interest. The Romantic thinkers (e.g., Johann Gottfried Herder) analyzed distinct cultures as unitary expressions of the unique genius of particular peoples. This interest encouraged the development of historical studies for each religion as unitary and unique. Earlier negative assessment by Enlightenment thinkers of what they had named "positive religions" (as distinct from a presumed common "natural religion") yielded, in the Romantics, to a positive comparativist assessment of particular religious traditions and cultures. The simultaneous nineteenth-century historical interest in the ancient Near East spurred renewed comparativist interest in the religions of ancient Assyria, Babylonia, and Egypt.

The rise of interest in Indian religions, moreover, paralleled both Western colonial expansion and the scholarly development of Indo-European studies in the expanding search for the sources of Western culture. Indeed, in the nineteenth century that interest in Indian religious traditions arose not only among scholars in Indo-European studies but also among philosophers with little strictly scholarly competence, but with strong comparative theological interests—such as the American Transcendentalists (Emerson, Thoreau, et al.) and the German philosopher Arthur Schopenhauer. With the emergence of historical consciousness, the transition from ancient, medieval, and early-modern comparative theological interests to a more complete modernism may be said to have begun.

**The modern period.** The crucial intellectual development in the rise of comparative theology in the modern period was the emergence of historical consciousness and historical-critical method. The recognition of the historically conditioned character of religious traditions led to a crisis of cognitive claims for Western Christian and Jewish theologians. The Enlightenment's hope that a universal "natural religion" could be abstracted from all "positive" (i.e., particularist) religions was a hope shared, in different ways, by most thinkers of the period, including both the Christian philosophers Leibniz and Kant and the Jewish thinker Moses Mendelssohn.

But the combined force of Romanticism's fascination with past cultures as living and unique wholes expressive of particular peoples and the scholarly development of historical-critical methods and a resultant historical consciousness led to a widespread awareness of the need to incorporate that historical sense in all the exercises of reason, including philosophy and theology. Thus Western philosophy and theology, by becoming historically conscious, became implicitly (and often explicitly) comparativist as well.

The two major thinkers who initiated this comparative philosophy and theology—although it is important to recall that neither ever so named it—were Friedrich Schleiermacher and G. W. F. Hegel. Schleiermacher, a Reformed theologian, developed a Christian theology that deeply influenced all later Christian theology, among other reasons because it incorporated explicitly comparative elements. Schleiermacher defined religion as "the sense and the taste for the Infinite" and, later and most influentially, as "a feeling of absolute dependence"; as such, religion is the central reality for humankind. Moreover, in his Christian theology he attempted a comparison of religions. He argued for the superiority of the monotheistic over the polytheistic religions and for the superiority of the "ethical monotheism" of Christianity over the "ethical monotheism" of Judaism and the "aesthetic monotheism" of Islam. The details of Schleiermacher's controversial theological arguments are less important here than his insistence that Christian theology should include genuinely comparative elements.

Schleiermacher's great contemporary and rival, Hegel, had a similarly controversial influence on the development of historical and comparative elements in philosophy (and, to a lesser extent, in Christian theology). Hegel's complex developmental-dialectical model for philosophy demanded, on intrinsic philosophical grounds, a systematic and comparativist account of the major civilizations and the major religions. The thrust of his argument was that Spirit itself (at once divine and human) had a dialectical development that began in China and moved through India, Egypt, Persia, Israel, Greece, and Rome to the "absolute religion" of Christianity. This last reached its climax in German Protestantism and in his new dialectical philosophy. Hegel's formulation of the intellectual dilemma for comparative theology and comparative philosophy is an attempt to show the "absoluteness" of one religion (Protestant Christianity) by relating it explicitly to a developmental and comparative (i.e., dialectical) schema. This attempt to demonstrate absoluteness proved influential upon both Western Christian theology and secular philosophy.

Although the comparativist conclusions of both Schleiermacher and Hegel are generally accorded little weight among contemporary philosophers and theologians, their joint insistence on the incorporation of comparativist elements into both Christian theology and secular philosophy has proved enormously influential. In the twentieth century, their most notable Christian theological successor has been Ernst Troeltsch. Troeltsch engaged in several disciplines: he was a major historian of Christianity, a sociologist of religion, an interpreter of the new comparative "science of religion," an idealist philosopher of religion, and an explicitly Christian theologian. His ambitious theological program has proved more important for its methodological complexity and sophistication than for any particular theological conclusions. Troeltsch insisted throughout his work in these different disciplines that Christian theology as an academic discipline must find new ways to relate itself critically not only to its traditional partner, philosophy, but also to the new disciplines of sociology of religion and the general science of religion. Troeltsch became, in sum, the systematic theologian of the newly emerging "history-of-religions" school of Christian theology centered at the University of Göttingen.

It is also notable that Troeltsch shifted his earlier theological judgment on the "absolute superiority" of Christianity among religions to a later position in which he held that Christianity was only "absolute" for Westerners. This controversial theological conclusion was based, above all, on Troeltsch's conviction (as a historian) of the unbreakable relationship of a religion to its culture. This was true, for Troeltsch, even for such relatively culture-transcending religions as Christianity and Buddhism. This theological conclusion of merely relative absoluteness was also warranted by Troeltsch's conviction that it is impossible to assess the relative value of a religion through objective or neutral criteria that are independent of the diversity of particular cul-

tural and religious values. Similar comparative theological enterprises (generally without Troeltsch's methodological sophistication and without his conclusion of the merely relative superiority of Christianity for Westerners) may be found in both liberal Protestant and Catholic modernist theologies in the early twentieth century.

However, the relative optimism, as well as the comparativist theological interests, of both the liberal Protestant and Catholic modernist theologians soon disappeared. In Catholicism, the end came through the intervention of Rome. Among Protestants, it occurred through the collapse of liberal optimism following World War I. The major theological alternative for Protestant thought at that time (generally called dialectical theology, or neo-Reformation theology) was found in the work of Karl Barth. Barth rejected most of the liberal Protestant theological program, including its comparativism. He held that Christian theology was a discipline not intrinsically related to the larger question of the nature of religion (including Christianity as a religion). Christian theology was determined only by the question of the meaning of God's self-revelation in the Word of Jesus Christ. As such, any Christian theological interest in comparativist analyses of religions was improper to the strictly theological task.

Barth's great theological contemporaries Rudolf Bultmann and Paul Tillich, however, continued to include some major historical and comparative emphases in their distinct and non-Barthian formulations of dialectical theology. Indeed, at the end of his long career, and influenced by his seminar work with Mircea Eliade, his colleague at the University of Chicago, Tillich returned explicitly to his earlier Troeltschian interest in history of religions in an important lecture entitled "The Significance of History of Religions for Systematic Theology" (1965). Other Christian theologians, moreover, continued and refined aspects of the program set forth by Troeltsch. It is notable that three of the most important founders of the discipline known as phenomenology of religion in the modern period, Nathan Söderblom, Gerardus van der Leeuw, and Rudolf Otto, were also Christian theologians who incorporated their phenomenological and historical work on religion into their constructive proposals for Christian theology.

Even granted these notable and important exceptions, however, Christian theology of the period between the wars largely abandoned its earlier comparativist interests: in Roman Catholic theology through the suppression of modernism and the revival of scholasticism; in Protestant theology through the ascent of Barthian dialectical theology. These developments tended to remove Christian theology from its earlier intellectual alliance with the "scientific" study of religion. Both Protestant dialectical theology and Roman Catholic scholastic theology gave relatively little attention to comparativism.

However, a comparativist theological analysis within the Barthian perspective, designed to show the radical contrast

of Christian revelation to that of other religions, may be found in the notable work of Hendrik Kraemer, especially in his detailed study of other religions, *The Christian Message in a Non-Christian World* (1938). In Roman Catholic theology (especially in the work of Jean Daniélou and Henri de Lubac), moreover, the "return to the sources" movement of the *nouvelle théologie* of the 1940s and 1950s engaged in historical and comparative work on the relationships of non-Christian religions and philosophies to historical Christianity in the scriptural, patristic, and medieval periods.

This scholarly work helped set the stage for the affirmative declarations on the world religions by Rome both during and after the Second Vatican Council (1961–1965). Roman Catholic theologians (most notably Karl Rahner and Hans Küng) began to include comparativist elements in their Catholic theological proposals. In Jewish theology, an earlier notable comparativist theological enterprise was achieved by the great Jewish theologian Franz Rosenzweig with his development of a "two-covenant" theme.

In our own period, many Christian theologians have returned to the kind of comparativist theological program initiated by Schleiermacher and Hegel and refined by Troeltsch. Without necessarily accepting the conclusions of earlier comparative theologies, and without abandoning the strictly theological gains of dialectical theology, many contemporary ecumenically oriented Christian theologians (whether Protestant, Catholic, or Orthodox) are concerned to include explicitly comparativist elements within their theologies. There are, at present, many alternative proposals for how this might best be accomplished. Among Christian comparative theologians these include the "theology of the history of religions" proposal of Wolfhart Pannenberg; the Christian theologies of religious pluralism of John Cobb and Raimundo Panikkar that allow for mutual and radical self-transformation; proposals of Hans Küng and Langdon Gilkey for dialogue among the religions as intrinsic to all Christian theological self-understanding; proposals for a "global" or "world" theology by Wilfred Cantwell Smith, a thinker who is both a Christian theologian and a historian of religion; a proposal for radical rethinking of Christianity's traditional christological claims by the Protestant theologian and philosopher of religion John Hick and the Catholic theologian Paul Knitter; explicitly comparative theological proposals based on the pluralism within the Christian tradition as a central clue to a pluralism among all religions (George Rupp); and revisionary comparative proposals for different religious models (saint, sage, etc.) from a Christian theological perspective (Robert C. Neville). Comparative theologies in other traditions have also been developed, such as the Hindu global theologies of Swami Vivekananda and Ananda Coomaraswamy, the Buddhist comparative theology of Masao Abe, and the Islamic global theology of the sacred of S. H. Nasr.

Important comparativist theological elements may also be found in the modern period in the philosophers Ernest

Hocking and F. S. C. Northrup, the historian Arnold Toynbee and the psychologist C. G. Jung. Each of these thinkers, although not a theologian, exerted a powerful comparativist influence upon many theological enterprises.

**GENERAL THEOLOGICAL METHOD AND THE POSSIBILITY OF A SHARED METHOD FOR COMPARATIVE THEOLOGY.** As contemporary theologians in a religiously pluralistic world grope for new, inevitably tentative formulations of a paradigm to guide their deliberations and inform their expectations, they are confronted with the question of method. Theological method must always be a secondary matter for comparative theology, subsidiary to concrete interpretations of the specific symbols of a particular religious tradition. Method—precisely as a necessarily abstract, heuristic guide—must always be secondary to the concrete interpretations of each particular theology. But the secondary also serves. Reflection on method serves the common cause of all concrete comparative theologies by bringing into sharper focus the principles behind the common search for a new paradigm—principles that are often obscured in the present sharp conflict among particular proposals and conclusions in this emerging discipline. The abstract does not merely extrapolate from the concrete; the abstract also enriches the concrete by highlighting and clarifying what is essential.

It is helpful, therefore, to reflect on what kind of general theological method may be shared by contemporary comparative theologians despite otherwise sharp differences among them. The present hypothesis can be described by four premises. First, comparative theology must be a reinterpretation of the central symbols of a particular religious tradition for the contemporary religiously pluralistic world. Second, a new paradigm for comparative theology must be so formulated that the interpretations of a tradition can no longer be grounded in older, classicist bases but must rely on new foundations that incorporate both past tradition and the present religious pluralism. Third, in keeping with the demands of an emerging globalism and a pluralistic world, theologians in all traditions must risk addressing the questions of religious pluralism on explicitly theological grounds. Fourth, it follows from these first three premises that contemporary theologians must engage in two complementary kinds of interpretation of a tradition—those now known as the “hermeneutics of retrieval” and the “hermeneutics of critique and suspicion.” There is no innocent interpretation, no unambiguous tradition, no history-less interpreter. There is no merely abstract, general “situation” and no theological method that can guarantee certainty. There is only the risk of comparative theological interpretation itself: the risk of interpreting the great symbols in all the traditions for the present pluralistic situation and then presenting those interpretations to the wider global theological community and the wider community of religious studies for criticism.

This general model can be made more specific by introducing the following definition of a shared theological method in the new situation: any theology is the attempt to estab-

lish mutually critical correlations between an interpretation of a particular religious tradition and an interpretation of the contemporary situation.

Thus, contemporary theology as a discipline shares with history of religions, the humanities, the social sciences, and, more recently, the natural sciences, a turn to reflection on the process of interpretation itself. For theology is one way to interpret the elusive, ambiguous, and transformative reality named, however inadequately, “religion.” Theology is not merely a synonym for any interpretation of religion but rather bears its own methodological demands and its own criteria. It is necessary, therefore, to clarify this definition of theology and to show how it can yield a common model for a theological method, one appropriate to a contemporary comparative theology in any tradition.

Theologians interpret the claims to meaning and truth in the religious classics of a particular tradition for a new situation. The religious classics are theologically construed as human testimonies to some disclosure of ultimate reality by the power of ultimate reality itself, as that power is experienced by human beings. The questions to which such testimonies respond are the fundamental “limit-questions” of the ultimate meaningfulness or absurdity of existence itself. Religious questions are questions of an odd logical type, emerging at the limits of ordinary experience and ordinary modes of inquiry (ethical, aesthetic, political, scientific). Like strictly metaphysical questions, the fundamental questions of religion must be logically odd, since they are questions concerning the most fundamental presuppositions, the most basic beliefs about all knowing, willing, and acting. Like strictly metaphysical questions, religious questions must be on the nature of ultimate reality. Unlike metaphysical questions, religious questions ask about the meaning and truth of ultimate reality, not only in itself but also as it relates existentially to human beings. The religious classics, therefore, are theologically construed as testimonies by human beings who cannot but ask these fundamental limit-questions and, in asking them seriously, believe that they have received an understanding of or even a response from ultimate reality itself: some disclosure or revelation bearing a new and different possibility of ultimate enlightenment, or some new way to formulate the questions themselves, or some promise of total liberation that suggests a new religious way to become an emancipated human being through a grounded relationship to that ultimate reality which is believed to be the origin and end of all reality.

It is not the case, of course, that theology has only become hermeneutical in the modern period. However, the explicit concern with hermeneutics after Schleiermacher has been occasioned, among Westerners, by the sense of cultural distance from the religious traditions caused by the seventeenth-century scientific revolution and the eighteenth-century Enlightenment. This sense of distance has been intensified by the emergence of historical consciousness (as expressed by Troeltsch and Joachim Wach), and the

development of the great liberation movements and their attendant hermeneutics of suspicion (with respect to sexism, racism, classism, etc.). And it has been still further intensified by the Western sense of cultural and religious parochialism stimulated by the emerging pluralistic and global culture as well as by the tensions, conflicts, and possibilities present in North-South and East-West relationships. The epoch-making events of modernity have brought about a need for explicit reflection on the hermeneutical character of all the religious disciplines, including the hermeneutical developments (as elucidated by Wach, Mircea Eliade, Joseph M. Kitagawa, Charles H. Long, et al.) in history of religions and the widely recognized hermeneutical character of all theology.

In order to understand the present situation of radical religious pluralism, theologians must interpret it theologically. Interpretation is not a technique to be added on to experience and understanding but is, as Hans-Georg Gadamer and Paul Ricoeur argue, anterior and intrinsic to understanding itself. This is especially the case for any theological interpretation of the contemporary situation. For theology attempts to discern and interpret those fundamental questions (finitude, estrangement, alienation, oppression, fundamental trust or mistrust, loyalty, anxiety, transience, mortality, etc.) that disclose a religious dimension in the contemporary situation.

Paul Tillich described this hermeneutical character of theology as the need for an explicit analysis of the given "situation," that is, for a creative interpretation of our experience which discloses a religious dimension (for example, of cultural pluralism itself). It is possible to distinguish, but not to separate, the theologian's analysis of the "situation" from his or her analysis of a particular religious tradition. Theologians, in sum, interpret both "situation" and "tradition." In some manner, implicit or explicit, they must correlate these two distinct but related interpretations. Like any other interpreter of the contemporary pluralistic situation, and like any other interpreter of the religious questions in that situation, the theologian brings some prior understanding to the interpretation—an understanding influenced by the historical givens of a particular religious tradition. A Buddhist comparative theology, for example, will inevitably be different from a Jewish comparative theology.

The clarification of the emerging discipline called "comparative theology" follows from this brief analysis of theology itself as an academic and hermeneutical discipline. In the sense outlined above, theology is an intrinsically hermeneutical discipline that interprets intellectually a particular tradition in a particular situation. Further, any interpretation of a tradition will always be made in and for a particular situation. In classical Western hermeneutical terms, this means that every act of interpretation includes not only *intelligentia* ("understanding") and *explicatio* ("explanation"), but also *applicatio*, an application of the interpretation to its context that is at the same time a precondition to any understanding and interpretation.

A properly theological interpretation of the contemporary situation demands that those fundamental religious questions cited above be raised, for the responses to them by a particular religious tradition are the primary, strictly theological, means of interpreting that tradition (e.g., an interpretation of the way of Buddhist enlightenment as the response to a fundamental situation of suffering and a fundamental state of inauthentic existence seen as "ignorance"; an interpretation of the Christian creed of faith, hope, and love as a response to the fundamental situation of suffering and an existential state of inauthentic existence seen as sin). Internal to each theological interpretation of each religious tradition, moreover, is a theological assessment and identification of the normative elements of that religion (e.g., identification of the proper canons of the religion, of the proper role of "tradition," of the proper role of modern historical research, etc.).

Any theology, therefore, involves the development of a set of mutually critical correlations between two distinct but related interpretations: an interpretation of the tradition and an interpretation of the contemporary situation. But it is important not to presume that a tradition will always supply adequate responses to the questions suggested by the contemporary situation. Rather, as the qualifying phrase "mutually critical" suggests, the theologian cannot determine before the concrete interpretation itself whether the traditional responses of a religion are adequate to the contemporary situation.

In strictly logical terms, the concept of "mutually critical correlations" suggests a number of possible relations between the theologian's two somewhat distinct interpretations: (1) identities between the questions prompted by and the responses to the situation and the questions and responses given by the tradition (as in many liberal and modernist Christian theologies); (2) similarities-in-difference, or analogies, between those two interpretations (as in many Neo-Confucian "theologies"); and (3) radical disjunctions, or more existentially, confrontations, between the two (as in the Hindu and Buddhist insistence on the necessity of the reality of a "higher consciousness"); or the radical dialectic of the sacred and the profane in archaic ontologies; or the radical correction of traditional self-interpretations of a religion after the emergence of historical consciousness.

In properly general and heuristic terms, therefore, theology is an intellectual enterprise that may now be described more exactly as the hermeneutical attempt to establish mutually critical correlations between the claims to religious meaningfulness and truth of a religious tradition and the claims to religious meaningfulness and truth within the historical situation for which that tradition is being interpreted.

This general model of theology as an intellectual discipline within religious studies may be further specified to demonstrate how "comparative theology" both fits and challenges it. Comparative theology fits the model insofar as it also demands that the theologian attempt to establish mutu-

ally critical correlations between the claims to religious meaning and truth in the same two sets of interpretations. What renders any theology within a particular tradition explicitly comparative, however, is a substantive (and not merely methodological) change in the interpretation of the contemporary situation. Any comparative theology in a particular tradition will insist on theological grounds that religious pluralism in the contemporary situation must receive explicit theological attention. Insofar as that crucial hermeneutic and theological change of focus is made at all, the theological task is notably altered. For now the different questions and responses of the various religions present in the contemporary pluralistic situation must be explicitly and comparatively analyzed as part of the task of any theological interpretation in any tradition. A sense of the cultural parochialism of traditional theological interpretations of both situation and tradition is likely to follow. A confrontation with any traditional, purely exclusivist, interpretation of the one tradition is also likely—just as earlier confrontations with traditional interpretations were occasioned by the emergence of historical and hermeneutical consciousness. A sense of the need for any comparative theological interpretation to take account of the comparative analyses of history of religions is also likely to arise, with the result that comparative theology will also recognize the need for the kind of interdisciplinary discourse found in “religious studies.”

Comparative theology is an emerging discipline with as yet no firm consensus on conclusions, but with a possible agreement on the revised method of correlation that it implicitly employs. It is a branch of the general field of religious studies that must learn from the comparative method used in the study of history of religions, by reflecting on the results of those studies in explicitly theological ways. Traditional theological self-interpretations in all traditions are likely to undergo radical revisions—indeed, even at this early stage in the discipline, such revisions are visible. The final conclusions for any tradition’s self-understanding in a religiously pluralistic world will be determined only by further, concrete comparative theological studies in and among all the traditions. Yet this much is clear: any contemporary comparative theology in any tradition must relate itself explicitly to the comparative studies of theologies in history of religions and to the theological dialogues among the religions. It must also explicitly raise the traditional theological questions of meaning and truth that earlier, secular comparative enterprises were legitimately able to “bracket.”

In sum, comparative theology, as theology, is an academic discipline that establishes mutually critical correlations between the claims to meaningfulness and truth in the interpretations of a religiously pluralistic situation and the claims to meaningfulness and truth in new interpretations of a religious tradition. The central fact of religious pluralism, as well as the existence of religious studies (especially history of religions), has challenged all theologies in all traditions to become explicitly comparative in approach. The future is

likely to see the evolution of most traditional theologies into comparative theologies in all non-fundamentalist traditions. With that development, the conflict in interpretations among various models and differing conclusions among contemporary comparative theologians may eventually yield to a disciplinary consensus for all theology. Any theology in any tradition that takes religious pluralism seriously must eventually become a comparative theology.

## THEOLOGY: CHRISTIAN THEOLOGY

The word *theology* always means discourse or speech about God. But which God is meant and what does this God do? Plato, in his *Republic*, assigns *theologia* to the poets (379a5); by *theology* he means narratives about the gods and theogonies. Aristotle contrasts the “theologians,” who offer mythological explanations of the world, with the “philosophers,” or “physiologists,” who look for the explanation of things within things themselves. On one occasion he divides “theoretical” philosophy into three parts: mathematics, physics, and theology, this last being identical with “first” philosophy, or metaphysics (*Metaphysics* 6.1025a). Toward the end of the second century BCE, Panaetius of Rhodes distinguished three kinds of theology and was followed in this by Varro, whom Augustine cites (*City of God* 6.5): mythological, “natural” or philosophico-cosmological, and civil or political. “Civil theology” or “political theology” referred to the cult of the Caesars.

Among Christians, the first applications of the term *theology* to knowledge of the God in whom they believed occur in the writings of Origen (d. 254). For Eusebius of Caesarea (d. 339), *theologia* no longer applied to paganism at all but designated exclusively the knowledge of the Christian God and of Christ. Eusebius was also familiar with the distinction that would become classic among the Greeks and would be known to the Latin Middle Ages as well, between *theology*, which means discourse about the inner life of God, and *economy*, meaning God's activity for our salvation, which includes Christ, church, sacraments, and eschatology. Proclus (d. 485), the Greek philosopher, wrote an *Elements of Theology*, a treatise on the ultimate principles of reality.

In the West, *theologia* was for a long time used only infrequently; other terms prevailed, such as *sacra scriptura* (“sacred scripture”), *sacra erudito* (“sacred knowledge”), and *divina pagina* (“divine pages”). Thomas Aquinas (d. 1274) preferred *sacra doctrina* (“sacred doctrine”). But in his time, *theologia*, which Peter Abelard (d. 1142) had used as the title of a work on Christian dogma in its entirety, meant the knowledge elaborated and taught in the faculty of the same name. Our modern use of the term was thus established.

**HISTORICAL DEVELOPMENT.** Theology exists because the godhead is revealed in historical actions or events, the meanings of which are conveyed in language or inspired writings. The words of a sage, even one who is “inspired,” are not enough. The writings provide food for a meditation of a sapiential kind that is geared to the conduct of human life. God revealed the relationship he wants to establish with man and in the process was also self-revelatory.

Before the end of the first century after the Hijrah, Islam was already discussing the dilemma of predestination and free will. Next to be discussed were the last things and the salvation of unbelievers who were in good faith. In these discussions and in the texts of the mystics were to be found only fragments of a theology. While Judaism had too lofty an idea of God's absoluteness to make an effort to investigate his na-

ture, it did gather into the Talmud the discussions and interpretations of the rabbis; it developed an apologetic for dealing with Islam; it reflected on the anthropomorphisms of the Bible; and it produced great religious philosophers (e.g., Maimonides, d. 1204).

Christians for their part not only had inherited the Jewish scriptures and the revelatory deeds that these scriptures narrate and explain; they also found themselves confronted with the fact of Jesus Christ. First an object of faith, this fact became also an object of thought. It was a complex fact: a man who is Son of God, dead yet living, weak yet Lord. It demanded that God be seen as Father of a Son, the two of them acting through a Holy Spirit who is at once immanent in the “hearts” of the faithful and transcendent over them. Help in expressing these ideas was found in the Stoicism of the day, which was widespread even among slaves. This philosophy provided the idea of a Logos and a Spirit (*pneuma*) that permeated the cosmos, kept it in motion, and quickened minds as well. On the other hand, to take this approach was to cosmologize God and turn the Logos and Pneuma into subordinate intermediaries between God and the things of the world. Before the Council of Nicaea (325), even Christians who proved their fidelity by martyrdom had been influenced by these ideas and had formulated their faith in an unsatisfactory manner. Various interpretations publicly expressed were judged to cast doubt on essential aspects of the object of faith. The result was that an orthodoxy—true praise, true faith—emerged and, with it, the beginnings of a reflection on faith and in faith or, in other words, something of a theology.

Faith, which is already in the realm of thought, must necessarily express itself in an active way. It looks for coherence among many facts and elements that, however diverse, all come from the same God who is carrying out a homogeneous plan. Since faith is also fidelity, and therefore orthodoxy, it develops in response to deviations. Since it has to do with mysterious realities that are irreducible to the facts grasped by our sciences and are very complex, the very assent of faith is accompanied by the questioning that Augustine and Thomas Aquinas call *cogitatio*: “*Crederet est cum assentione cogitare*” (“To believe is to assent while thinking”). When this reflection in faith ceases to be occasional and becomes systematic, it is theology.

This process began in the East. Schools of higher-level catechesis were established there; in these schools the quest was for gnosis, that is, a deepening both of knowledge and of Christian life. “True gnosis,” as it is called by Irenaeus (*Against Heresies* 4.33.8), fights the false gnosis of Basilides and Valentinian in the name of the authentic tradition guaranteed by apostolic succession. This true gnosis is in accordance with reason (3.12.11). The Didaskalion, or Catechetical School, of Alexandria was headed by Clement and then by Origen, who in his *On First Principles* gives the first complete theological statement that is linked to a philosophical culture. As a result, he distinguished what we now call dogma

and theology. In contrast to platonizing Alexandria, Antioch, another great Christian metropolis, practiced a more historical and literal reading of the scriptures. At Nisibis and Edessa, on the other hand, Ephraem of Syria (d. 373) theologized in a poetical and lyrical way that was alien to Greek culture.

The second half of the fourth century and the first half of the fifth saw in both the East and West a flowering of geniuses and saints: the Fathers. These included Athanasius (d. 373), Basil of Caesarea (d. 379), Gregory of Nazianzus (d. 391), Gregory of Nyssa (d. 395), Chrysostom (d. 407), and Cyril of Alexandria (d. 444), in the East; and in the West, Hilary (d. 367), Ambrose (d. 397), Jerome (d. 420), Augustine (d. 430), and Leo I (d. 461). These men defended and lent luster to the Christian faith chiefly by a rational explanation of scriptures that focused on the Christian mystery and made use of typology. In Origen’s thought, and that of some others, typology is pushed to the point of allegory. Even at this time, however, there were signs of a difference in the way theological activity was carried on in the Greek East and in the Latin West, at least beginning with Augustine in the West.

The Latin fathers (including Augustine) regarded the literary and philosophical culture of the patristic age (Second Sophistic, Platonic, and Stoic) to be a human formation of the Christian although it was acquired in the pagan schools of the time. Basil, Gregory of Nazianzus, and Chrysostom insisted on the value of this formation, while Julian the Apostate denied Christians access to it to prevent their being weakened by it. The Fathers engaged in argument chiefly in order to invalidate the conclusions drawn by heretics, but they did not use philosophical concepts and arguments in order to develop new theses that went beyond the traditional faith. From the philosophers, and especially from Platonism, they borrowed certain broad ideas and expressions but little with conceptual content new to their faith. They saw the philosophers rather as fathers of heresies. This did not prevent later philosophical borrowings by John of Damascus (d. 749), Photios (d. about 891), Cerularios (d. 1058), and Michael Psellus (d. 1078?). Even today, however, Orthodox theology dutifully follows the Fathers. The nineteenth canon of the Trullan Synod (692) says “The church’s pastors must explain scripture in accordance with the commentaries of the Fathers.” While the medieval and modern West has been receptive to many questions and currents of thought and has even formulated new dogmas, thus making the proof from tradition difficult and complicated, Eastern Christianity has kept a kind of direct contact with its patristic tradition. It derives its faith directly from the liturgy, in which that tradition finds expression. When the attempt was made on numerous occasions to introduce into Eastern Orthodoxy a creative appeal to reason, especially because of the influence of the West and in imitation of it, there was a reaction. Thus there was a reaction against John Italus, who succeeded Michael Psellus as head of the University of Constantinople; the seventh article of his condemnation in 1082 reads “Cursed

be those who devote themselves in depth to the sciences of the Hellenes and do not use these simply to exercise the mind but instead adopt their sterile opinions.” The reaction was even more vigorous in the fourteenth century when, after the great Latin classics had been translated into Greek, rationalist and humanist claims roused the opposition of Gregory Palamas (d. 1359), who developed a new systematization of the spiritual tradition of the Greek East. Since the fourth century this tradition had devoted itself to reflection on the incarnation of the Word and the divinization of creatures, to the union of the divine and the human, the uncreated and the created. This was the background for the two great debates peculiar to the East—the iconoclastic struggle, which was the final phase of the christological controversies (union of the spiritual and the sensible), and the debate over Palamism (divinization, communication of God to the human creature, and rejection of any rationalism in theology)—the victorious outcome of which is celebrated by the Feast of Orthodoxy. Established in 843, this feast commemorates the restoration of icon worship and Orthodox rejection of the theological rationalizers.

There have been other developments in Orthodox theology; for example, in the nineteenth century, the influence of G. W. F. Hegel and Friedrich Schelling in Russia. But even in fairly personal systematizations this theology has remained faithful to its special character. It is not a simple intellectual exercise but a call to live in a personal way the truth revealed by Jesus Christ and proclaimed in the faith of the Orthodox church, which draws its life and inspiration from the Holy Spirit. Theoretical knowledge must be integrated with life experience and with prayer that is practiced as part of the church community and in its liturgical celebration.

The Latin fathers differ very little from the Greeks. However, beginning with Anselm and continuing throughout Scholasticism, a favorite formula of Augustine’s became the motto for an exercise of reason in theology that is peculiar to the medieval West. In Augustine, reason and faith supply each other with nourishment within the unity of contemplation, in accordance with his formula: “Intellige ut credas, crede ut intelligas” (“Understand that you may believe, believe that you may understand”; *Sermons* 43.9). The second part of this formula has often been expressed by means of *Isaiah* 7:9: “Nisi credideritis non intelligetis” (“Unless you believe, you shall not understand”; Septuagint and Vulgate). Augustine himself focuses less on the duality of the two spheres than on the union of the two activities or ranges of activity in reaching the fullness of truth. For truth in itself is one. It exists in the triune God; it is to be found in the Wisdom of God that has come to us in sensible form in Jesus Christ. On our side, there is an *intelligere*, or knowing, that prepares for and nourishes faith, and an *intellectus*, or understanding, which is the fruit of a devout and loving faith that makes use of the resources and analogies supplied by nature and reaches the *intellectus fidei*, or understanding of faith, so that “what faith grasps the mind sees” (*On the Trinity* 15.27.49).

The *intellectus fidei* of Anselm (d. 1109) is not quite the same as that of Augustine. Anselm means a use of reason on the basis of faith (“I desire to gain some understanding of your truth which my heart believes and loves”), but reason, for him, has the power to discover at its own rational level the necessary connection that gives the truth of faith its objective coherence. That is what he means by understanding what we believe; this is true of the existence of God and it is true of redemption, which we can think out “as though we knew nothing about Christ.”

The monastic theology of Bernard of Clairvaux, who was nineteen years old when Anselm died, is quite different in character: a theology of the spiritual struggle and of the life of mystical union as experienced in the cloister. However, from Anselm and the theologians at Bec came the initiatives, timid at first, that produced Scholasticism. Anselm of Laon was a disciple at Bec. He in turn had Abelard for a pupil, but the pupil was too gifted and too aware of his gifts to find satisfaction at Laon. Abelard inaugurated what became systematic theology and the dialectical method of bringing together opposed theses that call for a solution. This method of the *quaestio* (interrogation) was applied in commentaries on Peter Lombard’s *Book of Sentences*, which was to be the textbook for the teaching of theology down to the sixteenth century. The teaching was done in schools or universities and came to be known as “Scholasticism.”

Scholastic theology had very great practitioners in Bonaventure and Thomas Aquinas (both of whom died in 1274). Thomas’s intention was to search out and express, with the help of analysis, the perceived order of things and reason, an order determined by God. That which revelation discloses to us provides the starting point, of course, but the Scholastic also had a fearless trust in the rational mind as trained in the school of Aristotle. Profound insights, rigorous arguments, honesty about the data, and sureness of Catholic sensibility have made Thomas the “Common Doctor” of the Catholic church. Following the Augustinian tradition, Bonaventure insisted more on the interior supernatural enlightenment and transformation that are necessary conditions for understanding sacred doctrine.

Although opposed to one another as realist and nominalist, John Duns Scotus and William of Ockham in the fourteenth century were at one in criticizing the trust in speculative reason when this takes God and Christian realities for its object. Ockham marked the beginning of the *via moderna* which was introduced in the universities in the fifteenth century. The development of a theology marked by abundant discourse and nice distinctions led by way of reaction to spiritual currents and a mysticism that were unrelated to dogma (Thomas à Kempis, *Imitation of Christ*). But another and different current was also born: humanism with its cultivation of the ancient languages, its criticism of Scholasticism, its publication of texts that printing carried far and wide. Martin Luther (d. 1546) was heir to all three currents: Ockhamist voluntarism, mystical inwardness, and the textual resources of humanism. Nonetheless, he would mark a new beginning.

The Protestant Reformation led, in Catholic theology, to the development of a scholarly apologetics (e.g., the *Controversiae* of Bellarmino, 1621); the criticisms of the *philosophes* likewise elicited an abundant apologetic production in the eighteenth century and down to the first third of the twentieth. Theology found itself faced with new activities of critical reason: history, science of religions, critical exegesis, psychology of religion. The serious urgency of the questions thus raised led to the modernist crisis. There had been creative minds that cultivated a healthy openness to modernity as well as close ties with tradition (Johann Adam Möhler, Matthias Joseph Scheeben, John Henry Newman), but the chief fruit of the Catholic restoration that the nineteenth century found necessary was a renewed scholasticism possessing little creativity. Once the modernist crisis was past, theology regained its vitality from a renewed sense of the church, a renewed contact with its own sources (Bible, Fathers, liturgy), and with the questions raised by twentieth-century thinkers (ecumenism, problems of unbelief, theology of liberation, and so on).

Luther began his Reformation with a reform of theology. In reaction to Scholasticism and Aristotle he eliminated philosophical concepts and expressed the religious relationship of salvation in biblical terms. The object of his theology is man as sinful and lost and God as the one who justifies and saves him; a “theology of the cross,” not a theology of the inner ontology of God; a theology that draws its life not from a symbiotic relationship with metaphysics but from pure faith in the gospel of grace, which is consonant with the spirit of scripture. Luther himself did not compose a comprehensive systematic treatise. His disciples made up for the lack by their *loci communes*, or dogmatic expositions (Melancthon, 1531; Chemnitz, 1591; Gerhard, 1610–1625; Hutter, 1619). John Calvin produced his *Institutes of Christian Religion* as early as 1536, but he also commented on scripture daily. Protestant theology took the form of an exposition of what the church ought to be teaching in the light of its biblical norm and also in the light of the church’s own past. Thus Luther and, to an even greater extent, Melancthon and Calvin, referred back to the Fathers and especially to the ancient symbols or creeds and the first four ecumenical councils.

Starting at the end of the sixteenth century, Lutherans reintroduced into theology the metaphysics of Aristotle along with that of Francisco Suárez. Seventeenth-century Lutheran orthodoxy was much like Catholic Scholasticism. In the eighteenth century, however, two divergent currents exercised their influence: Pietism, which expressed theology in terms of personal experience, and rationalism, which interpreted religion and God in terms of man and not of God and rejected the heteronomy involved in supernatural faith. An example of this theology based solely on reason is Julius Wegscheider’s *Institutiones theologiae Christianae dogmaticae* (Institutes of Christian dogmatic theology; 1815). The culture of the day had cut itself off from the faith as celebrated by the church. Some philosophers who had begun as theo-

gians (Fichte, Hegel, Schelling) treated religion as a branch of their philosophy. Friedrich Schleiermacher (d. 1834) took up these challenges and ushered in a new era of Protestant theology. He asserted the originality of religion, which is not to be identified with either metaphysics or morality: “The essence of religion is neither speculation nor action, but intuition and feeling,” and specifically the feeling of dependence, which constitutes our relation to God. Jesus Christ gave supreme expression to this feeling, and a community of believers took shape that found its origin in him. Theology, for Schleiermacher, is the sum total of scientific knowledge without which the life of the Christian community could not be ordered.

All subsequent Protestant schools of theology—the confessional, the orthodox, the liberal, as well as the contemporary restoration in the form of a return to the Reformers under the influence of Karl Barth (d. 1968)—have depended on Schleiermacher. Rejecting a simple description of what is believed and preached (*Glaubenslehre*), Barth began with the sovereignty of God’s word understood as an act of God. The Bible as such is not the word of God, but only a testimony to the acts through which God spoke and ultimately to Jesus Christ, who is God’s Word made flesh. The word can be received only in faith, which is the act by which God (the Holy Spirit who bears witness within us) enables us to understand when he speaks. This word has given rise in the course of history to the special community, the church, whose mission is to confess its faith in the word of God within the circumstances of the particular historical moment. At this point theology comes on the scene. Theology is the reflective critical act by which the church goes back over the word it speaks and the confession it makes of Jesus Christ; the purpose is to test the truthfulness of that word and confession, that is, their conformity to the word of God as attested in scripture. This theology has three parts: does the Christian word come from Christ? (biblical theology); does it lead to Christ? (practical theology); is it in conformity with Christ? (dogmatic theology).

The whole of Protestant theology is, of course, not reducible to Barth, and not all Protestant theologians accept his radicalism. Thus, while the pragmatism of William James (d. 1910) is not a genuine theology, the dogmatic theology of Emil Brunner (d. 1966) admits the validity in theology of a natural knowledge of God. There are even strict Calvinists in Holland, Scotland, and France, who allow a value to a natural knowledge of God. Paul Tillich (d. 1965) sought to bridge the gap between the modern mentality or culture and Christianity by establishing a correlation between the ultimate questions raised by human beings and the ever new challenge of the word of God. His work elicited an enormous response.

Catholic theologians for their part carry on their work not only under the supervision of a teaching authority but also in the context of a fidelity and a continuity that is provided by a tradition developed through the centuries. Protes-

tant theologians, on the other hand, are bound solely by the word of God and think under their own responsibility. They do, however, have the aid of the faithful witnesses who have gone before them and of their church's profession of faith. Many Protestant theologians work within a confessional dogmatics that derives its norms from the creedal documents and classical writings of their churches. In our time we find, for example, Werner Elert, Paul Althaus, and Edmund Schlink among the Lutherans, and Auguste Lecerc and G. G. Bekouwer in the Reformed church.

Since its beginnings Anglican theology has endeavored to integrate three tendencies and has been unwilling to abandon completely any one of them: a traditional and "Catholic" tendency (Fathers, liturgy, episcopate), a Protestant and Puritan tendency, and a rational and critical tendency (history; in extreme cases, certain "modernist" theses). One or other tendency may dominate in a given age or in a particular author but without excluding the other values and while endeavoring to remain in a *via media*. Thus a writer like Richard Hooker (d. 1600) resists the Calvinist tendency but rejects a number of Roman positions (papacy, transubstantiation) and remains closely associated with the political structure of the nation. After him it is the "Caroline divines" who are the classical authors of Anglo-Catholicism, which was revitalized in the nineteenth century by the Oxford Movement (1833–1845). In the interval, however, the seventeenth and eighteenth centuries had been marked by a rational and liberal current of thought (Latitudinarianism), and then by the "evangelical" movement (John Wesley, Methodism). After 1860, rational criticism began to be heard, but this was also the time of the Oxford Movement and ritualism; the second half of the century saw the appearance of great scholars now classical in biblical and patristic studies. In the twentieth century, Anglican theology has focused chiefly on Christology, on the vital ecumenical questions of the day (church, ministry), and on the problems of modern society. On the whole, Anglican theology is a theology that always seeks a balanced outlook. It endeavors to express the realities of Christian existence but without pressure from a Roman-style teaching authority.

**THE PRACTICE OF THEOLOGY.** Theology is discourse through which believers develop and express the content of their faith as confessed in the church; to this end the theologian uses the resources of the culture and focuses on the questions asked by the mind of the time. This activity involves the theologian, who is first of all a believer, in a series of intellectual operations, such as those analyzed by Bernard Lonergan (d. 1984). The theologian's starting point is the witness given to God's revelation of the divine plan and mystery in the Bible, tradition, and the current life of the faithful; the theologian attempts to lay out, explain, and communicate the rich and complex content found in this witness. In addition to the labor required in handling the great mass of data, theologians face two major difficulties. (1) How are they to express supernatural mysteries when they have at their disposal only concepts and terms from our earthly experience?

(2) How are they to overcome the dislocation between ancient testimonies that reflect histories and cultures no longer ours, and the needs and desires of our own day?

The answer to the first question is to be found in analogy. Certain terms contain an inherent imperfection and limitation: the Bible calls God a "rock," a "lion," a "fortress." These are metaphors expressing not the being of God but God's relation to us and the divine manner of acting. The Bible uses such language because it is concerned primarily with what God is *for us* and we for God. Other terms, however, do not inherently, or in their very notion (*ratio*), contain any imperfection, even though they exist only imperfectly in us: being, intelligence, wisdom, goodness, truth, substance, person, and so on. These terms are open to infinity. They can be applied to God, although we do not fully understand the nature of their existence in God. In the case of many of these concepts and terms, however, only positive revelation allows us to predicate them of God. Without revelation we would not have thought of applying to God such terms, for example, as *father*, *son*, and *generation* (for a discussion of this last, see Thomas's *Summa contra gentiles* 4.11).

The answer to the question concerning the dislocation of past and present is supplied by hermeneutics. This enables the theologian to express the meaning of a traditional statement in the language of the day and in response to present needs. But in the form hermeneutics takes today it is not restricted to the expressing of traditional statements in the language of contemporary culture and in response to its needs. Nor is theology a body of knowledge *organized* on the basis of an objectivist reading of the revealed "given" (scripture, dogma, tradition); it is not what Dietrich Bonhoeffer criticized, even in Barth, as "revelational positivism." The act of theologizing is an act of interpretation that actualizes the meaning of revelation, the event that is Jesus Christ, and the church's experience, and makes these relevant to contemporary believers. The danger in this process is to introduce the subject into the object in such a way that we substitute our ideas and questions for those of God. Hermeneutics can turn into a way of evading the authority that imposes itself on the subject. Was there not something of this in certain of the moral and allegorical readings of scripture by the early Fathers? Texts, after all, intend to say something. A text is not simply a stimulus to an existential decision (the demythologization program of Rudolf Bultmann). And there are certain objective norms—dogma, the ecclesial community's profession of faith: "The living tradition whose agent is the interpreting community defines a hermeneutical field that excludes erroneous or arbitrary interpretations" (Claude Geffré). It is true, however, that the inheritance is open to rereadings which are not simply repetitions.

**Theology as science.** Theology claims the status of a science, and this claim is supported by its publications and its place among the university disciplines. Its status as a science is justified (1) because it has a specific object given to it by the foundational events of Christianity, which were his-

torically real; and (2) because it employs a specific method for taking possession of this datum and organizing its complex content in a coherent intellectual way. This method, moreover, is not naive but critical, making use of the rational disciplines that study the religious fact: history, philology, critical exegesis, psychology, sociology, sociology of knowledge, and so forth. Theology is thus able to enter into competition with these disciplines, which, because they offer various interpretations of religious facts, are in danger of being reductionist. Theologians, however, must maintain the twofold fidelity mentioned above. They would cease to be theologians if they were to betray the originality of the faith, even as they employ the methods of other disciplines to analyze it. Theology may not, therefore, be reduced to a philosophy of religion. Contrary to David S. Adam, in his essay "Theology," philosophy of religion is not "the highest stage or form of theology" (*Encyclopaedia of Religion and Ethics*, edited by James Hastings, vol. 12, 1921, p. 299). The philosophy of religion analyzes the religious fact and reflects on religious experience as thematized in religions. This is, after all, one area of human experience. The philosophy of religion may therefore have the same material object as theology. It differs from the latter, however, (1) because it does not consider the objects of belief—the mysteries—as such, but studies religion as an activity, along with its conditions and the categories it uses, and (2) because it does not take revelation as a normative source of true propositions. On the other hand, unlike the science of religions or even religious psychology, the philosophy of religion is not purely descriptive. It studies the whole range of religious activity in order to discover the rational structures implied in it, examines these in a critical way, and sometimes strives to provide a critical justification of them. Theology goes further: it pursues its task while certain about the supernatural reality of what faith asserts.

**Parts and forms of theology.** Considered in its own proper nature, theology has some constituent parts. Materially, it includes various statements its object calls into being, for example, doctrines concerning the Trinity, Christology, the sacraments, ecclesiology, and Mariology. Formally it includes positive theology and speculative theology. Positive and speculative theology are two parts, or phases, that must not be separated but must rather be cultivated together. They incorporate the necessary appropriation of the "given" (the positive phase) by a scientifically competent study of the sources (scripture, monuments of tradition, magisterium, experience of the Christian people and of mankind generally) and the act of contemplation (the speculative phase) leading to the organization of a developed and communicable discourse.

Dogmatic theology and moral (or practical) theology are two different types of knowledge, but since no mystery is proposed for our belief except insofar as it is a source of salvation for us, the faith that seeks understanding (dogmatic theology) finds in this understanding the rules for our living

(morality or ethics). In Protestant theology, practical theology includes what Catholics call pastoral theology, and even ecclesiology. In the fifteenth century, when Scholasticism was getting lost in purely logical or dialectical subtleties, writings on spiritual or mystical theology multiplied in isolation, being connected less with the mysteries than with spiritual experience. Pietism played a comparable role in seventeenth and eighteenth century Protestantism. The separation was not a fortunate one; it pointed to a lack of spiritual depth in scholastic methodology. Similarly, we must not distinguish or separate "kerygmatic theology"—the communication of the essential gospel message—from dogmatic theology, a position proposed in 1936 in Austria by Franz Lackner. There must certainly be a connection between knowledge and a life-giving communication of a message. This connection is the problem of the apostolate and may call for an output of adapted works of theology, but it must not be turned into a division of theology.

The term *negative theology* comes from the unknown author at the end of the fifth century who wrote under the name of Dionysius the Areopagite (Pseudo-Dionysius). *Apophatic theology* would be a better term. This is not a special theology but a way of respecting the "unknowableness of God" (which is the title of a work of John Chrysostom). In its positive statements are put negatively, as in the Chalcedonian christological definition: "a union without confusion, without separation."

It is commonly assumed today that one person's work can no longer embrace all areas of theology because theology has become so comprehensive and complex and requires such a variety of knowledge. We may think, however, of the work of Barth, Michael Schmaus, and others. It is even more legitimately acknowledged that theology can no longer claim to control the culture through an all-embracing body of knowledge, as it could do in the West in the thirteenth century. It might more accurately be said that a pluralism is required in a world that has grown complex and secularized and in which ideas are exchanged without any possible compartmentalization. It should be observed, however, that there has always been a pluralism in theology: Alexandria and Antioch; Augustinianism, Thomism, and Scotism; realism and nominalism; pietism and rationalism; liberalism and confessional tradition; and so on. Pluralism is valuable. It is a quality of unity itself, provided the unity involves plenitude and communion. Nevertheless, all theology is required to be faithful to the apostolic confession of faith.

**Contemporary theology.** In contemporary theology three dimensions or functions in particular are being developed.

1. In a world of secularized cultures, fundamental theology is being developed as a critical justification of the foundations of faith and therefore of theology. It has replaced the apologetics of a bygone time. Apologetics sought to provide rational proof of the suitability and existence of a revelation, and of the divine authority of

the Roman Catholic magisterium. Fundamental theology, however, starts with the facts of the Christian message and shows its meaning and the way in which it meets the needs of the contemporary world. Christianity represents one existential possibility. We can see immediately that this approach is very close to the idea of theology as a hermeneutic and is subject to the danger, mentioned earlier, of giving too large a place to human subjectivity.

2. In dealing with contemporary men and women, theologians must take them in their real situations and with their real dimensions, and thus fundamental theology allies itself to a "political theology" (J.-B. Metz; Jürgen Moltmann). The latter seeks to overcome the "privatization" characteristic of bourgeois religion and establish itself as critic of society in the name of suffering and the cross of Jesus Christ; in so doing it brings a message of hope and Christian eschatology. Latin American "theology of liberation" examines the situation of the poor, who are deprived of their rights and their dignity, and determines the "given" which is to serve as a starting point for rethinking God, Christology, and the church and its mission (Gustavo Gutiérrez). The practice of struggle becomes a matrix within which theological reflection develops. The same is true, with modifications, of the theologies directed to the liberation of all those who are oppressed or excluded from a place in history: black theology, African theology, feminist theology.
3. Ecumenism has its theological literature, its periodicals, its meetings, but it is above all a dimension of every vigorous theology today. The name "ecumenical theology" is given more specifically to a well-informed reflection on ecumenism and its purpose and methods, to a theological study of the World Council of Churches, or to the subject matter of a professorship in *Konfessionsskunde*: the study of the Christian churches in their history, worship, theology, and life. It is no longer possible to theologize without taking account of ecumenical questions and of the contributions of all the churches, the theological originality of each, and the confessional life of each. As theology reexamines the sources of particular Christian beliefs and continues to develop in a pluralistic setting, it is becoming "metaconfessional"; chapters on particular subjects in works of theology are sometimes written by theologians from different churches. Closely associated with the ecumenical outlook is a critical attitude toward "dogmatism"—a dogmatic fundamentalism that has no sense of the historical development of dogmas.

All churches have their traditions. Many have norms for orthodoxy and the regulation of life. The work of the theologian is a specific ministry alongside the ordained or hierarchical pastoral ministry; it continues the ministry of the *didaskaloi*, the teachers, in the New Testament and the early church. The two ministries are subject to the same rule of

apostolic faith and serve the same believing people and in the same world, but their tasks and responsibilities differ. Theologians are dedicated to research; they associate with intellectual and cultural innovators; they claim a legitimate freedom to be innovators themselves. The hierarchic pastors, who are responsible for keeping communities united in orthodox faith, intervene at times in the theologians' work, depending on the discipline of the various churches. Many churches have institutions and laws for settling such conflicts.

#### BIBLIOGRAPHY

For further elaboration of the topics addressed above, see my "Theologie," *Dictionnaire de théologie catholique* (Paris, 1946), vol. 15, pp. 341–502. This essay has been partially translated as *A History of Theology* (Garden City, N.Y., 1968). See also my *La foi et la théologie* (Tournai, 1962).

From among the many books on theological method, see Johannes Beumer's *Theologie als Glaubensverständnis* (Würzburg, 1953), which follows the program outlined by Vatican I, and Bernard J. F. Lonergan's *Method in Theology* (New York, 1972). See also Henry Duméry, Claude Geffré, and Jacques Poulain's "Théologie," *Encyclopaedia universalis* (Paris, 1968), vol. 15, pp. 1086–1093.

On the history of the conception and practice of theology, see "Théologie," by Duméry and others, listed above; *Klassiker der Theologie*, edited by Heinrich Fries and Georg Kretschmar, vol. 1, *Von Irenäus bis Martin Luther* (Munich, 1981), and vol. 2, *Von Richard Simon bis Dietrich Bonhoeffer* (Munich, 1983); R. P. C. Hanson's *Allegory and Event: A Study of the Sources and Significance of Origen's Interpretation of Scripture* (Richmond, Va., 1959); and René Arnou's "Platonisme des Pères," *Dictionnaire de théologie catholique* (Paris, 1933), vol. 12, which defends Origen against the accusation of having given Platonism precedence over the pure Christian message. Also valuable are E. P. Meijering's *Orthodoxy and Platonism in Athanasius: Synthesis or Antithesis?* (Leiden, 1968) and Josef Hochstaffl's *Negative Theologie: Ein Versuch zur Vermittlung des patristischen Begriffs* (Munich, 1976).

The Greek and Latin fathers started the elaboration of theological treatises on the basis of scripture; this development is discussed in Aloys Grillmeier's "Vom Symbolum zur Summa: Zum theologiegeschichtlichen Verhältnis von Patristik und Scholastik," in *Kirche und Überlieferung*, edited by Johannes Betz and Heinrich Fries (Freiburg, 1960), pp. 119–169. Because of their documentation and clarity, the works of Martin Grabmann are still required reading: *Die Geschichte der scholastischen Methode*, 2 vols. (1909–1911; reprint, Basel,

1961), and *Die Geschichte der katholischen Theologie seit dem Ausgang der Väterzeit* (Freiburg, 1933). For Anselm, see G. R. Evans's *Anselm and Talking about God* (Oxford, 1978); for Thomas Aquinas, consult the stimulating studies of M.-D. Chenu, *La théologie comme science au troisième siècle*, 2d ed. (Paris, 1943), translated as *Is Theology a Science?* (New York, 1959), and *Introduction à l'étude de saint Thomas d'Aquin* (Montreal, 1950); for Bonaventure, see Georges H. Tavard's *Transiency and Permanence: The Nature of Theology According to St. Bonaventure* (New York, 1954).

- In the modern age one of the most important developments has been the emphasis intellectuals have put on history. See, for example, *Historische Kritik in der Theologie: Beiträge zu ihrer Geschichte*, edited by Georg Schwaiger (Göttingen, 1980). For a discussion of Catholicism, John Henry Newman remains a model that is unfortunately too little known; see, for example, Thomas J. Norris's *Newman and His Theological Method: A Guide for the Theologian Today* (Leiden, 1977). One of the many interesting studies of the crisis of modernism, which, however, errs in reducing it to an almost orthodox liberalism, is Thomas M. Looze's *Liberal Catholicism, Reform Catholicism, Modernism* (Mainz, 1979). Two important books on contemporary theology are *Bilan de la théologie du vingtième siècle*, 2 vols. (Paris, 1970–1971), edited by Robert van der Gucht and Herbert Vorgrimler, and *Theology in Transition: A Bibliographical Evaluation of the "Decisive Decade," 1954–1964* (New York, 1965), edited by Elmer O'Brien.
- On the general characteristics of Orthodox theology, there are several noteworthy articles, now rather old, by competent specialists. See, for example, articles by Aurelio Palmieri, *Studi Religiosi* 2, no. 2 (1902): 115–135, and 2, no. 4 (1902): 333–351; and Venance Grumel, *Echos d'Orient* 30 (1931): 585–596. For the cultural climate of Eastern Christianity, see Endre von Ivanka's *Hellenisches und Christliches im frühbyzantinischen Geistesleben* (Vienna, 1948). The best of today's specialists is doubtless John Meyendorff; see his *Byzantine Theology: Historical Trends and Doctrinal Themes*, 2d ed. (New York, 1979), and his studies of Gregory Palamas. On the fourteenth- and fifteenth-century debate between the hesychast spiritual tradition and humanist rationalism, see Gerhard Podskalsky's *Theologie und Philosophie in Byzanz* (Munich, 1977). Philip Sherrard's *The Greek East and the Latin West: A Study in the Christian Tradition* (London, 1959) perhaps rigidifies and oversimplifies the differences, but this work has some stimulating things to say on the approach to the mystery of God.
- In Protestant theology two introductions may be mentioned: Karl Barth's *Evangelical Theology: An Introduction* (New York, 1963) and Roger Mehl's *La théologie protestante* (Paris, 1966). Richard H. Grutzmacher's *Textbuch zur systematischen Theologie des 17. bis 20. Jahrhunderts*, 3d ed. (Leipzig, 1935) provides an excellent collection of representative texts from German theologians. The following books are also very useful: Wilhelm Gass's *Geschichte der protestantischen Dogmatik in ihrem Zusammenhange mit der theologie überhaupt*, 4 vols. (Berlin, 1854–1867); Isaak Dorner's *Geschichte der protestantischen Theologie* (Munich, 1867), translated as *History of Protestant Theology*, 2 vols. (1871; reprint, New York, 1970); and Otto Pfeleiderer's *The Development of Theology in Germany since Kant and Its Progress in Great Britain since 1825* (London, 1890).
- The Anglican classics have been collected in the eighty-eight volumes of the "Library of Anglo-Catholic Theology" (Oxford, 1841–1863); extracts with bibliography are given in P. E. More and F. L. Cross's *Anglicanism* (London, 1935). On the same tradition, see A. M. Allchin's *The Spirit and the Word: Two Studies in Nineteenth Century Anglican Theology* (New York, 1963). Vernon F. Storr's *The Development of English Theology in the Nineteenth Century, 1800–1860* (London, 1913) is regarded as a classic. It may be complemented by L. E. Elliott-Binns's *English Thought, 1860–1900: The Theological Aspect* (Greenwich, Conn., 1956) and Arthur M. Ramsey's *From Gore to Temple: The Development of Anglican Theology between Lux Mundi and the Second World War, 1889–1939* (London, 1960).
- On the practice of theology, see, in addition to the works by Congar and Lonergan already cited, E. L. Mascall's *Existence and Analogy* (London, 1949) and his *Words and Images: A Study in Theological Discourse* (New York, 1957). On the relation of theology to the scientific spirit, see Thomas F. Torrance's *Theological Science* (London, 1969).
- On the hermeneutical movement, see Hans-Georg Gadamer's *Wahrheit und Methode* (Tübingen, 1965), translated as *Truth and Method* (New York, 1975); René Marlé's *Le problème théologique de l'herméneutique*, 2d ed. (Paris, 1968); Jean Greisch, Karl Neufeld, and Christoph Théobald's *La crise contemporaine: Du modernisme à la crise des herméneutiques* (Paris, 1973); *Le déplacement de la théologie* (Paris, 1977) by J. Audinet and others; and various issues of *Revue des sciences religieuses* (Strasbourg), especially the volumes for 1977, 1978, and 1982.
- Of the many works of theological discourse by the oppressed, only a few can be mentioned here: by several authors, *Théologies du tiers-monde* (Paris, 1977) and *Théologie de la libération en Amérique Latine* (Paris, 1974), which has been translated as *Liberation Theology in Latin America* (New York, 1982); Gustavo Gutiérrez's *Teología de la liberación* (Lima, 1971), translated as *The Poor and the Church in Latin America* (London, 1984); James H. Cone's *A Black Theology of Liberation* (Philadelphia, 1970); Bruno Chenu's *Dieu est noir: Histoire, religion et théologie des Noirs américains* (Paris, 1977); Gerald H. Anderson's *Asian Voices in Christian Theology* (Maryknoll, N. Y., 1976); Tharcisse Tshibangu's *Le propos d'une théologie africaine* (Kinshasa, 1974); and Raymond Facelina and Damien Rwegera's *Théologie africaine: Bibliographie internationale, 1968–1977* (Strasbourg, 1977).
- For ecumenical theology, see Gustave Thils's *La "théologie oecuménique": Notion, formes, démarches* (Louvain, 1960) and the very extensive documentation in Siegfried Wiedenhofer's "Ökumenische Theologie (1930–1965): Versuch einer wissenschaftsgeschichtlichen Rekonstruktion," *Catholica* (Münster) 34 (1980): 219–248.
- For a critique of "dogmatism," see Josef Nolte's *Dogma in Geschichte: Versuch einer Kritik des Dogmatismus in der Glaubensdarstellung* (Freiburg, 1971) and my *Diversités et communion* (Paris, 1982), which raises the basic question enunciated in the title.

*Revised Bibliography*

**THEOSOPHICAL SOCIETY.** Founded in 1875 in New York City, the Theosophical Society is an organization whose name was chosen to align it with the larger theosophical tradition. This tradition embraced Neoplatonism, Gnosticism, medieval mystics like Meister Eckhart and Nicholas of Cusa, Renaissance philosophers like Giordano Bruno and Paracelsus, and Romantic mystics and philosophers like Jakob Boehme and Friedrich Schelling as well as wider religious philosophies like Vedānta, Mahāyāna Buddhism, Qabalah, and Sufism. The Theosophical Society functions as a bridge between East and West, emphasizing the commonality of human culture.

**THE FIRST GENERATION.** Among the sixteen persons who participated in the formation of the Theosophical Society, two were notable for their roles in its future development: Helena Petrovna Blavatsky (1831–1891), a charismatic Russian of upper-class family, and Henry Steel Olcott (1832–1907), an American lawyer and journalist. Blavatsky was the energetic force that brought the society into existence, and she remained its chief theoretician throughout her life. At the age of eighteen, to escape the bonds of an unwanted marriage, she began her world travels, in the course of which she circumnavigated the globe and became familiar with a wide range of intellectual and mystical traditions. In 1873 she moved to New York, eventually meeting Olcott in Chittenden, Vermont, at Spiritualist meetings he was reporting for a New York newspaper. The Theosophical Society subsequently grew out of evening gatherings held in Blavatsky's

New York apartment, at which papers and conversation about arcane matters attracted a small company of intellectuals. Blavatsky's first significant publication was *Isis Unveiled* (1877); her major book is *The Secret Doctrine* (1888), setting forth a cosmology; her most readable work is *The Key to Theosophy* (1889). Her periodical articles (in English and French, but excluding those in Russian) fill fourteen volumes of *Collected Writings* (1950–1991).

Olcott provided the organizing force that held the Theosophical Society together. During the American Civil War he had investigated procurement fraud for the military, and his early writings covered agriculture, insurance, and Spiritualism. He became the first president of the society and held that post until his death. He also became a champion of civil rights for the Ceylonese in Sri Lanka, where he remains a national hero; a promoter of education for the common people of Sri Lanka and India; and a key figure in the Buddhist revival, espousing an ecumenical Buddhism.

Three years after the Theosophical Society's founding, Olcott and Blavatsky left New York for Bombay, arriving there in 1879. A short-lived alliance with the Hindu reform movement of the Ārya Samāj failed because both sides misunderstood the basic orientation of the other. But Olcott and Blavatsky enjoyed a considerable popularity with some native Indians and members of the British raj, Blavatsky particularly among the latter for her ability to produce phenomena, such as the materialization of objects, and for her claim to be in touch with human teachers of extraordinary abilities.

In 1882 the Theosophical Society acquired property in southern India at Adyar, on the outskirts of Madras (now Chennai) where the Adyar River flows into the Bay of Bengal, property that is still the international headquarters of the society. In 1885 Blavatsky left India after an investigation by a staff member of the Society for Psychical Research (SPR) resulted in a report calling her an imposter, although the report was later shown by another member of the SPR to have been biased and flawed (Harrison, 1997). Blavatsky eventually settled in London, where she spent the last four years of her life producing the major body of her writings.

Meanwhile the Theosophical Society continued to grow, with national sections (semiautonomous bodies) being formed within the international organization. The first three sections were established in the United States (1886), England (1888), and India (1891).

**LATER GENERATIONS.** The most important person in the Theosophical Society's history after Blavatsky and Olcott was Annie Wood Besant (1847–1933). Already a proponent of free thought as well as an activist and the most famous woman orator in England, Besant met Blavatsky after reviewing the latter's book *The Secret Doctrine* for an English periodical. Besant joined the Theosophical Society just two years before Blavatsky's death and was almost immediately recognized as Blavatsky's spiritual successor. Besant became international president of the society upon Olcott's death in 1907.

Shortly after Blavatsky's death a disagreement arose about the role within the Theosophical Society of William Quan Judge (1851–1896), who was one of the society's original organizers and who had become the chief executive of the American section. As a result in 1895 most of the members and branches in the United States seceded from the parent society and formed an independent organization that is now headquartered in Pasadena, California. The parent society soon reestablished itself in the United States through lecture tours by Besant and others.

Besant was a supporter of Indian independence within the British Empire, and she became the first woman and the only non-Indian to serve as president of the Indian National Congress. Besant was also a vigorous promoter of education and of human and animal welfare. With her colleague Charles Webster Leadbeater (1854–1934), she added significantly to the body of Theosophical literature and sponsored the young Jiddu Krishnamurti (1895–1986), who later became an independent religious philosopher.

During the second generation the presentation of Theosophy focused on Indic and particularly Hindu spirituality in a Westernized form. Besant and Leadbeater also promoted several Western traditions interpreted in Theosophical terms, particularly Christianity through the Liberal Catholic Church and Freemasonry through a French-derived form of Co-Masonry that admitted women on equal footing with men. Besant also organized the Order of the Star in the East to promote Krishnamurti as the spokesperson for a new world teaching. These ancillary movements were organizationally autonomous but had overlapping memberships and leaderships with the Theosophical Society.

The Theosophical Society had its largest membership and influence during the 1920s. The 1929 decision of Krishnamurti to dissolve the Order of the Star and withdraw from the role envisioned for him, coupled with the effects of the Great Depression and World War II, reduced public awareness of the society. The society fared badly under totalitarian regimes, whether of the right or the left, being outlawed and persecuted in Francisco Franco's Spain, Adolf Hitler's Germany, Joseph Stalin's Russia, and other dictatorships. Yet Krishnamurti went on to become an important spiritual teacher in the late twentieth century, and the Theosophical Society continued under able leaders. Besant was followed in the presidency by an Englishman, George Arundale (1934–1945); a Sri Lankan, Curuppumullage Jinarajadasa (1945–1953); an Indian, N. Sri Ram (1953–1973); another Englishman, John Coats (1973–1979); and another Indian, Radha Burnier (1980–), daughter of Sri Ram. In the early twenty-first century the society has branches in some seventy countries and a membership of approximately thirty-two thousand.

**THEOSOPHY.** The Theosophical Society has no requirement of belief or practice for its members other than subscription to its three "objects" and a way of life not incompatible with them. These objects are:

To form a nucleus of the universal brotherhood of humanity, without distinction of race, creed, sex, caste, or color

To encourage the study of comparative religion, philosophy, and science

To investigate unexplained laws of nature and the powers latent in humanity.

In addition to these objects a body of teachings has evolved that attempts to state in present-day terms concepts called the ancient wisdom, the perennial philosophy, or simply theosophy. These concepts, which are not incumbent on members of the society, although they are widely espoused by members, have no official statement. The concepts may include such ideas as the following, each with ethical implications:

- There is only one ultimate reality, of which all existent things are expressions. Theosophy is philosophically monistic, with implications of human equality (formulated in the society's first object) and concern for animal welfare (resulting in the practice of vegetarianism for ethical reasons and the avoidance of other animal exploitation).
- The orderliness of the world is expressed in cyclical patterns, which can be seen in all aspects of reality from the macrocosm to the microcosm, including the reincarnation of an individual human consciousness in a long series of lives. The belief that an individual has lived or will live in bodies of both sexes and of various races and cultures fosters an understanding of and respect for human differences.
- The orderliness of the world is based on a principle of causation called karma, which operates in both material and moral realms, positing for every action a corresponding reaction, both physical and ethical. The fact that every action by a person has unavoidable consequences is a basis for practical morality: to do harm to another is to generate harm for oneself; to do good to another is to ensure good for oneself.
- World history follows an evolutionary pattern, not only of material forms but of intellect and spirit, governed by both causes and purposes. Evolution is teleological, and consequently human life is meaningful and purposeful, a recognition of which aids successful living.
- All objects in the universe are imbued with consciousness of some sort, and consciousness evolves through the ages so that, for example, mineral consciousness becomes successively vegetative, animal, human, and eventually something beyond human. Furthermore the interconnection and interdependence of all consciousness implies an ecological rather than exploitative approach to life.
- The final purpose of evolutionary development is that the ultimate reality may become conscious of itself

through its expression as the world (similar to the philosophy of Alfred North Whitehead), and the purpose of human life is to further that evolutionary development by a conscious participation in it. All individuals have a high and serious calling, which may be responded to by carrying out the duties of their stations in life.

- Human beings are assisted in fulfilling the purpose of their lives by the teachings and examples of sages, prophets, saints, avatars, or bodhisattvas; but the responsibility for that fulfillment and the impulse to meet it arise from within the individual, who is responsible for his or her own salvation. A means to fulfill one's purpose for being is an intelligent and spiritually sensitive activism, tempered by the realization that one's knowledge of the world and of oneself is still severely limited, making humility and tolerance the best guideposts to ultimate success.

**EXTENSIONS AND INFLUENCES.** For a small and nonproselytizing organization, the Theosophical Society has had some notable effects. Offshoots of the parent society, headquartered at Adyar, Chennai, India, include the Theosophical Society with international headquarters at Pasadena, California (the direct descendant of the Judge group); the United Lodge of Theosophists; the Temple of the People at Halcyon, California; the Anthroposophical Society, which began as the German section of the Theosophical Society; the Buddhist Society U.K., which began as the Buddhist Lodge of the Theosophical Society; the Arcane School, Lucis Trust, and other organizations springing from Alice Bailey (1880–1949), who was an employee of the Theosophical Society; and a number of organizations often loosely categorized as New Age.

The concepts of the Theosophical Society have affected modern life especially in the areas of religious and social reform, art, literature, and what may loosely be called spirituality. Olcott was a leading force in the modern Buddhist revival, as was a protégé of his, Anagārika Dharmapāla (1864–1933), who founded the Maha Bodhi Society to preserve Buddhist sites and to extend Buddhism. Besant's prominence in Indian politics and in social movements inspired a number of others in India, England, and the United States to promote reform, especially for women's rights. An earlier Theosophical exponent of woman's rights was Matilda Joslyn Gage (1826–1898), American feminist and coauthor with Elizabeth Cady Stanton and Susan B. Anthony of the *History of Woman Suffrage* (1881–1887). Wassily Kandinsky framed his theory of nonobjective art in Theosophical terms, citing Blavatsky in his manifesto, *Concerning the Spiritual in Art* (1912); another pioneer in abstraction, Piet Mondrian, developed the neoplastic style of art on Theosophical principles. The Irish literary revival was influenced by Theosophy, particularly in the person of its chief exponent, William Butler Yeats. On a more general level, the Theosophical Society popularized such concepts as reincarnation, karma, and the aura as well as practices such as yoga and the complementary healing technique called Therapeutic Touch.

#### BIBLIOGRAPHY

- Blavatsky, Helena Petrovna. *Isis Unveiled: A Master-Key to the Mysteries of Ancient and Modern Science and Theology*. 2 vols. London, 1877; reprint, Wheaton, Ill., 1972. The author's first major work, which established her reputation as a figure in nineteenth-century esotericism.
- Blavatsky, Helena Petrovna. *The Secret Doctrine: The Synthesis of Science, Religion, and Philosophy*. 2 vols. London, 1888; reprint, 3 vols., Wheaton, Ill., 1978. The author's major work, a commentary on the otherwise unknown *Stanzas of Dzyan*, dealing with the origin of the universe (cosmogogenesis) and of the human species (anthropogenesis) and including essays on symbolism and contemporary science.
- Blavatsky, Helena Petrovna. *The Key to Theosophy: Being a Clear Exposition, in the Form of Question and Answer, of the Ethics, Science, and Philosophy for the Study of Which the Theosophical Society Has Been Founded*. London, 1889; reprint, Pasadena, Calif., 1995. One of the author's last works, a presentation of her ideas for the general reader.
- Blavatsky, Helena Petrovna. *Collected Writings*. 15 vols. Compiled and edited by Boris de Zirkoff. Wheaton, Ill., 1950–1991. A collection of all known periodical articles and some other incidental writings by Blavatsky, with an extensive index by Dara Eklund as vol. 15.
- Blavatsky, Helena Petrovna. *The Letters of H. P. Blavatsky*, vol. 1: 1861–1879. Edited by John Algeo. Wheaton, Ill., 2003. The beginning of a collection of all of Blavatsky's known correspondence, this volume contains letters written before she settled in India in 1879, with extensive background essays and notes.
- Ellwood, Robert. *Theosophy: A Modern Expression of the Wisdom of the Ages*. Wheaton, Ill., 1986. A popular presentation of basic Theosophical concepts as viewed by a religion scholar who is also a Theosophist.
- Harrison, Vernon. *H. P. Blavatsky and the SPR: An Examination of the Hodgson Report of 1885*. Pasadena, Calif., 1997. An examination by an expert in forgery of the 1885 report submitted to the Society for Psychical Research, which branded Blavatsky as a fraud, concluding that the report was biased and that the crucial handwriting evidence was misinterpreted.
- Olcott, Henry Steel. *Old Diary Leaves: The True Story of the Theosophical Society*. 6 vols. New York, 1895–1935; reprint, Adyar, India, 1974–1975. The founder-president's recollections of events between 1874 and 1898, originally published partly as journal articles that were later collected.
- Prothero, Stephen. *The White Buddhist: The Asian Odyssey of Henry Steel Olcott*. Bloomington, Ind., 1996. A biography of Olcott focusing on his interactions with the Buddhist community and his role in the modern Buddhist revival, especially in Sri Lanka, where he became a national hero.

JOHN ALGEO (2005)

**THERAVĀDA.** The term *Theravāda Buddhism* refers, first, to a "school" and closely related "orientations" within

the history of Buddhist monasticism and, second, to forms of Buddhist religious, political, and social life in various Buddhist countries. Although these two aspects of Theravāda Buddhism must be distinguished, they overlap and interact in various ways at different points in Theravāda history. In the present article, the specifically monastic aspects will receive priority, but reference will be made to the civilizational dimension as well.

What is the best way to identify the school and the related orientations that should appropriately be considered under the Theravāda rubric? This is a very difficult question, and there is no answer that proves appropriate in all circumstances. For our purposes, however, the following characterization may be helpful. The Theravāda school and orientations within Buddhist monasticism are those that have been self-consciously identified with the “Way of the Elders” (Skt., Sthaviravāda; Pali, Theravāda) and have maintained Pali as the language in which they have preserved what they hold to be the authentic teaching of the Buddha. Within the larger divisions of the Buddhist community, the Theravāda is the sole surviving member of the so-called Eighteen Schools, the eighteen (by traditional reckoning) *nikāyas* that together made up what its detractors would come to call Hīnayāna Buddhism, the “lesser vehicle” to salvation. With the other Hīnayāna schools, the Theravāda shares a soteriology centered around the figure of the *arahant* (Skt., *arhat*), forms of community life strictly regulated by the Vinaya, or code of monastic conduct, and a canon that rejects the authenticity of the Mahāyāna *sūtras*. Theravāda remains today, as it has been for nearly a thousand years, the dominant Buddhist tradition in Sri Lanka (Ceylon), Burma, Thailand, Laos, and Cambodia.

Once this way of identifying the scholastic expressions and orientations of Theravāda Buddhism has been established, the identification of Theravāda forms of Buddhist civilization is much easier. Quite simply, Theravāda forms of Buddhist civilization are those that have been strongly influenced by the Theravāda school (including its conceptions and prescriptions relevant to society as a whole as well as to the monastic community) and heavily supported by Theravāda monks.

The recognition of these two dimensions of Theravāda Buddhism, and the specification of very general criteria for identifying each of them, does not resolve the very serious problems involved in generating an adequate historical description. It does, however, establish parameters that will facilitate the discussion.

**ORIGINS AND EARLY DEVELOPMENT.** Theravāda Buddhism, like other forms of Buddhism, had its origin in the life of the early Buddhist community. However, during the earliest stages of Buddhist development schools had not yet crystallized in any formal sense. Although the claim to represent the earliest Buddhism is doctrinally important, none of the schools that developed later can be considered, on the basis of purely historical scholarship, to be the sole inheritor and

preserver of the original form of Buddhist teaching and practice.

**The first centuries.** We know that not longer than 110 years after the death of the Buddha the different emphases that existed within the earliest community culminated in a major schism. The school known as the Mahāsāṃghika (“those of the great assembly”) was more populist in its attitude toward doctrinal matters, disciplinary practices, and modes of communal organization. By contrast, the Sthaviravāda school was more conservative in its approach to doctrine and practice and was more hierarchical in its patterns of community life.

Although a Theravāda tradition using Pali as its sacred language probably existed in the earliest days, its differentiation from other related traditions at this point was still quite nascent. The preferences for versions of the received tradition according to language or dialect were, as far as we know, not yet correlated with particular differences in doctrinal or practical orientation. Nor had the issues that later led to the more refined scholastic divisions been formulated in any hard and fast way.

Similarly, it is impossible to identify “Buddhist civilization,” much less its Theravāda form, during the first centuries of Buddhist history. This is not to say that the Buddhist tradition generally, and the Theravādins in particular, did not have civilizational aspirations. From texts dating to this period, it seems clear that they did. But at this point the opportunity for implementation had not yet arisen.

**Aśoka and after.** By the period of the reign of Aśoka (third century BCE) the initial division of the Buddhist community into those of the “Great Assembly” and those of the “Way of the Elders” had subdivided further. Exactly how many groups existed, what range of languages or dialects were used to preserve their Master’s teachings, and how sharply these groups were divided remains problematic. But according to Theravāda accounts dating from at least the fourth century CE, Aśoka himself sponsored a council that clarified the major differences.

According to these later accounts, Aśoka requested that a Buddhist council be held under the leadership of his monastic preceptor, a Theravāda monk named Moggaliputtatissa. At this council, the Theravādins claim to have bested their opponents in heated debates on numerous disputed issues. Not only was the Third Council supposed to have upheld the Theravādins’ orthodoxy but also to have resulted in the expulsion of the defeated heretics from the *saṃgha* (Pali, *sangha*), or monastic order. The lack of corroboration from non-Theravāda sources casts doubt on the ecumenical character of the Third Council; however, most scholars accept that some sort of council was held.

Further Theravāda accounts record that Aśoka sponsored Buddhist missions that traveled beyond the frontiers of his considerable empire. These accounts date the founding of the Theravāda school in Southeast Asia and Sri Lanka to

Aśoka's missions to Suvaṇṇabhūmi (CE, Southeast Asia) and Tambapaṇṇi (CE, Sri Lanka), respectively. Aśoka's Pillar Edicts corroborate only that he sponsored the mission to Tambapaṇṇi. Other inscriptional evidence, however, supports the chronicles' accounts about a mission to Himavanta (typically identified with the Himalayan areas), whereas again the Pillar Edicts are silent. Therefore, the chronicles' accounts about a mission to Suvaṇṇabhūmi may well be accurate.

There is no substantial reason to doubt that by Aśoka's time the Theravādins formed a distinctive group within the Buddhist *sangha*. They preserved the teachings of the Buddha in Pali through their oral tradition; by the Third Buddhist Council or shortly thereafter, the Theravādins held their own positions on specific points of doctrine and practice. They also actively contributed to the Buddhist missionary activity during the third and second centuries BCE. It may nevertheless be premature to speak of Theravāda's influence as having achieved civilizational scale apart from its role within the Indian *sangha* as a whole. During the centuries that followed Aśoka's death, the Theravāda tradition continued to spread its influence in India, but as one school among many (eighteen is the traditional number given). Specific information remains scanty.

**Sri Lanka and the Dhammadīpa tradition.** In Sri Lanka, however, the situation was quite different. Within this distinctive provincial area, Theravāda traditions became firmly established and prospered. The Pali chronicles compiled and preserved by the Sinhala monks, inscriptions, and extensive archaeological remains make it possible to reconstruct a comparatively full picture of Theravāda Buddhism in the Sri Lanka of the first century BCE.

For example, the Pali chronicle written in fifth-century Sri Lanka and known as the *Mahāvamsa* (Great Chronicle) records the momentous decision to commit the Theravāda canon, preserved and transmitted for centuries by oral tradition, to writing. According to the *Mahāvamsa*, between the years 29 and 17 BCE Sri Lanka was threatened by foreign invasion and famine, and the Theravāda monks feared that the monastic community would be dispersed and the oral tradition broken and lost. In an effort to prevent this, they gathered together and committed to writing the Tipiṭaka (Skt., Tripiṭaka; "three baskets"), that is, the Buddhist canon. As a result, this aspect of the tradition was solidified in a basic form that has remained largely intact through Theravāda history.

The first two Piṭakas, or "baskets," are the Sutta Piṭaka, which contains sermons, discourses, and sayings attributed to the Buddha, and the Vinaya Piṭaka, which contains stories about the Buddha that introduce rules concerning the conduct for monks and nuns and the proper functioning of the monastic order. These two baskets comprise many strata of traditions ranging in dates from the time of the Buddha himself up to at least the time of Aśoka. Most of the material that they contain is present also in the traditions preserved

by other Buddhist schools in various forms of Prakrit and Sanskrit, sometimes in slightly different form and often much embellished.

However, in the case of the third Piṭaka, called the Abhidhamma, or "Higher Teaching," the situation is quite different. Here we have a collection of seven compositions, each unique to the Theravāda school. These seven compositions represent a relatively late scholastic formulation, compiled possibly during the Aśokan or early post-Aśokan period. Together they present and summarize Buddhist teachings in a systematic form that differentiates Theravāda scholasticism from that of the other schools that were developing during the same period. This Theravāda distinctiveness is perhaps most explicitly expressed in the *Kathāvatthu*, an Abhidhamma text attributed to Moggaliputtatissa and associated with the Third Council. In this forensic and polemic text over two hundred Theravāda positions are defended against opposing doctrines. For example, the doctrine of *anatta* ("no-self") is defended against an opponent who asserts the existence of some kind of continuing personal entity (a view usually associated with the Pudgalavāda school); the doctrine of *anicca* (momentariness) is defended against an opponent who affirms the existence of past, present, and future times (a view usually associated with the Sarvāstivāda school); and the attainments of the *arahants* (Skt., *arhats*; fully perfected saints) are defended against opponents who questioned their perfection (a view associated most often, but not exclusively, with the Mahāsāṃghikas).

There is strong evidence to suggest that before the beginning of the common era an extensive tradition of commentaries on many portions of the Pali Tipiṭaka already existed in the Sinhala vernacular. To what extent the original forms of these commentaries were brought to Sri Lanka by the legendary missionaries of Aśokan times is unclear. Nor can we be sure to what extent these commentaries were composed in India in Pali and subsequently translated into Sinhala and to what extent they were actually composed or adapted in Sri Lanka. Since none of these commentaries has survived in its early Sinhala form, the contents cannot be determined with certainty. We know only that before the beginning of the common era a significant corpus of Tipiṭaka commentaries, preserved in Sinhala, formed an integral component of the Theravāda tradition in Sri Lanka.

By this time, too, Theravāda Buddhism in Sri Lanka had become a civilizational religion. It may be, as the later chronicles maintain, that the civilizational character dates to the time of the Aśokan missionaries to Sri Lanka. Said to have been the son of Aśoka, the monk named Mahinda (Skt., Mahendra) supposedly succeeded in his missionary goal of establishing the Theravāda lineage in Sri Lanka and converting the Sinhala king, Devānaṃpiyatissa. Shortly thereafter, according to the texts, Aśoka's daughter, the nun Sanghamittā, brought to Sri Lanka the ordination lineage for women. King Devānaṃpiyatissa is credited with founding the famous Mahāvihāra monastery, which not only encom-

passed the king's capital within its boundaries, but later housed the monks who authored the chronicles that we now possess.

Another possible point for the emergence of Theravāda as a civilizational religion is the reign of the Sinhala hero, King Duṭṭhagāmaṇī (r. 161–137 BCE). According to the fifth-century *Mahāvamsa* account (whose preeminent hero is Duṭṭhagāmaṇī, as opposed to the fourth-century *Dīpavamsa* account, whose hero is Devānampiyatissa), Duṭṭhagāmaṇī sought to evict the South Indians who had established their hegemony in northern Sri Lanka. While still a prince he organized a campaign in which the struggle to establish centralized rule and the struggle to establish Theravāda Buddhism as the “national” religion became closely identified. With the victory of Duṭṭhagāmaṇī and his construction of the Mahāthūpa (a funerary mound that enshrined relics of the Buddha and formed a key monument within the Mahāvihāra's monastic complex) in the capital of Anurādhapura, the civilizational character of Theravāda found a powerful vehicle of expression. Certainly, by the end of the first century BCE, after the Pali scriptures had been committed to writing, the Theravāda ideal of Sri Lanka as the Dhammāpā, the “Island of the Dhamma,” seemed well-developed not only in Sri Lankan religious and political institutions, but in Sinhala identity as well.

**THERAVĀDA BUDDHISM IN GREATER INDIA.** The history of Theravāda Buddhism in India and Southeast Asia during the first millennium CE continues to be extremely obscure. We know that Theravādins held sway in a number of important Buddhist centers in India, especially in Andhra Pradesh and Tamil Nadu. And we also know that several of the most famous Theravāda scholars were of Indian origin and, among these, some did their primary work in Indian monasteries.

In Southeast Asia, specifically among the Burmese of Lower Burma and the Mon peoples of Lower Burma and Thailand, the Theravāda tradition became firmly rooted and exerted a significant civilizational influence. Later legends trace the founding of this tradition to Soṇa and Uttara, the two missionaries reportedly dispatched to Suvāṇṇabhūmi by Moggaliputtatissa. The first archaeological evidence of Buddhism's presence has been found along inland and coastal trade routes, and dates to early in the first millennium CE. In Lower Burma inscriptions have been found that confirm a preeminent Theravāda presence in Pyu/Burmese royal centers beginning from the fifth century CE, and some sort of Theravāda influence is attested in Pagan somewhat later. In Thailand, similar evidence indicates that the Theravāda tradition was an important, perhaps central, religious element in the Mon civilization of Dvāravatī that flourished over a wide area of central, northern, and northeastern Thailand from the sixth to the eleventh century. Such sources notwithstanding, information concerning the kind or kinds of Theravāda Buddhism that existed among the Burmese and Mon is virtually nonexistent. Moreover, there is little data that illumines the relationship between the various

Theravāda traditions and the other schools—notably other Hīnayāna schools that used Sanskrit as their sacred language—that were also very influential throughout the mainland areas of Southeast Asia.

In Sri Lanka, literary and archaeological remains provide many more details regarding local Theravāda history. According to fifth-century chronicle accounts, the first major division within the Theravāda *sangha* in Sri Lanka occurred soon after the Pali Tipiṭaka was committed to writing, probably between 29 and 17 BCE. A famous monk named Mahātissa evidently built, with royal support, an impressive new monastery in Anurādhapura. Sometime thereafter, monks of the long-established Mahāvihāra fraternity (by whose account this story is preserved) accused Mahātissa of violating the monastic discipline and tried to expel him from the *sangha*. Monks loyal to Mahātissa then formed the fraternity of the Abhayagiri monastery, which became for some time the Mahāvihāra's archrival. The Abhayagiri lineage maintained independent institutional traditions that eventually gave rise to branch monastic communities as far distant as Java.

Like the Mahāvihāra, the Abhayagiri came to include an order of nuns among its residents. These nuns seem to have been very active and were responsible for transmitting the women's ordination lineage to China in the fifth century. With an extensive network of affiliated monasteries, the Abhayagiri controlled its own sizable collection of wealth and property. This new fraternity also came to possess its own version of the Pali Tipiṭaka, its own distinctive version of certain aspects of Theravāda doctrine, and its own interpretation of particular points of monastic discipline. In addition—in contrast to their Mahāvihāra rivals—the Abhayagiri *nikāya*, like the communities that supervised the great monastic universities of India, welcomed into their midst monks from other Hīnayāna schools, and from various Mahāyāna and, later, Tantric traditions as well.

This willingness of the Abhayagiri Theravādins to welcome Mahāyāna adherents into their company generated, some three centuries after its founding, a schism within its own ranks. In the middle of the fourth century three hundred monks declared their aversion to the presence of Mahāyāna monks at the Abhayagiri, withdrew from that fraternity, and formed an independent group that came to be known as the Jetavana fraternity. The new Jetavana *nikāya* acquired affiliated monasteries and also considerable land and other wealth. But compared to the Mahāvihāra and Abhayagiri *nikāyas*, the Jetavana remained relatively small. From time to time, it became associated with particular doctrinal and disciplinary interpretations of its own, but a sustained distinctive orientation never emerged to compete seriously with its two rivals. Although by the end of the third century the Theravāda *sangha* in Sri Lanka had become divided, certain tendencies remained common to all three *nikāyas*. For example, the Theravāda scholasticism that blossomed during the fifth century drew scholars from the Mahāvihāra and from other *nikāyas* as well.

The most influential scholar associated with this efflorescence, if not Theravāda scholasticism generally, was Bhandacariya Buddhaghosa. Probably a native of northern India, Buddhaghosa traveled to Sri Lanka in order to translate the Sinhala commentarial tradition, preserved by the Mahāvihāravāsins, into Pali, which by this time was recognized as the lingua franca of the international Theravāda community. Buddhaghosa's industriousness during his residence at the Mahāvihāra produced a rich and extensive corpus of Pali commentarial literature that became a fundamental resource for subsequent scholarship and practice throughout the Theravāda world. In addition, Buddhaghosa produced a comprehensive meditational guide and doctrinal summary known as the *Visuddhimagga* (The Path of Purification). Rich with historical anecdotes, the *Visuddhimagga* remains an authoritative resource for Theravāda scholars and adherents from his own time to the present. Although there is no corroborating evidence, a Southeast Asian tradition records that Buddhaghosa traveled to Burma late in his life and that his influence inaugurated a renaissance of Burmese Theravāda.

Two monks from South India, Buddhadatta, a younger contemporary of Buddhaghosa, and Dhammapāla, his successor, also made significant contributions to the new literature in Pali. And many scholars believe that it was a monk from the Abhayagiri monastery who composed a manual entitled *Vimuttimaggā* (The Path of Liberation), which, while not as wide-ranging, was nevertheless remarkably parallel to Buddhaghosa's *Visuddhimagga*. Some scholars suggest there may be a common source for both of these manuals that has parallels or variations in India as well.

Another movement in Sri Lanka that drew interested monks from all Theravāda *nikāyas* was ascetic in character and led to the rise of at least two prominent groups. The first group, known as the Paṃsukūlikas ("those who wear robes made from rags"), began to play an important role during the seventh century and continued to be noted in historical records until the eleventh and twelfth centuries. Although little is known about the group, it is quite possible that at least some of the Paṃsukūlikas were strongly influenced by Tantric trends that were becoming increasingly prominent throughout the Buddhist world, including Sri Lanka.

The second group, which attracted many proponents, especially from among the Mahāvihāravāsins, first began to be mentioned in tenth-century records. Referred to as *āraṇṇīkikas* ("forest dwellers"), these monks declined to reside in the rich monasteries of the capital and established their own monastic centers in the countryside. They adopted a more stringent discipline than their urban contemporaries, and emphasized more rigorous modes of scholarship and meditation.

Throughout the entire first millennium CE, as Sri Lankan Theravāda Buddhism developed its monastic teaching and modes of practice, it also developed various civilizational aspects of its orientation. There was often serious and some-

times destructive competition between segments of the monastic community for royal support in particular and lay support in general. Serious disagreements among different Theravāda groups concerned various matters such as the propriety of monastic land ownership and wealth, the status and authority of the king, the appropriateness of various forms of ritual practice, and the like. But despite the differences, several general trends emerged. For example, over the course of the millennium monastic institutions controlled increasing amounts of land and accumulated increasing amounts of wealth. With regard to royalty, the Theravāda notion of kingship became gradually more exalted until, by the end of the period, the king was generally portrayed as a *bodhisatta* (future Buddha). Various relics of the Buddha, especially the tooth relic and the alms bowl relic, came to be regarded as palladia of the kingdom, and also became centers around which large-scale "national" festivals were celebrated.

**THE GREAT REVIVAL AND BEYOND.** During the first centuries after the turn of the second millennium CE, the center of gravity in the Theravāda world shifted significantly to the east. In India, Buddhism, including Theravāda Buddhism, succumbed almost completely to the pressures exerted by Hinduism and Islam. But in Sri Lanka, Burma, and Thailand, Theravāda gained new vitality and spread to new areas. Establishing centers in the Mekong Valley, the Theravādins attained preeminence by the mid-fourteenth century both among the Khmer (Cambodians) and the Lao.

At the beginning of the period Theravāda fortunes were at a low ebb. In Sri Lanka, the Theravāda *sangha* had suffered serious setbacks as a result of Cōḷa invasions from South India and the collapse of the hydraulic civilization of northern Sri Lanka. In Southeast Asia, the Pyu-Burmese and Mon civilizations in which the Theravādins had played a major role had lost much of their vitality. During this period, the kingdom of Pagan seemed to be more oriented toward Hinduism and Sanskrit forms of Buddhism than toward Theravāda. And with hegemony over most of what is now Thailand, the powerful and expansive Khmer court at Angkor was strongly oriented toward Hinduism and Mahāyāna Buddhism.

