# images and the body

IMAGES AND THE BODY

One of the few generalizations about religion that may be safely declared is that the practice of belief is always, in one way or another, a firmly embodied affair, transpiring in the medium of the human body. Even in the hands of the most zealously ascetic or scholastic adherents,

religion's deep register is the body that is denied, cloaked, disciplined, or scorned. In less repressive religious cultures, the body is celebrated as the vessel of memory, the bearer of social status, the medium of divine presence, and the richly adorned display of fecundity, transport, joy, or sexual union.

The human body offers manifold possibilities to act as the medium of belief. Costume for ritual occasions such as prayer or recitation of holy writ (a) shapes personal performance by investing the individual with the solemnity of public display. More permanent changes to the body, such as tattoos, make personal statements that link the individual to a variety of communities—some of them ethnic or racial, but also the associations of tattoo wearers linked through tattoo shops, clubs, newsletters, and magazines. Religious iconography, such as

(a) A Jewish boy reads from the Torah at his bar mitzvah. [©Nathan Nourok/Photo Edit]

(b) ABOVE. A cross and the opening words of *Psalm 23* tattooed on a woman's back. [©Steve Chenn/Corbis] (c) RIGHT. Luba caryatid stool of carved wood, Democratic Republic of the Congo. [©Christie's Images/Corbis]

that displayed on the back of the woman shown here (b), operates across the lines of many subcultures.

In addition to the decoration of the body itself, artists everywhere have made use of the human form in objects and images that allow endless permutations of meaning. The Luba people of the Democratic Republic of the Congo carve figural stools (c) for the complex array of seating arrangements that structure the hierarchy of the privileged members of the Luba court. The stools consist of female figures (but can also be abstract forms) upholding the sitter, which is a male chief or a member of the royal court. The female body possesses the power of birth-giving and serves as the vessel containing the spirit of the king. Past kings remain invested in their stools. The features of the female figure, particularly the patterns of scarification, are material texts that encode royal history. Luba women are believed to hold the taboos and restrictions of kingship within their bodies and as such serve as the figures symbolically holding up the kings.

The material forms of religious practice are found to address all aspects of human embodiment. Four objects from South Pacific societies make this clear. Drumming is part of the liturgical life of peoples as far apart as Oceania, native North America, Africa, and Mongolia. As an accompaniment to song and dance, the drum helps to celebrate key ritual occasions, such as funerals or the completion of a house or canoe among peoples in Papua New Guinea **(d)**. The steady beat of the drum structures chant and resonates through the body, harmonizing the group that sings clan songs, initiates youth, or performs the lamentation of burial. The drum is an instrument that evokes bodily participation in the social life of ritual. No less a part of ceremony is the painting of the body. Dishes such as the one reproduced here **(e)** were used in Papua New Guinea to mix pigments. It has been suggested that since the figures on such dishes represent clan animals and ancestors, using them for the mixing of colors applied to the body may have been part of a ritual absorption of clan

or ancestral spirits into the very body of the participant. On the island of New Zealand, richly carved objects were used to attend to other aspects of the body. A carved wooden bar, called *paepae* (f), may have been part of the ritualizing of excreting waste. It has been suggested that such a device was bitten by someone using a latrine as the final act of elimination, providing a cleansing of taboo caused by excretion. The Maori also used another type of carved device, the feeding funnel (g). It was forbidden for food to touch the lips of chiefs while they healed from the application of tattoos. The feeding funnel allowed the chief to eat semi-liquid food. The elaborately tattooed faces on the outside of the funnel may correspond to the power the funnel seeks to preserve in the tattooed face of the chief who ate with the funnel.

Religious practices mine the human body for its rich metaphorical significance. Olmec artists produced marvelous ceramic figures of infants (**h**), whose interpretation remains inconclusive, but which have been linked to funerary practices, shamanistic rites, and fertility ceremonies. For example, small figures shown in the care of old women have led some to believe that the infant figures helped shamans perform rites effecting cures or healthy births. Other forms of evidence associate the sculptures of infants with sacrificial rites that transformed the infants into rain and vegetation, thus procuring seasonal regeneration and agricultural fertility. One authority indicates that the ceramic figures themselves may have been used in such rites, or may represent the children who were sacrificed. In either case, infancy meant rebirth and the remarkable skills of Olmec artists at naturalistic rendition of the infant's gesture and fleshy forms no doubt enhanced the efficacy of the rite.

If images of infants could assist with the renewal of nature in ancient Olmec culture, a visual practice at the beginning of the Common Era among Egyptians sought to ensure an individual's life after death. The practice involved affixing realistic portrayals of individuals to their mummified bodies in order for their spirits to recognize themselves and reside in the body after death (**i**). These portraits were commissioned during the lifetime of

the individual and displayed at home, then used in the preparation of the body after death. This close association of image and body may have been incorporated into Christian practice, which found an important place for the relics of saints and martyrs. The fifteenth-century bust of Saint Margaret of Antioch (j) recalls the early fourth-century saint who defeated a dragon, which is seen here lying docilely beneath her hand. She was martyred during the reign of Diocletian, one of the last pagan emperors of late antiquity. Now missing is the relic of the saint that occupied the compartment in the figure's chest. Margaret's dedication to assisting women in labor made her popular in the Middle Ages and the infantile size of the dragon may dramatize her power to soothe the pain of childbirth.

Another martyred woman, Daphne, was portrayed by the artist Kiki Smith in a way that recalls the torture of Christian saints. According to Ovid, Daphne was metamorphosed into a laurel tree in order to be delivered from the amorous pursuit of Apollo. When she prayed "change and destroy the body which has given too much delight," her human flesh changed to bark, limbs, and

leaves (Ovid, *Metamorphoses*, bk. 1). Smith portrays the body of the helpless nymph crucified by her own wish. Although Ovid indicates that it was the malice of Cupid that inflicted love upon the chaste girl by piercing Apollo with his fated arrow, Daphne blames her body for inciting desire. Smith leaves us to wonder why the body of a woman suffers as the victim of the male assault of desire. By contrast, the Baroque sculptor Gian Lorenzo Bernini produced a virtuoso performance in marble (**k**) in which the viewer is intended to marvel at the sensuous transformation of marble into flesh as well as marble into tree limbs and foliage, almost without pausing to consider the injustice done to Daphne.

The violent stilling of desire occupies a great deal of religious energy. Hinduism, like Christianity, possesses a long-established ascetic tradition in which practitioners deny themselves physical comforts, dress, and possessions, and take only the least amount of nutrition, as in the case of the Indian *Sādhu* or holy man shown here (**l**). One of the oldest aspects of Christianity is mortification of the flesh. In the later Middle Ages and the early modern period, visual contemplation of Christ's suffering was one of the primary forms of Christian spirituality. Following the Protestant Reformation, a reassertion of images of suffering—portraying Christ, his disciples, and the saints—were designed to invite devout viewers to direct their attention and devotion to the self-effacing merits of Christ (**m**) and

his martyred followers (n). At times this imagery was especially graphic in order to jolt viewers to attention and to elicit from them an empathic response accompanied by remorse and self-incrimination. The sacrifice and pain undertaken by Christ and the saints were the means of human salvation and were to be regarded with solemn gratitude.

## SOUTH AMERICAN INDIAN RELIGIONS

*This entry consists of the following articles:*

AN OVERVIEW  
 MYTHIC THEMES  
 HISTORY OF STUDY

### SOUTH AMERICAN INDIAN RELIGIONS: AN OVERVIEW

Since the Indians of South America do not conform culturally, there is no religious uniformity among them. Despite this inconsistency, an acceptable overview can be achieved by subdividing the continent's large, geographically distinct regions into the following cultural areas.

1. *The Andes.* This mountain range stretches from present-day Colombia to Chile. The highland regions of Peru, lying between the Pacific coast region and the valleys that cut through the mountain range, were taken over in the distant past by highly advanced agrarian cultures. Among the most significant of these cultures was the Inca empire, which extended into the dawn of historical times. Direct descendants of earlier Andean cultures, the Quechua and Aymara peoples inhabit present-day Peru and Bolivia.
2. *Amazon and Orinoco rivers.* These jungle- and savanna-covered regions were conquered by tropical farming cultures. From the standpoint of cultural history, this area also includes the mountainous sections of present-day Guyana; in early historical periods, the Amazon cultural area eventually spread to the Atlantic coast. As in the past, it is now inhabited by tribes belonging to a number of linguistic families, both small and large (Tupi, Carib, Arawak, Tucano, and Pano), and by a number of linguistically isolated tribes. Together they form cultural subareas that display religious specializations.
3. *Mountains of eastern Brazil.* This region is occupied by groups of the Ge linguistic family, who practice rudimentary farming methods; they settled in these hinterlands of the Atlantic coast region, joining indigenous hunting tribes. A few of these Ge groups have survived culturally up to the present time.

4. *The Gran Chaco.* The bush and grass steppes of this area stretch from the Paraguay River west to the foothills of the Andes. The area was initially divided among hunters, fishers, and gatherers, and these cultures came under diverse influences from neighboring agriculturists. A series of more or less acculturated groups of the Guaiacurú linguistic family (the Mataco and the Mascoy) may still be encountered at the present time.
5. *The Pampas and Patagonia.* Hunting groups wandered through these flatlands of the southern regions of South America. The extinct Pampa and Tehuelche Indians were among the peoples of this region. The Tierra del Fuego archipelago, near the Strait of Magellan, is also included within this territory. Although the inhabitants of these regions—the Selk'nam (Ona), Yahgan, and Alacaluf—are considered extinct, their culture and religion were well documented before they vanished.
6. *Southern Andes.* This area, especially its middle and southernmost regions, is populated by the agrarian Araucanians of Chile, who have prospered up to the present time. Their success has been attributed to their development of a self-sufficient culture a few decades before the Spanish invasion in the early sixteenth century. This development was the result of the influence of highly advanced Peruvian cultures, as the Inca empire progressed to the Maule River in Chile. In the eighteenth and nineteenth centuries, the Araucanians expanded eastward, but this part of the group, like its predecessors in the area, eventually became extinct.

Pronounced differences in religious phenomena appear within each of these cultural areas; these phenomena present certain discrepancies when seen together. The most outstanding contrast appears between the highly developed Andean religions, which are founded on priesthood and ruling cults, and the religious beliefs of the tribes in the eastern lowlands. Some typical examples of their forms and their respective beliefs should help to clarify their differences.

**DEITIES, CULTURE HEROES, AND ANCESTORS.** The tradition of a creator as the prime mover and teacher of mankind is universal among the Indians of South America (Métraux, 1949). In the majority of cases, the mythical person most often represented is not directly involved in the daily activities of mortals and therefore does not enjoy particular veneration. There is no fundamental discrepancy between this disinterested deity and the omnipotent creator whose cultic worship is integrated into a religious system; similar characteristics are attributed to both figures. A god previously venerated may fade to the position of a mythical figure, just as a mythical character can achieve cultic significance.

Under certain conditions, a creator, a culture hero, or an ancestor may rise to the position of a deity or supreme being. Such a case occurred in the old cultures of Peru with the religious figure Viracocha. Perhaps originally a culture hero of the Quechua or some other Andean people, Vira-

cocha eventually ascended to the ranks of the highest pantheon as a result of speculation on the part of the Inca priesthood. At the beginning of the sixteenth century, Viracocha was represented in anthropomorphic sculptures that appeared in special Inca temples and was venerated through prayers and sacrificial offerings. Inti, the Inca sun god, is portrayed with a human face within a golden disk, and as the tribal god of the ruling Inca dynasty he was embodied in the Inca emperor.

The establishment of an elaborate cult for an indigenous supreme being is a typical occurrence in highly advanced cultures, but such cults are seldom found in South America outside the Andes region. When they do appear elsewhere they are likely the result of the influence of these advanced civilizations on compatible cultural and geographical situations. A report by Karin Hissink and Albert Hahn (1961) on the cultures from the lowlands of Bolivia, near the Andes, points out that the Tacana Indians of the Beni River area maintain the belief in a supreme being known as Caquiahuaca, who created the earth, human beings, animals, and plants. An old man with a white beard, Caquiahuaca lives in a cave in a mountain that bears his name and that forms the center of the world. In temples he is represented by a small beeswax figure surrounded by a series of larger wooden statues that represent the lower gods, known as *edutzi*, who assist him. As the instructor of the priest-shamans, or *yanacona*, Caquiahuaca assists them in the performance of their office, and as their master he is responsible for their religious vocation.

In addition to this, Deavoavai, the lord of the animals, also represents a creator, culture hero, and master of the dead. In his capacity as ruler of the game, Deavoavai is rooted in an earlier cultural-historical level—that of hunters, fishers, and gatherers. Such a deity is also found among other agricultural peoples, including peoples of the Amazon lowlands. Despite their reliance on an economic subsistence that has long since undergone the transition from a hunting to an agricultural base, these groups of the Amazon Basin maintain a religious emphasis that incorporates a dependence on a powerful being who controls the game, an aspect that will receive attention below. It is sufficient here to point out that within this region a relationship exists between the master of the hunted game and the supreme being, a concept first recognized by Adolf E. Jensen (1951).

**Culture hero as supreme being.** Konrad T. Preuss was convinced that Moma (“father”) was the paramount, indeed, the only true god of the Witóto of the Putumayo area of the northwestern Amazon and that he was identified with the moon. According to creation legends among these people, Moma came into existence from the “word,” that is, he was a product of magico-religious incantations and myths that are endowed with supernatural powers. He was also the personification of the “word,” which he bestowed upon human beings, and the “word” was the doctrine that represented the driving force behind all religious ceremonies that Moma in-

roduced. The original father created the earth and all things of the world from the archetype (*naino*), the “not-substance,” of each individual entity. On the other hand, in a myth that explains the creation of the organic world, Moma extracts all the plants and animals from his own body. The blossoms of the food plants used by humans are evidence of his omnipotent presence, and when the trees of the earth no longer bear fruit they go to Moma in the underworld. In addition to being the moon in the heavens, he resides below as master of the dead. He was the first being to experience the suffering of death, but in the fruits of the plants he is continually resurrected.

Among the Witóto, such a representation demonstrates intensely the character of a particular form of culture hero, that is, one who is at the same time a supreme entity. Jensen applied the term *dema deity* in describing such a culture hero among the Marind-anim of New Guinea (Jensen, 1951). The distinguishing characteristics of this deity are revealed in his slaying, which occurred in primal times, and the consequent growth of all food plants out of his body.

**Waríkyana supreme being.** A supreme god is also manifested among the Waríkyana (Arikena), a Carib-speaking tribe of the Brazilian Guianas. The highest deity in the religion of the Waríkyana is Pura (a name that, according to the Franciscan missionary Albert Kruse, means “god”). With his servant Mura, Pura stands on the zenith of heaven’s mountains and observes all things that take place below (Kruse, 1955). At the command of Pura, the rain is sent from the sky. Pura and Mura are small men with red skin and are ageless and immortal. They appeared at the beginning of the world, together with water, the sky, and the earth. In early times Pura and Mura came down to earth and created humans and animals. Because mankind did not obey the ethical precepts of Pura, he retaliated by sending a great fire that was followed by a deluge. A segment of the human race survived this catastrophe, and the Waríkyana people believe that when the end of time comes, Pura will create another holocaust. It was therefore Pura to whom prayers were directed, and in his honor a celebration took place in which manioc cakes were offered to him.

Protasius Frikel, another Franciscan, completed Kruse’s description, noting that the Waríkyana view the supreme being as a reflection of the primal sun (Frickel, 1957). Pura continues to qualify as the superior god, and in addition he was also thought of as the world onto which the primal sun pours its blinding light. Pura also represents universal power, a belief that Frikel considers to be relatively recent among the Waríkyana.

In another instance, Pura is considered to be a “primordial man” or culture hero (*ibid.*). In any case, Pura resides in heaven and reigns over all elements. His companion and servant Mura is somehow connected with the moon and displays some features of a trickster. Such dual relationships as sun and moon, god and companion, culture hero and trickster—pairs that are often represented as twins—are encoun-

tered frequently in South American mythology. According to the Waríkyana, death is the beginning of the soul’s journey to heaven, where it will be reincarnated—a journey that is modeled after the eternal cycle of the sun.

**Yanoama and Mundurucú supreme beings.** Kruse’s work stimulated Josef Haeckel to write an article about monotheistic tendencies among Carib-speakers and other Indian groups in the Guianas, as well as among those groups bordering the western areas of the Guianas (Haeckel, 1958). According to Haeckel’s findings, reference to the name *Pura* in connection with a supreme being occurred in no other Carib-speaking tribe except the Waríkyana. To the west of their territory in the Guianas, however, the expression is used with only slight variation, even among different linguistic groups such as the isolated Yanoama (Yanonami) on the Venezuelan and Brazilian borders. According to the beliefs of some groups in Brazil, Pore is the name of a supreme being who descended to earth (Becher, 1974). Together with the moon, who is known as Perimbo, Pore established a dual relationship composed of both sexes—male and female—that was conceptually unified as a supreme entity who controls heaven, earth, and the underworld. As the most well-informed researcher of the Brazilian Yanoama, Hans Becher considers their mode of life to be strongly influenced by myths connected with the moon; the sun, on the other hand, is entirely unimportant. The awe in which these Indians hold Pore and Perimbo is so intense that they do not call on this supreme being directly. Instead, they employ the indirect services of intermediaries in the forms of plant and animal spirits (*hekura*) that reside on specific mountain ranges. Shamans identify with these spirits and when intoxicated with snuff come into contact with them.

There are strong similarities between the supreme being, Pura, of the Waríkyana and the figure of Karusakaibe, the “father of the Mundurucú” (an expression coined by Kruse, who was also a missionary among this central Tupi tribe). Karusakaibe once lived on earth and created human souls, the sky, the stars, game animals, fish, and cultivated plants, together with all their respective guardian spirits, and he made the trees and plants fruitful. Karusakaibe is omniscient: he taught the Mundurucú how to hunt and farm, among other things. He is the lawgiver of the tribe and the originator of its dual social structure. Karusakaibe is immortal. Because he was treated badly at one time by the Mundurucú, he went off to the foggy regions of the heavens. He is also credited with having transformed himself into the bright sun of the dry season. When the end of the world comes, he will set the world and all mankind on fire. But until that time he will look after the well-being of his children, the Mundurucú, who direct their prayers and offerings to him when fishing and hunting and in times of sickness. Martin Gusinde (1960) is of the opinion that Karusakaibe was once a superior god among the Mundurucú. Later his status changed to that of a culture hero.

**Tupi-Guaraní supreme beings.** Resonances of a supreme being concept among the Tupi-Guaraní linguistic

groups are mentioned by Alfred Métraux, who was the most important specialist in their religious systems (Métraux, 1949). Among these groups, the creator often has the characteristics of a transformer, and as a rule he is also the lawgiver and teacher of early mankind. After he fulfills these tasks, he journeys westward to the end of the world, where he rules over the shades of the dead.

Among the ancient Tupinamba of the Atlantic coast and the Guarayo of eastern Bolivia, traces were found of a cult devoted to the creator, Tamoi. In Métraux's opinion, the various culture heroes, including Monan and Mairamonan) were derived from a single mythical figure—the tribal grandfather, Tamoi. The occurrence of an eclipse of the sun or the moon is a signal that according to the beliefs of the Tupinamba relates directly to the end of the world, and the men must sing a hymn to Tamoi. These eschatological beliefs are characteristic of the Tupi-Guaraní and may be connected to the messianic movements of the Tupinamba at the beginning of the Portuguese colonization period. Such movements frequently led to mass migrations in search of the mythological land of Tamoi, a region perceived as a paradise where the inhabitants share immortality and eternal youth. A similar cult devoted to the worship of the great ancestor among the Guarayo was coupled with messianic movements at the beginning of the nineteenth century. In this case, Tamoi was considered the ruler of the celestial western kingdom of the dead as well as the dominant figure at burial rites and in beliefs about the afterlife.

The most revered god of the Guaraní-Apocuvá according to Curt Nimuendajú, the outstanding authority on this tribe at the beginning of the twentieth century, is the creator Nanderuvucu ("our great father"). Nanderuvucu has withdrawn to a remote region of eternal darkness that is illuminated solely by the light that radiates from his breast (Nimuendajú, 1914). He holds the means to destroy the world but retains the privilege of using this power for as long as he pleases. Because he is not concerned about the daily activities that occur on earth, no cultic practices are directed toward him. His wife Nandecy ("our mother") lives in the "land without evil," a paradise that at one time was believed to be in the east and then again in the west; this paradise also became the goal of various messianic movements of the Guaraní-Apocuvá.

**Ge solar and lunar gods.** In the eastern Brazilian area, the majority of the northwestern and central Ge tribes (Apinagé, Canella, and Xerente) hold that the Sun and Moon are the only true gods. Both Sun and Moon are masculine. Though not related to each other, they are companions; the Sun, however, is predominant.

The supremacy of a solar god among the Apinagé led Jensen to the conclusion that here the mythical concept of a sun-man has a secondary identity, that is, he is also a supreme god (Jensen, 1951). To support this theory, Jensen directs attention to the fact that human beings alone have the privilege of addressing this deity as "my father." He finds ad-

ditional support for this theory in the prayers that are offered to the solar god and in the role he plays in visions. An Apinagé chief spoke of an encounter he once had on a hunting expedition in which he met the sun-father in human form. The Apinagé consider the establishment of the dual organization of the tribe, as well as the placement of the two moieties within the circular settlement, to be the work of the Sun. A final supporting element observed by Nimuendajú (1939) is the Apinagé's consumption of round meat patties, which are eaten at feasts and are said to represent the sun.

At the beginning of the harvest season, a four-day dance festival is celebrated in honor of the Sun at which the dancers apply red paint to themselves in patterns representative of the sun. The Canella also publicly implore the heavenly gods, the Sun and the Moon, for rain, the safety of the game animals, the success of their harvest, and an abundance of wild fruit. In a similar manner, the Xerente call the sun "Our Creator" and pay the same devout tributes to the Sun-father as do the Apinagé. The Sun and the Moon themselves, however, never appear, but the Xerente receive instructions from these solar and lunar bodies through other celestial gods (the planets Venus, Mars, Jupiter) who are associated with the Sun and the Moon moieties. The most important ceremony of the Xerente is the Great Feast, at which a pole is erected so that the tribe members may climb to the top and pray to the Sun. At the end of the celebration, the master of ceremonies climbs this pole. Once at the top, he stretches his hand outward to the east and receives a message from a star within the constellation Orion, who acts as a celestial courier. In most cases, satisfaction is expressed and rain is assured.

The ceremonial pole as a link to the heavenly world is also believed to have been employed by the Botocudos, who were among the hunting tribes that once lived near the Atlantic Ocean but are now extinct. Their religion was apparently characterized by a belief in a supreme being in heaven, named White Head because of the image he created (the top of his head is white and his face is covered with red hair). He was also the chief of the heavenly spirits, who were known as *marets*. The *marets* spirits could be called to earth by the shaman, but in a form that is visible only to him; they also had to return to heaven in the same way. They took on the function of intermediaries between mortals and the supreme being when the shaman, through prayers and songs, turned to them in times of sickness or in an emergency. No one ever saw Father White Head face to face; although he was sympathetic toward mankind, he punished murderers and was responsible for sending rain storms.

**Mother goddesses.** As Métraux (1946) pointed out, the missionaries who searched for belief in a supreme being among the Indians of the Gran Chaco were not at all successful. The only mythical personality who comes close to the concept of a superior god, in Métraux's opinion, is Eschetewuarha ("mother of the universe"), the dominant deity among the Chamacoco, a Samuco group in the north Chaco region. She is the mother of numerous forest spirits as well as of the

clouds. As the controller of all things, Eschetewuarha ensures that mankind receives water. In return for this favor, she expects her people to send songs to her nightly, and when such expectations are not fulfilled she punishes them. Herbert Baldus (1932), who provided in-depth information about Eschetewuarha, compares her with the universal mother of the Cágaba (Koghi), a Chibcha tribe in Colombia that had been influenced by more advanced cultures. This comparison facilitates postulating at least a phenomenological relationship between the two.

The obvious characteristics of a supreme god are apparently present in Kuma, the goddess of the Yaruro, who subsist on fishing, hunting, and gathering along the Capanaparo River, a tributary of the Orinoco in Venezuela. She is considered to be a moon goddess and consort of the sun god, who is unimportant. Kuma created the world with the help of two brothers, the Water Serpent and the Jaguar, after whom the tribal moieties were named. Although she apparently created the first two human beings herself, her son, Hatschawa, became the educator and culture hero of mankind. Kuma dominates a paradise in the west in which gigantic counterparts for every plant and animal species exist. Shamans are capable of seeing the land of Kuma in dreams and visions and are able to send their souls there. As a reliable informant explained, "Everything originated from Kuma and everything that the Yaruro do has been arranged so by her; the other gods and cultural heroes act according to her laws" (Petrullo, 1939). Métraux drew attention to the typological affinities between Kuma and Gauteovan, the mother goddess of the Cágaba, who in turn is connected with Eschetewuarha of the Chamacoco (Métraux, 1949).

**Supreme beings of Tierra del Fuego.** Among the people living in the southern regions of the continent, a belief in a supreme being is common in hunting and fishing tribes, especially the Selk'nam (Ona) of Tierra del Fuego and the Yahgan and Alacaluf of the Tierra del Fuego archipelago. Despite many years of European influence in this area and the astonishing similarities of their beliefs to aspects of Christianity, Métraux believed that the religion of these three tribes remained substantially independent of Christianity (Métraux, 1949). Martin Gusinde, a member of the ethnological school of Wilhelm Schmidt, provided us with research information about these tribes shortly before their cultural extinction (Gusinde, 1931, 1937, 1974). The Selk'nam, the Yahgan (Yámana), and the Alacaluf (Halakwulip) maintain belief in a supreme being who is an invisible, omnipotent, and omniscient spirit living in heaven, beyond the stars. He has no physical body and is immortal; having neither wife nor children, he has no material desires. Among the Alacaluf, the creator god is named Xolas ("star"), and despite the great distance that separates him from the earth, he concerns himself with the daily life of human beings. Through his initiative a soul is allowed to enter the body of a newborn baby; it remains in the human being until death, at which time it returns to Xolas. The Alacaluf were obliged

to abstain from any form of veneration of this perfect supreme being, since any attempt to influence his will would have been fruitless. For this reason, it is not known what formal prayers were addressed to Xolas nor whether cultic practices associated with him were performed.

Watauineywa ("ancient one, eternal one") behaved quite differently, according to the beliefs of the Yahgan. He preferred to be addressed as "my father," and he was reputed to be the lord of the world and ruler over life and death. He was an astute observer of the actions of humans and punished violations of the laws he had established in relation to morals and customs. Such rules were inculcated into the young (boys and girls concurrently) during initiation rituals, which formed the core of Yahgan religious life. In seeking contact with Watauineywa, the individual Yahgan could draw upon numerous established prayers. A person would implore Watauineywa, who was the controller of the game animals and of all food plants, to help him to secure his subsistence needs and would turn to Watauineywa to ensure his continued health, to cure him of sickness, and to protect him from inclement weather and from drastic environmental changes. But Watauineywa was also the target for harsh complaints in cases of ailments and misfortune, and in the event of death he was accused with the words "murderer in heaven."

The supreme god of the Yahgan maintained a closer contact with human beings than did Témaukel, the Selk'nam's supreme god. Témaukel ("the one above in heaven") was considered to be the originator and protector of mankind's moral and social laws, although he was otherwise uninterested in daily life on earth. Témaukel had existed from the beginning of time, but he entrusted Kenos, the first ancestor, with the final configuration of the world and the institution of social customs. In spite of the respect they accorded Témaukel, the Selk'nam prayed to him less frequently than did the Yahgan to their supreme god. Contrastingly, the Selk'nam meticulously observed the practice of throwing the first piece of meat from the evening meal out of their huts with the words "This is for him up there," an action that can be considered a form of sacrificial offering. The dead were also believed to travel to Témaukel.

**Supreme beings of the Pampas, Patagonia, and the southern Andes.** Although our knowledge of the religious practices and beliefs of the earlier inhabitants of the Pampas and Patagonia is sparse and relatively superficial, it is almost certain that the Tehuelche had a supreme being. Like Témaukel of the Selk'nam, the god of the Tehuelche was characterized by his lack of interest in worldly activities; he was also lord of the dead. This supreme being was, in general, sympathetic toward human beings, but there is no proof of a public cult devoted to him. Traditionally he was called Soychu. A benevolent supreme being of the same name was also found in the religious beliefs of the Pampa Indians, at least after the eighteenth century.

It would appear that the tribal religions of the southern areas of South America were, in general, marked by a belief in a supreme god. The Araucanians of the southern Andes, and in particular the Mapuche, have left behind traces of the concept of a superior god, as well as a devout veneration of him that survived well into the eighteenth century. In most instances the supreme being is referred to as either Ngenechen (“lord of mankind”) or Ngenemapun (“lord of the land”). Other, more feminine descriptions may reveal an androgynous character. Ngenechen is thought of as living in heaven or in the sun and is credited with being the creator of the world as well as the provider of life and of the fruits of the earth. Although he is responsible for the well-being of mankind, he is not associated with the moral laws. An individual would turn to Ngenechen in personal emergencies with prayers, the sacrifice of an animal, or an offering of the first fruits of the harvest. A public ritual known as the Ngillatun, which has survived up to the present time among the Araucanians, consists of offering the blood of a sacrificial animal to him. Two important objects employed at this feast are the *rewe*, a thick, step-notched pole, and a sacrificial altar, both of which are circled by the participants at the beginning of the ceremony. In addition to the master of ceremonies, the female shaman (*machi*) takes over some of the most vital functions at the Ngillatun. With a flat drum (*kultrun*), she climbs the ceremonial pole and upon reaching the top turns to Ngenechen, who is now symbolically nearer. Métraux (1949, p. 561) and John M. Cooper (1946, pp. 742–743) have both come to the conclusion that in this instance the older features of god among the Araucanians have been conceptually modified through the centuries to conform with the concepts of the conquering Western civilization.

Earlier Spanish chroniclers viewed the thunder god Pillán as the central, if not the supreme, being of the Araucanians. Ewald Böning, in a more recent account, pointed out convincingly that the Mapuche describe Pillán in general as a powerful, extraordinary, and tremendous apparition (Böning, 1974, p. 175). Pillán primarily represents an impersonal power, but he can also manifest himself in a personal form. The concept of impersonal power seldom occurs in the mentality of the South American Indians. The Nambikwára of the Mato Grosso, for example, believe in an abstract power, known as *nande*, that is present in certain things and that contains a magic poison or a real poison. Although any individual can, to a certain extent, achieve contact with *nande*, it is the shamans above all who can manipulate this power.

**NATURE SPIRITS, HUNTING RITUALS, AND VEGETATION RITES.** In dealing with beliefs in a superior god, I have mentioned how the lord, or master, of the animals is one way in which the supreme being is conceptualized among South American tribes. Owing to the fact that hunting belongs to one of the oldest phases of human history, gods who are associated with this category of subsistence represent archaic beliefs. Not only do the Indians of South America believe in a master of all animals but they frequently display a belief in supernatural protectors of the various animal species. Such

nature spirits characteristically display strong individualistic tendencies and are often considered to be demons (Métraux, 1949). From the standpoint of cultural history, they are related to the lord of all beasts and have affinities with him that stem from the same hunting and fishing mentality.

**Tupi master of the animals.** The most important representation of a master of the animals in the tropical lowlands is the forest spirit Korupira, or Kaapora, of the ancient eastern Tupi and a few primitive isolates of the Tupi tribes, as well as of the *caboclo*, or mixed race, people of Brazil. A series of recorded myths and verbal descriptions have facilitated a reconstruction of this deity.

Although the use of two names creates the impression that Korupira and Kaapora are two separate mythical figures, they are so closely related as to be nearly indistinguishable. Korupira, the master of the animals, is the protecting spirit of the beasts as well as of the forest; he punishes those who maliciously destroy the game and rewards those who obey him or those on whom he takes pity. For a portion of tobacco, Korupira will lift the restrictions that he places on the killing of his animals. Encounters in recent times with a small isolated Tupi tribe, the Pauserna Guarasug’wä, who live in eastern Bolivia, have shown that the belief in Korupira/Kaapora has survived. Kaapora originated as a human being—that is, he was created from the soul of a Guarasu Indian. He is the lord of all animals of the forest and has put his mark somewhere on each of the wild animals, usually on its ear. A hunter must turn to him with a plea to release part of the game, but he is only allowed to kill as many as he will absolutely need for the moment. In thanksgiving for his success, the hunter will leave the skin, the feet, or the entrails of the slain animal behind when he leaves the forest: by doing so he begs forgiveness from the animal for having killed it. After such reconciliations, the soul of the animal returns home to Kaapora. Presumably this tribe, like others, believes either that the spiritual owner of the game will create an entirely new animal or that the soul of the animal itself is capable of reproducing a new material form from the remains the hunter leaves behind. (The preservation of the bones of game in the so-called bone ritual appears to be widely distributed throughout South America.)

Kurupi-vyra of the Guarasug’wä is a part-animal, part-human forest spirit, but not a lord of the animals. He is, however, a possible source of help for hunters in emergencies. At such times he will lend his miraculous weapon, a hardwood wand that he himself uses to kill game, and in return he demands total obedience. Evidence of a master of the animals and a helping spirit is well documented in other regions of the South American subcontinent.

**Mundurucú protective mother spirit.** In the Amazon region, the idea of a lord of all animals is sometimes replaced by the belief in a lord or master of each individual animal species, and sometimes both concepts occur. Starting from the basic Tupi premise that every object in nature possesses a mother (*cy*), the Mundurucú, a Tupi-speaking group, rec-

ognize and venerate a maternal spirit of all game. She is the protector of the animal kingdom against mankind and maintains a mother-child relationship between herself and the beasts. Although she possesses a homogeneous character, she does not have a definite external form, nor does she exist as an independent personal goddess. The shaman alone knows and understands the methods for approaching her. In an ecstatic frenzy, he will feed her sweet manioc when she manifests herself in any one of her various forms (for example, as a specific type of land tortoise). The Mundurucú also attribute to each individual animal species a mother spirit that serves as a species protector.

Formerly the Mundurucú held a reconciliation ceremony at the beginning of the rainy season in honor of the guardian spirits of the game and fish. At the climax of this ceremony, two men sang songs devoted to the spirit of each animal in order to call on the spirit mothers. They performed this act while sitting in front of the skulls of numerous animals that had been taken in the hunts of the previous year. These skulls were arranged in parallel rows, according to species, in front of the men's house. Additionally, a bowl of manioc porridge was offered to the mothers of the animals to eat. When the shaman was convinced that the spirits had arrived, he blew tobacco smoke over the skulls and then, using a bamboo tube, proceeded to symbolically suck out arrowheads or bullets that had entered the spirits. Through this action the animals were pacified and the dancing could begin. Such dances, performed by the men, consisted of pantomimes of a herd of peccary, followed by representations of the tapir and other animals. This organized presentation by the Mundurucú was the most pregnant and illuminating of such ceremonies in the Amazon region.

**Hunting dances.** The concept of a lord, or master, of a particular species also plays an important role in the religious systems of the Carib-speaking tribes of the Guianas. This is exemplified by the frequent use of the term *father* or *grandfather* when speaking of a certain type of animal. The Taulipáng and the Arecuná of the inland regions of the Guianas believe that each individual animal type has a father (*podole*), who is envisioned as either a real or a gigantic, legendary representative of that particular species, and who displays supernatural qualities. Two "animal fathers" are especially meaningful for their hunting ritual: the father of the peccary and the father of the fish. Both of these figures were originally human shamans who were transformed into spiritual beings and became incorporated into the opening dances of the Parischerá and the Tukui, the magical hunting dances of the Taulipáng. In the Parischerá, a long chain of participants, wearing palm-leaf costumes and representing a grunting peccary herd, dance to the booming of cane trumpets or clarinets. Performing the Parischerá ensures a plentiful supply of four-legged animals, just as the Tukui dance guarantees a sufficient supply of birds and fish. Starting with a dance performed by the neighboring Maquiritaré that is similar to the Parischerá of the Taulipáng, Meinhard Schuster classified the

ritual hunting dances devoted to the peccary, including those of other Carib-speaking tribes of the Guianas; he concluded that a relationship existed between these and the peccary dances of the Mundurucú (Schuster, 1976).

Animal dances devoted to the attainment of game and fish are found among other tribes of the Amazon area and the Gran Chaco. Instead of focusing on the controlling master of the animals, however, they are often directed at the soul of the animal itself. Dances in which the animals, or their spiritual master, are depicted with masks made from bast fiber, straw, or wood frequently do not belong to hunting rituals as such. Instead, they are used in conjunction with rites of passage, especially initiation and mourning feasts. This applies to the animal-mask dances of the northwestern Amazon, the tribes of the upper Xingu River, and the northwestern Ge tribes of eastern Brazil.

**The jaguar.** The predatory jaguar occupies a special position in the religious practices of peoples inhabiting an extensive area of South America that stretches from the coast of Brazil to the central Andes. The religious life of these peoples is dominated by activities related to the jaguar. The tribute paid the jaguar takes a number of forms: in some cases, attempts are made to pacify or to ward off the spirits of captured jaguars; in others jaguars are ceremonially killed; in yet others, the jaguar is venerated as a god.

Among the ancient Tupinamba, the cadaver of a jaguar was ornamented and then mourned by the women. The people addressed the dead animal, explaining that it was his own fault that he had been captured and killed since the trap into which he had fallen had been intended for other game. He was implored not to take revenge on human children. Among the western groups of the Boróro tribe of the Mato Grosso, who are included in the eastern Brazil cultural area, there is a dance of reconciliation performed for the slain jaguar. Such dances take place at night and consist of pantomimes of the jaguar acted by a hunter who wears a jaguar skin and is decorated with its claws and teeth. These Boróro groups believe that the soul of the jaguar will in this way be assimilated into the hunter. At the same time, the women mourn and cry emphatically to pacify the soul of the animal, which might otherwise take revenge by killing the hunter. The eastern groups of the Boróro tribe attach quite a different significance to their rites for the dead jaguar. Here the ceremonies are held in conjunction with the hunting rituals that accompany the death of an individual, and in this sense they belong to mourning rites.

Up to the beginning of the twentieth century, the Shipaya and Yuruna, Tupi-speaking tribes located on the middle Xingu River, knew of a cult dedicated to the creator of their tribe, who was known as Kumaphari. In the beginning Kumaphari had a human form, but in a state of anger he divorced himself from human beings and settled in the northern end of the world, where he became an invisible, cannibalistic jaguar. Through the shaman, who acted as a medium, the jaguar god occasionally demanded human flesh, where-

upon a war party was organized for the purpose of acquiring a prisoner. The victim was shot with arrows and a portion of the body was consumed by the participants in the ritual; the remaining part was presented to Kumaphari, the jaguar god. The ceremonies practiced in this cult apparently maintained ritual cannibalistic elements found among the Tupinamba of the sixteenth century, although at that time the offering of a captured warrior to a deity was not recorded.

An active jaguar cult was also known to the Mojo, an Arawakan tribe in eastern Bolivia. The killing of a jaguar, which automatically bestowed great prestige on the hunter, was accompanied by extensive rites. During the entire night, a dance was held around the slain animal. Finally the animal was butchered and eaten on the spot. The skull, paws, and various other parts were then placed within a temple of the jaguar god, and a sacrificial drink for the benefit of the hunter was presented by the jaguar shaman. The shaman was recruited from among those men who were distinguished for having escaped alive after being attacked by a jaguar. They alone could summon and console the jaguar spirit and could allegedly turn into jaguars, a transformation known to many other Indian tribes of the Amazon region. It is justifiable to view the jaguar god of the Mojo as a "lord of the jaguars" in the same sense that the concept "master of the animals" is applied among hunting groups.

This feline predator also played a part in the religion of ancient Peru. Either a particular god possessed attributes of the jaguar, or the jaguar was an independent deity who served as the lord of the earthly jaguars and who appeared in the constellation Scorpius.

**Protection from slain animals.** Rituals established around various slain animals are especially obvious in eastern Brazil and Tierra del Fuego. Among the Boróro of eastern Brazil, the shaman enters a state of ecstasy after big game has been killed. In this condition he performs various activities related to the game—for example, breathing over the meat. He may also sample it before the rest of the members of the tribe partake of the meal. In this way he bestows a blessing that will protect against the revenge of the slain animal spirit (*bope*). When the Kaingán-Aweicoma (Xokleng) in the state of Santa Catarina in southern Brazil have killed a tapir, chopped greens, which are particularly favored by this animal, are spread over its head and body, which is supported upright. At the same time, the spirit of the animal is addressed with friendly words. It is asked to give a favorable report to the other animals of its kind, to report how well it was treated, and to persuade them that they too should let themselves be killed. Similarly, when a hunter of the Selk'nam of Tierra del Fuego removed the skin from a slain fox, he spoke apologetic phrases, such as "Dear fox, I am not evil-minded. I have respect and don't wish to harm you, but I am in need of your meat and your fur." By this means, the entire fox society was expected to be pacified after the loss of one of its members. The offering of such deceptions and fabrications to the slain animals is a typical archaic ritual that also finds expression among hunters in the Old World.

**Plant fertility rites.** I now turn to those religious rites that center around the theme of fertility, not only of planted crops but also of wild edible plants. The most impressive religious celebrations of the tribes in the lowlands of the Amazon are those held for the vegetation demons by the peoples in the northwestern section of this region. Such demons are usually, though incorrectly, identified with the worst of all demons among the ancient eastern Tupi, which demons (and their cults) are known as *yurupary* in the local vernacular (Métraux, 1949).

Among the Tucanoan and Arawakan groups of the upper Rio Negro and the basin of the Uaupés River, the Yurupary rites take place at the time when certain palm fruits particularly favored by the Indians are ripe. At the beginning of the festival, baskets of these fruits are ceremonially escorted into the village by men blowing giant trumpets. These sacred instruments, which represent the voices of the vegetation demons, are hidden from the women and children, who must therefore remain within the huts at this time. During the first part of the ceremony, in which the men scourge one another with long rods, the women are also obligated to remain within their houses. After the secret part of the ritual has ended, however, the women may join the men in feasting and drinking, which continues for several days. The purpose of this feast is to thank the demons for a good harvest and to beg them to provide a rich yield in the coming season. In former times, the so-called Yurupary rites of the Arawakan groups, the Tariana and their neighbors, incorporated the use of two matted "mask suits" made from the hair of monkeys and women. These suits, worn by a pair of dancers, were also not allowed to be seen by the women.

The underlying meaning of the Yurupary rites involves the son of Koai, the tribal hero of the Arawakan groups. Milomaki of the Yahuna (a Tucano group), on the other hand, is a sun hero with an amazing talent for singing who was responsible for having created all edible fruits. He gave these gifts to mankind, although he himself was burned to death by men for having killed members of the tribe. From the ashes of his body sprang the palm tree that provides the wood for making the large trumpets used at the feasts. The trumpets allegedly have the same tones as his voice.

**Sacred wind instruments.** The reproduction of the voices of supernatural beings through the use of sacred wind instruments, including wooden flutes and trumpets made from rolled bark, is an element that is, or at least was, widespread over much of tropical South America. Their use is most often connected with the expansion of the Arawakan peoples from the north to the south. In the area north of the Amazon, these instruments are utilized in cultic activities devoted to vegetation deities, whereas south of the Amazon they are a central aspect of autonomous cults that have an esoteric character, but have little connection to fertility rituals. They appear in the Flute Dance feast of the Arawakan Ipurina of the Purus River as a representation of the ghostly *kamutsi*, who reside under water and are related not only to

the sun but also to the animals. The Paresi-Kabishi, an Arawakan tribe in the western Mato Grosso, have a secret cult in which the snake demon Nukaima and his wife are represented by a huge trumpet and a smaller flute. The Alligator Jump dance of the old Mojo (an Arawakan group) is considered to be the equivalent of the snake cult of the Paresi. At the climax of this alligator cult feast, a procession is formed in which twelve men play nine-foot-long bark trumpets. Women and children are not allowed to see the proceedings; were they to do so, they would allegedly risk being swallowed by an alligator. The cultural wave responsible for the use of sacred wind instruments in the reproduction of the voices of spiritual beings apparently died out in the upper Xingu cultural area.

The flutes, which are taboo for women, are stored in special flute houses like those of the Arawakan Mehináku. They are associated with a mother spirit (*mama'e*) who has the form of a bird, the jacu (*Crax spp*), and is represented by masked dancers during the ceremonies. Among the Camayura (a Tupi group), the Jacu feast was organized for the purpose of obtaining help from three manioc *mama'e* whose assistance was needed to guarantee success with a new manioc field.

**Human and plant fertility.** Among the Kaua (an Arawakan group) and the Cubeo (a Tucano group) in the northwestern Amazon region, fertility rites are obviously connected with a human generative power. At the end of the masked dances, in which the dancers represent animals, the participants unite to perform the Naädö (phallus dance). They hold artificial phalluses made of bast fiber in front of their bodies, and with coital gestures they mimic the scattering of semen over houses, fields, and forests.

Farther to the west, we encounter the primal father Moma of the Witóto, a superior god who has a strong influence on the fertility of all useful plants. Moma is responsible not only for the flourishing of the planted crops, including manioc and maize, but also for useful wild fruits. In his honor, the Okima, the festival of yuca (manioc) and of the ancestors, is performed. Those under the earth are invited to participate in the festival by their worldly descendants above, who stamp their feet or beat rhythmically on the ground with "stamping sticks" that are fitted with rattles. In the ball game festival known as Uike, the soul of Moma is believed to be present within the ball, which is bounced back and forth on the knees of the persons participating. Additionally, this ball symbolically represents the fruits that are brought to the feast, the idea being that the bouncing ball makes the same movements as the fruits in the branches of the trees.

Among the Jivaroan people in Ecuador, the cult of the earth mother Nunkwi is restricted to those cultivated plants whose soul is believed to be feminine—for example, manioc. The soul of the earth mother resides within a strangely shaped stone (*nantara*) that has the power to summon Nunkwi. The association between fertility of human females and the growth of plants considered to be feminine receives

obvious expression through the rule that every woman who plants a manioc cutting must sit on a manioc tuber. The same theme is expressed in the ritual for the first manioc cutting that is taken from a field whose yield is intended to be used at the Tobacco festival. The cutting is painted red, and the woman to be honored places it against her groin.

Even the *tsantsa*, the fist-sized shrunken head trophies of the Jivaroans, are connected with the fertility of the fields. The power that resides within these heads is expected to be transferred into the crops as the successful hunter, wearing the trophy around his neck, passes the fields. From the trophies the hunter also receives information concerning the fields, which he passes on to the women who tend them. The Quechua and Aymara peoples of the central Andes region frequently call upon Pachamama, the goddess of the earth, who is essentially responsible for the fertility of plants and who is believed to live underground. In addition to being connected with many celebrations, she is also associated with many daily rituals. The cult devoted to her originated in pre-Hispanic times. It has survived to the present, a persistence that is undoubtedly related to Pachamama's identification with the Virgin Mary.

For the cultural areas of eastern Brazil, the Gran Chaco, the Pampas, and Patagonia (including Tierra del Fuego), information concerning gods or spirits related to the fertility of cultivated plants is partial, has little significance, or is completely lacking.

**THE SOUL, THE DEAD, AND ANCESTORS.** Most of the Indian groups of South America believe that a human being has several souls, each residing in a different part of the body and responsible for numerous aspects of life. After death, each of these souls meets a different fate. One of the most interesting examples of this idea is found among the Guaraní-Apapocuvá (Nimuendajú, 1914). One soul, called the *ayvucue* ("breath"), comes from one of three possible dwelling places: from a deity in the zenith, who is the tribal hero; from "Our Mother" in the east; or from Tupan, the thunder god, in the west. In its place of origin the soul exists in a finished state, and at the moment of birth it enters the body of the individual. It is the shaman's task to determine which of the three places of origin each soul comes from. Soon after birth the breath soul is joined by another soul, the *acyigua* ("vigorous, strong"). The *acyigua* resides in the back of a person's neck and is considered to be an animal soul responsible for the temperament and impulses of that person, which correspond to the qualities of a particular animal. Immediately after death the two souls part company. The *ayvucue* of a small child goes to paradise, the "Land without Evil." The destination of the *ayvucue* of adults is another afterworld that lies just before the entrance to paradise. The animal soul or *acyigua* transforms itself into a much-feared ghost, called *angéry*, that persecutes mankind and must therefore be fought.

Research on a number of Indian tribes indicates that meticulous preservation of the bones of the dead is a widespread practice. Such action, which is similar to the preserva-

tion of the bones of hunted game, can be traced to the belief that residual elements of the soul remain in the bones after death. The conceptualization of a “bone soul” has led to the ritual consumption of bone ash from dead family members. This form of endocannibalism is practiced at the present time by different groups of the Yanoama and appears to have been relatively widespread in western South America. Among the Yanoama, we find a perception of a soul that resides outside the body of a living individual, a concept seldom documented in South America. Such a soul most often dwells in an animal, but sometimes also in plants. This type of soul may reside, for example, in a harpy eagle if the soul is that of a man, or in an otter if it belongs to a woman. The predominant element of such a concept is that of an identical life pattern: when the respective animal dies, its human counterpart will also die, and vice versa. An animal soul, usually referred to as a “bush soul,” represents the alter ego of a specific individual.

Some of the fundamental beliefs in an alter ego prevalent in South America stem from within the shamanic domain. The Araucanian female shaman (*machi*) possesses an alter ego in the form of an evergreen canelo tree (*Drimys winteri*) that she tends in the forest and whose fate is intimately linked to her own. If someone discovers this tree and destroys it, the *machi* invariably dies.

Honoring the dead was an essential component within the religions of old Peru, as exemplified by the care that mummies of the ancestors were given by priests (Métraux, 1949) and by the sacrificial victims brought to them. Mummies were also taken on procession at certain festivals.

One of the few cases of a developed cult of the dead in the tropical woodlands is exemplified by the ghost dance of the Shipaya of the lower Xingu, which is the most significant religious celebration of this Tupi tribe. The souls of the dead, which are well disposed toward mankind, express a desire to the shaman—through the words of the tribal chief—that the celebration known as the Feast for the Souls of the Dead should be held. It is believed that the souls of those long dead will take possession of the shaman, who is covered with a white cotton mantle; in this form, the soul can participate in the dancing and drinking enjoyed by the living in the center of the village. When souls have borrowed the body of the shaman, his own soul lies idle in his hut. The ceremony continues for eight or more nights, during which other men who have also become the embodiment of dead souls appear in similar dance mantles.

An ancestor cult is also the focal point in the religion of the Cubeo who live in the northwest Amazon region. The soul of a dead person proceeds to the abode of the benevolent ancestors, which is located near the dwelling place of his sib, where all its dead are reunited. The ancestors are represented by large trumpets that are used not only at funeral rites but also at the initiation ceremonies for the boys of the tribe, who are whipped as these trumpets are played. The ancestors, represented by the trumpets once again, are also guardian spirits

at sib gatherings. The sound they emit is believed to be a source of male strength when played during a men’s bath in the river.

Among the Mundurucú in central Brazil, the large wind instruments are the embodiment of the sib ancestors when played at a particular men’s feast. Like the trumpets of the Cubeo, they are not allowed to be seen by the women. At the end of the Mundurucú ceremony, a special drink made from manioc is poured into the instruments and is collected in a calabash bowl as it comes out the other end; it is then drunk by the participants. This ritual, which is looked upon as a form of spiritual communion with the ancestors, is intended as an act of reconciliation that will win their favor and help their descendants.

The combination of a memorial service for the recently dead and a commemorative ceremony for the legendary tribal ancestors can be seen in the Kwarup ritual of the Camayura, a Tupi group of the upper Xingu. The Kwarup (from *kuat*, “sun” and *yerup*, “my ancestor”) centers around a number of posts, each about three feet high, outfitted and ornamented as human beings and carved from the sacred camiriva wood from which the creator, Mavutsine, allegedly fabricated the first Camayura. The chant given as people dance around these posts is the same one that Mavutsine sang as he created mankind. In the Kwarup ritual the ancestors return symbolically for the purpose of welcoming those who have recently died.

Death cults and ancestor worship also play an important role in the eastern Brazilian cultural area, particularly among the Boróro. This tribe makes a sharp distinction between nature spirits and spirits of the dead. The Boróro believe that the souls of their ancestors (*aroe*) hold a close relationship to mankind that influences and maintains its daily life. On certain social occasions, the spirits of the dead are ceremonially invoked by special shamans to whom the spirits appear and whom they enlighten in dreams. As a result of this important attachment to the spirits, the funeral rites of the Boróro are highly developed and complex. After a ceremonial hunt, the successful hunter becomes the representative of the dead man at the funeral proper, which consists of a series of established rites. Among these is a dance in which the most interesting elements are large disk-shaped bundles of wood that represent the dead person. At the same time that the dance is being performed, the deceased person’s bones, which have been buried for two weeks, are exhumed and painted red with *urucú*. Feathers associated with clan colors are glued to the bones. The specially decorated skull is then displayed to the mourners. After a period of safekeeping in the house of the deceased, the basket in which the bones have been placed is sunk in a deep section of the nearby river.

Among the Ge-speaking Canella (eastern Timbira), it is the medicine men who usually establish contact with the spirits of the dead, since they are omniscient. But even those members of the tribe who do not possess particular spiritual abilities seek advice from their ancestors in emergencies. In

the first phase of the initiation ceremonies for young boys in which religion is emphasized, the initiates learn how to contact the dead. This knowledge is acquired in a race in which each person to be initiated carries a wooden block that is said to be the ghost of a dead ancestor. In the funeral rituals, the men carry much larger blocks in a similar race.

The cult of the dead is not only an impressive ritual but a basic foundation of the culture of the Kaingán, the southernmost Ge tribe. The objective that lies at the core of this ritual is the elimination of the ties that connect the living and the dead. This ritual insures that the souls of the deceased will finally arrive at the resting place in the underworld, located in the west.

A cult of the dead among the indigenous people in the southern regions of South America, including the Gran Chaco and the southern Andes, contains few authentic religious elements. At a funeral, the surviving family members sponsor a large feast in honor of the dead relative. The various ceremonies that take place during this feast—for example, eating and drinking bouts, lamenting, playing of music, feigned attacks, riding games, and speeches—are intended to drive from the village the dreaded spirits of the dead or the death demons, who are responsible for the death of the tribal member, to prevent them from causing more harm. Among the people in the Gran Chaco, an attempt is made to console the dead and to pacify them in their anger at having passed away. The mourning ceremonies, which begin immediately after a person dies, are meant to serve this end. Often an invalid is set outside or buried before having actually died. Little has been recorded regarding beliefs about life of the soul after death among the peoples of the Gran Chaco.

**INITIATION RITES.** Among the Indians of Tierra del Fuego there is no trace of a cult of the dead to be found in the funerary practices. In this region, socioreligious emphasis was placed on rites that are generally associated with the initiation of members of both sexes and particularly on those rituals connected with the acceptance of young males into men's organizations (the Kloketen of the Selk'nam and the Kina of the Yahgan). During these rites, a chain of men came out to frighten the women. The participating men wore conical masks made from bark or animal skin that covered their heads and faces. Their bodies were painted black, white, and pink in various patterns. Although they represented specific demons and spirits of the sea, forest, and animals, there was apparently no ghost of the dead among them.

The appearance of masks so far south is correctly attributed to the extensive influence of the Tropical Forest cultural areas. Between the Tropical Forest and Tierra del Fuego, there are no gaps in the appearance of masked dances in connection with initiation celebrations, as for example the Anapösö, or Forest Spirit feast, of the Chamacoco. In this region of the Gran Chaco, the performers representing the forest spirits were elaborately decorated with feathers. These spirits are believed to have been ruled by the dog demon Pohitschio, who was the consort of the great mother, Eschetew-

uarha. Formerly the performers wore artistically intricate feather masks that were later replaced by sacks worn over the head with eyeholes cut in them. In either case, the women were not allowed to discover that these spirits were in reality men from their own tribe.

The Lengua of the Gran Chaco use a masked dance to represent symbolically the supernatural danger that threatens women at the onset of menstruation. In this dance, the single men, wearing rhea-feather belts and masks, approach the young women during a typical female puberty celebration. The young women believe them to be the bad spirits. They are eventually driven away by the adult women after they harass and threaten the young girls.

**CONCLUSION.** Because of the extreme variety of time periods from which information about these tribes is drawn, the only perspective that can be achieved in such an overview is of a diachronic nature. To close this survey of the various forms of religion, I shall briefly indicate phenomena that are particularly characteristic of the individual cultural areas.

The central Andes of pre-Columbian times is characterized by a belief in high gods and their respective cults, by the worship of ancestors and of the dead, and by agrarian rites directed to a female earth deity. The peoples of the region of the Amazon and Orinoco rivers occasionally display signs of high-god worship (Witóto, Tupi-Guaraní). Along with the vegetation cults (northwestern Amazon) that are typical of crop-cultivating peoples, there is a markedly large number of ceremonies and rites associated with deities of the hunt and of wild animals (including fish). The Ge of eastern Brazil exhibit clear signs of worship of astral deities—the Sun and Moon. The cults of the dead and of ancestors dominate much of their religious life. The Gran Chaco, by contrast, is noticeably lacking in religious ceremonies and rites in the narrow sense. First-fruit ceremonies related to hunting and fishing predominate; there are no agrarian rites. In the Pampas and Patagonia region a number of socioreligious rites are attested. The Selk'nam and Yahgan of Tierra del Fuego Archipelago believe in a high god, but there is little indication of cult worship. The regions of southern and central Andes share many aspects of religious life. The high-god cult (Nge-nechen) is associated with a cultivation and fertility ritual. A highly developed form of shamanism is also prominent. Throughout South America outside the Andean region, the shaman remains the pillar of the religious life.

## SOUTH AMERICAN INDIAN RELIGIONS: MYTHIC THEMES

South American mythology is a vast field whose purview extends linguistically and archaeologically beyond the continent proper to include the oral traditions of Panama and eastern Costa Rica as well as those of the autochthonous inhabitants of the West Indies. This article will consider myths from the point of view of religious studies and will emphasize the cosmological patterns and sacred symbolism in narratives from nonliterate South American societies of both ancient and modern times.

Since the early sixteenth century more than one thousand languages, representing a variety of linguistic stocks and many unrelated tongues, have been listed for this area—a fact that suggests that South America was populated over a great number of centuries by successive migratory groups that trekked down from Siberia, North America, and Central America. One classification of South American languages attempts to reduce hundreds of mutually unintelligible tongues to only three groups: Macro-Chibchan, Andean-Equatorial, and Ge-Pano-Carib. This classification, however, is admittedly provisional and, in the case of the last two groups, very uncertain. These migrations began more than twenty thousand years ago. The majority of early South American archaeological sites date from between twelve and fourteen thousand years ago, but quartz tools found in Brazil in 1983 have been dated at about twenty-five thousand years before the present.

The higher civilizations of ancient South America occupied the Andean region and the Pacific coast from northern Colombia to central Chile. From the point of view of mythological studies the more or less "primitive" cultures are at least as important as the higher civilizations because the less developed societies usually possess abundant collections of sacred stories. The exceeding diversity of South American aboriginal peoples has precluded the formation of a common pantheon or mythico-religious system for the whole continent. Nevertheless, since many societies have been in contact at one time or another, more than a few myths are common to several tribes. Moreover, a large number of motifs are not only found in the mythologies of different South American groups but are also known to peoples of other continents, leaving room for speculation as to whether these motifs spread through diffusion or originated independently.

**MYTHS OF ORIGIN.** South American sacred stories about how the world originated do not, as a rule, conform to the pattern of creation out of nothing by the will of an omnipotent god. Rather, they commonly depict the coming into being and unfolding of a primordial spirit. In many cases little is said about the actual genesis of the world, but a detailed description of the structure of the universe is given. This description points out the universe's tiered levels, the *axis mundi* (often in the shape of a cosmic tree), and the heavenly bodies (whose existence is mostly conceived as the product of the transformation of heroes, animals, or other creatures).

Many myths deal with characteristics of the sky, and not a few with those of the underworld. There are also many stories about the origin of night. Even more abundant than myths of world creation are those about the destruction of the world, the recurrent agents of destruction being water or fire or both.

**Creation of the world.** The Piaroa, who live on the south bank of the Orinoco and speak a language of the Sáлива-Piaroan family, believe that everything was created by the powers of imagination. In the beginning, they say, there was nothing at all. The first thing to appear was the sky, and then the air and the wind. With the wind, words of song were born. The words of song are the creative powers that produce thoughts and visions. Out of nothing they imagined and created Buoko, the first being, who developed in the words of song. Then Buoko imagined his sister Chejaru, and Chejaru was born. Because of this, humankind also has the power of imagination. The Piaroa say that thought is actually the only thing humans have.

The Koghi, speakers of a Macro-Chibchan language who live in the Sierra Nevada de Santa Marta, have a creation story that also underscores the spiritual nature both of the first beings and of the essence of the universe. According to this myth, creation took place in nine stages, from the bottom up. Each stage is both a cosmic level and a spiritual being called the Mother, who is sometimes accompanied by a Father or another spiritual being. The first level, which lies in darkness, is also the Sea; the second, the spiritual Tiger; the fifth, the first House of Spirit. Finally, the Fathers of the World find a huge tree and make a temple in the sky above the water. They call it the House of Spirit.

The Muisca (Chibcha) lived in the highlands of Colombia at the time of the arrival of the Spanish, and spoke a language of the Macro-Chibchan family. According to their creation myth, before there was anything in the world, it was night, and light was kept inside a great thing that, according to the Spanish chronicler who recorded the story, is the same that Europeans call God—an omnipotent, universal, ever-good lord and maker of all things. The great being began to dawn, showing the light that he had in himself, and he commenced, in that primordial light, to create. His first creations were some black birds that he commanded to go everywhere in the world blowing their breath from their beaks. That breath was luminous and transparent, and, the birds' mission accomplished, the whole world remained clear and illumined as it is now.

**Cosmic levels.** In many South American myths, the universe is conceived as a series of layered planes—three or four in many cases, but sometimes more. The Mataco, whose language is a member of the Mataco-Mataguayo family and who live in the Gran Chaco between the Pilcomayo and Bermejo rivers, distinguish the levels of earth, sky, underworld, and (according to some) that of another earth farther down. Originally the sky had been joined to the earth, but the Owner of the Sky separated them. Afterward, a tree grew to

connect the sky and the earth. People of the earth used to climb the tree and hunt in the sky, but an old man who had been given a miserable portion of the game meat avenged himself by burning the tree. The hunters could not return; they became the Pleiades. The children of the hunters, who remained on earth, received from their mother, who was also stranded in the sky, a deerskin full of honey that she dropped from above. They grew up and became the ancestors of the present-day Mataco.

The Macuna of the Lower Pira-Parana River in the Vaupés region of Colombia, who speak a language of the Tucanoan family, think that the earth is the shape of a disk. A subterranean river is united with the earth by a whirlpool. The river is inhabited by monsters and bad spirits. Over the earth is a hot-water lake on which the sun sails from east to west in his boat every day. Over Sun Lake there is a house where the Lord of the Jaguars lives, a place that only shamans, in their flights to heaven, can reach. On top of the cosmos is a layer that covers all others like a lid. Nothing beyond it is known. The earth disk consists of several concentric zones, the innermost being the Macuna homeland. At the center, just below Sun Lake, stands a sacred mountain, which supports the firmament. No stone is taken from this mountain lest it fall, taking the sky with it. At a certain point on the earth's level is the House of the Dead. The outer zones are occupied by other Indian tribes, whites, and blacks.

**Sky and underworld.** The sky and the underworld are cosmic levels of special interest. They appear in myths influenced by the shamans' narratives of their ecstatic trips to the upper and lower worlds. The Marikitari, a Carib-speaking people living in the Upper Orinoco area, say that in the beginning the whole world was sky. There was no separation between heaven and earth. There was only light. In the sky dwelled good, wise people who never died; nor did they work: Food was always available. In the highest sky was Wanadi, who is still there. He gave his light to the people and they were happy. One day he said that he wanted to make people on that part of the sky called "earth." He sent a spirit who made the first people and brought them knowledge, tobacco, the maraca, and the shaman's quartz power stones. Later, an evil spirit called Orosha introduced hunger, sickness, war, and death.

**The sky and the cosmic tree.** Some of the myths so far recounted show a close connection between the cosmic levels and the *axis mundi*, often represented by a gigantic tree. In the Mataco myth the danger of the sky falling down is clearly pointed out. The same motif appears in many other myths of tropical forest tribes. The Ge-speaking Kayapó of central Brazil say that in the east there was a gigantic tree called End of the Sky. It supported the heavens, which in those days were parallel to the earth. After several tries, a tapir succeeded in gnawing the trunk until it broke. Then the sky drooped down at the edges, forming the celestial vault. At the place where the tree has its roots all kinds of strange beings live. When a group of people went to explore the east, they found

it so frightening that they fled back home with no desire to return to the End of the Sky.

**Sky, light, and darkness.** Myths in which the sky, usually associated with light, is related to the origins of night are also common. The following story is told by the Cuiba, who live in the western plains of Colombia and speak a language of the Guahiboan family. In ancient times there was no night, only an endless daytime. People could not sleep. A woman who had gone out of her mind wanted to break the sky. Her husband, who was a shaman and had had a dream, warned her to be careful and not to damage the sky, which belonged to the locusts. But she paid no attention and hurled a stone that broke the sky, which was made of mud. Directly it became dark and the earth was invaded by locusts as big as iguanas. They ate the eyes of everybody except the shaman. Then the swallows, who are able to carry heavy loads, brought all the necessary mud and repaired the sky again.

Other stories about the origin of the night suggest that it was created because girls, or wives, would not grant their favors to their lovers, or husbands, since it was always daytime. A Tupi myth from central Brazil indicates that night was kept in a coconut that was opened against the formal prohibition to do so.

**Sun, moon, and stars.** The sun and moon play important roles in many South American myths. Their origins, like those of stars and constellations, are due in many cases to the transformation of humans at turning points or denouements in the mythical stories. Many versions of the widespread myth of the “twins and the jaguar” end with the heroes’ ascending to the sky to become the sun and moon. This is perhaps the most ubiquitous myth of South America, found from Panama to the Gran Chaco and from the eastern coast of Brazil to the Amazonian forests of southern Peru, among dozens of tribes that speak mutually unintelligible languages. Different versions of this story diverge considerably, but the following summary contains a number of essential points common to a great number of stories known to widely scattered groups. A mysterious god or a civilizing hero impregnates a woman and then abandons her. While walking alone in the forest carrying twins in her womb, she is killed by one or more jaguars, but the jaguars’ mother takes care of the babies and raises them. A bird or other animal tells the twins how their mother died. The twins determine to avenge their mother and prepare themselves to do so through several ordeals. They finally kill all the jaguars except one, which escapes and becomes the ancestor of present-day jaguars. After some quarreling, the twins climb to the sky, where they can be seen as sun and moon. As an example of the differences between many versions of this story, it may be mentioned that in the rich Mashco account of this tale the twins do not appear; in this case the extraordinary boy Aimirinke kills the jaguars and then goes up to heaven and becomes Yuperax, the god of lightning.

The pre-Columbian Carib of northern South America, speakers of one or another language of the extensive Carib

family, were skilled navigators of the Caribbean Sea and had a rich lore about stars and constellations, some of which has survived to the twentieth century. One of their stories tells about a newly married girl who was seduced by a man in the shape of a tapir who asked her to follow him eastward to the place where earth and sky meet. Serikoai, her husband, accidentally cut off his leg with an ax and, after being cured by his mother, set out in search of his wife. He finally found her in the company of Tapir, whom he shot, severing Tapir’s head. He implored his wife to return, saying that if she refused he would follow her forever. She hurried on, chased by her lover’s spirit and her husband. On arriving at the earth’s steep edge, she threw herself into the deep blue sky. On a clear night, one can still watch her; she has been turned into the Pleiades, with Tapir’s head (the star cluster Hyades, the star Aldebaran being Tapir’s red eye) close behind, and Serikoai (Orion, with Rigel indicating the upper part of her husband’s sound limb) in pursuit.

**MYTHS OF DESTRUCTION.** Stories about the destruction of the world and humankind by a deluge—be it from excessive rain, or by high tides, or both—are fairly common in most regions of South America. Another type of myth of wholesale destruction is that of the world fire. In some cases these stories may recall actual catastrophes, but their significance seems to be symbolic of divine punishment for transgression of traditional taboos. Often, the destruction is believed to have occurred in the past; sometimes, however, the world fire is projected into the future.

**The Deluge.** The earliest recorded American myth of the deluge comes from the Taino, whom Columbus met on his first voyage of discovery. According to this version of the myth, a young man who wished to murder his father was banished and later killed by him. The old man kept his son’s bones in a calabash where he and his wife could see them. One day they accidentally overturned the gourd and the bones turned into fish. Another day, as the man was out in the fields, four brothers, whose mother had died at their birth, took the calabash and ate all the fish. Hearing that the father was returning, they hurried to hang the vessel back in place, but it fell to the ground and broke. The water from the calabash filled the whole earth and from it also came the fish in the sea. The theme of the Deluge as a consequence of killing forbidden fish is still present among the contemporary Mataco of Argentina and southern Bolivia. In the Andean countries, Deluge myths are generally associated with a magic mountain where humankind takes refuge. As the waters rise, the mountain also rises, thereby saving the lives of those who have reached the top. One of the best-known examples of this motif was recorded as early as the seventeenth century; its memory persists to this day among the speakers of dialects of the Araucanian language.

In the native traditions of the Huarochiri area of Peru that were collected from Quechua speakers early in the seventeenth century, the Deluge is caused by a god whose presence is not recognized by people who are reveling. Enraged,

he advises a young woman who has tended him and won his friendship to take refuge on a high mountain nearby. Soon afterward, heavy rain carries the village away, leaving no one alive. Among the Kaueskar-speaking Alacaluf of southern Chile, who were once supposed to have preserved no mythology, an increasing collection of mythic tales has been gathered since the late 1970s. Among these stories is one about a devastating flood caused by the breaking of a taboo forbidding the killing of an otter. Only a young couple is saved, again by climbing a mountain.

**The World Fire.** The Carib-speaking Taulipáng of Venezuela connect the deluge with the world fire. They say that after the great flood, when everything had dried up, there was a great fire. All the game animals hid in an underground pit. Fire consumed everything: people, mountains, stones. That is why big chunks of coal are sometimes found in the earth. The Zapiteri, of the Mashco ethnic group of the southwestern Amazon, say that in the beginning of time it rained blood, but later the sun began to heat up and there was a great fire. The tribes of the Gran Chaco have a rich repertoire of myths about the world fire. One of these myths, from the Mataco, says that long ago the Mataco lived in great disorder. One day black clouds broke into lightning and rain began to fall. The drops were not water but fire, which spread everywhere. There were only a few survivors, among them Tokhuah the trickster, who went underground for the duration of the fire.

Many fragments have been collected of what is thought to have been a widely diffused myth of the destruction of the world by fire. According to the Tupi-speaking Apocacuva Guaraní, the World Fire was the first of four cataclysms that annihilated almost all creatures, and it will be repeated when the creator removes from under the earth the crossed beams that hold it in place. Then the earth will catch fire, a long-lasting night will set in, and a blue tiger will devour humankind.

Such Ge-speaking tribes as the Apanyekra, Apinagé, Craho, and Ramkokamekra tell stories about the beginnings, when only two persons existed, Sun and Moon, both of them male. One day Sun obtained a beautiful plumed headdress that looked like fire. Because Moon also wanted one for himself, Sun got another and threw it to Moon, warning him not to let it touch the ground; but Moon was afraid to grab it and let it fall to earth, and it immediately started to burn, consuming all the sand and many animals.

**MYTHIC ANCESTORS.** Different South American myths place the origin of humans at distinct levels of the universe and variously depict the human race as being born from minerals, plants, or animals. Women are sometimes assigned a separate origin. The Urus of Lake Titicaca, speakers of a language of the Uro-Chipaya family, relate that in the time of darkness the universal creator made the Chullpas, who were the first men. They were destroyed by a cataclysm when the Sun appeared, and their survivors became the ancestors of those who now call themselves Kotsuns ("people of the lake"), but

are more commonly known by the name of Urus ("wild animals"), as they are called by their Aymara neighbors. The Carib-speaking Waiwai of Guyana say that before humankind existed there were on earth sky spirits, which now have the form of birds and which fly in the second heavenly layer. Some of them, however, have human form. Present-day humankind descends from the children of a woman who was one of these spirits and who, surprised while alone in the forest, was impregnated by a grasshopper-man.

The Quechua-speaking Inca of Peru had several myths of their origins that were recorded by Spanish chroniclers. According to one of these stories, the high god Vi-racocha created Alcaviza, a chieftain; and told him that after his (Viracocha's) departure the Inca noble would be born. Alcaviza resided at the place that would later become the main square of Cuzco, the capital of the Inca empire. Seven miles away, at a place called Paccaritambo ("lodge of dawn"), the earth opened to form a cave, from which the four Ayar brothers emerged, dressed in fine clothing and gold. Fearing the colossal strength of the one who had come out of the cave first, his brothers asked him to go back into the cave and fetch some golden objects that had been left behind. While he was inside, the others immured him there forever. Ayar Manco, who had come out last, took the prisoner's wife for himself. Another brother displayed big wings, flew to the sky, and from high above told Ayar Manco that the sun had ordered that he should change his name to Manco Capac ("Manco the Magnificent") and take the winged man's wife for himself. Finally the winged man turned into a stone. In the company of his only remaining brother and their wives, Manco Capac walked to Cuzco, where Alcaviza recognized from their garments that they were indeed the children of the Sun and told them to settle at whatever place they liked best. Manco Capac, the first Inca ruler, chose the site where later the Coricancha, or court of the sun, would be built. His brother went away to settle another village.

**HIGH GOD.** The belief in a high god conceived as omniscient and benevolent to humans rather than as an omnipotent and perfect creator (which in some cases he also is) is documented in many South American myths. It was first reported by Fray Ramón Pané in the earliest ethnological study of American Indians. He wrote that the Taino of Haiti believed in the existence of an immortal being in the sky whom no one can see and who has a mother but no beginning. At the the southernmost extreme of South America, the belief in the existence of a high god has been acknowledged among the tribes of Tierra del Fuego. The Tehuelche of Patagonia seem to have believed in a supreme being conceived as a good spirit who was also the lord of the dead. From the Araucanians (Mapuche) come testimonies of a belief, possibly autochthonous, in a supreme celestial being, Nguenechen. Very early reports say that the Tupí believed in a being they called Monan, and that they attributed to him the same perfections that Christians attribute to their God: He is eternal, and he created the heavens and the earth as well as the birds and animals.

The most famous of all South American high gods is the Andean deity Viracocha. Several etymologies have been proposed to explain the meaning of his name, among them "sea of grease" (as a rich source of life) and "lord of all created things." In any case the belief in a high creator god among the Andean peoples probably goes back to early prehistoric times. It has been suggested that Viracocha is none other than the same world creator and culture hero found in the mythology of many tribes from Alaska to Tierra del Fuego. Apparently, the ancient high god was obscured for a time by his conflation with the Inca sun god, but later the Inca were obliged to revert to the ancient high god of archaic mythologies in order to secure the support of their allies when Cuzco was threatened by other peoples. Another important Andean high god is Illapa, lord of rain, lightning, and thunder. As do some other Andean deities, Illapa hierophanically presents himself in trinitarian form comprising Illapa the Father, Illapa the Elder Son (or Brother), and Illapa the Younger Son (or Brother). Illapa's name is related to the Quechua word *illa*, meaning both "protective spirit" and "light" or "lightning."

While Illapa is a god of the Andean highlands, Con and Pachacámac belong to the Peruvian coast. Con is said to have created the sky, the sun, the moon, the earth with all its animals, the Indians, and the fish by means of his thought and breath. After having made everything, he ascended into the sky. Con was followed later by a more powerful god called Pachacámac ("world maker," or "the god who gives orders").

**ORIGINS OF PLANTS AND CULTURE.** The introduction of seeds for agriculture and the origins of certain staple plants and their fruits are recounted as etiological motifs in many South American myths. In Peru, several sacred personages of legendary times are credited with the creation of produce. According to an ancient story, the god Pachacámac transformed the sacrificed body of a divine being into the basic food plants of the Andean peoples.

In the traditions of the Ge-speaking Apinagé, Kayapó, Craho, and Xerenté, among the tribes of the Tropical Forest, as well as among the Mataco of the Gran Chaco, many fruits of the earth came from the heavens as gifts brought by Star Woman for her lover and his people. That is the way the Apinagé first came to know of sweet potatoes and yams and learned to plant maize and make maize cakes. The Kayapó obtained manioc, sweet potatoes, yams, and bananas through the good offices of Sky Woman, who was the daughter of Rain. Maize, however, was revealed by a little mouse who showed it to an old woman. Among the Waiwai it is said that an old woman allowed herself to be burned, and from her charred bones sprouted cassava plants of the type still in use today. In a Witóto myth an old woman who was ascending the sky in pursuit of a handsome youth fell down, transforming herself into the bitter yuca, while the young man became the sun.

In many tribal societies there are traditional stories teaching how artifacts and social institutions first came into

being. Among the Ayoré of western Paraguay and eastern Bolivia, who speak a language of the Zamuco family, there is an origin myth (or sometimes several) for every single object, whether natural or manmade. According to the Ayoré, most things originated through the transformation of an ancestor. In many cases, however, cultural objects were in the beginning owned by the ancestor who, at a certain point, gave them to humankind.

**ORIGINS OF FIRE.** Fire, the natural element required to transform the raw into the cooked, separates humans from animals and establishes the basis of culture; as such, it is the subject of many mythic stories, which can be broadly divided into myths about the origin of fire and myths about the origin of the techniques for fire-making. Most stories of the former group recount how, in the times of the beginnings, humans first obtained fire, either as a gift from a god or as an element stolen by a culture hero.

The greatest variety of myths about fire among South American societies probably occurs in the traditional oral literature of the Mataco. According to one of these stories, Raven was the owner of fire, and Toad, in an unsuccessful attempt to steal it, almost extinguished it. But Tokhuah, the trickster, did succeed in getting it, and, when chased away, waved his burning stick in all directions. The branches of all the species of trees that caught fire are now gathered to make drills for producing fire by friction. In another Mataco myth, Vulture, the guardian of fire, flapped his huge wings from time to time to fan the live coals. If someone attempted to take a burning piece of wood, however little, Vulture would flutter his wings with such force that the fire would flare up and the would-be thief would be burned to ashes. But according to the most widely reported version of the Mataco myth, the owner of the fire is Jaguar. In this story, Jaguar loses his fire to Rabbit, who puts live coals under his chin and runs away. Later Rabbit throws the embers in a meadow and the world begins to burn. People were thus able to obtain fire and to cook their meals, but Jaguar had to learn how to hunt and to eat his game raw. Then Tokhuah put the spirit of fire into the wood of the *sunchu* tree, which the Mataco use to make their fire-drills.

**ORIGINS OF DEATH.** Several types of myths about the origin of death have been noted among South American tribes. One of these may be called the "waxing and waning moon" type. The Ayoré of the Gran Chaco say that instead of following Moon, who waxes again after waning into nothing, their ancestor followed Tapir, who dies and never rises again.

The Warao of the Orinoco delta have several traditional stories representing different types of myth about the origins of death. One type concerns the "serpent and his cast off skin." It says that people lived happily on earth until one of them fell ill and died. He was buried, and the Master of the Palm-Leaf Fiber said that they should wail for their dead. The snakes immediately cried and shed their skins. That is why snakes do not die, but people do.

Another type of myth, and a very common one, attributes humanity's fate to its disobedience of a divine commandment. It is said that death and sickness came to the Warao as a punishment inflicted by the Master of Water Spirits because his daughter, who had married a Warao, had been obliged to go into the menstruation hut when she had her menses, according to the customs of her husband's village but against her will, and she died. To castigate the Indians, the water spirits caused accidents, sickness, and death.

Yet another myth type, the "ill-timed answer," is found not only among the Warao but also in Guyana and elsewhere. Once, when the world was young and animals could talk, a chief announced that Death would pass by that night. The chief added that Death would call to them first, and that a good spirit would call afterward. If they answered the second call, people would never die, but if they answered the first call, all would surely die. The chief asked everybody to stay awake, but a young man went to sleep. Night came and all was quiet. About midnight they heard a voice that they did not answer, but the young man who was sleeping woke up and answered it. From that time, people began to die.

The "malevolent decision" motif and the "shouting at and scaring away the revenant" motif sometimes overlap, as in the Mataco myth according to which there was a time when everybody lived for five hundred years and died only of old age. Three days after death they would return to life again, rejuvenated. Nevertheless, when Tokhuah, the trickster, saw Moon, who was a handsome young man with an oversized member, beginning to shine again, Tokhuah was frightened, shouting "Go away!" and threatening Moon with a stick. Moon fled upward until he reached the sky. Tokhuah did the same to those who returned from the dead, and it is surmised that because of his actions the dead do not come back to life any more.

Another widely scattered motif is the "resurrection ritual that fails." The Selk'nam of Tierra del Fuego used to say that when their hero Kenos reached old age and seemed to die, he rose up again, and caused other men who died to come back to life by washing them. Subsequently, when he decided at one point not to rise again and went into the sky and became a star, he instructed Cenuke, a powerful sorcerer, to wash old people and make them young again. But Kwanip, another powerful sorcerer, ordained that no person should be raised from the sleep of age. He hurried up to the sky where he also became a star. Since then nobody comes back from the grave.

**RELATIONSHIP BETWEEN MYTH AND RITUAL.** According to a well-known theory, myths recount rituals and rituals perform myths. Although this idea will hardly hold if applied to all myths and rituals, it is true that some myths relate the origins of certain rites. The southern Barasana, speakers of a Tucanoan language, tell a story of their culture hero Warimi, who in his childhood was called Rijocamacu and who always succeeded in escaping when pursued by the daughters of the supernatural Meni. One day the youngest

daughter of Meni caught Rijocamacu, who instantly turned into a little baby. The girl put him to her breast. Her father approved of what she was doing, and kindled some wax, blowing on the smoke in order to chase away the spirits of the dead so that they could not frighten the baby and make him cry. Since that time, when a woman gives birth, the chief blows on the household fire and only then are the people allowed into the house. In many tales, Meni is said to have been the first to do the things that the Barasana do now.

The close relationship between myth and ritual has been established in the case of the complex of sacred stories, holy performances, and tabooed musical instruments and other items that are associated with the name *Yurupary*, known to many tribes in the western Amazon region. The stories about Yurupary differ from one tribe to another. One of these stories, told among the Macuna, was that Yurupary was an old jaguar-shaman whose female companion was Romi Kumu, another powerful being. Since he devoured many men, two ancestors decided to kill him, and they did. Afterward they burned his body; but his ashes produced a palm tree that shot quickly into the sky. The ancestors cut the palm to pieces and these became musical instruments: three male trumpets and one female flute that did not give out any sound until a hole was made to imitate the vagina of Romi Kumi. When the ancestors found Romi Kumi on an island, they stuck the flute between her legs, and that was the origin of menstruation. They gave the instruments to men, who at that time performed the agricultural work that is now performed by the women. In the Yurupary ceremonies, females are not allowed to see the instruments.