Accounts of the beginnings of the Theravāda resurgence that occurred in the latter half of the eleventh century vary according to the tradition that has preserved them. However, one primary fact stands clear both in Sri Lanka and in Burma: Theravāda became the favored tradition at the major centers of political power. In Sri Lanka this occurred after the expulsion of the Cōḷa invaders and the restoration of Theravāda-oriented Sinhala royalty by Vijayabāhu I. In Burma, it occurred through the conquest of the Mon by King Aniruddha of Pagan, his introduction of Mon Theravāda monks and their traditions to Pagan, and the subsequent recognition in Pagan of the preeminence of the Theravāda *sangha*.

**Sri Lanka.** In Sri Lanka, the revitalized Theravāda tradition was given an important new direction in the twelfth

century when, during the reign of Parākramabāhu I, a major reform and reorganization of the *sangha* was implemented. Parākramabāhu I requested the Mahāvihāra-oriented *āraññīkas*, who had begun to appear on the scene two to three centuries earlier, to preside over a council. The goal of the council, not dissimilar from the goals of previous but less successful royal policies, was to purify and unify the Sri Lankan *sangha*. This time a number of factors contributed to success. On one hand, the *nikāyas* had been weakened by the recent confiscation of monastic property by King Vikramabāhu I (r. 1111–1132) and, on the other, there was a respite in the warring between Sinhala and South Indian groups.

The council “purified” the *sangha*, which meant that the code of proper monastic conduct was ascertained and monks who refused to comply were expelled. The reforms then unified the *sangha* by bringing all the remaining factions (and it is clear there were many) together into a single communal order. In so doing, the reforms provided the basis for a new structure of ecclesiastical organization that was established either at that time or shortly thereafter. The new system involved the appointment, by the king, of a *mahāsvami* or *sangharāja* to act as the monastic head of the *sangha* as a whole, and also the appointment (under him) of two *mahāsthaviras* to supervise the *gāmaṇḍin*, or village-dwelling monks, and the *vanavāsīn*, or forest-dwelling monks (also called *āraññīkas*), respectively.

The reform movement that the council expressed and abetted also generated a tremendous burst of literary creativity that matched and perhaps even exceeded the literary achievements of Buddhaghosa and others some seven centuries earlier. This new literary efflorescence had two very important dimensions. The first was the production, primarily by a monk named Sāriputta—a leading figure at the council who later seems to have held the position of *mahāsvami*—and his disciples, of a whole new strata of Pali literature. The new Pali compositions included a series of subcommentaries on the commentaries of Buddhaghosa, especially on Vinaya; also included were a number of very important texts dealing with the lineages or histories (*vaṃsa*) of various relics of the Buddha and monuments to him, as well as the more wide-ranging historical chronicles that brought the narrative of the *Mahāvamsa* up to date. This new literary dynamism also generated new genres of Pali and Sinhala literature that were often permeated with devotional themes. This literature vividly expressed the new reformist concern to convey the Theravāda message in linguistic and religious idioms acceptable both to monastic and lay constituencies in the countryside as well as in the urban centers.

This reformed tradition by and large remained preeminent and creative in Sri Lanka up to the coming of the Portuguese in the fifteenth century, and persisted for some centuries thereafter. The *sangha* retained its symbiotic relationship with the Sinhala kings, and the monasteries acquired new lands and wealth. However, during the period after 1500,

when the authority of the indigenous Buddhist kingdom was increasingly confined to the inland highlands, the *sangha* suffered a serious erosion of standards. By the early eighteenth century, the level of monastic scholarship and discipline had reached a very low level indeed.

**Burma.** In Southeast Asia, the resurgence of Theravāda proceeded rather differently. At the time King Aniruddha came to the throne in Pagan (eleventh century) the Mon in Lower Burma preserved a very ancient Theravāda tradition associated with the Aśokan missionaries Soṇa and Uttara. Through the reforms initiated by Aniruddha and his monastic preceptor, Shin Arahan, and renewed by his successor, King Kyanzittha, a strong Theravāda tradition was established in Upper Burma and given powerful royal support. In the twelfth century a further reformist element was introduced at Pagan by a monk named Chapaṭa, who had gone to Sri Lanka during the reign of Parākramabāhu I and had been reordained in the newly purified and unified Sri Lankan *sangha*. Thus, by the end of the twelfth century, when the Pagan dynasty was still a very powerful force, the Theravāda tradition had become firmly established as the preeminent religion in Burma. What is more, the three major subtraditions that were to coexist and compete with one another through the entire premodern period—those associated with Lower Burma, Upper Burma, and Sri Lanka—were all more or less firmly in place.

The Burmese monastic reforms, which in some respects corresponded to those that had been implemented in twelfth-century Sri Lanka, took place when the fifteenth-century Mon king named Dhammaceti assumed the throne in Lower Burma. Formerly a monk, King Dhammaceti sponsored a delegation of eighteen monks to be reordained in Sri Lanka. When these monks returned, Dhammaceti insisted that all those within his realm who wished to remain in the *sangha* be reordained by the new fraternity. Following this “purification” and unification process, the king proceeded to establish a monastic hierarchy whose responsibility it was to maintain strict adherence to the Vinaya rules. King Dhammaceti’s efforts served to emphasize the influence of Sinhala monastic traditions in Burma. Moreover, his activities gave impetus to a new tradition of Pali Abhidhamma scholarship and commentaries that has been a hallmark of Burmese Buddhism ever since.

**Thailand, Cambodia, and Laos.** Farther to the east, the Theravāda resurgence developed later than it had in Burma. The first hint that an expansion of Theravāda influence might be in the offing came from the report that one of the five monks who accompanied Chapaṭa on his journey to Sri Lanka in the late twelfth century was a member of the royal court of Angkor. However, it is not until the latter part of the thirteenth century that hard evidence becomes available. Based on the report of a Chinese visitor, Theravāda—possibly with connections both to Mon and Sinhala traditions—had become one of the major factors in the religious life at the Khmer/Cambodian capital at Angkor.

The newly established (thirteenth-century) Thai kingdoms of Lānnā in northwestern Thailand and Sukhōthai in central Thailand assumed the reigns of power from their Mon predecessors in areas formerly defined by the ancient Dvāravatī civilization. Like their Mon predecessors, the Thais also venerated Theravāda traditions. But during the mid-fourteenth century, Mon Theravāda traditions had to make way for a Sinhala reformist movement that spread from a center at Martaban in Lower Burma to several Thai capitals including Ayutthayā, Sukhōthai, and Chiangmai (Lānnā).

Theravāda monasteries continued to proliferate throughout the region. By the latter part of the fifteenth century the Lānnā capital of Chiangmai had emerged as one of the major intellectual centers in the Theravāda world. In central Thailand, where the locus of power gradually shifted from Sukhōthai to Ayutthayā, the Theravāda presence was consolidated. Farther east in Cambodia, Theravāda gradually displaced the deeply entrenched traditions of Hinduism and Mahāyāna Buddhism, a transition facilitated by the abandonment of the old capital of Angkor in the mid-fifteenth century. According to chronicle accounts, Theravāda became the preeminent tradition in Laos beginning with the conversion of a Laotian prince during his exile in the court of Angkor in the mid-fourteenth century. He subsequently became the ruler of the powerful Laotian kingdom of Luang Prabang. Through the entire area during this period, appropriation of reformist Theravāda influence from Sri Lanka continued. Indeed, by the beginning of the sixteenth century, reformist Sinhala fraternities dominated in all of the major royal centers and in many of the lesser ones as well.

Throughout the later premodern period in Southeast Asia there were a number of Theravāda kingdoms that held sway over various geographical areas for varying periods of time. A succession of such kingdoms constituted and fostered a loosely linked “national” tradition in Burma, and a more stable Thai kingdom was governed from Ayutthayā. A series of leading Theravāda kingdoms succeeded one another in Laos, and in Cambodia still another royal center was established. Since the pattern and development of Theravāda religion, both monastic and civilizational, varied from area to area and from kingdom to kingdom, generalizations are necessarily problematic. However, at least two important characteristics can be observed across the entire area.

First, monastic history, punctuated as it has been by reform movements, has necessarily also been subject to the considerable tensions intrinsic to that process. In Southeast Asia a continuing tension, more or less explicit, characterized relations between reformist movements and other Theravāda traditions that continued to coexist with them. Reformist groups vied with each other and indigenous groups over the purity and authenticity of their monastic observances. An extremely sensitive matter, monastic factionalism could readily be interpreted as a sign of the king’s inability to maintain order in his kingdom (and often was). By way of demonstrating their authority to rule, royal sponsors had to act judi-

ciously to balance the often contradictory demands of monastic purity and unity.

Generally speaking, the reformists were associated with Sinhala fraternities and sooner or later with royal sponsors. On the other hand, the Theravāda fraternities that resisted these reforms (fraternities that were often themselves the products of earlier reforms) typically maintained their own traditions about monastic discipline and the propriety of monastic wealth. In some instances these latter groups preserved texts and practices originally derived from Sanskrit Buddhist schools that had once exerted considerable influence in the area. They were often involved with localized modes of sacrality and were very resistant to attempts from the capital to exert centralized authority. In addition, they often utilized both Pali and vernacular texts, as well as mystical and magical modes of practice, that were clearly Tantric in character. It should be noted, however, that beliefs in the magical power of properly intoned sounds—especially Pali words—to effect order or secure protection seem to have been common to both groups.

The second characteristic of the premodern Theravāda tradition throughout Southeast Asia was the distinctive manner and extent of its civilizational role. Like the Theravāda *sangha* in Sri Lanka, the Theravāda *sangha* in Southeast Asia maintained symbiotic relationships with the various kings who ruled in specific areas. The *sangha* supported the veneration of *thūpas* and Buddha images that had connections with political and social life at every level. Also like the Theravāda *sangha* in Sri Lanka, the *sangha* in Southeast Asia developed a textual tradition in Pali and in the various vernaculars (some translated, some originally composed) that addressed the religious, social, and moral concerns of all groups from court to village. But in Southeast Asia there was a special practice that further enhanced the civilizational impact of Theravāda, namely, the temporary participation of a significant segment of the male population in the life of the monastic order. In some areas this involved a temporary ordination as a novice. In other areas it involved temporary ordination, or several temporary ordinations, as a full-fledged member of the Order. But whatever form this practice took, it provided the context for a monastic acculturation that has given the societies of Burma, Thailand, Cambodia, and Laos their distinctive Theravāda flavor.

**THERAVĀDA BUDDHISM SINCE 1750.** During the past two and a half centuries Theravāda Buddhism has retained its basic structure, and the major regional traditions have maintained many of the particularities that had come to characterize them during premodern times. However, during this period there have been important developments in the Theravāda world, some the result of internal dynamics and others the result of the external pressures of colonialism and “modernity.” Since most of these developments have appeared throughout the Theravāda world, we will pursue our discussion thematically. However, since these developments took very different forms in different areas, it will be neces-

sary to give careful attention to regional and national differences.

In the monastic context the stage was set for the developments of the modern period by major reforms that were implemented in each of the three major Theravāda regions. In Sri Lanka the relevant reform took place in the middle decades of the eighteenth century. Centered in the independent kingdom of Kandy and led by the *sangharāja* named Vālivita Saranamkara, this movement received royal support. Believing their ordination lineage to be defective, the reformers invited Thai monks to Sri Lanka to reintroduce an authentic Theravāda lineage. Through their efforts a new Siyam (Thai) *nikāya* was established.

Later in the eighteenth century King Bodawpaya (r. 1781-1819) succeeded in uniting Burma under his rule and in establishing a considerable degree of royally regulated discipline within the Burmese *sangha*. Through his efforts Bodawpaya officially resolved the long-standing and rancorous dispute between monastic factions about the proper way of wearing the monastic robes. Having more or less unified the *sangha*, Bodawpaya's reforms established the basis for the Thudhamma segment of the Order that has continued to include the majority of Burmese monks.

In Indochina the corresponding reforms were sponsored by King Rāma I, the founder of the Thai kingdom of Bangkok. Having claimed the throne after a period of severe disruption following the destruction of the former Thai capital of Ayutthayā, the first ruler of the new Cakkri dynasty introduced a series of reforms that unified the *sangha* and strengthened discipline within its ranks. This more or less unified fraternity—later called the Mahanikāya—has never lost its majority position within the Thai *sangha*. In Cambodia and Laos closely related, although less reformed, Mahanikāya fraternities were dominant at the beginning of the modern period and have held that position ever since.

During the nineteenth century there emerged within the *sangha* in each area a major competing faction or factions. In Sri Lanka two competing fraternities appeared on the scene—the Amarapura *nikāya* (so called because it received its new ordination lineage from the branch of the Burmese *sangha* that was recognized at the Burmese capital of Amarapura) and the Rāmañña *nikāya* (so called because it received its new ordination lineage from the Mon *sangha* that had its center in the Rāmañña country of Lower Burma). The Amarapura *nikāya* came into being because ordination in the Siyam *nikāya* had quickly become limited to members of the highest (*goyigama*) caste. Although the intrusion of caste distinctions into the Theravāda *sangha* in Sri Lanka was not a new phenomenon, such discrimination led, in the early nineteenth century, to the formation of a competing fraternity. This new fraternity was—and remains today—a rather loose confederation of several smaller groups from various other castes that are especially prominent in southwestern Sri Lanka.

The Rāmañña *nikāya* was established in 1864 when a group of monks with a more uncompromising attitude toward any kind of caste distinctions within the *sangha* and a more “modernist” approach to all aspects of Buddhist teaching and practice formed their own independent fraternity. (“Modernist” in this article refers to a skeptical attitude toward traditional beliefs regarding cosmology, the existence of gods and spirits, and the efficacy of rituals.) Although this stricter and more modernist Rāmañña *nikāya* has remained by far the smallest of the Sinhala fraternities, it has nevertheless exerted considerable influence on the Buddhist community in Sri Lanka.

During the nineteenth century many of the same factors and orientations were present in Burma as in Sri Lanka, but a different kind of political and social context led to a much greater proliferation of *nikāya* and similar groups called *ga-ings*. In Burma, much more than in Sri Lanka, the nineteenth-century British conquest disrupted the fabric of social life. In response to a disrupted environment, numerous small, more tightly organized groups formed alongside the majority Thudhamma monks who continued to accept the authority of the royally sponsored Thudhamma Council through the reign of King Mindon Min (d. 1878). These various groups both complemented one another and competed with each other for purity of monastic observance and its attendant lay support. Among these groups the Thudhamma monks and the Shwegyin fraternity came to play the most important role. In comparison with the Thudhamma monks, the Shwegyin group succeeded in maintaining a more rigorous level of scholarship and discipline. The Shwegyin and the other smaller reformist communities, although less explicitly “modernist” in their orientation than the Rāmañña fraternity in Sri Lanka, had close affinities with it.

In western Indochina during the nineteenth century a single new *nikāya*, the Thammayut, emerged to complement and compete with the established Mahanikāya fraternity. The Thammayut (Dhammayuttika) *nikāya* was founded in Thailand in the mid-nineteenth century by the future king Mongkut (Rāma IV) during his more than twenty years in the *sangha*. Clearly modernist in its orientation, the group received its ordination lineage from the same Mon tradition to which modern-oriented reformists in other Theravāda countries also turned. But unlike the Rāmañña fraternity in Sri Lanka and the Shwegyin fraternity in Burma, the Thammayut fraternity received special support from Thailand's unconquered monarchy all through the late nineteenth and early twentieth centuries. This, plus the closely related fact that its members were drawn largely from the highest levels of the Thai elite, enabled it to exert a powerful influence on the much larger Mahanikāya. The Thammayut's favored status and elite membership also enabled it to play an important role in drawing provincial traditions into the central Thai *sangha*, and in extending central Thai influence into the *sanghas* of Cambodia and Laos as well.

Thus, by the beginning of the twentieth century the various fraternities that still constitute the Theravāda *sanghas* in Sri Lanka and Southeast Asia had already come into being. But there is one related twentieth-century development that should also be mentioned, namely the very tentative and controversial reemergence of the order of nuns. For almost a millennium the order had not existed in the Theravāda context, although in some Theravāda areas there were many, typically older women who adopted a celibate mode of life and frequented the monastic environs. But in recent years a few determined women from Theravāda countries have gone to Taiwan, where they have been ordained into the lineage of nuns that had been transmitted from Sri Lanka to China in the fifth century. The number of such nuns in Theravāda countries is currently still minuscule, and the authenticity of their ordination is not recognized by the great majority of Theravāda monks and laity. But the seeds for a possible revival have clearly been planted.

During the modern period these essentially monastic developments have been complemented by a number of civilizationally oriented movements, all of which have drawn on long-established Theravāda traditions. But at the same time they have appropriated and adapted these traditions in new ways. Four movements may be cited as examples.

1. Millenarian movements, which constitute the first example, may be subdivided into at least two major types. The first type, which has appeared primarily in Burma and other Southeast Asian countries, is represented by more mystical, politically passive movements that have at their respective centers a cult devoted to a charismatic personage (sometimes identified with the future Buddha Metteyya) who is expected—at some very indefinite future time—to usher in a new age. The second type is represented by more activist movements that have arisen in periods and contexts where crises of power have occurred. Such politically active millenarian movements appeared in Sri Lanka and Southeast Asia during the period of British and French colonial conquest. They have appeared within the colonial context itself—most notably in the famous Saya San rebellion in Burma. They have also appeared when indigenous governments (particularly in Burma and Thailand) have sought to extend their authority into outlying areas.
2. A closely related set of movements that has been particularly strong in Southeast Asia has involved the cultivation of meditational practice. Many of these movements have coalesced around charismatic individuals who have achieved advanced meditational states and are in some instances rumored to be *arahants*, or fully perfected saints. Often in such cases these meditationally advanced individuals make their power available to their followers in the form of appropriately blessed amulets and other sacred objects. On the other hand, many of the movements in this set emphasize the importance of meditation for all. Special forms of practice have been developed for less committed monks and for the laity. Numerous lay-oriented meditation centers have been set up in Burma where the contemporary meditational emphasis began to take form in the early twentieth century, in Thailand where lay meditation has enjoyed great popularity in recent years, and increasingly in Sri Lanka as well.
3. A third set of movements that have had a significant impact are those that can be characterized as “modernist” in the specific sense noted above. In the monastic context, modernist concerns were very much involved in the formation of several of the monastic fraternities that developed in various Theravāda countries during the nineteenth century. Equally important, major lay movements with modernist ideologies have appeared and taken root. In Sri Lanka in the late nineteenth century, Anagārika Dharmapala and those who shared his views emphasized a “this-worldly” mode of lay asceticism (Anagārika is a title designating a lay ascetic) and rejected many traditional Buddhist beliefs and practices as superstitious and useless. During and since Dharmapala’s time many other modernist movements and associations have developed among the laity all across the Theravāda world, particularly in the urban areas. The influence of these movements and associations has been most evident in Sri Lanka and Thailand, but they have been—at certain points—active components in the Theravāda communities in Burma and, to a lesser extent, in Cambodia and Laos as well. It is also important to note that several of these modernist movements and associations have been instrumental in the establishment and maintenance of a significant Buddhist ecumenical organization known as the World Fellowship of Buddhists.
4. Considering Theravāda Buddhism’s civilizationally oriented character, it is not surprising that it became involved in the political processes and ideological trends that have affected the various Theravāda countries during the nineteenth and twentieth centuries. In Sri Lanka and Burma certain segments of the Theravāda community, including the monastic community, became very deeply involved with movements for national independence. These same groups were also involved with attempts, during the postindependence period, to build new, democratically structured societies that would be both Buddhist and socialist. In the 1950s such hopes were strongly expressed in the context of the 2,500th anniversary of the Buddha’s death, celebrated in 1956. These celebrations included a much-heralded “sixth” Buddhist Council that was sponsored by the Burmese government of U Nu.

Since the late 1950s the situation in both countries has changed considerably. In Sri Lanka the early hopes for Buddhist nationhood have been seriously eroded, and a nonsocialist government has come to power. Moreover, some Sinhala spokesmen representing both the left and the right have

used a Buddhist idiom in the rhetoric surrounding communal violence between the Sinhala majority and the substantial Tamil minority. In Burma the hopes for Buddhist nationhood also dimmed, and the military government that took over in the early 1960s—despite its nominal support for Buddhist socialism—sought to keep Buddhism isolated from the mainstream of national life. But in the Burmese case it should also be noted that in recent years the military government has taken a significantly new tack by initiating a reform of the monastic order that is intended to “purify” it, demonstrate government interest in monastic affairs, and open channels of communication between the government and the *sangha*.

Further east, the interactions between Theravāda Buddhism, politics, and ideology have been equally important but quite different in character. In Thailand the affinity between the Theravāda tradition and nationalism has been as strong as in Sri Lanka or Burma. But since Thailand was never conquered by a Western nation, this affinity has resulted in a basically cooperative relationship between Buddhism and the established government, and a rather stable continuation of the traditional symbiotic relationship between the *sangha* and state. In recent years Buddhism has become closely associated with capitalist development, while socialism—Buddhist or otherwise—has remained on the political and ideological periphery.

In Cambodia and Laos an early continuity with the received tradition was followed by a break that has been both dramatic and devastating. The continuity that characterized the religio-political situation during the colonial period was made possible by the fact that the French—who were the colonial overlords in the area—chose to rule at a distance and to leave the established religious and political order largely intact. The radical break was, of course, the result of the disruption caused by the war that racked the area in the late 1960s and early 1970s, and by the victory of the Communists in both countries. In Cambodia, the Communist devastation of Buddhism during the Pol Pot regime (1975–1980) was widespread and brutal. In Laos (and, since 1980, in Cambodia), the approach of the Communist authorities has been considerably more restrained; but even in these contexts traditional Buddhist institutions have suffered serious damage and traditional Buddhist values have been directly and severely challenged.

**THERAVĀDA TODAY.** Theravāda Buddhism remains very much alive in Sri Lanka and Southeast Asia, both as a monastic tradition and as a civilizational force. The *sangha*, despite its many problems, carries on its traditions of Pali scholarship and meditational practice. It continues to produce persons with intellectual substance and spiritual prowess. And it continues to generate movements (often conflicting movements) aimed at monastic reform, spiritual development, and societal well-being.

In addition, Theravāda Buddhism continues to exert its influence on the institutions and values of the societies in the

traditionally Theravāda areas. This influence takes quite different forms in Sri Lanka, where ethnic differences often involve religious differences; in Burma, where the nation's leaders have sought to insulate the populace from many aspects of “modernity”; in Thailand, where the pace of “modernization” is rapid indeed; and in Cambodia and Laos, where Theravāda Buddhism has been “disestablished” by recently installed Communist governments. But in each instance Theravāda Buddhism continues to provide meaning in the everyday life of its adherents.

#### BIBLIOGRAPHY

Unfortunately there is no one book that adequately covers Theravāda Buddhism as a whole. Perhaps the most comprehensive single study for the premodern period is Kanai Lal Hazra's *History of Theravāda Buddhism in South-East Asia* (New Delhi, 1982), which touches on Indian and Sri Lankan developments as well. This book needs to be supplemented by other works that deal with particular aspects of the tradition, such as Wilhelm Geiger's *Pali Literature and Language*, 2d ed., translated by Batakrisna Ghosh (Delhi, 1968); John C. Holt's *Discipline: The Canonical Buddhism of the Vinayapitaka* (Delhi, 1981); John Ross Carter's *Dhamma: Western Academic and Sinhalese Buddhist Interpretations* (Tokyo, 1978); Stephen Collins's *Selfless Persons: Imagery and Thought in Theravāda Buddhism* (Cambridge, 1982); Winston L. King's *Theravāda Meditation* (University Park, Pa., 1980); and Bhikkhu Nyanatiloka's *Guide to the Abhidhamma-pitaka*, 3d ed., revised and enlarged by Nya-naponika Thera (Kandy, 1971). Many of the civilizational aspects are covered in two related books edited by Bardwell L. Smith, *Religion and Legitimation of Power in Sri Lanka* and *Religion and Legitimation of Power in Thailand, Laos, and Burma* (both, Chambersburg, Pa., 1978). Similar themes are explored in Heinz Bechert's three-volume *Buddhismus, Staat und Gesellschaft in den Ländern Theravāda-Buddhismus* (Frankfurt, 1966–1973). Two other studies written for more general audiences are Robert C. Lester's *Theravāda Buddhism in Southeast Asia* (Ann Arbor, 1973) and Donald K. Swearer's *Buddhism and Society in Southeast Asia* (Chambersburg, Pa., 1981).

Because of vast translation efforts, primarily by the Pali Text Society, the nonspecialist has access to a large body of Theravāda literature. Virtually the entire Tipiṭaka has been translated into English and is included in either the “Sacred Books of the Buddhists” or the “Translation Series” of the Pali Text Society. Among the most important postcanonical texts that are available in English are Wilhelm Geiger's translation of *The Mahāvamsa, or The Great Chronicle of Ceylon* (London, 1964); Bhikkhu Nyanamoli's translation of Buddhaghosa's fifth-century work, *The Path of Purification*, 2d ed. (Colom-

bo, 1964); and Frank E. Reynolds and Mani B. Reynolds's translation of Phya Lithai's fourteenth-century cosmological treatise, *Three Worlds according to King Ruang* (Berkeley, 1982).

A useful introduction to the Theravāda tradition in Sri Lanka is provided in *Two Wheels of Dhamma*, edited by Bardwell L. Smith, Frank E. Reynolds, and Gananath Obeyesekere, "American Academy of Religion Monograph Series," no. 3 (Chambersburg, Pa., 1973). This introduction should be supplemented by the R. A. L. H. Gunawardhana's excellent *Robe and Plough: Monasticism and Economic Interest in Early Medieval Sri Lanka* (Tucson, 1979) and Kitsiri Malalgoda's *Buddhism in Sinhalese Society, 1750–1900* (Berkeley, 1976). For two books that deal with quite different dimensions of the "contemporary" tradition, see Michael Carrithers's *The Forest Monks of Sri Lanka: An Anthropological and Historical Study* (Delhi, 1983) and Richard F. Gombrich's *Precept and Practice: Traditional Buddhism in the Rural Highlands of Ceylon* (Oxford, 1971).

The most comprehensive overview of Theravāda Buddhism in Burma is provided by Melford E. Spiro in his *Buddhism and Society: A Great Tradition and its Burmese Vicissitudes* (New York, 1970). Serious students will also want to consult E. Michael Mendelson's very important study, *Sangha and State in Burma: A Study of Monastic Sectarianism and Leadership*, edited by John Ferguson (Ithaca, N.Y., 1975); Emanuel Sarkisyanz's *Buddhist Backgrounds of the Burmese Revolution* (The Hague, 1965); and Manning Nash's *The Golden Road to Modernity: Village Life in Contemporary Burma* (New York, 1965).

The Theravāda tradition in Thailand has been comprehensively studied by Stanley J. Tambiah in a trilogy of excellent books: *World Conqueror and World Renouncer* (Cambridge, 1976), *Buddhism and the Spirit Cults in North-East Thailand* (Cambridge, 1970), and *The Buddhist Saints of the Forest and the Cult of Amulets* (Cambridge, 1984). Other items of interest include Donald K. Swearer's *Wat Haripūñjaya* (Missoula, Mont., 1976) and our "Sangha, Society and the Struggle for National Integration: Burma and Thailand," in *Transitions and Transformations in the History of Religions: Essays in Honor of Joseph M. Kitagawa*, edited by Frank E. Reynolds and Theodore M. Ludwig (Leiden, 1980), pp. 56–88.

Studies that deal with Theravāda Buddhism in Laos and Cambodia are much less adequate and are virtually all in French. The best introductions are probably the articles on Buddhism in the collections edited by René de Berval in *France-Asie* entitled *Présence du royaume Lao* (Saigon, 1956), translated by Mrs. Tessier du Cros as *Kingdom of Laos* (Saigon, 1959), and *Présence du Cambodge* (Saigon, 1955). Two books that provide overviews of sorts are Marcel Zago's *Rites et cérémonies en milieu bouddhiste Lao* (Rome, 1972) and Adhémar Leclère's *Le bouddhisme au Cambodge* (Paris, 1899). The most important new studies are three short but erudite works by François Bizot that highlight an important Tantric influence in the Pali Buddhist traditions in Cambodia and draw implications for our understanding of the Theravāda tradition more generally. These have appeared under the titles *Le figuier à cinq branches* (Paris, 1976), "Le grotte de la naissance," *Bulletin de l'École Française d'Extrême-Orient* 66 (1979); and *Le don de soi-même* (Paris, 1981).

Further bibliographical information—including annotations of many of the works cited here—can be obtained by consulting the relevant sections in *Guide to Buddhist Religion* by Frank E. Reynolds et al. (Boston, 1981), or in Reynolds's "Buddhism," in *A Reader's Guide to the Great Religions*, edited by Charles J. Adams, 2d ed. (New York, 1977), pp. 156–222.

**THÉRÈSE OF LISIEUX** (1873–1897), epithet of Thérèse Martin, French Carmelite nun and Catholic saint. Thérèse was the youngest of nine children born to Louis and Zélie Martin. When Thérèse was eight her family moved to the small Norman town of Lisieux, where she was to spend the remainder of her life, with the exception of one pilgrimage to Rome shortly before she entered the convent. Within a few years of the family's arrival in the town, Thérèse's two older sisters became nuns at the cloistered convent of Discalced Carmelites in Lisieux, and at an early age Thérèse decided to join them. Her first application to enter the convent, made when she was fourteen, was rejected on account of her age, but at fifteen she entered the convent.

In the cloister Thérèse exhibited unswerving fidelity to the Carmelite rule and unfailing kindness to the convent's twenty-five nuns, some of whom had quite unattractive personalities. However, the full dimensions of her spiritual life

became evident only in her posthumously published autobiography. Eighteen months before her death she manifested signs of a fatal tubercular condition, and her last months were plagued by extreme pain and even nagging temptations against faith. She died at the age of twenty-four, exclaiming, "My God, I love you."

During the last years of her life Thérèse wrote her memoirs in three separate sections, mostly at the request of the convent's superior. One year after her death the memoirs were published under the title *L'histoire d'une âme* (The Story of a Soul). The simple book, written in epistolary style, is a candid recounting of her own unfailing love for and confidence in the goodness of God, and it achieved instant and enormous popularity in translations into many languages. In the next fifteen years alone more than a million copies were printed. This worldwide response prompted the Holy See to waive the usual fifty-year waiting period, and Thérèse was beatified in 1923 and canonized in 1925. In the bull of canonization, Pius XI said that she had achieved sanctity "without going beyond the common order of things."

#### BIBLIOGRAPHY

Of the many English translations of *L'histoire d'une âme*, perhaps the most readable is Ronald Knox's *Autobiography of St. Thérèse of Lisieux* (New York, 1958), which is done in Knox's usual felicitous style. Other of Thérèse's writings are contained in *Collected Letters of St. Thérèse of Lisieux*, edited by Abbé André Combes and translated by Frank J. Sheed (New York, 1949). For a short but incisive biography, see John Beevers's *Storm of Glory* (New York, 1950); for a more critical study, see my book *The Search for St. Thérèse* (Garden City, N. Y., 1961).

PETER T. ROHRBACH (1987)

**THERIANTHROPISM** is a term derived from the Greek compound of *thēr* ("wild beast") and *anthrōpos* ("human") and is usually used to denote a deity or creature combining the form or attributes of a human with those of an animal. As an analytic category, it has little salience, since scholars have variously included under its rubric not only animal-headed gods, were-animals, mythological demihumans and monsters (such as centaurs, sphinxes, and minotaurs) but also examples of animal impersonation in rituals, spirit possessions by animals, mythological beings of animal aspect but human character (such as the North American Indian figure Coyote), and anthropomorphic gods (such as Zeus and Dionysos) who sometimes transform themselves into animals. Ideas about the supernatural linkage of humans and animals are probably universal—even in cultures with anthropomorphic monotheism, there are ideas of were-animals, therianthropic demons, and the possession of human souls by animals. Visual or literary images of therianthropic beings can be found in virtually all of the world's cultures, where they contrast with and complement representations of other forms of supernatural beings.

**HISTORICAL INTERPRETATIONS.** Discussions of therianthropy were most prevalent during the nineteenth century, when the idea of a part human, part animal deity was seen as a critical development stage in human history, midway between the totemic identification of hunter and prey that was supposed to characterize savage religions and the anthropomorphic deities of civilization. The occurrence of therianthropic deities was interpreted either as a survival of savage ideas in later religions or as the result of a historical diffusion of these more advanced representations of the divine from their Egyptian/Mesopotamian point of origin. The fact that most therianthropic figures known at that time came from the civilizations of the Middle East, where most of the archaeological research was being conducted, and that these civilizations were seen as midpoints between savagery and civilization gave added weight to the idea that therianthropy was a partial progress toward a rational, anthropomorphic religion. (Interestingly, Plato uses an account—one that is probably spurious—of a rural Arcadian cult of lycanthropy to contrast with the rational religions of urban Athens.)

**CONTEMPORARY INTERPRETATIONS.** The categorical distinctions between primitive and civilized mentalities that provided the rationale for developmentalist interpretations of religious history have not been supported by anthropological research, and most contemporary interpretations of therianthropic symbolism take a semiotic approach to the subject. Animals are seen as emblems of principles, as vehicles for symbolically expressing existential truths about the human condition. Therianthropic images juxtapose two principles in a unified being. Thus, it is not the animality of the image that is important but its duality, its ambiguity, its nature as a dialectic category that simultaneously contrasts and synthesizes two opposing metaphorical principles—images of noncontiguous categories made continuous (culture-nature, wild-domesticated, rational-emotional, independent-submissive, etc.). Therianthropic images, given their nature as a category of representation betwixt and between other categories, as a category whose elements are neither separate nor unified, are frequently associated with rituals of transition and liminality (as in initiation rites and carnivals) or with the intermediate stages of creation, when the world is in neither its primal nor its finished state.

Only as the psychology of religion and the theory of symbolism permit the development of new modes of understanding can we hope to deal with the historical and theological questions that are posed by differentiating therianthropic images of the divine from those that are theriomorphic or anthropomorphic. All three kinds of images may exist simultaneously in the psychologies, if not the artistic representations, of the world's peoples. Therianthropic ideas simultaneously differentiate and synthesize the qualities that define humanness with those that define the nonhuman other, and they may not represent significantly different, historically traceable, understandings of the nature of divinity so much

as conventional representations of a universal religious phenomenon.

Therianthropism is discussed by Joseph Campbell, who takes a diffusionist approach to the topic, in *The Way of the Animal Powers* (New York, 1983).

STANLEY WALENS (1987)

**THESMOPHORIA.** The Thesmophoria was an annual women's festival widely celebrated in ancient Greece. In most areas it took place in autumn, at the season of plowing and sowing, and it was held in honor of the grain goddess Demeter and her daughter Persephone. Fertility of crops and of women was evidently the essential theme.

The Athenian form of the ritual is the best known. Here the festival occupied three days. On the first day the women went up to the sacred grove of Demeter Thesmophoros, set up an encampment there, out of sight of all males, and made some preliminary sacrifices. On the second day they fasted, sitting humbly on the ground, as Demeter was said to have fasted in grief over the abduction of her daughter. This abstinence was probably understood as a kind of purification in preparation for the main ceremonies. The third day featured pomegranates to eat, obscene jesting, and perhaps flagellation—all things associated with fertility. Piglets were slaughtered, and parts of them, it seems, were cooked and eaten; substantial portions, however, were thrown into *megara*, deep holes in the earth, together with wheat cakes shaped like snakes or like male genitals, and an otherwise unknown goddess, Kalligeneia, whose name means "fair birth," was invoked. At some stage—perhaps the night before—certain women who had for three days observed purity restrictions climbed down into the hole, and while others clapped, brought out the decayed remains of the previous year's offerings. These were ceremoniously carried out of the camp and set forth on altars. (The Thesmophoria itself took its name from this "bringing of the deposits.") If a farmer took a little portion of the remains and mixed it in with his seed corn, he was supposed to get a good crop. This element of primitive agrarian magic suggests that the Thesmophoria's origins lay in a remote past.

**THEURGY** (from the Greek *theourgia*) means literally something like "actuating the divine" and refers to actions that induce or bring about the presence of a divine or supernatural being, whether in an artifact or a person. It was a practice closely related to magic—not least in its ritual use of material things, sacrifices, and verbal formulas to effect the believer's fellowship with the god, demon, or departed spirit. It is distinguished from ordinary magical practice less by its techniques than by its aim, which was religious (union with the divine) rather than secular. Use of the term *theourgia*—as well as of the related *theourgos*, referring to a practitioner of the art—arose in the second century CE in Hellenistic circles closely associated with the birth of Neoplatonism. The practice was commended and followed, in the third and later centuries, by certain Neoplatonist philosophers and their disciples.

The origins of this movement can be traced, in all probability, to a work called the *Chaldean Oracles*, plausibly attributed to the reign of Marcus Aurelius (161–180). A collection of obscure and pretentious oracular utterances written in Homeric hexameters, this work, now known only in fragments, was apparently assembled (if not composed) by one Julian the Chaldean or (perhaps more likely) by his son Ju-

lian the Theurge. Much of its content is quasi-philosophical, and its account of the first principles shows affinities with the thought of the Pythagorean philosopher Numenius, who was teaching around the middle of the second century. It also contained, however, prescriptions for theurgic rites and indications of the “sights” that they produce, for example, “a formless fire whence a voice proceeds” (frag. 146).

Concerning the value of such practices, there was significant disagreement among Neoplatonist thinkers. Plotinus himself, it is now agreed, either knew or thought nothing of the *Chaldean Oracles*. His way to human fulfillment in the divine was the way of *theoria* (“contemplation”), not that of *theourgia*. It was his disciple Porphyry who was the first among philosophers to give some status to the practice of theurgy. In spite of the severe criticisms of it that he had leveled in his *Letter to Anebo*, Porphyry came, according to Augustine (*City of God* 10.9f.), to acknowledge a theurgy whose aim was purification of the soul and that produced “appearances of angels or of gods.” At the same time Porphyry insisted that the value of such practices was strictly limited. What they purified was not the intellectual soul, but only its lower, pneumatic adjunct, which is adapted to visions of spirits, angels, and inferior deities; they had no power to bring people into the presence of Truth itself. Presumably Porphyry continued to believe, with Plotinus, that it is only the practice of virtue and of philosophical contemplation that raises the soul to fellowship with the supreme God.

This conviction was not shared, however, by Porphyry’s own disciple, the Syrian Iamblichus (d. 325), who, in his long treatise *On the Mysteries*, replied to the strictures expressed by his teacher in the *Letter to Anebo*. According to Iamblichus, there exists, in theurgy, a mode of fellowship with the divine that is independent of philosophical thought and that “those who philosophize theoretically” do not achieve. “What effects theurgic union is the carrying through of reverently accomplished actions which are unspeakable and transcend any intellectual grasp, as well as the power of mute symbols which only the gods understand” (*On the Mysteries* 2.11).

This debate, however, did not end with the exchange between Iamblichus and his teacher. In his youth the emperor Julian was a disciple of the philosopher Eusebius, who taught that “the important thing is purification [of the soul] through reason” and who condemned wonder-working. Julian, however, was more impressed in the end by the teaching of one Maximus, who, by burning incense and reciting a formula in the temple of Hecate, caused the statue of the goddess to smile and the torches in her hands to blaze; the emperor-to-be accordingly adopted Maximus as his teacher (Eunapius, *Lives of the Philosophers and Sophists* 474).

What the practice of theurgy involved becomes plain from the text of Iamblichus’s treatise itself. There he defends and interprets a variety of rites and practices that involve either the use of offerings or tokens of some sort or the various phenomena that accompany divine possession. It is plain,

however, that in his mind the practices he explains can be understood and entered into—and indeed function—at more than one level. True theurgy, he suggests, is, “the summit of the priestly art” and is reserved “to a very few”—those, indeed, who “share in the theurgic gods in a way which transcends the cosmos,” because they “go beyond bodies and matter in service of the gods, being made one with the gods by a power which transcends the cosmos” (*On the Mysteries* 5.20–5.22). For all this, however, there is little new or unfamiliar in the phenomena he alludes to, from the “enthusiasm” of the Corybantes to the sacrifice of animals. He refers, for example, to levitation as one manifestation of possession by a god. He is also familiar with situations in which the theurgist makes use of a medium (*ho dechomenos*), and both he and the medium—and sometimes the assembled spectators—see the “spirit [*pneuma*] which comes down and enters” the one who is possessed (3.6). In another vein, he refers to theurgic use of hollow statues that are filled with “stones, herbs, animals, spices, [and] other such holy, perfect, and godlike things,” so as to create a receptacle in which the god will be at home (5.23). Though this practice seems to have been especially favored by late classical practitioners of theurgy, it clearly draws on widespread and ancient practices of sympathetic magic.

What is interesting and new, then, in Iamblichus’s account of *theourgia*, as over against *theoria*, is precisely the terms in which he understands and defends it. For one thing, it is plainly his conviction that theurgy is not a matter of manipulating the gods. Over and over again he denies that material objects or circumstances, or psychological states of human subjects, can supply the explanation of theurgic phenomena, which by their nature transcend the capacity of such causes. Similarly, he denies that the power of the gods is compelled by human agency. The presence of the human soul with the gods is effected through a gift of divine agencies—through their universal self-bestowal. It is this self-bestowal that empowers the invocations and actions of the theurgist, which reach out to the transcendent by reason of “assimilation and appropriation” to their object (3.18). Behind this conception there lies, of course, a rationalized concept of universal sympathy, which emphasizes not merely the interconnectedness of things at the level of the visible cosmos but also the presence and participation of all finite realities in their immaterial ground, the divine order. At the same time, however—and somewhat paradoxically, in view of this insistence on the mutual indwelling of the various levels of reality—Iamblichus insists that “the human race is weak and puny . . . possessed of a congenital nothingness,” and that the only remedy for its error and perpetually disturbed state is to “share as far as possible in the divine Light” (3.18). Thus the practice of theurgy, through which the gods themselves bestow their light and presence, is the one hope of humanity. Iamblichus had lost not the philosophy so much as the faith of a Plotinus.

In Christian circles, the term *theourgia* and its derivatives came into use in the writings of Dionysius the Areopa-

gite (Pseudo-Dionysius), himself a student of the Neoplatonist Proclus, who, after Iamblichus, was the weightiest philosophical advocate of theurgic practice. In Dionysius, however, the term is employed in the sense required by the Christian doctrine of grace: theurgy is not the effect of a natural and universal sympathy between different orders of being, but the self-communicating work of the divine. For Dionysius, Jesus is “the Principal [*archē*] of all hierarchy, holiness, and divine operation [*theourgia*].” The priesthood, by imitating and contemplating the light of the higher beings—who are, in their turn, assimilated to Christ—comes to be in the form of light, and its members are thus able to be “workers of divine works [*theourgikoi*].” The operative sense of Dionysius’s use of the term is captured later by Maximus the Confessor, for whom the (new) verb *theourgein* means “to divinize”; he uses it in the passive voice to denote the effect of divine grace conferred through Christ.

**THIASOI** is a term in Greek religious cults that designates the followers or adherents of a deity who, as a more or less formally organized group, participate in communal and private celebrations. While the Sanskrit root-word *dhīyāindhas* denotes devout and reverent supplication, the Greek term *thiasos* has become most strongly associated with the orgiastic and ecstatic frenzy of the worshipers of Dionysos, with features made famous through Euripides’ *The Bacchae*, such as omophagia (tearing animals apart and eating their raw flesh). The Dionysian *thiasoi* comprise such groups as the Maenads and Thyiads, which during the winter months performed their frenzied dances in trancelike states beyond “civilized” regions (i.e., cities and temple precincts) in the “wilderness,” in order to reenact the mythic fate of Dionysos himself (who was torn apart by Titans) as well as to reawaken the god of spring and fertility. While the *thiasoi* may have originated with the celebrations of any deity of the *polis*, after the fifth century BCE they seem to become more privatized, to be divorced at the same time from any specific sanctuary, and to lose their gender-specific separation of initiation rituals through which an individual becomes conversant with the mystery.

*Thiasoi* could be interpreted as the sometimes more public, sometimes more esoteric and secret fraternities, guilds, or clubs that are devoted and dedicated to any deity: in short, they are cult associations. Most commonly these associations were segregated by gender and age: as we find female attendants of Dionysos, we have also male clubs such as the Corybantes and Curetes for Zeus. The tendency toward dramatic representation and enactment of a deity’s mythic deeds appears in all such cult associations. All of them seem to have used such paraphernalia as masks and costumes.

*Thiasoi* may be closely related to such phenomena as women's and men's initiation clubs as found in the form of secret societies in many extant cultures. The Greek understanding would have come close to such dramatization of mythic events through imitation and identification: Plato mentions that the human *thiasoi* imitate their divine prototypes (Plato, *Laws* 815b). The initiation ordeals and actions of some cult associations can be historically verified, while the content and existence of many other such organizations must remain conjectural, such as the Idaean Dactyls, the Telchines, or the Cyclops, which could all have been mythic representations of existing secret craft associations of smiths.

What *is* certain is the development from purely religious and mystical cult associations to guild and craft associations (*technitai*), which continue to have religious characteristics. These guilds enjoyed many privileges, such as the right to asylum and freedom from taxation or military service. They were led by a priest of the Dionysos cult. In many ways the Greek development of clubs organized by gender and age seems to run a similar course, from mystical initiation and dramatic enacting of sacred history to rational organization of crafts and guilds, as we find in the development of fraternities and sororities in the history of Christianity.

KLAUS-PETER KÖPPING (1987)  
*Revised Bibliography*

**THOMAS À KEMPIS** (1379/80–1471), also known as Thomas Hemerken, late medieval Christian mystic. Born in the German town of Kempen, near Cologne, Thomas at age fourteen entered one of the schools of the Brethren of the Common Life in the Dutch city of Deventer and spent the rest of his long life in the Netherlands. Ordained to the priesthood in 1413, he entered an Augustinian monastery near Zwolle, where he remained until his death. A reputed portrait of Thomas carries this inscription: "In all things I sought quietness and found it only in retirement and books." Whether or not the portrait is indeed one of Thomas, the legend is one that accurately describes him.

His lasting fame proceeds from the book *Imitation of Christ*. While its authorship cannot be firmly established and has been disputed by many scholars, the preponderance of opinion is that Thomas was the author. A devotional manual for personal spiritual growth and development, *Imitation of Christ* has been an influential guide to personal piety for persons as different as Samuel Johnson and John Wesley. The number of known editions far exceeds two thousand.

The fifteenth century saw a reaction against what was felt to be the excessively intellectual quality of medieval scholasticism. *Imitation of Christ* reflects these feelings in its marked Christocentricity and its insistence upon experience rather than reason, and it presents a kind of piety that has appealed far beyond the Middle Ages. It shares many basic assumptions with eighteenth-century Protestant pietism and was an influential work for this movement, particularly in England and Germany.

The reputation of the book has diminished in the twentieth century because of its innate quietism. The social implications of the gospel and the activism that it might require find no support in Thomas's book. But wherever Christianity is seen as consisting primarily in personal devotion and private piety, the work's traditional reputation still holds.

Apart from *Imitation of Christ*, Thomas's writings have attracted little lasting attention. His *Small Alphabet for a Monk in the School of God* is in much the same vein as *Imitation*. A number of biographies of leaders in the Brethren of the Common Life breathe the same spirit but have never attained the same popularity.

Scholars have disagreed rather sharply about the relationship of Thomas to later movements, such as the Protestant Reformation. Albert Hyma argued that there was direct continuity between him and his school and Martin Luther. R. R. Post, on the other hand, maintained that the discontinuity was far greater than the continuity, especially in the way Thomas insisted on the virtues of monastic life. No definite answer is possible. Whatever his influence on Luther and Erasmus, it is known that *Imitation* was the favorite book of Ignatius Loyola, the founder of the Society of Jesus.

For the most part Thomas simply ignored the peculiarities of later medieval theology, concentrating instead on his own inner experience. It is for this reason that the popularity

of *Imitation of Christ* has far transcended the author's time and place. A devotionalist rather than a theologian, Thomas has had a continuing appeal to persons of similar disposition.

HOWARD G. HAGEMAN (1987)

**THOMAS AQUINAS** (Tommaso d'Aquino, 1225–1274), Italian Dominican theologian, doctor of the church, patron of Roman Catholic schools, and Christian saint. One of the most important and influential scholastic theologians, Thomas is seen by the Roman Catholic church as uniquely "her very own" (Pius XI). He has been honored with the scholastic titles Doctor Communis (thirteenth century) and Doctor Angelicus (fifteenth century), among others.

**LIFE AND WORKS.** The youngest son of Landolfo d'Aquino, lord of Roccasecca and Montesangiovanni and justiciary of Emperor Frederick II, and his second wife, Teodora of Chieti, Thomas had five sisters, three older brothers, and at least three half brothers. The family castle of Roccasecca, where Thomas was born, midway between Rome and Naples, was on a mountain in the northwest corner of the kingdom of Sicily. Sicily was ruled by the Hohenstaufen emperor Frederick II (1194–1250), who was in almost continual warfare with the papal armies of Honorius III (1216–1227), Gregory IX (1227–1241), and Innocent IV (1243–1254). Divided political and religious loyalties rendered the position of the d'Aquino family precarious.

Thomas spent his first five years at the family castle under the care of his mother and a nurse. As the youngest son of the family, Thomas was given (*oblatus*, "offered") to the Benedictine abbey of Monte Cassino by his parents at the age of five or six in the firm hope that he would eventually choose the monastic life and become abbot. His earliest training was in the spiritual life, mainly through the Latin psalter, and in the rudiments of reading, writing, and mathematics. The struggle between the pope and the emperor reached a climax in 1239, when Frederick was excommunicated a second time. The imperial troops occupied the abbey, foreigners were expelled, and the young students were sent to one of the Benedictine houses in Naples to attend the imperial university founded in 1224 as a rival to Bologna. At the university, where Thomas remained until 1244, he studied under Master Martin (grammar and logic) and Peter of Ireland (natural philosophy). It was there that he was introduced to Aristotle's philosophy.

By 1243 Thomas was attracted to the Dominicans living nearby at the priory of San Domenico. This order of mendicant friars, founded by Dominic (1170–1221) and confirmed by Pope Honorius III in 1216, was devoted to preaching, study, and the common life. Impressed by their apostolic zeal, poverty, and simplicity and free from obligation, Thomas received the habit in April 1244 at the age of nineteen. Under normal circumstances he would have made his novitiate at San Domenico, but because the friars feared that Thomas's family might intervene forcibly to prevent his entrance to the order, he was sent to Rome. At Rome it was decided that he should go to Paris, and so early in May 1244 he left Rome in the company of John of Wildeshausen, third master of the order, and John's companions, who were traveling to Bologna for the general chapter that met annually at Pentecost.

Learning of her son's entry into a begging order, Teodora, now head of the family, hastened to Naples, then to Rome, only to learn that her son had departed for Bologna. She sent orders to her older son Rinaldo, who was with Frederick's army north of Rome, to intercept Thomas and bring him home by force if necessary. Rinaldo and his escort intercepted the travelers near Acquapendente, north of papal territory, and forced Thomas to return on horseback. Stopping for the night at the family castle of Montesangiovanni in papal territory, the soldiers secured the services of a local prostitute to seduce Thomas, but to no avail. The next day the group rode to Roccasecca, where Thomas was restricted to the castle until Frederick II was excommunicated and deposed by the Council of Lyons on July 17, 1245. By then Teodora and her daughters saw that further attempts to change Thomas's resolve were useless and allowed him to rejoin the friars in Naples, from whence he was sent to Paris.

Arriving at the priory of Saint-Jacques by October 1245, Thomas began his studies at the University of Paris under Albertus Magnus, who was then lecturing on the writings of Dionysius the Areopagite. After three years of study in Paris, Thomas and others accompanied Albertus to Cologne, where a new *studium generale* was to be established, as decreed by the general chapter of Paris in 1248. For the next four years Thomas continued to attend and write down Albert's lectures on Dionysius and his questions on Aristotle's *Ethics*. As Albert's junior bachelor (1250–1252), Thomas lectured cursorily on *Isaiah*, *Jeremiah*, and *Lamentations*.

The position of the mendicant friars at the University of Paris came under increasingly severe attack from secular masters, particularly William of Saint-Amour. By 1252 the Dominican master general was eager to send promising young men to the university to prepare for inception as master (full professor). Albert convinced the master general to send Thomas, despite his young age, to study for the university chair for non-Parisians. Thomas began his studies under Elias Brunet de Bergerac in the fall of 1252, lecturing on Peter Lombard's *Sentences* for four years. His originality and clarity of thought were conspicuous in his teaching and writ-

ing, notably in his commentary on the *Sentences; On Being and Essence*, on the meaning of certain metaphysical terms; and in a short treatise entitled *Principles of Nature*. In the latter work he unequivocally defended (1) a real distinction between essence and existence (*esse*) in all creatures, (2) the pure potentiality of primary matter, (3) absence of matter in spiritual substance (*substantia separata*), (4) participation of all created reality, material and immaterial, in God's being (*esse*), and (5) the Aristotelian dependence of abstracted universals on individually existing material things.

Under tense circumstances in the spring of 1256, Thomas, though underage, was given license to incept by an order of Pope Alexander IV dated March 3. When finally he was allowed to incept, by an order of the pope dated June 17, he and his audience had to be protected by soldiers of Louis IX because the animosity of the town and some students against the mendicants was so great. William of Saint-Amour's antimendicant book *On the Perils of the Last Days*, sent to Rome by the king for examination, was condemned by the pope on October 5, and William was permanently exiled from Paris by the king. Thomas's reply to William's charges (*Contra impugnantes Dei cultum et religionem*), completed in late September or early October, arrived in Rome after the pope had made his decision and, therefore, did not influence the outcome.

Enjoying a respite from the antimendicant polemic, Thomas lectured from 1256 to 1259 on the Bible, held scholastic disputations (*Quaestiones disputatae de veritate*) over three years, preached, and began composing his *Summa contra gentiles* (1259–1264), apparently for Dominican missionaries in Spain and North Africa. This systematic summary in four books is an arsenal of sound and persuasive arguments "against the gentiles," that is, nonbelievers and heretics.

Having served the order's interests in Paris, Thomas returned to Italy where he taught, wrote, and preached from 1259 to 1268. After spending two years in his home priory of Naples, he was assigned to teach at Orvieto (1261–1265), where he lectured to the community on *Job* and was of great service to Pope Urban IV. At the pope's request, he composed the liturgy for the new Feast of Corpus Christi and expressed his views in *Against the Errors of the Greeks* on doctrinal points disputed by Greek and Latin Christians. Having thereby discovered the richness of the Greek patristic tradition, he also began compiling a continuous gloss, or exposition, of the Gospels (*Catena aurea*), made up almost entirely of excerpts from the writings of the Greek and Latin fathers, dedicating the commentary on *Matthew* to Urban IV. In June 1265, the provincial chapter of Anagni assigned Thomas to open a school of theology at Santa Sabina in Rome. Soon realizing that Peter Lombard's *Sentences*, then in common use, was unsatisfactory for young beginners, Thomas projected a three-part survey of Catholic theology (*Summa theologiae*) that would be simpler, more orderly, and more inclusive than other works available. The first part was com-

pleted and in circulation by 1268. More subtle questions were disputed in the Roman school in a special series on the power of God (*De potentia*) and on evil (*De malo*). In addition, Thomas lectured on the Bible during this period.

By the end of 1268, Thomas was ordered to return to Paris, as was the Frenchman Peter of Tarentaise (the future Pope Innocent V), to counter a revival of antimendicant sentiment among secular masters. When Thomas and his secretary Reginald of Piperno arrived in Paris early in 1269, Thomas realized that the situation was far more complex and serious than he had assumed. Almost single-handedly he was required to fend off attacks on three fronts: with all mendicants against secular masters opposed to mendicants' being in the university; with a few of his confreres against most of the Dominicans, Franciscans, and secular theologians, opposed to using Aristotle in theology; and with most theologians against young philosophers who tended to promulgate heretical views under the name of Aristotle or his commentator Ibn Rushd (Averroës). Over the next five years Thomas fulfilled his university obligations to lecture on the Bible, to hold disputations, and to preach, while also carrying on a vigorous polemic against the antimendicants, expounding all the major works of Aristotle, writing his *Summa theologiae*, and replying to numerous requests for his opinions.

Revival of the antimendicant controversy under Gérard d'Abbeville and his colleagues at Paris (encouraged by the exiled William) centered largely on the role of evangelical poverty in the spiritual life and on the practice of admitting young boys into their novitiate. Thomas attacked the views of Gérard in his quodlibetal disputations (1269–1271), in two polemical treatises on Christian perfection, and in his *Summa* (2.2.179–189). This phase of the controversy ended with the death of its chief protagonists, William of Saint-Amour on September 13, 1272, and Gérard at Paris that same year on November 8.

On December 10, 1270, thirteen philosophical propositions opposed to the Catholic faith were condemned by Étienne Tempier, bishop of Paris. To prevent such views from developing in the classroom, Thomas undertook a detailed literal commentary on all the main texts of Aristotle then in common use at the University of Paris. It is possible that Thomas began his commentary on *De anima* in Italy, but all the others were written after his return to Paris in 1269, namely, the commentaries on *Physics*, *On Interpretation*, *Posterior Analytics*, *Ethics*, *Metaphysics*, *Politics*, and certain others left unfinished at his death. Because all these works of Aristotle were used as textbooks in the arts faculty and had to be taught by the young masters whose best guide to date had been Ibn Rushd, Thomas therefore felt a particular urgency in writing his own commentaries that remained closer to the original sources and within the context of Christian faith. His unfinished expositions of Aristotle's *De caelo*, *De generatione*, and *Metheora* were among his last writings at Naples.

The extensive second part of the *Summa theologiae* was entirely written at Paris during the intense years 1269 to 1272. This part, later subdivided into two parts, discusses the ultimate goal of human life, namely, eternal life (2.1.1–5) and the means of attaining it, namely, human acts, reason (law), grace, and all the virtues considered in general (2.1) and in particular (2.2) as practiced in various states of life. The third part, begun at Paris, considers the incarnation and life of Christ (3.1–59) and the sacraments, and was left incomplete on the subject of penance when Thomas died.

Shortly after Easter 1272, Thomas left Paris with Friar Reginald for the chapter at Florence, which commissioned him to establish a theological *studium* anywhere he liked in the Roman province. He chose his home priory of Naples, where he subsequently taught, wrote, and preached. After five years of intense activity, however, Thomas had a traumatic experience while celebrating mass in the Chapel of Saint Nicholas on December 6, 1273. Although medieval biographers were uncertain about the nature of this experience, it seems that Thomas suffered a breakdown of some sort. In any case, his productive life had come to an end, and although he did remain physically mobile, he lived as if in a stupor.

Pope Gregory X personally requested that Thomas attend the Second Council of Lyons due to open on May 1, 1274. He also asked him to bring a copy of his treatise *Against the Errors of the Greeks*, composed for Urban IV. Leaving Naples with Reginald and others early in February, Thomas had a serious accident near Maenza in which he hit his head against an overhanging branch and was knocked down. Growing weaker, Thomas asked to stop at the castle of Maenza, home of his niece Francesca, the wife of Annibaldo, count of Ceccano. Lent had already begun on February 14, and Thomas's condition became so serious that he asked to be transported to the nearby Cistercian monastery of Fossanova, where the old abbot Theobald was a member of the Ceccano family. There he received the last rites and died early Wednesday morning March 7, 1274. Thomas's remains stayed at Fossanova until they were transferred by order of Urban V to the Dominican priory in Toulouse on Saturday, January 28, 1369, where they are today. Since the anniversary of Thomas's death always falls in Lent, the Latin church celebrates his feast on January 28.

Thomas had no immediate successors capable of grasping his originality and profundity, although he had many admirers. His labors in Paris were effectively dissipated by the condemnation of 219 various propositions at Paris on March 7, 1277, and of 30 different propositions at Oxford on March 18 that same year. Sixteen propositions of the Paris list reflected the thought of Thomas; three of the Oxford list directly concerned unicity of substantial form in material composites, a pivotal Thomistic thesis. It was not until Thomas's canonization on July 18, 1323, that a new generation of largely self-taught Thomists could begin to teach and develop his teachings freely.

**THOUGHT.** Thomas Aquinas was first and foremost a theologian whose teachings have been officially endorsed by the Roman Catholic church. Since 1567 Thomas has been considered one of the doctors of the church and has been numbered among the great teachers of antiquity such as Augustine, Jerome, Ambrose, and Gregory I. Moreover, the Latin church has regarded Thomas as the model for all theologians, requiring that his philosophy and his theology be taught in all seminaries and Catholic colleges.

**Philosophy.** While giving primacy of place and importance to what God has revealed through the Jewish people and through Jesus Christ, Thomas recognized the much larger, though less important, realm of knowledge available to unaided human reason. Unlike many of his contemporaries who merged reason into faith, Thomas emphasized the distinctness and importance of Aristotelian philosophy and the sciences, even for theology. His own strictly philosophical thought is found in his numerous commentaries on Aristotle and in independent treatises. In the manner of his contemporaries in the universities, he adapted his own understanding of Aristotelian ideas, terminology, and methodology to the study of "sacred doctrine," especially in his *Summa theologiae*.

Thomistic "philosophy" is basically Aristotelian, empirical, and realist, or what G. K. Chesterton called "organized common sense." Thomas preferred an order of study that presupposed the liberal arts and mathematics and began with Aristotelian logic, principally *On Interpretation* and the *Posterior Analytics*; moved through natural philosophy, involving all the natural sciences, including psychology; treated moral philosophy, including political science; and concluded with metaphysics, or first philosophy, which today would include epistemology and natural theology.

In logic the Aristotelian categories, syllogisms, and rules of correct reasoning for "demonstration" as distinct from "dialectics" and "sophisms" are considered essential for an accurate understanding of all other disciplines. Of special importance are the meaning of "scientific" knowledge based on "first principles" and the two ways in which both are acquired: experience (*via inventionis*) or education (*via disciplinae*).

In natural philosophy the existence of a physical world and its substantial mutability are taken as self-evident in order to establish the first principles of change: matter (potentiality), form (actuality), and privation (immediate possibility). Natural science is about natural things (not artificial or incidental), things that have within themselves "nature" either as an actual principle (form as a dynamic source of activity) or as a passive principle (matter as receptive of outside forces). The aim of natural science is to understand all natural things through their material, efficient, formal, and final causes. In so doing the naturalist discovers an ultimate, intelligent, efficient, and final cause that is not physical (i.e., not material and not mutable) and is the "first cause" and "agent" of all that is natural. The noblest part of this science is the

study of the whole human person composed of matter (body) and form (soul). This study also shows that the human soul has functions, namely, understanding and free choice, that transcend the limitations of animal nature, thereby proving the soul to be immaterial, created, and immortal.

Moral philosophy for Aristotle and Thomas presupposes psychology and deals with human happiness, which is the goal of each person in this life, and the optimum (morally good) means of attaining that goal for the individual, the family, and the body politic. The foundation of both goal and correct means is called the natural law, which is knowable by human reason but open to rejection by the individual. There are four cardinal virtues, or optimum means, for use in every state of life: prudence, justice, fortitude, and temperance. The highest of these is prudence, which binds all virtues together and securely guides humanity to happiness.

Finally metaphysics, or speculative wisdom (natural theology), is about all being-as-such and about the First Cause as the source of all being. For Thomas the most “sublime truth” of this wisdom is the realization that all creatures are composed of a “nature” and a borrowed existence (*esse*), while God’s nature alone is “to exist.” God is subsistent existence itself (*ipsum esse subsistens*), the Necessary Being that cannot not be. As the highest science, metaphysics has the added task of ordering, defending, and safeguarding all other sciences, speculative and practical. In this role it examines the roots and foundation of all human knowledge (epistemology), natural religion, and public worship.

**Theology.** Thomistic “theology,” which Thomas calls sacred doctrine, is distinct from pure philosophy and depends on the divine gift of faith, which involves the whole realm of revelation, divine law, ecclesial worship, the spiritual life, and human speculation about these. The realm of faith is in the strict sense “*super-natural*” in that its truths, values, and efficacy transcend the realm of “nature.” Faith’s abilities are freely given by God for human salvation and are beyond the abilities of pure nature (cf. *Rom.* 11:5–6). The content of faith concerns what one must believe (faith) and do (morals) to gain eternal life as revealed by God. The life of faith is a personal sharing by grace of the intimate trinitarian life of God here and hereafter. The efficacy of the life of faith is derived from the passion and death of Jesus Christ, God’s only begotten Son. These beliefs and morals are transmitted in history through the Bible and through the living church founded by Christ on Peter and his successors.

Thomas did not divide theology into such modern disciplines as biblical and scholastic, positive and speculative, dogmatic and moral, spiritual and mystical, kerygmatic and academic, and so on. In his day, however, each master in sacred theology lectured on the Bible, presided over scholastic disputations on specific points, and also preached regularly to the university community. Thomas wrote his *Summa theologiae* not as a replacement for the Bible but as an extra-

curricular aid for beginners who needed an overview of “sacred doctrine.” Although the *Summa* is divided into three parts, its conceptual unity is the Dionysian circle of the *exitus* (“going forth”) of all things from God and the *reditus* (“return”) of all things to God. The First Part considers God and the coming forth of all things from God. The Second and Third parts consider the final goal of human life and the actual return of all things to God. The two parts of the Second Part consider the intrinsic means such as virtues, law, and grace, while the Third Part considers Christ and his sacraments as indispensable extrinsic means to salvation. Without doubt Thomas’s most original contribution to theology was the large Second Part, on the virtues and vices, inserted between the original *exitus* and *reditus* found in all contemporary summae of theology. The “Supplement” to the *Summa* fills out what Thomas left unfinished when he ceased writing on December 6, 1273. It was compiled with scissors and paste by Reginald and other secretaries from Thomas’s earlier commentary on Peter Lombard’s *Sentences* (4.17–46). Certainly if Thomas had lived to finish the *Summa*, many more developed views would have been written than are now expressed there.

Because theology concerns mysteries revealed by God, it can in no way “prove” or “understand” these or any other mysteries. But it can clarify the terms used, determine what cannot be said, and defend the truth of revealed mysteries against attacks from nonbelievers. Of all the revealed mysteries, Thomas considered two as absolutely basic to the Christian religion: the trinity of persons in one God and the incarnation of the Son of God as true man born of Mary.

For Thomas the supernatural gifts of sanctifying grace and the virtues (faith, hope, love, and the moral virtues) are normally conferred through baptism by water in the name of Jesus or the Trinity of Father, Son, and Holy Spirit. But in an adult the beginnings of this supernatural life are stirred up by God before actual baptism by water. The supernatural life of grace (*gratia*) experienced in this life is, for Thomas, already a foretaste of eternal life (*gloria*) in heaven. The overflow of grace is expressed in good works and in the exercise of all the virtues.

Faith, hope, and love are called “theological” virtues, because they alone have God as their direct object. In the life to come, faith will give way to sight and hope will give way to the possession of God. Love, alone, which Thomas defines as friendship with God, will continue essentially unaltered in heaven in the degree of intensity achieved in this life. This divine friendship, which is none other than the indwelling of the Trinity, is initiated by baptism, nourished by the Eucharist, and increased by prayer and service to one’s neighbor. For Thomas, one’s place in heaven, or the intensity of beatitude, is determined by the capacity for love developed in this life.

The sources of Thomas’s theology are the Vulgate Bible, the life and practice of the church, and the writings of all the available Latin and Greek fathers in Latin translation. The

terminology, however, is always traditional, largely philosophical, and often Aristotelian. For this reason it is important to understand such technical terms as matter and form, substance and accidents, essence and existence, nature and operations, and soul and faculties, as well as the four Aristotelian causes, if one is to grasp the meaning of Thomas's exceptionally lucid and simple Latin.

**INFLUENCE.** Apart from the admiration, love, and respect accorded him by scholars and theologians, Thomas exerted little influence by the time he died in 1274. At Paris his literary and personal efforts could neither stem the tide of heterodoxy among teachers of philosophy nor abate the growing fears of Augustinian theologians against the use of Aristotle or any pagan philosopher in the schools of theology.

From 1278 onward, however, the general chapters of the Dominican order showed an increasing concern that the writings of Thomas be at least respected within the order. By 1309 the chapter required all Dominican lecturers to lecture from the works of Thomas, to solve problems according to his doctrine, and to instruct their students in the same. Even before his canonization, Dominicans were obliged to teach according to Thomas's doctrine and the common teaching of the church. In 1279 the Parisian Franciscan William de la Mare compiled a "correctory" (*Correctorium*) of Thomas's writings, indicating therein where Thomas differed from Bonaventure and Augustine. In May 1282 this correctory was made mandatory for all Franciscan teachers, but by 1284 there were five defensive replies by young Dominican teachers, three of whom were Oxonians influenced by the brilliant Thomas Sutton, a self-taught Dominican Thomist. The canonization of Thomas on July 18, 1323, and the lifting in 1325 of the Parisian condemnation insofar as it touched or seemed to touch Thomas removed the foremost barriers to the teaching of his ideas universally. But it was not until the sixteenth century that Thomists began to develop his seminal principles in a notable way. An exception was the French Dominican John Capreolus (1380–1444), "the Prince of Thomists," who in his *Defensiones* on the *Sentences* incisively expounded and defended Thomas's views against Henry of Ghent, Duns Scotus, John of Ripa, William of Ockham, and others.

In the sixteenth century four influential teachers substituted Thomas's *Summa* for the standard *Sentences* of Peter Lombard: Peter Crokaert in Paris (in 1509); Thomas de Vio Cajetan at Pavia (in 1497), author of an important commentary on the *Summa*, (1507–1522); Konrad Koellin at Heidelberg (1500–1511), author of a commentary on the first two parts of the *Summa* (1512); and Francisco de Vitoria at Salamanca (in 1526) and his many disciples throughout Spain. These Thomists were concerned not so much with defending Thomism as with replying to issues raised by the reformers, resolving new problems of an expanding civilization, and applying Thomas's principles to developments in international law and the treatment of Indians in the New World. By the time of the Council of Trent (1545–1563), most of the out-

standing Roman Catholic theologians were Thomists. The influence of Thomas is clear throughout the council's decrees, notably on justification, the sacraments, and the mass. The influential *Roman Catechism*, published by order of Pius V in 1566, was the work of three Dominican Thomists. Pius V declared Thomas a doctor of the church (1567) and ordered that the first *Opera omnia* (the "Piana") be published with the remarkable index (*Tabula aurea*) of Peter of Bergamo at Rome (18 vols., 1570–1571). Since the Piana edition, there have been ten editions of complete works apart from the current critical edition ordered by Pope Leo XIII in 1879 (the "Leonine").

After the Reformation and throughout the scientific and industrial revolutions, there was little interest in Thomistic philosophy or theology outside the decimated Dominican order and scattered groups in Catholic countries. However, a Thomistic revival in Italy and Spain slowly grew and reached its culmination in the encyclical *Aeterni Patris* of Leo XIII (August 4, 1879), urging the study of Thomas's works by all students of theology, and in subsequent legislation by Leo and his successors. This revival focused on Thomistic philosophy as a system capable of countering the effects of positivism, materialism, and secularism on Catholic beliefs and practices. This polemical intention was modified by the attitude of dialogue with the modern world that characterized the approach of the Second Vatican Council (1962–1965). In this spirit Paul VI, in his encyclical on the seventh centenary of Thomas's death (1974), proposed Thomas as a model to theologians, not only with respect to his teachings but with respect to his example of openness to the world and to truth from whatever the source. As a result, there has been increased study and critical reappraisal of Thomas's thought, principles, and methodology. Although Thomism in the restricted sense of a closed system seems no longer tenable, philosophers and theologians of all traditions continue to have recourse to Thomas's thought as a milestone in human thought and to develop his seminal insights in dialogue with modern thought and issues.

## BIBLIOGRAPHY

### Works by Thomas Aquinas

Of the ninety or more authentic works of Thomas there have been numerous editions of individual works from 1461 to the present day, over 180 incunabula editions alone. Since the Roman edition of Pius V, *Opera omnia* (1570–1571), there have been more than ten editions or reprints of older standbys, but the only modern critical edition of the *Opera omnia* is the Leonine, 48 vols. to date (Vatican City, 1882–). Both English translations of the *Summa theologiae* (22 vols., London, 1916–1938; bilingual edition, 60 vols., New York, 1964–1976) are far from satisfactory, except for some volumes. Besides the older translation of the *Summa contra gentiles* by the English Dominicans, there is a good edited translation by Anton C. Pegis, *On the Truth of the Catholic Faith*, 4 vols. in 5 (New York, 1955–1957). The most convenient

anthologies are *Basic Writings*, 2 vols., edited by Anton C. Pegis (New York, 1945); *Philosophical Texts*, edited and translated by Thomas Gilby (1951; reprint, Durham, N.C., 1982); and *Theological Texts*, edited and translated by Thomas Gilby (1955; reprint, Durham, N.C., 1982). The best single volume sampling of his writings in philosophy with good introductions by Vernon J. Bourke is *The Pocket Aquinas* (New York, 1960).

### Works on His Life and Writings

The most complete single volume on Thomas and his writings is my own *Friar Thomas d'Aquino: His Life, Thought, and Works* (1974; reprinted with corrigenda and addenda, Washington, D.C., 1983) with an annotated catalog of authentic writings. Some of the more important biographical documents have been translated and edited by Kenelm Foster in *The Life of Saint Thomas Aquinas* (Baltimore, 1959). All modern studies of the writings must start with the pioneer work of Pierre Mandonnet, *Des écrits authentiques de Saint Thomas d'Aquin* (Fribourg, 1910), Martin Grabmann, *Die Werke*, 3d ed. (Münster, 1949), and some others.

### General Works on His Life and Thought

Bourke, Vernon J. *Aquinas' Search for Wisdom*. Milwaukee, 1965.

Excellent alternating biographical and doctrinal chapters that should be read carefully to savor the wisdom of Thomas.

Chenu, M.-D. *Toward Understanding Saint Thomas Aquinas*. Chicago, 1964. Indispensable for understanding the medieval context and genre of Thomas's writings.

Chesterton, G. K. *Saint Thomas Aquinas*. London, 1933. A superb appreciation of "the dumb ox" that Gilson and Pegis would have liked to have written, by a natural Thomist.

Copleston, Frederick C. *Aquinas*. Baltimore, 1967. Most appreciated by historians of philosophy.

Gilson, Étienne. *The Christian Philosophy of Saint Thomas Aquinas*. Translated from the fifth edition with a catalog of authentic works by I. T. Eschmann. New York, 1956. Gilson's *chef d'œuvre*, frequently revised over forty years of a distinguished career with all his pet views.

Maritain, Jacques. *Saint Thomas, Angel of the Schools*. London, 1946. Reflections on the life and significance of Thomas by a distinguished modern Thomist.

McInerney, Ralph. *Saint Thomas Aquinas* (1977). Reprint, Notre Dame, 1982. The best short introduction to Thomas and his chief sources: Aristotle, Boethius, and Augustine.

Pegis, Anton C. *Introduction to Saint Thomas Aquinas*. New York, 1948. A handy volume with selections from both *summas* illustrating principal themes of Thomas's thought.

Pieper, Josef. *Guide to Thomas Aquinas*. New York, 1962. A thoughtful invitation to explore the world of Thomas for reflective students.

Sertillanges, A. G. *Saint Thomas Aquinas and His Work* (1933). Reprint, London, 1957. An exciting period piece by a university chaplain in Paris after World War I.

Walz, Angelus M. *Saint Thomas Aquinas: A Biographical Study*. Westminster, Md., 1951. A much-consulted historian's view of Thomas's life and works; see the improved French adaptation by Paul Novarino.

JAMES A. WEISHEIPL (1987)

**THOR** (ON, Þórr) was presumably the most popular god of the ancient Scandinavian peoples, who conferred upon him such epithets as *ástvinr* ("dear friend") and *fulltrúi* ("trusted friend"). The distribution of his cult is abundantly documented by onomastic evidence; his name is found all over present-day Scandinavia in place-names designating either cult sites or places dedicated to him—woods, fields, hills, brooks, and lakes (de Vries, 1957, pp. 116–120).

Equally abundant are the personal names with *Thor-* as first component. About one-fourth of the immigrants to Iceland had such names, according to the *Landnámabók*. Viking traders and raiders venerated him as their most powerful god and honored him in their new settlements. Local sources report the worship of Þórr by the Norse invaders of Ireland; Þórr's hammer, Mjöllnir, appeared on the coinage of the Scandinavian rulers of York in the tenth century; there was apparently a temple dedicated to Þórr by Varangian Northmen in Kiev in 1046; the Danes settling in Normandy are said to have invoked "Tur." Even the Lapps, who were strongly influenced by their Germanic neighbors, took Þórr Karl ("old man") into their pantheon as the hammer god Horagalles. Furthermore, artifacts such as Þórr's-hammer amulets bear witness to the strength and survival of his worship even some time after the conversion to Christianity (eleventh century). In this context the Cross of Gosforth in Cumbria, England, is particularly striking, for this essentially Christian symbol bears a graphic representation of one of Þórr's major myths, namely his fishing expedition with the giant Hymir at the rim of the world ocean to catch the cosmic serpent Miðgarðsormr: the scene represents the god "digging his heels so hard into the bottom of the boat" to draw the serpent on board "that both his legs went through it" (Snorri Sturluson, *Gylfaginning* 48).

Adam of Bremen, writing about 1080 and relying on the report of a Christian who had traveled to Sweden, described the temple of Uppsala as having a triad of divine statues: Óðinn, Þórr, and Freyr were worshiped there, but Þórr occupied the central position "because he was the most powerful of them all." This statement, which contradicts Snorri's ranking of Þórr in the second place, after Óðinn, presumably points to the fact that his closeness both to warriors and to peasants gave him more prominence in popular circles than the more "aristocratic" Óðinn. A satirical allusion to the social distribution of the cults of the two gods is recognizable in an exchange between plain, honest Þórr and Óðinn disguised as a ferryman in the Eddic poem *Hárbarzljóð*: "Óðinn gets all the jarls slain by edge of swords, but Þórr gets the breed of thralls." The tradition represented by Adam, however, may also be found in the Old English homily *De falsis diis* (Concerning false gods), commonly ascribed to Ælfric, where Þórr is identified with Jupiter and is "arwürðost ealra ðæra goda" ("the most venerable of all gods"). Several minor sources suggest that Þórr was also able to raise and use winds. For Snorri Sturluson (*Gylfaginning* 21), Þórr is the strongest of the Æsir and the most important among them (after

Óðinn); his domain is *Þrúðvangar* (“fields of force”), and his home, *Bilskirnir* (presumably “shining in flashes,” a reference to his connection with lightning). He has two goats, *Tanngrjóstr* (“tooth gnasher”) and *Tanngrísir* (“grinner”), which pull his chariot; therefore, Þórr is called *Ǫkuþórr* (“Þórr the charioteer”). He also has three precious objects: his hammer *Mjöllnir*, which all giants fear; his “power belt,” which doubles his strength; and his iron gauntlets, which he needs to manipulate his hammer. His adventures are so numerous that no one is able to tell them all.

This describes rather well the personality and function of Þórr: he is a characteristic second-function god in the Dumézilian tripartite system, the typical representative of the warrior class, the champion of the gods, the bulwark of the *Æsir* against the onslaughts of the giants. His whole career illustrates this functional role. Perhaps one of the best examples is the story of his combat with *Hrungnir* (*Snorri Sturluson, Skáldskaparmál* 3). The sequence of events can be summarized as follows. Having followed Óðinn in a wild gallop into *Ásgarðr*, the giant *Hrungnir* is invited by the *Æsir* to drink with them. His obstreperous behavior soon compels the *Æsir* to call upon Þórr to put an end to his drunken boasts and threats, but the laws of hospitality prevent the champion of the gods from sealing the giant’s fate then and there. As a result, Þórr is challenged to a single combat with *Hrungnir* at the boundary between the realm of the *Æsir* and *Jötunheimr* (the land of the giants). To back up *Hrungnir* in his fight, the giants build the monstrous *Mökkurkálfi*, a huge clay warrior equipped with a mare’s heart. Þjálfí, Þórr’s astute attendant, persuades *Hrungnir* that he will be attacked from below, and makes him stand on his shield, exposing him to a fulgurant assault from the sky. Þórr’s hammer clashes in midair with the hurled hone of the giant; *Mjöllnir* smashes *Hrungnir*’s skull while fragments of whetstone are scattered all around. One lodges in Þórr’s head as *Hrungnir* drops dead over him and has to be removed by Þórr’s fantastically strong three-year-old son, *Magní*. Meanwhile, *Mökkurkálfi* has ingloriously collapsed under Þjálfí’s strokes. A last episode shows how the witch *Gróa* attempts to remove the piece of *Hrungnir*’s whetstone from Þórr’s head but forgets her spells and incantations in the joy of learning that her husband, *Aurvandill*, has been safely brought home out of the icy North by Þórr.

*Snorri*’s narrative illustrates important features of the ethics and usages of the warrior class: respect for the laws of hospitality (e.g., in spite of *Hrungnir*’s outrageous behavior, Þórr cannot touch him as long as he is a guest in *Ásgarðr*); taboo on striking down an unarmed adversary (killing him would be an act of cowardice); moral obligation to accept a challenge to a duel; single combat, to be waged in the *no-man’s-land* between two enemy territories. The significance of the dummy (*Mökkurkálfi*) that the giants erect at the location of the duel has been ingeniously explained by Georges Dumézil: Þórr faces and defeats the “stone-hearted” monster, and his “second,” Þjálfí, duplicates his exploit by destroying

*Mökkurkálfi*. Dumézil sees a warrior initiation pattern in this two-level account, in which Þjálfí reproduces in a realistic terrestrial way the almost cosmic martial exploit of Þórr (Dumézil, 1970, pp 158–159).

His interpretation is supported by a comic episode in *Hrólfs saga kraka* (chapter 23), in which the hero *Böðvarr Bjarki* initiates the coward *Hǫttr*, making a proper warrior of him. On the eve of the midwinter festival (Yule), King *Hrólfr* forbids his men to leave his stronghold because an enormous winged troll will appear and kill any champion who challenges him. *Böðvarr*, however, goes out secretly to face the troll, dragging the fearful *Hǫttr* along. The monster arrives, and while *Hǫttr* shrinks in the mud in terror, *Böðvarr* dispatches the beast with one thrust of his sword. Picking up *Hǫttr*, he forces him to drink two gulps of the troll’s blood and eat a piece of his heart, after which he engages in a wrestling match with the young man. *Hǫttr* comes out of this test a truly strong and courageous fighter. They then stand the monster on its feet, as if it were still alive, and return to the king’s castle. The following morning, much to the king’s surprise, *Hǫttr* volunteers to go out and “kill” the monster. Ultimately, *Hrólfr* is not fooled, but he accepts *Hǫttr*’s overnight transformation into a real champion and renames him *Hjalti*, after the king’s sword *Gullinhjalti* (“golden hilt”).

Another well-known adventure of Þórr is narrated in the Eddic *Þrymskviða*. One day Þórr wakes up and realizes to his dismay that *Mjöllnir* has been stolen. He dispatches *Loki*, equipped with *Freyja*’s falcon coat, to *Jötunheimr* to look for it. *Loki* soon finds out that the giant *Þrymr* has gotten hold of Þórr’s mighty weapon and refuses to return it unless he gets *Freyja* as a bride in exchange. *Freyja* does not want to hear anything about marrying the uncouth giant, and the gods assemble in council to look for a solution to Þórr’s dilemma. On *Heimdallr*’s advice, they decide that Þórr himself must go to *Þrymr*, disguised as a bride and escorted by *Loki*. After their arrival in *Þrymr*’s hall, a lavish meal is served to the travelers from *Ásgarðr*, but Þórr almost betrays himself by his gluttony. *Loki*, however, saves the day by stating that “*Freyja* yearned so much for *Jötunheimr* that she fasted for eight full nights.” The situation threatens to deteriorate again when *Þrymr* attempts to kiss his “bride” and discovers the murderous flames in “her” eyes. Again, *Loki* finds the proper excuse: “So much did *Freyja* long to be in *Jötunheimr* that she did not sleep for eight full nights.” Then, *Þrymr*’s sister comes to claim her bridal gift, and *Þrymr* has the hammer *Mjöllnir* brought in and placed on his alleged bride’s knees, whereupon Þórr grabs his weapon and ruthlessly crushes the skulls of all the giants around him.

No other source duplicates the contents of this remarkable Eddic lay, which achieves its effect with an admirable economy of means and a robust sense of humor, paired with a well-structured scenario and marvelous characterization of the actors in this little drama. Although the poet undoubtedly took his material from older mythological sources, the bal-

lad style of the text and the jocular presentation of the argument clearly indicate that the *Þrymskviða* is one of the more recent poems of the Edda. The ludicrous disguise of the champion of the gods is unthinkable in the older tradition, where it would have been completely excluded by the explicit abhorrence of the *Æsir* for transvestism and other forms of *ergi* (“unmanly behavior”), as illustrated by the *Lokasenna* (23–24), for example.

The text, however, indicates the importance of Þórr’s hammer, Mjöllnir, which is not only associated with the thunderbolt, as its name perhaps indicates (it has been etymologically connected with Russian *molniia* and with Welsh *mellt*, “lightning,” but it can also be cognate with Old Norse *mala*, “grind,” *mөлva*, “crush”) and appears to be used to hallow the bride (*Þrymskviða* 30: “brúði at vígja”). This latter function has sometimes been associated with fertility, as the hammer can be considered a phallic symbol, but there is obviously more to the consecration with Þórr’s hammer, as the description of Baldr’s funeral indicates (Snorri Sturluson, *Gylfaginning* 49): “Þórr vígði bálit með Mjöllni” (“Þórr hallowed the pyre with Mjöllnir”). This would be done either to restore the god to life or to protect him from danger on his journey to the world of the dead. Since Baldr does not come back until after Ragnarök, the second hypothesis presumably prevails. It is furthermore confirmed by the repeated mention of Þórr as protector of the dead in memorial inscriptions on rune stones, especially in Denmark and southern Sweden, the earliest being found in Rök, East Götland, in the mid-ninth century. Thus, the inscription of Glavendrup (which is found on the Danish island of Fyn and dates to about 900–925) reads: “Þur uiki pas runar” (“May Þórr hallow these runes”).

The control of Þórr’s hammer over life and death is also illustrated by the following tale about Þórr’s goats (*Gylfaginning* 44): One day, while on a journey with Loki, Þórr decided to ask a farmer for hospitality for the night. For the evening meal, Þórr slaughtered his own goats, and after skinning them, cooked them in a cauldron. When the stew was ready, he invited the farmer and his family to share it with him and his travel companion. The next morning, Þórr rose at daybreak and went to the goatskins with the leftover bones. Raising his hammer, Mjöllnir, he consecrated them, and the goats stood up as if nothing had happened to them. However, one of them was found to be lame in a hind leg. When he noticed it, Þórr realized that a thigh-bone had been split for marrow, and he was angry with the farmer and his household for doing such a stupid thing. The farmer was terrified, and Þórr’s angry reproach sounded like a death knell to him. As his frightened family screamed, he begged his dangerous guest for mercy and offered him all he had in compensation. Þórr relented and specified that he would take along the farmer’s two children—his son, Þjalfi, and his daughter, Þóskva—as bond servants.

The association of Þórr with goats is abundantly documented. They pull his chariot; the *Húsdrapá* (st. 3) calls him

*hafra njótr* (“user of goats”), and the *Hymiskviða* (st. 31) describes him as *hafra dróttinn* (“lord of goats”). The picture of Þórr riding a vehicle drawn by goats appears repeatedly in the literature (e.g., in *Hauslǫng* 15), and according to a story, perhaps from the late twelfth or early fourteenth century but preserved in *Flateyjarbók* (1387–1390), when king Óláfr Tryggvason entered the pagan temple at Mærin in the Trondheim district, he found a statue of Þórr, adorned with gold and silver, seated on a splendid carriage drawn by finely carved wooden goats (Turville-Petre, 1964, p. 82).

EDGAR C. POLOMÉ (1987)  
JOSEPH HARRIS (2005)

**THOTH** was the god of wisdom from Hermopolis in Middle Egypt. According to the Hermopolitan cosmology (which is best known from texts found at other sites), the eight primordial gods representing “hiddenness,” “darkness,” “formlessness” (?), and the “watery abyss” produced an egg that appeared at Hermopolis when the inundation subsided and from which the creator god appeared and brought everything else into being. When mentioned in the Heliopolitan Pyramid Texts, this creator god was Atum, but in the local Hermopolitan tradition he could have been Thoth.

Thoth was the moon god and as such was the companion of Re, the sun god, but he also had his own following among the stars in the night sky. One mortuary tradition, probably originating at Hermopolis, permitted the dead who knew the correct spells to accompany Thoth in the sky. Thoth was the son of Re, but he also represented the injured eye of the falcon-headed sky god, Horus, whose sound eye was Re. For unknown reasons Thoth is identified with both

the ibis and the baboon. He is regularly depicted as a human with the head of an ibis. Baboons often appear in temple reliefs worshipping the sun god, and this association might indicate his subordinate relationship to Re. In the judgment scene of chapter 125 of the *Book of Going Forth by Day*, Thoth as the ibis-headed god presides over and records the weighing of the heart of the deceased owner of the book. A baboon is also represented in this scene seated atop the balance, apparently to ensure its accuracy. Thoth is credited in Egyptian mythology with separating the two contenders, Horus and Seth, as well as with magically restoring Horus's injured eye. He has one of the major supporting roles in much of Egyptian religious literature, and a number of hymns are addressed to him directly, although Re and Osiris are the principal gods discussed and invoked in these texts.

Thoth was renowned for his wisdom and praised as the inventor of writing. The *mdw-ntr* ("god's words," i.e., hieroglyphs) were recognized as perhaps his greatest contribution, and he was frequently shown with brush and papyrus roll in the attitude of the scribes, whose patron he was.

In the eighteenth dynasty several kings took as their throne name *Thothmose* ("Thoth is the one who bore him"). This Thutmosid family included several other members with *iḥ* ("moon") in their names, so it is clearly Thoth's position as moon god that is being recalled. Remains of two small temples to Thoth survive in the Theban area, one very late and poorly decorated. Since the eighteenth dynasty was of Theban origin and the son of Amun-Re at Thebes was the moon god, Khonsu, these two moon gods could have been assimilated, but the family could also have chosen the name of the northern god (Thoth) when they moved their residence (capital) to Memphis.

In Egyptian literature there clearly was an ancient tradition concerning the secret knowledge of Thoth. Secret rooms and mysterious books were sought by learned scribes, priests, and princes. This tradition was carried over into some of the Coptic gnostic library tractates, and the question arises whether these were Egyptian or Greek in origin since the Greeks had early identified their god Hermes with Thoth. The origins of the continuing traditions of Hermes Trismegistos and gnosticism can be traced to Egypt, to Thoth, and perhaps even to the Hermopolitan cosmology, but the extent of Egyptian influence on these beliefs remains to be determined.

The great temple of Thoth at Hermopolis has not survived, although its location is known from finds in the area. A large catacomb for the burial of mummified ibises and baboons has been found nearby at the necropolis of Tuna al-Gabal.

LEONARD H. LESKO (1987)

**THRACIAN RELIGION.** In ancient Greece the name *Thrakes* referred to most of the inhabitants of the northeastern Balkan Peninsula. Their neighbors to the east were the Scythians; to the west the Pannonians, Dalmatians, and Illyrians; to the north the Balts and the Celts. The name seems to have initially belonged only to the Thracian tribes in close proximity to Greece. Later on, it was extended to related tribes to the north, just as the name *Graeci*, which originally belonged only to a western Greek tribe, was later given by the Romans to all the Hellenes. Nevertheless, the location of the land called Thrake was always restricted to the area south of the Balkan Mountains, principally to the Chalcidice Peninsula.

**THRACIAN PEOPLES.** Nearly two hundred tribes are known under the generic name of Thrakes, of which the most important were the Odrysi, who lived in what is today southeastern Bulgaria; the Dentheleti, north of Macedonia; the Serdi, in Serdica, today the region of Sofia, the capital city of Bulgaria; the Bessi, west of Serdica; the Moesi, between the Balkan Mountains and the river Danube; and the Daco-Getae, who occupied a northern territory approximating modern-day Romania. Other Thracian tribes—the Thyni and Bithyni—settled in Asia Minor. The Phrygians and the Armenians, who originated in the Balkans, were related to them.

**History.** In the ancient world, the Thracians were, according to Herodotus (fifth century BCE), the most numerous people after the Indians. Thracians are attested in connection with the Trojan War, and they seem to have had a share in the foundation of Troy (in Asia Minor, or modern-day Turkey). Only occasionally did they form larger unions of tribes: the only known confederations are the kingdom of the Odrysi (fifth-fourth centuries BCE), the Geto-Dacian kingdom of Burebista (c. 80–44 BCE), and the Daco-Getic kingdom of Decebalus (87–106 CE). Nonetheless, a certain material and spiritual unity of the Thracians (though not without important inner distinctions) was preserved by several tribes, despite their frequent displacements. Herodotus (*Histories* 5.3) notes that most of the Thracians had kindred customs, with the exception of the Getae, the Trausi, and those living beyond the tribe of the Crestonians.

According to the Greek geographer Strabo (first century BCE), the Getae spoke the same dialect as the other Thracians. Subsequent scholarship has shown, however, that both the culture and the language of the Getae, whom Herodotus calls "the most religious and valiant among the Thracians," were distinct from those of the southern Thracians. Scholars such as Vladimir Georgiev, Ivan Duridanov, and Cicerone

Poghirc have established a clear distinction between two linguistic areas: the Thracian area, in which toponyms ending in *-para*, *-bria*, and *-diza* are dominant, and the Daco-Getic area, in which these endings are replaced by *-dava* and *-sava*. Anthroponyms and phonetic transformation both confirm this distinction. Culturally, the southern Thracians were related to the Iranians, to the Pelasgians, and to some peoples of Asia Minor. They exerted a certain spiritual influence on the Greeks, but they felt, in turn, the decisive impact of Greek civilization. The northern Thracians, the Daco-Getae, were, however, culturally closer to the Illyrians, the Celts, and the Balts. Before the Roman epoch, Greek influence north of the Danube was minimal: in Dacia only thirty Greek inscriptions have been found, representing 1 percent of the more than three thousand Roman inscriptions. In the northern territories the passage from the Hallstatt culture to the La Tène culture was determined by the Celtic invasions during the fourth and third centuries BCE.

**Testimonies.** The Thracians may be attested in documents written in Linear B, a form of writing used in Mycenaean records dating from the fifteenth to the twelfth century BCE. They are mentioned by Homer and by numerous later Greek and Roman authors. In the fourth century CE, the language of the Thracian tribe of the Bessi was still in use in Christian liturgy. A difficult question is whether any of the Thracian tribes ever used writing. It seems that they did, but only a few records have survived. At least the Geto-Dacians, who formed an impressive theocracy in the first century BCE, seem to have used the Greek and Roman alphabets to transcribe their own language. No document is attested, however, apart from some mysterious inscriptions, each composed of three Greek letters, on stone slabs from the ruins of sanctuaries at Sarmizegetusa Regia (modern-day Gradiştea Muncelului, Romania). In all probability these inscriptions are not marks used by the Greek builders of the sanctuaries but are, instead, numbers related to the complicated astronomical computations of the Dacian priests. Because the slabs were scattered, it has so far been impossible to reconstruct the pattern by which the series of numbers can be read.

The basic sources on Thracian religion are Greek and Roman authors, including Herodotos, Plato, Strabo, the geographer Pomponius Mela, and the Moesian-born Gothic historian Jordanes (sixth century CE). Other sources usually depend on these authors and only occasionally provide important information; a notable exception is the Neoplatonic philosopher Porphyry (third century), who wrote on Zalmoxis. For southern Thrace, Greek votive inscriptions are particularly important; the collection edited by Georgi Mikhailov (1955–1956) contains about 160 names of divinities, together with epithets.

The Thracian regions bordering the Aegean Sea were completely hellenized. The province south of the Balkan Mountains remained under Greek influence even during Roman occupation. The northern regions were decisively in-

fluenced by the Romans after being subdued by them: Moesia Superior in 15 CE; Moesia Inferior, along with the Greek Pontic colonies, on the western shore of the Black Sea, in 46 CE; and Dacia in 106 CE. The last speakers of Thracian dialects disappeared from the region south of the Balkan Mountains after the invasion of the Slavs in the sixth century.

**THRACIAN RELIGION: SOME GENERAL FEATURES.** Religion among the southern Thracians developed along different lines from that of the northern Thracians (the Daco-Getae) owing to what could be called the religious reformation of Zalmoxis in the north. Whether Zalmoxis was a god or a human is an open question, but it can safely be stated that his priests, forming an uninterrupted line of succession that was at times indistinguishable from Daco-Getic kingship, introduced among the northern Thracians religious principles and, later on, scientific speculations that conferred upon their religion a peculiar character. Different sources inform us of the penetration of these ideas among southern Thracians in early times, but Zalmoxis is uncontroversially known as a Gete. It is difficult to speak of a common religious heritage in regard to all Thracian peoples, for different beliefs and customs are attributed to various groups in various sources, but it is easy to recognize in the sources features pertaining to the cult of Zalmoxis. With the exception of Zalmoxis, whose influence extended from the north to the south, all Thracian divinities known in Greece from the fifth century BCE (e.g., Sabazios, Bendis, and Cotys) and the mythic characters to whom the Greeks attributed a Thracian background (e.g., Orpheus and Dionysos) originated among the southern Thracians.

According to Herodotos (5.7) the Thracians worshiped three divinities, corresponding to the Greek Ares, Dionysos, and Artemis, and their kings worshiped a fourth divinity, corresponding to Hermes, to whose posterity they were believed to belong.

As for Ares-Mars, the god of war, Jordanes (*De origine actibusque Getarum* 40–41) confirms his importance among the Getae, in whose land he was supposed to have been born (“apud eos . . . exortum”) and to have reigned (cf. Vergil, *Aeneid* 3.35). Prisoners of war were sacrificed to him, and his devotional cults were particularly intense in their affective tones.

Whether Herodotos in his mention of Dionysos was referring to Sabazios is a controversial point, since he could have directly mentioned the name of Sabazios. The same argument applies as well to the goddesses Bendis and Cotys, who are usually identified with Artemis. At the time of Herodotos both of them were known at Athens, and yet the historian did not mention their names in connection with the Thracian Artemis.

Ancient authors attributed to Dionysos himself a Thracian background. In the myth of Dionysos, a Thracian episode, mentioned by Homer (*Iliad* 5.130ff.), is particularly interesting. In numerous variants, it is recounted that the

Thracian king Lykurgos (lit., “wolf’s anger”) pursues Dionysos, who, in his turn, brings down madness upon the king. The king then either kills himself or is eventually killed by Dionysos. The symbolism of this myth is very complicated. It refers, in all probability, to the cosmic effects of a battle between opposite principles represented by Apollo and Dionysos. As a matter of fact, the wolf is related to Apollo, who is often called Apollo Lukeios, a name referring both to the wolf (Gr., *lukos*) and to light (Gr., *lukē*, “dawn”; Lat., *lux*, “light”).

In several variants of the myth, Lykurgos tries to cut down a vine with an ax. Dionysos confuses him so that instead he kills his own son and cuts off one of his own legs. The mythologist Nonnus of Panopolis (fifth century) reports that Lykurgos, an Arab king who pursues Dionysos with an ax in order to kill him, hits one of the Maenads, Ambrosia, who is then changed into a vine. It is difficult to unravel the implications of this myth: while Lykurgos appears to be a vine hater, an enemy of Dionysos, his action may instead simply represent a viticulturist’s pruning of his vines. There is nothing typically Thracian in all this, except perhaps the contradictory characterization of Thracians as either vine lovers or vine haters. Strangely enough, the calendar temple in the stronghold at Sarmizegetusa Regia seems to indicate that the Daco-Getic priests under Decebalus were concerned with the vegetative period of the vine, and that this concern was a major element in their culture; yet King Burebista is said to have ordered all vines in his kingdom to be cut down. Is the latter, perhaps, only a wrong assumption on the part of Strabo (*Geography* 7.7–11), who mistakenly expects wine hatred from the spiritualistic, Pythagorean features of Getic religion? This hypothesis deserves further investigation.

As for the Thracian Artemis, both Bendis and Cotys have been identified with this goddess. Bendis appears to be a goddess of marriage, while Cotys, or Koryto, is an orgiastic Thracian divinity in whose cult men wore women’s garments. Her name has been related to the Indo-European \**kot-u-* (“avenger”; cf. the Greek *koteo*, “I am angry”) and has thus been taken to mean “angry [goddess]” or “[goddess] of fight.” Gheorghe Musu prefers the etymology “[goddess] energy,” from the Indo-European \**kued-*, *kuod-* (“stimulate, urge on”). Both Bendis and Cotys were known at Athens from the fifth century BCE onward.

Neither worship of a heavenly god nor the institution of sacred kingship was confined to the northern Thracians. The military historian Polyaeos (second century) reported that the priests of Hera were kings of the tribes of the Kebrenoi and Sykaiboi. One of them, Kosingas, gathered many wooden ladders with the intent, he said, of climbing to heaven in order to indict the Thracians before Hera for their disobedience. Impressed, the Thracians swore to obey his orders.

Two practices that were general among the Thracians rested, in all probability, on religious bases: tattooing and the burial or cremation of living wives together with their dead

husbands. Among the Getae, tattooing was probably related to the story of the sufferings once inflicted upon Zalmoxis, and was thus applied to members of certain social categories (e.g., women and slaves) as a sign of suffering. Among the southern Thracians, where only the nobles were tattooed, it must have had another symbolic meaning.

As for the burial or cremation of living widows, archaeological finds confirm the rather puzzling written evidence that the Thracians practiced either one or the other, and sometimes both in the same place. No reasons for this variation are given. Two works based on the findings at several necropolises in Dacia (Protase, 1971; Nicolaescu-Plopsor and Wolski, 1975) have confirmed the concurrent existence of both ritual practices, although cremation prevailed. Wives, sometimes accompanied by their infant children, were sacrificed at the death of their husbands and were buried or cremated in the same tomb. Both Herodotos and Pomponius Mela (*De situ orbis* 2.2.19–20) report that among polygamous Thracians the wives of the deceased vied for the great honor of being killed and buried together with the corpse of their husbands.

Herodotos also reports a three-day exposure of the corpse, followed by animal sacrifices, feasting, mourning, and burial or cremation. To the historian Hellanicus (fifth century BCE) is attributed the information that the animal sacrifices and the banqueting were based on a belief that the deceased would return to the human world to participate in the feast. Pomponius Mela (2.2.18) affirms that some Thracians mourned a child’s birth and rejoiced over death. Therefore the feasts following one’s death were an expression of collective participation in the happy destiny of the dead. The Getae were not the only Thracians to believe in immortality, but their beliefs, which relate to the cult of Zalmoxis, are better known, for they impressed the Greek authors who came in contact with them after the fifth century BCE.

Strabo (7.3.3) reports that, according to the Stoic Posidonius of Apamea, the Mysians (whom Strabo correctly identifies as the Moesi, i. e., inhabitants of Moesia) practiced vegetarianism, feeding themselves on honey, milk, and cheese. These are called *theosebeis* (“worshippers of the gods”) and *kapnobatai* (“walkers on smoke”). Some among the Thracians lived in continence and are recorded as *ktistai* (lit., “founders”). To the latter applies the Homeric epithet *abioi* (lit., “lifeless,” i. e., poor), which was attributed to some of the inhabitants of Thrace. The epithet *kapnobatai* may refer to a practice mentioned by Pomponius Mela (2.2.21), according to which some Thracians did not use wine as an intoxicating liquor but instead inhaled smoke from fires upon which had been thrown seeds whose scent provoked exhilaration. The *Lexicon* of Hesychius of Alexandria (fifth or sixth century CE) reports under the word *kanabis* (“hemp”) that hemp seeds were burned, and so *Cannabis sativa* may be a plausible identification of the intoxicating plant referred to by Pomponius.

**THRACIAN RIDER.** The so-called Thracian Rider, a demigod who was the focus of a cult in ancient Thrace, is known principally from sculptures and inscriptions dating from the fourth century BCE to the early fourth century CE. In Greek and Latin inscriptions he is identified simply as "the hero" (*hērōs* or *heros*, usually, but also *hērōn*, *heron*, *eron*, etc.). According to Dimiter Detschew (1957, p. 200), the name of the Thracian horseman was probably related to the Thracian term for "hero," \**ierus*, or \**iarus*, which has Celtic parallels. If so, this linguistic fact reinforces the religious analogies between this Thracian type of divinity and the Greek heroes.

The oldest monuments of the Thracian Rider belong to the fourth century BCE, but his cult was particularly influential in Thrace and in Moesia Inferior (i.e., Lower Moesia, the region of Greco-Roman settlements on the western shore of

the Black Sea) during the second and third centuries CE. Roman iconography and inscriptions of that time show that he was identified with Asklepios, Apollo, Dionysos, Silvanus, and other divinities. He bore the epithets *sōtēr* ("savior"), *iatros* ("healer"), and even *meḡas theos* ("great god"), the last in the city of Odessus (present-day Varna), where he was also known by the Thracian name of Darzalas.

The extant monuments to the Thracian Rider are reliefs and statuettes having either a votive or a funerary character. The horseman is usually represented as riding to the right, toward a tree on which a serpent is coiled. In the inscriptions, Greek and Latin epithets are often added to the generic name of the hero, showing that the cult was adapted to particular heroes, who sometimes were known by Thracian names. The epithets are usually toponyms, names of tribes, or attributes of the horseman.

The names of the worshipers are known from votive inscriptions. It is interesting to note that 61 percent of the worshipers recorded in Moesia Inferior and Dacia (modern Romania and Bessarabia) bore Greek or Greco-Roman names, 34 percent bore Roman names, and only 5 percent bore names of Thracian or Thraco-Roman origin. Accordingly, it can be inferred that the majority of the adepts of the cult in Moesia Inferior were Greek.

Little is known about the cult itself, which was a combination of Greek and Thracian beliefs. At its height it was certainly related to concepts of survival after death and to healing, and it may have involved notions of survival either in the netherworld or in heaven. It was widespread among the population of Thrace and Moesia Inferior, and its devotees included people of various social standings and ethnic backgrounds. So far as we know, the cult never took the form of a mystery religion with secret communities organized in a hierarchy. The cult of the Thracian Rider died away in the first half of the fourth century CE.

*Revised Bibliography*

**TIAN.** A term of basic importance in the worldview and religious life of the Chinese from the remote past to the present, *tian* has two principal senses: as the supreme god of the universe, and as impersonal nature. Often it is not clear in a particular instance which of these meanings is intended, and it may well be that the distinction is vague to the user.

**TIAN AS GOD.** The root meaning of *tian* is sky or the heavens, the abode of numinous beings. When used without qualifiers the term may denote the supreme deity. The earliest known use of the graph for *tian* occurs in ancient texts of the Zhou period (c. 1111–256 BCE), where it refers to the supreme deity of the Zhou people. In early Zhou times Tian was conceived as the all-powerful, purposeful, apparently anthropomorphic god who sent down blessings or disasters according to whether he was pleased or displeased with human behavior. Politically, Tian was the source of the legitimacy of the king, conferring upon the most righteous man the mandate of Heaven (*tianming*) or withdrawing this mandate from corrupt or unworthy rulers. In this conception of divinity the early Zhou rulers successfully assimilated the supreme god of the preceding Shang dynasty (eighteenth century? to 1111 BCE), called Di, or Shangdi. This assimilation blurred the historical and cultic distinction between the god of the Shang and the god of the Zhou. Subsequently, the terms *hao-tian* ("heaven of the vast-primal-vital-breath"), or *huangtian* ("august heaven"), and *shangdi* ("supreme ruler") were used interchangeably to denote the greatest power of the universe. As Tian and as Shangdi, this supreme power was conceived of as the creator (*zaowuzhu*). In some texts, including the *Yi jing* (Book of changes), *tian* and *di* (Heaven and Earth) are at least figuratively anthropomorphized as the cosmic father and mother, from whose sexual intercourse all beings are produced.

Worship of Tian, as performed in the elaborate imperial rituals, was forbidden to any but the ruler, as it was the most impressive demonstration of his possession of the mandate of Heaven. But it would hardly have been possible to prevent the people from believing in and expressing their awe of Tian. In the course of time, the notion evolved that the supernatural dimension was an invisible counterpart to the temporal world. Tian was then personified as the emperor of that spirit world who, like the emperor in this world, headed a heavenly bureaucracy of deities. In this role Tian

was called Yuhuang Shangdi ("supreme ruler of jadelike augustness"). The common people invoked his aid when in dire trouble, and there were temples in which he was the chief deity. Many homes contained some representation of communication with him, such as an incense brazier. Among the people he was familiarly called Tiangong ("celestial duke") or Laotianye ("old celestial lord").

The omnipresence and concern of Tian with the human world are themes of many proverbs. In some of these, the deity is obviously personified: "Tian's eyes are everywhere, they see all without anyone escaping"; "Man can be fooled, but not Tian"; "Tian punishes the sinner"; "Blessings come from Tian"; "Tian helps those who help themselves"; "Tian knows the good and evil hidden in human hearts." Other sayings, however, are either ambiguous or definitely refer to an impersonal power: "The cyclical revolutions of *tian* cause things to be as they are"; "*Tian* is empty; earth is broad"; "Intelligence is endowed by *tian*"; "There may not be two suns in *tian*"; "It is difficult to go against the Way (*dao*) of *tian*."

The arrival of Buddhism from India and Central Asia at approximately the beginning of the common era introduced new and complicated notions of celestial beings and celestial realms. The Buddhist realms, for example, were divided into the Realm of Desire (*kama-dhatu*), the Realm of Form (*rupadhatu*), and the Realm of Formlessness (*arupadhatu*). These and other Buddhist realms were called *tian*. In the third and fourth centuries, as Daoism became a cohesive religion, it too developed elaborate notions of supernal realms and called them *tian*. In general, the *tian* of Daoism, variously twenty-eight, thirty-two, or thirty-six in number, were derived from Buddhism, although one novel idea held that counterparts to *tian* existed in the subterranean world. The Daoist *tian* are the abodes of gods and their subordinates, the perfected immortals (*xian*), as well as of the souls of the virtuous dead who will one day attain immortality as perfected beings. The term *tian* also figures in Daoist cosmology, where *xiantian* ("pre-cosmic") and *houtian* ("cosmic," that is, the phenomenal universe) denote stages of evolution that are represented in the performance of liturgical rites.

**TIAN AS IMPERSONAL NATURE.** The word *tian* often appears in writings of the classical period of philosophy (sixth to third century BCE), where it is used with the connotation "nature." Daoist texts of the period frequently express the idea of *tian* as an impersonal force that produces all natural phenomena. In this usage were blended the ideas of the will of a personal deity and a natural law. Thus, events, in particular, omens, commonly taken to signify the "decree" of *tian*, were here interpreted simply as having occurred spontaneously or of themselves (*tianming ji ziran*). The most forceful assertion of the impersonality of *tian* was made by the Ru (Confucian) scholar Xunzi (fl. c. 298–238 BCE), who denied that *tian* acted in response to human actions or pleas. In his view, *tian* was simply the operation of the physical universe. In another instance of the impersonal use of *tian*, the term

refers to something akin to “fate,” as in the expression *mingyun de tian* (“Heaven-determined destiny”).

As with the anthropomorphic conception of *tian*, the naturalistic interpretation was given its most authoritative expression in the *Yi jing*. There, *tian* is symbolized by the trigram *qian*, and is thus another term for the positive, male, creative principle or force (yang). Its complement is *di*, or earth, symbolized by the trigram *kun*, representing the negative, female, receptive principle or force (yin). The ceaseless, ever-changing interactions and permutations of these complementary principles or forces produce the universe and all beings, and are responsible for their birth, growth, decay, and death.

Although impersonal, the “naturalistic” *tian* has a close functional relationship with man. The classical philosophers see this relationship in a variety of not necessarily reconcilable ways:

- Human life or life span depends upon *tian* (*renzhiming zai tian*).
- Man is a microcosm of the universe, his feet being “square,” as earth is, and his head round, as Heaven is.
- Man’s nature (*xing*) is conferred at birth by *tian*.
- Man should model himself upon *tian* (*fatian*).
- Since *tian* is impersonal, it is man who acts as the mind (or heart) of *tian*.
- Man and *tian* constantly interact in mutual stimulus and response (a view denied, as we have seen, by Xunzi).
- The function of *tian* is to create, while the function of man is to nurture and bring to perfection those created things.
- *Tian* serves as the moral example for man, who can only attain his complete human development through the discipline of moral steadfastness (*cheng*).

Here again, the concept of *tian* is ambiguous: while moral perfection would seem to be possible only for a person, yet the unfailing regularity, benevolence, and impartiality of *tian* could also be interpreted in moral terms.

In the neo-Confucian movement, which began during the Tang dynasty (618–907) and came to maturity during the Song period (960–1279), philosophers again utilized the term *tian* in various new ways. The neo-Confucian goal may be stated in religious terms as an ultimate self-transformation for the attainment of sainthood or sageliness (*shengren*). Most important was a concept called the *tianli* (“principle of *tian*” or “heavenly principle”), which was interpreted in a number of ways. It stood for the sum of the anciently enunciated virtues of the Confucian tradition; it was a name for the metaphysical substance or embodiment of the *dao* (*xingshang daoti*); it was identified as mind; it was identified as conscience, which produced the innate knowledge of good and evil, right and wrong (*liangxi* or *liangzhi*); it was moral perfection, the very opposite of human desires (*renyu*), a propo-

sition rejected by certain later neo-Confucians; or it designated the totality of all principles, being cosmic Principle. These were some of the concepts the neo-Confucians used in constructing a metaphysics that had been lacking in the ancient Confucian system. They attempted, in this way, to arrive at an understanding of the nature of ultimate reality or the Absolute. In their philosophies, the term *tian* was used for this ultimate reality and also identified with other terms that had the same meaning—*dao*, *li*, *taiji*, and (in Wang Yangming’s thought) *xin* (“heart-and-mind”). Although the *tian* of the neo-Confucians was an impersonal metaphysical principle, even in this usage theistic implications were not entirely absent.

#### BIBLIOGRAPHY

There is no monographic treatment of *tian* in English, and the only one in a Western language, Anton Lübke’s *Der Himmel der Chinesen* (Leipzig, 1931), is not easily available in many North American libraries. A good overall discussion is found in Alfred Forke’s *The World-Conception of the Chinese* (1925; reprint, New York, 1975). On Tian as the god of the Zhou people, see Herrlee G. Creel’s “The Origin of the Deity T’ien,” in volume 1, appendix C of his *The Origins of Statecraft in China* (Chicago, 1970). On the concept of Tian (i. e., Shangdi) as the supreme deity, see James Legge’s *The Notions of the Chinese concerning God and Spirits* (1852; reprint, Taipei, 1971). A suggestive recent interpretation is Ha Tai Kim’s “Transcendence Without and Within: The Concept of T’ien in Confucianism,” *International Journal for Philosophy of Religion* 3 (Fall 1972): 146–160.

For the role of *tian* in political and social traditions, the definitive treatment is Yang Ch’ing-k’un’s *Religion in Chinese Society* (Berkeley, 1961); see the index references s.v. *Heaven*. Proverbs showing generally held notions of *tian* are sampled in Clifford H. Plopper’s *Chinese Religion Seen through the Proverb* (1926; reprint, New York, 1969), pp. 23–29, 59–76. Various concepts of *tian* are discussed in H. G. Lamont’s “An Early Ninth Century Debate on Heaven,” *Asia Major* 18 (1973): 181–208 and 19 (1974): 37–85, although this article is technical and contains considerable extraneous material. An important discussion is found in J. J. M. de Groot’s *Les fêtes annuellement célébrées à Émoui (Amoy)*, vol. 1 (1886; reprint, Taipei, 1977), pp. 35–83.

LAURENCE G. THOMPSON (1987)

**Tiantai.** The Tiantai tradition of Chinese Māhāyāna Buddhism is a lineage centered around the writings of the monk Zhiyi (538–597) and his successors. This tradition is characterized by the emphasis it places on the practice of meditation, its exegetical method, and the centrality it accords the teachings of the *Saddharmapuṇḍarīka Sūtra* (Chin., *Miaofa lianhua jing su*; abbreviated title, *Fahua jing*; the *Lotus Sūtra*) and the *Da ban niepan jing* (Skt., *Mahāyāna-parinirvāṇa Sūtra*). The Tiantai tradition forms, together with the Huayan tradition, one of the two major

academic and doctrinal systems of Chinese Mahāyāna Buddhism.

**ORIGINS.** Zhiyi's major meditation text, the *Mohe zhiquan* (The Great Stilling and Insight; T. D. no. 1911), states that the Tiantai lineage began with Huiwen, who transmitted the essence of his enlightenment experience to his disciple Huisi, who in turn instructed Zhiyi. Later Tiantai church history therefore refers to these monks as the first three (Chinese) Tiantai "patriarchs."

**Huiwen.** Other than the fact that he was active during the Northern Qi period (550–557), little is known of the life of Huiwen. Even late accounts admit that both his place of birth and his dates are unknown. His importance to the tradition derives from his adumbration of certain key concepts that, in the writings of Zhiyi, would become central to Tiantai thought. One source relates that while reading the *Da zhidu lun* (a commentary on the *Prajñāpāramitā Sūtra* in twenty-five thousand slokas that is traditionally attributed to Nāgārjuna) he was struck by a passage that notes, "When one moment of mind obtains all wisdom, the wisdom of the Path, and all species of wisdom, then all of the defilements and their traces are cut off." This concept of "three wisdoms in one mind" (*yxin sanzhi*) became identified in the writings of Zhiyi with his concept of "three insights in one mind" (*yxin sanguan*), a core teaching of the Tiantai system.

This link to the teachings of Nāgārjuna, founder of the Mādhyamika system and perhaps the greatest of all Buddhist thinkers, was later formalized by recognizing him as the tradition's first Indian patriarch and the inspirator of the system as a whole. Such post facto linkage with Indian figures of unquestioned authority was a common means of bestowing legitimacy and prestige upon the Buddhist traditions indigenous to China. Nāgārjuna, in fact, is counted as "first patriarch" of several East Asian Buddhist traditions.

**Huisi.** The master Huisi was a native of Honan Province; later biographies state that he was born under the Northern Wei on the eleventh day of the eleventh month of 515. At the age of fourteen he entered the monastic life and received full ordination, devoting himself to chanting the text of the *Fahua jing*. At the age of nineteen he had an enlightenment experience while reading the *Miaoshengding jing* (Sutra of Marvelous, Unsurpassed *Samādhi*; otherwise unknown); from this time on he retired to the woods and forests to practice meditation in solitude.

Sometime after this experience Huisi met the master Huiwen and received instruction from him concerning meditation and its concomitant, the experience of enlightenment. Thereafter, he confined his practice to meditation. Tradition alleges that he attained enlightenment only at the point when, despairing of ever realizing the goal of his practice, Huisi climbed to the top of the monastery wall to throw himself off. The resulting breakthrough he later termed *fahua sanmei*, or "Lotus *samādhi*."

A recurrent theme in his preaching is summarized in one of his biographies: "The source of enlightenment is not

far away, and one's (Buddha) nature, like a sea, is not distant. Only direct your seeking inward upon yourself; do not get enlightenment from another." Huisi died peacefully in 577, at the age of sixty-two.

Some six extant works are attributed to Huisi: the *Das-heng zhiquan famen* (The Mahāyāna Teaching of Stilling and Insight; T. D. no. 1924); the *Zhufu wucheng sanmei famen* (The Teaching of Noncontentious *Samādhi* with Respect to All Phenomena; T. D. no. 1923); the *Sui ciyi sanmei* (The *Samādhi* Attained at Will; *Zokuzōkyō* 2.3); the *Fahua jing anluo xingyi* (The Cultivation of the Anluo Chapter of the *Fahua jing*; T. D. no. 1926), a work that treats the ethics of a *Lotus* devotee in an era of the decline of the *Dharma*, as outlined in the fourteenth chapter of the *Lotus*; the *Shou pusa jiehyi* (The Ritual for Receiving the *Bodhisattva* Precepts; *Zokuzōkyō* 2.10); and the *Nanyue sidashi lishi yuanwen* (The Vows of Master Si of Nanyue; T. D. no. 1933). The authenticity of some of these works remains open to scholarly investigation. Attributions, in later catalogs, of some four other inextant works to Huisi may, to judge from the titles of these works, represent a retrospective attempt to ascribe many of the major teachings of Zhiyi to his master's inspiration.

**Zhiyi.** Zhiyi, the *de-facto* founder of the Tiantai tradition, was born in Jingzhou (present-day Hunan Province) in 538. At the age of seventeen he entered the monastic life under the direction of the master Fazhu of the guoyuan Si in Xiangzhou; after his ordination he began the study of the Vinaya (rules of monastic discipline) with Huikuang, reading at the same time various Mahāyāna texts. Sometime later Zhiyi made a pilgrimage to Mount Taixian, where he went into retreat, reciting the "three Lotus scriptures," the *Fahua jing*, the *Wuliang yi jing*, and the *Puxianguan jing*. He continued his chanting for twenty days, at which time he fully understood the meaning of these texts.

In 560 Zhiyi journeyed to Mount Dasu, where he met Huisi, who was now destined to become his chief instructor. Huisi instructed him in devotions centered around the figure of the *bodhisattva* Samantabhadra (Chin., Puhxian) and in the *Anluo* practices, practices taught in the fourteenth chapter (*Anluoxing pin*) of the *Fahua jing*. Following Zhiyi's enlightenment experience Huisi named him his *Dharma* heir and successor. Thereafter, Zhiyi took up residence in the Waguan Si in Jinling (Nanking), where he was to stay for eight years. During this period he lectured on the *Lotus* and the *Da zhidu lun* and taught a path of gradual meditative cultivation to his disciples. These teachings formed the basis for his *Fajie ziti chumen* (T. D. no. 1925). In 575 he moved to Mount Tiantai, a mountain that was to remain his major headquarters for the rest of his life and from which the tradition derives its name. In 577 Zhiyi and his followers were, by imperial edict, given the tax levies from Shifeng Prefecture (xian), and two clans were indentured to him to provide his community with fuel and water. Sometime in this period Zhiyi lectured on the *Jingning jing* (the *Vimalakīrtinirdeśa*

*Sūtra*) and the *Jingguangming jing* (a Prajñāpāramitā text); both of these lectures served as the basis for later written works.

In 585 Zhiyi lectured before the last emperor of the Chen dynasty on the *Da zhidu lun*. While in the Chen capital (Jinling) he also lectured on the *Renwang panruo jing* (Sutra of the Benevolent Kings; T. D. no. 246) and admonished the emperor against state intervention in the affairs of the *samgha*. In 587 Zhiyi gave a series of lectures on the *Fahua jing* in the Guangze Si; these lectures became the basis for his *Miaofa lianhua jing wenju* (Sentences and Phrases of the Lotus; T. D. no. 1718). With the establishment of the Sui dynasty (589–618) and the reunification of China after some three and a half centuries, the area around the two regions of Xiangzhou and Xingzhou was pacified and Zhiyi was able to make a pilgrimage to Mount Lu, a site famous in the history of Pure Land Buddhism. In 591 he administered the *bodhisattva* precepts to the later-to-be second Sui emperor, Prince Guang, in Yangzhou.

In 593 Zhiyi lectured on the *Fahua jing* at the Yuchuan Si, a monastery in Dangyang Prefecture whose construction he had overseen. The transcription of these lectures by Zhiyi's disciple and amanuensis, Guanding, served as the basis of the *Miaofa lianhua jing xuanyi* (The Profound Principles of the Lotus; T. D. no. 1716). The following year Zhiyi lectured on the practice of meditation; these lectures, again transcribed by Guanding, formed the basis for the last of his three major works, the *Mohē zhiguan*. In 595, once more at the request of the prince, Zhiyi found himself in the capital, Jinling, where he composed a commentary on the *Vimalakīrti Sūtra* on behalf of his most eminent patron. Soon thereafter, however, inspired by a premonition of impending death, he returned to Tiantai to impart his final teachings to his disciples. These were transcribed under the title *Guanxin lun* (On Visualizing the Mind; T. D. no. 1920). Zhiyi died in the eleventh month of 597.

Although Zhiyi considered himself part of a spiritual lineage that derived ultimately from Nāgārjuna and that had been transmitted through Huiwen and Huisi, the doctrines that have in East Asia been most typically associated with (early) Tiantai are the products of his own skill as a teacher and exegete. His biographies record that Zhiyi was responsible for the construction of some thirty-five monasteries, had fifteen copies of the Tripiṭaka copied and thousands of Buddha images cast, ordained over a thousand monks, some thirty-two of whom became advanced students under his personal guidance, and produced a large number of works on doctrine and meditation. (Forty-six are attributed to him, but a number are clearly later forgeries.)

Also important were the links he established with the Sui ruling house, who saw in Zhiyi's synthesis of diverse strands of the Buddhist tradition a compelling analogue to their own political unification of the empire. Unfortunately, the close relationship enjoyed by Zhiyi with the Sui rulers, and the lavish patronage he and his community received at

their hands, were responsible for the school's dramatic loss of prestige in the aftermath of the fall of the Sui in 518. The new dynasty, the Tang, wishing to disassociate itself from Sui policies, naturally eschewed the symbols of religious legitimacy treasured by its predecessor.

**DOCTRINE AND PRACTICE.** The Tiantai tradition is characterized by the use of an exegetical method developed by Zhiyi and employed by him in his works; all subsequent Tiantai writers employed this same method. Tiantai doctrine is founded upon a particular reading of the *Lotus Sūtra*, to which is imported a wide variety of teachings associated with other texts and traditions and an organizational principle whereby the disparate texts and teachings of Mahāyāna Buddhism are seen in the context of an overarching scheme of revelation and levels of textual interpretation. Although the systematization of this insight into the so-called Five Periods and Eight Teachings doctrine is probably the work of a later hand, the basic inspiration for the system clearly derives from Zhiyi. Three works in particular, all by Zhiyi, are recognized by the tradition as constituting the core and epitome of its teachings.

**Miaofa lianhua jing wenzhu.** The first of these, the *Miaofa lianhua jing wenzhu* (*Fahua wenzhu*, for short), or *Words and Phrases of the Lotus Sūtra*, is based on Zhiyi's lectures at the Guangze Si in 587 on the meaning of key words and phrases in the *Lotus Sūtra*. Guanding's compilation and redaction of notes taken at this lecture series were completed in 629.

The *Wenzhu* employs four types of explanation (*sishi*) in commenting on the text:

- (1) The explanation according to conditions (*yinyuan shi*), in which the author analyzes the Buddha and his audience and the four "benefits" (*siddhāntas*) produced by this *sūtra* (it leads to joy and happiness, it generates roots of good, it destroys evil, and it enables the devotee to enter into an understanding of the Absolute).
- (2) The explanation in which this and all other *sūtras* are analyzed on the basis of the place they occupy in the teachings of the Buddha over his entire lifetime (*yuejiao shi*). The standards for evaluating any teaching are two: whether it is "partial" or "perfect" (i. e., whether it is fully expressive of the insights of the Buddha or only partially so), Hīnayāna or Mahāyāna; and where it is included in the scheme of the Five Periods and the Eight Teachings.
- (3) The explanation based on whether the teachings in question constitute the "basic" or "peripheral" message of the *sūtra* (*benji shi*).
- (4) The explanation based on the type of meditational practice taught in the *sūtra* (*guanxin shi*).

These four exegetical methods are employed on the *Lotus Sūtra* as a whole, and then on each chapter's title and on selected passages from each chapter. The first three explanations are theoretical, the last practical.

Zhiyi divided the contents of the *Lotus Sutra* into three parts, two parts, and a combination of the two. He divided the whole of the scripture into three parts: an introduction (chapter 1), the core teachings (chapter 2 to the first half of chapter 17), and a postscript (the last half of chapter 17 to the end of the work, chapter 28). He also divided the scripture into two parts (based on the *benji shi* method, mentioned above): The first fourteen chapters constitute the fictive or provisional teachings; the second fourteen chapters constitute the basic or absolute level of teaching. Here again, a tripartite analysis is employed against each section. The fictive or provisional teachings are composed of an introduction (chapter 1), a core teaching (chapters 2 to 6), and a postscript (chapters 7 to 14). The basic or absolute teachings are similarly divided into the introduction (the first half of chapter 15), the core teaching (latter half of chapter 15 to the first half of chapter 17), and the postscript (latter half of chapter 17 to the end of the text).

For Zhiyi, the teachings of the first half of the *Lotus* (the first fourteen chapters) center around the promise of salvation for all beings. In this section, the Buddha Śākyamuni reveals that the traditionally articulated soteriological paths (*yānas*)—that of the *śrāvaka*, or “Hīnayāna” devotee, consisting of the teaching and practice of the Four Noble Truths; the pratyekabuddha, or self-enlightened Buddha, epitomized by the teaching of dependent origination (*pratītya-samutpāda*); and the *bodhisattva*, or Mahāyāna practitioner, characterized by the practice of the “perfections” (*pāramitās*)—are only apparently distinct religious paths. In fact, the end of each is nothing less than full and complete Buddhahood; there are not three vehicles to salvation, only one, the *ekabuddhayāna*, or “One Vehicle of the Buddha.” This section of the *sūtra* also preaches, according to Zhiyi, that phenomenal existence is identical with the absolute, and that all *dharmas* have real and tangible characteristics.

The second half of the *sūtra* proclaims, however, that Śākyamuni’s very appearance in the world is a mere fiction, a device employed, so says Zhiyi, by the one, eternal Buddha to aid in the salvation of all beings. Under this interpretation, the historical Buddha, indeed all Buddhas of the ten directions, are nothing more than emanations of this one Buddha, and their earthly careers—the paradigmatic sequence of birth, renunciation of family life, cultivation of ascetic practices, even the enlightenment and final *nirvāṇa* (*parinirvāṇa*)—mere elements in a great soteriological drama designed to reveal the *Dharma* to sentient beings. For this reason, Zhiyi termed the teachings of the first half of the text provisional; only the latter half constitutes the full revelation of absolute truth.

All subsequent Tiantai writings having the words *wenzhu* in their titles employ the fourfold exegetical method described here.

**Miaofa lianhua jing xuanyi.** The second of the major works of Zhiyi, the *Miaofa lianhua jing xuanyi*, is primarily

an exegesis of the five words in the title of the *sūtra* from five points of view. The exegetical method of this commentary is thus called the “five types of profound principles” (*wuzhong xuanyi*). These five exegetical categories characterize all subsequent Tiantai writings having the term *xuanyi* in their titles and were used to analyze all Buddhist scripture, not merely the *Lotus*. The first explains the name of the *sūtra* (*shiming*); the second is a detailed analysis of its philosophy, a philosophy that may not be necessarily expressed in the text itself (the *bienti* explanation); the third clarifies important points expressed in the body of the text (the *mingzong* explanation); the fourth discusses how the *sūtra* expects persons to act or to think with respect to the teaching presented therein (the *lunyong* explanation); and the fifth evaluates the *sūtra* and ranks it in relationship to the Absolute teachings presented in the *Lotus* (the *panjiao* explanation). Zhiyi continues with an explanation of the meditational practice taught in the *Lotus*, how the devotee should visualize that the different characteristics of all *dharmas* are all in one’s own mind and that this mind actually (not merely potentially) possesses all *dharmas*.

Zhiyi’s specific explanation of the meaning of the word *fa* (*dharmā*) derives from the explanation that he learned from his master Huisi: The word *fa* includes the aspect of mind, the Buddha, and sentient beings. All these three are at once provisional *and* absolute, a truth that is realized when the devotee sees that he or she and all other sentient beings possess the “ten suchnesses” (*shi rushi*) and the “ten *dharmadhatu*,” or realms of rebirth (*shi fajie*). Each realm possesses each of the ten suchnesses for a total of one thousand characteristics, and each one of these one thousand characteristics are empty (*kong*), provisionally existent (*jia*), and both empty and existent at the same time (*zhong*). This threefold characterization is referred to as the “three wisdoms.”

In the last part of the commentary, Zhiyi refutes various theories of early Huayan and Weishi (Yogācāra) masters. He also denies the equality, maintained by many, of the *Lotus Sutra* and the *Huayan jing* and refutes the theories of several early Lotus thinkers.

**Mohe zhiguan.** The last of the major works of Zhiyi is the *Mohe zhiguan*. Unlike the former two works, which deal primarily with theory and only peripherally with meditation, this work constitutes the core of Tiantai teachings concerning practice. The text of the *Zhiguan* was composed by Zhiyi, but the introduction to the work was written by Guanding. In it, Guanding speaks of the lineage of Tiantai meditational practice and teaching. He speaks of two lineages: The first is taken from the *Fu fazang jing* and posits a line of transmission that begins with the Buddha Śākyamuni and may be traced to the Indian monk Śiṃha. This lineage also includes Nāgārjuna. Because it begins with the “golden mouthed” words of the Buddha it is called the “golden mouth lineage.” The second lineage is called the “lineage of contemporary masters”; it traces its origin from Nāgārjuna, through Huiwen to Huisi, to Zhiyi.

**THE FIVE PERIODS AND THE EIGHT TEACHINGS.** One of the most distinctive features of Tiantai thought was its classification of the whole of Śākyamuni's teachings, that is, the whole of Buddhism, into five periods, during which the Buddha is said to have taught different doctrines to different classes of persons. These teachings are further subdivided on the basis of their contents.

The "five periods" (*wushi*) are (1) the Huayan (Skt., Avatamsaka) period, (2) the period of the Ehan, or Agamas, also called the Luyuan (Skt., Mṛgadāva, "Deer Park") period, (3) the Fangdeng (Skt., Vaipulya) period, (4) the Boruo (Skt., Prajñāpāramitā) period; and (5) the Fahua (Skt., Saddharmapuṇḍarīka) or *Niepan* (Skt., Nirvāṇa) period. These take their names, as is obvious, from specific scriptures or scriptural collections preached during these eras.

The "eight teachings" (*bajiao*) are two sets of four teachings, so divided on the basis of the method and the type or content of the teaching employed. The first four, the *huayi*, or methods of conversion, are (1) the Sudden Teaching (*dunjiao*), (2) the Gradual Teachings (*jianjiao*), (3) the Secret Teachings (*bimi jiao*), (4) the Indeterminate Teachings (*buding jiao*). The *huafa* teachings, that is, the teachings classified on the basis of their contents, are (1) the Piṭaka Teachings (*zangjiao*), (2) the Common Teachings (*tungjiao*), (3) the Separate Teachings (*biejiao*), and (4) the Perfect Teachings (*yuanjiao*).

When the Buddha Śākyamuni was first enlightened he is reputed to have sat silently for twenty-one days, during which time various emanations from his body are said to have taught several sermons that were later compiled into one work, the *Huayan jing* (*Avatamsaka Sūtra*). During this twenty-one-day period the Buddha presented the teachings to advanced *bodhisattvas*, the only beings capable of comprehending their lofty contents.

After this twenty-one-day period, the Buddha then spent the next twelve years preaching the Hīnayāna teachings to an audience that was incapable of understanding the "sudden" presentation of the Mahāyāna teachings of the Huayan jing. These Hīnayāna teachings, also called the Āgamas (known in Pali as the Nikāyas), were first preached in the Deer Park (Mṛgadāva) in the town of Sārnāth, a suburb of Banaras, and were intended as an initial step in preparing his listeners for more advanced (i. e., Mahāyāna) teachings. These Hīnayāna discourses were thus deemed expedient (*upāya*) teachings designed to lead the Buddha's hearers eventually to greater understanding of the ultimate or absolute level of the Truth.

Following this, the Buddha then preached for eight years to those followers who had attained the fruit of the Hīnayāna teachings, that is, to *arhats*, in order to bring them to the realization that arhatship does not represent the acme of the religious career. Thus, the Buddha preached a large number of Mahāyāna sermons—represented by such scriptures as the *Weimo jing* (*Vimalakīrtinirdeśa*), the *Shengman*

*jing* (*Śrīmālādevī Sūtra*), the *Jinguang ming jing* (*Suvarṇaprabhāsa Sūtra*)—which were taught, in the words of Zhiyi, "to deprecate the partial and to praise the perfect; to demolish the Hīnayāna, and to praise the Mahāyāna," so that the followers would "be ashamed of the Hīnayāna and long for the Mahāyāna."

Next, the Buddha taught the Prajñāpāramitā (Perfection of Wisdom) teaching of the emptiness of all *dharmas*. This twenty-two year period was followed by the presentation, for the first time since the teachings of the *Huayan jing*, of the absolute truth: For the next eight years the Buddha taught the *Lotus Sutra*. As the Buddha was about to die, he spent his last day and night preaching the *Mahāparinirvāṇa Sūtra*, the *Niepan jing*. In this teaching he emphasized that all beings have the Buddha nature, or the potential to become fully enlightened Buddhas, thus converting those who had remained unswayed by the preaching of the *Lotus Sutra*. In order to remove the delusions of those "of weak capacities among later generations" who would come to have the "false view of extinction and annihilation," he stressed the importance of the Vinaya and its precepts for the moral life, and taught the eternal existence of the Buddha. Because the message and the approximate time period of the preaching of the *Lotus Sutra* and the *Mahāparinirvāṇa Sūtra* were the same, these two scriptures were said to make up a single era.

Zhiyi did not assign any specific number of years to each of these periods; these were first added to this scheme in the early thirteenth century by the scholar-monk Yuansui in his *Sijiaoyi beishi* (*Zokuzōkyō* 2.7.1). This identification with a specific number of years for each period became standard in Tiantai circles, although it was criticized by Zhixu (in his *Jiaoguan kangzong*), the Japanese master Shōshin (in the *Hokkegenji shiki*), and by the seventeenth- and eighteenth-century Japanese masters Fujaku and Hotan.

Of the four methods of conversion, the Sudden Teaching is identified with the Huayan period and the Gradual Teachings with the second, third, and fourth periods. The Secret Teachings are those in which one group of persons is taught the Sudden Teaching and another group is taught a Gradual Teaching, yet neither group realizes that the other has received a different presentation of the teachings. Hence, they are termed "secret [and indeterminate]." But should these two groups realize that each is receiving a different teaching and a different type of spiritual benefit, then the teachings are termed the "[revealed] indeterminate teachings." No specific scriptures are assigned to these last two categories.

The classification of the teachings according to their contents begins with the Piṭaka Teachings, a synonym for the Hīnayāna. In this teaching the Four Noble Truths are taught differently for the *śrāvakas*, *pratyekabuddhas*, and *bodhisattvas*. Then the Four Truths are taught with respect to emptiness and nonarising to these three categories of followers equally. This is termed the Common Teaching. When an unlimited number of Four Truths are taught only to

Mahāyāna *bodhisattvas*, this teaching is coupled with a presentation of the three insights, emptiness (*gu*), provisional existence (*jiā*), and the middle, or reconciliation of these two (*zhong*), in a sequential manner. This is the Separate Teaching, as each defilement is cut off separately. When the three insights are taught, cultivated, and realized simultaneously, and when the three defilements are cut off all at once, this is the Perfect Teaching.

The teaching of the Huayan period is the Perfect Teaching, but not exclusively so; it also contains traces of the Separate Teaching. The Deer Park period is devoted exclusively to the Piṭaka Teaching. The third period, the miscellaneous Mahāyāna or Vaipulya period, contains elements of all four teachings, and the fourth period teaches the Perfect Teaching but with strong traces of both the Common and Separate Teachings. In the fifth period, the *Lotus Sutra* is purely the Perfect Teaching, with no admixture of any of the other teachings, whereas the *Mahāparinirvāṇa Sūtra* constitutes a subsidiary teaching, and includes all of the four types of teachings.

**Meditation.** According to Guanding, Zhiyi's teaching of meditation can be traced to the master Huisi, and comprehends "three types of stilling and insight meditation" (*sanzhong zhiguan*): the gradual attainment of stilling and insight (taught in full in Zhiyi's *Shichan poluomi ziti famen*, T. D. no. 1916), the indeterminate attainment of stilling and insight (represented by his *Liumiao famen*, T. D. no. 1917), and the perfect and sudden attainment of stilling and insight (represented by the *Mohe zhiguan*).

The *Mohe zhiguan* is divided into ten major sections; sections one and seven are further subdivided into important subdivisions. Section one is entitled *Dayi*, ("great teaching") and is subdivided into (1) generating the *bodhicitta* (in which ten types of good and bad *bodhicitta* are enumerated); (2) cultivating the great practice, in which four types of *samādhi* are enumerated: the "*samādhi* of perpetual walking," the "*samādhi* of perpetual sitting," the "*samādhi* of half-walking and half-sitting" (which, coupled with the perpetual recitation of the Nembutsu, became important in Japanese Tendai and Pure Land practice), and the "*samādhi* of neither walking nor sitting"; (3) experiencing the great result (i. e., the *sambhogakāya*); (4) rending asunder the great snare of doubts, in which the author refutes doubts and objections based on other writings and teachings; and (5) returning to the great source, *nirvāṇa*.

Section two discusses the name (*Stilling and Insight*) of the text. Section three discusses its characteristics; section four states that this practice embraces all *dharmas*; section five discusses whether this practice is partial or perfect; and section six gives some twenty-five external and internal preparations for the practice of meditation. Section seven is entitled "The Real Practice" and is subdivided into ten subdivisions. According to section seven, on the first of the devotee's intensive meditations he or she should meditate on "the three thousand *dharmas* in one instant of mind" (*yinian sanqian*),

a practice that has become one of the hallmarks of Tiantai meditation. This teaching states that the devotee's five skandhas presently contain all of the *dharmas* ("the three thousand *dharmas*") of existence. These three thousand are the ten realms of rebirth (hell, *pretas*, animals, *asuras*, humans, *devas*, *śrāvakas*, *pratyekabuddhas*, *bodhisattvas*, and Buddhas) multiplied by the ten "suchnesses," or real, tangible characteristics (nature, external characteristics, body, power, creative ability, causes, conditions, results, recompenses, and the totality of the Absolute), in turn multiplied by the three realms (the realm of sentient beings, their physical lands, and their five *skandhas*).

The remaining portions of section seven elucidate meditational practices designed to remove the influences (*vāsanās*) of one's past *karman*. At this point the *Mohe zhiguan* comes to an abrupt end; that is, it ends at the seventh subdivision of section seven; the remaining sections (eight to ten) are missing, although the names of their titles are known from the introduction to the work: Section eight is concerned with karmic results, section nine with the teachings, and section ten with the general purport. There are two traditional reasons given for this abrupt ending to the text: Either Zhiyi was asked to speak for a certain period of time and his time ran out, or he was beginning to speak of states of attainment that could not be expressed in words. That is to say, if the devotee progressed as far as was already described in the text, the devotee would automatically know the ending of the book.

**Introductory manuals.** Even though the major writings of the Tiantai tradition are large, voluminous works, early on it became obvious to Zhiyi that his thought would be best presented in shorter epitomes of his teachings. One of the distinctive features of the Tiantai tradition is that it produced a number of one-volume works that present the salient points of Tiantai doctrine in a brief, easy to remember form.

One of the first of these works was Guanding's Tiantai *bajiao dayi* (The Major Points of the Eight Teachings of the Tiantai; T. D. no. 1930). Another popular one volume introduction to Tiantai thought is the Tiantai *sijiaoyi* (Kor., *Chōndee sagyōngui*; T. D. no. 1931) by the Korean monk Chegwan (Chin., Tigan). This text is divided into two sections: The first describes the "five periods" (in the teaching career of the Buddha) and the "four teachings" (four types of doctrine preached by Śākyamuni); the second describes the meditational practice of the lineage. With this arrangement the author appears to separate the doctrinal from the practice aspect of the teaching, a point upon which he was criticized by later writers (e.g., Zhihxü).

Another short, one-volume introductory work is the *Jiaoguan kangzong* (T. D. no. 1939) by the Ming dynasty master Zhixu (1599–1655). In this work Zhixu attempts to present the orthodox Tiantai teachings without any admixture of his own interpretations, yet his definition of orthodox Tiantai are the thoughts of the *shanjia* masters of the Song

dynasty. This work was written along the lines of Chegwan's *Sagyōngui*, but whereas Chegwan presents the meditational practices of the various Four Teachings apart from their doctrines, Zhixu stresses the close interrelation between teaching and practice (meditation) in each of the Four Teachings.

Another short introductory work by Zhixu that is still widely read in both China and Japan is the *Fabua lunguan* (A Synopsis of the *Lotus Sutra*; Zokuzōkyō 50). In this work Zhixu adopted Zhiyi's exegetical method and selected passages from Zhiyi's *Fabua xuanyi* and *Fabua wenju* to illustrate the purport of the *sūtra* and its title. He also quotes from these two works to illustrate the teaching of each of the twenty-eight chapters of the *Lotus Sutra*.

**Tiantai historiographical works.** The Tiantai contribution to Chinese Buddhism is not confined to doctrinal works alone. Two major church histories, the *Fozu tongji* (Comprehensive Record of the Buddha and the Patriarchs; T. D. no. 2035) and the *Shimen chengtong* (*Zokuzōkyō* 2.3.5), bear the imprint of Tiantai thought.

The former, composed in 1269 by Zhipan, is a general history of Buddhism in both India and China rendered from the Tiantai point of view. In it are preserved biographies of the Buddha and major patriarchal figures, chronologies of Chinese and Indian church history, histories of rival orders, Tiantai cosmology, accounts of church-state relations, miraculous tales, and the texts of important steles. The work contains much material pertaining to the *shanjiashanwai* debates of the Northern Song period, and is altogether notable for the attention it accords the Pure Land tradition in China, an account of which occupies a full three volumes.

The latter work, the *Shimen chengtong*, is in its present form the work of the Southern Sung master Zongqian, who rewrote the text from an earlier history, the *Zongyuan lu*. It is modeled after secular Chinese historical writings. In its five sections are chronicles of the Buddha and major Indian figures; sectarian lineages; monographs treating such topics as popular customs, social welfare, monastery administration, and so forth; biographies of lesser Tiantai masters; and records of other traditions.

**LATER MASTERS.** Although Zhiyi represents the lynchpin of Chinese Tiantai, his work was carried on and developed by a succession of later masters whose efforts ensured that Tiantai remained one of the most influential and doctrinally sophisticated traditions of East Asian Buddhism.

**Guanding.** Zhiyi's successor as abbot and leader of the Tiantai lineage was Guanding (561–632). A native of Zhanran (Zhejiang Province), Guanding entered the monastic life at the age of six, particularly distinguishing himself in literary studies. He was fully ordained at the age of nineteen. After the death of his ordination master Guanding left the local monastery and went to the Xiuchan Si (later the chief monastery of the Tiantai tradition) on Mount Tiantai, where he met Zhiyi for the first time. It was here that he began his study of the Tiantai meditational practices and doctrinal synthesis established by Zhiyi.

In 583 Guanding accompanied Zhiyi to the Guangze Si in Jinling; here he studied Zhiyi's meditational teachings and was certified as Zhiyi's successor and permanent attendant. In 614 Guanding completed his two-volume commentary on the *Mahāyāna-parinirvāṇa Sūtra*, his *Daniepan jing xuanyi*, and the thirty-three volume commentary on this same scriptures, his *Daniepan jing shu*. With the completion of these works the Tiantai tradition now had complete commentaries on the two most important scriptures in their lineage, the *Lotus Sutra* and the *Mahāyāna-parinirvāṇa Sūtra*, whose doctrines, in the view of Zhiyi and Guanding, make up the "perfect" or "round" teaching (*yuanjiao*). Guanding's biographer states that, owing to the civil disorder attendant upon the collapse of the Sui, the five years it took him to complete his commentaries were ones of extreme privation.

In his later years Guanding lived in the city of Kuaiji, where he lectured on the *Lotus Sutra*. His biography records that contemporary popular rhyme said that he "surpassed Falang, Huiji, Fayun and Sengyin," the ranking scholar-monks of his day. It was through the efforts of Guanding that the monastery on Mount Tiantai began again to enjoy imperial patronage; Guanding was also responsible for the transcription and propagation of the major and minor works of Zhiyi, thus ensuring their survival for later generations.

In addition to the works mentioned above, Guanding's extant corpus includes the *Guanxin lun shu*, a commentary on Zhiyi's *Guanxin lun*; the *Sui Tiantai Dashi biezhuān*, a one-volume biography of Zhiyi and the primary source for existing knowledge of his life and works; and the *Guoqing bailu*.

**Zhanran.** Zhanran, counted as the ninth Tiantai patriarch, was born in 711 in Jingxi (present-day Jiangsu Province) to a family that had for generations produced Confucian scholars and officials. His biography states that in his youth he excelled in scholarship; at the age of sixteen he developed an interest in Buddhism and began to search out teachers of the faith. His first recorded teacher was Fangyan, who taught him the elements of *zhiguan* meditation. At the age of seventeen he met Xuanlang (later to be counted as the eighth patriarch of the Tiantai tradition), who, it is said, immediately recognized the youth's intelligence and taught him both the doctrines and the meditation techniques of the Tiantai tradition.

For the next twenty years Zhanran, still a layman, devoted himself to the study of Tiantai doctrines, finally becoming ordained in 748. After his ordination, Zhanran journeyed to Kuaiji where he studied the monastic discipline with the Vinaya master Tanyi (Kor., Tamil). Sometime thereafter Zhanran gave a series of lectures on the *Mohē zhiguan* in the Kaiyuan Si in Wujun. Following the death of Xuanlang in 754, Zhanran took upon himself the task of propagating the Tiantai doctrines. This he did by writing commentaries to the three major works of Zhiyi, polemics against the Huayan, Yogācāra, and Chan systems, and short manuals of meditational instruction. His voluminous writ-

ings earned him the informal title of *jizhu*, the Master of Commentaries. Zhanran died in 782, and was buried next to the remains of Zhiyi. For his role in propagating Tiantai doctrines at a time of their eclipse Zhanran has been termed “the patriarchal restorer of the Tiantai tradition” (*Tiantai zhongxing zu*). He had some thirty-nine disciples, including Daosui and Xingman, as well as the academician Liang Xiao.

Zhanran’s fame rests on his literary works. These include commentaries on Zhiyi’s three major works: *Fahua wenju ji* (T. D. no. 1719), *Fahua xuanyi shiqian* (T. D. no. 1717), and the *Zhiguan fuxing zhuanhongjueh* (T. D. no. 1912). In addition to these, Zhanran also reedited the *Niepan shu* and composed three commentaries on the *Weimo jing* (*Vimalakīrtinīrdeśa Sūtra*), a selection of significant passages from the *Mohe zhiguan* (his *Zhiguan wenju*), works on Huayan (his *Huayan gumu*), on selected topics in Tiantai doctrine (*Jingang bi lun* and *Shibuer men*, important works in the subsequent Song-dynasty *shanjiashanwai* debates), and a number of introductory manuals of meditation.

**Zhili.** Zhili, later to be counted as the seventeenth patriarch of the Tiantai tradition, was born in 960 in Siming (Chegiang Province). At the age of six, he lost his mother, and his father sent him to live in a local monastery. It was there, at the age of fourteen, that he received full ordination. At nineteen he began his study of Tiantai doctrine with Yitong (Kor., Ŭitōng). After Zhili had been with Yitong for one month the master had him lecture on the *Xinjing* (the *Prajñāpāramitāhṛdaya Sūtra*), and after a period of three years Zhili was giving all of his master’s lectures. Yitong died in 988; in 991 Zhili took up residence in the Qianfu Si, where he stayed for four years, lecturing on Tiantai doctrines and writings. As his students grew in number the accommodations of the Qianfu Si proved to be too small, so in 995 he moved to the Baoen Yuan; in the following year the abbot of the Baoen Yuan resigned his office and Zhili was able to turn the monastery into a Tiantai teaching center.

Zhili’s entire life was devoted to religious instruction. In addition to a voluminous corpus of writings, twenty-three titles by one account, and his lectures on the major Tiantai works and commentaries, he also pursued a rich liturgical and meditative career. He was responsible for the construction of hundreds of monasteries, the mass printing of Tiantai literature, the casting of devotional images, and the inauguration of an “Assembly for the Recitation of the Name of the Buddha and for Giving the Precepts” (*nianfo shijie hui*), convened annually on the fifteenth day of the second month. But Zhili is perhaps best known for his role in the so-called *shanjiashanwai* debates, the seminal Tiantai dispute of the Northern Song period (960–1127).

The *shanjia* (“mountain school,” the “orthodox” position) centered around Zhili and his followers; the *shanwai* (“outside the mountain,” i. e., non-orthodox) position centered around the monks Qingzhao and Jiyuan. The dispute turned on whether the correct object of meditation should be the “mind as it currently is,” defiled and ignorant, or the

“true mind,” in which case the devotee was to visualize a deity or some other transcendental object in order that the mind might take on the feature of the object of meditation. In the course of the debate the authenticity of various works popularly attributed to Zhiyi and Zhanran was also disputed, so that what came to be at issue was the very question as to which teachings would be recognized as “orthodox” Tiantai doctrine. The debate was joined initially in a series of correspondence between Zhili and his *shanwai* counterparts Wuen, Qingzhao, and Jiyuan. Many of these documents are preserved in Zhili’s collected works, the *Siming zunzhe jiaoxing lu* (T. D. no. 1937). In the course of this correspondence Zhili made a case for the everyday mind, replete with defilements as it is, as the proper object of meditation, a point around which a variety of notions concerning the nature of the Absolute also crystallized.

By the time of his death in 1028 Zhili had gathered around him a large number of students, more than thirty of whom were his close disciples. Zhili also personally ordained over seventy monks.

**Zhixu.** The scholar-monk Zhixu was born in 1599 in the Suzhou district of present-day Jiangsu Province. In his youth he was an ardent student of the Confucian classics. Like many of the Confucian scholars of his day, he had an intense dislike for Buddhism and even composed an essay purporting to refute Buddhist doctrine. But at the age of sixteen he chanced to read the *Zizhilu* and the *Zhushuang suibi* of the master Yunqi Zhuhong (1535–1615) and was converted to Buddhism. At nineteen he underwent an enlightenment experience while reading the *Lunyu* (Analects) of Confucius; as his biographer put it, “he was enlightened to the mind (*xinfa*) of Confucius and Yanzi.”

In 1638 Zhixu resolved to compose a commentary on the *Fanwan jing* (T. D. no. 1815), the standard Chinese Mahāyāna text treating the precepts. Undecided as to which doctrinal point of view he should adopt in his explanation of the text, he made four tokens in order to practice a rite of divination in front of a Buddha image. On these tokens he wrote “the Huayan tradition,” “the Tiantai tradition,” “the Weishi tradition,” and “my own tradition,” respectively, signifying by this last that he would develop his own understanding of the Buddha’s teachings. In this rite, the token marked with the Tiantai tradition came to the fore, and from this time onward he composed all of his textual commentaries based on Tiantai principles.

In the summer of 1655 Zhixu fell ill, and on this occasion compiled the *Jingtu shiyao* (Ten Essential Works on the Pure Land), an anthology of ten essays dealing with the Pure Land doctrines. At the end of summer his illness abated and he was then able to complete his *magnum opus*, the forty-four-volume *Yuezang zhijin* and the five-volume *Fahai guanlan*. Later that year his illness returned, whereupon he established a Pure Land religious sodality and composed a set of vows for the group. He also composed some stanzas on seeking rebirth in the Pure Land (the *Qiusheng jingtu jie*). Zhixu

died in 1655 at the age of fifty-six; his popular posthumous title was *Lingfeng Yuyi Dashi*. His extant corpus of writings is voluminous: Some forty-six titles appear in various canonical collections and a number of texts still circulate independently. Zhixu's miscellaneous pieces were collected in 1678 by his disciple Chengshi into the ten-volume *Lingfeng Yuyi Dashi zonglun*.

Zhixu's corpus includes several works concerned with the *Lengyen jing*, a scripture hitherto not commented upon from the Tiantai standpoint, and works dealing with the precepts, Buddhist logic, different aspects of Buddhist philosophy, many different scriptural commentaries, and interestingly enough, a Buddhist commentary on the Four Books (four Confucian classics) and a ten-volume *Zhouyi chanjie* (a Chan commentary on the *Book of Changes*). Zhixu's largest work is the forty-four-volume *Yuezang zhijin* (Examining the Canon and Determining Its Depth). In this work he comments on every book included in the Buddhist canon, a task he began when he was twenty-nine years old.

Zhixu's text divides the whole of the canon into four parts: Sūtra, Vinaya, Śāstra, and Miscellaneous. The Sūtra section is divided into Mahāyāna Sūtras and Hīnayāna Sūtras, and the Mahāyāna Sūtras are divided on the basis on the Five Periods: Huayan, Vaipulya, Prajñā texts, Lotus-related texts, and Mahāparinirvāṇa texts. The Vaipulya scriptures are divided into Revealed Teachings and Secret Teachings, and the Secret Teachings are further divided into Secret (i. e., Tantric) scriptures and *sādhana* literature.

The Vinaya is here divided into Mahāyāna Vinaya texts and Hīnayāna Vinaya texts. The Sastra section is divided into Mahāyāna Śāstras and Hīnayāna Śāstras. Mahāyāna Śāstras are divided into three: Śāstras that comment on scriptures, sectarian Śāstras, and Śāstras that comment on other Śāstras: this section is also broken down on the basis of those composed in India and those composed in China. The Miscellaneous section is divided into works composed in India and those composed in China, and the section of those works composed in China is divided into fifteen subsections: repentance rituals, Pure Land, Tiantai, Chan, Huayan, Weishi, Tantrism, Vinaya, compilations, biographies, defense of the faith (i. e., polemical writings), glossaries, indices, "prefaces, hymns, poems, and songs," and last, a list of works that *should* be included in the canon. Zhixu comments on a total of 1,773 titles; for each work he gives the name of the translator or author, a summary of its contents, and the names of its chapters. Zhixu's classification of Buddhist scriptures was employed in the printing of the *Dai-Nippon kōtei shukukoku daizōkyō*; the influence of Zhixu's classification can also be found in the internal arrangement of the *Taishō daizōkyō*.

The *Yuezang zhijin* was not published during Zhixu's lifetime. It was first printed by 1669, and was reprinted in 1892 in Nanking. The first full Japanese printing came in 1783, and the work is now included in volume 3 of the *Shōwa hōbō sōmokuoku*, appended to the *Taishō daizōkyō*.

Zhixu also wrote a small work, the *Fabai guanlan* (Drops of Insight into the Sea of Dharma), treating his classification of the canon, which first circulated in a printed edition of 1654. In this work Zhixu divides Buddhist literature into five sections: the Vinaya, texts dealing with "teaching and insight" (Tiantai, Huayan, and Weishi), Chan, the Secret Teachings, and Pure Land works.

#### TIBETAN RELIGIONS

*This entry consists of the following articles:*

AN OVERVIEW  
HISTORY OF STUDY

### TIBETAN RELIGIONS: AN OVERVIEW

To the Western mind, Tibet has traditionally appeared as a remote yet uniquely fascinating country. Profoundly Buddhist in all aspects of its social, cultural, and religious life, it was, until 1959, dominated by a monastic hierarchy. In the imagination of some, the so-called Land of Snow (as the Tibetans style their country) has also been regarded as the home of mysterious, superhuman beings, *mahatmas*, who, from their secret abodes in the Himalayas, give mystic guidance to the rest of humanity.

As sources become more abundant, a more realistic and complex view of Tibetan history and religion is gaining ground. The following points, which make this clear, should be kept in mind.

First, Buddhism in Tibet is represented by several traditions, monastic “orders,” or schools, which have certain basic traits in common but also differ in significant respects. This must be taken into account when reading written sources, since traditional Tibetan historiography (which invariably is religious historiography) tends to reflect the more or less partisan views of the authors.

Second, Buddhism is not the only religion that must be taken into account. Buddhism penetrated into Tibet relatively late—perhaps not before the eighth century CE—and only gradually succeeded in supplanting a well-established indigenous religion that is still only fragmentarily known. Furthermore, from the tenth or eleventh century onward, the various Buddhist orders have existed alongside a religion known as Bon, which, while claiming, certainly not without some justification, continuity with the pre-Buddhist religion, is nevertheless almost indistinguishable from Buddhism in many respects. Bon has retained its own identity to this day. In addition, there remains a vast area of rites and beliefs that are neither specifically Buddhist nor Bon but may be styled “popular religion” or “the religion without a name.” There is also a small minority of Tibetan Muslims (who will, however, not be treated in this article).

Third, it should be recognized that *Tibet* is a somewhat ambiguous term. In the present context it can only be used in a meaningful way to refer to an ethnically defined area—including parts of India and Nepal—that shares a common culture and language, common religious traditions, and, to a large extent, a common history. The so-called Tibetan Autonomous Region of China only comprises the western and central parts of Tibet, including the capital, Lhasa. The vast expanses of eastern and northeastern Tibet (Kham and Amdo) have since the 1950s been incorporated into Chinese provinces, but are ethnically and historically entirely Tibetan. Beyond Tibet (thus defined), Tibetan Buddhism is the official religion of Bhutan; until the early years of the twentieth century it reigned supreme in Mongolia; and it is still found among the Buriats, Tuvin, and Kalmuks in Russia. Its spread in the West will be discussed at the end of this article.

The term *Lamaism* is frequently used to refer to Tibetan religion. Tibetans often object to this term, as it could be

taken to imply that Buddhism in Tibet is somehow basically different from Buddhism in other parts of Asia. To the extent that the term *Lamaism* points to the important role of the lama (Tib., *bla ma*), or religious guide and expert in Tibetan religion, it can be said to refer equally to Buddhism and Bon, and thus it retains a certain usefulness. However, as a term intended to describe Tibetan religion as a whole, it remains one-sided and hence misleading.

**THE PRE-BUDDHIST RELIGION.** When Buddhism was introduced into Tibet in the eighth century, it did not enter a religious vacuum. At present, however, it is not possible to arrive at an adequate understanding of the pre-Buddhist religion because of the incompleteness of the sources.

These sources fall into two categories: ancient and later. Ancient sources are those that predate the collapse of the royal dynasty in the middle of the ninth century. Archaeological sources are practically nonexistent, since only sporadic excavations have been undertaken to date. The royal tombs at *Phyong rgyas* in central Tibet are still prominently visible but were plundered at an early date. The vast majority of the written sources are later than the introduction of Buddhism and thus often show traces of syncretic beliefs. These sources include inscriptions on pillars and bells, manuscripts containing fragments of rituals and myths or of divinatory practices, Buddhist texts that refute the ancient religion, and Chinese chronicles from the Tang dynasty (618-907). The language of these Tibetan texts, however, is archaic and all too often obscure, and the manuscripts themselves are not infrequently in a fragmentary condition.

The later sources date from the twelfth century onward and are found mainly in the historical writings of Buddhism and the Bon religion, which, between them, had by this time been completely successful in an institutional sense at least in replacing the ancient religion. Many indigenous beliefs and practices have persisted until today in the popular, non-monastic religion, but as they are usually closely intermixed with elements of Buddhism (or, as the case may be, with Bon), it is an exceptionally delicate task to use folk religion as a basis for reconstructing the pre-Buddhist religion.

Thus the picture of pre-Buddhist religion that emerges on the basis of the ancient sources is, unfortunately, fragmentary. Certain rituals, beliefs, and parts of myths may be discerned, but the overall feeling of coherency is lacking. Those elements that are known focus largely on the person of the king. It is safe to assert that the Tibetans, at least from the sixth century onward, if not earlier, had a sacral kingship. The welfare of the country depended on the welfare of the king. Accordingly, rites of divination and sacrifice were performed to protect his life, guarantee his victory in battle, and ensure his supremacy in all things. It is said in the ancient sources that “his helmet is mighty” and his rule “great, firm, supreme,” and “eternal.” The king “does not change”; he is endowed with “long life.”

The king was regarded not only as a vitally important personage but above all as a sacred being. According to a fre-

quently encountered myth, the first king of Tibet descended from heaven (“the sky”) and alighted on the summit of a mountain (according to later sources, he made the descent by means of a supernatural rope or ladder). At the foot of the mountain he was received by his subjects. The earliest kings were believed to have ascended bodily to heaven by the same means, thus leaving no corpse behind. Furthermore, the king was assimilated to the sacred mountain itself, just as in later popular religion the distinction between a sacred mountain and the deity residing on it was often blurred.

The myth relates that when the seventh king was killed, funerary rites had to be performed for the first time. In fact, in historical times (i.e., from the sixth century CE onward) huge funerary mounds were erected, assimilated both to the sacred mountains and to the kings, the tombs being given names that consisted of the same elements as those found in the names of the kings themselves. The death of a king was surrounded by elaborate rituals: processions, sacrifices, and the depositing on a lavish scale of all sorts of precious objects in the burial chamber. The officiating priests were known generically as *bon pos*, but apparently there were numerous specialized subgroups. Animals were sacrificed: in particular, sheep, horses, and yaks. The sacrificial sheep seem to have had an important role as guides for the deceased along the difficult road leading to the land of the dead—a land apparently conceived of in terms analogous to that of the living. Servants and officials, perhaps also members of the family, were assigned to the dead king as his “companions”; it is uncertain, however, whether they, too, actually accompanied him to the grave, or, as certain later sources suggest, only lived within the precincts of the tomb for a specified period.

A surviving early text outlines an eschatological cosmology that embodies a cyclical view of time. In a “golden age” plants and animals are transposed from their celestial home to the earth for the benefit of humanity. Virtue and “good religion” reign supreme. However, a demon breaks loose from his subterranean abode and causes a general decline in morals as well as in the physical world. Those who nevertheless follow the path of virtue and honor the gods are led after death to a land of bliss. In the meantime, the world rapidly reaches a point at which everything is destroyed, whereupon a new golden age begins in which the virtuous dead are reborn. Thus the cycle presumably—the text is not explicit—repeats itself.

Little is known of the pantheon of the pre-Buddhist religion. The universe was conceived of as having three levels: the world above (the sky), inhabited by gods (*lha*); the middle world (the earth), the abode of human beings; and the world below (the subterranean world, conceived of as aquatic), inhabited by a class of beings known as *klu* (and later assimilated to the Indian *nāgas*).

According to some sources, the heavenly world above had thirteen levels, inhabited by a hierarchy of male and female deities. Both Chinese sources and epigraphic evidence speak of the sun, the moon, and the stars being invoked as

guardians and guarantors of treaties. Sacrifices in the form of various animals were made at the conclusion of the treaty of 822 between China and Tibet. By this time, however, Buddhism had appeared on the scene and the Three Jewels of Buddhism (i.e., Buddha, Dharma, and Sangha) were also invoked. A Buddhist monk with the rank of minister was at the head of the Tibetan delegation.

The subterranean beings, the *klu*, posed a constant danger to humanity, since they were particularly prone to be annoyed by activities that interfered with the surface of the land, such as plowing and digging. The *klu* could cause the eruption of diseases, especially leprosy and dropsy, that could only be cured through rites of atonement and propitiation. However, in determining the details of these rites and in obtaining specific information about the host of demons presumably populating the supernatural world of the ancient Tibetans we are to a large extent reduced to speculation on the basis of later, popular religious practices. Likewise, we meet with the names of various types of deities that are of great importance in later, popular religion: warrior god (*dgra bla*), god of the fireplace (*thab lha*), life god (*srog lha*), god of the land (*yul lha*), and so on.

It is difficult to establish which elements in the pre-Buddhist religion are truly indigenous. The later sources insist that many of the Bon priests came from countries bordering Tibet, in particular, areas to the west. After Buddhism had triumphed, the Tibetans themselves speculated whether the Bonpos were Śaiva adepts from Kashmir. Possible influences emanating from the Iranian world have also been the subject of speculation by Western scholars, so far without conclusive evidence. On the other hand, the importance of the Chinese influence, long ignored, has now been firmly established. The royal tombs have obvious Chinese prototypes, as does the sacredness of the king: he is “god son” (*lha sras*), corresponding to the Chinese emperor, the “Son of Heaven”; he is “sacred and divine” (*phrul gyi lha*), corresponding to the Chinese *sheng-shen*. This sacredness is manifested in a supernatural intelligence and in the power to act, politically as well as militarily.

It has been suggested that the pre-Buddhist religion was transformed into a coherent political ideology in the seventh century, modeled on the Chinese cult of the emperor. This royal religion was, according to this view, referred to as *gtsug* or *gtsug lag*, a word that was defined as “the law of the gods.” However, the later sources, Buddhist and Bonpo, unanimously refer to the ancient religion as Bon, a claim that is supported by recent research. In any case, the cult of the divine kings disappeared together with the organized priesthood.

**BUDDHISM.** Buddhism was established in Tibet under royal patronage in the eighth century. In the preceding century, Tibet had become a unified state and embarked upon a policy of military conquest resulting in the brief appearance of a powerful Central Asian empire. The introduction of Buddhism was certainly due to the need to provide this empire

with a religion that enjoyed high prestige because of its well-established status in the mighty neighboring countries of India and China. The first Buddhist temple was built at Bsam yas (Samyé) in approximately 779; soon afterward the first monks were ordained. From the very start, the Buddhist monks were given economic and social privileges.

When Buddhism was introduced, the Tibetans had a choice as to whether the new religion should be brought from India or China. Modern scholarship has established the important role that China played as a source of Buddhism in the early stages of its history in Tibet. Nevertheless, it was the Indian form of Buddhism that eventually predominated. According to later sources, the Tibetan kings were guided by spiritual considerations and the proponents of Indian Buddhism emerged victorious from a doctrinal debate with Chinese monks representing a form of Chan Buddhism. However, hard political motives were surely equally important: in military and political terms China was Tibet's main rival, and China's influence at the Tibetan court would be unduly increased if it gained control of the powerful Buddhist hierarchy.

In any case, Tibet turned to India for its sacred texts, philosophical ideas, and rituals, in the same way as it had adopted, in the seventh century, an Indian alphabet. Once set on its course, Buddhism rapidly became the dominant religion, suffering only a temporary setback after the collapse of the royal dynasty in 842. In several important respects, Buddhism in Tibet remained faithful to its Indian prototype. It must, of course, be kept in mind that this prototype was, by the seventh and eighth centuries, a form of Mahāyāna Buddhism that was, on the one hand, increasingly dependent on large monastic institutions, and on the other, permeated by Tantric rites and ideas. Both these features—vast monasteries and a pervasive Tantric influence—have remained characteristic of Buddhism in Tibet. Similarly, there has been little development in the realm of philosophical ideas; the Tibetans have, on the whole, been content to play the role of exegetes, commentators, and compilers. However, the political domination that the monasteries gradually obtained was without precedent. A uniquely Tibetan feature of monastic rule was succession by incarnation—the head of an order, or of a monastery, being regarded as the reincarnation (motivated by compassion for all beings) of his predecessor. In other cases, a religious figure might be regarded as the manifestation of a deity (or a particular aspect of a deity). In the person of the fifth Dalai Lama (1617–1682) both ideas were combined. Each Dalai Lama was already regarded as the incarnation of his predecessor; the fifth, who established himself as head of the Tibetan state, also came to be regarded as the emanation or manifestation of the great *bodhisattva* Avalokiteśvara (Tib., Sphyanrasgzigs), as have all subsequent Dalai Lamas down to the present, the fourteenth.

The choice of Avalokiteśvara was not made at random. As early as the twelfth or thirteenth century, Avalokiteśvara had come to be regarded in a double respect as the divine

protector of Tibet. In the form of an ape he had, in ancient times, assumed the role of progenitor of the Tibetan people in order that the teachings of the Buddha might flourish in Tibet in due course; in the form of the great Tibetan king Srong bstan sgam po, who created the Tibetan empire in the seventh century, Avalokiteśvara had established Buddhism—according to this retrospective view—in the Land of Snow. The Potala Palace in Lhasa, the ancient capital, was built in its present form by the fifth Dalai Lama and made his residence; situated on a hill, it symbolically reestablished the pre-Buddhist connection between the divine king and the sacred mountain.

**POPULAR RELIGION.** It would be illusory to draw a sharp line of demarcation between popular and monastic religion. Nevertheless, while the study of the Mahāyāna philosophical systems and the performance of elaborate Tantric rites take place within the confines of the monasteries, monks actively participate in a wide range of ritual activities outside the monasteries, and beliefs that do not derive from Buddhism are shared by monks and laypeople alike.

These rites and beliefs may be styled “popular religion,” a term that only signifies that it is nonmonastic, traditional, and related to the concerns of laypeople. It does not imply a system representing an alternative to Buddhism (or the Bon religion). For the last thousand years, Buddhist ideas have provided a general cosmological and metaphysical framework for popular religion. In many cases one may also assume that there is continuity with the pre-Buddhist religion, but it is often a delicate task to determine this continuity in precise terms.

Turning, first of all, to elements inspired by Buddhism, the most important—and conspicuous—are undoubtedly the varied and ceaseless efforts to accumulate merit. The law of moral causality (*karman*) easily turns into a sort of balance in which the effect of evil deeds in this life or in former lives may be annulled by multiplying wholesome deeds. While an act of compassion, such as ransoming a sheep destined to be slaughtered, theoretically constitutes the ideal act of virtue, the accumulation of merit generally takes a more mechanical form. Hence the incessant murmuring of sacred formulas (in particular the *mantra* of Avalokiteśvara, “Om mani padme hum”), the spinning of prayer wheels (ranging in size from hand-held wheels to enormous cylinders housed in special buildings), the carving of *mantras* on stones (which may eventually grow into walls several miles in length, so-called *mani-walls*), and the hoisting of banners and strings of flags on which prayers are printed (“prayer flags”). Ritual circumambulation of holy places, objects, and persons is also a distinctly Buddhist, as well as truly popular, practice. Showing generosity toward monks and observing—lightly or scrupulously, as the case may be—the universal precepts of Buddhism (particularly the prohibition against taking the life of any living being, however small) are ethical norms that Tibetans share with all Buddhists.

Pilgrimages constitute an important religious activity: above all to the holy city of Lhasa—sanctified by its ancient temples and (since the seventeenth century) the presence of the Dalai Lama—but also to innumerable monasteries, shrines, and caves in which relics of holy men and women may be seen, honored, and worshiped. Sacred mountains, such as Mount Kailash in western Tibet, attract a stream of pilgrims who circumambulate, perhaps for weeks or months, the holy abode of the chosen deity. The supreme pilgrimage is the long journey to the sacred sites of Buddhism in India and Nepal (Bodh Gayā, Rājagṛha, Lumbinī, Sārnāth); although the flow of pilgrims to India virtually ceased after the thirteenth century, it again became possible in the twentieth century.

Ritual practices, while generally having an overall Buddhist conceptual framework, often contain elements that point back to the pre-Buddhist religion. One such element, frequently met with, is the “ransom” (*glud*) in the form of a small human figurine that is offered as a gesture of propitiation to demons. In the New Year rituals as traditionally practiced in Lhasa, the *glud* was in fact a human scapegoat who was driven out of the city and who, in earlier times, was symbolically killed.

As in other Buddhist countries, regional and local deities have remained objects of worship, generally performed by laypeople. In particular, the deities connected with (or even identified with) sacred mountains, powerful gods of the land (*yul lha*), are worshiped during seasonal festivals with the burning of juniper branches that emit clouds of fragrant smoke; horse races; archery contests; drinking bouts; and songs extolling the might of the deity, the beauty of the land, the fleetness of its horses, and the valor of its heroes. These gods have a martial nature and are accordingly known as enemy gods (*dgra bla*); they are also known as kings (*rgyal po*). Usually they are depicted as mounted warriors, dressed in archaic mail and armor and wearing plumed helmets.

The house ideally reproduces the outside world, and it has its own guardian deities, such as the god of the fireplace (*thab lha*). Care must be taken to avoid polluting the fireplace in any way, as this angers the god. On the flat rooftops are altars dedicated to the “male god” (*pho lha*) and the “female god” (*mo lha*) and a banner representing the enemy god. The “male” and “female” gods are tutelary deities of the household, supervising the activities of its male and female members, respectively. The “enemy god” is—in spite of its name—a deity who protects the entire household or, as a member of the retinue of the local “god of the land,” the district. The worship of these gods on the rooftops corresponds to that performed in their honor on mountaintops and in passes: spears and arrows dedicated to them are stacked by the altar and juniper twigs are burned amid fierce cries of victory and good luck.

The person, too, possesses a number of tutelary deities residing in different parts of the body. Every person is also accompanied, from the moment of birth, by a “white” god

and a “black” demon whose task it is, after death, to place the white and the black pebbles—representing the good and evil deeds one has done in this life—on the scales of the judge of the dead. The basic opposition between “white” and “black,” good and evil, is a fundamental concept in Tibetan popular religion and figures prominently in pre-Buddhist traditions as well. Iranian influences have been suggested, but it seems likely that the Chinese conceptual dichotomy of *yin* and *yang* lies closer at hand.

The ancient cosmological scheme of sky, earth, and underworld remains fundamental in popular religion. In particular, the cult of the *klu*—subterranean or aquatic beings easily irritated by activities such as house building or plowing, which provoke them to afflict people as well as animals with various diseases—remains widespread and provides a direct link to the pre-Buddhist religion.

An important aspect of popular religion (and, indeed, of the pre-Buddhist religion) is the emphasis on knowing the origins not only of the world but of all features of the landscape, as well as of elements of culture and society that are important to man. Tibetans have a vast number of myths centering on this theme of origins; while some of them have a purely narrative function, others serve to legitimate a particular ritual and must be recited in order that the ritual may become effective.

Rites of divination and of healing in which deities “descend” into a male or female medium (*lha pa*, “god-possessed,” or *dpa’ bo*, “hero”) and speak through it are an important part of religious life, and such mediums are frequently consulted. Other, simpler means of divination are also extremely widespread.

A special kind of medium is the *sgrun pa*, the bard who in a state of trance can recite for days on end the exploits of the great hero Gesar. Regarded as an emanation of the *bodhisattva* Avalokiteśvara, Gesar has been approved by the Buddhist hierarchy; but essentially he is a popular, epic hero, a mighty king and warrior. His epic is a storehouse of myths, folklore, and pan-Eurasian narrative motifs, and is widespread outside Tibet in the Hindu Kush and, above all, among the Mongolians. Other visionaries (*’das log*) travel in trance to the Buddhist purgatories, their bodies lying as if dead; on awakening, they give detailed accounts of the punishment awaiting sinners beyond the grave. Still others find hidden “treasures” (*gter ma*) consisting of texts or sacred objects; indeed, this has remained until today an important way of adding to the body of authoritative texts translated from Sanskrit (and, to a lesser extent, from Chinese), for the “treasure-discoverers” (*gter ston*) claim to bring to light texts that have been hidden away (especially by the eighth-century Tantric master Padmasambhava) during times of persecution of Buddhism, to be rediscovered, usually with the assistance of supernatural beings, for the benefit of humanity when the time is ripe. Finally, ecstasies and visionaries point the way to earthly paradises such as the mythical kingdom of Shamb-

hala or to hidden valleys, untouched by man, in the secret recesses of the Himalayas.

Summing up, Tibetan popular religion may perhaps be characterized as an infinitely varied attempt to circumvent, or at least mitigate, the mechanism of the law of moral causality. According to orthodox Buddhist doctrine, this law is inexorable and its justice cannot be avoided; however, since one cannot know what acts one has committed in the past for which one may have to suffer in the future, the intolerable rigor of the law of cause and effect is in practice modified by a religious worldview in which the destiny of the individual also depends on ritual acts and on spiritual beings—benevolent as well as malevolent—who may at least be approached and at best be manipulated.

**BON.** It has already been noted that a class of ritual experts in the pre-Buddhist religion were known as *bon pos* and that certain early sources indicate that their religion was known as Bon. In any case, the later sources all agree that the pre-Buddhist religion was in fact known as Bon, and these sources tend to describe the struggle between Bon and Buddhism in dramatic terms. This is true not only of the later Buddhist sources but also of texts emanating from a religious tradition, explicitly styling itself Bon, that emerged in the eleventh century, if not before.

While virtually indistinguishable from Buddhism in such aspects as philosophy, monastic life, ritual, and iconographical conventions, this “later” Bon has always insisted that it represents the religion that prevailed in Tibet before the coming of Buddhism. In spite of occasional syncretic efforts on both sides, the Buddhists have tended to regard Bon as heretical, and not infrequently the term *bonpo* has been used in the sense of “heretic,” “black magician,” and so forth.

Two points about Bon must be made. First, the historical background of the Bon religion that emerged in the eleventh century is far from clear. There is a significant element of continuity with the pre-Buddhist religion, but nothing approaching identity. Second, it is seriously misleading to identify Bon with popular religion in general. On the level of popular religion, followers of Bon and Buddhism alike share the same beliefs and perform, to a very large extent, the same rituals, although details may differ (for example, the Bonpos spin their prayer wheels and perform circumambulations in the opposite direction than the Buddhists do, i.e., counterclockwise; they worship different deities and hence use other *mantras*, and so forth). These correspondences do not represent a case of “perversion,” “contradiction,” or the like (as has been too hastily suggested), for Bon and Buddhism share the same religious ideals and goals, and they approach them by essentially similar means.

**TIBETAN RELIGION TODAY.** An overview of Tibetan religion would be incomplete without an attempt to take stock of the situation in the early years of the twenty-first century. The most significant single fact is the downfall of monastic religion. Starting in the 1950s and culminating in the period of the Cultural Revolution in the 1960s and 1970s, the Chinese

unleashed a violent antireligious campaign in Tibet that resulted in the total destruction of monastic life. A large number of monks were killed, and the rest were, without exception, defrocked. Most monasteries were razed to the ground, and others were converted into secular buildings such as granaries or army barracks. Vast libraries were destroyed, and ritual objects, Buddha images, and relics were systematically profaned. At the height of the campaign, even the most insignificant expression of religious faith would be severely punished by Chinese soldiers or Red Guards.

The new and more pragmatic policy in China began to take effect in Tibet around 1980. A number of buildings, officially regarded as historical monuments, were carefully restored; a limited number of monks were installed in a number of the largest monasteries: ‘Bras-spungs (Drepung) near Lhasa, Bkra shis lhun po (Tashilhunpo) outside Gshis ka rtse (Shigatse), and Bla brang (Labrang) and Sku ’bum (Kumbum) in eastern Tibet; a few temples were reopened for worship; and hundreds of other monasteries were reconstructed on a voluntary basis by the Tibetans themselves. On the whole, religious activity seems to be tolerated as long as it does not interfere with government policies. Tibet has in fact seen a remarkable resurgence of religious fervor that finds outlet, among other things, in the reconstruction of monasteries and the traditional practices of the popular religion, including extended pilgrimages to sacred mountains and other sites throughout Tibet. Within the limits set by the political and economic conditions imposed on Tibet, it is clear that religious belief and practice remain a fundamental factor in the overall situation in the Land of Snow.

Among the Tibetan refugees in India and Nepal, religious life flourishes, to a large extent along traditional lines. There is a tendency to emphasize monastic life together with those aspects of Buddhism that are common to all Buddhists. In the West, many Tibetan lamas have become highly successful “gurus,” and numerous Tibetan Buddhist centers have been established, generally focusing on the teachings of one particular order and emphasizing meditation and ritual rather than conventional, scholastic studies. In exile, the fourteenth Dalai Lama, Bstan ’dzin rgya mtsho (Tenzin Gyatsho; b. 1935), has become an internationally respected Buddhist figure, a Nobel Peace Prize laureate in 1989 and a guide to the Buddhist way to human happiness and world peace through the development of insight and compassion.

#### BIBLIOGRAPHY

Tibetan religion is a field in which quasi-esoteric literature abounds. However, there are also many works of serious scholarship available to the general reader. The following survey lists titles that are easily available.

### General Studies

A classic and still useful introduction to the subject is Charles A. Bell's *The Religion of Tibet* (1931; reprint, Oxford, 1968). More recently, several excellent studies have been published: David L. Snellgrove and Hugh E. Richardson's *A Cultural History of Tibet* (1968; reprint, Boulder, 1980); Rolf A. Stein's *Tibetan Civilization*, translated by J. E. Stapleton Driver (Stanford, Calif., 1972) and republished in a revised French edition as *La civilisation tibétaine* (Paris, 1981); Giuseppe Tucci's *The Religions of Tibet*, translated by Geoffrey Samuel (Berkeley, 1980); Geoffrey Samuel's *Civilized Shamans, Buddhism in Tibetan Societies* (Washington and London, 1993); and Donald S. Lopez Jr. (ed) *Religions of Tibet in Practice* (Princeton, NJ, 1997). A particularly lucid exposition is Anne-Marie Blondeau's "Les religions du Tibet," in *Histoire des religions*, edited by Henri-Charles Puech, vol. 3 (Paris, 1976), pp. 233–329.

### Pre-Buddhist Religion

Most studies of the pre-Buddhist religion can be found only in specialized publications. The works of Snellgrove and Richardson, Stein, and Blondeau, however, all contain pertinent discussions based on their own research. A useful study of the early inscriptions is H. E. Richardson's *A Corpus of Early Tibetan Inscriptions* (London, 1985).

### Buddhism

Snellgrove and Richardson's work is particularly strong on the formation of the orders and the subsequent political history of the church. Tucci's *The Religions of Tibet* contains a most useful survey of Buddhist doctrine and monastic life. A concise presentation of Tibetan Buddhism is provided in Per Kvaerne's "Tibet: The Rise and Fall of a Monastic Tradition," in *The World of Buddhism: Buddhist Monks and Nuns in Society and Culture*, edited by Heinz Bechert and Richard F. Gombrich (London, 1984), pp. 253–270. For a discussion of ritual and meditation, see Stephan Beyer's *The Cult of Tārā: Magic and Ritual in Tibet* (Berkeley, 1973).

### Popular Religion

General surveys of Tibetan popular religion are given by Stein in *Tibetan Civilization* and in Per Kvaerne's "Croyances populaires et folklores au Tibet" in *Mythes et croyances du monde entier*, edited by André Akoun, vol. 4 (Paris, 1985), pp. 157–169, and Samten G. Karmay, *The Arrow and the Spindle, Studies in History, Myths, Rituals and Beliefs in Tibet* (Kathmandu 1998). A basic reference work is René de Nebesky-Wojkowitz's *Oracles and Demons of Tibet, The Cult and Iconography of the Tibetan Protective Deities* (1956; reprint, Graz, 1975). The reprint edition contains an introduction by Per Kvaerne in which numerous corrections and additions to the earlier edition are provided. A useful supplement to this work is Tadeusz Skorupski's *Tibetan Amulets* (Bangkok, 1983). A major study of ritual texts has been published by Christina Klaus, *Schutz vor den Naturgefahren: Tibetische Ritualtexte aus dem Rin chen gter mdzod ediert, Übersetzt und Kommentiert* (Wiesbaden, 1985). A discussion of Tibetan myths intended for the nonspecialist is provided by Per Kvaerne in a series of articles in *Dictionnaire des mythologies*, edited by Yves Bonnefoy (Paris, 1981), vol. 1, pp. 42–45, 249–252; vol. 2, pp. 194–195, 381–384, 495–497. A survey of the most important pilgrimages is provided in Anne-Marie Blondeau's "Les pèlerinages tibétains," in *Les*

*pèlerinages*, edited by Anne-Marie Esnoul et al. (Paris, 1960), pp. 199–245. A collection of more specialised articles is Alex McKay (ed.) *Pilgrimage in Tibet* (Richmond, Surrey, 1998). The most complete study of Tibetan festivals is Martin Brauen's *Feste in Ladakh* (Graz, 1980).