**MODERN MYTHS.** The myths mentioned above are ancient stories exhibiting the characteristics of South American cultures before contact with European civilization, but the creative forces of native imagination were not totally withered by the impact. Old myths were recast in new molds, making allowance for the presence of the whites and their ways. Hundreds of legends—that is, myths with some historical component—were coined in colonial times, and the process is still alive today in many areas where indigenous and foreign cultures meet. One such legend is the so-called myth of Inkarrí, which has been traced to several localities in the vicinity of Cuzco, but has also been found in other areas of Peru. Its gist is that the Spanish conqueror Pizarro imprisoned and beheaded Atahualpa, the Inca king (Span., *Inca rey* = Inkarrí), but the head, which is secretly kept somewhere, is not dead, and is growing a body, which when completed will shake off the chains and fetters that hold the Inca people in bondage. Eventually, Inkarrí will reestablish justice and bring back the ancient culture of the vanquished.

#### **BIBLIOGRAPHY**

The best collection of sources, translated into English from the Spanish, Portuguese, and other European languages, is the multivolume *The Folk Literature of South American Indians*,

edited by Johannes Wilbert (Los Angeles, 1970–), published as part of the “UCLA Latin American Studies” series. Separate volumes have been devoted to the Warao (1970), Selk’nam (1975), Yamana (1977), Ge (1979), Mataco (1982), Toba (1983), Boróro (1983), and Tehuelche (1984). Extensive compilations of South American myths are Theodor Koch-Grünberg’s *Indianermärchen aus Südamerika* (Jena, 1901), which does not include the Andean civilizations, and Raffaele Pettazzoni’s *Miti e leggende*, vol. 4, *America Centrale e Meridionale* (Turin, 1963).

Other sources are included in more restricted ethnological studies or in anthologies devoted to Indians of a single country, such as the following works: Walter E. Roth’s *An Inquiry into the Animism and Folk-Lore of the Guiana Indians* (Washington, D.C., 1908–1909), which has myths of the Arawak, Carib, and Warao; *An Historical and Ethnological Survey of the Cuna Indians*, by Erland Nordenskiöld in collaboration with Ruben Pérez Kantule, edited by Henry Wassén (Göteborg, 1938); Herbert Baldus’s *Die Jaguarzwillinge* (Kassel, 1958), with myths from Brazil; Fray Cesáreo de Armellada and Carmela Bentivenga de Napolitano’s *Literaturas indígenas venezolanas* (Caracas, 1975); Hugo Nino’s *Literaturas de Colombia aborigen: En pos de la palabra* (Bogotá, 1978). The Taulipan and Arekuna are represented in Theodor Koch-Grünberg’s *Von Roroima zum Orinoco*, vol. 2 (Stuttgart, 1924); the Marikitare, in Marc de Civrieux’s *Watunna: An Orinoco Creation Cycle* (San Francisco, 1980). Myths from some tribes of the huge Amazonian area are included in C. Manuel Nunes Pereira’s *Moronguetá: Um Decameron indígena*, 2 vols. (Rio de Janeiro, 1967); Gerardo Reichel-Dolmatoff’s *Amazonian Cosmos: The Sexual and Religious Symbolism of the Tukano Indians* (Chicago, 1971); Gerald Weiss’s *Campa Cosmology: The World of a Forest Tribe in South America* (New York, 1975); Manuel García-Renduelas’s *Duik Múum: Universo mítico de los aguayunas*, 2 vols. (Lima, 1979); Stephen Hugh-Jones’s *The Palm and the Pleiades: Initiation and Cosmology in Northwest Amazonia* (Cambridge, 1979), on the Barasana, important for the study of the Yurupary myth; Mario Califano’s *Análisis comparativo de un mito mashco* (Jujuy, Argentina, 1978), based on versions from three groups of southeast Peru; Peter G. Roe’s *The Cosmic Zygote: Cosmology in the Amazon Basin* (New Brunswick, N.J., 1982), on Shipibo mythology. Classic studies in Guaraní mythology are part of Alfred Métraux’s *La religion des Tupinamba et ses rapports avec celle des autres tribus Tupi-Guarani* (Paris, 1928) and Curt Nimuendajú’s “Die Sagen von der Erschaffung und Vernichtung der Welt als Grundlagen der Religion der Apapocuva-Guarani,” *Zeitschrift für Ethnologie* 46 (1914): 284–403. For the Kamayurá and other tribes of the Upper Xingu: Orlando Villas Boas and Claudio Villas Boas’s *Xingu: The Indians, Their Myths* (New York, 1973). The myth of the “twins and the jaguar,” widely diffused in the Amazon, is studied in relation to early Andean civilizations by Julio C. Tello in his article “Wira Kocho,” *Inca* 1 (1923): 93–320, 583–606. Two recent anthologies of Andean myths are Henrique Urbano’s *Wiracocha y Ayar: Héroes y funciones en las sociedades andinas* (Cuzco, 1981) and Franklin Pease’s *El pensamiento mítico* (Lima, 1982). The best edition of the Huarochiri traditions collected by Francisco de Ávila is Jorge L. Urioste’s *Hijos de Pariya Qaqa: La tradición oral de Waru Chiri: Mitología, ritual y costumbres*,

2 vols. (Syracuse, N.Y., 1984). Many South American myths, or parts of them, are included in the first three volumes of Claude Lévi-Strauss’s monumental *Mythologiques*, translated as *The Raw and the Cooked* (New York, 1969), *From Honey to Ashes* (New York, 1973), and *The Origin of Table Manners* (New York, 1978), also useful for its extensive bibliographies.

There is no large-scale treatment of South American mythology from the point of view of religious studies. The best overview is Harold Osborne’s *South American Mythology* (London, 1968). A survey of the field since the publication of the *Handbook of South American Indians*, 7 vols., edited by Julian H. Steward (Washington, D.C., 1946–1959), is found in Juan Adolfo Vázquez’s “The Present State of Research in South American Mythology,” *Numen* 25 (1978): 240–276. Although dated in many respects, the *Handbook* has not been replaced as a general work of reference. Invaluable for the ethnological background to the mythology of many tribes, it also includes brief summaries on religions and mythologies, and an article by Alfred Métraux, “Religion and Shamanism” (vol. 5, pp. 559–599). The article “Inca Culture at the Time of the Spanish Conquest” by John Howland Rowe (vol. 2., pp. 183–330) provides an excellent introduction to the subject and includes sections on Inca religion and mythology. The chapters on archaeology can be updated by consulting Gordon R. Willey’s *An Introduction to American Archaeology*, vol. 2, *South America* (Englewood Cliffs, N.J., 1971). The field of South American linguistics has been surveyed by different authors, among them Cestmír Loukotka in his *Classification of South American Indian Languages*, edited by Johannes Wilbert (Los Angeles, 1968).

The following periodicals have published many myths from South America: *Amérindia* (Paris, 1976–), *Anthropos* (Mödling, 1906–), *Journal de la Société des Américanistes* (Paris, 1895–), *Journal of Latin American Lore* (Los Angeles, 1975–), *Latin American Indian Literatures* (Pittsburgh, 1977–1984) *Revista do Museu Paulista* (São Paulo, 1895–1938, 1947–), and *Scripta Ethnologica* (Buenos Aires, 1973–).

#### SOUTH AMERICAN INDIAN RELIGIONS: HISTORY OF STUDY

Systematic study of South American indigenous religions began with the arrival of the first Europeans. Almost imme-

diately after landing in the New World, scholars, priests, scribes, and soldiers began describing and assimilating the Indians' peculiar and, to them, outlandish practices for their Old World sponsors and public. The confrontation between these early explorer-chroniclers and their indigenous subjects established the basis of a religious opposition between Christian reformer and "pagan" Indian; and it is no exaggeration to say that these early accounts set the stage for all later scholarly and scientific studies of the continent's diverse religious traditions.

All early accounts of religion were driven by the practical needs of empire. For the Spaniards, the political importance of understanding and analyzing native religious belief first arose through their encounters with the powerful Inca state of highland Peru. Chroniclers such as Juan de Betanzos (1551), Pedro Cieza de León (1553), and Cristóbal de Molina (1572) among others provided vivid accounts of imperial religion and Inca state mythologies. Two concerns tempered their descriptions and choice of subject matter: the spectacle of Inca rituals and the parallels they imagined to exist between their Christian millenarian and apostolic traditions and the natives' own beliefs in a "creator god" whose prophesized return coincided with—and thus facilitated—the initial Spanish conquests in Peru. Similar messianic beliefs among the Tupi-Guaraní of eastern Brazil attracted the attention of the explorers Hans von Staden (1557) and Antoine Knivet (1591). Their writings provide fascinating accounts of Tupi religion as part of an argument intended to prove the presence of the Christian apostle Thomas in South America long before its sixteenth-century "discovery." Such early accounts inevitably strike the modern-day reader as ethnocentric. The tone of these writings is understandable, however, since their purpose was to make sense of the new cultures and peoples they met within the historical and conceptual framework provided by the Bible. Within this framework, there was only one "religion" and one true God. All other belief systems, including those encountered in the Americas, were judged as pagan. For some early theologians, the pagan practices of the South Americans placed them well outside the domain of the human. Others, however, believed the Americans were humans who had once known the true God and then somehow fallen from grace or were innocents with an intuitive knowledge of God. Early accounts of religious practices were driven by this desire to uncover evidence of the Indians' prior evangelization or intuitive knowledge of God. Catholic writers thus often interpreted the indigenous practices they observed by comparing them to such familiar Catholic practices as confession. In what is perhaps the most sympathetic account of a native religion, the Calvinist Jean de Léry made sense of the religious practices of the Brazilian Tupinambá Indians by comparing their ritual cannibalism to the Catholic Communion, in which Christians partook of the body and blood of Christ. De Léry's account suggests the extent to which all early inquiries into South American religions were inevitably colored by the religious

and political lines drawn within Europe itself by the Reformation.

For Iberians, however, it was the *Reconquista* or Liberation of Catholic Spain from Moorish rule that lent the study of religion an urgent, practical tone. If Indian souls were to be recruited to the ends of the "one true religion," it was necessary to isolate and eradicate those aspects of the indigenous religions that stood in the way of conversion. Priests had to be instructed, catechisms written, and punishments devised for specific religious offenses. The ensuing campaigns to extirpate idolatries produced the first true studies of religion in the Andean highlands. Combining knowledge of Christian doctrine and missionary zeal with an increasing practical familiarity with indigenous life, theologians and priests such as José de Acosta (1590), José de Arriaga (1621), Cristóbal de Albornóz (c. 1600), and Francisco de Ávila (1608) set out to define in a rigorous and scholarly way the parameters of indigenous religion.

A few indigenous and mestizo writers sought to vindicate their culture and religion from the attacks of these Catholic campaigners, in the process contributing greatly to the historical study of Andean religion. Among the most interesting of the indigenous chronicles is an eleven-hundred-page letter to the king of Spain written between 1584 and 1614 by Felipe Guamán Poma de Ayala, a native of Ayacucho, Peru, who had worked with the extirpation campaigns. Other native accounts include the chronicle of Juan de Santacruz Pachacuti Yamqui Salcamaygua (c. 1613) and the monumental *History of the Incas* (1609), written by the half-Inca Garcilaso de la Vega. These native writers defended the goals but not the cruel methods, of Christian conversion and defended many native beliefs and practices as more just and rational than the abuses of the Spanish colonizers.

Other chronicles record European reactions to religions of the Amazonian lowlands; these include among others the travel accounts of Claude d'Abbeville (1614) and Gaspar de Carvajal, a priest who accompanied the first exploratory voyage up the Amazon River system in 1542. But if what the Europeans understood by "religion"—that is, hierarchies, priests, images, and processions—fit in well with what they found in the Andean state systems, it differed markedly from the less-institutionalized religions of the tropical forest region. Accounts of lowland religions were accordingly couched in an exaggerated language stressing atrocity, paganism, and cannibalism. Such emphases had more to do with prevailing European mythologies than with the actual religious beliefs of tropical forest peoples.

This early literature on Andean religion provided irreplaceable data about ritual, dances, offerings, sacrifices, beliefs, and gods now no longer in force—including, in the case of Guamán Poma's letter, a sequence of drawings depicting indigenous costume and ritual and, in the chronicle of Francisco de Ávila, a complete mythology transcribed in Quechua, the native language. But these colonial writings also provided a powerful precedent for religious study thereafter.

From the time of the extirpators on, religion was the salient element or institution by which indigenous peoples were judged in relation to their Christian or European conquerors. Religion, in short, became the principal index for defining the cultural and social differences separating two now adjacent populations. Such religious criteria helped shape as well the unfortunate stereotypes applied to Amazonian peoples and cultures.

**NINETEENTH-CENTURY TRAVEL AND EXPEDITIONARY LITERATURE.** The interval between the seventeenth-century campaigns against idolatry and the early-nineteenth-century independence period was marked by an almost complete absence of religious studies. In Europe itself the accounts of Garcilaso de Vega, de Léry, and others provided the raw materials from which eighteenth-century philosophers crafted their highly romanticized image of the American Indian. While Jean-Jacques Rousseau (1712–1778) and others looked to the Tupinambá as a model for the “noble savage,” other French philosophers held up Inca religion as an example of what an enlightened monarchy and nonpapist religion could look like. Although far removed from South America itself, these writings continued to influence the study of South American religions for many future generations.

With their independence from Spain in the early nineteenth century, the new South American republics became once again available to the travelers, adventurers, natural historians, and scientists who could provide firsthand observations. Whereas earlier colonial observers had approached the study of religion through the political and theological lens of empire and conversion, these nineteenth-century travelers used the new languages of science and evolutionary progress to measure the Indians’ status with respect to contemporary European cultural and historical achievements. While none of these travelogues and natural histories was intended as a study of indigenous religion *per se*, many of them include reports on religious custom. Among the most important of these are the travel accounts of Ephraim George Squier (1877), Charles Wiener (1880), Friedrich Hassaurek (1867), and James Orton (1876) for the Andean highlands and Johann Baptist von Spix and Carl von Martius (1824), Henri Coudreau (1880–1900), Alcides d’Orbigny (1854), and General Couto de Magalhães (1876) for the Amazonian lowlands. Such descriptions were augmented, especially in the Amazon, by detailed and often highly informative accounts of “pagan” practices written by missionary ethnographers such as José Cardus (1886) in Bolivia and W. H. Brett (1852) in British Guiana (now Guyana).

This nineteenth-century literature tended to romanticize the Indians and their religions through exaggerated accounts of practices such as head-hunting, cannibalism, blood sacrifice, and ritual drinking. In these “descriptions” of religion emphasis is placed on the exotic, wild, and uncivilized aspects of the Indians’ religious practices—and on the narrator’s bravery and fortitude in searching them out. Such ro-

manticizing and exoticizing, however, tended to occur unevenly. Thus whereas religions of the Amazon Basin were subject to the most exotic and picturesque stereotypes of what a tropical primitive should be, the less-remote Andean Indians were described primarily in terms of their degeneration from the glories of a lost Inca religion that was considered to be more enlightened or “pure.”

**EARLY- TO MID-TWENTIETH-CENTURY STUDIES.** The twentieth century ushered in new forms of scientific inquiry and scholarly ideals. Departing from the narrative, subjective styles of the chroniclers, travelers, and natural historians, modern writers sought to describe indigenous religion independently of any personal, cultural, or historical biases about it; subjectivity was to be subsumed to a new ideal of relativism and objectivity. These writers conform to two general yet interrelated disciplinary fields: (1) the anthropologists and historians of religion, who use a comparative and typological framework to examine the universal, phenomenological bases of religious belief, and (2) the area specialists, or Americanists, who are interested in defining the specificity and social cultural evolution of religions in the Americas.

The first group included such early scholars of lowland religions as Paul Ehrenreich (1905), Max Schmidt (1905), and Adolf E. Jensen (who later founded the Frankfurt ethnographic school, home to such important modern scholars of South American religions as Otto Zerries and Karin Hissink). Their comparativist theories proved an impetus for the later field studies of Martin Gusinde (1931–1937) in Tierra del Fuego, William Farabee (1915–1922), and Günter Tessmann (1928–1930) in the Northwest Amazon, Konrad T. Preuss (1920–1930) in both highland and lowland Colombia, and Theodor Koch-Grünberg (1900–1930) in the Orinoco and in Northwest Brazil. These field-workers wrote detailed general accounts of lowland or Amazonian religions and placed special emphasis on the analysis of iconography, mythology, and animism.

Studies of highland religion during this early-twentieth-century period tended to focus almost exclusively on antiquities. The most important of these studies are the linguistic treatises of E. W. Middendorf (1890–1892) and J. J. von Tschudi (1891) and the archaeological surveys of Max Uhle and Alfons Stubel (1892). Both Incaic and contemporary Andean materials, however, were included in the broad surveys done by the scholars Adolf Bastian (1878–1889) and Gustav Brühl (1857–1887), who were interested in comparing the religions and languages of North, South, and Central America to establish a theory of cultural unity.

The Americanists’ interdisciplinary studies of indigenous religion drew on the early twentieth-century German studies and on at least three other sources as well. The first was the fieldwork during the 1920s, 1930s, and 1940s by European ethnologists such as Alfred Métraux, Paul Rivet, and Herbert Baldus as well as by American anthropologists from the Smithsonian Institution’s Bureau of Ethnology. Beyond describing the general social organization, religion, rit-

ual, and mythologies of the Indians, these men were interested in classifying the cultures and religions they found by tracing their interrelationships and linguistic affiliations. In their writings therefore a detailed account of religion is often subordinated to an overriding interest in linguistic data and material culture. For example, detailed studies of shamanism were produced by the Scandinavian ethnographers Rafael Karsten, Henri Wassen, and Erland Nordenskiöld as part of a broader comparative examination of the material culture of South America. Of these early ethnographers, the German anthropologist Curt Nimuendajú stands out both for the extent of his fieldwork among the Ge, Boróro, Apinagé, Tucano, and Tupi tribes and for the degree to which his interests in describing these groups focused on their religious and ritual life. Other important sources on religious practices during this period are provided in the accounts of missionaries and priests, such as Bernadino de Nino (1912) in Bolivia, Gaspar de Pinelli (1924) in Colombia, and Antonio Colbaccini and Cesar Albisetti (1907–1942) in Brazil.

A second group that influenced early Americanist approaches to religion was composed of ethnohistorians and archaeologists. Often hailed as the first true Americanists to work in the Southern Hemisphere, the archaeologists left a distinctive imprint on South American studies by the nature of their specialty: the study of the pre-Spanish Andean past. Excavations, surveys, and analyses of previously unstudied sites in both coastal and highland Peru by Max Uhle and Adolph Bandelier were followed by the more detailed chronological studies of Alfred Kroeber, Junius Bird, Wendell Bennett, and John Rowe. Although the chronologies and site inventories constructed by these archaeologists did not focus on religion per se, the temple structures, burials, offerings, textiles, ceramics, and other ritual paraphernalia they unearthed provided new data on the importance of religion in pre-Columbian social organization and political evolution. Interpretation of this material was facilitated by the work of ethnohistorians such as Hermann Trimborn and Paul Kirchhoff. Their historical investigations of both highland and lowland religions contributed immeasurably to an overall working definition of South American religious systems and their relation to systems of social stratification, state rule, and ethnicity.

A third and final group that helped shape Americanist studies was composed of South American folklorists, indigenists, and anthropologists. In attempting to resurrect indigenous culture and religion, *indigenista* writers of the 1930s and 1940s differed from the foreign ethnologists of these formative Americanist years. Their work was motivated largely by an explicit desire to record South American lifeways and religions before such practices—and the people who practiced them—disappeared completely. The emphasis of the *indigenista* studies on the vitality of living religious systems also served as an important counter to the archaeologists' initial influence on Americanist thinking. The prodigious group of national writers influenced by *indigenismo*

subsequently compiled a vast archive of oral traditions, “customs,” and ritual practices. Notable among these folklorists and anthropologists are Antonio Paredes Candia and Enrique Oblitas Poblete of Bolivia, Roberto Lehmann-Nitsche of Argentina, Gregorio Hernández de Alba of Colombia, and Jose-María Arguedas, Jorge Lira, and Oscar Nuñez del Prado of Peru. Unique among them was the Peruvian archaeologist-anthropologist Julio C. Tello. One of the most creative archaeologists working in Peru, Tello was also the only one interested in exploring the relation of the religious data he unearthed to modern-day Quechua beliefs and practices. His ethnographic publications of the 1920s are landmarks in the study of Andean religion, and his archaeological investigations of the 1930s and 1940s extended knowledge of the Andean religious mind into a comparative framework interrelating highland and lowland cosmologies and religions.

The major work to appear out of the formative period of Americanist studies is the seven-volume *Handbook of South American Indians* edited by Julian H. Steward (1946–1959). Though somewhat outdated, the *Handbook's* articles, which cover aspects of prehistory, material culture, social organization, and ecology, still provide what is perhaps the most useful and accessible comparative source for beginning study of South American religions. Its interest for a history of religious studies, however, also lies in what it reveals about the biases informing Americanists' treatment of religion. These are (1) a preoccupation with relative historical or evolutionary classifications and the description of religious systems in terms of their similarity to, or degeneration from, a pre-Columbian standard, (2) a lowland-highland dichotomy informed by this evolutionary mode and according to which tropical forest religions are judged to be less “complex” than the pre-Hispanic prototypes formulated for the Andes by archaeologists and ethnohistorians, and (3) the comparative framework used by scholars who were more interested in discovering the cultural affinities and evolutionary links that connected different religious practices than they were in describing and analyzing the function and meaning of religious practices on a local level. The shortcomings of this dispersed and comparative focus are intimated by many of the *Handbook's* authors, who lament the inadequacy of their data on specific religious systems.

**FUNCTIONALIST AND FUNCTIONALIST-INFLUENCED STUDIES.** The next group of scholars to address religious issues set out specifically to remedy this situation by studying indigenous religion in its social context. The manner in which local religious systems were treated was, however, once again tempered by the theoretical orientations of their observers. Thus the first group of anthropologists to follow the *Handbook's* lead during the 1950s and early 1960s was influenced by the functionalist school of British anthropology. According to this theory, society is an organic whole whose various parts may be analyzed or explained in terms of their integrative function in maintaining the stability or equilibrium of a local group. Religion was considered to be a more or less passive reflection of the organic unity of a total social

system. Examples of this approach are the monographs of William W. Stein (1961) on the Peruvian Andes, Allan R. Holmberg (1950) on the Siriono of lowland Bolivia, and Irving Goldman (1963) on the Cubeo of Brazil. In several cases more detailed monographs were written that focused specifically on the role of religion in indigenous social organization; these include works by Robert Murphy on the Brazilian Mundurucú, Segundo Bernal on the Paez of Colombia, David Maybury-Lewis on the Akwe-Xavante, and Louis C. Faron on the Mapuche, or Araucanians, of coastal Chile.

One variant of this functionalist approach brought out the role of religion as a means of achieving or maintaining balance between social and ecological systems. Prime examples of this approach are Gerardo Reichel-Dolmatoff's brilliant, Freudian-influenced treatments of mythology, shamanism, and cosmology among the Koghi Indians of Colombia's Sierra Nevada highlands and the Desána (Tucano) of the Northwest Amazon. Other studies of shamanism, cosmology, and hallucinogens have been carried out by the anthropologists Douglas Sharon in coastal Peru and Michael Harner in eastern Ecuador.

**STRUCTURALIST STUDIES.** During the 1960s and 1970s scholars began to question the passively reflective, or "superstructural," role to which much of functionalist anthropology had relegated religion as well as the simplistic and ultimately evolutionist dichotomies between the Andean and tropical forest cultures. The major theoretical impetus for this new approach came from structuralism, which proposed to analyze the affinities connecting mythologies and ritual practices and the societies in which they occurred by referring all to a pervasive symbolic or cognitive structure based on dual oppositions and on diverse forms of hierarchical organization. The pioneering works of this tradition were Claude Lévi-Strauss's studies of social organization and mythology in the Amazon basin and his four-volume *Mythologiques* (1964–1971), which presented a system for analyzing mythic narratives as isolated variants of an organizational logic whose standardized structure he invoked to explain the commonality of all North and South American modes of religious expression and social organization.

The structuralist approach has been particularly important for the study of religion. For the first time a mode of thinking—evidenced by religion and mythology—was not only taken as the principal index of cultural identity but was also seen to influence and even partly to determine the organization of other spheres of social and economic life. In its renewed focus on religion, structuralism inspired myriad studies of lowland ritual and mythology, including those by Jean-Paul Dumont, Michel Perrin, Terence Turner, Jacques Lizot, Anthony Seeger, Stephen Hugh-Jones, and Christine Hugh-Jones. These structuralist studies of mythology and social organization were completed—and often preceded—by collections of mythologies and descriptions of cosmologies (or "worldviews") by ethnographers such as Johannes Wilbert, Marc de Civrieux, Darcy Ribiero, Roberto DaMat-

ta, Egon Schaden, Neils Fock, and Gerald Weiss. Though departing from the structuralists' methodologies, these anthropologists shared with the structuralists an interest in studying religion as an expression of social organization, society-nature classifications, and broad cultural identities.

In the Andes, where mythologies and religion were judged to be less pristine and less divorced from the ravages of historical, social, and economic change, Lévi-Strauss's theories generated interest in the study of social continuity through examination of structural forms. These studies of underlying structural continuity were based on extensive fieldwork by ethnographers and ethnohistorians such as Billie Jean Isbell, Juan Ossio, Henrique Urbano, Gary Urton, John Earls, and Alejandro Ortíz Rescaniere. These scholars have argued for the existence of a constant and culturally specific religious (as well as mythological and astronomical) structure by means of which indigenous groups have retained their cultural identity over time. Their studies of postconquest religious continuity drew on ethnohistorical models of Andean social organization, in particular R. Tom Zuidema's complex structural model of Inca social relations and ritual geographies and María Rostworowski de Diez Canseco's studies of pre-Hispanic coastal societies. Both of these ethnohistorians have emphasized the role of mythology, ritual, and religious ideology in the shaping of Andean economic and political history.

Structuralist methodology also motivated a new type of comparative study focusing on the similarities linking Andean and Amazonian religions. For example, Zuidema's structural model for Inca socioreligious organization pointed out the important similarities between this elaborate highland state system and the equally complex modes of ritual and social organization found among the Ge and Boróro Indians of Brazil. D. W. Lathrap's archaeological model for the evolution of South American social organization used similar comparative techniques to establish a common heritage of lowland and highland cosmologies. By combining this comparative insight with the historical dynamics of archaeology and ethnohistory and by assigning to religion a determinative role in the evolution of social systems, such models not only questioned but in many ways actually reversed the prevailing stereotypic dichotomy between "primitive" Amazon and "civilized" Andes.

**HISTORICAL AND POSTSTRUCTURALIST VIEWS.** In the final decades of the twentieth century anthropologists and other students of religion began increasingly to question the notions of unity, coherence, and continuity that had characterized much earlier work on indigenous religion. Structuralists had interpreted myth as the partial expression or transformation of mental structures that endured over time and ritual as the symbolic performance of the formal, structural principles that lent meaning to a particular culture's cosmology or worldview. Through such forms of analysis, structuralists emphasized the coherency and mobility of the structural principles expressed in the many different domains of social

life. In so doing they also made important claims concerning the pervasive character of “religion” and the impossibility of drawing a definite boundary between religious and secular activities in indigenous societies.

Poststructuralist work has built on and expanded this methodological and theoretical claim that “religion” must be studied in many different and overlapping domains of social life. At the same time scholars working in the 1980s and 1990s used historical methodologies to question structuralism’s claims regarding the coherency and stability of mental and symbolic structures. Because the study of indigenous societies often depended on the use of documentary sources written by Spaniards and other nonindigenous authors, history or ethnohistory has been a foundational methodology for many South Americanists. For example, Zuidema and other structuralists built their models of pristine Inca and Andean religious systems through the creative, critical use of Spanish chronicles and archives. The new historical work on religion by Tristan Platt, Thomas A. Abercrombie, Joanne Rappaport, and others has drawn on ethnohistorical methods in their search for an indigenous “voice” in the colonial archive. Unlike the earlier structuralists, however, their goal was not to reconstruct the elements of a precontact society but to understand the complex role played by religion in the political worlds formed through the interaction of indigenous and European societies.

In part because of their heavy debt to structuralist methodologies and perspectives, early historical anthropologies tended to approach religion as an inherently conservative domain of belief whose persistence in colonial times could be read as a form of resistance to colonial rule. Of particular importance in this respect were the studies of messianic movements as forms of religious conservatism coupled with situations of social resistance or even revolution. In the Andes such work was stimulated largely by ethnohistorical studies of colonial messianisms by the Peruvian anthropologists Juan Ossio, Franklin Pease, and Luis Millones. Other studies interpreted indigenous religious beliefs and practices as strategies for consolidating ethnic identities threatened by the encroachment of “modern” national societies. These include studies by Norman E. Whitten Jr. in Amazonian Ecuador, the mythology collections of Orlando Villas Boas and Claudio Villas Boas in the Brazilian Xingu River area, Miguel Chase-Sardi’s studies of ethnicity and oral literatures in Paraguay, and William Crocker and Cezar L. Melatti in the Brazilian Amazon.

Through its emphasis on contingency, political complexity, and intrigue, subsequent work has tended to complicate the category of resistance itself, along with the dual-society models that were often implied by the concept of resistance. Stefano Varese’s groundbreaking work on the Peruvian Campa or Ashaninka, based on fieldwork conducted during the late 1960s and early 1970s, provides an early example of a political anthropology of religion that emphasized the political economic contexts in which messianic

movements and indigenous political resistance took shape. Other examples include the work of anthropologists Robin M. Wright and Jonathan Hill on northern Amazonian religious movements and political organization; Xavier Albó, Platt, Olivia Harris, Abercrombie, and Roger Rasnake on the colonial origins and rationality of the sacred landscapes, social practices, and authority structures through which Aymara religious practices engage issues of politics and power; and Jean Jackson and Alcida Ramos on ethnic relations and indigenous politics in the Colombian and Brazilian Amazon. Although the concept of a religious syncretism between colonial (usually Catholic) and indigenous belief systems has long been a central issue in anthropological treatments of religion, these new historical studies move well beyond the notion of syncretism to paint a more complex picture of how individuals, groups, and political movements strategically manipulate and conceptualize the semantic and epistemic divides that ideally differentiate “native” and “colonial,” Indian and mestizo, resistance and accommodation.

Ethnographers have also begun to question the models of culture and meaning through which early anthropologists once defended the unity of indigenous cultural systems and the interpretation of ritual and myth. Rather than looking for the inner “meaning” hidden within religious words and practices, these ethnographies build on poststructuralist models of language and practice to explore how meaning accrues to words and practices as they unfold in time. Though focused on different areas of social production, these ethnographies hold in common the idea that “religion” is best studied across different domains of social practice rather than as a discrete symbolic system that functions to give “meaning” to other domains of indigenous experience. Thus ethnographers such as Catherine J. Allen in the Peruvian Andes have examined etiquette and sociality as lived domains in which religious belief takes hold not as an extant symbolic system but as the moral and ethical perspective that is played out through the many small routines and interactions of daily life.

Studies of Andean spatial practices and aesthetics by Urton, Nathan Wachtel, and Rappaport among others emphasized how “religious” meanings are woven into such collective material practices as wall construction and territorial boundary maintenance. Other anthropologists, such as Greg Urban and Jackson, have looked at the linguistic practices through which myths are recounted and interpreted in local social life. Finally, Michael T. Taussig’s important work on the Colombian Putumayo and modern Venezuela has explored shamanism as a lens on the working of power, fear, and memory in the shaping of Colombian modernity. Taussig’s work has been particularly important in that it takes the claims of indigenous religious belief and historical narrative seriously as a force in the shaping of modern Latin America. Taussig thus succeeds in questioning the spurious distinction between magical and rational thought and with it the categories of myth and history that permeated so much earlier work on South American religion.

**CONCLUSION.** Taken together historical and poststructuralist approaches have had the singular effect of undermining the integrity and coherency of the very categories “religion” and “indigenous” that animated so much earlier anthropology in the region. For a majority of the anthropologists and historians working in South America, it is no longer possible to speak of indigenous communities, practices, identities, or beliefs without situating them in broader regional and national histories. As the notion of indigenous religion becomes unhinged from its original location in the pristine, or supposedly pristine, life of the “Indian community,” it has become possible for scholars to think critically and historically about the place of different Christian belief systems in South American indigenous life. Anthropologists have begun to study the Protestant evangelical and Catholic charismatic sects that have become so prominent in many indigenous communities of South America. Wachtel, Antoinette Fioravanti-Molinié, and others have analyzed the persistence of indigenous religious beliefs regarding threatening *ñakaqs*, or spirits who extract body fat, in contexts of uncertainty and change, including among urban indigenous groups. Similarly the category of “popular Catholicism” that was first introduced by Liberation theologians in the aftermath of Vatican II has become a staple of anthropological writing about indigenous religion, allowing for a similar extension of the category of indigenous religion to encompass a broader array of ritual practices and beliefs that are more consonant with the actual experiences of modern indigenous people living in nation states.

An important inspiration for studies focused on subaltern or indigenous groups is the new work by historians such as Sabine MacCormack on the philosophical and theological origins of South American notions of idolatry, redemption, and the miracle and Kenneth Mills on the complex political and religious forces behind the sixteenth-century campaigns against indigenous “idolatry.” Through such works it becomes possible to appreciate the long route that has been traversed from early scholarly obsessions with locating a pure indigenous religion to the more historically grounded scholarship in which religious practices are at once seen as fully, even paradigmatically modern, without for that reason ceasing to be any less “indigenous.”

## SOUTH AMERICAN INDIANS

*This entry consists of the following articles:*

INDIANS OF THE ANDES IN THE PRE-INCA PERIOD  
 INDIANS OF THE COLONIAL ANDES  
 INDIANS OF THE MODERN ANDES  
 INDIANS OF THE NORTHWEST AMAZON  
 INDIANS OF THE CENTRAL AND EASTERN AMAZON  
 INDIANS OF THE GRAN CHACO

### SOUTH AMERICAN INDIANS: INDIANS OF THE ANDES IN THE PRE-INCA PERIOD

The Andean region is formed by the Andes mountain range, which extends the entire length of western South America. This region can be divided into three geographically contrasting subareas: the highlands, the coast, and the eastern cordillera. In the highlands the intermontane valleys lie at altitudes of between three and four thousand meters. These valleys were the places in which the Chavín (tenth to first centuries BCE), Tiahuanaco-Huari (eighth to tenth centuries CE), and Inca (fifteenth century CE) cultures flourished. In the region along the Pacific coast, composed mostly of low-lying desert plains, life was concentrated out of necessity in the valleys formed by the rivers that drain from the highlands into the ocean. The coastal valleys in the Peruvian sector of the Andes region were the cradles of cultures such as the Moche (second to eighth centuries CE), the Paracas-Nazca (second to eighth centuries CE), and the Chimú (twelfth to

fifteenth centuries CE), who devised colossal irrigation works that enabled them to bring extensive areas of desert under cultivation. The dramatic, abruptly changing topography of the eastern cordillera is covered by dense tropical vegetation. Peoples of the intermontane valleys entered this region and built the cities of Machu Picchu and Pajatén, and they terraced vast areas of the rugged, wooded hillsides to gain land for cultivation and to prevent erosion.

The sheltered agricultural cultures of the Andes have interrelated since ancient times. The areas where such cultures did not develop, although geographically "Andean," are not considered part of the Andean cultural region. The territory of the central Andes—basically equivalent to present-day Peru—became the center of the Andean cultural process. The northern Andes (parts of present-day Colombia and Ecuador) was the scene of the Quimbaya and Muisca (Chibcha) cultures and of the earlier Valdivia culture, which may have given the initial impulse to the entire high-Andean culture.

More than ten thousand years have passed since human beings first trod the Andes. The earliest settlers were hunters and Neolithic agriculturalists. By the third millennium BCE there appear incipient signs of complex cultures, such as that of Aldas on the northern coast of Peru, whose people built monumental temples. During the second and first millennia BCE, the appearance of Valdivia and Chavín represented the first flowering of developed culture, which set the foundation for the developments that eventually culminated in the Inca empire. By the time that Europeans arrived in the Americas, the Inca empire stretched for more than four thousand miles along the western part of South America, from southern Colombia in the north to Maule, in south central Chile, in the south. The empire passed into Spanish dominion in 1532, when Atahualpa, the thirteenth and last of the Inca sovereigns, was beheaded. From then on, the breakdown of indigenous Andean cultural values is apparent.

**SOURCES OF DOCUMENTATION.** Study of Andean religion rests on two principle sources: the reports of early chroniclers and the archaeological documentation that presents a visual record of Andean civilizations. A number of chronicles exist that were written in the sixteenth and seventeenth centuries by Indians, mestizos, and Spaniards (who based their accounts on the reports of native informants). There are also other reports—files relating to the prosecution of cases of "witchcraft"—that remain scattered in archives, mostly unedited. The detailed reports composed by the "eradicators of idolatries" are of special value. For the most part, the chroniclers' accounts are interwoven with evident prejudices of divers origin.

Even though the archaeological and iconographic evidence is scanty, it may be that the conclusions drawn from it are founded on a firmer basis than are those derived from chroniclers' reports. Naturally, study of iconography requires specific hermeneutic methods, especially when drawings are heavily loaded with symbols or are confusingly executed. Present-day Andean religious practices (especially in rural

areas), which in many cases represent survivals of the pre-Conquest Andean religious world, represent a third source of documentation.

**SUBSISTENCE AND RELIGION.** The peoples of the Andes are predisposed toward mysticism and ceremonial; even today, Andeans are steeped in an elaborate religious tradition. A significant part of their intense religiosity may be explained by ecological factors: No other agricultural society in the world has had to face a more hostile environment than that of the Andes region, with its vast areas of desert, its enormous wastes, and the heavy tropical vegetation that covers the mountains' rugged eastern flanks. All physical effort, all organization of human labor, and all technological solutions are insufficient to counter the environment, to whose ordinary harshness are added nature's frequent scourges, especially droughts. This endemic state of crisis could only be exorcised, it seems, through intense magico-religious practices; only through manipulation of supernatural powers have Andean peoples believed it possible to guarantee their existence.

The dramatic situation imposed by the environment perhaps explains why Andean religiosity appears to have been unencumbered by the moralizing of other religious traditions. Rules such as "Thou shalt not steal" and "Thou shalt not commit adultery" were of course enforced, but theft and adultery were considered social offenses: It was the duty of the administrators of state law to punish offenders. There was no concept of a future expiation. The relationship between religion and morality was closest in regard to behavior toward the deities; if their worship was not properly carried out, they were affronted, resulting in a series of calamities that could be checked through prayers, weeping, and sacrifices. The hostility of nature in the Andes led to a permanently febrile state of religiosity.

**GODS OF SUSTENANCE.** Andean deities jointly governed both individual and collective existence by providing sustenance. Soil fertility plays a significant role in Andean religion, as demonstrated by the profuse worship given to the deities that personified and controlled the forces of nature. The gods, though individualized, form a hieratic unit and share one focus: the economic state of the people. They are conceived in the image of nature, which simultaneously separates and conjoins the creative forces, masculine and feminine. Thus the first basic division appears in the opposition of Inti-Viracocha-Pachacámac and Quilla-Pachamama. Both of these deity-configurations are creative forces, but in accordance with the social order of the sexes, the supremacy of the former, masculine element is asserted. The powerful Illapa ("thunder, weather") is also integrated into the sphere of Inti-Viracocha-Pachacámac, but, above all his other functions, Illapa directly provides life-giving rain.

**Viracocha.** Glimpses of a culture hero on whom divine attributes have been superimposed can be seen in the figure of Viracocha, and therefore Pierre Duviols (1977) and María Rostworowski de Diez Canseco (1983) correctly deny him the character of a creator god. Because of these same divine

attributes, however, Viracocha was thought by the sixteenth-century Spaniards to resemble the God of Christianity, although Christian-Andean syncretism preserved some aspects of Viracocha's indigenous origin. Thus, according to the stories told about him, Viracocha molded humans in clay or sculpted them in stone. (They finally spring from the womb of Pachamama, "mother earth," which is sometimes represented as a cave.) On the other hand, stories about Viracocha also portray him as entering into confrontations with other divine beings and as engaged in other tasks ordinarily associated with culture heroes (for example, "teaching the created people"). Evidence of Viracocha's original character as a god of sustenance may be found in the prayer to him that was transcribed by the seventeenth-century chronicler Cristóbal de Molina, in which Viracocha is presumed to be based "in thunder and tempests." Franklin Pease (1973) assigns to him outright solar and fertility attributes.

**Pachacámac.** The myth of Pachacámac ("animator of the world") links this Andean deity even more strongly than Viracocha with the creation of the first generation of human beings. This deity is characterized, above all, as bringing to humankind the food necessary for survival as a result of the entreaties of a primordial woman, Mother Earth. The provision of edible plants is shown in other myths: In one of these, Pachacámac disguises himself, taking the form of the sun (in some instances, the son, the brother, or even the father of Pachacámac, according to the chronicler Francisco López de Gómara), who with his rays fertilizes the primordial woman, perhaps the incarnation of Pachamama. In another myth, Pachacámac kills what he has created, and this action may be interpreted as the institution of human sacrifice to nourish the food and fertility deities. When the victim is buried, his teeth sprout maize, his bones become manioc, and so on.

**Inti.** According to both the surviving mythic literature and the images discovered by archaeologists, the masculine creative force was incarnated in Inti, the sun. He offers heat and light, and his rays possess fertilizing powers, as is evident in the myth of Pachacámac. Mythic literature testifies to the Andeans' reliance on the power of the sun and to their anxiety that he may disappear, causing cataclysm and the destruction of humankind (an event that would be followed by the creation of a new generation of humans). This anxiety explains the redoubled prayers and supplications during solar eclipses—rituals that ended with loud cries and lamentations (even domestic animals were whipped to make them howl!). Archaeological evidence of another form of magico-religious defense against this premonition of the tragic disappearance of the sun is found in stone altars called *intihuatanas*, a word revealingly translated as "the place where the sun is tied." Inti was also associated with fertility through water, as when the sun ceases to give light, yielding to clouds and rain (which would seem a contradiction were it not for the fact that the thunder and weather god Illapa was conjoined with the sun). In visual representations, particularly those at Chavín and Tiahuanaco, Inti appears with big teardrops that surely sym-

bolize rain. Gold was the symbol par excellence of the sun, and the robes of head shamans were covered with oscillating metal disks that reflected the sun's rays and imitated its radiance.

**Pachamama-Quilla.** Pachamama ("mother earth") symbolized the feminine element of divinity for the Andeans. Pachamama is incarnated as the primordial mother of mythic literature, and she is personified as Quilla, the moon. In this connection she is symbolized by silver; with this metal many representations of Pachamama were made, especially in the form of the half-moon (called *tumi*), which was one of the most important religious symbols of the Andes. The cult of Pachamama was, and still is, extensive (Mariscotti de Görlitz, 1978). Pachamama was held to be the producer of food, animals, and the first human. As primordial mother, she creates through the fertilizing action of the Sun, and she later becomes co-donor of food plants, especially maize.

The mythological literature tells of several female supernatural beings. These are likely regional versions of Pachamama. Among them are Chaupiñanca, the primordial mother of Huarochirí mythology; Illa, who appears in the mythic traditions of the Ecuadorian Andes; and Urpihuáchac, sister and wife of Pachacámac, who seems to be an expression of Cochamama, the marine form of Pachamama. To Cochamama is attributed the creation of fish and of seabirds such as the guanay, which latter act is in turn related to agricultural productivity because of the use of guano to fertilize crops.

Ancient documents show that Pachamama was individualized *ad infinitum* to guarantee the abundance of specific produce—maize, for example. Andean iconography offers representations of Pachamama incarnated in specific vegetable forms: multiple ears of maize, for instance, or groups of potatoes. In other instances these agricultural products metaphorically acquire human aspects, and they are also portrayed as being fertilized by a supernatural, anthropomorphic personage. Pachamama in her Cochamama aspect also appears to symbolize the presence of abundant water—essential for fertilizing the agricultural fields.

The symbolism of Pachamama has implications regarding the social status of women: As compared with the male element of divinity, Pachamama, the female, is clearly a passive and subaltern being. Her dependence on the male is established in the mythological literature. She uses her feminine attributes to win from the male gods favors, such as irrigation canals, that are beneficial to the collectivity. Pachamama also enshrines the modesty and passivity in sexual matters that characterizes the Andean woman to this day. The attitude of sexual modesty is to be seen in the many representations that appear to show versions of Pachamama, from the archaic terracotta figures of Valdivia to those of the late Chancay civilization of the central coast of Peru. In all these, sexual characteristics are not pronounced: The figures seem to represent almost asexual beings, and they remind one of the existence of non-Christian sexual taboos (see Kauffmann Doig, 1979a). Not only do these figures rarely

stress sexual characteristics, but, curiously, they seldom portray pregnant women or women giving birth. Perhaps the anthropomorphic figures with birdlike attributes that appear on the walls of Pajatén—which figures are shown in crouching positions with spread legs—are in fact female procreators (Kauffmann Doig, 1983, p. 531). Except for the cases of sexual representations from Vicus and, especially, in Moche art (both from the northern coast of Peru), images of women found throughout the Andean culture region seem to underscore that female sexuality was marked by modesty.

Pachamama continues to play an important role in the deeply rooted peasant magic of today's Andean people. She is even venerated in Christian churches. In the Peruvian village of Huaylas, for example, Saramama (a version of Pachamama) is venerated in the form of two female saints who are joined in a single sculpture—like Siamese twins—to give visual representation to a pathetic fallacy: the symbolization of abundance that is identified in the double or multiple ears of grain that maize plants often generously produce.

**Illapa.** The deity Illapa (generally translated as "thunder," "lightning," or "weather") occupies a preferential place in the Andean pantheon. Much of the mythological literature makes reference to Illapa, who takes on regional names and is expressed in varying forms: Yaro, Ñamoc, Libiac, Catequil, Pariacaca, Thunapa (possibly), and so on. To refer to these beings as if they were separate would be artificially to crowd the Andean pantheon by creating too great a number of distinct deities—a trap into which many interpreters, both early and recent, have fallen. Illapa may be seen as the incarnation of Inti, the sun, in Illapa's primary mythic form of a hawk or eagle (*indi* means "bird" in Quechua), a form to which were added human and feline attributes; thus Inti-Illapa may be said to be a true binomial in the Andean pantheon.

Associated with meteorological phenomena such as thunder, lightning, clouds, and rainbows, Illapa personifies rain, the element that fecundates the earth. As the direct source of sustenance—giving rains to the highlands and rivers and rich alluvial soils to the coastal valleys—Illapa is revered in a special and universal way. Yet he is also feared: for the crash of his thunder, for lightning that kills, for catastrophic hailstorms, severe floods, and even perhaps earthquakes. The worst of his scourges is drought. Proof of Illapa's prestige is the major temple to him (individualized as the ruler of atmospheric phenomena) that stood in Cuzco, the Inca capital; according to the plan of Cuzco drawn by Guamán Poma and the description written by Molina, Illapa's temple was rivalled only by the Coricancha, the temple of the sun.

After the Conquest, Andeans fused Illapa with images of James the Apostle, a syncretism perhaps suggested by earlier Spanish traditions. In the realm of folklore, Illapa's cult may be said still to flourish in the veneration of hills and high mountains, which are the nesting places of the *huamani* (falcons) sacred to this deity. Also associated with Illapa are the

*apus*, the spirits of the mountains, and the spirits of the lakes, which, if they are not worshiped, make the waves rise destructively, and which are offended if approached by someone not protected by the sacred coca leaf.

When he appears as an incarnation of, or as joined to, Inti, Illapa may be represented by a male feline with human and avian attributes. According to iconographic studies, Illapa's image as the "flying feline," or "tiger bird" (Kauffmann Doig, 1967; 1983, p. 225) is still current in the Andes, as witnessed in the oral documentation collected by Bernard Mishkin (1963) regarding Qoa, a god who is ruler of meteorological phenomena. Qoa still appears as a flying cat, his eyes throwing out lightning and his urine transformed into fertilizing rain. Pictorial representations of the "tiger bird," which have been made since the formative period, especially in Chavín and allied art (see below) have recently been related to Qoa by Johan Reinhard (1985, pp. 19–20).

**ANDEAN ICONOGRAPHY.** Iconographic portrayal of supernatural beings is abundant and dates back more than three thousand years. In iconographic representations, supernatural beings are configured in complex ways; their hierarchal aspects are emphasized, and some achieve the status of gods. Supernatural beings other than gods are the figures represented in Sechín and in some Chavín art. Beings with the rank of gods are found in Chavín and related cultures—Vicús, Moche, Paracas-Nazca, Tiahuanaco, Huari, and others (especially Lambayeque).

Mythological literature indicates that those male beings who fertilize Mother Earth form the topmost division of the hierarchy of the Andean pantheon, which, again, is made up of deities of sustenance. One of the most obvious expressions of the Andean gods' character as providers is the anthropomorphic wooden figure of Huari style adorned with symbols referring to basic food products that was found in the temples of Pachacámac near Lima.

The image of a conspicuously superior being is found in the initial stages of high Andean civilization (especially in Chavín and related cultures). This image, typically a human form with feline and raptorial-bird attributes, is repeated in practically all the Andean cultures that succeeded Chavín, with variations of secondary importance. At Chavín, such hierarchal figures of the highest order appear on the Raimondi Stela; although lacking human elements, the figures on the Tello Obelisk and the Yauya Stela, both Chavín in style, may also be considered as representations of the highest level of being, because of their monumental stature and fine execution. The central figure of the Door of the Sun at Tiahuanaco is an almost anthropomorphic representation of the highest-ranking god. Attributes of a culture hero are perhaps also incorporated here.

A frequently encountered image of what was perhaps the same god as the one described above (but represented in a clearer and more accessible form) is that of a hybrid being that also had a form somewhere between a feline and a bird

of prey (a falcon?), represented naturalistically, in which elements of human anatomy are sometimes completely absent. This "winged feline" may be the most ancient and authentic representation known to us of an Andean god. The convoluted, baroque style of Chavín art is responsible for the fact the the "winged feline" has sometimes been identified as a caiman and sometimes as a lobster, a shrimp, or even a spider. These animals, however, do not appear in relation to the divine sphere at any later stage of Andean culture.

Supernatural beings of the highest category are to be found in representations of the culture-heroes/gods Ai-apaec and Naymlap and of the gods at Tiahuanaco and Paracas-Nazca. All are anthropomorphic beings that combine traits of both bird and feline; in this context they imply an evolutionary development of the older "winged feline" of Chavín. In the archetypical versions of Ai-apaec, the figure bears wings (Kauffmann Doig, 1976; 1983, pp. 362, 624). At Paracas-Nazca, one figure seems to represent an evolution from a purely birdlike body into one that incorporates human elements (Kauffmann Doig, 1983, pp. 303, 325, 331–332). Feline and ornithomorphic ingredients are evident in the large figures at Tiahuanaco and Huari; from their eyes fall large tears in the form of birds, which, since Eugenio Yacovleff (1932) and even before, have been interpreted as symbolic of the fertilizing rainwater of Pachamama (Mama-pacha).

Connubial gods in which the male element radiates fertilizing solar rays are found especially in the iconography derived from Huari and, more particularly, in the valleys of Huara, Pativilca, and Casma on the coast of Peru (Kauffmann Doig, 1979a, pp. 6, 60). The examples of Inca art that have survived have but scant votive content. But both the feline and the falcon continue to occupy their place of honor among iconographic elements, as may be seen in the "heraldic shield" of the Inca rulers drawn by Guaman Poma.

**FORMS OF WORSHIP.** Through acts of worship, the sphere of the sacred could be manipulated to benefit humankind. The effectiveness of human intervention into the realm of the supernatural powers depended on the intensity with which the rites were performed. In the Andean world, where natural factors put agricultural production and even existence itself to a constant test, worship assumed an extraordinary intensity and richness of form. The calamities that endangered personal and collective welfare were believed to have been caused by offenses to supernatural beings and especially to a lack of intensity in worship. Offerings to the gods of sustenance and to other supernatural beings related to them complemented the cultic display. Cruel sacrifices were necessary to worship's efficacy; in times of crisis they were performed lavishly and included human sacrifices.

The diversity of forms of worship in this region was due in part to the variety of forms of divine or magical conditions that these people perceived. These conditions were in general denoted by the term *huaca*, which can be translated as "holy." *Huaca* could refer to various unusual geographical

features (including special stones, hills, lakes, etc.), heavenly bodies, atmospheric phenomena, mummies, amulets, idols, and even the Inca (i.e., the ruler) himself in his capacity as a living god.

The popular form of communication with *huaca* (i.e. the entire supernatural world) was effected through the *muchay* ("worship, reverence"). *Muchay* was performed by removing one's sandals, gesticulating, throwing kisses, murmuring supplications, bowing one's shoulders in humility, puffing out one's cheeks to blow in the direction of the object worshiped, and so on. Other forms of contact with supernatural beings were made through oracles, whose traditions go back to early forms of Andean cultures, such as the Chavín. Oracles were represented in the form of idols located in sanctuaries such as the famous one of Pachacámac, near Lima; these oracles rendered predictions about important future events to shamans and priests.

To make an offering was an act of paying tribute. Offerings were made voluntarily, but they were also collected in the form of compulsory tribute, the administration of which was centralized in temples. A widespread, popular offering was *mullo*, a powder made of ground seashells, which by association was linked to fertility through water; another was coca (*Erythroxylon coca*) in the form of a masticated wad. Stone cairns in the high passes were places of worship; wads of coca would be thrown in a ritual act called *Togana*. The mummified dead were offered special jars containing grains, fruits, and liquids. Guinea pigs and llamas served as important sacrificial offerings.

Among sacrifices, that of young boys and girls was the most important; sometimes human sacrifice was performed by walling up a living female person. It appears that among the Inca the sacrifice of boys and girls was received as a form of tribute, called the *capaccocha*, from the provinces. The person who was to serve as the *capaccocha* was delivered to the capital city of Cuzco in great pomp; after his death, his remains were returned to his homeland and mummified; the mummy acquired votive rank and was the object of supplications for health and agricultural welfare. Necropompa (Span., "death rite") was a special type of human sacrifice that consisted of immolations (voluntary or not) that were performed on the occasion of the death of an illustrious person (Araníbar, 1961). Decapitation of human sacrificial victims had been performed since ancient times: The Sechín stone sculpture of northern Peru depicting this practice is over three thousand years old. Head shrinking was rare and there is no evidence of cannibalism in the Andean region. (Though in the myths there are a number of supernatural beings, such as Carhuincho, Carhuallo, and Achké, who are anthropophagous.) Human sacrifice, performed to achieve greater agricultural fertility, drew its rationale from the principle that the Andeans believed governed nature: Death engenders life.

The dead, mummified and revered, were expected to implore the supernatural powers for sustenance, soil fertility,

abundant water, and the multiplication of domestic animals. Often bodies were buried in the cultivated fields in order to enrich them. As has recently been reported from Ayacucho, Peru, this practice survives in secret, isolated cases even to the present day: A mentally ill person is selected, intoxicated with liquor, thrown into a pit, and buried alive. Such "strengthening" rites were, according to sixteenth-century chroniclers, also practiced in laying the foundations of houses and bridges, and traces of these rites also have been recently reported from the central Andes.

Funeral rites included expressions of grief such as loud sobbing intermingled with chants in praise of the deceased; a practice that also survives in isolated areas of the Andes. The dead were mummified and taken to their tombs on stretchers. Peoples of the arid coast practiced earth burial, but in the highlands mummies were placed—singly or in groups—in *puccullos*, or *chullupas* (mausoleums that were built on almost inaccessible outcrops of rock). Individual or collective tombs were also hollowed out of extremely steep mountainsides. With few exceptions (e.g., among the Moche), bodies were buried in seated positions. Frequently the hands held the head, perhaps to simulate the fetal position. These "living" corpses were surrounded with food and drink, weapons, and other belongings meant to serve as provisions in the hereafter; some were buried with their mouths open, both to express the terror of sacrifice and to voice supplications to the gods for success in agriculture.

Religious festivals were celebrated continuously in the great plazas of Cuzco and at temples such as the Coricancha, the temple of the sun. Festivals dedicated to specific themes, especially in the context of food production, were held monthly with great pomp; the sovereign Inca presided, and guests were invited at his expense. Great quantities of *chicha* (maize beer) were consumed, drunk from ceremonial wooden vessels (*queros*).

Andeans have made pilgrimages since the remote times of Chavín, and one of the favorite *huacas*, or shrines, was the sanctuary of Pachacámac. "Natural" shrines such as those on the peaks of high mountains were also popular with pilgrims. The Collur Riti festival, a celebration that coincides with the Feast of Corpus Christi, follows ancient rites in which to this day people climb to heights of almost five thousand meters. Some of the pilgrims dress as "bear men," imitating the gestures of animals and speaking in animal-like voices; they act as intermediaries between other pilgrims and supernatural beings. Originally, the Collur Riti was dedicated to water, and even today pilgrims return to their homes with pieces of ice carved from the mountain glaciers, symbolizing the fertility imparted by water. In the past, pilgrims fasted for variable periods of time, abstaining from maize beer, *aji* (*Capsicum anuum*), and sexual intercourse.

**MEDICINE AND MAGIC.** Shamans use maracas in their healing rites, a practice carried on into the present by Andean *curanderos* (Span., "healers"). The *curanderos* also use hallucinogenic substances to cause them to enter the trance state.

The San Pedro cactus (*Trichocereus pabhanoi*) is a powerful hallucinogen used particularly on the Peruvian coast; it gives the *curandero* the ability to discover the cause of an illness. In the highlands the diagnosis is still made by rubbing the body of a sick person with a guinea pig or with substances such as maize powder. The cure was effected through the use of medicinal plants. Today, *curanderos* complement their ancient remedies with modern pharmaceutical products.

Divination was often performed under the influence of hallucinogens or coca. Several studies, among them those of Alana Cordy-Collins (1977) and Ralph Cané (1985) speculate that the intricate art of Chavín originated in hallucinogenic experiences.

Institutionalized worship gave rise to a rich range of folk magic. Thus, for example, there were magic love-stones (*guacangui*). Small stone sculptures of domestic animals, used to propitiate the spirits of abundance, are still produced. Ceramic figures representing vigorous bulls (*toritos de Pucará*) are still placed on rooftops, where they signify prosperity and fertility and offer magical protection of the home.

**MESSIANISM.** Andean mysticism and ritual experienced a vigorous rejuvenescence some thirty years after the Spanish conquest in the form of the nativistic movement called Taqui Oncoy (see Duviols, 1977; Millones, 1964; Ossio, 1973; Curatola, 1977; Urbano, 1981). The aims of this sixteenth-century messianic movement were to drive the white invaders from the land and to reinstate the structures of the lost Inca past. The movement's power was based on the worship of *huacas*, the popular form of Andean religiosity after the Sun had lost its credibility with the defeat inflicted by the Christian God. By a kind of magic purification, Taqui Oncoy sought to free the land from European intrusion after it was no longer possible to do so by force of arms. The movement's adherents believed that, with intensified supplications and increased offerings, the *huacas* could become powerful enough to help reestablish the old order. This movement declined after ten years, but the hope of a return to the Inca past is still alive, although it is confined more and more to middle-class intellectual circles in Peru and Bolivia.

The messianic myth of Inkarrí (from Span., *Inca rey*, "Inca king") should also be mentioned here. Originally recorded by José María Arguedas (1956), the myth centers on a figure, Inkarrí, who is the son of the Sun and a "wild woman." According to Nathan Wachtel (1977), this archetypal "vision of a conquered people," although of native extraction, seems to be immersed in syncretism. The cult of Inkarrí lacks the action that characterized the Taqui Oncoy movement. Inkarrí is not an Andean god but rather a pale memory of the deified sovereign of ancient times, who after patient waiting will rise to life to vindicate the Andean world.

### SOUTH AMERICAN INDIANS: INDIANS OF THE COLONIAL ANDES

A number of promising points of entry beckon the student of emerging religious systems among people of indigenous descent in the colonial Andes. These beginnings include transformations within native ritual specialists' repertoires, customs surrounding death and the dead, and the expansion of elemental Catholic Christian catechization within families (and of sacramental life in general). But no feature of colonial religiosity was more vital and dynamic than the emergence of the cult of the saints as reconfigured and understood by native Andeans. The acceptance of images of Christ, the Virgin, and the other saints into the Andean religious imagination in colonial times challenges us to understand why and how new understandings emerged and developed. The ca-

capacity for mobility, inclusion, and reimagination inherent in beliefs and practices surrounding images of Christ and the saints offers up colonial Indian religion's central trunk and an analytical space from which other branches of colonial religiosity and culture can be productively studied.

Consider, first, an Andean system of meaning that appears to have encouraged native reception and understandings of Christian images: beliefs surrounding, and the interrelationships between, Andean divinities known as *huacas* (material things that manifested the power of ancestral personalities, cultural founders, and also wider sacred phenomena [Mills, 1997, chap. 2; Salomon, 1991]). There is no escaping the fact that one reads postconquest reflections upon these older phenomena, and that, as with much about the Andean past, any process of learning involves an appreciation of the needs of authors in a series of colonial presents (Graubart, 2000; Julien, 2000). Yet the fact that most understandings of *huacas* became "hybridic"—that is to say, authentically native Andean *and* influenced, to one degree or another, by the thought worlds and vocabularies of Spanish Catholic Christianity—is integral to the colonial processes and realities to be explored here. As will become abundantly clear, ideas about *huacas* and saints were soon shared not only among Spanish and Hispanicized Andean commentators, but among native devotees around sacred images. Two originally disparate systems ceased only to repeat themselves and were instead finding shared territories and conjoining to generate new understandings and religious forms (Sahlins, 1985). It is a case in which even the exceptions suggest the rule. By midcolonial times in the Andes, steadfast native opponents of the growing presence of Christian images in the hearts and minds of Indian commoners tellingly incorporated within their rejections and counterteachings the very characterizations employed against their *huacas* (Mills, 1994, pp. 106–107, *passim*; Cummins, 2002, pp. 159–160).

And one can turn, finally, to the ways in which key Christian personalities such as Christ, the Virgin Mary, and other saints were brought inside Andean imaginations and societies in colonial times. Space does not allow the concrete exemplification required, but by sampling colonial Andean transformations, a key to understanding religious change appears. It lies in doing two things simultaneously: appreciating the novelty and seriousness of the early modern Catholic project, namely total and obligatory Christianization, in the Andes as elsewhere in Spanish America; and allowing the many consequences of this enterprise of "spiritual conquest" to slip the noose of official intentions, expectations, and prescriptions. My explorations build upon what has already been proposed by others and myself about the contest and compatibility of Andean ways with aspects of Catholic Christianity; selectively, and in somewhat chronological order, these include Kubler (1946), Millones (1969, 1979), Duviols (1971, 1977), Marzal (1977, 1983] 1988), Barnadas (1987), Sallnow (1987), Platt (1987); MacCormack (1991), Dean (1996, 2002); Mills (1997, 1994, 2003), Salles-Reese

(1997), Saignes (1999), Cussen (1999), Cummins (2002), Gose (2003), and Estenssoro Fuchs (2003, 1996).

Evidence for the convergence between what one can surmise about an Andean *huaca* complex of beliefs and practices and those of the Catholic cult of the saints is compelling, especially in accounting for early transformations. But such convergences are not confining, as if pre-Hispanic understandings of *huacas* had to dictate an entire colonial aftermath of belief and action. What stands out, rather, is the unremitting dynamism of that which came to converge, a thrilling capacity for localized adaptation and translocal reproduction shown both by *huacas* (Urton, 1990; Taylor, 1987; Salomon and Urioste, eds., 1991) and by Christian images in the hands and minds of native Andean people. Saints, like *huacas*, were many and various, and they were reproducible in ways that defy simple notions of how copies and peripheries relate to originals and centers. Evidence of the often unofficial and overlapping diffusion of saintly cults and their devotional communities turns up everywhere and in ways that ought to revise not only elderly presentations of a “spiritual conquest of Indians” but also the most unidimensional portrayals of indigenous cultural agency and resistance. This brief entry emphasizes colonial Indians’ complex motivations and continuing kinds of receptivity to ideas and practices that, whether sparked by non-Indian mobilizers or not, often became operative in shared and transforming colonial terms.

**A PROLIFIC PAST IS PERCEIVED.** An exploration of the ways in which the originally foreign power of saints was brought within and became vital parts of a colonial Andean cultural and religious system begins with conquest-era perceptions. One of the first in a series of perceptions glides past the Andean phenomena whose divine personalities and webs of relations would guide early indigenous understandings of Catholic Christian saints.

When Hernando Pizarro and other members of his advance raiding party wrote about their time in the coastal valleys of Peru just south of what became the Spanish capital of Lima in January 1533, theirs were among the first European minds with an opportunity to engage with fundamental native Andean religious forms and meanings.

Their encounter with Pachacámac, a venerable divine force of pan-Andean proportions, reveals Spanish instincts in the period immediately after the seizure of the Inca Atahualpa in Cajamarca. Despite learning from Andean informants and from one of Pachacámac’s attendants of the divinity’s long oracular tradition, and of an awesome world-making and world-shaking might that had been taken carefully into account by the Incas, Pizarro and his companions were otherwise concerned. Accumulated offerings of gold and silver to Pachacámac caught their attention. They admired, too, the jewels, crystals, and corals bedecking a door at the very top of the pyramid structure.

Pachacámac himself struck the treasure seekers both as hideous and as a sad indication of the native people’s gullibil-

ity. In crossing over the final threshold at the top of the pyramid, the Spaniards faced what their Judeo-Christian tradition and experience had fully prepared them to identify as an “idol.” Here was a male figure carved at the top of a wooden pole. It took no effort and less theology to perceive Pachacámac as Miguel de Estete did, as a thing beneath contempt, a vile material form crafted by human hands and pilfering the adoration human beings ought to reserve only for the Christian God. The precious offerings, reportedly piled around the figure and adorning the site, showed only how much Andean peoples had been hoodwinked by an active devil who “appeared to those priests and spoke with them,” conspiring to siphon “tribute” from up and down the entire coast and demanding a respect that in Incan times was rivaled only by the Temple of the Sun in Lake Titicaca (Pizarro, [1533] 1920; Estete, [c. 1535] 1924). It mattered particularly to establish whether the famous voice and oracular utterings of Pachacámac were the handiwork of the devil speaking through him or, as Hernando Pizarro sought to prove through interrogation of an Indian minister, artifice worked by the false god’s attendants.

It was not long, however, before Pachacámac gave pause to different minds. Pedro de Cieza de León, who blended his own observations and inquiries with information about the coastal region gained from the Dominican Domingo de Santo Tomás, among others, can represent an uneasy transition. While still content to label his subject the “devil Pachacámac” and fascinated by tales of the vast quantities of gold and silver the “notables and priests” of Pachacámac were said to have spirited away in advance of Hernando Pizarro’s arrival, Cieza also pushed harder and uncovered more (Cieza de León, [1553] 1995, pp. 214–215). His closer examinations and those of others beginning in the 1540s and 1550s began to reveal the *huacas*’ multifaceted natures and interrelationships with other divine figures.

Pachacámac’s divine personality offers one of the more majestic but still broadly illustrative cases in point. While consistently described across coastal and Andean regions as a predominant creative force “who gives being to the earth” (Castro and Ortega Morejón, [1558] 1938, p. 246; Santillán, [1563] 1968, p. 111b; MacCormack 1991, pp. 351–352, 154–159), he coexisted with other divine figures. The other *huacas*, too, were sometimes creative founders, oracular voices, and otherwise translocally significant. In some cases, sacred oral histories recounted these ancestral beings’ origins, featured their contributions to local and regional civilization, in many cases told of their lithomorphosis into the regional landscape, and, importantly, explained their interrelationships and coexistence with other divine beings. Explanations of the natural environment and entire histories of interaction between human groups were encapsulated within the durably fluid form of the *huacas*’ narratives, which themselves were remembered by ritual tellers, singers, and dancers (Salomon, 1991).

In Pachacámac’s midst, Dominican friars from the convent at Chíncha in the 1540s and 1550s learned much about

one of these other regional ancestors and “creators,” a divine figure named Chinchaycama. He was revered by the Yunga people at a certain rock from which the divinity was said to have emerged. And Chinchaycama had hardly been the only *huaca* of the Yunga. He was, rather, one of a number “who responded” to the requests and entreaties of his people. According to what the Dominicans learned and could express about this set of relationships, the Yunga made choices and assigned precedence according to their own changing requirements (including economic and environmental stress, and also political necessity). They effectively moved between *huacas* “who responded” and “this not always but only when they had need of them.” This apparently selective horizontality did not much impress Spanish commentators, and it has struck at least one modern historian as an approach that treated “matters of religion somewhat casually” (Castro and Ortega Morejón, [1558] 1938; MacCormack, 1991, p. 155).

In fact, such glimpses of Chinchaycama’s place within a broader picture, and of Yunga attitudes towards their *huacas*, suggest fundamental Andean religious notions. When the Incas entered this coastal region in force, with settlers from other zones, they built a shrine to their principal divinity the Sun and impressed upon others the importance of this divinity’s attributes and consecration of themselves as his children. But Inca expansionism tended to incorporate rather than erase existing cults, effectively smoothing over necessary conflict and injecting themselves into longer regional mythohistoric trajectories. Cieza found that the cult of Chinchaycama continued for the natives of Chíncha, operating alongside those of other divinities, including those favored by the arriving Incas (Cieza de León, [1553] 1995, p. 220). Later fragments of learning, while steadily reflecting more Cuzco-centered understandings of the historical and spiritual interrelationships between Andean divinities and the Sun, point in similar directions. Plastic and practical relationships between divine beings and between *huacas* and their peoples marked something of a ruling principle.

One such multiply informative bit of colonial learning was produced by the lawyer Hernando de Santillán amid a 1563 response to a royal *cédula* inquiring about Inca taxation. Along his purposeful way, Santillán rendered an oral tradition about Topa Inca Yupanqui on the eve of Inca expansion into the coastal valleys of the Yunga. While Mama Ocllo was pregnant with the child who would become Topa Inca, his voice was said to have issued from within her belly to inform her that a great “creator of the earth” lived on the coast, in the “Irma valley” (today the valley of Lurín, south of Lima). When Topa Inca was older, his mother told him of the experience, and he set out to find this creator. His wanderings led him to the sacred place of Pachacámac. Once in the presence of the great *huaca*, the story stresses, the Inca’s gestures were those of a respectful supplicant, for he spent “many days in prayer and fasting.”

After forty days, Pachacámac was said to have broken the silence, speaking from a stone. He confirmed that he was

the “maker of the earth” whom Topa Inca sought. Yet Pachacámac also explained that he was not alone as this kind of force. He explained that while he had made (literally “given being”) to all things “down here,” that is to say on the coast; the Sun, who “was his brother,” had performed the same creative function “up there,” in the highlands. Delighted to hear that such an understanding had been struck, the Inca and his traveling companions sacrificed llamas and fine clothing in honor of Pachacámac. Their tone, according to Santillán’s report, continued as gratitude, “thanking him [Pachacámac] for the favour he had bestowed.” The Inca even asked Pachacámac if there was anything else he particularly desired. The great coastal divinity replied that since he had a “wife and children,” the Inca should build him a house. Topa Inca promptly had a “large and sumptuous” house for the *huaca* constructed. But the gifting in the interests of his progeny had only begun. Pachacámac also spoke of his “four children.” They, too, would require houses, shrines. One was in the valley of Mala just to the south, another in Chíncha, and there was a third in the highlands, in Andahuaylas near Cuzco. A fourth child of Pachacámac was conveniently portable and would be given to Topa Inca for his safekeeping while he traveled about so that he could “receive responses to that for which he asked” (Santillán, [1563] 1968, p. 111; Rostworowski, 1992; Patterson, 1985).

Santillán’s story merits both caution and close attention. Notably, privilege is granted to an Incan point of view, and to the origin of relatively recent Incan constructions at an oracular cultic center that was over half a millennium old. One is being treated to an explanatory narrative of political and religious incorporation in the interest of Incan overlordship. Scholars from a variety of disciplines have added different perspectives to show this kind of action to have been representative of how the Incas adopted certain oracular *huacas* in accordance to their need for effective regional influence and advice (Patterson, 1985; Gose, 1996; Topic et al., 2002). Yet there is a simultaneous demonstration here of the corresponding benefits of Inca sponsorship for Pachacámac and his cult: alliance and support were the surest ways to ensure that Pachacámac’s “children,” or new expressions, would spread across the land. In Pachacámac’s case, one such expression needs no place and is to be carried about by the traveling Inca, ready to be consulted if the ruler should require a response.

The story invites us to contemplate what Andean *huacas* were and how they related to one another (Julien, 1998, esp. pp. 64–65). The matter of just how *huacas*’ multiple personae, diffusions, and relationships with other divine figures might remain operative in colonial times—in cases where *huacas* endure and especially where Christian personalities enter the picture—must simply hover about us for the moment. Pachacámac’s power continued to spread well beyond the regional landscape in which he was revered as a founder and creator because of developing relationships of cultic interdependence and his ability to replicate himself across time

and space. Evidence of this prolific quality struck and clearly troubled Hernando de Santillán. He explained it to himself and his imagined readership in the following way: “The Devil, who speaks through them [the *huacas*], makes them believe that they [the *huacas*] have children,” Santillán wrote. “And thus,” he continued,

they [native Andeans] built new houses for them, conceived of new forms of worship to the *huacas* from whom they believed themselves descended, and understood them all to be gods. Some they worshipped as men, others as women, and they assigned devotions to each one according to a kind of need: they went to some in order to make it rain, to others so that their crops would grow and mature, and to [still] others to ensure that women could become pregnant; and so it went for all other things. What happened with so much multiplication is that soon almost every thing had its *huaca*. And through the *huacas* the Devil had them [the Indians] so thoroughly deceived that herein lies the chief obstacle in that land to lodging the faith firmly among native peoples . . . to make them understand the deception and vanity of it all [reverence for these *huacas*]. (Santillán, [1563] 1968, pp. 111–112)

Other Spanish commentators reported similarly upon the Andean *huacas*' ability to enjoy multiple selves, propagate beyond original territories, take over new specializations, and win local loyalties by making themselves indispensable. Santillán himself noted the findings of his contemporary and fellow lawyer Juan Polo de Ondegardo, who claimed in 1561 to know of more than four hundred temples [*adoratorios*] within one and a half leagues of Cuzco at which offerings were actively made (Santillán, [1563] 1968, p. 112 and n. 1). Expressions of alarm were often followed by attributions of diabolic authorship seen in Santillán's account. More than a decade later, for instance, the Jesuit José de Acosta claimed to have received a priest's report in Chuquisaca (today Sucre, Bolivia) about a *huaca* named Tangatanga, whom that region's Indians believed represented three divine identities in one and one in three, like the Christian holy Trinity. “When the priest shared his astonishment at this,” Acosta wrote,

I believe I told him that the Devil always stole as much he could from the Truth to fuel his lies and deceits, and that he did so with that infernal and obstinate pride with which he always yearns to be like God (Acosta, [1590] 1962, p. 268).

Writing almost two decades later, El Inca Garcilaso de la Vega went to some trouble to point out the fragility of the evidence upon which Acosta relied. But what stands out instead is his conviction that this understanding of an Andean divinity was a “new invention” of the Indians of Chuquisaca in colonial times, “constructed after they had heard of the Trinity and of the unity of Our Lord God” (Garcilaso de la Vega, [1609] 1985, p. 54). While Garcilaso disapproves of what he depicts as a blatant effort to impress Spaniards and gain from a supposed resemblance, he raises the distinct possibility that such colonial “inventions” were commonplace among native Andeans, and without the cunning he implies.

Quite convinced of the devil's wiles, but much closer to the ground of an early colonial local religiosity than either Acosta or Garcilaso, were the Augustinian friars stationed in Huamachuco in the northern Andes in the 1550s. They met and attempted to destroy a number of provincial *huacas* in what had clearly been a bustling pre-Hispanic religious landscape but found themselves particularly embedded within the realm of a divinity named Catequil. As with Pachacámac on the central coast, the oracular fame of Catequil had been fanned by close association with the Inca dynasty and, in his case, with Huayna Capac. Despite the fact that this Inca's son, Atahualpa, had turned against this *huaca* after unfavorable news and attempted his destruction, Catequil's essence in a large hill and high rocky cliffs proved impossible to extinguish. Because the children or expressions of Catequil had already begun to spread, sometimes with resettled people and as part of Incan political policy in the time of Huayna Capac, he had other ways to endure (Topic et al., 2002, p. 326). What is more, his pattern of cultic diffusion appears only to have continued as Catequil's tangible “pieces,” or children, were spread by mobilizing devotees. A perplexed Fray Juan de San Pedro, writing on behalf of the divinity's newest enemies, the Augustinians, claimed to have discovered some three hundred of Catequil's “sons” arrayed through various towns and smaller settlements in the region. Most were particularly beautiful stones that seemed easy enough to confiscate and grind into dust, but in other ways Catequil seemed to be everywhere at once. San Pedro believed that this multiplication of “idols” had continued “after the arrival of the Spaniards in the land” (San Pedro, [1560] 1992, pp. 179–180).

As the words of these post-Pizarran commentators acknowledged, in one way or another *huacas*' cults were various and overlapping. While one divine being might remain rooted in a precise physical landscape and connected to a certain association and responsibility (often as a founding ancestor), others developed multiple roles and personalities that allowed them to transcend local beginnings and associations. In the cases of Pachacámac and Catequil, translocal significance and power were augmented by their association with members of the Inca line. Yet as the unparalleled narrative evidence collected in the late sixteenth- and early seventeenth-century province of Huarochirí would prove in the case of the cult of Pariacaca, not every important regional *huaca* with multiple identities and a vibrant supporting cast of mythohistoric “relatives” who had been important in the times of Tawantinsuyu was so actively promoted by the Incas (Taylor, ed., 1987; Salomon and Urioste, eds., 1991). In fact, Pariacaca can stand as a most famous representative for legions of other *huacas* not only in his region but across the Andes. While regionally powerful, these ancestral divinities were not so completely adopted (or rejected) by the Incas. Their intricate regional networks and transforming roles and significance for indigenous people continued deep into colonial times, especially in rural areas, where they were investigated and harassed sporadically by inspectors of native Ande-

an religious error through the seventeenth and early eighteenth centuries (Mills, 1994; Mills, 1997).

Spanish churchmen who were commissioned as inspectors of “idolatry” in the seventeenth- and early eighteenth-century archdiocese of Lima sometimes found precisely what an earlier Santillán or Acosta might have guessed they would find among so persistently credulous a people. They found the latest, elastic work of the devil. Did it ever seem too easy to these inspectors when Indian witnesses who appeared before them sometimes confessed that they ministered to figures whom they called the devil? Part of what the devil represented in this emerging religious reality was evidence of self-Christianization, that unpredictable by-product of uneven Spanish evangelization. After all, diabolic explanations for the *huaca* complex of beliefs and practices in pre-Hispanic and emerging colonial Andean religious life had, for generations, been broadcast in Quechua in schools for the sons of regional nobles, during confession, and from the pulpits in Andean churches. Not surprisingly, the *huaca*-like appearance, nature, and competences of these reported “devils” were unmistakable and continued to change (Mills, 1997). While the wild omnipresence of these Andean devils only served to confirm many Spanish churchmen in their understanding of who had spoken through the *huacas* and made them seem so powerful to indigenous people all along, it should signal rather more to us.

What remains pertinent is the fact that the devil was an originally Spanish Christian idea that, through persistence of association and gradual processes of selective appropriation and reinvention, had been reconstituted and internalized by Indians. If reconfigured Andean “devils” had lodged inside a transforming *huaca* complex, what other originally foreign, extraordinary things encouraged by Spanish Christian efforts, and simultaneously attractive and useful to native Andeans, had also been brought within the ordinary?

**A NATURALIZATION OF IMAGES AND INSTITUTIONS.** Some of the ways in which colonial Catholic Christianity was lived in the Andes recalled older indigenous forms and purpose, and thus encouraged a gradual transformative process. For example, when new population centers and administrative districts coincided or approximated older territorial understandings, this integrative process began with the settling of extended kin groups (*ayllus*) in new towns (*reducciones de indios*). It is impossible to generalize about the consequences. Proximity to *huacas*, and the bodies of *mallquis* too, combined with a sporadic or unevenly demanding Catholic clerical presence, encouraged everything from survivals through coexistence to innovative fusions (Mills, 1994, 1997; Gose, 2003). Even when such “new” communities failed in the wake of the late sixteenth-century epidemics, or were abandoned because of excessive tribute exactions or Spanish and mestizo interlopers, the more remote places and hamlets into which Indian families settled reflected changes. The churches and chapels that went up in very small and remote places suggested more than a hankering for “annex” or secondary

parish status. “Arguments in stone,” or at least in adobe blocks, could be made by native Andean Christians as well as by hopeful church officials (Brown, 2003, pp. 29–32).

Sacred images and the voluntary lay religious associations (*cofradías*, confraternities) around them sometimes coaxed new religious allegiance directly out of older ones, as in the cases in which confraternities of Indians took over the herds and lands dedicated to the kin groups’ *huacas* and *mallquis*. Like Andean people at the sacrament of baptism, and like Indian towns themselves, members of the lay associations took on a saint as an advocate and protector, and these became new markers of identity and difference. But if the rise of an image-centered, confraternity Christianity was encouraged by a striking convergence of Andean needs with the arriving European institution (Celestino and Meyers, 1981; Garland Ponce, 1994), the reimagining of what came together, and the answers *cofradías* proffered to colonial lives, were just as crucial. The *cofradías* facilitated new kinds of belonging especially for displaced individuals and kin groups in parts of the colonial world where older kinship ties had fragmented or where resettlements and work regimes kept people far from their home territories. In these conditions, new generations were born. A parish and, even more, a *cofradía*, appears to have offered spaces in which members might come together for each other and themselves. Indian *cofradías* emerged in such great numbers by the late sixteenth century that churchmen worried openly about their lack of supervision. Prelates from at least the time of the Third Provincial Council of Lima (1582–1583) attempted to discourage new foundations among Indians (Vargas Ugarte, 1951–1954, vol. 1, p. 360). The discouragement was not always observed by churchmen, let alone by indigenous *cofrades*, nor did thriving lay associations of Indians fall obediently into decay. According to the Jesuit provincial Rodrigo de Cabredo, the principal Jesuit-sponsored confraternity of Indians in Potosí, that of San Salvador (sometimes called Santa Fe), boasted “more than 1,000 Indian men and women” in 1602. Contemporary observers wrote admiringly of the religious leadership of female confraternity members in particular and of the care they gave the image of the Baby Jesus in the Jesuit church (“Carta anua del año de 1602,” [1603] 1986, pp. 231–233; Ocaña, c. 1599–1608, fol. 181r).

Catholic Christianity’s convergence, through the saints, with structures that had guided the operations of an older *huaca* complex do not offer straight and easy answers or a singular “way” in which change occurred. In the middle of the seventeenth century, the indigenous parishioners in the town of San Pedro de Hacas, Cajatambo, revealed something of the complexity of the colonial religiosity and culture at hand. In testimonies before an investigator of their “errors” between 1656 and 1658, they explained how their local *huaca*, Vicho Rinri, was annually consulted on the eve of the Catholic festival of the town’s eponymous patron. What was more, their celebrations had come to feature sacred dances, indigenous ritual confessions, and Andean offerings to Saint

Peter in the home of his standard's honorary bearer. While the officiating Spanish judge and his notary insisted that the *huaca* was being asked permission (as the devil might wish) and that the activities of the saint's guardians and the intimate sacrifices before the representation were the height of irreverence, our interpretative options should not close so readily. It seems more likely that for at least some of the parishioners of Hacas, Saint Peter had been brought within an emerging system in ways that altered but did not interrupt older religious allegiances and understandings (Mills, 1994).