Among numerous studies published in recent years on the cult of mountains, Toni Huber, *The Cult of Pure Crystal Mountain, Popular Pilgrimage and Visionary Landscape in Southeast Tibet* (New York and Oxford, 1999) is likely to become a standard work.

There is a considerable body of literature on the Gesar epic. The fundamental study is R. A. Stein's *L'épopée et le barde au Tibet* (Paris, 1959). Several translations of the text exist, mainly in the form of summaries. The most easily accessible is probably that of Alexandra David-Neel, *La vie surhumaine de Guésar de Ling* (Paris, 1931), translated with the collaboration of Violet Sydney as *The Superhuman Life of Gesar of Ling* (1933; rev. ed., London, 1959). More scholarly translations are R. A. Stein's *L'épopée tibétaine de Gesar dans la version lamaïque de Ling* (Paris, 1956), and Mireille Helffer's *Les chants dans l'épopée tibétaine de Gesar d'après le livre de la course de cheval* (Geneva, 1977). On visionary journeys to Sambhala and related phenomena, see Edwin Bernbaum's *The Way to Shambhala: A Search for the Mythical Kingdom beyond the Himalayas* (New York, 1980).

### Bon

An important translation of a Bon text is David L. Snellgrove's *The Nine Ways of Bon: Excerpts from the gZi-brjid* (1967; reprint, Boulder, 1980). Samten G. Karmay surveys the Bon religion in "A General Introduction to the History and Doctrines of Bon," *Memoirs of the Research Department of the Toyo Bunko*, no. 3 (1975): 171–218. On Bon literature, see Per Kvaerne's "The Canon of the Bonpos," *Indo-Iranian Journal* 16 (1975): 18–56, 96–144. See also the works of Snellgrove and Richardson, Stein, and Blondeau cited above.

### Contemporary Religion

Peter H. Lehmann and Jay Ullai's *Tibet: Das stille Drama auf dem Dach der Erde*, edited by Rolf Winter (Hamburg, 1981), and on Bon art and iconography, Per Kvaerne, *The Bon Religion of Tibet, The Iconography of a Living Tradition* (London 1995, reprint 2001). The book is remarkable not least for its photographic documentation of the years following the Cultural Revolution. The situation at the end of the twentieth century is discussed in Melvyn C. Goldstein and Mathew T. Kapstein (eds.) *Buddhism in Contemporary Tibet, Religious Revival and Cultural Identity* (Berkeley, 1998).

PER KVAERNE (1987 AND 2005)

### TIBETAN RELIGIONS: HISTORY OF STUDY

Until the 1980s, scholars took a threefold approach to the study of Tibetan religions. First, they used Tibetan materials to supplement Indian and Chinese materials; second, Western scholars were drawn by a fascination with Tibetan Buddhism itself; and third, they studied the numerous Tibetan texts completed since the 1970s by Tibetans who were living either in exile or in Tibet and China. Events and developments of momentous importance for research into the reli-

gious life of Tibet occurred during the twentieth century. These events drove some Tibetans into a Western-oriented study of their own religion, brought Western scholars into close contact with learned lamas, and drew scholarly attention to a very early period of Bon and Buddhism in Tibet, while almost simultaneously revealing contemporary practices with a precision and on a scale previously impossible for various political or geographical reasons.

The first event was the discovery in 1905 of Tibetan texts from the eighth to eleventh centuries in a cave along the Silk Road at Dunhuang, China. For the next several years, British, French, Russian, and Japanese scholars were able to study manuscript materials that were much older than those previously known and that were contemporary to the events they described. These materials revolutionized the study of Bon and Buddhism in Tibet, as well as the study of the religious currents flowing through the Tibetan empire from the East and the West. The development of the study of the Dunhuang manuscripts has been of paramount importance in the understanding of Tibetan religions, which for decades had been studied only from a Buddhist perspective, and historically only from a relatively late perspective. Following the studies of Gustave Charles Toussaint and Marcelle Lalou in Paris, one of the most innovative books in this field was *Études Tibétaines dédiées à la mémoire de Marcelle Lalou* (1971), which contained articles by Ariane Macdonald, Rolf A. Stein, and others, and which presented a truly new perspective on the religions of Tibet. The work begun with this volume was later completed by the publication of selections of the Pelliot *Choix de documents tibétains conservés à la bibliothèque nationale* (1978–2001) by Ariane Macdonald, Yoshiro Imaeda, and T. Takeuchi.

The second event was the Chinese invasion of Tibet in the 1950s. Numerous lamas took up residence thereafter in Nepal, northern India, Europe, the United States, and elsewhere. These exiles took some of their vast literature and physical culture with them, and made it accessible to Western scholars. In the late 1980s, Tibetans in China also started to publish a great number of texts through state-owned publishing houses, and later privately. Some of these texts had been previously unknown to many scholars, and they added to the corpus of materials already available.

A third important development occurred in the early 1980s with the relative opening of Tibetan areas, which, along with inexpensive air travel, allowed many researchers to travel and do fieldwork in Tibet. A fourth major development was the advent of the Internet and the digitalization of many Tibetan texts beginning at the end of the twentieth century.

Since the mid-1980s, therefore, there has been no dearth of publications about the religion of Tibet. There has been, however, a shift from a purely philological approach to a more interdisciplinary approach that incorporates history, anthropology, and even art history (numerous exhibitions of Tibetan art have been accompanied by expert catalogues).

This shift was certainly the result of scholars being able to travel to Tibet and adjacent areas, and it was also a reflection of the monastic background of some writers. Moreover, the role of women in Tibetan Buddhism, which was all but ignored in earlier writings, became prominent, along with the study of the Bon tradition and Tibetan popular religion, including local cults that are not necessarily Buddhist or have become “buddhicized.” These trends in scholarship have profoundly transformed the study of Tibetan religions.

One of the first major contributions to the advancement of the field was the United States Library of Congress project initiated in the 1970s in New Delhi by Gene E. Smith. This program encouraged Tibetans to publish previously unknown texts and disseminate them to academic institutions in the West. Smith added further to the study of the field by establishing the Tibetan Buddhist Resource Center, which promotes research and scholarship in Tibetan Buddhism through digital text and image preservation. Similar projects include the Tsadra Foundation, sponsored by the Trace Foundation, which publishes Tibetan texts and translations. The Trace Foundation has also established the online Latse Contemporary Tibetan Cultural Library, which offers texts and other research materials and sponsors programs for people interested in Tibetan culture. The Tibetan and Himalayan Digital Library, sponsored by the University of Virginia, publishes multilingual and multimedia texts and resources, as well as creative works concerned with the culture and history of Tibet and the Himalayas. Digital versions of the Dunhuang Tibetan documents are available at Old Tibetan Documents Online, a website established by a group of Japanese scholars. Other useful websites include Digital Himalaya, sponsored by Department of Social Anthropology at Cambridge University and the Anthropology Department at Cornell University, and Tibet Visual History Online, sponsored by the Pitt Rivers Museum in Oxford. Such websites are popular with researchers because they include old and previously unavailable footage and photographs, and they constitute a good base for religious studies from an anthropological approach. In 2002, the Tibetology team of the French National Center for Scientific Research inaugurated the first digital academic journal on Tibetan studies: *Revue d'Études Tibétaines*. In addition, the major Tibetan religious traditions and lamas have their own websites, where one can find texts, teachings, and photos, as well as polemical writings. In 2003, in Oxford, Tibetologists from all over the world who had gathered for the International Association of Tibetan Studies seminar decided to launch the digital *Journal of the International Association of Tibetan Studies* (JIATS).

The use of the Internet is truly a revolution for a field as previously obscure as the study of Tibetan religions; the Internet allows information to flow even to remote areas of the Tibetan world. The great Western pioneer student of Tibet's religious culture was the Hungarian traveler Alexander Csoma de Körös (c. 1784–1842), some of whose work is still valuable, while that of many of his near-

contemporaries is completely outdated. His work parallels that of the founders of Buddhist studies in Europe, who worked from Indian sources. His *Notices on the Life of Shakyas, Extracted from the Tibetan Authorities* (1838) is an early work in the field, as is F. Anton von Schiefner's "Eine tibetische Lebensbeschreibung Cakyamuni's, des Begründers des Buddhathums" (*Mémoires de l'Académie impériale des sciences de Saint Pétersbourg* 6, 1851).

The best of the early monographs is Emil Schlagintweit's *Buddhism in Tibet, Illustrated by Literary Documents and Objects of Religious Worship* (1863), which deals comprehensively with the Buddhist world in Tibet from its basis in Indian Mahāyāna theory to local customs. Equally rich in data is L. Austine Waddell's *The Buddhism of Tibet, or Lamaism, with its Mystic Cults, Symbolism, and Mythology, and in its Relation to Indian Buddhism* (1895). Giuseppe Tucci's *Die Religionen Tibets* (1970; translated as *Religions of Tibet*, [1980]) is enhanced by Tucci's abundant use of Tibetan sources and his high level of knowledge about the philosophical and historical background of Tibetan religions. One of the most important newer books in the field is *Indo-Tibetan Buddhism: Indian Buddhists and their Tibetan Successors* by David L. Snellgrove (1987). The publication of Gene E. Smith's previously scattered articles and introductions—*Among Tibetan Texts: History and Literature of the Himalayan Plateau* (2001)—has also reinforced the study of Buddhist transmissions in Tibet.

Tibetan scholars have written many works on the introduction and spread of Buddhism in their country and on its origins in India. Studies by European scholars of three such works are particularly important: Schiefner's *Tāranāthas Geschichte des Buddhismus in Indien* (1869), a translation of Tāranātha's 1608 *Tibetan-Language History of Buddhism in India*, has sufficient interpretations and explanations by the translator to make it useful for the student of Tibetan Buddhism; and Eugene Obermiller's *History of Buddhism* (1931–1932), a translation of Bu ston's *Chos 'byung*, contains information on Tibet, but Indian subjects predominate. The great achievement in scholarship in this area is George N. Roerich's *The Blue Annals* (1949–1953), a translation of 'Gos Lo tsa ba Gzon nu dpal's *Deb ther snon po*; this classic text describes major developments in Tibet up to the 1470s. Roerich's diligence as a scholar, combined with the various indexes to the text, have made this translation an invaluable reference work.

Another important work is *The Nyingma School of Tibetan Buddhism: Its Fundamentals and History* (1991, 2d ed., 2002), a translation of *Dudjom Rinpoche* by Matthew Kapstein and Gyurme Dorje. Enriched with maps and several indexes, this work is an excellent resource for the history of Buddhism in Tibet, and more particularly for the Rnying ma (Nyingma) school. Austrian, German, and Japanese scholars still lead the field in philological works on the Indian Buddhist texts used by Tibetans, as well as on the Tibetan canons.

A number of works attempting synthetic interpretations of major events or trends in Tibetan religious history appeared in the twentieth century. In particular, Charles Bell's *The Religion of Tibet* (1931) analyzes the history of Buddhism until the early twentieth century, including Tibet's influence on Mongolian Buddhism and the political dimensions of the rule of the Dalai Lamas. In the guise of a description of a series of Tibetan paintings, Tucci's *Tibetan Painted Scrolls* (1949) contains much (well-indexed) material on topics ranging from mythology to iconography that concerns the history of Tibetan religions and sectarian developments.

Eva Dargyay's *The Rise of Esoteric Buddhism in Tibet* (2d ed., 1979) provides data on the Rnying ma pa religious tradition; this work discusses Rnying ma pa's "discovered Treasure" literature and its history. The study of the "discovered" religious writings is now a subfield by itself as a result of access to Tibetan masters and a better knowledge of the transmission lineages. One of the pioneers was Anne-Marie Blondeau, who wrote several articles. Janet Gyatso also published a series of articles on the Treasure movement. Also noteworthy is the *Life and Revelations of Pema Lingpa* (2003) by Sarah Harding and Ganteng Tulku.

The basis of all Buddhist practice is yoga and meditation, and studies of Tibetan versions of such practices with commentaries by learned lamas are appearing in great numbers. Among older established studies that are still frequently consulted, the following are notable either for their lucidity of presentation or their accompanying commentary. Herbert Guenther's translation of Sgam po pa's twelfth-century account of Tibetan religious practice, *The Jewel Ornament of Liberation* (1971), and Guenther's *The Life and Teaching of Nāropa* (1963) on an eleventh-century yogin, are characterized by a sophisticated analysis of the psychology of Buddhist practice. A clear exposition is made by Tenzin Gyatso (Bstan 'dzin rgya mtsho, the fourteenth Dalai Lama) in *The Opening of the Wisdom Eye and the History of the Advancement of Buddhadharma in Tibet* (1966). An analysis of philosophical positions, meditation, and ritual is found in Ferdinand D. Lessing and Alex Wayman's *Mkhas grub rje's Fundamentals of the Buddhist Tantras* (1968), a translation of a fifteenth-century work. Rdzogs chen, a meditative and philosophical teaching common to both the Rnying ma pa and Bon traditions, is explained by Samten Karmay in *The Great Perfection: A Philosophical and Meditative Teaching in Tibetan Buddhism* (1988).

Traditional Buddhist biographies (*rnam thar*) are being used more and more as sources to put meat on the bones of doctrinal studies, but they are also translated into English to cater to an interested audience. Perhaps the best of the earlier efforts is Jacques Bacot's *La vie de Marpa le "traducteur"* (1937). Also worthy of recommendation is Rolf A. Stein's *Vie et chants de 'Brug-pa Kun-legs le yogin* (1972), and of course the different translations of the great saint and poet Mi la ras pa's biography and mystic songs. A more recent

study of autobiographical writing in Tibet, especially by visionary yogis, is Janet Gyatso's *Apparitions of the Self: The Secret Autobiographies of a Tibetan Visionary* (1998).

An excellent work intended as a manual for students is *Religions of Tibet in Practice*, edited by Donald Lopez (1997). In addition, *Tibetan Literature: Studies in Genre*, edited by José Cabezón and Roger R. Jackson (1996), covers mainly religious literature.

Westerners who went through Tibetan scholastic education as monks in the 1970s, including Robert Thurman and Jeffrey Hopkins, have published numerous books that provide insight on religious studies in a traditional context. Such works include Georges Dreyfus's *The Sound of Two Hands Clapping: The Education of a Tibetan Buddhist Monk* (2003). Each of these authors holds a chair in religious studies in an American university. Matthieu Ricard, an active monk, contributed to the field with his translation of *The Life of Shabkar: An Autobiography of a Tibetan Yogin* (1994), as well as his own books and the archiving of the teachings and writings of his lama, Dilgo Khyentse Rinpoche (1910–1991).

In the 1980s, with the importance given to feminist studies in the West, there was a sudden interest in the role that female figures played in Tibetan religions as nuns or partners of lamas, or by themselves. Among the pioneers in translation of women's biographies was Keith Dowman with *Sky Dancer: The Secret Life and Songs of the Lady Yeshe Tsogyel* (1984), and Tsultrim Allione with *Women of Wisdom* (1984). Later, Hanna Havnevik published her dissertation on Tibetan Buddhist nuns, *Karma Lekshe Tsomo, Sisters in Solitude: Two Traditions of Buddhist Monastic Ethics for Women* (1996), and Janice Willis edited *Feminine Ground: Essays on Women and Tibet* (1995). In *Machig Labdrön and the Foundations of Chöd* (1996) Jérôme Edou studied the extraordinary life of this eleventh-century yogini, whose teachings are still practiced today; this work was followed by *The Lives and Liberation of Princess Mandarava*, translated by Lama Chonam and Sangye Khandro (1998).

The Bon religion has been much less studied than Buddhism. Its literature and teachers were not accessible, and some Tibetan Buddhists succeeded in giving early Western visitors a highly inaccurate view of its origins and practices. This trend is now reversed, and by the end of the twentieth century there was great interest in Bon studies, often linked to the Western Tibetan region of Zhang zhung. The field is now flourishing under the impetus of pioneers like Per Kvaerne in Norway and Samten Karmay in France. Bon studies has become linked to the publications program initiated in 2000 by Yasuhiko Nagano at the Ethnological Museum of Osaka; published works include *New Horizons in Bon Studies* (2000), *A Survey of Bonpo Monasteries and Temples in Tibet and the Himalaya* (2003), and *The Call of the Blue Cuckoo: An Anthology of Nine Bonpo Texts on Myths and Rituals* (2002), all edited by Nagano and Karmay. One of the first valuable contributions to the study of Bon mythology and a veritable catalog of the Bon pantheon was A. H. Francke's

*gZer mig: A Book of the Tibetan Bonpos*, a translation that was published in five volumes between 1924 and 1949.

Where are the origins of Bon to be sought—beyond Tibet or within? What is its relationship to Buddhism and other religions, in particular to those of Iran? How did Bon evolve? What can be called Bon? These questions are still debated by scholars. Studies on Bon that were particularly valuable include a lengthy essay in Giuseppe Tucci's *Die Religionen Tibets*; Samten Karmay's "A General Introduction to the History and Doctrines of Bon" in *Memoirs of the Research Department of the Toyo Bunko* 33 (1975): 171–218; as well as Karmay's *Treasury of Good Sayings: A Tibetan History of Bon* (1972). An extensive doctrinal text was presented by David L. Snellgrove in *The Nine Ways of Bon: Excerpts from the gZi-brjid* (1967). An important study and the first work on Bon yoga is Per Kvaerne's "Bonpo Studies: The A Khrid System of Meditation," in *Kailash* 1 (1973): 19–50 and 247–332, as well as his important work, *The Bon Religion of Tibet: The Iconography of a Living Tradition* (1995). Dan Martin's *Unearthing Bon Treasures: Life and Contested Legacy of a Tibetan Scripture Revealer* (2001) deals with a Tibetan "text discoverer" and includes a general bibliography of Bon. Martin updated this bibliography in "Bon Bibliography: An Annotated List of Recent Publications," in *Revue d'Etudes Tibétaines* 4 (2003): 61–77, which demonstrates the contemporary strength of Bon studies. Martin joined forces with Per Kvaerne and Yasuhiko Nagano to edit *A Catalogue of the Bon Kanjur* (2003). In addition, Karmay and Nagano edited *A Catalogue of the New Collection of Bonpo Katen Texts* (2001). In France, Jean-Luc Achard is researching the Dzogchen tradition of the Bon and Rnying ma schools. Achard has published several articles in the *Revue d'Etudes Tibétaines*, as well as the book *L'Essence perlée du secret: Recherches philologiques et historiques sur l'origine de la Grande Perfection dans la tradition rNying ma pa* (1999).

The literature and adherents of the normative Buddhism and Bon traditions were the first elements to strike Alexander Csoma de Körös and his successors, and they remain today the center of focus in Tibetology. However, popular religion and its numerous cultic manifestations have increasingly become the topic of studies, especially in Europe since the late 1980s. One such study is Françoise Pommaret's *Les revenants de l'eau-delà dans le monde Tibétain: Sources littéraires et traditions vivantes* (1989).

Of course, the interest in Tibet's epic hero, King Gesar, an important figure in popular Tibetan literature and religion, dates back to the eighteenth century when Mongolian-language texts of the epic became known to Western travelers. A comprehensive analysis of the religious and ethnographic data in these materials certainly lies far in the future, but two works may be cited here that analyze different versions of Gesar's life and deeds and thus give an idea of the variety of information available: A. H. Francke's *Der Frühlings- und Wintermythus der Kesarage: Beiträge zur Kenntnis der vorbuddhistischen Religion Tibets und Ladakhs* (1902)

and Rolf A. Stein's *Recherches sur l'épopée et le barde au Tibet* (1959). The former study shows the influence of the "nature mythology" school of religious studies, while the latter includes sections dealing with Buddhist, Bon, and popular religious influences and motifs. Gesar studies are a subfield in themselves, with Chinese scholars taking a keen interest in the matter.

Among early general studies on popular religion in Tibet, an extensive analysis of the iconography and hierarchical ordering of Tibet's spirits and deities in ritual and literature was René de Nebesky-Wojkowitz's *Oracles and Demons of Tibet* (1956; 2d rev. ed., 1975). Rolf A. Stein's *Tibetan Civilization* (1972) also dwelt on popular religion.

Many anthropologists have studied what is sometimes called shamanist practices in Tibet and the Tibetan areas. Geoffrey Samuel's *Civilized Shamans: Buddhism in Tibetan Societies* (1993) is a challenging and innovative work on the links between Tibetan Buddhism and shamanism. Anthropologists with the opportunity to do fieldwork started studying local deities more or less integrated into Buddhism, as well as different cults and other religious manifestations. These were important in understanding the daily religious life of the people and their relation to their territory. Among different publications, four collections should be noted: *Mandala and Landscape*, edited by A. W. Macdonald (1997); *Reflections of the Mountain: Essays on the History and Social Meaning of the Mountain Cult in Tibet and the Himalayas*, edited by Anne-Marie Blondeau and Ernst Steinkellner (1996); *Tibetan Mountain Deities: Their Cults and Representations*, edited by Blondeau (1998); and *Territory and Identity in Tibet and the Himalayas, Tibetan Studies in Honour of Anne-Marie Blondeau*, edited by Katia Buffetrille and Hildegard Diemberger (2002).

Alex McKay's edition of *Pilgrimage in Tibet* (1998) was another important contribution to the study of religion as practiced by the common people. The history of Tibetan religions must also take into account the numerous publications and translations done in Tibetan Buddhist centers in the West, as well as the biographies of lamas written directly in Western languages. In most cases, such works were not produced as contributions to the field of study, but rather as a means of propagating Buddhist thought. Still, the material they present is often new and interesting for the researcher, while appealing to a wider audience. Two such works that were successful worldwide were *The Words of My Perfect Teacher* by Patrul Rinpoche (1998) and especially *The Tibetan Book of Living and Dying* by Sogyal Rinpoche (2002). Also noteworthy is Philippe Cornu's handy and informative *Dictionnaire encyclopédique du Bouddhisme* (2001).

Religious studies scholars and followers of Tibetan religious traditions have begun engaging in fruitful exchange and interface, although both are often still wary of each other. The academics tend to scorn the disciples' lack of critical approach, and the disciples tend to condescend towards the scholars' lack of "inner understanding" of the religious

traditions. A promising development is that Tibetan and Chinese scholars from different research institutes and universities in China have begun to show interest in religious studies, mostly in the Gesar epic and in popular religion. The Tibetan and Chinese scholars concentrate mostly on historical, ethnographic, and sociological subjects. Working as researchers in different academies and institutes, they have good opportunities to publish their studies. They also participate in the seminar of the International Association of Tibetan Studies (IATS), which is held every four years and where they exchange ideas with their Western and Japanese colleagues.

Since the 1980s the amount of written literature and the number of learned informants from all traditions has increased dramatically. Tibetans for the most part feel a great urge to accommodate Western research into their traditions, and many are now working in research institutions in Europe, Japan, and North America. Indeed, Tibetan studies are now awash in resources, and scholars have begun to call into question many of the most important positions that were only recently thought to be firmly established. There is also a new interest in Buddhism as practiced today in Tibet, as evidenced by Melvyn G. Goldstein and Matthew T. Kapstein's *Buddhism in Contemporary Tibet: Religious Revival and Cultural Identity* (1998), which demonstrates that the study of religions of Tibet needs to be envisaged in a cultural and political context.

#### BIBLIOGRAPHY

An appreciation of the status of modern scholarship can perhaps best be gained by perusing volumes of the Proceedings of the Csoma de Körös Memorial Symposium, as well as the Proceedings of the International Seminar on Tibetan Studies, which are being published regularly. Along with university presses, several private publishing houses, including Wisdom Publications in Boston, Serindia Publications in Chicago, Shambhala Publications in Boston, Snow Lion Publications in Ithaca, N.Y., Padma Publishing in Junction City, California, Prajna Press in Boulder, Colorado, the Tsadra Foundation in New York City, and Dharma Publications in Berkeley, California, as well as the Padma karmo Translation committee in Denmark, are continually releasing books on different aspects of Tibetan Buddhism.

MICHAEL L. WALTER (1987)  
FRANÇOISE POMMARET (2005)

**TIELE, C. P.** (1830–1902), Dutch historian of religions. Cornelis Petrus Tiele studied theology at the University of Amsterdam and was a Remonstrant minister for twenty years (1853–1873). During this time he applied himself to the study of ancient religions and taught himself the Avestan language as well as Akkadian and Egyptian. In 1872 he obtained the Th.D. degree at the University of Leiden; and the following year he became a professor at the Remonstrants' seminary in Leiden, where he taught the history of religions. In 1877, Tiele was appointed to the new chair in history of religions and philosophy of religion at the University of Leiden, in the faculty of theology. He retired in 1900.

Tiele was a pioneer of the “science of religion” and one of the first to offer a historical survey of a number of religions based on the study of source materials. His own research opened up the religions of ancient Iran, Mesopotamia, and Egypt, putting the history of religions on a firm philological-historical basis that was long to be the hallmark of the discipline.

Tiele was much concerned with the broader notion of a “development” of religion, a notion that was natural at a time when evolution and progress were accepted ideas. He saw religion—man’s “disposition of the heart toward God”—as a distinct province of life that can be found everywhere, and he was convinced that there is a unity and independence of religious life underlying all its different external forms. The gradual development of the human mind in history implies a parallel development in religion, which is, basically, a progressive expansion of self-consciousness. According to Tiele, the historical changes of the forms of religion show a process of evolution in the course of which the “religious idea” and the religious needs receive an ever fuller and more perfect expression. The historical forms of religion represent different stages of this evolution, in particular from nature religions to ethical religions. The historian of religions has to compare and classify religious phenomena in accordance with the state and direction of their development.

Tiele sharply distinguished all forms of religion from religion itself, and his deeper concern in the study of religion is the question of the real nature and origin of the religion that “reveals” itself in its manifold forms and phenomena. He therefore divides the study of religion into two parts. The first is *morphology*, that is, the inductive study of the phenomena and their changes and transformations as a result of a continuing development. This study requires, among other things, a comparative history of religion.

The second part of the study of religion is *ontology*, the study of the permanent element, beyond and through all changes and passing forms, that is the core and the source

of religion. The real nature of religion is under investigation here, and this part of the study demands a deductive reasoning on the basis of what has been reached by means of inductive “empirical” research. The ontological study contains both a phenomenological-analytical part, in which the religious phenomena are studied in each stage of development, and a “psychological-synthetic” part in which the essence and origin of religion are investigated; in fact this stage is philosophical (rather than “psychological”) in nature. For Tiele historical, phenomenological, and philosophical questions logically followed from each other. Because Tiele took as his departure the premise that religion fundamentally is a general human phenomenon and that the way in which it has manifested itself as well as the elements of which it is composed are the same always and everywhere, the study of permanently recurring phenomena made sense.

Tiele’s history of religions may have been somewhat schematized, but it was dynamic; further, his phenomenology had a dynamic character because of his notion of the development of the human mind. His insistence that religion “manifests” itself in the phenomena, and that this manifestation happens through the activity of the human mind, has an almost modern, phenomenological flavor, like the idea that religions are different expressions of that “religion” that as a tendency slumbers in every person. Religion here is investigated as a human phenomenon, and the unifying factor of all religious phenomena is the human mind.

#### BIBLIOGRAPHY

For bibliographic data on Tiele’s person and work, see my *Classical Approaches to the Study of Religion*, vol. 2, *Bibliography* (The Hague, 1974), pp. 283–286. A noteworthy commemoration by Tiele’s colleague P. D. Chantepie de la Saussaye was delivered at the Netherlands Royal Academy of Sciences in 1902 (in Dutch) and republished in the latter’s *Portretten en kritieken* (Haarlem, 1909), pp. 82–120.

Three of Tiele’s longer works exist in English translation: *Outlines of the History of Religion, to the Spread of Universal Religions*, 7th ed. (London, 1905); *History of the Egyptian Religion*, 2d ed. (London, 1884); and his Gifford Lectures, *Elements of the Science of Religion*, 2 vols. (Edinburgh, 1897–1899).

**TIKHON** (born Vasilii Ivanovich Belavin; 1865–1925), patriarch of the Russian Orthodox church. Prior to becoming metropolitan of Moscow (1917), Tikhon served as archbishop of Vilna and archbishop of Yaroslavl. Before that he was bishop and archbishop of the Aleutians and North America (1898–1907), laying the foundations of the Orthodox church in America. The Alaskan mission, founded in 1794, was extended and coordinated, so that it was able to grow into an autocephalous church in 1970. Tikhon's plan was to permit the Orthodox of various nations to form a single church, initially dependent on the Russian church, but eventually becoming autocephalous. The goal of a single church in the United States remains to be achieved, its delay being one of the consequences of the Russian Revolution.

Patriarch Tikhon was elected twelve days after the Bolshevik coup by the Great Sobor, or Pomestnyi Sobor (1917–1918), the first assembly of magnitude in the Russian church since the Great Sobor of 1666–1667. His election signaled the successful outcome of a nearly two-hundred-year struggle by the church to emancipate itself from control by the Russian state. Yet, Tikhon and the sobor delegates were aware of the danger in the demise of the provisional government that left the Orthodox church as the only pan-Russian institution to which the masses could turn. The contest that ensued between the church and the Bolsheviks developed into the most extensive persecution experienced by Christians since the days of the Roman emperor Diocletian.

Tikhon's first months as patriarch witnessed the first onslaught of Bolshevik violence when monasteries, cathedrals, and churches were bombarded and desecrated, and priests, bishops, and lay defenders of the church murdered. Tikhon countered through an encyclical urging the Bolsheviks to cease the massacres and telling them that they were doing the work of Satan; he also excommunicated all collaborators in the terror. The encyclical, combined with the reaction to persecution, produced a major groundswell of support for the church. The Bolshevik regime reacted by depriving the church of its legal status, confiscating all its properties and revenues, and launching a holocaust designed to devastate the church and eliminate its legacy in Russian history and culture.

During the persecution the regime pursued two methods of weakening and discrediting the patriarch. First, it supported dissident schismatics who splintered the ecclesiastical administration, and second, it tried to compromise Tikhon with the public in a dispute over the disposition of church values during the famine of 1921–1922. The Living Church, composed of those opposed to restoring traditional canonical authority to the patriarchal office, was created as a result of the schism. Its leaders were allowed to seize the patriarchal palace, the patriarchal administrative offices, and the offices

of the metropolitanate of Moscow in May 1922. By this time Tikhon was already under arrest, and leading Moscow clergy had either been tried and condemned to death for inciting the masses "to engage in civil war" or were under indictment for that offense. In the resulting paralysis, the Living Church takeover was accomplished under the guise of providing leadership in unusual circumstances and with the assistance of the secret police. Clergy and bishops who refused to acknowledge the takeover were immediately declared unfrocked by the Living Church administration and arrested, tried, and, in many cases, executed by the secret police.

The takeover coincided with vitriolic attacks upon Tikhon, the hierarchy, and the clergy for refusing to hand over eucharistic vessels for famine relief. Tikhon had already agreed to strip the churches, monasteries, and cathedrals of precious metals and jewels except for the eucharistic vessels. The regime accused the church of hoarding its valuables and launched a massive propaganda attack. Churches were plundered anew, and their defenders arrested and indicted for antistate activities. The Living Church administration went through the motions of deposing Tikhon, and the Soviet government prepared to put him on trial for treason.

A major part of the government's indictment consisted in the accusation that Tikhon was working to overthrow the regime. That accusation was based upon a resolution passed by émigré hierarchs and lay leaders at Karlovci, Yugoslavia, in November 1921, demanding the restoration of the Romanov dynasty. Tikhon had already ordered his faithful and clergy to desist from antistate activities in September 1919 and repudiated the Karlovci statement. He also formally dissolved the émigré church administration in May 1922.

The Soviet regime soon realized that the Living Church did not have the support of the majority of Orthodox believers. Moreover, a general intensification of persecution of the Orthodox church in 1922, during which the popular metropolitan of Petrograd, Benjamin Kazanskii, was tried and executed, produced a deepening of dissatisfaction with Bolshevik rule among the masses. The regime also had put on trial Ioann Cieplak, acting Roman Catholic archbishop in Russia, together with Konstantin Budkiewicz, pastor of the chief Roman Catholic church in Petrograd. The execution of Budkiewicz had raised such an international outcry that the Bolsheviks faltered in their determination to execute the patriarch.

The circumstances led to a compromise. Tikhon wished to meet the Living Church challenge head-on, while the regime was concerned to avoid creating a martyr. Tikhon agreed to issue an encyclical in which he stated his personal loyalty to the Soviet government. He implied that the Living Church, rather than the regime, was the key danger to the Orthodox church. The regime slackened its support for the Living Church and Tikhon was released from prison. However, he was required to live in seclusion in the Donskoi Monastery, where he remained, except for brief hospitalization, until his death on April 7, 1925. While Tikhon con-

tained the damage from the Living Church, he paid the heavy price of being effectively isolated from his shattered flock and of paving the way for further subordination of the Orthodox church to the Soviet regime.

JAMES W. CUNNINGHAM (1987)

**TIKHON OF ZADONSK** (Timofei Savelich Sokolov, or Sokolovskii; 1724–1783), Russian Orthodox bishop and saint. Son of a church reader in the Novgorod province of Russia, the young Sokolov spent his youth in poverty. After graduating from the Novgorod seminary in 1754, he taught Greek and rhetoric until his monastic tonsure and priestly ordination in 1758, when he received the name Tikhon. Having held several academic positions, Tikhon was consecrated suffragan bishop in the Novgorod diocese in 1761 and became bishop of Voronezh in 1763. He retired from episcopal service in 1767 and finally settled in 1769 in the Zadonsk Monastery (hence his popular appellation), where he lived until his death. He was canonized a saint of the Russian Orthodox church on August 13, 1860.

Tikhon surrendered his episcopal ministry for reasons of ill health, probably emotional as well as physical. He was a high-strung person, radically committed to his pastoral work and greatly frustrated in his activities by the ecclesiastical and secular conditions of the imperial Russia of his time. In monastic solitude Tikhon lived a life of continual prayer, reading the Bible (in particular the Gospels, *Psalms*, and Prophets, especially *Isaiah*), as well as the Fathers and saints of the Orthodox church (particularly Chrysostom). He also read Western Christian literature and was particularly interested in the books of the Anglican bishop Joseph Hall and the German Pietist Johannes Arndt, in imitation of whom he wrote his most famous works, *A Spiritual Treasure Collect-*

*ed from the World* and *On True Christianity*. The collected works of Tikhon are in five volumes, including letters, sermons, and instructions of various sorts written mostly for seminarians, pastors, and monastics.

Tikhon regularly attended liturgical church services in the monastery and always participated in the sacraments, but he celebrated in his episcopal rank only at the matins of Christmas and Easter. In his everyday life he practiced great simplicity and poverty. He rarely met with people, particularly those of rank and wealth, and found communication generally very difficult. He did speak with peasants and beggars, however, giving them money, food, and counsel, and he frequently visited prisoners and criminals.

Tikhon was of melancholy spirit until the end of his life, frequently despondent and depressed. He was much given to prayerful lamentation and often wept over the state of the church and the world, particularly within the Russian empire. Even during church services he could be heard weeping and begging God for forgiveness and mercy. His main visual aids to devotion in his monastic cell were not classical Orthodox icons, but Western pictures portraying the passion of Christ in realistic form. Tikhon's life and works had great impact upon subsequent generations in the Russian church, particularly upon intellectuals such as Fedor Dostoevskii, who used Tikhon as a model for figures in his novels, and Bishop Feofan Govorov, known as Feofan the Recluse.

#### BIBLIOGRAPHY

Numerous editions of Tikhon of Zadonsk's many writings, sermons, and letters were made in nineteenth-century Russia, mostly by the official synodal press in Saint Petersburg. None of Tikhon's major works exists in entirety in any other language but Russian. Extracts of his writings can be found in such works as G. P. Fedotov's *A Treasury of Russian Spirituality* (1950; reprint, Belmont, Mass., 1975). The definitive work on Tikhon in English is Nadejda Gorodetzky's *Saint Tikhon of Zadonsk, Inspirer of Dostoevsky* (1951; reprint, Crestwood, N.Y., 1976). This work contains many long quotations from Tikhon's writings as well as an exhaustive bibliography of writings concerning the man, his life, times, and works.

THOMAS HOPKO (1987)

**TIKOPIA RELIGION.** Tikopia is a small island, three miles long and a mile and a half wide. It is part of the political grouping of the Solomon Islands, a thousand-mile chain of islands in the Pacific Ocean. It is also the peak of an old volcano, now largely sunk beneath the sea, and the original vent of the mountain has become a small brackish lake. To the northeast of the island the sacred mountain Reani rises; to the southwest are flat swamplands. The population of around fourteen hundred lives mainly around the western and southern coast of the island. Another six hundred Tikopia have migrated either temporarily or permanently to other parts of the Solomons. Whereas the island is theoreti-

cally controlled by the central government of the Solomon Islands, its distance from the seat of government and its general isolation have meant a degree of autonomy in retaining traditional practices and beliefs. The effect of this isolation on its religious practices will be discussed below.

While the majority of islands in the Solomons are peopled by Melanesians, Tikopia is a Polynesian outlier. That is, while it lies outside the true Polynesian triangle in the Pacific Ocean, it shares genetic, linguistic, and cultural traits with Polynesian islands such as Samoa, Tonga, and with the Maori of New Zealand. The major religious beliefs and practices of traditional (i.e., precontact) Polynesia were similar. Traditional Polynesians believed humans had an invisible counterpart or soul that continued its existence after death in an afterworld variously located in the sky or the sea and often composed of a series of heavens. They believed in an analogous life principle in animals and plants. They worshiped gods (*atua*) who had never been human as well as important human ancestors now also regarded as *atua*. Some of these gods could be regarded as departmental deities having responsibility for the sky, the sea, the land, and warfare as well as for elements, like the wind. The *atua* generally were beneficent, but there were also spirit entities that could cause harm.

Traditional Polynesian religion used abstract thought and symbolism. Offerings of food to the gods were made in the belief that the immaterial substance of the food was consumed by the gods but that the actual food could later be eaten by human participants in the rituals. Equally the material symbols of gods and ancestors (statues, significant rocks and trees) were seen as representations or memorials and not actual figurations with specific powers.

Existing knowledge of traditional Polynesian religion is, on the whole, fragmentary and often mediated through the records of missionaries whose duty it was to extirpate these pagan beliefs. Complete conversion of most of Polynesia to Christianity had taken place by the middle of the 1800s. However, Tikopia's isolation and small size made it difficult to find in the early days of Pacific exploration and not worth the effort of exploiting commercially for forced labor or land. This meant that when Raymond Firth carried out his first period of anthropological fieldwork in 1928–1929, the traditional religion was still practiced by three out of the four chiefs and by half the population. Therefore an excellent ethnographic record exists of the traditional ritual cycle, which was referred to as the "Work of the Gods." This summary of traditional Tikopia religious beliefs comes from Firth's extensive writings.

The island is traditionally controlled by four *ariki* (chiefs), heads of patrilineages believed, according to origin myths, to have begun with the birth of four male children to the Atua Fafine (premier female god) and the Atua Lasi (great god). The birth order of the children is reflected in the ranking of the chiefs, and their divine antecedents meant that the chiefs traditionally were regarded as sacred (*tapu*). The

body of the chief, and especially his head, is still regarded as *tapu* because of his *mana* or inherent mystical power. In this hierarchically ranked society, *maru* or ritual elders are next below the chiefs. They are men who come from junior chiefly lines. They originally had roles with the *ariki* in the traditional religion, and they still have a political function on the island. Commoners, or *tauarofa*, make up the bulk of the population. Descent is traced patrilineally, and women take no roles in either the politics or the religious practices of the island, although this is changing among those who have left the home island.

**TIKOPIA CONCEPTS AND RITUAL.** Tikopia religion traditionally rested upon a belief that a set of spiritual beings (*atua*) controlled the fertility of nature and the health and well-being of the people. These *atua* comprised the spirits of dead chiefs and their ritual elders and a number of major gods, most notably the eponymous gods of each clan: the Atua i Kafika, Atua i Tafua, Atua i Taumako, and Atua i Fangarere. The Kafika clan is the senior of the four, and most significant in the Tikopia pantheon was the Atua i Kafika. An elision may have occurred here: the original four brothers were the children of true deities and were themselves deities, but the Atua i Kafika, as he is conceptualized now, was believed to have lived as a mortal man, a chief and a culture hero, responsible for many Tikopian traditional institutions. Killed by an opponent in a struggle for land, he abjured retaliation as he lay dying, and thus morally elevated, he succeeded to the highest position among the gods.

A few female deities were usually highly dangerous to humans: Nau Fiora was preeminent in this group and was believed to have the power to steal the souls of children, thereby killing them. Other female spirits, not deities but also never human, existed in various parts of the island and were sometimes seen benignly leading their spirit children to the sea. However, more dangerous ones existed in the bush and were capable of seducing and killing men. Ideas about gender in the temporal world, where women were conceptualized as powerless but having the potential to be dangerous, were reflected in the spirit world. There were also some other potentially dangerous entities with human origins, such as the spirits of children, either stillborn or miscarried. A child that died before recognizing his or her parents, that is, up to about the age of six weeks after birth, also came into this category, as did occasionally the spirits of young males who had died in accidents. While these spirits could perform mischievous actions by themselves, they were also the ones that often manifested themselves through spirit mediums.

The major gods of the pantheon had several personal names or titles that were held as secret information by the religious leaders, and it was through the ritual invocation of the name that the god could be stimulated to listen to and grant the requests of his worshipers. The deities were on the whole "owned" by different clans and lineages, and although there was some overlap in their attribution, each spirit had a primary social affiliation.

Unlike some of the larger Polynesian groups, the Tikopia had no separate category of priests whose main function was ritual performance. The four chiefs themselves, and their ritual elders, communicated with the gods and ancestor spirits with prayers, invocations, and offerings on behalf of their people. They also performed secular social roles as heads or administrative officers of lineages overseeing clan lands, canoes, and other property. The four *ariki* were the main priests, and each had a primary responsibility for certain crops and elements. The Ariki Kafika had prime responsibility for the success of the yam crop and for the welfare of the island generally. The Ariki Tafua was responsible for the coconut, and he looked out, away from the island, to matters concerning outsiders. The Ariki Taumako was responsible for the taro and for things to do with the sea, while the Ariki Fangarere looked after the breadfruit. This latter chief, for reasons described in the origin story of the birth of the four males, was also connected with disasters like cyclones and drought.

On the whole, commoners were merely supporters in the rituals, providing food and mats and, on some but not all occasions, an audience. However, there were some men (and a few women who had usually passed menopause) who had the potential to go into trance. These mediums were called *vaka atua* (spirit vessels). Their function was more informal and usually involved healing by communicating with some spirit that may have caused sickness. Spirits could also speak through the mediums to express concern at social and interpersonal derelictions. Where the chiefs and ritual elders performed rituals for the larger groups of clan and lineage, the mediums tended to cater to the concerns of families with whom they were connected.

The basic traditional Tikopia religious rite was the presentation of kava to the gods. Kava is the root of *Piper methysticum* that is macerated by pounding or chewing and mixed with water. In modern Tonga, Samoa, and Fiji, kava is prepared and drunk in ceremonies and on social occasions, but traditionally it had a religious function. In Tikopia the kava liquid was hardly drunk at all; it was offered to the gods as a libation poured on to the ground to the accompaniment of prayers for welfare. To perform a kava rite, a chief or elder assumed ritual purity by bathing, and he then donned a special waist cloth and a leaf necklet as a sign of formal religious dedication and set out offerings of bark cloth and food that, with the libations, served as a channel for invoking the spirits. The language used was highly symbolic and honorific; the chief adopted a tone of great humility, pleading poverty and signifying abasement before a god. Using conventional and ritual terms, the chief beseeched the gods to excrete on the earth, the gods' excrement being seen symbolically as all the goods things of the land and the sea.

**THE WORK OF THE GODS.** A notable feature of Tikopia traditional religion was a collective set of seasonal rites that involved elaborate organization of the community and the assembly of large supplies of food. The title *Work of the Gods*

used by the Tikopia to refer to these rituals represented the amount of energy that was required from the people in performing them.

The basic theme of the Work of the Gods was the periodic resacralization of some of the most important elements of Tikopia culture. Under religious auspices, canoes and temples were repaired and rededicated, yams were harvested and replanted, and a red pigment was extracted from turmeric rhizomes and preserved for ritual use. (The turmeric ceremony, *nuanga*, is one of the few elements of traditional ritual to survive the island's conversion to Christianity and will be described below.) Ceremonies were performed for the welfare of the crops and fishing. However, these rituals not only dealt with the technological and economic affairs of the island, they also included a sternly moral public address, under conditions of great sanctity, instructing the people on proper behavior as members of Tikopia society. This included injunctions about birth control, an essential matter on a small island far distant from the next piece of land.

The period ended with ritual dancing in which formal mimetic displays and chanting of archaic songs were succeeded by freer performances by firelight at night in which men and women could indulge in often ribald reference to sexual matters, although still in a highly controlled setting. This aspect of the festival, partly cathartic in nature, was thought to seek the gods' approval of human recreation. Most of the rituals of the Work of the Gods were carried out on *marae*, ceremonial assembly spaces, often outside temples or large meetinghouses.

The Work of the Gods comprised a two-part cycle. It was not strictly calendrical but recognized the two major seasonal alternations: the trade wind period that went from April to October and the monsoon season of sometimes savage cyclones and rain from November to March. The timing of each cycle was based on natural observations, such as the appearance of constellations, especially the Pleiades, the migration of birds, and, for the beginning of the turmeric making, the flowering of the bright red coral tree (*Erythrina sp.*). Each ritual lasted about thirty days and was elaborately organized with much mobilization and exchange of food supplies, drawing the whole community into a vast network of social and economic relationships. Two clear functions of the whole series of religious performances seemed to be to provide occasion for the expression of personal and role status, especially of the chiefs, and to demonstrate communal solidarity.

The Work of the Gods had a special quality of sanctity through traditional authority. No particular myth was told by the Tikopia people to account for the genesis of the ritual cycle. They merely described it as having been instituted by the Atua i Kafika, and the performances of the rituals were regarded as a continuation and replication of the practices the deity had initiated. Therefore every effort was made to see that they were repeated in accurate detail, which required the careful passing on of the rituals from one generation to

the next. The cycle began with the burning of a fire stick, and until the ceremony was completed, there was a ban on noise and much secular activity. Each ritual cycle concluded with the lifting of the taboo in a ceremony known as “freeing the land” that was emphasized by deliberate loud noise in contrast to the previous peace. Children ran about shrieking, and men whooped and yelled from the hills as they went about their daily work, making hollow booms by beating the buttresses of giant Tahitian chestnut tree trunks. A detailed description of the rituals is in Firth’s *The Work of the Gods in Tikopia* (1940/1967).

**CONVERSION TO CHRISTIANITY.** Tikopia’s relative isolation, as mentioned above, protected the small island from early intrusions by colonizers, traders, and missionaries (who initially contacted the Tikopia in 1858), but the Tikopia themselves discouraged outsiders from settling on their island. This kept missionaries at bay until 1907. Where much of the rest of both Polynesia and Melanesia was missionized by Europeans, Tikopia’s first resident missionary was a man from the Banks Islands, a Melanesian. This probably muted to some degree the impact of a new religion. Where the technological superiority (including guns) of Europeans in other parts of the Pacific led to some fairly rapid conversions, in Tikopia the first missionary was not white and not particularly well equipped. The Tikopia gave him a Tikopian name, Pa Pangisi (after Banks), and married him to a Tikopian woman. He spent his whole life with the Tikopia, and his sons underwent the manhood ceremonies of all Tikopia boys.

Pa Pangisi was a missionary for the Melanesian Mission, the Anglican Church in Melanesia. He settled on the leeward side of the island, where one of the four chiefs lived, the Ariki Tafua. This chief converted to Christianity, and a number of commoners belonging to his clan followed him. Pa Pangisi instituted some changes to traditional practices: he discouraged the young men from growing their hair long and joining in the pagan dances. He also insisted on marriage between young people who were in sexual relationships. In this matter, his interpretation, through a Christian lens, of sex outside of marriage failed to take into account the pragmatic Tikopia thinking underlying human relationships. On a small island the necessity to control the population had been recognized in the exhortations of the Work of the Gods. To this end only the eldest son was allowed to marry, “marriage” involving the production of children. Younger sons were allowed to have sexual affairs, but they could not produce offspring, something ensured through abortion or infanticide. Pa Pangisi’s insistence on marriage for all sexually active couples led to a population explosion. In about thirty years the population increased 50 percent and led to deaths after a cyclone, when the island’s carrying and recuperative capacity was overextended.

The Work of the Gods had also involved the participation of most of the population in the rituals. By 1955 only one of the chiefs, Tafua, had become Christian, but many

commoners had converted and were therefore prohibited from joining in the rites of the old beliefs. This meant that the remaining three pagan chiefs did not have sufficient material and human support to carry out the rituals in a manner they thought appropriate. The unity of the people for the good of the land was central to Tikopia belief, and the pagan chiefs, always pragmatists, met and decided that for the good of the land they should convert to Christianity. There are two accounts of the decision to convert.

The first comes from the ethnographic records of Firth and James Spillius, who carried out fieldwork in Tikopia in 1952 and 1953. They recorded that one chief was baptized by Pa Pangisi, who had married into this chief’s family, but the other two chiefs insisted that their reception into the Church of Melanesia should be performed by the bishop. A radio message was therefore sent to Honiara asking the bishop to come to Tikopia, and the mission ship, the *Southern Cross*, set out. The two remaining chiefs and nearly all of their clans were thereupon baptized as Anglicans. Only one old woman refused, saying that her husband had died a pagan and she would too. The degree to which there was a deeply felt doctrinal understanding is unknown, although it has been noted that the Ariki Taumako did not intellectually reject his old gods; he just decided not to worship them any longer. Nonetheless the old temples were left to decay, the ritual adzes were destroyed or buried, and new church buildings were constructed in the centers of several villages. The chiefs no longer led the rituals; they were simply members of the congregation. The first priest was the Melanesian Pa Pangisi, but the Tikopia quickly arranged for the education of some of their men as Anglican priests or brothers of the Franciscan order. Priests and catechists in Tikopia have since been largely Tikopian.

The second story of the island’s final conversion is consistent with a society taking control of its own history and rewriting it to some degree. This version, recorded in 1980, suggests that, rather than the historical accident of being missionized by Anglicans, a deliberate choice was made. In this version the chiefs looked at all the religions then practiced in the Solomon Islands. They rejected Roman Catholicism on the grounds that the prohibition on priests marrying was an unnatural practice. They rejected Seventh-day Adventism, to which the people of two other Polynesian outliers in the Solomons (Rennell and Bellona) had converted, on the grounds that the dietary restrictions of this religion were unrealistic. The chiefs considered, it was said, that Anglicans were the least trouble and that the island would therefore become Anglican.

With one priest on the island but several churches, the priest moved around the various parishes, named by Anglican tradition after saints. Catechists or senior men of rank could conduct prayer services in the other churches in the priest’s absence. The mission ship came once a year for the confirmation of the young, and the priest and other church functionaries were taken off the island once a year for synod.

Various parts of the order of service and some gospels were translated into the Tikopia language, and the communion service was always conducted in the local language. However, accretions that were purely Tikopian crept into the religious practice. Women, allowed no voice in political, economic, or even domestic matters in Tikopia, were not allowed a role in the church, and women's groups like Mothers' Union were actively discouraged. Menstruating women, excluded from traditional rituals and even from dances, were technically prohibited from attending church in that state, something that was seen more as a relief than an exclusion.

The earlier priests were more doctrinally rigid, and ceremonies associated with the Work of the Gods were specifically prohibited. However, by 1980 the turmeric-making ceremony was reinstated. Turmeric is the culinary spice made from the rhizomes of a lilylike plant. The yellow lees from the process are used in food, but the bright orange part of the spice is mixed with coconut oil to make a body and cloth paint. Turmeric was used to mark the body in every life passage ceremony, as well as in the decoration of dancers and their bark-cloth skirts or loincloths. Referred to as "the perfume of the [old] gods," it was traditionally believed to draw the kindly attention of the gods to whatever activity was in progress. During the time it had not been made on the island, turmeric, judged inferior but necessary, was imported from another island. The making of the turmeric in Tikopia involved ritual withdrawal from everyday life and a series of elaborate taboos and restrictions to be followed over the two to three weeks the process took. Once again chiefs or their ritual elders took up their traditional roles in directing the process.

In 1980 the oldest of the four chiefs, the Ariki Tau-mako, was still alive and was the only one who had taken part in the traditional rituals. His ritual paraphernalia was kept in a small house, which he referred to as a "museum," behind his main dwelling place, and he regularly threw a small offering of food toward the museum. He still remembered and used his invocations to the gods of the sea, who had been the responsibility of his clan when people were to take the interisland ship away from Tikopia. However, he has subsequently died, and two or three generations have passed since the forebears of the present chiefs practiced the old rituals. Their memory exists only in Firth's record.

The interventions by the first missionary in Tikopian birth-control measures resulted in an increase in the population that was unsustainable for the island. From the late 1960s on, people left the island for other parts of the Solomons, forming permanent settlements first in the Russell Islands, later on Makira, and increasingly in the capital of the Solomon Islands, Honiara. There, Tikopia men sometimes married Melanesian women whose exposure to Christianity and practices inclusive of women differed from the Tikopia experience. In the Tikopia village of Nukukaisi on Makira, an in-marrying Melanesian woman became president of the Mothers' Union for the top half of the island. Some Tikopia

women (mainly those related to this woman's husband) joined and took responsibility for matters like church linen, something that was not used in Tikopia itself because no money economy existed there. Meanwhile, Tikopia in Honiara have been exposed to a variety of sects, and young men especially have been attracted to religions that provide youth activities such as dances. While Anglicanism remains virtually the only religion on the home island, Tikopia in other parts of the Solomons have begun to espouse other religions, including Jehovah's Witnesses and Mormonism, whereas others have ceased religious observances.

**TILAK, BAL GANGADHAR** (1856–1920), was an Indian political leader. Known by his followers as *Lokamanya*, "revered by the people," but as the "father of Indian unrest" by the British authorities in India, Tilak had a crucial role in defining Indian nationalism by an appeal to Hindu religious and cultural symbols. He was born on July 23, 1856, in the Ratnagiri district of the Bombay Presidency. His family belonged to the Citpavan subcaste of Brahmans, members of which had been influential as both religious and secular functionaries under the Marathas, the last indigenous rulers of the region, and Tilak had a proud consciousness of the greatness of Hindu civilization. He began his career in the recently established Fergusson College in Poona, where in 1881 he and his friend G. G. Agarkar established two newspapers: *Kesari*, in Marathi, and *Maratha*, in English. The papers criticized many aspects of British rule and called for a rejuvenation of India's national life.

Tilak's rise to prominence as a nationalist leader must be seen in the context of movements for social and religious

reform that had attracted many intellectuals in the Poona region and elsewhere. Many reformers believed, however, in working with the British to bring about gradual political change and in seeking to reform deeply embedded social practices that seemed to have Hindu religious sanction. Tilak did not condone such practices but insisted that freedom from British rule was the first priority, not social or religious reform.

Sometimes Tilak supported, but he also opposed, the Indian National Congress, the organization founded in 1885 that became the chief agent in winning Indian independence. Two characteristics often alienated him from other nationalist leaders: one was his use of Hindu religious symbols as expressions of Indian nationalism, and the other was his acceptance of violence as a legitimate political tool sanctioned by the Hindu tradition.

In two of Tilak's books, *Orion* (1893) and *The Arctic Home of the Vedas* (1903), he argued that the mythic Hindu stories could be interpreted as actual history, thus giving Indians pride in the antiquity of their nationalist narrative. In *Gītā Rahasya* (1915), a commentary on the *Bhagavadgītā*, written while he was imprisoned for sedition, Tilak argued that it was not, as many commentators had interpreted it, a text that encouraged passive devotion to a deity, but, on the contrary, it was a revolutionary call to use violence against oppression. Mahatma Gandhi was later to argue, with Tilak in mind, that the message of the *Bhagavadgītā* was one of nonviolence and love of one's enemies.

Tilak's appeal to the Hindu tradition as a basis for a renewal of Indian greatness and opposition to the British was dramatized in numerous initiatives. One of these was starting festivals to celebrate Śivājī (1621–1680), the great warrior who fought the Mughal emperors, defending Hinduism against the invading Muslims. The implication of the message was not lost on either the Muslim minorities or the British rulers. More directly identified with Hinduism were festivals supported by Tilak in honor of the popular deity Gaṇapati, or Gaṇeśa. These had been in existence as family or local celebrations, but Tilak saw them as a chance for widespread group support for the project for political freedom, for Gaṇapati is the god of new beginnings, a help in overcoming obstacles, and the son of Śiva, the most powerful and potent of the great gods, often pictured as a warrior smiting his enemies. Tilak also joined in the campaign against cow slaughter, arguing that Hindus venerated the cow as a religious symbol. Since Muslims and the British were beef eaters, the campaign had a potent social and political message.

Some of the causes that Tilak supported in the name of Hindu cultural nationalism seemed, not only to the British but also to other Indian intellectuals, reactionary. One was his denunciation of the government when, in 1890, it introduced legislation to raise the permissible age of marriage for girls from ten to twelve. Orthodox Muslim leaders, as well as Hindus, argued that the government was interfering with

a practice sanctioned by religion. Then, in 1897, there was an outbreak of bubonic plague in Poona, and the government ordered a house-to-house search under a military officer, W. C. Rand, which Tilak said violated the sanctity of the Hindu home; he also argued that, following the example of Śivājī, violence was justified to protest it. When Rand was assassinated, Tilak was charged with incitement to murder because of his writings, and he was sentenced to eighteen months in prison.

Such activities made Tilak the leading figure in the group within the Indian National Congress that he proudly called the "Extremists," in contrast to the "Moderates," whom he denounced for begging favors from their British overlords when they should be taking by force what was rightfully theirs. He popularized the slogan, "*Swarāj* [self-rule] is my birthright and I will have it." In 1907 he and his group tried to gain control of the annual meeting of the Indian National Congress in Surat, but failed, leading to a split in the organization. In 1908 Tilak was arrested on charges of incitement to violence and sentenced to six years of imprisonment in the unhealthy Andaman Islands, but he survived the ordeal and in 1916 he rejoined the Congress.

At this time, Gandhi arrived on the Indian political scene with a message of nonviolence that rejected Tilak's reading of the *Bhagavadgītā*. Tilak's death in August 1920, just before the Indian National Congress adopted Gandhi's platform of nonviolence, prevented Tilak from questioning the new direction that the nationalist movement was taking. Gandhi's success in subsequent years in persuading Indian nationalists to accept his version of Hinduism as a religion of nonviolence and love overshadowed for many years Tilak's insistence that Hinduism could be the basis for a militant nationalism that would fight to win India's independence. At the beginning of the twenty-first century, however, Tilak's version of militant Hinduism, not Gandhi's pacifism, was dominant in India's political life.

#### BIBLIOGRAPHY

There is no good biography that comprehensively examines Tilak's personal life, political activities, and religious views, and assesses his role in the nationalist narrative. Richard I. Cashman, *The Myth of the Lokamanya: Tilak and Mass Politics in Maharashtra* (Berkeley, 1975), is a scholarly study of aspects of his political activities. Stanley A. Wolpert, *Tilak and Gokhale: Revolution and Reform in the Making of Modern India* (Berkeley, 1962), contrasts his positions with those of his great liberal contemporary and rival, G. K. Gokhale. D. V. Tahmankar, *Lokamanya Tilak: Father of Indian Unrest and Maker of Modern India* (London, 1956), is an authorized biography but gives a fuller picture of Tilak's life and times. G. P. Pradhan, *Lokamanya Tilak* (New Delhi, 1994), is intended to show Tilak as a great patriot and thinker. Examples of Tilak's combination of religious and political thought can be found in B. G. Tilak, *Tilak: His Writings and Speeches*

(Madras, India, 1922). An English translation of his Marathi work is available in *Srimad-Bhagavadgītā-Rahasya*, edited by B. S. Sukthanankar (Poona, India, 1965).

AINSLIE T. EMBREE (2005)

**TILĀWAH.** Recitation of the sacred words of scripture in Islamic contexts of prayer, liturgy, and public performance is designated by the Arabic terms *tilāwah* and *qirā'ah*. The very name of Muslim scripture, Qur'ān, is a cognate of *qirā'ah* from the finite verb *qara'a*, which means “he read,” in the sense of “recited.” *Tilāwah* is the more general term for Qur'ān recitation, and its root carries the double sense of “to recite” and “to follow.” Thus, the Muslim concept of scripture entails the notion of divine speech meant to be recited, as indeed is the case with several other scriptures, such as the Hindu Vedas and the Jewish Torah. The sacred archetype of Muslim scripture is the Preserved Tablet (*lawḥ mahfūz*, surah 85:22) or Mother of the Book (*umm al-kitāb*, 13:39, 43:4), the heavenly inscription of God's word from which it is believed that scriptures had been sent down to other prophets (e.g., the *torah* to Moses and the gospel to Jesus) and ultimately from which the angel Gabriel recited the Arabic Qur'ān to Muḥammad. This notion of divine speech, preserved and transmitted in heaven and on earth in both written and oral forms, can be traced among Semites to ancient Near Eastern cosmologies. In both its inscribed and its recited Arabic forms, the Qur'ān lies at the heart of Islamic symbolism, ritual, and social experience—indeed, even among many non-Arabic-speaking Muslims.

The tendency of Western scholars to concentrate on problems of textual history and interpretation to the neglect of the contextual modes of oral transmission and performance has resulted in a general failure to appreciate the significance of *tilāwah* in Islamic society. Although the textual form of the Qur'ān is paramount in such areas of classical Muslim scholarship as law (*fiqh*), theology (*kalām*), grammar (*nahw*), and scriptural commentary (*tafsīr*), it is in its oral form that most Muslims down to the present have learned the Qur'ān.

**TILĀWAH AND THE QUESTION OF CANON.** In Islam, the problem of establishing an authoritative text was not a question, as it was in Judaism and Christianity, of authorized councils deciding which writings were inspired or otherwise authentic. Materials for the body of scripture (*kitāb*, “book, writing”) were from the beginning regarded as simply and exclusively the accurate preservation of Muḥammad's recitation of God's speech, which tradition affirms had circulated orally, and in a less well-assembled form in writing, among contemporaries of the Prophet. Of greater significance was the question of collecting—implying also the arranging—of the Prophet's recitation of *sūrah*s and *āyah*s (“chapters” and “verses”). Tradition assigns the beginning of this task to the Prophet himself and stipulates further that the Qur'anic text was rehearsed in the presence of the angel Gabriel periodical-

ly until the revelation ended at the time of Muḥammad's death (632 CE). It is also held that through his secretary, Zayd ibn Thābit (and others), Muḥammad had at least some of the Qur'ān written down during his own lifetime. Various copies (*maṣāḥif*, sg., *maṣḥaf*) of these and the transcription of others were collected by the first two caliphs (Muḥammad's successors as head of the community). Islamic tradition regards the definitive collection ordered by the third caliph 'Uthmān (d. 656), however, as the official copy to which all authoritative copies since that time are traced.

As is often the case when the texts of sacred speech assume written form prior to the development of widespread functional literacy, the *scriptio defectiva* of the earliest transcriptions of the Qur'ān did not present the full and unambiguous script that was later developed for the enunciation, phrasing, and punctuation of each vocable, and it did not provide for other matters of enormous significance for meaning and consistency in oral recitation, such as guidance for phrasing and pauses. *Scriptio plena*, the full and precise system of writing, had neither fully evolved nor was it really necessary in the early stages when the “text” was transmitted primarily in oral form. As a result, slightly different variant readings (recitations) of the written Qur'anic text have existed and been accepted since the formative period of Islam.

Tenth-century Qur'ān scholars, the most famous of whom was Ibn Mujāhid (859–935), analyzed and evaluated the existing variant readings of their day and established the orthodox systems of reciting from the written text attributed to the caliph 'Uthmān (r. 644–656). Tradition accounts for the variations among the reciters, as Ibn Mujāhid's work shows, on the basis of a report (*ḥadīth*) that Muḥammad had been given the Qur'ān to recite according to seven *ahruf* (“letters”), a term that is sometimes taken to mean the dialects spoken by Arab tribes contemporary with the Prophet. In this view, God revealed the Qur'ān to Muḥammad in the seven dialects of Arabic understood by the various tribes in Arabia, and these phonetic variations account for the different *qirā'āt* of the text of 'Uthmān. The connotation of *ahruf* as “dialects” is controversial among Islamicists, however. Ibn Mujāhid's work, *Kitāb al-sab'ah* (The Seven Recitations), identified the most renowned orthodox eighth-century reciters of the Qur'ān, and although later authorities boosted to ten and fourteen the number of acceptable recitation systems, Ibn Mujāhid's seven remain the most widely recognized among Muslims today. Disciples of the seven charter reciters promulgated slight variations from their masters; these seven secondary transmitters are known as *rāwī*s, and their traditions of recitation have also survived and found acceptance in the Muslim community.

Thus, for example, in the postscript to the official edition of the Qur'ān printed in Egypt, the editors state that the basic orthography is that of 'Uthmān's copy and that it reflects the phonetic qualities of the oral transmission by the *rāwī* Ḥafṣ (d. 805), whose master was the reciter (*qārī*, *muqri'*) 'Aṣim (d. 744)—one of Ibn Mujāhid's seven. Many

professional reciters know several of the phonetic systems of the classic reciters and their disciples, and they will often repeat a given Qur'anic phrase in other *qirā'āt* in order to bring out several possible emphases and meanings allowed by the basic script.

**TILĀWAH AND THE RULES OF TAJWĪD.** The significance of acceptable variations in the enunciation of the text is considerable insofar as meaning is established not only by written symbols but also by sounds. Although written texts of the Qur'ān, such as the modern Egyptian edition traced to the *qirā'ah* of 'Āṣim, are elaborately marked to reflect the phonetic qualities of a given *qirā'ah* and are further coded to guide the reciter in proper phrasing and oral emphasis, the actual art of reciting can be learned properly only from a teacher. This oral, performative, pedagogical context has characterized Qur'anic studies in Islam since the seventh century. Nonetheless, a considerable literature about the rules that govern recitation has accumulated over the centuries.

Learning to recite the Qur'ān traditionally began in the Qur'ān school (*kuttāb, maktab*), where rote memorization of Qur'anic passages by children seated around a teacher (*shaykh*) marked the first, and for some the only, stage of formal education. Even with increasing government control of public education in modern times and the changes this has brought about, many contemporary Muslims are attempting to retain some form of the traditional Qur'ān school as an important first stage of Islamic pedagogy. At more advanced levels, students specializing in *tilāwah* learn the rules of *tajwīd*, that is, the rules for rendering correctly the recitation of the Qur'ān (and their application) in more critical learning and performance situations. Again, this is primarily an oral context dominated by a shaykh who has received special training and earned recognition as a reciter. In one of the most popular recitation manuals in use in Cairo today, *tajwīd* is defined as “articulating each letter from its point of articulation, giving it its full value. The intent of *tajwīd* is the reciting of the Qur'ān as God most high sent it down. . . . Knowledge of it is a collective duty, and the practice of it is a duty prescribed for all who wish to recite something from the holy Qur'ān.”

Rules for proper recitation are usually printed at the back of the Qur'ān. These include specifications on how to produce the correct phonetic sounds, assimilation of certain juxtaposed phonemes, proper duration of vowel sounds, and sectioning (the rules for pauses and starts in reciting). The first three kinds of rules account for the unique sound of Qur'anic recitation—a sound that easily distinguishes *tilāwah* from the pronunciation of Arabic for any other purpose. Sectioning allows the reciter to build a cadence or stress a particular phrase through the use of required and optional points of pausing and starting within each verse of the text and through calculated repetition of phrases. The rules of *tajwīd* also cover the proper Arabic formulas used before and after each recitation, such as “I take refuge in God from the

evil Satan,” followed by the Basmalah, “In the name of God, the merciful, the compassionate.” At the completion of each recitation one recites: “The majestic God has spoken truly.”

Two general styles of recitation may be distinguished. *Murattal* is the more straightforward type, appropriate for individuals reciting in the context of prayer and private devotions; *mujawwad* refers to the more melodious and ornate styles employed by trained and professional reciters for religious celebrations and public performances. Both *murattal* and *mujawwad* are governed by the rules of *tajwīd*, although *mujawwad* is an art form that takes years to master, and its practitioners receive high recognition in Islamic society.

The term *tilāwah* (which has thus far been used synonymously with *qirā'ah*) has the special connotation, as al-Ghazālī (d. 1111) put it, of being an act of recitation in which the tongue, heart, and mind are equally involved. Thus, *tilāwah* involves three essential ingredients: sound, thought, and emotion. Insofar as the rules of *tajwīd* and the contexts in which they are taught are intended to realize all three factors, Qur'ān recitation cannot be regarded as an empty verbal exercise, a cultural form without content. Muslim literature about *tilāwah* indicates that “the necessary, obligatory recitation is the thoughtful one that engrosses the whole self,” or “those who would listen to the Qur'ān with their ears, not attending with their hearts, God faults them for that.” The rules of *tajwīd*, then, have to do with sound production in relation to the proper cognitive and emotional responses.

The *tilāwah* literature addresses the rules of *tajwīd* for listening to Qur'ān recitation as well. This dual focus reflects the facts that the Qur'ān is an integral aspect of Muslim piety and worship and that most occasions of Qur'ān recitation entail a speaker/listener social relationship. The reciter's skill and correct frame of mind for his task are to be matched by listeners who likewise are prepared to hear the word of God.

Besides the manuals on *tajwīd*, other sources contributing to the cognitive and intellectual understanding of the Qur'ān include phrase-by-phrase commentaries (*tafsīr*), biographies of the prophet Muḥammad (*ṣirāṭ*), and descriptions of the specific occasions of revelation during Muḥammad's mission (*asbāb al-nuzūl*). Then too, there are the personal meanings each phrase might symbolize for individual reciters and hearers: when an individual or community feels tempted or threatened by an intrusive outside force or circumstance, for example, a passage about Satan may be recited. In general, the rules of *tajwīd* and Qur'ān recitation are closely connected with these other sources—both literary and social/contextual—of meaning. Any adequate appreciation of the meaning of the Qur'ān would have to involve knowledge of the written text, the commentary literature, the performance of recitation, and the social-ritual contexts—in short, the whole spectrum of Qur'anic presence in Islamic culture.

**THE CONTEXTS OF TILĀWAH.** Among the most important settings for Qur'ān recitation are the ritual celebrations ap-

pointed by the Muslim calendar. The ninth month, Ramaḍān—the month when Muḥammad’s mission was first announced to him with the transmission of the first revelation (surah 96) by the angel Gabriel, and also the month of the obligatory fast—is the occasion for public recitation of one-thirtieth of the text each day in mosques and special gatherings. The written text of the Qur’ān indicates these liturgical divisions with symbols in the margins marking each thirtieth part (*juz*), the halves of each of these, and the quarters of each half. Another set of markings divides the text into seven weekly sections. The apportioning of the text in this fashion is separate from the literary chapter divisions (surahs) and specifically applies to the liturgical and mnemonic functions of reciting.

The actual speed with which a Muslim may choose to recite the entire text (over a month, a week, three days, or even in one night), like the question of which passage to recite on a given occasion, is a matter of personal preference. Various recommendations of the Prophet and his companions on these matters are found in the *ḥadīth* and are quoted in the literature on Qur’ān recitation.

On important calendrical festivals (*‘uyūd*; sg., *‘īd*), such as the Prophet’s birthday (Mawlid al-Nabī), the Feast of Fast-Breaking (‘Īd al-Fiṭr, at the end of the month of Ramaḍān), and during the pilgrimage assemblies in Mecca during the twelfth month, Qur’ān recitation also plays an important role. Whereas such public occasions call for the skills of a trained reciter, every Muslim individually recites a portion of the Qur’ān during the five daily prayers. The most frequently recited passage is the brief first surah, the Fātiḥah (Opener).

The Muslim lunar calendar captures in its festivals and holidays the rhythms of sacred history that center around God’s revelation to the Prophet and the sacred time of the formation of the Prophet’s community (*ummah*) in Mecca and Medina. Another set of social rhythms, the human life cycle, is also celebrated by moments of recitation. The Muslim rites of passage, including birth and naming of the child, circumcision, acquiring the ability to recite the entire Qur’ān from memory, marriage, and death, are normally celebrated among family, friends, and neighbors, and it is common practice to hire a Qur’ān reciter for the edification and enjoyment of those gathered. Numerous political and social occasions also call for a religious blessing attended by Qur’ān recitation. Because Qur’ān recitation in the more ornate *mujawwad* style is also a critical art form, a well-known reciter can attract a large and responsive crowd just to hear him perform his art. Indeed, the ethnomusicological field research of Kristina Nelson has shown that public knowledge and appreciation of different personal styles of *mujawwad* performance are very keen among reciters and their audiences in Egypt today; such intense appreciation of Qur’ān recitation is characteristic of all Muslim societies including regions outside the Arabic-speaking Middle East.

The development of electronic media in the twentieth century has created new contexts for Qur’ān recitation. Tape recordings of the *murattal* and *tajwīd* styles of recitation by famous recent and contemporary reciters are widely available for private and public listening. Cassettes also allow individuals to record their favorite reciter from the radio or at private reciting sessions and to exchange tapes with other connoisseurs. Television stations in Muslim countries typically begin and end each program day with a passage of Qur’ān recitation; as the shaykh recites, the Arabic text rolls down the screen in place of or in addition to the image of the reciter. In some non-Arabic-speaking countries such as Malaysia and Indonesia, a simultaneous translation of the text in the local language may also appear on the screen. Radio, however, is by far the most widely used broadcast medium for Qur’ān recitation today. Most stations broadcast Qur’ān recitation at selected intervals, along with religious poetry, readings of the Prophet’s *ḥadīth*, and homiletic materials. Some stations devote programming entirely to Qur’ān recitation and other religious materials, and listeners are able to select times for listening or recording their favorite passages and reciters from broadcast schedules in the print media. Along with reciters famed for their skills and in high demand for public and private recitations in person, those chosen for broadcast performance are carefully screened, and many become well-known personalities in Muslim societies. Given the new media contexts of modern Islam, it is not uncommon, therefore, for someone walking down a street to hear the Qur’ān being recited from several sources at once—from radios and cassette recorders in private homes, small shops, and automobiles, along with those carried by passersby. Throughout the Muslim world students, both male and female, compete in local and national Qur’ān reciting contests, which are decided internationally each year at such renowned centers as al-Azhar University in Cairo.

The contexts of Qur’ān recitation described above have a striking symbolic association with “occasions of revelation” during the sacred time of the Prophet’s mission in Mecca and Medina. Recitation then and now belongs to those significant moments in the life of the community that call for enunciation of the divine word. *Tilāwah* is, then, a meaningful speech act governed by rules that situate the speaker and the addressee within the sacred paradigm of God’s address to humankind. The recited Qur’ān is, however, no more considered by Muslims to be the actual words of the contemporary reciter than it is attributed to the prophet Muḥammad. The Qur’ān is enthusiastically held to be God’s beneficent revelation to the Arabs in the seventh century and, through the Arabs and their language, to the rest of humankind. *Tilāwah* as an Islamic cultural framework embraces not only the sounds but also the cognitive processes of meaning and the emotional responses appropriate to this symbol of divine manifestation. A full appreciation of *tilāwah*, therefore, engages the student of religions with texts, rules, and practices that touch virtually every aspect of Muslim society.

#### BIBLIOGRAPHY

The standard work on the Qurʾān is by Theodor Nöldeke, Friedrich Schwally, and others, *Geschichte des Qorāns*, 2d rev. ed., 3 vols. (1909–1938; reprint, New York, 1970), of which the third volume by Gotthelf Bergsträsser and Otto Pretzl, *Die Geschichte des Korantexts*, 2d ed. (Leiden, 1938), contains information about Qurʾān recitation. Another standard source of information is Ignác Goldziher's *Die Richtungen der islamischen Koranlegung* (1920; reprint, Leiden, 1970), especially pages 1–54. A summary of European scholarship on Qurʾān recitation is presented in Rudi Paret's "Kirāʾa," in *The Encyclopaedia of Islam*, new ed. (Leiden, 1960–). Useful information about *tajwīd* may be found in Edward Sell's *The Faith of Islam*, 3d ed. (London, 1907); see appendix A, "Ilmuʿt-tajwid."

The most important modern research on Qurʾān recitation has been done by Kristina Nelson; see *The Art of Reciting the Qurʾan* (Austin, 1985). Also useful is the *International Congress for the Study of the Qurʾan*, series 1, 2d ed., edited by A. H. Johns (Canberra, 1982); see especially Frederick M. Denny's "The *Adab* of Qurʾan Recitation: Text and Context," pp. 143–160, and John Bowman's "Holy Scriptures, Lectionaries and Qurʾan," pp. 29–37. On Qurʾān recitation in the wider context of Islamic culture, see Frederick M. Denny's "Exegesis and Recitation: Their Development as Classical Forms of Qurʾānic Piety," in *Transitions and Transformations in the History of Religions: Essays in Honor of Joseph M. Kitagawa*, edited by Frank E. Reynolds and Theodore M. Ludwig (Leiden, 1980), pp. 91–123, and my own "Understanding the Qurʾan in Text and Context," *History of Religions* 21 (May 1982): 361–384.

Most Muslim works on the Qurʾān are written in Arabic and thus little known in the West except among specialists. An exception is Labib al-Said's *The Recited Koran: A History of the First Recorded Version*, translated and edited by Bernard Weiss, M. A. Rauf, and Morroe Berger (Princeton, 1975).

RICHARD C. MARTIN (1987)

**TILlich, PAUL JOHANNES** (1886–1965), German-American theologian and philosopher, was born in Starzeddel (now Starosiedle, Poland), in Brandenburg, Germany, on August 20, 1886, the son of a Lutheran pastor. He attended the University of Berlin, from which he received his Ph.D., and the University of Halle, where he received his doctorate in theology. After passing his second theological examination at Halle, he was ordained into the ministry in 1912.

**CAREER AND THEORY FORMULATION.** During World War I Tillich served as a military chaplain. These years had a profound impact on Tillich's understanding of human reality. The effect of the war's devastation, both physical and spiritual, is reflected in a letter that he wrote in November 1916: "I have become purely an eschatologist [in that] what I, along with others, am experiencing is the actual end of the world

of this time." Completing his military service in December 1918, Tillich received his qualification for university teaching (*Habilitation*) at the University of Berlin in 1919. This was also the year in which he published one of his most influential essays, "On the Idea of a Theology of Culture" (*Über die Idee einer Theologie der Kultur*). The essay presented the principles for interpreting culture theologically that Tillich followed throughout his career and that became the basis of a new field of theological study. The guideline that Tillich used for such an interpretation was, in his formulation, that the *Gehalt* (import, or substance) of a cultural work is "grasped in the content (*Inhalt*) by means of the form and given expression." Expressionistic art is an example. In such art, the forms of everyday reality—for example, the human shape or the shapes of everyday objects—are distorted in such a way that this distortion expresses a power, or reality, that manifests itself by the very way in which it breaks through the form and content of the objects. A theology of culture undertakes to interpret the meaning of this "substance" (*Gehalt*), or depth content, which thus breaks through the form into the content. Accordingly, an interpretation of culture always involves a reference to three elements of cultural works: the form, the content (*Inhalt*), and the substance (*Gehalt*).

In the spring of 1929 Tillich accepted a call to teach philosophy and sociology at the University of Frankfurt. It was there that, in 1933, he published the work that was to cause his emigration to the United States, *Die sozialistische Entscheidung* (*The Socialist Decision*). In content, this was a cautious analysis of socialism and a critique of unrestrained capitalism. It was based upon the idea of *kairos* (right time)—the idea that, even politically, there are "right" times for accomplishing certain things—and upon an analysis of German democracy as only an abstract, not yet a real, democracy. Tillich drew the conclusion that the time was ripe for a new socialism, specifically, for a religious socialism that could incorporate democracy. National Socialism, however, was not what Tillich envisaged. Hence, the essay also contained a criticism of the totalitarian element in the National Socialist movement, and as a result Tillich became one of the many educated Germans who emigrated under the threat of those years as the movement developed.

Tillich left Germany in October 1933. In February 1934 he began his long teaching career at Union Theological Seminary in New York, remaining there until his retirement in 1955. He then became University Professor at Harvard—a great distinction—and in 1962 he became, with similar distinction, the Nuveen Professor of Theology at the University of Chicago. His last public address, "The Significance of the History of Religions for the Systematic Theologian," delivered at the University of Chicago shortly before his death on October 22, 1965, reflected the direction that his thought had taken toward the questions raised by the encounter of Christianity with other religions. These differed from the questions he had treated in his earlier works because they involved differences in the religious symbols themselves.

**THEORY OF RELIGION AND SYMBOLS.** Tillich's major work is the three-volume *Systematic Theology*, in which Tillich undertakes to interpret Christian symbols so as to show how they provide answers to ontological questions. Through the "method of correlation," he shows how the question of the meaning of being (the ontological question) is correlated with the symbol of God as its answer (the theological answer). The symbol *God* is the reality that answers the question of the meaning of being. In the five divisions of *Systematic Theology*, Tillich provides, on the one hand, an analysis of the three basic ways in which the ontological question is asked and, on the other hand, an interpretation of religious symbols in which he shows how the symbols present the reality that answers the question of the meaning of being as such. Simply put, the three basic questions are these: What is the meaning of being itself? What is the meaning of (human) existence? What is the meaning of life? The first question, answered by the symbol *God*, is occasioned by the finitude of human being. The second question, answered by the symbol of Christ, is occasioned by the contradictoriness (estrangement) of the human being—the fact that things are not what they should be and could be. The third question, answered by the symbol of the Spirit, is occasioned by the ambiguity of actual life—the fact that life is a mixture of being and non-being, of the good and the bad, of the creative and the destructive. The symbol *God* presents the meaning of the finitude of being; the symbol *Christ* presents the meaning of the contradictoriness of existence; and the symbol *Spirit* presents the meaning of the ambiguity of actual life. The actual human situation is that of life, in which the finitude of being and the contradictoriness of existence as such are always ambiguously mixed. To say that "God," "the Christ," and "the Spirit" are symbols is to say that they actually convey the reality of the answer that they represent. In other words, as a symbol, the word "God" (or the meaning and image borne by that word) actually presents an ultimate meaning in the finitude of being in the world; as a symbol, the word or the image or the history connected with "the Christ" conveys a real power to bear the contradictions and meaninglessness of reality without being overwhelmed by them; and the symbol of "the Spirit" is the actual presence of an unambiguous meaning that can be discerned through the ambiguities of life.

Through this method of correlation, Tillich intended to assign an equal importance to the question of being, which is the main subject matter of philosophy (or ontology), and to God as the symbol in which the meaning of being is present, which is the main subject matter of theology. The correlation between the two is formulated in the statement "God is being-itself." That is to say, what is present in the *symbol* God is also the reality to which the ontological *concept* of being-itself refers.

Besides the method of correlation, Tillich's distinctive contribution to Christian theology lies in three characteristics of his work. The first is his application of the Protestant

principle of justification to the realm of theoretical thought. One who doubts the reality of God knows the truth despite that doubt, just as one who sins is justified despite the sin; the reality of God shows itself to the human mind despite the doubt, just as the goodness of God appears in human actions despite their imperfection. The second characteristic of Tillich's theology appears in his theology of culture. This theology of culture is based on the conception that culture itself is capable of expressing, indirectly, the ultimate meaning that is intended by religious faith. Thus, in his analysis of contemporary culture Tillich showed how, as culture, it did express indirectly what religion expresses directly. The third characteristic, which is at the basis of the method of correlation used in *Systematic Theology*, is the idea that philosophy, which asks the question of the meaning of being as such, and religion, which is based upon the reality shown in the symbol of God, cannot be reduced to each other, and they cannot be derived from each other, but they can be "correlated." What human beings seek when they ask the question of the meaning of being can be correlated with what human beings receive through the meaningfulness of religious symbols. Accordingly, Tillich's definition of faith as "ultimate concern"—in the sense of one's being ultimately concerned about that which concerns one unconditionally—implies both the ontological question of the meaning of being and also the symbol *God* as the presence of being-itself, which, as such, is beyond both being and nonbeing.

Tillich's wide influence, especially in the United States, is attributable to the ecumenical character of this theology, to the effectiveness of his teaching, the appeal of his work to professionals as well as to the laity, and, no doubt, to his extraordinary ability to relate theology to the issues of the time.

#### BIBLIOGRAPHY

The most complete biography of Tillich is that of Wilhelm Pauck and Marion Pauck, *Paul Tillich: His Life and Thought*, vol. 1, *Life* (New York, 1976); the projected volume 2 was never published. A highly compact but excellent interpretive study of the unity of his life and thought is the pamphlet by Carl Heinz Ratschow, *Paul Tillich* (Iowa City, 1980). Of several autobiographical sketches, the most helpful one, first published in 1936, was published separately under the title *On the Boundary* (New York, 1966).

Tillich's collected works have been published in German in the *Gesammelte Werke*, 14 vols. (Stuttgart, 1959–1975), and in six supplementary volumes, *Ergänzungsbände* (Stuttgart, 1971–1982). Volume 14 contains an index and bibliography, including a list of unpublished manuscripts in the Tillich Archives at the Harvard Divinity School, Cambridge, Massachusetts, and the Paul-Tillich-Archiv at the University of Marburg, Germany. Among Tillich's major works are *The Socialist Decision* (1933), translated by Frederick Sherman (New York, 1977), *Systematic Theology*, 3 vols. (Chicago, 1951–1963), *What Is Religion?* (New York, 1969), *The Protestant Era* (essays edited by James Luther Adams, Chicago, 1948), *The Courage to Be* (New Haven, Conn., 1952), *Biblical Religion and the Search for Ultimate Reality* (Chicago,

1955), *Theology of Culture* (New York, 1959), *Christianity and the Encounter of the World Religions* (New York, 1963), and *Dynamics of Faith* (New York, 1957), the last of which provides perhaps the best introduction to his thought.

A useful variety of critical and appreciative responses to Tillich's thought is contained in *The Theology of Paul Tillich*, 2d rev. ed., edited by Charles W. Kegley (New York, 1982), with three new essays and a revised bibliography. Responses to his theory of religious symbolism are contained in *Religious Experience and Truth: A Symposium*, edited by Sidney Hook (New York, 1961); included in the volume are two basic essays by Tillich. An excellent brief account of Tillich's religious socialism is John R. Stumme's introduction to the English translation of Tillich's *The Socialist Decision* (New York, 1977). A more recent secondary study is *Mystical Heritage in Tillich's Philosophical Theology*, edited by Gert Hummal and Doris Lax (Münster, 2000).

**TIMOTHY AILUROS** (d. 477), known as Timothy II, fifth-century Monophysite theologian who became the first patriarch of the Coptic Church in Alexandria (457–460; 475–477). He was surnamed by his opponents Ailuros (“the cat”) because of his small stature and his weasel words and ways. Venerated as a saint by the Coptic Church, Timothy, along with other monophysite patriarchs, was anathematized by the church of Rome under Pope Hormisdas (514–523).

Little is known of Timothy's early life. It is certain that during the Christological controversies of the fifth century he sided with those who rejected the decree of the Council of Chalcedon (451), which defined Christ as “one hypostasis in two natures.” The council appointed the orthodox Proterios as patriarch of Alexandria. But the local mob lynched Proterios, and in 457 the Egyptian bishops elected Timothy to succeed him. He served as patriarch for three years, until 460, when he was removed from the patriarchal position and banished. While in exile, Timothy carried on a correspondence against the Chalcedonian decisions and wrote several essays promoting Monophysitism.

Timothy's fate changed again when, upon the death of Emperor Leo I, Basiliskos usurped the throne and turned to the monophysites for support. He reinstated Timothy, who became instrumental in the writing of an encyclical that Basiliskos issued in an attempt to impose Monophysitism as the official Christology of the church. Timothy ruled the church of Alexandria for two more years, until his death in 477. His ecclesiastical policy was characterized both by ambiguity and by fanaticism.

Of Timothy's writings against the Council of Chalcedon three letters have survived in a Syriac translation. A ser-

mon and fragments of his essays have been incorrectly attributed to Timothy III of Alexandria.

DEMETRIOS J. CONSTANTELOS (1987)

**TINGLEY, KATHERINE** (1847–1929), was a leader of the Theosophical movement in the United States from 1896 to 1929. She led the organization that established the Point Loma Theosophical Community and was a well-known figure in early-twentieth-century American society.

Tingley was born Catharine Augusta Westcott in Newburyport, Massachusetts, in 1847. According to her own account, she was a dreamy child who enjoyed walking in the woods or along the seashore, engrossed in her imagination. During the Civil War her father equipped and led a company of volunteers to fight for the Union. His unit was transferred to Virginia, and his family followed him. Tingley, as a teenager, witnessed the aftermath of battle, caring for wounded soldiers from both the Union and Confederate armies. Other details of her adolescent and early adult years are sketchy. She married three times, the third time to Philo Tingley. No children resulted from these marriages. By the 1880s she was living in New York City. Like many women from the middle classes of that period, she was interested in various late Victorian, Progressive causes that would improve the quality of life for the urban poor, especially women and children. She was responsible for one or more voluntary establishments that provided food and other relief. Supposedly in the early 1890s, while she was conducting one such operation, she met William Q. Judge (1851–1896), the leader of the Theosophical Society in the United States. Some sources also point to her interest in Spiritualism as a possible context in which she had contact with him.

The Theosophical Society began in 1875 in New York City under the leadership of Helena P. Blavatsky (1831–1891) and Henry Steel Olcott (1832–1907). It attracted urban, middle-class individuals interested in Spiritualism, comparative religions, and the occult. By the time Judge and Tingley met, Theosophical lodges across the United States were growing in size and number. But the most influential leaders of this nationwide movement resided in New York City. They included businessmen, teachers, physicians, and other middle-class, often professionalized, men and women. Judge led many American Theosophical lodges to declare their independence from the worldwide Theosophical Soci-

ety in 1895. He died the next year. Tingley succeeded him, although the circumstances surrounding her succession remain unclear. Over time, many leaders loyal to Judge shifted their loyalty to her, but not all. Some of the dissenters formed their own Theosophical groups.

Tingley mobilized Theosophists across the United States to work for social reform. Theosophists were responsible for public vegetable gardens, orphanages, halfway houses for prostitutes, job training for the poor, emergency relief, and Theosophical Sunday schools for children, which were originally begun under Judge but expanded under Tingley and called Lotus Circles. The Theosophical response to American soldiers returning from Cuba after the Spanish-American War in 1898 is noteworthy. The United States Army was not prepared to receive the troops who came home weak and ill from tropical diseases. At one such disembarkation point on Long Island, Theosophists led by Tingley staffed a hospital camp where soldiers received food and medical treatment.

In the late 1890s Tingley and the leadership around her took steps toward the establishment of a community of like-minded adults who would provide an education for children based upon Theosophical principles. They selected Point Loma as the location for this community. It was a relatively isolated site a few miles from San Diego, California, with a mild climate and space to expand facilities. American Theosophists led by Tingley believed that they stood on the cusp of a new cycle or age in human history. Ancient souls who had reincarnated countless times in past eons were especially mature and ready to advance spiritually and morally as they appeared in this incarnation as children. This promising cohort required special nurture, and Point Loma was their nursery. Tingley and other adults at Point Loma strictly controlled their children's exposure to the outside world, their diets, their reading material, their physical activities, and their relationships with one another. This system of child-rearing and education was called Raja Yoga, a term that the Theosophists borrowed from Hinduism but invested with their own meaning. In their worldview, Raja Yoga was the holistic education of children in which all of their faculties—spiritual, mental, physical, and emotional—could be cultivated simultaneously. From 1900, when Tingley and others moved to Point Loma, until the community relocated to Covina, California, in 1942, Point Loma Theosophists raised and educated hundreds of children.

Throughout the first three decades of the twentieth century, Tingley made numerous tours of the United States and the world. She set the tone for such travel in 1896 by visiting Theosophical lodges worldwide. This tour, called the Crusade, was designed to consolidate support for her leadership and establish good working relationships with Theosophists elsewhere. For many years afterward she traveled avidly, publicizing the Point Loma Theosophical Community and advocating a number of social and political causes, especially world peace. During the years immediately preceding World

War I she became a noted national and international figure in various peace conferences. Even after the American entry into the war, she continued to advocate peace, and for this reason briefly attracted the attention of the United States government as a possible agent for Germany, although suspicion of Tingley's cooperation with German agents proved unfounded.