Reproducibility offers another critical theme to consider. Just as important *huacas* developed multiple personalities and specializations, generating expressions of themselves in other places, so too was it common for saints to transcend their original forms, functions, and places through networks of image "copies" and shrines. In this sense, the local religious enthusiasms of Spanish Christianity for images, newly defended and refortified at the Council of Trent (Christian, 1981a, 1981b) were planted in most fortuitous soil. In some cases, *huacas* themselves were Christianized, morphing into saintly personages as their places became sacred shrines in the Catholic system (Sallnow, 1987, p. 54). Like ambitious *huacas* who, through their ministers and often out of necessity, tied their fortunes to Inca rulers or speculated through "children" in widening locations, Christ, Mary, and the other saints were amenable to being co-opted, copied, and reenergized in new environments. Many sacred images, either brought originally from Europe or made in the Andes but based upon Old World models, both capitalized on their curious novelty and shed their identity as foreigners, becoming "localized and . . . renewed" in the Andes, as elsewhere (Dean, 1996, p. 174; Gruzinski, 1990). Whether "new" expressions or faithful copies, saints became local originals, favoring a horizontal approach to religious matters similar to that which Santillán, the Dominicans, and others had so worried over among the Yunga. William B. Taylor's words on the character and development of "devotional landscapes" in colonial Mexico apply just as usefully to our understanding of how saints appealed to and worked for the colonial descendants of the Yunga and their Andean neighbors: "People were likely to be interested in more than one shrine or saint," Taylor writes, "and felt a more intense devotion to one or another at a particular time, as the array of saints' images available in most churches suggests; and devotees may never have actually visited the shrine of a favourite image or relic" (Taylor, 2004).

The working of saints' images and their copies can be partly explained through the "familiar" language and associations used most often to elucidate divine connections and expansion. Spanish, Indian, and mestizo descriptions of *huacas* as ancestors, husbands, wives, and progeny, and of themselves as the children of these beings, abound. Idioms of kinship and marriage that had symbolized interrelationships and subtle hierarchies between *huacas* and their peoples offered affectionate titles and also a vocabulary for characterizing as-

sociations between the images of saints and Christ and their colonial groupings of people. Early-seventeenth-century Ay-mara speakers on the shores of Lake Titicaca, for instance, were said to have bestowed the title of *mamancheq* (*mamancheq*), "mother of all," upon Francisco Tito Yupanqui's sculpture of the Virgin of the Candlemas at Copacabana (Ramos Gavilán, [1621] 1988; Salles Reese, 1997, p. 162). Similarly, their contemporaries, indigenous mineworkers and their wives and families in Potosí, flocked to a miraculous painting of Our Lady of Guadalupe from Extremadura in the church of San Francisco whom they called the *señora chapetona*, "the new lady in the land" (Ocaña, c. 1599–1608, fols. 159r). Such familiar and localizing designations abound for images of Mary (Dean, 2002, pp. 181–182), but they were not confined to her. As Thierry Saignes has found, the inhabitants of main Andean towns sometimes included (and subordinated) the sacred images of annex hamlets in a remarkably similar fashion: "the crosses and statues that decorated the village chapels were considered the 'sons-in-law' of those belonging to the church in town" (Saignes, 1999, p. 103).

The Marian images featured above are, of course, only two of many. They offer illustrative examples of the significance of multiplication and circulation and of a wider range of devotional networks across the Andean zone and early modern world. It is to ponder only an inviting surface to note that Tito Yupanqui's Our Lady of Copacabana from the early 1580s both was and was not an Andean "original." Her Indian maker famously modeled his Virgin of the Candlemas on a statue of Our Lady of the Rosary brought from Seville to the Dominican convent and church in Potosí, an image that had caught his eye and fired his devotion when he was learning his art in the silver-mining center (Mills et al., 2003, pp. 167–172). The miraculous image at Copacabana herself quickly spawned many sculpted and portrait "copies" that were enshrined in chapels across the Andes. These local copies grew more compelling to devotees by signaling their connection to the divine presence of their originals. Some began to sweat, others moved, and many were judged responsible for interceding with God to produce miracles, the narratives of which spread in the street and were broadcast from the pulpits and pages of clerical promoters and patrons. In the case of a copy of the Virgin of Copacabana among a group of disgruntled, resettled Indians in Lima's Cercado, the image reportedly cried for attention and devotion, prompting decades of contest not only over the purported miracles but over her rightful place and constituency. The intersecting roles of different Indian groups, African slaves, prelates, secular clergy, and Jesuits in this case defy simple explanations.

The image of the Virgin of Guadalupe de Extremadura painted by Ocaña in Potosí can seem a more straightforward case, that of an official purveyor's painstakingly faithful expression of a Spanish original being transplanted in the Andes. Yet the localization and rooting of a new expression

here also repays closer inspection. The image's creator, the Jeronymite Diego de Ocaña, claimed to have rendered the image with the Indians' self-identification and affections foremost in mind: "Since I painted her a little dark, and the Indians are like that, they said that That Lady was more beautiful than the other images, and [that] they loved her a lot because she was of their colour." Among other aspects of his orchestration of new devotions around this image in Potosí, Ocaña quickly mobilized the Franciscan preacher Luis Jerónimo de Oré to preach to the Indians in their tongue about the history of the original Virgin of Guadalupe and about the transfer of this celestial advocate's powers through the new image to their place. (Ocaña, c. 1599–1608, fols. 159r, 163v; Mills, 2003). A miraculous narrative tradition was being added to and reshaped in Potosí as new Andean stories were being spun.

**AN ANDEAN CHRISTIAN INTERCULTURE.** The cult of the saints offers an aspect of the Catholic Christian system that appealed to colonial native Andeans as much for its familiarity as for its access to new local powers. In highly interactive regions such as the Andean zones on which Spanish Christians began to impinge in the 1530s, that which was foreign was not unexpected. The foreign and novel might—like a new *huaca*, like the concept of the devil—require understanding initially in terms that would allow definition within emerging systems of meaning and practice. But the allure and utility of unfamiliar expressions of sacred power were tied to their perceived ability to summon valuable powers from "outside" (Helms, 1993). In time, visual expressions of Christ, the Virgin Mary, and other saints appear to have offered this kind of power for many native Andeans. Closer studies need to be made of a variety of divine personalities and sacred territories over time to understand whether the associations and competences of particular *huacas* are related in any way to the specializations of saints as advocates and if a tendency away from highly localised and specificist saints and toward generalist advocates such as the Virgin and Christ proposed by William Christian (1981) for contemporary rural Castile plays out in cultic developments in the colonial Spanish Americas. But what is clear is that the saints became principal inhabitants and powers within what Thomas Cummins has called a contested but mutual "cultural area between Catholic intention and Andean reception" (Cummins, 1995; 2002, p. 159).

Discovering how the thoughts of contemporaries can inform us on such matters—and, more often than not, interpreting their silences—offers a constant challenge. This is as true of representations of saints and their developing domains as it is of renderings of the *huacas'* pre-Hispanic natures and what had been their catchment areas. Yet even triumphant declarations about the saints that seem to skate over difficulties and ignore complex possibilities hold promise for our project. For instance, when considering the fact that the seventeenth-century Augustinian Creole Antonio de la Calancha carved up Peru into three devotional zones watched over by miraculous images of Mary that just so hap-

pened to be nurtured and championed by his religious order, it can be tempting to throw in the towel. It was, he wrote, as if the Virgin of Guadalupe in the north coastal valley of Pacasmayo, the Virgin of Copacabana in Chucuito, and the Virgin of Pucarani (toward La Paz) were divinely linked and spread apart so as "to bless [*beatificar*] the different territories in which they are venerated, and so as not to tire travelers and pilgrims when they go in search of them" (Calancha, [1638] 1974–1982, p. 1362). Yet we must view this as more than Augustinian pride and claim-making against the encroachments of other religious, and more, too, than simply a solemn register of God's designs in these friars' favor. Calancha's appeal is arguably also to native Andean devotees who he knows from experience had once moved across these very territories according to earlier divine markers and divisions.

The representations of the Jesuit provincial Rodrigo de Cabredo in 1600 as he described the work of *padres* from the Jesuit college at Cuzco in towns and villages in the region of Huamanga (modern Ayacucho) in 1599 offer an even more illuminating example for our purposes. In one place (probably San Francisco de Atunrucana), the Jesuits had set to building a new church to replace one struck by lightning and burned to the ground. In the presence of many people, including the *kuraka*, sacred images of the town's patrons San Francisco and the Baby Jesus had been enshrined and a sermon was given in commemorative thanks that local people had been freed from their blindness and the clutches of the devil. According to Cabredo:

One of the principal fruits of this mission was teaching the Indians about the veneration (*adoración*) of images, telling them [first] not to worship (*adorar*) them as Indians do their *huacas*, and [second] that Christians do not think that virtue and divinity resides in them [the images] themselves but, rather, look to what they represent. . . . [Teaching] this [matter] is of the utmost importance, because a bad Christian with little fear of God had sowed a very pernicious and scandalous doctrine in this *pueblo*, saying many things against the honor and reverence that the images deserve.

Cabredo's emphasis falls ultimately on what was needed to "remedy the poison the Devil had sown through his minister" ("Carta anua," [1600] 1981, pp. 73–76). The notion of a wandering "bad Christian" as the devil's instrument, leading Indians astray with "pernicious and scandalous" confusions about images and *huacas*, does not fail to raise questions and suggest complications. For even if this "bad Christian" did exist, he or she appears to have found a ready audience for comparative thoughts about saints' images and *huacas*, an audience of Indians at the dawn of the seventeenth century about whom the Jesuits in Huamanga and well beyond had grown concerned.

Cross-cultural thinkers and mobilizers—contemporary people who conceptualized, influenced, and reflected religious in-betweens in the colonial Andes—offer perhaps the most remarkable indications of why and how the cult of the

saints came to underpin local Andean Christianities. As dismissive as the mestizo humanist El Inca Garcilaso de la Vega had found himself in thinking over the possible interpretative needs of colonial Indians in Chuquisaca, as noted above, he did concoct a definition of the concept of *huaca* with considerably more paths into emerging colonial understandings than dead ends. At its center was a denial that people in Incan times had understood *huacas* to be gods and a hint that the appeal of Christian images and miracle stories to a native Andean might follow on naturally (Garcilaso de la Vega [1609] 1985, pp. 51–55, pp. 45–55; MacCormack, 1991, pp. 335–338). Saints, like the extraordinary ancestral beings, might be represented in forms, and stories of their deeds might be conveyed, collected, and retold by special humans.

Luis Jerónimo de Oré, the experienced Franciscan Creole whom Diego de Ocaña had recruited to preach about the Virgin of Guadalupe in Potosí in 1600, was a figure who approached such matters of possible congruence directly, in the course of evangelization. Engraved images of the Virgin begin and end his *Symbolo Catholico Indiano* of 1598, accompanied by words to guide contemplation. Mary was also a principal concern in the book itself, as Oré translated her and his faith through prayers and hymns, expounding doctrine and mysteries for Quechua-speaking Christians (Oré, [1598] 1992). The so-called anonymous Jesuit of the late sixteenth or early seventeenth century—possibly but not certainly the mestizo Blas Valera (Jesuita Anónimo [c. 1594] 1968, BNS ms. 3177; Urbano, 1992; Hyland, 2003), offers another rich case in point. He was an author immersed in a project of interpreting the Incan past as an ordered and moral anticipation for Catholic Christianity, particularly as directed by the Jesuits in structured environments such as Lima's resettled enclosure for Indians, Santiago del Cercado. Yet he had also had much else to say en route.

The Jesuit held, for instance, that the only mode of entry into Christianity that was working for native Andeans in his day amounted to self-Christianization sustained by a regular experience of the sacraments. Certainly the people benefited from priests fluent in the Quechuan language to administer to them, and they required good examples to excite their faith, just as his contemporary Acosta insisted more famously. "But when they lack someone to instruct them," the anonymous Jesuit added, "they look for ways to pick up what is required and teach it to their children." Like Oré, this Jesuit believed that native Andeans were inclined toward Catholic Christianity by their pre-Hispanic understandings and that their depth in the faith depended most upon Christianity being enlivened by careful formulations in the Quechuan language. Most Indian Christians were new and vulnerable, in his view, but this did not make them any less genuine additions to the fold. The arrival at a moment when the pace and character of religious change would depend upon the Indians' own efforts and controls was already at hand in some places, he implied, even if further work was needed on communicating key aspects of the faith.

Near the heart of such further efforts, in this Jesuit's opinion, should be "historical narration and . . . personal conversations in which the saints' lives are told and matters of virtue are treated." Picking up on what his contemporaries the Creole Oré and the peninsular Ocaña also believed and were putting into action, the anonymous Jesuit wrote that if an evangelizer's skills were such that he could translate Christian narratives into the Indians' languages, then so too could the articles of the faith, the commandments, the works of mercy, and the sacraments be rendered, allowing the arriving religion, finally, to be deeply understood. His emphasis upon the gains which might come from "*conversaciones particulares*" about the saints captures his understanding both of the intimate and horizontal manner in which the cult of the saints had already begun to enter the hearts and minds of native Andeans, and of the way that self-Christianization—daily ritual activity, communication, and developing understandings among Indian women and men, within families and lay sodalities, and between friends and acquaintances—would see this process continue. Saints could take on new Andean lives in Quechua. Only the older generation of Indians and their oral traditions seemed to present an obstacle to this vision. But for this too, the Jesuit had a suggestion. Indian children could begin "to sing before them [the adults] so that in this way they forget the ancient songs" (Jesuita Anónimo, [c.1594] 1968, pp. 80–81).

The "ancient songs" stand in here for the *huacas* and, in a certain sense, for the pre-Hispanic religious complex as a whole. This Jesuit's optimistic view of his colonial present and his faithful glimpse into the future sees a gradual substitution of one set of songs, beliefs and practices for another, the old for the new. But students of these matters are not obliged to think so instrumentally. The author's acknowledgment of what one might call a "creative tension" between modes of religious understanding and ritual remembrance in operation in the colonial Andes is more telling. He believes that a fundamental Andean religious aptitude and enthusiasm for the saints, and for their hagiographic narratives and edifying stories, had come from somewhere elastic and enduring in native Andean cultural tradition. Evidence of the survival of *huaca* cults, and their relationships and sacred histories, exists into the eighteenth century and beyond and suggests that he was correct. But what can be understood about *huacas* should not stop just here, split off, as if the study of pre-Hispanic phenomena, much less colonial "idolatry," can be separated from the culturally dialogic reality of evangelization and response and from the emergence and fruition of Andean Christianities. *Huacas*, with their multiple personalities and translocality, provided Spanish and Hispanicizing minds with ways of thinking and expressing religious relationships, and they provide colonial indigenous people with ways of understanding the images of saints and their "copies" as newly local repositories of beneficence and power.

KENNETH MILLS (2005)

## SOUTH AMERICAN INDIANS: INDIANS OF THE MODERN ANDES

The Quechua and Aymara Indians of the Andes mountains are the largest group of Indians still existent in the New World. Approximately 28 million Indians and mestizos (persons of mixed Spanish and Indian descent) live along the Pacific coast and in the Andean highlands. About one-fourth of these Indians live and speak as they did before the Spanish conquest in the sixteenth century. Six million speak Quechua and approximately 1 million speak Aymara. For the purposes of this article, the religious systems of both the Quechua and the Aymara will be treated together, and both groups will be referred to, collectively, as “Andeans.”

Although some Andeans have moved to large urban centers, such as La Paz, Bolivia, and Lima, Peru, the majority live in small communities (from twenty to five hundred families) scattered throughout the Andes, with a population density of three hundred persons per square kilometer of habitable and arable land. Indians live in rectangular, single-family, adobe huts with thatched gable or hip roofs. The Aymara group their huts in extended-family compounds surrounded by a wall with a central patio. For both Aymara and Quechua, marriage is monogamous, with trial marriages lasting several years. Residence is patrilocal, with bilateral inheritance among the Quechua and patrilineal inheritance among the Aymara.

Andeans practice intensive agriculture using crop rotation, irrigation, dung fertilization, and terracing of fields. They cultivate more than fifty species of domesticated plants, in a number of ecological niches: Potatoes, quinoa, and oca are grown at the highest levels of cultivatable land; corn (maize) at lower levels; and beans, squash, sweet manioc, peanuts, peppers, fruit trees, and cotton in the deep valleys and along the coast. Herders graze alpacas, llamas, and sheep on fallow fields and in high, nonarable tundra regions (14,000–17,000 ft.). Although Andeans live dispersed over wide areas, resource exchange unifies the people of different communities. The ecological band narrows as the altitude increases, so that there are many distinct communities, each utilizing the natural resources characteristic of its altitude. Because of ecological specialization, exchange of resources is very important. Andean civilization arose through these efforts to utilize many vegetational zones to furnish communities with a variety of resources.

Andeans have also adapted to this mountainous region by means of a religion that is essentially a system of ecological symbols. They use their ecological setting as an explanatory model for understanding and expressing themselves in mythology and ritual. Andeans are very close to their animals, plants, and land. Their origin myths tell how in times past llamas herded humans; in present times humans herd llamas only because of a linguistic error when llamas misplaced a suffix in Quechua, saying “Humans will eat us” instead of “We will eat humans.” Andeans consider coca (*Erythroxylum coca*) a divine plant: “The leaves are like God. They have wisdom.” Diviners learn about nature by chewing coca and reading its leaves. Andeans see themselves as part of nature, intrinsically affected by its processes and intimately linked with plants and animals. Moreover, Andeans believe they originated in the earth and will return to it.

**PACHAMAMA AND ACHACHILAS.** Earth and mountains provide two principal Andean symbols, Pachamama and the *achachilas*. *Pachamama* means “mother earth,” but *pacha* also refers to time, space, and a universe that is divided into heaven, earth, and a netherworld. For Andeans, time is encapsulated in space. *Pacha* is an earth that produces, covers, and contains historical events, and Pachamama symbolizes the fertile nature of the earth, which provides life. Pachamama

is a universal deity, referring to all the earth and the universe because she represents the principle of nature that recycles life from death, and death from life. Pachamama is unlike the *achachilas*, the mountain spirits who represent certain peaks.

Ritually, Andeans libate Pachamama with drops of liquor before drinking and present her with three coca leaves before chewing coca. The husband places coca leaves daily into the male family members’ earth shrine, an indentation within the adobe bench surrounding the inside of the patio, and the wife puts leaves under her household shrine, a table within the cooking house, so that Pachamama will provide the family with food. Diviners also offer ritual meals (*mesas*) to Pachamama during August, before Andeans begin planting. Andeans believe that the earth is open at that time and needs to be given food and drink.

Roman Catholic missionaries attempted to replace Pachamama with the Blessed Mother, but this resulted in beliefs that associate the Blessed Mother with the bountifulness of the earth. For example, two major pilgrimage sites in the Bolivian Andes are La Virgen de Copacabana and La Virgen de Urkupiña. Nominally, these shrines refer to the Blessed Mother, but Andeans associate them with Pachamama and the earth (Urkupiña means “rock hill”). People travel to these shrines in August to feed Mother Earth and thus ensure an abundant harvest and an increase in flocks, offspring, or, more recently, money. This illustrates how Catholicism became syncretized with the ecological symbols of the Andean religion.

*Achachilas* are mountain spirits, indistinct from the mountains themselves, who are the masculine protectors of the earth and ancestors of the community. Diviners feed *achachilas* with ritual meals. Every Andean community has certain bordering mountains that are considered sacred: For example, the *achachilas* of La Paz, Bolivia, are the snow-crested mountains (16,000–20,000 ft.) of Illimani (“elder brother”), Mururata (“headless one”), and Wayna Potosi (“youth-Potosi”). A more traditional Aymara community, Cacachaqa, near Oruro, Bolivia, has eleven *achachilas* that together encircle it and separate it from neighboring communities. Each peak symbolizes an aspect of nature—a mineral, plant, animal, bird, or person—that is suggested by its shape and its particular resources and natural environment. Condo, a neighboring community north of Cacachaqa, shares with Cacachaqa two *achachilas*, which shows how neighboring communities are united by *achachilas*.

Throughout the Andes, there are hierarchical relationships among the *achachilas*. Ancestral *achachilas* are related to tutelary peaks of the community, the community’s tutelary peaks to the region’s, and the region’s to the nation’s. Traditionally, the metaphor for this relationship is a kinship pyramid: At the apex is the chief of the clan, followed by the heads of the major lineages and then the leaders of the local lineages. Although clans are no longer found in the Andes, lineages are important, and Andeans refer to *achachilas* in

kinship terms—*machula* (“ancestor”), *apu* (“leader”), *awqui* (“grandfather”), and *tío* (“uncle”). In sum, mountains exhibit a hierarchy that is analogous to social and political systems. The worship of these mountains, then, made Andeans conscious of social, political, and natural systems.

**EARTH SHRINES.** Diviners are responsible for naming and feeding earth shrines (*huacas*), which are pre-Columbian in origin and are still ritually important. Earth shrines are natural openings or small holes dug into the ground through which the earth is ritually fed. They are found near passes, water holes, knobs, and rocks. Alongside the hole is usually a rock pile, where Indians place their coca quids before fresh leaves are put inside the hole. A shrine’s many names may express history, humor, geography, and social relationships. For example, one earth shrine is called Jilakata’s Recourse, because it was once a rest stop for Indian officials on their journey to pay tribute to the Spanish. This shrine’s knob suggests its other names: Goat Corral, Bachelor’s Haven, Coitus, and Chicha (corn beer) Bubble. Another earth shrine was formed, according to legend, when a certain leader expelled his sister-in-law from his land and set her upside down alongside the road. She became a rock shaped in the form of buttocks and a vagina. Today, Andean travelers place coca in the crotch of this earth shrine. Other earth shrines are dedicated to irrigation canals, agricultural fields, and livestock. An *apacheta* is an earth shrine at a mountain pass, that is, the highest point of the trail. Travelers rest at these sites, discard their coca, and pray, “With this quid may my tiredness leave me, and strength return.”

Earth shrines are stratified according to ecological levels, social groupings, time, and historical epochs. Individuals have their own earth shrines; an Andean baby receives an earth shrine at birth, and must reverence it throughout his or her life. If they move from their natal village, they will periodically return to pay homage to their shrines, which continually beckon for their return until they die and are buried with their ancestors near their sacred mountain. The patri-lineage has its household shrines dug into the inside and outside of the house; the community has its shrine corresponding to its level on the mountain; and the ayllu, an economically and religiously related group of communities, has its shrines up and down the mountain. Certain irrigation canals have earth shrines that are associated with the Inca civilization, and, in many villages, the chapel in the plaza is often interpreted as another earth shrine, reminiscent of the Spanish conquest. Yet the earth is the center that perdures through time, and that unifies the different places and earth shrines.

**RITUALISTS.** Ritual specialists of the Andes fall into two categories: diviners and sorcerers.

**Diviners.** Andeans frequently consult with diviners, the principal ritualists of the Andes. All Andean communities have diviners. Although they are identified from within the group by being associated with some extraordinary natural event (commonly, a bolt of lightning), they are selected as

individuals for their divining skills. A typical diviner reads coca leaves by first selecting twelve perfect leaves. He marks them with insectlike bites and designates the significance of each: good luck, bad luck, community, road, a person’s name, enemies, or whatever concerns the person paying for the divination. He then casts the leaves, like dice, upon a cloth to see which leaves pair with good luck and which with bad luck. If the cast is unfavorable, the participants often argue about the outcome and require another cast. Because coca leaves usually do not fall in a conclusive way, diviners are free to suggest their insights. There are many kinds of diviners: Some read the signs of nature and predict when to plant and harvest, others are skilled in social dynamics and redress conflicts, and still others understand human problems and treat mental illnesses. A few possess mystical knowledge and can reveal the inner nature of the Andean universe. Such people are highly esteemed, and Andeans travel long distances to seek them out.

Diviners conclude divinations with ritual meals (*mesas*), which are the basic rituals of the Andes. Although *mesas* vary regionally, they follow a similar pattern. A diviner sets a table (*mesa*) with a ritual cloth and scallop shells for plates, each of which is assigned an *achachila* and an earth shrine. He places a llama fetus at the head of the table for Pachamama. Next, the diviner places white llama wool, coca, llama fat, carnation petals, and animal blood on the scallop shells, beseeching the invited deities to accept the offerings. The participants imitate the diviner. There are other ritual foods, depending upon the ecological zone, but the three principal foods are coca, which symbolizes knowledge, fat, symbolizing energy, and blood (preferably from the llama), symbolizing vitality. Finally, the diviner wraps the food with the wool to make about twelve bundles (*kintos*) and ties them to the back of the llama fetus. The diviner places this in an earth shrine, and burns it, which symbolizes the consumption of the food. Andeans say that if the fire sparkles and crackles, then Pachamama and the *achachilas* have enjoyed the meal and will repay them with a good harvest.

**Sorcerers.** Sorcerers are different from diviners. Diviners are usually male and feed the earth shrines with llama fat, llama fetuses, and white llama wool at specific times—Wednesday and Thursday nights. They are ritualists for *achachilas*, Pachamama, and earth shrines. In contrast, sorcerers are often female and feed the wind and river with pig fat, rat fetuses, and black sheep wool on Tuesday and Friday nights. They are ritualists for the *supaya*, a term that has often been equated with the Spanish concept of the devil, although it actually refers to certain of the dead who either have not completed something in this life or have died in a strange fashion. The *supaya* belong to the netherworld of the dead (*ura pacha*), but they act in the world of the living (*kay pacha*) as living shadows. *Supaya* enter the world of the living to gather companions for the netherworld. Symbolically, they represent the consumptive forces of nature, such as death and decay, which are necessary to renew life. When someone is

sick and a *supaya* is implicated, sorcerers attempt to appease him by killing and substituting the life of a llama for that of the sick person. They also offer pig fat and rat fetuses at *mesas de contra* ("misfortune tables"), so called because the ritual items are contrary to those employed by diviners in a *mesa de suerte* ("good-luck table") or *mesa de salud* ("health table"). Pig fat is inferior to llama fat because Andeans consider the pig a tropical animal that lives on fecal matter and garbage. Rat fetuses, symbolizing destructive rodents, are inferior to llama fetuses, which symbolize an animal very beneficial to Andean society.

Andeans select sorcerers by their reputation for either removing or inflicting misfortunes. Some sorcerers claim responsibility for as many as seven deaths, but others are secretive about their reputation because sorcerers are occasionally killed in revenge by victims of unsuccessful sorcery. Sorcery takes many forms in the Andes, but one way sorcerers curse people is by placing nail filings or hair of the victim inside the skulls of a cat and a dog, whose teeth are locked as if in battle, which symbolizes that husband and wife are fighting. (The breakdown of the household is a major tragedy in the Andes because it is the unit of production and subsistence.) The sorcerer hides the skulls inside the thatched roof of the victim. If the victim is aware of this, he can remove the curse by having another sorcerer perform a *mesa de contra*. Sometimes the victim has the sorcerer brought before the magistrate, who fines her and makes her take an oath not to do it again. Sorcery is taken seriously and is often the attributed cause for loss of livestock, crops, money, health, and even life.

**THE AYLLU AND ITS EARTH SHRINES.** The *ayllu* is basic to Andean social organization. Although *ayllus* are often based on kinship ties, they are also formed by religious, territorial, and metaphorical ties. One contemporary example is Ayllu Kaata of the Qollahuaya Indians, who live in midwestern Bolivia. Ayllu Kaata is a mountain with three major communities: Niñokorin, Kaata, and Apacheta. The people of Niñokorin are Quechua speakers who farm corn, wheat, barley, peas, and beans on the lower slopes of the mountain (10,500–11,500 ft.). The people of Kaata, who also speak Quechua, cultivate oca and potatoes on rotative fields of the central slopes (11,500–14,000 ft.). In the highlands (14,000–17,000 ft.), the Aymara-speaking people of Apacheta herd llamas and sheep. The three communities use the metaphor of the human body to understand their *ayllu*: Apacheta corresponds to the head, Kaata to the trunk, and Niñokorin to the legs. Just as the parts of the human body are organically united, so are the three levels of Ayllu Kaata.

The thirteen earth shrines of Ayllu Kaata are understood in relation to the body metaphor and to ecological stratifications. The three community shrines are Chaqamita, Pachaqota, and Jatun Junch'a. Chaqamita, a lake located to the east near the legs, is related to the sun's birth, fertility, and corn, making it a suitable shrine for Niñokorin, whose Corn Planting rite reverences this site. This lower lake is also a

shrine for Curva and Chullina, neighboring *ayllus*. Earth shrines, when shared by several *ayllus*, religiously unite separate mountains, and so Qollahuaya Andeans claim that they are one people because they worship the same shrines. Pachaqota, a large lake at the head of the mountain, is the "eye" into which the sun sinks; it symbolizes death, fertilization, and llamas. On the shores of the lake, the herders of the highland community of Apacheta celebrate the All Colors rite for the increase of llamas. Pachaqota is also associated with the lakes of uma pacha (at the top of a mountain), from which animals and humans derive their existence and to which they return after death.

The Great Shrine (Jatun Junch'a), associated with the liver and the central community of Kaata, is a major shrine of Ayllu Kaata because of its central location and physiography. The Great Shrine rests on a spur, which rises from the slopes and resembles a small mountain. The Great Shrine is nourished at the rite of Chosen Field, in the middle of the rainy season, and it is also the site of a mock battle (*tinku*) between the elders and clowns during Carnival. The clowns, who sprinkle people with water, are symbolically put to death by the elders slinging ripe fruit at them.

Similar ritual battles are fought throughout the Andes: The Aymara of the Bolivian Altiplano, for example, wage theatrical warfare between the upper and lower divisions of the community. *Tinku* emphasizes the importance of contrasting pairs, and in the Andes almost everything is understood in juxtaposition to its opposite. Earth shrines, also, have meanings corresponding to binary opposition. Chaqamita and Pachaqota, for example, correspond to life and death, as well as to the rising and setting of the sun, and each term explains the other; moreover, each leads to the other.

The highlands, central altitudes, and lowlands of Mount Kaata have community shrines reflecting their ecological zones, but from the viewpoint of the *ayllu*, the community shrine is only one part of the body of the mountain. In some way every level must feed all the mountain's shrines during the *allyu* rites, such as the New Earth rite. The people of Apacheta, Kaata, and Niñokorin come together during New Earth to recreate the mountain's body. The upper and lower communities send leaders to Kaata for this rite, each bringing his zone's characteristic product: a llama or some chicha (corn beer). The llama's heart and bowels are buried in the center fields, and blood and fat are sent by emissaries to feed the earth shrines of the mountain. The body awakes to become the new earth.

The New Earth rite is one illustration, of which there are many others throughout the Andes, of how Pachamama, the *achachilas*, and earth shrines are holistically understood in terms of metaphor, ecology, and *ayllu*. The New Earth rite expresses how levels of land are understood in terms of a body with a head, heart, bowels, and legs, through which blood and fat circulate when ritualists feed the earth shrines. Specific earth shrines not only refer to specific ecological zones but also symbolize parts of the body that holistically

constitutes the *achachila* and symbolizes the social and political unity of Mount Kaata. Andeans experience the solidarity of their mountain and *ayllu* similarly to the way they experience the organic unity of their corporeal bodies. The individual's corporeal life is dependent on environmental life. Thus, the New Earth rite assures the individual's organic life by awakening Mother Earth to provide a good harvest.

**RITUAL CALENDAR.** Andeans insert themselves by ritual into the cycles of nature—not to control them, but to experience them and be in harmony with them. New Earth, for example, is the second of three rites dedicated to the rotative field of the year. Through these three rites the earth is gradually awakened. One year before planting, the community leaders study the fertility of the fields lying fallow to see which one is ready to begin another growth cycle of potatoes, oca, and barley. A diviner observes nature's omens and asks the neighboring mountains (*achachilas*) for their assistance. Once a field is picked, the people of the *ayllu* celebrate the rite of Chosen Field (Chacrata Qukuy) in the middle of the rainy season. Leaders dance across the field's terraces to the music of flutes, and they offer a llama fetus to the earth shrine of the selected field. The fetus brings new life to the soil, and thus the field becomes the anointed land for the year. Andeans later fertilize their plots by spreading sheep dung along the furrows where they will plant potatoes.

The rains continue to soak the anointed field, and near the end of the rainy season, in April, Andeans prepare to plow. But before the earth can be entered, it must be nurtured by the sacrifice of a grown llama during the rite of New Earth. With this rite the land is vitalized; it is opened for water, air, dung, and blood, until the time of Potato Planting, when it is covered over again. Potato Planting (Khallay Papa Tarpuna), in mid-November, is the field's final ritual, celebrated after the Feast with the Dead. According to Andean legends, the dead push the potatoes up from the inside of the earth. Also in November, people of lower levels celebrate Corn Planting (Khallay Sara Tarpuna), and at Christmastime herders sponsor their herding rituals, All Colors (Chajru Khallay). Although each rite is concerned with the animal and plant life of its zone, collectively the rites influence the corporate life of the *ayllu* and region, and leaders from the various communities participate in all of the rituals of the *ayllu* and the region.

Between the cycle of the seasons there is a day when ancestors return to the community—2 November, the Feast with the Dead. Ancestor worship remains an important part of Andean religion. Prior to the conquest, Andeans mummified the dead by wrapping them in cloth and seating them in *chullpas*, which are rock monuments above subterranean cists. The Incas dressed the mummies of their kings in fine textiles and kept them in the Temple of the Sun in Cuzco, where they were arranged in hierarchical and genealogical relationships. Today, Andeans dress the dead person for a journey, provide him or her with coca, potatoes, corn, and a candle, and bury the deceased in a cemetery near the

community. Traditionally, many Andeans believe that people originate from and return to the highland lakes of the mountain. They compare death to the eclipse of the sun: Death is ecliptic, hiding the dead within the earth, where they journey with the movements of the sun, seasons, and land.

The Feast with the Dead is an annual rite of passage from the dry to the wet season and from the activity of the dead to that of the living. The dry season connotes resting; the wet season, growth. The living invite the dead to a meal when the harvest and festive times have ended and planting rituals begin. At this pivotal point in the Andean year, the dead visit the living, and then they are sent on another year's journey with their share of the harvest.

At noon on November 1, the leader of the community awakens the dead with dynamite, and for twenty-four hours the dead are served food on tables that usually have three tiers, symbolizing highlands, central altitudes, and lowlands. The arrival of a fly or the flickering of a candle signals to the living that the dead are present. The living and dead share in a meal and communicate with each other by laments and prayers. At noon the next day, everyone returns to the cemetery to place more food near the graves. Relatives of the deceased distribute food to friends, who pray for the dead relatives. Later the same afternoon, the fiesta ends with a meal and drinking.

**COSMOLOGY.** For Andeans, the finality of death is alleviated by their ecology. During life, Andeans become part of the land that they work: As their bodies get older, their land increases. When they die, they enter into the mountain, journey upward, and have access to the land of the dead. Moreover, the decay of their bodies enriches the land of the living. The visible levels of the living are only half of the mountain; the other half consists of the subterranean waterways of the dead.

The Andeans' worldview is an extension of the three mountain levels; they divide their universe into the heavens (*janaj pacha*), this world (*kay pacha*), and the netherworld (*ura pacha*). Each place has an ancient, a past, and a present time, to which specific beings correspond. The heavens are where the elders of lightning, sun, and stars have dwelled since ancient times; where God, Jesus, and Santiago have roamed since past times; and where dead baptized babies are descending to the *uma pacha* in present times. By their permanent and cyclical features, the heavens suggest origination and restitution, whereas the experiences of this world are temporal and consecutive. The three times of this world are symbolized by *chullpas*, the cross, and the graveyard, which refer respectively to the ancestor mummies, Jesus, and the recent dead (those who have died within three years). The ancestor mummies and the past and recent dead journey to the highlands within the subterranean waterways of the netherworld, which is the recycling area between death and life. The *supaya* are dead unable to travel because of some unfinished business. They bridge the gap between the netherworld

and this world. The earth shrines denote being, space, and time, the metaphysical concepts for the universe, which are intertwined in each of the three gradient levels; thus the mountain serves as an expression of Andean cosmology.

The *uma pacha* is the point of origin and return for traditional Andeans. The highlands are the head (*uma*) of the *achachila*. Bunchgrass grows near the summit of the mountain, as hair on the head. The wool of the llamas that graze on this grass resembles human hair. As human hair grows after cutting, so llama wool and bunchgrass grow continually in the highlands. In a manner similar to the regeneration of hair, humans and animals originate in the highland lakes, or the eyes (*nawi*) of the *achachila*. The sun dies into these eyes of the highlands, but from the reflections within the lake come all living creatures. The lake's reflections (*illa*) are the animals and people returning from inside the earth to this world.

Animals and people originate in and return to the head of the mountain. It is the place of origin and return, like the human head, which is the point of entry and exit for the inner self. The dead travel by underground waterways to the mountain's head, the *uma pacha*, from whose lakes they can arise to the land of the living. The living emerge from the eyes of the mountain (the lakes of the *uma pacha*), journey across its head, chest, trunk, and legs (high, center, and low levels), and die in the lowlands. They are buried and return with the sun to the *uma pacha*, point of origin and return.

**SICKNESS AND HEALTH.** Western medicine ascribes sickness to internal disorders of the body or to the malfunctioning of organs within it, whereas Andean curing looks outside the body to the malfunctioning of the social and ecological order. Bodily illnesses are signs of disorders between the person and the land or between the person and his lineage. The diviner's role is to reveal this conflict and to redress it by ritual, which resolves the dispute or reorders the land. Diviners cure not by isolating the individual in a hospital, away from his land, but by gathering members of a sick person's social group for ritual feeding of the earth shrines of the *achachila*, because if their lineage and mountain are complete, then their body will also be complete (healthy). Community and land are inextricably bound to the physical body, and disintegration in one is associated with disorder in the other.

One illustration of how diviners interrelate environmental and social factors with sickness is the *mesa de salud* ("health table"), a commonly performed ritual in the Andes. This ritual begins with a preliminary divination session in which the diviner casts coca leaves to determine the causes of an illness. Relatives of the sick person attend and contribute to the analysis of the causes. Diviners then redress social conflicts within the lineage. If the sick person, for example, has fought with her mother-in-law, the diviner delves into the cause of this conflict and instructs the patient to gather some ritual item from the mother-in-law's household. The participants then spend several days gathering ritual items symbolic of the various altitudinal levels: chicha (corn beer)

and carnations from the lowlands, potatoes from the central lands, and llama fat and a fetus from the highlands. The gathering of the ritual items reinforces the concept that health is related to the utilization and exchange of resources from different levels. Indirectly, the ritual affects health by reinforcing the need for a balanced diet. In this way, Andean ritual promotes holistic health rather than merely removing disease.

Traditionally, Andeans distinguish between *curanderos*, who cure with natural remedies, and diviners (*yachaj*), who cure with supernatural remedies. Andeans have many classes of *curanderos*, revealing a striking knowledge and classification of anatomy and an enormous list of medical paraphernalia. Because they have excelled in the practice of native medicine, Andeans have adapted to an environment that produces many stresses (hypoxia, hypothermia, malnutrition, and epidemics). Qollahuaya herbalists, for example, use approximately one thousand medicinal plants in curing. Andeans visit both diviners and herbalists for treatment of a disease, because both kinds of specialist are needed to deal with all the physical, social, spiritual, and ecological factors involved.

**CHRISTIANITY.** Andeans have incorporated Catholicism into their traditional way of life by stratifying it according to place and time and thus allowing it to function in ways analogous to the function of an earth shrine. For many Andeans, Catholicism is a state religion that replaced the Inca religion. Every Andean community has a chapel with a statue of a saint who is the patron protector of the village. Sculptors mold a realistic statue from plaster of paris, and seamstresses dress it with velvet and gold cloth. These statues appear almost alive, like waxworks. For some Andeans, the saint represents a white rock; for others, the saints are transformations of the dead ancestors whom they venerated during Inca times.

Annually, each village celebrates a fiesta to its saint, whose statue is paraded around the four corners of the plaza while brilliantly costumed groups dance to the music of flutes, drums, and trumpets. The official sponsor, the *preste*, walks alongside the saint, for which privilege he provides the participants with alcohol, coca, and food. Ritual and natural kin, as well as people in debt to the *preste*, contribute supplies and sponsor dance groups. For the first day or two, the fiesta is a celebration of great beauty and festivity, but by the third day it often degenerates into drunkenness and brawling. One reason is that during recent times raw alcohol has replaced the traditional beverage, *chicha*, which has a much lower alcohol content. However, alcohol and coca also relax the participants, making them susceptible to the liminal meanings of the fiesta—the basic Andean meanings being expressed in the dance, music, and ritual. These elements are highly structured and communicate underlying symbolic patterns important to Andean culture.

Although the cult of the saints reflects the importance of Catholicism in contemporary Andean culture, Andeans are only nominal Catholics: They baptize their babies pri-

marily to prevent hailstorms and to obtain *padrinos* (“godfathers”), who provide social and political connections. Sometimes couples marry in the church, but only after a trial marriage (*iqhisiñā*) to see whether the wife is fertile. Catholic catechists and Protestant missionaries have recently been converting Andeans to an evangelistic Christianity opposed to earth shrines, fiestas, and traditional Andean beliefs. Many evangelistic Protestants emphasize literacy and the reading of the Bible. Protestantism cannot be incorporated into the traditional Andean system because it tends to be comparatively barren of symbols and ritual. Consequently, converts to certain Protestant sects have radically changed their traditional cultural patterns. In sum, Catholicism has been adapted peripherally to traditional Andean religious practices, whereas evangelistic Protestantism has been very effective in changing traditional belief systems. This is because many Andeans see traditional religious practices, which reflect verticality, resource exchange, *ayllu* solidarity, and ecology, as being unimportant to modernization, with its emphasis on literacy, horizontal links, competition, and individuality.

Nevertheless, the traditional religion retains a strong hold on Andeans, who continue to look to earth and nature for their identity. Their land and their mountains continue to be their deities—not as abstract symbols but as real entities with whom they live and work and with whom they share important relations of reciprocity. For these reasons, the Andeans built a high civilization in a mountainous land that they came to worship.

## SOUTH AMERICAN INDIANS: INDIANS OF THE NORTHWEST AMAZON

In principle, the Northwest Amazon includes, as its southern limits, the region from approximately the Middle Amazon, around the mouth of the Río Negro, to the Upper Solimões; all of the Río Negro and its northern tributaries, including the Parima mountain range, up to the upper Orinoco Valley; and an arc connecting the Upper Orinoco to the Upper Solimões. Historically, the societies that inhabited this vast region, at least at the time of Spanish conquest in the sixteenth century, were far more numerous than they are today, and far more complex in terms of their social and political organization and interrelations amongst each other. Undoubtedly, their religious organizations and institutions were more complex as well. Sixteenth-century chroniclers left tantalizing notes describing the existence of chiefdoms and priestly societies in the Amazon floodplains region that were similar to those of the circum-Caribbean region.

The usefulness of these notes for understanding native religions at the time of conquest is, however, limited and subject to much guesswork. Scholars are not even certain which languages many of these societies spoke, much less what their religious beliefs were. Modern archaeology is just beginning to uncover the rich complexity of these societies

and may, in the future, provide important elements for understanding their religions. In any case, it is certain that the vast majority of the societies of the Río Negro, the main northern tributary of the Amazon that connects with the Orinoco via the Cassiquiare Canal, were Arawak-speaking peoples. There were also significant numbers of Tukanoan-speaking peoples in the region of the Uaupés River and its tributaries; forest-dwelling Makuan peoples in a vast region from the lower to the upper Negro; Cariban-speaking peoples on the tributaries of the upper Orinoco; and Yanomami populations in the mountainous forest regions north of the Río Negro.

**EARLY HISTORY OF THE REGION.** A survey of the first historical sources and the earliest recorded traditions of the societies of Northwest Amazon indicates the widespread distribution of a ritual complex involving the use of sacred flutes and trumpets, masked dances, and the practice of ritual whipping, associated with a mythology the central themes of which included initiation, ancestors, warfare, and seasonal cycles marked by festivals. Early observers noted that this ritual complex was of central importance, and that the guardians of the sacred trumpets formed an elite priestly class with a supreme leader who was also a war chief. There are indications of ceremonial centers where rituals were celebrated among societies of different language groups.

The evolution of this complex was drastically truncated and transformed by the advance of the Portuguese and Spanish slaving commerce in the seventeenth and eighteenth centuries. Many of the most powerful chiefs were co-opted into destructive wars to obtain slaves, thus irremediably fragmenting political-religious formations, as well as leaving vast parts of the Northwest Amazon region depopulated, as people were herded into mission-run settlements, where they were forced to adapt to Western culture. By the late eighteenth century, even with a brief respite in the advance of colonization, many of the surviving societies had been introduced to Christianity and had adopted its calendric festivals, if not its belief system, into their religious patterns.

In the second half of the nineteenth century, as an early reaction to exploitation by merchants, pressures from missionaries, and the waves of epidemics that decimated the Indian population, a sequence of prophetic movements and rebellions broke out in the Northwest Amazon region. Dressing as priests and identifying themselves with Christ and the saints, prophet-shamans led the people in the “Dance of the Cross,” a fusion of traditional rituals with elements of Catholicism that promised freedom from white oppression and relief from the “sins” that were believed to be causing the epidemics. While many of these movements suffered repression, the prophetic tradition continued among both Tukanoan- and Arawak-speaking peoples until well into the twentieth century in areas that escaped the attention of missionaries and government officials.

**CONTEMPORARY PEOPLES AND THEIR RELIGIOUS TRADITIONS.** For the indigenous peoples of the Northwest Amazon

today, religion is not an institution differentiated from other aspects of their lives. When they use the term *religion*, they are generally referring to the Christian religions introduced among them in their long history of contact with nonindigenous society. When they wish to refer to their own beliefs and practices that have to do with the sacred, they generally use such phrasings as “our tradition” and “the wisdom of our ancestors.” To understand these traditions, it is useful to consider four dimensions that characterize all religious traditions: cosmogony (the meaning of the beginning); cosmology (spatial and temporal structures of the universe); anthropology (the relations among living beings, including “specialists” who mediate relations with the spirits and divinities); and eschatology (the meaning of the end). This entry will seek to provide a minimum understanding of these dimensions from the rich and complex contemporary traditions of the Tukanoan-speaking peoples, the Arawak-speaking Baniwa and Kuripako, and the Maku of the Rio Negro region and its main tributaries, the Uaupés and Içana; the Yanomami of the Parima highlands on the border of Brazil and Venezuela; and the Carib-speaking Makiritare of the upper Orinoco Valley.

**Tukanoans.** Tukanoan-speaking peoples inhabit the rainforest region on the border of Brazil and Colombia. Although they are divided into numerous linguistic groups, they nevertheless share a body of broadly identical mythology. Religious life revolves around these myths; the importance of sacred flutes and trumpets representing the ancestors of each group; shamans and chant specialists; and a cosmology centering on the themes of mortality and immortality, death and rebirth, and the conjunction of male and female principles in the creation and reproduction of culture.

The myths explain the origins of the cosmos, describing a dangerous, undifferentiated world with no clear boundaries of space and time and no difference between people and animals. They explain how the first beings created the physical features of the landscape, and how the world was gradually made safe for the emergence of true human beings. A key origin myth explains how an anaconda-ancestor entered the world-house through the “water-door” in the east and traveled up the Rio Negro and Uaupés with the ancestors of all humanity inside his body. Initially in the form of feather ornaments, these spirit-ancestors were transformed into human beings over the course of their journey. When they reached the center of the world, they emerged from a hole in the rocks and moved to their respective territories. These narratives give the Tukanoan peoples a common understanding of the cosmos, of the place of human beings within it, and of the relations that should pertain between different peoples and between them and other beings.

The universe consists of three basic levels: the sky, earth, and underworld. Each layer is a world in itself, with its specific beings, and can be understood both in abstract and in concrete terms. In different contexts, the “sky” can be the world of the sun, the moon, and the stars; the world of the

birds who fly high; the tops of mountains; or even a head adorned with a headdress of red and yellow macaw feathers, which are the colors of the sun. In the same way, the underworld can be the River of the Dead below the earth, the yellow clay below the layer of soil where the dead are buried, or the aquatic world of the subterranean rivers. In any case, what defines the “sky” or the “underworld” depends not only on the scale and context, but also on the perspective: at night, the sun, the sky, and the day are below the earth and the dark underworld is on top.

In symbolic terms, the longhouse is the universe, and vice versa. The thatched roof is the sky, the support beams are the mountains, the walls are the chains of hills that seem to surround the visible horizon at the edge of the world, and under the floor runs the River of the Dead. The longhouse has two doors: the one facing east, called the “water door,” is the men’s door; the other, facing west, is the women’s door. A long roof beam called the “path of the sun” extends between the two doors. In this equatorial region, the underworld rivers run from west to east, or from the women’s door to the men’s door; completing a closed circuit of water; the River of the Dead runs from the east to the west.

The longhouse is likewise a body—the “canoe-body” of the ancestral anaconda—which, according to the myth of creation, brought the ancestors of humanity, the children of the ancestral anaconda, inside it, swimming upriver from the Amazon to the Uaupés in the beginning of time. These children are the inhabitants of the longhouse, replica of the original ancestor, containers of future generations and they themselves are future ancestors. But if the longhouse is a human body, its composition is also a question of perspective. From the male point of view, the painted front of the longhouse is a man’s face, the men’s door his mouth, the main beams and side beams his spinal column and ribs, the center of the house his heart, and the women’s door his anus. From the female point of view, however, the spinal column, ribs, and heart are the same, but the rest of the body is inverted: the women’s door is her mouth, the men’s door her vagina, and the inside of the house her womb.

In the Tukanoan life cycle, there is a notion of reincarnation shared by all Tukanoans: at death, an aspect of the dead person’s soul returns to the “house of transformation,” the group’s origin site. Later the soul returns to the world of the living to be joined to the body of a newborn baby when the baby receives its name. People are named after a recently dead relative on the father’s side. Each group owns a limited set of personal names, which are kept alive by being transmitted back to the living. The visible aspect of these name-souls are the feather headdresses worn by dancers, ornaments that are also buried with the dead. The underworld river is described as being full of these ornaments and, in the origin story, the spirits inside the anaconda-canoe traveled in the form of dance ornaments.

Buried in canoes, the souls of the dead fall to the underworld river below. From there they drift downstream to the

west and to the upstream regions of the world above. Women do not give birth in the longhouse, but in a garden located inland, upstream, and behind the house—also the west. The newborn baby is first bathed in the river, then brought into the longhouse through the rear women's door. Confined inside the house for about a week with its mother and father, the baby is again bathed in the river and given a name. Thus, in cosmological terms, babies do indeed come from women, water, the river, and the west.

In the Tukanoan view, *masa*, the word for “people,” is a relative concept. It can refer to one group as opposed to another, to all Tukanoans as opposed to their non-Tukanoan neighbors, to Indians as opposed to whites, to human beings as opposed to animals, and finally to living things, including trees, as opposed to inanimate objects. In myths and shamanic discourse, animals are people and share their culture. They live in organized longhouse communities, plant gardens, hunt and fish, drink beer, wear ornaments, take part in intercommunity feasts, and play their own sacred instruments. All creatures that can see and hear, communicate with their own kind, and act intentionally are “people”—but people of different kinds. They are different because they have different bodies, habits, and behaviors and see things from different bodily perspectives. Just as stars see living humans as dead spirits, so also do animals see humans as animals. In everyday life, people emphasize their difference from animals, but in the spirit world, which is also the world of ritual, shamanism, dreaming, and ayahuasca visions (ayahuasca being a psycho-active liquid that is drunk on ceremonial occasions), perspectives are merged, differences are abolished, the past is the present, and people and animals remain as one.

In Amazonia, ritual specialists with special powers and access to esoteric religious knowledge are often referred to as “shamans.” In order to operate successfully in the world, all adult men must be shamans to some extent. But those who are publicly recognized as such are individuals with greater ritual knowledge and a special ability to “read” what lies behind sacred narratives; they are individuals who choose to use their skills and knowledge on behalf of others, and who acquire recognition as experts. With rare exceptions, ritual experts are always men, but the capacity of women to menstruate and to bear children is spoken of as the female equivalent of shamanic power.

Tukanoans distinguish between two quite different ritual specialists, the *yai* and the *kumu*. The *yai* corresponds to the prototypical Amazonian shaman whose main tasks involve dealing with other people and with the outside world of animals and the forest. The shaman is an expert in curing the sickness and diseases caused by sorcery from vengeful creatures and jealous human beings. *Yai* means “jaguar,” a term that gives some indication of the status of the shaman in Tukanoan society. The *kumu* is more a savant and a priest than a shaman. His powers and authority are founded on an exhaustive knowledge of mythology and ritual procedures, knowledge that only comes after years of training and prac-

tice. As a knowledgeable senior man, the *kumu* is typically also a headman and leader of his community and will exercise considerable authority over a much wider area. Compared to the sometimes morally ambiguous *yai*, the *kumu* enjoys a much higher status and also a much greater degree of trust, which relates to his prominent ritual role. The *kumu* plays an important role in the prevention of illness and misfortune. He also officiates at rites of passage and effects the major transitions of birth, initiation, and death, transitions that ensure the socialization of individuals and the passage of the generations, and which maintain ordered relations between the ancestors and their living descendants. The *kumu*'s other major function is to officiate at dance feasts, drinking parties, and ceremonial exchanges and to conduct and supervise the rituals at which the sacred instruments are played, rituals that involve direct contact with dead ancestors.

The yearly round is punctuated by a series of collective feasts, each with its own songs, dances, and appropriate musical instruments, which mark important events in the human and natural worlds—births, initiations, marriages, deaths, the felling and planting of gardens, the building of houses, the migrations of fishes and birds, and the seasonal availability of forest fruits and other gathered foods. The feasts take three basic forms: *cashiris* (beer feasts), *dabukuris* (ceremonial exchanges), and rites involving sacred flutes and trumpets. The rituals involving sacred musical instruments are the fullest expression of the Indians' religious life, for they synthesize a number of key themes: ancestry, descent and group identity, sex and reproduction, relations between men and women, growth and maturation, death, regeneration, and the integration of the human life cycle with cosmic time. (For a complete description and analysis of these rites, and the symbolism of the sacred instruments, see Hugh-Jones, 1979.)

Effective missionary penetration among the Tukanoans began towards the end of the nineteenth century with the arrival of the Franciscans. The Franciscans, and the Salesians who followed them, saw native religion through the lens of their own closed religious categories. Without knowing or caring about what Tukanoan religion meant, the missionaries set about destroying one civilization in the name of another, burning down the Indians' longhouses, destroying their feather ornaments, persecuting the shamans, and exposing the sacred instruments to women and children. They ordered people to build villages of neatly ordered single-family houses and send their children to mission boarding schools, where they were taught to reject their parents' and their ancestors' ways of life.

If the missionaries were resented for their attack on Indian culture, they were also welcomed as a source of manufactured goods, as defenders of the Indians against the worst abuses of the rubber gatherers, and as the providers of the education that the Indian children would need to make the most of their new circumstances. From the 1920s onwards, the Salesians established a chain of outposts throughout the

region on the Brazilian side of the frontier. At the beginning of the twenty-first century, the growing body of evangelicals apart, most Tukanoan Indians would consider themselves to be Catholics. As more and more people now leave their villages and head for urban centers in search of education and employment, life in the longhouses and the rich variety of ritual life that went with it now persists only in the memories of the oldest inhabitants. On the Colombian side of the border, the more liberal Javerians preach tolerance of Indian culture and accommodation with its values and beliefs, allowing the Tukanoans to conserve much of their traditional religion and way of life to this day.

**Baniwa and Kuripako.** The religious life of the Arawak-speaking Baniwa and Kuripako of the Brazil/Venezuela/Colombia borders was similarly based on the great mythological and ritual cycles related to the first ancestors and symbolized by sacred flutes and trumpets, on the central importance of shamanism, and on a rich variety of dance rituals called *pudali*, associated with the seasonal cycles and the maturation of forest fruits.

Baniwa cosmogony is remembered in a complex set of numerous myths in which the main protagonist is Nhiāperikuli, beginning with his emergence in the primordial world and ending with his creation of the first ancestors of the Baniwa phratries and his withdrawal from the world. Many of these myths recount the struggles of Nhiāperikuli against various animal-tribes who seek to kill him and destroy the order of the universe. More than any other figure of the Baniwa pantheon, Nhiāperikuli was responsible for the form and essence of the world; in fact, it may even be said that he *is* the universe.

Another great cycle in the history of the cosmos is told in the myth of Kuwai, the son of Nhiāperikuli, and the first woman, Amaru. This myth has central importance in Baniwa culture for it explains at least four major questions on the nature of existence in the world: (1) how the order and ways of life of the ancestors are reproduced for all future generations, the Walimanai; (2) how children are to be instructed in initiation rituals about the nature of the world; (3) how sicknesses and misfortune entered the world; and (4) what is the nature of the relation among humans, spirits, and animals that is the legacy of the primordial world. The myth tells of the life of Kuwai, an extraordinary being whose body is full of holes and consists of all the elements of the world, and whose humming and songs produce all animal species. His birth sets in motion a rapid process of growth in which the miniature and chaotic world of Nhiāperikuli opens up to its real-life size.

The myth of Kuwai marks a transition between the primordial world of Nhiāperikuli and a more recent human past, which is brought directly into the experience of living people in the rituals. For that reason, the shamans say that Kuwai is as much a part of the present world as of the ancient world, and that he lives “in the center of the world.” For the shamans, he is the Owner of Sicknesses and it is he whom

they seek in their cures, for his body consists of all sicknesses that exist in the world (including poison used in witchcraft, which is still the most frequently cited “cause” of death of people today), the material forms of which he left in this world in the great conflagration that marked his “death” and withdrawal from the world. The shamans say that Kuwai’s body is covered with fur like the black sloth called *wamu*. Kuwai ensnares the souls of the sick, grasping them in his arms (as the sloth does), and suffocating them until the shamans bargain with him to regain the souls and return them to their owners.

In Baniwa cosmology, the universe is formed by multiple layers associated with various divinities, spirits, and “other people.” According to one shaman, it is organized into an enormous vertical structure of twenty-five layers or “worlds” (*kuma*), there being twelve layers below “this world” (*hliekwapi*) of humans, collectively known as Uapinakuethe, and twelve above, collectively known as Apakwa Hekwapi, the “other world.” Each one of the layers below the earth is inhabited by “people” or “tribes” with distinctive characteristics (people painted red, people with large mouths, etc.). With the exception of the people of the lowest level of the cosmos, and one other underworld, all other peoples are considered to be “good” and assist the shaman in his search for the lost souls of the sick. Above our world are the places of various spirits and divinities related to the shamans: bird-spirits who help the shaman in his search for lost souls; the Owner of Sicknesses, Kuwai, whom the shaman seeks in order to cure more serious ailments; the primordial shamans and Dzuliferi, the Owner of Pariká (shaman’s snuff) and tobacco; and finally, the place of the creator and transformer Nhiāperikuli, or Dio, which is a place of eternal, brilliant light, like a room full of mirrors reflecting this light. The sun is considered to be a manifestation of Nhiāperikuli’s body. With the exception of the level of Kuwai, all other levels are likewise inhabited by “good people.” Some may “deceive” or “lie” to the shaman, but only the “sickness owner” possesses death-dealing substances used in witchcraft.

This world of humans is, by contrast, considered to be irredeemably evil. Thus, of all the layers in the universe, four are considered to be comprised of wicked people. It is remarkable how, in the context and from the perspective of the most elaborate cosmic structure thus far recorded amongst the Baniwa, the theme of evil in this world of humans clearly stands out. In shamanic discourse, this world is frequently characterized as *maatchikwe* (place of evil), *kaiwikwe* (place of pain), and *ekúkwe* (place of rot [due to the rotting corpses of the dead]), contrasting it with the world of Nhiāperikuli, which is notable for its sources of remedies against the sicknesses of this world. This world is considered to be contaminated by the existence of sorcerers and witches. Shamanic powers and cures, by contrast, are characterized in terms of the protective, beneficial, and aesthetically correct: to make the world beautiful; to make this world and the people in it better and content; to not let this world fall or end (meaning,

to be covered in darkness and overrun by witches); to retrieve lost souls and make sick persons well—all are phrases that appear in shamanic discourses about journeys to the other world. In all phases of this journey, the beauty, goodness, unity, order, and truth—in a word, the “light”—of the other world (with the exception of the places of Kuwai) stand in contrast with this world of multiple pain and evil. In one sense, then, the shaman’s quest would seem to be one of “beautifying” this world by seeking to create order and preventing the darkness of chaos.

In the 1950s, the majority of the Baniwa converted to evangelical Protestantism, introduced by missionaries of the New Tribes Mission. Their mass conversion was historically continuous with their participation in prophetic movements ever since the mid-nineteenth century; however, evangelicalism provoked a radical break from their shamanic traditions, as well as serious divisions and conflicts with Catholic Baniwa and those who sought to maintain their ritual traditions. Today, after half a century, evangelicalism is now the predominant form of religion in over half the Baniwa communities, although there is a growing movement among non-evangelicals to revitalize the initiation rituals and mythic traditions.

**Maku.** The universe of the nomadic Maku Indians of the interfluvial region in the Northwest Amazon takes the form of an upright egg, with three levels or “worlds”: (1) the subterranean “world of shadows,” from where all the monsters come, such as scorpions, jaguars, venomous snakes, the river Indians, and whites; (2) “our world”; that is, the forest, and (3) the “world of the light” above the sky, where the ancestors and the creator, the Son of the Bone, live. Light and shadow are the two basic substances from which all beings are composed in varying proportions. Light is a source of life. Shadow is a source of death. In “our world,” leaves and fruit are the beings with the highest concentration of light, while carnivores have the highest concentration of shadow. For this reason, it is better to avoid eating carnivores and restrict one’s diet to herbivores. In the world of light after death, people nourish themselves with delicious fruit juices and become eternal adolescents.

The main mythological cycle of the Maku relates the epic tale of the Son of the Bone, whose name varies with the subgroup. The myth describes the survivor of a fire that put an end to the previous creation. His attempts to recreate the world resulted in a series of blunders: conflicts, sickness, and death, all resulting from the mess left behind. After his wife is abducted by his youngest brother, the Son of the Bone leaves this world behind forever, going to live in the world of light, above the sky and the thunder, from where he sometimes emits an expression of revenge. Coincidence or not, in real life, brothers often fight among themselves, in dispute over the same women, or with their affines, in accordance with the clan system.

**Yanomami.** The Yanomami comprise four linguistic subgroups inhabiting the mountainous rainforests of north-

ern Brazil and southern Venezuela. Accounts of creation vary considerably among the groups, although a common theme holds that after the destruction of the primordial world by a cosmic flood, humans originated from the blood of the Moon. The souls of deceased Yanomami, whose bone ashes are consumed during the rituals of *reabu*, are incorporated into the blood-lakes of the Moon, where they are regenerated and later reincarnated, through falling rain, to a new existence on earth.

The Yanomami word *urihi* designates the forest and its floor. It also signifies territory or the region currently inhabited. The phrase for “the forest of human beings,” the forest that Omama, the creator, gave to the Yanomami to live in generation after generation, is “Yanomami land” or “the great forest-land.” A source of resources, for the Yanomami, *urihi* is not a simple inert setting submitted to the will of human beings. A living entity, it has an essential image and breath, as well as an immaterial fertility principal. The animals it shelters are seen to be avatars of mythic human/animal ancestors of the first humans, who ended up assuming their animal condition due to their uncontrolled behavior, an inversion of present-day social rules. Lurking in the tangled depths of the *urihi*, in its hills and its rivers, are numerous malefic beings, who injure or kill the Yanomami as though they were game, provoking disease and death. On top of the mountains live the images of the animal-ancestors transformed into shamanic spirits, *xapiripë*. The *xapiripë* were left behind by Omama to look after humans. The entire extent of *urihi* is covered by their mirrors, where they play and dance endlessly. Hidden in the depths of the waters is the house of the monster *Tëpëresiki*, father-in-law of Omama, where the *yawarioma* spirits also live; their sisters seduce and enrage young Yanomami hunters, thereby enabling them to pursue a shamanic career.

The initiation of shamans is painful and ecstatic. During initiation, which involves inhaling the hallucinogenic powder *yākōana* (the resin or inner bark fragments of the *Virola* sp. tree, dried and pulverized) for many days under the supervision of older shamans, they learn to “see” or “recognize” the *xapiripë* spirits and to respond to their calls. The *xapiripë* are seen in the form of humanoid miniatures decorated with colorful and brilliant ceremonial ornaments. Above all, these spirits are shamanic “images” of forest entities. Many are also images of cosmic entities and mythological personae. Finally, there are the spirits of “whites” and their domesticated animals.

Once initiated, the Yanomami shamans can summon the *xapiripë* to themselves in order for these to act as auxiliary spirits. This power of knowledge, vision, and communication with the world of “vital images” or “essences” makes the shamans the pillars of Yanomami society. A shield against the malefic powers deriving from humans and nonhumans that threaten the lives of members of their communities, they are also tireless negotiators and warriors of the invisible, dedicated to taming the entities and forces that move the cosmologi-

cal order. They control the fury of the thunder and winds brought by storms, the regularity of the alternation between day and night, or dry season and rainy season, the abundance of game, and the fertility of gardens; they keep up the arch of the sky to prevent its falling (the present earth is an ancient fallen sky), repel the forest's supernatural predators, and counterattack the raids made by aggressive spirits of enemy shamans. Most importantly, they cure the sick, victims of human malevolence (sorcery, aggressive shamanism, attacks on animal doubles) or nonhuman malevolence (coming from malefic *nē waripë* beings).

**Makiritare.** The Makiritare, Carib-speaking peoples of the upper Orinoco Valley, recount the story of their creation in the great tradition called *Watunna*. According to this tradition, the primordial sun brought the heavenly creator Wanadi into being. Through his shamanic powers, Wanadi created "the old people" and then, in his desire to place "good people" in houses on the earth, he dispatched three aspects of himself to earth. The first buried his own placenta in the earth, which gave rise to an evil being, called Odosha, who then sought to destroy every creative effort and introduced death into the world. The second aspect of Wanadi was sent to teach the people that dying is an illusion and that dreaming holds the true power of reality. He brought good people, as sounds, inside a stonelike egg to earth, where they would be born, but Odosha prevented this from happening. Wanadi then hid them in a mountain to wait until the end of the world and the death of Odosha. Wanadi's third aspect, Attawanadi, then came to earth to create the enclosed structure of the earth, which was then shrouded in the darkness created by Odosha. A new sky, sun, moon, and stars were created in this house, village, universe. Then there ensued a struggle between Odosha and Attawanadi in which Odosha is initially victorious, but Attawanadi outsmarts the evil being by assuming elusive guises. As trickster, Attawanadi thwarts Odosha's constant attempts to destroy existence in a sort of negative dialectic of the sacred. Thus cosmic history was set in motion.

Other episodes of this important cycle relate the destruction through deluge of the primordial beings and their world, and the origins of periodicity, differentiation, and bounded spaces. The deluge was the result of the killing of a primordial anaconda-monster. After this destruction, Wanadi decided to make houses and "new people," who live in a symbolic world in which, through song, ritual, and weaving, they recall these primordial events. The landscape of the Makiritare world provides constant reminders of the primordial times. The center of the universe is a lake in Makiritare territory where, in ancient times, waters poured forth from the cut trunk of the tree that originally bore all fruit. This lake contains the sea that once flooded the earth and is now bounded at the edges of the world.

Although numerous Makiritare communities converted to Protestant evangelicalism in the 1980s, many others rejected conversion, maintaining firm belief in the *Watunna* tradition.

## SOUTH AMERICAN INDIANS: INDIANS OF THE CENTRAL AND EASTERN AMAZON

The vast region covered by the central and eastern Amazon may, for the purposes of this entry, be delimited by the Río Negro at the western end, the mouth of the Amazon to the east, the Guyana highlands to the north, and the central plateau of Brazil to the south. Within this region many of the great language families of South America are represented: Arawak, Tupi, Carib, Ge, and Timbira. Besides this diversity

the area is also notable for some of the most complex prehistoric cultures, such as Marajoara and Santarém. This entry provides an overview of the religious systems of prehistoric and contemporary indigenous peoples as well as of peasants or *caboclos*.

#### PREHISTORIC CULTURES AND RELIGIOUS MANIFESTATIONS.

Archaeological excavations at Marajó Island in the Amazon Delta reveal the existence of a complex society of Mound Builders spanning the period from roughly 500 to 1300 CE. The abundance of ceremonial and funerary remains on the higher mounds attests to the existence of political and ceremonial centers. Differential burials, houses for the dead, and possibly temples indicate ancestor cults. Marajoara ceramics are marked by the use of animal motifs with clear supernatural and mythical connotations that modern studies have sought to interpret in terms of Amerindian perspectivism. The symbolism of death and rebirth, shamanic motifs, binary images, abstract geometric patterns, and bodily images are all characteristic of Marajoara ceramics, indicating a complex religious system (see Schaan, 2001). Similarly the prehistoric Santarém culture at the mouth of the Tapajós was the center of a great chiefdom from the tenth century to the sixteenth century. Female fertility is a predominant element in ceramic motifs; the famous caryatid vessels display bicephalous humanlike zoomorphic figures (especially the king vulture), recalling the transformations experienced in shamanic trance or in great collective rituals using psychoactive substances in which great trumpets representing the divinities were played. Finally, mention should be made of the many cemeteries with large funerary urns discovered near the Maracá River on the lower Amazon. These urns display anthropomorphic or zoomorphic figures, with the anthropomorphic figures, often female, being seated, decorated, and painted. It has been suggested that the Maracá culture was linked to early Arawakan populations that were possibly ancestors of the Palikur.

**BRIEF HISTORY OF CONTACT.** The size and complexity of Amazon floodplain societies astonished the first European explorers in the mid-sixteenth century. Their populations were dense, internally stratified, and settled in extensive villages capable of producing surpluses for a significant intertribal commerce. The sociopolitical organization of what observers called “provinces” was far more elaborate than any indigenous society since then, with reports of local chiefs subordinate to regional chiefs endowed with sacred qualities, hierarchically organized lineages, sacrifice of concubines at the deaths of chiefs, ancestor cults with the preservation of the corpse through rudimentary techniques, and other evidence of social and ritual stratification.

None of this resisted the advance of the European slave hunters, spice collectors, diseases, and missionaries who, by the end of the seventeenth century, had penetrated well into the Amazon Valley. Their advance resulted in the dispersion and captivity of a majority of the riverine peoples such that the eastern Amazon was practically depopulated and infested

by diseases, as mission industries and towns struggled to survive. With the depopulation of the main tributaries, expeditions penetrated ever farther into the interior to “persuade” whole populations to relocate to ethnically mixed, mission-run settlements. This process led to the formation of a neindigenous stratum of the population, whose original cultural and linguistic differences had been neutralized, dissolving ethnic diversity into the homogeneity of generic Indians that eventually gave rise to the *caboclo* or mixed population of the region.

With the decline of colonial control by the end of the eighteenth century, many peoples withdrew from colonial settlements to reorganize and reconstitute their societies, often in new territories and with new sociopolitical and religious forms of organization. From the mid-nineteenth century until well into the twentieth, rubber extraction and exportation became the dominant form of labor organization in the Amazon, and with the severe droughts in northeastern Brazil at the end of the nineteenth century, there was a massive influx of northeastern migrants into the Amazon region. By the late twentieth century even the most isolated regions of the central and eastern Amazon, which until then had served as a refuge for many indigenous peoples, were invaded by highways, miners, and ranchers.

**CONTEMPORARY INDIGENOUS RELIGIONS.** The religions of several peoples will be briefly considered. Those included are the Palikur (Arawak) of the state of Amapá; the Araweté and Juruna (Tupian) of the state of Pará; the Kayapó and Xikrin (Ge) of the state of Pará; the Canela and Krahó (Timbira) of Maranhão; and the Arara (Carib) of Pará.

**Palikur (Arawakan).** For the contemporary Palikur, the creation and structuring of the universe and all that is part of it is the work of the Christian God. They usually disparage the beliefs of their ancestors, declaring that they were superstitions, and cite as an example the constitution of the universe in layers. In the early twenty-first century they “know that the world is round.” Nevertheless they possess a vast repertoire of myths that reveals a good part of their ancient cosmology.

The myths can be divided into two categories: cosmogonic myths that tell of the emergence of the Palikur and their relations with the environment or with other ethnic groups of the region, and those myths that speak of the relation with the “beings of the other world.” The myths are generally further classified into two types: “stories of the old times, of the past, a long time ago” and “false stories.” They always refer to a time past, in which the “true” belief, the Christian religion, was unknown. At times, however, narrators reflect and point out that the fact in question is real and still occurs, revealing the ambiguity with which the Palikur regard the myths. It is exactly this ambiguity that has allowed for the coexistence of indigenous mythology with Christian religion, but that has not occurred with the rituals, for which reason they are no longer held. Myth is consciously relegated

to an inferior position in relation to the Christian religious system.

The mythical universe appears to be divided into three layers: the world below, the terrestrial plane, and the celestial plane. The first is the mythical space par excellence, for in it dwell the supernatural spirits. Located just below the surface of the earth, its parallel position in relation to the terrestrial level facilitates contact between the two worlds, a necessary condition for the existence of the mythical world, since this plane only makes sense in connection with the world of humans. The representation of the passage between the two worlds is physical: there is a “hole” in the terrestrial level that allows for displacement from one sphere to another. The switch from one plane to another is marked by the transformation of supernatural beings that, in their world, have human form but, to come up to the terrestrial level, need to “clothe themselves” with a “cloak” that gives them animal form.

On the terrestrial level live human beings, plants, animals, and occasionally supernatural beings. This level has a topography that is analogous to this earth, about which there are many mythical narratives; however, geographical locations are fluid and vary from one narrative to another.

Finally, the celestial plane seems to be a space that is dominated exclusively by Christian cosmology—represented as Eden, inhabited by the Trinity, and reserved for the chosen, meaning those who have “accepted Jesus” before the “end of time.” In terms of Palikur myths, heaven appears to be empty. But even while fragmentary, several aspects of indigenous cosmology still occupy space in this domain. The Palikur believe there are six unnamed levels. Among these, two have notable inhabitants: on the second level lives the two-headed king vulture and on the sixth is Jesus Christ, awaiting the chosen “in the celestial Eden made of gold.” The other levels are described as “display windows” of purgatory, in which one sees the souls of those who do not attain eternal life. These souls are anthropomorphic, with a human body up to the neck dressed in a white cloak and the head of an animal (monkey, alligator, and so on).

In 1926 Curt Nimuendajú mentioned the existence of three heavens: Inoliku, the lowest, Mikene, and Ena. Just above the first there was a special heaven, Yinoklin, inhabited by the Yumawali spirits (or “demons,” as Nimuendajú called them) of the mountains. This division of the sky by named levels does not exist now, but with small alterations, the names given to the heavens are confirmed.

**Araweté and Juruna (Tupian).** The guiding thread of Araweté religion is the relationship between humanity and the Máï, the immortal beings who left the earth at the dawn of time and now live in the sky. Humans define themselves as the “abandoned ones,” or “forsaken,” meaning those who were left behind by the gods. Humans and Máï are related as affines, for the souls of the dead are married to the gods. The Máï may, and in the long run will, destroy the earth by

causing the sky to crash down. The ultimate cause of all deaths is the will of the Máï, who are conceived as being at once ideal Araweté and dangerous cannibals. The Máï are not thought of as creators, but their separation from humanity produced old age and death. Among the hundreds of types of Máï, most of which have animal names, the Máï *bete* (real gods) are those who transform the souls of the dead into Máï-like beings by means of a cannibal-matrimonial operation. That is, following its arrival in the celestial realms, the soul of the dead is killed and devoured by the Máï, after which it is resurrected by means of a magical bath and made into a godlike being who will be married to a Máï and live forever young. Besides the Máï, there are also Ani forest spirits, savage beings who invade settlements and must be killed by the shamans, and the powerful Master of the River, a sub-aquatic spirit who delights in kidnapping women’s and children’s souls, which must then be retrieved by shamans.

The most important shamanic activity is bringing down the Máï and the souls of the dead to visit the earth and partake of ceremonial meals. In these ceremonial banquets collectively produced food (honey, fish, and *cauim*, a fermented corn beverage) is offered to the celestial visitors before being consumed. The *cauim* festival is the climax of ritual life and contains religious and warrior symbolism. The leader of the dances and songs that accompany the consumption of *cauim* is ideally a great warrior, who learned the songs directly from the spirits of dead enemies. Singing is thus the heart of ceremonial life. The “music of the gods” sung by shamans and the “music of the enemies” sung by warriors are the only two musical genre known to the Araweté, and both are formed by the words of “others” quoted in complex ritual formulas.

The souls of the recently deceased often come to earth in the shaman’s chants to talk to their living relatives and tell them of the bliss of the afterlife. After two generations they cease to come, for there will be no more living contemporaries who remember them; they are not ancestors, however.

Juruna cosmology has three basic coordinates. First is the opposition between life and death. This is far from being a drastic dichotomy as in Western cosmology, because there are various transitions, such as minor temporary “deaths,” as in sleep, that typically take the form of dreams. The relation between life and death involves not so much the notion that if someone is dead he or she cannot be alive but rather that someone can be dead in one place but alive in another or that he or she may be alive here but already dead somewhere else. In other words, the relation is one of relative disjunction, which allows for important conjunctions. Juruna shamans used to be masters at such transitions.

Second, the world axes are formed by the oppositions between river and forest and sky and earth, each being articulated with the opposition between the presence and absence of cannibalism. The river and the sky have a positive link with cannibalism. One can say that all existence can be divided into these oppositions: human beings (river peoples and forest peoples), spirits of the dead (those living in the cliffs

on the banks of the Xingu, who do not like human flesh, and those living in the sky), mammals (forest species and those living on the river bed), and so on. In addition the Juruna believe everything that exists on earth also exists in the sky, which is a kind of earth resembling that of humans. Even though the Juruna do not consider the river to be a copy of the forest, they say it can be viewed by some river inhabitants as a copy of the earth, except that the forest in their earth resembles human gallery forests, and their gardens are portions of land broken off from the river banks. Finally, there is an opposition between the viewpoints—or perspectives—of living, conscious human subjects and alien beings, such as animals, spirits, and the dead. The dynamism and complexity of Juruna cosmology depends on the confrontation between these discordant viewpoints.

Juruna shamanism used to be composed of two systems, each related to a society of the dead. Rarely was it possible for a shaman to practice both types of shamanism. The spirits of the dead inhabiting the river cliffs fear those living in the sky, whose society is composed of the souls of warriors and their leader. Indeed the Juruna fear these spirits of the sky the most, and thus this form of shamanism was considerably more powerful, dangerous, and difficult to perform. Each system of shamanism was associated with a great festival in honor of its particular category of the dead. The festival for the dead of the river cliffs was accompanied by the sound of flute music and songs performed by the dead through the mouth of the shaman. Another festival was accompanied by the music of a set of trumpets. When the Juruna offered food to the souls of warriors during their festival, they said they would rather eat the flesh of roasted Indians brought from the other world; they also refused to drink manioc beer, saying they were already drunk enough. By contrast, the spirits from the river cliffs would drink plenty after eating the meal from their hosts, spicing up the manioc beer made by Juruna women with a dose of beer brought from the other world. The last of these celebrations was held in the 1970s. Despite the changes in their ritual life, the Juruna continue to celebrate beer parties and two major festivals every year, each held for approximately one month.

**Ge-Timbira.** Ge-Timbira religiosity is marked by a strong dualism. That characteristic divides creation, nature and society, and the groups that make up society.

**Canela.** A Canela origin myth recounts that Sun and Moon walked over the land, transforming the world that already existed and thus creating the norms for social life. Sun established the norms favorable to life, whereas Moon modified them to test its imperfections. Sun created ideal men and women, whereas Moon created those with twisted hair, those with dark skin, and those seen as deformed. Sun allowed machetes and axes to work by themselves in the gardens, whereas Moon made them stop. Consequently people had to work hard to make their gardens—the origin of work. There are at least a dozen episodes of this myth that recount the beginning of death, floods, and forest fires, why the *buriti* palms are tall, why the moon has its spots, and other conditions.

Other Canela myths explain the origin of fire and corn. A boy brought fire for his people after having stolen it from the hearth of a female jaguar. Star Woman fell in love with a Canela and so came down to live for a while among his family members. During her stay she indicated that corn would grow in the forest, and she taught them that it was good to eat. This was the origin of gardens. She then returned to the sky with her mate and both transformed into twin stars, known as Castor and Pollux.

**Krahó.** Krahó origin myths are similar to those of the Canela. Indeed these myths seem to suggest that everything in Krahó culture, even shamanism, came from the outside. Like the Canela, the Krahó believe all of their culture was created by the twins Sun and Moon. The Krahó disapprove of the actions of Moon not only because he was less skilled than Sun but also because he insisted that Sun do what he requested, for it was from these requests that the evils that afflict humans entered the world.

Other myths tell how the Krahó studied agriculture, obtained fire, and learned the rituals and songs. Generally the myths tell the story of an individual who leaves the village and, in the world outside, learns something important, later returning to the village where he or she transmits the new knowledge. In the case of agriculture, however, a being from nature brings the knowledge of planting to the villagers and then withdraws to the outside world. The myth of Auke, which is important for understanding Krahó participation in messianic movements in the 1960s, follows the same pattern. But Auke, on entering the village, is not given the opportunity to teach the Indians what he knows, for they are afraid of him and end up violently expelling him from the village. Auke then creates white humans. Several other myths tell of individuals who, having been expelled from the village, do not return with new things that could be used by its inhabitants; rather, they stay in the world outside, transforming themselves into animals or monsters.

The Krahó have many rituals. Some are short and linked to individual life crises (such as the end of seclusion after the birth of a first child, the end of a convalescence, and the last meal of a deceased person) or to occasional collective initiatives (such as exchanges of foods and services). Others are associated with the annual agricultural cycle, for instance, those that mark the dry and wet seasons, the planting and harvesting of corn, and the harvesting of sweet potatoes. Yet other rites form part of a longer cycle, associated with male initiation, that must take place in a certain order; nowadays this cycle is difficult to reconstitute, in part because one of the rites has been abandoned. Various rites related to the annual and initiation cycles have myths that explain their origins. However, there is not a strict correspondence between the sequence of myths and that of rites, although they overlap in some ways.

The first human who acquired magical powers was carried up to the heavens by vultures, where he was cured and received powers from the hawk. There is apparently no

trance among Krahó shamans, which might suggest that they are not true shamans. But each shaman explains how, like the man who went up to the sky in a myth, he was initiated through a sort of spontaneous rite of passage. He became sick and was abandoned, he was rescued by an animal (or other being) that cured him and gave him magical powers, which he tested, and then he was sent home with his new powers. In some cases there seems to occur a transformation of the shaman into the being that gives him powers, for example, the animal puts parts of his own organism into the body of the shaman, makes him eat the same food, and so on.

*Kayapó.* As among the Timbira, the village is the center of the Kayapó universe and the most socialized space. The surrounding forest is considered an antisocial space, where humans can transform into animals or spirits, sicken without reason, or even kill their relatives. Beings who are half-animal, half-people dwell there. The farther one goes from the village, the more antisocial the forest becomes, and its associated dangers increase. As there is always the danger that the “social” may be appropriated by the natural domain, escaping human control, the Kayapó engage in a symbolic appropriation of the natural, transforming it into the social through curing chants and ceremonies that establish a constant exchange between humans and the world of nature.

The section of forest in which the village population hunts, fishes, and cultivates land is first socialized by the attribution of place names. Thereafter human modifications of the natural world are accompanied by rituals. The opening of new gardens is preceded by a dance presenting many structural similarities to the war ritual. Opening up new gardens can be interpreted as a symbolic war against a natural rather than human enemy. Returning from the hunt, men must sing to the spirits of the game they themselves have killed in order for the spirits to remain in the forest. Each animal species designates a song that always begins with the cry of the dead animal.

Kayapó rites express basic values of their society, reflecting the image the group has of itself, the society, and the universe. Each rite translates a part of this cosmological vision and establishes a link between humans and nature, in which above all the human-animal relationship is reinforced. Kayapó rituals are many and diverse, but their importance and duration varies greatly. They are divided into three main categories: the large ceremonies for confirming personal names; certain agricultural, hunting, fishing, and occasional rites, for example, performed during solar or lunar eclipses; and rites of passage. The last are frequently solemn affairs, though short and only rarely accompanied by dances or songs. Examples of rites of passage include all ceremonies qualified by the term *merêrêmemex* (people who extend their beauty), a reference to the highly elaborate way in which people decorate themselves on such occasions. Such ceremonies are group-based activities whose goal is to socialize “wild” or antisocial values. This applies to the attribution of names, a central theme of most Kayapó ceremonies; in fact personal

names are borrowed from nature. Shamans enter into contact with the natural spirits and learn new songs and names from them, introducing them into culture through the large naming ceremonies.

On these occasions most of the ritual sequences take place in the village’s central plaza, where an inversion of ordinary social space may be noted. The center of the village, normally organized on the basis of friendship and nonkinship, is converted into the domain of activities in which both personal family bonds and natural—and therefore “wild” elements, such as the personal names or those of killed prey—are central. The true nature of “beauty” is not only visual but also refers to an inner beauty that results from the group’s activity, from the common effort required to “socialize” the names of people or of other precious objects.

*Xikrin.* For the Xikrin, the center of the world is likewise represented by the center of the circular village plaza, where rituals and public life in general unfold. The symbol of the center of the world and the universe is the rattle, a round, head-shaped musical instrument, played as the Indians sing and dance following a circular path that accompanies the solar trajectory. The Indians say that, when dancing, they return in time to their mythic origins, thereby recreating the energy required for the continuity and stability of the environment and the resources needed for survival, the continual reproduction of life, and the different social institutions that ensure the equilibrium indispensable to life in the community.

The Xikrin define distinct natural spaces of their universe: the earth, divided into open tracts and forest, the sky, the aquatic world, and the subterranean world. These are thought to possess distinct attributes and inhabitants, though related among themselves in different ways. The forest is home to different ethnic sets of enemies, terrestrial animals, and plants. Disrespectful appropriation of the animal world causes the fury of the spirit owner-controller of the animals who, through sorcery, regulates the predatory activities of humans. On the other hand, the forest is also the source of important attributes of Xikrin sociability, for there, in mythical times, the Indians acquired fire and ceremonial language. Clearings—places formed by the village or the swidens—are the site for kinship and alliance relations and for the individual’s socialization, in other words, for the definition of Xikrin humanity. The aquatic domain provides the possibility for strengthening physical and psychological aspects of the individual, because water causes rapid maturation through ritual immersions yet without altering the being’s substance. Water is a creative element in contrast to fire, which is a transformative element. An owner-controller also exists in the aquatic domain whose relationship with humans is one of solidarity. It was the owner-controller of the waters who taught humans to cure sicknesses. Medicinal plants come from the terrestrial domain, but their knowledge and the rules for manipulating them were acquired in the aquatic world through the mediation of a shaman. The sub-

terranean world is linked with blood, raw food, and cannibalism, representing a truly antisocial condition in which humans are prey rather than predators. It represents all that humans do not want to be. In the celestial domain, the East is the place of humanity par excellence, the place where the Xikrin originated. The Xikrin have two myths that consecrate them as inhabitants of the earth, in opposition to the sky where they originated and in opposition to the subterranean inhabitants, whom they succeeded in eliminating forever.

In Xikrin society an individual becomes a shaman after he survives an ordeal, in which he climbs a giant spider web and reaches celestial space with its eternal light, where the nape of his neck is symbolically perforated by a large harpy eagle and he thus acquires the capacity to fly. As in other native societies, the shaman has the power to transit between the human world and the natural and supernatural worlds. In life humans accumulate over time attributes from different cosmic domains, but the shaman lives, shares, and constantly communicates with these domains. In his role of intermediary, he lives in human society, shares the social world of animals and the supernatural, and has the capacity to manipulate the different domains. He negotiates with the owner-controllers of the animal world for plentiful game or an abundant catch of fish. He has the capacity to “see” in the widest sense, perceiving what is invisible to humans.

When a community has enough people and thus human resources, the cycle of rituals is continuous. During rituals individuals acquire knowledge of aspects of social organization and reproduction. Song, choreography, and decorations, which humans acquired in mythical time, are reproduced in ritual as manifestations of the present situation of humanity in the cosmos. The most important rituals are those focused on male and female naming and male initiation, consisting of five phases, each of which is symbolically related to one of the particular cosmic domains. These rituals are sometimes inserted within others, such as the new maize festival or *merêrêmei*, “beautiful festival,” which takes place during the transitional period between the dry and rainy seasons; the festivals incorporating new members of a ceremonial society, such as the armadillo society; the marriage ritual or mat festival; and the funerary rituals and ritual fishing using *timbó* vine poisons. There are also newly introduced rituals, such as *Kworo-kango*, or the manioc festival, which comes from the Juruna people. At certain periods, the ritual cycle attains its climax and develops over several days with high intensity and lavish style. Ceremonial life also acts as a crucial context for the expression of the ways in which the Xikrin reflect on the relationships developed with the white world.

**Arara (Carib).** The history of the formation of the Arara cosmos states that the primordial cosmos was shattered after a fight occurred between two people related as *ipari* (matrilateral cross-cousins or, more generally, affines). The land on the terrestrial level now is said to be what was left

over from the primeval cosmological floor that broke up and fell from the sky after the combat. That floor was also the edge of the domain where all benign beings used to live. Outside that domain, there were only malicious beasts who constantly fought, living a horrifying existence. With the shattering of the cosmos, the coexistence of all types of living beings became a necessity. Consequently extraordinary and evil creatures even now can appear on the terrestrial plane. To distinguish what is ordinary and beneficial from what is extraordinary and vicious, one must develop expertise through shamanic experiences.

As an institution Arara shamanism is dispersed, diffused, and generalized among the men. Acting as healers and agents for mediating with powerful metaphysical beings, all the men are initiated and practice at least some part of the shamanic techniques and arts. They are also responsible for ensuring, with metaphysical beings, the conditions for the hunts and rites that in turn ensure the circulation of game meat and beverages among the various subgroups. Game meat and drink make up an integral part of a system whose main axis is the native doctrine concerning the circulation of a vital substance called *ekuru*. Passing from the blood of killed animals to the earth and from there to the liquids that nourish and stimulate the growth of plants, this vital substance is the main object of desire—not only of human beings, but also of all beings who inhabit the world. Humans seek to acquire *ekuru* through the deaths of animals during the hunt and the transformation of plants into a fermented drink called *piktu*—a primordial source for acquiring these vital substances for humans.

The capacity of the earth to reprocess vital substances, transforming them into plant nutrients with which humans produce beverages, also shapes Arara funeral practices. In general the Arara do not bury their dead but construct a platform for them in the forest inside a small funeral house built especially for the occasion. Raised above the earth, the deceased gradually dries out, losing the body’s vital substances that are absorbed by metaphysical beings that lurk around corpses and feed on the elements that previously gave life to the deceased. The Arara funeral is thus a kind of an eschatological exchange or reciprocity with the world’s other beings. On the other hand, the circulation of *ekuru* takes place among the living through the exchange of meat for drink in the rites that follow the return of the hunters. Consequently rituals are the mode through which the circulation of vital substance conjoins various subgroups through reciprocity and mutual dependence. Through their overall symbolism, the prominent rites associated with the collective hunting trips are an efficient mechanism through which ethical and moral values become manifest and serve to constitute a native idea of their own collectivity. An intricate network of values and principles of interaction related to good conduct, kindness, solidarity, and generosity finds its primary medium of expression in the rituals.

**CABOCLO RELIGION.** The *caboclo* population lives in communities from the mouth of the Amazon to its headwaters

and on many of its tributaries. *Caboclos* are the mixed descendants of Indians and whites, and their religiosity consists of an intermixture of the rituals and beliefs of indigenous shamanism and popular Catholicism. Both forms are ways of explaining and dealing with the powers of the universe.

The shamanic universe is populated by “enchanted beings,” which were left by God as guardians of the forest, the waters, game animals, and so on. They are entities with powers of enchantment, metamorphosis, and hypnosis and can be either generous or vengeful. They include the “father” or “caboclo of the forest,” protector of the forest; the *caipora*, responsible for game animals; and the “caboclos of the water,” which can take humans to the bottom of rivers and streams. There are also animals (snakes, deer, and turtles) with human features that can protect, deceive, hypnotize, or make pacts.

The presence of these entities in nature makes the relations of the *caboclo* to the forest, rivers, and game highly ritualized. Daily activities, such as going into the forest or fishing, are marked by prayers or requests from the spirit entities to hunt or fish; the failure to do so could bring *panema* (bad luck), a force that infects humans, animals, or objects and makes them incapable of action. As there are procedures to cure *panema*, there are also procedures to enhance the power of the hunter, sometimes called “pacts,” in which, for example, the hunter exchanges the blood of the animal for greater productivity in the hunt. The relation of the *caboclo* to nature is thus one of dependence that is kept in balance by respecting norms of relations with its inhabitants and the exploitation of its resources.

The other aspect of *caboclo* religiosity is popular Catholicism, which, far from being opposed to the supernatural beings, consists of entities and practices that are integral parts of a single religious field. In general appeals are made to the Catholic saints to deal more with human affairs, whereas the enchanted beings and pacts have relatively more to do with relations to nature. As in other regions of Brazil, popular Catholicism involves saint day festivals, collective reciting of the rosary, novenas, devotion to patron saints, and making vows. The actual presence of church representatives (priests) is infrequent in this region, as it is restricted to annual visits to administer the Sacraments.

#### SOUTH AMERICAN INDIANS: INDIANS OF THE GRAN CHACO

The Gran Chaco (*chaco*, derived from Quechua, means “hunting land”) is an arid alluvial plain in the lowlands of south-central South America. Approximately 725,000 square kilometers in area, it lies between the Andes in the west and the Paraguay and Paraná rivers in the east, and between the Mato Grosso to the north and the Pampas to the south. The scrub forests and grasslands of the Gran Chaco, though sparsely populated, were the home of numerous indigenous groups. In the main they were hunters, fishers, and gatherers, moving seasonally in search of food and practicing supplementary farming. Few still follow their traditional way of life.

The religion of the indigenous groups of the Gran Chaco can be understood through an examination of their mythic narratives, which contain their primary structures of meaning. These myths give an account of a primordial time in which an ontological modification was produced by the actions of various supernatural beings who shaped present-day cultural reality. This rupture may be caused by a lawgiver (who frequently has the appearance of a trickster), or it may be the result of infractions by ancestors or by the transformations of ancestors. Numerous supernatural beings with avowedly demonic characteristics monopolize the realm of fear and danger; their ambivalent intentions toward human

beings are usually resolved through malevolent action that manifests itself in illness, culminating in the death of the individual. The general notion of power, such as the *la-ka-áyah* of the Mataco, or specific powers, such as the *uhopié* of the Ayoré, are the structures that ontologically define the supernatural beings as well as people who have been consecrated by them.

The spectrum of supernatural beings encompasses everything from shamans and witches, in the cases of the Guiacurú or the Mataco, to the state of "amorous exaltation" known to the Pilagá. For an integral understanding of the peoples of the Chaco it is important to consider the contributions of these special personages and states of being, which contribute a unique cultural identity to each group's cosmology. In almost all the ethnic groups of the Gran Chaco the shaman occupies the central role in religious tasks, sometimes defending and protecting, and, at other times, injuring. When engaged in healing practices, he can combine various techniques, such as singing, shaking rattles, blowing, and sucking, and can command the collaboration of familiar spirits who are generally powerful owing to their demonic nature. An important aspect of Gran Chaco religions is the idea that one or many souls are incarnated in an individual. Once the individual is dead, these souls, or spirits, enter a demonic state. Although they are directed to an established underworld, they continue to prey upon human communities.

**THE ZAMUCO FAMILY.** The two members of the Zamuco language group are the Ayoré and the Chamacoco of Paraguay, in the northeastern Chaco.

**The Ayoré.** The religion of the Ayoré (Ayoreo, Ayorocode) is expressed primarily in an extensive set of myths. All natural and cultural beings have their origins related in mythic tales, and in certain cases in various parallel myths. The morphology of the myths centers upon the metamorphosis of an ancestral figure into an entity of current reality. Each tale narrates events that occurred in primordial times and is accompanied by one or more songs, which may be used for therapeutic (*sáude*) or preventive (*paragapidi*) purposes.

Despite the abundance of tales, it is possible to classify the Ayoré myths in different cycles as they relate to a particular supernatural being or theme:

- (1) *The cycle of ancestors.* Each tale in this cycle recounts events in the life of an ancestor (*nanibahai*). These generally end with the ancestor's violent transformation into an artifact, plant, animal, or some other entity of the cosmos, and with the establishment by the ancestor of cultural prescriptions (*puyák*) governing the treatment of the new being and punishments for ignoring these prescriptions.
- (2) *The cycle of Dupáde.* A celestial supernatural being, Dupáde is associated with the sun; he causes the metamorphosis of the ancestors.
- (3) *The cycle of the Flood.* The tales of the Flood (*gedekesna-*

*sóri*) describe an offense inflicted on lightning by the *nanibahai*, their punishment in the form of a continual rain that inundated the world, and the survival of a few Ayoré, who became the first aquatic animals.

- (4) *The cycle of "water that washes away."* These tales describe a flood (*yotedidekesnasóri*) similar to that that appears in the preceding cycle, which was caused by Dicsná ("cricket"), the ruler of water.
- (5) *The cycle of the Asohsná bird.* This bird (*Caprimulgidae spp*) is surrounded by numerous *puyák*. The central tale of this cycle relates the life of the female ancestor who created this bird. Asohsná is a supernatural being who established the annual ceremony that divides the year into two segments, one of which is characterized by an incalculable quantity of restrictions.
- (6) *The cycle of Asningái.* This cycle relates the courage of an ancestor named Asningái ("courage"), who threw himself onto the fire, transforming himself into an animal with certain morphological characteristics. It also established the meaning of slaughter, an important institution among the Ayoré, since an individual could rise to the status of chief (*asuté*) through contamination by spilled blood.

Illness is thought to be caused in almost all cases by the individual's violation of *puyák*. The cure is entrusted to the *igasitái*, those who have knowledge of *sáude*, whose power can undo the illness through the powerful word of the ancestors. The shaman, or *daihsnáí*, arrives at this state through an initiation that involves the ingestion of a strong dose of the juice of green mashed tobacco, which enables him to assume a special potency called *uhopié*. When an individual dies, the body (*ayói*) and mind (*aipiyé*) are destroyed; the soul (*oregaté*) moves to the underworld (*nabupié*).

**The Chamacoco.** The narrative of the Chamacoco, which recounts sacred events, is called "The Word of Ešnuwérta." This tale constitutes the secret mythology of those men who have undergone initiatory ordeals and contains the social and religious knowledge of the group. Ešnuwérta is the primordial mother. The myth is connected to the women of primordial times who were surprised by harmful supernatural beings (*axnábsero*). "The Word of Ešnuwérta" includes the actions of these *axnábsero*, characters to whom Chamacoco reality is subordinated. The physiognomy of these supernatural beings is similar to that of the Ayoré ancestors in that current reality originates from their transformations and their deaths. The distinctive characteristic of the *axnábsero* is their malignant power (*wozós*) over people.

The foundation of the social order is presented in this myth, since Ešnuwérta instituted the clans as well as the male initiation ceremonies in which the participants identify themselves with the principal deities of the myth.

The Chamacoco shaman (*konsáxa*) exercises a power appropriate to a specific region of the cosmos; for this reason

there are shamans of the sky, of the water, and of the jungle. The shaman initiation begins with a vision of Ešnuwérta, who reveals the cosmos as well as the practices appropriate to the work of the shamans. Another custom originating from Ešnuwérta is called *kaamták* and has to do with a ritual offering of food; it relates to the impurity of blood, among other themes.

**THE TUPI-GUARANÍ FAMILY.** The Tupi-Guaraní language family includes the Chiriguano of Bolivia and the Tapuí of Paraguay.

**The Chiriguano.** The tale of the mythical twins Yanderú Túmpa and Áña Túmpa is the most prevalent myth among the Chiriguano (Mía) and appears in conjunction with lunar mythology. The celestial supernatural being Yanderú Túmpa made the cosmos and bestowed its goods on the Chiriguano, at the same time instructing them in cultural practices. He conceived and made Áña Túmpa, who, because of envy, attempts to undermine all Yanderú Túmpa's works. Áña Túmpa received from his maker power (*imbapwére*), which he in turn gives to other beings (*áñas*) who aid him in his malignant activities. As a result the world has undergone a profound alteration. It is now the actions of the *áñas* that determine the condition of the Chiriguano world, and they have introduced calamities such as illness and death. The expression *túmpa* is difficult to comprehend, but it appears to designate a quality that transforms the various entities into "state beings." The terms *áña* and *túmpa* define the supernatural nature of these beings, that is to say, they emphasize that they are extraordinary.

The shaman and the sorcerer are both initiated by the acquisition of power from the *áñas*. The initiation itself is centered on the *áñas*. Due to their ambivalence, an initiate can become a shaman (*ipáye*) if their intent is benevolent; if their intent is malevolent, the initiate receives only malignant power that causes misfortune to the people and the community.

**Tapuí and Guasurangwe.** The religion of the Tapuí and the Guasurangwe, or Tapieté (an offshoot of the former), does not differ essentially from that of the Chiriguano; the same structures of meaning and the same supernatural beings may be observed.

**LENGUA-MASCOY FAMILY.** The Lengua-Mascoy language group of Paraguay includes the Angaité, Lengua, Kaskihá, and Sanapaná peoples.

**The Angaité.** The religious nature of the Angaité (Chanamá) has undergone syncretism owing to their proximity to the Mascoy and Guaranian groups. Their mythology makes reference to three levels—the underworld, the terrestrial world, and the celestial world—all of which are inhabited by supernatural beings characterized by their ambivalent actions toward humans. The deity of the dead, Moksohanák, governs a legion of demonic beings, the *enzlép*, who pursue the sick, imprison them, and carry them to the "country of the dead," which is situated in the west. At night it is even

possible for them to overpower passersby. The *gabioamá* or *iliabiün* act as the spirit familiars of the shaman, and with him their role is ambivalent in a positive sense. For example, they are in charge of recapturing and restoring the souls of the sick.

According to Angaité myth, fire was obtained by a theft in which a bird was the intermediary; it was stolen from a forest demon, one of the *iek'amá*, who are anthropomorphic but have only one leg. Also anthropomorphic is the soul-shadow (*abiosná*), whose eyes are its distinguishing feature. The concept of corporal material as such does not exist, except for the *iek'amá* ("living cadaver" or "skeleton"), which is what remains after death.

During the initiation process, the shaman goes into the depths of the forest or to the banks of the river, where the familiar spirits (*pateaskóp* or *enzlép*) come to him in a dream. He communicates with the familiars through ecstatic dreams and songs. His therapeutic labors include sucking harmful agents from the bodies of the sick and applying vegetable concoctions whose efficacy resides in their "bad smell." There are shamans with purely malignant intentions, such as the *mamobót*, who are responsible for tragic deaths among members of the group. The benevolent shaman is responsible for discovering the identity of the bewitching shaman and for quartering and burning the body of the victim as a restorative vengeance. The Angaité do not have "lords" or "fathers" of the species; the figures closest to this theme are Nekéñe and Nanticá, male and female supernatural beings respectively, who are anthropomorphic and whose realm is the depths of the waters.

**The Lengua.** The anthropogenic myth of the Lengua (Enlhít, Enslét) attributes the formation of giant supernatural beings and the ancestors of the Lengua to Beetle, who utilized mud as primary material. After giving these beings a human form, he placed the bodies of the first *enlhíts* to dry on the bank of a lake, but he set them so close together that they stuck to one another. Once granted life, they could not defend themselves against the attacks of the powerful giants, and Beetle, as supreme deity, separated the two groups. Eventually the inability of the *enlhíts* to resist pursuit and mistreatment by the giants became so grave that Beetle took away the giants' bodies. The giants' souls gave birth to *kilikháma* who fought to regain control of the missing bodies, and it is for this reason that they torment present-day humans.

The important Lengua myths include the origin of plants and fire and the fall of the world. Ritual dramatizations of the myths are part of the celebrations for female puberty (*yanmána*), male puberty (*wainkya*), the spring and autumn equinoxes, the summer solstice, war, the arrival of foreigners, marriage, and mourning.

Human reality consists of a "living soul" (*valhók*), whose dream existence is important. At death, a person is transported to *vangáuk*, which is a transitory state that leads to the

*kilikháma* state. The *apyxóólhma*, or shaman, receives power (*siyavnáma*) through visions and apprenticeship to the song of the plants, whose ingestion, though lacking hallucinogenic properties, produces ritual death. Once he obtains *siyavnáma*, the shaman commands the *kilikháma*, who control numerous beings and realms of the universe. The territory of the dead (*pisisl*), situated toward the west, is the destination of the souls of the dead, although some remain close to the living.

**The Kaskihá.** The “masked celebration” of the Kaskihá is of particular interest. It is based on a myth that describes the origin of the festive attire following the quartering of the water deity Iyenanik. The practice of *kindáian*, which is a dance, is the only medium for invoking the power of such deities.

**The Sanapaná.** The rich mythic narrative of the Sanapaná focuses on the war between the heavenly world, inhabited by the ancestors (*inyakahpanamé*), and the terrestrial world, inhabited by the fox (*maalék*). The ancestors, who differ morphologically from present-day humanity, introduced the majority of cultural goods. Among the fundamental structures distinguished by the Sanapaná is the “dream,” the soul’s life in its wanderings separate from the body. Death is understood as theft of the soul by demonic forces, the souls of the dead that stalk during the night in forests and marshes. The demonic spirits are anthropomorphic. Some are malignant, including those whose mere appearance can cause immediate death. There are also benevolent spirits who are the familiars of shamans (*kiltongkamák*). The shaman’s initiation involves fasting and other tests.

**MATACO-MAKKÁ FAMILY.** The Mataco-Makká language family of the central Chaco includes the Mataco, Chulupí, Choroti, and Makká.

**The Mataco.** The religious universe of the Mataco (*Wichi*) centers on the notion of power (*la-ka-áyah*), which is the property of innumerable supernatural beings of demonic (*abát*) or human (*wichi*) nature, personifications of such phenomena as the sun, moon, stars, and thunder. The Mataco recognize a dualism of body (*opísán*) and spirit (*o’ nusék*) in humans. Death changes the *o’ nusék* into a malevolent supernatural being.

The central character in Mataco mythic narrative (*pahláts*), Tokhwáh, is the one who imposes cosmic and ontological order on the present-day world. The actions of this supernatural being, who has a demonic nature, are incorporated in his trickster aspect; nonetheless, he is perceived by the Mataco as a suffering and sad being. In his law-giving role he introduces economic practices and tools; humanizes the women who descend from the sky by eliminating their vaginal teeth; institutes marriage; and teaches the people how to get drunk, to fight, and to make war. He also introduces demonic spirits who cause illnesses (*aités*) and establishes the shamanic institution (*hayawú*) and death. The most important Mataco ceremony is carried out

by the shamans, in both individual and communal form, with the objective of expelling illnesses according to Tokhwáh’s teachings.

The shamanic initiation includes possession (*welán*) by a demonic spirit (*abát*) and the consequent separation of the initiate’s soul (*o’ nusék*), which undertakes journeys to the different realms of the cosmos. When the initiation is complete, the shaman has achieved an ontological alteration in the state of his soul—he has been transformed into a demonic being. The smoking or inhalation of the dust of the sumac (*Anadenanthera macrocarpa*) is a frequent shamanic practice.

**The Chulupí.** The mythology of the Chulupí (Nivaklé, Aslusláy) comprises three narrative cycles on the deities who acted in primordial times, but who then distanced themselves from humanity and the earthly world. The Xitscittsamme cycle describes a supernatural being comparable to an almost forgotten *deus otiosus*. The cycle of the supernatural being Fitsók Exíts includes prescriptions for the rites of female initiation; myths recounting the origin of women, of the spots on the moon, and of honey, among other things; and the tale of the expulsion from the universe of the supernatural creator. The Kufiál cycle relates the cataclysmic events accompanying the fall of heaven and the subsequent actions of the demiurge Kufiál, to name a few of its themes.

A structure essential to the Chulupí religion is *sič’ee*, or ultimate power, which defines and dominates a vast group of beings and actions. In effect, *sič’ee* is the strange made powerful, which can manifest itself in unexpected guises—in human or animal form, by means of a sound or a movement like a whirlwind, or as master of the spirits of the forest. The *sič’ee* plays a significant role in the initiation of the shaman (*sič’ee*): He appears to the shaman in the guise of an old man, for example, who offers the shaman power and grants him the spirit familiars called *wat’akwáís*. By fasting, enduring solitude in the woods, and drinking potions made of various plants, the initiate achieves a revelatory experience rich in visions, many of which are terrifying. The Chulupí idea of animistic reality is extremely complicated and varied, given that the soul can appear in any number of manifestations.

**The Choroti.** The principal cycles of the Choroti are five in number. The cycle of Kixwét describes a supernatural being, of human appearance but gigantic, whose role comprises the duplicity of both the demiurge and the trickster. The cycle of Ahóusa, the Hawk, the culture hero *par excellence*, recounts how he defeated the beings of primordial times, stealing and distributing fire and teaching humans the technique of fishing and the making of artifacts. The cycle of Woiki, the Fox, who partakes of the intrinsic nature of Kixwét and is a very important figure in indigenous cultures, contains myths describing his creation of various beings and modalities of the present-day world. The cycle of We’la, the Moon, relates the formation of the world. The cycle of Tsematakí alludes to a feminine figure characterized by her ill will toward men and her uncontainable cannibalism.

The Choroti shaman (*áiew*) receives power (*i-tóksi*) from the supernatural beings (*thlamó*), and the strength of his abilities depends on the number of familiars (*inxuélai*) he has.

**The Makká.** The Makká mythology can be classified as eclectic, as it demonstrates cultural contact with almost all the other indigenous groups of the Gran Chaco. The Makká cycle of the fox is similar to the narrative cycle surrounding the Mataco supernatural being Tokhwáh and demonstrates similar themes, such as the origin of women and the toothed vagina. The Makká hero Tippá, who possesses an immense penis, is somewhat reminiscent of Wéla, the Mataco moon deity.

In earlier times, power (*t'un*) was obtained by capturing a scalp, after which a complex ceremony was held in which the scalp was discarded but the soul (*le sinkál*) of the dead enemy was retained as a personal familiar, or spirit helper. This familiar would manifest itself during sleep by means of a song that even today is sung during drinking bouts. Ceremonies of drinking bouts among adults permit the regulation of power among people. The ceremony of female initiation is also important, as is true throughout most of the Gran Chaco.

The organization of the traditional religious universe was altered through the introduction of Christianity by General J. Belaieff, who brought the Makká from the interior of the Chaco to the outskirts of Asunción. The icon of Belaieff is now a central theme in Makká shamanism. Just as among the Mataco, the shaman (*weihet'x*) is charged with controlling the demonic supernatural beings (*inwomét*).

**GUIACURÚ-CADUVEO FAMILY.** The Guíacurú-Caduveo language family of the Gran Chaco and Brazil includes the tribes known as the Pilagá, the Toba, the Caduveo, and the Mocoví.

**The Pilagá.** Certain mythic cycles may be distinguished in the Pilagá mythology. One cycle describes the celestial deity Dapiči, to whom is attributed the inversion of the cosmic planes and the transference of some animals and plants to the sky. In the past, prayers were offered for his help in the most diverse activities. Another cycle describes Wayaykaláciyi, who introduced death, made the animals wild, and established hunting techniques, modifying the Edenic habits of an earlier time. Among the eminent supernatural beings is Nesóge, a cannibalistic woman who determines the practices of the witches (*konánagae*). Such characters and themes as the Star Woman and the origin of women appear in Pilagá myths.

Among the significant structures, the *payák* is the most important. This notion defines nonhuman nature, which is peculiar to supernatural beings, shamans (*pyogonák*), animals, plants, and some objects. Relations with the *payák* determine conditions in the indigenous world. Either people acquire *payáks* as familiars who aid them in their customary activities, or the *payáks* inflict suffering on them in the form

of illness, the death of domestic animals, the destruction of farms, or a poor harvest of fruit from wild plants. Such concepts as the “master-dependent” (*logót-lamasék*) and the “center-periphery” (*laiñi-lail*) allow the Pilagá to classify beings and entities according to a hierarchy of power.

The initiation of women takes place at the onset of menses. The young girl is locked in a corner of her hut and forced to fast rigorously. When males reach adolescence, they submit to scarification of their arms and legs by a shaman, and the young man is given the characteristics of the species of animal whose bone was used as a scarifier. Throughout entire lives, men continue to scarify themselves, especially when preparing for the hunt or going into battle.

**The Toba.** The principal themes of Toba (Kom) narrative are celestial cosmology and mythology, which appear in stories about Dapiči and the Pleiades; cataclysms; the origin of specific entities; stories of animals; stories of the trickster Wahayaka'lacigu, the lawgiver Ta'ankí, and Ašien, a supernatural being with a repulsive appearance; and encounters between Toba people and the supernatural being Nowét. The morphology of these characters, all of whom were powerful in the primordial times, fluctuates between the human and the animal.

For the Toba, the central structure of the cosmology is *nowét*, which appears in the forms of the masters of animals and of the spheres. Nowét, as a supernatural being, initiates the shamans (*pi'ogonák*) and grants them power that can be used equally to heal or to harm. Outside the shamanic sphere, all special skills—hunting, fishing, dancing, and so on—derive from power given by Nowét. Dreams are structures that have importance in the relations between humans and Nowét. Shamanic power is established by the possession of spirit familiars (*ltawá*), who help shamans cure serious illnesses, which are considered intentional and also material. Therapy combines singing, blowing, and sucking as methods of removing the harmful agent from the victim's body.

Some of the important ceremonies of the Toba are name giving, the initiation of young boys, the offering of prayers to Dapiči, matutinal prayers to the heavenly beings, and the supplications of the hunters to some supernatural being in a *nowét* state.

**The Caduveo.** Go-neno-hodi is the central deity of Caduveo mythology; he is maker of all people and of a great number of the cultural goods. His appearance is that of a Caduveo, and he is without evil intention. In his benevolence, he granted the Caduveo, in ancient times, an abundant supply of food, clothes, and utensils, as well as eternal life, but the intervention of Hawk, astute and malicious, made Go-neno-hodi modify the primordial order. Nibetád is a mythical hero identified with the Pleiades; he greeted the ancestors during the ceremony celebrating the annual reappearance of this cluster of stars and the maturation of the algaroba (mesquite).

The shamanic institution is actualized in two different individuals: the *nikyientgi* (“father”), who protects and bene-

fits the community, and the *otxikanrīgi*, the cause of all deaths, illnesses, and misfortunes in the group. Celebrations that are particularly worthy of note are the lunar ceremonies, the rites celebrating the birth of the chief's son, and the initiations of young men and women.

**The Mocoví.** Prominent in the scattered Mocoví material is the myth of an enormous tree that reached to the sky. By climbing its branches, one ascended to lakes and to a river. An angry old woman cut down the tree, extinguishing the valuable connection between heaven and earth.

Gdsapídogaté, a benevolent supernatural being, presides over the world of the living. His activity contrasts with that of the witches. Healing practices among the Mocoví are the same as those of the other shamans of the Gran Chaco, with the addition of bloodletting. The Mocoví, like all the Guaicurú, believe in the honor of war and value dying in combat as much as killing. When they return from a battle they hang the heads of the vanquished on posts in the center of town and they sing and shout around them. The horse plays an important role in daily life and in the hereafter; when the owner of a horse dies, the horse is sacrificed and buried beside the owner to bear him to his final destination in the land of the dead.

**ARAWAK FAMILY.** The extensive Arawak family of languages includes the Chané of Argentina. Fundamental distinctions cannot be made between the corpus of Chané myths and that of the Chiriguano; similarities abound between them, particularly with respect to the figure of the shaman. There are two kinds of shamans: one with benevolent power (the *ipáye*) and another dedicated exclusively to malevolent actions that cause death (the *ipayepóci*). The *mbaidwá* ("knower, investigator") has dominion over the individual destinies of humans.

One of the most important aspects of Chané religion is the carnival of masks (also celebrated by the Chiriguano). Some of the masks are profane, representing animals and fantastic anthropomorphic characters. The sacred masks represent Áña, and these are deadly playthings that cannot be sold to travelers. When the carnival is finished, the masks become dangerous and must be destroyed.

#### BIBLIOGRAPHY

One can find an abundant bibliography on indigenous groups of the Gran Chaco in *Ethnographic Bibliography of South America*, edited by Timothy O'Leary (New Haven, Conn., 1963). The *Handbook of South American Indians*, 7 vols., edited by Julia H. Steward (Washington, D.C., 1946–1959), offers general characteristics on habits and customs of the peoples of this cultural area. The *Censo indígena nacional* (Buenos Aires, 1968) is restricted to the Argentine Chaco. Fernando Pagés Larraya's *Lo irracional en la cultura* (Buenos Aires, 1982) studies the mental pathology of the indigenous people of the Gran Chaco and then reviews their religious conceptions. *Scripta ethnológica* (1973–1982), a periodical published by the Centro Argentino de Ethnología Americana, Buenos Aires, contains more systematic information about the aboriginal peoples of the Gran Chaco.

There are only a few specific works that deal with particular groups; among those few are *Los indios Ayoreo del Chaco Boreal* by Marcelo Bórmida and myself (Buenos Aires, 1982). Branislava Susnik has also given attention to the Chulupí natives in *Chulupí: Esbozo gramatical analítico* (Asunción, 1968). Also worthy of mention are Miguel Chase-Sardi's *Cosmovisión mak'a* (Asunción, 1970) and *El concepto Nivaklé del Alma* (Lima, 1970). Bernardino de Nino wrote an *Ethnografía Chiriguano* (La Paz, 1912). In reference to the Caduveo culture, see Darcy Ribeiro's *Religião e mitologia Kadiwêu* (Rio de Janeiro, 1950). One can also consult Johannes Wilbert's *Folk Literature of the Mataco Indians* and *Folk Literature of the Toba Indians* (both Los Angeles, 1982).

INSULAR CULTURES  
NEW RELIGIOUS MOVEMENTS IN INSULAR CULTURES

### SOUTHEAST ASIAN RELIGIONS: HISTORY OF STUDY

Southeast Asia straddles one of the two trade routes linking East Asia and the Mediterranean. For many centuries, merchants traveled through the Straights of Malacca to points further east, bringing spices, gold, and other precious commodities, and with them came religious texts, modes of ritual practice, iconographies, and other religious systems. A consequence of this strategic location is that virtually all of the major religions of the world can be found in Southeast Asia. Today by far the most common religious traditions are Theravāda Buddhism, Islam, Roman Catholicism, and the Vietnamese variant of traditional Chinese religion. Yet there are also communities of Balinese and Tamil Hindus, Protestant Christians, Sikhs, and Zoroastrians. Prior to the Second World War there were significant Jewish communities. One can also find a vast array of indigenous religions in traditionally isolated portions of the region that are either upland or on remote islands far from the trade routes.

The diversity of religion in Southeast Asia has attracted area specialists in almost all religious traditions to study the region, and the theoretical orientations and methodologies employed in the study of religion in the region are nearly as diverse as the religions of the region itself. The academic study of religion in Southeast Asia began in the early decades of the nineteenth century. The earliest works are largely descriptive. Most of them were written by colonial officials or Christian missionaries. Stamford Raffles, John Crawfurd, and Christiaan Hurgronje were among the colonial officers who made enduring contributions to the study of religion in Southeast Asia. Among the most important works by missionary scholars are Hans Scharer's studies of the indigenous religions of Kalimantan (Borneo) and Paul Bigandet's study of Burmese Buddhism. Subsequent scholars have employed a variety of philological, archeological, historical, literary-critical, political-science, and anthropological approaches. Many more general works provide important data for scholars of religion. Among the most important of these are district gazetteers and other publications of colonial governments. These often provide the only available materials for the study of the history of religion at the local level. James Scott's *Gazetteer of Upper Burma and the Shan States* (1900–1901) and John Crawfurd's *History of the Indian Archipelago* (1820) are outstanding examples. Novels and other works of fiction can also provide valuable information. A clear example is Pramoedya Ananta Toer's four-volume novel *Buru Quartet* (1996), which is a fictionalized account of the religious and cultural forces that contributed to the rise of Indonesian nationalism.

Despite this double diversity, one can detect the following general themes and questions that have shaped the academic study of religion in Southeast Asia:

- Links between scholarly agendas and the agendas of colonial and postcolonial states.
- Relations between religion and politics in traditional Southeast Asian states.
- The development of increasingly nuanced understandings of the nature of religious traditions.
- The emergence, in the last decades of the twentieth century, of a symbiotic relationship between religious studies and the social sciences, particularly cultural anthropology.

These four factors interact in very complex ways in the academic discourse about religion in Southeast Asia.

**POLITICAL AGENDAS.** The political agendas of colonial and postcolonial states did much to shape the development of scholarly traditions. They have influenced the topics scholars have chosen to investigate and the interpretation of their findings. The academic study of religion in Southeast Asia dates back to the early decades of the nineteenth century at a time when the British, French, Dutch, and Spanish were consolidating colonial empires. Edward Said has argued that in the Middle East, colonial scholarship was among the

means through which Europeans sought to dominate and domesticate potentially hostile religious elites. Much the same can be said of colonial scholarship on Southeast Asia.

Such works as compilations of customary law and gazetteers describing local customs and periodic rituals were of immediate value to colonial officials and other resident Europeans. They remain valuable resources for scholars concerned with religious change, and are particularly important for scholars of the indigenous religions of tribes of the region. An overwhelming number of these groups converted to Christianity in the first half of the twentieth century. As their traditional religions were orally transmitted, European writings provide the only available information about those early religions.

The study of religion also provided instruments for domination in a more subtle sense. Many of the monumental works of colonial scholarship, including Stamford Raffles's *History of Java* (1817) and Paul Mus's *Barabudur* (1935), locate the greatness of Southeast Asian cultures in the distant past. These studies provided support for colonialist apologetics, a major theme of which was that Southeast Asian cultures had become decadent and corrupt and that benevolent Europeans were assisting these cultures with colonial rule. While intended for a European audience, these works were also read by many Southeast Asians and are in part responsible for the sense of cultural dislocation so vividly described by Toer in his novels.

Islam and Buddhism were equally misrepresented, though in very different ways. Raffles and Theodore Pigeaud went to great lengths to deny the Islamic character of Indonesian and particularly Javanese civilization. For them, Islam was a threat to colonial authority. Portraying Indonesia as a Hindu culture was part of a strategy of colonial domination. Indonesian elites educated in Dutch schools were taught that their culture and religion were an amalgamation of Hinduism and Mahayana Buddhism, and were discouraged from learning more than the rudiments of Islam. Christiaan Hurgronje, the greatest Islamicist of the colonial era, also contributed to this agenda. His studies of the Achehnese and the Southeast Asian community in Mecca were as much political briefings as they were scholarship. The Dutch were involved in a bitter war with the Achehnese and regarded Mecca as a dangerous source of rebellion.

Buddhism was misrepresented in a different way. Many of the early works on Theravāda Buddhism in Southeast Asia were written by scholars who, if not Buddhists themselves, were extremely sympathetic towards a particular understanding of Buddhism. James Scott, Harold Fielding-Hall, and others understood Buddhism as an abstract rational science of the mind with little use for spirits, gods, or what they understood as superstitious practice. They regarded what are now clearly understood as Buddhist ritual practices as either the superstitions of the lower classes or remnants of a heathen past. Like many other earlier European interpreters of Buddhism, they imagined Buddhism as they wished it to be.

The academic study of religion continues to be politically significant in the region. This is especially true of scholarship published in the languages of the region. Religious studies are not well developed in the region, but with the expansion of modern education since the end of the colonial era, studies of religion by Southeast Asian scholars have become increasingly common. Many Southeast Asian scholars of religion are trained in history; others in area, Buddhist, or Islamic studies. In many instances the lines between academic and committed scholarship is a fine one. In Southeast Asia many scholars of religion are actively engaged in political causes, movements, or parties. In addition to more traditional academic venues, intellectuals regularly publish in daily papers and weekly news magazines. Among the issues of concern to these scholars are economic development, ecological degradation, human rights, social justice, and democratization. There are no systematic studies of the writings of scholar-activists in European languages. In the Islamic societies of the region, questions concerning banking and finance are also important because of the traditional Islamic prohibition on interest. Most of this literature is inaccessible to non-specialists because there are very few translations.

More conventional scholarship may also be pointed. Muslim Indonesia provides a cogent example. Indonesian scholars are familiar with Western scholarship that has depicted traditional cultures as being only trivially Muslim. Islamists often cite the works of Clifford Geertz as proof that their own critiques of religious traditionalists are valid. To establish the orthodoxy of their positions, traditionalists have produced countertexts that can be read simultaneously as history and theology. Zamakhsyari Dhofier's *The Pesantren Tradition* (1999) is a ready example. In this way academic scholars of religion are drawn into Southeast Asian religious discourse.

Political considerations have also influenced which communities are studied and which are not. Politically significant communities receive greater attention than minorities. Scholarly neglect of Southeast Asian Christianity, traditional Chinese religion, and Tamil Hinduism is especially apparent. Neglect of Southeast Asian Christianity is among the most serious problems confronting the field. The conversion of many tribal and Chinese people to Christianity has fundamentally altered the religious landscape of Southeast Asia. In general, there has been very little research on the interaction of religious communities in any Southeast Asian country. The religions of Myanmar (Burma) have also suffered from scholarly neglect, but for a different reason: very few scholars have been able to conduct research there since the middle of the twentieth century.

**RELIGION, POLITICS, AND CULTURE.** Many scholars of Southeast Asian religions have been concerned with the role of religion in indigenous political systems and the interrelation of religion and culture. Archeologists and historians have attempted to discern the religious foundations of Southeast Asian statecraft. Of the few manuscripts that have

survived from the precolonial period, a substantial number concern theories of kingship. This concern is also found in nineteenth-century texts, many of which are preserved in libraries and archives in Holland, Great Britain, and France, as well as Southeast Asia. Other important sources of the role of religion in politics include Chinese texts, inscriptions on monuments, and archeological sites, such as Pagan, Angkor, Ayutthaya, and Borobudur. George Coedes, Robert Heine-Geldern, Stanley Tambiah, and others have found that Southeast Asian kingdoms were structured as representations of Hindu or Buddhist cosmologies and that kings were often described as divine or semidivine beings. Muslim kingdoms retain some of the symbolism of the Hindu and Buddhist past and also describe Sultans as descendants of the Prophet Muhammad and as representatives of God on earth.

A substantial body of scholarship focuses on the role of traditional religious concepts in contemporary Southeast Asian politics. Benedict Anderson, Clifford Geertz, and others suggests that traditional concepts of power and authority continue to inform political discourse and the conduct of politics throughout the region. In modern Southeast Asia, religion has been used to legitimize the political programs of states, leaders, and parties, be they authoritarian or liberal.

**ON THE NATURE OF RELIGIOUS TRADITIONS.** For most of its history, the academic study of religion has looked to ancient, philosophically complex texts for the essence of religious traditions and has assumed that popular and contemporary variants of these texts are in some sense corrupt. This understanding of world religions is apparent in many important studies of contemporary Southeast Asian religions, including Melford Spiro's *Buddhism and Society* (1982) and Clifford Geertz's *The Religion of Java* (1960). As Boone observes, this has led to the construction of artificial canons recognized only by Western or Western-trained scholars. The tendency to understand world religions as philosophical systems embodied in ancient texts has contributed to the view that Southeast Asian Buddhists, Hindus, and Muslims are only superficially such and that indigenous animisms remain the most important of Southeast Asian religions. This view was articulated by Raffles in the early nineteenth century and has been subject to serious criticism only since the mid-1970s.

As scholars of religion have become increasingly concerned with religion as lived experience, many have come to question the assumptions of traditional philological scholarship. As a result, there is a greater appreciation of noncanonical texts and the relation of religion to daily social life. This has led to a creative convergence of religious studies and cultural anthropology.

**RELIGIOUS STUDIES AND CULTURAL ANTHROPOLOGY.** Since the 1970s the distinction between cultural anthropology and religious studies has been muted by developments in both disciplines. Earlier generations of anthropologists generally focused on exclusively oral traditions. Even those who studied Buddhists, Muslims, and other adherents of literary

religions paid scant attention to religious texts. This state of affairs began to change in the 1960s and 1970s as anthropologists became increasingly concerned with systems of symbols and meanings and as scholars of religion turned their attention to contemporary versions of world religions. This convergence began in communities of scholars focused on Theravāda Buddhism and Balinese Hinduism and has progressed to the point where works by cultural anthropologists and scholars of religion are difficult to distinguish. Its greatest impact is seen in the study of Southeast Asian Islam, which has moved from the margins to the mainstream of scholarly discourse on Southeast Asian religion and the Islamic tradition more generally.

**CONCLUSIONS.** Southeast Asia offers a wealth of research opportunities for scholars of many disciplines concerned with the study of religion. Scholars can study particular variants of most of the major religions of the world or social and cultural systems comprising multiple religious communities, with their different religious traditions and languages.

MARK R. WOODWARD (2005)

## SOUTHEAST ASIAN RELIGIONS: MAINLAND CULTURES

Mainland Southeast Asia has been termed the “crossroad of religions,” for in this region, today divided into the countries of Burma, Thailand, and Laos, Cambodia (Kampuchea), and Vietnam, a large diversity of autochthonous tribal religions are intermingled with Hinduism, Theravāda and Mahāyāna Buddhism, Daoism, Confucianism, Islam, and Christianity, as well as the modern secular faith of Marxist-Leninism. Beneath this diversity there are many religious practices and beliefs that have common roots in the prehistoric past of peoples of the region. This is not to say, as have some scholars, that the historic religions are merely a veneer and that those Southeast Asians who adhere to religions such as Buddhism have been, as Reginald LeMay said of the Northern Thai, animists from time immemorial. Although certain beliefs and practices can be seen as linking peoples of the present to ancient Southeast Asian religions, they have often been reformulated to make sense within worldviews shaped by historic religions. The processes of religious change have, moreover, intensified in the wake of radical shaking of traditional orders taking place throughout the twentieth century.

Mainland Southeast Asia is not only a region of religious diversity; it is also a veritable Babel. Insofar as historical linguistics permits a reconstruction of the past, it would appear that most of the earliest inhabitants of the region spoke Austroasiatic languages ancestral to such modern-day descendants as Khmer and Mon. Many of the tribal peoples living in the highlands of central Vietnam and Laos, as well as a few groups found in northern Thailand and as far distant as Assam in India and Hainan Island belonging to China, speak Austroasiatic languages. Speakers of Austronesian languages, whose major modern-day representatives are the peoples of Indonesia, Malaysia, Micronesia, and Polynesia, as well as parts of Melanesia and Madagascar, were also present from prehistoric times in what is today southern Vietnam and the Malay Peninsula. Cham living in southern Vietnam and in Cambodia, as well as tribal peoples such as the Rhadé and Jarai in southern Vietnam, speak Austronesian languages. In the northern uplands of the region and in what is today northeastern India and southern China most peoples in prehistoric times appear to have spoken languages belonging to the Tibeto-Burman language family. The present-day Burmans and such tribal peoples as the Chin, Kachin, Lisu, Akha, and Lahu all speak Tibeto-Burman languages. Speakers of Tai (or Daic) languages seem to have originated in southern China and did not begin to settle in mainland Southeast Asia until much before the tenth century CE. Today, however, Thai (or Siamese), Lao, Northern Thai (or Yuan), and Shan—all speakers of Tai languages—constitute the major peoples of Thailand, Laos, and the Shan state of Burma, and Tai-speaking tribal peoples such as the Tho, Red Tai, Black Tai, and White Tai are found in northern Vietnam as well as northeastern Laos. Modern-day Vietnamese, which linguists assign to the distinctive Viet-Muong language family, is believed to have evolved from an Austroasiatic

language that was transformed under the influence of Chinese. The distinctive Karen languages spoken by peoples living on the eastern border of Burma and in parts of western Thailand are thought by linguists to be descendants of Tibeto-Burman stocks. Speakers of Miao-Yao languages, distantly connected to Tibeto-Burman and Sinitic language families, have migrated from southern China into mainland Southeast Asia only within the past century or so. Major migrations from China and India, spurred by the economic changes during the colonial period, also led to the introduction into the region of large numbers of speakers of Sinitic, Dravidian, and Indo-European languages.

**PREHISTORIC FOUNDATIONS.** People have lived in mainland Southeast Asia for as long as there have been *Homo sapiens*, and there is evidence of *Homo erectus* and even earlier hominid forms in the region as well. Paleolithic hunting-and-gathering peoples must have constructed their religious understandings of the world out of images drawn from their experiences in their environments and from the workings of the human body. Beyond this, little can be said, for there is no mainland Southeast Asian equivalent of the cave paintings of Lascaux to provide insight into the world of Paleolithic humans. It would, moreover, be quite illegitimate to project the religious beliefs of the Negritos of the Malay Peninsula, the last remaining significant groups of hunter-gatherers in the region, into the prehistoric past, for these beliefs have developed through as long a period as have other religions and have, moreover, been influenced by the religions of neighboring peoples.

The first significant evidence of religious beliefs and practices in mainland Southeast Asia comes from the period when humans in the region first began to live in settled agricultural communities. The domestication of rice, which may have taken place in mainland Southeast Asia before 4000 BCE, led to the emergence of a powerful image that was to become incorporated in almost all of the religious traditions of the region. To this day, most Southeast Asians think of rice as having a spiritual as well as a material quality; rice, like humanity, has a vital essence and is typically associated with a feminine deity. The recognition of rice as fundamental to life among most peoples in mainland Southeast Asia has been intertwined in religious imagery with the nurturing attribute of a mother.

Neolithic burial sites, many only recently discovered, are proving to be sources of knowledge about prehistoric religions in Southeast Asia. The very existence of such sites suggests that those who took so much trouble to dispose of the physical remains of the dead must have had well-formed ideas about the afterlife and about the connection between the states of the dead and the living. In the mass burial sites of Ban Chiang and Non Nok Tha in northeastern Thailand, the graves contain many items, including pottery, tools, and metal jewelry. The items found in the graves may be interpreted, on the basis of ethnographic analogy, as constituting goods believed to be used by the dead in the afterlife. In com-

munities in northeastern Thailand today, the dead are cremated in accord with Buddhist custom, but the practice of burning personal belongings of the deceased at the same time perpetuates a pre-Buddhist tradition.

In a Neolithic burial site in western Thailand, the grave of an old man was found to contain a perforated stone disk and an antler with the tines sawed off. Per Sørensen, the archaeologist who excavated the site, believes these items may represent the headdress of a shaman; if so, they would be the earliest evidence of shamanism in mainland Southeast Asia. Shamanism must have an ancient pedigree in the region because it is found among most tribal peoples. Among the most intriguing Neolithic burial sites are ones in central Laos where large stone jars were found containing cremated human remains. This discovery suggests either that cremation predates Indian influence in Southeast Asia or that the jars were used long after they had originally been constructed as depositories of remains by peoples who had adopted the Buddhist practice of cremation.

Sites mainly in northern Vietnam and southern China dating to the first millennium BCE contain bronze drums associated with assemblages termed Dong-Son after a site in northern Vietnam. Dong-Son-type drums were later distributed widely not only in mainland Southeast Asia but in the islands of the region as well, although manufacture of the drums apparently continued to be restricted to a rather small area in northern mainland Southeast Asia. In more recent times, drums have been used by tribal peoples such as the Karen in funerary rites, and some archaeologists believe that the drums were always associated with death customs. Boat designs found on some of the Neolithic drums have been interpreted as being symbols of the means whereby souls of the dead were conveyed to the afterworld. The soul-boat image is found in a number of Southeast Asian cultures today, and a prehistoric notion may have persisted also in transformed form in the Buddhist symbol of the boat that conveys the saved across the sea of *samsāra* to *nibbāna* (Skt., *nirvāṇa*).

The designs on the drums, including concentric circles, frogs, birds, snakes or dragons, human figures in headdresses, buildings, and in some southern Chinese drums miniature scenes of rituals, have been variously interpreted. Some understand these as indicating a type of shamanism in which the drum played a part; others have seen them as having totemic significance. It is quite probable that at least some drum designs encode a dualistic cosmology, symbolized in part by an opposition between birds and snakes/dragons. Of particular interest are the images of buildings on piles, which may probably be regarded as a type of ritual hall or perhaps a men's house, and which are clearly related both to those found in many tribal communities today and to the *dinh*, the communal ritual hall of the Vietnamese.

There was never a uniform Dongsonian culture in northern mainland Southeast Asia. Peoples of the region in late prehistoric times were often isolated from each other by the numerous ranges of hills and must have developed dis-

tingentive religious traditions. Even though drums were widely traded throughout the region, they were most certainly put to different ritual purposes by different peoples.

An older generation of scholars, best represented by Robert Heine-Geldern, posited an underlying unity of prehistoric Southeast Asian religions that stemmed from the diffusion of a cultural complex from a single European source. While there were certainly contacts among peoples widely separated in Southeast Asia in prehistoric times, and while these contacts resulted in the diffusion of some practices and beliefs, most basic similarities must be understood to reflect the ordering of similar experiences (for example, those related to death, human fertility, cultivation of rice) that follow universal modes of human thought.

Drawing on later historical data as well as ethnographic analogy, Paul Mus, a distinguished student of Southeast Asian civilization argued that the autochthonous religions of protohistoric Southeast Asia coalesced around cults he termed "cadastral." Such cults were organized around images drawn from the local worlds of everyday experience. Spirits, such as the *nats* of various Tibeto-Burman peoples or the *phī* of the Tai, populated these worlds. Humans were able to act in their worlds because they had "vital spirits," often conceived of as multiple, as with the Vietnamese *hon*, Khmer *pralu'n*, or Tai *khwan*. These vital spirits, which only in some cases constituted souls that gained immortal states after death, could leave the body for periods of time, but unless called back and secured—a practice widely seen among many peoples in Southeast Asia—the person would weaken and die.

These cadastral cults constituted the religions of agricultural peoples who had long since made rice their staple, although some cultivated it by swidden or slash-and-burn methods and others cultivated by irrigation. Rice also was believed to possess a vital spirit. Even today, peoples as diverse as the Chin in Burma, Lawa in northern Thailand, Lao in Laos, Jarai in southern Vietnam, and Khmer in Cambodia all perform rites after the harvest to call the spirit of the rice to ensure that it will provide essential nourishment when consumed. Some peoples also believe that other beings—especially the water buffalo used for plowing in wet-rice communities and elephants used for war and heavy labor—also have vital spirits.

The cosmologies of protohistoric Southeast Asian farmers, like those of primitive peoples throughout the world, were structured around fundamental oppositions. In Southeast Asia, the oscillation between the rainy rice-growing season and the dry fallow season found expression in such religious imagery. The fertility of the rainy season is widely associated with a female deity, the "rice mother," although a male image, that of the *nāga*, or dragon, and sometimes a crocodile, is also found in many traditions. In some cases—such as among the Cham, as attested by seventh-century CE inscriptions—the female deity is a *nāgī*. The dry season finds expression in images of male creator gods associated with the

sun. To this day, many peoples who have long been Buddhists still engage in rites that entail a dualistic conception of the cosmos. The Lao perform a rite toward the end of the dry season, heavy with sexual symbolism, at which they set off rockets to inform the gods that it is time to send the rains. At the end of the rainy season, when the rivers have flooded, another ceremony is held at which men compete in boat races. The boats, representing *nāgas*, serve to ensure that the earth as supreme *nāga* will accept the flood waters before they drown the rice. The concern with the power of the earth continues after the harvest when attention is turned to the Rice Mother, who is propitiated at the same time that the vital spirit of the rice is called.

The world in which protohistoric peoples lived was marked by uncertainty: Crops might fail as a consequence of late rains or devastating floods; women might be barren, die in childbirth, or lose child after child; and both men and women might die young. Hence, people wished to influence the spirits and cosmic forces that controlled fertility and life. The fundamental method of gaining the favor of spiritual powers was through sacrifices. Human sacrifice was rare in mainland Southeast Asia, although the Wa of northern Burma and southern China even in recent times took heads to offer at New Year rites. Most peoples sacrificed domestic animals, with lesser rites requiring a chicken and more important rites, a pig or even a carabao. In tribal groups such as those in Burma and northeastern India, those men who organized large-scale sacrifices and the so-called feasts of merit associated with them acquired not only the esteem of their fellows but also a spiritual quality that was believed to persist even after their death. Such tribal chiefs are assumed to be similar to what O. W. Wolters calls “men of prowess,” who were the heads of protohistoric chiefdoms. What is noteworthy about the tribal chiefs, and presumably about the earlier men of the same type, is that because of the vagaries of life, their potency could never be firmly established. Attempts were made to fix this potency by making the remains of men of prowess objects of cultic attention, especially by those who succeeded them. Rough stone monuments associated with early Cham culture in southern Vietnam and upright stones found together with the prehistoric stone jars in Laos have been interpreted, by analogy with the practice by such modern tribal peoples as Chin of Burma and related groups in northeastern India, as monuments that perpetuated and localized the potency of men who had succeeded during their lifetimes in effecting a relationship between the society and the cosmos. Such monuments were to lend themselves to reinterpretation in Hindu-Buddhist terms when Indian influences began to appear in Southeast Asia.

**HISTORICAL TRANSFORMATIONS.** Prior to the adoption of Indian or Chinese models, there appears to have been no priesthood in any Southeast Asian society capable of enforcing an orthopraxy among peoples living over a wide area. As the ritual effectiveness of men of prowess waxed and waned, so did the relative power of the polities they headed, thus giving rise to a classic pattern of oscillation between “democrat-

ic” and “autocratic” communities found among tribal peoples such as the Kachin of Burma even in recent years. What made it possible for Southeast Asians to imagine themselves as parts of communities whose members, both living and dead, were not all known personally was the introduction of religious conceptions fixed in written texts.

Some evidence, especially from among tribal peoples in what is today southern China, suggests that writing was invented independently by Southeast Asian peoples. However, the historical fact is that the earliest written records are either in some form of Indian script or in Chinese logographs. With these borrowed writing systems came Indian and Chinese texts, rites rooted in the texts, and institutions to perform the rites and perpetuate the textual traditions.

**Sinitic influences.** Chinese influences appear first in conjunction with the Han conquest of what is now northern Vietnam. Between the first Han movement into the area, in 124 BCE, and 43 CE, when the Chinese suppressed a rebellion led by the legendary Trung sisters, Chinese influence appears to have lain rather lightly on the Vietnamese. From the first century CE, however, the Vietnamese came increasingly to see themselves as part of a Sinitic world, which they knew through the same texts as were used in China proper. This sense of belonging to a Chinese world remained even after the Vietnamese gained independence from China in the eleventh century.

The Chinese model was most significant for literati—the Confucian mandarinate, Mahāyāna Buddhist monks, and even some Daoist priests—who derived their cultural understanding of the world from Chinese and Sino-Vietnamese texts. As none of these literati ever attained the role of a dominant priesthood in the villages, pre-Sinitic traditions, centered on a multitude of local spirits and deities, continued to be perpetuated by spirit mediums, soothsayers, and sorcerers (*thay*). Those Vietnamese who moved out of the Red River delta in the “push to the south” that began in the thirteenth century and continued into recent times came into contact with other traditions—those of the Hinduized Cham and Khmer, the Buddhist Khmer, and local tribal peoples. In part because of significant non-Sinitic influences in southern Vietnam, the impress of Chinese culture was somewhat less evident in the popular culture of that region than in that of northern Vietnam. Vietnamese in southern Vietnam have to the present often turned to non-Sinitic religious practitioners—montagnard sorcerers and Theravāda monks, for example—for help in confronting fundamental difficulties in their lives. Many of the religiously inspired peasant rebellions originating in southern Vietnam as well as some modern syncretic popular religions have drawn inspiration from non-Chinese sources. This said, Vietnamese religion in all parts of the country has assumed a distinctly Sinitic cast, being organized primarily around ancestor worship in the Chinese mode. Elsewhere in mainland Southeast Asia, only migrant Chinese and those tribal peoples such as the Hmong and Mien who have lived long in Chinese-

dominated areas show similar concern with ancestor worship.

**Indian influences.** In those areas of mainland Southeast Asia where Indian influences first appeared in the early centuries of the common era, individuals were rarely apotheosized for being apical ancestors in a line of descent. If, however, a man (but rarely a woman) succeeded in his lifetime in demonstrating through effective action in ritual and in warfare that he possessed some charismatic quality, this quality could continue to be influential after the individual's death by giving him a cosmic body to replace his worldly one. The earliest monuments of indianized civilization in Southeast Asia appeared in significant numbers between the fourth and eighth century CE. Particular examples are Śiva *lingā* of the Cham in southern Vietnam, the Buddhist *semā* (Skt., *sīmā*) or boundary markers with scenes from the life of the Buddha or from the Jātakas in bas-relief found in Dvāravatī sites in northeastern Thailand, and the stupas at Beikthano and Śrīkṣetra in central Burma, Thaton in lower Burma, and Nakhon Pathom in central Thailand. These monuments can best be interpreted as having been put up to elevate a man of prowess to a divine form. Whereas an older generation of historians often associated early historical sites in mainland Southeast Asia with large kingdoms, most historians now accept that there were many petty kingdoms in the area whose power waxed and waned much as did that of the chiefdoms that preceded them. The proliferation of monuments, a pattern that climaxes in the classical civilizations of Angkor in Cambodia and Pagan in Burma, most likely represents a continuing effort by new kings, their families, and their rivals to establish their own claims to be identified with divine and cosmic power.

Influential mainland Southeast Asians who worked with Indian texts made minimal use of the Indian idea that one's place within the world was fixed at birth by some cosmic plan. The caste system did not survive the voyage across the Bay of Bengal except in a very modified form, whereby kings claimed to be *kṣatriya*; even then a man of quite lowly origins could become a *kṣatriya* by successfully usurping the throne and clothing himself in sacralized regalia.

The process of indianization in Southeast Asia included identifying a power believed to be embodied in a local shrine with divine or cosmic powers known in Indian texts. This made possible the creation of larger polities, since peoples in very different parts of a realm saw themselves as part of the same cosmos and worshiped the same gods, often gods who were also equated with the rulers. The polity was a *maṇḍala*, the "circle of a king," a domain in which a particular ruler succeeded in being viewed as the link between the world and the cosmos. The kings who founded Angkor near the Great Lake in Cambodia in the ninth century were notably successful in establishing a cult of the *devarāja*, a god-king, whose *maṇḍala* included at its height all of present-day Cambodia, the Mekong Delta of southern Vietnam, and central and northeastern Thailand. The *devarāja* cult centered on the as-

similation of the king to Śiva, as represented by a lingam. The capital was a place where, through erection of temples, dedicated not only to Śiva but also to Viṣṇu and other Hindu gods and to *bodhisattvas*, each king could ensure that his *maṇḍala* was a microcosm of the cosmos. While the Angkorean empire experienced a number of defeats by rulers of other *maṇḍalas*, it was not until the fifteenth century that it finally ended; by this time, the religious orientations of the populace had begun to change radically.

On the western side of mainland Southeast Asia, Burmese kings also succeeded in establishing a *maṇḍala*, that of Pagan, that between the eleventh and thirteenth centuries rivaled the splendor and power of Angkor. Although the Burmese kings promoted cults that usually equated them with the Buddha rather than with Hindu gods, the stupas and temples they built were like the Hindu and Mahāyāna temples at Angkor; they were both funerary monuments in which the kings became immortalized, albeit in this case in Buddhist terms, and recreations of the sacred cosmos. In both Pagan and Angkor, Meru, the sacred mountain that lies at the center of the universe and is also an *axis mundi*, was represented in the temple or stupa erected by a king.

The *maṇḍala* organized around a shrine that served as an *axis mundi* became the model for villages as well as capitals. In nearly every village in Buddhist Southeast Asia, a stupa has been erected. Those who contribute to its construction believe they gain merit that will ensure a better rebirth and perhaps even rebirth at the time of the next Buddha, Metteyya (Skt., Maitreya). The localized cults of the relics of the Buddha link Southeast Asians not only with early Indian Buddhism but also with the cosmographic practices of the rulers of the classical indianized states and beyond that with the cadastral cults of pre-indianized Southeast Asia.

The cult of the relics of the Buddha does not constitute the whole of Buddhism as practiced in Southeast Asia. Between the thirteenth and fifteenth centuries, missionary monks established a Theravāda Buddhist orthodoxy among the majority of peoples, both rural and urban, living in what are today Burma, Thailand, Laos, and Cambodia. In a sense, orthodox Buddhism made sense to Southeast Asians because of the pre-Buddhist idea that religious virtue is not a product solely of descent from particular ancestors but also a consequence of one's own religiously effective actions. In Buddhist terms, this idea was formulated so that people understood that although they were born with a certain karmic legacy of both merit and demerit they also continually acquire new merit and demerit from morally significant acts.

Those who became adherents of Theravāda Buddhism also retained pre-Buddhist beliefs in spirits and deities. These beliefs were given new significance in the context of a Buddhist worldview. Some of the supernatural beings were universalized and identified with Hindu deities also known to Buddhism. More significantly, spirits and deities were accorded a subordinate place within the Buddhist cosmic hierarchy generated by the law of *karman*. Beliefs in pre-

Buddhist concepts of the vital spirit—the *leikpya* of the Burmese, the *khwan* of the Tai, the *pralu'n* of the Khmer—also remained and continued to be part of ritual. These beliefs were, however, reformulated to take into account the Buddhist teaching that the soul is not immortal and that “consciousness” (Pali, *viññāṇa*) links one life with the next.

The Theravāda revolution in mainland Southeast Asia did not lead to the demise of the *maṇḍala*; on the contrary, it led local lords to demonstrate their effectiveness by claiming to be righteous rulers and validating such claims by asserting their independence or even embarking on military ventures to extend their domains at the expense of other lords. Despite the political fragmentation of premodern Buddhist societies, all could conceive of being part of a common Buddhist world. Such a conception was expressed, for example, in the recognition of important pilgrimage shrines—ones containing relics of the Buddha—that lay in other domains.

The success of Theravāda Buddhism led to a much sharper distinction between the religious traditions of the peoples of the western part of mainland Southeast Asia and those east of the Annamite cordillera. Not only were the Vietnamese becoming increasingly sinicized, but the Cham, who had once had an important indianized culture in southern Vietnam, turned from this tradition and embraced Islam, a religion that was becoming established among other Austronesian-speaking peoples in major societies of the Indonesian archipelago and on the Malay Peninsula.

Tribal peoples in Southeast Asia, mainly located in highland areas where they practiced swidden cultivation, did not remain totally isolated from the changes occurring in the lowlands. A myth among many tribal peoples in the northern part of the region tells of a “lost book” or “lost writing.” The Kachin version of the myth is typical. Ninggawn wa Magam, the deity from whom humans acquired culture, called all the different tribes of humans together. To each tribe he gave a book to help them in their lives. Shans and Burmans received books written on palm leaves; Chinese and foreigners (i.e., Westerners) received books on paper; and Kachin received a book of parchment. The Kachin, not truly understanding the significance of the book, ate it and have been without writing ever since. The myth reveals a sense on the part of tribal peoples of being culturally deprived relative to those who have writing.

When tribal peoples have turned to expand their horizons, they have tended to do so through acquiring access to the literature of their lowland neighbors. The Lawa, an Austroasiatic tribal people in Thailand, see themselves as Buddhists, like their Northern Thai neighbors, but unable to practice the religion in the hills where they have no monks to instruct them. When they move down from the hills, however, they quickly transform themselves into Northern Thai. Mien, who are found more in southern China than in Southeast Asia, long ago developed a tradition of craft literacy, with ritual specialists being able to read Daoist texts in

Chinese. An interesting variant on the myth is found among some Karen in Burma, who were converted in significant numbers to Christianity beginning early in the nineteenth century. Their myth tells how the book will be returned to them by foreign brothers who are identified with the Western missionaries. Even among Karen, however, more have become Buddhist than have become Christian.

Missionization—not only by Christians but in recent years by Buddhists—and the spread of modern systems of compulsory education have rendered tribal religions increasingly peripheral. So, too, have improved health care and secular education undermined beliefs in spirits that were previously elements of the religions of Southeast Asian Buddhists and Vietnamese. Moreover, as agriculture has been transformed by large-scale irrigation works and the introduction of new technology and new high-yield varieties of rice, peoples in the region have become less inclined to credit supernatural powers with the control over fertility. They may continue to perform traditional rites, but these are becoming more secular celebrations than sources of religious meaning. Nonetheless, even as the worlds of Southeast Asians are radically transformed by political-economic forces and cultural changes that have occurred over the past century and a half, there still remains among many the ancient idea of cultivating virtue through morally effective action.

#### BIBLIOGRAPHY

Robert Heine-Geldern interprets archaeological and ethnographic evidence with reference to a diffusionist thesis that posited the source of a prehistoric “megalithic complex” in Europe. His most recent formulation of his position appears in “Some Tribal Art Styles in Southeast Asia,” in *The Many Faces of Primitive Art*, edited by Douglas Fraser (Englewood Cliffs, N.J., 1966), pp. 161–214. Kenneth Perry Landon, in *Southeast Asia: Crossroads of Religion* (Chicago, 1969) and Pierre-Bernard Lafont, in “Génies, anges et démons en Asie du Sud-Est,” in *Génies, anges et démons* (Paris, 1971), provide introductions to Southeast Asian religions in other than diffusionist terms. By far the most detailed comparison of beliefs and practices relating to agriculture found among peoples not only in mainland Southeast Asia but also on the islands of the region is Eveline Porée-Maspero’s *Étude sur les rites agraires des Cambodgiens*, 3 vols. (Paris, 1962–1969). Also see in this connection P. E. de Josselin de Jong’s “An Interpretation of Agricultural Rites in Southeast Asia, with a Demonstration of Use of Data from Both Continental and

Insular Asia," *Journal of Asian Studies* 24 (February 1965): 283–291. A general introduction to Southeast Asian religions with reference to their social context is provided in my book *The Golden Peninsula: Culture and Adaptation in Mainland Southeast Asia* (New York, 1977).

The volume *Early South East Asia: Essays in Archaeology, History, and Historical Geography*, edited by R. B. Smith and William Watson (Oxford, 1979), contains information on prehistoric and protohistoric religion; the work also has a good bibliography. H. G. Quaritch Wales's *Prehistory and Religion in Southeast Asia* (London, 1957), although dated and relying too heavily on diffusionist theory, still remains the only work to attempt a synthesis of prehistoric evidence. Per Sørensen reports on the find he interprets as evidence of prehistoric shamanism in "The Shaman's Grave," in *Felicitation Volumes of Southeast-Asian Studies Presented to Prince Dhaninivat*, vol. 2 (Bangkok, 1965), pp. 303–318. The model of the "cadastral cult" was advanced by Paul Mus in *India Seen from the East: Indian and Indigenous Cults in Champa*, translated by I. W. Mabbett and edited by I. W. Mabbett and D. P. Chandler (Cheltenham, Australia, 1975). O. W. Wolters, in *History, Culture, and Region in Southeast Asian Perspectives* (Brookfield, Vt., 1982), proposes the notion that "men of prowess" was a general type in prehistoric and protohistoric Southeast Asia. His interpretation is based, in part, on A. Thomas Kirsch's argument developed in a comparison of Southeast Asian tribal ethnography in *Feasting and Social Oscillation: A Working Paper on Religion and Society in Upland Southeast Asia* (Ithaca, N.Y., 1973). Kirsch, in turn, has elaborated on the idea of oscillation between "democratic" and "autocratic" chiefdoms first advanced by Edmund Leach in *Political Systems of Highland Burma* (Cambridge, Mass., 1954).

Vietnamese scholars have shown considerable interest in recent years in tracing the Southeast Asian origins of Vietnamese civilization. Much of their work is discussed by Keith Weller Taylor in *The Birth of Vietnam* (Berkeley, Calif., 1983). The process of "indianization" and the relationship between this process and what H. G. Quaritch Wales called "local genius" in the shaping of Southeast Asian religious traditions has been most intensively explored by George Coedès in *The Indianized States of Southeast Asia*, edited by Walter F. Vella and translated by Susan Brown Cowing (Canberra, 1968); H. G. Quaritch Wales in *The Making of Greater India*, 3d rev. ed. (London, 1974) and *The Universe Around Them: Cosmology and Cosmic Renewal in Indianized Southeast Asia* (London, 1977); O. W. Wolters in "Khmer 'Hinduism' in the Seventh Century," in *Early South East Asia: Essays in Archaeology, History and Historical Geography* and in *History, Culture and Region in Southeast Asian Perspectives* (both cited above); Hermann Kulke in *The Devaraja Cult*, translated by I. W. Mabbett (Ithaca, N.Y., 1978); and I. W. Mabbett in "Devaraja," *Journal of Southeast Asian History* 10 (September, 1969): 202–223; "The 'Indianization' of Southeast Asia: Reflections on Prehistoric Sources," *Journal of Southeast Asian Studies* 8 (March 1977): 1–14; "The 'Indianization' of Southeast Asia: Reflections on the Historical Sources," *Journal of Southeast Asian Studies* 8 (September 1977): 143–161; and "Varnas in Angkor and the Indian Caste System," *Journal of Asian Studies* 36 (May 1977): 429–442. O. W. Wolters, in *History, Culture and Region in Southeast Asian*

*Perspectives*, discusses the *maṇḍala* model, a model also discussed at some length under the rubric of the "galactic polity" by Stanley J. Tambiah in *World Conqueror and World Renouncer* (Cambridge, 1976).

- A. Thomas Kirsch in "Complexity in the Thai Religious System: An Interpretation," *Journal of Asian Studies* 36 (February 1977): 241–266; Melford E. Spiro in *Burmese Supernaturalism*, 2d ed. (Philadelphia, 1978); and Stanley J. Tambiah in *Buddhism and the Spirit Cults in North-East Thailand* (Cambridge, 1970) discuss the relationship between pre-Buddhist and Buddhist beliefs in Thai and Burmese religion. Similar attention to pre-Sinitic religious beliefs in Vietnamese religion is given by Leopold Cadière in *Croyances et pratiques religieuses des Vietnamiens*, 3 vols. (Saigon and Paris, 1955–1958). See also Pierre Huard and Maurice Durand's *Connaissance du Vietnam* (Paris and Hanoi, 1954).
- Kirk Endicott's *Batek Negrito Religion* (Oxford, 1979) describes the religion of the last remaining major population of hunting-and-gathering people on the mainland. Karl Gustav Izikowitz's *Lamet: Hill Peasants in French Indochina* (Göteborg, 1951), Peter Kunstader's *The Lua' (Lawa) of Northern Thailand: Aspects of Social Structure, Agriculture and Religion* (Princeton, 1965), and H. E. Kauffmann's "Some Social and Religious Institutions of the Lawa of Northwestern Thailand," *Journal of the Siam Society* 60 (1972): 237–306 and 65 (1977): 181–226, discuss aspects of religious life among Austroasiatic-speaking tribal peoples. Among the more detailed accounts of the religions of Hmong (Meo) and Mien (Yao) peoples are Jacques Lemoine's *Yao Ceremonial Paintings* (Atlantic Highlands, N.J., 1982); Guy Morechand's "Principaux traits du chamanisme Méo Blanc en Indochine," *Bulletin de l'École Française d'Extrême-Orient* 54 (1968): 58–294; and Nusit Chindarsi's *The Religion of the Hmong Nua* (Bangkok, 1976). Theodore Stern in "Ariya and the Golden Book: A Millenarian Buddhist Sect among the Karen," *Journal of Asian Studies* 27 (February 1968): 297–328, and William Smalley's "The Gospel and Cultures of Laos," *Practical Anthropology* 3 (1956): 47–57, treat some aspects of religious change among tribal peoples.

## SOUTHEAST ASIAN RELIGIONS: INSULAR CULTURES

The cultures of insular Southeast Asia are made up predominantly of peoples speaking Austronesian languages, and the traditional religions of the area, despite substantial diversity and extensive borrowing from other sources, retain significant features that reflect a common origin. Linguistic evidence indicates that the point of origin of the languages of present-day Austronesians was the island of Taiwan (Formosa) and possibly also the adjacent coastal region of southeastern China. The initial expansion of the Austronesians began in the third millennium BCE and proceeded, by stages, through the Philippines and the islands of Indonesia, then east to the islands of the Pacific, and eventually west as far as the island of Madagascar.

In the first stage of this expansion, migrating Austronesian groups possessed a basic cultural technology that included the domesticated dog and pig, a knowledge of the cultivation of rice, millet, and sugarcane, and a developing craftsmanship in pottery, weaving, and barkcloth making. At a later stage in the course of this continuing expansion, the Austronesians developed further forms of cultivation involving breadfruit, bananas, taro, and yams and the use of a variety of fruit-bearing or starch-yielding palms. By this time they also possessed domesticated chickens and had developed sails for their canoes and some of the sailing techniques that were to carry them from island to island. By about 2500 BCE they had expanded through the southern Philippines and into Borneo and had begun to penetrate the islands of both eastern and western Indonesia.

Because this expansion involved a scattering of numerous small groups through thousands of islands over several millennia, it gave rise to considerable linguistic and cultural diversity. Earlier island populations were undoubtedly assimilated, although there is very little linguistic evidence on these peoples except for those in Melanesia.

Regional variation is indicated by the various linguistic subgroups of Austronesian that are currently recognized. Formosan languages are distinguished from Malayo-Polynesian languages within the Austronesian family and the Malayo-Polynesian languages are divided into (1) a western subgroup that includes the languages of the Philippines, Borneo, Madagascar, and western Indonesia as far as the island of Sumbawa, (2) a central subgroup that begins in eastern Sumbawa and comprises the languages of the Lesser Sundas and most of the Moluccas, and (3) an eastern subgroup that includes the languages of southern Halmahera and all of the languages of the Pacific.

In the course of migration, natural ecological variation as well as numerous outside influences led to the development, emphasis, or even abandonment of different elements of a general Neolithic culture. In the equatorial zones, for example, reliance on rice and millet gave way to a greater dependence on tubers and on fruit- and starch-gathering activities. As populations moved into the interior of the larger

islands some sailing skills were abandoned, but a coastal or riverine orientation was generally maintained. During most of their protohistory, Austronesian populations lived in impermanent settlements and combined shifting cultivation with hunting and gathering. The development toward centralized states began on Java, on the coast of Sumatra, and in several other coastal areas that were open to trade and outside influences. Chief among these influences were religious ideas and inspiration that derived variously, at different periods, from Hinduism, Buddhism, Islam, and Christianity.

The earliest Hindu inscriptions found in insular Southeast Asia date from the fourth century CE; their location and composition, however, suggest a long period of prior regional contact with Indian religious ideas. By the fifth century, Hinduism is reliably reorted to have been established on Java, and by the sixth century, there is evidence of Buddhist influence on Sumatra and Java, with the port of Srivijaya developing into a major Buddhist center of learning in the seventh century. Javanese monuments dating from the eighth to the fourteenth centuries indicate a lively development and interrelation of Saivaite, Vaisnavite, and Buddhist traditions. By the thirteenth century, Islam had begun to spread through the islands and exert a major influence. By the fifteenth century, Catholicism had reached the region with the arrival of the Portuguese and Spanish, and by the sixteenth century, Protestantism had made its appearance with the Dutch and English. In addition, the popular traditions of Taoism and Confucianism were brought to the region by Chinese traders and settlers. Both individually and together these religions have had a profound effect in shaping religious practice in the region.

At present, 88 to 89 percent of the Indonesian population is classified as Muslim, although a significant portion of this population, particularly on Java, still adheres to traditional practices that are not considered orthodox. In the Philippines, approximately 84 percent of the population is Catholic; 3 percent is Protestant; and a further 5 percent are classified as Aglipayan, followers of an independent Philippine Christian church. Muslims constitute a small minority of approximately 5 percent in the Philippines, while Christians make up about 9 percent of the Indonesian population. In Indonesia, Bali forms a traditional Hindu-Buddhist enclave but there has occurred a recent resurgence of Hinduism on Java and elsewhere. Many members of the Chinese population of Indonesia are officially considered Buddhists, although some continue to practice forms of Taoism or Confucianism. A considerable portion are also Christian. Official statistics from Indonesia and the Philippines thus indicate only a small minority of the population in either country as official adherents of some form of traditional religion. In Sarawak and Sabah, adherents of tradition constitute a high percentage of the population of their local area, but in Malaysia as a whole they are a minority. In Brunei, similar groups form an even smaller minority.

National policies of the countries of the region affect the practice of traditional religions. Indonesia gives official rec-

ognition only to Islam, Protestantism, Catholicism, Hinduism, and Buddhism, with the result that in effect no traditional religion is regarded as a religion. In some areas a tacit tolerance of traditional practices has developed, but in general there is mounting pressure to assimilate to an officially recognized religion. On the basis of early cultural borrowings and some similarity in forms of worship, various ethnic groups have gained recognition of their traditional religion as a Hindu sect. In the Philippines, missionary efforts by both Catholics and Protestants have been directed to conversion of the remaining adherents of tribal religions. In Sarawak and Sabah, there is pressure to convert to Islam as well as to Christianity. In all the countries of the region the adherents of traditional religions are minorities whose distinct ways of life are under pressure to change. Generally, they participate only at the margins of national life.

The tribal religions of the region vary according to the groups that continue to practice them. These groups include small, often isolated peoples whose economy is based primarily on hunting and gathering with limited cultivation. Examples of such groups are the Sakkudei of the island of Siberut off the coast of western Sumatra; various wandering bands of Kubu scattered in the interior forests of Sumatra; groups of a similar kind in Kalimantan who are referred to generically as Punan; as well as a variety of other small-scale societies on other islands—the Agta and other Aeta of Luzon, the Batak of Palawan, the Da'a or To Lare of Sulawesi (Celebes), or the Alifuru groups, such as the Huaulu and Nuaulu, of Ceram in eastern Indonesia. Many of these groups, with their simplified technology, no longer possess the range of economic pursuits attributed to the early Austronesians. Other adherents of traditional religions include the unconverted members of larger, economically and socially more complex populations: some Batak, particularly Karo, from north Sumatra; Ngaju communities in Kalimantan; various Toraja peoples in Sulawesi; as well as the Sumbanese, Savunese, and Timorese in eastern Indonesia. Sumba has the distinction of being the only island in Indonesia where a majority of the population profess to follow their traditional religion.

Some of these Indonesian populations have formally established religious associations to preserve their traditional practices and some have come to be identified as followers of Hindu-Dharma, a status that affords them official government recognition. This is one possibility available to members of the Toraja "Alukta," the Batak "Pelbegu," the Ngaju "Kaharingan," and the Bugis "Towani."