Tingley was a high-profile figure, often in the news because of remarks she made at public gatherings or in court cases that included various individuals at Point Loma. Some of these cases dealt with divorces of married couples, some with the settlement of estates left behind by deceased Point Loma residents. In all such instances, Tingley was a witty and feisty participant, yet she maintained a pronounced Victorian respectability consistent with her social class, gender, and generation.

Tingley was praised by Point Loma Theosophists as the rightful successor to Blavatsky and Judge as the leader of world Theosophy, in spite of the opposition to this assertion by other Theosophical organizations. Theosophists claimed that their leaders were granted both paranormal abilities and special authority to teach Theosophical principles by a group of advanced beings called the *masters*, who supervised the great cosmic evolution of souls and worlds. Point Loma Theosophists believed that, as the sanctioned leader, Tingley manifested extraordinary powers of prediction and perception. Her commands were followed without question by those who revered her. She was seen as the mother of the age, as well as the mother of people in this age, especially the suffering and destitute. Maternity defined her particular style of leadership, in contrast to the masculine style of Judge before her, and the more scholarly style of her successor, Gottfried de Purucker (1874–1942). Tingley was a persuasive speaker in an era when public speakers enjoyed widespread popularity and influence in American society. Many of her speeches appeared in the magazines and books printed by Point Loma's press. But within the Point Loma Theosophical tradition, both during and after her lifetime, she was regarded as a great organizer and manager, not a scholar. Her speeches and writings mostly repeated Theosophical ideas already extant, but she articulated them in a way that appealed to late-nineteenth- and early-twentieth-century Americans. She evoked patriotic pride as well as concern for all of humanity; advocated gender distinctions as well as common characteristics of men and women; and argued for children to be both protected and challenged in their nurture. Her genius lay in her ability to tap into American folkways and middle-class discourse about culture, and to intertwine those with Theosophical doctrine.

Tingley was in an automobile accident in Germany in May 1929. As a result of injuries sustained in that accident, she died of illness while convalescing on the island of Visingsö, in Sweden, in July 1929. She was eighty-two years of age. Today, the organizational descendant of the Point Loma Theosophical Community is the Theosophical Society, Pasa-

dena, which publishes a bimonthly magazine and Theosophical classics, including the works of Katherine Tingley.

W. MICHAEL ASHCRAFT (2005)

**TĪRTHAṂKARAS.** According to the Jains, one of the oldest religious communities in India, the *Tīrthamkaras* (called *tīthagaras* in the Jain canon) are the prophets who periodically teach the world the truth of the imperishable Jain tradition; the term is almost equivalent to *jina* ("victor") or *arhant* ("saint"). The term *tīrtha(m)-kara* refers literally to one who "builds the ford" that leads across the ocean of rebirths and suffering, and thus builds or renews the Jain fourfold community of monks and nuns, laymen and laywomen.

Twenty-four *Tīrthamkaras* are said to appear at given periods in selected regions. As they are capable of ultimate spiritual perfection they are thus regarded as having more than a human status. Together with the *cakravartins* (universal sovereigns) and other such heroes, they form the class of the venerated sixty-three personages of the Jain "universal history." They are called *mahāpuruṣas* ("great men") by the Digambaras and *śalākāpuruṣas* ("men with the staff") by the Śvetāmbaras.

**MEMBERS OF THE LINEAGE.** *Tīrthamkaras* are born only in the "middle world" (Madhyadeśa), and there only in the very few *karmabhūmis* (regions where one reaps the fruit of one's actions) of the central continent (Jambūdvīpa): in the southern land of Bhārata (i.e., India), in the northern land of Airāvata, and in half of the central land of Videha. Except in Videha, where conditions differ, they are said to live exclusively during the third and fourth of the six stages of the *avasarpinīs* and *utsarpinīs*, that is, the descending and ascending halves of the endless temporal cycle, thus at times of mixed happiness and misery.

In Bhārata, the teacher of the present era is Vardhamāna Mahāvīra, the twenty-fourth and last of the series of *Tīrthamkaras* in our *avasarpinī* half cycle. According to tradition, he was born seventy-five years and eight and one-half months before the end of the fourth period, in which he lived for seventy-two years. Three years after his *nirvāṇa*, allegedly

in 523 BCE, the present period began, characterized by misery.

The first *Tīrthamkara* was Rṣabha, who is said to have been born toward the end of the third period and to have died three and one-half years before its completion. His life span extended over millions of so-called Pūrva years. In the fourth period, after Rṣabha and before Mahāvīra, the law was preached by twenty-two *Tīrthamkaras*: Ajita, Sambhava, Abhinandana, Sumati, Padmaprabha, Supārśva, Candraprabha, Suvidhi (Puṣpadanta), Śītala, Śreyāṃsa, Vāsupūjya, Vimāla, Ananta, Dharma, Śānti, Kunthu, Ara, Malli, Munisuvrata, Nami, (Ariṣṭa)nemi, and Pārśva.

Tradition also gives the lists of their contemporaries in Airāvata, as well as of past and future *Tīrthamkaras* of Bhārata. In Videha, the prevailing conditions of happiness mixed with misery are always akin to those of this, the third period in an *avasarpinī* half cycle, so that a *Tīrthamkara* can be preaching there at any time.

**THE CAREER OF A TĪRTHAṂKARA.** No soul will become the soul of a *Tīrthamkara* unless it has gone through a considerable number of rebirths and has finally practiced exceptional virtues resulting in a special *karman*. The soul is urged by gods to "fall" from its divine mansion and be reborn to practise and propagate the true law. *Tīrthamkaras* are usually considered to become incarnate only through male figures; the Śvetāmbaras nevertheless consider the nineteenth, Malli, to be a female, although the Digambaras deny this point.

The career of a *Tīrthamkara* conforms to a well-structured pattern, and traditional descriptions of the *Tīrthamkaras* provide very few or no distinctive individual characteristics. The biography of a *Tīrthamkara* is stereotyped, listing in an almost formulaic sequence the following information: (1) some details of his former existence, (2) the five *kalyāṇas*, or religiously significant moments of his life (i.e., conception, birth, renunciation, attainment of omniscience, *nirvāṇa*), (3) the names of his parents, (4) the number of his followers, (5) the duration of his life, (6) the color of his body (most are golden, but the twentieth and twenty-second are black, the eighth and ninth are white, the sixth and twelfth are red, the twenty-third and another [the nineteenth, according to the Śvetāmbaras, the seventh, according to the Digambaras] are blue-green), (7) his height, (8) his guardian divinities, and (9) the length of time elapsed since his predecessor's *nirvāṇa*. All are born to princely families, and, with two exceptions, are related to the Ikṣvāku dynasty. The conception of a *Tīrthamkara* is announced to his mother by a standardized succession of auspicious dreams (fourteen according to the Śvetāmbaras, sixteen according to the Digambaras).

**ICONOGRAPHY.** Like their biographies, the images of the *Tīrthamkaras* are all fundamentally similar. The figures are represented in meditation, either seated cross-legged or standing in a *kāyotsarga* pose (representing a particular type of Jain austerity), with arms stretched slightly apart from the body. Although the canon for the *Tīrthamkara* images ap-

pears to have been well fixed by the beginning of the common era, there have been some developments through the course of time. After the fifth century, Śvetāmbara icons are characterized by a dhoti (a wrapped garment of draping layers of cloth) and various ornaments; Digambara icons remain naked. Moreover, a series of characteristic marks (*cibhas*) are added to the pedestals in order to distinguish the individual *Tīrthamkaras*: Rṣabha's symbol is the bull; Nemi's, the conch shell; Pārśva's, the snake; Mahāvīra's, the lion. Representations of Rṣabha, Pārśva, and Mahāvīra are particularly numerous; Pārśva is easily recognized by the snake hoods over his head.

The comparative monotony of the *Tīrthamkara* images is somewhat striking. These icons, however, are not meant to be picturesque but to suggest omniscient awareness and absolute detachment, serenity.

**MYTHIC IMPORTANCE.** Despite such uniformity, several *Tīrthamkaras* emerge as prominent figures. On the whole, the general trend of the present *avasarpinī* implies a notable decline from a golden age and is marked by the considerable shortening of life span, prosperity, and happiness. Thus the legends concerning Rṣabha, the "first lord" of this cycle, are of special significance because in them he is shown in a pioneering role.

Rṣabha is said to have set the groundwork for civilization: first as a sovereign, when he organized kingdoms and societies, instituted legislation, taught agriculture, fire, cooking, arts and crafts, writing, and arithmetic, and later, when he renounced the world and became the first mendicant, thus shaping the religious life of the present *avasarpinī*. These two spheres of influence were further served by two of Rṣabha's sons: Bhārata is renowned in Indian tradition as the first *cakravartin* of Bhārata. Bāhubali became a forebearing ascetic and as such has long been revered by the Digambaras, especially in the South, where several impressive monoliths representing this hero were erected. One of the best known is a colossal fifty-seven-foot image towering at the top of one of the hills overlooking Śravaṇa Beḷgoḷa, about one hundred miles northwest of Bangalore.

The twenty-second *Tīrthamkara* (Ariṣṭa)nemi, is allegedly related to Kṛṣṇa and the Yādavas. He is extremely popular, especially in Gujarat, where on the sacred Girnar Hills he practiced austerities and eventually understood the ultimate truth, thus achieving enlightenment; after many years he reached final emancipation, *nirvāṇa*, on the same mountain. His revulsion at the sight of the animals awaiting slaughter for his wedding ceremonies as well as his subsequent refusal to marry his betrothed, Rājīmatī, are highly significant and are the subject of many narratives, songs, and paintings that illustrate the greatness of the doctrine of *ahiṃsā*, or noninjury.

Pārśva, the twenty-third *Tīrthamkara*, has been regarded by most scholars as possibly being a historical figure. He is said to have lived for a hundred years, some two hundred

and fifty years before Mahāvīra, and to have been born in Banaras and ended his life in Bihar on Mount Sameta, which is now also known as Pārasnāth in his honor. He is alleged to have established the "law of four restraints" (*caturyāma-dharma*), which is generally, though not unani- mously, considered to be the forerunner of the five "great vows" (*mahāvratas*) followed by Mahāvīra's disciples. Pārśva is associated with serpents and consequently the object of much veneration.

**CULTIC LIFE.** Immediately after death, the *Tīrthamkaras* become *siddhas* ("perfected" souls), and thus became completely inaccessible. But the example they set should be meditated upon, and it is extolled daily when the Jains recite the *Caturvīṃśatistava* (Praise of the twenty-four [*Tīrthamkaras*]); the images of the *Tīrthamkaras* should serve only as meditative supports. Archaeological evidence indicates that this method of worshiping the *Tīrthamkaras*, known as *deva-pūjā*, goes back to the first few centuries BCE.

Many lay believers, however, cannot refrain from appealing to superhuman benevolence. They direct their worship and supplications for assistance to the pairs of guardian deities who serve the *Tīrthamkaras*. Among the most popular are the snake god Dharaṇendra and his consort Padmāvātī, both of whom flank Pārśva. The Jain teachers, however, have always insisted on the inferior position of these deities and have succeeded in preventing them from usurping the supremacy of the *Tīrthamkaras*.

**TĪRTHAṂKARAS AND INDIAN RELIGIOUS EXPERIENCE.** In Jainism it is clear that the recurrent presence of *Tīrthamkaras*, who periodically appear in the human realms in order to preach and show the true law, have a function similar to that of the seven (later twenty-five) Buddhas in Buddhism, and also to that of the Hindu *avatāras* of Viṣṇu. On the other hand, by promoting civilization, the first *Tīrthamkara*, Rṣabha, recalls the role played by Pṛthu in the epics, by Mahāsammata in Buddhism, and by Prometheus in the Greek and Roman traditions. Thus from many perspectives Jainism offers a coherent system that links the evolutions of time, cosmos, humankind, and the Jain church.

#### BIBLIOGRAPHY

The standard books on Jainism provide general information on the *Tīrthamkaras*. A comparatively detailed treatment will be found in Helmuth von Glasenapp's *Der Jainismus: Eine indische Erlösungsreligion* (Berlin, 1925; reprint, Hildesheim, 1964; English translation by S.B. Shrotri: *Jainism. An Indian Religion of Salvation*, Delhi 1998). Padmanabh S. Jaini, *The Jaina Path of Purification*. (Berkeley, Los Angeles London 1979). A substantial although short account is provided by Josef Deleu's "Die Mythologie des Jainismus," in H. W. Haussig's *Wörterbuch der Mythologie* (Stuttgart, 1976), pp. 207–284, esp. pp. 270–273. Various aspects of the *Tīrthamkaras*—concept, worship, representation—are considered in several papers of *Approaches to Jaina Studies: Philos-*

*ophy, Logic, Ritual and Symbols*, edited by N.K. Wagle and Olle Qvarnström (Toronto, 1999).

Sculptures of *Tīrthaṃkaras* are among the most ancient Indian religious images, dating from first to second century CE. Since the eleventh century, illustrated manuscripts (first palm-leaves, later paper manuscripts) represent figures of Jinas and/or depict important moments of their lives. Brightly coloured Jain miniatures (especially in “Western Indian Style”), as well as statues and bas-reliefs are reproduced in Pratapaditya Pal et al., *The Peaceful Liberators: Jain Art from India* (Los Angeles, 1994); Kurt Titze, *Jainism: A Pictorial Guide to the Religion of Non-Violence* (Delhi, 1998); Jan Van Alphen, *Steps to Liberation: 2500 Years of Jain Art and Religion* (Antwerp, 2000). Also see the monograph by José Pereira, *Monolithic Jinas: The Iconography of the Jain Temples of Ellora* (Delhi, 1977).

For the iconography of the *Tīrthaṃkaras*, see Brindavan Chandra Bhattacharya’s *The Jaina Iconography*, 2d rev. ed. (Delhi, 1974), and Klaus Bruhn’s *The Jina-Images of Deogarh* (Leiden, 1969). The lives of Mahāvira and the other Jinas are the subject of the *Jñācariya*, edited and translated by Hermann Jacobi in *The Kalpasūtra of Bhadrabāhu* (Leipzig, 1879), and of the *Jaina Sūtras*, vol. 1 (London, 1884; reprint, Delhi, 1964). See also *Triṣaṣṭiśalākāpuruṣacaritra*, or *The Lives of the Sixty-three Illustrious Persons by Hemacandra*, 6 vols., translated by Helen M. Johnson (Baroda, 1931–1962). On Rṣabha and civilization, see Adelheid Mette’s *Indische Kulturstiftungsberichte und ihr Verhältnis zur Zeitaltersage* (Mainz, 1973).

COLETTE CAILLAT (1987 AND 2005)

**TITHES.** In the ancient Near East lie the origins of a sacrificial offering or payment of a tenth part of stated goods or property to the deity. Often given to the king or to the royal temple, the “tenth” was usually approximate, not exact. The practice is known from Mesopotamia, Syria-Palestine, Greece, and as far to the west as the Phoenician city of Carthage. Tithing also continued in Christian Europe as a church tithe and as a tax upon Jewish landholdings formerly owned by Christians (or claimed to have been so). Tithes paid in support of parish rectors continued in England into the twentieth century.

Early texts associate the tithe with support of the king and of temples of the royal house (see *Am.* 4:4, 7:1, 7:13; see also Samuel’s forecast of actions to be taken by the king, *1 Sm.* 8:15, 8:17). The early biblical references to the tithe in *Genesis* 14:20 and 28:22 are also related to sites where royal shrines were located, such as Jerusalem and Bethel. It is not certain, however, that the tithe originated as a royal levy in support of temples and their personnel.

It is difficult to be sure whether or not the offering of the firstborn of animals and the firstfruits of field and orchard should be treated as a tithe. It seems unlikely, because the two are distinguished in *Numbers* 18 and in *Deuteronomy* 12:17. Moreover, the first fruits of grain and nonanimal

products represented only a token amount, which would hardly have corresponded to the tenth or tithe. Firstfruits and tithes are closely related, however, in *Deuteronomy* 26:1–15 and in *Tobit* 1:6–8.

From the time of the monarchy in Israel, and especially from the eighth century forward, the Levites more and more were recognized as the beneficiaries of the tithe. They were not to share in the allotment of land along with the other tribes but were set apart to the service of the Lord (*Nm.* 18, *Dt.* 18:1–8, *Jos.* 21). The Levite cities seem to have been the store cities in which the tithes collected by the Levites were stored (see *Neb.* 10:38), just as the tithes in Mesopotamia were collected by temple personnel and stored in the temples or in their vicinity.

The tithe became the means of livelihood for the Levites during the middle and later periods of the monarchy. Once the city of Jerusalem had been designated by Josiah’s reform as the central sanctuary for Israelite worship (622/1 BCE; see *2 Kgs.* 22–23), the need for the tithe to support the Levites at the many local sanctuaries would have disappeared. Accordingly, the law in *Deuteronomy* 14 specifies a quite different character and purpose for the tithe (*Dt.* 14:22–29). The tithe was to be taken to Jerusalem and eaten there before the Lord with rejoicing. It could be converted to money, if need be. And every third year the tithe was to be set aside for meeting the needs of the Levite, the resident alien, the orphan, and the widow. Scholars are divided over the issue of whether or not the text in *Deuteronomy* 14 can be reconciled with those in *Numbers* 18 and *Leviticus* 27.

If the legislation in *Numbers* 18 is later than that in *Deuteronomy* 14, however, the tithe was originally an offering associated with the king and with royal sanctuaries. It was then democratized to become the basis for a celebrative meal before the Lord at the places of worship. After that the priests and Levites claimed the tenth for themselves, with the firstfruits in particular going to the priests and the tithes going to the Levites (*Nm.* 18). Many scholars assign the priestly literary deposit to a period later than that of the Deuteronomic legislation. All acknowledge, however, that the priestly materials contain elements older than *Deuteronomy*; it seems probable that, in this case, the materials found in *Numbers* 18 are the older.

According to *Leviticus* 27:30–33, a distinction is made between those tithes that were redeemable—that is, convertible into silver—and those that were not. Animals were not redeemable, but grain, wine, and oil were. Items that were placed under the ban (Hebrew *cherem*) were never redeemable, and tithed animals, if suitable for offering, also were not redeemable. When a tithe was redeemed, one-fifth of the value was added (*Lv.* 27:31; see also *Lv.* 5:14–16).

With regard to tithes in other parts of the ancient world, Egyptian sources are not informative. There is no indication that the vast temple complexes in ancient Egypt were supported by a tithe. In Greece the situation is different. Nu-

merous references to tithes of the annual harvest and to tithes of spoil taken in battle are known. Delphi, Delos, and Athens are mentioned as recipients of tithe offerings made to the gods. The offering of firstfruits and of tithes seems to have been quite closely associated.

As a part of the Jewish legislation, the tithe becomes fixed and indeed extends beyond the original prescription. The tractates *Terumat* and *Ma'aserot*, along with other talmudic collections, give particulars on postbiblical understandings. The *Book of Tobit* (second century BCE) offers important testimony of the changes in the understanding of the tithe. Tobit reports that when he was a young man, prior to his having been taken captive by the Assyrians and transported to Nineveh, he brought firstfruits, tithes of the produce, and first shearings to Jerusalem. He also gave three tithes: he presented the first tenth to the Levites (as required by *Nm.* 18), offered the second tenth in Jerusalem (as required by *Dt.* 14), and gave the third tenth to the needy (as specified in *Dt.* 14 as well).

In the early church, tithing became a means of securing a livelihood for church leadership, although in the earliest days of the Christian movement tithing seems to have been abandoned entirely in many Christian circles as a practice not in harmony with the Christian divergence from Jewish observances. The tithe remained of great importance for the church as a means of securing a stable institution, providing for ecclesiastical establishments, and offering resources for the care of the poor and the needy. In Judaism the tithe helped the community meet human needs, although complaints were voiced that a "second tithe," amounting to 20 percent (as apparently demanded by the different specifications in *Nm.* 18 and *Dt.* 14), was too heavy a burden on the community. Christian understanding of the tithe has had to combat both an overzealous application of the law of tithing (as some communities have understood it) and the supposition that to provide a tenth of one's goods to the church or to charitable purposes meant that the remainder of one's goods could be used in complete disregard of the claims of Christian stewardship.

WALTER HARRELSON (1987 AND 2005)

**TIV RELIGION.** The Tiv, who live in the central Benue valley of Nigeria, have a name for God, Aondo (sky), but are not much interested in him because they say that he is not much interested in them. God, in their view, created the earth and everything within it—including the forces of evil. Then he walked away—the Tiv do not ask where God went.

The Tiv are concerned with health (and with death, the ultimate manifestation of poor health), with fertility of crops, animals, and themselves, and with social harmony. To be healthy, to have plenty, and to live in harmony are natural states. Although the Tiv have some lore about spirits, no spirits manipulate the forces that interfere with these desirable states; Tiv respect their ancestors, but no ancestors manipulate the forces. Rather, the acts and devices of living human beings activate the forces of evil. Tiv ritual is designed to overcome these forces.

The Tiv say that some people grow a substance called *tsav* on their hearts that acts much like a physical organ. *Tsav* is both a sign of and source of special talent or ability, whether musical and artistic, social and political, or the ability to live to old age. One such special talent is to manipulate the forces that repair the society ritually.

*Tsav* is not present in all people. It becomes enlarged and nefariously powerful in any person who eats human flesh. *Tsav* itself does not tempt its bearers to eat human flesh—but lust for power may. Cannibalism is a metaphor for antisocial misuse of other people, their property, and substance.

The Tiv postulate that some of those with the special talents of *tsav* meet at night as an organization to keep the social and cosmic forces working for the benefit of society

as a whole. The *mbatsav* (people with *tsav*) perform rituals to repair the land, but they may, through reckless human emotions such as spite, envy, or fear, use their power (as may any individual with *tsav*, acting alone) for antisocial and deadly purposes that spoil the land. To call the *mbatsav* witches is not accurate, even though they were labeled as such in some of the early literature.

The postulated activities of the *mbatsav*, both for the good of the community and for the evil purposes of some individuals, are associated with certain rituals performed with symbols called *akombo*. This ritual manipulation is called repairing the *akombo*. Those aspects of the natural and social world about which Tiv are most concerned are parceled out among named *akombo*, which exist as amulets, figurines, pots, or plants. Each is associated with a disease (although certain diseases are not associated with *akombo* because the Tiv recognize that some diseases are merely contagious). Each has its own ritual required to activate it or to pacify it. *Akombo*, however, are not personalized and are not spiritualized; they are certainly not gods. They work by forces akin to what Westerners think of as laws of nature.

When Tiv become ill, they assume that an *akombo* is the cause. That means either that some person of ill will who grows *tsav* has ritually manipulated the *akombo* so that it would seize a victim, or else that the victim or one of his or her close kinsmen has performed an act that was precluded by that *akombo* at the time of its creation (usually a commonplace and neutral act, although adultery and battery are prohibited by one or more *akombo*). To determine just which *akombo* is involved, Tiv consult diviners who throw chains of snake bones and pods to determine which *akombo* have been used to cause an illness or create social misfortune.

When the responsible *akombo* is revealed, the Tiv perform rituals to neutralize it. They must also remove the malice that activated it. The latter is achieved by a modest ritual in which every person concerned takes a little water into his or her mouth and spews it out in a spray, signifying that any grudges are no longer effective. Medicines will work only after the ill will is ritually removed and the *akombo* repaired. The ritual for each *akombo* varies, but the climax of all is a prayer that “evil descend and goodness ascend.” These rituals are as much group therapy sessions as they are religious acts.

Tiv recognize two major categories of *akombo*. Small *akombo* attack individuals and their farms; their repair demands minor sacrificial animals, usually a chicken. A few small *akombo* require special sacrificial animals such as turtles or valuable ones such as goats or rams. Coins or other forms of wealth can be added to a less valuable sacrificial animal to make it taller and so serve as a more valuable one.

The great *akombo*, on the other hand, attack social groups; they must be repaired either by the elders of the community acting by day, or by a secret group (the same people) acting as the *mbatsav* by night.

At the end of any *akombo* ritual carried out by day, or as the last act of any funeral, the Tiv prepare and break a

symbol called *swem*. Made in a potsherd from hearth ashes and symbolic plants, it is held high, then smashed to earth. The ashes, spreading on the breeze, mean that justice spreads through the land and that *swem* will punish evildoers.

Most Tiv claim not to know the details of any *akombo* or its ritual, and all deny knowing that the ritual was carried out at night. But they never postulate that any part of it is a mystery. Somebody knows. Tiv say “God knows” at funerals if they can find no other reason for the death. They mean that they have not yet discovered the human motivation behind the misfortune. But they do not question that the motivation is there and that ultimately it will be detected and either neutralized or punished.

PAUL BOHANNAN (1987)  
*Revised Bibliography*

**TJURUNGAS.** Originally an Aranda word referring to a particular type of secret-sacred object (a stone board bearing engraved designs), the term *tjurunga* has now become ge-

neric in anthropological literature and is used to identify a wide variety of Australian Aboriginal religious objects. (The term *tjurunga* also has by now generally replaced the term *churinga* in anthropological writing.) The term covers a wide variety of meanings and can refer not only to the stone and wooden objects to which it was originally restricted but also to bullroarers, ground paintings, ritual poles, headgear, and religious songs (Strehlow, 1947, pp. 84ff.).

*Tjurungas* and *tjurunga*-type objects are widely distributed throughout central, southern, and western Australia, as well as the Northern Territory. They are usually secret-sacred and may be viewed only by initiated men, although in some cases women too possess religious boards. In all cases, *tjurungas* are closely associated with the mythic and totemic beings of the Dreaming. In the beginning, these beings shaped the physiographic features of the Aboriginal countryside and were, ultimately, responsible for creating human beings, who are regarded as their spiritual descendants. They also established particular Aboriginal social orders and were especially responsible for instituting religious ritual. The Dreaming characters are believed to be as alive today, spiritually, as they were in the past, and their significance continues. It is through the sacred objects that they live on in spiritual form. *Tjurungas* are often considered to represent particular mythic beings, and their engraved designs to represent specific localities and the activities associated with them; some *tjurungas*, however, are undecorated.

Stone *tjurungas* are flat oval platters that vary in size from nine to more than fifty centimeters in length and that, for the most part, are engraved on both sides. Smaller wooden objects are similarly decorated, but they are lenticular in cross section and elongated with rounded ends. Larger boards, between two and three meters in length, are made from tree-trunk sections; they are flat or slightly concave on the incised side and convex on the reverse. Traditionally, the lower incisor of a wallaby's jaw was used to engrave both stone and wooden *tjurungas*, but today steel rasps are used to shape the basic form and chisels to make the design. The act of incising the *tjurunga* is accompanied by songs relevant to the mythological associations of the pattern being made and is itself a ritual act. The knowledge of such songs is held by members of particular local groups, which have the responsibility of maintaining and reproducing the range of emblems and the designs connected with their own territories. Cognate groups collaborate with them in a complex patterning of ritual information between members of a number of similarly constituted social groups.

*Tjurungas* have a profound religious significance in contemporary desert Aboriginal cultures. Decorated with incised meandering lines, concentric circles, cross-hatching, zigzags, and, more rarely, naturalistic designs of bird and animal footprints and stylized human figures, they represent a compact and conventionalized statement of land occupation, utilization, and ownership, seen in terms of specific areas of land associated with particular mythic beings who in turn have

their living representatives today. Beliefs about the origin of *tjurungas* vary according to culture (Davidson, 1953; Strehlow, 1964). Basically, though, it is believed that *tjurungas* were either created by mythic beings or represent tangible aspects of their bodies or something directly associated with them. In virtually all cases a *tjurunga* served as a vehicle in which resided part of a mythic being's spiritual essence. Some stone *tjurungas*, particularly those with well-worn designs or those having none, are regarded as the actual metamorphoses of mythic beings and may be ritually relevant to several sociodialectal groups. Usually, however, a *tjurunga* is personal; it is connected with both men and women and is symbolic of their mythic associations: men look after those belonging to the women of their own local group. As far as men are concerned, *tjurungas* play an important part in conception, initiation, and death.

While the Aranda may manufacture stone *tjurungas*, ensuring that male members of the oncoming generation possess such objects, they basically replicate the older ones according to their particular mythic and topographic type—that is, new *tjurungas* must correspond with those concerning the place of a person's conception and/or local group. In the Western Desert, Aborigines believe that all stone *tjurungas* are of supernatural origin, and these groups manufacture only wooden sacred boards. Small wooden boards or bull-roarers are made and presented to a novice during the final stages of his initiation; they signify his acceptance into the religious life of his people. It is only some years after a man's first initiation that he is introduced to the *tjurungas* of his own group. Later, he may prepare and incise such examples, either alone or in the company of close kin who share the same mythological associations.

The designs that appear on these religious objects are similar to those on spear-throwers, some shields, pearl-shell pendants, and a variety of head ornaments (all of which are used or worn publicly in contrast to the actual ritual objects). Clearly the form of an object and its purpose, rather than the design, indicate whether or not the item is to be regarded as open-sacred or secret-sacred (Berndt, Berndt, and Stanton, 1982, pp. 114–116). The designs depict, through a repetitive but symbolic structure, a particular segment of territory linked to an artist, his mythological connection with it, and some of the physiographic features that characterize this area of land. Moreover, this is usually shown looking from above rather than horizontally from the ground level. This is because mythic beings saw the land in this way. Some Western Desert Aborigines believe that the spirits of men who live a far distance from their own country travel through the sky on their sacred boards during sleep, and they, too, see the country in that way.

The same designs that appear on *tjurungas* are also reproduced in ochers on the bodies of participants in rituals. Depending on the area and the particular ritual being performed, ground structures of furrows and mounds have blood and red ocher superimposed on them and are decorat-

ed with feather down: these too represent stylized versions of territories within their mythic context. In such circumstances, *tjurungas* are hung from pole emblems or are worn in the men's headdresses. Since these objects are considered to be ritually and mythologically alive, they signify that the mythic being is actually present in a spiritual form.

The major function of *tjurungas* is to provide a tangible, visible representation of personal and social identity, but it is in fact much more than this. The *tjurunga* affirms and reaffirms a particular group's rights to a specific stretch of country through the land-based associations of mythic personages. These objects are always stored close to the places to which they belong, and such sites fall within different local group territories, the members of which are their custodians. When Aborigines moved away from their own countries as a result of European contact and eventually settled on government and mission stations, they brought some of their sacred objects with them, leaving others behind at their mythic sites. Smaller *tjurungas*, however, are often carried from one place to another when groups gather to hold large rituals that involve both men and women. In the Western Desert, these meetings, in which expressions of hostility are forbidden, are also occasions for settling interpersonal and intragroup disputes and grievances.

Deep reverence and respect are displayed toward all *tjurungas*, whether they are of stone or of wood. For example, fully initiated men may be specially invited to have revealed to them particular boards stored within a repository. This revelation must take place in the presence of a senior man who has the religious right to show them and explain their significance. In such cases, the boards have been prepared by a small group of elders who reanoint them with red ochre mixed with fat: they are treated as if they are living creatures. On approaching the place, the invited men use small branches of leaves to stroke the backs and heads of the sitting elders. This act is said to insulate the power that is believed to be inherent in the *tjurungas* and that can be dangerous to the unprepared. Mythic songs are sung and explained, and the objects are pressed to the bodies of the men who are seeing them for the first time. This action indicates that the men share in their power, which is regarded as eternal and is symbolized by the *tjurunga* objects.

JOHN E. STANTON (1987)

**TLALOC**, the pan-Mesoamerican deity of rain and fertility, was named by the Aztec, or Mexica, of Central Mexico. They chose a word derived from the Nahuatl term meaning "he is the embodiment of the earth." Other fertility deities throughout Mesoamerica include Chac among the Maya, Cocijo among the Zapotec, Tzahui among the Mixtec, and Tajin among the Totonac. Many of these deities continue to be worshiped by the contemporary indigenous people of Mesoamerica.

Tlaloc made his first appearance at Teotihuacan between 200 and 700 CE. He is depicted iconographically in murals and temples with round, "goggle" eyes and a fanged mouth. He strongly resembles a jaguar, with predatory features. At Teotihuacan, ideas regarding rain, fertility, wealth, and prestige were combined with human sacrifice and warfare.

More detailed textual information exists regarding Tlaloc during the Mexica period (1325–1521 CE). During the calendar year, which for the Aztec consisted of eighteen twenty-day "months" and five "unlucky days," approximately half of the ceremonies were dedicated to Tlaloc. These ceremonies—such as human sacrifices, fasting, and feasts—focused on topics such as ancestors, food, rain, and fertility. Worship of Tlaloc, therefore, encompassed a wide spectrum of Mesoamerican concerns and articulated more general understandings of the entire cosmology.

Water was an important element in Mesoamerican religions. Its presence in the iconography at ceremonial centers illustrates its material and symbolic importance. The circulation of water through the ceremonial precinct was intimately associated with the deities who were housed in temples there.

According to the Aztec cosmology, all material existence was surrounded by water. In Nahuatl, the language of the

Aztec (still spoken by nearly three million Mexicans), the word for city is *altepetl*. Its literal translation is “water mountain,” and it describes the central ceremonial temple that defined the city. Mountains were thought to be containers of water, which made its way from the sea. Tlaloc oversaw the circulation of water through the earth; therefore, human beings propitiated him so that he would release just the right amount of water.

Ritual descriptions emphasized the relationship of the human body and the earth. Both objects were understood to simultaneously be containers of, and surrounded by, liquid. Human flesh was a container for blood, which was understood as a living fluid. During gestation, the human body was surrounded by amniotic fluid. These material aspects of human existence mirrored the Aztec’s understanding of their living landscape. Thus, they would perform healing practices, divinatory activity of various sorts, and rituals surrounding childbirth and child-rearing at particular places, where Tlaloc could receive the gifts of human beings.

The material makeup of the human body corresponded with the material makeup of land. Thus Tlaloc, although a rain deity, was also understood to be Tlalteuctli—the “earth lord.” His body was likened to that of the crocodile: the ridges of his back were associated with the mountains and ravines, and he was said to float on the primordial saltwater sea. The Tlaloques were “rain dwarfs”; namely, lesser deities associated with various climatological phenomena such as snow, sleet, and lightning.

Tlaloc needed to eat. The ceremonial relationship between human beings and the Tlaloques was primarily based on food exchange. Rain was essential for the development of agriculture in Mesoamerica. In particular, the development of maize cultivation over several thousand years had become the basis for urban culture. Consequently, the Aztec performed ritual strategies for propitiating the rain deities so that they would release adequate amounts of moisture for agricultural bounty. Human beings grew and prospered due to the interaction of earth and water on Tlaloc’s body. The Aztec believed that the flesh and blood of human beings, given to Tlaloc through human sacrifice, sustained and regenerated his body. Thus, Tlaloc and the Aztec were in an intimate, reciprocal relationship.

Ceremonial temples, or *altepetl*, were openings to the watery dwelling of the deities. Yet human existence was understood to materially depend on this hidden world of Tlalocan (“the place of Tlaloc”). Ritual activities performed at these places brought human beings into intimate contact with the entire cosmos. Material elements such as earth, water, air, human flesh and blood, trees, and various kinds of animals were understood to be in dynamic interaction with each other.

Since Tlaloc was seen as a living embodiment of the land, whose primary duty was to control the circulation of water both inside and above the earthly plane, the title of

“rain deity” is an insufficient description. Attempting to describe the dynamic nature of the ceremonial interactions between the Aztec and Tlaloc as a feeding relationship, one scholar has referred to the mythic world of the Aztec as an “eating landscape.”

**TLAXCALAN RELIGION.** What is in the early twenty-first century the Mexican state of Tlaxcala occupies roughly the same territory as the old pre-Hispanic Tlaxcalan confederacy, an alliance of several indigenous principalities independent of the so-called Aztec empire. Its inhabitants were Nahuatl-speaking Indians, and they were the main allies of Hernán Cortés in the Spanish conquest of Mexico from 1519 to 1522. Present-day Tlaxcala is located on the western fringes of the central Mexican highlands. It is the smallest state in the nation, with a population of slightly more than 600,000. Although less than 15 percent of the population still speaks Nahuatl, the ethnic and somatic composition of Tlaxcala is predominantly Indian, and there persists a strong identification with the Indian past.

**PRE-HISPANIC BACKGROUND.** When the Spaniards arrived in Mexico in 1519 they found a polytheistic religion widespread throughout the area that in the twentieth century came to be known archaeologically and ethnologically as Mesoamerica. Mesoamerica exhibited a rather high degree of cultural uniformity, and in no cultural domain was this more true than in the realm of religion. Thus, Tlaxcalan polytheism was a variant of a pan-Mesoamerican religion, minimally different from, say, Méxica-Aztec, Huastec, Tarascan, Zapotec, or even Maya polytheism.

The main characteristics of Tlaxcalan polytheism were seven:

1. A highly diversified and specialized pantheon, in which hundreds of patron gods and goddesses relating to nearly every human activity, natural phenomenon, or social grouping were arranged in a somewhat hierarchical order
2. A complex and extensive ritual and ceremonial yearly cycle regulated by the calendrical system
3. A sophisticated cosmology and theology centered on the origins and nature of the gods, the creation of humans and the universe, the regulation of humanity's relationship to the gods, the disposition of the dead, and after-life
4. A religious ideology that emphasized pragmatism in the relationship between humanity and the supernatural at the expense of values and morality, which were almost exclusively an aspect of the social structure in operation
5. An extensive and well-organized priesthood in charge of the administration of religion and several ancillary aspects of the social structure
6. A tremendous emphasis on human sacrifices to the gods and a significant degree of ritual cannibalism
7. A pronounced concern with bloodshed and the dead, and a cult of the dead approaching ancestor worship

Tlaxcalan religion pervaded every significant cultural domain of the confederacy: society, economy, polity, administration, and the military. Indeed, religion was the driving force of Tlaxcalan culture. In many distinct ways, however, Tlaxcalan religion was not that different from Old World polytheistic systems such as those of the Indo-Europeans and the Chinese: the gods were made in the image of humans, and they exhibited the foibles, virtues, and vices of human beings; the gods were hierarchically arranged in an organized pantheon; the social structure of the gods mirrored that of humans, with whom they interacted in a variety of ways; and religion was essentially a pragmatic ritualistic system regulating the relationship between humans and the supernatural.

**SYNCRETIC DEVELOPMENT.** Tlaxcala was one of the first regions of the continental New World to be subject to systematic efforts to convert its inhabitants. In 1524, the task of indoctrinating the Indian population in the ritual, ceremonial, and theological practices of Roman Catholicism was assigned to the Franciscan friars. For nearly a century the Tlaxcalans were under the religious leadership of the Franciscans. During the second decade of the seventeenth century, the Franciscans were replaced by secular priests and clerics, who continued the catechization of the Indian population. By the end of the seventeenth century, Tlaxcalan Indian Catholicism had essentially crystallized into what it is in the early twenty-first century.

The context of conversion and indoctrination to Catholicism in Tlaxcala can be characterized as "guided syncre-

tism," a policy that the Franciscans consciously followed for two principal reasons: first, to convert the Indians rapidly; and, second, to soften the impact of forced conversion and thus make the new religion more palatable to the masses of the Indian population. This policy of conversion was greatly facilitated by the symbolic, ritual, ceremonial, and formal similarities between the lengthy roster of Catholic saints and the highly diversified Tlaxcalan pantheon. As early as the turn of the seventeenth century, the Tlaxcalan Indians were already practicing a syncretic kind of Catholicism. This was partly the result of the Franciscans' efforts in fostering identifications between the interacting religious traditions, particularly between Tlaxcalan gods and Catholic saints. The same process is evident in the emergence of local (community) religious hierarchies, in which such pre-Hispanic institutions as the priestly houses (*calmecac*) and people's houses (*telpochcalli*) came to interact with such similar Catholic institutions as stewardships (*mayordomías*) and sodalities (*cofradías*). The syncretic process undergone by Tlaxcalan religion from 1524 until approximately the last quarter of the seventeenth century permanently marked Indian Catholicism, and to a lesser extent all rural and urban Catholicism throughout the region.

**CONTEMPORARY TLAXCALAN RELIGION.** Contemporary Tlaxcalan Catholicism is centered on several institutions: the cult of the saints, the cult of the dead, the *mayordomía* system, the *ayuntamiento religioso* (local religious hierarchy), and the magico-symbolic system. It may be characterized as primarily a type of folk religion; that is, its ritual and ceremonial complex is markedly different from the national Catholic religion of Mexico and is carried on by the *barrios* (quasi-socioreligious units), *hermandades* (brotherhoods), *cofradías*, and other religious institutions of a syncretic nature. The single most important institution in the administration of Tlaxcalan religion is the *república eclesiástica* (ecclesiastic republic), which includes all annually elected officials of the numerous stewardships and the local hierarchy.

One fundamental aspect of Tlaxcalan religion remains unchanged: The present-day folk Catholicism retains the essentially pragmatic and ritualistic character of pre-Hispanic polytheism. The supernatural belief system has one general, predominant aim: to make the individual and the collective world of social existence safe and secure by the proper propitiation of all supernatural forces, regardless of the structural means employed. The relationship between humans and the supernatural, then, is characterized by pragmatic and rather selfish motives for which the individual and the group pay dearly in terms of time and economic and social resources.

Finally, there is a significant magical component to Tlaxcalan religion. It coexists side by side with folk Catholicism and is regulated by the same belief system. Although the practice of magic sometimes merges with folk Catholicism and is part of the syncretic complex, more often it forms a separate system. Witchcraft, sorcery, soul loss, and belief in a series of anthropomorphic or animistic supernaturals

constitute the bulk of the magical component. All these practices are of pre-Hispanic origin, but they do contain elements of European and even African witchcraft and sorcery, some of which became syncretized independently of Catholicism.

## TOADS SEE FROGS AND TOADS

**TOBACCO.** Now used recreationally throughout the world, tobacco originated in South America as long as eight thousand years ago as a product of two cultivated hybrid species of the genus *Nicotiana*, *N. rustica* and *N. tabacum*. The genus, which belongs to the nightshade or potato family (Solanaceae), occurs naturally in many parts of the world, including North and South America, Australia, some of the South Pacific Islands, and—with but a single species—Africa. The greatest number is native to North and South America, but even with this relative abundance of nicotine-bearing species, only in one small area of the New World, most likely fertile valleys located between Peru and Ecuador, did early food cultivators discover and make use of the extraordinary effects on mind and body of the powerful alkaloid from which the genus derives its name.

More than likely the early experiments with cross-fertilization that resulted in the two cultivated hybrid species

of tobacco, *Nicotiana rustica* and *N. tabacum*, were products of that moment in time when some South American Indians turned from a pure hunting and gathering economy to food cultivation, beginning with the root crop cassava, or manioc. Although all species of the genus contain nicotine, that alkaloid is present in much greater amounts in the two cultigens of ancient lineage, *N. tabacum*, the progenitor of commercial blends, and *N. rustica*. The former is the more variable, with percentages of nicotine content in the leaf ranging from only 0.6 percent to 9.0 percent. In contrast, in a Mexican species of *N. rustica*, the percentage of nicotine was as high as 19 to 20 percent. Although, as Johannes Wilbert notes in his pathbreaking book *Tobacco and Shamanism in South America* (1987), nicotine is distributed throughout the plant, in both species the leaves contain the highest amount, those of *N. rustica* far outstripping the milder species in its capacity to inebriate and addict. Little wonder, then, that the leaves were used either whole or dried and crushed and that *N. rustica* achieved by far the widest distribution as a sacred ecstatic intoxicant among many Native American peoples. Often, especially in South America, it serves as the exclusive vehicle of the shamanic trance, and sometimes it is one of several herbal preparations employed for the altered mental state in which the shaman, it is believed, travels out-of-body to consult with the spirits of the deceased and the gods or to do battle with disease demons and other negative forces on behalf of his or her clients.

Tobacco is sometimes also employed to create an especially receptive state of mind for the application of another psychoactive species with even greater ramifications in the intellectual culture. Thus, to cite just two examples, on their peyote pilgrimages to the north-central Mexican desert, the Huichol Indians of northwestern Mexico, whose most sacred and supernaturally charged plant is peyote, smoke *N. rustica* tobacco wrapped in cornhusks to intensify the effects of the psychoactive cactus. Far to the south, on the north coast of Peru, Mestizo *curanderos* combine tobacco syrup administered through the nostrils with infusions of San Pedro (*Trichocereus pachanoi*), the popular name for a tall, columnar cactus that, like peyote, has mescaline as its primary alkaloid and whose place in Andean shamanism is archaeologically documented as reaching back at least three and half millennia.

It should be emphasized that as many as two hundred major and minor species have been identified in the visionary-therapeutic pharmacopoeias of Native American shamans, the majority in the tropics. Of these, tobacco had the widest distribution even before it became a major item of commerce as a recreational drug in the centuries after Christopher Columbus arrived in the New World. Curiously, despite the rapid pre-Columbian diffusion of tobacco through the Indian Americas, tobacco's cultural role as a visionary intoxicant seems to have stopped at the shores of the Atlantic and the Pacific. Tobacco and the custom of smoking reached West Africa in the 1500s, not long after Columbus's first

landfall in the Western Hemisphere, and spread on that continent so quickly that some students of the phenomenon assumed it to be African in origin, reaching the New World with the slave trade, rather than the other way round.

In parts of Africa, notably the Cameroons and Nigeria, tobacco pipes of terra-cotta, metal, and other materials evolved into great sculpture, real masterpieces of portable art and objects of prestige associated with the nobility, great warriors, and priests, with long stems and complex chimneys rivaling in size and volume the monumental pipes of the so-called Mound Builder cultures of prehistoric North America. Both men and women smoked pipes, some with sculptural bowls whose interiors exceed the size of large teacups or coffee cups. Even if the tobacco was of the milder kind, it is hard to believe that the amount of nicotine the smoker absorbed would not have had some effect on consciousness. And yet if African medicine men or shamans used tobacco to contact the spirits, no evidence for it exists. The only possible hint that there was more to African smoking than pleasure or sociability comes from a report by the French anthropologist and Africanist Marcel Griaule (1898–1956). During field research with the Dogon people of Mali, Griaule met an old blind hunter named Ogotemméli, who was especially knowledgeable in the cosmology and religion of his people. “Having sat down on his threshold,” Griaule recounts, “Ogotemméli scraped in his tobacco pouch and gathered some yellowish dust on the flap. ‘Tobacco,’ he said, ‘clears up the sense of judgment.’ And he began to reconstruct the system of the world, for one had to begin with the very beginnings of things” (Griaule, 1970, p. 16).

Tobacco was introduced into Siberia by trade from Russia’s possessions in Alaska and the Aleutians—or even earlier; that is, at least by the 1700s. But there are no reliable reports that Siberian shamans adopted it as a ritual intoxicant alongside, or even instead of, the fly agaric mushroom, *Amanita muscaria*. In the Himalayas, on the other hand, Nepalese shamans have added *N. rustica* tobacco to a long list of psychoactive species they classify as “traveling plants” belonging to the god Śiva—“traveling” because they enable the shaman to travel to other worlds. *N. tabacum*, in contrast, is regarded as merely “pleasurable.” Both species were introduced in colonial times.

**TOBACCO MYTHS.** A common theme in the origin mythology of tobacco among Native Americans is that this most widely distributed psychoactive species in the New World was given to the first people by the gods. The gods themselves were believed to require tobacco as their sacred, and even only proper, food. But in making it a gift to humanity they neglected to keep any for their own use—“not even one pipeful,” in the words of an elder of the Fox tribe of Wisconsin (Michelson, 1932, p. 127). So they must rely on human beings to give it to them. In exchange, the gods listen to petitions and confer their blessings or, conversely, withhold evil. Reciprocity is thus extended from the social realm to interaction between the spirit world and human beings, whose con-

trol over a spirit food fervently desired by the supernaturals gives them some leverage, for the gods are said to be unable to resist it.

The craving for tobacco attributed to the supernaturals can thus also be understood as an extrapolation from human experience, in this case nicotine addiction, especially among tribes whose shamans regularly intoxicated themselves with tobacco. The use of tobacco as smoke, snuff, cuds mixed with lime, or liquid infusions to induce “drunkenness” for the purpose of “communicating with demons” is repeatedly described by sixteenth-century sources from the Caribbean, Mexico, and South America, though in some cases the intoxicating substance was probably not tobacco but another of the many botanical hallucinogens then and now in ritual use.

Wilbert found a particularly complex variety of “tobacco shamanism” among the Venezuelan Warao, whose sacred geography and cosmic architecture are virtually constructed of tobacco smoke and whose shamans smoke themselves into “out-of-body” ecstatic trance states with cane cigarettes three and four feet long. Warao shamans travel to the House of Tobacco Smoke in the eastern part of the universe over a celestial bridge of tobacco smoke conceived of as a channel of energy that guarantees health and abundance on earth as long as the supernaturals continue to be properly fed with tobacco smoke. Wilbert reports that Warao shamans crave tobacco smoke with such “tremendous physiological and psychological urgency” that they are literally sick without it. They believe that the gods likewise await their gift of tobacco with the craving of an addict and will inevitably enter into mutually beneficial relationships with human beings as long as humans provide the gift.

This attribution of addictive craving to the gods probably diffused together with cultivated tobacco itself. The notion dominates tobacco mythology and ritual even among peoples who, like those of the North American Plains and Prairies, customarily reduced the potency of tobacco with such nonpsychoactive plant materials as red willow bark and who, in any event, smoked only small quantities ceremonially in sacred pipes with chimneys of limited interior diameter to please gods and spirits and sanctify the spoken word, never to the point of intoxication.

A significant dichotomy may be noted between the origin mythologies of the cultivated hybrid species *Nicotiana rustica* and the less potent and less widely distributed *N. tabacum*, on the one hand, and the wild species (*N. attenuata*, *N. bigelovii*, and *N. trigonophylla*) of aboriginal western North America, on the other. While the origin of the Indian species is commonly credited to the divine realm, the latter two species are frequently attributed to the dead, perhaps because, as casuals, these species (like the daturas, which also belong to the Solonaceae) are sometimes seen to grow in disturbed soil (e.g., on graves). In California and the Great Basin they are often highly valued as gifts of the ancestors, but in transitional areas, where both wild and cultivated spe-

cies are available, the wild varieties are sometimes feared for their association with death.

The oldest evidence thought to point to smoking comes from California, where conical stone pipes dating to circa 4000 BCE have been excavated and where wild tobaccos were widely employed for shamanistic, magico-religious, and medicinal procedures, including the ecstatic trance. The Shoshonean (Uto-Aztec) Kawaiisu of south-central California used virtually every technique of ingestion reported from South America, including smoking, snuffing, licking, chewing, and swallowing. Likewise, the prophylactic, therapeutic, and metaphysical uses for cultivated species in South America and eastern North America were paralleled by these and other California tribes with the native wild species. The most common method was mixing the pulverized, dried leaves with slaked and powdered lime and either swallowing the mixture dry or liquified or licking and sucking it.

The Kawaiisu participated in the ecstatic-initiatory *toloache* (*Datura innoxia*) religion common to other California Indians, but tobacco, whose magical potency was given to the first people by the trickster culture hero Coyote, was much more generally employed by them and their neighbors. They used it as a mild-to-potent dream-inducing soporific; as a shamanistic and initiatory intoxicant; or for preventing and curing illness; repelling and killing rattlesnakes; driving away ghosts, monsters, and other threatening supernatural beings; and divining and manipulating the weather.

In North America the widespread function of tobacco to please the spirits is particularly well documented among the Iroquois and Algonquin of the Eastern Woodlands and the Plains and Prairie tribes. Seneca mythology attributes the origin of tobacco (*Nicotiana rustica*) to Awen'hai'i (ancient bodied one), the pregnant daughter of the Great Chief in the Sky, who stripped the heavens of tobacco when she fell onto the newly created earth island through a hole in the sky. This left not only the heavenly powers but the vast company of other spirits that manifest themselves in nature without their most essential divine sustenance. To induce these spirits, which included masters and mistresses of animals and plants as well as the "faces" that appear to hunters in the forest or in dreams and that are represented by the wooden masks of the shamanistic medicine societies of the Iroquois, to act on one's behalf requires the indispensable gift of tobacco.

**THERAPEUTIC APPLICATIONS.** Though widely employed to trigger the ecstatic visionary trance that is one of the cornerstones of shamanism, tobacco was also deeply embedded in native therapeutics. Almost certainly this was in large part based on observation and experience with the pharmacological effects of nicotine, not only on the human organism but other phenomena in the environment. Answering his own question whether pharmacological science corroborates nicotine therapy and curing practices with tobacco of South American shamans, Wilbert, in a paper published in 1991, lists a whole series of tobacco administrations by shamans

that at first sight might be considered "magical" but whose therapeutic efficacy can be pharmacologically demonstrated.

Take, for example, the shaman's breath. Not only in the Americas but wherever shamanism survives, the shaman's breath is considered to have curative, purifying, and strengthening powers. Except in the Arctic, breath is of course invisible, but in the American tropics it is often given form by tobacco smoke. This phenomenon of shamanic practice was noted by the earliest European explorers. Shamans blow both their breath alone and thick clouds of tobacco smoke over their patient and his or her relatives and also fumigate the house. Blowing tobacco smoke is especially valued at the planting season. Before putting their seeds in the ground, farmers ask their shaman to "purify" their seed stock with tobacco smoke to assure a good harvest. Of course, tobacco smoke is sacred and feeds the spirits. But there is more to it than magic or religion: nicotine is a powerful insecticide and vermifuge. German experimenters found that fully 8 percent of the insecticides in tobacco are transferred into tobacco smoke. Seeds fumigated with nicotine against insect pests have in fact been observed to do better than those not so treated.

In treating their patients, shamans not only blow thick clouds of smoke but "capture" the smoke in their cupped hands; direct it into a wound, an aching or extracted tooth, eyes, nose, and mouth; and then massage the affected body parts. In addition curers blow nicotine-laden spittle and soothe aches and pains with tobacco juice. "Looking at these therapeutic practices from the point of view of drug administration," writes Wilbert, one recognizes in them more or less sustained-release mechanisms of application. Tobacco leaves are also used as plasters or compacts. Tobacco therapy thus involves the respiratory, dermal, and even gastrointestinal routes.

In both South America and Mexico, tobacco was also employed in the form of therapeutic enemas. In addition to tobacco, other plants that native peoples invested with sacred power and even divinity were so used. For example, a seventeenth-century Spanish colonial account of therapeutic practices and incantations in a community of speakers of Nahuatl (Aztec) in Guerrero, Mexico, lists therapeutic enemas not only of *piciétl* (tobacco, *Nicotiana rustica*) but of peyote (*Lophophora williamsii*), the little cactus of the north-central Mexican desert whose most important visionary alkaloid is mescaline; an aquatic species of *Datura*; and *ololiuhqui*, the Nahuatl name for the potent seeds of the white-flowering morning glory *Turbina* (form. *Rivea*) *corymbosa*, whose active principles are lysergic acid derivatives related to synthetic LSD.

Native American tobacco lore and therapy thus run counter to modern experience with the effects of tobacco on human health. Of course, Indian tobaccos are truly "organic"—they are cultivated, processed, and ritually employed without chemicals. Shamans often reach great age, including those for whom tobacco is the primary avenue of ecstasy.

Whatever negative effects tobacco intoxication has on the vocal cords, visual acuity, color perception, and so on—and Wilbert lists many of these—have, by way of natural modeling, long since been processed into desirable qualities in the intellectual world of tobacco shamanism. Still, there are no statistics to show whether tobacco shamans fall victim to lung cancer, heart disease, emphysema, or any of the other ills associated in the West with smoking. That Native American peoples are well aware that tobacco can kill is obvious from the many traditions of symbolic death and resurrection through the experience of initiatory intoxication. But there is also the reverse: revitalization, bringing the dead back to life by means of tobacco. This desirable end is dramatically illustrated in the following Seneca myth from upstate New York (Hewitt, 1918):

In his travels a youth encounters a skeletonized man in a place heaped with the bones of dead people. Skeleton Man tells the youth that the only thing he desires is tobacco, but his pipe and pouch are empty. He sends the youth on a harrowing journey, past or through dangerous obstacles and variations of an ordeal familiar from heroic, funerary, and shamanic mythology—the Symplegades-like “paradoxical passage,” that is, clashing rocks, islands, or icebergs that open and close in an instant and through which the hero, the soul, or the shaman must pass. The Seneca youth survives these ordeals and finally reaches a distant place where tobacco is guarded by Seven Sisters and their terrible old mother. Using his *orenda* (spirit power) and trickery, he succeeds in entering the lodge of the female spirits, evading their war clubs and escaping with the magical tobacco. When he returns and fills Skeleton Man’s pipe, the bones of the dead people are re clothed with flesh, and the people return to life.

PETER T. FURST (2005)

**TOLSTOY, LEO** (1828–1910), Russian writer. Leo Nikolaevich Tolstoy was born on his family’s estate of Yasnaia Poliana (Bright Meadow), in Tula Province. His parents, both from the high aristocracy, died in his early boyhood. Tolstoy was a melancholy child, self-centered but filled with the desire to be a better person.

He entered the University of Kazan in 1844, planning to become a diplomat, but left the university in 1847 without taking a degree. That same year, he inherited Yasnaia Poliana and went there to live. In 1849 he opened a school for the village children and was one of its teachers. At this time, as later, he was strongly under the influence of Rousseau.

Tolstoy volunteered in 1851 for army service in the Caucasus, and he subsequently took part in the Crimean War (1854–1856) in the Danube region and at Sevastopol. He left the army in 1856 and returned to Yasnaia Poliana.

By the following year he had published a semi-autobiographical trilogy on his childhood and youth and a group of short stories on the war in the Caucasus and at Sevastopol. These works soon brought him fame.

Tolstoy made the first of two trips to western Europe in 1857 and was repelled by the absence of spiritual values and the materialism he found there. In Paris he witnessed a public execution and from it concluded that all governments were immoral. During his second trip abroad in 1860 his favorite brother, Nikolai, who had tuberculosis, died in Tolstoy's arms. The next year Tolstoy returned to Russia and resumed teaching at the Yasnaia Poliana school.

In 1862 Tolstoy married Sofia Andreevna Bers, eighteen years old. They had thirteen children, of whom five died. The first decade of his marriage was the happiest time of his life. During this period he wrote *War and Peace* (1863–1869).

Tolstoy's concern with moral development and religion was evident from his childhood. At the age of nineteen he wrote out rules of behavior for himself that were close to the precepts of his later Christianity. In 1855 he wanted to found a new religion, free of dogma and mysticism. Happiness would be achieved not in heaven but on earth, by following the voice of one's conscience. His letters from the 1850s on, and his literary works from *Childhood* (1852) to *Anna Karenina* (1873–1877), reflect the development of his ideas.

Beginning in the early 1870s, Tolstoy engaged in a moral and religious quest that was to continue until the end of his life. He had begun reading Schopenhauer in 1867 and was influenced by Schopenhauer's negative view of life. In the fall of 1869, while on a trip to buy land, he stopped at the provincial town of Arzamas, staying overnight at an inn. There, in the middle of the night, he had a terrifying vision of death. From this time on, Tolstoy was obsessed with thoughts of his own death—although earlier works, like *Three Deaths* (1859), were witness that the problem of death had been on his mind for years. It was this obsession that led to his search for a viable religious faith, one that would make life worth living and would reconcile him to the bitter fact that he too must die.

Tolstoy's spiritual crisis began during the writing of *Anna Karenina* and lasted until 1879. It is mirrored in the seekings of Levin, the novel's hero, and is akin to the spiritual quest that had occupied Pierre Bezukhov, the hero of *War and Peace*. But whereas *War and Peace* had ended in optimism, in *Anna Karenina* a dark force seems to take over. Levin cannot accept a materialist explanation for his life. That would be "the mockery of Satan," the power that remains in the universe if there is no God. This power is Schopenhauer's blind force of will, the same force that destroys Anna. Levin thinks that suicide is the only possible escape from his situation.

In *A Confession*, which he wrote from 1879 to 1882, Tolstoy described his own crisis. Reason and the sciences

gave him no answer to his questions, which marriage and family life had stifled only temporarily. He read extensively, but the thinkers he studied—Socrates, Solomon, Buddha, Schopenhauer—all concluded that life was an evil and that the greatest good was to free oneself of one's existence. Tolstoy then turned to the peasants. He saw that their simple faith in God gave their life meaning. They did not fear death, which they regarded as the natural outcome of life. Tolstoy concluded that the answer was simply to believe, without reasoning. Belief in God and in the possibility of moral perfection made life meaningful. The peasants' faith, however, was bound up with Orthodox ritual and dogma, which Tolstoy could not accept. He ended *A Confession* promising to study the scriptures and the church's doctrines in order to separate the truth in them from falsehood.

Tolstoy taught himself Greek and Hebrew in order to read the biblical texts in the original. In his *Translation and Harmony of the Four Gospels* (1880–1881) he rearranged the Gospels, rewriting or eliminating material he thought incomprehensible or untrue. Miracles, including the resurrection, were discarded. Tolstoy's version presented the tenets of Christianity as he saw them. He said that this book was the most important thing he had written. The other promised work, *A Criticism of Dogmatic Theology* (also 1880–1881), was an attack on the Orthodox church. In it, Tolstoy examined the church's doctrines and said they were distortions of the true teachings of Christ, who had wanted only love, humility, and forgiveness.

His next book, *What I Believe* (1882–1884), was a summing-up of Tolstoy's creed. He listed in it five commandments of Christ: (1) do not be angry; (2) do not lust; (3) do not swear oaths; (4) do not resist evil with force; (5) love all persons without distinction. Observance of these rules would transform life on earth by putting an end to courts of law, governments, and wars between nations. Tolstoy's other religious and moralistic works, such as *On Life* (1887) and *The Kingdom of God Is within You* (1892–1893), contained essentially the same ideas as the earlier ones. All of these books, including *A Confession*, were banned by the censor, but they circulated in underground editions or were published abroad and smuggled into Russia.

Tolstoy's new religion was essentially a system of personal ethics, the same rules he had been trying to live by since boyhood. The church, he said, had obscured true Christianity with ritual, miracles, and symbols. It tried to keep from people the true Christ, a man and not a divine being, who wanted to unite men in peace and make them happy. Tolstoy's Christianity was based primarily on the sermon on the mount, and especially on Christ's principle of turning the other cheek (*Mt.* 5:38–42). God had placed the light of conscience within each person. By heeding their inner voice, people would act with simple truthfulness and love and would achieve happiness. The only way to combat evil was by a constant effort at self-perfection, not by opposing the evil of others with force. If each person does good whenever

possible, evil will die of itself. Nonresistance to evil became Tolstoy's main tenet.

But Tolstoy's Christianity did not bring him peace and did not end his search, any more than Levin's quest in *Anna Karenina* had ended with his conversion. Never believing in personal immortality, Tolstoy was not able to accept death's physical finality and the thought of his own physical annihilation. He returned again and again to the theme of death, which continued to haunt him. Efforts to include death in his vision of harmony on earth by viewing it as a peaceful merging with nature warred with flashes of nihilism. Only in his last years did he make his peace with death.

After his conversion Tolstoy condemned his own pre-1878 fiction, saying that it contained morally bad feelings. He resumed writing literary works in the mid-1880s, but they had changed. He now used a bare, plain style that would be accessible to every reader. Tolstoy wrote two kinds of works, both fundamentally tracts: short stories for peasants and children that presented his views on love and nonviolence, and longer stories for the educated reader, such as *The Death of Ivan Il'ich* (1886), *Kreutzer Sonata* (1889), *The Devil* (1889), and *Father Sergii* (1890–1891). He still had all his literary force, but the joy in life that had animated his earlier fiction was gone; the longer stories are dominated by gloomy, strong passions. Most of them express a hatred of the flesh, the source of life and of death.

Tolstoy's last work to be published in his lifetime was *Resurrection* (1899). It depicts the moral regeneration of Nekhliudov, a nobleman whose early debauchery had ruined the life of a young servant girl. In prison, Nekhliudov observes a religious service during which the priest, after giving communion, "took the cup back with him behind the partition and drank all the remaining blood and finished all the remaining pieces of God's flesh." Because of the heretical passages in *Resurrection* and his attacks on the church and state, the Holy Synod excommunicated Tolstoy in 1901. On the day the decree was announced, a cheering crowd of supporters gathered around his house.

By the 1880s Tolstoy had numerous disciples in Russia and abroad, many of them misfits or half-mad. One of his followers, Vladimir Chertkov, gained increasing influence over him. Tolstoy's disciples regarded him as a living saint, and Yasnaia Poliana became a goal of pilgrimages. Groups of Tolstoyans formed who tried to live by his ideas. All these groups eventually fell apart. (Many of the early *kibbutsim* in Palestine, however, were inspired by the ideology of a Russian-Jewish Tolstoyan, Aharon David Gordon.) Tolstoy continued to write in the final years of his life, expressing his views on most of the social, religious, and political issues of the day. He corresponded with Mohandas K. Gandhi, and Gandhi's doctrine of *satyagraha* was an adaptation of Tolstoy's nonresistance to evil.

Tolstoy's relations with his wife had deteriorated as he became more and more preoccupied with religion. Friction

between her and Chertkov made Tolstoy's life at home unbearable and led to his flight from Yasnaia Poliana in late October of 1910. He had long wanted to live quietly in solitude. On the train journey he fell ill and was taken to the stationmaster's house at Astapovo, where he died on November 7.

While Tolstoy's religious writings are peripheral to his literary achievements, his art is unimaginable without the moral and religious vision that informs it. Perhaps he cheated death better than he knew; as artist and seeker he has continued, generation after generation, to attract passionate adherents, and Yasnaia Poliana remains a focus of pilgrimages from all over the world.

In one of his Sevastopol stories, Tolstoy had written: "The hero of my narrative, whom I have tried to render in all its beauty and who was, is, and always will be beautiful, is truth." Tolstoy's brother Nikolai had said that in a certain spot at Yasnaia Poliana there was a green stick on which was written a secret that would destroy evil in men and make them happy. As a boy, Tolstoy searched in the bushes at Yasnaia Poliana for this stick. Much later, he wrote: "I believe that this truth exists, and that it will be disclosed to men and will give them what it promises." According to his wish, Tolstoy was buried at the place where he thought the green stick was hidden.

SYLVIA JURAN (1987)

**TOLTEC RELIGION.** In pre-Columbian central Mexico, *Tolteca* literally meant "people living at a place named Tollan [i.e., among the rushes]." However, even then the name had no single application, and it has none today. Because there was more than one place called Tollan, the word *Toltec* refers not to a single culture or religion, but rather to at least five specific groups of people, all belonging to Postclassic Mesoamerica: (1) the inhabitants of what is now the archaeological site of Tula de Allende near Mexico City, (2) the inhabitants or, more precisely, the elite, called Toltec-Maya, of Chichén Itzá, Yucatán, (3) the inhabitants of Tollan as it is described in central Mexican historical documents of the sixteenth century, (4) militant leading groups in other parts of Mesoamerica claiming descent from a place called Tollan, (5) members of various, often quite different, ethnic

groups, all bearing the typological name Tolteca, that migrated to central Mexico. In addition, the term *Toltec* was generally applied to any person who exhibited extraordinary skills, arts, or wisdom.

The present article discusses, in turn, each of these five groups, which overlap only to a certain degree. The familiar hybrid picture of “Toltec,” resulting from an unsophisticated merging commonly found in overall descriptions, can no longer be supported. Presumably there never existed either a single, homogeneous Toltec culture or, consequently, a single Toltec religion. But many traits are certainly common to various of the above-mentioned “Toltecs,” including religious traits. In this article, common features will be stressed, but the reader should be aware that they are not necessarily all elements of one coherent whole.

**TOLTECS OF TULA.** The rather extensive archaeological site of Tula de Allende in the modern Mexican state of Hidalgo, 75 kilometers north-northwest of Mexico City, has been excavated professionally since 1940. Its main ceremonial center, Tula Grande, flourished from about 950 to 1200 CE (dates established by ceramic cross-ties but only very few radiocarbon readings). In its final shape, Tula Grande consisted of some ten hectares of magnificently arranged buildings, surrounded by ten to twelve square kilometers of living quarters. So far, Tula-Toltec religion can be reconstructed only from the archaeological remains of the main ceremonial center. In contrast to buildings of the earlier metropolitan civilization of the region, Teotihuacan, Tula-Toltec religious buildings were designed for the full participation of large groups of people, who gathered in pillared halls, or colonnades, along one side of the huge central square. Different types of benches along the walls of the colonnades suggest that they were intended for groups of people of varying rank, although all participants probably belonged to the social elite. Numerous bas-reliefs show them dressed as warriors and aligned in rows, emphasizing their function in the cult as a homogeneous group: no single person is highlighted.

Archaeological vestiges indicate that the ceremonies of the Tula-Toltecs focused on the strange effigies known as chacmools. These are approximately lifesize sculptures of a reclining male figure dressed in some of the paraphernalia of a warrior, but clearly no warrior himself. He holds an object, perhaps a receptacle, over his belly and glares with sharply turned face at approaching worshippers. Despite recent attempts to interpret the chacmools as the stones on which human sacrifice was made, their specific function is as yet unknown. The practice of human sacrifice, however, was not uncommon among the Tula-Toltecs. The practice seems to be addressed metaphorically in endlessly repeated sculptural reliefs depicting eagles devouring human hearts. There are also frequent allusions in the reliefs to death in the form of skulls and bones.

More difficult to establish from archaeological data is the deity to whom the devotion of the presumed caste of warriors was directed. Most probably it was that highly complex

being that in Tula is metaphorically depicted by a combination of reptilian, avian, and human elements: the face of a man with circular, spectacle-like eyes is shown looking out of or emerging from open reptilian jaws. The figure, depicted *en face*, is surrounded by feathers and supports itself on legs with birdlike claws. Despite clear analogies, this hybrid being is not the famous feathered serpent, which in Tula architecture is represented only as a subordinate element.

Another quite different aspect of Tula-Toltec religious activities centered on a ritual ball game, which is generally believed to have been important as a symbolic reenactment of cosmic movement. In Tula Grande at least three giant ball courts existed, but there is no basis for any extensive interpretation.

**TOLTEC-MAYA.** Similar to Tula-Toltec culture in its essential expression, Toltec-Maya also seems to have been restricted to a single, extremely important place: Chichén Itzá in north-central Yucatán. The great resemblances between Chichén Itzá and Tula, 850 kilometers away, as the crow flies, are a commonplace in Mesoamerican archaeology, although the site of origin of these particular traits has not been definitively established. Chichén Itzá was always an important center of late Classic Puuc Maya, which toward its final period (c. 900 CE) exhibited an increased extra-Mayan influence. Subsequent development, to be found only at Chichén Itzá, shows a merging of traditional and newly introduced elements, the latter having been found so far only in Tula. The center of the Toltec-Maya city covers some thirty hectares, the general outline very much resembling that of Tula: large courts, colonnades, and ball courts. The more abundant and detailed iconography and a historical tradition, albeit a faint one, give the picture a little more color: the dominant social stratum, that of the warriors, is principally the same as in Tula, but a wider variety of grades is displayed.

The central deity of Toltec-Maya culture at Chichén Itzá is depicted, as in Tula, as the man-reptile-bird combination. The image is omnipresent, but there are practically no variations to provide deeper insight, although sometimes artists misinterpreted the stereotyped picture and made it look like a heavily adorned warrior with his pectoral and feathered headdress. The theme itself is an old Maya one: a man's head emerging from a snake's mouth. It is already known in Classic Maya representations and is frequent in the Puuc-style ruins, where the feathered rattlesnake is also common. Colonial sources call this mythological animal *k'uk'ulkan* (“quetzal-feathered serpent”) and mention a famous leader of Chichén Itzá who bore this name and who is said to have “returned” to central Mexico. A person intimately associated with this feathered serpent serves as the focus of a story with a mythical flavor, the wording of which is unknown but which is depicted with considerable detail in various Chichén Itzá temples. The sculptural narration makes clear that this feathered serpent was the center of devotion for the Toltec-Maya elite.

There is evidence, however, that the feathered serpent did not occupy the paramount place in the Toltec-Maya pantheon. Not infrequently, what seems to be a supreme deity is depicted seated on a low throne-bench in the shape of a jaguar before a giant sun disk designed in the manner of central Mexico. This theme demonstrates the preoccupation of Toltec-Maya religion with the sun, which is presumably also the main concern of the ritual ball game. Based on central Mexican analogies, long rows of reliefs of strangely reclined warriors have been interpreted in relation to the sun cult: the sun that passed beneath the earth during the night had to be revived every morning through rituals executed by the warriors.

To the water deities was directed a special cult peculiar to Chichén Itzá: on certain occasions, human beings were thrown into the sacred cenote (natural well) and drowned to appease the rain gods or to act as intermediaries between them and men. The continuing belief in the old Maya water god Chac is clearly visible in the large masks with elongated noses that adorn the corners and facades of most temples, sometimes together with the bird-snake-man motif.

A great variety of human sacrifice was practiced among the Toltec-Maya, in contrast to earlier Maya times. The sheer quantity of victims, whose skulls were displayed on special racks, is impressive. Striking, too, is the constant presence of the death symbol on buildings, as well as on warriors' clothing. The act of human sacrifice is frequently depicted, not only in the metaphorical form of wild beasts (symbolizing warriors) feeding on human hearts but also in naturalistic representations found on the interior walls of temples and along the field of the ball court. In the latter, the decapitation of the leader of the losing team is depicted. The rubber ball of the game in this scene is a symbol of glorious death, and snakes emerging from the victim's neck symbolize precious blood.

These are examples of the abundant metaphorical motifs, also seen in the chacmools and the images of feathered serpents, whose interpretation is fraught with difficulties. Chichén Itzá clearly presents a syncretic religion in which the veneration of old Maya water gods mingles with foreign solar-astral ideas. Everything points to the martial rituals as being associated with the elite warrior group, or "Toltecs," whereas the cult of the water deities is likely to have been connected with the commoners, the Maya farmers.

**TOLTECS OF TOLLAN XICOCOTITLAN.** Although identified by Jiménez Moreno with Tula de Allende, the famous Tollan Xicocotitlan referred to in colonial sources is not this town alone. As epithet or name, the word *Tollan* has been used to designate other famous cities, and the description of this Tollan corresponds—if to any place on earth at all—more to Classic Teotihuacan than to Tula de Allende. As described in the written sources, Tollan Xicocotitlan was a sort of paradise. Thanks to their prudence, the inhabitants of Tollan possessed everything they needed in abundance, including maize and cotton, precious stones, and gold.

They worshiped only one god, whom they called Quetzalcoatl ("quetzal-feathered serpent"), a name also given to the highest priest of the deity. This god did not require any sumptuous service and reportedly abhorred human sacrifice (although scholars believe that these accounts were designed to please the Spanish missionaries and divert from historical truth). People were admonished to offer their god only serpents, flowers, and butterflies. They considered their incomparable wisdom, science, skill, and arts as emanating from their god and strictly obeyed the orders given by Quetzalcoatl and voiced by his priest. The god, resembling a monster, lay like a fallen rock, as one source says, in his temple on the top of a tall pyramid. He had a long beard. He—or perhaps his priest—repeatedly made autosacrifice by bleeding himself with sharp thorns, thus becoming a prototype for all later priests in central Mexico.

This account, given to the sixteenth-century Spanish missionary and historian Bernardino de Sahagún by educated Indians, is incompatible in its details not only with the ecological situation of Tula but also with a warrior-dominated society like that of archaeological Tula. It seems to correspond to earlier times, when the idea of a divine feathered serpent was developed or introduced in Teotihuacan iconography and later refined and elaborated in places like Xochicalco and Cacaxtla. On the other hand, Sahagún and other sources tell the story of a famous ruler of Tollan Xicocotitlan, who, confusingly enough, bore the title of Quetzalcoatl in addition to his personal name Topiltzin ("our beloved prince") and the name of the date of his birth, Ce Acatl. Details of his origin, genealogy, and life are contradictory. He may have belonged to the Nonoalca, the culturally (and perhaps politically) dominant group of multiethnic Tollan Xicocotitlan. Scholars assume that the Nonoalca migrated from the southern Veracruz region, where they had been in contact with a more sophisticated civilization, which would explain their opinion of themselves and of Quetzalcoatl as the incarnation of cultural superiority.

One of the more important virtues of the people of Tollan Xicocotitlan was their forthrightness. According to Sahagún, they spoke thus: "It is so, it is true, yes, no." But the very personification of their integrity—Topiltzin himself, the Quetzalcoatl—was attacked by three demons, two of them bearing the names of later, Aztec deities (Huitzilopochtli and Tlalacahuan, that is, Tezcatlipoca), although they do not seem to have been identical with them. One should refrain from interpreting this incident as the mythic rendering of an antagonistic struggle between divine principles or between two religious factions practicing and opposing human sacrifice. Topiltzin was eventually overthrown, and consequently one disaster after the other befell his city. Finally he had to gather his followers and leave the place. It is generally accepted that part of the story reflects internal dissent in Xicocotitlan between Nonoalca and Tolteca-Chichimeca, another constituent ethnic group.

From here on, history once more becomes legend. On his flight, Topiltzin Quetzalcoatl worked miracles in many

places. Eventually, on reaching the Veracruz coast, he either burned himself and became the morning star, or, according to other versions, he walked or sailed on a raft, miraculously made by intertwining serpents, to the mythical land Tlapallan, where he may have died. After his departure from Xicotitlan, Topiltzin was replaced by a more secular ruler, Huemac, perhaps Topiltzin's kinsman, who himself was also persecuted by the demons and who finally fled to a cave where he killed himself or disappeared—the sources are hopelessly contradictory on this point. Huemac, too, assumed divinity, as lord of the underworld.

**Conquerors of "Toltec" Affiliation.** In various parts of Mesoamerica during early Postclassic times a local population had to submit to small groups of militant immigrants. These usurpers, who showed positive "Toltec" traits, established themselves as ruling elites. In the case of the Quiché and Cakchiquel Maya in highland Guatemala, the respective elites claimed descent from a mythical place of origin called Tulán, far to the north, and ethnic affiliation with those they called the Yaqui (Nahuatl-speaking Mexicans). After their initial migration the Quiché settled for a long time near the Laguna de Términos on the Gulf of Mexico and later continued their migration into the Guatemalan highlands. They carried with them a "sacred bundle"—in Mesoamerica generally considered the very essence of their god and the sacrosanct symbol of ethnic identity—which they were given by Nacxítl at Tulán. Nacxítl or Acxítl is one of the names of Quetzalcoatl, according to central Mexican sources.

Quiché tradition of the sixteenth century, amply preserved in their "sacred book," the *Popol Vuh*, relates that at Tulán their four ethnic subdivisions had each been given tribal deities: Tohil, Avilix, Hacavitz, and Nicacatah. The most powerful, Tohil, who was identified by the *Popol Vuh* with Quetzalcoatl, was the possessor of fire; he offered this cultural achievement to other starving tribes at the price of using them as victims for human sacrifice, hitherto unknown at Tulán. The other tribes thus came under Quiché dominance, which they unsuccessfully tried to shake off.

The creation myth recorded at length in the *Popol Vuh* is generally considered an adaptation of central Mexican (Toltec) prototypes: here, the creation of the world in various stages of completion is referred to as the work of Tepeu and Cucumatz (Gucumatz). The name *Tepeu* recalls the ruler of Tollan, named Totepueh (*to* is a Nahuatl possessive prefix), sometimes referred to as the father of Topiltzin or Huemac; the name *Cucumatz* is a literal translation of *Quetzalcoatl* into Quiché. The account of the *Popol Vuh* also gives deep insight into the wide corpus of legends of the Quiché that do not seem to be of Toltec origin.

**TOLTECA CHICHIMECA.** As a rule, central Mexican ethnic groups have ample traditions regarding their migration to their present homes. Most of these refer to a place of origin at Chicomoztoc (Seven Caves), and they count Tollan among their stopping places during their long migration. This holds true for the inhabitants of Cholula (Cholollan)

in the Puebla valley. They report in the monumental *Historia Tolteca-Chichimeca* that their forefathers, bearing the characteristic name Tolteca-Chichimeca, had to leave the decaying Tollan. Before starting off, their messenger-priest asked the god of Cholollan, then already a famous place of pilgrimage, for permission to settle in his city, which was granted. The god is referred to in the Nahuatl text as Quetzalcoatl Nacxítl Tepeuhqui and is addressed as Tloque' Nahuaque' (Lord of Proximity and Vicinity), the omnipresent deity. The allusion of the source to Quetzalcoatl as already present in Cholollan seems to indicate that well before the fall of Tollan the god's cult had begun to spread, certainly fostered by "Toltec" groups, into wider parts of central Mexico.

**CONCLUSION.** Only a few characteristic elements common to various facets of "Toltec" religion can be singled out so far: a supreme deity, Quetzalcoatl, who gave his name to priests and rulers; a cult dominated by eagles and jaguars (i.e., the warriors); a ritual ball game as reenactment of cosmic processes; and the importance of human sacrifice. These traits, whose roots go back far into Classic times, survived, sometimes altered or obscured, into late Postclassic times. For example, Quetzalcoatl ceded his rank to the Aztec Tezcatlipoca, the former being reduced to a mere wind god while the latter assumed titles peculiar to the "Toltec" Quetzalcoatl. Thus many religious descriptions in the colonial sources contain "Toltec" nuclei, although they are often barely recognizable.

**SEE ALSO** Quetzalcoatl.

#### BIBLIOGRAPHY

No special treatment of Toltec religion in any form has yet been published. The most comprehensive study of the Toltecs, written from an ethnohistoric point of view but making full use of available archaeological data, is Nigel Davies's *The Toltecs* (Norman, Okla., 1977). The subsequent period and developments are covered in detail by the same author in *The Toltec Heritage* (Norman, Okla., 1980), an expanded version of his *Los Mexicas, primeros pasos hacia el imperio* (Mexico City, 1973). There is no published synthesis yet of archaeological work at Tula de Allende, but Jorge R. Acosta's "Los Toltecs," in *Los señoríos y estados militaristas* (Mexico City, 1976), can be profitably consulted. The Toltec-Maya period of Chichén Itzá is summarized, although not very satisfactorily, in Román Piña Chan's *Chichén Itzá, la ciudad de los brujos del agua* (Mexico City, 1980).

The Quiché text of the *Popol Vuh* has been translated many times. *Popol Vuh: The Sacred Book of the Ancient Quiché Maya*, translated by Delia Goetz and Sylvanus G. Morley from the Spanish edition of Adrián Recinos (Norman, Okla., 1950), was the standard English version until it was superseded by the more scholarly work of Munro S. Edmonson in *The Book of Counsel: The Popol Vuh of the Quiché Maya* (New Orleans, 1971). A recommendable interpretation of this highly important text is, however, still lacking.

*Revised Bibliography*

**TOMBS.** In many European languages, to speak of “the tomb” is synecdochically to speak of death. In other places this is not true, since mortuary rites do not involve anything resembling a tomb. Moreover, where they exist, there are a wide variety of structures that may be described as tombs.

**TOMBLESS DEATH RITUALS.** There are ethnographic instances where corpses are simply abandoned. When a death occurs in the camps of some of the hunting and gathering peoples of the Kalahari Desert, there is an outpouring of grief, but nevertheless the band rapidly decamps leaving the corpse just as it lay at the moment of dying. There is a ritual response in that the site is avoided for years afterwards, but it is about as minimal a response as can be imagined. Corpses abandoned in this way are generally disposed of by carrion creatures, most commonly hyenas. Across much of Africa, hyenas are the subject of black humor, since they are always ready to devour the injured or dig up shallow graves.

The same theme of disposal as carrion is found in the Tibetan practice of “sky burial,” in which corpses are ritually butchered by a caste of death specialists, and fed to vultures. What this expresses in the starkest possible terms is the Buddhist contempt for the body, whose transience stands in contrast to the eternal verities of the spiritual world. The Jain “towers of the dead” use vultures in the same way, but the doctrinal emphasis is on avoiding pollution of the earth.

If these cases seem obscure, consider the ancient Hindu tradition of cremation, still followed by millions of people in Northern India. The purpose is to allow the corporeal elements to return to their origins—vision to the sun, feeling to the air, and so on. Consequently, rather than retaining the ashes, they are cast into rivers so that they can be dispersed. The most auspicious river of all is the Ganges, and the temples and burning *ghats* of Benares are a major focus of Hindu ritual.

**IMPERIAL MORTUARY COMPLEXES.** At the opposite end of the spectrum, there are examples of royal tombs constructed

on such a vast scale that they constitute some of the most spectacular finds of archaeology. When Chinese archaeologists began in the 1970s to probe the mound associated with the Qin Emperor Shi Huangdi, the first to unify the Chinese into one state, they discovered a series of vaults containing an estimated seven thousand life-size terra-cotta statues comprising an entire army of infantry, cavalry, crossbowmen, and charioteers. The figures are extremely lifelike, each face different and thought to have been modeled from life. They comprise a stunning artistic and technical triumph, but it is not clear what ideology lay behind the complex, especially as it was not imitated by subsequent emperors. At first sight it seems to reflect the megalomania of an emperor who evidently thought that he could ride into the afterlife at the head of his army, but there were also sociological effects that may or may not have been part of the emperor’s intentions. The organizational challenge of such a project was appropriate to a new state in the process of establishing its infrastructure, especially as it must have trained thousands of artisans in pottery techniques for which China has ever since been famous. Moreover, it augmented a national cult focused on the emperor.

Much the same argument could be made about the massive pyramids of Giza in Egypt. Although the pyramids were all built within a century near the beginning of the pharaonic state, they can also be placed within the context of a religion that developed over several millennia. The most famous archaeological discovery of the 1920s was the tomb of a relatively unimportant pharaoh of the eighteenth dynasty obscure enough to have avoided the attention of grave robbers in antiquity. By comparison with the temple complexes of other pharaohs, Tutankhamen’s tomb was modest. Nevertheless, it contained a fabulous storehouse of treasures, including enough furniture to equip a small palace. As is demonstrated by the tombs in the Valley of the Nobles at Luxor, such grandeur was not restricted to pharaohs.

**GRAVE GOODS.** The Qin emperor’s soldiers and Tutankhamen’s furniture are examples, if remarkable ones, of the practice commonly found all over the world of entombing useful or valuable objects with a corpse. It is often argued that such grave goods are among the earliest prehistoric evidence of ritual activity, and that they demonstrate belief in an afterlife. This does not, in fact, follow. Other motives are possible, such as the desire to prevent the further use of objects sentimentally associated with the deceased. Even so, grave goods often do imply an equipping of the dead. For instance, in parts of Borneo there is an elaborated theory of the journey of the dead to the afterlife by canoe. Consequently, paddles and sun hats are often hung from the sides of mausoleums. These grave goods are of little intrinsic value, and in a similar fashion even humble graves are often found to contain pottery or tools.

Archaeologists are also familiar with finding valuables in gravesites. Often these are goods originating from far away, and so give evidence of ancient trade. Examples are the

shell disks and embossed copper sheets found in mounds throughout central North America, and the gold and precious stones found across much of the Middle East. It is a safe assumption that such valuables were not taken out of circulation lightly, but it is often unclear exactly what the goal was. There may have been an element of sacrifice, especially where animals or even humans were immolated at the graveside. In accordance with that conception, in many places grave goods must be broken before they can be transmitted to the other world.

**HIERARCHY AND TOMB ELABORATION.** Diversity in grave goods from tombs of the same period is often taken by archaeologists as evidence of differences in the social status of the living, and hence a measure of social hierarchy. There are, as usual, exceptions that undermine the validity of the inference. For instance, the funerals of the kings of Bali, an island in Indonesia, were theatrical displays of pomp and hierarchy, yet the king's ashes ended up strewn on the sea according to the Hindu origins of the ancient empire of Majapahit. Noble Balinese families that had lost a member in the previous few years took the opportunity to participate in the grand cremation rites, so that the only graves that remained were those of commoners. Again, the kings of the Shilluk of southern Sudan had no tombs because it was intolerable that the king should die. Since the king's vitality was associated with that of the whole nation, signs of frailty meant that he had to be suffocated by his own wives, or so it was said. However the king died, his body was simply left where it lay, and the door of the hut walled up with bricks. Until the new king was installed, the spirit of the nation passed into an effigy kept for the purpose. Consequently, mortuary structures provide no evidence of the existence of the state. As a further example, Saudi kings are buried in plain graves facing Mecca as a gesture of humility before Allāh.

Nevertheless, it remains true that the tombs most characteristic of a place or an epoch are often those of the elite, especially where there is intense status competition. In Iron Age northern Europe, warrior kings tried to establish their lineages by building impressive tumuli containing stone-lined vaults and passageways. The size of the artificial hill was physical proof of a king's ability to muster numerous followers. A striking variant was the ship burials that have proved such a treasure trove for archaeologists and were particularly appropriate to images of death as a voyage. Ship symbolism is in fact widely found in connection with tombs, and particularly with coffins that resemble dugout canoes.

**PRIMARY AND SECONDARY STORAGE.** Tumuli or burial mounds often became ritual centers, incorporating subsequent interments. This was especially true when they were associated with secondary treatment of the dead. This involves the temporary storage of a corpse while the flesh decays from the bones, with final entombment of the bones at a later date.

The technique was employed in ancient times across the Mississippi region. At Cahokia in present-day Illinois, there

are over a hundred flat-topped earth mounds, the largest of which is one hundred feet high. The mounds show traces of wooden buildings on top, which probably included charnel houses where corpses were left to rot until the remains were ready for burial in the mound. There are also graves containing whole skeletons, the remains of burials of particularly prestigious people. Bundles of bones were also brought from elsewhere, to produce a complex pattern of interment in one mound. The Cahokia site supported a dense population, but dispersed populations in less fertile regions of the Appalachian Mountains also built mounds, which grew over many generations by accretion of new bones and earth. Exposure platforms were widely used across North America, the corpse dressed and equipped suitably for the gender and role of the deceased.

Secondary treatment is by no means restricted to the Americas. It is found in parts of Southeast Asia and in New Guinea, where corpses are laid out on platforms or set behind domestic fireplaces to dry out. In rural Greece the burial of corpses is only temporary. After some years, the grave is dug up and the bones stored in a communal ossuary. The same process in monastic communities in southern Europe produced crypts lined with anonymous skulls and femurs neatly arranged in patterns—a dramatic expression of death as the great leveler. In other cases in Europe, the removal of bones from communal graveyards to make room for others is the fate of paupers buried at public expense.

**BURIALS, TOMBSTONES, VAULTS, AND MAUSOLEUMS.** Simple earth burial is often associated with those on the lower rungs of a social hierarchy. It may be argued that this is a matter of practical expedience, the most rapid way to dispose of corpses before putrescence sets in. The carnage of a battle or a lethal epidemic makes mass graves necessary. At Cahokia, however, immediate burial was a privilege of a small elite, whereas paupers in southern Europe were lucky to rest undisturbed in their graves. In the Christian tradition, earth burial is the norm for rich and poor, in accordance with the doctrine of the resurrection of the body. Moreover, missionaries have exported Christian practices to the indigenous populations of Africa, the Americas, and Asia. The spread of Islam has had the same effect, so that burial is now more universal than it was in previous centuries.

Accordingly, tombstones provide the most familiar of death monuments. They are found in many varieties, from stones or plain slabs covering a grave to elaborate sculptures. The commonest are headstones inscribed with brief accounts of the deceased, but changing fashions have sometimes produced much more elaborate and imposing structures. In parts of the Islamic world, grave markers are nothing more than short wooden posts, carved in abstract or floral designs, but elsewhere the same process of elaboration has occurred as in Christian cemeteries.

Such changes of fashion date back to classical antiquity. Until sometime in the first century, Romans of any respectability were cremated, and their ashes stored in barrel-vaulted

brick and masonry chambers, with niches in the walls to contain urns. Such was the expense of building them that subscribers joined funeral cooperatives called *collegia*. Meanwhile, the poor and slaves were disposed of casually in pits, initially on the Esquiline Hill. Beginning in the first century, Romans began to copy Greek fashions of inhumation, which had long been the practice throughout the eastern Mediterranean. The motivation appears to have been display, since Greek funerary monuments had developed from amphorae over graves to structures elaborately decorated with an eclectic iconography, including sphinxes and winged lions. Roman versions can still be seen along the Via Appia, some originally displaying bas-relief portraits of the occupants. Also to be seen in Rome are the catacombs of the early Christian era, which represent a continuation of the Middle Eastern practice of burial in caves or rock-cut tombs.

Underground vaults are another common development from simple earth burial, and not only in the Mediterranean. In much of sub-Saharan Africa, graves are roofed with logs before being covered over.

A stone vault built above ground is usually described as a mausoleum, after the massive tomb of King Mausolus in Asia Minor. In central Borneo, ironwood mausoleums were constructed on top of large pilings. Sometimes thirty feet or more high and delicately carved in swirling designs, they are the premier artistic achievements of the region. They may contain coffins, large jars used for corpses, or smaller ones for bones collected after secondary treatment, with sometimes a dozen or more sets of remains in one aerial chamber. Adjacent to them are simple earth burials.

**LOCATION OF TOMBS AND LOCATION OF THE DEAD.** There are striking differences from culture to culture in where tombs are located in relation to the community. In New Britain, corpses were buried directly under the floor of the house, with the explicit aim of keeping the dead with their kinsmen. Pressure from missionaries and colonial authorities forced an end to the practice, but the dead are still buried as close to their houses as possible. In parts of eastern Indonesia, corpses were buried under the dance ground in the middle of the village. Moreover, kin and neighbors were required to sit by uncomplaining during a long wake because bodily corruption was seen as a positive process that allowed the deceased to return to mother earth. At the same time the dead were associated with ancestral villages in the mountains, so that they had a complex multiple presence for the living.