In the Philippines, a majority of the indigenous peoples in the mountains of northern Luzon (among them the Isneg, Ifugao, Bontok, Ibaloi, Kalinga, and Ilongot), in Mindoro (the Hanunoo, Buhid, and Alangan), and in the interior of Mindanao (the Subanun, Bukidnon, Tiruray, Manobo, Bagabo, and Mandaya) have retained their traditional religions despite increasing missionary efforts. In Sarawak, similar tribal peoples include the Iban, Kayan, Kenyah, and Kelabit;

in Sabah, the Dusun, Murut, and Lun Dayeh; all of these tribal populations and other small groups as well have undergone conversion to Christianity in varying degrees.

Other adherents of traditional religion are more difficult to classify. Some form small enclaves, often consisting of no more than a few villages, whose traditional practices represent nonacceptance of the dominant religion of their region. Such groups would include the Badui (or Kanekes) of West Java, the Tengger of East Java, and the Waktu Tiga villagers of Lombok. All of these three groups maintain special priest-hoods. Badui priests are confined to an inner territorial realm, whereas among the Tengger, there is one priest for each of twenty-eight villages. Both groups claim to preserve an "Agama Budha," which refers not to a form of Buddhism but to a pre-Islamic fusion of Indic and local practice. The Tengger priests, for example, follow an ancient Saiva liturgy that is kept secret from the village population, who see their worship as an ancestral cult.

Many of the millenarian movements that have occurred in Indonesia and the Philippines can be seen as religious movements and the communities of members of these movements, such as the Kesepuhan in West Java, the Samin of Central Java, or the Rizalistas of Luzon, may also be considered as traditional religious adherents. In addition, many other individuals and groups carry on traditional rituals under nominal adherence to another formally recognized religion. On the island of Flores, for example, the people of Tana Wai Brama continue to maintain their traditional ceremonial cycle, even though they are formally classified as Catholics. The same is true for other populations, both Christian and Muslim, throughout the islands. Official statistics are therefore often misleading in assessing the extent of traditional religious adherence.

Studies of traditional religion, many of which have been written by missionaries or colonial administrators, document beliefs and practices that have since been either abandoned or modified through the process of conversion. Significant evidence on traditional religion is also derived from present practices and general conceptions that have been incorporated and retained in the major recognized religions in the course of their accommodation to the traditions of the region.

Chief among these basic conceptions and practices are the following: (1) the prevalence of complementary duality; (2) the belief in the immanence of life and in the interdependence of life and death; (3) the reliance on specific rituals to mark stages in the processes of life and death; and (4) the celebration of spiritual differentiation. All of these notions may be regarded as part of a common Austronesian conceptual heritage.

**THE PREVALENCE OF COMPLEMENTARY DUALITY.** Forms of complementary dualism are singularly pervasive in the religions of the region. Such dualism figures prominently, for example, in a wide variety of myths of the origin of the cos-

mos that combine themes of reproduction and destruction. Among the Ngaju of Kalimantan (Borneo) creation begins when the mountain abodes of the two supreme deities clash repeatedly, bringing forth the upperworld and underworld and various of its parts; in the next phase of the creation, male and female hornbills of the two deities, perched on the tree of life, renew the struggle, destroying the tree but in the process creating the first man and woman. Among the Toraja of Sulawesi the universe originates from the marriage of heaven and earth: Heaven lies upon the broad earth and, as they separate, the land is revealed and all their divine children, including the sun and moon, come forth. Among the Mambai of east Timor, a formless hermaphroditic being molds and shelters Mother Earth and Father Heaven; they separate and the pregnant Mother Earth bears the first mountain, known as the Great Father. Heaven descends upon Earth again and from their union are born the first trees and rocks and the first men and women. At each birth, the waters of the world increase, until Father Heaven eventually abandons Mother Earth, who is left to decompose and disintegrate.

Ideas of complementary duality are reflected in ideas about the principal divinity, who is often conceived of as a paired being (Mahatala/Jata among the Ngaju, Amawolo/Amarawi among the Sumbanese, or Nian Tana/Lero Wulan among the Ata Tana Ai); in ideas about categories of spirits, heroes, and other ancestral figures; in ideas about the division of sacred space: upperworld and underworld, upstream and downstream, mountainward and seaward, or inside and outside; and above all, in ideas about classes of persons and the order of participants in the performance of rituals.

Major celebrations based on this complementarity can become a form of ritual combat that reenacts the reproductive antagonisms of creation. To choose but one example, the Savunese of eastern Indonesia gather on the day preceding the night of a full moon to form male and female groups according to lineage affiliation; they position themselves at the upper and lower end of a sacred enclosure on the top of a particular hill. There they engage in ceremonial cockfighting that is timed to reach its crescendo precisely at noon. This high cosmological drama is based on a series of complementary oppositions: the conjunction of male and female, the union of the upper and lower divisions of the cosmos, and the antagonism of spirits of the mountain and sea, all of which are timed to climax when the sun is at its zenith and the moon at its fullest.

A significant feature of the traditional religions of the region is the preservation of sacred knowledge through special forms of ritual language that are characterized by the pervasive use of parallelism. Parallelism is a form of dual phraseology and, in its most canonical form, results in a strict dyadic expression of all ritual statements. The following lines, excerpted from a traditional Rotinese mortuary chant, give an idea of the parallelism of such ritual poetry:

Delo Iuk has died

So plant an areca nut at her foot  
And Soma Lopo has perished  
So plant a coconut at her head  
Let the coconut grow fruit for her head  
And let the areca nut grow flowerstalks for her feet.

This parallelism, which is a common feature of oral composition, resembles in form the parallelism that is to be found in the sacred literatures of other peoples of the world. (Both the *Psalms* and the *Popol Vuh* of the Quiche Maya provide good examples of such canonical parallelism.) Myths of the Batak, of the people of Nias, of the Ngaju, Kedayan, and Mualang Dayak, of the Toraja, and of a majority of the peoples of eastern Indonesia adhere to relatively strict forms of parallelism, whereas the myths of other traditional religious adherents follow freer forms of parallel compositions. In all cases, a form of duality is an essential part of the very process of composition.

Conceptions of complementary dualism continue to pervade even those societies that have adopted Hinduism, Islam, or Christianity. Balinese society is replete with dualism. The opposition between Barong and Rangda, which forms one of Bali's best-known dramatic temple performances, is a particularly striking example of complementary dualism. The Javanese *wayang*, or shadow theater, is similarly based on forms of dual opposition. Although the initial basis for many of the most important dramas was Indian, the Javanese have developed and extended these dramas to suit local conceptions. In the *Bhāratayuddha* (in the Javanese version of the Hindu epic *Mahābhārata*), the Pandawa heroes defeat and destroy their cousins, the Korawa. Yet according to the *Korawasrama*, an important Javanese text for which there exists no Sanskrit equivalent, the Korawa are resuscitated to continue their struggle with Pandawa for, as the text asserts: "How could the world be well ordered if the Korawa and Pandawa no longer existed? Are they not the content of the world?"

**BELIEF IN THE IMMANENCE OF LIFE.** Virtually all of the traditional religions of the region are predicated on a belief in the immanence of life. In the literature this concept is often simplistically referred to as "animism." In traditional mythologies, creation did not occur *ex nihilo*: The cosmos was violently quickened into life and all that exists is thus part of a living cosmic whole. Life is evident everywhere in a multitude of forms whose manifestation can be complex, particularistic, but also transitory. There are many different classes of beings, including humans, whose origin may be identified in some mythological account but the system is inherently open and other classes of beings may be recognized whose origin is unknown, even though their manifestation is evident. In many of the traditional religions there is no single origin of humankind. Commonly, humans either descended from a heavenly sphere or emerged from earth or sea; yet, often, the origin of some categories of humans is left unexplained. The openness of these systems does not necessarily involve indifference so much as a recognition of the limitations of human knowledge.

Although there exists an ultimate ground of identity to all manifestations of life, the traditional view makes no assumption of identity or equality among particular manifestations. The result is a general acceptance of a plurality of beings and at the same time, especially in the mystic traditions elaborated in Java, a recognition of the oneness of the individual with the whole in the commonality of life.

The traditional religions differ markedly, however, in their classification of categories or classes of beings. Priests of the Ifugao, for example, are reported to be able to distinguish over fifteen hundred spirits or deities, who are divided into forty classes. By contrast, the Rotinese recognize two broad classes of spirits—those of the inside and those of the outside—and are only concerned with naming the spirits of the inside. The traditional religions also differ significantly in attitudes to the spirit world. For some, all spirits are potentially malevolent and must be placated; in others, benevolent spirits are called upon to intervene against troublesome spirits. In the majority, however, attitudes vary according to types of spirits. The result is a kind of spiritual empiricism in which various ritual procedures are employed as experiments to see what occurs. Often this is highly individualistic: What works for one person may not work for another. In general, all traditional religions aim to achieve some form of ritual balance that accords each category of life its appropriate due.

Although rarely accorded philosophical justification except in the more consciously elaborate traditional religions, there exists the underlying assumption that, since all is part of a whole, any part can stand for the whole. Among the simplest but most common microcosmic representations of the macrocosm are rock and tree, whose union is variously interpreted as the primordial source of life and as the progenitorial conjunction of male and female. Other representations abound. Ceremonial space may be constructed to mirror the whole: Villages, houses, or ships may be symbolically arranged on a macrocosmic basis, or particular objects, such as the *kayon* that is held up to begin and end a *wayang* performance, the four-cornered *raga-raga* rack that hangs suspended in a traditional Batak house, or merely a flag and flagpole, can be vested with all-embracing cosmic significance. Frequently, the human body itself may represent the whole of the cosmos. All such representations have a potency that is centered, ordered, and ultimately diffused outward.

A fundamental feature of the traditional religions is their recognition that life depends upon death, that creation derives from dissolution. This is the emphatic theme of most myths of creation and is repeated in origin tales and in much folklore. In widespread tales of the origin of the cultivation of rice, millet, or of various tubers, for example, the first sprouts or shoots of the new crop come from the body of some ancestral figure. Moreover, since life comes from death, the ancestral dead or specific deceased persons, whose lives were marked by notable attainments, are regarded as capable of bestowing life-giving potency. Thus the dead figure prom-

inently in the religious activities of the living and the tombs of the dead are often sources of religious benefit. In some areas, as on Sumba, the tombs of the dead occupy the center of the village; elsewhere they form the focal point of pilgrimage.

The chief sacrificial animals in the traditional religions are the chicken, the dog, and the pig (although among those populations that keep them the water buffalo is by far the most important sacrificial animal). Sacrifice generally involves creative analogies on an ordered scale. The people of Nias, who perform spectacular pig sacrifices, describe themselves as “God’s pigs.” In the mortuary ceremonies of the Toraja, the sacrificial water buffalo is identified with the deceased but, in other contexts, can represent the entire descent group. Among the Rotinese, as among other peoples of Southeast Asia, the water buffalo can also be analogically identified with the whole of the cosmos and sacrifice can thus be conceived as a reenactment of creation.

The entrails of chickens and the livers of pigs frequently provide a means of divination within a sacrificial context. These forms of divination, as well as others, such as the augury of birds or divination by spear, together with spirit possession form part of a complex revelatory process by which humans seek to interpret the wishes and intentions of the spirit powers.

**RITUALS OF LIFE AND DEATH.** The rituals of the different traditional religions of the region invariably constitute part of a continuing process or cycle and are primarily concerned with the enhancement of life, either the life of particular persons or the life of large collectivities, including that of the cosmos as a totality. Life-cycle rituals mark the process of life and death. They may be seen to begin with marriage—the union of male and female—and proceed through specific stages. Prominent among these rituals are those that mark the seventh month of a woman’s pregnancy, haircutting, tooth filing, circumcision (which may have had a pre-Islamic origin but has been given increased significance through the influence of Islam), the coming of adulthood through marriage, and the formation of an autonomous household, which in many societies centers on the celebration of the completion of a house. In numerous societies, tattooing is a physical marking of this process of development and special tattoos are used to identify individuals who can claim outstanding achievements. Often tattoos are regarded as a prerequisite for admission as well as individual identification in the world after death.

Death rituals are part of the same process as those of life and in general are celebrated throughout the region with great elaboration. Death rituals are also performed in stages commencing with burial and continuing sometimes for years. Such rituals are believed to chart, or even effect, the progress of the spirit of the deceased in its journey or elevation through the afterworld. Major celebrations often occur long after initial burial, when only the bones of the deceased remain. These bones, separated from the flesh, may either be

reburied in a special sepulcher or reunited in a single tomb with the bones of other members of the descent group. Often the groups involved in performing these mortuary rituals complete and reverse the exchanges that began at the marriage ceremony of the parents of the deceased, thus ending one phase and beginning the next phase of a continuing cycle. On Bali, a Hindu cremation marks a comparable stage following a similar pattern, whereas in Java and elsewhere, despite an Islamic requirement of immediate burial, the spirits of the dead are given regular offerings and the tombs of former great rulers and leaders are prominent places of pilgrimage.

A feature of many of the rituals of life and death is their botanic idiom, which reflects a common Austronesian agricultural inheritance. The rituals describe a process of planting, growing, and ripening into old age; after the harvest comes the renewal of the cycle with the planting of new seed. Thus the rituals of the life cycle often parallel those of the agricultural cycle. Conceptually they are part of the same process.

Headhunting was once a prominent feature of the social life of many of the peoples of the region. Although this form of limited warfare was given various cultural interpretations, headhunting was frequently linked in rituals to the general cycle of death and renewal. In this sense, headhunting was a form of "harvest" in which particular individuals were able to achieve great renown.

**THE CELEBRATION OF SPIRITUAL DIFFERENTIATION.** In the traditional religions of the region, there is no presumption of identity attached to any of the manifestations of life. Creation produced myriad forms of being and the processes of life that began in the past continue to the present. Generally, not even humankind is credited with a single origin or source of being. The result is an essential openness to life, a basic acceptance of life's many manifestations, and ultimately a celebration of spiritual differentiation.

The tendency in most traditional religions is to personalize whatever may be considered a manifestation of life. Included among such manifestations are the heavenly spheres—the sun, moon, and stars; the forces of nature—thunder, lightning, or great winds; points of geographical prominence—high mountain peaks, volcanic craters, waterfalls, caves, or old trees; places endowed with unusual significance as the result of past occurrences—sites of abandoned settlement, a former meeting place of some spirit, or the point of a past, powerful dream; and simpler iconic representations of life—ancient ancestral possessions, royal regalia, amulets, and other objects of specially conceived potency. Veneration for all such objects is accorded to the potency that the objects are considered to possess, but only as long as this potency is evident. Confrontation with any new source of unknown power requires a kind of ritual empiricism to discover precisely what is that power's appropriate due.

In social terms, these spiritual premises are conducive to notions of precedence and hierarchy. No society in the region is without some form of social differentiation. Even in the simplest of tribal societies the birth order of the children of the same parents becomes a means for such distinctions. In many societies—perhaps a majority of the societies of the region—forms and degrees of differentiation are endowed with considerable importance. The populations of many of these societies regard themselves as derived of different ancestral origins or even of different classes of creation. Thus, for example, the ranked class structures of the Ngaju of Kalimantan, of the Bugis of south Sulawesi, or of the peoples of Sumba or Tanimbar in eastern Indonesia are all predicated on distinct creations.

Equally, the same spiritual premises may promote notions of achievement. A recurrent image of life involves the metaphor of the "journey of achievement." Myths recount the founding journeys of the ancestors, folk tales extol the attainments of heroic journeys, and dreams and séances can take the form of a spiritual journey. Furthermore, many societies encourage a period of journeying in early adulthood as a means of gaining knowledge, wealth, fame, and experience.

Literally and spiritually, individuals are distinguished by their journeys. Rank, prowess, and the attainment of wealth can be taken as evident signs of individual enhancement in a life's odyssey, and this enhancement may be celebrated through major rituals, both in life and after death. In many traditional religions, mortuary rituals and the feasting that generally accompanies them are the primary indicators of a person's social and spiritual position and are intended to translate this position into a similarly enhanced position in the afterlife. These rituals invariably invoke a journey, often described as the sailing of the ship of the dead, and by these rituals the living act to accord the deceased a proper spiritual position. (Often heaven or the underworld are considered to have many layers through which the soul of the dead wanders to find its proper abode.)

In return for the performance of the mortuary ritual, the deceased ancestor becomes capable of returning benefits to the living. In ancient Java, these ideas were given an Indic interpretation in the mortuary elevation of rulers to identification with Śiva or the Buddha. Similar ideas still underlie major temple rituals on Bali, megalithic tomb building among the Sumbanese, the spectacular mortuary ceremonies and cliff burial of the Sa'dan Toraja, or the simple, less obtrusive rituals of rock and tree elsewhere in the archipelago.

Today throughout insular Southeast Asia, the basic premises of traditional religions are under challenge from religions such as Islam and Christianity that preach transcendence in place of the immanence of life and assert spiritual equality rather than celebrate spiritual differentiation. These religions are also under challenge from modernizing national governments that insist upon bureaucratic homogeneity and positive rationalism. Yet despite present pressures, traditional

ways of thinking and acting continue to show remarkable resilience and continuity with the past.

## BIBLIOGRAPHY

A useful starting point for the study of Southeast Asian religions is Waldemar Stöhr and Piet Zoetmulder's *Die Religionen Indonesiens* (Stuttgart, 1965). A French translation of this volume is available: *Les religions d'Indonésie* (Paris, 1968). Stöhr examines various specific traits of the tribal religions of Indonesia and the Philippines on a regional basis, while Zoetmulder provides a succinct introduction to Hinduism, Buddhism, and Islam in Indonesia, together with an excellent discussion of the Balinese religion. Stöhr has since extended his general examination in *Die Altindonesischen Religionen* (Leiden, 1976). Both volumes have extensive and useful bibliographies. The general study of animism by the Dutch missionary-ethnographer A. C. Kruijt, *Het animisme in den Indischen archipel* (The Hague, 1906), is of historic interest as is the study of the Batak religion by the German missionary Johannes G. Warneck, *Die Religion der Batak* (Leipzig, 1909). Three studies of particular traditional religions by Leiden-trained anthropologists emphasizing features of complementary duality are Richard Erskine Downs's *The Religion of the Bare'e-Speaking Toradja of Central Celebes* (The Hague, 1956), Hans Schärer's *Ngaju Religion*, translated by Rodney Needham (1946; reprint, The Hague, 1963), and Peter Suzuki's *The Religious System and Culture of Nias, Indonesia* (The Hague, 1959). Roy F. Barton has provided considerable documentation on the Ifugao, including a study of their religion, *The Religion of the Ifugaos* (Menasha, 1946); Clifford Geertz has contributed enormously to the study of Java, particularly with an influential book, *The Religion of Java* (Glencoe, Ill., 1960). Our understanding of traditional religions has also been greatly enhanced by a series of recent ethnographies: Erik Jensen's *The Iban and Their Religion* (Oxford, 1974), Michelle Z. Rosaldo's *Knowledge and Passion* (Cambridge, 1980), Gregory L. Forth's *Rindi* (The Hague, 1981), and Peter Metcalf's *A Borneo Journey into Death* (Philadelphia, 1982), as well as by a number of as yet unpublished Ph.D. dissertations: Elizabeth Gilbert Traube's "Ritual Exchange among the Mambai of East Timor" (Harvard University, 1977), Robert William Hefner's "Identity and Cultural Reproduction among the Tengger-Javanese," (University of Michigan, 1982), E. D. Lewis's "Tana Wai Brama" (Australian National University, 1982), and Janet Alison Hoskins's "Spirit Worship and Feasting in Kodi, West Sumba" (Harvard University, 1984).

## SOUTHEAST ASIAN RELIGIONS: NEW RELIGIOUS MOVEMENTS IN INSULAR CULTURES

Uprisings with religious content have occurred throughout insular Southeast Asian history, but religious movements show a distinctive focus. They are not anarchic protests but organized efforts, of national or international scope, to achieve reforms or some other positive objective. Such movements are apparent especially since the beginning of this century. By limiting the discussion to such movements, we can at least begin to summarize a complicated fabric of history in which local processes are as varied as they are fascinating. For the sake of simplicity, it is convenient to group the myriad insular Southeast Asian religious movements under the three streams of religious tradition from which they draw, in part, their inspiration: Buddhism and Hinduism, Islam, and Christianity. These are discussed with reference to the major island or peninsular areas of Southeast Asia: Indonesia, Singapore, Malaysia, and the Philippines.

**HINDU-BUDDHIST MOVEMENTS.** The first important twentieth-century Hindu-Buddhist movement was Budi Utomo ("high endeavor") founded in 1908 by three students from the colonial Netherlands Indies medical school (STOVIA). The movement gained early adherents in other colonial technical schools, those for veterinarians and engineers, suggesting that the Western technical training was leaving the native students without any cultural or religious grounding, and that such grounding is what they sought in movements like Budi Utomo. Budi Utomo hoped to revitalize the deeply cherished Hindu-Buddhist-Javanist core of the Indonesian identity, so that a meaningful and respectable alternative could be found to the values offered by the West. Looking to India's Rabindranath Tagore and Mohandas Gandhi as inspirations in the revival of these traditions, Budi Utomo was controlled by the aristocracy and intelligentsia and never gained a broad popular following, although it had amassed some ten thousand members within a year of its founding.

Another movement, Taman Siswa ("garden of learning"), has a cultural grounding similar to that of Budi Utomo, but, unlike the earlier movement, it emphasized education. Taman Siswa was founded by Suwardi Surjaningrat, later known as Ki Hadjar Dewantara ("teacher of the gods").

Inspired by Tagore as well as such critics of Western education as Maria Montessori, Dewantara founded schools

designed to restore lost traditions and identities by combining Western and Javanist-Hindu-Buddhist values. Taman Siswa schools taught the Javanese arts to encourage the child to express its inner identity, and they encouraged a family like school community in which students and teachers were mutually involved as “brothers in learning.” By 1940, Dewantara had succeeded in building some 250 schools throughout the islands, some of which survive today.

A third major Hindu-Buddhist movement is really many movements and cannot be reduced to any single date of founding. These are known as *kebatinan*, from the Javanese word (of Arabic origin) *batin*, meaning “inner.” Something in the range of one thousand different *kebatinan* sects now flourish, primarily on Java, most founded since the beginning of the twentieth century but rooted in practices and beliefs that go back to the beginnings of the Javanese Hindu-Buddhist civilizations in the eighth century CE.

The aim of Javanese *kebatinan* is to mute the crude feelings and perceptions of the material world in order to experience the underlying reality that is simultaneously god, self, and cosmos. The techniques are ascetic practice (abstinence from food, sleep, or sex), philosophical and psychological speculation, and meditation. Guidance in *kebatinan* meetings is provided by a teacher who is believed to possess charismatic and sacral qualities. The objective is not only to reach ultimate truth but also to balance and unify the self and, in this way, the wider society and world. Some *kebatinan* movements, such as Subud, have established branches in the West, while others, such as Sumarah, have attracted Westerners to Java; but, on the whole, *kebatinan* movements remain a quintessentially Javanese phenomenon.

While Budi Utomo, Taman Siswa, and *kebatinan* are primarily Javanese movements, Balinese Hinduism has been an important stimulus for a revival of Hindu traditions as an organized movement spreading through Java as well as Bali. Associated with this Neo-Hinduism is a Neo-Buddhism that claims as a root the only surviving folk-Buddhist population, the Tengger, who live near Mount Bromo on Java. The Indonesian Buddhist Association claims to have built ninety monasteries and acquired fifteen million adherents since 1965 (when, following the massacre of an estimated half-million so-called Communists, all Indonesians were required to declare some explicit religion or risk being branded atheistic and, therefore, Communist). These revivals, which hold massive celebrations at such revered monuments as Lara Janggrang and Borobudur, combine indigenous Bali-Java traditions with Hindu-Buddhism.

**MUSLIM MOVEMENTS.** Where the Hindu-Buddhist movements of insular Southeast Asia have been confined primarily to Java and Bali, the Muslim movements have ranged more widely: throughout the three thousand miles of Indonesian islands and into Singapore, Malaysia, and the southern Philippines. The stimulus for these movements was the opening in 1870 of the Suez Canal and associated increase in steamship travel, which encouraged great numbers of Southeast

Asian Muslims, many of whom remained in the Near East for study, to make the pilgrimage to Mecca. By the beginning of the twentieth century, several Malay, Indonesian, Arab, and Indian citizens of insular Southeast Asia had come under the influence of the proponent of Islamic modernism, Muhammad Abduh of Cairo’s al-Azhar center of learning. Returning to Singapore or other ports of embarkation and disembarkation to the Near East, these students founded schools, journals, and associations that spread through the islands and were known as the Kaum Muda (“new faction”) of Southeast Asian Islam.

Pressing for a return to the fundamental truths of text and tradition, the Qur’ān and the *ḥadīth*, while rejecting the authority of teachers, scholars, and the ornate speculations of medieval Islam, modernists extolled the method of *ijtihād*: analysis of the original Arabic scriptures in order to read for oneself the word of God. Paradoxically, the return to scripture stimulated an advance to modernity, at least in certain respects. Folk practices that were not in the text were excised, while proper reading was held to demonstrate an Islamic basis for modern economics, science, medicine, and law. In what they themselves termed a “reformation” (*reformasi*), the devout Muslim could rediscover a pure identity and inspiration while equipping himself for the challenges of modernity.

Gaining impetus first in Singapore, where returning scholars founded such still-existing schools as Alsagoff, the Kaum Muda encountered resistance in Malaya but spread rapidly throughout the islands of Indonesia. Of the many Indonesian organizations standing for the Kaum Muda viewpoint, the most successful is the Muḥammadīyah, founded in 1912 by Kiai H. A. Dahlan, in the court city of Jogjakarta, Java. Muḥammadīyah worked not only to purify Islamic practice to accord with Qur’ānic teaching but also in education and welfare, building a large system of schools as well as clinics, orphanages, and hospitals. Muḥammadīyah has been notable, too, in the strength of its women’s movement, Aisjah. Having survived periods of turmoil and repression, Muḥammadīyah now boasts some six million members.

In reaction to Kaum Muda, the so-called Kaum Tua (“old faction”) took steps to cement its cherished traditions, which the reformers threatened to sweep away. In Malaya, where Islam was identified with the state, the old could be buttressed simply by stiffening the established hierarchy of Islamic officialdom. In Indonesia, lacking such an establishment, reaction took the form of a counterreformation. In 1926, Indonesian traditionalists founded the Nahdatul Ulama (“union of Muslim teachers”) to withstand the threat of reformism. Ruled by a dynasty centered around a famous religious school in East Java, Nahdatul Ulama has outstripped Muḥammadīyah in gaining support from the rural masses. While Nahdatul Ulama’s membership is larger, its organization is looser, and this organization has not equalled Muḥammadīyah in educational and welfare activities.

**CHRISTIAN MOVEMENTS.** Although significant Christian populations are found in Indonesia—especially among the

Batak, the Amboinese, the Toraja, and the Minahas—and among the Chinese throughout insular Southeast Asia, the only Christian nation is the Philippines. More than 80 percent of the Philippine population is Roman Catholic but an estimated 350 distinct Christian bodies exist there today, many of which could be termed “movements.” Most significant, perhaps, is the Iglesia Filipina Independiente (IFI, or Philippine Independent Church). The foundations for this offshoot of the Roman Catholic church were laid during the Philippine revolt against Spain in 1896, but the IFI was officially founded in 1902 by Gregorio Aglipay, who became its first archbishop. When the Spanish were defeated, the Filipino priests of the IFI took over parishes held by the friars and achieved a membership of 1.5 million, or 25 percent of the Christian population. Highly nationalistic, the IFI has been known to raise the Philippine flag at the time of the consecration of the Host in the Mass.

At one time the IFI canonized José Rizal, the Filipino novelist and nationalist martyr, and other movements, too, deify Rizal as a Christ of the Malays. An example is Iglesia in Cristo, founded in 1914 by Feix Manalo and now a highly organized movement based on a special method of meditation. Another Rizalist group, Lapiang Malaya, attacked the city of Manila in 1967. Believing themselves immune to bullets, they provoked the police and military into violent reaction and thirty-three of them died. Such movements fuse Christian inspiration with nativism, nationalism, and millenarianism, often opposed to westernization, modernization, and oppression.

**RELIGIOUS MOVEMENTS AND CONTEMPORARY SOCIETY IN INSULAR SOUTHEAST ASIA.** At different periods and in different places, these religious movements have contributed differently. Most of them, regardless of affiliation, were inspirational catalysts in giving rise to the striving for independence and modernity that led to the more directly political nationalist movements that began in the early twentieth century and culminated in the independence of these new nations soon after World War II. Since independence, their role has varied. In Indonesia, the Muslims have generally acted as an oppositional force complementing the government, while the Hindu-Buddhist streams have either fed into the Javanist-oriented national culture and government or provided personal fulfillment outside the governmental arena.

In Malaysia, the Muslims have identified more strongly with the government, while Hindu-Buddhism has not claimed a place in the national political culture equal to that of Hindu-Buddhism in Indonesia. In the Philippines, Islam has been oppositional, entrenched in the south against Christian incursions identified with the national polity; Christianity has been identified more with governmental authority, although Christianity, too (exemplified by such movements as the Christians for National Liberation and church support of Corazon Aquino during her rise to power in 1986), has had an oppositional role. In Singapore, the Muslims have played an oppositional role in relation to the dominant gov-

ernment party, but in this highly modernized, formally pluralistic society, religious movements have not played a post-war role equal to that in the other insular Southeast Asian nations.

In all of these countries, religious movements were dominant sources of nationalism and creative ferment in the early twentieth century. Later, as the impetus toward independence was seized by more purely political movements, the religious movements became relatively less important. After independence was achieved, the regimes in these countries (especially the two largest, Indonesia and the Philippines) have tended to become authoritarian, while religious movements (such as the Muslim fundamentalists) have eclipsed the Communists and others as the locus of aspiration independent of the government. The beginning of the twenty-first century could parallel the beginning of the twentieth, in that the stage is set for religious movements to resume their earlier role as a reformative force independent of the central power.

## SOUTHERN AFRICAN RELIGIONS

*This entry consists of the following articles:*

AN OVERVIEW

SOUTHERN BANTU RELIGIONS

### SOUTHERN AFRICAN RELIGIONS: AN OVERVIEW

There is a basic similarity in religious practice, symbols, and ideas throughout southern Africa, from Uganda to the southern sea, from the east coast to Cameroon. This is the area in which Bantu languages are spoken, and there is a link, though no absolute coincidence, between language family and religious symbolism. Some of the religious symbols of Africa also occur in Europe: The divine king of the Ganda, the Bemba, the Nyakyusa, and the Zulu appeared in the Grove of Nemi in ancient Italy and in Stuart England; but there are many other symbols of more limited provenance, such as fire, symbol of lordship or authority, and blowing out water, or "spitting," a symbol of the confession of anger and the act of forgiveness and goodwill.

Religious belief in southern Africa can best be understood through its symbolism, for religion here is expressed more through drama and poetry than through dogma or theological speculation. The invisible is embodied in tangible symbols which are bent to human purposes. Hence attention must focus on the rituals celebrated.

Among any one people there are likely to be dominant symbols which recur in one ritual after another, and full understanding of them depends upon analysis of the whole ritual cycle. Examples of such symbols are the muddyi tree (with a milky latex), which among the Ndembu represents matriliney, motherhood, and womanhood, and the plantain and sweet banana—the leaves, flowers, fruit, succoring stem—which among the Nyakyusa represent male and female respectively. These symbols are as obvious to a Nyakyusa as the skirt and trousers used to differentiate gender on washroom signs are to a European or an American.

The present tense is used for observations made during the twentieth century (with some references to earlier observers); but since rapid change is going on throughout Africa and since traditional African practice exists side by side with, and interacts with, modern Christian and Islamic practice, this article should be read in conjunction with others in the encyclopedia. What is described here is but a fragment of current religious practice in southern Africa: The symbolic

systems and institutions discussed here indeed still exist widely but are not the sole beliefs or practice of whole populations.

**CONCEPTS OF GOD.** Throughout southern Africa there is an apprehension of God as a numinous being associated with light, brightness, and sheen. God may be represented by a high mountain glittering with snow, a tree symbolizing the mountain, or a sacred grove. There is a lively belief in the survival of the dead and in their power over the living, a power closely akin to that which living senior kinsmen have over their juniors. There is a belief in medicines—material substances which can be manipulated for good or ill, healing or murder, and which include poisons put in food as well as ointments which are rubbed on the body to make a hunter's aim true, a warrior "slippery," a candidate successful in examinations, or a choir or rugby team victorious in competition. Everywhere the power of evil is feared—a power thought to be incarnate in certain persons or familiars they control, which is called witchcraft. The notion of witchcraft involves the personification of anger, hate, jealousy, envy, lust, and greed—the negative feelings which people observe in themselves and in their neighbors. All these beliefs are general, but they appear in infinite variety, modified by kinship and political structure, by economy, and by poetic imagination, and they have changed through time.

How clearly God is distinguished from the first human, or from the founding heroes of a particular lineage, also varies with place and time. Among some peoples, at least, the distinction became clearer as outside contacts extended and the known world was no longer confined within a frame of kinship. Over many centuries Hebrew, Christian, and Islamic ideas of God, with their symbolism of monotheism and of God on high, have impinged on other ideas in Africa, notably the association of the dead with the earth; in some places a process of change may be traced over the past hundred years.

Throughout southern Africa God has been remote, approached only by exceptional priests or by the "elders." The dead are regarded as alive, and it is the shades, or ancestors, the senior dead kin, who are the mediators between humanity and divinity, communicating human needs to the divine. Prayer or direct offerings to God himself rarely occur in traditional practice, but awe of God is constantly manifested, as fear of contamination, as a distancing of humanity from God, and avoidance of such emblems of sacred power as the thunderbolt, the tree struck by lightning, and the python in the grove. One does not speak readily of God, and one speaks of him not at all if he is near. Once, when this writer was at school in London, a fellow student (later a head of state in Africa) started in his seat when this writer was so rash as to discuss lightning on a day when the Lord was muttering overhead. Unusual fecundity, such as twin birth, is also of God and fearful, hence twins and their parents are isolated from the normal village community and, because of their divine connection, they function as "herds" to drive off storms.

Gabriel M. Setiloane, himself a Methodist minister, argues cogently in *The Image of God among the Sotho-Tswana* (Rotterdam, 1976) that the first missionary to the Tswana, Robert Moffat (the father-in-law of David Livingstone), misunderstood the Tswana language (into which he translated the New Testament) and hence the Tswana experience of God. But it is John V. Taylor who shows, in *The Primal Vision*, that in Africa God is both there and not there, that he is both sought and rejected. Bishop Taylor fastens upon the “significance of this ambivalence,” saying that humans have been aware of the numinous and their dependence upon it but have sought to separate themselves from it.

**SHADES.** Among southern African peoples shades are of two categories: the dead senior kin (male and female) of each family or lineage and the founding heroes. Family shades are relevant only for their junior kin who celebrate “rituals of kinship”; founding heroes (male or female) have relevance for political units, that is, chiefdoms, groups of chiefdoms, or regions which honor a hero and his or her descendants in “communal rituals.” The ancestors of a ruling lineage, where one exists, commonly claim descent from the founding hero; or the hero may be thought of as a benefactor or prophet who left no descendants but who is celebrated in some grove or cave by a lineage or priests. The ancestors of a chief, it is believed, retain power over the country they once ruled, so in addition to rituals for founding heroes there may be a series of offerings to past chiefs.

Like God, the shades are associated with brightness, light, radiance, and whiteness. Among the Zulu and Xhosa a gray-leaved helichrysum, whose leaves and pale gold flowers both reflect light, is linked with the shades; in Pondoland “the medicine of the home” is a small, yellow-flowered senecio which gleams in the veld. The beads offered to shades and worn by a diviner, novice, or pregnant bride are white, and when an animal is slaughtered and offered to the shades, the officiants wipe their hands in the chyme, a strong bleaching agent. But again, as with God, contact with the shades is seen to be somehow contaminating. A shade must be “pushed away a little”; it must be kept from continually “brooding” over humans as a hen broods over its chicks. The dead must be separated from the living and then “brought home,” that is, transformed.

Although they are numinous, the shades are held in far less awe than is God himself. To many Africans the shades are constantly about the homestead, evident in a tiny spiral of dust blowing across the yard or through the banana grove, or in the rustling of banana leaves; thought to be sheltering near the byre or in the shade of a tree, or sipping beer left overnight at the back of the great house. Their presence is so real in Pondoland that (into the twentieth century) a wife of the homestead carefully avoids the yard and the byre where men sit, even at night, lest the shades be there, and as she walks through a river associated with her husband’s clan she lets her skirts trail in the water, for to tuck up her skirts would insult his shades.

The living and the dead are so closely associated in southern Africa that it is common for a man’s heir (a brother, son, or sister’s son) and a woman’s heir (a sister, daughter, or brother’s daughter) to take the property, the name, the social position, and the responsibilities of the deceased. Hence one may be told that the holder of some office—a priest, chief, king, or senior kinsman—is “Mswati the third” (or tenth, as the case may be). A founding hero frequently has a living representative in this sense, a “divine king,” that is, a ruler or priest on whose health and virility the health and fertility of men, cattle, and land are thought to depend. Even into the twentieth century, a divine king who was ailing or feeble would be smothered—he must “die for the people”—and then be replaced.

Founding heroes typically are associated with a bed of reeds, from which the first man is said to have sprung; with a river source along the watershed between the Zambezi and Kongo rivers; with a pool in one of the rushing rivers of the south; with a hole in the ground (from which men and cattle emerged) on the dry edge of the Kalahari Desert; or with a grove of trees. Like family shades, heroes are of the earth and water, not of the sky. The place of celebration has moved as groups of kinsmen have moved, as chiefs have been installed and later buried, and as trees planted as boundary marks or on graves have spread into thickets.

**RITUAL LIFE.** Communal rituals are of various sorts, including offerings to the founding heroes, their living representatives, and chiefly descendants. Such offerings are celebrated by the leading men of the region, chiefdom, or village. The common people know little of the details; they are aware only that a celebration has taken place.

But there is also a type of purification ritual that concerns everyone. Sometimes it is linked to a celebration of first fruits; at other times it is accompanied by a military review. At the break of the rains in tropical Africa, or at the summer solstice farther south, and in any general emergency such as plague or war, the people may be called upon to purify themselves, to sweep the homesteads, throw out the old ash from hearths, and rekindle new fire. Among at least some peoples everyone is expected to “speak out,” that is, to confess anger and grudges held against neighbors and kin, or against fellow priests and leading men. It is a spring-cleaning of hearts and minds as well as homesteads.

In the Swazi kingdom today—as formerly in other Nguni kingdoms and chiefdoms on the southeastern coast of Africa—all the men of the country, and many women also, gather at the time of the summer solstice to celebrate the first fruits and strengthen their king, while regiments dance and demonstrate their loyalty. The Zulu form of this ritual was powerfully interpreted by Max Gluckman (1954) as a “ritual of rebellion,” but it now seems that this early analysis was based on a mistranslation. According to Harriet Ngubane (1977), a Zulu anthropologist, the key phrase used in the ritual expresses a rejection of pollution: “What the king breaks to pieces and tramples upon is a gourd that sym-

bolizes the evil of the past year.” This exactly parallels rituals farther north for “cleansing the country” in which the population of entire regions “throw out the rubbish,” especially ashes from all the hearths, and distribute newly kindled fire. The Ngonde (Malawi) chant: “Let us dance, let us fight that the homesteads may be peaceful. . . . Let us throw out the ashes that death may leave the homesteads and they be at peace.” Close analysis shows that such rituals symbolically cast out the anger in people’s hearts. The Taita of Kenya celebrate a similar rite of casting out anger, as Grace Harris (1978) has shown.

These cleansing rites speak repeatedly of ridding the people of “the dirt” of the past year. The similarity to ancient Hebrew rituals is obvious, although published reports from southern Africa make no mention of any symbolism having to do with driving out a scapegoat. Rather, the symbols which recur here are those of heat and coolness. Heat is associated with pollution, which in turn is closely associated with anger and sexual activity; coolness is associated with rain, tranquility, and purification. These symbols are familiar to all Sotho-Tswana-speaking peoples and to others also.

Throughout southern Africa communal rituals have to do with rain, especially the dramatic “break of the rains,” so eagerly awaited after the dry season. Local rituals celebrate seedtime and harvest; the firing of pasture to destroy unpalatable grass and bush which harbor tsetse flies; game drives or a fishing battue; murrain or plague; war and peace; the coronation of a chief and/or the handing over of power from one generation to the next. Details of such celebrations vary both with economy and with political structure. Regional rituals may involve the distribution of once-scarce goods, such as salt and iron tools, which in former times were brought to the shrine from beyond the boundaries of the political unit. The priests who brought the goods were sacred people: Among the Nyakyusa these priests traveled in safety, announcing their status by drumbeat. Other rituals may be connected with the growth of chiefdoms. J. Matthew Schoffeleers has written about the spread of the Mbona cult with the development of Mang’anga chiefdoms in Malawi.

**KINSHIP RITUALS.** Unless they concern a royal family, the rituals of kinship have no political overtones. They are celebrated on the great occasions of a person’s life: at birth and death, at maturity and marriage. In southern Africa each family or lineage directs its celebrations to its own dead senior kinsmen, who are not sharply distinguished from living seniors. The living may indeed be referred to by the term for a shade as they grow old. In 1931 in Pondoland this writer heard the word *itongo* (“a shade”) used in reference to an elderly father’s living sister. Living as well as dead seniors are thought to bring sickness, sterility, and other misfortunes—even failure to secure a job or a residence pass—on insolent, quarrelsome, or neglectful juniors.

Family rituals vary with the economy, for the place of the shrine and the form of the offering depend upon the staple foods. Among a pastoral people the altar is the byre, the

offering milk or a slaughtered animal. If the people cultivate, beer is added. Among banana-eating peoples the altar is set in a plantain grove, at the base of a succoring stem which represents the patrilineage; among hunting peoples it may be a tree or branch on which are placed trophies of the chase. To the Lele, who live on the southern edge of the equatorial forest belt, the forest is holy and is associated with men; the grassland, where villages are built, has no prestige and is associated with women. Among other peoples the cleavage is between the open pastureland or bush (the veld) and the village; or, within the village itself, between the byre and its gateway—where prayer and offerings are made and men gather—and the great hut occupied by the senior woman of the homestead. But everywhere the hearth and house, especially the doorway of the house, are sacred also, for among some peoples explicitly, and probably for all implicitly, the house represents the mother, the hearth stands for the marriage, and the doorway is the passage through which children are born. Taboos surrounding the hearth, the fire, and the whole reproductive process may be seen as an expression of the holiness of normal fertility and procreation, processes which are thought to be controlled by the shades.

Offerings to the shades consist of staple foods, especially choice foods such as a tender cut of beef eaten by the one on whose behalf prayer is made (the same cut from the right foreleg is used by peoples from Tanzania to the southern coast of Africa); a libation of fermented milk or beer; a sprinkling of flour or porridge; seeds of pulses, cucurbits, and grains. A strongly pastoral people will cling to the symbolism of slaughtering an animal—shedding blood—even when they live in a city. White goats may yet be seen grazing on the outskirts of the African quarters of Cape Town, or one may see them being led along a country road or wandering about on some modern farm where African laborers are employed. They are there to be used as offerings at times of birth or death, sickness or initiation, when meat from the butcher will not suffice; at such times informed authority turns a blind eye. The beer poured out may be made of sorghum, millet, bananas, bamboo, or even maize or cassava, which reached the coasts of Africa only in the sixteenth century and parts of the interior only in the nineteenth century.

Whatever the material used, the intention of the offering is the same: The shades are called to feast, and what is offered is a communion meal for living and dead kinsmen. If an ox has been slaughtered or much beer brewed, friends and neighbors will be asked to gather with the kinsmen, but they do not share in the sacred portions set aside for kin, who first eat and drink in a place set slightly apart from the main gathering. At an offering to the shades it is essential that kinsmen be present—the range of kin summoned depending upon the gravity of the occasion—and that they be loving and charitable to one another. Any quarrels must be admitted and resolved. This writer has heard the officiant at such a ritual urging all the kinsmen present to “drink up and speak out.” Sometimes a funeral feast, or a feast celebrating the re-

turn of a prodigal son to his father, may seem like a cursing match as one after another participant admits “anger in the heart,” a grudge against kinsmen. This writer heard individual women complain that they had not been received with due respect by a brother’s wife when they visited and the brother’s wife reply that her sister-in-law had been seen picking and stealing, taking green food from the garden as she passed through, and so forth. Unspoken anger, festering in the heart, is thought both to be the root of witchcraft and to invalidate an offering to the shades, for quarreling between kinsmen infuriates the shades.

When an offering is made, an officiant, usually the senior man of the lineage, or occasionally a dead father’s sister or a grandmother of the homestead, addresses the shades, calling them by name, explaining why the offering has been made—that is, what is troubling the homestead—and requesting help. The calling of ancestors by name is in itself a form of praise, and the manner of speech is that used in the presence of a senior kinsman, or (as among the Nguni) that used to honor a chief. Prayer and praise are here barely distinguishable.

The occasions of family rituals are constant throughout the area: death and birth, especially abnormal birth such as that of twins; maturity, whether physically or socially defined; marriage; misfortune and serious illness; reconciliation after a quarrel; and the first fruits that the family celebrates after the national or regional ritual. Thanksgiving rituals also occur, particularly after escape from danger in war or hunting, or on the return home of a migrant laborer or a person released from imprisonment; and there are rituals invoking blessing for an important new tool such as a plough, but these are less general than the rituals of life crises. Everywhere the death rituals persist through time and are adapted to the new economy. In the south funeral parlors with facilities for keeping a corpse exist even in some country districts, and funerals are delayed until close kin, scattered at work centers, can gather. Sometimes the corpse of a town worker who has not visited the country for years is brought “home” to the country to be buried. Great numbers of people come to mourn, and, relative to the family’s earnings, enormous sums are spent on traveling, funeral expenses, and food for guests. Many guests bring a contribution of money, but even so the family may be crippled financially. Whether a man has been buried in a Johannesburg township or a remote village, as of 1982 family status still depended on lavish expenditure just as it did among the Nyakyusa in 1935, when a hundred cattle might be slaughtered on the death of a rich chief.

Although funerals have been adapted to the new economy, they include certain traditional rites, notably a washing and purification rite after the burial and a lifting of mourning after about a year. Among the Nguni peoples of the southeast coast a commemoration dinner may replace the rite of “bringing home” the shade and implies an awareness of the continuing existence of the dead which is much greater than that experienced by many contemporary Europeans and

Americans. Setiloane describes the vitality of such rites in Sotho-Tswana families of professing Christians.

All the kinship rituals, but especially funerals, are an affirmation of kinship and the unity of the extended family, and the efficacy of the ritual depends upon the presence, in love and charity, of a network of kin. Exactly who is involved varies both with the people—be they Ndembu, Bemba, Zulu, or Sotho—and with the occasion. The celebrations are a strong conservative force, for the health and well-being of the whole kinship group is thought to depend on “following the customs of the ancestors” in observing the ritual. This is evident even in a city.

Maturity rituals have many aspects; the extent to which any one aspect is stressed varies from one society to another. This article has classed maturity rituals as religious, since they are explicitly concerned with fertility, which in turn is controlled by the shades; often they involve an offering and invocation to the shades, whose blessings are sought. Frequently, perhaps always, there is a symbolic death, a period of seclusion when the novice must observe taboos associated with the world of the dead, which is followed by a rebirth after which he or she returns to ordinary life. The rituals are viewed as a proper prelude to, if not a condition of, marriage and procreation. Rituals of maturity for boys often (but not invariably) involve circumcision: Those for girls may or may not involve clitoridectomy or some lesser operation.

Circumcision is most often celebrated for a group, and those who have endured this rite together share a bond for life. The boys’ group may become a unit in the army, and in areas where the political structure is based on age, its members may graduate together as elders holding legal and administrative office, and finally, as old men, share ritual functions. Where there are chiefs, a royal youth is sought to lead each circumcision group, and those circumcised with him become his closest followers. The circumcision school draws a youth out of the immediate network of kin and establishes links with scattered contemporaries and political authority, links sometimes expressed in an esoteric language known only to those initiated.

Girls’ initiation, on the other hand, is most often an individual celebration at the first menstruation, and wider links with contemporaries or political authority are not treated as important. But among a few peoples, notably the Sotho-Tswana and the neighboring Venda in precolonial times, girls’ initiation was a group affair with political implications; a women’s regiment was linked to a men’s regiment, and, like its male counterpart, it might be called out for public service.

Maturity rituals are everywhere concerned with inculcating respect for authority: respect for seniors, shades, chiefs, and respect of a wife for her husband. A man must learn to keep secrets and never reveal the affairs of his chief or the secrets of the lodge. A woman likewise must learn to hold her tongue; she must not create conflict through gossip

or reveal the affairs of her husband. Often there are taboo words and riddles with a set answer, knowledge of which are taken as proof of initiation. In *Chisungu* Audrey I. Richards (1956) admirably demonstrates the use of songs, mimes, designs, and models to inculcate in a Bemba girl the proper behavior of a wife. Always the rituals instruct the novice in the behavior required of an adult man or woman, and a transformation from childish behavior to responsible behavior is expected.

The rituals assert the authority of a senior generation over a junior: The initiated secure the young novice's submission through the pain of an operation, beating, scolding, and threats, or by playing upon the novice's fear of the unseen and longing to become an honored and fertile man or woman. The ritual creates a fraternity or sorority of those who have undergone the ordeal: Those who have not undergone it are outsiders, but all who have endured are free to participate in the admonition of their juniors. A determination to use circumcision rites to bolster civil authority was made explicit in October 1981 when the Ciskei, later an "independent state" on the border of the Republic of South Africa, passed legislation empowering a chief to compel a young man to be circumcised, on the ground that "it is well known that circumcision causes irresponsible youths to behave in a responsible manner." This happened at a time when opposition by school boys and students to Ciskeian political authority was intense.

Why maturity rituals have survived among some peoples but not others, or for one sex but not the other, in fast-changing societies can only be demonstrated by analyzing historical events in particular areas. What is certain is that in some areas changes in practice have occurred since the eighteenth century, rites spreading or being abandoned; but there is also eyewitness evidence from survivors of wrecks on the southeastern coast of Africa which suggests minimal change in circumcision rites among Xhosa and Thembu peoples over three centuries.

**CULTS OF AFFLICTION, SPIRIT POSSESSION, AND DIVINATION.** Besides the cycle of rituals associated with families and the birth, maturity, and death of individuals, and the cycle celebrated for a chieftom or region, there is a cycle of rituals for those individuals "called" by their shades to become diviners, or for sufferers whose sickness has been relieved by what Victor Turner has called a "ritual of affliction." Cults or guilds are formed of those who have suffered a particular travail and been cured by a particular ritual. Their experience entitles them to participate in any celebration for a sufferer of the same category. Rituals for diviners who have been called (as opposed to herbalists who learn certain medicines) and rituals of affliction are much less widespread than those for birth, maturity, and death, or those for a chieftom or region. They are not contained within the frame of kinship or locality and seem to have proliferated with trade and travel, but of that process not much is yet known. What is certain is that among some isolated peoples (such as the Nyakyusa)

these rituals do not occur at all, and among peoples with a long tradition of distant trade, such as the Shona and Tsonga, possession is often interpreted as being the work of an outsider, not that of a family shade. This phenomenon has appeared recently among the Zulu, as Harriet Ngubane (1977) has shown, and, according to John Beattie (1969), it exists among the Nyoro of Uganda as well.

Diviners are thought to be in a peculiarly close relationship with their shades, who reveal themselves in dreams and trances. Communication with the shades is fostered by cleansing and purging, observance of taboos (including sexual abstinence), fasting, isolation in the bush, offerings to the shades, and dancing to clapping or drums. The emotion is often intense when, with an insistent beat of clapping provided by a packed crowd, a novice speaks of what she has seen in dreams. In Western society the closest analogue to the diviner in this respect is the medium, and among some peoples—notably the Shona of Zimbabwe—a state of trance undoubtedly occurs. Even though it may be a stranger spirit who possesses the medium, she remains in close contact with her family shades.

Most mediums deal with the domestic problems and health of clients who come to consult them. Occasionally, however, a medium may influence public events, as did Nongqause, the Xhosa girl who in 1856 urged all Xhosa on the eastern frontier of the Cape of Good Hope to kill their cattle and destroy their grain, prophesying that when they did so the dead would rise up and sweep the whites into the sea, or the Shona medium who in 1898 urged resistance against whites in what is now Zimbabwe. During the colonial period old prophecies of the coming of whites were repeatedly recorded, and these may be seen partly as a reconciliation of old and new. To at least some Nyakyusa Christians, such prophecies were evidence of the reality—"the truth"—of ancient institutions, the prescience of past prophets. Had not the prophecy been fulfilled?

**WITCHCRAFT.** In southern African belief, evil does not come from the shades, who are essentially good. They discipline erring descendants, sending sickness or sterility if they have been starved (for in a real sense the shades partake of the communion meal—that is, the beer and flesh—and are satisfied by it) or neglected, not informed of a marriage, or affronted by the quarrels of their juniors. But they are concerned about the welfare of their children and are held to be the source of blessing. Rather, evil comes from another source: witchcraft. It is thought to be embodied in a serpent—a "python in the belly" (Nyakyusa), a "snake of the women" (Pondo); or it takes the form of a baboon, or a fabulous hairy being with exaggerated sexual organs (Xhosa), and so forth. Such creatures are as real in imagination as was the pitchfork-wielding Devil to the medieval European, and like him they walk the earth seeking those whom they may devour. The witch familiars (and witchcraft generally) personify the evil recognized as existing in all humans, specifically, anger, hatred, jealousy, envy, lust, greed. Even sloth appears,

in the belief that certain evil people have raised others from the dead to work their fields for them.

The form of witch belief varies with the social structure, as does the relationship of victim and accused, for the points of friction in a society vary with the form of residence and economic cooperation (i.e., who lives and works together), the occasions of competition, and the location of authority. Injury is thought to come from those with whom one has quarreled: a co-wife, mother-in-law, half sibling, fellow employee, rival claimant for inheritance, affine claiming marriage cattle, litigant in court against whom judgment has been given, or fellow priest. In some societies it is mostly women, poor men, and juniors who are accused; but in societies where egalitarian values are stressed the rich man is suspect, as is the successful grower of cash crops who is thought to have attracted the fertility of his neighbors' fields to his own. The one legitimately greater than the commoner (i.e., the chief) may covet the cattle of a wealthy stock owner, who is then accused of some wrongdoing—or so outsiders have thought.

Again and again during the colonial period, "witch-finding" movements arose when some prophet would call on his people to reject evil, to purge themselves of witchcraft and medicines used for sorcery. Over large regions people in fact complied, bringing out horns of medicines or other objects to throw publicly on a pyre and implicitly or explicitly admitting evil in themselves and expressing goodwill to all. The bamucapi movement which swept through what are now Zambia, Malawi, and parts of Zimbabwe and Tanzania in 1934 was followed by a somewhat similar movement in much the same area (but with greatest influence in what is now Tanzania) between 1956 and 1964. Long before these movements arose, the Xhosa of the eastern Cape frontier had repeatedly been urged to purify themselves and reject witchcraft. In 1856 Nongqause, a sixteen-year-old medium, reported to the noted diviner Mhlakaza, her father's brother, that the shades had told her they would come to the rescue of their Xhosa descendants in their long war with whites over land on the eastern frontier, on condition that the living purify themselves and kill all their cattle. In the famine that ensued, twenty thousand people died. There is no evidence that such revivalist movements began in the colonial period: They may well have happened periodically before that, although certain characteristics of movements in colonial times, notably millennialism, were related to Christian missionary teaching.

People are known to confess to the practice of witchcraft, usually following an accusation and pressure to confess. One young mother in Pondoland explained to this writer that her baby had at first refused to nurse because she had had a witch-lover (who appeared in the form of a young man she named). The mother had then confessed, complying with the instructions of the midwives and giving her account precisely in terms of current beliefs; she was now being cleansed, and the baby was nursing all right. In some areas

confessions have at times been extracted forcibly (through a poison ordeal or torture), since the recovery of the victim is held to depend upon the witch's confession and subsequent expression of goodwill toward the victim.

**RITUAL, ORDER, AND THE RELIGIOUS EXPERIENCE.** Analysis of ritual is important in any study of religion, for ritual enshrines the dogma and values of participants. There is always a gap between the values expressed and everyday practice, but ideals and ideas of ultimate reality are embodied in ritual action. In southern Africa there is constant emphasis on fertility—of human beings, stock, and fields; on health; on goodwill between kinsmen and neighbors; on amity among the ruling men of the region; on respect of juniors for seniors and the responsibility of seniors toward their dependents; on the continuation of life after death.

Order exists in the universe, and the natural and social orders are felt to be interrelated: As in *King Lear*, disharmony in the world of humans is reflected both in the world of physical elements and in the tempest within a person's mind—in madness. If the divine king breaks a taboo, drought or flood may follow; if the ritual for a widow or a nubile girl is neglected, she may become distraught. Right order is expressed in traditional custom, and in their essence, rituals—whether positive action or negative avoidance—express the sacredness both of physiological processes, that is, menstruation, coition, parturition, and death, and of the approved relationships of men and women, old and young, leaders and followers. Both family and communal rituals are occasions of emotion, and the celebrations themselves arouse emotion, as is obvious to any observer who listens to the drumbeat and watches the dancing. Rituals, then, channel emotion and teach the mourner, the adolescent, or the parent what it is proper to feel. Nyakyusa mourners were required to express the passion of grief and fear to the men "fighting death" in the war dance and to widows, mothers, and sisters weeping violently and smearing themselves with ash and mud; but the rituals reveal little of the actual experience of the individual.

Any understanding of religious experience must come primarily from what individuals report of their own lives. Firsthand accounts are meager, but there is evidence that an awareness of the numinous exists. The talk of priests hints at their fear of a grove in which a founding hero or chief has been buried; at a communion meal of living and dead kinsmen, there is a sense that the shades are present and that the participants find satisfaction in their company; people speak of the comfort felt in a moment of danger when a man or woman has called on the shade of a parent or grandparent and sensed its presence; the fear aroused by a nightmare may be interpreted as the attack of a witch. Dreams are indeed the most common experience of the unseen, and so real that in recording the experiences of southern Africans I often had to ask, "Were you asleep or awake when this happened?" Those closest to their shades, and hence most aware of the numinous, are the hereditary priests, or rainmakers, and diviners who have been "called" and who practice as mediums.

#### BIBLIOGRAPHY

To supplement the relatively few works cited in the text, the works listed herein range over all parts of the enormous area of southern Africa. Many of the books cited here were written by missionaries, who provided most of the early published evidence of the traditions of peoples in the area.

Beattie, John, and John Middleton, eds. *Spirit Mediumship and Society in Africa*. London, 1969. Firsthand accounts by trained observers of spirit mediums in thirteen African societies, with a comparative introduction.

Berglund, Axel-Ivar. *Zulu Thought-Patterns and Symbolism*. London, 1976. By far the best study of the symbolism of an Nguni people (on the southeast coast), written by a missionary who grew up speaking Zulu as a second language.

Bernardi, Bernardo. *The Mugwe: A Failing Prophet*. London, 1959. A competent account of a hereditary priest in Meru, Kenya, written by a Consolata priest who was a missionary in the area.

Callaway, Henry. *The Religious System of the Amazulu* (1870). Reprint, Cape Town, 1970. Contains valuable statements of belief by Zulu. Includes Zulu texts and English translations, with notes, by the Reverend Canon Callaway, a Zulu-speaking missionary who sought to understand traditional ideas.

Colson, Elizabeth. *The Plateau Tonga of Northern Rhodesia*. Manchester, 1962. One volume of a longterm study by an anthropologist; gives an account of ancestral spirits and rain shrines.

Crawford, James R. *Witchcraft and Sorcery in Rhodesia*. London, 1967. Based on records of court cases.

Douglas, Mary. *The Lele of the Kasai*. London, 1963. A brilliant essay on Lele symbolism, first published in *African Worlds*, edited by Daryll Forde (London, 1954).

Douglas, Mary. *Natural Symbols*. New York, 1970. Discusses the relationship between symbols and inner experience.

Douglas, Mary, ed. *Witchcraft Confessions and Accusations*. New York, 1970. Sets witch beliefs in comparative perspective.

Fortes, Meyer, and Germaine Dieterlen. *African Systems of Thought*. London, 1965.

Gluckman, Max. *Rituals of Rebellion in Southeast Africa*. Manchester, 1954.

Hammond-Tooke, W. David. *Boundaries and Belief: The Structure of a Sotho World View*. Johannesburg, 1981.

Harris, Grace Gredys. *Casting Out Anger: Religion among the Taita of Kenya*. Cambridge, 1978. A discussion of rejection of anger, through spraying out water or beer, as the central religious act among the Taita.

Junod, Henri A. *The Life of a South African Tribe*. 2d ed., rev. & enl. 2 vols. London, 1927. A classic by a missionary; first published as *Les Ba-Ronga* (1898; reprint, New Hyde Park, N.Y., 1962).

Kenyatta, Jomo. *Facing Mount Kenya* (1938; New York, 1962). A valuable firsthand account of Kikuyu ritual and belief.

Mbiti, John S. *African Religions and Philosophy*. New York, 1969.

Mbiti, John S. *Concepts of God in Africa*. London, 1970. Useful on the concept of time in East Africa. Makes clear that ancestors are not worshiped; offerings to them are family celebrations with the "living dead."

McAllister, P. A. "Work, Homestead and the Shades: The Ritual Interpretation of Labour Migration among the Gcaleka." In *Black Villagers in an Industrial Society*, edited by Philip Mayer, pp. 205–253. Cape Town, 1980. Evidence on a very conservative section of Xhosa on the southeast coast.

Middleton, John, and E. H. Winter, eds. *Witchcraft and Sorcery in East Africa*. London, 1963. Essays based on firsthand observation.

Ngubane, Harriet. *Body and Mind in Zulu Medicine*. London, 1977. Particularly illuminating on the ancestors and illness, pollution, color symbolism in medicine, and possession by evil spirits. An important work by an observer whose mother tongue is Zulu.

Ranger, T. O., and Isaria N. Kimambo, eds. *The Historical Study of African Religion*. Berkeley, Calif., 1972.

Richards, Audrey I. "A Modern Movement of Witch-finders." *Africa* 8 (October 1935): 448–461. Describes the bamucapi movement of 1934.

Richards, Audrey I. *Chisungu: A Girl's Initiation Ceremony among the Bemba of Northern Rhodesia*. London, 1956. The most vivid account yet written on girls' initiation; interprets symbols and explains methods of inculcating certain lessons.

Roscoe, John. *The Baganda*. London, 1911. Written by a missionary who worked closely with James G. Frazer. Includes an account of founding heroes and rituals at their shrines.

Setiloane, Gabriel M. *The Image of God among the Sotho-Tswana*. Rotterdam, 1976.

Smith, Edwin W., and Andrew Murray Dale. *The Ila-Speaking Peoples of Northern Rhodesia* (1920). 2 vols. Reprint, New Hyde Park, N.Y., 1968. Smith was a missionary, Dale a magistrate, and both were very competent linguists. They lived among the Ila of the Zambezi from 1902 and 1904, respectively, until 1914. The sections on religion are chiefly the work of Smith, who later served as president of the Royal Anthropological Institute, London. The book is a classic of early African ethnography.

Smith, Edwin W., ed. *African Ideas of God*. London, 1950. A symposium with twelve contributors and an introductory essay by Smith. Five contributors refer to southern Africa.

Swantz, Marja-Liisa. *Ritual and Symbol in Transitional Zaramo Society, with Special Reference to Women*. Uppsala, 1970. An account of the ritual and symbolism of the Zaramo of the Tanzanian coast. "Every occasion of prayer," Swantz argues, "is a restatement of the position of the family in relation to their elders and to their present leadership and authority."

Taylor, John V. *The Primal Vision: Christian Presence amid African Religion*. Philadelphia, 1963. A penetrating study based on Taylor's experience in Uganda and elsewhere in Africa.

Turner, Victor. *The Forest of Symbols*. Ithaca, N.Y., 1967. This volume was followed by Turner's *The Drums of Affliction*

(Oxford, 1968), *The Ritual Process* (Chicago, 1969), and *Revelation and Divination in Ndembu Ritual* (Ithaca, N.Y., 1975); together they constitute a profound study of Ndembu ritual and symbolism.

Willoughby, William C. *The Soul of the Bantu*. New York, 1928. Based on the experience in Botswana of a missionary who believed that "ritual is a variety of the vernacular."

Wilson, Monica. *Reaction to Conquest*. London, 1936. Includes eyewitness accounts of animal offerings and prayers to the shades.

Wilson, Monica. "Witch Beliefs and Social Structure." *American Journal of Sociology* 56 (January 1951): 307–313.

Wilson, Monica. *Rituals of Kinship among the Nyakyusa*. London, 1957. This work and its companion volume, *Communal Rituals of the Nyakyusa* (London, 1957), describe the whole cycle celebrated; they quote the texts and describe the situations on which interpretation of symbols is based.

Wilson, Monica. "Co-operation and Conflict." In *The Oxford History of South Africa*, edited by Monica Wilson and Leonard Thompson, vol. 1. Oxford, 1969. Shows that the Xhosa cattle killing of 1856 was one of a series led by prophets who urged purification from witchcraft and sacrifice to the shades.

Wilson, Monica. *Religion and the Transformation of Society*. Cambridge, 1971. Discusses the change in traditional religion as the scale of societies in Africa increases.

Wilson, Monica. "Mhlakaza." In *Les Africains*, edited by Charles-André Julien et al., vol. 5. Paris, 1977. The Xhosa cattle killing has been seen by various writers as a plot of the chiefs to drive the Xhosa to war, as a plot of the whites to destroy the Xhosa, and as a resistance movement. Little attention has been paid to its fundamental religious aspect, which is discussed here. (The text is, alas, marred by many mistakes in the French printing of names.)

MONICA WILSON (1987)

## SOUTHERN AFRICAN RELIGIONS: SOUTHERN BANTU RELIGIONS

Patrilineal herdsmen and farmers belonging to the large Bantu linguistic group, which is widely spread over central and eastern Africa, moved into southern Africa in distinct waves. They appeared in the region as distinct cultural groups probably between 1000 and 1600 CE. The Sotho (Pedi, Matlala, et al.) and the related Tswana settled on the arid inland plateau where the San were hunting and the Khoi were raising livestock. The Nguni (Zulu, Swazi, and Xhosa) spread out along the southeastern coast. The Lovedu and Venda, two closely related peoples who became strongly amalgamated with the Sotho in the twentieth century, successively broke away from the Karanga in ancient Zimbabwe; the last Venda migration may have crossed the Limpopo River after 1600 CE, but their predecessors were probably among the first inhabitants of the northeastern Transvaal. The Tsonga, or Thonga, migrated in the early nineteenth century into the Transvaal, where they ran into Sotho and

Venda, but their lands still lie principally in Mozambique. In spite of these people's cultural diversity, their ceremonies as well as their conceptions of the world have sprung from the same fundamental cosmology, either through derivation from a common heritage or else from interactions.

**A THERMODYNAMIC CONCEPTION OF THE INDIVIDUAL AND OF THE UNIVERSE.** The opposition between hot and cold is fundamental to many different rites found among the southeastern Bantu-speaking peoples. J. D. Krige and Eileen Jensen Krige have shown the importance of this opposition among the Lovedu. In effect, heat upsets equilibrium and causes dysphoria. To end severe drought, ward off the dangers associated with premature birth, and heal sickness, a cooling treatment is applied. This is also done after the birth of twins, for the whole country risks becoming dry.

The Venda also use this dialectic. Similarly, the Zulu make a sacrificer avoid warmth before undergoing an immolation to the ancestors, who are associated with water and sperm. The day before, he has to give up drinking beer, stop making love, and keep away from fire. Communication with the ancestors is possible only if all participants are cool—neither angry nor spiteful. According to the Tsonga, sick persons give off heat, as do menstruating or pregnant women and excited warriors who have just killed an enemy. The cosmic order is threatened by the birth of twins because the mother "has gone up to the sky" during pregnancy, a period of dangerous overheating inside her womb. The Pedi even recommend that pregnant women not go outside whenever it rains. The Tswana say that the hot blood of pregnant women counteracts rain medicine. Moreover, their rainmakers and chiefs must abstain from sexual intercourse throughout most of the rainy season.

The Tsonga liken the normally born baby to a pot that has not cracked when baked. The mother and child are secluded until the umbilical cord falls off. The father cannot approach his wife because she is considered to be too hot. If the baby is male, the father runs a special risk. A series of rites gradually separates the infant from the mother's burning body and integrates him into the father's sphere. The cooling process can be clearly observed during Tsonga funerals for infants. If death follows soon after birth, the body is put inside a cracked pot that is covered with a layer of ashes. If death occurs before the Boha Puri tribal integration, which allows the parents to resume sexual intercourse and is performed when the child reaches the age of one, the body is buried in a humid place. If the child dies after this rite, the funeral is conducted like that of an adult, and the corpse is buried in dry earth.

The same thermal code underlies rites of passage that, though differing in form, are basically similar. An example is the presentation to the moon. A cooling feminine principle, the moon is responsible for watching over the child's growth and is often likened to a paternal aunt. During the first new moon visible after birth, the Pedi place the baby on the ground for a few seconds, and water, symbolizing

rain, is poured through the roof and onto the infant. Three months after birth, the Tsonga present the baby to the new moon, throwing a torch toward it. Once the torch goes out, the baby is separated from his or her mother and laid on a pile of ashes. This example keenly reveals the transformational process that brings these rites within a single symbolic system: the Tsonga replace rain with an extinguished torch. Moreover, whenever twins, as “sons of the sky,” assist at funerals, their fontanels are smeared with ashes because they are seen as burning, hence dangerous creatures.

**THE PYTHON CULT.** A major divinity known as the python spirit among southeastern Bantu-speaking peoples symbolizes the coolness that is responsible for individual, social, and cosmic equilibrium. He is undoubtedly part of the most archaic Bantu cultural substratum, and both the Swazi and Venda perform ceremonies in his honor. Among the Luba in Zaire, he has a celestial manifestation, that of the rainbow. The Zulu and Luba reverse his climatic functions. Nkongo, the Luba python, is, like the Zulu one, associated with terrestrial waters. As the rainbow, however, he burns rain rather than bringing it. In contrast, the Zulu hold the python and rainbow to be two distinct spirits whose beneficial actions with regard to water are complementary. “Coolest of all animals” according to Axel-Ivar Berglund, Python licks the fat of the black sheep that rainmakers sacrifice to him. On the other hand, the rainbow princess, iNkosazana, is the virgin daughter of the lord of heaven (and of thunderbolts), whose changing moods are dreaded by men. She intercedes so that he regularly sends gentle, soaking rain. Her rays of light plunge into the waters. Virgin girls, disguised as warriors, offer her vegetables and beer on top of a mountain forbidden to men. The feminine rainbow cult stands opposite the masculine python rite of sacrifice. Only princes may kill this venerated animal provided that they not spill its blood. Its fat goes into medicines that specialized magicians use against thunderbolts.

The rainbow princess cult is found specifically among the Nguni. Traces of it are found among the Swazi, who inaugurate the annual Ncwala ceremony during the southern summer solstice with a quest for the waters of the world. National priests lead two separate processions, one in search of river water and the other in search of seawater. Carried on a shield at the head of each procession is a ritual calabash, called “princess.” These two calabashes represent the rainbow princess. This extraordinarily complex ceremony, which principally regenerates the king’s mystical force, ends with a purifying bonfire that is supposed to be put out by rain.

Although the Swazi apparently have no python cult, Venda religion honors the python, and snake cults thrive among the Karanga. According to Venda cosmogony, the whole creation took place inside Python’s stomach. This primordial, aquatic demiurge vomited nine creatures who roamed over the soggy earth, which was still in darkness. They became the sun, moon, and stars. Controlling fertility and rain, Python also presides over girls’ puberty rites. Kill-

ing a python during the rainy season is strictly forbidden. During the dry season, its carcass is thrown into water, although the head and tail are buried in the cattle fold in order to bring prosperity. People use its fat to protect themselves from burns and to prevent fires.

Most Bantu cosmogonies are fundamentally dualistic. Thus opposite Python is Raluvhumba, who has often been mistaken for a supreme being. His name evokes the eagle, *luvumba*. Raluvhumba’s voice is thunder, and during storms he is visible as a big flame. He controls the sun, which could burn the earth if it came too near. His complementarity with Python stands out in a royal ceremony that is no longer observed. After communicating with Raluvhumba in a sacred cave, the Venda king used to order his people to perform Python’s dance (*tshikona*) for two nights. Much like other, neighboring societies, the Venda believe that the universe’s equilibrium depends upon the joint action of two fundamental principles—water and fire, coolness and heat. Water and coolness have the advantage of having originated first; fire and heat are always menacing because they threaten life. Therefore, the Venda put out all fires when their king dies. The Lovedu do the same because the earth is “hot” whenever their queen (who is responsible for keeping the rain medicine—and keeping it cool) passes away.

These myths and rites parallel various fragmentary tales collected among the Karanga. The Korekore, a branch of the Karanga, worship Dzivaguru (“big pool”). This rain spirit lived on earth before he disappeared into a pool on a mountaintop. He was forced to vanish by the magic of a rival chief who coveted his wealth and put on red attire (the color of fire). Like the Venda Python, this vanquished spirit was the primordial ruler of the world. By going down into water, he brought darkness over the earth. His opponent had to use a new magical trick to bring the sun back. Dzivaguru said that he would accept only sheep as offerings—the same animal that the Zulu sacrifice to Python.

This tale is apparently a variation of a Hungwe myth, taken down by Leo Viktor Frobenius, that accounts for the origin of the mighty Zimbabwe kingdom, whose stone ruins are unique in the Bantu-speaking world. In olden times, a poverty-stricken people known as the Hungwe were dwelling on a mountain. They ate food raw because their chief, Madzivoa, had lost the fire that his daughters kept in a sealed horn containing oil. Hunters from the north, the Hungwe’s ancestors, came into the land. They had fire and ritually smoked a pipe to sustain their magical force. Their chief gave fire to Madzivoa, married his daughter, and became the first “king” (*mambo*). Many people united around him, and even Madzivoa became his servant. The name of this fallen autochthonous chief derives from *dzivoa* (“lake” or “pool”), also found in the name Dzivaguru. These two similarly named figures met up with parallel fates at the hands of newcomers who seized their power and wealth.

The new mythical rulers of fire had to accommodate the demiurges associated with water, as told in another Karanga

story collected by Frobenius. A snake spirit used to dwell in a lake on the Zimbabwe plain. The king's daughters are thought to copulate with this spirit to keep the sacred pool and rain from disappearing. The vaginas of these princesses, who enjoyed total sexual freedom, had to be continuously moist. Victims to be sacrificed for rainfall were chosen from among them. A second group of princesses had to stay chaste. They were associated with a ritual fire kept by the king's incestuous wife, Mwiza, who represents the morning star.

The Venda myth transposes these elements. Python lived with two wives. Only the first one knew his real nature and could visit him freely during daytime. The second could draw near him only at night when she was soaked. Driven by curiosity, she broke this rule and caught her husband smoking a pipe. Angrily, Python went down into a lake. To end the subsequent drought, the guilty wife had to sacrifice herself and join her husband in the water. The Venda primordial Python clearly brings to mind Zimbabwe's aquatic serpent, of whom Dzivaguru and Madzivoa are avatars.

These variant myths relate both the incompatibility of water and fire and their complementarity. The duality of the Karanga princesses with dry and moist vaginas expresses the southeastern Bantu dialectic of coolness and heat. The Venda myth about the python who secretly smoked a pipe recounts the same theme as the Hungwe one about a mysterious foreigner who drew force out of smoking and prevailed over Madzivoa, an aquatic spirit who used to keep fire in a horn. The sacrifice of the Venda Python's second wife obviously corresponds to the sacrifices demanded of the Karanga princesses. Karanga symbolism vividly distinguishes a primordial spirit associated with both terrestrial and rain waters from a ruler of fire who was his opponent or else became his ally through marriage. The Korekore see these two spirits as rivals but ultimately invoke Dzivaguru whenever there is no rain. However, this cosmogony has been obscured by the cults of possession dedicated to regional or particularistic gods. The ubiquity of these cults, borrowed from the Shona, has distracted researchers from the still-present ancient gods. In fact, Dzivaguru is the only local spirit with no medium.

The Venda, however, have made an original transposition of the ancient dualism. Python, ruler of waters, and Raluvhumba, ruler of celestial fire, are ritually complementary. In Zimbabwe, neighboring Karanga worship Mwari, a supreme being who combines the attributes of both. This "possessor of heaven" is also called Dzivaguru. Mwari's representative, the python, is venerated as a spirit of the mountains, whereas a water snake keeps rivers and springs from going dry.

**COSMOLOGY AND SACRED KINGSHIP.** James G. Frazer was the first to describe as "divine kingship" a political institution whose primary function is control over fertility and natural forces. I prefer to use the term "sacred kingship" because the particular chiefs who are essential to this institution are not actual gods. The Venda and Lovedu inherited the institution

of sacred kingship from the Karanga while the Sotho and Tswana did not (sacred kingship is not apparently a feature of Sotho or Tswana culture despite the existence among them of some powerful military chieftaincies). The Swazi established a political and symbolic system remarkably similar to that of the Venda. Sacred kingship is widespread throughout Africa. Surprisingly constant characteristics are thus attributed to African, particularly Bantu-speaking, kings: they are uncommon beings; they take paramountcy through transgression (often incest); they are surrounded by prohibitions; and they are condemned to die early unless other victims make it possible for them to continue reigning.

The Swazi king, master of thunderbolts and of the sun, rules along with a queen mother associated with the moon and with lush vegetation. Together they control the rains. The king has the privilege of marrying his real or classificatory sisters. While young, he succeeds his father with the title "child," and when adult he takes full power by marrying the "queen of the right hand," with whom he commingles blood to become twins. But his real so-called twin is his mother. During the summer solstice, his force weakens, and the whole nation goes through a crisis. He then performs the Ncwala ceremony, which opens with the previously described quest for water. He is proclaimed "bull of the nation" after the sacrifice of an ill-treated black ox, which represents him. Following several events that alternately show his weakness and his force, he consumes the first fruits and is then disguised as the spirit of vegetation.

According to the Venda founding myth, the first two sovereigns were Sun and Moon, his twin sister as well as incestuous wife. Paradoxically, the Venda king rules with a paternal aunt (Makhadzi, a title also used to refer to the moon); an agnatic half sister takes the aunt's place during the next reign. His principal wife, often a real or classificatory sister, belongs to the royal family. The king, "light of the world," controls rain through both Python and Raluvhumba. Although no ritual marks the summer solstice, Makhadzi presides over the first-fruit ceremony.

Venda and Swazi symbolic configurations are related through transformations. In practice, the Venda put agnatic ties in place of the incestuous uterine (or twin) ties of their myth. The Swazi, on the contrary, maintain these mythical ties through a fiction. Mirrored by a queen who is the king's agnatic half sister, the Venda queen aunt obviously fills the same ritual position as the Swazi queen mother, who is a "twin" to her son. The queen of the right hand, who is both the king's wife and fictive twin, is a substitute for the queen mother. More meaningful parallels exist. The "twin body" of the Swazi kingdom expresses a great power of life; it is completed by the male *tinsila*, the sovereign's symbolic twins associated with his right and left hands. A similar pair in the Venda kingdom corresponds to the paternal uncle and agnatic half brother, respectively Makhadzi's and the queen sister's masculine doubles.

The Lovedu's mythic and historical traditions throw light upon this structural transformation of the ideal twin model. A very long time ago, Princess Dzugudini, the daughter of the king of Monomotapa, bore a son, Muhale, to her uterine brother. Their mother kept their secret, stole her husband's rain medicine, and gave it to her daughter, who fled southward with her young son. With some supporters, they reached the Lovedu land, where Muhale, who had brought fire along, founded a kingdom. The incestuous uterine couple are thus closely associated with the ritual couple formed by a son (keeper of fire) and mother (supplier of rain medicine). The Swazi have simply combined these two images to present the queen mother as her son's twin sister. Succession in the Lovedu royal house later came into the hands of women. The first queen was born out of incest between a king and his daughter. Even though the model for perpetuating sacred kingship through the union of a brother and his uterine sister (ideally between twins of the opposite sex) has shifted agnatically, the Lovedu did not adopt the Venda solution. Their rain queen reigns alone but reputedly has intercourse with a brother in order to bear an heiress.

Lovedu traditions have kept alive the incestuous marriage of sacred chiefs in the ancient Karanga civilization. The king of Monomotapa reigned with Mazarira, his sister and wife. A later account (Frobenius) states that, in ancient Zimbabwe, Mazarira was the monarch's own mother. The heir apparent lived in incest with a sister who became his principal wife with the name Mwiza (in Monomotapa, Nabwiza). When enthroned along with her brother, she lit the new ritual fire for her keeping.

Unlike the Venda one, the Karanga founding myth does not mention a primordial monarchy of the Sun and Moon twins. Moon, the first king, emerged from the primeval waters. For two years he lived chastely with Morning Star, who brought him fire and bore vegetation before being taken back by Mwari, the supreme being. Moon received a second wife, Evening Star, who invited him to have sexual intercourse. She bore mankind and animals. Moon became "ruler" (*mambo*) over a large population. Two years later, Evening Star left him to go live with Snake, master of the rains. When Moon tried to take her back, Snake bit him. Moon pined away. Rain stopped falling. His children strangled him and buried him with Evening Star who had decided to die with him. After that the children chose a new king. This myth perfectly illustrates the cosmological function of sacred kingship, here under the sign of the moon. Having lost his power over nature, the weakened king was condemned to an early death. The rulers of Monomotapa were killed whenever they showed the least physical failing, whether sickness or impotence. The following ceremony clearly associated them with the moon. At the rising of the new moon, the king had to mock fight invisible enemies in the presence of the realm's dignitaries. According to several accounts, the sacred chiefs of the Karanga and related peoples were eliminated after reigning either two or four years. In the myth, this period

corresponds to the Venusian cycle. Mwiza represents Venus, the morning star. Recall that Mwiza was surrounded by chaste, dry princesses. They greeted the first rising of the morning star. On the other hand, the second group of humid princesses, who had intercourse with the snake spirit of the waters, probably had to do with the evening star.

This cosmological system obviously differs from the Venda's, even though the Karanga origins of the Venda kingdom are beyond doubt. In charge of the rains, Karanga and Venda kings are related to aquatic snake spirits. In the Venda myth, both Venusian wives belonged to Python, but only the daytime one could be with her husband whenever he smoked (i.e., used fire). The morning/evening star opposition exists but is concealed. Moreover, the Venda sovereign was not lunar. The first king was none other than Sun, whom Python vomited out. Present-day rulers proclaim to be descended from Raluvhumba, who controls thunderbolts and is symbolized by the eagle. The thunderbird's role in Karanga royal cosmogony needs to be better known. Thomas Huffman, an archaeologist, has suggested that Zimbabwe's famous stone birds represent successive rulers in the form of fish eagles. In old Zimbabwe, this brightly feathered bird was the mediator between humanity and Mwari, the celestial demiurge and congener of the Venda Raluvhumba. Recall that the Hungwe, whose name literally means "fish eagle," brought fire to the destitute folk ruled by the aquatic Madzivoa. The complementarity of the eagle and serpent restores the fundamental opposition between fire and water.

Two diverging traditions relate the origin of fire, the celestial symbol of sovereignty. The Venda king is apparently associated with the second. He went ahead of Raluvhumba when the latter appeared on earth as a big, thundering flame. The stick that the king uses to stir his porridge is called "the fire lighter."

Whereas the Karanga moon kings were killed after they reigned a short time (or whenever their physical forces failed, as in Monomotapa), the Venda kings enjoy long lives provided they do not have children after enthronement. They have to take a drug that inhibits their sexuality. Comparisons with central Africa lead to the conclusion that this practice aims at containing the king's dangerous, almost sorcerous, magical power. Among the Pende in Zaire, some sacred chiefs are forced to refrain from sexual intercourse after taking office. Lovedu ritual ascribes power over the rains to a secretly incestuous queen who had to commit suicide. It has its place in the same system of symbolic transformations, which goes back to a common ideology.

**THE RITUAL COMPLEX OF CIRCUMCISION.** Neither the Karanga nor the Shona practice circumcision. However, all accounts agree that this custom and its related initiation are a time-honored institution among the Sotho and Tswana, who have passed it on to the Lovedu, Venda, and Tsonga. Girls' puberty rites usually correspond to male circumcision. Girls undergo a pretended circumcision that amounts to slightly cutting the clitoris (Lovedu) or upper leg (Tswana) or to

placing a knife between the legs (Pedi). The southern Sotho designate both feminine initiation and masculine circumcision with the same word (*lebello*). The Pedi, a northern Sotho people, make boys go through two successive rites (Bodika and Bogwera), but girls undergo a single collective rite (Byale). The Lovedu have adopted the latter; they call it Vyali and correlate it with the second masculine initiation. Those peoples with Karanga origins initially held only individual rites (the Venda Khoba or Lovedu Khomba) at the first menstruation.

Among the Sotho circumcision enables young men to become warriors. Each new class of circumcised youths forms a regiment in their chief's service. Although chiefs lack the attributes of sacred kings, the symbolisms of Sotho initiation and of the Swazi kingdom are strikingly close. Major Pedi chiefs keep a tribal fire that neither women nor uncircumcised boys may approach. From it initiates take a brand to light the fire that will burn continuously in the center of their circular bush camp during the dry season. After being circumcised, they gather each morning around this fire, the "little lion," and stage a feigned attack. They "pierce the laws." The solar symbolism of the lion fire is indicated by its bed lying along an east-west axis. The sun symbolizes the adult Pedi man. The "spotted white hyena" represents the lunar feminine principle but also refers to a small conical tower forbidden to those undergoing initiation. Built at the camp's eastern entry with carefully polished stones grouted with cinders, it stands alongside a smaller structure, its child. At the end of initiation, the newly circumcised follow the "hyena's tracks," a trail of cinders inside the camp, from the western entry northward to the eastern one. This path depicts the moon's apparent movement eastward, opposite to the sun's. The discovery of the hyena monument by initiates brings together pairs of opposites: sun and moon, male and female. When the masculine ceremony ends, girls who have just had their first period begin collective initiation. They experience a pretend circumcision and are secluded for a month under the authority of the chief's principal wife.

The Matlala have made interesting changes in this ceremony. The fire bed, called "lion," also lies along an east-west axis. Initiates are awakened at dawn while the morning star is shining. Since looking at the sun is forbidden during the first phase of initiation, the boys turn their faces westward. During the second phase, they look eastward and expose the right half of their bodies to the fire's heat. During this "night of change," a stake is erected and its top decorated with ostrich feathers. Greeted as grandmother, this stake replicates the Pedi's lunar monument. Throughout their retreat, initiates pretend to attack the moon. The Matlala use obviously phallic metaphors to liken the waning moon to a female elephant that has to be "stabbed" and "made to fall." Pedi initiation songs also mention a mysterious elephant, an image that instructors take explicitly to mean the dangerous menstruating woman.

Just as the lion is in opposition to the elephant, so a solar fire along an east-west axis is in opposition to the moon. This

Sotho symbolism can be compared to that surrounding the Swazi lion king, associated with the sun and fire, who rules along with an elephant queen mother, associated with the moon. During the Ncwala ceremony, the weakened king runs after the summer solstitial sun. He finally has sexual intercourse with the queen of the right hand, a notorious action comparable to the solar quest for virility by newly circumcised Sotho youth. During their retreat, Pedi initiates are as weak as the Swazi king during the Ncwala. They try in vain "to run past the sun." The king's successor is chosen from among his very young sons. This child king is the only Swazi male who, at adolescence, goes through a circumcision-like ceremony. Otherwise, the Nguni do not hold circumcision or related initiation ceremonies, although they might have in the past. The Swazi seemingly concentrate the symbolism of Sotho initiation within their royal institution. The Swazi king may never drink water, just as those undergoing Sotho initiation may not. At the end of initiation, the newly circumcised jump into water while their camp is set ablaze; the Ncwala ends as the Swazi king washes while a purifying bonfire is lit. Like this king, the Pedi who have completed initiation become lions and brave warriors. Just as Pedi initiation leads to the formation of new military regiments, so the Swazi military age grades actively participate in the Ncwala, under the sign of the moon. Throughout the Sotho region, circumcision camps fall under the chiefs' direct control. The Swazi Ncwala and Sotho puberty rites are variations of the same symbolic and sociological themes.

Similarities lie even closer. Recall how the lion fire in the Pedi initiatory camp is lit. The chief's principal wife has a function like that of the Swazi queen mother—to keep rain medicine. To be wedded, she appears at sunset as all fires are put out. The fire ignited in her dwelling is used to renew the tribal fire. The fire in the chief's keeping (which he gives to those undergoing initiation) and the rain medicine kept by his principal wife (who gives birth to his successor) are both complementary and opposite. The newly circumcised youth's solar/lunar quest for a woman is also a search for rain. Strictly kept apart from the opposite sex, initiates gather around the solar lion fire during the dry season. Ritual chants invite them to follow the elephant's (woman's) tracks "when it rains," for then this animal has "no more force" and can be killed easily. Such phrases mean that a man may approach a woman only after her menstrual period. The cycle of fertility is linked to the change of seasons; menstruation suspends sexual relations and, like the dry season, falls under the sign of fire.

The Tsonga and Venda use this cosmological code. They borrowed and also adapted the institution of circumcision camps from their Sotho neighbors. A feminine elephant fire replaces the masculine lion fire in initiation camps. How should this inversion be understood? For many southeastern Bantu-speaking peoples, particularly the Swazi and Sotho, the masculine sun is complementary to the feminine moon (associated with rain and lush vegetation). But in general fire

is feminine and terrestrial water masculine. Menstruation and pregnancy have to do with heat. The profound symbolic changes separating Sotho and non-Sotho circumcision rites come down to a fundamental alternative: should the ritual fire be given masculine and solar attributes or the hot properties of menstrual blood? The Sotho have made the first, the lion fire, their choice; the Tsonga and Venda have opted for the second, the elephant fire.

Moreover, the Tsonga do not put political authorities in charge of initiation. Unlike the Pedi, they entrust the ritual fire to the chief's principal wife, who keeps it burning in her dwelling in order to smoke medicine objects. Furthermore, the moon is dissociated from the sun; Moon's husband is Evening Star. For all these reasons, solar/lunar symbolism sinks into the background. Instead, all symbolism related to Tsonga circumcision is dominated by the opposition between masculine water and feminine fire, as shown by the ritual formulas taught during initiation.

Three animals successively figure in these formulas. Symbol of the circumcising knife that makes boys fit for reproduction, the crocodile "moves heavily across fords and in the rushes." The hippopotamus "opens the road for elephants toward the ford." The elephant "walks slowly on dry ground" where rain will fill her tracks. These metaphors strongly contrast the aquatic, masculine domain of the crocodile with the solid ground of the female elephant. Between these two lies the road opened up by the hippopotamus, which is associated with a virgin girl whom young boys rape. They thus open the way to the female elephant, the adult woman who becomes fertile only after menstruation, which supposedly stops with the start of the rainy season. The elephant fire is a sign of both feminine sterility and the dry season. Every day, initiates confront this fire and "stab" it with a phallic stick while they sing, "Elephant, stay calm!" Significantly, they may not drink any water during their retreat. When the camp is burned down at the end of initiation, they jump into a pool as they proclaim their virility. How to interpret this sequence? Circumcision, the necessary condition for procreative functioning, falls under the sign of masculine water. Separated from this element during seclusion, initiates are brought close to a feminine fire, which they cannot extinguish before the rainy season. The symbolic space around the elephant fire in the center of the initiation camp and the crocodile's watery place outside the camp are clearly delimited. The elephant fire corresponds to menstruation, dry earth, and feminine sterility; the crocodile's watery realm to circumcision, terrestrial water, and masculine fertility.

By playing on these oppositions, the Tsonga merely adjusted Sotho symbolism to the thermodynamic code with which all their rites of passage comply. Recall that newborn Tsonga children, created inside burning wombs, undergo cooling rites and that the growth of boys is placed under the sign of the moon. Just before puberty, the ritual process is reversed, for sexuality is a new source of heat to be carefully controlled. Tsonga circumcision rites are an initiation into

the mysteries of feminine fire. Circumcision definitively cuts the maternal bond and marks the beginning of a young man's search for a wife. Wives are normally taken from among pubescent girls who, excessively hot during their first menstruation, undergo a collective cooling rite, which is the reverse of the masculine ceremony. Every morning during their month-long retreat, they are led, with faces veiled, to a pool and dunked into water up to their necks. Back in the hut, they are not allowed to warm themselves near the fire. During Pedi initiation, girls are also dunked into a stream to take away heat caused by menstruation, but this occurs at sunset. The Tsonga and Venda both apply cooling treatments to lower girls' temperatures.

Solar symbolism remains a vital part of the Tsonga ceremony. Initiates leave for the place of circumcision at dawn while the morning star heralds the sun, which will pull them out of the "darkness" of childhood. In addition to putting a feminine elephant fire in place of the Pedi masculine lion fire, the Venda (and probably also the Tsonga) change its direction along a north-south axis. According to a widespread conception in southern Africa, the sun travels from its northern to its southern houses between dry and rainy seasons. Like the Pedi, the Tsonga hold initiation ceremonies during the dry season. As the southern summer solstice and the first rains draw near, the newly initiated may start "following the elephant's tracks"—fearlessly approaching women. The opposition between the elephant's dry ground and the crocodile's watery place is a sign of the changing seasons. Sexuality corresponds, as among the Pedi, to the cosmic order governed by the sun's course.

Thus the symbolic system of circumcision is based upon a kind of thermodynamics that characterizes all thought among the southeastern Bantu-speaking peoples. Moreover, circumcision resembles the *mukanda* complex of rituals that is diffused among such matrilineal Bantu-speaking peoples as the Ndembu and Chokwe in western central Africa. Consequently it brings to light a particularly interesting historical problem. Did the matrilineal societies in the region that is now comprised of Zambia, Angola, and northwest Zaire maintain a very old Bantu cultural tradition that was lost by other groups (much like the patrilineal Sotho and their near neighbors did in southern Africa)? This hypothesis cannot be dismissed *a priori*. However many arguments support another interpretation (de Heusch, 1982). It seems more plausible that the southern Bantu-speaking zone should be considered as the center of diffusion of this institution to central Africa. This type of diffusion would have taken place in the land of the Lozi, or Rotse, where the Kololo conquerors (of Sotho origin) took power in 1836. They ruled until 1864 and set up circumcision camps there that were associated with the military formation of young men. Among the Ndembu these rites also make one a warrior. Everything leads one to believe that during the nineteenth century the circumcision camps inaugurated by the Sotho conquerors were gradually adopted by neighboring populations who

added to the circumcision rituals their own practice of using masks. Naturally, in each case the model is transformed from one region to another, but this transformation always takes place within the logic of symbolic thought already at work in southern Africa.

Revised Bibliography

**SOUTHERN SIBERIAN RELIGIONS.** Southern Siberia is a region covered by a large wooded band, called taiga, that stretches from the Ural Mountains to the Pacific Ocean and is bordered by two treeless zones, the tundra to the north and the steppe to the south. The taiga evokes an entire procession of images: It is here where images of impenetrable immensity and absolute refuge mix with the intimacy of nature alone. The dense mass of huge dark trees is penetrated only by the great rivers (Ob, Yenisei, Lena, and tributaries) that roll their vast waters toward the Arctic Ocean, flooding their valleys in the summer and offering their frozen surfaces as bridges in the winter.

Throughout history the natural environment has prohibited any concentration of population; people continue to live in small scattered groups and to devote themselves to various kinds of hunting, fishing, and harvesting, which causes population shifts, varying in number and distance, throughout the year. These forest groups (from small isolated ethnic groups like the Ket—1,100 in 1979—to much larger groups) belong to one or the other of two great families of the Siberian peoples: Uralic to the west of the Yenisei River and Altaic to the east. Moreover, the majority of both groups live in the zones bordering the forest; these areas serve as pastoral land, while the forest is a hunting ground. Hence, one finds ethnic groups divided between taiga and tundra or between taiga and steppe. It must be noted, however, that forest peoples of different families are more similar to each other than to steppe or tundra peoples of their own family; there are specific religious features associated with hunting life in the forest.

This distribution between taiga and tundra or taiga and steppe encourages a comparative approach, deliberately focusing on the specific religious implications of the forest, as opposed to the steppe and the tundra. However, in order to avoid the pitfall of ecological determinism, the form of societal organization and mode of thought must be considered

with the natural environment (more precisely, the means of access to natural resources). This approach can also be hampered by the nature of the sources and facts themselves. The representations described in this article are those of the pre-Soviet period, that is, of the beginning of the twentieth century.

**THE FOREST PEOPLES.** The Uralic and Altaic families each may be divided into smaller units. The two Siberian branches of the former are the Ob-Ugrian and the Samoyed. The Ob-Ugrian people, essentially a forest-dwelling group, consists of the Khanty and the Mansi, known in the eleventh century as the Yugra to the Russians of Novgorod, who traded with them for skins and furs. After their entrance into the Russian empire in the seventeenth century they became known as the Ostiaks and Voguls, respectively. At the time of the 1979 census there were 21,000 Khanty and 7,600 Mansi (a minor increase from the 1926 figures of 17,800 and 5,700, respectively).

Because of their proximity to European Russia, the Khanty and Mansi were severely exposed to the impact of colonialism. Far worse than the burden of taxation, the appearance of new illnesses, and the exactions from civil servants were the appropriation of the best land, that bordering the rivers, by Russian peasants and the forced conversion to Orthodox Christianity; both actions provoked strong opposition. Nevertheless, rather than staging a revolt, which would be quickly crushed, some preferred submission and assimilation while others elected to escape into the depths of the forest. The traditional society of the Khanty and Mansi is organized in exogamic moieties—the “hare moiety” and the “bear moiety,” each having descended through the male line from one clan, which eventually divided into many.

The Samoyed branch, settled primarily in the tundra, also has groups living in the forest: the Selkup, in particular, and a small group of the Nentsy. The Selkup (6,000 in 1926; 3,600 in 1979; called the Yenisei Ostiaks in the past when the Ket were included) were forced back from the Yenisei Valley to valleys situated farther west (Taz, Turukhan, and Yeloguy) with the onset of Russian farming. Here too, each exogamic moiety—“eagle” and “nutcracker crow”—includes several patrilineal clans divided into various territorial units.

The other major group of forest people, the Altaic family, is divided into the Turkic, Mongol, and Manchu-Tunguz branches; these comprise the principal population of eastern Siberia. The Turkic branch (722,500 in Siberia in 1979), the most important of the three, is barely represented in the forest. However, certain ethnic groups, while primarily settled in the tundra (Yakuts) or steppe (eastern Tuva, Tofa, southern Shor), are found in the adjacent mountainous forest area as well.

On the other hand, the Toj-Tuva of the upper Yenisei River, the Tofa of the Sayan Mountains, and the Shor of the Altaic forest still practiced the traditional kinds of hunting

in the nineteenth century. The Tuva and Tofa combine this with the raising, riding, and milking of deer. Each clan of the Shor has its own hunting ground; any infraction of the system entails vengeance. Each Shor hunter is entitled to hunt in the grounds of his wife’s clan and must share his booty with her father.

The Mongol branch is represented in the forest by the Ekhirit-Bulagat Buriats who are native to the Cisbair-kalian forests. These people were not influenced by the Mongolian empire. Although they did borrow animal breeding from their Mongolian cousins of the steppe in the sixteenth century, they have nonetheless retained an authentic hunting culture as well as the remaining visible traces of a social organization divided into exogamic moieties (Ekhirit and Bulagat), with each moiety further subdivided into several patrilineal clans.

Stemming from the Tunguz branch are the Eveny (12,000 in 1979), the various Tunguz groups along the Amur River, and the Evenki, the Tunguz of the taiga (28,000 in 1979 as compared to 38,804 in 1926). Contrary to the other Siberian peoples whose populations are concentrated in a particular region (albeit in scattered groups), they are scattered throughout all of eastern Siberia. Still identifiable in spite of a variety of lifestyles, the traditional Tunguz is a hunter, an unparalleled observer and indefatigable traveler who is also incessantly driven by the search for game. It was the Tunguz who were chosen as guides by all explorers of Siberia.

**HUNTING, ALLIANCE, AND THE HORIZONTAL CONCEPTION OF THE WORLD.** Considered in terms of the life they lead and the type of society in which they live, the Siberian hunters’ conceptions are based on a series of principles that create a structural analogy between the social, economic, and religious domains and that inform the mechanism of the interaction of these domains. Hunting is conceived of as an alliance in which the game is equivalent to the woman: The exchanging partners in each case are on the same plane, thus the world is thought of as horizontal.

Natural beings that supply sustenance are thought to be organized, like humans, into clans and linked to each other as well as to human clans through relations of alliance and vengeance. To be outside the clan is anomalous, and brings illness, death, and other trouble; everything possible is done to avoid such an anomaly. This conception applies primarily to game that is consumed but is in general not applied either to fish or to game hunted for fur, an occupation that is engaged in to meet external demand, thus making the game simple merchandise. Although fishing is a traditional practice and often supplies an important part of their subsistence, fish is still thought of simply as food, and rarely involves the same ritual treatment as game. (On the other hand, marine mammals on the coast of the Sea of Okhotsk are considered to be hunted and not fished; they are classified under the category of consumed game.) Nor is this concept applied to gathered products, which are not conceived of as

beings and which depend on a woman's activity without symbolic value. Likewise, only game that is consumed forms the subject of sociologically pertinent collective practices (hunting, ritual of consumption) and popular discourse (myths, tales, stories).

Birds appear to be particularly rich in symbolic value, a value that derives primarily from their signaling function. Thus, birds of prey and birds living on carrion, which signal the presence of game, serve as evocations of hunting. Migrators, which signal the coming and going of the seasons, evoke the voyage to the supernatural world and the circulation of souls between the world of the living and that of the dead.

Species-specific hunting and consumption restrictions are imposed upon each clan based on the mythical animal that is regarded as the clan's founder. This system has led many writers to speak of totemism, but the theory linked with this term is outdated today and even forgotten. Such a distribution of symbolic attributes—found in other places in the world—is to be understood as the clans' way of assuring networks of relationships among themselves and the necessary complementarity for general cohesion. However, the facts are insufficient to allow a systematic establishment of the roots of the symbolic exploitation of one animal species or another, except those whose relationship can be assimilated to that of a hunter and a guide (e.g., the eagle or crow).

In the representations and the ritual treatment of the slain animal, the taking of game is reduced to a taking of meat. The bones are not destroyed but are disposed of (along with the head and other parts believed to contain the vital breath of life) in such a way that the animal will be reincarnated or that another animal of the same species will appear. Seemingly out of gratitude to the animal that came to offer its flesh, the hunter treats it as a guest of honor and invites it to return. That he symbolically takes only meat and not the animal as such prevents the hunt from being likened to the murder of a member of another clan, which would unleash a chain of vengeance. It also happens that the death of the animal is recognized, but the responsibility for it is attributed to a stranger belonging to another tribe.

Just as there is a system of matrimonial alliance that legitimizes the individual's taking a wife, there is a system of economic (or one could say "food") alliance that justifies the hunter's taking of game. These two systems are often compared in detail in mythical discourse, as are their subjects and their protagonists: wife and game, the taker of wife and hunter, giver of wife and giver of game. As opposed to the others, the giver of game is an imaginary being, generally called the "spirit of the forest" and qualified as "rich." With this title and that of "owner of hunted species," he is indeed a "supernatural" power in the etymological sense of the word.

In societies divided into two exogamic moieties, the matrimonial system is one of restricted exchange, which is realized in the marriage of bilateral cross-cousins (children of both the mother's brother and the father's sister) and

which amounts to an exchange of sisters. Whereas this system is sociologically simple and efficient considering the precarious conditions of life known to the Siberian hunters, it is nevertheless lacking in the constraints (debt of one side, claim from the other) necessary for its perpetuation: Partners are released immediately through the simple act of exchange. However, the system is conceived of by people who bring it into operation as though it involves three stages or three partners, thereby preventing a person from perceiving himself as both giver and taker at the same time with respect to the same partner and delaying the obligation of exchange. Thus, the taker's and giver's positions toward the same partner alternate from one generation to the next. In this way the system becomes self-perpetuating within a patrilineal line: Compensation for the wife taken by the father is a daughter of this same woman given by the son.

The hypothesis of the analogy of hunting with the matrimonial system leads both to the discovery of what compensation the hunter gives for the game he has taken and to an understanding of what are otherwise inexplicable practices: These come from the need for a third partner to create dynamics in the exchange system. The compensation for game taken is one of the same nature as the game itself—food—and is given by the hunter's wife to small tame animals (most of which belong to species that are neither hunted nor used: eagles, swans, cranes, nutcracker crows, foxes, etc.) as well as animal representations (furs, wooden figurines, etc.). The latter (Selkup, *kbekbe*; Tuva, *eeren*; Buriat, *ongon*; Tunguz, *singken, sevek*), made at the time of marriage, are "fed" pieces of meat through their mouths, smeared with blood, and anointed with animal fat. In this way, the food taken from the animal world is symbolically returned. From the point of view of a tripartite system, these tame animals or animal representations occupy the taker position with respect to the hunter and the debtor position with respect to the forest spirit, the giver of game. If they are not fed, these spirits supposedly prevent the hunter from taking game and cause him and his family to fall ill and even die.

Built on an analogous model, these two systems—matrimonial and economic—also make use of mutual compensation. Frequently, the myths and tales attribute a loss in the realm of alliance (abduction of the hunter's wife or sister while he is away hunting) to excessive hunting. In the Evenk ritual called the Feast of the Bear, the taker of a wife becomes a supplier of game for his wife's brother. The numerous restrictions concerning the hunter's sexual activity before the hunt, on the one hand, and the wife's behavior (notably concerning menstrual blood) with respect to hunting weapons on the other, may also be interpreted in terms of maintaining a balance between hunting and alliance. Furthermore, in these two systems, the act of taking requires the observance of strict rules vis-à-vis the giver, such as the giving of specific offerings and demonstrating the qualities of taker. One will note that what is offered to the forest spirit (incense, tobacco, amusing stories) is intended to put him in a good mood and

make him laugh, so that he will be easily persuaded to release the game: The catch involves some cunning.

Whereas these two systems and their interaction normally function autonomously, they are dependent both structurally and functionally upon the third system, shamanism, which is built on an analogous model. Based on the idea that the life of the body is subordinate to what is conveniently called the "soul" that dwells in it, this system ensures the exchange of souls between their supernatural dispensers and their natural human and animal supports. Upon death, the souls return to the spirits (which suggests the hypothesis of their reincarnation within the same clan). The artisan of this circulation is the shaman, who, it is believed, obtains the souls of game and people from their supernatural dispensers.

From the standpoint of the system, the shaman is homologous to both the wife-taker and the hunter, a fact that is often clearly demonstrated by the idea that he has a symbolic wife who is the daughter of either the forest spirit or water spirit (Selkup), or of the earth spirit Khosedam, as the Ket believe. The office of the shaman is generally transmitted through the patrilineal line, usually from grandfather to grandson; agnatic relatives oversee the rites of investiture and control the position and the exercise of the shamanic function. Thus, among the Selkup, the death of every adult blood relative entails the destruction of the shaman's drum and its replacement by a larger one. In fact, the shaman's power increases as each soul of a deceased relative rejoins the spirit world. The very presence of the shaman in the midst of his group guarantees the existence of a relationship with the soul-giving spirits. This relationship can be reinforced by certain detailed roles, such as the Buriat shaman acting as godfather to newborns and the Tunguz shaman leading the souls of the dead to the otherworld. However, the shaman's active intervention is essential whenever there is a disturbance: scarcity of game; lack of descendants; or departure of a soul, which, by leaving the body vacant, renders it sick and soon dead. The shaman, who performs a divination procedure (throwing an object that falls on the "good" or "bad" side, answering his questions "yes" or "no"), then determines the cause of the disturbance. The two major causes considered are infractions of the rules governing the exchanges (excessive or insufficient hunting or alliances, inadequate amount of food given to tamed animals and figurines, violation of taboos concerning hunting, etc.) and the death of any animal or human surviving outside the framework of the clan and thus outside the system, which results in a wandering, unintegrated soul that is consequently harmful. Mediator *par excellence*, the shaman then negotiates a return to order with the spirits, tricking them somewhat, but also giving them offerings or a new cult (for example, by making a new figurine to be fed, zoomorphic in the event of a hunting infraction and anthropomorphic in the event of a deceased outsider to be reinstated). Thus, he symbolically secures the reappearance of game, the birth of children, the return of the soul to the ailing person's body, and so on.

The taking (or retaking) of these souls cannot be realized by the shaman without the aid of what is usually called his "auxiliary spirits," equivalent to such equally essential auxiliaries as the intermediary in the marriage and the beater or guide in the hunt. He sends these spirits to search for the soul that has strayed from the sick and to track down vengeful spirits, descended from the frustrated souls of those who died violent deaths, to keep them from doing harm. The Selkup rite involving the "dark tent" is held in total darkness in the presence of the shaman's kin and consists of the shaman's proving to them his ability to stir up his auxiliary spirits and summon their services. His power increases with their number and promptness in hastening to his call. Their remuneration is found in the type of offering given them (primarily food) and, for those descended from wandering souls, in their reinstatement.

In each system, the relationship between the taker and his auxiliary has the character of a personal contract, updatable and reversible, corresponding to an exchange of services. These services, which are not identical but complementary, are not organized into a hierarchy: Thus, hunter and beater or guide have an equivalent status and an equal part regardless of the catch. This relationship between taker and auxiliary is based on the general principle of a dualist organization of the operating units from various levels, which finds expression in the very name of the Khanty-Mansi (bear, hare) or Selkup (eagle, crow) moieties (in the myths of origin, the moieties being descended either from two brothers-in-law or from two brothers, forming separate lines), in the custom of nomadic camping set up by two allied families, and so on. The Feast of the Bear, celebrated by most of these peoples, is still the totalizing ritual *par excellence*, despite some differences. There, the organization in moieties of the different units and the three systems of exchange come into play, a fact that illustrates the exceptional symbolic versatility of the bear.

While the forest world is at once aerial and terrestrial and dominates symbolic space, the aquatic world also plays an important role. The souls of the dead descend along the course of the great rivers; boats or representations of boats appear in certain funerary or commemorative rites. Because of the orientation of the rivers, both the north and downstream water are associated with death. Symmetrically, upstream water and the south have a positive connotation. Birds that migrate from the south are offered ritual receptions upon arrival and invitations to return upon leaving, as if to materialize the rebirth of life (since it is believed that they bring the souls of newborns). The simultaneous presence of quadrupeds and birds does not really affect the uniqueness of the forest, represented by the omnipresent but indivisible element that is the tree. The declivity of the rivers there does not result in a separation of "upstream" from "downstream." "Up" and "down" are not superposed positions; rather, they are contiguous in the depth of the same horizontal plane, a plane in which forest and water are essen-

tial constituents conceived of, respectively, as giver of game and giver of fish.

**CATTLE BREEDING AND THE VERTICAL CONCEPTION OF THE WORLD.** The notion of superposed worlds—and correlatively of a vertical liaison between them—develops from the opposition of upstream/downstream, which is reinterpreted in terms of up/down and then divided into the oppositions of sky/earth and earth/lower (or subterranean) world. This is due to the combined influence of two factors: the adoption of animal breeding and incorporation into a state organization, the Russian empire.

In that the adoption of animal breeding (or, with a subtle difference, agriculture) creates a patrimony to be handed down (herds, fields), ties of descent filiation develop and the systems of relationships tend to become vertical. Thus the alliance increasingly attempts to postpone reciprocity and begins to follow the model of a “generalized exchange” (according to which the clan from which one takes a wife is not the same as the clan to which one gives a sister). Instead of becoming segmented, the clans organize their lineages into a hierarchy. In the economic system, alimentary compensation is given to a “consecrated” or “tabooed” reindeer (or other domestic animal), fed along with its own herd but never utilized. Whereas the ritual treatment of the bones of the game animal aimed at its reincarnation on earth, the sacrifice of the domestic animal (always slaughtered in a manner different than the hunted wild animal) is intended to increase the herds of spirits. The animal gradually becomes less a being and more a product; the proportion of zoomorphic representations decreases. This ideological change, only initiated with the animal breeding in the forest, expresses itself through the obviously production-oriented breeding found in the steppe (and, to a lesser degree, in the tundra). Associated with the hierarchical centralization, it lays the groundwork for the emergence of transcendental entities and is receptive to the adoption of a world religion with dogma and clergy, such as Russian Orthodoxy or Buddhism.

It is significant that the animal breeders living in the forest consider their own shamans as decadent and the shamans of their neighbors, who remained, for the most part, dependent on hunting, as powerful. Such is the case with the Nentsy toward the Entsy, the Entsy toward the Selkup and the Ket, and with all of them toward the Tunguz. This is because in the cattle breeders’ ideology the giver is now conceived of in terms of the irreversible mode of filiation and therefore acquires the status of absolute superiority. He is no longer a partner with whom one negotiates, but a master on whom one is dependent. The shaman’s capacity to act is therefore necessarily reduced in principle (since he is more dependent and has fewer opportunities to negotiate). As for the spirits, the pastoral ideology organizes them into a hierarchy, multiplies and localizes them (which leads to the notion of spirit-master of separate places), and also develops supporting myths and figures of the founders and creators over the ancestors.

The Russian empire instituted Peter the Great’s idea of “only one God, only one Tsar.” At the same time, the Orthodox church searched for (or created) indigenous equivalents compatible with its own concepts and refused all compromise with other beliefs. The traditional spirits were lowered to the rank of “devils and demons” and confined to the underworld. The promotion of heavenly bodies (sky, sun) to the rank of supreme being owes as much to the Christian attempt to support the idea of God as to the native effort to set up a rival against it and make more powerful their traditional view of the world (since a God is conceived of as “higher” than mere ancestors).

The case of the sun (Num, Nom) among the Uralic peoples is an example of this process. Its artificially constructed image as a supreme being is vague, fluctuating, and without ritual importance. In the myths of creation attributed to it the only constant element is its opposition to Nga, its (or his) son or brother-in-law, depending upon the case, an opposition that, rather than illustrating the Christian notion of a relationship between God and the devil, is indicative of a fundamental problem of kinship among the Uralic peoples concerning the opposition between older and younger people that is the framework of the creation myths. The same is true with the Tunguz concerning the *bugha* (“sky,” derived from an earlier meaning, “moose”). Relationships with the spirits are reinterpreted. That which was nothing but a reaction by the spirits (beneficial or baleful) to the treatment received from humans is radicalized into a moral opposition of good and evil. The shaman’s “voyages” to the forest and aquatic worlds are replaced by an ascension into the sky or descent to the underworld. Nevertheless, the traditional pragmatic sense remains: The icons of the saints, interpreted as the souls of the dead, are “fed” in the same way as traditional representations in order to ensure the proper continuation of domestic life.

ROBERTE HAMAYON (1987)

Translated from French by Sherri L. Granka  
Revised Bibliography

**SOZZINI, FAUSTO PAVOLO** (1539–1604), was an antitrinitarian theologian, known in Latin as Faustus Socinus. Sozzini was born in Siena on December 5, 1539. When his uncles fell under suspicion of heresy, and the Inquisition threatened the Sozzini family, Sozzini left Italy on April 21, 1561, for Lyons, France. After the death of his uncle Lelio Sozzini on May 14, 1562, Fausto acquired Lelio's manuscripts, which decisively turned his interests from literary studies to religious studies, specifically to doctrinal reform. His *Explicatio primae partis primi capituli Ioannis* (Explanation of the First Part of the First Chapter of John's Gospel), written in 1562 during his stay in Zurich and Basel, developed more fully Lelio's view of Christ as the person who revealed God's new creation by his teachings and his life.

Sozzini returned to Italy in 1563, where he served at the court of Cosimo I, duke of Florence (later grand duke of Tuscany). In 1574, after Cosimo's death, he returned to Switzerland and spent the following three years in Basel studying scripture and theology. In his greatest work, *De Jesu Christo Salvatore* (On Jesus Christ, the Savior), completed in 1578, he attacked the doctrine that God requires satisfaction for human sins, argued that Christ is savior by his teachings and exemplary life, and emphasized the importance of faith, as trust in God and in Christ, as essential for salvation. In his response to Francesco Pucci (a widely traveled Italian humanist from Florence) in 1578, *De statu primi hominis ante lapsum* (On the State of the First Man before the Fall), Sozzini argued that humanity is mortal by nature; immortality is a gift of God. He next traveled to Kolozsvár, Transylvania, to attempt to dissuade the Hungarian theologian Dávid Ferenc (Francis Dávid) from his opposition to prayer to Christ (a view known as nonadorantism—that is, a denial that either religious worship or prayers for aid should be addressed to Christ). When Dávid refused to change his stance, Sozzini went on to Cracow, Poland, in 1579.

Although he was not admitted as a full member of the Minor Reformed Church of Poland (the Polish Brethren) because he did not regard adult baptism as essential for church membership, Sozzini became the outstanding theologian of that church, uniting its various groups. He wrote numerous works defending the church against attacks on its antitrinitarian theological views and its pacifist social and political views. In *De Sacrae Scripturae auctoritate* (On the Authority of Holy Scripture), which was published under a pseudonym in 1580, Sozzini used rational and historical ar-

guments to refute the skeptical views of those who doubted the divine authority of the Bible.

In 1586, Sozzini married Elzbieta Morsztyn, who died within a year. The Inquisition cut off his income from Italy, and university students tried to kill him as a heretic. In 1589 he moved from Cracow to Luclawice. His colloquies with his followers in 1601 and 1602 at Raków presented his mature views. Sozzini died at Luclawice on March 3, 1604.

Sozzini viewed Christ as unique, a man who is divine, not by nature, but by virtue of his office, for God instructed Christ, resurrected him, and gave him all power over the church in heaven and on earth. He opposed the nonadorantism of Dávid and others, insisting on prayer to Christ for guidance and for aid. He regarded scripture as God's revelation and denied that God can be known through a natural theology. He held that humankind is mortal by nature and that only the righteous will be resurrected. At death, sinners suffer eternal extinction.

Sozzini's theological analyses and arguments elicited intense controversies, which resulted in significant changes in the thought of some Protestant theologians, particularly on the doctrine of the atonement. The Polish Brethren modified and continued his biblical, rational theology in their famous *Racovian Catechism*.

## BIBLIOGRAPHY

### Works by Sozzini

Alodia Kawecka-Gryczowa has provided detailed information on the original publications of Sozzini's works in *Ariańskie oficyny wydawnicze Rodeckiego i Sternackiego: Dzieje i bibliografia / Les imprimeurs des antitrinitaires polonais Rodecki et Sternacki: Histoire et bibliographie* (Cracow, 1974), pp. 177–187, 290–323. The principal comments on each work are in Polish and in French. Sozzini's works have been collected and reprinted as *Socini opera*, volumes 1 and 2 of *Bibliotheca Fratrum Polonorum quos Unitarios vocant* (Amsterdam, 1656). Ludwik Chmaj has added detailed notes to his Polish translation of Sozzini's correspondence, *Listy*, 2 vols. (Warsaw, 1959). Letters discovered since that date have been published in various scholarly journals.

### Works about Sozzini

*The Radical Reformation* (Philadelphia, 1962), by George H. Williams, gives an authoritative account of the historical contexts and main themes of Sozzini's work. The most complete study available, Ludwik Chmaj's *Faust Socyn, 1539–1604* (Warsaw, 1963), is in Polish with one-page summaries in Russian and English. George H. Williams has illuminated many issues in Sozzini's theology in "The Christological Issues between Francis Dávid and Faustus Socinus during the Disputation on the Invocation of Christ, 1578–1579," in *Antitrinitarianism in the Second Half of the Sixteenth Century*, edited by Róbert Dán and Antal Pirnát (Leiden, 1982), pp. 287–321.

**SPEKTOR, YITSHAQ ELHANAN** (1817–1896) was an Orthodox rabbi and foremost traditional Jewish legal authority during the last half of the nineteenth century. Born in Rosh, in the Grodno district of Russia, Spektor was raised in a highly traditional milieu and as a young boy mastered the study of Talmud under the tutelage of his father, Yisra'el Isser. After his arranged marriage at the age of thirteen, Spektor went to live with his in-laws in Volkovysk, where Binyamin Diskin instructed him in rabbinics and ordained him as a rabbi. Spektor occupied his first rabbinical post at the age of twenty and served as rabbi in several Russian towns, including Nishvez and Novogrudok, centers of traditional Talmudic scholarship. In 1864 Spektor became rabbi of Kovno, where he also headed the *kolel* (advanced rabbinic academy) until his death.

Spektor's piety, his absolute command of traditional rabbinic sources and methods, and his virtually unparalleled genius in rendering Jewish legal decisions made him the communal leader of Orthodox Jewry in Russia during his day. He participated in a host of charitable and civic affairs on behalf of Russian and world Jewry, arbitrated Jewish communal disputes throughout the world, and was a staunch supporter of Jewish colonization in Palestine. In addition, Spektor attempted to defend traditional Judaism against many of the onslaughts of modernity. He himself was unable to speak Russian and was an opponent of the Haskalah (Jewish Enlightenment); he forbade the translation of the Talmud into Russian and opposed the creation of modern rabbinical seminaries where secular subjects would be taught.

Spektor's first volume of *responsa* (Jewish legal decisions), *Be'er Yitshaq* (1858), was published when he was thirty-one years old, a relatively young age for such a work. Two other collections of *responsa*—*Nabal Yitshaq* (1872, 1884) and *Ein Yitshaq* (1889, 1895)—further enhanced his stature. His decisions, marked by an astonishing ability to cite the whole range of rabbinic literature in arriving at a judgment, display a tendency toward leniency. They remain a valuable and authoritative source for contemporary Orthodox rabbis in dealing with Jewish legal issues. The largest Orthodox rabbinical school in the United States, the Rabbi Isaac Elchanan Theological Seminary of Yeshiva University in New York, is named after him.

## BIBLIOGRAPHY

The most comprehensive work yet written on Spektor's life is Ephraim Shimoff's "Rabbi Isaac Elchanan Spektor: His Life and Works" (Ph.D. diss., Yeshiva University, 1959). Samuel K. Mirsky has also written an article, "Isaac Elchanan Spektor," in *Guardians of Our Heritage* (New York, 1958), edited by Leo Jung. While both these pieces provide valuable information for an understanding of Spektor's life, a definitive critical study remains to be completed.

DAVID ELLENSON (1987)  
*Revised Bibliography*

**SPELLS** belong to the general context of magical thought. They consist of words or sets of words that issue a command that is efficacious merely because it has been pronounced. Spells represent one of the many techniques used to control nature and the evils arising in a given society. They are found universally and are probably as old as language itself, having been in existence since the Lower Paleolithic.

The basis of the power of spells is the primitive idea that nothing exists without a name and that to know the names of things is to possess them. Thus, to give orders with the appropriate words is to ensure success, made even more certain when the speaker is a witch, shaman, holy person, or anyone else whose profession it is to deal with mystery.

Stated in other terms, spells are all-powerful spoken formulas, words, or phrases of power. They are definitive: Once uttered, the desired chain of events is set irrevocably in motion. Each word, once enunciated, has a magical value and weight that none can control.

The order given in the spell, addressed to deities, spirits, or the forces of nature, can be creative, destructive, protective, or medicinal; it can demand triumph over an enemy, or the attainment of impossible powers or things. It can be used to break spells, cast spells, or obtain love.

**CONDITIONS OF SPELLS.** According to magical thought, only prayers can be spoken by anyone at any time and remain effective. Spells, by contrast, and other such magical activities, have many prerequisites. Spells in particular must be pronounced by a person who is initiated into the mysteries or endowed with supernatural powers, and who is sexually, dietetically, and socially pure. The person casting the spell must know with precision the words he or she will pronounce, the time when they must be uttered, the cardinal point toward which one will face, what one will stand or sit on, how his or her person must be arranged, the clothing, colors, ornaments, and objects to be used, the number of times one must repeat the words, and the psychological attitude and manners one must assume. Everything must be precise. As a part of religious and magical activities, spells

sometimes require musical backgrounds, specially prepared settings, appropriate instruments, prudent timing, and attention to taboos that might be violated, such as sex, the lack of initiation, or impurity.

Spells can serve either collective ends, such as victory in battle, the banishing of plagues and epidemics, or the bringing of rain, or they can serve personal ends, such as the attainment of love, health, power, wealth, virility, fertility, finding out who has stolen something, or causing harm to an enemy. The former collective spells require a complex ceremony and initiates. The latter, usually carried out on a popular level, generally need only to be repeated continually or for a magical number of times.

As a general rule, spells accompany the preparation of potions, amulets, weapons, magical paraphernalia, scepters, and objects of sorcery. They are recited over sick people, addressed to the natural elements one wants to control, or murmured softly and continuously. Rarely are they repeated by large groups of people, although this does happen occasionally.

**POWERFUL SOUNDS AND WORDS.** Many scholars have concentrated on the study of the word as a symbol. These scholars include linguists, sociologists, anthropologists, philosophers, educators, psychiatrists, and occultists. Many of these researchers are inclined to give an onomatopoeic value to sounds: For example, /m/ and /n/ are related to the mother because of the sound made during breastfeeding; /g/ is related to water, because that is how it sounds when swallowed; and /a/ is an imperative for calling attention. Since ancient times, philosophers such as Plato (in his dialogue *Cratylus*) have remarked on how words somehow take on the form of the things they name.

Nevertheless, a serious analysis yields very few sounds or words that have the same value in all cultures. Greater universality can be found, perhaps, in the language of gestures: assenting by moving the head up and down, negating by moving it from right to left, beckoning with the arm and hand, pointing things out with the index finger or the eyes and brows, or threatening by raising a fist.

In Qabbalah, the interest in a knowledge of sounds, written letters, and words was intensified. Each sign was given a magical value that had a religious meaning and a numerical relationship. For example, the Hebrew letter *alef* became the symbol of humankind and the abstract principle of material objects; it is the trinity in unity and its numerical value is 1 (Scholem, 1974). Freemasonry also produced speculations in this field, but it assigned many meanings to the same letter. The letter *A* became an emblem of the first of the three faculties of divinity—creative power—in addition to being the abbreviation for the word *architect* (Powells, 1982). This association of the word with creation is found among many peoples of the world.

The history of religions has provided several words or short phrases that have been believed to be particularly pow-

erful. The gnostics of North Africa, for instance, made an abundant use of talismans and incantations. Two words in particular have survived to this day: *abraxas* and *abracadabra*. The word *abraxas* represents the supreme deity and his supreme power. Numerically ( $a = 1, b = 2, r = 100, a = 1, x = 60, a = 1, s = 200$ ) it adds up to 365, or the number of days in the solar year, the cycle of divine action. The word was carved into stone as a talisman and pronounced as a protective device. The word *abracadabra*, derived from the Aramaic phrase “Avreiq ‘ad havra’ ” (“Hurl thunderbolts to [unto? at?] darkness”), was used to invoke the aid of the supreme spirits. Inscribed as an inverted triangle, with one less letter on each successive line, it was considered a powerful talisman.

The Jews, a people rich in esoteric and magical lore, were the inventors of Qabalah, which includes one of the most important techniques for the numerological analysis of words and letters, intended to reveal their esoteric meaning. Four words in particular deserve mention. *Adonai*, which means “supreme lord,” was spoken as an infallible invocation of aid. *Haleluyah*, translated as “hymn to the lord,” also served as an invocation. *Amen* was a term that gave a full and definitive meaning to whatever was expressed. It was understood as “So be it,” but with the magical sense that things could not be otherwise. Some think it was derived from invocations to Amun. *Golem* referred to the basic substance from which God created humans. When deprived of a soul, it could be used to create evil beings, who could be controlled only by pronouncing the true and secret name of God.

Within Islam, three phrases are believed by some to have a magical power. The phrase “*Lā ilāha illā Allāh*” (“There is no god but God”) has been used to perform miracles (Idries Shah, 1968). The phrase “*Allāh akbar*” (“God is great”) serves as a basis for white magic, and the words “*Ism al-a‘zam*” are used to subjugate or subdue evil spirits.

Among Christians, the names *Christ* and *Jesus* serve to stave off evil. Roman Catholics may seek triple insurance by naming all three members of the holy family: “Jesus, Mary, and Joseph.”

For Tibetan Buddhists, the phrase “*Oṃ maṇi padme hūṃ*” contains many occult meanings. It is believed that the first word, *oṃ*, emanates from the cosmic vibration essential to creation. Some scholars maintain that it is equivalent to the *Amin* of the Muslims and the *Amen* of the Jews. It is the basic name of the creator god. The complete phrase expresses a desire to be pure and to be part of the universal spirit.

**SPELLS IN THE HISTORY OF RELIGIONS.** Since ancient times people have uttered and written words, phrases, and formulas that they have believed to have some magic power or irresistible influence. Spells to ward off what is evil or undesirable and to bring about what is good or desirable are known in many cultures.

**Egypt.** The basic esoteric activity of the ancient Egyptians was preparation for life after death. For this purpose

they developed high levels of art, magic, and religion. The preparation of a scarab, carved from semi-precious stone to replace the heart of the deceased, required that the artisan recite the following spell: “I am Thoth, the inventor and founder of medicine and letters; come to me, thou who art under the earth, rise up to me, great spirit.” This spell was to be uttered without fail on a set number of days after the new moon (Idries Shah, 1968). Many similar spells are known to have been used, usually with apotropaic intent. In addition, the Egyptian *Book of Going Forth by Day* records spells that were to be used for each moment after a person’s death.

**Mesopotamia.** The earliest Mesopotamian cultures have left very few records of their magico-religious thought. Later Assyro-Babylonian translations make it seem that one of the most crucial concerns of these peoples was the evil eye, the evil that surrounds people on all sides and affects them especially in the form of the envy of enemies. One spell against the evil eye went as follows:

Let the finger point to the evil desires,  
the word of ill omen.  
Evil is the eye, the enemy eye,  
eye of woman, eye of man,  
eye of a rival, anyone’s eye.  
Eye, you have nailed yourself to the door  
and have made the doorsill tremble.  
You have penetrated the house. . . .  
Destroy that eye! Drive out that eye!  
Cast it off! Block its path!  
Break the eye like an earthen bowl! (Garcia Font, 1963)

The old spells used in Assyrian medicine had something of a mythical nature. Take, for instance, this spell for toothache:

After Anu made the heavens, the heavens made the earth, the earth made the rivers, the rivers made the canals, the canals made the swamps, and the swamps, in turn, made the Worm. The Worm, crying, approached Shamash, and he approached Ea, spilling tears: “What will you give me to eat and what will you give me to destroy?” “I will give you dried figs and apricots.” “Of what use are they to me? Put me between your teeth and let me live in your gums, so that I can destroy the blood of the teeth and gnaw at the marrow of the gums. . . .” “Since you have spoken thus, O Worm, let Ea crush you with his powerful fist.” (Hocart, 1975)

This was repeated until the pain disappeared.

**Greece.** The Greeks imagined their gods as having human form and character, and they occasionally ordered them to help the needy by means of magical formulas, as in the following spell addressed to Hekate:

Come, infernal, earthly and heavenly one . . . goddess of the crossroads, bearer of light, queen of the night, enemy of the sun, friend and companion of the darkness; you who are happy with the barking of dogs and bloodshed, and who wander in the darkness, near the tombs, thirsty for blood, the terror of mortals, Gorgon,

Mormon, moon of a thousand forms, accept my sacrifice. (Caro Baroja, 1964)

**Medieval Europe.** In Europe, the practitioners of witchcraft developed multiple spells for defense against enemies, always preceded by the name of God and the archangels. Terrible spells that try to control enemies have also been found. In the anonymous medieval work *Clavicula Salomonis* (Small Key of Salomo), one reads: "Man or woman! Young man or old! Whoever might be the evil person trying to harm me, either directly or indirectly, bodily or spiritually . . . MALEDICTUS ETERNAM EST, by the holy names of Adonai, Elohim, and Semaforas. Amen." After reciting this spell, a candle was extinguished as a sign of the finality of the curse.

**Sudan.** The Sudan covers a territory between Egypt and Ethiopia, where the magic of Egyptian antiquity and the later Muslims is mixed with primitive animistic magic. Popular sorcerers and magicians abound, openly offering their services. Frequently they exalt their own powers, which they obtain through their spells. For example, when a hunter hires one to obtain luck at hunting, the magician says: "I am a magician, all powerful in spells. What I say comes true. I say, 'Give victory to so and so.' He will have victory in all things." Afterward, the magician goes about filled with the desire that events might occur that will instill the hunter and the warrior with luck. This is accompanied by whistle-like sounds and by facing toward different cardinal points, whistling three times in each direction while holding a receptacle of water. The Sudanese believe that spells are more powerful when pronounced over running water.

The Sudanese also have spells to give power to certain leaves that are used in the preparation of medicines. The spells are recited over the leaves a specific number of times in order to bring about the desired effect.

To obtain the love of the opposite sex, the magician draws a magic circle within which the magician prepares a potion of herbs and feathers. In order to give the potion the necessary potency, the magician repeats the following spell: "I am a magician, O Pot, you contain the medicines of love, the spell of love, of passion. My heart throbs like the drum, my blood boils like water." This is repeated three times, and afterward another spell is intoned: "Bring my desire to me, my name is so-and-so, and my desire is the one whom I love." This spell requires solemnity and precision. To make it more effective, one has to open and close one's eyes four times, slowly, while saying it.

Such spells are not taught to laypersons, only to initiates. To be able to pronounce them one has to undertake a series of purifications, such as abstaining from food and sex for forty to sixty days (Idries Shah, 1968).

**India.** The sheer number of spells used in the sacred books of India is noteworthy in itself. The *Atharvaveda* in particular is full of them. Here will be mentioned only one, dedicated to obtaining a man's love: "By the power and laws

of Varuna, I invoke the burning force of love, in thee, for thee. The desire, the potent love-spirit which all the gods have created in the waters, this I invoke, this I employ, to secure thee for me" (Idries Shah, 1968).

**China.** One result of China's use of ideograms is that its magic produces mostly written talismans, although spells abound, greatly influenced by their historical past. A spell written on the blade of a sword could make it invincible: "I wield the large sword of Heaven to cut down specters in their five shapes; one stroke of this divine blade disperses a myriad of these beings" (Idries Shah, 1968).

**Mesoamerica.** As in most cultures, magic in pre-Conquest Mexico was highly specialized, permitted only to initiates. The spells themselves prove this, since their language was comprehensible only to occultists of the time; for example, a spell for alleviating intestinal pain—very common in tropical countries—was recorded in the seventeenth century by Jacinto de la Serna:

Ea, white serpent, yellow serpent, observe that you are damaging the coffer . . . the tendons of meat. . . . But the white eagle already goes ahead, but it is not my intention to harm or destroy you, I want only to stop the harm you cause by withdrawing . . . by stopping your powerful hands and feet. But should you rebel and disobey, I will call to my aid the pledged spirit Huactzin and also call the black chichimeco, who is also hungry and thirsty, and who rips out his intestines, to follow you. I will also call my sister, the one with the skirt of jade, who soils and disorders stones and trees, and in whose company will go the pledged leopard, who will go and make noise in the place of the precious stones and treasures: the skeletal green leopard will also accompany her. (de la Serna, [1656] 1953)

The serpents mentioned at the beginning are the intestinal maladies (intestinal worms, pinworms, tapeworms, etc.) that harm the stomach and intestines. They are threatened with the eagle, which represents the needle used to pierce the stomach for bloodletting. They are also threatened with the spirit of medicinal plants and liquids.

**Modern-day spells.** With the development of experimental science, one would expect magic and religion to decline. In fact all three remain active, although magic has certainly yielded ground. (Magic tends to gain ground in times of crisis.) One finds both ancient and modern spells disguised in the folk tales recorded by the brothers Grimm, such as the traditional "Magic wand, by the powers you possess, I command you to make me [rich, invisible, etc.]."

Mexico provides an interesting example of the survival of ancient spells. In pre-Conquest Mexico, death was believed to be a change of life, and it was thought that the god of the underworld, Mictlantecuhltli, was a disembodied, skeletal being with whom those who died natural deaths were united in burial. After the Spanish conquest, the figure was assimilated, ending up as a being who lends aid when the request is made in the appropriate fashion. Thus today, at the

entrance to thousands of churches throughout Mexico, one can buy prayers and spells "To Most Holy Death." The most common of these tries to obtain the love of some indifferent person and says: "Death, beloved of my heart, do not separate me from your protection; do not leave him a quiet moment, bother him every instant, frighten him, worry him so that he will always think of me." This is repeated as often as possible, with the interjection of Catholic prayers.

The new mythology is even felt in the kitchen. For example, when there is some fear the the cooking will not turn out well, the following spell is recited: "Saint Theresa, you who found God in the stew, help my stew not to be [salty, burned, overcooked, etc.]." It must be admitted, however, that this and many other spells are usually said out of habit, not from a certainty that the words, through their intrinsic power, will bring the desired results. Nevertheless, a belief in the power of spells can still be found among marginal groups even today, as it has been found in the past.

**SPENCER, BALDWIN** SEE GILLEN, FRANCIS JAMES, AND BALDWIN SPENCER

**SPENCER, HERBERT** (1820–1903), was an English philosopher who became the most influential exponent of social evolutionism. Born in Derby, England, and educated largely in an atmosphere of religious dissent (and especially influenced by Quakers and Unitarians of the Derby Philosophical Society), Spencer combined a practical bent (for railway engineering, inventions, etc.) with a constant search for scientific principles. He became assistant editor at the *Economist* in London in 1848. After an early essay (1852) on the "development hypothesis" (concerning the laws of progress), he settled on evolution as the basic principle governing all change in the universe and began propagating a theory of evolution even before Charles Darwin's *On the Origin of Species* appeared in 1859.

The core of Spencer's literary output was published in several volumes under the general title *A System of Synthetic Philosophy*; this huge endeavor was left unfinished at Spencer's death. Its bearing on religion was at least fourfold. First, the prefatory volume, called *First Principles* (1862), contains the earliest philosophic exposition of the position known as agnosticism. Proceeding beyond the fideism of William Hamilton and Henry Mansel, both of whom maintained that the existence of God was a matter of faith rather than certain knowledge, Spencer argued that the force behind the cosmic process of evolution was unknown and unknowable. Second, this work and his books *The Principles of Biology* (1864–1867) and *The Principles of Psychology* (1855–1870) defended evolution as a universal natural process of development from simple and homogenous to more complex and differentiated forms of life over millions of years. Thus Spencer became embroiled with Darwin, T. H. Huxley, and others in the debate with those who held to a literal interpretation of *Genesis* or who denied the simian ancestry of human beings. Spencer also used the evolution debate as a forum to attack the idea of established religion.

Social evolutionism was the third and most important of his system's implications for religious questions. In *The Principles of Sociology* (1876–1896), he presented a barely qualified unilineal account of religious evolution and also fleshed out the first "sociology of religion" (at least in English). Spencer thought that the origins of religion lay in the worship of ghosts or ancestors; he extrapolated this view

from the balance of evidence found among “primitives,” or what he had no hesitation in describing as “the lowest races of mankind.” Although primitive religions had, according to Spencer, barely evolved, he believed that marks of progress could be found in the religions of the greater civilizations, and he tended to plot Greco-Roman and Hindu polytheisms, the “cruder” monotheisms of Jews and Muslims, and the relative refinements of Catholicism and Protestantism on an ascending scale, envisaging his own agnostic, scientific position as the pinnacle in the history of religious consciousness. Apart from suggesting that history reflected progress toward more mature insights and institutional complexity, Spencer outlined the kinds of religious activity worth investigation. He isolated ceremonial institutions, for example—a category in which he placed laws of intercourse, habits and customs, mutilations, and funeral rites, as well as ecclesiastical institutions.

Finally, his system also carried ethical implications. In *The Principles of Ethics* (1879–1893), and in various social essays (especially those in his book *Education: Intellectual, Moral, and Physical*, 1861), he was seen as a liberal and an “individualist” who opposed punitive child-rearing, narrow biblical morality, and state legislation that interferes in private affairs or with the entrepreneurial spirit.

Spencer’s book sales were poor during his lifetime, and he eked out a frugal existence as a London bachelor until he was taken in by two elderly women in his old age. Through the later popularization of his ideas, however, his influence was immense, especially in the United States. His work and that of E. B. Tylor were crucial in conditioning the widespread preoccupation in English-speaking scholarship with the evolution of religion. Always ready for a lively interchange with other scholars and literati, Spencer struck up close intellectual friendships with George Eliot and her companion Henry Lewes and debated with Max Müller about mythology and the origins of religion. Spencer combined cautious distinctions and vitriolic attacks in an attempt to dissociate himself from Comtism and the views propounded by Frederick Harrison, an English disciple of Auguste Comte.

Spencer’s written approach to religion suffered from a certain dilettantism: His knowledge of foreign languages was limited, and his educational background provided him no basis for the in-depth study of any single historical religion. He barely traveled outside Great Britain, although his encyclopedic tendencies, as well as his ability to collect data through travelers’ accounts and mission reports from all over the world, made him a precursor to the armchair scholarship associated with James G. Frazer and *The Golden Bough*.

At the turn of the twentieth century, the liveliest popularizer of Spencer’s ideas was W. H. Hudson, and his most cogent critic in matters of religious sociology was Émile Durkheim. His impact has waned with the decline of social evolutionism, but his influence on cosmological theory (that of Pierre Teilhard de Chardin, for instance) and on evolu-

tion-oriented educational philosophy, especially that of John Dewey, has been more durable.

#### BIBLIOGRAPHY

Other works by Herbert Spencer include *Social Statics* (1851; reprint, New York, 1954), *The Study of Sociology* (London, 1873), *The Man versus the State* (1884; reprint, London, 1950), and *An Autobiography*, 2 vols. (London, 1904). There is no monograph especially devoted to Spencer’s ideas about religion, although one-half of my “The Origins of the Comparative Study of Religions” (M.A. thesis, Monash University, Clayton, Australia, 1967) analyzes these in depth. Of published works on Spencer’s social theory, J. D. Y. Peel’s *Herbert Spencer: The Evolution of a Sociologist* (London, 1971) and David Wiltshire’s *The Social and Political Thought of Herbert Spencer* (Oxford, 1978) are the best. See also J. W. Burrow’s *Evolution and Society* (London, 1966) on Spencer in the context of British evolutionist thought as a whole; Eric J. Sharpe’s *Comparative Religion: A History* (London, 1975) on placing Spencer in the history of the field of comparative religion; and my “Radical Conservatism in Herbert Spencer’s Educational Thought,” *British Journal of Educational Studies* (1969): 267–280, on religious and philosophical assumptions underlying Spencer’s views on education.

GARRY W. TROMPF (1987)  
*Revised Bibliography*

**SPENER, PHILIPP JAKOB** (1635–1705), is the most widely recognized representative of early Pietism. Spener was born in Rappoltsweiler, Alsace, on January 13, 1635. He grew up in a Lutheran home in which the prevailing religious atmosphere was heavily influenced by Johann Arndt’s *True Christianity*, the widely beloved devotional guide of seventeenth-century Lutheranism. Thus Spener was naturally predisposed toward Arndtian piety. Being an omnivorous reader, even at a tender age, he acquainted himself early with Puritan works that had been translated into German, as well as with those coming out of the reform party within Lutheranism, the avowed aim of which was the furtherance of religious devotion and ethical sensitivity within the Lutheran churches.

After he had completed the necessary preliminary studies, Spener matriculated at the University of Strasbourg in 1651. His student life manifested what was considered, by the prevailing standards of the day, an unusually ascetic tendency, insofar as he abstained from excessive drinking, revelry, and generally rude behavior. The dominant intellectual influence upon him during his university days was exert-

ed by his theology professor, Johann Konrad Dannhauer (1603–1666), who, among other things, deepened Spener's lifelong interest in the teachings of Martin Luther. Upon completion of his studies, Spener spent some years in travel. That he did so largely in Reformed territories seems to say something about his appreciation of the piety found in various Reformed circles. During his itinerary he visited Basel, where he studied Hebrew under Johann Buxtorf (1599–1664). At Geneva the fiery French representative of Reformed Pietism, Jean de Labadie (1610–1674), impressed Spener so much that in 1667 he published a translation of one of Labadie's edificatory tracts. During an extended visit to Tübingen he set in motion various impulses toward the development of Swabian Pietism. Upon his return to Strasbourg (1663) he worked for his doctoral degree, taught and preached, and married Susanne Ehrhardt. They had eleven children.

Spener was called to a succession of pastorates, beginning with his appointment in 1666 to the position of senior pastor at Frankfurt am Main, where his emphasis on the catechization of children and on confirmation began to evoke critical reactions. So did his introduction of private meetings among the laity for the purpose of promoting a life of personal piety. Here, too, began his correspondence with highly placed people, which gradually helped to make him the most influential pastor in Germany during his time. Then, weary of the controversies that his activities and writings had provoked, Spener accepted a call to Dresden, in Saxony, where in 1686 he became chaplain of Elector Johann Georg III. However, the elector's lack of sympathy for Spener's concerns prompted him to move to Berlin in 1691. As rector of the Church of Saint Nicholas, as a member of the Lutheran consistory, and as inspector of churches he was now at the zenith of his effectiveness. Enjoying the confidence of the ruling house of Prussia and of a large segment of the German nobility, he was instrumental in opening up many pastorates throughout Germany to the appointment of pastors with Pietist leanings. Spener died on February 5, 1705, having expressed the wish that he be buried in a white coffin, a symbol of his hope that the church on earth might expect better times.

A prolific writer, Spener published many hundreds of letters; sermons; edificatory and catechetical tracts; works on genealogy, history, and heraldry; and writings of a polemical nature. The most famous of his literary productions was his *Pia desideria*, which appeared as a preface to Arndt's *Postil* in 1675 and later was published separately at various times. In it he proposed his program for the moral and spiritual reform of individuals, church, and society, which he followed throughout his life.

The major emphases of Spener's works are typical of Pietism, namely, natural humanity's lost estate, the necessity of its religious renewal, the possibility of its conscious experience of God's regenerating and sustaining presence, the desirability of continued spiritual nourishment through wor-

ship and appropriate literature, the holy life expressed in love for God and humans, the need for religious fellowship of like-minded people, and the hope of being able to reform the church for the purpose of reshaping a sinful world. Spener was opposed chiefly because of his often expressed vision of a better future for the church, which implied that the church was in need of renewal; for his insistence on religious instruction and on a way of life calculated to be a protest against the moral laxity of the day, which in the eyes of his opponents marked him as a zealot; and for instituting private meetings (*collegia pietatis*), which were seen as having the potential to fragment the church.

#### BIBLIOGRAPHY

Toward the end of his life Spener published some of his writings in his *Theologische Bedencken*, 4 vols. in 2 (Halle, 1700–1702), to which Karl Hildebrand von Canstein posthumously added *Letzte theologische Bedencken*, 3 vols. (Halle, 1711). Since then many of Spener's works have been published singly, and a long series of unsuccessful attempts have been made to bring out a complete edition of his writings. Toward the end of the nineteenth century Paul Grünberg, the noted Spener scholar, edited a modernized version of Spener's *Hauptschriften* (Gotha, 1889). The Historical Commission for the Study of Pietism (Kommission zur Erforschung des Pietismus) has begun publication of a multivolume edition of *Philipp Jakob Spener Schriften*, edited by Erich Beyreuther (Hildesheim, 1979–). Spener's best-known work, his *Pia desideria*, has been translated into very readable English and supplied with an introduction by Theodore G. Tappert (Philadelphia, 1964).

The classic biography of Spener is still Paul Grünberg's *Philipp Jakob Spener*, 3 vols. (Göttingen, 1893–1906); volume 3 contains an exhaustive bibliography. The major contemporary work on Spener is Johannes Wallmann's *Philipp Jakob Spener und die Anfänge des Pietismus* (Tübingen, 1970). Martin Kruse's *Speners Kritik am landesherrlichen Kirchenregiment und ihre Vorgeschichte* (Witten, 1971), and Jan Olaf Rüttgardt's *Heiliges Leben in der Welt: Grundzüge christlicher Sittlichkeit nach Philipp Jakob Spener* (Bielefeld, 1978), are important studies of Spener's attitude toward the church government of his day and of his ethics, respectively.

F. ERNEST STOEFLER (1987)

**SPINOZA, BARUCH** (1632–1677; known as Bento in Portuguese, Benedictus in Latin) was a Jewish rational naturalist of Marrano descent and the author of a rigorously monistic interpretation of reality expressed through an interlocking chain of propositions demonstrated in the geometrical manner. Spinoza's relentless drive for the naked truth was of singular intensity, and his scientific assessment of traditional Jewish thought thoroughly uncompromising. His aim was to contemplate things as they really are rather than as we would like them to be. Anthropocentrism is pe-remptorily and unceremoniously banished from his philosophical purview. Despite Spinoza's unadorned style, considerable controversy still envelops the interpretation of the very foundations of his thought.

**LIFE AND WORKS.** On July 27, 1656, Bento de Spinoza was excommunicated by the ma'amad (ruling board) of the Amsterdam Jewish community into which he had been born. His father, Mikael, had been born in Vidigere (modern-day Figueira), Portugal, and had a close personal and financial relationship with the Portuguese merchant Abraham de Spinoza of Nantes, who was both his uncle and his father-in-law. Bento was the son of Mikael's second wife, Hanna Debora, who died when the child was scarcely six. Spinoza was never trained to be a rabbi, as previously thought, and was never a full-time pupil of Sha'ul Levi Morteira, a senior instructor in Talmud-Torah Ets Hayyim, although he may have attended an adult group known as Yeshivat Keter Torah that was led by Morteira. He apparently left school at age thirteen or fourteen to work in his father's business. From 1654, the year of Mikael's death, to 1656, the firm Bento y Gabriel de Spinoza was managed by Bento and his younger brother Gabriel. In March 1656, several months before his excommunication, Spinoza decided to take advantage of a Dutch law that protected minors who had been orphaned, and dispossessed himself of his father's estate, which was heavily burdened by debts.

The manuscript of the ban, written in Portuguese, the language of all documents of the Amsterdam Jewish community, is still preserved in the municipal archives of Amsterdam but contains no signatures. Other contemporary documents suggest that young Spinoza's heretical views, which led to his excommunication, were reinforced especially by Juan (Daniyye'l) de Prado. Excommunicated in 1658, de Prado was also a member of Morteira's Keter Torah circle and had attacked biblical anthropomorphism, poked fun at the idea of Jewish chosenness, and asserted that the world was eternal and the immutable laws of nature constituted the only form of divine providence. A report of Tomas Solano y Robles to the Inquisition of August 8, 1659 also indicated that Prado and Spinoza were excommunicated because they thought the Law (Torah) untrue, that souls die with the body, and that there is no God except philosophically speaking.

The precise reasons for the excommunication of Spinoza have been much discussed and debated. Steven Nadler has argued strongly that it was Spinoza's denial of personal immortality of the soul that played the key role (*Spinoza's Heresy*, 2001). In seventeenth-century Amsterdam, four community rabbis are especially prominent, and each one of them composed treatises in defense of immortality (Isaac Aboab, Sha'ul Levi Morteira, Moses Raphael d'Aguilar, and Menasseh ben Israel). Moreover, Morteira and Menasseh tended to lump together the three doctrines that seem to have played a role in Spinoza's ban: the truth of the Torah, divine providence, and immortality. Admittedly, the Dutch may not have been unduly concerned with the goings on in the Jewish community, but what is significant here is the psychology of the community that banned Spinoza, convinced as it was of the reality of such a threat.

Jonathan Israel, on the other hand, has argued eloquently and persuasively that it was Spinoza's public and provocative repudiation of the fundamentals of Rabbinic Judaism that made it impossible for the synagogue authorities not to expel him (Israel, 2001, pp. 162–174). This is reinforced by the exceptional severity of the excommunication formula used in his case. Israel points out that if the core ideas of Spinoza's mature system were already outlined in Spinoza's *Short Treatise* (1660–1661), and if he was capable of convincing Oldenburg in 1660 that he had outflanked Cartesianism, then it seems most unlikely that if one assumes, as most scholars do, that Spinoza started his philosophical odyssey around the time of his excommunication in 1656, just four years before, that he could conceivably have reached such a level of achievement so speedily. One must conclude that he had begun his philosophical phase long before this, as indicated by various strands of evidence. Thus Jarig Jelles affirms in his preface to *Opera Posthuma* that long before the ban in 1656, Spinoza had seriously engaged the Cartesian philosophy, rebelling inwardly against the teachings of the synagogue. Similarly, the eighteenth-century historian of Amsterdam Sephardic Jewry, David Franco Mendes, stresses that, even as a boy, Spinoza vacillated in his Jewish belief as a result of his philosophical excursions. But the clearest proof, argues Israel, is what Spinoza reveals in the autobiographical passage of the *Emendation of the Intellect* (1658), where he dwells on the long inner struggle he experienced before he could tear himself loose from the double existence he had been leading, in which outward conformity was uneasily joined with inner turmoil. Spinoza was finally able to cut the Gordian knot when, by 1655, his family business was ruined and his father's estate became encumbered by sizable debts.

According to Israel, the only personage who seems likely to have guided Spinoza in a radical direction was his ex-Jesuit Latin master Franciscus van den Ende. Thus was Spinoza's precocious genius caught up in the Cartesian ferment that swept the Netherlands, and the resulting identity crisis that smoldered within him since his early teens finally came to a head through a confluence of circumstances, in 1656. The ban was consequently the inevitable outcome of a long intellectual struggle that could no longer be contained.

Apart from the report in Lucas's biography of Spinoza, which elevates Spinoza to the status of a philosopher saint, there is no evidence of an appeal by the Jewish community that Spinoza be banished from the city of Amsterdam, and no legal record of any forced exile of Spinoza. In fact, says Nadler, Spinoza appears to have been in that city throughout most of the period of his excommunication in 1656 to the beginning of his correspondence in 1661 (Nadler, 1999, pp. 156–158, 163). It also appears that sometime before early 1659 he was either staying in or making periodic visits to Leiden to study at the university there. By early 1661, Spinoza was already well known as one who "excelled in the Cartesian philosophy." Nadler further suggests that it may

have been his association with university life, where all instruction was in Latin, that first moved Spinoza to use the Latinized version of his first name, Benedictus.

It is to the final years of his Amsterdam period that Spinoza's earliest philosophical writings belong. According to Nadler, following Mignini, there are good reasons for thinking that the *Treatise on the Emendation of the Intellect* (*Tractatus de intellectus emendatione*), an unfinished work on philosophical method and language, is the first of Spinoza's extant philosophical treatises (Nadler, 1999, pp. 175–176). Its content and terminology suggest a dating before the *Short Treatise on God, Man and His Well-Being* (*Korte Verhandeling van God de mensch en des zelfs welstand*), which he probably began sometime in late 1660 or early 1661.

To devote himself more fully to his philosophical investigations, Spinoza decided in the summer of 1661 to settle in the small village of Rijnsburg, a few miles outside of Leiden. This sleepy village had been the center of Collegiant activity in Holland, and Spinoza may have been directed there by his Collegiant friends, though its proximity to Leiden, with its university where he probably still had friends from the time he had studied there, must have added to its attraction for Spinoza. In the back of the house in which he lodged was a room where Spinoza set up his lense-grinding equipment, where in addition to lenses he also made telescopes and microscopes. Problems in optics were an abiding interest for Spinoza, and Christian Huygens, a scientist of international reputation, considered himself, Spinoza, and the mathematician Johannes Hudde to be the three leading specialists who were seeking to improve and extend the capabilities of the microscope. Huygens got to know Spinoza personally in the early 1660s and often conferred with him about scientific matters.

While Spinoza was still in Amsterdam, his friends soon became aware of the originality of his philosophical approach and persuaded him to provide them with a concise exposition of his developing ideas so they could study and discuss them. Acceding to their request, Spinoza composed a work in Latin probably sometime between the middle of 1660 and his departure for Rijnsburg. When his friends asked for a Dutch version, Spinoza reworked the text, while making many additions and revisions. Fully conscious of the novelty and daring of his thought, he urged them “to be very careful about communicating these things to others” (Nadler, 1999, p. 186). Spinoza worked on the *Short Treatise* throughout 1661 and into 1662, transcribing and emending it. This short work outlines most of the essentials of Spinoza's mature system as exhibited in the *Ethics*. Moreover, *Short Treatise*, discovered about 1860 and of which two Dutch versions are available, bears witness to the birth pangs of Spinoza's thought, which, with its strong pantheistic coloring, is still couched in language that is clearly theological. Spinoza hesitated to publish it for fear of the Calvinist theologians who might be deeply offended by it and, as Spinoza himself puts it, will “with their usual hatred attack me, who absolutely

dread quarrels” (Ep. 6; Curley, 1985, p. 188; Nadler, 1999, p. 191).

In April 1663 Spinoza moved to Voorburg, near The Hague, thus gaining the advantage of proximity to a major city. Before leaving, however, he visited his old friends in Amsterdam, whereupon Jarig Jelles and Lodewig Meyer prevailed upon him to expand his Euclidean exposition of Descartes's *Principia philosophiae* and allow its publication together with his *Cogitata metaphysica* (*Metaphysical thoughts*). This was the only book of Spinoza's to appear in his lifetime under his own name. In 1670, after Spinoza's move to The Hague, his *Tractatus Theologico-Politicus* was published anonymously under a false imprint in Amsterdam. A few months thereafter, the Reformed Church Council of Amsterdam pronounced its condemnation of the book, and a series of lesser councils and consistories swiftly followed the example. In July 1674 the Court of Holland condemned the *Tractatus* and prohibited its printing, distribution, and sale. Although the great Dutch statesman Johan De Witt seems to have preferred not to proceed to a formal provincial ban of the *Tractatus*, it is a mistake, according to Jonathan Israel, to deduce from this that he viewed it in any way favorably (Israel, 2001, pp. 277–278). A surviving fragment from a diary of the classicist Jacob Gronovius reveals that in the Dutch governing circles Spinoza was then deemed the most dangerous of the Dutch atheists and considered by De Witt a miscreant deserving imprisonment. Given the vehemence of the outcry against him, Spinoza became apprehensive when he learned that a Dutch translation of his *Tractatus* was about to be published, and he contacted his faithful friend Jelles to stop the printing. The need for caution was underlined by the trial of Adrian Koerbagh, in which the prosecutor questioned him about his relations with Spinoza and attempted to obtain from him a confession that his book contained Spinoza's teachings. Koerbagh was condemned to ten years in prison but died shortly after, in jail, in October 1669. It was Adrian's tragic end, observes Nadler, “in Spinoza's eyes a sign of collusion between the secular and the sectarian authorities, that gave him the impetus to put the final touches on his *Tractatus* and prepare it for publication” (Nadler, 1999, p. 269).

In 1672 came the French invasion of Holland and the murder of De Witt, events that cast a dark shadow on Spinoza's last years. In February 1673 he received an invitation from the elector palatine Karl Ludwig to accept a professorship at Heidelberg. Spinoza refused it for fear that it would interfere with his “further progress in philosophy,” and because of his misgivings about a statement in the invitation concerning the prince's confidence that Spinoza would not misuse his freedom in philosophical teaching to disturb the public religion (Nadler, 1999, p. 313).

Late in the summer of 1675, Spinoza completed his magnum opus, the *Ethica ordine geometrico demonstrata* (*Ethics*), and went to Amsterdam to arrange for its publication. There, as he wrote to Henry Oldenburg, “while I was negoti-

ating, a rumor gained currency that I had in the press a book concerning God, wherein I endeavored to show there is no God" (*Letter* 68, September 1675). He therefore decided to put off the publication.

Spinoza's last major work, the *Tractatus Politicus*, written in 1676–1677, abandoned the theological idiom employed in the *Tractatus Theologico-Politicus* and offered instead a straightforward analysis of aristocracy, monarchy, and democracy in an attempt to demonstrate how a stable government could be ensured. This work was unfortunately interrupted by Spinoza's death on February 21, 1677. Another late work that remained incomplete was his Latin *Compendium of Hebrew Grammar*, which he "undertook at the request of certain of his friends who were diligently studying the Sacred Tongue" (Bloom, 1962, p. 11). Spinoza was buried in the New Church on the Spuy, and his *Opera posthuma*, edited by Jelles, Meyer, and Georg Hermann Schuller, appeared in November 1677 with only the initials B. D. S.

**BIBLICAL CRITIQUE.** Spinoza's excommunication left a psychological scar that explains, partly at least, much of his subsequent bitterness toward his own people and their traditions. Although his pioneering biblical critique is frequently illuminating (for example, his view that Moses did not write the Pentateuch was already openly expressed by Isaac La Peyrère, whose work *Prae-Adamitae* Spinoza possessed), much of his writing in the *Tractatus* is marred by a onesidedness that distorts his judgment. Although it is undoubtedly true that Spinoza's intended audience was a Christian one, and that this dictated his partiality toward the figure of Christ and the Apostles, the unnecessary slurs against the Pharisees and the Rabbis and the unmistakable hostility that sometimes surfaces in a number of his formulations point to the psychological effects, conscious or unconscious, of his expulsion from the Jewish community. Spinoza characterizes his new method of investigating scripture as an empirical approach that accepts the biblical text as a natural datum. Since prophecy claims to surpass human understanding, Spinoza must somehow take it at its word. For the sake of the masses, who cannot be reached by reason alone, Spinoza is willing to grant that prophecy is possible. There may be, he says, laws of imagination that are unknown to humans, and the prophets, who received their revelations from God by means of the imagination, could thus perceive much that is beyond the boundary of the intellect. Although Moses is the chief of the prophets, his eminence consisted only in his receiving his prophecies through a real voice rather than an imaginary one. In other respects, however, Moses' imagination was not especially distinguished, for he was not sufficiently aware of God's omniscience, and he perceived the Decalogue not as a record of eternal truths but as the ordinances of a legislator. Spinoza set up the figure of Christ in contrast to Moses. If Moses spoke with God face-to-face, Christ communed with him mind-to-mind (a probable allusion to the Johanne conception of Christ as the *Logos*, as noted by Leavitt in *Christian Philosophy of Spinoza* [1991]). No one except Christ received the revelations of God without the aid of the

imagination, meaning Christ possessed a mind far superior to those of his fellow men. Moreover, because Christ was sent to teach not only the Jews but the whole human race, it was not enough that his mind be attuned only to the Jews; it was attuned to ideas universal and true. If he ever proclaimed any revelations as laws, he did so because of the ignorance of the people. To those who were allowed to understand the mysteries of heaven, he taught his doctrines as eternal truths. To Spinoza, the biblical doctrine of the chosenness of the Hebrews implies on their part a childish or malicious joy in their exclusive possession of the revelation of the Bible. The doctrine is to be explained by the fact that Moses was constrained to appeal to the childish understanding of the people. In truth, he claims, the Hebrew nation was not chosen by God for its wisdom—it was not distinguished by intellect or virtue—but for its social organization. Spinoza explains the extraordinary fact of Jewish survival by the universal hatred that Jews drew upon themselves. From *Jeremiah* 9:23, Spinoza deduces that the Jews were no longer bound to practice their ceremonial law after the destruction of their state. The Pharisees continued these practices more to oppose the Christians than to please God. (Spinoza's view of the Pharisees is consistently derogatory. He attributes to them economic motives in their quarrel with the Sadducees and goes so far as to say that Pontius Pilate had made concession to the passion of the Pharisees in consenting to the crucifixion of Christ, whom he knew to be innocent. Maimonides is pejoratively termed a *Pharisee*, and Spinoza dismissed his interpretation of scripture as harmful, useless, and absurd.) Moreover, on the basis of *Ezekiel* 20:25, Spinoza finds the explanation of the frequent falling away of the Hebrews from the Law, which finally led to the destruction of their state, in the fact that God was so angry with them that he gave them laws whose object was not their safety but his vengeance. To motivate the common individual to practice justice and charity, certain doctrines concerning God and humans, says Spinoza, are indispensable. These, too, are a product of the prophetic imagination, but they will necessarily be understood philosophically by those who can do so. This universal scriptural religion is distinguished both from philosophical religion, which is a product of reason and is independent of any historical narrative, and from the vulgar religion of the masses, which is a product of the superstitious imagination and is practiced through fear alone; it consists of seven dogmas. The first four concern God and his attributes of existence, unity, omnipresence, and power and will. The other three deal with people's religious acts, and seem to derive from a Christian context: human beings' worship of God, their salvation, and their repentance. Each of the seven dogmas can be understood either imaginatively, in which case they would all be false, though useful, or philosophically, in which case they would all be true. Presumably, the average individual's score would be a mixed one.

**THOUGHT.** Spinoza begins and ends with God. He is convinced that upon reflective analysis individuals become immediately aware that they have an idea of *substance*, or that

which is in itself and is conceived through itself. Because substances having different attributes have nothing in common with one another, and because if two things have nothing in common, one cannot be the cause of the other, then it is evident that all the entities of which humans have experience, including themselves, must, because they all have extension in common, constitute one substance. Although a human being is also characterized by thought, which has nothing in common with extension, since one is aware of one's own extension, these two attributes cannot denote two substances but must be instead two parallel manifestations of one and the same substance. Spinoza thus insists that humans have a clear and distinct idea of substance or God having at least two parallel attributes. (In *Ethics* 1.11 he defines God as consisting of infinite attributes, each one of which expresses eternal and infinite essence, but some scholars believe that Spinoza is here using the term *infinite* as a synonym for *all*, and that what he means to say in this proposition is that God exists in every possible basic way. Although he elsewhere hints that there may be more than two attributes, he stops short of saying that there are. Even more controversial is the question whether the attributes are to be understood as subjective or objective.) Although this conception of substance is ultimately derived from empirical observation, it is not dependent on any particular observation as such but follows from the analysis of ideas and is therefore a product of the power of the mind to think ideas and analyze their logical structure. It is in this sense that knowledge of substance, or God, is *a priori*, deriving essentially from an analysis of a given true definition contained within the human mind. Spinoza designates knowledges of this kind as intuitive; he ranks it as the highest form of knowledge humans have, above deductive reasoning, which is mediated by the syllogistic process, and imagination, which is based either on hearsay or random experience. For Spinoza, the only adequate or clear and distinct ideas humans possess are those related to God, simple ideas, and common notions, or axioms, and what is deduced from them. Knowledge derived from syllogistic reasoning (which yields universal knowledge) and intuitive knowledge (which represents the power of the mind itself, on which syllogistic reasoning ultimately rests) are necessarily true.