In Borneo, the elaborate mausoleums described above were sited across the river from communal longhouses, so that flowing water formed a barrier between the living and the dead. The mausoleums were described as houses of the dead; they were raised on pilings like the longhouse, and no one entered this village of the dead without very good reasons for fear that the inhabitants would see the intrusion as the arrival of a new member. This perception was contradicted, however, by long sacred chants at the funeral that took the deceased on a riverine journey to the land of the dead. Con-

sequently, the dead were seen as simultaneously both near and far, and that mystery contributed much to the power and drama of indigenous ritual. The entire community of ancestors was invited to funerals by other chants, but great care was taken to disentangle them from the living after the deceased was delivered to them.

Archaeological data from China show evidence of burials beneath the house, but in recent centuries the living have been careful not to live near graveyards for fear of unquiet ghosts. However, in many Chinese communities, both in China and abroad, ancestors figure prominently in the rituals of extended kin groups, and they are represented by tablets in special ancestor temples. Moreover, the location of the tombs is thought to have a major influence, and the ancient techniques of feng shui, or “wind and water,” are designed to site deceased family members so that they deflect evil and funnel blessings towards the living.

**RELIQUARIES, STUPAS, AND CENOTAPHS.** A special case of the ambiguous presence of the dead is provided by holy relics. In medieval Europe there was a brisk trade in body parts supposedly belonging to saints, and they were handled lovingly and stored in valuable reliquaries. Yet the virtue of the relics is, to say the least, doctrinally obscure. The saints are presumably in heaven, and there is no reason why their blessing should somehow inhere in their blood or bones. The paradox is sharper in Buddhism, but from its beginnings relics of the Buddha have been enshrined in large stupas that became centers of pilgrimage. Officially, relics, like statues, have no power other than to provide a focus of individual meditation, yet they have become national symbols. When the Portuguese conquered Sri Lanka they seized the relic housed in the Temple of the Tooth in Kandy, ground it into powder and threw it in the sea. But faith is not so easily destroyed. Within a short time the relic was miraculously rediscovered by a fisherman in his net and restored to its rightful place. Even when there are no remains in a tomb, it may become a national symbol, as with the Cenotaph in London, which honors the dead of both world wars.

**CHANGING STYLES OF TOMBS IN ENGLAND AND THE UNITED STATES.** Since the eighth century, graveyards in England were located within settlements next to the parish church. Consequently, villagers attending services were reminded of their forebears, now resting under the protection of the church. The elaboration of grave markers also served to remind them of the local social order. Throughout the Middle Ages, senior clerics tried to prohibit burials inside the church, which were seen as desecrating. One thirteenth-century prelate grumbled that such was the clutter of memorials that the graveyard appeared to have moved inside the church. It was difficult, however, to refuse landowners who patronized churches so that they could be buried there. Life-sized effigies were not unusual atop grand family tombs.

The urbanization accompanying the industrial revolution changed this pattern. City churches could no longer provide space, and graveyards had to be moved to the out-

skirts of cities, where they were often overtaken by further expansion. Consequently, graveyards became an issue of urban planning, although authorities were slow to respond. In the Victorian era, this changed under the influence of a new sentimentalization of death and the afterlife. Graveyards became “cemeteries,” a term derived from the Greek *koimete-rion* (a sleeping place), which were filled with fanciful architecture imitating Roman and Egyptian motifs.

A similar development occurred in the United States. In New England the Puritan tradition meant that graveyards were treated as mere necessities, and all affectation in burials was frowned on. Further south, things were not much different, and visitors to the colonies remarked on the chaotic state of graveyards in New York and Philadelphia. In the nineteenth century the rural cemetery movement set out to change this state of affairs. Their best-known achievement is Mount Auburn cemetery outside Boston, which is beautifully landscaped with tombs discretely set into hillocks. A Swedish visitor remarked, “A glance at this cemetery almost excites a wish to die.” A parallel innovation was the embalming of corpses, which originated during the Civil War so that distant families could take their sons home for burial. By the mid-twentieth century the entombing of embalmed corpses had become standard among Americans, whether newly immigrant or long established. Cemeteries were made efficient by inseting tombstones flat on the ground to allow regular mowing, but underneath these neat lawns lay massive concrete vaults and luxuriously furnished steel coffins. Cremation came into vogue at the end of the twentieth century, but an archaeologist of the future would certainly conclude that American notions of death paralleled those of the ancient Egyptians.

PETER METCALF (2005)

**TOMOL.** The indigenous people of the central California coast now collectively known as the Chumash are known in ethnographic circles for their unique use of the plank canoe, or *tomol*, a vessel that was not only instrumental in the Chumash exploitation of their marine resources, but served to so-

lidify the complex regional trade system whose influence was felt far beyond the Chumash interaction sphere. However, for some contemporary Chumash, this important item of material culture reaches beyond its practical value and into the realm of prime symbol, tapping into the essence of Chumash culture and religious orientation and encompassing a nexus of meaning surrounding issues of dependence upon nature, belief in the reciprocity of social life, and the world view of the people.

**THE CHUMASH.** In classical times, the Chumash were never a discreet linguistic or cultural entity. They lived in a geographic area along the California coast from roughly Topanga Canyon in the south to Estero Bay in the north, extending east to the western edge of the San Joaquin Valley, and in the northern Channel Islands. The people who have come to be known as the Chumash inhabited numerous relatively autonomous villages, each with its own internal political structure, the largest of which acted as capital cities for smaller village collectives. These individual city-states supported several dialects of the Hokan linguistic family, first identified by anthropologist Alfred Kroeber in 1925 and named, for the most part, for the missions in the areas encompassed by the dialects, namely the Ventureño, Barbareño, Ineseño, Purisimeño, Obispeño, and the additional Emigdiano, Cuyama, and Island dialects. While these dialects have been identified as branches of the Hokan linguistic family tree, they in fact operated much like distinct languages. This, in turn, has given rise to the notion that the various regional entities actually operated as distinct tribes in their own right, but with the necessary economic and sociopolitical system that would unite a region into a relatively cohesive network.

The regional federations consisted of smaller villages, which varied in population from sixty to over a thousand people, each presided over by a chief, or *wot*. The smaller villages owed their allegiance to a major chief for the region who resided in a capital village, enabling him to control the production and redistribution of the goods within his villages, thereby strengthening the federation's position among the other regions. Perhaps the key feature of this complex of inter-regional trade is the presence of specialized craft guilds, or brotherhoods, both within the villages and extending into a regional alliance of like craft specialists. These guilds were fraternal in nature, with the knowledge needed to produce the various products of these guilds passed on to subsequent generations via familial ties.

These specializations standardized the production of a number of important elements of Chumash material life, including baskets, obsidian projectile points, plant fiber cordage, shell bead money, and especially the plank canoe known as the *tomol*. In fact, the most powerful of these guilds was the brotherhood of the *tomol*, with its members in possession of high social status, important links to the religious leadership (*'antap*), and unprecedented access to the political leadership, as well. The *tomol*, with its powerful brotherhood, was the glue that held the entire system together. In order

to fully understand the importance of the *tomol* and the brotherhood in classical times, it is necessary to analyze the region's economy prior to the Spanish arrival.

**TRADE AND TRAVEL.** As the Chumash interaction sphere exists within a coastal zone and encompasses some eight to ten thousand years (since, roughly, the recession of the last coastal ice-age permafrost), it should not be construed as a stable environment. Changes in rainfall patterns and sea surface temperatures and their resulting impacts on terrestrial and ocean resources prompted the Chumash to rely upon a complex trade system in order to mitigate against shortfalls. As Daniel Larson and his colleagues state in "Missionization Among the Coastal Chumash of Central California":

As Chumash population levels increased there was a greater dependence on exchange of food from one settlement to the next. This reciprocity allowed groups to meet their provisioning needs when there were shortfalls within a village's catchment. As populations continued to grow, subsistence strategies expanded and intensified, settlements became increasingly interdependent, and mutual trade became critical to subsistence success. Tied to the mutual trading relationship was a hierarchical political system involving chiefs who acted as brokers in the exchange relationships. They were also responsible for the scheduling of feasts, ceremonies, and celebrations, which were essential to intervillage social interaction and conflict resolution. (p. 264)

The *tomol* was the tool par excellence for the maintenance of this system of trade, enabling the reciprocal exchange of goods and ideas and galvanizing the network of interdependence that contemporary Chumash see as fundamental to their ethical system. Owing to its role as facilitator for the trade system, the *tomol* represents an investment of time, ingenuity, and resource management techniques. In addition to requiring an estimated 180 to 540 person-days of labor to complete, not to mention great amounts of skill in order to produce a sea-worthy vessel, the raw materials for the *tomol* represent sometimes years of careful management before they ever make it to the production level.

The key ingredients of the canoe are, of course, wood, with redwood driftwood (washed down from the northern California coast) being the most prized; natural fiber cordage for lashing the planks together as well as for tether and anchor lines; a mixture of asphaltum (naturally occurring petroleum deposits and pine pitch) for caulking and sealing; and the assorted tools (adzes, drills, etc.) for the manufacturing process. These raw materials are employed as a result of reproduction processes such as gathering (or purchasing via the aforementioned trade system), preparation (curing and planking the wood), knowledge of availability (in the case of asphaltum deposits); and ongoing resource management.

This last point is especially true with regard to stands of red milkweed (*Asclepias fascicularis*) and/or dogbane (*Apocynum canabis*) for the approximately one mile of cordage needed for the finished *tomol*. In this last case, contemporary Chumash assert that the availability of large amounts of this

important resource depended upon management. Chumash ethnobotanist Julie Cordero states that the plant simply will not occur in useable stands if merely left to its own growth patterns. Clearly, the *tomol* required a vast amount of personnel and resource management before the manufacturing even began.

**PADDLING AS PRACTICE.** This system does not stop at the production level. Crew responsibilities and the environmental knowledge required for safe travel are also important. It is this last point that provides the clearest metaphorical connection between the contemporary *tomol* crew and their classic predecessors. The rowing of a relatively small vessel in the hazardous Santa Barbara Channel requires great skill and teamwork for safety and efficiency. Individual paddlers must be physically capable, mentally adroit, and socially connected to the other paddlers for the safe and successful operation of the *tomol*.

The nature of the vessel is such that individual balance while compensating for the movement of the other paddlers and synchronous strokes of the paddles are key for the smooth movement of the canoe. For this to occur, it is optimal that the crew be experienced with the other members so they will be aware of their style and physical types and their various strengths and weaknesses, and for the formation of personal bonds of trust, as the process, even in the contemporary context, is not without some measure of risk. It is precisely this relationship-building, among both paddlers and non-paddling support and building crews, that gives the Chumash involved in paddling the *tomol* the tangible elements for understanding the underlying ethos viewed as uniquely Chumash.

In the process of learning the behaviors and skills required for the rowing of the *tomol*, the contemporary Chumash have also begun to fashion a rhetorical system within which the *tomol* protocol, as well as the actual requirements for paddling, are transmitted to others. This oratory ranges from practical concerns regarding canoe operation to ontological statements of emotive quality that are seen as pertinent to living a proper life. Maintenance of the *tomol* is linked to maintenance of interpersonal relationships. Paddling together is connected to bonds of trust, interdependence, and ancestral honor. Suffice it to say that, in the reprise of canoe culture for the Chumash, the *tomol* provides both an exemplar of the entire ethos seen as essentially Chumash, as well as an opportunity to express through practice what it is that comprises the particular Chumash ethic.

The *tomol*, for the Chumash who are involved in the revival of their maritime culture, provides a key symbol of an ancient ethos that navigated its way through some ten thousand years of history, through many transformations in climate, and continues to provide a vessel with which they can carry their children into a future that regards their past as continually present.

DENNIS F. KELLEY (2005)

**TÖNNIES, FERDINAND** (1855–1936), German sociologist. Tönnies provided elaborate definitions of branches of sociology long before it was recognized as an academic discipline.

Ferdinand Julius Tönnies's academic preparation for his work as sociologist was uncommonly broad. In 1877 he received his doctorate in classical philology. Beginning his teaching career at the University of Kiel in 1881, he successively taught philosophy, economics, statistics, and sociology, and meanwhile published many articles on public policies. From 1909 to 1933 he was president of the German Sociological Society (founded by him along with Georg Simmel, Werner Sombart, and Max Weber). Having been publicly opposed to rising National Socialism and anti-Semitism, he was later illegally discharged from this post by the Hitler regime.

In 1887 he published his most famous book, a typological study, *Gemeinschaft und Gesellschaft* (translated as *Community and Society*, 1957). Outside Germany the reputation of this work overshadowed his other important writings such as those on Thomas Hobbes, on Karl Marx, on custom and morals, and on public opinion. Employing his dichotomous ideal types, *Gemeinschaft* ("community") and *Gesellschaft* ("society"), he attempted to define fundamentally different kinds of human relationships in their dimensions and structures. He took into account biological and psychological as well as institutional perspectives, and he expounded the typology with impressive erudition and poetic imagination. He leaned heavily on English literature from Hobbes to Herbert Spencer and Henry Maine. He compared his typology to Maine's distinction between status and contract.

For Tönnies, all social groupings are willed creations manifesting different kinds of human will. He saw these dif-

ferentiations in terms of another dichotomy. On the one hand is a common "natural will" consisting of life forces associated with instincts, emotions, and habits, forming personal bonds and obligations that engender an unconscious sense of organic unity and solidarity of persons and groups. On the other hand is a deliberate, consciously purposeful "rational will" manifest in the impersonal pursuit of individual and group interests. In the rational will is a combination of motifs issuing from romanticism and rationalism. These differentiations become evident also in religion. (In his later period he envisaged the possibility of a nondogmatic universal religion to unite humankind.)

The "natural will" of community is integrative; the "rational will" of society is pluralistic and segmental, reaching its peak in capitalism. Both kinds of will are always present in some form or degree, but Tönnies favored a community-oriented socialism.

Some critics have seen these typological dichotomies inimical to strictly empirical studies. Typology, they say, should not replace historiography, though the latter requires the former. Tönnies was aware of the danger of oversimplification and reduction in one's view of social reality. This becomes readily evident in his sharp critique of statisticians.

In his early essay on Spinoza, "Studie zur Entwicklungsgeschichte des Spinozas" in *Vierteljahrsschrift für wissenschaftliche Philosophie* (1883), Tönnies spoke of the emphasis on will as revealing a philosophy (stimulated by Arthur Schopenhauer) that he called "voluntarism," which entails the recognition of the primacy of will over intellect, and which is applicable to psychology, epistemology, and metaphysics. His old friend Friedrich Paulsen in his *Einleitung in die Philosophie* (1892) spelled out the conception of voluntarism in psychological terms. Paul Tillich in *Socialist Decision* (1933) adapted Tönnies's concepts of community and society. William James was so enthusiastic about Paulsen's book that he provided a lengthy introduction for the English edition, and one can see voluntaristic elements in James's concept of the "will to believe."

**TORAH.** It is no exaggeration to claim that the term *torah* is the quintessential symbol in Judaism. The present essay

approaches this symbol from a variety of linguistic, historical, and phenomenological points of view. The discussion is divided into nine basic parts. The first of these offers basic etymological orientation to the semantic range of the term *torah* in classical Hebrew usage. Parts two to four address the problem of the nature and origins of the diverse sorts of writings that have come to be called *torah* in Judaism. With the literary survey of *torah* complete, we then move to a survey of the ideological perspectives that Jews in various times and places have used to explain the meaning and the authority of *torah*. Part eight traces the profound role that the value of Torah study has played in the history of Judaism. The final part addresses the ritual functions of the book of the Torah as physical object.

**ETYMOLOGY AND BASIC MEANINGS.** The Hebrew noun *torah* is formed from the linguistic stem *y-r-h*. This stem has a complex semantic history, bearing at least three distinct senses: “to throw or shoot,” “to water,” and “to proclaim or instruct.” Some nineteenth-century scholars held that the stem has a primary setting in the context of divination practices, as in the casting of lots (e.g., *Jos.* 18:6). Indeed in Akkadian a closely related stem underlies the noun, *tertu*, which refers to an oracular directive or instruction. Nevertheless, in contemporary times, there has been no firm consensus about the linguistic history of the term *torah* prior to its characteristic usages in the Hebrew Bible and associated ancient Hebrew literature. In these sources, *torah* bears the primary sense of “teaching” or “instruction.” Depending upon the context, *torah* can refer to the orally imparted wisdom of parents (*Prv.* 1:8, 4:2) as well as to the teachings of formal instructors, including sages (*Prv.* 13:14), priests (*Dn.* 17:11), or prophets (*Dn.* 1:5). Very commonly it refers to messages delivered by the God of Israel to prophetic spokespersons, usually in the form of auditory disclosures of the divine voice (*Is.* 30:9). Especially in the biblical book of *Deuteronomy*, and at key junctures in the historical accounts of the books of Joshua through 2 Kings (e.g., *Jos.* 8:31, 2 *Kgs.* 14:6, 23:25), “the book of the Torah of Moses” (*sefer torat mosheh*) refers to a written collection of hortatory teachings and legal instructions. Equivalent terms, apparently referring to a complete document, are “the book of the Torah of YHWH” (*sefer torat yhw*; e.g., *Neh.* 9:3) and “the book of the Torah of God” (*sefer torat ’elohim*; e.g., *Jos.* 24:26). According to *Deuteronomy*, these teachings were copied by Moses in response to the divine command and deposited for posterity in the ark that housed the stone covenantal tablets received on Sinai/Horeb (*Dn.* 31:24-26). The author of the biblical book of *Nehemiah*, writing sometime between the fifth and the fourth centuries BCE, assumed that the scroll read by the priestly scribe, Ezra, in the covenant-renewal ceremony described in *Nehemiah* 8:1 and following, was a copy of this very same book of the Torah. It is represented as the written testimony of a covenantal relationship between the Israelite nation and the God of Israel, who redeemed it from slavery in the time of Moses and promises to restore Israel’s fortunes

in the future in return for full loyalty to the norms contained within the Torah (*Neh.* 9:6-10:31).

**THE LITERARY FORMAT OF THE CANONICAL TORAH.** In the authoritative version known for well over 2000 years, the Torah refers collectively to the first five books in the canon of the Hebrew Bible. Ancient Jewish translations of the Hebrew Bible into Greek (i.e., the *Septuagint*, c. 250 BCE and later), which form the textual basis of the Christian Old Testament, refer to these five books collectively as the Pentateuch (“the Five Books”). Greek-speaking Jews commonly referred to this collection by the term *ho nomos* (“the Law”; e.g., 2 *Mc.* 15:9, *Rom.* 7:1). Through the mediation of Christianity, deeply influenced by the usages of Greek-speaking Jews, it has become common in Western culture to conceive of the Torah as a law code and of *torah* as “law.” More properly, the Torah founded in the Hebrew Bible is an extended narrative that contains law codes. In traditional Jewish usage, the general noun *torah*—without the definite article—refers broadly to any authoritative religious teaching—legal, ethical, or theological.

Neither ancient Hebrew copies of the Torah nor modern scrolls used in Jewish worship identify either the Torah as a whole or its separate books by name. In traditional Jewish usage the title of each book is drawn from Hebrew words that appear in their first sentences: *Bereshit* (“In the beginning”), *Shemot* (“Names”), *Vayiqra* (“And he called”), *Bamidbar* (“In the wilderness”), and *Devarim* (“Words”). In Christian usage, the titles are drawn from Latin renderings of the Septuagint’s Greek titles that allude broadly to the theme of each work. These are the origins of the terms routinely used in Christian communities. English translations of the Old Testament, for example, list the titles of the Pentateuchal books as *Genesis* (Gr. *Genesis*); *Exodus* (Gr. *Exodos*); *Leviticus* (Gr. *Leuitikon*); *Numbers* (Gr. *Arithmoi*); and *Deuteronomy* (Gr. *Deuteronomion*).

Modern readers of the Torah in Hebrew will find it in two forms: as a printed book in the larger collection of a printed Hebrew Bible or as a handwritten scroll used in synagogue rituals which call for reading from the Torah in public. Scholars, perhaps, will have consulted medieval handwritten copies of the Torah that take the form of codices—separate leaves of parchment or other writing material bound together into a book. The format of the scroll is the most ancient and is found in the earliest surviving fragmentary copies of parts of the Torah that have been found among the Dead Sea Scrolls. These fragments, over eighty in number, offer evidence of the state of the text as early as the mid-second century BCE. They also show that the books of the Torah, like other writings presently included in the canon of the Hebrew Bible, circulated in a variety of versions, many of which differ from that found in the official scriptural canon. It is not clear how early the five books comprising the Torah were routinely copied together on one scroll. Nevertheless, Jewish and early Christian literary sources from the beginning of the Common Era assume that all five books formed a single literary entity.

**THE CONTENTS OF THE CANONICAL TORAH.** The canonical version of the Torah is a complex narrative work of extremely sophisticated composition. No simple outline of the plot of the Torah can do justice to its complexity. Major and minor themes and subplots are skillfully woven throughout the five books so that passages in one book are alluded to or even quoted in others (e.g., *Ex.* 16:2-3 and *Nm.* 11:4-6). The thematic unity of the Torah, then, fully justifies the rabbinic view that the books must be copied on a single scroll (B.T., *Git.* 60a). The following summary suggests the overall coherence of the Torah's narrative across the five books in which the story is told.

The Torah's master theme organizes diverse stories and collections of laws into a theologically coherent statement as well as a compelling historical narrative. The Torah is a history of the expressions of divine love for Israel and of Israel's inability to accept and respond to that love. The theme is given a universal significance in the first eleven chapters of *Genesis*, a complete literary unit that forms a prologue describing the origins of the world in God's creative speech (*Gn.* 1:1-2:4) and the early history of humanity. These chapters describe various forms of human rebellion from the time of the primordial man and woman, Adam and Eve (*Gn.* 2:4-3:24) and continuing through their descendants: Cain's murder of his brother, Abel (*Gn.* 4:1-16); the violence of Noah's generation that led to the destruction of nearly all life (*Gn.* 6-9); and the insolence of the generation that sought to invade the heavens by building a tower in Babel (*Gn.* 11:1-10).

This history of human rebellion foreshadows the Torah's depiction of God's relationship with the family of Abraham and his descendants through his son, Isaac, and grandson, Jacob. *Genesis* chapters 12 to 36 describe various covenantal promises sealed between God and these Patriarchs (*Gn.* 12:1-4, 15:1-21, 17:1-14, 22:15-19, 26:23-25, 28:10-15). Essential to these is the promise of the Land of Canaan as the eventual dwelling place of the Israelite people. Thematically, this Land recalls the original Garden in which Adam and Eve lived and from which they were expelled due to their rebellion. It is to be the place in which God and his human partners dwell together in harmony. But as the Torah's narrative unfolds, it becomes clear that Israel is no less susceptible than the original humans to the urge to defy God. Each patriarch lives in the Land for a time, and each is tested with various hardships that require him to leave the Land. Ultimately, through a combination of famine and certain intrigues involving a plot by Jacob's eleven sons against their brother Joseph, all of Jacob's descendants migrate to Egypt (*Gn.* 37-50), abandoning entirely the Land promised to them through their ancestor, Abraham.

The book of *Exodus* opens (chapter 1) with a description of the enslavement of Jacob's descendants to the Egyptian Pharaoh. The focus of chapters 2 to 4 is the figure of Moses, a son of Hebrew slaves, spared from death and raised in the royal household, who discovers his true identity and is called

upon by God to lead Israel out of slavery into a formal covenant of servitude to God himself. Chapters 5 to 15 trace the negotiations of Moses and his brother, Aaron, with Pharaoh for the release of Israel from slavery. They also describe Israel's liberation through the visitation of plagues against Egypt, culminating in the death of firstborn sons. Moses brings the freed slaves to a wilderness mountain chosen by God—Sinai—and there concludes a covenant-making ceremony that includes the revelation to Moses and Israel of the legal terms of covenantal service to God (chapters 19-24). At this point Israel is in full possession of the covenant revelation and anticipates rapid entry in the Land of Canaan, where its terms are to be fulfilled.

With a few crucial narrative interruptions, the details of these covenantal laws extend from chapter 25 of *Exodus*, through the entire book of *Leviticus*, and into the first ten chapters of *Numbers*. The first narrative interruption in this extensive collection of laws is of great importance to the Torah's overall theme of human rebellion against divine love. *Exodus* chapter 32 describes how Israel, just having seen the saving power of God in his punishment of Egypt, initially rebels against the terms of its covenant at Sinai. The very first divine statement of the covenantal terms was the commandment to avoid worship of any image as a divinity and to devote cultic service exclusively to the God who redeemed Israel from Egyptian servitude (*Ex.* 20:1-4). Nevertheless, when Moses is delayed on Sinai in discourse with God, Israel coerces Aaron to supply a cultic icon in the form of a golden calf to serve as a focus of religious devotion. Although Israel atones for this violation, and God's anger is appeased, a pattern of disloyalty familiar from the first chapters of *Genesis* has been reestablished.

The book of *Numbers*, from chapter 11, resumes the theme of Israel's inability to be loyal to the terms of the divine covenant. It repeatedly offers stories that illustrate Israel's lack of trust in God's power. The most important illustration comes in chapters 13 and 14. Two years after the liberation from slavery, Moses has led Israel to the border of the Land promised to Abraham. In response to God's word, he sends spies into the Land to help prepare the invasion. But the spies are intimidated by the might of the Canaanite nations living there and convince Israel not to invade. The divine response to this lack of trust is to force Moses to lead Israel on a wilderness journey lasting thirty-eight years, during which the entire generation of adults that refused to enter the Land dies off. Only thereafter is Israel brought again to the Moabite territory adjacent to the Land, with a new generation prepared to take the Land and divide it among the tribal descendants of Jacob's sons (chapters 35-36).

The book of *Deuteronomy* opens with Moses delivering an extended speech to Israel, assembled on the banks of the Jordan River. Moses recounts the history of God's redemptive acts and Israel's ungrateful or rebellious responses, repeating and elaborating on stories told in *Exodus* and *Num-*

bers. He reviews the covenantal laws delivered on Sinai and elaborates in many cases upon their performance. He repeatedly underscores the fact that Israel's covenant with God entails both a blessing and a curse (e.g., *Dn.* 11:26-30, 28:1-68). If Israel obeys the covenantal laws in the Land it will prosper there; but disobedience will be punished by war and exile from the Land. Finally Moses writes down all God has told him in a document called the Book of the Torah of Moses. Deuteronomy closes with final words of dire prediction as well as hopeful blessings placed in Moses' mouth (chapters 32-33). At the end, in chapter 34, Moses dies and passes on the leadership of the people to his disciple Joshua. With this the Torah concludes, its readers fully aware of the eventual fulfillment of Moses' most dire predictions.

**THE FORMATION OF THE CANONICAL TORAH.** The canonical Torah described above contains many instances of Moses writing down utterances delivered by God. Readers both ancient and modern have wondered about the relation of the Torah-text found in the Hebrew Bible to the various documents that Moses is asserted to have written at divine dictation. Indeed, it is not unusual to read in the Torah that Moses wrote down "this Torah" or "these words" in response to a divine utterance. But careful readers also note that the antecedent of such expressions can be interpreted plausibly as the immediately preceding divine utterances—or perhaps the book of *Deuteronomy* itself—rather than a series of five books beginning with the creation of the world and ending with the death of Moses. Nevertheless, virtually all Jewish writings known to have been composed during the later Second Temple period (c. 400 BCE-70 CE) assume that the Torah which Moses received and copied is identical to the five books found in Torah scrolls. But in some writings, such as the preamble to the noncanonical book of *Jubilees* (c. 160 BCE), it is also assumed that the received Torah is incomplete; Moses received other revelations on Sinai as well and wrote them down. These, too, should share the authority of the Torah of Moses. The early rabbinic sages, in traditions formulated from the second through the fourth centuries CE, also believed in the Mosaic origin of the canonical text. But noticing a host of chronological discrepancies and other textual problems, they debated the possibilities that the original revelations were received and transcribed by Moses in an order that is no longer preserved in the canonical version (*Mekh.Yish.*, to *Ex.* 15:9). Others suggested that the last verses of *Deuteronomy* describing the death of Moses were written by his disciple, Joshua (B.T., *Bava Bat.* 14b-15a).

The issue of the Mosaic authorship of the canonical text of the Torah has been a particular focus of modern literary-historical scholarship since at least the seventeenth century. The fundamental assumption of modern scholarship is that the Torah, like all texts, is an essentially human product composed by authors immersed in specific historical situations. Proper interpretation of the Torah, then, involves critical study of the text, reading it for literary, stylistic, and linguistic clues to the historical setting in which it was composed. This assumption has freed historians from tradi-

tional Jewish and Christian claims about the Torah's Mosaic origins, and inspired them to propose a host of theories about the historical setting of the Torah's composition and the persons or groups responsible for its creation. Since the middle of the nineteenth century, the most influential historical reconstructions of the composition of the Torah have been associated with the Documentary Hypothesis proposed, most notably by the German scholar Julius Wellhausen (1844-1918) and refined by generations of later scholars.

As its name indicates, the Documentary Hypothesis holds that the canonical Torah is a composite literary creation composed, in part, of written documents that are more ancient than the final five-volume narrative into which they have been incorporated. These documents may have originated in oral narrative or legal traditions, but for the most part circulated in ancient Israelite priestly and scribal circles as written sources. Most versions of the hypothesis identify four specific sources, each with its own geographical and chronological point of origin, and each representing a distinct point of view regarding theology, politics, and, most importantly, the early history of Israel as a covenant people. The canonical Torah was created by editors who selected and combined elements from each of these sources in light of their own views about the history of Israel's covenant relationship to its God.

Most versions of the Documentary Hypothesis identify the four documentary sources as follows. The oldest source, often regarded as originating by the ninth century BCE, is a collection of stories reflecting many of the historical interests of the canonical Torah: stories about early humanity, the Israelite patriarchs, and the events surrounding the liberation from Egypt. It is characterized by a preference for the proper name, *YHWH*, in reference to the God of Israel. It also has a particular interest in events located in the southern part of the Land of Israel. It is called the *J-source*, an indication of its Judean origins and its preference for the divine name (spelled *yhwh* in German). Scholars usually identify its creators as a school of scribes associated with the Davidic dynasty in Jerusalem.

The second major documentary source is identified as the *E-source*. This reflects its tendency to prefer the divine title 'elohim ("God") in reference to the God of Israel, and a greater degree of interest in depicting the Patriarchs as founders of worship sites in the northern part of the Land of Israel, also known as Ephraim. Most scholars regard E as a fragmentary source used to supplement and comment on basic elements of the J-source. Presumably it was composed in the northern part of the Land of Israel prior to the destruction of the Northern Israelite Kingdom by the Assyrians in 722 BCE. When Ephraimite refugees migrated south to the Davidic Kingdom they brought their traditions with them. Over time they were incorporated into the J-source traditions to produce a richer and more complex narrative. Some scholars designate this blended document as JE.

The *Priestly* or *P-source* stems, as its name indicates, from priestly writers associated with the Temple in Jerusalem. Like J and E, P contains narratives that comment on primeval human history, the Patriarchal era, and experience of liberation. But its distinctive contribution is enormous and includes detailed collections of legal codes focusing largely, but hardly exclusively, on cultic rules of sacrifice, matters of cultic purity, sexual and dietary behavior, and other matters concerned with the separation of the Israelite community from various sources of ritual contamination. These are richly represented in Leviticus and Numbers in particular. The P-source was at first thought by scholars to be relatively recent, even postexilic in composition. Most opinion holds that it is probably pre-exilic in origin, although it may incorporate certain revisions and additions stemming from postexilic priestly editors.

The final source of the Torah, according to the Documentary Hypothesis, survives in the Torah largely intact as the book of Deuteronomy. It is called D. Most regard it as having been composed by 621 BCE in order to justify, in terms of Mosaic authority, King Josiah's program for a reform of Israelite cultic practices. Its continual preoccupation is that Israel's tenure on the Land is dependent upon total opposition to idolatry in all its forms and the destruction of non-Israelite shrines throughout the Land. In its present form, Deuteronomy is the introduction to a larger historical work, called by scholars the Deuteronomistic History, extending from the scriptural books of Joshua through 2 Kings. Deuteronomy closes with Moses' prediction of Israel's failure to heed the covenant, and the Deuteronomistic History concludes with a description of the destruction of Jerusalem and the deportation of its royal house and priests. Accordingly, most scholars argue that D and the history attached to it are pre-exilic works completed in the wake of Jerusalem's destruction and the onset of the period of exile.

There remains in the twenty-first century no universal consensus about precisely how to divide the canonical Torah into the constituent four source documents. Debates continue as well regarding the dating and identity of the authors—whether individuals or “schools”—that stand behind the sources. Most contemporary scholars accept the view that the final work of editing the various sources into their present form must have been done sometime between the destruction of Jerusalem in 587 BCE and the career of the priest, Ezra (c. 450–398 BCE), depicted in the books of Ezra and Nehemiah as imposing the laws of the Torah of Moses upon the Judean community.

Also in contemporary times, the Documentary Hypothesis has been subject to some heated criticism by historians who regard as implausible the hypothesis's principle scenario: that the Torah was created by an editorial team that took apart and recombined elements of earlier written sources. Many contemporary students of oral tradition in ancient scribal cultures, like those of ancient Israel and early Judaism, acknowledge that written sources may lie behind both narra-

tive and legal parts of the Torah. But they have also observed that the so-called “scissors and paste” method of composition proposed by the Documentary Hypothesis has no parallel in other ancient literary traditions. These depend heavily upon orally transmitted material, much of which undergoes transformation due to numerous public performances. This neglect of the oral-traditional dimension of the Torah, when combined with the failure of documentary critics to reach total consensus on the range of each documentary source, has drawn charges that the method of documentary analysis is too subjective to provide a definitive historical account of the composition of the Torah. Nevertheless, at the beginning of the twenty-first century no other theory of the Torah's origins and composition has won a consensus among contemporary academic historians of ancient Israel's literature.

**TORAH AS REVELATION.** As much as the term Torah is etymologically linked to the idea of teaching, it is in all forms of Judaism linked rhetorically to the idea of revelation, i.e., teaching that stems from a transmundane source. Like the other monotheistic religions originating in the Middle East (i.e., Christianity and Islam), Judaism is grounded in claims to possess revealed texts or doctrines. Since at least the early Second Temple period, the text of the Torah of Moses has served as the paradigmatic revelation. Specifically, the document inscribed on the scroll of the Torah stems from a disclosure of God's love and will to Moses. But this is not to say that Judaism in all times and places has had a single conception of revelation or of how the Torah found in the canon of Scripture and in other more recent writings is related to the actual words disclosed to Moses.

The writings of Palestinian Jewish scribes from the Second Temple period, whose pens produced dozens of books represented as revelations disclosed to ancient prophets and sages from Abraham to Ezra, commonly accepted a stenographic model of revelation derived from the depictions of Moses found throughout the Torah itself (e.g., 4 *Ezr.* 14:37–48). Just as ancient authors commonly dictated their books to scribal copyists, so God dictated his teachings to his prophetic scribe, Moses. Some Second Temple scribal circles, however, asserted that Moses had written down more of the divine revelation than was contained in the scroll anchoring the growing collection of scriptural literature. Both the book of *Jubilees*, many copies of which were found among the Dead Sea Scrolls, and the singular *Temple Scroll*, represent themselves as records of revelation to Moses. Presumably, the authors or groups promoting these works as revelation affirmed that they, no less than the canonical Torah, constituted authoritative, divinely authorized teaching.

Despite the popularity of the stenographic model of revelation in Palestinian scribal circles, there is at least one Jewish source from the late Second Temple period that suggests a rather different view. In the opinion of Philo (15 BCE–45 CE), a philosophically trained Jew who thrived in the Greco-Roman culture of Alexandria, Egypt, Moses was more than the copyist of the Torah. Rather, in Philo's view, Moses was

the author of the Torah (e.g., *On the Sacrifices of Abel and Cain*, 12, 94). He wrote his book in a state of philosophical closeness to God that constituted prophetic illumination. In Philo's view, Moses' narratives and laws are the external form that concealed the deeper philosophical truths taught long after Moses' death by Socrates and Plato. Only by application of allegorical methods of interpretation, Philo held, could the philosophical content of the Torah be recovered. This content, only alluded to allegorically in the concrete text of the Torah's stories and laws, constituted for Philo the true revelation to Moses. The revelation of the Torah was the perception of philosophical truth disclosed to the human mind in a state of prophetic ecstasy (e.g., *On the Sacrifices of Abel and Cain*, 78).

Medieval Jewish thinkers, entirely independently of Philo, would revive the idea of the Torah as an allegory whose truths had to be decoded through appropriate interpretive systems. But they would do so in a way deeply influenced by Rabbinic Judaism, the form of Judaism that grew to dominate Mediterranean and Middle Eastern Jews from the second century CE until the rise of Islam in the seventh century. In its classical form, as found in the later Talmudic literature of Late Antiquity, the rabbinic theory of revelation is grounded in three basic conceptions.

The first is that "Torah is from Heaven" (M. *San.* 10:1)—that is, the God of Israel is the exclusive source of the Torah. In holding this view, the rabbinic sages shared the views of generations of Palestinian Jewish scribes before them, who regarded Moses as a kind of stenographer taking dictation from the God of Israel. The sages also accepted another element of Second Temple Jewish thought, the idea that certain writings produced after the time of Moses were disclosed to religious teachers—prophets in the line of Mosaic authority but subordinate to him in status—whose writings were the result of inspiration by the "holy spirit" (*ruah haqodesh*; e.g., B.T., *Meg.* 7a). Rabbinic discussion of the extent of the canon of the Hebrew Bible revolved in part around the criterion of inspiration (T. *Yad.* 2:14). Thus the relatively recent book of Daniel, composed around 167 BCE, is included within the rabbinic scriptural canon on the basis of its attribution to an ancient seer from the Exilic period. But an older work, a collection of wise sayings from the pen of the Temple Scribe Yeshua ben Sirach (included in Christian collections of the Apocrypha as the *Wisdom of ben Sira*, c. 180 BCE), was not included in the rabbinic canon, despite its popularity among rabbinic sages as a source of wisdom.

The third key element in the rabbinic conception of revelation is that the Sinaitic revelation to Moses included two intertwined but discrete bodies of teaching. One of these, the actual scroll of the Torah of Moses (and by extension, later books included in the rabbinic scriptural canon), was called the written Torah (e.g., *Tanh.-Bub.*, to Ex. 19:1). But in addition, God had disclosed an unwritten body of knowledge which alone could unlock the secrets of the written Torah. This unwritten revelation is called the oral Torah (e.g., *Avot*

*Nat.*, A:15). Other Jewish groups of the Second Temple period had asserted the existence of books of revelations that were not contained in the Torah of Moses. But the rabbinic claim is unique in insisting that this revelation was not found in books, but only available as oral tradition learned at the feet of rabbinic sages themselves. Indeed, in rabbinic terminology, the "study of Torah" (*talmud torah*) refers specifically to the study of the written and oral Torah, for Torah had become the comprehensive term denoting the entirety of teachings recognized by rabbinic tradition as authoritative. By early medieval times, rabbinic scribes and teachers had come to preserve oral Torah in discrete written compilations, most importantly, the Mishnah and its Talmudic commentaries. These were routinely memorized by rabbinic disciples, whose discussions and inquiries into the texts of oral Torah continued the oral tradition despite the use of writing in its preservation.

**TORAH AS LAW AND ONTOLOGICAL PRINCIPLE.** The term *torah*, in addition to its specific sense of "teaching" and the more comprehensive suggestion of "revealed teaching," has also served to convey the concept of "legal rule." This meaning is already well attested in the Hebrew Bible (e.g., *Nm.* 19:14). It is confirmed as well in the penchant of Greek-speaking Jews and early Christians to refer to their collection of scriptures as "the Law" (*ho nomos*, *Matt.* 5:17). Within classical rabbinic Judaism, the written Torah served as a fundamental source of civil and ritual law. Rabbinic sages, functioning as jurists, interpreted and applied the law within the traditional framework of the oral Torah.

A homiletic passage of the Babylonian Talmud (B.T.) (*Mak.* 24a) asserts that God had revealed in the written Torah no less than 613 specific commandments (*mitsvot*; sing. *mitsvah*). The Talmud nowhere lists these commandments, a task that would be taken up by many medieval legal codifiers. Nevertheless, the conceptual tools and interpretive principles for identifying these commandments and applying them in practical affairs were transmitted in the oral Torah tradition (e.g., the *Bar. Yish.*). These yielded the authoritative procedures (*halakhot*; sing. *halakhah*) for embodying the commandments in the covenant life of Israel. In practice, the legal force of a commandment in the written Torah was delimited exclusively by the meaning ascribed to it in the halakhic tradition of the oral Torah, regardless of what the semantic meaning of the commandment might suggest. Thus, to take a famous example, the written Torah's commandment to take "an eye for an eye" in the case of damages caused by negligence (*Ex.* 21:23) is defined halakhically to mean that the responsible party must compensate the victim financially for his or her loss (e.g., *Mek. Yish.* to *Ex.* 21:23).

The most decisive development in rabbinic conceptions of Torah as a legal system was the emergence of various attempts to systematically organize the vast legal discussions of the Talmudic literature into manageable codes that could serve the needs of rabbinic courts and educated laity. First in the Islamic world, and then in Latin Christendom, rabbin-

ic scholars produced a series of influential halakhic collections. These experimented with a variety of organizational formats. The *She'iltot* of Rabbi Aha (c. 750), for example, organized halakhic norms in tandem with the rabbinically prescribed Torah readings for the Sabbath which served as their sources. Others, such as the halakhic digest of Rabbi Isaac Al-Fasi (1013-1103), followed the traditional sequence of Talmudic tractates, extracting essential halakhic conclusions from the give-and-take of the debates within which the Talmud had preserved them. The most innovative and encyclopedic attempt at codification was the *Mishneh Torah*, composed by Moses ben Maimon ("Maimonides," 1135-1204). He organized all of rabbinic halakhah within the framework of fourteen major topical headings, each of which included several subheadings, all arranged in scrupulous logical sequence. Subsequent codes, such as Rabbi Jacob ben Asher's *'Arb'a Turim* (fourteenth century) and Rabbi Joseph Caro's *Shulhan 'Arukh* (sixteenth century) revised Maimonides's comprehensive organizational categories. They also narrowed Maimonides's scope, focusing only upon halakhic norms that governed the daily life of individuals and the community as a corporate entity. Thus, vast halakhic topics that depended upon the existence of the Jerusalem Temple were excluded, despite their extensive treatment by Maimonides. The primary categories developed in the *'Arb'a Turim* have become conventional in later rabbinic halakhic thinking until contemporary times. They are *'Orakh Hayyim* (laws governing the liturgical cycle of the day, week, and year); *Yoreh De'ah* (ritual laws, such as the dietary restrictions, that signify the holiness of the Jewish community); *Hoshen Mishpat* (the topics of civil and criminal law); and *'Even Ha'ezer* (*halakhot* governing the contraction, duration, and dissolution of marriage).

In addition to this halakhic-jurisprudential development of the meaning of Torah as "law," classical rabbinic tradition also suggested that Torah constituted a kind of law of being, "a precious instrument through which the world was created" (M. *Avot* 3:14). The thought was driven home vividly in midrashic settings, in which the Torah was likened to an architect's blueprint that proved indispensable to the builder of a palace (*Ber. Rab.* 1:1) or claimed to have existed for 947 generations prior to the creation of the world (B.T., *Zev.* 116a). Such suggestions that the Torah in some sense preceded the creation of the world entailed, of course, a radical disassociation of Torah, conceived as a principle of being, from the specific writings found in books. Torah, in the context of such discussions, now denoted an ontological principle that transcended the existence of the historical Torah of Moses, even as the latter pointed toward and symbolized that ontological reality.

The jurisprudential and ontological developments of the idea of Torah among the sages of Late Antiquity provided the foundations upon which medieval rabbinic intellectuals, responding to larger movements in Islamic and Christian thought and piety, created fresh formulations of these

themes. Many of these formulations were inspired by polemical interactions. The pioneering figure in the Jewish philosophical tradition, Rabbi Sa'adia ben Joseph (882-942) produced his masterpiece, *The Book of Opinions and Beliefs*, in part as an effort to demonstrate to rationalist critics the rationality of the Torah as a legal system stemming from God and disclosed in its complete and final form to Israel's prophets. Deeply influenced by the rationalist Islamic school known as the Mut'azilite Kalam, Sa'adia hoped to use the Kalam's own rigorous methodology to demonstrate the intellectual sufficiency of Torah as a comprehensive source of divine knowledge. Building upon traditional Talmudic distinctions between pragmatic rules (*mishpatim*) and inscrutable divine decrees (*huqqim*), Sa'adia argued that both were absolutely essential in the context of the Torah as revelation. Laws self-evidently necessary for social order, such as the prohibition against murder (*Ex.* 20:13), were entirely susceptible to rational explanation. Apparently absurd requirements, such as the injunction against certain types of foods (e.g. *Lev.* 11:1ff.), on the other hand, required revelation because unaided reason would never discover them as the will of God. In this sense, the rational laws of the Torah are a crucial part of revelation because they inspire confidence in the inscrutable divine will that commands as well the nonrational prohibitions and injunctions of the Torah (*Book of Beliefs and Opinions*, III.3-5).

Reflection on the rationality of the Torah as a source of law, a characteristic leitmotif of the Jewish philosophical tradition since the time of Sa'adia, reached its high point in the work of Maimonides. An Aristotelian critic of the Kalam, Maimonides argued for the complete rational intelligibility of all of the laws of the Torah. He did so both by philosophical argument and jurisprudential demonstration. Maimonides' great codification of the *halakhah*, discussed above, demonstrated the rational integrity and complete harmony of the entire body of written and oral Torah. By contrast, Maimonides' principal philosophical work, the *Guide of the Perplexed*, offered a powerful defense of the rationality of the Torah as a guide to the perfection of human beings as creatures of God. He rejected earlier distinctions, such as those of Sa'adia, between rational and nonrational commandments, arguing instead for the conceptual cogency of the entire system of revealed law as developed in the oral Torah. Acknowledging that the rationality of some commandments was more immediately clear than others, he insisted that the Torah's law remains the most complete and incomparable disclosure of the divine will in human language (*Guide of the Perplexed* III:26-28).

When thinking about the ontological dimension of the Torah, thinkers such as Sa'adia and Maimonides hesitated to subscribe to the idea of the Torah as a pre-existent ontological principle that pervaded creation. In their view, to speak of the Torah pre-existing the world was tantamount to questioning the fundamental belief that God created the world from nothing. Torah could reflect, as law, the mind

and will of God, but it could not be conceived as something co-eternal with God. This type of ontological thinking about Torah, in fact, became characteristic of the qabbalistic tradition, a distinctly antiphilosophical movement of Spanish and southern French pietists that began to take shape in the eleventh through thirteenth centuries.

Qabbalists such as Rabbi Todros Abulafia (1220-1298, writing in *’Otsar Hakavod*, to *Shab.* 28b), tended to reject as hubris the Maimonidean idea that the human mind could justify divine commandments through the exercise of reason. All of the 613 commandments—the reasonable as well the absurd—were profound mysteries fulfilling some hidden purpose in the economy of creation. In qabbalistic thought, which reprised certain neo-Platonic themes that had originally inspired Jewish philosophers as well, thinking about the Torah as law and ontological principle was, in fact, elegantly combined. The pioneering Talmudist, biblical interpreter, and qabbalist Rabbi Moses ben Nahman (“Nahmanides,” 1194-1270), asserted in the introduction to his commentary on the Torah that the Torah is nothing less than the being of God in linguistic form, a series of divine names. Reflecting such conceptions, writers such as Azriel of Gerona (early thirteenth century) conceived the 613 commandments of the halakhic tradition metaphorically as the “limbs” of God, each limb corresponding to an appropriate human limb for which that commandment was destined (*Per. Ag.*, 37). On this view, the “reason” for the commandments had nothing to do with rational justification of the divine will. Rather, a Jew’s performance of commandments according to their halakhic prescriptions effected a communication of being between God and his creatures (e.g., *Zoh.* II: 165b). The *Zohar*, a canonical expression of thirteenth-century Qabbalah, expressed this principle as a kind of axiom: “Three dimensions of being are bound up with each other—the Blessed Holy One, Torah, and Israel” (*Zoh.* III:73a). That is to say, Torah is at one and the same time a system of law and the root of all existence. By enacting the law, Israel unifies the limbs of God into their ideal configuration, thus bringing blessing to the world (*Zoh.* II:85b).

The qabbalistic unification of Torah as law with Torah as a principle of being proved immensely influential. The Jewish philosophical tradition, which had never engaged more than a relatively small minority of Jews, would essentially die out by the sixteenth century. But from the thirteenth century onward, qabbalistic ideas transmitted in the *Zohar* and by its exegetical interpreters came to dominate much of the rabbinic intellectual leadership. Indeed, one of the last great Jewish philosophers, Hasdai Crescas (1340-1410), was himself deeply sympathetic to the Qabbalah’s insistence that the Torah could not be comprehended by human rationality. Qabbalistic perspectives on Torah are also represented in the writings of later intellectual leaders, such as Rabbi Isaac Abarbanel (1437-1508), Rabbi Moses Alshekh (c. 1590), Rabbi Haim Vital (1542-1620), the Maharal of Prague (Rabbi Judah Loewe ben Betsalel: 1525-

1609) and the Vilna Gaon (Rabbi Elijah ben Solomon: 1720-1797). The writings of Rabbi Haim Vital and the Maharal were particularly influential in the development of Eastern European Hasidism, a revivalist movement founded in the eighteenth century. The idea of Torah as an ontological principle of being is richly represented in the early Hasidic writings of such influential masters as Rabbi Shne’ur Zalman of Liady (1745-1813), author of *Tanya*, and Rabbi Menahem Nahum of Chernobyl (1730-1797), the author of *Me’or ’Enayim*.

**TORAH AS A RECORD OF JEWISH MORAL AND HISTORICAL EXPERIENCE.** In the contemporary world it is still possible to find communities of Jews remaining ideologically committed to stenographic conceptions of the revelation of the Torah. For the most part, such Jews structure their behavior exclusively in light of the oral Torah’s halakhic tradition as defined in the *Shulhan ’Arukh*, and regard the Torah as a creative principle at the heart of reality. But they consider themselves—and are so considered by most other Jews—as ultra-orthodox rejectionists, opposed to all influences of Western civilization upon Judaism. Accordingly, their intellectual impact upon the thought of Jews more accepting of modern civilization has tended to be minimal. Of far greater influence in most forms of contemporary Jewish thinking about the Torah are intellectual traditions that emerged in the context of modern European Protestant religious thought and went on to shape much of the intellectual style of modernity. These include in particular an ethical universalism associated with the philosopher Immanuel Kant (1724-1804), a romantic focus on personal religious experience stemming from the work of the theologian Friedrich Schleiermacher (1768-1834), and an idealist search for the patterns of historical development that achieved influential formulation in the philosophy of G. W. F. Hegel (1770-1831).

These traditions stand behind three fundamental shifts in Jewish thinking about the Torah in the past two centuries. The first, inspired by Kant, is the shift from conceiving Torah as a legal instrument requiring absolute obedience to conceiving it as a source of eternal moral values and ethical norms. Thinkers following in this tradition include, among others, Moritz Lazarus (1824-1903), Hermann Cohen (1842-1918), and Leo Baeck (1873-1956), all of whom found the essence of Judaism to be in the Torah as the first historical expression of ethical monotheism. The Torah remains essential, in this view, as an ongoing inspiration to moral seriousness and universal ethical concern on the part of the Jewish people. The ritual and civil laws of the Torah are no longer literally binding upon Jews, although the ethical values informing them abide.

The second shift, inspired by Schleiermacher, moves the traditional notion of revelation in the direction of personal subjectivity, transforming the giving of the Torah from an historical event to a moral and psychological experience. For much of modern Jewish religious thought, the Torah is conceived as a written record of the profound personal religious

experiences enjoyed by Israel's prophets and still retrievable for the modern reader through the proper interpretation of the text. A brilliant and influential exponent of this view was Abraham Geiger (1810-1874), the founder of Reform Judaism. In the middle of the twentieth century, the existentially oriented philosophical and hermeneutical writings of Martin Buber (1878-1965) brought this theme to the attention of a wide audience. Buber focused upon revelation as the matrix of an I-Thou relationship with God as the Eternal Thou. He was famous for insisting that the laws of the Torah could only constitute revelation if they were subjectively experienced as commandments by the individual.

Finally, the third shift involves a revision of the relationship of the Torah to historical and cultural processes. Classically, the Torah is transhuman and originates with God. For most modern Jewish thinkers, the Torah—both as a collection of texts and as a system of values—is a tradition that developed in accord with historical processes and under a variety of cultural influences. This shift can ultimately be traced back to the influence of Hegel's notion of history as the temporal unfolding of an eternal Absolute Spirit that would eventually come, through the dialectical patterns intrinsic to the logic of its own being, to a complete self-consciousness of itself. This conception was first applied to the history of Judaism by Nahman Krochmal (1785-1840). He viewed the Torah in dialectical terms as both the product of historical Jewish experience and the eternal, ideal structure of that experience. The influential writings of the twentieth-century philosopher Franz Rosenzweig (1886-1929) take issue with much of Hegelian idealism, but remain deeply committed to the concept of the eternity of the Torah as a unique structure of Jewish being and consciousness. Rosenzweig's interchange of letters with Buber over the nature of the Torah's commandments as revelation remains a crucial signpost in the history of modern Jewish thinking about the Torah.

Throughout the twentieth century, modern Jewish religious thought in the United States, Europe, and the State of Israel has elaborated upon the Torah as a source of Jewish ethics, a record of Jewish religious insight, and a product of Jewish historical and cultural experience. For the most part, this conversation has proceeded without the contribution of those Jews, mostly of Eastern European and Middle Eastern origin, who for a variety of reasons have rejected modern culture in principle. A singular exception is Rabbi Joseph B. Soloveitchik (1903-1992), descendant of a prestigious family of Lithuanian Talmudists, and the principal mid-twentieth-century exponent of modern Orthodox Judaism. Fully conversant with the Kantian, Scheiermachiian, and Hegelian foundations of modern theology, Soloveitchik devoted himself to constructing a workable theory of the continued authority of the halakhic tradition of written and oral Torah over Jewish life. For Soloveitchik, the halakhic tradition embodies an historically given and existentially grounded mode of human consciousness. Intellectual mastery and scrupulous

observance of Torah—paradigmatically, the tradition of received halakhic norms—enables Jews to transform their broken human existence in accordance with the ideal construct of human personhood imagined for all humanity at the time of creation.

At the beginning of the twentieth-first century, Torah continues to occupy a central place in Jewish religious discourse. All of the traditional themes of modern Jewish conceptions of the Torah—the ethical, the personalist, and the historicist—have their exponents and these conceptions continue to be refined in both popular and academic writings. A potentially significant development in more recent decades is the emergence of an explicitly “postmodernist” style of Jewish thought inspired by developments in European philosophy and literary studies associated with a movement known as “Deconstruction.” Emanuel Levinas (1905-1995), the French author of both philosophical works and Talmudic commentaries, has been influential in this trend, particularly among American thinkers. The principle tendency of Jewish postmodernism is to expose the ideological underpinnings of the primary pillars of modern thought in general—its claim to ethical ultimacy and historically comprehensive vision. By depriving modern thought of its absolute authority over values and visions of the past, Jewish postmodernists have begun to experiment with new ways of engaging the texts of Torah—broadly conceived now as the entire sum of texts that disclose dimensions of Jewish existence. It remains to be seen how these new ways of reading will influence Jewish conceptions of Torah in coming decades.

**TORAH STUDY AS A FORM OF JUDAIC PIETY.** A famous rabbinic text included in the rabbinic ritual for daily morning blessings concludes its list of praiseworthy acts with the phrase “and the study of Torah overrides all of them” (*talmud torah keneged kulam*: P.T., *Pe'ah* 1:1). This phrase summarizes the centrality of Torah study in rabbinic Judaism. To a certain degree the study of the Torah of Moses is given a high evaluation in a variety of Second Temple-period Jewish settings (cf. *Ps.* 119, Preface to the *Wisdom of ben Sira*, and *Rule of the Community*, QS 6:6-8). But in rabbinic Judaism, which coalesced over a century after the destruction of the Jerusalem Temple in 70 CE, Torah study came to occupy a new role. It was conceived as a form of piety which, on a par with formal public worship, substituted for the vanished sacrificial service performed in ancient times by the Jerusalem priesthood (B.T., *Meg.* 16b). Both activities were regarded by sages as world-sustaining acts which, like sacrifice itself, drew divine energy into the world and ensured its being (e.g., *M. Avot* 1:2). Indeed, it is not uncommon for rabbinic sages to suggest that Torah study may be even more important than prayer and performance of other commandments as a form of sacrificial worship (e.g., B.T., *Qid.* 40b). Like public prayer, however, *talmud torah* was conceived by rabbinic sages as a paradigmatically male form of divine service (B.T., *Qid.* 29a). Accordingly, for most of the history of rabbinic Judaism, Torah study has been primarily a male activity, deemed crucial in the shaping of masculine Jewish identity.

The character of Torah study in classical rabbinic times can be inferred from careful study of the surviving rabbinic literature. It is clear, first of all, from the remarkable facility of midrashic literature in finding the most obscure biblical texts to make an exegetical point, that many rabbinic sages had full recall of virtually the entire canon of the written Torah. Indeed, a common form of Palestinian rabbinic entertainment included competitions in stringing the most impressive list of biblical verses under specific themes (P.T., *Hag.* 2:2). The disciples of sages were also expected to master the emerging tradition of oral Torah. Whereas written versions of such crucial texts as the Mishnah may have circulated as early as the third century, the preferred way to study oral Torah was by hearing the text recited by a teacher or an official text-memorizer (B.T., *Git.* 60b). Disciples would rehearse their oral texts prior to examination by a master, often using distinctive tunes (T. *Ob.* 16:8) or other mnemonic techniques (B.T., *Hor.* 12a) as an aid to memorization. The master would then review not only the orally memorized text (B.T., *Eruv.* 54b), but engage the student in extemporaneous analysis of the text in comparison with other texts on connected themes (B.T., *Bava Qam.* 117a).

The rabbinic disciple-communities of late antiquity were rather small circles associated with individual sages. Torah study in this setting was, therefore, part of an evolving relationship between teacher and student. In medieval times the expansion of the rabbinic community and the consequent production of written compendia of the Talmudic tradition engendered important changes in the character of Torah study. Large institutionalized schools of rabbinic education (*yeshivot*; sing. *yeshivah*) were created and the study of a fixed text, often encountered primarily in written form, began to replace the process of oral memorization. By the tenth century, written commentaries by especially influential masters (e.g., Rabbi Hanan'el ben Hushi'el of Kairouan, Rashi of Troyes) began to circulate in manuscript copies as part of the Torah curriculum and came as well to be regarded as part of the oral Torah.

The emergence of print technology in the late fifteenth century was embraced by rabbinic authorities as providential, for it enabled the wide dissemination of both the written and the oral Torah in uniform formats that transcended local textual differences and scribal practices. The expansion of profound Talmudic scholarship in sixteenth- through seventeenth-century Eastern Europe was in part enabled by the production of printed copies of rabbinic literature for use in the great *yeshivot*. Thanks to printers, the prodigious memories encouraged by Talmudic learning were aided by the production of text editions in which identical, clearly printed words could be found on the exact same page of hundreds of copies of a given rabbinic work throughout the Jewish world. Whereas this premium on memorization led at times to a rather arid academicism, various educational reforms renewed rigorous conceptual analysis of Talmudic discourse under various pedagogical theories until well into the nineteenth century.

The premium on memorized mastery of the written text and its commentaries, in conjunction with distinct methodological approaches derived from nineteenth- and twentieth-century innovators, continues to be the distinguishing trait of *yeshivah*-grounded Torah study in contemporary Orthodox and Hasidic centers of Torah study throughout the world. Curricula vary depending upon the specific ideological commitments of distinct communities. For example classical Hasidic sources are not commonly taught in *yeshivot* founded by anti-Hasidic authorities. Nevertheless, the core of contemporary Torah study remains the Babylonian Talmud and the commentaries printed on its margins and in the appendices to each printed volume. Closely associated with study of the Talmud is careful analysis of the traditional medieval codes, particularly those of Maimonides, Rabbi Jacob ben Asher, and Rabbi Joseph Caro, with their panoply of associated commentaries and supercommentaries. A recent innovation in many contemporary *yeshivot* is the inclusion within the curriculum of explicitly theological studies (*hashqafah*). Examples might include the more philosophical passages of Maimonides's *Mishneh Torah*, works of classical Qabbalah, or works of ethical self-scrutiny stemming from the nineteenth-century Musar movement founded by Rabbi Israel Salanter (1786-1866).

Among contemporary Jews, the primacy of Torah study as a Judaic religious value is felt even beyond the circles of traditional *yeshivot*. The explosion of electronic media and an ongoing industry in the translation of classical Judaica into a variety of languages has enabled the creation of novel settings for popular as well as advanced Torah study. Similarly, the revolutionary achievements of feminism in Western culture have affected most Jewish communities. Since the latter half of the twentieth century, Torah study was made widely available to women in the more liberal religious denominations. Most recently, certain Orthodox communities in both the United States and the State of Israel have experimented with opening advanced Torah study to women.

Contemporary Jewish communities of any size will have multiple outlets for the study of Jewish history and tradition at diverse levels in synagogues or community centers. Many of these, based upon Western educational models, take the form of classes for children and adults on various themes and include the study of the written and oral Torah in the original languages and in accessible translations. Whereas such contexts do not yet provide the comprehensive technical mastery and ideological *élan* of Orthodox *yeshivot*, they testify to the continued significance of Torah study as a form of Jewish identification.

**TORAH SCROLL AS AN OBJECT OF RITUAL DEVOTION.** The Torah in Judaism is more than a subject of study. The scroll of the Torah, read aloud in the synagogue liturgies of the Sabbath, holy days, and at other prescribed occasions, is Judaism's most important ritual object. It is invested with a numinous quality—*qedushah* (“holiness”)—which, like other ritual objects described in the anthropological studies of trib-

al cultures around the world, is conceived both as a source of charisma and as something deeply vulnerable to violation. The *qedushah* invested in the scroll must therefore be protected. This protection is afforded by ritual activities that surround all aspects of its handling.

The ritualization of the scroll begins even prior to its first use in public synagogue worship. Complex halakhic requirements surround every stage of its creation. These govern the preparation of the hides and inks used by the scribe, the shapes of the letters used in writing, the spellings of the words in the text, and the paragraphing of textual units. The scribe, who must copy the text letter-by-letter from another suitable scroll, will have rinsed his hands prior to setting to work to ensure the requisite degree of bodily purity. Women whose menstrual cycles render them ritually unclean for certain periods of each month may not serve as scribes for this reason.

Once it is ready for use, a Torah scroll must still be protected from defilement through contact with sources of impurity, including the hands of synagogue worshipers. The means of protecting the scroll also serve a second function of drawing attention to and beautifying it. It is wrapped in a finely made, embroidered sheath or case. Often it will be adorned as well with finely wrought silver crowns and breastplates. Thus protected from random touching, the scroll is stored in a specially designed, ornate cabinet at the very front of the synagogue. This cabinet is normally called the *'aron haqodesh* ("the holy ark") and recalls the box in which Moses placed the stone tablets that represented the covenant between Israel and God.

The formal liturgy of reading the Torah in public is also deeply enmeshed in ritual performances. These call to mind the charismatic *qedushah* of the scroll and, at the same time, assimilate the empirical, existing scroll in the synagogue to the Torah of Moses revealed on Sinai and stored in the original holy ark. When, at the appropriate liturgical moment, the ark is opened, the entire congregation must rise to attention, as if royalty had entered the room. At this point the worshippers recite in unison a verse from the Torah: "And when the Ark began to move, Moses said: 'Arise, O Lord, and scatter your enemies, and may those who hate you flee from before you'" (*Nm.* 10:35). The scroll is then borne around the synagogue in a solemn procession accompanied by the singing of texts from the book of Psalms. During this procession, worshippers engage in formal acts of adoration—particularly, touching the sheath with a prayer shawl or prayer book, and kissing the place on the shawl or book that touched the Torah. At the end of the procession, the scroll is brought to a reading table, usually in the front of the congregation or in its very midst. It is carefully removed from its sheath and placed on the table, covered by a protecting cloth.

The actual reading of the Torah, commencing at this point, is equally surrounded by ritual performances. Depending upon the occasion, anywhere from three to seven

congregants will be honored with an "ascent" (*'aliyah*) to the Torah. The term *ascent* intentionally recalls Moses' ascent to Sinai. During these ascents a preselected passage will be read aloud, normally by a professional reader. Each person who ascends to the Torah recites, before and after the reading, a benediction of thanks to God for the privilege of having received the Torah. During the reading, the reader keeps track of the text with a silver or wood pointer (*yad*), so as to avoid touching the scroll. At the conclusion of the final ascent, the Torah, now unfurled to expose a minimum of three columns of its text, is raised high in the hands of a designated congregant. At this the congregation points to the scroll and intones the following formula from the Torah itself (*Dn.* 4:44): "This is the Torah which Moses placed before the children of Israel at God's command, by Moses' hand." The scroll is then rolled, returned to its sheath, and carried in a second adoration procession back to its storage place in the ark.

Like all sacred objects, Torah scrolls can become defiled and disqualified for liturgical use (*pasul*). For example, constant use over the years may cause ink to chip from the scroll, rendering a word illegible. This is sufficient to prevent the scroll from being read until the ink is restored by a duly qualified scribe. Tears in the parchment and other minor repairs may also be made to restore the scroll to service. But if a scroll suffers massive irreparable damage—as in a fire or other disaster—the scroll is retired from use. In some communities, a defiled scroll is afforded the honor due to a human corpse and buried. In others it is stored in a special storage area (*Genizah*) with other damaged books that contain the divine name and, therefore, cannot be intentionally destroyed.

## TORAH SHEBE'AL PEH SEE ORAL TORAH

**TORAJA RELIGION.** The Sa'dan Toraja, a people numbering about 325,000, live in Tana Toraja, the mountainous northern part of the southwest peninsula of the Indonesian island of Sulawesi (formerly Celebes). The name *Sa'dan* is derived from the Sa'dan River, the main stream in the region. *Toraja* is a contraction of *To-ri-aja* ("men of the mountains"), a name given the people by their Bugis neighbors. Following local customs, we refer to these people as Toraja.

The region of approximately 3,180 square kilometers, originally heavily forested, has been changed by cultivation. The few remaining forests cover slopes unsuitable for cultivation. The principal means of subsistence is agriculture. Rice, cassava, and maize are the staples; coffee and cloves are the principal cash crops. Animal husbandry is practiced on a large scale, but only the breeding of pigs is of economic importance. The buffalo, a status symbol, is rarely used for work in the fields. The animal has primarily a ritual function, for the superior type of death feast demands the sacrifice of about a hundred buffalo.

Social change began with the introduction of coffee growing and the coffee trade in the last quarter of the previous century. The subduing of the Toraja country by the Dutch (1906), the period of the Japanese occupation (1942–1945), and the independence of Indonesia (1945) accelerated this process. Tourism, a recent development, has brought further change. The school system introduced by the Dutch government and missionaries opened a new world for a peo-

ple who had known only an oral tradition. Tana Toraja became the missionary field of the Reformed Alliance of the Dutch Reformed Church and half of the population has been converted to Christianity.

**THE "BELIEF OF THE OLD."** The autochthonous religion of the Toraja is called Aluk To Dolo (*to dolo* literally means "people bygone"), that is, "belief of the old," or "rituals of the ancestors." In this religion, ancestor cult, myth, and ritual are intertwined. During the celebration of major rituals, the *to minaa*, a priest well versed in tribal lore and history, recites the lengthy litany of the tribe's origins. He tells of how the cosmos and the gods came into being, how man, his food plants, and animals had originated in heaven and were brought down when the first nobleman descended to earth, landing on a mountain. The *to manurun*, that is, the person of status who descended from heaven, brought with him the entire social order and a complete heavenly household, including a house, slaves, animals, and plants. With the *to manurun* also came priests: the *to minaa*, the *to burake* (the highest rank of religious functionary), the rice priest, and the medicine man. The death priest, however, is not mentioned. The descent of a nobleman was believed to have occurred several times in Toraja history. With regional variations these main themes are found throughout Tana Toraja.

**THE TRIPARTITE COSMIC WORLD.** In the Toraja view, the cosmos is divided into three parts: the upper world, the world of mankind (earth), and the underworld. In the beginning, however, heaven and earth were one expanse of darkness, united in marriage. With their separation came light. Several gods sprang from this mythical marriage. Puang Matua ("the old lord") is the principal god and the deity of heaven. Pong Banggai di Rante ("the master of the plains") is the god of the earth. Gaun ti Kembong ("the swollen cloud") resides between heaven and earth. Indo' Belo Tumbang ("the lady who dances beautifully") is the goddess of the medicine that cures the sick in the Maro ritual. Pong Tulak Padang is the Toraja Atlas; he carries the earth, not on his shoulders but in the palms of his hands. Together with Puang Matua in the upper world he keeps earth, the world of mankind, in equilibrium, separating night from day. His bad-tempered spouse, Indo' Ongon-ongon, however, upsets the equilibrium by causing earthquakes when she is in a bad mood. She is much feared, as is Pong Lalondong ("the lord who is a cock"). Puya ("the land of souls") lies in the southwest under the earth's surface. The underworld and upper world have other deities, and there are also *deata* (deities, ghosts) residing on earth and in rivers, canals, wells, trees, and stones. Eels are revered as fertility symbols.

**THE BIPARTITE DIVISION OF THE RITUALS.** By observing the rules of deities and ancestors, man observes his part in maintaining the equilibrium between the upper worlds and the underworlds. He does so by means of rites and rituals. Rituals are divided into two spheres, one of the east, the Rising Sun or Smoke Ascending (Rambu Tuka), and the other of the west, the Setting Sun or Smoke Descending (Rambu Solo'). The north is associated with the east, the south with

the west. Rituals of the Rising Sun are those celebrating joy and life. This category includes birth, marriage, rice ceremonies, and feasts for the well-being of the family, the house, and the community. Ceremonies for healing the sick are also rituals of the Rising Sun; yet to the extent that sickness poses a danger to the community the rituals of healing share some traits with those of the Setting Sun. The Setting Sun ritual is associated with darkness, night, and, of course, with death. With the exception of the healing rituals, the ritual spheres of east and west are kept quite distinct from one another.

The most important ritual of the eastern sphere is the Bua' feast, a ceremony for a whole territory, the Bua' community. During this feast the *burake*—in some districts a priestess, in others a priest who is considered a hermaphrodite—implores the gods of heaven to bestow their benevolence on the community. Another feast of importance is the Merok, held for the welfare of a large family. At the center of the Merok is the *tongkonan*, the dwelling founded by the family's first ancestor. The most important of these houses are the ones considered to have been founded by a *to manurun*. These major rituals of the east have their ritual counterparts in high-ranking death feasts. Ritualizing the dead is a major focus of Toraja culture. A ranking order in funerals exists that corresponds to the status of the deceased. Toraja society is a stratified one, with much emphasis laid on the display of wealth. By the efforts and the devotion of the family, and through the expenditure lavished on buffalo, entertainment, and care of the death priest, the deceased of rank will reach Puya. After being judged by Pong Lalondong he climbs a mountain and reaches heaven. There he will occupy a place among the deified ancestors, who form a constellation that guards mankind and the rice. Thus the spheres of death and life, notwithstanding an apparent opposition, meet each other.

*Revised Bibliography*

**TORQUEMADA, TOMÁS DE** (1420–1498), Spanish inquisitor. Tomás de Torquemada, nephew of Juan de Torquemada (1388–1468), the celebrated Dominican theologian, canonist, and cardinal, was born at Valladolid and as a youth entered the Order of Preachers. For twenty-two years he was prior of the Dominican convent of Santa Cruz at Segovia. In 1474 he was appointed confessor to Queen Isabella I of Castile, and later he performed the same service, nominally at least, for King Ferdinand V of Aragon.

By a brief of February 11, 1482, Pope Sixtus IV named Torquemada, along with ten other Dominicans, to replace former officers of the Spanish Inquisition who had been charged with corrupt practices. On August 2, 1483, Torquemada was appointed grand inquisitor for the kingdoms of Castile and León; a few months later his authority was extended to Catalonia, Aragon, Valencia, and Majorca. He forthwith established tribunals at Seville, Cordova, Jaén, and Villarreal (later transferred to Toledo). Between 1484 and 1498 he set down the basic procedure of the Inquisition in a series of *instrucciones*—fifty-four articles in all—that guided the activities of succeeding grand inquisitors. These were published in 1576.

Torquemada, though himself descended from Jewish forebears, was particularly harsh in carrying out the mandate of the Inquisition against crypto-Jews (Marranos), Jews who continued to practice Judaism in secret after their forced conversion to Christianity. In 1492 he supported, and perhaps promoted, the expulsion of the Jews from the newly united Spain. Complaints about his severity moved Pope Alexander VI in 1494 to add four colleagues to his judicial bench, but as early as the next year they were accused of financial misconduct, and there was no discernible change in the Inquisition's practices after Torquemada's retirement or even after his death.

Torquemada became, and has remained, the personification of religious intolerance at its worst. It is believed that

as many as two thousand people were burned to death under his regime, and many thousands of others suffered imprisonment, confiscation of their property, and various other forms of harassment and indignity. Papal efforts to moderate the inquisitorial zeal in Spain were usually ineffectual, because the Spanish Inquisition, as Torquemada fashioned it, was an instrument to secure the racial and religious uniformity that was a primary concern of the Catholic kings and of Spanish policy for a long time afterward.

#### BIBLIOGRAPHY

Two classic works include treatments, hostile, of Torquemada: Henry C. Lea's *A History of the Inquisition in Spain*, 4 vols. (1907; reprint, New York, 1966), and Juan Antonio Llorente's *Discurso sobre el orden de procesar en los tribunales de Inquisición* (Paris, 1817); an English translation and abridgment of Llorente's work (London, 1823) has been many times reprinted. A good brief study is A. S. Turberville's *The Spanish Inquisition* (1932; reprint, London, 1949), and a popular account of a special subject is Thomas Hope's *Torquemada, Scourge of the Jews* (London, 1939).

#### TORTOISES SEE TURTLES AND TORTOISES

**TOSAFOT [FIRST EDITION].** *Tosafot* is the Hebrew word that designates the glosses printed alongside the commentary of Rashi (Rabbi Shelomoh ben Yitshaq, eleventh-century French sage and commentator) in most editions of the Babylonian Talmud. Yet these *tosafot* are only a fraction of those composed by the French and German scholars (*tosafists*) of the twelfth and thirteenth centuries. The descendants of Rashi and his students edited his commentaries and added glosses to them. Even after these additions became much more extensive than the original commentaries, they continued to be called *tosafot* (additions). The *tosafot* emerged from disputations in the Talmudic academies that were recorded by teachers or by students under their direction. Students traveled from place to place recording the novel interpretations of their rabbis, and an academy of study acquired a good name based on the collections of *tosafot* available there.

**EMERGENCE OF THE *TOSAFOT*.** The beginnings of this new literary form are discernible already in the commentaries of Rashi's son-in-law Yehudah ben Natan, and even more so in the commentaries of his other son-in-law, Me'ir ben Shemu'el, and those of the latter's son, Rashbam (Rabbi Shemu'el ben Me'ir), who wrote addenda to Rashi's commentaries on the Talmud. The new style can be seen also in the works of Riva' (Rabbi Yitshaq ben Asher), who was Rashi's student in Troyes, France, and who later settled in Speyer, in southwestern Germany. While Rashi's commentaries generally explain each *sugyah* (Talmudic discussion of a specific subject) where it occurs (i.e., on the same page), in the works

of these others the dialectical and polemic tendency and the trend to comparison predominate.

In the establishment and perfection of the distinctive style of the *tosafot* a decisive influence was exercised by Rashi's grandson, Ya'aqov ben Me'ir, known as Rabbenu ("our teacher") Tam (after *Genesis* 25:27). With his immense breadth of knowledge and his sharp and penetrating mind, Tam influenced the scholars of his generation. The students who came to learn with him in his academy in Ramerupt adopted his method of study. His students were subsequently active in all regions of France, in England, in the communities on the Rhine, and in southern Germany, Bohemia, Carinthia, and Hungary, and in Kiev. Many others who never studied under him personally accepted his authority as binding and were influenced by his method.

Rabbenu Tam's successor was his nephew, generally known by the acronym Riy (Rabbi Yitshaq [ben Shemu'el]). Students flocked to Riy's academy in Dampierre from every country in Europe that was inhabited by Jews, including Spain. Moses Nahmanides, known as Ramban (Rabbi Mosheh ben Nahman), the thirteenth-century rabbi and commentator from Barcelona, described the influence of Rashi and his successors thus: "The French sages . . . they are our teachers, they the instructors; they reveal to us everything that is hidden" (*Dina' de-garmi*, intro.). The academy of Riy could be considered the forge of the *tosafot*. His work and that of his disciples established the method for writing *tosafot*: verification of the text of the Talmud and clarification and analysis of each *sugyah* through comparison of parallel passages in the Babylonian Talmud with the rest of the halakhic and aggadic sources, thus uncovering and resolving contradictions and fixing methodological principles. Few of Riy's *tosafot* have reached us in their original formulations, but they were included in the collections compiled by his students—his son Elhanan, Rash (Rabbi Shimshon [ben Avraham]) of Sens and his brother Yitshaq, Yehudah ben Yitshaq of Paris (also known as Rabbi Yehudah Sir Leon), Eli'ezer ben Shemu'el of Verona, Barukh ben Yitshaq of Worms, and others. Riy's teachings were recorded in their works and, through them, in the *tosafot* of later generations.

**TYPES OF *TOSAFOT*.** The greatest of the teachers edited collections of their *tosafot*, but their disciples did not consider these closed collections. On the one hand, they abridged long *tosafot*, while on the other, they added to the collections more recent *novellae*. As a result, the students appended glosses in the margins of the *tosafot*, which copyists subsequently introduced into the body of the text.

The disciples of Riy did not simply record his teachings. Moreover, they did not all study with him at the same time, and later students often added to the *tosafot* of their predecessors the new explanations that grew out of their discussions and decisions of their master, which were rendered to them orally or in writing. Even within the works of given individuals we can sometimes discern development. The *tosafot* of Rash of Sens to tractate *Ketubbot* (modern edition, Jerusa-

lem, 1973) were compiled, it would seem, when he was still young. In them the teachings of his teacher Riy are exceptionally predominant, and one can still sense in his style the give and take of the discussion in the academy. In contrast, the second edition of his *tosafot* to tractate *ʿAvodah Zarah* (modern edition, New York, 1969) exhibit little of the style of disputation characteristic of most *tosafot*; they are instead rather similar to the style of the Rash in his Mishnah commentaries.

Authority in the academies of the tosafists was not institutionalized; there was no well-defined hierarchy within them. Whoever could demonstrate exceptional capabilities and great erudition gained authority, but this authority was constantly subject to the challenges and criticism of younger scholars and students.

With the passage of time, different styles of *tosafot* developed. Some scholars were content to record their critical notes on famous *tosafot*, such as those of Rash of Sens. This is what Elʿazar of Worms (the author of *Sefer ha-roqeah*) and Berakhiyah of Nicole (modern-day Lincoln, England) did. In contrast, after the burning of the Talmud in Paris in 1244, there is a clearly discernible tendency, especially in the academy at Évreux, to compose *tosafot shiṭah*—a presentation of the Talmudic *sugyah* together with various explanations of it and the discussions of tosafists. One such *shiṭah* from Évreux on tractate *Nazir* was published from a manuscript in New York in 1974.

Toward the end of the thirteenth century, in the wake of the emigration of many of the sages of northern France and the increasing persecutions in Germany, original creativity among the scholars became rarer, while the collection of existing *tosafot* became more widespread. The great compilers, whose works spanned the entire Talmud, were Perets of Corbeil, Eliʿezer of Touques, and Asher ben Yehiʿel. The *tosafot* of Perets of Corbeil were extant in Italy until the time of the printing of the Talmud, and they also reached Spain. Eliʿezer of Touques abridged and edited the *tosafot* compiled by Rash of Sens, added to them from other collections, and appended his own *novellae* in the margins. His *tosafot* quickly spread through France and Germany.

When Asher ben Yehiʿel, known as Rabbenu Asher (also as Roʿsh), left Germany, he brought with him to Spain collections of *tosafot* from the collections of Riy and Rash of Sens and copied them almost unchanged, occasionally adding an explanation of his teacher, Meʿir ben Barukh, known as Maharam of Rothenburg. Rabbenu Asher prepared this work in order to present the community of scholars in Spain with an important collection of the teachings of the outstanding scholars of France. His son Yaʿaqov (that is, Yaʿaqov ben Asher), author of the halakhic codex *Arbaʿah Turim*, wrote to a German scholar who was preparing to come to Spain: “Bring whatever books you have, whether commentaries of Rashi, or *gemaraʿ*, or other works, but you needn’t bring the *tosafot*, for they only learn the *shiṭah* of my father and teacher, may the memory of the righteous be a blessing.”

These *tosafot* did not spread beyond Spain, though, and they were subsequently dispersed abroad (especially to Italy and the Ottoman Empire) with the exiles from Spain. While the scholars of Germany and Poland remained unaware of their existence, for us these *tosafot* are an important source for reconstructing the original formulation of the *tosafot* of Riy and his disciples.

The aforementioned compilations sealed a period of nearly two hundred years of creativity. The earlier *tosafot* were superseded by the later collections, but many of the former were preserved by individuals, some of whom copied from them into their own compilations and collections. This phenomenon can be observed in various collections: the catalogs of decisions and *responsa*, like *Or Zaruʿa*, compiled by Yitshaq ben Mosheh of Vienna, and the *Mordekhai* of Mordekhai ben Hillel; in the *Haggabot Maymuniyyot* and the *Teshuvot Maymuniyyot* of the school of Maharam; the collections of exegesis of the Pentateuch (such as *Daʿat zeqenim*, *Hadar zeqenim*, *Moshav zeqenim*, and *Minhat Yehudah*); and in manuscripts. All of these works help us to identify the editors of extant collections of *tosafot* and the authors of anonymous interpretations recorded in them.

**PRINTING OF THE TOSAFOT.** The spread of the *tosafot* encouraged printers of the Talmud to print these commentaries alongside the commentary of Rashi, which were already being printed alongside the Talmudic text. Yehoshuʿa Shelomoh first printed the *tosafot* to tractate *Berakhot* in Soncino, Italy, in 1484. By 1519 his nephew Gershom Soncino had printed twenty-three tractates with *tosafot*. The Bomberg Press in Venice (1520–1523) generally copied the *tosafot* from the Soncino edition, but they corrected them from manuscripts. After that time, the *tosafot* were printed in every edition of the Talmud, except in some early Eastern editions, until the *gemaraʿ*, the commentary of Rashi, and *tosafot* came to be studied as a single unit, referred to as GePeT (from *gemaraʿ*, *perush Rashi*, and *tosafot*).

**EDITING OF THE TOSAFOT.** Examination of the *tosafot* printed in standard editions of the Talmud in relation to other collections that have been printed or preserved in manuscript and in comparison with other sources demonstrates that the standard *tosafot* originated in various academies and at different times. A summary of the conclusions that can be drawn about the origins of the *tosafot* of the various tractates can be found in table 1.

**THE METHOD OF INTERPRETATION IN THE TOSAFOT.** Despite the diversity and the convoluted process of development of all the various collections, the *tosafot* nevertheless share a common method of explication, for they all are characteristically dialectical and critical. These methodological foundations, as drawn by Rabbenu Tam and Riy, remained fixed, with variation only in the quality of their employment. On the one hand, the tosafists themselves adopted the style of discussion of the amoraim and developed special techniques by which to express it; on the other hand, they traced and criticized the way in which the amoraim used this style.

<b>Origins of the Tosafot</b>	
<b>B. T. Tractate</b>	<b>Origins Of Tosafot</b>
<i>Berakhot</i>	A reworking of the <i>tosafot</i> of Yehudah ben Yitshaq of Paris, including material added by his students, edited by a German scholar who studied in the academy at Évreux.
<i>Shabbat</i>	Edited by Eli'ezer of Touques. The editing of the final section (from page 122b) was never completed.
<i>`Eruvin</i>	Compiled by Shimshon ben Avraham of Sens (Rash), edited by students of Yitshaq ben Avraham (known as Ritsba').
<i>Pesahim</i>	Edited by Eli'ezer of Touques. The first nine chapters are based on the <i>tosafot</i> of Shimshon ben Avraham of Sens while chapter 10 is based on the <i>tosafot</i> of Yehi'el of Paris.
<i>Yoma'</i>	Edited by Me'ir ben Barukh of Rothenburg.
<i>Sukkah</i>	Compiled by Shimshon ben Avraham of Sens.
<i>Beitsah</i>	Edited by a disciple of Perets of Corbeil.
<i>Ro'sh ha-Shanah</i>	Compiled by Shimshon ben Avraham of Sens.
<i>Ta'anit</i>	Late <i>tosafot</i> , apparently from the fourteenth century.
<i>Megillah</i>	Edited by Yehudah ben Yitshaq of Paris.
<i>Mo'ed Qatan</i>	Edited by Shemu'el ben Elhanan, grandson of Yitshaq ben Shemu'el.
<i>Hagigah</i>	Edited by Mosheh of Évreux, based on the <i>tosafot</i> of Elhanan and Yehudah ben Yitshaq of Paris.
<i>Yevamot</i>	Edited by Eli'ezer of Touques based upon the <i>tosafot</i> compiled by Shimshon ben Avraham of Sens up to chapter 12; from there, based primarily on the <i>tosafot</i> of Yehudah ben Yitshaq of Paris.
<i>Ketubbot</i>	Edited by Eli'ezer of Touques but without a final editing; apparently a first edition.
<i>Nedarim</i>	Edited by a student of Perets of Corbeil, based on the <i>tosafot</i> of Évreux.
<i>Nazir</i>	Edited by a student of Perets of Corbeil based upon the <i>shitah</i> of Yitshaq of Évreux.
<i>Sotah</i>	German <i>tosafot</i> , edited by a disciple of Yehudah and Me'ir, the sons of Qalonimos.
<i>Gittin</i>	Edited by Eli'ezer of Touques.
<i>Qiddushin</i>	<i>Tosafot</i> from Évreux, from the end of the thirteenth century.
<i>Bava' Qamma'</i>	Edited by Eli'ezer of Touques based upon the <i>tosafot</i> of Yehudah ben Yitshaq of Paris.
<i>Bava' Metsi'a'</i>	Edited by Eli'ezer of Touques, based on the <i>tosafot</i> of Elhanan, Shimshon ben Avraham of Sens, and German students of the disciples of Yitshaq ben Shemu'el.
<i>Bava' Batra'</i>	Until page 144a, edited by Eli'ezer of Touques based on the <i>tosafot</i> of Shimshon ben Avraham of Sens, Mosheh of Évreux, and Yitshaq ben Mordekhai (known by the acronym Rivam), who worked under the supervision of Ya'aqov ben Me'ir; after page 144a, the primary source was the <i>tosafot</i> of a disciple of Yitshaq ben Shemu'el.
<i>Sanhedrin</i>	<i>Tosafot</i> from the school of Perets of Corbeil, based on the <i>tosafot</i> compiled by Shimshon ben Avraham.
<i>Makkot</i>	Edited during the lifetime of Perets of Corbeil.
<i>Shavu'ot</i>	Edited by Eli'ezer of Touques, after the <i>tosafot</i> of Elhanan of Sens.
<i>`Avodah Zarah</i>	Edited by a disciple of Perets of Corbeil, who copied unchanged the <i>tosafot</i> of Shemu'el of Falaise, who had drawn from the <i>tosafot</i> of Yehudah ben Yitshaq of Paris, whose explanations were in accordance with the <i>tosafot</i> of Elhanan, son of Yitshaq ben Shemu'el. The <i>tosafot</i> of Elhanan, composed around 1182, were in fact used as a major source for all the aforementioned <i>tosafot</i> on <i>`Avodah Zarah</i> .
<i>Horayot</i>	German <i>tosafot</i> , based primarily on the explanations of Simhah of Speyer.
<i>Zevahim</i>	Compiled and edited by Barukh ben Yitshaq of Worms.
<i>Menahot</i>	Compiled by Shimshon ben Avraham of Sens.
<i>Hullin</i>	Edited by Eli'ezer of Touques, based on the <i>tosafot</i> compiled by Shimshon ben Avraham of Sens and the <i>tosafot</i> of Yehudah ben Yitshaq of Paris.
<i>Bekhorot</i>	Compiled by Shimshon ben Avraham of Sens.
<i>`Arakhin</i>	<i>Tosafot</i> from Évreux, edited by a disciple of Shemu'el of Évreux's son.
<i>Temurah</i>	<i>Tosafot</i> from Évreux, the handiwork of a different editor.
<i>Keritot</i>	Edited by a disciple of Yitshaq ben Shemu'el.
<i>Me'ilah</i>	Edited by a disciple of Perets of Corbeil during the life of his master.
<i>Qinnim</i>	German <i>tosafot</i> , used as sources for the <i>tosafot</i> of Yitshaq ben Asher and Ya'aqov ben Yitshaq ben Eli'ezer ha-Levi (known as Ya'avets).
<i>Niddah</i>	Edited by Eli'ezer of Touques, based on the <i>tosafot</i> of Shimshon ben Avraham of Sens and other disciples of Yitshaq ben Shemu'el.

TABLE 1.

Every single line of the Talmud was analyzed acutely and tested, sometimes by uncovering contradictions between it and other statements in the sources, and sometimes by drawing from it the most extreme inferences and conclusions possible. Precisely because they perceived the Talmud to be the eternal source of halakhic decision, the tosafists considered it incumbent upon them to compare, to question, and to solve contradictions between the cases in the contradictory sources by formulating “distinctions” (*hilluqim*). In this manner they hoped to advance the determination of the *halakhah* by supplementing what was already explicit in the Talmud.

The efforts of the tosafists were directed toward the verification of the accurate text of the Talmud. Rabbenu Tam condemned those who emended texts in order to remove difficulties and problems, and he and his disciples developed a whole methodology for textual criticism. The principles and explanations they elaborated to explain the development of defective texts anticipated modern philology.

In their work supplementing the commentary of Rashi and expanding its bounds, the tosafists had at their disposal a number of additional sources, such as the commentaries of Hanan’el ben Hushi’el and the Talmudic dictionary, *Sefer ha-’arukh*, of Natan ben Yehi’el, an eleventh-century rabbi. They relied primarily on their broad knowledge of the classical sources, however, including not only the Babylonian Talmud but also the Tosefta, the halakhic and aggadic *midrashim*, and the Palestinian Talmud (Jerusalem Talmud). While using these works the tosafists also contributed toward the establishment of their correct versions and toward a better understanding of their contents. Nevertheless, the tosafists’ main aim remained the clarification of every *sugyah* of the Babylonian Talmud from all possible angles, including the testing of the logical arguments, distinctions, and classifications that they posited and the marshaling of support for their conclusions. All this activity was directed toward the attempt to see every subject and problem in its widest context. Every dictum of the *tosafot* demonstrates the extent to which the tosafists had assimilated the way of learning embodied in the Babylonian Talmud; they studied until they were willing and able to comment on what is the “way of the *sugyah*” and what is the “method of the Talmud.” Taken together, the principles governing their study constitute a complete methodology. Their formulations describe the use of the “rules for expounding scripture”; the relationship between the Talmud and *baraitot* (teachings of the tannaim that were not included in the Mishnah); the proper identification of tannaim and amoraim; the proper definition of the terms of the *sugyah*; the order of the Mishnah; and the editing of the Talmud. In this aspect of their endeavor, also, several of the tosafists’ conclusions anticipated modern research.

**THE METHOD OF TOSAFOT IN DECIDING HALAKHAH.** The tosafists did not ignore the normative aim of the Talmudic discussions. Although their comments generally do not explicitly contain halakhic summaries or decisions, the clarifi-

cation of the various strains of Talmudic thought nevertheless essentially contributed to the formation of the *halakhah*. This fact justifies the work of the author of *Pisqei tosafot* (The decisions of *tosafot*)—whether he was Rabbenu Asher or his son Ya’aqov—who abstracted the halakhic decision from each dictum of *tosafot*. Indeed, the later rabbinic authorities (decisors) learned much practical *halakhah* from the *tosafot*.

While the tosafists used the books and *responsa* of the geonim and the halakhic codices of the decisors, such as Rif (Rabbi Yitshaq Alfasi), the Talmud remained for them the primary source, and they evaluated the decisions of the geonim and the decisors in its light. Rabbenu Asher explained: “Who is as great in our estimation as Rashi, may the memory of the righteous be a blessing, who enlightened the entire Diaspora with his commentary? Nevertheless his descendants Rabbenu Tam and Riy, may their memories be a blessing, disagreed with him in many instances and refuted his positions, for the Torah is known as ‘the *torah* of truth,’ so we do not allow flattery of anyone” (commentary to *San.* 4.6). Likewise he wrote elsewhere, “[We do not flatter the geonim] for respecting any subject not explicitly dealt with in the Talmud which Rav Ashi and Ravina’ edited, anyone can rise and build up [arguments], even if he opposes the conclusions of the geonim” (*Responsa* 54.10).