God is eternally in a state of self-modification, producing an infinite series of modes that are manifested under either of his attributes. Under the attribute of extension, there is the immediate infinite mode, motion and rest; and under thought, the absolutely infinite intellect, or the idea of God. Finally come the finite modes, or particular things. Substance with its attributes is called *natura naturans*, the creative or active divine power, whereas the entire modal system, the system of what is created, is called *natura naturata*. Spinoza's God is thus not identical with the natural world as such but only with the creative ground that encompasses it.

While others consider human actions and appetites as virtues and vices to be bewailed or mocked, Spinoza consid-

ers them natural facts to be studied and understood. Vice is impotence, whereas virtue is power. Individuals act when anything is done of which they are the adequate cause; they suffer when anything is done of which they are only the partial cause. The first law of nature (as the Stoics had already noted) is the impulse, or effort (*conatus*), by which each thing endeavors to persevere in its own being. Humans do not desire anything because they think it good, but humans judge a thing good because they desire it. Desire is activity conducive to self-preservation; pleasure marks its increase, pain its decrease. Spinoza offers a pioneering psychological analysis of the ways through which the human imagination acts and discusses in some detail the various laws of what he calls the association and imitation of the emotions.

Spinoza calls active emotions those which are related to the mind insofar as it acts and of which an individual is the adequate cause. Of these there are only two: desire, or the effort of self-preservation in accordance with the dictates of reason, and pleasure, or the enjoyment experienced from the mind's contemplation of itself whenever it conceives an adequate or true idea. In the conflict of emotions, weaker emotions are removed by stronger ones, as Plato had already indicated in the *Timaeus*. Knowledge of good and evil can be a determining factor only insofar as it is considered an emotion—that is, a consciousness of pleasure and pain. Inasmuch as happiness consists in humans' preservation of their own beings and they act virtuously when effecting their self-preservation in accordance with their full powers, humans must seek to maximize their power to act, which means removing their passive emotions to the greatest possible extent and substituting for them active emotions.

Spinoza suggests various remedies for the passive emotions, which he describes as mental diseases (already described by the Stoics). Since a passive emotion is a confused idea, the first remedy is to remove confusion and transform it into a clear and distinct idea. Another remedy is to realize that nothing happens except through the necessity of an infinite causal series. Humans should also endeavor to expel the many ghosts that haunt their minds by contemplating the common properties of things. Indeed, the emotions themselves may become an object of contemplation. The sovereign remedy, however, is the love of God. The mind has the capacity to cause all affections of the body to be related to the idea of God; that is, to know them by intuitive knowledge. Spinoza endeavors to demonstrate the immortality of the human mind (stripped of sensation, memory, and imagination) but insists that even during a lifetime one can experience that state of immortality which he calls blessedness and describes as union with, or love for, God. The intellectual love of God, which arises from intuitive knowledge, is eternal and is part of the infinite love with which God loves himself.

**INFLUENCE ON LATER THOUGHT.** Among the major philosophers, Spinoza was the only one who did not found a school. During the first hundred years after Spinoza's death, his name was connected principally with the *Tractatus*

*Theologico-Politicus*, and as Isreal has emphasized, “no one else rivaled his notoriety as chief challenger of revealed religion”) (Isreal, 2001, p. 259). Only toward the end of the eighteenth century did Spinoza begin to arouse enthusiasm among men of letters. In 1778, Johan Gottfried Herder equated Spinoza with John himself as the apostle of love, and in 1780 Gotthold Ephraim Lessing declared to Friedrich Jacobi that “there is no other philosophy than that of Spinoza” (Vallée, *Spinoza Conversations*, 1988, p. 86). Although a follower of Christian Wolff, who directed a formidable critique against Spinoza, Moses Mendelssohn hailed Spinoza as early as 1775 as a martyr for the furthering of human knowledge. As a result of the publication of Mendelssohn’s *Morgenstunden* in 1785, in which he sought to attribute to Lessing a purified form of pantheism, Jacobi countered with a work called *Über die Lehre des Spinoza* (“On the teaching of Spinoza,” 1785), in which he branded Spinozism as atheism and the Jewish Qabbalah as a confused Spinozism. Goethe, on the other hand, eagerly devoured Spinoza’s *Ethics*, noting that it “agreed most with his own conception of nature,” and that “he always carried it with him.” Goethe shared two of Spinoza’s most fundamental principles, his monism and his theory of necessity (Bell, 1984, pp. 153, 168). Salomon Maimon, the first to call Spinoza’s system *acosmic*, spoke admiringly in his autobiography of the profundity of Spinoza’s philosophy, and his first book, *Versuch über die Transcendentalphilosophie* (*An essay on Transcendental philosophy*, 1790), was an attempt to unite Kantian philosophy with Spinozism. According to G. W. F. Hegel (1770–1831), there was “either Spinozism or no philosophy,” and Friedrich Wilhelm Joseph von Schelling (1775–1854) wrote that “no one can hope to progress to the true and complete in philosophy without having at least once in his life sunk himself in the abyss of Spinozism” (McFarland, 1969, p. 103).

Appreciation for Spinoza in England was due especially to Samuel Taylor Coleridge, who wrote in about 1810 that only two systems of philosophy were possible, that of Spinoza and that of Immanuel Kant (1724–1804). In a letter of 1881, Friedrich Nietzsche (1844–1900) expressed his astonishment at the kinship between Spinoza’s position on morality and his own, although elsewhere he is severely critical of Spinoza. Martin Buber (1878–1965) found much inspiration in Spinoza, seeing in him the highest philosophical exemplification of Judaism’s unique quest for unity, but he criticized the Spinozistic attempt to depersonalize God.

In the 1850s, Shemu’el David Luzzatto stirred up a literary polemic concerning Spinoza after having been aroused by the first laudatory biography of Spinoza in Hebrew (1846), written by the poet Me’ir Letteris; by the essays of Schelling’s student Senior Sachs from 1850 to 1854, in which he links together Shelomoh Ibn Gabirol, Avraham ibn Ezra, the qabbalists, and Spinoza; and by Shelomoh Rubin’s *Moreh nevukhim he-hadash* (1857), which contains a positive account of Spinoza’s thought. Luzzatto attacked Spinoza’s emphasis on the primacy of the intellect over the feelings of

the heart and his denial of free will and final causes, and called unjustified his attack on the Pharisees and on the Mosaic authorship of all of the Pentateuch. Nahman Krochmal’s son, Avraham, wrote an apologetic work, *Eben ha-ro’shah* (1871), in which he defended Spinoza, whom he reverently called *Rabbenu* (Our Master) Baruch (an epithet already applied to Spinoza by Moses Hess (1812–1875) in 1837, and later also adopted by Einstein). Hermann Cohen later mounted a virulent attack against Spinoza, as impassioned as that by Luzzatto, in Cohen’s “Spinoza über Staat und Religion, Judentum und Christentum” (1905; 1924, pp. 290–372).

Shortly after arriving at Sedeh Boker on December 13, 1953, in order to settle at a kibbutz in the Negev, first prime minister of Israel, Ben Gurion, published an article in the newspaper *Davar* titled “Let Us Make Amends,” in which he expressed the wish “to restore to our Hebrew language and culture, the writings of the most original and profound thinker that appeared amongst the Hebrew people in the last two thousand years.” The injustice that required mending was thus not the excommunication of Spinoza, since in Ben Gurion’s eyes that was nothing but a historic curiosity, which in the course of time had been automatically nullified. What still needed mending was the literary cultural fact that Hebrew literature remains incomplete as long as it does not include the entire corpus of Spinoza’s writings as one of the greatest spiritual assets of the Jewish nation. Ben Gurion’s wish has now finally been fulfilled with the appearance of all of Spinoza’s major works in Hebrew translation, and with the establishment of a Spinoza Institute in Jerusalem which holds biannual conferences devoted to Spinoza’s thought. This piece of historical irony by which Spinoza’s philosophical legacy has now been emphatically included in the intellectual life of Israel would undoubtedly have afforded Spinoza a measure of supreme delight. (See Dorman, 1990, pp. 154–163).

Spinoza has been regarded as the founder of scientific psychology, and his influence has been seen in the James-Lange theory of the emotions and in some of the central concepts of Freud (see Bidney, 1962). A more recent version of this kind of influence is found in the work of the noted neurologist Antonio Damasio, *Looking for Spinoza: Joy, Sorrow, and the Feeling Brain* (New York, 2003). Spinoza has also received an enormous amount of attention in the former Soviet Union. Spinoza’s concept of nature as self-caused, infinite, and eternal was first singled out for comment by Friedrich Engels in his *Dialectics of Nature*. From the Soviet viewpoint, Spinoza’s materialism is unfortunately wrapped in a theological garb, but his consistent application of the scientific method is seen as overshadowing “the historically transient and class-bounded in his philosophy” (see Kline, 1952, p. 33).

In America, the transcendentalists of the eighteenth century held Spinoza in very high regard. Oliver Wendell Holmes (1841–1935) read and reread Spinoza’s *Ethics*, and

his famous formulation that freedom of thought reached a limit only when it posed a “clear and present danger” appears to have been made under Spinoza’s influence. Moreover, Spinoza had special appeal for the young American Jewish intellectuals who were children of the first wave of immigrants from eastern Europe. Morris Raphael Cohen (1880–1947) had, as a youthful Marxist, valued Spinoza the cosmopolitan who had rejected Judaism, and Lewis Feuer described Horace M. Kallen’s *The Book of Job as a Greek Tragedy* (New York, 1918) as “embedded in a Spinozist matrix.” Some of the greatest Jewish scientists and philosophers in modern times, such as Albert Einstein, Samuel Alexander, and Henri Bergson, also felt a deep affinity with Spinoza (see Feuer, pp. 36–79).

### BIBLIOGRAPHY

The best critical edition of Spinoza’s works is that by Carl Gebhardt, *Spinoza Opera*, 4 vols. (Heidelberg, 1925; a fifth volume was added in 1987). According to Nadler, this will be superseded by an edition from the Groupe de Recherches Spinozistes. A useful edition with translation and notes of Spinoza’s *Tractatus Politicus* is by A. G. Wernham, *Benedict de Spinoza, The Political Works* (Oxford, 1958). For Spinoza’s Compendium of Hebrew Grammar, see Baruch Spinoza, *Hebrew Grammar*, ed. and trans. by Maurice J. Bloom (New York, 1962). A new and reliable translation of Spinoza’s works by E. M. Curley is *The Collected Works of Spinoza*, vol. 1 (Princeton, N.J., 1985; vol. 2, forthcoming). In the meantime, there has appeared *Spinoza, Complete Works, with translations by Samuel Shirley*, edited with introduction and notes by Michael L. Morgan (Indianapolis, 2002). A comprehensive bibliography of Spinoza up to 1942 is Adolph S. Oko’s *The Spinoza Bibliography* (Boston, 1964), which has been supplemented by Jon Werlesens’s *A Spinoza Bibliography, 1940–1970*, 2d rev. ed. (Oslo, 1971). See also E. M. Curley’s bibliography in *Spinoza: Essays in Interpretation*, edited by Eugene Freeman and Maurice Mandelbaum (LaSalle, Ill., 1975), pp. 263–316; Wilhelm Totok’s *Handbuch der Geschichte der Philosophie*, vol. 4, *Frühe Neuzeit 17* (Frankfurt, 1981), pp. 232–296; and Theo van der Werf, H. Siebrand, and C. Westerveen’s *A Spinoza Bibliography, 1971–1983* (Leiden, 1984).

The best biography of Spinoza is Steven Nadler, *Spinoza: A Life* (Cambridge, U.K., 1999); supplemented by his *Spinoza’s Heresy: Immortality and the Jewish Mind* (Oxford, 2001). See also A. Kasher and S. Biderman, “Why was Baruch De Spinoza Excommunicated?” In *Sceptics, Millenarians, and Jews*, edited by David S. Katz and Jonathan Israel (Leiden, 1990), pp. 98–141. For Spinoza’s Marranism and his relationship to later thinkers, see Yirmiyahu Yovel, *Spinoza and Other Heretics: The Maranno of Reason and The Adventure of Immanence* (Princeton, N.J., 1989) 2 vols. Thomas McFarland, *Coleridge and the Pantheist Tradition* (Oxford, 1969); David Bell, *Spinoza in Germany from 1670 to the Age of Goethe* (London, 1984). For the Pantheism Controversy, see Frederick C. Beiser, *The Fate of Reason* (Cambridge, Mass., 1987) 44–108; and Gerard Vallée, J. B. Lawson, and C. G. Chapple, *The Spinoza Conversations between Lessing and Jacobi* (Lanham, Md., 1988). For Jewish critiques of Spinoza, see Hermann Cohen, “Spinoza über Staat und Religion, Juden-

tum und Christentum,” (1905), reprinted in Cohen’s *Jüdische Schriften* (Berlin, 1924) 3.290–372; and Menahem Dorman, *The Spinoza Dispute in Jewish Thought* (Hakibbutz Hameuchad, 1990; in Hebrew). For Spinoza and modern psychological theory, see David Bidney, *The Psychology and Ethics of Spinoza* (reprint, New York, 1962); and Antonio Damazio, *Looking For Spinoza: Joy, Sorrow, and the Feeling Brain* (New York, 2003). For Spinoza in the former Soviet Union and in America, see G. L. Kline, *Spinoza in Soviet Philosophy* (London, 1952); and Lewis S. Feuer, “Spinoza’s Thought and Modern Perplexities: Its American Career,” in Barry S. Kogan, ed., *Spinoza: A Tercentenary Perspective* (Cincinnati) pp. 36–79. A good brief introduction to Spinoza is Stuart Hampshire’s *Spinoza* (Baltimore, 1951). The most detailed and illuminating commentary on Spinoza’s *Ethics* is Harry A. Wolfson’s *The Philosophy of Spinoza*, 2 vols. (Cambridge, Mass., 1934). A comprehensive introduction and commentary (in Hebrew) on the *Short Treatise*, along with a Hebrew translation by Rachel Hollander-Steingart, can be found in *Ma’amar qatsar ‘al Elohim, ha-adam, ve-oshero*, edited by Joseph Ben Shlomo (Jerusalem, 1978). A similar edition of *De Intellectus Emendatione* with Hebrew commentary is *Ma’amar ‘al tiqqun ha-sekheh*, translated by Nathan Spiegel and edited by Joseph ben Shlomo (Jerusalem, 1972). Detailed analyses of Spinoza’s *Theological-Political Treatise* can be found in Sylvan Zac, *Spinoza et l’Interpretation de l’Ecriture* (Paris, 1965); Leo Strauss, *Spinoza’s Critique of Religion* (New York, 1965); and André Malet, *Le Traité Théologico-Politique de Spinoza et la pensée biblique* (Paris, 1966). See also the important study of J. Samuel Preus, *Spinoza and the Irrelevance of Biblical Authority* (Cambridge, U.K., 2001); Steven Frankel, “Politics and Rhetoric: Spinoza’s Intended Audience in the *Tractatus Theologico-Politicus*,” *Review of Metaphysics* 52.4 (June 1999): 897–924; Steven Frankel, “The Piety of a Heretic: Spinoza’s Interpretation of Judaism,” *Journal of Jewish Thought and Philosophy* 11.2 (November 2002): 117–134; Shlomo Pines, *Studies in the History of Jewish Thought*, edited by Warren Z. Harvey and Moshe Idel (Jerusalem, Israel, 1997), 660–734 (The Collected Works of S. Pines, vol. 5); and Frank Leavitt, “The Christian Philosophy of Benedict de Spinoza,” *Daat* 26 (1991): 97–108 (Hebrew).

Indispensable collections of documents on Spinoza’s life are I. S. Révah’s *Spinoza et le dr. Juan de Prado* (Paris, 1959) and “Aux origines de la rupture spinozienne,” *Revue des études juives* 3 (July–December 1964): 359–431, and A. M. Vaz Dias’s *Spinoza Mercator & Autodidactus* (The Hague, 1932), translated from Dutch in *Studia Rosenthaliana* 16 (November 1982) and supplemented by four related articles. A stimulating account of the social-political context of Spinoza’s work is Lewis S. Feuer’s *Spinoza and the Rise of Liberalism* (Boston, Mass., 1958). Two important and provocative interpretations of Spinoza from the viewpoint of contemporary philosophy are E. M. Curley’s *Spinoza’s Metaphysics: An Essay in Interpretation* (Cambridge, Mass., 1969) and Jonathan Bennett’s *A Study of Spinoza’s Ethics* (Indianapolis, Ind., 1984).

Useful collections of essays on Spinoza include *Studies in Spinoza: Critical and Interpretive Essays*, edited by S. Paul Kashap (Berkeley, Calif., 1972); *Spinoza: A Collection of Critical Essays*, edited by Marjorie Grene (Garden City, N.Y., 1973);

*Speculum Spinozanum, 1677–1977*, edited by Siegfried Hessing (London, 1977); *Spinoza: New Perspectives*, edited by Robert W. Shahan and J. I. Biro (Norman, Okla., 1978); *The Philosophy of Baruch Spinoza*, edited by Richard Kennington (Washington, D.C., 1980); *Spinoza, His Thought and Work*, edited by Nathan Rotenstreich and N. Schneider (Jerusalem, 1983); *Spinoza's Political and Theological Thought*, edited by C. De Deugd (Amsterdam, 1984); *God and Nature: Spinoza's Metaphysics*, edited by Yirmiyahu Yovel (Leiden, 1991); *Spinoza on Knowledge and the Human Mind*, edited by Y. Yovel (Leiden, 1994); *Desire and Affect: Spinoza as Psychologist*, edited by Y. Yovel (New York, 1999); *The Cambridge Companion to Spinoza*, edited by Don Garrett (Cambridge, U.K., 1996); *Spinoza: Metaphysical Themes*, edited by Olli Koistinen and John Biro (Oxford, 2002); *Spinoza*, edited by Gideon Segal and Y. Yovel (Burlington, Vt., 2002). For Spinoza and his relationship to Judaism, see Genevieve Brykman, *La Judeite de Spinoza* (Paris, 1972); Zeev Levy, *Baruch or Benedict: On Some Jewish Aspects of Spinoza's Philosophy* (New York, 2002); *Jewish Themes in Spinoza's Philosophy*, edited by Heidi M. Ravven and L. E. Goodman (New York, 2002). For Spinoza and the Enlightenment, see the superb study of Jonathan Israel, *Radical Enlightenment: Philosophy and the Making of Modernity 1650–1750* (Oxford, 2001); and Adam Sutcliffe, *Judaism and Enlightenment* (Cambridge, U.K., 2003). On the troubled question of whether there were qabbalistic influences on Spinoza's thought, see the good summary and analysis of this issue by Nissim Yosha, *Myth and Metaphor: Abraham Cohen Herrera's Philosophical Interpretation of Lurianic Kabbalah* (Jerusalem, Israel, 1994; in Hebrew) pp. 361–374.

## SPIRIT POSSESSION

*This entry consists of the following articles:*

AN OVERVIEW  
WOMEN AND POSSESSION

### SPIRIT POSSESSION: AN OVERVIEW

Spirit possession may be broadly defined as any altered or unusual state of consciousness and allied behavior that is indigenously understood in terms of the influence of an alien spirit, demon, or deity. The possessed act as though another personality—a spirit or soul—has entered their body and taken control. Dramatic changes in their physiognomy, voice, and manner usually occur. Their behavior often is grotesque and blasphemous. Justinus Kerner, a nineteenth-century German physician and disciple of the philosopher Friedrich Schelling, describes a demonically possessed woman in his native Swabia:

In this state the eyes were tightly shut, the face grimacing, often excessively and horribly changed, the voice repugnant, full of shrill cries, deep groans, coarse words;

the speech expressing the joy of inflicting hurt or cursing God and the universe, addressing terrible threats now to the doctor, now to the patient herself. . . . The most dreadful thing was the way in which she raged when she had to submit to be touched or rubbed down during the fits; she defended herself with her hands, threatening all those who approached, insulting and abusing them in the vilest terms; her body bent backward like a bow was flung out of the chair and writhed upon the ground, then lay there stretched out full length, stiff and cold, assuming the very experience of death. (quoted in Oesterreich, 1930, p. 22)

Some of the possessed, those who suffer what the German scholar Traugott K. Oesterreich has called a somnambulistic form of possession, remember nothing of their possession. Others experience a more “lucid” form and remember it. In this case the possessed become passive spectators of an “internal” drama. Often they are said to be inhabited simultaneously or sequentially by several spirits, and their behavior varies according to the different possessing spirits. Although possession is sometimes considered desirable, as in spirit mediumship, more often, at least initially, it is considered undesirable, an affliction requiring a cure. Cures, or exorcisms, may be simple affairs involving only the exorcist and his patient, or they may be elaborate, highly theatrical performances involving the patient's whole community.

In one form or another, spirit possession occurs over most of the world. The anthropologist Erika Bourguignon found that in a sample of 488 societies 74 percent believe in spirit possession. The highest incidence is found in Pacific cultures and the lowest in North and South American Indian cultures. Belief in possession is widespread among peoples of Eurasia, Africa, and the circum-Mediterranean region and among descendants of Africans in the Americas. It occurs more frequently in agricultural societies than in hunting and gathering ones, and women seem to be possessed more often than men. However, altered states of consciousness, such as trance, are not always interpreted as spirit possession. In Bourguignon's 488 societies, 437 societies (90%) have one or more institutionalized forms of altered states of consciousness, but only 251 of these (52% of the total) understand them in terms of spirit possession.

Scholars have attempted to classify possession phenomena in many ways. Some have based their classification on the moral evaluation of the spirit. The French scholar Henri Jeanmarie argues that exorcism aims at the permanent expulsion of the possessing spirit in societies that regard the spirit as essentially evil, whereas exorcism in societies that regard the spirit as morally neutral aims at the transformation of the “malign” spirit into a “benign” one. Other scholars have looked to the cultural evaluation of the possession state itself. In *Ecstatic Religion* (1971) the anthropologist I. M. Lewis distinguishes between central and peripheral spirit possession. The former are highly valued by at least a segment of society and support the society's moral, political, and religious assumptions. In these cases possession is considered de-

sirable, and the spirits are generally thought to be sympathetic. Peripheral possession does not support, at least directly, the moral, political, and religious order. In these cases possession is considered undesirable and requires some form of cure, and the spirits are thought to be malign. Still other scholars, such as Oesterreich, have sought the basis for classification in the phenomenology of the experience. Oesterreich divides possession into involuntary or spontaneous possession and voluntary or artificial possession.

Oesterreich's distinction plays an implicit role in many other classification systems. For example, in *Tikopia Ritual and Belief* (1967, p. 296), the anthropologist Raymond Firth distinguishes "spirit possession," "spirit mediumship," and "shamanism" on the basis of the host's control of the spirit. According to Firth, spirit possession refers to "phenomena of abnormal behavior which are interpreted by other members of the society as evidence that a spirit is controlling the person's actions and probably inhabiting his body." Spirit mediumship involves the "use of such behavior by members of the society as a means of communication with what they understand to be entities in the spirit world." The medium's behavior must be fairly regular and intelligible. Firth applies the term *shamanism* "to those phenomena where a person, either a spirit medium or not, is regarded as controlling spirits, exercising his mastery over them in socially recognized ways." In the case of spirit mediumship and shamanism, at least after the initial possession, the state of possession is often deliberately induced by inhalation of incense or mephitic fumes (as at the Delphic oracle in ancient Greece), by ingestion of drugs (as in North Africa and the Middle East) or emotionally laden substances (such as the blood of a sacrificial victim in parts of India), or by mechanical means (such as drumming, dancing, hyperventilation, or the incantation of repetitive prayers).

All these classifications impose on the reality of spirit possession a conceptual rigidity that distorts the essential fluidity of the phenomena. Often the host moves in and out of all of Firth's three states—if not in one séance then in the course of his relationship with the spirit. The anthropologist Esther Pressel found that in the African American cults of Brazil initial possessions tended to be involuntary and subsequent ones voluntary as the host gained control of his or her spirit. One Moroccan woman with whom this writer worked suffered periodic possessions in which she was very much the victim of her possessing spirit (*jinī*). At times, however, she was able to gain some control over the spirit and convey its messages to those about her. It was rumored, though this writer never witnessed this, that she would sometimes force her possessing spirit to perform nefarious deeds for her and her secret clientele.

Too rigid a definition of spirit possession precludes recognition of its power as an authentic and believable metaphor for other conditions not usually associated by the Western observer with altered states of consciousness or with trance. For example, possession metaphors were used in Mo-

rocco to describe extreme rage, sexual excitement, love, prolonged erections, morbid depressions, and on occasion those conditions in which the subject did not want to accept the consequences of his or her own desires. In the West, possession metaphors also occur—for love, extreme anger, depersonalization, multiple personality, autonomous behavior—in short, for any experience in which the subject feels "beside himself." Such metaphors may be a residue of an earlier belief in spirit possession.

The discussion in the remainder of this article will be restricted to spirit possession as defined by Firth. Exorcisms will be divided into the permanent and the transformational. Permanent exorcisms aim at the complete expulsion of the possessing spirit; the patient is liberated from all spirit influence. Transformational exorcisms strive to change the nature of the spirit from malign to benign; as a result the relationship between spirit and host also changes. In transformational exorcisms, the patient is usually incorporated into a cult that sponsors periodic ritual occasions when the patient can again experience possession and reaffirm his relationship with his possessing spirit.

**ALTERED STATES OF CONSCIOUSNESS.** An altered state of consciousness refers to any mental state subjectively recognized or objectively observed as a significant deviation from "normal" waking consciousness. Sleep, dreaming, hypnosis, brainwashing, mental absorption, meditation, and various mystical experiences are all altered states of consciousness. These states are characterized by disturbances in concentration, attention, judgment, and memory; by archaic modes of thought; by perceptual distortions, including those of space, time, and body; by an increased evaluation of subjective experiences, a sense of the ineffable, feelings of rejuvenation, loss of a sense of control, and hypersuggestibility.

The altered state of consciousness most frequently associated with spirit possession is trance (Lat., *trans*, "across," and *ire*, "to go"; cf. OFr., *transir*, "to pass from life to death"), defined as "a condition of dissociation, characterized by the lack of voluntary movement and frequently by automatism in act and thought, illustrated by hypnotic and mediumistic conditions" (*Penguin Dictionary of Psychology*, Harmondsworth, 1971, p. 38). The subject experiences a detachment from the structured frames of reference that support his usual interpretation and understanding of the world about him. The subject is, as the Balinese say, "away," quite literally dissociated (Lat., *de*, "from," and *socius*, "companion"), removed from companionship and from society.

Ritual trance, the trance of possession, is induced by various physiological, psychological, and pharmacological means. The most common techniques involve sensory bombardment (an increase in exteroceptive stimulation), sensory deprivation (a decrease in exteroceptive stimulation), or an alternation between the two. Techniques of bombardment include singing, chanting, drumming, clapping, monotonous dancing, inhaling incense and other fumes, and experiencing the repetitive play of light and darkness. Techniques

of deprivation include ideational and perceptual restrictions, blindfolding, and isolation. Fasting and other dietary restrictions, hypo- and hyperventilation (during incantations, for example), and ingestion of drugs (tobacco, cannabis, and various psychedelic substances) may also be used. Psychosocial factors—group excitement, heightened expectations, theatricality, costumes and masks, a generally permissive atmosphere, and the presence of strong behavioral models—all facilitate trance.

Although trance is considered the hallmark of possession, it is important to recognize that “possession” has been used to describe nontrance states and that the experience of possession is neither continuous nor unchanging. The possessed person moves in and out of dissociation. There are some moments of ordinary lucidity, other moments when consciousness appears to have surrendered to the possessing spirit, and still other moments of complete unconsciousness. Frequently there is a “doubling of consciousness” (*Verdopplungserlebnis*), whereby one of the two (or more) consciousnesses looks on passively at what is happening and is quite capable of remembering what Oesterreich has called “the terrible spectacle” of possession. At other times consciousness is submerged, and the actor loses all awareness and memory of the spectacle; recall of the trance experience is confused, dreamlike, and often stereotypic. The possessed person makes frequent use of mythic plots and symbols when recounting the experience, although his tales are not as elaborate as those of the shaman describing, for example, his voyage to the netherworld.

**THE POSSESSION IDIOM.** The interpretation of dissociation, ritual trance, and other altered states of consciousness as spirit possession is a cultural construct that varies with the belief system prevalent in a culture. Although the relationship between spirit and host has been described in many different ways, most indigenous descriptions suggest the spirit’s entrance, intrusion, or incorporation into the host. The relationship is one of container to contained. Usually, in any single culture a wide variety of metaphorical expressions are employed. The spirit is said to mount the host (who is likened to a horse or some other beast of burden), to enter, to take possession of, to have a proprietary interest in, to haunt, to inhabit, to besiege, to be a guest of, to strike or slap, to seduce, to marry, or to have sexual relations with the host. In part, this variety reflects changes in the spirit-host relationship, a relationship that should not be regarded as static, well-defined, and permanent but rather as dynamic, ill-defined, and transitory.

Although it is often of analytic significance to distinguish between the psychobiological condition of the possessed (the trance state) and the cultural construct (“spirit possession”), it should be recognized that the construct itself affects the structure and evaluation of the psychobiological condition. The construct articulates the experience, separating it from the flow of experience and giving it meaning. The experience itself instantiates the interpretive schema. The

process involves the subjectification of the “external” elements, the symbols, of the spirit idiom.

It is important to stress the belief in the existence of the spirits on the part of the possessed and those about him or her in order to grasp adequately the spirits’ articulatory function. The spirit idiom provides a means of self-articulation that may well radically differ from the self-articulation of the Westerner. Much of what the Westerner “locates” within the individual may be “located” outside the individual in those societies in which the spirit idiom is current. This movement inward is perhaps seen on a literary level in the gradual internalization of the “double” in nineteenth- and twentieth-century European and American literature.

Spirits, as exterior to the individual, are not projections in the psychoanalytic sense of the word. For the psychoanalyst, projection is the subject’s attribution to another of feelings and desires the subject refuses to recognize in him or her self. Projection occurs only after introjection. The movement is centrifugal, from inner to outer. If “external” spirits represent as “outside” what the Westerner would regard as within, then, strictly speaking, there can be no projection, for there is nothing within to project. The movement here is centripetal, from outer to inner.

A construction of human experience so radically different from that of the Westerner is difficult to convey; nonetheless, it has been suggested by many scholars who have worked with the spirit-possessed. The anthropologist Godfrey Lienhardt, for example, refers in his study of the Dinka, a Nilotic people, to “Powers” (spirits) as extrapolations or images that are the active counterpart of the passive element in Dinka experience. Since the Dinka have no conception of mind as a mediator between self and world, the images—the powers or spirits—mediate between self and world:

Without these Powers or images or an alternative to them there would be for the Dinka no differentiation between the experience of the self and of the world which acts upon it. Suffering, for example, would be merely “lived” or endured. With the imaging of the grounds of suffering in a particular Power, the Dinka can grasp its nature intellectually in a way which satisfies them, and thus to some extent transcend and dominate it in this act of knowledge. With this knowledge, this separation of a subject and an object in experience, there arises for them also the possibility of creating a form of experience they desire and of freeing themselves symbolically from what they must otherwise passively endure. (Lienhardt, 1961, p. 170)

Of utmost significance in both projection and articulation through “external” spirits is the status accorded the vehicle within the individual’s culture. A Western paranoid who believes he or she is pursued by secret agents responds to dominant cultural images, just as does an African who believes himself hounded by ancestral spirits. Both give expression to feelings of persecution and suffer the consequences of that expression. In the first instance, the secret agents are not gen-

erally thought to exist by anyone other than the paranoid. In the second instance, the ancestral spirits are generally recognized by others. The consequences of this difference are immense. The haunted person does not necessarily suffer the same social isolation, loneliness, derision, and feelings of abandonment as does the paranoid. He or she enters a new symbolic order. The paranoid learns the language of the spirits and of possession and submits to its grammar; and is afforded the possibility of therapeutic intervention.

This is not meant to suggest that the idiom of spirit possession is more conducive to cure than the “psychological” idiom of the modern Western world. Both have their successes and failures. In societies with spirit possession some individuals articulate their experiences in terms of spirits in purely idiosyncratic ways and hence do not respond to indigenous therapeutic intervention. In *Medusa’s Hair* Gananath Obeyesekere compares two patients who were exorcised at a shrine in Sri Lanka:

One woman possessed by a demonic spirit ran around the ritual arena threatening to tear her clothes off. Her behavior was perfectly intelligible in terms of the *preta* [spirits of the dead] or demonic myth model. The other patient, a male, was pulling and pinching her skin, saying that demons were residing under it. Later on he abused the gods, the very beings who should help him to banish the demons. None of this was intelligible to the exorcist and his subculture in terms of available myth models. Demons do not get under one’s skin in this culture, and it is unheard of for the gods to be abused in this manner. (Obeyesekere, 1981, p. 161)

The first patient was amenable to cure; the second was not. When Obeyesekere asked the exorcist what could be done for the second patient, the exorcist suggested taking him to a Western-trained psychiatrist! Exorcists are usually clever diagnosticians and avoid treating those patients whom they cannot cure.

The spirit idiom must be flexible enough to accommodate the individual if it is to establish itself and remain powerful. It may be composed of a highly elaborate demonology, as in Sri Lanka, Brazil, or Haiti. In these cultures the spirits have attributes and make specific demands on their hosts. In Haitian Voodoo, for example, the *lwa*, or possessing spirits, have highly developed characters. Legba, the master of the mystic barrier between men and spirits, is described as a feeble old man in rags who smokes a pipe, slings a knapsack over his shoulder, and walks painfully with a crutch. He is terribly strong, however, and anyone possessed by him suffers a violent trance. Dambala-wédo, another *lwa*, is pictured as a snake; he forces those whom he possesses to dart their tongue in and out, crawl on the ground sinuously, and fall like a boa from roof beams headfirst. Ezili-Freda-Dahomey, a sea spirit, personifies feminine grace and beauty. (She has been likened to Aphrodite.) Men and women possessed by her behave in a saucy, flirtatious manner. By contrast, in other cultures, for example in North Africa, spirits are ill defined and ambigu-

ous. Unlike their Haitian counterparts, many North African spirits have no “biographies.”

While the spirits must not be so specifically characterized as to discourage individual elaboration and specification, this does not entail that they be simply random refractions of individual desires, as some scholars, notably the German classicist Hermann Usener, have argued. The spirits must resonate with both the psychological and the social circumstances of the possessed. Psychologically, they may mirror some aspect of the individual that he refuses to accept or some desire that he denies. Or they may compensate for deficiencies in his relations with others. Thus, I. M. Lewis (1971) relates the high frequency of possession among women and marginal men to their “inferior” position in society. The spirits relate to the social world of the individual. In his study of Tikopian spirit mediumship Raymond Firth writes, “The idiom in which these personal phenomena of anxiety, conflict, illness, and recovery was couched was one in which the physical and psychological syndrome of trance was described in terms of social constructs, including notions of spirit powers and spirit action” (Firth, 1967, p. 329). Whether elaborated or unelaborated, the spirits may relate to specific social groupings. In many societies that are organized into lineages, in Africa for example, the spirits are thought to be lineage members or to have some other significant relationship with a lineage. Often they are conceived of as ancestral shades or lineage or household spirits. Diagnosis of the spirit possessed involves discovering the spirit’s identity, the cause of his displeasure that led to the possession, and the nature of his demands. Therapy involves the regulation of the relationship between the possessed and the spirit. (Many anthropologists have understood this regulation as symbolic of a regulation of the possessed’s “real” social relations.) In societies with looser social organizations, for example in many urban centers, the spirits are not so closely related to specific social groups. They are “open” to a larger variety of social relations, but they are not devoid of symbolic social attachment.

**INITIAL POSSESSION.** A first possession may be conceived of as an articulatory act. The possessed is thrust into a new symbolic order. His or her initiation frequently takes the shape of a dramatic illness—paralysis, mutism, sudden blindness, or profound dissociation—or contrary behavior, such as a wild and seemingly destructive flight into the bush or, for women, nursing the feet of a newborn infant. Many psychiatrically oriented observers have considered these symptoms to be of a hysterical nature, but careful study reveals that they may be symptoms of other forms of mental disturbance or reactions to the stresses and strains inherent in the individual’s social position. Even with such dramatic symptoms, the diagnosis of possession is not necessarily immediate. There may be other options within the “medical” system of the particular society. The initial symptoms may, however, be far less dramatic. The neophyte may have been attending a possession ceremony when seized by the spirit. Such “contagious possession” has been frequently described in the literature of

spirit possession. (Aldous Huxley gives a particularly readable account of contagious possession in *The Devils of Loudun*, 1952, a study of demonic possession in seventeenth-century France.)

Often the initial possession is articulated in retrospective accounts in a stereotyped manner. These may be elaborate, particularly where the possessed becomes a curer, the account providing the possessed with a culturally acceptable charter for his or her profession, or they may be a simple sentence or two. Alice Morton records the story given her by an Ethiopian curer, Mama Azaletch.

In 1936, I was caught by a certain spirit. I ran away from my home in Bale to the desert, and there I lived in a cave. I would not see anyone or speak to anyone, and I became very wild. But there was one woman of high rank there who was interested in my case, and she would send her son to bring me beans and unsalted bread. I stayed there in that place, eating very little and seeing no one, for four years and eight months. If they had tried to take me from that cave and put me in a house with other people, I would have broken any bonds and escaped back to the desert. It was the spirit that made me wild that way. (Crapanzano and Garrison, 1977, p. 202)

Morton calls attention to Mama Azaletch's stereotypical flight into the wild, her fasting in the desert, and her renunciation of family. Mama Azaletch's story was told in both public and private. Many Moroccans with whom the writer of this article had worked had less elaborate but stereotypical stories of their "slippage" into the spirit idiom. They were at a possession ceremony, mocked the possessed or possessing spirit, and were immediately struck by the spirit.

The initiatory illness itself is an eloquent symbol, for not only does it focus attention on the possessed (who must be cured!), but it also requires definition. Such definition occurs through a variety of diagnostic and healing procedures. The initiate has to learn to be possessed and undergo exorcism. This is particularly evident where possession involves incorporation into a cult. Technically, the initiate must learn to enter trance easily, to carry out expected behavior gracefully, and to meet the demands of his spirit. Almost all reports of spirit possession emphasize the clumsiness of the neophyte and the necessity of learning how to be a good carrier for the spirit. Members of the Moroccan religious brotherhood, the Hamadsha, who mutilate themselves when in possession trance, can explain how they learned to slash their scalps with knives and halberds without inflicting serious injury. Many have serious scars from their initial possession when, as they put it, they had not yet learned to hit themselves correctly. Similar stories have been reported from Sri Lanka, Malaysia, and Fiji by adepts of the Hindu god Murukan who skewer themselves with hooks and wires. For possessions involving complex theatrical behavior, dancing, and impersonification, as in Sri Lanka or Indonesia, the learning process can be quite rigorous.

The neophyte must learn to recast conflicts in the spirit idiom and to articulate essentially inchoate feelings in that idiom, feelings of persecution or inferiority, of fear or bravado, of hatred or love. This process may proceed by trial and error, or it may occur through the guidance of a curer. The Puerto Rican Espiritistas "work" their patients through various levels of possession and develop in them, when possible, mediumistic faculties. (Such development resembles the mystic's passage through various stages of ecstasy.) The movement from initial illness to accommodation with the spirit and incorporation into the cult is often accompanied by an indeterminate period during which the possessed resists the call of the spirit and suffers depression, extreme alienation, dissociation, and even fugues. Such a period, analogous in many respects to what mystics refer to as the "dark night of the soul," may be symbolized as a period of wandering or isolation. Mama Azaletch's life in the cave may refer to such a period.

**EXORCISM.** Spirit possession has the tripartite ritual structure first delineated by the folklorist Arnold van Gennep in 1908. The possessed is removed from the everyday world by the possessing spirit. The possessed enters a liminal world—the world of possession, dissociation, trance—and through exorcism (which replicates the tripartite structure of possession itself) is returned to the ordinary world. Exorcisms may be permanent or "transformational." In permanent exorcism, the patient is returned to the world from which the patient came, ideally as he or she was before he was possessed. Not much is known about such patients. Have they undergone some sort of social or psychological transformation through possession and exorcism? It would seem that they have been marked by the spirit: They have been possessed, and they have been cured. In transformational exorcism, the patient is explicitly transformed. He or she has undergone a change in identity and are now, to speak figuratively, more than their self; he or she is in intimate relationship with a spirit whose demands must be recognized. Usually the possessed is incorporated into a cult, which not only provides legitimate occasions for future possessions but also supplies a new social identity. Often, as a member of such a cult, the possessed becomes an exorcist or a member of a team of exorcists.

Exorcisms may comprise little more than simple prayers or incantations sung over the possessed, as happens in Christian and Islamic contexts. Sometimes exorcisms involve torturing the possessed (pulling the ear, flagellating, or burning) until the possessing spirit has revealed its identity and demands or has released the patient. In many societies that support possession cults, the exorcisms are semipublic or public occasions. Such ceremonies tend to be highly dramatic. There is music, most frequently drumming but also music of woodwind, reed, and string instruments, and dancing, which may be simple or quite complex. In Sri Lanka and elsewhere in Southeast Asia comic or other dramatic interludes often play a role. The exorcist, the possessed, and other performers may don masks, wear special costumes, and take

on the part of well-known mythic and legendary figures. The ceremonies are often accompanied by sacrifices and communal meals, and last through the night. This passage from light through darkness to light again seems to parallel the tripartite ritual movement that culminates with the “rebirth” of the patient as cured or transformed.

Patient, exorcist, and other spectators may all fall into trance. There is considerable variation in the depth and style of these trances. In some the possessed fall into an ill-defined, seemingly superficial, dreamy trance. In others they become frenetic and out of control. And in still others they take on the character of the spirit that possesses them, responding only to special songs, dancing characteristic dances, talking in a distinctive language (glossolalia), and demanding special costumes, perfumes, or objects. In many parts of the world, the possessed perform uncanny feats, such as walking over burning coals (in the Greek *Anastenaria*), piercing themselves with skewers and pins (the followers of Murukan in Sri Lanka, Malaysia, and Fiji), slashing their heads with knives and halberds (the *Hamadsha* of Morocco), playing with poisonous snakes (the rattlesnake cults of Appalachia), or stabbing themselves with swords and spears without harm (in Java, Bali, and among the Cape Malay in South Africa).

The exorcisms provide an occasion for both an individual and a transcendent drama of order and disorder, of control and the absence of control. At least in societies that consider the spirit demonic, possession reveals the underside of social, cultural, and psychological order. Possession negates the “rational” order of everyday life; it displays the world in reverse. Ritual and exorcism restore order and rationality to that world. The anthropologist Bruce Kapferer has written that in Sri Lanka the demons embody human suffering and symbolize the destructive possibilities of the social and cultural order. They provide a “terrifying commentary on life’s condition and individual experience in it.” They cast the individual’s experience into a wider social and cultural order, and the encounter with the demonic becomes a metaphor for his or her “personal struggle within an obdurate social world” (Kapferer, 1983).

Exorcisms regulate the relationship between spirit and host. Formally, spirit possession may be understood as a series of transformations of usually negative metaphorical attributions into occasionally positive and at least ritually neutral metonymic ones in a dialectical play of identity formation. The spirit often represents what the possessed is not or does not desire. The Moroccan man who is inhabited by the female spirit ‘A’isha Qandisha is no woman; the chaste Haitian woman possessed by the promiscuous Ezili-Freda-Dahomey would disclaim any of Ezili’s promiscuous desires. The host’s identity and desires are here the opposite of the spirit’s. During possession, however, the host becomes nearly identical with the spirits. The Moroccan man comes as close to being ‘A’isha Qandisha, a female, as possible; the Haitian woman as close to the flirtatious, saucy Ezili as possible. A negative metaphor is transformed into a positive metonym, even to the limit of identity within a very special context.

Possession cults aim to transform the relationship between spirit and host much as the Furies were transformed into the gentle Eumenides in Aeschylus’s *Oresteia*. The transformation usually involves the conversion of a “wild” possession, an illness, into an institutionalized, ritualized, and periodized possession in which negative metaphorical attributes become for the occasion metonymic ones. It is as though the host were allowed to play out in a sanctioned manner who he is not and to give expression to desires that he cannot express in everyday life. This movement from metaphor to metonymy is neither direct nor simple. The changing, essentially complex relationship between host and spirit or spirits is given a sort of theatrical representation. The two may enter into conversation with one another in a friendly or inimical manner, they may struggle with each other, or the host may succumb to the spirit. Often, as in Sri Lanka, the possession includes a comic interlude that plays an important part in the exorcism itself. The comedy of exorcism, Bruce Kapferer (1983) has suggested, displays through its very irrationality the rationality of the world and allows the host to reformulate his self in accordance with that rationality. Although this movement toward the discovery or rediscovery of the rationality of the world is not immediately apparent in many simpler possessions, even these tend to bring about a transformation of the way the possessed sees his world. He takes on the view of his cult. He is attached to the demon, who becomes a primary orientation point for his understanding of himself and the world about him.

If the exorcism is successful, the patient has to become fully possessed and then released by the spirit. To be released from the spirit’s influence the possessed must meet the spirit’s demands, whatever they may be. In Morocco, for example, the spirit requires the host to wear certain colors, burn special incense, make regular pilgrimages to the spirit’s favored sanctuaries. Often the demand includes the sacrifice of an animal with which, as the anthropologist Andras Zempléni (1984) has suggested, the spirit’s host is identified. Thus the host is separated by the power of the sacrifice from the spirit with which the host has become one. So long as the possessed follows the spirit’s commands, the host is blessed, protected, and generally favored. A failure to follow the commands usually leads to a renewal of the possession crisis: The host falls ill, becomes paralyzed, or is blinded. A new exorcism is then required.

Without doubt the spirit and its commands are of symbolic import to the host, resonating with significant events in the host’s biography, reflecting the host’s present situation, and orienting the host toward the future. The commands may symbolize adherence to the social and moral obligations and commitments the individual has in his or her everyday life; a failure to follow the commands may represent a failure to live up to these obligations and commitments; the possession may make articulate feelings that in other “psychological” idioms are described as feelings of guilt. The roles played by the spirits and their commands, by “wild”

and institutionalized possessions, differ in each individual case. Generalizations tend to become overgeneralizations. The spirit idiom is subtle and, as the existentialists would say, reflects the subtlety of the individual in situation. It is, of course, important to recognize that possession also plays an important role for those who witness it, providing them with an often theatrical representation, an objectification, of their cultural presuppositions, their social situation, and their psychological conditions. For them and for the possessed, possession confirms belief in the spirits. Exorcism affirms faith in a social and cultural order, an order that gives perhaps only the illusion of mastering the “irrational forces” that surround and on occasion besiege its members.

## SPIRIT POSSESSION: WOMEN AND POSSESSION

Spirit possession has largely been interpreted by scholars as a phenomenon that impacts "traditional people," the poor, the uneducated, and women. The conjunction of spirit possession with oppressed or vulnerable persons has produced theories that Susan Starr Sered has called "deprivation theories" (1994, pp. 190–191) that begin with the assumption that possessions are abnormal behaviors and result from social, physical, and mental deprivations. From a feminist perspective, deprivation theories are suspect, and a reevaluation of spirit possession suggests that: (1) the cross-cultural and transhistorical prevalence of accounts of spirit possession present a familiar rather than an exotic model of religious subjectivity to most human communities across the broadest spectrum of history; (2) the capacity to be possessed by an ancestor, deity, or spirit is best approached, as Sered and Janice Boddy (1989) argue, as an ability, like musical or athletic ability, although in the case of spirit possession it is likely that the person being possessed does not choose to develop the ability to receive the spirit but rather cannot choose otherwise in the face of the spirit's demands; and (3) possession is the formal root of religious experience in general, in that

spirit possession is exemplary of the situation in which humans negotiate with a will that is not of human origin. These three reevaluations are examined below after attending to the translational issues involved in employing spirit possession as a category of comparative study. A survey of the thematics of power found in possession studies concludes the entry.

Spirit possession can refer to a spectrum of experiences in which the person involved negotiates with or is overcome by a force such as an ancestor, deity, or spirit that employs the human body to be its vehicle for communicating to human communities. Ann Grodzins Gold provides a useful definition and discussion of the term *spirit possession* in her study of possession in rural Rajasthan (1988, p. 35): "any complete but temporary domination of a person's body, and the blotting of that person's consciousness, by a distinct alien power of known or unknown origin." This definition highlights the problem of subjectivity and agency; the possessed person is not a conscious individual but rather has a blotted consciousness and has become an instrument for the will of an alien power. While the term *spirit possession* is rarely used outside of the Western European tradition, Gold argues that the term does not "radically violate indigenous categories and does facilitate controlled comparisons with similar phenomena in other linguistic regions" (p. 39) if, she emphasizes, regional nominations are brought to bear. Applying Gold's logic, the term *spirit possession* is used below with caution, noting: (1) the importance of translating specific linguistic terms (discussed below); and (2) that the term *possession* carries with it many overdetermined connotations regarding Western notions of property and subjectivity as epitomized in the idea of a self-possessed individual.

**TRANSISTORICAL AND CROSS-CULTURAL CONTEXT.** Spirit possession exists on all continents and throughout most of Western history as well. In part because of the often spectacular nature of possession accounts and because spirit possession demands a witness or a community response, we have evidence of spirit possession in legal, medical, historical, literary, and theatrical texts. As Western missionaries and academics began recording information about other cultures, the force and vivacity of spirit possession repeatedly drew authors to describe and discuss possession, producing a tremendous volume of materials. A proliferation of spirit possession ethnographies in the late twentieth and early twenty-first centuries indicates that spirit possession is a major force in a globalized world because the practice survives dislocations and relocations of culture, and women predominate in these accounts. This prevalence of material is particularly important in the study of women's religious lives because the records provide information when other references are minimal or nonexistent. Important examples include the maenads of Greek antiquity who appear in Greek tragedies such as Euripides' *Bacchae*; women possessed by the *mono no ke* spirit described in *The Tale of Genji*, a masterpiece of medieval Japanese literature (Bargen, 1997); and the *dybbukim* of medieval Eastern European Hasidic Jews described in the acclaimed play *The Dybbuk*, by S. Y. Ansky. The diaspora

hosts of African and syncretic spirits found in vodou, Santería, and Candomblé in all regions of the African diaspora (Brown, 1987; Olmos and Paravisini-Gebert, 1997) have figured prominently in anthropology and literature of the diaspora. Where information is scarce about women's lives in Asia and the Pacific, we have information about Korean housewives participating in *Kut* rituals (Kendall, 1985) and the *tangki* of Taiwan (Wolf, 1992). Islamic traditions in the Middle East, Saharan Africa, Pakistan, and India describe women's predisposition to possession by *jinn* and regional spirits such as the *hantu* of Malay (Ong, 1987) and emphasize how women's possession activities are tolerated, although authorities address women's need to maintain vigilance through prayer and sanctity to avoid possession. With an increased emphasis on the study of women's lives, as well as the lives of the poor and lower castes in Hinduism has come a wave of studies of spirit possession (Egnor, 1984; Inglis, 1985; Gold, 1988; Stanley, 1988) by the gods and goddesses of Hindu traditions. In most indigenous traditions some elements of spirit possession continue to appear, as with African traditional religions (Mbiti, 1991), including those regions of Africa where Muslim and Christian influences are strong (Boddy, 1989; Maaga, 1995; Stoller, 1989 and 1995).

The controlled comparison of similar phenomena across traditions allows one to identify culturally specific models of religious subjectivity. Indigenous terms for the dynamic and role of the possessed person are rich with conceptual and rhetorical depth, related to receptivity, the mandatory element of the human's agency in a possession. In many vodou traditions the possessed person is considered to be a *chwal*, or horse, who is mounted by her spirits (Brown, 1987, p. 54), an activity that is often sexualized. In her study of Hinduism, Kathleen Erndl (1984) notes that the Goddess plays those whom she possesses and that the Punjab word for a theatrical play, *khel*, is the same word used to describe a possession. David Lan (1985, p. 59) notes that among the Korekore, a Shona group in Zimbabwe, the spirits are considered to grab their mediums, who may be referred to as *homwe*, which means "pocket" or "little bag." In all of these instances, a complex model of human agency is evoked by the notion that the human will and consciousness have been overcome, and that the human body has become receptive to the intervening agency of the possessing spirit.

**RECEPTIVITY TO POSSESSION AS GENDERED ABILITY.** In contrast to deprivation theories, Sered argues that women's preponderance in possession traditions can be related to their roles in nonautonomous experiences such as childbirth and their receptive role in heterosexual intercourse (1994, pp. 190–191). From this perspective, receptivity to the interventions of ancestors or deities is understood as an element of a feminine-gendered ability. From an androcentric perspective, receptivity has often been negatively evaluated as passivity, but spirit possession requires a shift in perspective critical of the claims that a self-possessed, impermeable subject is the norm of human experience. Whether male or fe-

male, possessed persons are likely to be evaluated for their receptivity. The gendered configurations of spirit possession take many forms. Women are possessed by male and female deities, men are possessed by male and female deities, and in all cases gendered tropes are employed. For example, in the Hasidic tradition (Schwartz, 1994, p. 72.), the name for the possession of a male was *ibur* (pregnant), and such a possession was highly valued by the community, while possession of women was widely interpreted to be malevolent possession by *dybbukim* and was not considered *ibur*. Helen Hardacre (1992) discusses the prominent role women have had in Japanese new religious movements founded since 1800, noting the gender transformations that were central to the theology of Deguchi Nao, whom Hardacre calls a genius of Japanese religious history. Nao was a middle-aged woman whose theology, written by her younger, male colleague while she was in a trance, turned traditional Buddhist wisdom on its head, proclaiming that Nao was The Transformed Male who signaled the arrival of a new era.

**SPIRIT POSSESSION AS EXEMPLARY RELIGIOUS SUBJECTIVITY.** The subjectivity of the possessed woman is radically non-autonomous, but rather than seeing this as an aberration it can be viewed as exemplifying religious subjectivity in general. The broad spectrum of roles humans have played in religious history, from mystics to prophets, are all variations on this very central theme. Hence Marilyn Robinson Waldman and Robert M. Baum (1992) compare the subjectivity of a Diola woman prophetess who reached adulthood at the beginning of World War II on the border between French Senegal and Portuguese Guinea with the subjectivity of the prophet Muhammad in that both channeled communication from an extrahuman source to oppose the status quo. From this perspective, it is not important to create categorizations in which people can be placed; rather, the spectrum in which people experience themselves negotiating with a force of nonhuman origin is the common, formal ground of religious subjectivity in general.

What makes spirit possession unique is the degree to which the human has become an instrument for the will of the intervening agency. In terms of voice, for example, Michel de Certeau (1988) makes the following observation in his study of the seventeenth-century nuns of Loudun, whose nunnery was disrupted by a series of possessions:

That the possessed woman's speech is nothing more than the words of her 'other,' or that she can only have the discourse of her judge, her doctor, the exorcist or witness is hardly by chance . . . but from the outset this situation excludes the possibility of tearing the possessed woman's true voice away from its alteration. On the surface of these texts her speech is doubly lost. (p. 252)

If, at the formal level, we are dealing with speech that is doubly lost, we are dealing with a model of subjectivity that is radically instrumental (as with a flute that is played, or a hammer that is wielded) rather than with an individual who

is speaking. As a model of subjectivity it is the instrumentality rather than the autonomy that marks the possessed person's speech and actions. Social psychologists and ethnopsychologists have suggested that the difference found in the model of subjectivity of a possessed person and the model of subjectivity employed by modern psychology (that of an individual whose sickness is located in an individual psyche) leads to different levels of community-wide mental health. In her study of possession in India and in his study of possession in African American communities, Waxler (1977) and Csordas (1987) argue that possessions often function pragmatically to heal community problems, perhaps more effectively than modern psychiatry in some instances.

The speech of possessed persons is not only doubly lost but is often replete with critical, symbolic value, leading some ethnographers studying spirit possession to employ psychoanalytical interpretations of the speech in a way similar to the analysis of dreamwork. Willy Apollon (1999), Susan J. Rasmussen (1995), and Judy Rosenthal (1998) bring contemporary French psychoanalytic theory (Jacques Lacan) to the analysis of possessed language. Postcolonial literary scholars (Cooper, 1992; Henderson, 1993) have noted the significance of the possessed woman as a literary trope that signifies the experience of having multiple languages and heritages speak through a subject, particularly women. Spirit possession metaphorically depicts the sensibility of postcolonial subjectivity, a subjectivity that is not pure but rather spoken-through by many forces. By the turn of the twenty-first century, questions of agency, voice, and body theory had coincided with a growing effort by historians and ethnographers to produce a significant number of possession studies, granting the "Third World woman" a profound position in possession studies. Signifiers of possessed subjectivity that cross the historical spectrum of case studies include nonautonomous models of agency, heteroglossia, and volatility that attracts the attention of a community and relates to gendered notions of the ambivalent power of receptivity.

**THEMATICS OF POSSESSION AND POWER.** From a revalued approach to the power of possession, it is the work, war, and performance of possessions that merit analysis. In each scenario the possessed body's power is exerted in ambivalent ways, deeply implicated with the social symbolic of the community. In Malaysia, for example, indigenous possession traditions have survived, and accounts of possessed women in multinational free trade zones have caught the attention of news media and scholars. Possessed women work in free trade zones. The women stop work when possessed by *hantu* (ambivalent ghosts or spirits) and weretigers (akin to werewolves) in the factories. Aihwa Ong (1987) analyzes these possessions from a feminist and materialist perspective. Similarly, in *The Devil and Commodity Fetishism in South America* (1980), Michael Taussig interprets indigenous spirits as a critical reaction to commodity fetishism in South America. The danger is that these materialist analyses dismiss the possessing ancestors or spirits as mystifications, a categorization that might be more comfortable from a materialist perspec-

tive but that elides the agency of a pouncing *hantu* or the devil in a dollar. If, on the other hand, religious subjectivity is itself understood to be a kind of work, then the efforts made by the Malay women to decrease their vulnerability to the spirits through prayer and vigilance indicates that they are working with the forces of global capitalism and the forces of possessing spirits. So also, the devils associated with the dollars of international mining companies in South America are not merely symbols to be interpreted, but rather are working forces in the religious lives of the miners.

In terms of the wars engaged by possessed women's bodies, there are two central types: gender conflict and territorial conflict. Doris Borgen (1997) argues that spirit possession was a woman's weapon in medieval Japan because a woman who was spoken-through by a possessing spirit could say things to public audiences that women were not otherwise tolerated for saying. Ann Braude (2001) discusses the spiritualism that coincided with the women's suffrage movement, noting that women who were inspired by the spirit were allowed a public forum in which to speak. These approaches can suggest that possession is a guise for political struggles. From a revalued perspective, however, the religious person is approached as a training and disciplining person, whose body is prepared to enact the will of its deity, and thus there is no viable distinction between a religious and a political struggle. In the case of the Shona in Zimbabwe, spirit possession by powerful land-governing ancestors (*mbondoro*) was largely the remit of men, but two women who were possessed by the spirit of Nehanda, a female ancestor of an early Shona dynasty, were central to the struggle for indigenous rule (Lan, 1985; Keller, 2001). In two *chimurengas*, or battles for freedom (1890 and 1950–1970), an older woman possessed by Nehanda significantly inspired and focused the fight against colonizers. The Nehanda *mbondoro* from the first *chimurenga* was tried and hung by the British, using old British witchcraft laws, but was revered for her claims that her bones would rise again to secure victory. Nehanda was revered in the songs of the socialist-inspired armies of the second, successful *chimurenga*, and the Nehanda *mbondoro* of the second *chimurenga* inherited the potent legacy of the first Nehanda. Territorial wars and gender wars have been waged through the body of a possessed woman who serves as an instrumental agency in the struggles for power that religious bodies have been trained and tempered to engage.

As Gold notes (1988, p. 37), the performative elements of possession have received great attention in Sri Lanka and across South Asia. Possessions are inherently performative. Without an audience, the possession has not effectively transpired because the possessed person is not conscious during the event to report on what has happened. Also, possessions are often violent, volatile, laden with sexual innuendo, and dramatic in the knowledge they produce. While anthropologists have invoked performance theory to explore this element of the power of possession, the question of subjectivity is again raised because performance theory largely begins

with the assumption that an actor wills herself into a performative mode. Most possession traditions have rigorous tests with which they judge the validity of a possession in order to assure that it is *not* a performance by an agent. Not only are rigorous tests applied by the communities, but, as Gold notes, in Sri Lanka as well as in rural Rajasthan, the theatrical traditions of these communities show high levels of critical analysis in their employment of possessions in plays. Some plays depict fake possessions, which the entire audience recognizes as fake and laughs at, while other theatrical performances might spontaneously produce possessions that the audiences regard as authentic. Gold identifies “ethno-performance theory” (p. 37) as the cultural backdrop against which the performative power of possession has long been analyzed by these traditions.

Viewed as a prevalent and exemplary model of religious subjectivity in general, the specific historical and geographical accounts of spirit possession provide resources for expanding the horizons against which women’s religious subjectivity is understood and evaluated in the context of instrumental struggles for power and meaning.

**SPIRITUAL DISCIPLINE.** Throughout history, religious traditions have noted that those people who long for a transformative or complete understanding of themselves and of their place in the world must somehow find a teacher or set of teachings to help them along. That guide may be a person, an idea, or a set of values; whatever it is, it establishes the orientation and outlines the procedures the seekers should follow in order to make real the transformation for which they hope. Many traditions further maintain that, having found (or having hoped eventually to find) that guide, the seeker then must practice various regimens that will help him continue along the way to ultimate transformation. Such endeavors constitute spiritual discipline, the means by which people find their fullest potential in the context of any particular religious ideology.

The practice of spiritual discipline marks the notion that one who is in search of the guide is not only a human being but also a human “becoming,” one on his or her way toward an ideal. Images of such discipline, therefore, often include themes of movement or passage. Mahāyāna Buddhists describe the spiritual endeavor as *bodhicaryāvatāra*, “entering the path to enlightenment”; Jewish traditions speak of religious norms as *halakhab*, “the way to go”; and traditional Hindu literatures outline the three sacred “paths,” *marga*, of proper action, proper meditation, and proper devotion. Not infrequently, religious systems refer to the sacred cosmos as a whole with terms meaning “the Way,” like the Chinese *dao*.

The perfection such a person seeks may take a number of forms, each reflecting the fundamental worldview presented by the pertinent religious system. It may be the fulfillment of being or the return to nonbeing; it may be personal or impersonal; it may be the enjoyment of the good life or the release of the good death. Whatever the goal, spiritual disciplines claim to offer their adherents the means by which the religious ideal may be reached.

Without discipline, the seeker founders. The Šūfī mystic Jalāl al-Dīn Rūmī spoke perhaps for many religious tradi-

tions besides his own when he noted that “whoever travels without a guide needs two hundred years for a two day’s journey.”

**CONNOTATIONS OF THE TERM.** The word *discipline* is a particularly apt one. To some people it rings of punishment, which in some cases is the point. But this certainly is not the primary meaning of the term, which carries a good number of connotations. The scope of its etymological cousins shows the broad applications the term can have in the study and practice of religion.

The word *discipline* may be derived through one of two ways, or, more likely, in a semantic combination of the two ways. It may come from the Latin *discere*, “to learn,” and thus be directly related to the English word *disciple*, “one who follows the instructions of a teacher.” *Discere* itself reflects the Indo-European root *\*dek-* (“take, accept”), which also appears in the English *decent*, *docent*, *docile*, *dogma*, and *dogmatic*; *doctrine*, *doctor* (“one who teaches doctrine”), and thus *indoctrinate*; as well as *dignity*, “to be acceptable,” and *decorous*, “elegant, worthy of respect, graceful.”

Perhaps the word comes from the Latin *discipulus*, “pupil,” from *discapere*, “to grasp,” in the sense of “to take hold of mentally” and thus “to understand.” If so, then the word *discipline* derives primarily from the Indo-European *\*kap-* (“grab hold of”) and is related to such words as the English *captive*, *capture*, and *captive*; *accept*, *precept*, *concept*; and *participate*. Often that sense of *reception* (a related word) is described as a safe and protected experience, as would be the sense of the Germanic derivative of the root *\*kap-*, *\*hafno*, appearing in the Old English *haefen*, which leads in turn to the modern English *haven*, “place of refuge.”

To be disciplined, then, is to be caught up by the teachings of a guide—whether that guide be a person, an ethic, a community, a historical tradition, or a set of ideas—and to organize one’s behavior and attitude according to those teachings. The person who undertakes such discipline may be understood, then, to be a disciple of that which is felt to be true, a captive of that which is valuable. Religious traditions do not tend to view this as “punishment.” Rather, they generally stress the notion that this very captivity allows one to become who he or she really is, or really could be. As Zen Buddhists have long noted, one is most free when one is most disciplined.

**TYPES OF SPIRITUAL DISCIPLINE.** Just what kind of teacher the student follows and what type of relationship exists between the two varies from tradition to tradition and within each tradition itself, so any typological classification of spiritual disciplines runs the risk of oversimplification. Classed very generally, however, the different kinds of spiritual discipline may be understood as heteronomous, autonomous, or interactive in nature. (Within these types one can discern various modes of discipline, to which this article shall return.) These three should be understood as ideal types only: Analysis of different examples of actual spiritual endeavors

will show that individual disciples and specific traditions practice a combination of all three.

**Heteronomous discipline.** In heteronomous discipline, the disciple submits in his or her search for realization, completion, or genuine understanding to the guidelines presented by an external authority. While this authority may be personal or impersonal in nature, the structure of the relationship between guide and disciple is often represented as objective and depicted in oppositional images: creator/creature; lord/subject; teacher/apprentice; parent/child; shepherd/sheep; wise one/foolish one; judge/judged. In obeying the commands or by imitating the paradigmatic actions of the central authority, the seeker finds the way to fulfillment and meaning.

One sees the ideals of heteronomous discipline in any account of a disciple who serves a master: the Chan Buddhist who sweeps the floor and washes the pots for his teacher; the American Indian who follows the instructions discerned in the tones of a coyote's call; the orthodox Hindu who obeys the social regulations prescribed by the Dharmasāstras. Heteronomy is found in those cases where people find meaning and validity in their actions as defined by an external authority of some kind.

Sometimes the teacher is so distant, either in time or in space, that the disciple first must learn from a fellow, but wiser, seeker who knows the teachings if not the teacher and who, having traveled it, can illumine the difficult passage from one mode of being and understanding to another. Such is the case, for example, in the Jewish figure of the rabbi, the Christian *pater spiritualis*, the Buddhist *arhat* and *bodhisattva*, the Chinese sage, and the Siberian shaman—although the particular ideologies in which each of these figures present their teachings vary immensely.

A good example of heteronomous discipline appears in Islamic spiritual traditions. Muslims repeatedly hear in the Qur'an the notion that a person's sole purpose in life is to serve the will of God (Allāh) by cultivating his or her potential in accordance with God's "command" (*amr*). This submission (*islām*) to God is the purpose for which God sends through prophets and revealed literatures the divine "guidance" (*hidāyah*). The central revelation, the Qur'an, describes itself as an invitation to come to the right path (*hudan li-al-nās*) and is the source of the Islamic sacred law (*sharī'ah*, literally "the way to the water hole," an appropriate image for spiritual travelers in a desert region). Islamic tradition notes that examples of such guiding laws include what is known as *farḍ* or *wājib*—those duties and actions all Muslims must obey, such as daily prayer (*ṣalāt*), almsgiving (*zakāt*), and fasting during the holy month of Ramaḍān (*ṣawm*).

The paradigmatic disciple in this case is the prophet Muḥammad, who is said to have heard the sacred instructions from divine teachers and then to have obeyed the order to recite (*qur'ān*) those teachings to the community. Tradi-

tion holds that Muḥammad first received these lessons one night during Ramaḍān when he was visited by the angel Gabriel. After cleansing Muḥammad's body and spirit, Gabriel swept him up into the air, carrying him first to the sacred shrine at Mecca and then upward through the seven heavens to the throne of God. There, surrounded by mystic light, the Prophet received divine instructions on proper religious action, specifically the practice of the five daily prayers (*ṣalāt*), in which the Muslim is to cleanse himself and touch his forehead to the ground as he bows toward Mecca in the early morning, at noon, in midafternoon, at sunset, and in the evening. According to traditional stories, Muḥammad then returned from the heavens and shared those instructions with the human community on earth. "The key to paradise is *ṣalāt*," Muḥammad is reported to have said; and the practice of the daily purification and prayer remains today one of the Five Pillars of Islamic faith. The four remaining pillars are *shahādah* (the profession of faith), *zakāt* (care for the unfortunate through almsgiving), *ṣawm* (fasting during the month of Ramaḍān), and *ḥajj* (pilgrimage to the Ka'bah in Mecca).

According to Islamic mystical traditions, primarily those influenced by Ṣūfī ideologies and practices, a person intent on gaining a direct experience of God's presence and power first seeks out a teacher (Arab., *shaykh*; Pers., *pīr*) who guides the disciple (Arab., *murīd*, "one who wishes to enter [the path]") through the stages of the spiritual journey. The teacher then watches over the *murīd* carefully, for the path (*ṭarīqah*) is a long and difficult one. The master comes to know the disciple at the most intimate of levels. The master reads the student's mind and sees into the student's dreams in order to advise as the disciple moves through the anxiety and doubt inherent in the religious transformation. The master may make the *murīd* practice ascetic meditation for periods of forty days at a time and demand that the pupil direct all of his attention to God; or the master may require the student to live in a community of fellow seekers in order to benefit from the support a group can give. The master is careful to keep the disciple attentive to his or her spiritual duties as the disciple progresses through the "stations" (sg., *maqām*) on the path: repentance (*tawbah*), abstinence (*wara'*), renunciation (*zuhd*), fasting (*ṣawm*), surrender to God (*tawakkul*), poverty (*faqr*), patience (*ṣabr*), gratitude (*shukr*), the cultivation of ecstatic joy (*bast*) through constraint of the ego (*qabd*), and—finally—love (*maḥabbah*) and mystic annihilation (*ma'rifah*) into the being of God. Bringing the student through these stages, the Ṣūfī master shows the way to *fanā'*, in which the seeker disposes of all human imperfections and takes on the qualities of the divine.

**Autonomous discipline.** The typological opposite of heteronomous discipline is characterized by ideologies in which the guide is said not to live or exist somewhere outside of the seeker but, rather, to inhabit the very depths of one's personal being. There, deep within the heart, the teacher rests timelessly beneath the swirling currents of the seeker's confused identity, unaffected by the vagaries of the objective

world. The adept's task is to discover that inner wisdom. The discipline that arises from this notion of the guide may be called *autonomous* in nature because the aspirant's spiritual endeavors are self-contained and independent of external authority.

A good example of autonomous discipline would be the set of practices and assumptions reflected in the stories of Siddhartha Gautama's enlightenment and subsequent life as the Buddha. According to traditional accounts, the prince led a comfortable and secure life in his father's palace until, as a young man, he was shocked and utterly disillusioned with the passing enjoyments of the material world by the sight outside the royal walls of an old person, a sick person, and a corpse, sights that his father's protection had hitherto prevented him from seeing. After encountering a wandering ascetic who seemed to have attained a certain equanimity in the world of sickness and death, Gautama at age twenty-nine left his father's palace in search of a teacher who could help him understand the nature of life. He is said to have found successively two highly respected masters, but eventually left each one, unsatisfied, because he had become their equal in wisdom and yet still did not understand. He despaired of any teachings from another person, because even the most knowledgeable people did not know the full truth.

Traditional accounts say that Gautama then went alone into the forest, where he found a quiet place to fast and to control his breathing in order to enter into a trance in which he could gain transcendent knowledge. Eventually abandoning even some of these techniques because they led to what he experienced as a debilitating and therefore counterproductive physical weakness, he developed his own kind of meditation, which was neither austere nor self-indulgent. While meditating in this "middle way," he was confronted by demonic forces who tempted him, unsuccessfully, with worldly power and prestige.

Gautama is said to have entered into four successive levels of meditation (Pali, *jhāna*), each one giving him deeper awareness of the origins and nature of suffering. Finally, at the dawn ending the night of the full moon, he gained complete understanding and stood up, alone. At that point he became the Buddha, the Enlightened One. He understood what have come to be known as the Four Noble Truths: (1) that all conditioned existence is permeated by suffering; (2) that there is a cause of suffering (namely, desire); (3) that there is a way to end suffering (namely, to cease desiring); and (4) that the way to cease desiring is to follow a set of principles that became known as the Noble Eightfold Path.

Traditional Buddhist hagiographies and commentaries note that one follows that path by maintaining and practicing the following disciplines: correct views (*sammā-diṭṭhi*) to see things as they really are rather than as one wishes them to be; correct thoughts (*sammā-sankappa*), directed only to the goal of enlightenment; correct speech (*sammā-vācā*), in which one does not say anything that would harm his or other people's integrity; correct action (*sammā-kammantā*),

in which one refuses to kill another creature, take what is not given, or enjoy illicit sexual relations; correct livelihood (*sammā-ājīva*), to earn a living only by ways in which living beings are not injured; correct exertion (*sammā-vāyāma*), characterized by dispassion and benevolence; correct mindfulness (*sammā-sati*), the remembrance of the Four Noble Truths; and correct meditative concentration (*sammā-samādhi*), which allows one to understand the harmful nature of selfish desire. The Eightfold Path thus combines the practice of proper wisdom (namely, correct views and thoughts), morality (correct speech, action, and livelihood), and meditation (correct mindfulness and concentration).

Buddhist tradition firmly maintains that the Buddha gained this insight by himself. Records of the Buddha's first discourse after his enlightenment note that he told his followers, "No one in any of the worlds—neither the gods, nor Māra, nor Brahmā, nor ascetics or priests or gods or human beings—had ever gained this highest complete enlightenment. I [alone] knew this. Knowledge arose in me, insight that even my mind cannot shake." No teacher is said to have given this insight to the Buddha; the implicit lesson here is that other people, too, can gain such knowledge if they cultivate autonomous discipline. Gautama himself seems to have resisted the role of a master. One text records his encouragement to others that "as wise people test gold by burning, cutting and rubbing it, so are you also to accept my teachings only after examining them and not simply out of loyalty to me" (*Jñānasāra-samuccaya* 31).

**Interactive discipline.** In another form of discipline, the teacher is neither completely external nor completely internal to the seeker. Rather, teaching and learning occur in a continuing and flexive process. The discipline needed here centers on a dialectical way of seeing or knowing that in itself brings the seeker to the desired transformation. Outside authority exists in the form of tradition, *ethos*, or structures of the natural world; but that authority is affected in various degrees by the hopes, worldviews, and training of the disciple. Similarly, internal authority holds sway, but it is defined and given form by external structures. Interactive discipline centers on practices that arise in an open-ended or multivalent relationship between the seeker and what he seeks.

Representative examples of interactive discipline might best come from the aesthetic arena. One thinks of a New England Shaker crafting a perfectly simple wooden chair; a *sitar* player quietly practicing a morning *rāga* in the Indian dawn; an Italian sculptor lovingly fashioning an image of the Virgin Mother out of a piece of marble. In such cases the disciple undergoes experiences in which the ideal is made real through his or her own creative power, but that ideal itself determines the form in which the disciple can make it real. Not only is there disciplined action; there is also a cultivated *interaction* between the disciple and the discipline itself.

At times the artist seems to be the effective agent in the creative process who brings his or her work to fruition through bold assertion. "This is not the moment for hesita-

tion and doubt,” Vincent van Gogh wrote of the creative process, “the hand may not tremble, nor may the eye wander, but must remain fixed on what is before one.” Yet, no matter how subjective or personal this creative discipline may be, it frequently is described almost paradoxically as a participation in an impersonal event that transcends the idiosyncracies of the artist. “Everything vanishes around me,” Paul Klee once noted to himself, “and works are born out of the void. . . . My hand has become the obedient instrument of a remote will.” The artist cultivates a vision and undertakes a discipline in which the objective and subjective worlds converge and yet remain distinct.

Interactive discipline thus involves a kind of “attentive selflessness.” Or perhaps it would be better to say that it centers on an “attentive wholeness”—for one who perfects this type of discipline is said to experience himself or herself as a creative and vital participant in the larger scope of life itself. Techniques of interactive discipline are different from those of heteronomous and autonomous discipline in that the former do not revolve around conceptual knowledge. The master is both external and internal, and neither external nor internal, to the disciple.

Interactive experience, like the artistic experience, centers on what the Japanese call *myō*, the wondrous mystery and rhythmic flow of life. One who disciplines himself or herself toward this experience seeks to know eternal truths within the mysteries of the constantly changing world. Such discipline is exemplified, to choose one of any number of possibilities, in the Japanese *haiku* tradition, in which poets compose short verses in moments of sublime understanding of the world. These poems reveal the unmediated nature of the world as it exists objectively but also the fond and attentive regard the poet holds for that world. Bashō (1643–1694) is said to have set the *haiku* tradition with this verse, translated by D. T. Suzuki:

Furu ike ya!	The old pond, ah!
Kawazu tobikomu,	A frog jumps in:
Mizu no oto.	The water’s sound!

Quite typically, the images presented in *haiku* come from the ordinary world, but the terseness with which they are described comes from the poet’s discerning vision of that world as an entirely remarkable place. The poet Buson (1716–1783) once exclaimed:

Tsuri-gane ni	On the temple bell
Tomarite nemuru	Perching, sleeps
Kocho kana.	The butterfly, oh!

If perfected, such interactive awareness of the world is said to lead to *satori* (enlightenment), which finds its meaning in one’s everyday activities such as eating, sleeping, and moving one’s body. The meaning that *satori* illumines in these activities does not come from outside; it is in the event itself. It is beingness, or life itself. Better still, it is the “is-as-it-isness” of something, the quality that in Japanese is known as *kono-mama* or *sono-mama*. It is this discipline of “seeing the isness”

of the world that led the *haiku* poet Jōsō (1661–1704) to find transformative appreciation in the following image:

Mizu soko no	Under the water,
Iwa ni ochitsuku	On the rock resting,
Kono ha kana.	The fallen leaves.

Or Bashō, in a moment’s notice of

Nomi shirami,	Fleas, lice,
Uma no nyo suru	The horse pissing
Makuramoto.	Near my pillow.

The freedom to experience the world as it arises from such cognitive or perceptual discipline occurs only when the poet’s mind is in perfect harmony with the rhythms of life itself. “Wonder of wonders!” Hō Kōji exclaimed in an eighth-century verse, “I carry firewood, I draw water!”

There are no heteronomous or autonomous authorities in this type of discipline, for to distinguish between object and subject is to bifurcate the essential unity of being. Interactional discipline takes a person beyond all dualities, including the duality of “self” and “other” or “disciple” and “master.” Interactive discipline in the *haiku* tradition eventually frees the disciple from the need for a teacher. Such discipline recognizes that the guide, the way, and the wayfarer are one.

**MODES OF SPIRITUAL DISCIPLINE.** The three types of spiritual discipline just outlined should not be understood as mutually exclusive. Despite the autonomous ideals reflected in his early discourses, for example, even Gautama’s followers directed their lives according to the instructions given them by their master and subsequently codified in the Vinaya Pitaka, a canonical collection of community rules and regulations established by the Buddha and his immediate followers. Conversely, even the Sūfī mystic who advances through the stages of the path under the heteronomous guidance of a shaykh finally experiences *fanā*, the annihilation of ego-consciousness that brings knowledge of the unity of reality in a state similar to that called *jam*, “unification.” The Muslim, in fact, learns from the Qur’ān itself that God is “closer to man than is man’s jugular vein” (50:16) and that God has placed within each person an “inner torch” (*taqwā*), which, if allowed to burn brightly, guides that person toward fulfillment. And the Japanese notion of immediacy of *myō* is said to be taught at first by a master, who teaches the student either through example or through specific instructions how to see and to experience sublime beauty himself.

In all three types of discipline, therefore, the seeker and the path on which that seeker travels are inextricably linked. Within the general parameters of these three types of spiritual discipline, one may recognize a number of ways in which the disciple actually practices the regimens deemed necessary for movement along the path. For simplicity’s sake, these modes of activity can be classified in the following categories: ecstatic discipline, constructive discipline, discipline of the body, discipline of the mind, discipline of the heart, and discipline of enduring personal relationships.

It should be stated, once again, that these categories serve typological purposes only; they are not rigid classifica-

tions but general descriptive groupings of a variety of practices and ideas.

**Ecstatic discipline.** Many religious traditions maintain that the desired state exists outside of the human realm. It may lie in some other place such as in the heavens, across the mountains, or at the bottom of the sea; or it may take place in some other time, typically the past or the future. Whatever the case, in order to reach that extraordinary state personally or in order to be able to communicate with spirits from that other world, the seeker must somehow cultivate the ability to move out of his or her physical body, because that body is limited by the confining structures of time and space. Such out-of-the-body experience is classified generally as “ecstasy” and is attested in a variety of religious traditions throughout history.

The discipline needed to attain ecstasy typically includes practices in which the seeker deprives himself or herself of normal bodily pleasures in order to be free of his or her physical body. Such privational or ascetic discipline may begin with the seeker’s withdrawal into solitude and spiritual tutelage under a master. It often culminates in the visitation by a guardian spirit and subsequent transformative vision or in an experience of death and resurrection.

Ecstatic discipline appears, for example, in North American Indian practices centered on what has come to be known as the vision quest. In such a quest practiced among the Thompson River Indians, for instance, a young man observed severe dietary restrictions and fasts, cleansed his spirit with such rituals as sweat bathing and immersion in a cold river, purged his body of impurities by forcing himself to vomit or by taking sacred medicines, and camped alone on a mountaintop, where he forsook sleep for nights on end. There he hoped to be visited by a guardian spirit who would teach him sacred ways and lead him through the dangers of life. The Ojibwa Indians of the Algonquin tribe near Lake Superior demanded that a boy entering puberty set up camp alone under a red pine tree, where he was to fast and to lie awake for days, waiting for a vision that would allow him to see who he was in the context of the sacred cosmos as a whole. These visions were often described as journeys taken into the worlds of the spirits, where the seeker was introduced to divine teachers who would guide him throughout his life.

Such ecstatic practices often included the seeker’s ritualized symbolic death and resurrection. Shamanic initiates among the Pomo and Coast Miwok Indians of California lay on the ground and were covered with straw as if they had died and been buried; standing up and casting off the straw, the initiate was then known to have been resurrected from the dead. Among the Tlinglit Indians of coastal Alaska, a man was recognized as a potential shaman when he fell to the ground in a deathlike trance and subsequently revived.

In some instances of ecstatic discipline, the value of an enduring, rather than temporary, out-of-the-body experience

lies at the very center of religious ideology itself. Perhaps the best example is that of the Tibetan traditions based on the notion of *bar do'i sems can* (or simply *bar do*), the “intermediate stage” through which a departed soul moves over the interval of forty-nine days between death and rebirth. Tibetan priests read a series of instructions—most frequently from the the *Bar do'i thos grol* (often transliterated and simplified as *Bardo Thodal*, the *Tibetan Book of the Dead*)—to the dying or dead person to help him through the dangers of the *bar do* and to help him gain a comfortable rebirth or, ideally, freedom from the cycle of rebirth itself.