The tosafists’ method of study provided them with powerful tools to harmonize, circumvent, and redefine, but nevertheless their contemporary reality, with all its conflicting claims and conditions, sometimes asserted itself as a challenge to their methods. The tosafists had to take account of “everyday occurrences” and justify “generally accepted custom.” Thus, just as they found means to abrogate laws and customs well supported in the sources, they likewise managed to include within the system of *halakhah* late developments that were without a basis in the sources. To a certain extent, the willingness to venture bold new explanations was a function of the differing personalities of the tosafists, who differed from one another in their personal inclinations and in their spiritual characteristics. However, they were united in their intention to continue the formulation and further the organic development of the Talmudic project as a way of life.

**THE TOSAFISTS AND THE GLOSSARISTS.** Several scholars have noted the similarity between the method of the Scholastics and that of the tosafists. Some of these scholars speak in terms of influence, but the spiritual meeting ground between Christians and Jews took place in biblical exegesis; there is no hint of direct contact in the fields of law and *halakhah*. The *tosafot* were not known to the glossarists, nor were the tosafists familiar with the works of the Roman and canonical legal scholars. Nevertheless, comparison of the *tosafot* and the glosses shows similarities both in the way they came into being and in details of terminology and presentation. Both presume that contradictions in the sources could and must be resolved, whether by distinguishing the cases from one another or by clarifying differences in the time, place, and social

position of the various personalities. The way in which the *tosafot* spread and the way in which they were studied also parallel the success of the activities of the glossarists of both Roman and canon law. Despite the differences between the political and social contexts of the Jewish and Christian communities, which lived in a constant, unequal struggle with one another, their assumptions and aspirations were similar. Both communities acknowledged the authority of the Bible and considered themselves commanded to draw from it instruction for their day-to-day existence. Thus both communities greatly esteemed the intellectual ability, sharp-wittedness, and breadth of knowledge that made it possible to solve contradictions and deal with social change in the context of the tradition.

**THE INFLUENCE OF THE TOSAFOT.** *Tosafot* came to occupy a central role in the system of study and education of the Jews. It is true that Yehudah Löw ben Betsal'el (known as Maharal of Prague) bitterly decried the teaching of *tosafot* to children, but only few paid any attention to his objections, and until the modern period the traditional schoolbook remained *gemara'*, the commentary of Rashi, and *tosafot*. In the more advanced stages of education the *tosafot* were learned not only in relationship to the Talmud but also as independent sources whose own internal contradictions required resolution. In the fourteenth and fifteenth centuries, the circles of Yisra'el Isserlein, Ya'aqov Molin, Yosef Qolon, and Yitshaq Stein in Germany devoted much energy to deriving positions implied by *tosafot*. The *tosafot* stood in the center of the course of study of the Polish and the Turkish scholars. In Vlorë, Albania, scholars of the sixteenth century debated about the *tosafot*, which they called "the short profundities of Touques." In the contract of Italian rabbis, the rabbi "accept[ed] upon himself the obligation to come to the synagogue and teach the *tosafot* for an hour or more before the afternoon prayer."

Suspicion of casuistry and excessive exhibition of sharp-wittedness were concerns already of the first tosafists. Rabbenu Tam, who understood the power and possibilities of casuistry as few others did, decried "casuists" who find "bundles and bundles" of answers to every question. In similar fashion, Mosheh al-Ashqar (1462–1542) declared himself against "those who scrutinize the words of the *tosafot* and say senseless things about the redundancies in their language" (*Responsa* 29–30). The influence of the methodology of *tosafot* far exceeded the tendency toward dialectics that arose in their study. This influence is clear in the works of the decisors, in the *responsa*, and in the works of *novellae* of interpreters trying to get at the simple sense of the text, as well as in various aspects of modern Talmudic research.

#### BIBLIOGRAPHY

Research on the *tosafot* first concentrated on biography and bibliography. Leopold Zunz edited a list of tosafists and sages mentioned in *tosafot* that appears in his book *Zur Geschichte und Literatur* (Berlin, 1845), in which he refers to the manuscript of the important book by Heimann J. Michael, *Or*

*ha-hayyim* (Frankfurt, 1891). Isaac H. Weiss discussed the activities of the tosafists in *Dor dor ve-dorshau*, vol. 4 (Vienna, 1887); he also wrote a monograph on Rabbenu Tam that appeared in *Beit Talmud*, 3 (1883). Heinrich Gross gathered important information about the French tosafists in his book *Gallia Judaica* (Amsterdam, 1897). Abraham Epstein's criticism of the book, printed in the *Monatsschrift für Geschichte und Wissenschaft des Judenthums* (MGWJ) 41 (1897): 464–480, is especially valuable. A similar work, dealing with the German sages, is *Germania Judaica*, published in two parts, edited by Marcus Brann et al. (Frankfurt, 1917–1934). Victor Aptowitz devotes a long chapter to this subject in his *Mavo' le-sefer ha-Ra'avyah* (Jerusalem, 1938). The principles of the Talmud described in *tosafot* were collected by P. Buchholtz in his article "Die Tossafisten als Methodologen," *MGWJ* 38 (1894): 342–359. On the methodology of the tosafists, see Chaim Tchernowitz's article "Lederekh halimmud shel ba'alei ha-tosafot," in *Festschrift Adolf Schwarz*, edited by Samuel Krauss (Berlin, 1917). Following publication of my book *Ba'alei ha-tosafot* (Jerusalem, 1956), there ensued intensive activity in the publishing of *tosafot*; most of the newly published works were from manuscripts that had never been printed, but new editions of *tosafot* that had previously been published in corrupt editions also appeared. There have also been a number of studies of the historical and social reality discernible through the compilations of the tosafists, as well as works on their ideas and influence. A summary is given in Salo W. Baron's *A Social and Religious History of the Jews*, vol. 9, 2d ed., rev. & enl. (New York, 1965). A full bibliography can be found in the expanded and corrected fourth edition of my book mentioned above (Jerusalem, 1980).

E. E. URBACH (1987)

Translated from Hebrew by Akiva Garber

**TOSAFOT [FURTHER CONSIDERATIONS].** Research conducted during the early twenty-first century focuses on identifying and evaluating more precisely the distinctions between northern French and German Tosafists, integrating newly discovered collections of *Tosafot* texts and bringing to the fore Tosafists whose writings and contributions have not been fully assessed, reconsidering the extent of Christian intellectual influences on Tosafist methods, and examining the non-Talmudic disciplines with which the Tosafists were significantly engaged.

**DIFFERENCES BETWEEN FRANCE AND GERMANY.** *Tosafot* texts produced in northern France failed to cite leading German scholars who were active circa 1200 (with barely an exception), including those who authored prominent books such as Judah b. Qalonymus of Spire (d. 1199; *Sefer Yihusei Tanna'im va-Amora'im*), Eliezer b. Joel ha-Levi (1160 to 1165–c. 1235; *Sefer Rabiah*), Barukh of Mainz (1150–1221; the no longer extant *Sefer ha-Hokhmah*), Eleazar of Worms (1176–1238; *Sefer Roqeah*), and Simhah of Speyer (c. 1230; the partially extant *Seder Olam*). At the same time, these German works cite few northern French Tosafists after Rabbenu Tam (c. 1100–1171) and his immediate students. Between

the years 1170 and 1220 students from Germany did not study with northern French Tosafists (as they did before and after this period) and vice versa. During this period German Tosafists are known as leading judges and judicial figures. In this context they produced extensive works that dealt primarily with monetary law. Two examples (that are no longer extant) are Ephraim of Regensburg's (d. c. 1175) *Arba'ah Rashim* and Barukh of Mainz's *Sefer ha-Hokhmah*.

On the other hand, the Tosafists of northern France, who undoubtedly participated as judges in cases of monetary law and in the preparation and adjudication of bills of divorce, are rarely identified as such. They are known as *rashei yeshivah* (heads of academies), whose power and reputation derived mainly from their ability to put forward overarching interpretations and novellae (*hiddushim*), rather than from any role that they played as communal judges. The period of disengagement between the northern French and German centers ends only in the days of R. Isaac ben Moses (1180–1250; *Or Zarua*) and his student, R. Meir of Rothenburg (1220–1293), who spent a significant amount of time studying in northern France. The mid-thirteenth-century Tosafist study hall at Evreux, France, that appears to represent an amalgam between the Talmudic methodology of the Tosafists of northern France and the educational critique and ethical imperatives of the German pietists, should also be noted in this regard.

The *Tosafot* that were produced in these different centers throughout the twelfth and thirteenth centuries employed somewhat different methodologies as well. German *Tosafot* (and *halakhic* writings) take into account a wider selection of Talmudic and rabbinic literature (e.g., *midreshei halakhah va-'aggadah*) than did their counterparts in northern France. Northern French *Tosafot* most often focused on penetrating analyses of relevant texts within the Babylonian Talmud in particular (seeing themselves as a continuation of the methodology of the Amoraim), while German dialectic is milder. In the end, however, the northern French *Tosafot* form dominated. The three leading *Tosafot* collections from the late thirteenth century, *Tosafot Tukh* (Turcheim, Germany), *Tosafot ha-Rosh*, and *Tosafot Rabbenu Perez*, were essentially collections of earlier northern French material (even as all the editors had German roots).

During the twelfth century northern French Tosafists produced *Tosafot* comments almost exclusively, while German Tosafists produced a wider spectrum of *halakhic* works and self-standing texts that contained Talmudic commentary as well. The production of *halakhic* works in northern France at the turn of the twelfth century and into the thirteenth (such as Barukh b. Isaac's [d. 1211] *Sefer ha-Terumah* and Moses of Coucy's [c. 1240] *Sefer Mizvot Gadol*) may reflect the influence of the German pietists with regard to the primacy of practical *halakhah* as well as the notion that a period of great literary creativity is most often followed by one of collection and assessment. The thirteenth century also saw the collection and compilation of earlier *Tosafot* texts, with

R. Isaac (Ri) of Dampierre's (d.c. 1200) student Samson of Sens (1150–1230) as one of the first and most prominent examples. Manuscript discoveries in the last decade show, however, that unlike other students of Ri who presented *Tosafot* interpretations that their students then copied and edited, Samson composed his own *Tosafot* interpretations and intended them as an organized work that could be cross-referenced from one tractate to another. Another leading student of Ri, Judah Sirleon (d. 1224), is the first to cite Maimonides, Moses (Mosheh ben Maimon, 1135/8–1204) in his *Tosafot*. Judah's successor, R. Yehi'el of Paris (d.c. 1265), also produced material in the style of *Tosafot*, although his teachings are cited most often in the form of *halakhic* and ritual decisions (*pesaqim*).

Northern French Tosafists generally did not preserve their *responsa* or *pesaqim*, while their German counterparts did. German Tosafists consulted and communicated much more frequently with each other and collected and preserved more faithfully the writings of their Tosafist predecessors from both northern France and Germany. German *Tosafot* were produced by Moses Taku (c. 1230), Simhah of Speyer, Judah b. Qalonymus of Speyers, and Eleazar of Worms, as well as Meir of Rothenburg. Tosafists in Germany, perhaps under the influence of the German pietists, also tended to produce more commentaries than their French counterparts to those tractates that were taught or studied less frequently, such as those included in *Seder Qodashim*.

Although it has been assumed that the genre of *Tosafot* originated in northern France during the mid-twelfth century, the earliest such activity is actually to be found in the work of the German scholar R. Isaac b. Asher (Riga) of Spiers (d.c. 1130), who flourished a full generation earlier than Rashi's (R. Solomon b. Isaac, 1040–1100) grandsons, Rabbenu Tam and Rashbam (1085–1174). There is, however, an important stylistic or methodological distinction between them. While Riba functioned more like a judge, who tried to decide between the various possible positions by pushing aside or ferreting out as much material as possible that was not centrally relevant, the early Tosafists in northern France sought to bring together similar *sugyot* to encourage comparisons (as a lawyer might typically do).

It was, however, in northern France that the classical form of *Tosafot* proliferated. Ri, who was Rashi's great-grandson, transformed the Tosafist method from a tool of the elite that was to be used only by the greatest of scholars (such as Rabbenu Tam and his closest students), to the predominant method of learning in study halls throughout northern France. From the days of Ri a series of northern French Tosafists expressed the notion that authoritative Torah study and Talmudic readings and rulings are not solely the property or province of the teacher but belong equally to his students as well who, on the basis of their analysis of underlying Talmudic and rabbinic texts, may "outsmart" or emend the conclusions of the teachers.

All these newly highlighted distinctions between Germany and northern France can account for a number of systemic differences in *halakhic* rulings and outlook between the two regions. At the same time, their commonly held customs, basic methodologies, and interpretational values often led to an unwavering consensus, whether in specific practices and matters of belief, or in the need to formulate valid *halakhic* justifications for economic and other societal practices that appeared *prima facie* to contradict Talmudic law. To be sure, the issue of intentionality in developing these justifications has been the subject of renewed, vigorous discussion in recent years, just as it was when Urbach's *Ba'alei ha-Tosafot* first appeared.

Urbach essentially reverses his original position on possible Christian influences on Tosafist dialectic, whether by canon lawyers and masters of theology or by Christian scholars of Roman law, in the revised edition of his work. Then, after adducing additional parallels in method and terminology, Urbach concludes that it is difficult to argue for more than *zeitgeist*. Disparate geographic centers and differences in textual valence were at the core of the critiques of Urbach's original view. More recent research suggests that the argument for influence should not be abandoned. New paradigms, such as the jurists at Pavia, have been suggested. In addition the presence of nascent dialectic at the *yeshivah* in Worms already in the last quarter of the eleventh century (not to mention the presence of critical dialectic within the Talmud itself) lessened the role that external influence would have to play. Influences transmitted by passing personal contacts and conversations rather than through literary sources must also be considered.

Although Urbach notes at various points in his work that certain Tosafists produced writings that were not related to *Tosafot* texts or *halakhic* treatises, the impression fostered by his presentation is that Tosafists were involved only marginally in these other disciplines. So-called Tosafist Torah commentaries (*perushei Ba'alei ha-Tosafot 'al ha-Torah*) are mentioned by Urbach mostly because they also contained parallel or reworked *Tosafot* texts to the Talmud. At the end of his long and nuanced discussion of the *Tosafot* corpus of Ri, Urbach writes that Ri and his son, R. Elhanan (d. 1184), "tried their hand" at the composition of liturgical poems (*piyyutim*), referring the reader to the listings of Leopold Zunz (1794–1886) for details. Urbach refers only in passing to Abraham b. Azri'el of Bohemia (c. 1230), a student of Eleazar of Worms better known for his large and important treatise of *piyyut* commentary *'Arugat ha-Bosem* (which Urbach edited as well) than as a Talmudist. This further supports the perception that Tosafists did Talmud and legal studies, while other disciplines were handled by specialists, a change from the situation in Ashkenaz before the First Crusade when leading scholars typically embraced several different disciplines.

Current research is beginning to question this supposition. Although the impact of twelfth-century legalism caused

some Tosafists (and leading ones at that) to focus exclusively on Talmudic and *halakhic* texts and studies, manuscript evidence and a concomitant reevaluation of published texts suggest that others displayed interest in virtually the same variety of disciplines as did their Ashkenazic predecessors from the pre-Crusade period. The more than two hundred manuscript collections of *perushei Ba'alei ha-Tosafot 'al ha-Torah* have barely been analyzed by modern scholarship. Many of them do contain a large amount of Talmudic and *halakhic* material. But at the same time, some display a much greater interest in forms of simple or literal biblical interpretation (*peshat*) than has been imagined.

To be sure, there is greater interest in the *peshat* approach favored by the Tosafist and biblical commentator Yosef b. Isaac Bekhor Shor of Orleans (d.c. 1200) than in the more radical *peshat* of the earlier northern French Tosafist and biblical scholar Rashbam. Also, the Tosafist biblical collections or compilations of the mid- and late thirteenth century often blend (and perhaps blur) *peshat* interpretations with unrestrained midrashic- or *gematria*-based comments. Nonetheless, it is possible to identify a group of Tosafists writing in the late twelfth and early thirteenth centuries that cultivated *peshat* interpretations on their own terms, while also serving as a kind of super-commentary to Rashi. In this role they were interested in verifying not only the Talmudic and midrashic underpinnings of Rashi's Torah commentary, but also his approach to *peshat* and his consistency as a *peshat* exegete. Among these figures are Jacob of Orleans (d. 1189), Isaiah di Trani the Elder (d. c. 1240), and Moses of Coucy. Interestingly, they are joined by R. Yehudah he-Hasid (d. 1217) in a number of the exoteric biblical comments that have been attributed to him. At the same time, Tosafist figures such as Rashbam's brother, Rabbenu Tam, and Ri Samson and R. Samson of Sens (d. 1204) play almost no role in these endeavors.

A similar reevaluation has also been undertaken with regard to the writing of liturgical poetry. Some scholars suggest that no *piyyut* was composed by northern French Tosafists after Rabbenu Tam. Although German Tosafists and rabbinic scholars such as Ephraim of Regensburg, Menahem of Worms (d. 1204), Barukh of Mainz, and Meir of Rothenburg out-produced northern French Tosafists by far in this realm in terms of quantity, a number of northern French Tosafists including Elhanan the son of Ri, Yosef Bekhor Shor (of Orleans), Tuvyah of Vienne (d.c. 1260), and Isaac of Chinon (c. 1250) produced particular genres or patterns of *piyyutim*, suggesting that their involvement was intentional and focused. In any case the German Tosafists just noted appear to have received Spanish material in this discipline (as was the case with respect to biblical interpretation in the preceding discussion). As will be seen shortly, a number of German Tosafists who composed *piyyutim* were also involved with mystical teachings. Lesser-known Tosafist figures such as Avigdor Katz of Vienna and Samuel b. Abraham of Boppart (d.c. 1250) also composed *piyyutim*.

Strong ascetic tendencies and related interest in mysticism and magic were demonstrated in both Germany and northern France during the twelfth and thirteenth centuries, once again, primarily on the basis of texts and fragments still in manuscript. For these disciplines, the direction of influence extends from Ashkenaz to Provence and Spain (as was the case for Talmudic studies). Tosafists display awareness of and interest in ancient Jewish mystical texts, including *Sefer Yezirah* and especially *Hekhalot* literature. They wished to understand the secrets of the Divine Names, the use of Divine Names for magical purposes, and the mystical functioning of the heavenly realm. Although Rashbam and Rabbenu Tam in northern France and R. Eliezer b. Nathan (Raban) of Mainz (c. 1090–1170; who were aware of some of these teachings as well) tried to play them down, they were embraced by leading Tosafists (including Ri) in the second half of the twelfth century and became even more prominent through the thirteenth century, culminating in the figure of Maharam of Rothenburg). The influence of the German pietists in cultivating these disciplines also appears to have been significant, although French figures such as Ezra the (*ha-Navi*) of Moncontour (d.c. 1200 and other students of Ri suggest that there was an independent core of influence as well that perhaps extended back to Elijah of Paris (d.c. 1130) in the early twelfth century.

All of this has implications for the way(s) that anthropomorphism was approached and understood in medieval Ashkenaz, which in turn impacts on the realities behind the Maimonidean controversy. In any event, rabbinic culture in medieval Ashkenaz during the Tosafist period was clearly broader and more variegated than has been thought, although Talmudic interpretation and *halakhic* writings remained the Tosafists' most important areas of endeavor and achievement.

EPHRAIM KANARFOGEL (2005)

#### TOSEFTA SEE MISHNAH AND TOSEFTA

**TOTEMISM** is the systematic symbolization of social entities (individuals, social units) through concrete phenomenal images, often natural species, and the development of these symbols into relationships of identity, power, and common origin. The term *totem* derives from *dotem*, a term used by the Ojibwa, an Algonquin people of North America, to denote clan membership. As a concept, totemism has been treated in two distinct senses, or phases, of anthropological theory. In the first, or evolutionary sense, it was postulated as an institution of primitive thought, a necessary stage of religious conceptualization that all peoples must pass through in the course of cultural evolution. This notion was developed by such theorists as James G. Frazer and Émile Durkheim, and it was the subject of a definitive critique by Alexander A. Goldenweiser. The second, more modern sense of the term might be called its "systematic" sense, one that allows for a wide range of variance in culture-specific schemes of symbolization and classification and that approaches the significance of totemism through its relationship to these schemes. This modern sense informs the viewpoint of Claude Lévi-Strauss's critique *Totemism* (1963) and forms the basis for his subsequent idea of a "science of the concrete" (*The Savage Mind*, 1966).

The first sense of totemism tends to exaggerate its unitary aspects and make of it something of a universal primitive institution; the second tends to dissolve it into general issues of denomination and symbolism and to underplay the distinctiveness of the term and the usages to which it refers.

Instances of the naming of clans for natural species among North American peoples were known long before the

practice came to be called totemism. By the time the origin, significance, and definition of totemism became a major topic of controversy among theorists of tribal religion, the area of ethnographic exemplification had shifted from the Americas to central Australia. This shift was in part a consequence of the splendid ethnography of Baldwin Spencer and Francis James Gillen, but it also coincided with the widespread adoption of the evolutionist notion of the “psychic unity of mankind.” According to this idea, human culture was essentially unitary and universal, having arisen everywhere through the same stages, so that if we could identify a people who were “frozen” into an earlier stage, we would observe modes of thought and action that were directly ancestral to our own. Australia, a continent populated originally by hunting and gathering peoples alone, seemed to furnish examples of the most primitive stages available.

Together with the concept of taboo, and perhaps also that of *mana*, totemism became, for the later cultural evolutionists, the emblem (or perhaps the “totem”) of primitive thought or religion—its hallmark, and therefore also the key to its suspected irrationality. The origin and significance of totemism became the subject of widespread theoretical speculation during the first two decades of the twentieth century. Much of the early theorization developed along the lines of E. B. Tylor’s conception of the evolution of the soul (for example, totemic species as representations or repositories of the soul), or as literalizations of names (as in Herbert Spencer’s hypothesis that totems arose from an aberration in nicknaming).

The controversy over totemism reached its peak after the publication of Frazer’s *Totemism and Exogamy* (1910). In that work, Frazer distinguished totemism, as implying a relationship of equality or kinship with the totem, from religion, as a relationship with higher powers. He emphasized the solidarity function of totemism, which knits people into social groups, as a contribution to the “cause of civilization.” Frazer’s speculation concerning the origin of totemism, however, came more and more to reflect the particulars of his Australian exemplars. From an initial theory identifying the totem as a repository for a soul entrusted to it for safekeeping, Frazer turned to an explanation based on the Intichiuma rites of central desert Aborigines, in which each subgroup is responsible for the ritual replenishment of some (economically significant) natural species. The idea of the economic basis of totemism was later revived, in simplified form, by Bronislaw Malinowski. Finally, Frazer developed the “conception theory” of totemism, on the model of the Aranda people of central Australia, according to which a personal totem is identified for a child by its mother on the basis of experiences or encounters at the moment she becomes aware that she is pregnant. A creature or feature of the land thus “signified” becomes the child’s totem.

In 1910, Goldenweiser, who had studied under Boas, published “Totemism: An Analytical Study,” an essay that became the definitive critique of “evolutionary” totemism.

Goldenweiser called into question the unitary nature of the phenomenon, pointing out that there was no necessary connection between the existence of clans, the use of totemic designations for them, and the ideology of a relationship between human beings and totemic beings. Each of these phenomena, he argued, could in many cases be shown to exist independently of the others, so that totemism appeared less an institution or religion than an adventitious combination of simpler and more widespread usages.

Despite the acuity and ultimate persuasiveness of Goldenweiser’s arguments, the more creative “evolutionary” theories appeared in the years after the publication of his critique. Like Frazer’s theory, Durkheim’s conception of totemism is exemplified primarily through Australian ethnography. Durkheim viewed totemism as dominated by what he called a quasi-divine principle (Durkheim, 1915, p. 235), one that turned out to be none other than the representation of the social group or clan itself, presented to the collective imagination in the symbolic form of the creature that serves as the totem. Totemism, then, was a special case of the argument of *Elementary Forms of the Religious Life*, a work stating that religion is the form in which society takes account of (reverses, worships, fears) its own collective force.

Sigmund Freud included the concept of totemism, as an exemplar (like the notion of taboo) of contemporary ideas of primitive thought, in his psychodynamic reassessment of cultural and religious forms. Freud’s *Totem and Taboo* (1918) projected human culture as the creative result of a primal oedipal guilt. The totem was selected and revered as a substitute for the murdered father, and totemic exogamy functioned as an expiatory resignation on the part of the sons of claims to the women freed by the murder of the father.

In the last major theoretical treatment of “evolutionary” totemism, Arnold van Gennep argued, against Goldenweiser, that its status as a particular combination of three elements did not disqualify totemism’s integrity as a phenomenon. Yet Gennep rejected the views of Durkheim and other social determinists to the effect that totemic categorization was based on social interests. Anticipating Lévi-Strauss, who based his later views on this position (Lévi-Strauss, 1966, p. 162), Gennep saw totemism as a special case of the more general cultural phenomenon of classification, although he did not pursue the implications of this position to the degree that Lévi-Strauss did.

Claude Lévi-Strauss’s modern critique effectively concludes the attack on evolutionary totemism begun by Goldenweiser, although it aims at the term *totemism* itself. In *Totemism* (1963), Lévi-Strauss critically reviews the history of the subject and reaches the conclusion that totemism is the illusory construct of an earlier period in anthropological theory. Reviewing the more recent ethnographic findings of writers like Meyer Fortes and Raymond Firth, he arrives at the proposition that it is the differences alone, among a series of totemic creatures, that serve to distinguish the corresponding human social units. He disavows, in other words, any

sort of analogic relationship (of substance, origin, identity, or interest) between a totem and its human counterpart, and he thus reduces totemism to a special case of denomination or designation. This leaves unexplained (or reduces to mere detail) perhaps the bulk of the ethnographic material to totemism, concerned as it is with special ties and relationships between totem and human unit. In order to deal with this question, Lévi-Strauss developed, in *The Savage Mind* (1966), his notion of the “science of the concrete,” in which totemic “classifications” are but a special instance of a more widespread tradition of qualitative logic. Thus Lévi-Strauss is able to substitute the systematic tendencies of an abstract classifying schema for the specific relations between a totem and its social counterpart.

What is the place of totemism in the life of an ongoing community? Consider the Walbiri, an Aboriginal people of the central Australian desert. Walbiri men are divided into about forty lines of paternal descent, each associated with a totemic lodge devoted to the lore and ritual communication with an ancestral Dreaming totem (kangaroo, wallaby, rain, etc.). When they enact the Dreaming rituals, the men are believed to enter the “noumenal” phase of existence (Meggitt, 1972, p. 72) and to merge with the totemic ancestors themselves. Here the analogies between human beings and totemic creatures are sacramentally transformed into identities, made ritually into real relationships of mutual origin and creation, so that men of the different lodges actually belong to different totemic species. When the ritual is concluded, however, they return to everyday “phenomenal” existence and re-assume their human character, so that the totemic designations revert to mere names, linked to respective moieties, linked subsections, and other constituents of the complex Walbiri social structure.

Thus the “noumenal phase” of Walbiri life, the ritual state, is constituted by the analogies drawn between human beings and their totems, whereas in the “phenomenal phase” these analogies collapse into arbitrary labels. Only in the latter phase does Lévi-Strauss’s proposition about the “differences alone” being the basis for coding human groups apply, for, as human beings, the members of these subsections and moieties can marry one another’s sisters and daughters, something that different species cannot do. Within the same culture, in other words, totemic distinctions can serve either as “labels,” to code the differences or distinctions among human groups, or, by expanding into metaphoric analogues, accomplish the religious differentiation of men into different “species.”

The totemic symbolization of social units is, in many cultures, integrated into a larger or more comprehensive categorial or cosmological scheme, so that the totemic creatures themselves may be organized into broader categories. Among the Ojibwa of North America, totems are grouped according to habitat (earth, air, or water). Aboriginal Australia is distinctive in carrying this tendency to the extreme of “totem affiliation,” in which all the phenomena of experi-

ence, including colors, human implements, traits, weather conditions, as well as plants and animals, are assigned and grouped as totems (Brandenstein, 1982, p. 87). These universalized systems, in turn, are generally organized in terms of an overarching duality of principles. Brandenstein identifies three of these—quick/slow, warm/cold, and round/flat (large/small)—as generating, in their various permutations and combinations, the totemic-classificatory systems of aboriginal Australia (*ibid.*, pp. 148–149). A similarly comprehensive system is found among the Zuni of the American Southwest, for whom totemic clans are grouped in respective association with seven directional orientations (the four directions, plus zenith, nadir, and center), which are also linked to corresponding colors, social functions, and, in some cases, seasons.

At the other extreme is individuating, or particularizing totemism, for the individual is also a social unit. Among the Sauk and Osage of North America, traits, qualities, or attributes of a clan totem will be assigned to clan members, as personal names, so that members of the Black Bear clan will be known for its tracks, its eyes, the female of the species, and so on (Lévi-Strauss, 1966, p. 173). Among the Kujamaat Diola of Senegal, on the other hand, individuals are totemized secretly through relationships with personalized animal doubles, which are produced by defecation from their own bodies, and which live in the bush near their dwellings (Sapir, 1977). Among the Usen Barok of New Ireland, individual names are taken from plant or animal manifestations of the essentially formless *masalai*, or tutelary clan spirit. Wherever personal names are conceived of as a relation between the bearer of the name and some phenomenal entity, we can consider naming itself to be a form of individual totemism.

Totemic individuation of this sort, in which the character of the name itself bears a specific relational significance, occurs frequently in the naming of modern sports teams, and in formal or informal national symbols, such as the eagle or the bear. Totemism has been proposed as the antecedent of the syncretistic religion of ancient Egypt, with possible indirect connections to the Greco-Roman pantheon. Predynastic Egypt was subdivided into a large number of local territorial units called nomes, each identified through the worship of a particular theriomorphic deity. As the unification of Egypt involved the political joining of these nomes, so the evolution of Egyptian religion led to the combining of the totemic creatures into compound deities such as Amun-Re (“ram-sun”), or Re-Harakhte (“sun-hawk”). There are possible archaic connections of these theriomorphic deities, with Homeric Greek divinities: for example, the cow Hathor with the “ox-eyed Hera.” Alternatively, of course, these divinities may have acquired such characterizations as the heritage of an indigenous totemism.

Totemism may not be the key to “primitive thought” that Frazer, Durkheim, and Freud imagined it to be, but the use of concrete phenomenal images as a means of differentia-

tion is not easily explained away as merely another mode of designation, or naming. Wherever social units of any kind—individuals, groups, clans, families, corporations, sports teams, or military units—are arrayed on an equal footing and in “symmetrical” opposition to one another, the possibility arises of transforming a mere quantitative diversity into qualitative meaning through the use of concrete imagery. Diversity is then not merely encoded but instead enters the dimension of meaning, of identity as a concrete, positive quality.

Whenever we speak of a sports team as the Braves, Indians, Cubs, or Vikings, or speak of the Roman, American, German, or Polish eagle, or consider Raven, Eagle, and Killer Whale clans, we make the differences among the respective units something more than differences, and we give each unit a center and a significance of its own. Whenever this occurs, the possibility arises of developing this significance, to a greater or lesser degree, into a profound relationship of rapport, communion, power, or mythic origin. Viewed in this light, the “totems” of a social entity become markers and carriers of its identity and meaning; to harm or consume the totem may well, under certain cultural circumstances, become a powerful metaphor for the denial of qualitative meaning. When theorists of totemism sought to explain the phenomenon solely in terms of the food quest, marriage restrictions, coding, or classification, they subverted the force of cultural meaning to considerations that would find an easier credibility in a materialistically and pragmatically oriented society, “consuming,” as it were, meaning through its markers and carriers.

The ostensibly “primitive” character of totemism is an illusion, based on a tendency of literate traditions to overvalue abstraction and to reduce the rich and varied spectrum of meaning to the barest requirements of information coding. In fact abstract reference and concrete image are inextricably interrelated; they imply each other, and neither can exist without the other. Certainly, peoples whose social organizations lack hierarchy and organic diversity (e.g., social class or the division of labor) tend to develop and dramatize a qualitative differentiation through the imagery of natural species, whereas those whose social units show an organic diversity need not resort to a symbolic differentiation. The choice, however, is not a matter of primitiveness or sophistication but rather of the complementarity between social form and one of two equally sophisticated, and mutually interdependent, symbolic alternatives.

**TOTONAC RELIGION.** In the city of Zempoala (Cempoallan), situated in what is today the state of Veracruz, Mexico, the Totonac people were the first to receive Europe-

ans to the great land mass of continental America. The year was 1519 and the Spanish conquest of Mexico had begun. At that time the Totonac occupied a strip of land flanked by the Atlantic Ocean and the Sierra Madre Oriental, between the Cazonas River in the north and La Antigua River near the present port of Veracruz. Two important Totonac ceremonial centers existed in this territory. The first, El Tajín, was located in the north and had ceased to function before the arrival of the Spanish. The second, Zempoala, is reputed to have been populous when the Spanish arrived; soon after, it witnessed the collapse of its idols and their replacement with the Christian cross.

Well before the Conquest, the Totonac people had extended even farther south, to the margins of the Papaloapan River. The Nahuatl-speaking Aztec had, however, reduced the extent of the Totonac's southern territories, and at the time of the Spanish arrival Zempoala, the Totonac capital, was paying tribute to its Aztec rulers. By this time Nahuatl was the lingua franca in the region, and thus the Spanish priests used Nahuatl terms to describe Totonac religion, a practice still common among scholars today.

At present some one hundred thousand Totonac-speaking people survive in the northern part of their original territory between the states of Puebla and Veracruz. Linguistically, the Totonac are related to the Zoqueano- and Mayan-speaking peoples. However, there is no evidence connecting the religion and culture of the Totonac to those of the Maya and the Zoqueano. Our understanding of the Totonac religion is based upon archaeological evidence primarily from Zempoala, El Tajín, and Puebla, and upon analysis of early descriptions provided by Fray Bartolomé de Las Casas and Fray Andrés de Olmos.

**EVIDENCE FROM ZEMPOALA.** According to Las Casas, who relied on information supplied by a young page of Cortés, daily homage was paid in Zempoala to the Sun (Chichiní in Totonac), who was the creator of all other gods. Early in the morning seven priests would attend the temple. One of the priests would gaze skyward, paying reverence to the Sun before bathing the Sun's image, as well as the images of other gods, in incense. On ceremonial occasions nobles and officials would go to the temple to worship. According to Las Casas, every Saturday everyone was obliged to gather in the atrium of the temple to pray. Scholars now believe that this took place every fifth day. There, the nobles and principal dignitaries mutilated themselves before their gods by passing numerous straws through incisions made in various parts of their bodies. Las Casas mentions in particular tongues, thighs, and ears. The act of bleeding was a mechanism of purification.

At the winter solstice an important festival was celebrated during which eighteen people, men and women, were sacrificed. Eighteen is also the number of *veintenas* (Span., "set of twenty," i.e., "months" composed of twenty days each) into which the Mesoamerican year was divided. The human sacrifice took place at midnight; the hearts of the victims

were ground into the mouths of the principal idols. Blood was the food of the Sun. The persons sacrificed were messengers sent to plead with the Sun to send his son to liberate the Totonac from the practices imposed on them by the Aztec. (Fine illustrations of human sacrifice are to be found in the reliefs at El Tajín.) Similar practices were followed at Zempoala for at least two other important festivals. The flesh of the victims was eaten by dignitaries and a few other influential people. Besides this elitist communion, there existed a practice popular among men who were more than twenty-six years of age: every six months they consumed a paste prepared from the blood of infants' hearts, seeds from plants grown in the temples, and a milky latex from the *Castilla elastica* tree. This sacrament was called *yoliaimtlqualoz*, a Nahuatl word meaning "food for the soul."

Another regular custom was a confession of sins, called *maiolcuitta* in Nahuatl. A person would retire to some isolated spot and confess his wrongdoings aloud. According to Las Casas, penitents would often wring their hands and cry out in anguish with such conviction that it was, in his words, a custom "well worth consideration."

The Totonac had a goddess, the consort of the sun god, whose temple was high in the sierra. She received sacrifices of decapitated animals and birds as well as offerings of herbs and flowers. Her name was Tonacayohua, which means "preserver of the flesh" in Nahuatl. In contrast to many other Mesoamerican cultures, the Totonac did not believe the Sun's consort to be the Moon, since Totonac tradition considered both the Sun and the Moon to be male deities. The Totonac's hope, reported by Las Casas, that the sun god would intercede by sending his son to liberate them from servitude to the Aztec's gods, who required human sacrifice, may well have been a Christian interpretation of Totonac belief. Similarly, although the Sun, the Moon, and the planet Venus together figure prominently in the paintings in the temple of Las Caritas in Zempoala, it is improbable that the Totonac viewed these three celestial deities as forming a unified Trinity.

In the same city a temple was dedicated to Xolotl, the twin brother of Quetzalcoatl. These brothers were personifications of the different manifestations of the planet Venus as Morning Star and Evening Star.

To the south of Zempoala, large sculptures were erected of women who had died during their first childbirth. Such women were venerated, their deaths being seen as equivalent to the deaths of soldiers killed while taking prisoners (new servants for the Sun). Called *cihuateteo* (Nah., "deified women") by the Aztec, they were responsible for transporting the Sun on his course across the sky. Statuettes from the same area provide evidence that human beings were flayed in homage to a god similar to the Aztec deity Xipe Totec; the sacrifice was made to ensure a bountiful harvest.

**EVIDENCE FROM EL TAJÍN AND PUEBLA.** The relief sculptures among the archaeological remains of El Tajín reveal the

existence of another god, Huracán (whence the English word *hurricane*). While in Zempoala Huracán is represented as a *chacmool*, a reclining anthropomorphic figure, in El Tajín he is represented as a one-legged deity whom I consider analogous to Tezcatlipoca. From the Sierra Madre near El Tajín, Olmos reported the existence of (and denounced) a god called Chicueyozumatli (“8 Monkey”), to whom homage was paid at a time near that of the Christian festival of Easter. Like Huracán, Chicueyozumatli is analogous to Tezcatlipoca. Huracán was also equivalent to the god Tajín himself; this storm god survives today among the Totonac, who give him various names, including Trueno Viejo (Span., “old thunder”), Aktsini’, and Nanahuatzin.

It was also from the Sierra Madre that the Spanish first reported a festival, called Calcusot by the Totonac, which was held in November for the remembrance of the dead. This festival was widespread among the indigenous peoples of Mexico and survives today in a modified form celebrated on All Souls’ Day.

Religious beliefs bore upon sexual practices. Totonac priests were required to maintain celibacy. The high priest and the secondary priest were responsible for the circumcisions of month-old boys, and they also broke the hymens of infant girls. Priests would recommend that mothers repeat the latter operation once their daughters had reached the age of six. Through Olmos we also know that those seeking good health for some relative would refrain from sexual contact for eighty days before making their petition. The general regard for abstinence is demonstrated in a popular tale in which an old man arrives too late for a competition as a result of his libertine ways. The winner of the competition is transformed into the Sun; the old man is transformed into the Moon.

Several popular tales today constitute the remnants of the Totonac religion. In the area of Zempoala the Totonac language is no longer spoken, but in the area of El Tajín (present-day Papantla de Olarte) it still survives. Here the Totonac religious tales have become syncretized with Roman Catholic beliefs. One example is that the Sun and Jesus Christ are often considered to be the same. Another example is that Saint John and the god Tajín (or Trueno Viejo) are also identified as the same. The spread of Catholic (and, more recently, Protestant) religion continues to break down the original Totonac religion.

ROBERTO WILLIAMS-GARCÍA (1987)  
Translated from Spanish by Robert Allkin  
Revised Bibliography

**TOUCHING.** In religious usage touching often implies more than simple physical contact with the hands or other parts of the body. One may confer a touch to heal or assert power, to convey or obtain grace, or to consecrate or constrain a person or object.

**HEALING TOUCH.** A classic instance of touching is recorded in the first three Gospels. They relate that a woman who had had an issue of blood for twelve years came behind Jesus in a crowd and touched the fringe of his garment. According to Luke, Jesus asked, “Who touched me?” and added, “I perceive that power has gone out from me” (*Lk.* 8:45–46). When the woman saw that she was hidden despite the pressing crowd, she fell down before Jesus and declared that she had been immediately healed. As a charismatic healer, Jesus laid his hands upon sick folk, touched lepers, and put his fingers into the ears of a deaf mute and touched his tongue; he also put his spittle on the eyes of a blind man and twice laid hands on his eyes to effect a cure (*Mk.* 8:22–26).

In the Hebrew scriptures, the prophet Elisha is said to have laid himself upon the corpse of a child and to have put his mouth on the child’s mouth, his eyes on his eyes, and his hands on his hands. The child’s flesh became warm, and the prophet got up and then again stretched himself upon the body. Then the child sneezed seven times and opened his eyes (*2 Kgs.* 4:34–35). The prophet Isaiah, after having had a vision of God “high and lifted up,” confessed his own sinfulness, whereupon a seraph flew to him with a live coal from the heavenly altar and touched his mouth with it to purge his iniquity (*Is.* 6:1–7).

Not only the touch of a sacred person but the touch of anything connected with him could exercise healing power. The New Testament reports that the shadow of Peter was

sought by the sick, who were brought into the street to be cured as he passed by (*Acts* 5:15). And miracles were wrought not only by the hands of Paul but by the clothes that were taken from his body and given to the sick, whereupon diseases and possession by evil spirits went out of them (*Acts* 19:12).

The disciples of Jesus healed the sick by anointing them with oil (*Mk.* 6:13), and the elders of the church were instructed to pray for the sick and anoint them with oil in the name of the Lord (*Jas.* 5:14–15). From this developed what came to be called the unction of the sick, in some Eastern and Western churches, and extreme unction (a sacrament) in the Roman Catholic church. To the accompaniment of prayer, anointing oil is administered to the eyes, ears, nose, lips, hands, and feet of the sick person “for the health of body and soul.” This rite is to be distinguished from the viaticum (“provision for a journey”) of Holy Communion, which is administered to those near death.

Although Islam affirms that Muḥammad was a man and that the one miracle he wrought was the Qurʾān, devotees have credited the Prophet with a healing touch. Al-Bakhārī recorded that when one of Muḥammad’s companions broke his leg, the Prophet passed his hands over the limb, whereupon it seemed as if nothing had ever been wrong with it. A woman brought him her son who was possessed, and Muḥammad stroked the boy’s breast and prayed until the lad vomited and was healed. The Prophet even had power over nature: a palm tree that was one of the pillars of his mosque is said to have shouted out until it almost split, whereupon the Prophet embraced it until it calmed down and was quiet again.

In ancient and preliterate societies, power is attributed to the touch of healers, priests, and shamans. Doctors of the Ndembu of Zambia, for example, encircle a patient’s hut and bring medicines of roots and leaves. The patient’s chest and shoulders are washed, and then the doctor catches him by the little finger and directs him to a fire to warm himself. Still holding the patient’s little finger, the doctor gives him a rattle, and after a while the patient begins to tremble and dance. A helper puts his hands on the patient’s shoulders while the doctor places a medicine basket on the patient’s head; after further dancing, the patient is led backward into his own hut to rest and recover.

The practice of touching an animal in order to transfer evil to it is illustrated in the Bible. The priest Aaron was instructed to take two goats into the wilderness, one to be sacrificed as a sin offering and the other to be given as a scapegoat to ‘Aza’zel, a desert demon. The priest placed his hands on the head of the second goat, confessing over it the sins of the people, and sent it off to wander in the wilderness (*Lv.* 16:7–10, 21). In West Africa, a mother of twins who had died took a goat by the horns and placed her forehead three times against it in order to transfer her evil to it. Then the animal was sent away to wander outside the village.

In Asia and North America, both medicine men and shamans alike have performed functions of healing by touching. Although the shaman may utilize the curative properties of plants and animals or may massage patients, many illnesses are regarded as spiritual, that is, caused by injury to the soul. Thus the shaman’s method is meant to restore the soul, and this he accomplishes by ascending to the heavens or descending to the underworld in a trance. If he perceives the disease to have been caused by a foreign body, visible or invisible, he may extract it by sucking the part of the body that he saw while in a trance, sucking the skin either directly or through a bone or wooden tube. The shaman then dances and afterward may paint magical designs on the patient’s body or instruct the patient’s family on how this is to be done.

In Japan, Nakayama Miki (1778–1884), founder of the Tenrikyō religion, sought to heal sick people by giving them food or one of her belongings. As the numbers of her followers increased, she prepared amulets to give them. Relatives of the sick consulted her and brought with them some of the afflicted one’s clothes. She took them in her hands and breathed on them, and it was said that recovery followed at once. Miki also distributed to her disciples pieces of paper on which she had breathed, and when the demand on her became too great she granted this power of breath to her chosen disciples.

**TOUCHES OF POWER OR REVERENCE.** According to the *Laws of Manu*, a Hindu high-caste student must clasp the feet of his teacher both at the beginning and at the end of each lesson in the Vedas, crossing his hands so that he touches the left foot with his left hand and the right foot with his right hand. Similarly, he should touch the feet of his teacher’s wife and the wife of his teacher’s brother, if she is of the same caste (*Manu* 2.72, 132, 217).

Down to modern times, the physical presence of a teacher or guru has been treasured above books or learning, since true knowledge, power, and even divinity come through him. Sometimes the guru sits before his disciple in silence, and the latter squats with eyes closed. The guru may eventually touch the disciple’s forehead or gaze into his eyes, and thus power is felt to pass from one to the other.

In daily religious practice, a devout Hindu asks pardon from the earth for touching it with his feet as he rises from bed. When he is ready for worship, he invokes his god by *nyāsa*, “placing” or “fixing” the presence of the divinity in his body by holding the right hand successively in front of the mouth, eyes, ears, nostrils, top of the head, forearms, navel, and back. The touching is accompanied by recitation of a mantra, a scriptural text, and prayers that the gods who protect different parts of the body may each take up his special place. *Nyāsa* is also performed on images to install the gods within them. With bunches of sacred grass, the breast of the image is touched to install Brahma, the hand is touched to install Indra, the feet for Viṣṇu, and other parts for the appropriate gods.

In Sri Lanka, Buddhists perform comparable rites. In the presence of a superior, one joins the hands in reverence, bows or kneels, and even touches the ground with the forehead or touches the feet of the person saluted. Similar reverence is accorded images of the Buddha and other holy figures. The “eye festival,” which is held on completion of an image of the Buddha, is an elaborate ritual performed to ensure that the gaze of the image does not fall directly on the craftsman who paints in the eyes. He looks into a mirror to see the eyes as he paints them, thus avoiding the dangerous gaze; afterward he is led blindfolded from the room, and the covering is removed only when his eyes will fall on something harmless, such as water.

In Buddhist myth and imagery occurs the symbolic gesture (*mudrā*) of the Buddha “touching the ground” (Bhūmiśparsa Mudrā). There are several versions of this event. In one version, the Buddha at the point of attaining perfection was warned that he would be attacked by demons. So he pointed to the ground with his finger and called on the gods of the earth to rise up and kill the demons. In another version, the demon king Māra claimed the Buddha’s throne and summoned his troops as witnesses. The Buddha then touched the earth as his witness, and it proclaimed his right to the throne. Yet other accounts call this symbolic gesture the *mudrā* of the defeat of Māra, or touching the earth to oblige its gods to swear eternal fealty. Touching the ground has the meaning of repressing evil and also of calling the earth to witness. The five fingers of the left hand hold the Buddha’s robe at the level of the breast, and with the right hand five fingers touch or press the earth. In Buddhist imagery, this gesture is a distinctive sign of the historical Buddha, Śākyamuni, whereas other gestures in images and pictures are common to several Buddhas.

An Islamic tradition, from al-Bukhārī, says that once, when there was only a little food, Muḥammad blessed it until there was enough for a great multitude. This is similar to the gospel accounts of Jesus praying, blessing, and breaking five loaves of bread for five thousand people. Another Islamic narrative says that once, when the followers of Muḥammad were thirsty, he put his hand into a bucket and water gushed out from between his fingers like a spring. One follower said that the Prophet came to him in a dream and kissed his cheek, so that when he awoke the house was full of scent.

In Christianity, laying on of hands is said to communicate power. The Gospels record that parents brought children to Jesus in order that he might touch them. He brushed aside the protective barrier formed by the disciples and, taking the children in his arms, “he blessed them, laying his hands upon them” (*Mk.* 10:16). The Gospels record that the first Christian apostles chose deacons to help in secondary duties, laid hands on them, and prayed, whereupon the deacons became filled with power. Peter and John laid their hands on converts so that they would receive the Holy Spirit (*Acts* 6:6). The magician Simon tried to buy this power so that the Spirit might also descend on those on whom he laid

his hands (*Acts* 8:18–19). Paul and Barnabas had hands laid on them for success in a special mission, but a warning to Timothy to “lay hands suddenly on no man” shows that care was needed in such dedication.

Commission to service by laying on hands, especially in the ordained ministry of the church, has continued through the ages. It is practiced by nonepiscopal and free churches as well as by those that claim an unbroken apostolic and episcopal succession transmitted through this sacred touch. In the Church of England, the ordination of priests by the episcopal touch gives power as well as office, as reflected in these words from the traditional *Book of Common Prayer*: “Receive the Holy Ghost for the office and work of a priest in the Church of God, now committed unto thee by the imposition of our hands.” In the consecration of a bishop, other bishops lay hands on his head and exhort him to “stir up the grace of God which is given thee by this imposition of our hands.” At the investiture of a high-caste Hindu, the candidate passes from low or neutral status to that of a “twice-born.” The central rite is the Upanayana, the “donning of the sacred thread,” nowadays confined usually to boys, although in former times girls also were invested with this symbol of rebirth. While the preceptor recites appropriate texts, the candidate, facing the sun, slips the cotton threads over his head and across his breast. The teacher puts his right hand on the right side of the boy, alternately touching the candidate’s shoulder and his own breast while exhorting obedience and unity of mind. The teacher then takes the boy’s right hand into his own and asks him his “old name”; he then gives him a “new name” (which is uttered only at this ceremony). When the candidate is finally considered ceremonially pure, he performs *nyāsa*, touching his own head, eyes, nostrils, hands, arms, limbs, and other parts of his body to purify them all. The third finger of the right hand is considered the most auspicious, and, with it, the newly “twice-born” man touches some of the ashes of the sacred fire that is burning nearby and puts them on his forehead, throat, and right shoulder and over his heart. Then he is blessed and bows to his teacher and all his elders.

Not only prophets and healers but secular rulers have been credited with a potent touch, thereby expressing the divinity that “doth hedge a king.” European kings touched their subjects who suffered from scrofula, also called “the king’s evil,” a swelling of the glands that supposedly was cured by the royal touch. French kings had done this since ancient times, and the custom was introduced to England in the eleventh century by the saintly Edward the Confessor. In the late fifteenth century, Henry VII, perhaps to encourage support for his claim to the throne, instituted a ceremony for touching persons suffering from scrofula and presented the afflicted with gold coins; in the seventeenth century, Charles I distributed silver pieces for the sufferers to touch. From then until 1719, the Anglican *Book of Common Prayer* contained an office called At the Healing, in which the monarch laid hands on the assembled infirm persons and put gold

or silver about their necks while a chaplain recited the following prayer: "God give a blessing to this work, and grant that these sick persons on whom the king lays his hands may recover." The practice of royal touching to gain popular support reached its peak in England under Charles II, who reigned from 1660 to 1685. Charles touched nearly one hundred thousand people. According to Thomas Macaulay, "in 1684, the throng was such that six or seven of the sick were trampled to death." A short time later, William III called the practice "a silly superstition," though his wife and coregent, Mary II, continued it. Queen Anne, who reigned from 1702 to 1714, was the last British monarch to practice royal touching. James Boswell recorded in his biography of Samuel Johnson that the infant Johnson had been taken to be touched by Queen Anne because he had a disfigured face, "his mother yielding to the superstitious notion, which, it is wonderful to think prevailed so long in this country, as to the virtue of the regal touch." Queen Anne's touch, however, had no effect on the young Johnson, and Boswell teased him that "his mother had not carried him far enough, she should have taken him to Rome." A practice comparable to the royal healing touch is the washing of feet performed on Maundy Thursday by notable people in imitation of Christ's washing his disciples' feet. The practice took its name from the Latin *mandatum*, the translation of the "new commandment" that is given in *John* 13:34. Popes, bishops, and kings practiced the ablution; the pope would wash the feet of his cardinals or, in modern times, the feet of selected poor men. In England, kings did such washing until the reign of James II in the late seventeenth century. Specially minted "Maundy money" is still distributed by the monarch to certain old people during a religious ceremony that takes place at a different cathedral in England each year on Maundy Thursday, the Thursday before Easter.

Power in the royal touch, look, or presence is attested in many places. In the *Laws of Manu* the presence of the king, like the sun, is said to burn eyes and hearts, and nobody on earth can even gaze on him; even an infant king is a deity in human form. The monarch's responsibilities are great, and he must conquer his own senses if he is to require obedience from others. The king rules by the rod but must do no bodily injury unjustly. If he fights his foes in battle, he must not strike with poisonous weapons or smite one who surrenders. His highest duty is to protect his subjects and gratify with a kindly reception all who come to see him.

West African kings often wore beaded veils over their faces, a practice that seems to be very ancient, from the evidence of bronze masks with holes for veils. To look directly at a king's face or to receive his unveiled gaze were considered equally dangerous. For the monarch to point at or touch a commoner might be seen as either a mark of favor or of danger.

In China, the physical obligations of a king were detailed by the Confucian scholar Tung Chung-shu, who stated that the monarch must personally grasp a plow handle

and plow a furrow, pluck mulberries and feed silkworms, and break new ground to increase the supply of grain. As the representative of Heaven, the king formally touched the plow or sickle to initiate the harvest. In Japan, to this day the emperor cuts the first rice of the harvest. Photographs in public newspapers show him dressed in shirt, suspenders, and trousers, harvesting rice. The rice he has cut is sent to the central Shinto shrines at Ise.

**KISSING AND HANDSHAKING.** Kissing is a form of close touching, a sign of reverence as well as of greeting or affection. It is performed on human beings and objects alike. The Bible's report that the prophet Elijah was assured that there were in Israel seven thousand people who had not kissed the god Baal indicates that the Canaanite and Phoenician custom of kissing the images of their gods was being practiced by the Israelites. The prophet Hosea also spoke despairingly of the Israelites kissing silver idols of calves. The Greeks and Romans also kissed images of their gods, and early Christians were persecuted for refusing to make such homage.

The ancient Hebrews kissed the floor of the Temple. Jews still kiss the scroll of the Torah when they are about to read it, and they kiss any holy book if it has been accidentally dropped. When the Torah scrolls are taken around the synagogue in procession, worshipers touch them and then place their hands on their own breasts. When a Jew puts on a prayer shawl, he kisses it, and upon entering or leaving a room, Jews may kiss or touch a *mezuzah*, the miniature container holding several verses of scripture that is affixed to a doorpost. At the Western Wall in Jerusalem, worshipers handle and kiss pieces of paper on which they write prayers and that they then put into cracks in the wall.

In the celebration of the Mass, Roman Catholic priests kiss the altar and the corporal cloth on which the sacred elements are laid. A priest also kisses the cross on a stole before he puts it on. In both Eastern and Western churches, ritual kissing is also performed with relics and with books of the gospel, crosses, candles, palm branches, vestments, and utensils of the liturgy. In British courts, oaths are sworn by taking the Bible or another holy book in ungloved hands; formerly the book was kissed.

Images and icons are popular objects of the kiss. In Saint Peter's Church in Rome, the toe of a statue of the apostle has been partly worn away by the kisses of devotees. In Ireland, the kissing of the Blarney Stone is a modern tourist attraction that may look back to prehistoric times. Part of the ritual of the Islamic pilgrimage to Mecca is kissing the Black Stone, which is set in the wall of the Ka'bah. Because the crowds are vast, some pilgrims use long sticks to touch the stone, or from a distance they simulate a gesture of touching and afterward pass their hands over their faces while praising God and his prophet. In the opposite corner of the Ka'bah is another stone, which it was the Prophet's custom to touch. When the crowd prevents a pilgrim from touching it, he says a prayer for blessing and forgiveness. Followers of the late shah of Iran may still be observed kissing his portrait, and

the same gesture of reverence is offered to pictures of his rival, the Ayatollah Khomeini.

The Second Psalm (2:11) exhorts Israelite worshipers to “kiss [the Lord’s] feet,” no doubt an act of homage. This carried over to the kissing of kings’ and popes’ feet. In India, to kiss the feet or take the dust of the feet upon one’s own head is a sign of submission and reverence. A farewell kiss to the dead is an old practice, one that was sometimes forbidden. It is still practiced in an attenuated form by touching the coffin.

In the Islamic world, kissing the shoulder, the foot, or, especially, the hand of a holy man is believed to communicate spiritual benefit. The water in which saints have washed their hands confers grace, and schoolboys may drink the water they have used to wash the board on which they write passages from the Qur’ān, in order that they may learn the text more easily. The saliva of a holy man is said to have medicinal value, and schoolboys are thought to learn their lessons better when their teachers spit into their mouths.

The kiss of peace became a distinctive Christian ritual: both Paul and Peter exhorted their readers to “salute one another with a holy kiss,” but by the time of Tertullian, in the second century, it was ruled that men should kiss only men and women should kiss only women, to prevent suggestions of scandal. The kiss had a sacramental value. It was an outward sign of spiritual union or blessing: bishops were given a kiss at their consecration and kings at their coronation. The practice of the kiss of peace has been revived in modern times, either by shaking hands and uttering a phrase of peace or, for the less reserved, by giving a holy kiss.

The shaking of hands may also transfer grace or mark privilege. In Morocco, when equals meet they may join hands in salutation, and then each person will kiss his own hand. Among the West African Ashanti, during intervals of dancing, priests walk around the circle of spectators, and each places his right hand between the extended palms of the person saluted. The right hand is usually considered the proper or fortunate one, and the Ashanti may refuse to take a gift or even the payment of a debt from the left hand of the giver. In Latin, the word for left is *sinister*, and the Greeks euphemistically called the left the “well-named” side in order to avert bad luck. Shaking with the left hand, or with a finger bent back, is practiced by special societies and copied by Freemasons and Boy Scouts.

**TOUCHING PROHIBITED.** On the negative side, the prohibition against touching may be as important as the act itself. Usually it serves to save a person from contamination. When Moses brought the Israelites to Mount Sinai, he alone went up into the presence of God. Although the people were sanctified by ritual washing, they were exhorted not to touch the mountain or its border, for “whosoever touches the mount shall surely be put to death” (*Ex.* 19:12). The elaborate regulations described in *Leviticus* include many prohibitions against touching objects and people that were deemed sacred

or dangerous. Touching any unclean thing would bring guilt and pollution and would require purgation by the presentation of a sin offering and an atonement effected by a priest. Touching a dead body was considered particularly dangerous, and there are repeated warnings against such action. The power of blood was always perilous, and touching a menstruating woman or anything she sat on required washing and the presentation of a sin offering. Because blood was considered the life or soul, prohibitions against its consumption were imposed on Jews, and this rule was extended to Muslims as well.

The Bible also strictly forbade touching to harm, or even to suggest disrespect for, a sacred object or person. When Uzzah put out his hand to steady the Ark, “God smote him” (*2 Sm.* 6:7). The Bible records God’s command, “touch not mine anointed, and do my prophets no harm,” a sentiment echoed in the vicar of Bray’s damnation of those who “touch the Lord’s anointed”—a reference to the execution of Charles I. An example of reverential and perhaps numinous prohibition against touching is found in the words of the risen Christ to Mary: “Touch me not” (*Jn.* 20:17). There are many other examples of religious figures who kept themselves from being touched. When Nakayama Miki felt herself to be filled with divinity and chosen for a special mission, she separated herself from the common people. She ordered that a separate fire and separate vessels be used to cook her food, and she wore only red robes to show that she was not an ordinary person. This emphasized the numinous value of the amulets that she gave to her faithful, since she claimed to be the mediatrix between God and men, saying, “I must be set aside and live in a special and separate room.”

#### BIBLIOGRAPHY

Among the countless books on Christian teaching and life that may be consulted on themes related to touching, special reference may be made to *A New Dictionary of Christian Theology*, edited by Alan Richardson and John Bowden (London, 1983), and to the oft-reprinted *Oxford Dictionary of the Christian Church*, edited by F. L. Cross (Oxford, 1957). See also *Touching* by Ashley Montagu (New York, 1971). Islamic rituals of pilgrimage and prayers are described by Ahmad Kamal in *The Sacred Journey* (New York, 1961). Victor Turner describes “religious processes” among the Ndembu of Zambia in *The Drums of Affliction* (Oxford, 1968), and Henry van Straelen’s *The Religion of Divine Wisdom* (Tokyo, 1954) gives an account of the history and rituals of Tenrikyō. *The Rites of the Twice-Born* (1920; reprint, New Delhi, 1971) by Margaret S. Stevenson is probably still the most detailed and readable account of Indian high-caste life and practices. *Mudra* (New York, 1960) by E. Dale Saunders is an illustrated study of symbolic gestures in Buddhist sculpture. A valuable study of the rites and symbols associated with kissing is *The Kiss Sacred and Profane: An Interpretive History of Kiss Symbolism and Related Religio-Erotic Themes* (Berkeley, Calif., 1969) by Nicholas J. Perella. Shamanic activities in a variety of cultures are described at length by Mircea Eliade

in *Shamanism*, rev. & enl. ed. (New York, 1964), and perhaps the most exhaustive account of particular Islamic customs is to be found in Edward Westermarck's *Ritual and Belief in Morocco*, 2 vols. (1926; reprint, New Hyde Park, N.Y., 1968).

GEOFFREY PARRINDER (1987)

**TOURISM AND RELIGION.** Tourism and its associated practices interact with religious life and the institutions of religion in virtually every corner of the world. From Amish communities of rural Pennsylvania to the snowy summits of Mount Fuji in Japan, from the mysterious ruins of Machu Picchu in the Peruvian Andes to the monumental pyramids of Giza in Egypt, from Chartres in France to the Western Wall in Jerusalem, millions of tourists seek out places of religion every year. The relationship between religion and tourism, however, amounts to far more than places of religion that host tourist visitors. In fact, there are at least three broad approaches to understanding this relationship: spatial, historical, and cultural. Each of these illuminates different implications for religious life when tourists enter a sacred precinct.

**SPATIAL RELATIONS BETWEEN RELIGION AND TOURISM.** Tourists and religious adherents often occupy the same spaces; consequently, they both play a role in attributing meanings to these spaces and in sustaining the sacred character of sites that host both casual and deeply committed visitors. In fact, the religious meanings that make a place sacred also make the site a meaningful destination for tourists. At the same time, however, tourists and religious practitioners usually have very different attachments to and understandings of these sacred spaces.

Spaces become sacred according to the historical, social, and cultural contexts of particular religious traditions. The holy nature of Mecca, for instance, cannot be understood apart from the historical and sociocultural contexts of Islam. Indeed, the close identification between Islam and its most sacred city make them nearly indistinguishable. Likewise, the shrine at Tepeyac, which houses the sacred image of the Virgin of Guadalupe in Mexico City, gains its auspicious powers from the miraculous appearance of the Virgin there; these powers, however, also derive from the historical circumstances of colonial relations between European Christians and Native American converts, as well as from the racial, ethnic, gender, and socioeconomic dynamics of subsequent generations of Catholic worshippers at the site. Both of these cases demonstrate how places are made holy according to particular religious traditions and the spatial practices that sustain their sacred character.

Tourists, on the other hand, arrive with a different set of spatial practices embedded in their own peculiar historical, social, and cultural contexts. Unlike religious practices related to particular sacred spaces, however, the spatial practices of tourists rely on modern conventions of travel and aesthet-

ics practiced in the context of global capitalism. Hence, they make these spaces into touristic places that remain distinct from the sacred places of religious people. At Tepeyac, for instance, the sacredness sustained in veneration of the Virgin of Guadalupe appears to a touristic sensibility in terms of aesthetics, history, and the exotic otherness of unfamiliar cultic behaviors. Thus, the space of Tepeyac becomes simultaneously a place of religious practice and a place of touristic indulgence.

Places of both religion and tourism range from the predominantly religious to the predominantly touristic. As an example of the former, the prohibition of non-Muslims in Mecca keeps Islam's most holy city free from purely touristic travelers, although the touristic imagination of non-Muslims makes it a desirable, if improbable, destination. In contrast, Uluru in Australia, the world's largest monolith, retains its mythic significance as a sacred site for Aboriginal people, but it is best known for the striking beauty of its ethereal hues. A half million annual visitors make the journey deep into the Australian interior to view the giant outcropping set in the stark outback landscape.

Between the extremes of predominantly religious and predominantly touristic lies a great variety of religious places that host significant numbers of tourist visitors. These places range from the ancient to the contemporary, from auspicious features of the natural landscape to glass and steel architectural structures, from remote spots far from human habitation to the centers of the world's most densely populated urban areas. In addition, tourists seek out religious events that include regularly performed rituals, special dedicatory events, festivals, and carnivals. There seems no end to the types and locales of religious sites and celebrations that appeal to the curiosities of touristic travelers.

Among the most auspicious of places that tourists seek out are natural features regarded as sacred by one or more religious traditions. Mount Fuji, for example, looms above the Japanese landscape as a sacred monument in both the Shintō and Buddhist traditions; at the same time, the mountain serves as one of Japan's most recognizable icons for tourists. Caves, on the other hand, tend to appeal to visitors more for their ancient artwork associated with prehistoric religions rather than for their inherent sacredness. At places like Lascaux in France and the Altamira caves of northern Spain, visitors can tour exact replicas of the caverns complete with detailed copies of their ancient paintings, even though entrance into the caves themselves is restricted at both sites.

Tourists also visit the architectural ruins of places where ancient peoples practiced their religions. Among the most famous of these sites are the remains of structures built by the Egyptian, Greek, Roman, and other civilizations of the ancient Mediterranean world. Similarly in Indonesia, travelers can visit the restored Buddhist temple of Borobudur. Prehistoric sites in the Americas include the monumental pyramids and other sacred structures of Teotihuacan in central Mexi-

co, and the Inca ceremonial center of Machu Picchu in Peru remains a favorite stop for tourists.

Places where contemporary people continue to practice their religion also capture the attention of tourists. Tourists can view the Dome of the Rock, one of the holiest sites for Muslims in the ancient city of Al-Quds (Jerusalem). Also in Jerusalem, an ancient ruin that remains an active place of religious practice for Jews is the Western Wall of the Temple Mount, popularly known as the Wailing Wall. In Rome, holy places of Christianity abound; among the most popular are St. Peter's Basilica and other sites of the Vatican. In Japan, the Ise temple complex, the most sacred site of the Shintō religion, is a favorite destination for tourists.

Tourists often take more interest in witnessing religions in practice than in merely viewing the places of religion. A visit to a church, temple, mosque, or shrine becomes more meaningful and fulfilling if a ritual or some other event happens to be occurring at the time of the visit. Special celebrations and religious festivals generate even more enthusiasm among visitors. Widely known festivals such as Carnival in Rio de Janeiro in Brazil or Mardi Gras in New Orleans in the United States attract huge crowds every year. But smaller, lesser-known celebrations often have greater appeal for travelers. Visitors in China intent on experiencing authentic Chinese culture may have more interest in a local village's Lantern Festival than in a large celebration that is widely promoted in tourist literature.

There is no end to the places and events of religion that tourists visit each year, and an attempt to list all the possible religious attractions for travelers would prove futile. Indeed, outsiders visit religious sites and witness religious activities virtually everywhere. Many of these visitors do not regard themselves as religious practitioners or pilgrims; they come as tourists, modern consumers of religious culture. Certainly, a good number find themselves actively participating in religious practices at the places they visit, but at the same time they rarely falter in pursuit of their touristic objective to have authentic, aesthetically pleasing experiences.

**HISTORICAL RELATIONS BETWEEN RELIGION AND TOURISM.** It is tempting to suggest that tourism has its roots in religious pilgrimage. In fact, as categories of practice and experience, pilgrimage and tourism are easily confused. In contemporary settings, pilgrims often engage in touristic activities; like tourists, they take photographs of the places they visit, they purchase souvenirs and gifts, and they avail themselves of the same transportation and lodging accommodations that tourists use. At the same time, tourists who visit religious sites, including pilgrimage destinations, sometimes find themselves participating in religious practices, and many so-called tourists are overtaken by feelings that can be described as religious at sites regarded as sacred. Thus, it is easy to confuse the experience of the tourist with that of the pilgrim.

Yet despite the difficulty of distinguishing between them, the practice of tourism has origins largely independent

of the traditions of religious pilgrimage. By 1780, when the term *tourist* first appeared in the English language, conventions of recreational and educational travel in the Western world already had established themselves with more than two centuries of development. In fact, the history of touristic practices follows on the same historical forces that challenged the traditional authority of Christianity and consequently led to the demise of pilgrimage in much of northern Europe. These include the rise of humanism beginning in Renaissance Italy and spreading northward; the Protestant reformations of the sixteenth century that shook the foundations of traditional church authority in Christian Europe; and the Enlightenment of the seventeenth and eighteenth centuries, which introduced new models of political authority and modern forms of subjectivity. Along with their profound impact on European societies in general, these movements also changed the expectations and requirements for an educated citizenry. Sara Warneke (1995, p. 30) notes that, instead of a pure scholasticism pursued in earlier times, the Renaissance education sought to prepare students for a life of service to their community, their prince, and their state; this often included stays in foreign states to learn firsthand the culture and politics of other societies. By the second half of the sixteenth century, significant numbers of travelers were leaving their homelands in hopes of gaining the educational benefits of a continental journey.

Following the Thirty Years' War of the seventeenth century, travelers settled into a conventional pattern of educational travel that would be the basis for what became known in the eighteenth century as the Grand Tour. Not unlike their counterparts in the sixteenth and seventeenth centuries, participants in the Grand Tour sought education and refinement. But tourism changed over the course of the eighteenth century. Early in the century a classical view of the Grand Tour dominated, most typically involving young men traveling with an entourage of servants and tutors to selected European destinations, most often Paris and Italy, to finish their education and practice the refinements of cultivated society. But in the second half of the century, as Jeremy Black (1992, p. 300) points out, the classical model became less typical as more people traveled for enjoyment and amusement. Black goes on to note that although many aristocratic families continued to send their sons abroad for education and social finishing, the emphasis on education declined as tourism joined in the growing European fascination with leisure activities (p. 303).

By the time of Napoleon's defeat at Waterloo in 1815, travel practices in Europe were undergoing significant changes that precluded a return to the heyday of the Grand Tour. Steamships and railroad service allowed for more convenient, more enjoyable, and less time-consuming tours of the Continent. And although tourist travel throughout most of the nineteenth century remained primarily a privilege of wealthy classes, the growth of railroad transportation made travel available to at least a few members of the middle class-

es. In the twentieth century, however, mass production of automobiles, along with a trend toward shorter workweeks, allowed greater numbers from all but the lowest socioeconomic classes to indulge in regular, if infrequent, tourist travels. Air travel has extended the range of the twenty-first-century tourist to every continent on earth, and space travel has even taken tourists even beyond the earth's atmosphere.

From the very beginning of tourism's history, tourists have held a fascination with religion. Early travelers of the European Renaissance regularly visited churches, cathedrals, shrines, and other religious sites in their studies of the art, architecture, culture, and history of the nations they visited. On occasion, Renaissance travelers also condemned the practices of the religious people they encountered at such places. In fact, the humanist Desiderius Erasmus (1466?–1536) signaled a pivotal moment between Christian pilgrimage and the beginnings of religious tourism with his colloquy "A Pilgrimage for Religion's Sake," which first appeared in 1526, with an anonymous English translation appearing a decade later as "The Pilgrimage of Pure Devotion." Erasmus traveled as a secular visitor to various pilgrimage sites where he had little patience for traditional religious practices; indeed, his observations and subsequent criticisms of pilgrims reflected the groundswell of intellectual, political, and religious reforms sweeping Europe at the time.

The tension between practices of the earliest tourists and those of their pilgrim counterparts, as exemplified in Erasmus's essay, has continued into the twenty-first century. In fact, pilgrimage sites remain favorite tourist destinations even today. Nonreligious visitors frequent such popular Christian pilgrimage destinations as Lourdes in France, Santiago de Compostela in Spain, and the Basilica of the Virgin of Guadalupe in Mexico. In the Hindu tradition, Benares, India, serves as a favorite destination of tourists, and Buddhist stupas throughout Asia attract both religious and nonreligious travelers. In these auspicious religious places, pilgrims become tourists even as tourists fancy themselves as pilgrims. A cultural understanding of tourism, however, reveals that the appeal of religion as a desirable attraction for tourist visitors extends beyond the confusion between tourist and pilgrim. In fact, tourism as a modern cultural practice transforms religious places, rituals, artifacts, and people into objects for touristic consumption.

**CULTURAL RELATIONS BETWEEN RELIGION AND TOURISM.** Tourism amounts to a set of cultural practices aimed most often at aesthetically pleasing experiences of unfamiliar places and peoples. Tourists encounter cultural otherness by leaving their familiar surroundings, but touristic practices tend to domesticate unfamiliar places and novel experiences by making them into objects of consumption. In this regard, tourism exemplifies modernity; in particular, its conventions, habits, and discursive concerns rely on and respond to the forces of modern capitalism, especially in its emphasis on consumption, its tendency toward globalization, and its aesthetic proclivities. Put simply, tourists are practitioners of

modernity. Moreover, tourism has become pervasive in modern life. Not only do modern people travel far more than ever before, but as some commentators insist, they are tourists most of the time, even in their own homes and communities. Indeed, touristic practices pervade the modern way of life.

On the other hand, tourists rank among the most maligned of modern subjects. In fact, derogating tourists is a part of being a tourist; Jonathan Culler (1981, p. 130) notes the somewhat ironic fact that tourists gain esteem by denying their status as a tourist; indeed, there is always someone else less adept in the arts of modern travel whom one can disparage as "tourist," elevating oneself as something better than a tourist. Consequently, maligning others conceals one's own touristic inclinations and practices, even as it makes one a better tourist.

Being a better tourist, then, involves having only a discreet engagement with touristic practices. At the most fundamental level, these practices rely on the technologies, networks, and discourses that constitute modern travel practices in general. Travel practices can be defined as any practice, discourse, or circumstance that either necessitates translocal movements or that generates a desire for travel and encourages people to travel; besides tourism, these practices also encompass migration, business and trade, military deployments, research excursions, family visitations, and many other forms of and motives for travel. The practices themselves involve various modes of transportation, most commonly airlines, trains, buses, and automobiles. They also include communication networks that facilitate travel, especially telecommunications and the Internet, but also television and radio broadcast media, newspapers and magazines, and other forms of mass communication. Other aspects of the modern practice of travel include banking networks that allow convenient and trustworthy currency exchange; accommodations for lodging and food services; and any other services or products that meet the needs and desires of modern travelers.

Besides modern infrastructures and services that make global travel possible, convenient, and comfortable, touristic practices participate in modern discourses that make travel desirable. Foremost among these is a discourse on experience. In fact, as a discursive category, experience serves tourism as an epistemological mode of knowing the world in a modern way. This includes equating authenticity with truth and interpreting experiences as meaningful by aestheticizing landscapes, cultures, events, cities, villages, and even entire societies. In fact, touristic discourse attributes aesthetic qualities to anything and everything that travelers might encounter. Indeed, tourists everywhere seek out and expect the most authentic and aesthetically pleasing experiences possible.

The emphasis on experience in touristic discourse aligns tourism with religion in the modern world. Robert Sharf (1998, p. 95) points out that theologians and scholars of religion invoke the category of experience in dealing with two

peculiarly modern challenges to traditional religious authority: empiricism and cultural pluralism. Indeed, the claim of authentic religious experience forestalls critiques of religious authority on strictly objective, empirical grounds. At the same time, cross-cultural similarities of religious experiences lend a universal authority to the category of religion beyond the limited claims of particular religious traditions. In a similar fashion, touristic experiences, at once both authentic and aesthetic, confer validity, authority, and meaningfulness on the modern traveler.

As a modern practice, however, tourism submits these experiences to a thoroughgoing process of commodification. Every sight, sound, and taste; every locale and event; indeed every experience available to modern travelers becomes subject to a system of exchange that commodifies them in aesthetic terms for touristic consumption. Tourists are hyperconsumers of aestheticized culture, including religion. In fact, religious people themselves oftentimes adopt touristic practices to commodify their religion for touristic consumption. They do this not only for financial gain, but also to proselytize, and in many cases religious groups capitalize on touristic attention simply to present themselves and their religion publicly in the best possible light. For example, the Church of Jesus Christ of Latter-day Saints takes advantage of touristic interest at Temple Square in Salt Lake City to tell the Mormon story in heroic terms and to draw visitors into the church's missionary process. On the other hand, numerous churches in Europe pay for their upkeep and improvements by charging admission to visitors and by operating retail shops where tourists can purchase souvenirs and religious paraphernalia.

This process of commodification highlights the implications of the encounter between religion and tourism. Nearly all religious people in the world today must contend with the challenges that modernity presents to long-standing traditions, and tourists bring those challenges into the sacred spaces of the world's religions. By involving themselves in the touristic discourse on experience, both authentic and aesthetically pleasing, religious people conform to conventional assumptions about the role of religion in the modern world even as they assert the validity and power of their religious traditions and values in modern terms. At the same time, tourists experience religious life according to their own assumptions, expectations, and desires. Consequently, most tourists rarely appreciate the uniqueness and complexity of the religious practices and traditions they observe in their touristic travels. On the other hand, viewing tourism from the perspective of its spatial dimensions, understanding its historical origins, and regarding it as a cultural phenomenon of the modern world obviates a simple dichotomy between religion and tourism. Differentiating religious people and tourists in strictly oppositional terms becomes more difficult when considering the many dimensions of their relationship. Indeed, tourism and religion are not mutually exclusive, and in fact they often reside together in individuals who remain at once both tourists and religious adherents.

THOMAS S. BREMER (2005)

**TOWERS.** Strictly speaking, a *tower* is any architectural structure that is high in proportion to its lateral dimensions. Broadening that definition, tower here will be understood to be any architectural structure whose religious meaning is related to its lofty vertical dimension. This entry will refer to this quality as vertical aspiration, which, while inexact, at least sets towers apart from merely massive structures. Towers have no single explanation but betray a variety of meanings that show clearly the ingenious fertility of the religious imagination and offer a challenge to the interpreter, especially in cases where there is a paucity of written sources. Their meanings are not fixed but can change over time.

The Egyptian pyramid, one of the earliest examples of tower building, is essentially a funerary monument used to inter and glorify deceased pharaohs, yet the pyramid is not simply a gigantic tombstone. Because of the divinization of the ruler, it is also a structure that houses a sacred presence. The obelisk, originally a monument to the sun god Re, later became a popular architectural feature in Europe and North America. The ziggurat of ancient Mesopotamia was a multistoried structure surmounted by a temple, where gods were worshipped, annual rites were performed, and the authority of the ruler was confirmed; it was a place of communication between upper and lower worlds.

The Zarathushtrian *dokhma*, often translated as "tower of silence," has an entirely different meaning. These towers are twenty- to thirty-foot cylindrical funerary structures that continue to be used in the twenty-first century by the small Parsi population of South Asia and Iran (e.g., Mumbai, an-

cient Yazd). Because earth, fire, and water are sacred and because the more common means of disposing of the dead (burial, cremation, interment) would pollute these elements, bodies of the deceased are placed over grates at the summit of the tower, through which body fluids and rain can pass until the vultures and sun leave nothing but bones. The towers therefore prevent pollution of the sacred elements, thus protecting the living and also becoming passageways for the dead from this life to eternity.

**STUPA AND PAGODA.** The basic form of the Buddhist stupa was a hemispherical earthbound dome built to house the sacred relics of the Buddha or his disciples and to be the focus of ritual circumambulation or meditation by devotees. The group at Sāñcī in central India remains the best surviving example of this genre. Although stupas were not conceptually towers in their original form, reliefs on Indian Buddhist buildings already depict the stupa in the second to third centuries CE with a vertical character. Early stupas in Nepal, such as that of Carumati, show a towerlike elongation of the *harmikā* (the finial above the dome of the stupa). Generally the vertical elongation took place as the stupa form crossed central Asia, and by the time it entered China in the later Han dynasty (25–220 CE) it had become a true tower.

The Chinese Buddhist pagoda represents a culmination of this development, becoming a multistoried building that ascended at times to dizzying heights, as does the Fogong monastery pagoda at Yingxian, built in 1056. At 550 feet it is still the tallest wooden structure in the world. Since earlier Chinese architecture was horizontal in character, with rare examples of multistory buildings, the pagoda suggests an aspiration for transcendence not found previously. Yet in its original meaning the lofty pagoda signifies the same as its architectural opposite, the earthbound stupa. It is a structure built to house and honor the relics of the Buddha. At the same time it acquired a wealth of new meanings over a long history in China and elsewhere in East Asia. Built to house the living presence of deity in the form of the Buddha's remains, it was at first the principal worship space in early Chinese Buddhist architecture. The Yongning Temple at Loyang, built in 516 CE, for example, had the pagoda sited at the center of the temple complex. Later the pagoda shared its centrality on the main axis of a monastic or temple compound with the Great Buddha hall just behind it. As time passed the Buddha hall became the main place of worship, and the pagoda declined in importance and came to be situated outside and behind the monastic or temple complex. Ritual circumambulation of the stupa was replaced by circumambulation of the Buddha image.

The pagoda acquired other meanings, becoming an imposing sign of Buddhist presence in China, a demonstration of the merit of the emperors and wealthy patrons who were able to fund such a project, a "guiding tower" to lead pilgrims toward their destination, and a funerary structure built to house the ashes of cremated monks. Finally, the pagoda was fully "domesticated" as a familiar element in the Chinese

landscape, a site for popular rituals and a protective element in the complex system of fengshui (geomancy) that sought to balance *qi* (vital energy) that flowed in patterns across the surface of the earth. Yet older meanings were rarely lost. At the pagoda of the Temple of the Buddha's Tooth outside Beijing, post-Communist crowds still come as pilgrims, kowtowing as they ascend the steps to revere the sacred relic and worship the Buddha.

**ŚIKHARA.** By the fifth century CE the Indian Śilpa Sāstra texts had formally designated the tower or *śikhara* as the most prominent architectural statement for the Hindu temple (i.e., *vimāna*, that which is “well measured”) and the crowning achievement for the idea of *pratibimba* (the creation of divine regions). The *śikhara* served at least three functions: as denoting generally sacred space, as a sacred mountain that denotes the dwelling place of the deity, and as a vehicle that carries the deity into the presence of the people and the people into the presence of the deity. The Śilpa Sāstra texts also suggest that those who build temples will not only be prosperous and have peaceful reigns but will have sons to succeed them and care for the funerary rites. Thus the reigning dynasties had great incentives to build these towering temples to the gods.

The Hindu temple as a whole became the architectural form of the *vāstupuruṣa maṇḍala*, the locus where the divine being (*puruṣa*) dwells. It is almost always built on an east-west axis, with the entrance from the east and the tower above the western end. Underneath the tower is the inner sanctum, the *garbagrha*, the dwelling place of the deity. Along the roof of the *vimāna* from entrance to *śikhara* are gradually ascending towers that imitate the sacred Himalayas, the ultimate dwelling place of the gods and goddesses on earth. Surmounting the *śikhara* on all temples is a *kalaśa*, or water pot, signifying the eternal bathing (*abhiseka*) of the tower by the holy waters of the Ganges River. In the northern- or *nāgara*-style the temple tower is convex, with an *āmalaka* or fruit of the Indian gooseberry (*Emlica officinalis*) immediately below the *kalaśa*. The southern- or Dravida-style tower is concave and has a small stupa (*stūpika*) below the *kalaśa* symbolizing the cosmic dome over the dwelling of the deity.

Most temples were constructed as places where *brahman* priests could perform *pūja*, ritual worship on behalf of the king and his realm, reminding the people of the king's power and divine right to rule. Temples thus became centers of political, social, and cultural as well as religious activities. As the towers became higher in both North and South India, this sense of dominance was enhanced. The architectural climax of this movement is evident in the Bṛhadeśvara temple of the early eleventh century CE Cōḷa king, Rājarāja, of Thanjavur in South India. Towering 210 feet above the base of the temple, the *śikhara* is as high as the technology of the period would allow, and it remains the tallest temple tower in all of India. The eighty-ton *stūpika* that crowns the *śikhara* is the largest single stone employed by Indian architecture on any temple tower.

Following the Cōḷa period the temple tower that marked the holy of holies began to lose its vertical dominance in the south, whereas the *goparam*, or gateway to the temple precincts, achieved ascendancy. By the sixteenth and seventeenth centuries, at the temple cities of Śrīraṅgam and Madurai, the gateways reached as much as fourteen stories into the sky and could be seen for miles around as one approached the city. Here both resident and visitor entered the sacred precincts and were at the same time reminded of the king's power to protect his people. As many of the *śikharas* had done in earlier times, these towers assumed a didactic function, visualizing in hundreds of sculpted images various mythic narratives of the lives of the gods for the mostly non-literate population.

The Indian temple *śikhara* as mountain-sacred city exhibits its most extravagant forms and highest ornamentation in the Hindu temple complexes of the Khmers of Cambodia (e.g., Angkor Wat) and the Buddhist temple tower complex at Borobudur in Java. The latter combines the stupa idea with Hindu *śikhara* towers in imitation of the holy mountain range of the Himalayas with Mount Meru as the center peak. At Borobudur pilgrims are guided through a ritual of ascension from the lower and outer precincts until they reach the central stupa representing Mount Meru, the culmination of their journey.

**CHRISTIAN CHURCHES.** The architecture of the Christian churches provides the principal example of towers in Europe, and their development is a revealing history in stone. In the earliest pre-architectural stage, the *ecclesia* was simply the gathering of believers in crypts or private homes. In the post-Constantinian period Christians adopted the Roman basilica, a secular and civic building, as a place for worship. Two developments followed, both containing the seeds for the vertical development that occurred in the following centuries. The central domed structure of Byzantine classical style that developed from the circular plan of the martyrion and baptistery gained height and size, resulting in an interior space that was homologized to the universe of time and space. Standing firmly on the earth in the present, the worshiper could look upward at the dome of the church as a symbol of the heaven to come. The iconography of Christ, the Virgin, and saints, often portrayed against a background of gold mosaic, enhanced this impression. The Romanesque church of western Europe, a development of the basilica form into a cruciform plan, showed the first high vaulting and spires, then developed into the Gothic style, the epitome of vertical aspiration. Without drawing out the distinctions between spire, steeple, belfry, and bell tower, it is clear that from the twelfth century on architects strove for luminosity, lightness, and majestic height in their cathedrals.

The French Gothic cathedrals of Chartres, Reims, and Amiens seem to push the vertical aspiration to its material and architectural limit. Whether as the domed eastern style or the lofty vaulted western style, the change in meaning is clear. From a gathering of people in an ordinary secular

structure, believers took their place in an increasingly hierarchically demarcated church building: the bishop's throne, the apse for the clergy, the communion railing separating lay from religious. Jesus became a lordly king; Mary, his mother, became a grand queen of both worlds. The upper stories of the towering churches carried worshipers in spirit to this higher realm. At the same time these "towers" marked the earthly splendor of the dwelling place of the divine presence and the place where God was most fittingly worshiped.

The churches acquired a host of other meanings. Not only did they house divinity, they were images of divinity as the body of Christ crucified. Many, such as Westminster Abbey in London, served funerary purposes as crypts for the royalty, nobility, and high clergy, whose funds had built, supported, and maintained the churches. They were the sites of colorful pageantry and elaborate ritual, where the secular and sacred often mixed indistinguishably. They housed the relics of the saints; hermits attached themselves to certain churches like barnacles to anchors; and pilgrims flocked to them seeking miracles, sometimes creating new meanings and discomfiting ecclesiastical authorities. These churches also became symbols of civic pride, with cities vying with other cities to have the largest, highest, or most costly cathedral. All of these factors, together with many others, must be considered if one wishes to interpret the meaning of Christian churches.

**MINAR.** In Islam the *minar* towers over the landscape as a reminder of the obligation of Muslims to pray five times a day in conformity with the second pillar (prayer) of the religion. Traditionally the muezzin or prayer caller would climb the *minar* at the prescribed times, projecting his voice over village or city to remind Muslims of their duty to pray. *Minars* also mark off a significant ritual space for worshipers, as *minars* are most often positioned at the four corners of the mosque where Muslims come to pray, at least once a week on Fridays, and where they may gather periodically for other important social occasions.

*Minars* normally stand as slender towers (thus the French *minarette*) rising above the domed mosques, though in parts of Asia the *minars* took on enormous proportions, as, for example, at the Emin mosque in Turpan in China, where the tower, like a huge inverted ice cream cone, dwarfs its companion mosque. At least once in Islamic history the *minar* symbolism was changed into a blatant expression of political and military power. Q'tub-ud-din, the twelfth-century central Asiatic conqueror of India, built the original Q'tub *minar* some 238 feet high as a symbol of his victory over North India. It remains the tallest *minar* in the Islamic world.

**MESOAMERICAN STRUCTURES.** Though tall, narrow structures are rare in pre-Columbian Mesoamerica (the multistoried palace at Palenque is the outstanding exception), the abundant pyramidal temples of that region are suitably construed as towers. Often inaccurately contrasted with the Egyptian pyramids as architecture for the living instead of

for the dead, the comparison is not exact, for many of the Mesoamerican structures, such as the Temple of Inscriptions at Palenque, had burial chambers within them. Imitating mountains and generally conforming to the Eliadean paradigm of the *axis mundi*, they were considered to mark the center of the earth, the site of creation, and could be described as places where the three worlds were connected. The pyramids were often linked with nearby cenotes (sacred wells), their contrasting meanings of upper- and underworld mutually reinforcing one another.

The Temple of the Sun at Teotihuacán was considered a mountain where celestial gods, terrestrial deities of fertility and plenty, and underworld beings met. The temple, and the entire city around it, was oriented to the place where the setting sun on the summer solstice touched the horizon. The great pyramid of Cholula was built over a spring (underworld), and its iconography, including the feathered serpent motif, indicate that it was a place of communication between the lower and upper worlds, the worlds of humans and the gods. The Castillo pyramid at Chichén Itzá, with its famous descending serpent, is the best-known expression of this motif and a veritable compendium of cosmic, astral, and calendrical correlations; at the same site the Caracol, a circular pillbox rather than pyramidal configuration, provides a similarly prominent variation on the tower theme. Tenochtitlán of the Aztecs had its Templo Major, the twin pyramid sites for worship of the god of war, Huitzilopochtli, and the god of rain, Tlaloc, referring to mountains in the mythic history of the Aztecs. The pyramids of Mayan Tikal in the Peten area are the most vertical in feeling, with sharply inclined steps leading to a temple platform. The temple in turn was surmounted by a *cresteria* (comb) rising high above the back wall of the temple, adding to the impression of height. The priests would have performed rites of worship with the people watching from far below.

The Mesoamerican pyramids show cosmic orientation and astronomical and calendrical correlations and are generally built in layered levels, manifesting a stratification expressive of the hierarchical societies that produced them. Besides being sites to worship the gods, the pyramids offered a ritual stage to carry out rites of warfare and human sacrifice and to dramatize the coronations that established sovereignty and claimed divine authority and purified and renewed the community. As with church architecture, their forms are quite similar from place to place, while their meaning has changed from one historical period and culture (e.g., Toltec, Maya, Aztec) to another.

**MODERN TOWERS.** The U.S. Capitol and the Washington Monument obelisk in Washington, D.C., stand as symbols of American civic religion. The Capitol was planned as the center of the city, and it manifests the same spatial metaphors as the Byzantine church, with its dome showing the first president in the heavenly realms and a crypt below the rotunda floor originally intended for his burial. The Washington Monument's towering height, together with its mysterious

and nontextual character, has captured the central place in the popular American imagination. It stands in the middle of the city's ritual core, with the Capitol, the White House, and the Lincoln and Jefferson Memorials cardinally placed on its four sides.

Perhaps it is the skyscraper, more than any other building, that symbolizes the city since the nineteenth century. And while lacking sacrality, skyscrapers are not without symbolic power. When the Twin Towers of the World Trade Center in New York were destroyed on September 11, 2001, the terrorists were attacking a symbol of U.S. financial dominance. But subsequent events have cast a religious aura over the site, making it into a place of martyrdom and heroic self-sacrifice, a shrine to the mythical best qualities in the American spirit. Public and private rituals, the placing of flowers, a lone flag flying over the debris, notes, names, and other signs of grief all transformed the site almost immediately into a shrine. Though some events were orchestrated public expressions of grief, most of the actions enacted there were spontaneous. The changed significance of the site is a clear example of the mutability of meaning noted in towers everywhere. No architectural meaning is final. A purely secular building may become a sacred one, and the rituals that have and will be performed at the site will influence the reception of whatever structure succeeds the former monument to financial power.

**TRADITION.** The word *tradition* comes from the Latin noun *traditio* (handing over), which derives from the verb *tradere* (hand over, deliver). *Traditio* corresponds closely to the Greek *paradosis*, which also comes from a verb (*paradidomi*) meaning “hand over.” *Traditio* and *paradosis* can be used literally or figuratively, in the latter case often to mean “teaching” or “instruction.” *Traditio* and *paradosis* were commonly used in this sense by Latin and Greek Christian theologians to denote the body of teachings preserved and handed down by the church as “the Catholic faith.” In the modern study of religion, however, a broader and more differentiated concept of tradition must be employed.

**THE CONCEPT OF TRADITION.** Culture depends on teaching and learning, and teaching and learning presuppose a tradition. The concept of tradition thus applies to all fields of culture, including science, arts and letters, education, law, politics, and religion.

A belief or practice in any field of culture may be said to be a tradition to the extent that it is received from the hands, lips, or the example of others rather than being discovered or invented; that it is received on the assumption that the authors and transmitters are reliable and therefore the tradition valid; and that it is received with the express command and conscious intention of further transmission without substantial change. Hence, as a source of knowledge, tradition is to be distinguished from rumor and fashion. Rumor and fashion, although received from others, are not necessarily assumed to be reliable or to merit transmission without alteration; on the contrary, they invite speculation and elaboration. Tradition, purporting to embody a fixed truth from an authoritative source, demands faithfulness and obedience.

Established traditions command respect because of their relative antiquity and the presumed trustworthiness of their authors and transmitters. Sacred traditions provide a link between the origin and destiny of things. The ancient Greek poet and prophet Hesiod in his *Theogony* says that the Muses, the daughters of Zeus, “inspired me with a divine voice to tell of the things that are to come and the things that were before” (ll. 31–32). Similarly, the sacred traditions of all religions offer access to beginnings and insight into endings that personal experience and unaided reason cannot supply.

Sacred traditions sometimes tell of a golden age in the past. They preserve glimmers of the glorious age and establish beliefs, practices, and institutions to help people cope with the “iron age” of the present. At other times, traditions

anticipate the attainment of a glorious future age, which they portray in prophecies. And sacred traditions often address past and future together. In all three cases, a view of time as something that can be recapitulated, or at least held in synoptic vision long enough to lend perspective on the present, underlies the concept of sacred tradition. The work of seizing time through myth or prophecy explains the critical importance of memory in religious traditions. Memory defies time and change. “Remember!” is the first commandment of tradition.

The second commandment is “Trust!” which in practice means “Obey!” Obedience to authorities who are deemed trustworthy is indispensable to the working of tradition because tradition is by definition something received from others. Within the community of tradition, obedience is validated by the benefits a person derives, or expects to derive, from following the tradition. From the outside, however, and especially from a modern critical perspective, the obedience tradition requires (and inspires) may appear to be confining, even oppressive. The discussion of tradition in the modern study of religion has been much affected by this clash of perspectives.

The concept of tradition in religion may be applied to the means by which norms of belief and practice are handed down (e.g., bards, books, chains of teachers, institutions) or to the norms themselves. This article is concerned with the norms, whereas the word *transmission* refers to the means by which traditional norms are handed down. The distinction between tradition and transmission is not absolute, however. Religions typically resist it, especially if it is used to justify attempts to abstract the supposed essence of a religion from its historic vehicles and forms of expression. Because tradition is by definition an indirect source of knowledge, the forms in which traditional knowledge is transmitted cannot be cast away without risking loss of content, because the content is not accessible or verifiable from contemporary sources. To the extent that it is immediately accessible, it ceases to be traditional in the strict sense of the word.

A sense of tradition as normative is a basic element in all religious systems, whether or not formal concepts of tradition exist. When formal concepts appear, they may be broad or specialized, depending on their function in the system and the degree of differentiation among the sources of religious belief and practice. Often the sense of tradition as normative is expressed by a broad collective reference to authoritative teachers or compendia: “the fathers,” “the elders,” “the sages,” “the poets.” An evolution from broad to specialized concepts can sometimes be discerned. In early Catholic Christianity, for example, the concept of tradition embraced all the formal sources of belief and practice handed down by the church, including the Holy Scriptures. Only much later, and only in the Western as distinct from the Eastern church, did “tradition” come to signify the extrabiblical (ecclesiastical) sources in particular, at which point the “problem” of scripture and tradition could arise. In Sunnī Islam, by con-

trast, the formal concept of tradition, the *sunnah* (custom, example) of the Prophet, became more specialized as a result of the formation of a closed collection of traditions—the six books of *ḥadīths*, or stories of the Prophet, compiled in the third and fourth centuries AH (ninth and tenth centuries CE) and eventually accepted as authoritative throughout Sunnī Islam.

Even more specialized cases are presented by two words meaning “tradition” in Judaism, *Masora* and *Qabbalah*, which come from verbs meaning “hand down” and “receive,” respectively. The verbs are used at the beginning of the early rabbinic *Ethics of the Fathers* (*Avot* 1.1) with reference to the handing down of the Torah from God to Moses, Moses to Joshua, Joshua to the elders, and so on. However, the nouns *Masora* and *Qabbalah* eventually came to be used not for tradition in the comprehensive sense but for specialized traditions: *Masora* for the exegetical traditions governing the transmission of the Hebrew text of the Holy Scriptures (hence “Masoretic text” for the canonical version of the Hebrew Bible), *Qabbalah* for the mystical and esoteric traditions of Judaism. The function of specialized concepts is to sharpen the definition of tradition in selected areas, not to diminish the scope of tradition as a comprehensive norm. In religions with highly specialized concepts of tradition, much that is traditional falls outside the formal concepts without being any less traditional for that reason.

In addition to occurring in the practice of religion, the concept of tradition appears also in the modern study of religion, where it is used descriptively rather than normatively and often rather loosely. Sometimes the word is little more than a synonym for the name of a religion, as when “Islamic tradition” simply denotes “Islam.” This way of speaking may be questioned to the extent that it singles out traditionality as the most basic characteristic of a religion.

More problematic in relation to normative concepts of tradition is the pluralism reflected in some uses of the descriptive concept, as when “Chinese tradition” is applied collectively to the several religious systems of China or “Christian tradition” is used to group together conflicting normative versions of Christianity (Orthodox, Catholic, Lutheran, and so on). In some cases the modern descriptive concept of tradition fosters research into what might be called “deep tradition”—cultural patterns and values so basic to a civilization that they are not formally stated in the classical tradition and may not even be clearly recognized by the bearers of the tradition. The concern of some modern scholars of India with the problem of defining the “Indianness” of India—the deposit of culture underlying the many different normative traditions of India—is a case in point. In this case the notion of “Indian tradition” hypothesizes a unity that remains to be found and described. Such unities are difficult to define and are rejected by many scholars as mystifications meriting no more credence than “the Russian soul,” “the Oriental mind,” or other cultural stereotypes. Nevertheless, the presentiment of continuity in the world’s great civili-

zations is powerful enough to motivate continuing research on “deep tradition.”

**TYPES OF TRADITIONS.** Traditions may be verbal or nonverbal. Nonverbal traditions include traditional artifacts (e.g., icons, monuments, symbolic objects), sites, designs, gestures, postures, customs, and institutions. Nonverbal traditions cannot exist in isolation from verbal traditions, for the latter are needed to interpret them. However, nonverbal traditions possess a measure of autonomy in relation to verbal traditions because verbal interpretations can never completely penetrate the “thickness” of traditional objects or, in the case of religious objects, their presumed sacrality. Far from being dependent on specific verbal interpretations, nonverbal traditions typically host multiple or successive interpretations without losing their identity or traditional status. The persistence of nonverbal traditions in relative autonomy over against the interpretations attached to them is a good example of traditionality: the ascription of value to something by virtue of the fact that it has been handed down from early times on good authority.

**Oral and written tradition.** Verbal traditions may be oral or written. Although the distinction pertains first of all to the means of transmission rather than to tradition, the substance of traditions is affected by the differences between oral and written transmission.

First, the forms of expression used in traditions are dictated in part by the means available. Some forms, such as hymns, proverbs, riddles, and folk tales, are essentially oral. They may be written down, but writing does not open the way to a fuller realization of the form. Other forms, such as chronicles, law codes, and commentaries, depend on writing or are fully realized only in writing. Some of the most important forms of expression used in traditions, such as mythology and epic poetry, may reach a high level of development in either mode.

Second, oral tradition is a much older phenomenon than written tradition and precedes it in the formative period of traditions, even after the invention of writing. This fact suggests that written traditions themselves are shaped in part by oral traditions. In many literate religious traditions, for example, scriptural and pedagogical titles recall and even purport to re-create an oral system of communication. Thus, *Qurʾān* means “recitation.” The title of the first book of rabbinic law, *Mishnah*, comes from a verb meaning “repeat” and refers to pedagogy based on oral recitation. *Upaniṣad*, a name for books of philosophical and esoteric teaching in Vedic tradition, comes from Sanskrit words meaning “sit down before [a teacher].” An accomplished monk in early Buddhism was called a *bahusuta*, “one who has heard much.” The Greek word *euangelion*, “gospel” or “good news,” means news in the literal sense of something proclaimed aloud in the hearing of the general public.

Third, oral tradition exists mainly in performance, while written tradition exists also in objective form apart from its

applications. The relative independence of written texts stimulates the development of intellectuality and greatly increases the possibilities of dissemination in a fixed form. At the same time, writing involves significant dangers for a tradition. When a tradition is put into writing, its inconsistencies become more evident. It may not be an exaggeration to say that the quickened intellectuality that accompanies written traditions arises first of all from the need to address the inconsistencies that the writing down of a tradition exposes. Also, the independence of written texts opens the way to the use of traditional materials in ways not intended by traditional authorities, ways that are remote from the “living word” actualized in pedagogy and cult. To be sure, a written tradition is not further removed from the living word than an oral tradition insofar as the latter is understood as a tradition in the strict sense. Tradition, oral or written, is the word handed down by others—the vehicle of the living word but not the living word itself. Nevertheless, the organic connection of oral tradition with performance guarantees the close proximity of tradition to the living word, whereas in the case of written tradition the connection is not as direct and greater pains must be taken to regulate the use of traditions.

Many moral and religious teachers have felt anxiety about writing. In the *Phaedrus*, for example, Plato has Socrates tell a story about a wise Egyptian king who, in reply to the god who offered the Egyptians the gift of writing as “a drug to produce memory and wisdom,” observed that the invention was more likely to produce just the opposite, because those who came to depend on it would tend to seek wisdom in an external source rather than having to look within their own souls, and so they would “seem wise without being wise” (*Phaedrus* 274c–275).

Fourth, oral and written traditions coexist and influence each other even after many authoritative sources of tradition have been committed to writing. Oral tradition is not a stage that is outgrown with the arrival of written tradition. Even after it has been replaced by writing as the chief means of transmission, oral tradition continues to thrive in the form of customs, folklore, popular preaching, storytelling, esoteric speculation, practical applications of religion to everyday life, and other manifestations of traditional mentality. The text of the *Book of Exodus* was well established by ‘Aqiva’ ben Yosef’s day, but that did not prevent the rabbi and his colleagues from arguing about the number and size of the frogs sent against Egypt in the famous plague (B.T., *San.* 67b). People love to talk, and talk preserves and extends itself by means of oral tradition. Sometimes oral tradition even generates new bodies of written tradition, as in the case of the oral Torah canonized in the rabbinic law codes, the *Mishnah* and the *Talmud*.

The importance of oral tradition in the history of traditions has been widely recognized in the modern study of religion. In particular, the concept of oral tradition has been used by scholars seeking to reconstruct the origins and early history of religious traditions. Unfortunately, the method-

ological problems of applying the concept of oral tradition are severe. Except for the data supplied by modern anthropologists and ethnographers from direct observation, the evidence for oral tradition must be extracted from written sources. Scholarly opinion thus divides along a spectrum running from skepticism about the possibility of ever isolating the original oral layer of a written tradition to more confident approaches based on literary and rhetorical analysis and the selective application of archaeological evidence.

**Scripture and tradition.** Many classical religious systems make a formal distinction between scripture and tradition. *Scripture* refers to divinely revealed texts; *tradition* refers to revelation mediated by human teachers. The distinction tends to be clear enough in practice. Thus Catholic Christians have no trouble distinguishing between the New Testament writings and the creeds and canons of the church councils; Muslims do not confuse the *sunnah* of the Prophet with the Qurʾān delivered by him. Yet the distinction between scripture and tradition is a difficult one to make in theory. It does not turn on the difference between divine revelation and human teaching, for in most religions authoritative tradition is revered almost as much as scripture as a conduit of revelation. Furthermore, the theoretical priority of scripture over tradition rarely translates into a higher degree of binding force in practice.

To some extent the distinction between scripture and tradition reflects the history of canonization in a religion. When a canon of scripture is definitively closed, authoritative teaching accruing thereafter is “tradition.” Even so, the relationship must not be construed as a mere serial progression, least of all as a purely exegetical relationship, as if tradition were in essence commentary on a body of scripture that antedates it. Traditions often manifest a significant degree of independence from scripture for a variety of reasons: their origin in a time prior to the canonization of scripture, the diversity of sources embodied in tradition as opposed to the more restricted sources constituting a written canon, and the reference of tradition to basic religious functions not adequately treated by scripture, such as liturgy or law.

Beyond providing a source of religious authority in addition to scripture, tradition plays an indispensable role in the appropriation of scriptural sources. Scripture cannot be used if it cannot be interpreted, and every use (liturgical, legal, theological) implies an interpretation. Interpretation, however, requires a framework and accepted rules of discourse that scripture by itself cannot supply. They are supplied by tradition. Thus there arises a practical dependence of scripture on tradition. Dependence need not imply diminished regard for the authority of scripture. While the critical historian might view a hermeneutical tradition as a device for overcoming the piecemeal character or obscurity of scripture, the pious mind will regard it as the only conceivable means by which to gain access to the vast and awe-inspiring contents of divine revelation—the means established by divine authority as opposed to human ingenuity. In the eyes of piety

there is no contradiction between an appreciation of the grandeur and sufficiency of scripture and a recognition of the crucial role of interpretation. The aim of interpretation is not to threaten but to preserve and protect scriptural revelation: “Tradition [Masora] is a fence to the Torah” (*Avot* 3.14).

Nevertheless, conflicts between scripture and tradition are bound to arise because of differences in provenance, time of origin, and ideological tendency. In every religion with a body of scripture, there will be traditions lacking scriptural warrant or even contradicting the plain sense of scripture, and there will be beliefs and practices mandated by scripture with no living function in the tradition. While exegetical ingenuity can go a long way toward resolving these conflicts, the problem of scripture and tradition cannot be settled by exegesis alone. From the outset, a conciliatory assumption of harmony between scripture and tradition must be made to support the work of exegesis and interpretation; otherwise the situation of the interpreter would be impossible, for scripture and tradition always diverge enough to make reconciliation impossible without the antecedent assumption of an ultimate harmony. This assumption is itself a *traditum*, a thing handed down and explicitly confessed by religious traditions with respect to their scriptures. The determination to affirm the harmony of scripture and tradition suggests that scripture has a significance that goes beyond its substantive contents, namely as an object of traditional loyalty, a badge of affiliation, and a symbol of continuity.

The role of the Vedic scriptures in Hinduism affords a good example. The Vedas were for a long time not scripture in the strict sense of the word because they were transmitted orally, but they played a quasi-scriptural role long before being committed to writing. In scriptural form they enjoy theoretical priority over the books of tradition (*smṛti*; literally, “remembered”) that were produced later. A wide gulf separates the religion of the Vedas from that of later Hindu tradition. The Vedas present a religion of animal sacrifice and of meat-eating, intoxicant-drinking priests; a worldview that knows nothing of the cycle of rebirth (*samsāra*) and little of the theory of action (*karman*); a cult without temple worship; and a pantheon in which many of the most popular gods and heroes of later Hinduism play little or no role. Nevertheless the books of *smṛti* consistently avow loyalty to the Vedas, and conciliatory explanations of departures from Vedic ways are offered. As Louis Renou put it, “The Veda is precisely the sign, perhaps the only one, of Indian orthodoxy” (Renou, 1960, vol. 6, pp. 2–3). In the religious history of India a crucial line of division separates the continuators of Vedic tradition from groups, such as the Jains and Buddhists, who broke with the tradition in principle. Among the continuators a community of tradition existed, despite many differences of doctrine and practice. Between the continuators and the others there was not a community of tradition, despite many historical and cultural affinities.

**TRADITION AND RELIGIOUS ORIGINATORS.** For a number of reasons the consciousness of standing in a sacred tradition

is a typical feature of the outlook of originating figures in the history of religion. First, bearers of a new prophecy, revised values, or new loyalties must address their audience in terms the latter understands. The terms have to be drawn from a shared tradition. A classic example is in the *Book of Exodus* in the connection the prophet Moses proclaims between the God Yahveh, whose name he is commanded to reveal to the Israelite slaves, and “the God of your fathers, the God of Abraham, the God of Isaac, and the God of Jacob,” that is to say the God or gods of ancient tradition (*Ex.* 3:13–15; cf. *Ex.* 6:2–3).

Second, religious originators must be able to reflect upon their own experiences. Affording a means of achieving distance from the immediate present, tradition provides a framework for interrogation, interlocution, interpretation, and evaluation, without which reflection would be impossible. For example, early in his prophetic ministry Muḥammad experienced visions that he later came to regard as encounters with the archangel Gabriel, the figure thereafter identified by Muslims as the agent of Qur’anic revelation. Scholars have pointed out, however, that the only reference to Gabriel as a revealer in the Qur’ān occurs in a late *Medinan sūrah* (2:97–98) and that the descriptions of visions in earlier *sūrahs* (53:1–18, 81:15–25) are vague about the identity of the being Muḥammad encountered. In other words, it appears that an angelological tradition, not invented by Muḥammad but accepted by him at some point, served the Prophet (and later Islam) as a way of understanding his early experiences.

Third, the consciousness of standing in a sacred tradition supports religious originators who break with the sacred traditions of their contemporaries and coreligionists. The originator’s sense of tradition makes the break bearable and keeps it from being episodic or nihilistic. So, for example, the Apostle Paul, preaching a break with the Jewish law on the basis of faith in the gospel of Jesus Christ, was greatly aided by his conviction that he represented a tradition of faith authenticated by the law itself in its testimonies concerning Abraham (*Rom.* 3–4; *Gal.* 3–4).

The complexity of the relationship of religious originators to tradition can be seen in Jesus’ confrontation with Jewish tradition as presented in the Synoptic Gospels. That presentation has decisively shaped the way the problem of tradition and innovation has been understood in the history of Christianity and even in modern scholarship. The German sociologist Max Weber (1864–1920), in his famous discussion of charismatic leadership, was thinking of the rhetorical dichotomies of Jesus when he wrote, “From a substantive point of view, every charismatic authority would have to subscribe to the proposition, ‘It is written . . . but I say unto you,’” and when he wrote, “Hence, in a revolutionary and sovereign manner, charismatic domination transforms all values and breaks all traditional and rational norms: ‘It has been written . . . but I say unto you’” (Weber, 1978, vol. 1, p. 243, vol. 2, p. 1115; cf. *Mt.* 5:21–48). Actually, in

*Matthew*, Jesus does not say “It is written” but “You have heard that it was said to the men of old,” but he then proceeds to quote from the Torah. Thus the confrontation is indeed between a written law and a living master. Jesus is also shown in the Synoptic Gospels to be sovereign over the sacred oral tradition claimed by the Pharisees, as when he reproached them saying, “You leave the commandment of God, and hold fast the tradition of men” (*Mk.* 7:8; cf. *Mt.* 15:1–9).

Nevertheless, Jesus’ relation to Jewish tradition is misconstrued if one assumes that at bottom it was dichotomous. Throughout the Gospels, including the passages cited above, there is much evidence of continuity: “Think not that I have come to abolish the law and the prophets; I have come not to abolish them but to fulfill them” (*Mt.* 5:17). The theme of continuity has often been muted by the anti-Judaic tendencies of much historical Christianity, including nineteenth- and twentieth-century liberal theology, which made a sharp distinction between the “legalistic” religion of the Jews and the “spiritual” religion of Jesus. Weber’s discussion of charisma also tends to emphasize the break with tradition in the work of Jesus, as well as that of other prophets, military heroes, and messianic figures. Weber’s emphasis is justifiable given his aims, namely the clarification of pure (“ideal”) types. Abstractly considered, a charismatic leader always stands against tradition. He or she offers his or her followers something new and lays claim to a highly personal kind of authority, whereas “authority will be called traditional if legitimacy is claimed for it and believed in by virtue of the sanctity of age-old rules and powers” (Weber, 1978, vol. 1, p. 226). In historical reality, however, charismatic leaders always possess notions of tradition that play a crucial role in their own thinking and in their relationships with followers and with the general public. Thus Jesus, in the ostensibly anti-Mosaic teachings of *Matthew* 5 (e.g., vv. 21–22: “You have heard that it was said to the men of old, ‘You shall not kill; and whoever kills shall be liable to judgment.’ But I say to you that every one who is angry with his brother shall be liable to judgment”) was probably not trying to invalidate the law of Moses but simply demanding behavior radically consistent with it. Jesus also frequently cited traditional authorities in his confrontation with the Pharisees, as when he cited the Prophet Isaiah to support his condemnation of “your tradition” (hand washing before meals) in *Mark* 7:6–7 (cf. *Mt.* 15:7–9; *Is.* 29:13). Here the condemnation of a certain understanding of tradition is itself supported by an appeal to tradition, as Jesus draws an analogy between his conflict with the Pharisees and the conflicts of the prophets of Israel with the religious establishment of an earlier day. Even conflicts with tradition are molded by tradition.

Charismatic prophets who attack the sacred traditions of their contemporaries are not the only type of originators in the history of religion. Sociable teachers of virtue who accept the commonly received forms of tradition but reinterpret their contents are also important. Originators of this

type often make a conscious effort to deny the novelty of their message. Confucius is a good example. A powerful originator who reoriented Chinese tradition, Confucius achieved a remarkable humanization of the substance of Chinese religion in his doctrine of “humanity” (*jen*). Yet he vigorously denied that there was anything new in his work. “I transmit but do not innovate; I am truthful in what I say and devoted to antiquity” (*Analects* 7.1, Lau translation). Confucius’s words and deeds were designed to authenticate this claim. He was scrupulous in his observance of the established rites, devoted himself to traditional poetry and music, took the worthies of antiquity as his models, and showed reverence for the spirit world and for heaven.

The approach of Socrates to tradition, at least in Plato’s quasi-canonical version, runs parallel to that of Confucius in an important way, though with an equally important difference. The difference lies in the method—dialectic—which allows for the critical interrogation of received tradition in a spirit quite foreign to Confucius’s approach. The parallel lies in Socrates’ insistence that he had neither new truths to teach people nor access to a special or secret source of truth, but simply wanted to clarify the traditional values—justice, goodness, piety—that most people accept on faith but cannot define or defend when challenged to do so. Thus throughout Plato’s portrait of Socrates there is a tension between the critique and the affirmation of Greek tradition. Socrates is depicted as a man who respects and participates in the common forms of tradition even as he demolishes the arguments of pretentious and incompetent apologists, such as Euthyphro, Ion, and Agathon. The *Republic*, for example, although it contains the sharpest attack on Greek tradition in Plato’s dialogues, namely the critique of Homer and Hesiod for “badly portraying the nature of gods and heroes” (*Republic* 377e), opens with Socrates telling how he went down to Piraeus to pray to a goddess during a religious festival and ends with him recounting a myth of gods and heroes (the myth of Er).

**THE FORMATION OF TRADITIONS.** A general theory of the formation of religious traditions has eluded scholars of religion despite the large body of specialized scholarship on the formative periods of many world religions. The difficulty is related to the conflict between the modern critical view of tradition as a historical product and the religious concept of tradition as a body of inviolate sacred canons transcending time and change. The application of historical and philological analysis to sacred traditions never fails to demonstrate their dependence on historical determinants. Yet the critical analysis of sacred traditions, if carried to the point of radical relativism, fails to account for the most distinctive fact of all: the continuity of certain sacred traditions with the capacity, however limited, to preserve themselves in a world of time and change.

The dynamics of traditionalism and relativism are further complicated by the instability of critical-historical theory itself. The annals of the modern study of religion abound

with examples of theories that at one time commanded a substantial scholarly consensus but subsequently collapsed, not because they were opposed by religious traditionalists but because they were rejected by a new generation of critical scholars. For several decades of the twentieth century, for example, students in the reputable Protestant theological schools of Europe and North America were taught to view the Pentateuch through the lens of the “tradition history” school of Albrecht Alt, Gerhard von Rad, and Martin Noth. These scholars regarded the Pentateuch as the product of the expansion of smaller yet well-defined units of traditional material dating in some cases from as far back as the Middle Bronze Age (2100–1600 BCE). Toward the end of the twentieth century this theory gave way to a view of the Pentateuch as a much later body of material reflecting the party struggles of the waning years of the Israelite monarchy (seventh–sixth centuries BCE) and owing relatively little to canonical forms handed down from earlier periods. The revisionist view itself is susceptible to revision, of course, not least because it tends to evade rather than settle the issue of tradition. While emphasizing the decisive role of political and religious elites in the fashioning of the Pentateuch, the revisionists concede that the elites did not create their material from nothing but worked with an antecedent “body of lore (myths, legends, laws, etc.),” “a basic core of stories, traditions, and so on,” or a “body of diverse traditional material” (Van Seters, 1998, pp. 8–9, 14). If so, then an account of the history of these traditions is demanded. The category of tradition, marginalized by criticism of “tradition history,” enters the picture again.

Political determinism, namely the view that traditions are formed by elites as a means of legitimating power and privilege, has been a powerful factor in modern theoretical reflection on the formation of religious traditions. Attention focused originally on clerical elites who, as Enlightenment rationalists supposed, invented the apparatus of religious tradition to exploit the ignorant masses. Beginning with the French Revolution the role of secular political elites also came under scrutiny, as critics of “ideology” exposed the cozy relations between church, throne, and aristocracy. As monarchical and aristocratic power declined in the nineteenth century, ideological criticism was directed against the new power elite, namely the middle class. The feminist criticism of tradition took shape in the same historical context. A related form of political determinism reverses the terms, suggesting that certain traditions were formed by oppressed groups as a way of contesting established power structures, whether through a revolutionary assault or through some sort of exodus from them. Such a view has been particularly influential in the interpretation of the Hebrew Bible, in presentations of the ethics and “politics” of Jesus in the New Testament, and in liberation theology.

Delineating the connections between traditions and power elites has proved complicated enough to prevent the emergence of a generally accepted analysis. That power elites

manipulate traditions and play a role in maintaining them has been clearly established by three centuries of critical analysis. What is not so clear is the extent to which traditions are the invention of power elites. The difficulty lies in the concept of legitimation. The legitimation, via tradition, of arrangements favorable to a power elite works only as long as the tradition is actually perceived as encapsulating a truth that transcends the elite. If the target audience—including the power elite itself—loses faith in the objective or unconstructed truth of a tradition, the latter quickly becomes useless for political as well as all other purposes. Legitimation thus proves to be an ambiguous concept: it combines political and transpolitical elements without clarifying the relationship between them.

The persistence of the tao-t'ai pattern (the animal mask or dragon figure) in traditional Chinese ritual and art can serve as an example of the dilemma faced by the interpreter of any enduring tradition. Widely disseminated by the Shang rulers of China in the second millennium BCE, especially as a motif on the bronze ritual vessels of the period, the tao-t'ai and related patterns have been called "signs or emblems of Shang authority" (Hsu and Linduff, 1988, p. 19). Yet the origins of the pattern are almost certainly to be looked for in a shamanistic spirituality that long predated the Shang. Moreover, when the Chou dynasty overthrew the Shang in the late twelfth century BCE, the new rulers perpetuated the classical pattern, thereby showing that they and their audience regarded it not as a Shang emblem but as a tradition of general validity, a channel of truth. Even if one can show that the meaning of the tao-t'ai changed significantly in the course of its long history, the persistence of the ancient template as a form for the discovery of new meaning is itself a highly significant fact about Chinese religion and thought, an example of a certain kind of traditionality.

An important contribution to study of the formation of traditions has been made by Eric Hobsbawm, Terence Ranger, and others who have investigated "the invention of tradition" in modern times. Careful to distinguish their subject from tradition in a more comprehensive sense, these critics focus on the conscious production of new rituals in response to the social, political, and ecological upheavals created by modern capitalism. Invented traditions are designed to establish or symbolize social cohesion in an environment where traditional communal bonds have been disrupted or revolutionized. Typically modern communities, such as new nation-states, awakened ethnicities, labor unions, voluntary organizations, environmentalist groups, gender-based associations, and others, invent traditions as a way of justifying their novelty. Often this takes the form of embracing "traditions" that appear to be old but are in fact quite new. The Romantic movement, with its interest in premodern folk culture, was an important source of ideas for inventors of traditions. Archaeology and anthropology also contributed by stimulating interest in prehistoric civilization.

Efforts to promote the cult of goddesses (or the Goddess) in Europe and North America are a good example of

the invention of tradition. The critical framework of modern goddess religiosity is provided by the feminist critique of patriarchy and the environmentalist critique of capitalism and modern technology. The positive religious content is drawn from the work of archaeologists, such as Marija Gimbutas, who seek to reconstruct the goddess-centered spirituality of a putatively pre-patriarchal period of European civilization. The limitations of the enterprise derive from the difficulty of determining the actual significance of goddess motifs in their original context, given the absence of written sources.

In addition to political theories, linguistically based theories of the formation of tradition have been influential in the modern study of religion. Here traditionality is seen not just as the product of social and political interests but as something inherent in the very structure of human understanding. This view of tradition is connected with the linguistic turn in the human sciences in the twentieth century. Many twentieth-century thinkers lost confidence in Enlightenment rationalism with its search for an unmediated starting point of knowledge and focused instead on the medium in which human beings actually think and communicate. The concreteness of language seemed to provide a surer foundation for a theory of human understanding than metaphysical notions, such as self, substance, or God. In Anglo-American thought the linguistic turn generated analytic philosophy; in continental European thought it produced philosophical hermeneutics and postmodernism. The contribution of analytic philosophers to the theory of tradition has been modest. Continental philosophers on the other hand, especially Martin Heidegger, Hans-Georg Gadamer, Paul Ricoeur, and Jacques Derrida, have had an enormous impact. By rejecting "pure" experience and insisting on the radically historical, interested, necessarily biased character of all human expression, these thinkers stimulated a new respect for tradition to the extent that tradition manifests the predicament of human understanding generally. If all human expression (ideas, values, symbols, and so on) is, in effect, a commentary on its own temporal situation (including the other human expressions found in its situation), then one may say that all human expression functions in and as a tradition of some kind.

Ironically, reverence for tradition played little part in the rise of philosophical hermeneutics and postmodernism. Heidegger viewed his philosophical project as a revolutionary break with the entire tradition of Western philosophy and theology since Plato, a view not unconnected with the European fascist project of leaping beyond modernity into a radically new historical epoch. The "post" in *postmodernism* encodes the same idea of an irrevocable break with the Western tradition. However, by rejecting the Enlightenment project of modernity, philosophical hermeneutics and postmodernism stimulated a fresh look at the premodern value systems the Enlightenment rejected, including historic religious traditions. Heidegger's more moderate heirs in the following

generation, especially Gadamer and Ricoeur, have played a particularly prominent role in recasting the discussion of tradition.

**IDEALIZATION AND CANONIZATION.** All religious traditions construct pictures of their own formative periods. The pictures are built up over time by the retrospective projection of religious ideals onto the history of the tradition. Such pictures must not be accepted as literal descriptions of the formation of a tradition. Their function is to stress the unity and continuity of tradition, whereas the critical history of any tradition in the formative period never fails to reveal breaks, conflicts, and a diversity of views and practices.

An example of an idealized picture of the formative period of a tradition is the picture of the early Christian church in the *Acts of the Apostles*, a New Testament work composed in the last third of the first century. The picture of the church in *Acts* was shaped in part by the proto-Catholic ideal of a single apostolic church, and it contributed to the spread of this ideal in the following decades. *Acts* depicts a worldwide church directed from Jerusalem by twelve apostles governing alongside elders who are not identified as apostles, such as Jesus' brother James. Much attention is devoted to the missionary work of Paul, who is not identified as an apostle except in *Acts* 14. Stress is placed on Paul's cooperation with the Jerusalem church and on the harmony of his views with those of Peter, the only apostle to receive a substantial amount of attention in *Acts*. Matters that would tend to qualify the general impression of a unified church leadership, such as the nature of the relationship between the twelve apostles, Paul, and James, are not clarified. The picture in *Acts* is at variance with the evidence preserved in Paul's letters. Paul does not hesitate to call himself an apostle, does not deal with a group of twelve apostles in Jerusalem, records a sharp conflict with Peter (*Gal.* 2:11–14), and in general gives the impression of a more independent relationship to the Jerusalem Church than the one ascribed to him by *Acts*.

The idealization of tradition by later canonizers stands in tension not only with protean historical experience but with living traditions originating prior to the canonization of the tradition. No religious tradition springs onto the scene already possessing the canonical structures that will hold it together in the long run. Nevertheless, nascent tradition must be defined and held together in some way in the circles where it is received. In these circles the legacy of charismatic leaders who can claim a direct link to the originating source of sacred tradition plays an important role, as do beliefs and practices validated by custom and oral tradition. Local centers of living tradition developing independently and without much central coordination are the original hearths of tradition. Examples are the regional schools of law in early Islam (e.g., Medinese, Iraqi, Syrian), the metropolitan churches in early Christianity (e.g., Antioch, Alexandria, Rome), and the various monastic disciplines elaborated by the Buddha's successors around a common core but admitting significant differences of practice and eventually belief.

The fixing of canons in a tradition necessarily breeds conflict with the original local centers of living tradition. Conflict would be inevitable even if the work of later canonizers were free of ideological or regional bias, which is rarely the case. The function of canonization is to generalize and standardize, that of living tradition to affirm and develop inherited beliefs and practices.

Yet it must not be thought that canonization represents nothing but the regimentation of tradition by a central authority. Canonization is a process that presupposes a significant measure of consensus among the centers of living tradition to begin with. Without it the canonization of a tradition could not be successful but would result in division. An example of division is the split in the order of monks at the second Buddhist council, said to have been held at Vaisali about a century after the Buddha's death. Catholic Christianity and Sunni Islam, on the other hand, are examples of extremely successful efforts of broad-based canonization, accomplished in each case during the first three to four centuries of the religion's existence. The consolidation of broad segments of Judaism in late antiquity on the basis of the Talmud is another example of canonization carried out in a religious environment that modern scholarship has shown to be far more diverse than formerly supposed.

If canons are by definition clear, communicable, and relatively easy to identify once the process of canonization has been completed, the consensus presupposed by canonization is more difficult to locate and define. The concept of consensus is further complicated by the fact that some religious traditions possess their own particular concepts of consensus, such as the concept of the consensus (*ijmā'*) of the law schools in early Islam. While concepts of consensus in religious systems function primarily as ideals, the ideals usually preserve evidence of the fact that the formation of the tradition was not the work of a single religious center dictating canons to the periphery but resulted from the simultaneous emergence of distinct living traditions whose informal agreement on fundamentals was the *sine qua non* of the formal consolidation of tradition at a later time.

A good example of these dynamics is seen in the evolution of the *sunnah*, or tradition, in early Islam. In the third and fourth centuries AH (ninth and tenth centuries CE) the *sunnah* of the Prophet received its classic form in the six canonical books of *hadīths*, or stories of the Prophet, eventually accepted by Sunni Muslims. How these books were produced is not a mystery. They were the leading works to emerge from decades of travel, research, and discussion by learned seekers of *hadīths* who undertook to discriminate between sound and spurious reports and whose methodology—the testing of the chain of transmission (*isnād*) of each report—was rigorous, even though modern critical historians would question some of the criteria applied. However, to suppose that one has explained the formation of the *sunnah* upon rendering an account of the work of the seekers of *hadīths* is to fail to address more basic and difficult questions:

what was the connection between the *ḥadīth* material on which the seekers worked and the living traditions of Islam before their time, and what factors of consensus operating in earlier times paved the way for their work?

Much modern Western scholarship on *ḥadīth* and the closely related subject of early Islamic law stresses the breaks between the work of the canonizers and earlier Islam. It is pointed out that the transmission of *ḥadīths* with a certifying *isnād* was a late phenomenon and that there is reason to doubt that *ḥadīths* were formally transmitted at all in the first century of Islam. It is sometimes questioned whether the Prophet left any *sunnahs*, or traditions, apart from the Qurʾān. Above all it is pointed out that the schools of law, whose roots went back to early times, looked upon the later *ḥadīth* movement as a disruptive force that threatened their own understanding of the *sunnah* as the tradition of the law schools (rather than of the Prophet himself) and undermined the ideal of consensus.

Some modern scholars, however, notably Fazlur Rahman in *Islam* (1979), have pointed out the ultimate irrationality of a critical historiography that bars the assumption of continuity in early Islam, since the consolidation of the *sunnah* and the integration of the traditional law schools into Sunnī tradition cannot be imagined without assuming significant elements of continuity and consensus at work from early times. Thus Rahman holds that, from the beginning, *sunnah* could not have meant the *sunnah* of the law schools alone but must have focused on the Prophet, at least in intention, even if “it was not so much like a path as like a riverbed which continuously assimilates new elements.” Accordingly, transmission of the *sunnah* would have taken the form of a “‘silent’ or ‘living’ tradition” rather than a formal discipline (Rahman, 1979, pp. 54–55). The later *ḥadīth* movement formalized and, so to speak, professionalized the *sunnah*. But the movement was successful, in Rahman’s opinion, because the concept of “the *sunnah* of the Prophet” had always been the implied ideal of Muslim practice, and also because a fixed corpus of *ḥadīths* provided a more solid basis on which to build a pan-traditional (“Sunnī”) consensus than did the ideal of the consensus of the law schools.

Beyond their role in the formative period of traditions, groups oriented toward a traditional consensus often play a significant role in the regulation or reformation of traditions. Brahman castes in many parts of Hindu India may be cited as an example of tradition-minded regulators. An important group of brahmans even goes by the name of Smārtas (from *smṛti*, “tradition”), or “traditionists.”

For an example of tradition-minded reformers, one may point to the Pharisees in Judaism in late antiquity. Scholarly debate continues over how best to classify the Pharisees as a religious group and how to define their role in the reorganization of Judaism culminating in the canonization of the Mishnah and Talmud. In the twentieth century, George Foot Moore, Louis Finkelstein, and other scholars propounded a view of the Pharisees as representatives of a

“normative Judaism” that served as the foundation for later rabbinic tradition. Subsequent scholarship has richly documented the religious diversity of Judaism in late antiquity, the influence of Hellenistic culture on the Pharisees themselves, and the role of parties other than the Pharisees in the making of rabbinic Judaism. The result has been to give rise to a revisionist view of the Pharisees almost diametrically opposed to the earlier one. Far from being seen as the bearers of “normative Judaism,” the Pharisees are presented as simply one sect among many in the religiously complicated world of Judaism around the beginning of the Common Era. That the name *Pharisee* may have originally meant “sectarian” lends support to this view.

Yet the revisionist view has its problems. The conceptual problem is how to distinguish between sectarians and traditionists. If all religious activists in a given setting are “sectarians,” then none of them are. To put it another way, the term *sect* in the history of religion has meaning only in contrast to *church* or similar terms denoting broad-based traditional structures emphasizing consensus and continuity. To be sure, the distinction between sectarians and traditionists is a relative one, but without it one cannot speak about some basic differences between religious groups. For example, the difference between the Pharisees on the one hand and the early Christians and the community at Qumran (where the Dead Sea Scrolls were discovered) on the other was a difference of kind, not just degree. The latter two were sects: small bands of devotees living apart from the ordinary world in a closely knit commune (Qumran) or preaching a radical new prophecy with its own novel cult (Christians). Moreover, Christians and Qumranians lived in the expectation of an approaching cosmic cataclysm that would put an end to the historic Judaism of their day. Long before the destruction of the Second Temple in 70 CE, these groups had broken with Jerusalem and the Temple by reinterpreting Jewish tradition in terms of their own sources of illumination. The Pharisees too were innovators, but they had a completely different orientation to tradition. What set the Pharisees apart from Christians and Qumranians was the assumption of continuity with the historic institutions of Judaism, including the Temple, and the stress on realizing the goals of piety in the everyday world, without new prophecies and without a new cult.

**THE MULTIFORMITY OF CLASSICAL TRADITIONS.** Classical traditions are multiform. Multiformity results from the adaptation of traditions to the variegated quality of human experience, including religious experience. Nestor, the voice of tradition in the Homeric poems, describes the problem exactly: “The gods do not give people all things at the same time” (*Iliad* 4.320). Talents, tastes, values, social and political roles, age, gender, and station in life vary among individuals and groups. Tradition is called upon to unite what experience divides, so that the old can communicate with the young, the intellectual with the illiterate, the urbanite with the rustic, the priest with the flock, the prince with the pauper. Unity is sought not through regimentation but through

the multiform elaboration of tradition. Multiformity in turn makes it possible for tradition to play a number of mediating roles in a civilization: to apply religious values flexibly, to mediate conflicts between different sets of values, to host creative interaction between different theoretical viewpoints, and so on. The multiformity of classical traditions stops short of radical pluralism, however. In the end, every tradition recognizes a hierarchy of values.

Several kinds of multiformity can be seen in the history of classical traditions. One kind results from the sociocultural differentiation of a tradition. Using terms that subsequently found wide application in the study of religion, the anthropologist Robert Redfield, in his *Peasant Society and Culture* (1956), called the two basic forms of tradition resulting from this type of differentiation “the great tradition” and “the little tradition.” The great tradition is literate, reflective, cultivated by specialists working in cities, schools, temples, monasteries, and the like. The little tradition is typically illiterate, customary, embodied in the common beliefs and practices of the mass of ordinary folk. Scholars and cultivated practitioners of religion have always recognized that classical and popular religion diverge, yet this recognition seldom led to advances in understanding because of the tendency to regard popular religion as a “lower” form of expression. The contribution of modern anthropological studies of religion has been to show, first, that popular religion is just as much a tradition as classical religion, a tradition that can achieve high levels of organization, complexity, and “rural cosmopolitanism”; and second, that the interaction between great and little forms of tradition is a dynamic one in which the little tradition not only receives from the great but also contributes to it. Great and little traditions are, as Redfield put it, “two currents of thought and action, distinguishable, yet ever flowing into and out of each other” (Redfield, 1956, p. 72). Redfield’s distinction has been criticized by other anthropologists for oversimplifying “great” and “little” traditions and for underestimating the degree to which ordinary believers are conversant with their great tradition via nonliterary means, such as icons, oral tradition, preaching, rituals, and authority structures (Tambiah, 1970, pp. 3–4, 367–377). But these criticisms do not so much refute the distinction as suggest a more nuanced version of it. Almost no responsible scholar of religion wishes to return to the privileging of text-based religiosity and the neglect of demotic factors.

A second kind of multiformity in classical traditions develops from the recognition of the multiplicity of paths to religious fulfillment. Classical Hinduism, for example, distinguishes at least three valid paths to the goal of liberation (*mokṣa*): the path of knowledge (*jñāna mārga*), the path of devotion to a personal God (*bhaktimārga*), and the path of ritual and dutiful action in the world (*karma-mārga*). It is fairly clear that the paths originated at different times and in different circles and that they evolved in relative independence of each other. Furthermore there has never been a consensus in Hinduism about the relative merits of the paths.

Monist philosophers unanimously proclaim the superiority of the path of knowledge, and their control of much of the higher philosophical literature of Hinduism has led some observers to assume that this appraisal is shared by most Hindus. Yet in the fervor of communion with God, the devotionalist does not doubt the superiority of the devotional path, nor in all probability has the majority of Indians doubted the practical superiority of dutiful action in the world. Thus the idea that the three paths are expressions of a common aspiration cannot be explained as the natural outcome of the paths themselves but must be seen as a *traditum* in its own right—a tradition of handing down distinct paths in association with each other on the assumption of their mutual coherence. The assumption is an act of faith, since a systematic doctrine reconciling the different paths has never been accepted by all Hindus.

The Hebrew Scriptures constitute another *traditum* embodying a multiplicity of ways to religious insight. In Judaism and Christianity this multiplicity, while recognized, has not been emphasized in ways that would threaten strict monotheism or ecclesiastical unity. Nevertheless, the religious multiformity of the Bible has always been exploited by Jewish and Christian traditionists. Certainly the Bible would be a far less usable book if it admitted only the normative religion of priests and legists, only the charismatic religion of the prophets, only the Logos of the wise men, or only the devotionalism of the psalmist or if it lacked the rage of Job, the skepticism of *Ecclesiastes*, the eroticism of the *Song of Songs*. Nothing is more characteristic of the Hebrew Scriptures as a *traditum* than the transmission of many ways of theological insight together in a single canon of law, prophets, and writings. Historically, the various forms of religion represented in the Bible originated in relative independence from each other and were cultivated selectively by different groups. One must not project back into the ancient period a general fraternization of priests, legists, prophets, wise men, cult singers, and skeptics united in the praise of the Lord of Israel. Their solidarity in witness to and celebration of the One—the “Bible” as distinguished from its component parts—was the contribution of tradition.

Other kinds of multiformity result from the adaptation of a tradition to stages of life and degrees of religious virtuosity. An example is the classical Hindu doctrine of the four *āśramas*, or stages of life (celibate student, householder, forest hermit, wandering ascetic). In the classical doctrine the four *āśramas* are seen as successive stages through which a pious male of the twice-born castes will pass in the course of his life. It appears, however, that the distinction between the *āśramas* antedates the notion that they represent “stages” in a coherent succession. In any case only a minority of Hindu householders have ever passed beyond the second stage, and many hermits and ascetics in the history of Indian religion were never householders. The doctrine of the *āśramas* appears to be an attempt on the level of ideals to reconcile the world-affirming, dutiful religion of the Indian

family system with the renunciationist religiosity of ascetic and mystical virtuosos. The contribution of tradition is the assumption that the four *āśramas* are coherently related to each other, and that respect and communication are therefore possible among their representatives. The reach of Hindu tradition is thereby significantly expanded.

A special adaptation of tradition to stages of life is represented by forms of religion connected with dying and the treatment of the dead. In all societies these matters are regulated chiefly by tradition, because neither reason nor experience can offer much guidance. By establishing a role in death, a tradition secures a place for itself in life, because people's lives will be affected by the way they expect to die. In Japan, for example, Buddhism has traditionally been the religion of funerals, and only at the grave does it come close to being the universal religion of the Japanese people. Still its special authority over death is one of the ways Buddhism gains visibility and prestige in Japanese tradition as a whole.

In some religions the distinction between the religion of virtuosos and that of ordinary people is built into the fundamental structure of the tradition. Buddhism is a case in point. In its first century Buddhism was a religion of monks that, although moderate in comparison with other asceticisms in its day, proposed a way of life incompatible with life as a householder in the everyday world. Yet Buddhism managed to establish itself as the dominant religious tradition in several Asian societies. It achieved its hegemony not by abandoning monasticism but by developing a mode of lay religious participation distinct from the monastic one yet in harmony with it: laypeople are invited to earn "merit" by providing food, clothing, dwellings, and other services for monks. The rewards of this exchange for the laity are ritual protection against the chaotic forces of the universe, enhanced moral clarity in this life, and a better birth in the next life. This "domestication" of Buddhism, as Todd T. Lewis has called it, had a profound effect not only on Buddhist societies but on Buddhist monasticism itself (Lewis, 2000, pp. 3–4). While the Western scholarly stereotype of the Buddhist monk as a detached seeker of transcendental enlightenment (*nirvāṇa*) can certainly be documented, the large majority of Buddhist monks seem to have been more concerned with such sociable pursuits as collecting and disseminating parables, conducting rituals, and preaching for the edification of the community as a whole. Indeed it is hard to imagine how Buddhism could have been such a successful religion if most of its monks had followed the more detached way. The dialectic of multiformity and community occurs in one form or another in every religious tradition.

**MYSTICISM, ESOTERICISM, AND TRADITION.** Mysticism and esotericism are forms of religious expression that present special problems for classical traditions. *Mysticism* is the cultivation of closeness to or union with the divine or ultimate. It may or may not involve special doctrines; it always involves special techniques. *Esotericism* is the study and application of "secret" teachings of a speculative (e.g., theosophical, cos-

mological, eschatological) or practical (e.g., magical, occult) sort. Mysticism and esotericism need not overlap, although they often do. The genius of classical religious traditions is nowhere better seen than in their capacity to host mysticism and esotericism, if not always as honored traditions within the tradition at least as a traditionally tolerated religious "night life."

Experience is the goal of mysticism regardless of the means employed, which range from strict asceticism through sociable middle ways to antinomian abandon. In essence, mysticism is not a matter of tradition, since experience cannot be received from or handed on to others. Mysticism is a matter of insight or perception, not texts, doctrines, or rules. However, because mysticism is interesting to most religious communities, and because human beings need to communicate about the things that interest them, mysticism typically generates formal mystical traditions, which may grow to an imposing size and complexity even against the wishes of a saintly originator. Formal mystical traditions are canons applied specifically to adepts or aspirants, such as myths of foundation, sacred histories, chains of authoritative transmitters, initiatory rites, techniques of devotion and ecstasy, sayings, texts, and rules regulating physical functions. As a general rule, once a mystical tradition is formed, little vagueness or laxity in its application is tolerated even though the goal of mysticism remains personal experience. In fact the canons of mystical traditions tend to be even more rigorously defined and enforced than those of mainstream traditions. This is partly because of the elite character of mystical traditions—rules can be more strictly enforced when applied to a few; partly because of the central role of the spiritual master in many mystical traditions, a role commanding a high degree of obedience from aspirants and apprentices; and also perhaps because of the need to guard against the explosive forces of unstructured mysticism. In madness and in method the traditional mystic is not unlike a classical *Ṣūfī* poet: God-intoxicated yet still mindful of the meters.

Whereas the interaction between mysticism and host traditions is extremely complex, the history of religion supports the generalization that the two need each other. Mysticism needs a host tradition as a source of vocabulary and symbols. Even though the meaning of these may be revised by the mystics who use them, without them the mystics would not be understood by anyone. In addition, the reserve shown to mystics by the authorities of a host tradition, beyond safeguarding the interests of the latter, is generally healthy for mystics because it challenges them to clarify their goals and refine their methods. As a rule the nemesis of mysticism is not too much structure but too little.

Mysticism can renew tradition. Cadmus and Tiresias, personages representing the Greek political and religious establishment in Euripides' play *The Bacchae*, gave good advice to every established tradition when they counseled the young ruler of Thebes, Pentheus, to admit the revels of the god Dionysos into the city, maintaining that incorporation of the

cult would fortify tradition and enhance the prestige of the ruling house. If Pentheus disregarded his elders' advice with disastrous consequences to himself and his city, established traditions in the history of religion have usually heeded it. Traditions may also strengthen their links with popular culture by patronizing mystics. In spite of the elitism involved in a formal mystical discipline, many mystics have been rather sociable individuals, and they have almost always found favor with the popular strata. Among other things, this has made mystics and ascetics effective agents of mission in religious traditions with missionary ambitions.

Conflicts between mystics and host traditions are common and may be severe. In the sixth century certain Palestinian monks, seekers of union with Christ through mental prayer, claimed that they would achieve "equality with Christ" in the restoration of all things at the end of time, for which reason they were called Isochrists or "Equal-to-Christers." They were expelled from their monastery, and the doctrines supporting their position were condemned by the Council of Constantinople (553 CE). The great Muslim mystic al-Ḥallāj was executed in Baghdad in 922 CE for claiming "I am the Truth" (i.e., God). In both cases, however, the conflict was precipitated more by the doctrinal implications of verbalized claims than by the practices or experiences that prompted the claims. The suppression of the Isochrists did not stop the spread of the mysticism of mental prayer in Eastern Orthodox monasteries; it simply showed that certain claims could not be expressed in public and probably should not be entertained in private, even if inspired by mystical experiences. Similarly many a Ṣūfī after al-Ḥallāj has doubtless thought "I am the Truth" but has not said it or has said it in figurative language, with an appropriate gloss, or in the secrecy of the heart.

As a general rule, mystics and traditionists tend to recognize their mutual interest in avoiding direct conflict, or at least in finding ways to routinize it. Moreover, the way is always open for creative individuals to experiment with means of uniting mysticism and tradition. Individuals who succeed in this enjoy great popularity in their tradition. One may point to al-Ghazālī, who achieved fame in eleventh-century Islam as a doctor of law and a Ṣūfī adept; to Gregory Palamas, the fourteenth-century bishop of Thessalonica, who employed the refined intellectual traditions of Greek Orthodox theology to defend the radical experientialism of rustic monks; and to the Indian philosopher Rāmānuja (eleventh to twelfth century), who, using the texts and methods of Vedānta, attempted to reconcile monism with the experientially based claims of devotionalists in a "qualified nondualism." In most cases the theoretical differences between mysticism and the doctrines of its host tradition are great enough to put an absolute synthesis beyond reach. But tradition does not require synthesis; mediation is enough.

Esotericism is concerned with teachings rather than experience, although mystical and esoteric currents mingle in the history of religion. The basis of esotericism in religion

is the claim to possess secret or otherwise special traditions from an authoritative source—traditions that support speculation, occult practices including magic, or both. The possession of secret traditions may provide the basis for independence from other religious groups or for the existence of an elite group within a larger host tradition. Among the reasons given to justify secrecy are that most people are too simple or too perverse to understand true teachings or that the withholding of secrets is part of a providential plan to be revealed in the future. Also at work is the natural desire to avoid engaging the guardians of normative tradition by undercutting their authority in public. The threat of conflicts is real because esotericists always claim access to authoritative sources beyond those of normative tradition. So, for example, certain masters of Jewish Qabbalah claimed access through secret tradition to a primordial revelation from Adam or to texts composed by biblical patriarchs and other ancient worthies. Such claims compromised the singularity of the Torah received from Moses, and therefore also the authority of the Orthodox rabbis. Similarly, the teaching authority of Catholic Christian bishops was threatened by the belief of Gnostics that the inner meaning of the gospel was handed down by the apostles to an elite of spiritual and intellectual Christians, not to the church as a whole.

Like mystics, esotericists generally steer away from direct conflicts with traditional authorities and aim instead at accommodation. Rarely a religion in its own right, esotericism needs an exoteric tradition in order to define itself. The common tradition is enriched by the multiformity. One of the most important contributions of modern research on Qabbalah, for example, has been to show that many forms of esotericism were deeply embedded in the soil of Palestinian Judaism from early times and developed within the framework of the Talmudic tradition. This is not to deny that influences from other religions and from popular culture helped shape Qabbalah. But influences have consequences in the history of religion because they resonate with the needs and themes of established traditions. Esotericists, for the most part, are less interested in reshaping traditional piety than in heightening its intensity by focusing on specific values and goals within it. The "paradoxical emphasis on the congruence of intuition and tradition" that Gershom Scholem observed in Qabbalah is typical of the approach of most esotericists to their host traditions (Scholem, 1978, p. 3).

**TRADITION AND CHANGE.** Religious traditions are not hostile to change, provided the new can be integrated with the old through reform or renewal. Integration is difficult to accomplish in practice, and religious traditions rarely make the effort except when compelled to do so by a crisis of some sort. In critical situations, however, when the outward authority or inner coherence of tradition is at stake, religious traditions can demonstrate a vitality that contrasts sharply with their apparent inertia at other times. There is no paradox here. One of the primary functions of religious traditions is to provide direction in times of change. A sense of tradi-

tion, allowing for the old to be appreciated as ever new and the new to be received as clarifying or fulfilling the old, serves to check the chaotic potential of change. Of course, traditions may be overwhelmed by a crisis of catastrophic proportions, such as the European conquest of the Americas. Even in these cases, however, features of the displaced tradition often survive under the auspices of the successor tradition, usually on the popular level in the form of an ongoing little tradition.

While religious traditions are not necessarily opposed to reform or renewal, revolutionary change is a different matter. By definition, a tradition is opposed to changes that abrogate the link with the past preserved in its fundamental *tradita*. The completely new is intolerable in a traditional religion. Even prophetic religions promising new and wondrous things typically do so in a way that reflects the mind of tradition. Prophets depend on traditions of expectation—that is, patterned ways of seeking and announcing the new—and they use traditional paradigms to make sense of new developments. The Prophet Isaiah heralded the fall of Babylon and the liberation of the Judean exiles in his day as “new things . . . created now, not long ago” (*Is.* 48:6–7). But the rhetoric of novelty did not keep him from understanding the liberation as a new Exodus and the liberator as the same Lord who stood for Israel in ancient times.

Before modern times, the greatest challenges to religious traditions came not from antireligious or nonreligious value systems but from rival religious traditions. The coexistence of different religious traditions in the same societies for long periods of time was also a source of change. While the interaction of religious traditions before modern times has not yet been studied in great detail, there is plenty of evidence to suggest that the boundaries between traditions were much more permeable than either the guardians of tradition or their modern detractors suppose. Wilfred Cantwell Smith went so far as to propose a “history of religion in the singular” based on the countless ideas, stories, practices and accoutrements that have found their way into many different religious traditions (Smith, 1981, p. 3). Smith’s paradigm is the legend of the Christian saint Josaphat (or Joasaph), the young Asian prince who abandoned his opulent, cocoon-like circumstances to seek salvation as a monk. The legend is the story of Siddhārtha Gautama, the Buddha, and it entered the repertoire of medieval Christianity from the East through an Islamic intermediary. By such a route did the Buddha become a Christian saint.

There is general agreement that the pace of religious change has quickened in recent centuries as a result of the economic, social, political, and intellectual changes summed up in the term *modernization*. The problem of tradition and modernity concerns the fate of traditional value systems, including religious traditions, in a world shaped by modern science and market capitalism and the ideologies and technologies resulting from them, such as liberalism, nationalism, socialism, and biological and social engineering. Despite nu-

merous studies of the problem of modernization in particular societies, however, there is little consensus among scholars about the lasting effects of modernity on religious traditions.

When the problem began to be studied by social scientists in the nineteenth century, progressivist ideologies, liberal or socialist, shaped the discussion. Most critics assumed that tradition was fated to give way to modernity, either at a stroke or through gradual evolution. This view received a great deal of support from the spectacle of antitraditional, Marxist revolutions coming to power in Russia and China in the twentieth century. In the late twentieth century and the early twenty-first century, however, with the worldwide collapse of Communism and the decline of secularist regimes in the Islamic world and elsewhere, more attention has been given to the persistence of religious traditions. Evidence has also been adduced to show that in many societies modernization actually reinforces and even reinvigorates certain aspects of tradition, as, for example, when modern technologies of communication make it possible for religious groups to promote their messages with unprecedented militancy (e.g., Protestant Christian and Islamic fundamentalism), or when economic and political revolutions result in power and prominence for groups whose outlook remains deeply traditional (e.g., Hindu nationalism). In many places modernizing ideologies actually appear to require an alliance with tradition, including religious tradition, in order to promote their goals. The central role of nationalism in the contemporary world is a good example of this type of linkage. Nationalism owes its dynamism to the fact that whereas it promotes essentially secular values, it also serves to reaffirm traditional solidarities.

Postmodernism has attempted a resolution of the problem of tradition and modernity by declaring modernity, as such, to be over. Modernity in this context means the Enlightenment project of reforming the world on the basis of science, natural law (human rights), and a common human rationality. Postmodernism rejects this universalism in principle on the grounds of the endless plurality of human cultures and the unfinalizability of discourse. Although postmodernism was invented by radically secularized philosophical elites, its critique of Enlightenment liberalism has been embraced by some apologists for religious tradition according to the principle “my enemy’s enemy is my friend.” Yet the use of postmodernism to defend religious tradition is problematic. The world-historical religious traditions are universalist in principle, and it is hard to see in the final analysis how a case for them can be based on radical relativism. Postmodernists respond to this criticism by asserting that supposedly universalist or “great” traditions are in fact a vast congeries of essentially local and constantly changing beliefs and practices. There is truth in this assertion, but also a problem. Classifications such as “Christian,” “Muslim,” “Buddhist,” and the like appear to count for something in the traditions that claim these names. Religious communities seem to aspire to identification with a great tradition, no matter

how embedded they are in their local context. To be sure, there are several great traditions, not just one. But this multiplicity can be interpreted in a number of ways, including some that cohere with the universalism of the traditions themselves.

The postmodernist assertion that modernity is over can also be questioned. The claim seems to ignore the large body of evidence summed up in the term *globalization*. Globalization, as Peter Berger has observed, is “a continuation, albeit in an intensified and accelerated form, of the perduring challenge of modernization” (Berger and Huntington, 2002, p. 16). The forces of globalization—science, market capitalism, individualism—are expanding, not contracting in the world, and religious traditions everywhere are struggling to come to terms with them. The religious fundamentalisms that are often cited as evidence of the collapse of modernity are in fact just one of a number of responses to modernity, their stridency and extremism marking them as untraditional phenomena. While globalization occurs in diverse forms, there are enough similarities among its forms to suggest that it is indeed a global process. In short, whereas postmodernist critics have significantly refined the discussion of modernity by discrediting simplistic theories, the case is by no means closed.

For the time being the best approach is probably to recognize that the problem of tradition and modernity is part of the religious situation of contemporary civilization and not likely to be resolved, or even greatly altered, in the near future. The naïve progressivism of the early theorists of modernization has been abandoned by most scholars, but the general problem stands. Given globalizing trends, the continuators of tradition may be expected to go on experiencing threats to their identities, including some that arise from within their own traditions as modernizing tendencies insinuate themselves even there. Yet the work of the globalizers is also full of tensions, and these are likely to intensify as idealistic enthusiasm for modern visions gives way to the difficulty of putting these visions into practice. Globalizers risk losing the way to the future for lack of a connection with the past. A steady orientation in any field of endeavor seems to require traditions: traditions inherited from premodern times, new traditions of modernity’s own making, or new cultural syntheses combining elements of both.

#### BIBLIOGRAPHY

Edward Shils’s *Tradition* (Chicago, 1981) is an excellent introduction to the concept of tradition, although the book does not contain a specialized discussion of tradition in religion. Josef Pieper’s *Überlieferung: Begriff und Anspruch* (Munich, 1970) is a good introduction to religious and theological dimensions of the concept. The lectures by Jaroslav Pelikan, *The Vindication of Tradition* (New Haven, Conn., 1984), offer

a lively if brief defense of the centrality of tradition in religion and culture. The broad influence of Robert Redfield’s concept of tradition makes his *Peasant Society and Culture: An Anthropological Approach to Civilization* (Chicago, 1956) required reading, especially chap. 3, “The Social Organization of Tradition.” The most influential sociological discussion of tradition is Max Weber’s in *Economy and Society: An Outline of Interpretive Sociology*, 2 vols., edited by Guenther Roth and Claus Wittich (Berkeley, Calif., and London, 1978). The seminal essay by T. S. Eliot, “Tradition and the Individual Talent,” in *The Sacred Wood: Essays on Poetry and Criticism* (London, 1920), pp. 47–59, reprinted in *Selected Essays*, 3d ed. (New York, 1950), pp. 13–22, is also essential reading.

For the contribution of philosophical hermeneutics to the discussion of tradition, one should consult the two masters of the discipline, Hans-Georg Gadamer, *Truth and Method*, translated by Joel Weinsheimer and Donald G. Marshall, 2d rev. ed. (New York, 1989); and Paul Ricoeur, *Hermeneutics and the Human Sciences: Essays on Language, Action, and Interpretation*, edited and translated by John B. Thompson (Cambridge, U.K., and New York, 1981). For an overview see Jean Grondin, *Introduction to Philosophical Hermeneutics*, translated by Joel Weinsheimer (New Haven, Conn., and London, 1994).

On oral tradition one may begin with Jan Vansina’s *Oral Tradition: A Study in Historical Methodology* (Chicago, 1965), a rigorous discussion of the value of oral tradition as a historical source; and Walter J. Ong, *Orality and Literacy: The Technologizing of the Word* (London and New York, 2002). The fundamental work on oral poetic tradition is Albert Bates Lord’s *The Singer of Tales* (Cambridge, Mass., 1960). For a more recent treatment see Ruth Finnegan, *Oral Poetry: Its Nature, Significance, and Social Context* (Bloomington, Ind., 1992). On oral tradition in the Hebrew Bible see Eduard Nielsen’s *Oral Tradition: A Modern Problem in Old Testament Introduction*, with a foreword by Harold H. Rowley (Chicago, 1954); and Susan Niditch, *Oral World and Written Word: Ancient Israelite Literature* (Louisville, Ky., 1996).

A large literature exists on the concept and practice of tradition in particular religions. The best of these works shed light not only on the traditions under investigation but on traditionality in general. On goddesses in prehistoric Europe see Marija Gimbutas, *The Civilization of the Goddess*, edited by Joan Marler (San Francisco, 1991). Douglas A. Knight, ed., *Tradition and Theology in the Old Testament* (Philadelphia, 1977), is a good collection of essays on tradition in the Hebrew Bible. James A. Sanders’s *Torah and Canon* (Philadelphia, 1972) is a suggestive discussion of tradition and canonicity. See also John Van Seters, “The Pentateuch,” in *The Hebrew Bible Today: An Introduction to Critical Issues*, edited by Steven L. McKenzie and M. Patrick Graham (Louisville, Ky., 1998), pp. 3–49. For contrasting approaches to tradition in rabbinic Judaism see Jacob Weingreen, *From Bible to Mishna: The Continuity of Tradition* (New York, 1976); and Jacob Neusner, *Early Rabbinic Judaism: Historical Studies in Religion, Literature, and Art* (Leiden, Netherlands, 1975), especially chap. 1, “The Meaning of Oral Torah, with Special Reference to Kelim and Ohalot.” On tradition in mystical Judaism see Gershom Scholem, *Kabbalah* (New York, 1974).

On tradition in the history of Christianity one cannot do better than to consult Jaroslav Pelikan, *The Christian Tradition: A History of the Development of Doctrine*, 4 vols. (Chicago, 1971–1989). Yves M.-J. Congar, *Tradition and Traditions: An Historical and a Theological Essay* (New York, 1967), is another masterful treatment by one of the intellectual leaders of the Second Vatican Council. One should also consult the classic that inspired both Pelikan and Congar, John Henry Newman's *An Essay on the Development of Christian Doctrine* (New York, 1845). For Orthodox Christian approaches see John Meyendorff, *Living Tradition: Orthodox Witness in the Contemporary World* (Crestwood, N.Y., 1978); Constantine Scouteris, "Paradosis: The Orthodox Understanding of Tradition," *Sobornost* 4, no. 1 (1982): 30–37; and Michael Plekon, ed., *Tradition Alive: On the Church and the Christian Life in Our Time: Readings from the Eastern Church* (Lanham, Md., 2003). See also the critical assessment by Paul Valliere, *Modern Russian Theology: Bukharev, Soloviev, Bulgakov: Orthodox Theology in a New Key* (Edinburgh, U.K., and Grand Rapids, Mich., 2000), chap. 15, "Conclusion: The Limits of Tradition."

A probing discussion of tradition in Islam is in Fazlur Rahman's *Islam*, 2d ed. (Chicago, 1979), chaps. 3, "Origins and Development of the Tradition," and 4, "The Structure of the Law." Rahman's critique of the analysis of Islamic tradition by Western scholars illuminates the problem of continuity in religion in general. Similarly Robert Lingat's study of tradition (*smṛti*) in Hinduism, *The Classical Law of India*, translated with additions by J. Duncan M. Derrett (Berkeley, Calif., 1973), provides insights into the workings of any system of norms based on tradition. See also Louis Renou, *Études védiques et pāṇinèennes*, vol. 6 (Paris, 1960).

On tradition in early Chinese civilization, see K. C. Chang, *Art, Myth, and Ritual: The Path to Political Authority in Ancient China* (Cambridge, U.K., and London, 1983); Cho-Yun Hsu and Katheryn M. Linduff, *Western Chou Civilization* (New Haven, Conn., and London, 1988); and Aihe Wang, *Cosmology and Political Culture in Early China* (Cambridge, U.K., 2000). The complex interaction between religious tradition and social systems in Buddhism is explored by S. J. Tambiah, *Buddhism and the Spirit Cults in North-East Thailand* (Cambridge, U.K., 1970); Melford E. Spiro, *Buddhism and Society: A Great Tradition and Its Burmese Vicissitudes*, 2d ed. (Berkeley, Calif., 1982); and Todd T. Lewis, *Popular Buddhist Texts from Nepal: Narratives and Rituals of Newar Buddhism* (Albany, N.Y., 2000).

On tradition and change in modern times, see Robert N. Bellah, "Epilogue: Religion and Progress in Modern Asia," in *Religion and Progress in Modern Asia*, edited by Robert N. Bellah (New York, 1965), pp. 168–229; and Eric J. Hobsbawm and Terence Ranger, eds., *The Invention of Tradition* (Cambridge, U.K., 1983). Lloyd I. Rudolph and Susanne Hoeber Rudolph, *The Modernity of Tradition: Political Development in India* (Chicago, 1967), is a classic study of the role of tradition in modern politics. Milton Singer, *When a Great Tradition Modernizes: An Anthropological Approach to Indian Civilization*, with a foreword by M. N. Srinivas (New York, 1972), is another fine work on tradition and modernity in South Asia. The tenacious reader will be rewarded by working through Joseph Richmond Levenson's *Confucian China and Its Modern Fate: A Trilogy*, 3 vols. (Berkeley, Calif.,

1958–1968). Donald H. Shively, ed., *Tradition and Modernization in Japanese Culture* (Princeton, N.J., 1971), is a good collection of essays on tradition and change in early modern Japan. Paul Heelas, ed., with the assistance of David Martin and Paul Morris, *Religion, Modernity, and Postmodernity* (Oxford, U.K., and Malden, Mass., 1998), provides a sampling of postmodernist perspectives on issues of tradition and modernity.

From the growing literature on the cultural and religious impact of globalization, see Arjun Appadurai, ed., *Globalization* (Durham, N.C., and London, 2001); Peter L. Berger and Samuel P. Huntington, eds., *Many Globalizations: Cultural Diversity in the Contemporary World* (Oxford, U.K., 2002); and Mark Juergensmeyer, ed., *Global Religions: An Introduction* (New York, 2003), which includes a helpful bibliography. In the same connection, William Ernest Hocking's suggestive typology of the interaction between religious traditions in *Living Religions and a World Faith* (New York, 1940) is receiving fresh attention, as is Wilfred Cantwell Smith's *Towards a World Theology: Faith and the Comparative History of Religion* (Philadelphia, 1981).

PAUL VALLIERE (1987 AND 2005)

**TRANSCENDENCE AND IMMANENCE.** According to *Webster's New International Dictionary of the English Language*, second edition, unabridged, to transcend is to "ascend beyond, excel." The term is used of the "relation of God to the universe of physical things and finite spirits, as being . . . in essential nature, prior to it, exalted above it, and having real being apart from it." *Immanence*, defined as "presence in the world . . . in pantheism is thought of as uniform, God . . . equally present in the personal and the impersonal, in the evil and the good. According to theism, immanence occurs in various degrees, more in the personal than the impersonal, in the good than in the evil."

It is clear that *transcendence* is a value term expressing the unique excellence of God, because of which worship—utmost devotion or love—is the appropriate attitude toward the being so described. It is less obvious that *immanence* is a value term, but *ubiquity*, "being everywhere," comes closer to expressing a unique property. If God is everywhere in the world and also in some sense beyond the world, then God certainly surpasses all ordinary objects of respect or love.

"Prior to the universe" seems to suggest a time when God was alone, with no cosmos of creatures to relate to—first a creator not actually creating, then one creating. But it also might mean that there was a different universe before our own. Origen thought God had created an infinity of universes in succession and never lacked relation to some actual creatures. We see a partial return to that position in Alfred North Whitehead's hypothesis of "cosmic epochs," each with its own natural laws. Whitehead held that having a universe, some universe or other, is, in principle, inherent in God's nature and not subject to divine choice. What may be subject to such choice are the particular laws that will govern

a cosmic epoch about to arise. God's "real being apart from the universe" means, in such a view, a vantage apart from our current universe, not apart from all universes. Not every theologian agrees with those who think to compliment God by affirming divine freedom to have simply no creatures. The objection to this once-popular view is that since any creatures are better than none (that being as such is primarily good and only secondarily bad is a classical doctrine), God would be making the worst possible choice by not creating at all. Freedom to do this seems nonsensical when affirmed of God.

In what sense is God *in* the universe? The suggestion in *Webster's*, attributed to "idealists," is that the divine presence is "like that of a conscious self in the world of that self." Or, attributed to "realists," it is like "that of a self in its organism and its behavior." The latter suggestion makes Plato a realist, for it was he who in the West first thought of God as the World Soul, whose body is the entire cosmos of nondivine things and persons. This proposal (in the *Timaeus*) was, however, seldom followed until recent times, and was rejected by Whitehead. In this I take Whitehead to have been mistaken. The relation of mind to body in human (and other) animals is the relation of mind to physical reality, to "matter," that we most directly and surely know. If our thoughts do not influence our behavior, then we know nothing of any influence of mind or spirit on the physical world. David Hume pointed this out in his *Dialogues concerning Natural Religion* through the character Cleanthes.

**REALISTIC IDEALISM.** The idealist view referred to above is less obviously intelligible. Does our mere contemplation of the world make us immanent in that world? When we remember past experiences, does that put our present consciousness back into those experiences? If I think of someone in Hong Kong, does that put me in Hong Kong? The form of idealism referred to by *Webster's* definition is no longer widely held. It is the data of an awareness that are in the awareness, not vice versa. If this realistic principle—accepted by the theistic metaphysicians Charles S. Peirce and Whitehead, who in some respects are properly called idealists—is sound, then it is the creatures' awareness of God, not God's awareness of them, that constitutes the divine presence in the universe. And if God is universally present, then the creatures universally are, however inadequately, aware of God, who is the universal object as well as the universal subject. This implies, as Peirce and Whitehead held, as did Henri Bergson and some other recent theists, that every creature has some form of awareness, even if it be nothing more than some mode of feeling. For those of this persuasion, dualism and materialism are both inconsistent with a well-thought-out theism.

Unfortunately, the term *idealism* is still often applied to the now antiquated doctrine presupposed by the editors of *Webster's*. Few changes of opinion are more definite or important than the shift, in this century, in the way the relations of mind or experience to its data are conceived. Indeed, the alternative to idealism is no longer realism but the choice

between dualism and materialism. A "realistic idealism" makes perfectly good sense. And Plato was both realist and idealist, except insofar as, like all ancient Greeks, he was unable to escape dualism and materialism entirely. No one in the West knew how to conceive mind, or awareness, as a universal property of creatures until Leibniz, the true founder of realistic idealism, made his distinction between dynamic singulars and aggregates or groups of singulars. (The singulars he called monads, but this term tends to connote some further doctrines peculiar to Leibniz that are no longer accepted, even by those strongly influenced by Leibniz, so far as the problem of mind and matter is concerned.) In Asia, where Leibniz has not as yet had much influence, there seems to be no comparably well-articulated doctrine of realistic idealism that can be called theistic.

The distinction between dynamic singulars—all of which are sentient—and their groups or aggregates depends, for Leibniz, on the primitive form of the atomic theory then entertained by physicists and also upon the discovery by Leeuwenhoek of the realm of microscopic animals. With a stroke of genius, Leibniz generalized this and held that larger animals consist of smaller animals (in a generalized sense), thus anticipating the cell theory established much later. Leibniz may well have realized the philosophical meaning of Leeuwenhoek's discoveries better than some philosophers do now. He made a realistic idealism at last possible and thereby freed theism from one of its greatest difficulties, enabling it to give a positive explanation of the divine ubiquity.

**GOD'S DUALLY TRANSCENDENT LOVE.** Whitehead's theory of prehension (or "feeling of feeling"), applied to God and all creatures, makes God the universally prehending and universally prehedded subject, feeling all and felt by all. Hence God is in all and all is in God. Since creaturely prehensions are those of subjects in principle inferior to God, they feel God inadequately, whereas God, in principle superior to all, feels the creatures and their mostly unintellectual feelings with ideal adequacy. Although each creature contains God and God contains each creature, the divine containing is unqualified, but the creaturely containing is more or less drastically qualified. Thus, for theism, God is present "in various degrees" in the parts of the universe, but the creatures are wholly present to God. As Berdiaev urges, the most pertinent question is not "Is God in the world?" but rather "Is the world in God?" The Pauline saying, that in God "we live and move and have our being," can be taken literally without necessarily implying pantheism.

To say that God feels the feelings of all creatures is to contradict the doctrine of classical theism that God is impassible, wholly unaffected by others. Anselm said that God was not compassionate, although the effects of the divine being were *as if* God were compassionate. What this amounts to, for some of us, is that the New Testament saying "God is love" is untrue, yet the effects of God's nature upon us are what they would be if God loved us. We here confront a deep divergence between that theism pervasive in Scholasticism

(with Bonaventure producing the most thoroughgoing attempt to interpret divine love), and found also in medieval Islamic and Jewish writings, and the theism that I call neo-classical, which has been set forth by some recent philosophers and theologians (e.g., Nikolai Berdiaev, Alfred North Whitehead, Rudolf Otto, Otto Pflleiderer, John Oman, Alfred Ernest Garvie, and Edgar S. Brightman). Whitehead's assertion that "to attribute mere happiness to God is a profanation" hints at this rejection of Anselm's doctrine, and his further statement that "God is the fellow sufferer who understands" makes the contrast quite clear. Berdiaev is no less plain on this point.

The denial that love, however generalized, can characterize deity is implied by Plato, who, in his *Symposium*, interprets love as the longing for absolute beauty and hence a confession of imperfection. The nearest Plato comes to attributing love to God is to say that there is no envy in the divine nature, and hence God is willing to have creatures sharing existence with him. Plato does definitely attribute to God knowledge of the creatures, whereas Aristotle denies this. All his deity thinks is the generic nature of thinking itself, totally free from the contingency and particularity that go with individuals in the world.

In India, the Advaita Vedāntins, often regarded as the orthodox Hindus, thought of the highest and only genuine reality as beyond anything that could be called love. The latter is a social relation, presupposing a plurality of subjects in space and time, whereas *brahman* is without temporal or spatial plurality. In India, however, there are also various proponents of pluralism. Ramanuja and Madhva are the most obvious examples, but there are others whose views show striking analogies to the Western "process" view, the greatest single representative of which is Whitehead. To appreciate adequately the strength of the worldwide effort to find something greater and better, or more real, than love at its best, we need to relate the issue to the problem of anthropomorphism. We human animals are social, and it has with some justice been said that an absolutely nonsocial animal does not exist. God, however, is in principle superior to any animal. God is uniquely excellent, without possible rival or equal.

The Christian doctrine of the Trinity is an attempt to have it both ways. In some sense, the Son and Holy Spirit are equal to God the Father; in some sense God is supreme. The three divine persons could love each other, even were there no creatures. This doctrine is too paradoxical to be defended apart from revelation. Apart from some such doctrine, either God does not love anyone or the being in principle superior to all conceivable others loves these lesser beings. Even with the trinitarian doctrine, the question remains relevant: must not God, conceived by analogy to what we know of ordinary beings (and how else can we conceive anything?), cherish the creatures? If we can sympathize with children and other kinds of animals, must God view them and us with mere indifference? If so, was not Aristotle right in saying that God does not know particular, contingent individuals because they are "not worth knowing"?

**EXTREMIST AND MIDDLE-GROUND STRATEGIES.** History shows two ways of approaching philosophical disagreement. One way, in practice taken by some of the wisest philosophers, is to suspect extreme views and look for a "middle way" between opposite extremes. Some of the ancient Buddhists did this explicitly. With regard to transcendence and immanence, one extreme is gross anthropomorphism, taking God to be, as Matthew Arnold put it, "a magnified, nonnatural man." The opposite extreme is to say, as Karl Barth once did (he later partly rescinded the statement), that God is "wholly other" than ourselves. The middle way is to look for a difference in principle between God and all else and yet also, consistent with this, a resemblance in principle between God and all other beings. Many philosophers and theologians have more or less consciously proceeded in this fashion, and two of these, Plato and Whitehead, have been especially successful (at least according to some scholars strongly influenced by Whitehead). However, conditions in the ancient world were unfavorable to this side of Plato; and for many centuries a quite different way was taken in the West (beginning with Aristotle and the theologian Philo Judaeus).

In India, also, it was not a middle way that was the mainstream of thought. Instead, an extremist strategy was followed, though with some inconsistency. It was taken for granted that truth is an extreme with error its opposite. The maxim, without ever being so stated, perhaps, was "Let us find the view that is most hopelessly wrong and affirm the opposite." That the God of all the worlds is like a localized and mortal animal, dependent for its very existence on an environment, is clearly wrong, the absurd error of anthropomorphism. So, let us deny of God, or the supreme reality, all traits that animals and still lesser beings have in common, and, by achieving the opposite of anthropomorphism in characterizing God, we will come as close to the truth as is in our power. All animals and lesser beings are finite, changeable, subject to influence by others, complex, and have feelings as well as thoughts (if they have the latter). Let us say, therefore, that God is infinite, unchangeable in every way, wholly impassible, immune to influence by others, wholly simple, incapable of feeling, but with purely intellectual knowledge (whatever that may be). It was David Hume who first indicated the possible fallacy in all this. What is to guarantee that, when we have denied all that constitutes reality as we experience it, anything is left to distinguish God from mere nonentity? The famous negative way, the *via negativa*, must, after all, be supplemented by something positive, or we may end up worshiping a mere nothing or a mere verbal formula.

As a matter of fact, the premise of the negative way—is its characterization of beings in the world—is seriously inaccurate. What is common to ordinary individuals is only inadequately or ambiguously described as finite, changeable, subject to influence by others, and complex. Furthermore, the distinction between awareness as feeling and awareness as pure thought or knowledge is problematic. What thought or

knowledge would be without feeling is not something that our experience makes transparently obvious. Finally, we animals are not simply finite; each of us is a mere *fragment* of the finite. The entire cosmos may be spatially finite; and even a beginningless past would be in a sense finite compared to the infinity of all that is conceivable. It is very well arguable that no knowledge of finite things could, without contradiction, be considered absolutely infinite. Hence an all-knowing God must be in some sense or respect finite.

Similarly, knowledge of the contingent must be contingent. What we are and what God cannot be is fragmentary. The divine finitude must encompass at least the world's finitude and also its infinity in whatever sense the world is infinite. Yes, we are affected by others, but it is just as true that we affect others. We are cause and effect; the question is, does it even make sense to view God as the cause of all and the effect of nothing? As Aristotle said, knowledge of contingent things is conditioned by the reality of the things known. The all-knowing cannot be simply and in every sense uncaused, unconditioned.

The alternative to the negative way is the doctrine of dual transcendence, according to which God in principle excels over others both in the sense that the divine nature is uniquely absolute and infinite and in the sense that it is uniquely relative and finite. If we could not be absolute (independent) or infinite in the divine sense, neither could we be relative or finite in the divine sense. Nor need it be contradictory to attribute both of these contrasting properties to God. Contradiction occurs only if a subject is said to have a property and a contrary property in the same respect; otherwise contradiction does not obtain. And if it be said that since God is simple, God cannot contain a duality, the reply is ready: the divine simplicity is itself only one side of the duality of transcendence. In Whitehead's view, God's "primordial nature" is simple (I would say even simpler than Whitehead makes it) but God's "consequent nature" is the most complex reality there is. The complex can include the simple.

It was said above that "changeable" is an inadequate or ambiguous characterization of things other than God. There are changes for the better, for the worse, and neutral changes. Animals are open to good changes—growth, enrichment of experience—but also to bad ones—decay, impoverishment. To demand that God be, in every respect, immutable is to imply that there is no form of the capacity to change without which a being would be defective, or even a mere abstraction, not a concrete, actual being. The divine excellence requires immunity to negative change, to loss or degeneration; but does it require an incapacity for any and every kind of good change, every kind of increase in value? Plato (not the scriptures) proposed the argument "God must be perfect, hence any change would have to be either for the worse or without value, meaningless." This argument presupposes for its force that we have a positive idea of a maximum of value such that no additional value would be possible. Plato's phrase for such an unincreasable, unsurpassable value was "absolute beauty."

What this is neither Plato nor anyone else has told us. An analysis of aesthetic principles strongly suggests that given any conceivable beauty there could be a greater beauty. If this be so, Plato's argument proves nothing.

Another ambiguity or problematic concept in the negative way was the idea that dependence was necessarily a defect distinguishing ordinary things from God. This excludes knowledge from God, if indeed Aristotle, or anyone else, can tell us what "to know" means. In addition there are two kinds of dependence, only one of which is obviously a weakness, this being dependence for very existence and essential properties. Denying this radical dependence of God for very existence leaves quite open the possibility of a dependence for qualities not necessary to the divine existence. If there is any genuine freedom in the creatures, they will do things they might not have done. God will know what they have done, but (as the Socinians saw long ago) this knowledge cannot be essential to God's very existence. Rather, had a creature done something other than what it did, God would have had correspondingly different knowledge other than the knowledge he does have. If the word *knowledge* is given an honest meaning, one can consistently assert the compatibility of creaturely freedom with divine knowledge only if one admits divine knowledge without which God could and would—had the world been otherwise—have existed as God, incapable of error and ignorance. Total independence of others entails not knowing these others. Plato did not know us and was independent of us; we know Plato and *therefore* are not wholly independent of Plato.

Step by step, the reasoning of simple or nondual transcendence has been examined by this and other writers. It seems lacking in cogency. To understand the steady loss of support by philosophers (beginning with Hume and Kant) for classical theism (which denies dual transcendence), this lack of cogency is important. Belief in the divine uniqueness can survive the admission that it is not change but certain kinds of change, not dependence but certain kinds of dependence, that are excluded by the divine excellence. That the issue is worldwide and intercultural is remarkably well illustrated by the following coincidences.

In a year—I think the very month or week—in which I was thinking and writing about how God in some senses is changing, yet also in other senses unchanging, a man from India delivered a sermon in the chapel of the University of Chicago, with which I was connected for twenty-seven years. He was Radhakamal Mukerji, a leading sociologist of India, but also a writer on mysticism. He said in his sermon that God is unchanging in "ethical" goodness but increases in "aesthetic" value, which I took to mean in the richness or beauty of the divine experience of the world as new creatures come into being. This distinction between ethical value as capable of an absolute maximum and aesthetic value as an open infinity with no upper maximum was exactly the conclusion I had come to before hearing or knowing Mukerji. Also before this, I had had a somewhat similar intercultural

experience, which was confirmed again long after Mukerji's visit. It involved two monks of the modern Bengali sect of Hinduism whose views harmonized with the idea of a deity both unchanging and yet in some respects changing. One of these monks, Ma-kanam Brata Brahmachari, who did his doctoral dissertation under me, quoted a representative of his sect who wrote of God: "Lo, the cup is eternally full, yet it grows without ceasing." When this man began talking to me about "love" as a theological term I asked him what he meant by the word. "I mean," he said, "the consciousness of consciousness, the thinking of thinking, the . . . of . . ." I am not sure, but he may have said, "the feeling of feeling." If he did, the analogy with Whitehead was close. In his dissertation he writes: "God is more than the absolute." Of course, for a mere negative like *nonrelative* by itself constitutes no sufficient account of any actuality. Plato is not relative to us, but that is Plato's total ignorance of us; we constitute nothing of Plato's being, whereas, by his knowledge of and hence relativity to them, Parmenides and many others whom he did know contributed much to his wonderfully comprehensive awareness.

**THE REALITY OF DIVINE LOVE.** Finally, I want to focus on the proposition "God is love." Mortimer Adler has recently explained why, although he is convinced that an intelligent divine being exists as creator of all, he does not think it can be demonstrated that this being is benevolent or loving. One may, however, question the distinction drawn here between divine intelligence and divine love. If God is to know us, God must know our feelings. How can feelings be known except by feelings? Can mere intellect (whatever that is—perhaps a computer) know feelings while having none of its own? And if God has feelings, what kind of feelings? Envy, malice, conceit, hatred, inferiority complexes? What have these to do with all-encompassing intelligence? For me, this is a wholly absurd combination of ideas. By embracing in knowledge all the qualities of reality, God possesses all that anyone possesses by way of value, so what could envy mean? Hatred would be baseless, since by willing the suffering of creatures God would be willing divine sharing in these sufferings. Whitehead's wonderfully simple formula of "feeling of feeling" as a basic element in knowledge excludes any ground for Adler's dilemma. To know others without intuiting their feelings is scarcely knowledge at all, and such an ability would hardly seem likely as an essential quality of an indestructible cosmic subject upon which all others radically depend. Simple atheism would be more reasonable than affirming such a God, so far as I can see. To give intelligence cosmic and everlasting scope, but to deny such scope to love, seems a discordant mixture of notions. Or is Advaita Vedānta and the doctrine of *māyā* the alternative to love? We think we exist as individuals, but really only *brahman* exists, spaceless and timeless. We are appearances of *brahman*, although *brahman* is unaware of us. Or does *brahman* constitute us by dreaming us? I have a different theory of dreams, and so had Bergson. Perhaps we can leave the doctrine of

*māyā* to the Indians, who are by no means in agreement on the subject.

It is fair to add that there is no agreement in the West on the reality of divine love. Can a fragment of reality comprehend the encompassing? I feel entirely confident that if love cannot encompass all, including creaturely hatred as a degenerate case of love (the total lack of which is mere indifference), then nothing positively conceivable by such as we are can do so either.

If no form of theism escapes difficulties, puzzles it cannot solve, questions to which it finds no convincing answer, this is perhaps to be expected. A god easily understood is not God but a fetish, an idol. Dual transcendence removes some of the traditional paradoxes, especially if we include a clear doctrine of freedom as well as of more or less humble forms of sentience and feeling for all dynamic singulars in nature. Peirce had already done this before Whitehead took creativity as the ultimate category, applicable in the uniquely, divinely excellent form to God and in humbler forms to all creatures. But still there are puzzles. Change in God seems to imply, and Berdiaev hints at this, a divine kind of time. But how to relate this timelike aspect of God to worldly time is a problem that overwhelms me with a sense of incompetence. Physicists have their own difficulties with time, and without a mathematical competence beyond that of most of us one can scarcely begin to understand these difficulties, let alone overcome them.

By attributing freedom as well as minimal sentience to even the least single creatures (particles, atoms), the classical atheistic argument from evil loses its cogency. The details of nature are decided not by God but by the creatures concerned, by atoms, molecules, bacteria, single-celled animals, and many-celled animals, including human beings. And if it be said that God, in deciding to have free creatures instead of unfree creatures, is indirectly responsible for evil, the reply is that for the new type of idealism "unfree creature" is an ill-formed formula. As God is supreme freedom, ordinary singular beings are instances of less than supreme freedom, not of total lack of freedom. To be is to create, to decide what is otherwise undecided. Decision making, freedom, cannot be monopolized. Supreme freedom would have nothing to do were there not also less exalted forms of freedom. Genuine power is not power over the powerless. No single agent ever decides exactly what happens. The new physics (and even classical physics as interpreted by Clerk Maxwell, Reichenbach, Peirce, Whitehead, Sudarshan, and others) seems to harmonize better with this doctrine than did classical physics as it was usually interpreted by philosophers.

The present climate of opinion suggests the need for reconsidering many an old controversy and for questioning not only certain assumptions of classical theologians but also some of those of classical atheists or agnostics, including Hume, Kant, Marx, Comte, Russell, and Nietzsche. Not all contemporary forms of theism can be refuted by antiquated forms of skeptical argument.

Religion is a two-story affair, to adapt a phrase from James Feibleman. It is in part an empirical and historical matter, concerned with contingent fact about human nature and traditions. The idea of God, however, is nonempirical and metaphysical. Dealing as they do with what is eternal and necessary, including the eternal and necessary aspects of God, metaphysical statements are true if they make coherent sense and false otherwise. To admit that one has no idea of the answers is to imply that one has no idea of the question; for they are either self-answering or else confused. It is humanly difficult to admit this confusion. If one could clearly see that and how one is confused, would one still be confused? I feel confident there will be other writers in this collective enterprise whose confusions will contrast with mine. And there is something to be said for making one's partialities explicit.

#### BIBLIOGRAPHY

My article "Pantheism and Panentheism" in this encyclopedia deals with closely related topics; its bibliography is relevant here. My *Omnipotence and Other Theological Mistakes* (Albany, N.Y., 1984) is a somewhat popular, nontechnical presentation of my own version of the idea of God as supreme love exalted above ordinary love by dual transcendence. My article "Transcendence" appears in *An Encyclopedia of Religion*, edited by Vergilius Ferm (New York, 1945), pp. 791–792; see also in the same work my articles "Hume, David," "Omnipotence," "Omnipresence," and "Perfect, Perfection," as well as Herman Hausheer's "Fechner, Gustav Theodor."

For a distinguished Jewish theologian's idea of God, see John C. Merkle's *The Genesis of Faith: The Depth Theology of Abra-*

*ham Joshua Heschel* (New York, 1985); see also Heschel's *God in Search of Man: A Philosophy of Judaism* (New York, 1955). Heschel's view is remarkably close to the neoclassical view, although both doctrines were worked out independently. Edgar S. Brightman's *The Problem of God* (Nashville, 1930) is an approximation to the dual transcendence view; see also Brightman's *A Philosophy of Religion* (1940; Westport, Conn., 1969), especially chapters 7, 10, and 11, for a fine historical sketch of the idea that God must have finite as well as infinite aspects. Brightman's conceptualization is in line with the trend to turn away from the extremist strategy that prevailed from Aristotle to early modern times toward a middle-ground strategy, in which God is neither exclusively infinite nor exclusively finite but is, in suitable divine ways, both.