Immediately upon death—in fact, before a person even knows he or she is dead—a departed soul is said first to enter the *'chi kha* state, a realm of pure light and bliss. Reading set instructions from the *Book of the Dead*, the priest tells the deceased that this is the ultimate reality and encourages the deceased to sever all emotional ties to the world left behind in order to remain free in this state. Most spirits are afraid of such freedom, however, and turn from it toward a second state known as *chos nyid*, in which the dead person encounters wondrous and beautiful creatures. The priest tells the person that these beings are images of his or her self that have been constructed through the person’s own selfishness and that the person must renounce all attachment to them because they will soon turn into demonic monsters. Fearing these terrors, the person then enters a third state, *srid pa*, in which the person panics and flees into a new birth on earth as a way to avoid the horrors that have been experienced in the intermediate realm. The priest attempts to keep the person from moving through the second two of these realms—and thereby allowing the person to remain in the state of pure light and bliss—by reciting lessons and offering encouragement in the highly structured discipline of the long funerary ritual.

**Constructive discipline.** This mode of discipline does not seek in general to deprive the spiritual aspirant of unwanted or harmful characteristics; rather, it helps that person perfect his or her being by building on desirable characteristics that are already there.

Such constructive discipline often takes the form of personal imitation of a paradigmatic figure or figures who are said to embody desirable qualities or to have undertaken beneficial actions. Many times, therefore, such discipline takes the form of the correct performance of a ritual. “We do here what the gods did in the beginning,” the priests report while explaining why they officiate at the sacred rites of Vedic India (see *Śatapatha Brāhmaṇa* 7.2.1.4). For those priests, all work performed as part of the ritual thus becomes a disciplined imitation of a divine model. So, for example, the artist who fashions the utensils and ritual paraphernalia expresses artistry in a religious context: “Those works of art produced here by a human being—[an image of] an elephant, a goblet, a sacred robe, a gold figure, a chariot—are works of art only because they imitate the art of the gods” (*Aitareya Brāhmaṇa* 6.27).

But it need not be explicit ritual behavior only that embodies the ideals and techniques of constructive discipline. Such discipline appears in any system which assumes that within the seeker lie qualities that, although perhaps dormant, can be brought to the surface so that the ideal can be made real. “Be faithful imitators of Jesus, and perfect imitators of Mary,” the fifteenth-century monk Thomas à Kempis wrote to his fellow Christians in his *Imitation of Mary*. “Be simple, like the simple children of God, without deception, without envy, without criticism, without murmuring, and without suspicion.” In his *Imitation of Christ*, Thomas similarly taught others to “learn to turn from worldly things, and give yourself to spiritual things, and you will see the Kingdom of God come within you” (2.1).

Elements of constructive discipline may also be seen in the Chinese, specifically the Neo-Confucian, tradition of the cultivation of sagehood. Zhangzai (1021–1077) defined the sage as one who understands the harmonious and holistic nature of oneself and one’s relationship to the world. According to his teachings, a human being’s essential nature (*xing*) is identical with all of nature (*tiandi*), and the sage understands the principle (*li*) that unites his essential nature with all things. According to Neo-Confucian thought, transformative understanding of this unity can be obtained through various techniques reflecting the ideology of constructive discipline. Gao Pan Long (1562–1626), for example, advocated a combination of several attitudes and practices: the cultivation of an open-minded reverence (*jing*) for all things; an intuitive exploration (*ge wu*) of the unifying principle that links the inner and outer worlds; a pervasive appreciation of the natural world; a sense of one’s place in history; and a practice he generally characterized as “quiet sitting” (*jing zuo*) in which the student brings the body and mind together into a whole. Gao described this latter technique as “ordinary” (*ping chang*) because it reflects the basic unified nature of being itself.

In his *Fu qi gui* Gao notes that one may practice such quiet sitting by observing some general procedures:

Burn incense and sit in the lotus position. . . . Try not to be lazy. After eating one must walk slowly for a hundred steps. Do not drink too much wine or eat too much meat or you will stir up the muddy waters. When resting do not take off your clothes. If you feel sleepy, then lie down. As soon as you awaken, get up.

**Discipline of the body.** There is a general recognition among religious traditions that the body’s tendency to please its own senses tends to distract the spirit from its more ethereal tasks. Therefore, most spiritual disciplines involve the seeker’s control and restraint of his or her physical body.

Christian monastic traditions provide a good example of such discipline of the body. “The life of a monk should always be as if Lent were being observed” even though “few people have the fortitude to do so,” wrote Benedict of Nursia in the sixth century (*Rule of St. Benedict* 49), for “monks should have not even their bodies or their wills under their

own command” (33). According to Benedict, monks were to “let one pound of bread be enough for one day, whether there be one meal only, or both dinner or supper,” and “wine is not appropriate for monks at all” (39–40). Benedict nevertheless admitted, “Since it is not possible these days to convince the monks of this, let us agree at least on this: we should not drink excessively nor to the point of satiation. . . . one pint of wine a day is enough for each one” (40).

Benedict’s *Rule* thus reflects the value he placed on the monk’s renunciation of material goods, the primary purpose of which is to satisfy the body. “He should have nothing at all as his own: neither a book, nor tablets, nor a pen—nothing at all” (33). Six centuries later, Francis of Assisi restated and modified for his fellow monastics many of Benedict’s rules, telling them, for example, “to go and sell all that they have and carefully give it to the poor,” and that “all the brothers shall wear humble garments, and may repair them with sack cloth and other remnants” (*Rule of St. Francis* 3.2).

It may be, however, that the best classical example of the discipline of the body comes from the *rājayoga* tradition of India, particularly as represented by Patañjali’s *Yoga Sūtra* and its principal commentaries, Vyāsa’s *Yogabhāṣya* and Vācaspati Miśra’s *Tattvavaiśārādī*. According to that tradition, the path to the ultimate goal of meditation practices—namely, complete autonomy (*kaivalya*)—involves eight stages or “branches” (*aṅga*) and is therefore known as the “eight-limbed discipline” (*aṣṭāṅgayoga*).

The first of the eight steps given by Patañjali is known as restraint (*yama*) and is centered on injunctions not to kill, not to lie, not to steal, not to enjoy sexual contact, and not to envy other people’s possessions (*Yoga Sūtra* 2.30). The second stage is comprised of the five traditional spiritual practices (*niyama*) of cleanliness, mental equanimity, asceticism, scriptural study, and devotion to a master (2.32). At the third level, the yogin masters the various limber body postures (*āsanas*, e.g., the lotus position) that strengthen the body against the rigors of severe asceticism (2.46), some of which take many years of training before they can be practiced without the risk of dangerous injury. The fourth level consists of breath control (*prāṇāyāma*) in which the adept slows down his rate of respiration, sometimes to the point of stopping his breathing altogether for long periods of time, and in so doing releases for his disciplined use all of the life force (*prāṇa*) that is said to reside within the breath itself (2.49–51).

At the fifth stage of the eight-limbed discipline, the yogin withdraws all senses from their objects in an enstatic process known as *pratyahara*, which includes in part focusing all attention thus retrieved from external distractions on a single object—such as the spot between his eyebrows—in a technique described as *ekāgratā*, the sustained concentration on one thing (*Yogabhāṣya* 2.53). Mastering this technique gives the yogin power over all of his body, which possesses an almost immeasurable amount of energy.

The sixth level, known as *dhāraṇā*, a term that might best be translated as “mental concentration,” is a form of *ekāgratā* in which the yogin, under strict guidance of a master, concentrates all powerful attention on a single sacred syllable (*mantra*) or visual diagram (*yantra*) in such a way that the mind ceases to wander about in its constant fluctuations and the yogin comes to know and experience the unity of his or her soul (*ātman*) with the soul of the universe.

In these first six stages of the eight-limbed discipline, the adept subdues and controls the instincts, desires, movements, respiration, senses, and mental activities of the physical body. This is done in order to prepare for the seventh and eighth levels of discipline, which may be said to transcend corporal existence. The seventh stage is known as *dhyāna* (deep meditation) in which the adept experiences the light of the Absolute within his or her own eternal soul. The final stage, *samādhi*, brings the yogic discipline to its fruition. At this point the yogin knows pure being, absolute consciousness, and complete bliss and is released from all suffering entailed in the cycle of rebirth.

**Discipline of the mind.** Many religions teach that one’s mind tends to distract one from the necessities of spiritual growth and that it, like the body, must be restrained. Sometimes religious masters admonish their students not to daydream. Sometimes they scold their students for being too analytical. In either case, they encourage them to retain control over the mind.

The *Kaṭha Upaniṣad* records a mythic conversation between Naciketas, a young boy desirous of sacred knowledge, and Yama, the lord of the dead. One sees reflected in Yama’s teachings the notion, cited often in ancient India, that the mind must be restrained the way a charioteer must control his horses:

Think of the true self as [riding in] a chariot  
and that the body is the chariot.

Think of the intellect as the charioteer  
and the mind as the reins.

He who has no understanding, whose mind is out of  
control—

his senses are unchecked

Like wild horses [when unrestrained by a bad] charioteer.

He, however, who has understanding,  
whose mind is always under control—

his senses are checked

Like the obedient horses [of a good] charioteer. (3.3–6)

The lord of the dead continues to teach Naciketas that the search for the absolute truth residing within the self is difficult because it “cannot be known through language, nor by the mind, nor by sight” (6.12). According to Yama, one reason it is so difficult to comprehend the nature of the self is that it has no discernible qualities or characteristics: It is “without sound, without touch, without form, imperishable . . . without taste, eternal, odorless, without a beginning and without an end, beyond the great, constant.” Neverthe-

less, Yama asserts that “by discerning That, one is liberated from the jaws of death” (3.15).

Another Upaniṣad notes that the master should accept as a disciple only a student “whose mind is tranquil and who has attained peace. He teaches in its very truth that knowledge of *brahman* [absolute reality] by which one knows the true eternal soul” (*Munḍaka Upaniṣad* 1.2.12–13).

The adept who disciplines his or her mind undergoes here a kind of “unknowing” of all of the categories through which one’s self, the world, and divine reality is normally understood. Part of this mental discipline involves the practice of seeing the essence of things as distinct from their form. In a classic teaching recorded in the *Bṛhadāraṇyaka Upaniṣad*, the Upaniṣadic sage Yājñavalkya repeatedly asserts (see 4.5.15, for example) that the eternal soul is “not this, not this.”

Christian mystical traditions centered on the *via negativa* present similar teachings regarding the need in one’s spiritual advancement to break down the categories to which one’s undisciplined empirical mind clings. In his work *The Mystical Theology*, Dionysius the Areopagite (sixth century) taught that “the universal and transcendent Cause of all things is neither . . . a body, nor has He a form or shape, or quality, or quantity, or weight; nor has He any localized, visible, or tangible existence; He is not sensible or perceptible” (Happold, 1970, p. 212). Dionysius accordingly encouraged his followers to “leave behind the senses and the operations of the intellect, and all things sensible and intellectual, and all things in the world of being and nonbeing, that thou mayest arise, by knowing, towards the union, as far as is attainable, with Him Who transcends all being and all knowledge” (op. cit., pp. 216–217).

**Discipline of the heart.** Some religious traditions teach that the final universal truth centers on a profound, delicate, and enduring love. According to these traditions, everything that is real arises from and returns into love; and it is through the openhearted awareness of that love that one comes closer to divine truth. The cultivation of those attitudes and actions that help one see and know that love may therefore be called the discipline of the heart.

At times such discipline of the heart is described as a way of seeing the world in its sublime nature. As the Ṣūfī poet Muḥammad Gīsūdarāz (d. 1422) proclaimed,

You look at the beautiful one and see figure and statue—  
I do not see anything save the beauty and art of the  
creator.

Jalāl al-dīn Rūmī (d. 1273) saw the structures of the natural world as expressions of universal love:

If this heaven were not in love, then its breast would  
have no purity,  
and if the sun were not in love, in his beauty would be  
no light,  
and if earth and mountain were not lovers, grass would  
not grow out of their breast.

The Hebrew *Song of Songs* (whose verses date as early as the tenth century BCE) presents classic love imagery set in a dialogue between a bride and her bridegroom. Traditional commentaries have interpreted the relationship between the characters of the bride and groom in four ways: literally, as a man and a woman in love with each other; figuratively, as a model on which proper marriage should be based; allegorically, as the people of Israel and their god; and anagogically, as the account of an individual soul's perfected relationship to God. Whatever its reference, the love between these two finds vivid expression:

Bride: Night after night on my bed

I have sought my true love;

I have sought him but not found him,

I have called him, but he has not answered.

Groom: How beautiful you are, my dearest, how beautiful! . . .

Your lips are like a scarlet thread, and your words are delightful;

your parted lips behind your veil are like a pomegranate cut open. . . .

Your two breasts are like two fawns, twin fawns of a gazelle.

Bride: I am my beloved's, his longing is all for me.

Come, my beloved, let us go out into the fields to lie among the henna bushes. (3.1–7.11)

The Cistercian monks of twelfth-century Europe tended to see the religious quest as an ongoing apprenticeship in the ways of love. In his *Sermons on the Song of Songs*, Bernard of Clairvaux urged his readers to remember that “when God loves, he wants nothing else than to be loved; for he loves for no other purpose than that he may be loved, knowing that those who love him are blessed by that very love” (83.4). Christian mystics of that era often defined God in masculine and the soul in feminine terms and described the religious life as a relationship between the two. Richard of Saint-Victor, for example, outlined in *The Four Degrees of Passionate Charity* the stages through which the soul moves in its relationship to the loving God:

In the first degree, God enters into the soul and she turns inward into herself. In the second, she ascends above herself and is lifted up to God. In the third, the soul, lifted up to God, passes over altogether into Him. In the fourth the soul goes forth on God's behalf and descends below herself.

Discipline of the heart carries the seeker further and further into the depths, or heights, of divine love. This is seen in India, too. As Kṛṣṇa (i.e., God) is reported in the *Bhagavadgītā* to have told his disciple, Arjuna:

Through loving devotion [bhakti] he comes to know Me—my measure, and who, in very truth, I am. Then, knowing Me in that complete truth, he enters immediately into Me. (18.55)

**Discipline of enduring personal relationships.** According to some religious ideologies, religious fulfillment is

best achieved through the observation of principles that serve to uphold the relationship between the human community and the deity or to maintain important familial and other interpersonal bonds.

A classical example of such relational discipline appears in the traditions centered on and developed from the Jewish notion of *mitsvah* (“commandment”; pl., *mitsvot*), a rule of discipline that is understood to have divine sanction. The rabbinic tradition of Judaism notes that God has given the people of Israel 613 *mitsvot* outlining the 248 positive instructions and 365 negative injunctions the people are obligated to honor. The most general and most familiar of the *mitsvot* are known as the Ten Commandments (see *Exodus* 20:2–14 and *Deuteronomy* 5:6–18), which combine strict monotheistic ideology with rules against destructive social behavior. According to these rules of discipline, the people of Israel are to believe in no other god but Yahveh, not to construct idols, to keep the commandments, not to misuse God's name, to observe the day of rest, to honor their parents, not to commit murder, not to commit adultery, not to steal, not to testify falsely against their neighbors, and not to be envious of other people's possessions. Rabbinic traditions are careful to say that the Ten Commandments do not exhaust *mitsvot*, and remind the people of Israel of the religious duty incumbent on all Jews, for example, to marry and have at least two children in accordance with the divine commandment to “be fruitful and multiply” (*Gn.* 1:22).

Such relational discipline finds similar expression in Paul's teachings to the hellenized Jewish-Christians at Thessalonica that the true disciple must “not [give] way to lust like the pagans who are ignorant of God; and no man must do his brother wrong in this matter, or invade his rights, because, as we have told you before with all emphasis, the Lord punishes all such offenses.” Paul further noted to those disciples that we are “taught by God to love one another” in a selfless way and that “anyone who flouts these rules is flouting not man but God” (*1 Thes.* 4:4–9).

Discipline based on the maintenance of proper relationships also appears in another way in the classical Hindu notion of *varṇāśramadharmā*, the sacred duties determined by one's vocation and stage of life. An entire science (*śāstra*) of such sacred duties developed in Brahmanic India in order to interpret and preserve those rules by which orthodox Hindus are to act in society.

According to the texts of that tradition, the Dharmaśāstras, society is divided into four classes (*varṇas*, sometimes translated as “castes”) of people. Each *varṇa* has its own particular function, and the whole system may be understood as a symbiosis in which all parts depend on the others. The priests (*brāhmaṇas*) perform rituals that ensure the favor of the gods for specific individuals or for society in general. Warriors (*kṣatriyas*) protect the society from foreign invasions and increase its land holdings. The responsibilities of production and distribution of material goods throughout society fall to the merchants (*vaiśyas*), and the laborers

(*śūdras*) perform the manual work the other classes need in order to fulfill their responsibilities.

Dharmaśāstra literatures similarly outline the four stages (*āśramas*) of one's individual life, each having its own disciplined requirements. According to a representative text, the *Mānava Dharmaśāstra* (the Laws of Manu, second century BCE), a student (*brahmacārin*) must study the Vedic scriptures under the guidance of a master until he is old enough to marry. Becoming a householder (*gṛhasthin*), one must raise a family and secure its well-being. Having carried out these responsibilities long enough to see one's grandchildren grow to be adults, one leaves the demands of family life to the children and enters the stage of the forest-dweller (*vānaprasthin*) in order to offer private oblations to his ancestors and various deities. Only if one lives long enough, and has met all of these other responsibilities, can one then become a wandering ascetic (*saṃnyāsīn*) who, having finally abandoned all possessions and family obligations, seeks the inner wisdom that will bring eternal release.

#### BIBLIOGRAPHY

Readers interested in discussions of spiritual disciplines in several traditions not outlined above and interpreted from a variety of approaches by eminent scholars will want to consult *Papers from the Eranos Yearbooks*, vol. 4, *Spiritual Disciplines*, edited by Joseph Campbell (New York, 1960), a collection of papers read over several years at the Eranos meetings in Ascona, Switzerland.

On the development of Islamic *sharī'ah* and its relationship to personal piety, see Marshall G. S. Hodgson's *The Venture of Islam*, vol. 1, *The Classical Age of Islam* (Chicago, 1974), pp. 315–409; Fazlur Rahman's *Islam* (New York, 1966), pp. 100–116; and Frederick Mathewson Denny's *An Introduction to Islam* (New York, 1985), pp. 216–292. On Islamic spiritual traditions and mystical poetry, see Annemarie Schimmel's *Mystical Dimensions of Islam* (Chapel Hill, N. C., 1975), esp. pp. 98–227 and 287–343; Reynold A. Nicholson's *Studies in Islamic Mysticism* (Cambridge, 1921); and William C. Chittick's *The Sufi Path of Love: The Spiritual Teachings of Rumi* (Albany, N.Y., 1983). One of the better translations of the Qur'ān remains A. J. Arberry's *The Koran Interpreted* (London and New York, 1955). For an elucidating introduction to Qur'anic thought, see Fazlur Rahman's *Major Themes of the Qur'ān* (Chicago, 1980).

Translations of traditional accounts of the Buddha's enlightenment, mostly from Pali sources, appear in E. J. Thomas's *The Life of Buddha as Legend and History*, 3d rev. ed. (London, 1949), pp. 38–96, esp. pp. 61–80, and in Edward Conze's *Buddhist Scriptures* (Harmondsworth, 1959), pp. 34–66, which is a translation of Aśvaghōṣa's Sanskrit work, *Buddhacārīta* (Acts of the Buddha). For a traditional commentary on the Noble Eightfold Path, see Buddhaghosa's *Vissuddhimagga* 16.77–83, translated by Bhikkhu Nyanamoli as

*The Path of Purification* (Berkeley, Calif., 1976), vol. 2, pp. 583–584. For commentaries on the First Sermon, see Nalinaksha Dutt's *Aspects of Mahāyāna Buddhism and Its Relations to Hīnayāna* (London, 1930), pp. 129–202. An example of Mahāyāna Buddhist spiritual discipline can be found in Marion L. Matics's translation and study of Śāntideva's *Bodhicaryāvatāra* entitled *Entering the Path of Enlightenment* (New York, 1970). Robert C. Lester discusses Theravāda Buddhist ideals in *Theravada Buddhism in Southeast Asia* (Ann Arbor, Mich., 1973).

The quotation from Vincent van Gogh comes from *Dear Theo*, translated and edited by Irving Stone (New York, 1969), p. 114; that from Paul Klee is taken from *The Diaries of Paul Klee, 1898–1918*, edited by Felix Klee (Berkeley, Calif., 1964), p. 386.

Selections of Japanese *haiku* poetry appearing above come from D. T. Suzuki's *Zen and Japanese Culture*, 2d ed. (Princeton, 1959), pp. 215–268. See also R. H. Blyth's *Haiku*, 4 vols. (Tokyo, 1949–1952).

On the American Indian practices centered on the vision quest, see Ruth Benedict's "The Vision in Plains Culture," *American Anthropologist* 24 (1922): 1–23; Benedict's *The Concept of the Guardian Spirit in North America* (1923; Millwood, N.Y., 1974; Ake Hultkrantz's *The Religions of the American Indians* (Los Angeles, 1979), pp. 66–83; and Sam D. Gill's *Native American Religions: An Introduction* (Belmont, Calif., 1982). For personal accounts of the vision, see Gill's *Native American Traditions: Sources and Interpretations* (Belmont, Calif., 1983). On patterns of initiation in North America, see Edwin M. Loeb's *Tribal Initiations and Secret Societies* (Berkeley, Calif., 1929). The best general discussion of shamanism around the world remains Mircea Eliade's *Shamanism: Archaic Techniques of Ecstasy*, rev. & enl. ed. (New York, 1964).

Translations of the *Bar do'i thos grol* into English may be found in W. Y. Evans Wentz's *The Tibetan Book of the Dead*, 2d ed. (London, 1949), and in Francesca Fremantle and Chögyam Trungpa's *The Tibetan Book of the Dead: The Great Liberation through Hearing in the Bardo* (Berkeley, Calif., 1975). The notion of *dao* in China is discussed by Arthur Waley in *The Way and Its Power* (New York, 1958). Rodney L. Taylor offers a concise discussion of Neo-Confucian sagehood in *The Cultivation of Sagehood as a Religious Goal in Neo-Confucianism* (Missoula, Mont., 1978). The translation from Gao Pan Long's *Fu qi gui* is taken from Taylor's work.

The only available complete English translation of the *Śatapatha Brāhmaṇa* is by Julius Eggeling, *The Śatapatha Brāhmaṇa*, 5 vols., "Sacred Books of the East," vols. 12, 26, 41, 43, 44 (Oxford, 1882–1900). The *Aitareya Brāhmaṇa* has been translated by Arthur Berriedale Keith in his *Rigveda Brāhmaṇas: The Aitareya and Kausīktaki Brāhmaṇas of the Rigveda*, "Harvard Oriental Series," no. 25 (Cambridge, Mass., 1920). The best English translations of the Upaniṣads are Robert Ernest Hume's *The Thirteen Principal Upaniṣads*, 2d ed. (London, 1931), and Sarvepalli Radhakrishnan's *The Principal Upaniṣads* (London, 1953). There are many translations of the *Bhagavadgītā*. One of the best remains Franklin Edgerton's *Bhagavad Gītā* (Chicago, 1925), which includes helpful studies and a summary. Patañjali's *Yoga Sūtra*

with commentaries by Vyāsa and Vācaspati Miśra has been translated by James Haughton Woods as *The Yoga-System of Patañjali* (1914), 3d ed. (Delhi, 1966).

Those interested in the writings of Thomas à Kempis might look to *The Imitation of Mary*, edited and translated by Albin de Cigala (Westminster, Md., 1948) and his far better-known *The Imitation of Christ*, translated by Leo Sherley-Price (Harmondsworth, 1953). Those wishing to read Benedict's rule have available many translations, a good one being *The Rule of St. Benedict*, edited and translated by Justin McCann (London, 1921). For Bernard of Clairvaux, see Étienne Gilson's *The Mystical Theology of Saint Bernard*, translated by A. H. C. Downes (London and New York, 1940). Translations from Dionysius the Aeropagite come from F. C. Happold's *Mysticism: A Study and an Anthology* (Harmondsworth, 1970), pp. 212, 216–217. The same is true for the translation from Richard of Saint Victor's *The Four Degrees of Passionate Charity* (see Happold, pp. 241–248, esp. p. 242). Happold's book contains short selections drawn from mystical tracts from a variety of classical religious traditions around the world.

For studies on rabbinic understanding of Jewish sacred law and custom, both written and oral, one might turn first to *The Code of Maimonides*, 15 vols. (New Haven, 1949–1980). Less imposing works include *A Maimonides Reader*, edited by Isidore Twersky (New York, 1972), and Maimonides' *Mishneh Torah*, 3 vols., edited and translated by Moses Hyamson (New York, 1949). For other codes, see *Code of Hebrew Law: Shulhan 'Aruk*, 5 vols., edited and translated by Chaim N. Denburg (Montreal, 1954–), or *Code of Jewish Law: Kitzur Shulhan Aruh*, 4 vols., annot. rev. ed., compiled and translated by Solomon Ganzfried and Hyman E. Goldin (New York, 1961). Otherwise, see Alan Unterman's *Jews: Their Religious Beliefs and Practices* (Boston, 1981); *A Rabbinic Anthology*, edited by C. G. Montefiore and Herbert Loewe (New York, 1974); and *The Mishnah*, edited and translated by Herbert Danby (Oxford, 1933).

WILLIAM K. MAHONY (1987)

**SPIRITUAL GUIDE.** Since ancient times, the figure of the spiritual guide has stood at the center of contemplative and esoteric traditions. It would appear that all such traditions stress the necessity of a spiritual preceptor who has immediate knowledge of the laws of spiritual development and who can glean from the adept's actions and attitudes his respective station on the spiritual path as well as the impediments that lie ahead. Furthermore, the guide is responsible for preserving and advancing the precise understanding of the teaching and spiritual discipline to which he is heir, including both a written tradition and an oral tradition “outside the scriptures,” which at its highest level is passed on from master to succeeding master and to certain disciples according to their level of insight. The precarious nature of this transfer has been recognized by all traditions, but no one has described the situation more succinctly than the fifth Chan patriarch, who warned that from “ancient times the transmission of the Dharma has been as tenuous as a dangling thread” (Yampolsky, 1967, p. 133).

Hinduism is not alone in its insistence that the spiritual bond (*vidyāsambandha*) that exists between the spiritual preceptor (*guru*) and his disciple (*śiṣya*) is no less real than a blood relationship. Taking Socrates as the model preceptor, Kierkegaard maintained that the maieutic relationship between teacher and disciple was the highest possible relationship between man and man. Socrates, writes Kierkegaard, entered into the role of midwife, not because his thought lacked “positive content,” but because he “perceived that this relationship is the highest that one human being can sustain to another” (Kierkegaard, 1962, p. 12; cf. Plato, *Theaetetus* 150).

Whether he is regarded as a midwife, *daimōn*, or *bodhi-sattva*, the paradigmatic feature of the spiritual guide is always his intermediate status; in a hierarchically ordered cosmos, the guide is situated in an intermediary world of subtle possibilities, between the realms of pure matter and pure spirit, between earth and heaven, or, one might say, between the exoteric and esoteric. The mythological paradigm for this idea finds expression in a variety of forms: Eros is the half-mortal, half-immortal *daimōn* of special significance to Socrates (See Plato, *Symposium* 202); in Twelver Shiism the guide is the Hidden Imām who lives unseen in the third world of the esoteric Church, a Paradise *in potentia*, between the physical and spiritual cosmos; and as Hermes, he is both the messenger of the gods and their interpreter (*hermeneutēs*), an intermediary between the terrestrial and celestial worlds who has an additional function as the “guide of the souls of the dead.”

The legitimacy of the unearthly, inner guide has been vouchsafed by all traditions; but the “masterless master” who has been initiated and guided by the inner spiritual guide without first having been counseled by an outer, human guide (as in the case of Ibn al-ʿArabī, the “disciple of Khidr”; see Corbin, 1969) is especially rare. Hui-neng, the sixth Chan patriarch, said that if a man cannot gain awakening on his own

he must obtain a good teacher to show him how to see into his own self-nature. But if you awaken by yourself, do not rely on teachers outside. If you try to seek a teacher outside and hope to obtain deliverance, you will find it impossible. If you have recognized the good teacher within your own mind, you have already obtained deliverance. (Yampolsky, 1967, p. 152)

On the other hand, the Indian guru Maharaj has suggested that it is the inner guru who leads the disciple to the outer guru, and it is the outer guru who reveals the inner guru (Maharaj, 1973).

**ANCIENT GREECE.** Pythagoras and Socrates remind us that the worthy figure of the spiritual guide is not confined to the strict forms of religion but can also be identified in various fraternities, orders, and academies whose primary concern is the self-transformation and spiritual enlightenment of their members. As is often the case with founders of religions and lineages, there are no writings that have been attributed to

Pythagoras or Socrates. The first written material on the “master” or founder of these traditions emerges often only after a long gap, so that in the instance of Pythagoras we find many of the earliest accounts idolizing and mythologizing him, attributing numerous miracles to him but remaining silent as to the essentials of his teaching.

According to Aristotle, the Pythagoreans taught that among rational beings there is that which is God, that which is man, and “that which is like Pythagoras” (Arist., frag. 192). The spiritual guide, as in the case of Pythagoras, stands between the human and the suprahuman worlds, between the mundane and the sacred; the guide is the intermediate *par excellence*, mediating energies from above and attracting disciples from below. The idea is further exemplified by the tradition quoted by Diogenes Laertius that Pythagoras was the son of Hermes in a previous incarnation and that he received from his father a memory of all things that had happened to him (Diogenes Laertius 8.4).

The historical Pythagoras, however, remains a mystery; we have inherited a fragmentary picture of his ascetic practices, taboos, *sumbola*, and orally transmitted maxims, but nowhere does the man Pythagoras emerge.

The problem with Socrates is somewhat different. Whereas Pythagoras had no single student to organize his teaching into a “system,” Socrates was followed by his disciple Plato. But the problem here is trying to separate the real Socrates, whose stature as an exemplary guide emerges even in the dialogues, from Plato’s literary achievement “Socrates.” Jacob Needleman’s study of the *Symposium* (in *The Heart of Philosophy*, New York, 1982) reminds us of certain aspects of Socrates’ personality and energy as a guide, aspects that have been long overlooked by philosophers. Socrates, as in the other dialogues, is allowed to speak for himself to the extent that he alone among Athenians admits that he does not know; he is a man who is questioning. The state of questioning once again reflects the idea of the intermediate; it represents an intermediate state of unknowing, free at least from false and unexamined views. Similarly, Alcibiades, as the “authentic” pupil of Socrates, is also alone in that, unlike the other Athenians, he is neither for nor against Socrates; many times he wishes Socrates were dead, and yet he realizes that his death should make him more sorry than glad. Alcibiades is, alas, at his “wit’s end” when he enters the *symposium*. A glimpse of Alcibiades’ estimation of Socrates is given after the former recounts his failed amorous advances:

What do you suppose to have been my state of mind after that? On the one hand I realized that I had been slighted, but on the other I felt a reverence for Socrates’ character, his self-control and courage; I had met a man whose like for fortitude I could never have expected to encounter. The result was that I could neither bring myself to be angry with him and tear myself away from his society, nor find a way of subduing him to my will. . . . I was utterly disconcerted, and wandered about in a state of enslavement to the man the like of

which has never been known. (Plato, *Symposium* 219, trans. Hamilton)

Many other of Socrates’ extraordinary attributes are described by Alcibiades in the dialogue, including Socrates’ ridiculous and yet perfect choice of words (221), so that one might finally agree with Alcibiades that Socrates’ “absolute unlikeness to any human being that is or ever has been is perfectly astonishing” (221).

**JUDAISM.** Although it is difficult to speculate on the figure of the spiritual guide as he might have existed in ancient Judaism, as, for example, suggested in the texts of *Psalms* and *Ecclesiastes*, the dominant figure of later times became the rabbi. The title is derived from *rav* (“master” or “teacher”) and a suffix of possession; hence its literal meaning is “my master” or “my teacher.” In modern times the Western world has come to regard the rabbi as a congregation leader, but his original function as a “master” is indicated in the New Testament where Jesus is frequently referred to as rabbi. Similarly John the Baptist is indicated by the title in a singular instance (*Jn.* 3:26). Jesus, when he warned his disciples not to call themselves rabbis, surely meant that this title was not to be taken lightly.

In Talmudic times the rabbi was an interpreter and teacher of the Bible and the oral law (*Mishnah*). Like many teachers in the nonmonastic traditions of the East, the rabbi derived no income from these activities but had an additional occupation that produced private income; most often he was a simple artisan or craftsman. According to doctrine, all rabbis are mutually equal, while reserving their individual freedom to give ordination to suitable disciples. However, the rabbinical mysticism of the medieval period emphasized hierarchy in other ways; to belong to the inner circle of discipleship presupposed an extraordinary degree of self-discipline. Furthermore, the most esoteric level of exegesis and transmission of teaching was reserved for the most select: “It is forbidden to explain the first chapters of *Genesis* to more than one person at a time. It is forbidden to explain the first chapter of *Ezekiel* even to one person unless he be a sage and of original turn of mind” (*Hag.* 2.1).

The title was adopted and altered to *rebe* by Hasidism in the eighteenth century. The didactic and often humorous stories told by the *rebeyim* of Poland and East Europe were passed on by tradition, so that collections exist today that faithfully reflect the scope and activity of these remarkable guides (see Buber, 1947–1948 and 1974).

**CHRISTIANITY.** The foundation for guidance and discipleship in the Christian tradition is naturally found in the reported actions of Christ: he called his disciples to him; they lived with him and were taught by his actions, words, and gestures.

For Christianity in general, Christ has remained the unequalled teacher, rabbi, a transcendent inner guide through whom man seeks salvation. Over and beyond this tendency toward reliance on a transcendent guide, Eastern Orthodox

Christianity has stressed the importance of the *startsy*, or elders, who guide one's spiritual and practical work. The primary texts of this tradition (called hesychasm) are contained in the *Philokalia*. They represent an unbroken tradition of practical guidance based on the teachings and disciplines of the Desert Fathers, having been written between the fourth and fifteenth centuries by spiritual masters of the Orthodox tradition. The texts show the way to awaken and develop attention and consciousness, and they describe the conditions that are most effective.

Many of the writings indicate the difficulty of accepting the vocation of spiritual guidance and attempt to discourage the false guide from destructive actions and consequences. Nilus the Ascetic (d. around 430) writes:

But what if someone, not from any choice of his own, is obliged to accept one or two disciples, and so to become the spiritual director of others as well? First, let him examine himself carefully, to see whether he can teach them through his actions rather than his words, setting his own life before them. . . . He should also realize that he ought to work as hard for his disciples' salvation as he does for his own; for, having once accepted responsibility for them, he will be accountable to God for them as well as for himself. That is why the saints tried to leave behind disciples whose holiness was no less than their own, and to change these disciples from their original condition to a better state. (*Philokalia*, vol. 1, p. 223)

Not only is there a great temptation for the more advanced monks to consider themselves as highly evolved spiritual guides or directors, but the novice must face the temptation of relying merely on himself and trusting his own judgment when he has as yet insufficient material to understand the guile and cunning of the "enemy." The monk should bring his thoughts and confessions to an elder so that he might learn the gift of true discrimination. John Cassian (d. c. 435) relates: "The devil brings monks to the brink of destruction more effectively through persuading him to disregard the admonitions of the fathers and follow his own judgment and desire, than he does through any other fault" (*ibid.*, p. 104).

But in confessing one's thoughts and concerns there is still the pitfall of following the pseudoguide. John Cassian further encourages monks to seek out spiritual masters who truly possess discrimination and not those whose hair has simply "grown white with age." He relates: "Many who have looked to age as a guide, and then revealed their thoughts, have not only remained unhealed but have been driven to despair because of the inexperience of those to whom they confessed." *Unseen Warfare*, a text with roots in both the Western and Eastern traditions of Christianity, echoes the necessity of a qualified teacher: "A man who follows their guidance and verifies all his actions, both inner and outer, by the good judgments of his teachers—priests in the case of laymen, experienced *startzi* in monasteries—cannot be approached by the enemy" (Kadloubovsky and Palmer, 1952, p. 165).

**ISLAM.** It has been suggested that much of the wit, humor, and fullness of the image of the spiritual guide in the writings of the Desert Fathers and subsequent accounts of spiritual fathers in early Christianity has been gradually diluted and extracted through generations in an attempt to make the writings more generally palatable. The Sūfī master remains, as in the case with various Buddhist guides, a robust and vigorous man, full of life, paradox, and humor.

**Shaykh or pīr.** The *sharī'ah*, or divine law, is meant for all Muslims, but beyond that lies the *ṭarīqah*, or spiritual path, for the *murīd* (literally "he who has made up his will," i.e., to enter the path). In order to enter the path, it is essential that the adept find and be accepted by a spiritual master, a *shaykh* (Arabic) or *pīr* (Persian); as a *ḥadīth* (tradition) says: "When someone has no shaykh, Satan becomes his shaykh."

Many accounts are given of adepts who have undergone seeming rejection and Abūse by the master who must test the resolve and serious intent of the *murīd*. After this testing (sometimes the adept is made to wait for years), the *murīd* will only then actually begin on the path under the guidance of his master.

The Sheikh would teach him how to behave in each mental state and prescribe periods of seclusion, if he deemed it necessary. It was well known that the methods could not be alike for everybody, and the genuine mystical leader had to have a great deal of psychological understanding in order to recognize the different talents and characters of his *murīds* and train them accordingly. (Schimmel, 1975, p. 104)

The keen attention paid by the guide to the daily activities of the adept gradually developed in the course of time to the image of the shaykh "who acutely supervised every breath of the *murīd*." The problem of finding and dwelling in the presence of an authentic shaykh is particularly acute, for the adept must choose a guide (or be chosen by a guide) who possesses the qualifications for guiding that particular disciple. "Not every *sheikh* is a master for every disciple. The disciple must seek and find the master who conquers his soul and dominates him as an eagle or falcon pounces upon a sparrow in the air" (Nasr, 1970, p. 144).

The absolute necessity of a spiritual guide is so central to the credo of Sufism that at least one biography of the Sūfī master Abū Sa'īd ibn Abī al-Khayr (d. 1049 CE) reports the maxim that "if any one by means of asceticism and self-mortification shall have risen to an exalted degree of mystical experience, *without having a Pīr to whose authority and example he submits himself*, the Sūfīs do not regard him as belonging to their community" (Nicholson, [1921] 1976, p. 10).

In this way the transmission of doctrine, method, and exercises is secured in a continuous lineage traced back through a series of dead pīrs or shaykhs to the Prophet. The appearance of Muḥammad and his son-in-law, 'Alī, at the head of a list fits in more with necessary fiction than strict historicity; the Sūfīs maintained they were the legitimate heirs of the esoteric teachings of the Prophet. Abū Sa'īd's lin-

eage is traced by his biographer through ten *pīrs* to Muḥammad; the twentieth-century Ṣūfī saint Shaykh Aḥmad al-ʿAlawī (d. 1934) is credited with a “tree of spiritual mastery” including scores of generations as well as sectarian connections complex enough to require a navigator (see Lings, 1973, appendix B).

Although the shaykh has certainly undergone the ascetic and meditative training through which he guides his pupils—*dhikr* (“remembrance” [of God]), fasting, deprivation of sleep, intense physical labors, and so on—he abides in the fullness of life, active and yet detached from his actions. “The true saint,” states Abū Saʿīd, “goes in and out amongst the people and eats and sleeps with them and buys and sells in the market and marries and takes part in social intercourse, and never forgets God for a single moment” (Nicholson, 1921, p. 55). For this reason the shaykh’s actions often appear paradoxical or inconsistent with Islamic doctrine. Nicholson relates yet another story of Shaykh Abū Saʿīd from the *Asnār*: when the shaykh was holding one of his lavish feasts and entertainments, an arrogant ascetic—ignorant of the shaykh’s novitiate and forty years’ austerities—challenged him to a forty-day fast, hoping to humiliate the shaykh before his pupils and thereby earn their respect. The shaykh accepted and ate nothing while the ascetic continued to eat the small amounts of food allowed by the practice. Throughout the forty days the Ṣūfīs continued by order of Abū Saʿīd to be served delicious food while the two looked on. Finally the ascetic, no longer strong enough to perform his obligatory prayers, confessed his presumption and ignorance.

**The Perfect Human Being.** The idea of the Perfect Human Being (*insān-i kāmil*) seems first to have been employed by the Ṣūfī theologian Ibn al-ʿArabī (d. 1240) and somewhat later in a more technical sense when al-Jīlī (d. between 1408 and 1417) systematized his predecessor’s work. Although the idea of the Perfect Human Being has received several different treatments, a general definition might describe him as “a man who has fully realised his essential oneness with the Divine Being in whose likeness he is made” (Nicholson, 1921, p. 78). The saint (*walī*) is the highest knower of God, and consequently he occupies the highest of all human degrees, saintship (*walāyah*), as the Perfect Human Being *par excellence*. Al-Jīlī maintained that the Perfect Human Being of any period was the outward manifestation of the Prophet Muḥammad’s essence, claiming that his own spiritual guide was just such an appearance. According to the system of Ibn al-ʿArabī and al-Jīlī, the Ṣūfī shaykhs are “vicegerents” of Muḥammad, invested with the “prophecy of saintship” and brought back by God from the state of *fanāʾ* (“annihilation”) so that they might guide the people to God. Something of this idea is reflected in the definition by Maḥmūd Shabistarī (d. 1320) of the Perfect Human Being as he who follows a twofold movement: down into the phenomenal world and upward to the divine world of light.

Mention must also be made of the Ṣūfī master’s relationship to the role of the twelfth imām, who is the Hidden

Imām in both Shiism and Sufism. The Hidden Imām is the pole (*quṭb*) with whom all Ṣūfī masters are inwardly connected.

As Annemarie Schimmel writes:

The veneration shown to the *imām* and the *quṭb*, as manifested in the mystical preceptor, is common to Sufism and Shiism. The Shia teaches: “who dies without knowing the imām of his time, dies an infidel,” and Jalāluddīn Rūmī (d. 1273), though a relatively moderate Ṣūfī, said: “He who does not know the true *sheikh*—i.e., the Perfect Man and *quṭb* of his time—is a *kāfir*, an infidel.” (Schimmel, 1975, p. 200)

**HINDUISM.** The idea of a spiritual preceptor to guide one’s study of religion and philosophy has been a constant influence on the religion of India since the most ancient times. Already in the *R̥gveda* we see him referred to as the *ṛṣi* (“seer”) or *muni* (a sage, or “silent one”); as such, he is the possessor of deep spiritual insights (often resulting from performing austerities) and is considered to be the “author” of the sacred hymns. In later times we find him referred to as *ācārya*, *brahmāṇa*, and *svāmi* (swami), but he has most dramatically captured the attention of the West as the *guru*.

Only knowledge that was gained from a teacher was capable of successfully leading one to one’s aim (*Chāndogya Upaniṣad* 4.9.3). And from *Chāndogya Upaniṣad* 6.4.1f., it appears that the spiritual guide is also necessary in order to cut through and disperse mundane, empirical knowledge and to become conscious of true spiritual knowledge.

There is also the prevalent concern for the secret transmission of esoteric knowledge. Hence, *Chāndogya Upaniṣad* 3.11.5 states that a father can teach the esoteric doctrine to “his eldest son or to a worthy pupil, and to no one else, even if one should offer him the whole earth”; see also *Aitareya Āraṇyaka* 3.2.6.9: “Let no one tell these *samhitās* to one who is not a resident pupil, who has not been with the teacher for at least a year, and who is not himself to become a teacher.” That the pupil is often tested by the *guru* and admitted only sometimes after a novitiate or probation is attested to in several sources (e.g., *Chāndogya Upaniṣad* 8.7.3; *Praśna Upaniṣad* 1.2).

It would seem that the word *guru* is used in the sense of “teacher” or “spiritual guide” for the first time in *Chāndogya Upaniṣad*, but one should also point out that its original adjectival sense (“heavy one” or “weighty”) is illustrative of the widespread belief that holy persons are characterized by uncommon weight, not necessarily in the outer, physical sense. Hendrik Wagenvoort and Jan Gonda have both commented on this (Gonda, 1947, 1965; Wagenvoort, 1941). Wagenvoort has shown that *guru* is etymologically related to Latin *gravis*, which is remarkable only because its derivative, *gravitas*, was frequently used in connection with the nouns *auctor* and *auctoritas*. The Latin expression *gravis auctor* (“the important or true authority”) also carries the same general sense of a *guru* as a man of influence who takes the initiative, in other words, a man who can “do” and have an effect on others.

Although the tendency to deify the *guru* only gradually gained a doctrinal position, the idea can already be seen in the *Svetāśvatara Upaniṣad* 6.23, which speaks of a man who has the highest love and devotion for God and for his *guru* as for God. In later times this distinction is erased so that the *guru* is identified with the gods. The great poet and mystic Kabīr (d. c. 1518) taught that the *guru* should be recognized as the Lord himself; a view echoed by Caitanya (d. 1533) and his followers. This process of deification (no doubt aided by the conception of *avatāras*) went to such extremes that the *guru* might be said to have usurped and displaced the gods in importance. Thus, the Śaiva texts teach that if Śiva becomes angry, “then the *guru* can pacify him, but if the *guru* becomes angry, no one can pacify him.”

It is in relation to this theme that the idea of the “guru’s grace” arose, a concept of particular force even today. Many Indian seekers feel that the mere presence of the *guru* (as in *satsang*, or keeping spiritual company) can somehow lead the pupil to liberation. This view, however, is not held universally. One can easily find numerous exceptions that suggest that the intensity of the disciple’s wish for knowledge and his earnest striving are all that is necessary; the *guru*’s only true function then is to act as a messenger. Seen in this light, one can easily understand the statements that contend there is no lack of *gurus*, only of qualified and true disciples.

That the prestige and influence enjoyed by *gurus* has persisted to modern times is attested to by certain teachers of our century who possess the force and unmistakable ring of authenticity. One need only mention by way of example the writings by and about Nisargadatta Maharaj, Ramana Maharshi, and Shri Anirvan. Although in modern times there has been a great deal of speculation and criticism about the claims made by many spiritual guides of India, especially those offering their services to the West, it would be difficult and perhaps a mistake to attempt to judge those teachers on the basis of their outward actions. For no one, as Maharaj has said, could know the motives behind the actions of a truly realized *guru*. To illustrate this point, Maharaj tells the story of a *sannyāsin* (world-renouncing ascetic) who was told by his *guru* to marry. He obeyed and suffered bitterly. But all four of his children became the greatest saints and *ṛṣis* of Maharashtra.

**BUDDHISM.** Accounts of the Buddha’s early life indicate that he retired to the forest in order to receive the teaching and guidance of various celebrated hermits and teachers. However, after practicing a series of austere yogic exercises for several years, the Buddha determined that their guidance was insufficient and set out on his own to attain enlightenment. Once the Buddha attained his enlightenment he remained in a blissful state of meditation for several days and contemplated the trouble he would cause himself should he attempt to share his vision and offer guidance to a deeply deluded and ignorant mankind. He overcame this final temptation of remaining secluded and private in his vision, resolving to share his knowledge with other seekers and to guide them towards

a similar transformation. It is upon this fundamental attitude that the Buddhist tradition of spiritual guidance takes its precedence.

Unlike some Indian traditions that tend to view the *guru* as an incarnation of divinity or as an intermediary to the sacred, early Buddhism emphasized the humanity of the guide and his own attainment of spiritual knowledge. The term designated by the texts for the guide or teacher is “good or virtuous friend” (Pali, *kalyāṇamitta*; Skt., *kalyāṇamitra*). The *kalyāṇamitra* provides guidance based entirely on the insight he has gained from personal experience. In one instance the *Samyutta Nikāya* reports that when Ānanda suggested to the Buddha that reliance on “virtuous friends” was half the holy life, the Buddha corrected him by declaring it the whole of the holy life. The same text (1:88) relates an episode in which the Buddha describes himself as the “virtuous friend” *par excellence*, as a spiritual guide who leads sentient beings to freedom from birth, old age, suffering, and death.

**Bodhisattva.** At the core of the development of Mahāyāna Buddhism was the role to be performed by the *bodhisattva* (“enlightenment being”). Mahāyāna doctrine argues that the old order was decidedly individualistic and that the emphasis on desiring a personal liberation, or *nirvāṇa*, was actually a hindrance to the full development of one’s spiritual potentialities, stopping the larger movement toward “complete enlightenment.” The *bodhisattva* relinquishes his personal enlightenment and vows to work for the enlightenment of all sentient beings. After attaining the requisite insight (*prajñā*), the final stage of the *bodhisattva*’s career is devoted to the welfare of others as practiced via skillful means (*upāya*). The doctrine maintains that *prajñā* without *upāya* leads to the incomplete quietistic enlightenment, while possession of *upāya* without *prajñā* results in continued bondage to *samsara*. Therefore, the skillful guidance of others toward enlightenment, as an expression of compassion, becomes paramount to the spiritual progress of the *bodhisattva*; through this process of guidance something “more” is gained by him.

The employment of skillful means or technique is essentially intended for use by those spiritual guides or masters who possess a complete and perfect knowledge of the teachings and the methods of practice and who are themselves free from the delusions of the mind and emotions. The *bodhisattva* perceives through spiritual insight (*prajñā*) the inner barriers and the potentialities of the pupil and can respond to each accordingly. Candrakīrti (fl. 600–650 CE) argued that contradictory teachings would naturally arise because the Buddhas were physicians rather than teachers; in considering the mental and spiritual stations of their disciples, the Buddhas would vary their teachings accordingly. The idea that the master could teach people by playing various roles while remaining inwardly free was presented in its ultimate form by the *Vimalakīrti Sūtra*, which declared that even the Māras are all *bodhisattvas* dwelling in an “inconceivable liberation” and “playing the devil in order to develop beings through their skillful means.”

**Lama.** In what historians have termed the “second diffusion of the teaching” in Tibet, the Buddhist masters emphasized the necessity of an authoritative tradition of teaching, the validity of which was assured by direct transmission from master to disciple. The first two schools of Buddhism to appear in Tibet were the Bka’rgyudpa (Kagyüpa) and Bka’gdamspa (kadampa), founded by Marpa (d. 1096 or 1097) and Atīśa (d. 1054) respectively. With regard to the esoteric tradition of initiation and oral transmission, both schools recognize the same Indian teachers. It is also clear that the first objective of both Marpa and Atīśa was to gather around them tested disciples who would be capable of transmitting the tradition. When asked by a disciple whether scripture or one’s teacher’s instructions were more important, Atīśa replied that direct instruction from one’s teacher was more important; if the chain of instruction and transmission is broken, the text becomes like a corpse, and no power can bring it new life. Marpa’s Indian teacher, Nāropa (d. 1100), gave him similar instruction when he declared:

Before any guru existed  
Even the name of Buddha was not heard.  
All the buddhas of a thousand kalpas  
Only came about because of the guru.  
(Nalanda Translation Committee, 1982, p. 92)

There is, perhaps, nowhere in world literature a more dramatic and haunting portrayal of the kind of guidance provided by a great master than is found in the *Life of Milarepa*, an account of Marpa’s most famous disciple, Milaraspa (d. 1123). Milaraspa came to Marpa filled with remorse for the evil he had done by sorcery in his youth; he sought instruction that could free him from the karmic consequences in his future lives. But, as Lobsang P. Lhalungpa has pointed out, Marpa clearly perceived that, as a result of his previous actions, Milaraspa could not gain the desired transformation by means of any normal training. “Thus, as the condition of receiving the Dharma, Mila was required to fulfill a series of bitterly demanding and dispiriting tasks. In enforcing the great ordeals, Marpa used shifting tactics and seemingly deceitful ways” (Lhalungpa, 1977, p. x). During the so-called ordeal of the towers Milaraspa was commanded by Marpa to build single-handedly a tower. But each time Milaraspa had completed a tower, Marpa ordered him to tear it down, claiming he had not paid enough attention to the plans or that he had been drunk when he gave the “Great Magician” directions. Finally, having constructed a ten-story tower (which is still said to exist today) and at the brink of suicide, Milaraspa at last received from Marpa the secret teaching. Not just Milaraspa but Marpa’s wife and several of his disciples were baffled by the apparent cruelty and irrationality of the lama Marpa, of the verbal and physical abuse he showered on Milaraspa and his seeming lack of compassion. Marpa countered the doubts of the uninitiated by saying that he merely tested Milaraspa in order to purify him of his sins.

After these trials, Marpa led his disciple through initiations and offered instruction and consultation on medita-

tion. It is said that Milaraspa became “even greater than his teacher” and he is today remembered in Tibet as the greatest of Buddhist “saints.” Later, when Milaraspa took on his own pupils, one disciple suggested that he must have been the incarnation of a Buddha or great *bodhisattva* owing to the extent of the trials and ascetic practises he had undergone and based on his great devotion to his lama. Milaraspa replied tersely that he had never heard whose incarnation he was.

**Zen patriarchs and Zen masters.** It has been observed that every tradition emphasizes the importance of an oral tradition of instruction for the guidance of adepts. The foundation of Chan (Jpn., Zen) Buddhism is based squarely upon this premise, as is indicated in the following verses attributed to the “founder” and first Chan patriarch in China, Bodhidharma (d. before 534):

A special tradition outside the scriptures;  
No dependence upon words or letters;  
Direct pointing at the soul of man;  
Seeing into one’s own nature, and the attainment of  
Buddhahood.  
(Dumoulin, 1963)

Hui-neng, the sixth patriarch, was said to have been illiterate, and it is reported in a story that is most probably apocryphal that he ordered all of the *sūtras* of his monastery thrown into a heap and burned in order to teach his disciples not to rely on word and texts but direct experience only.

The golden age of Chan in China (the period from Hui-neng’s death until the persecution of Buddhism in the ninth century) was a time in which Chan masters of the most remarkable originality won the day. These were vigorous and effusive men who sought to bring their disciples to new levels of insight by demonstrating their own inexpressible experiences of enlightenment by shocking and often violent methods.

One such figure was Mazu (d. 786). A robust and unflinching presence, Mazu is described in a Chan chronicle of the period as a man of remarkable appearance: “He strode along like a bull and glared about him like a tiger.” He was the first to use shouting (especially the famous cry “ho!” [Jpn., “katsu”]) as a means to shock the disciple out of his habitually duality-conscious mind. In one famous story it is related that after a typically paradoxical dialogue with one of his disciples, Mazu grabbed him by the nose and twisted it so violently that the pupil cried out in pain—and attained enlightenment.

For Mazu the important thing was not a deluded attachment to quiet sitting in meditation but enlightenment, which could express itself in everything. This was impressed upon Mazu by his own master, Huairang (d. 744). While still a student, Mazu was “continuously absorbed in meditation.” On one occasion Huairang came across Mazu while the disciple was engaged in meditation and asked, “For what purpose are you sitting in meditation?” Mazu answered, “I want to become a Buddha.” Thereupon the master picked

up a tile and started rubbing it on a stone. Mazu asked, "What are you doing, Master?" "I am polishing this tile to make a mirror," Huairang replied. "How can you make a mirror by rubbing a tile?" exclaimed Mazu. "How can one become a Buddha by sitting in meditation?" countered the master (Dumoulin, 1963, p. 97f.).

Linji (d. 866) led his numerous disciples toward enlightenment by continuing and enlarging the use of shouting, adding to that his own favorite method of beating disciples. The "shouting and beating" Chan of Linji was not intended as punishment or random mischief. Experience had taught Linji that harsh and unexpected encounters with "reality" could lead more quickly and certainly to enlightenment than endless lectures and discourses.

An unrelenting giant among Japanese Zen masters was Hakuin (d. 1769). Born in a "degenerate" period of Buddhism in Japan, Hakuin revived the Rinzai form of Zen begun by Linji, particularly emphasizing the investigation of *kōans* and "sitting in the midst of activity." Throughout Hakuin's life he attacked forms of "silent-illumination Zen," which he consistently referred to as "dead-sitting." In his youth, Hakuin tells us, his *kōan* meditation was poor, and as a result he engaged in dead-sitting until his Zen-sickness was cured by the instruction of an insightful teacher, the hermit Hakuyu. As a result, Hakuin was totally uncompromising in his insistence of a right understanding of meditation; his ironic and acerbic tone seems to have been inherited from the harsh patriarchs and Zen masters of the past:

How sad it is that the teaching in this degenerate age gives indications of the time when the Dharma will be completely destroyed. Monks and teachers of eminent virtue, surrounded by hosts of disciples and eminent worthies, foolishly take the dead teachings of no-thought and no-mind, where the mind is like dead ashes with wisdom obliterated, and make these into the essential doctrines of Zen. They practice silent, dead sitting as though they were incense burners in some old mausoleum and take this to be the treasure place of the true practice of the patriarchs. They make rigid emptiness, indifference, and black stupidity the ultimate essence for accomplishing the Great Matter. (Yampolsky, 1971, p. 170)

It has been argued that the ultimate purpose of the Zen master is one thing alone: to produce a disciple who can carry on the teaching and preserve the transmission of the Dharma. The lineages of many famous monks became extinct after a generation or two because they had no disciples to hand down their teachings.

The biography of Bozhang (d. 814) states: "He whose view is equal to that of his teacher diminishes by half his teacher's power. He whose view exceeds that of his teacher is qualified to transmit the teaching." Hakuin was keenly aware of the necessity of producing a worthy disciple and in fact sanctioned several of his own pupils to carry on his teaching. Armed with spiritual powers and techniques for

guiding others in their quest for enlightenment, the Zen master "smashes the brains of monks everywhere, and pulls out the nails and knocks out the wedges." With typical Zen irony Hakuin describes the worthy successor he has produced who is qualified to transmit the teaching: "Without the least human feeling he produces an unsurpassedly evil, stupid, blind oaf, be it one person or merely half a person, with teeth sharp as the sword-trees of hell, and a gaping mouth like a tray of blood. Thus will he recompense his deep obligation to the Buddhas and the Patriarchs" (Yampolsky, 1971, p. 39).

STUART W. SMITHERS (1987)

**SPIRITUALISM** is a widespread and generally unorganized movement that arose in the United States at the end of the 1840s, was influential through the nineteenth century in the United States and elsewhere, and persists at the beginning of the twenty-first century. At its core is the belief that the living can conduct conversations with spirits of the deceased through a sensitive instrument (either a mechanical or electronic device) or a human *medium*.

Spiritualism's advent was occasioned by two events. The first was the publication of Andrew Jackson Davis's visionary cosmology and universal history, *The Principles of Nature, Her Divine Revelations, and a Voice to Mankind*, in 1847. The second was the production of audible rapping that was interpreted as coded responses of spirits to questions posed by two young sisters, Margaret and Kate Fox. Others soon reproduced the sounds during "spirit circles" or séances around the country. Spiritualists later annually commemorated the rappings as having begun on March 25, 1848.

Practitioners said Spiritualism was precipitated when spirits, including that of electrical experimenter Benjamin Franklin, established a practical "spiritual telegraph" between this world and the spirit world. Those who were not Spiritualists looked elsewhere for the sources of the movement, crediting demons, mass delusion, human folly, fraud, or simply to the influence of social and religious trends in the larger culture.

#### SPIRITUALISM'S THEORY AND CULTURAL BACKGROUND.

The "harmonial philosophy" of Davis and his sympathizers envisioned a harmonization of past, present, and future; of matter and spirit; of reason and intuition; of men and women; and of individuals and society. It provided an ostensibly rationalist stock onto which was grafted a variety of exotic psychic phenomena, such as mesmeric trance and the Fox sisters' rappings. The result was "Modern Spiritualism," as it was called, which was optimistic about the destiny of each individual after death and of human society in the long run, and egalitarian insofar as it accepted the revelations of women, children, and others who lacked education or credentials.

Spiritualism was part of the larger culture's effort to reconcile science and religion. In the United States and Europe the intersection of matter and spirit had been explored in experiments with mesmerism. Influential books included the 1845 translation of Justinus Kerner's case study of a somnambulist, *The Seeress of Prevorst*, and the 1855 translation

of Louis Alphonse Cahagnet's description of conversations with entranced clairvoyants, *The Celestial Telegraph*. The term *Spiritualism* came from mesmerism and referred to the concept of an exalted expanse opened to clairvoyants traveling without the body to realms where spirits could communicate secrets to them.

The disappearance or surrender of one's identity to another was a theme of the seventeenth-century mystical writings of Madame Guyon and Francois Fénelon, who emphasized the individual's surrender of the will to divine love. These writings were popular among American antebellum Protestant intellectuals. The Romantic movement fostered a similar surrender of the self, or hypersensitivity to spiritual or psychic "impressions." Goethe had depicted such sensitivity in his novels *The Sorrows of Young Werther* (1744) and *Elective Affinities* (1809), and it was exemplified in Bohemian wanderlust, the desire to follow personal "monitions" rather than conventional expectations. The abandonment of the self to holy enthusiasm and impulse was also encouraged in the religious revivals of the time. The Gothicism of the period resulted in the enormous popularity of Catherine Crowe's 1848 collection of stories about uncanny phenomena, *The Night-Side of Nature*.

The concern with reconciling science and religion, as well as matter and spirit, coincided with a popular interest in the newly translated writings of Swedish engineer and visionary Emanuel Swedenborg, who had conversations with spirits about their lives in other worlds that intersected with this one. Transcendentalists urged a spiritualization of the natural world, and Perfectionists suggested that the earthly could be reformed into, or revealed to be, the heavenly, stimulating seekers to set up utopian communities founded on the ideas of French socialist Charles Fourier. Also influential in the birth of Spiritualism was an efflorescence of trance visions among Shakers during the late 1830s and 1840s, which presaged many of the features of Spiritualism.

Spiritualism promoted the notion of surrendering the will to the inspiration of spirits, but it simultaneously elevated the importance of the individual's perception and judgment. It assented to testing the reality of the spirits, ranking empirical experience over traditional authority. It made a "scientific" appeal to evidence available to anyone. It also adopted the individualism and anticlericalism of the Protestant dissenting tradition, evident in the Pietistic origins of the religious groups—such as the Universalists, the Unitarians, and Quakers—among whose members Spiritualism flourished. Spiritualism, by and large, was antiauthoritarian and Spiritualists valued the liberty of individual conscience. The movement was associated with progressive politics and social theory, and was most popular in the northern United States. Southerners often saw spiritualism as one strand of a twisted skein of Yankee fanaticism that also included such causes as utopian socialism, women's rights, and the abolition of slavery.

Spiritualists accepted the naturalistic idea of geological and biological change and development, and they extended the idea to religion, which they believed also evolved and progressed. Spiritualists supposed that individuals progressed as well, continuing beyond this life into the afterlife, and Spiritualism thus expanded the realm of natural law into the supernatural. They did not view the Fox sisters' rappings or other Spiritualistic phenomena as miracles in the sense of a suspension of natural law, but they saw such phenomena as the ultimately rational—although not yet understood—effects of the interaction between this world and the higher world. The clairvoyant travels of spirit mediums also resembled the travels of naturalist explorers of exotic cultures, such as, for example, A. J. Davis's travels while in "the superior state" to the afterlife, which he envisioned as "The Summerland," a socialist community of enlightened souls. The "scientific" tendencies of Spiritualists led some of their early religious opponents to refer to them as "rationalists."

Many personal accounts described conversion to Spiritualism as a joyful liberation from a bleak Calvinist belief that the soul was powerless to affect its final disposition, or even liberation from an arid materialist belief that denied life after death. Other accounts described the adoption of Spiritualism as only a small step from the beliefs of liberal churches that already had a tenuous relationship with traditional Christian doctrine. Many Spiritualists saw themselves as "come-outers," that is, as part of a group that had left Christianity, just as their spiritual forebears had left corrupted churches. Many other Spiritualists, however, believed that they were simply finding their way back to the true core of Christianity and called themselves "Christian Spiritualists." Spiritualists were early advocates of "higher criticism" of the Bible and they were convinced that apocrypha, such as Gnostic texts, contained a true picture of Jesus's life and teachings. Spiritualists generally accepted the rococo speculations of comparative religion as it was practiced by such savants as Louis Jacolliot, who believed that the biblical story of Christ was a fiction based on the Hindu myth of Kṛṣṇa.

Traditional churches vigorously opposed Spiritualism, attributing it to the devil and equating it with previous forms of necromancy. Traditional churches also opposed Spiritualism because it made revelation deliberately open-ended and subject only to individual judgment. Spiritualism moved religion from churches, which were public places subject to the control of traditional (male) authority, to home parlors, which were private places subject to domestic (female) sentiment, or, as opponents put it, dark places where people were free of restraint. Opponents also took issue with Spiritualists' equating the authority of the Bible with that of the messages and wonders produced at séances and in other religions.

Most of the public and most scientists, with a few exceptions, treated Spiritualism as delusion, fraud, or mental disorder. Some scientists attributed séance messages to the medium's ability to read the thoughts of others in the spirit circle, rather than to the medium's ability to hear the whis-

perings of spirits. These scientists believed this explanation was more naturalistic.

In nineteenth-century America, Spiritualism bore the marks of the progressive wing of Protestantism. Local varieties, however, sometimes drew from other sources, such as the Spiritualism of New Orleans, which incorporated Catholicism's traditions of intercessory saints and sacraments, as well as voodoo. The Spiritualism practiced in some parts of the United States incorporated Native American methods of divination, trance induction, and spirit possession, and white mediums often discovered that their spirit guides were Indians. Modern Spiritualism was largely a phenomenon of white Americans, however, with some notable exceptions, such as Sojourner Truth and Pascal Beverly Randolph. Nevertheless, Spiritualists believed that spirit contact was at the heart of all religion, and they believed they found support for this view in the Bible, in ancient accounts of the Sibylline oracles and of prophets and druids, and in historical records of witchcraft and haunting.

Some opponents of Spiritualism argued for replacing the term *Spiritualism* with *spiritism*. As they saw it, *Spiritualism* was a word with wide application but only appropriate as a contrast to *materialism*. They insisted that *spiritism* was the proper term for what was commonly called "Spiritualism," which, according to them, was merely a submission or unhealthy attachment to spirits. Their argument had little effect on popular usage, and gained no acceptance by Spiritualists.

*Spiritism*, however, was used by French seer Hippolyte Léon Denizard Rivail, writing under the pseudonym Allan Kardec. Kardec's publications in the late 1850s and 1860s influenced many in the French-speaking world to accept the reality of spirit contact. They also accepted the existence of reincarnation, whereas American and English Spiritualists, at least for the first decades of the movement, rejected it.

In general, European Spiritualism was more influenced than was American Spiritualism by occult traditions, such as Hermeticism, Rosicrucianism, irregular orders of Freemasonry, and ideas from the eastern lands that Europeans had colonized. Nevertheless, American spirit mediums spread their variety of Spiritualism to Europe by lecturing and holding séances there. Maria Trenholm Hayden, for example, visited England and made an early convert of socialist Robert Owen. Daniel Dunglas Home traveled throughout Europe and gave spectacular performances, some of which powerfully affected the czarist court.

Doctrinal controversies arose within the movement: Did spirits provide tangible assistance or mere comfort? In trance, was the will erased or exalted? Was Spiritualism's essence a public platform of progressive reform, or the phenomenal manifestations of the séance? Why were revelations from trance mediums contradictory? Controversies also arose on the specifics of the afterlife (Were animals reborn there? Was retrogression possible after death?) and on the interac-

tion between spirit and body (Did sexual prompting signal an attraction of true spiritual “affinities?”).

**THE FORMS AND PRACTICES OF SPIRITUALISM.** Spiritualists developed their own church services, with congregational singing of hymns, lectures, and Sunday schools (“lyceums”) for children. Spiritualists also encouraged the development of mediums who could conduct séances or give lectures under the influence of spirits.

The séance was meant to be a ritual communion of the saints still in the flesh with those who had left it, but the séance was also meant to be a proof test of the reality of the afterlife. The earliest Spiritualists formed spirit circles similar to those that mesmerists already used to investigate “animal magnetism,” where men and women touched hands around a table, forming a “magnetic battery.” Mesmeric investigators had produced trance, clairvoyance, eruptions of tics or automatisms, sometimes involving writing or speaking, and the tilting of tables and levitating of people, furniture, and musical instruments. Now sitters attributed these to discarnate spirits rather than to their own manipulations of energy.

Personal messages voiced or written by the medium from the sitters’ deceased friends and family were always the main products of a séance, with the sitters conducting their conversation with the spirits through the medium. But the medium might also give voice to the spirits of famous people who corrected or supplemented the ideas for which they had been known while living. Other phenomena produced at a séance might include musical sounds, disembodied voices, floating lights and phosphorescent hands, and the materialization of coins, flowers, letters, or birds. Mediums produced spirit-inspired songs, poetry, paintings, scriptures and narratives of travel to other times or worlds, revelations of hidden treasures or lucrative business opportunities, chalk messages on slate boards, spirit images on photographic plates, and novel plans for inventions and for political or social reforms. Mediums also reported the ability to read minds, to see the future, and to escape from tied ropes or locked jail cells. At séances in the 1870s and 1880s mediums might extrude from their bodies a pale diaphanous substance eventually called “ectoplasm,” or they might conduct “dark cabinet materializations” in which they were locked in a cabinet and produced spectral forms who walked among the audience.

Mediums also diagnosed disease. Their reputed clairvoyance allowed them to see into a person’s body to the source of illness, and, sometimes with assistance of the spirits of famous physicians, to prescribe treatment. This often included the medium’s manipulation of the energy “aura” surrounding the patient’s body through the laying on of hands. Many mediums made their living through healing, rather than through conducting séances or giving lectures.

Far more women than men were spirit mediums, and male mediums often characterized their sensitivity as a feminine power. Spiritualist lecturers, on the other hand, were often men, although the exceptions—such as self-styled

“trance lecturers” Cora L. V. Scott Richmond, Emma Hardinge Britten, Hannah Frances Brown, Achsa White Sprague, Lizzie Doten, Ada Hoyt Foye, and Amanda Britt Spence—drew enthusiastic audiences, thrilled to see women on a platform speaking fearlessly and authoritatively.

Spiritualists believed that one feminine aspect of Spiritualism was its focus, not on the abstract intellect, but on subjective feeling and on the body. They believed that spirits had begun to affect the biological elevation of the human race by exerting spiritual influence over the conception and development of the human embryo. They also believed the spirits could free women from undesired sex, which literally degraded their offspring. Women had to be made equal to men, and each woman had to be given sole authority over when, and how often, and with whom she would have sex and children. Some Spiritualists were the first public advocates of women’s reproductive rights, and Spiritualists occupied the most radical wing of the early women’s rights movement.

Spiritualists made effective prophets, perhaps, but not loyal group members. They attempted to organize, but with only sporadic successes. Many were leery of setting up a hierarchy that would judge individual practices or experiences. On the other hand, they valued communion, association, and small spirit circles as aids to amplify a medium’s sensitivity. In addition, groups fortified the camaraderie of believers, inculcated children in the belief in spirit communion, trained mediums, and sponsored lecturers. Local associations licensed mediums, ministers, and lecturers to protect them from ordinances against fortune telling and “jugglery.” They also investigated charges of mediumistic fraud or immorality to protect Spiritualism from abuse by con artists or from embarrassment by anti-Spiritualist opponents.

Spiritualists also formed state, regional, and national associations, with varying success, and they held conventions. Propaganda for the movement was carried out by word of mouth, by experiments with séances, by lectures from traveling mediums, and by the publication of pamphlets and books. Spiritualist newspapers connected far-flung and often isolated believers into a community of faith. The most influential were *Spiritual Telegraph*, *New-England Spiritualist*, *Herald of Progress*, *Religio-Philosophical Journal*, and *Banner of Light*.

The first Spiritualist camp meeting was held in a field outside Malden, Massachusetts, in the summer of 1866. Camp meetings became very influential in the movement, sometimes drawing as many as twenty thousand attendees to such rural surroundings as Lake Pleasant, Massachusetts, or Cassadaga, New York (the forerunner of the center for the Spiritualist movement today at Lily Dale, New York, and the namesake for another settlement in Florida).

**SPIRITUALISM’S PROGRESS THROUGH THE NINETEENTH CENTURY AND BEYOND.** The popularity and influence of Spiritualism rose and fell. Little solid evidence exists for judg-

ing the number of Spiritualists during these years because the organizations of Spiritualism were transient, and the criteria of who counted as a Spiritualist were extremely elastic. In the United States population of thirty million on the eve of the Civil War in 1860, estimates of the number of Spiritualists have varied from a few hundred thousand to eleven million. At the time, however, both proponents and opponents of Spiritualism often accepted as reasonable the figure of two to three million Spiritualists.

By the 1880s, Spiritualism's influence had receded. Some Spiritualists defected to the newer systems of Christian Science, New Thought, and Theosophy. Some who were more politically radical were drawn into Freethought, Anarchism, and Communism, losing their religious outlook. At the same time, Spiritualism's influence had diffused through the culture, most notably in the idea of artistic and religious inspiration.

Meanwhile, Spiritualism's séance phenomena had devolved into elaborate materializations that were often indistinguishable from stage magic, inviting well-publicized exposures of fraudulent mediums by such people as magician Harry Kellar, who blazed a trail later followed by Harry Houdini. Scientists investigating Spiritualism also developed more rigorous protocols for what they began to call "psychical research," which eventually allowed the field of psychology to distance itself from the need to consider spirit as a subject for empirical research. Sigmund Freud's development of a compelling theory of the unconscious also helped render the notion of the paranormal uninteresting to psychologists, with some exceptions, notably Carl Jung. By the turn of the century, Spiritualism no longer seemed to many potential converts as a progressive, avant-garde reconciliation of religion and science, but as an antique.

Nevertheless, Spiritualism has continued throughout the world, with periodic revivals, to this day, with an umbrella organization—the National Spiritualist Association of Churches—founded in 1893, forty-five years after the Fox sisters' rappings. Interest in Spiritualism grew in England after World War I, sometimes linked to the desire by survivors for comfort and reassurance, not just concerning the fate of their loved ones who had died, but perhaps also for the old order of society. Since the late 1960s a revival of Spiritualism has taken place under the banner of the New Age movement. A strong element of theatrics, nearly always present in Spiritualism, is continued in television shows in which psychics face studio audiences in order to contact, or even "channel," the spirits.

From the beginning, Spiritualists criticized Christian miracles and superstition. Nevertheless, they also claimed as true the manifestation of physical phenomena that have yet to be empirically verified. Spiritualists sometimes said that the evidence was real but only anecdotal, and that the spirits' ability and willingness to manifest themselves were constrained by the testing requirements imposed by skeptical investigators. On the other hand, like ancient Gnosticism and

present-day postmodernism, Spiritualism judged the objective, external, matter-of-fact world to be essentially devoid of truth. Truth lay instead in a dematerialized, spiritual, inner realm. One goal of Spiritualism was to demonstrate this. As a result, some Spiritualists tacitly believed that if intransigent fact had to be helped along by hidden manipulation, hoax, fiction, or impersonation in order to turn the world into, or reveal it as, or convince an observer that the world was, a magical one in which mind ruled matter, then there was little or no fault, but rather virtue, in doing so.

JOHN B. BUESCHER (2005)

**SPIRITUALITY** is the concern of human beings with their appropriate relationships to the cosmos. How the cosmic whole is conceived and what is considered appropriate in interacting with it differ according to worldviews of individuals and communities. Spirituality is also construed as an orientation toward the spiritual as distinguished from the exclusively material. This entry considers classic spiritualities, contemporary spiritualities, and spirituality as an alternative to religion. By the end of the twentieth century spirituality, long considered an integral part of religion, was increasingly regarded as a separate quest, with religion being distinguished from secular spiritualities. A predilection to speak of

having spirituality rather than having religion indicated a change in worldview and a transition from exclusive religious traditions to inclusive, overlapping expressions of commitment to world and community.

**CLASSIC SPIRITUALITIES.** Each religion has a characteristic way of living in the world. Each embraces an attitude and outlook rooted in its particular worldview and has developed a set of disciplines that assists devotees in pursuing their relationship to the cosmos. Thus, one speaks, for example, of Islamic spirituality, Christian spirituality, indigenous Australian spirituality, or Hindu spirituality. By *spirituality* one denotes the characteristic sentiments and way of life of those who were born into, or came to embrace, a particular tradition. Thus, Crossroad Publishing's series, *World Spirituality: An Encyclopedic History of the Religious Quest*, which treats spirituality as essential to religious traditions, has published volumes on world religions and on indigenous religious traditions. However, recognizing the trend that emerged in the second half of the twentieth century of not confining spirituality to religious contexts, the series includes volumes titled *Modern Esoteric Movements and Spirituality and the Secular Quest*. In a preface, the series editor, Ewert Cousins, states:

The series focuses on that inner dimension of the person called by certain traditions "the spirit." This spiritual core is the deepest center of the person. It is here that the person is open to the transcendent dimension; it is here that the person experiences ultimate reality. The series explores the discovery of this core, the dynamics of its development, and its journey to the ultimate goal. It deals with prayer, spiritual direction, the various maps of the spiritual journey, and the methods of advancement in the spiritual ascent. (Olupona, 2000, p. xii)

Spirituality regarded as a dimension of religious expression may describe the sensibility and practices of schools, orders, or denominations within a tradition. Spiritual leaders and scholars of Christianity distinguish approaches to the spiritual life of various Catholic and Protestant groups—for instance, Jesuit spirituality, Franciscan spirituality, Anglican spirituality, and Calvinist spirituality. Each spirituality employs resources of the Christian tradition (Bible reading, sacraments, prayers, good works) to develop a life based on the example of Jesus Christ and the New Testament. Similarly, each of the schools and movements within Hinduism, Buddhism, and Islam has its characteristic spirituality.

The difference between classic spirituality and those who claim to have spirituality but not religion is not so much a disagreement about what constitutes spirituality. The latter may agree with Cousins that spirituality has to do with "the deepest center of the person" and with experiences of "ultimate reality." Both see spirituality as a way of situating the self in the world. However, while the practitioners of classic spiritualities see spirituality is an aspect of religion, those on contemporary spiritual quests do not limit it in this way.

Moreover, they may see their spirituality as an alternative to religion.

**CONTEMPORARY SPIRITUALITIES.** Contemporary spiritualities combine practices of particular religious traditions with concern for the global situation and the life of the planet. Like classic spiritualities, approaches to spirituality that were developed in the last quarter of the twentieth century are also concerned with cultivation of the self and have generated many volumes on self improvement. Contemporary spiritualities are pluralistic and diverse; they search for a global ethic, are concerned with ecology, encourage the cultivation of healthy relationships, support feminism, and pursue peace.

In *A Spirituality Named Compassion and the Healing of the Global Village, Humpty Dumpty, and Us* (1979) Matthew Fox pointed toward spirituality as an alternative to religion and, indeed, as resistance toward traditional religion. Fox was concerned with compassion as the mode of spirituality that the world needed. Aware of regional and international conflicts, some of them provoked by religious differences, he sought to discover how the members of the global community might learn to live and survive together. "Now that the world is a global village we need compassion more than ever—not for altruism's sake, nor for philosophy's sake or theology's sake, but for survival's sake" (p. 11). Thus, from within his Roman Catholic heritage, Fox began to promote what he said was "a spirituality named compassion," a spirituality that did not belong to a particular religious tradition, but that could be adopted by anyone genuinely committed to the world community. "Survival's sake," as Fox put it, is also the focus of those who, with him, advocate an ecological spirituality. For them it is not only the survival of human communities that is at stake, but also the survival of animal and plant populations and of the earth itself. "Green spirituality" has increasingly become part of religious traditions. David Kinsley, in *Ecology and Religion: Ecological Spirituality in Cross-Cultural Perspective* (1995), showed how concern with the environment becomes part of ongoing religious commitments, building on and reinterpreting the resources of existing traditions and, perhaps, adding to them. This was the concern, too, of the Harvard University Center for the Study of World Religions when in the late 1990s and early 2000s it conducted a series of conferences on "Religions of the World and Ecology." The participants reflected on the literary, doctrinal, and ritual resources that help traditions to think about and respond to the earth. Many of the contributors recognized that religions stand in need of dialogue with each other and with the disciplines of science, education, and public policy. An openness to other traditions and disciplines is a characteristic of many spiritual quests at the turn of the century.

Some, though, have sought not so much to expand traditional religious spirituality to incorporate environmental concern as to abandon traditional religious beliefs and practice in favor of commitment to the environment. Faithful-

ness to earth as their home, and solidarity with the creatures of the earth as their community, shape their orientation toward the world. Some call their quest and their commitment *spirituality* rather than *religion*. With a broad definition of religion, environmentally concerned spirituality could be seen as a new kind of religion—an ecological religion—but such terminology at the beginning of the twenty-first century was still in the making. All religion may have been turning to ecology as some people left behind more organized forms of religion and adopted more flexible and personal forms.

Classic spiritualities prescribed practices to help the person come closer to the ideal upheld by the religion. The self-cultivation aspect of contemporary spirituality has been presented in much popular writing, including that of Thomas Moore. In the early 1990s his trilogy on the soul—the first volume called *The Care of the Soul: A Guide for Cultivating Depth and Sacredness in Everyday Life* (1992), the second *Soul Mates: Honoring the Mysteries of Love and Relationship* (1994), and the third *The Re-Enchantment of Everyday Life* (1996)—were on the *New York Times* best-seller list. His later works have also been popular. Moore advised readers and workshop participants to attend to relationships, to cultivate a sense of place, and to make time for music. Many people who belong to organized religions and many who do not have found his nonjudgmental approach and encouragement of authenticity in daily life appealing. Yet, he has suffered scathing criticism by those who see his work as pandering to self-indulgence.

Contemporary spirituality contended with the many changes the world underwent in the second half of the twentieth century. James Conlon, the director of the Sophia Center in Culture and Spirituality at Holy Names College in Oakland, California, wrote in *The Sacred Impulse: A Planetary Spirituality of Heart and Fire* (2000) of a new vision of the world and of ways of living authentically within that vision. Expressing hope for where this would lead he asserted:

This new vision will involve a synthesis of the wisdom of science, mystical and prophetic traditions, women, indigenous peoples, and other groups that have not previously been heard. We will strive to create a culture that will foster new energy and a zest for life, a culture based on interaction and choice, identity and purpose, images and stories, values and structures that will give renewed expression to harmony, balance, and peace. This will be a culture that celebrates diversity and pluralism at every level—pluralism revealed in the lives and stories of people and groups whose diversity is manifest in language, lifestyle, temperament, economics, and a capacity for inclusion. (pp. 30–31)

**SPIRITUALITY AS AN ALTERNATIVE TO RELIGION.** Among people who say that they do not have a religion but do have spirituality are some who say they once had a religion but that they outgrew it or it let them down. In North America and elsewhere, affirmation of spirituality while criticizing religion has been particularly evident in New Age groups, but has been seen, too, within traditional religions as their mem-

bers search to become more attuned to contemporary circumstances. The shift in terminology that led people to say that they do not have “religion” but do have “spirituality” marked a change in consciousness, representing both a rejection of the perceived shortcomings of religion—such as inflexibility, dogmatism, and authoritarianism—and an embracing of spiritual paths that are both individual and inclusive. Moreover, this shift in terminology pointed to new visions of the world.

Those who wanted spirituality, but not religion, desired to develop themselves in their own ways. They embarked on a quest for authenticity—a quest with promise and problems. The promise lay in the potential for genuine engagement with the world in which they lived, with their own being, and with whatever they considered sacred. The problems were the dangers of self-indulgence and self-delusion against which classic spiritualities warned their devotees. The latter-day emphasis on the self may be at odds, for example, with classic Christian spirituality, which expects the Christian to be selfless in love and good works, and with the Buddhist emphasis on overcoming the self. Reflecting on the fact that many people pursue their spiritual quests without relationship to organized religion James J. Bacik urged respect for, and use of, classic religious ways when he wrote: “Individuals who pursue spiritual growth without benefit of traditional religious wisdom are in danger of adopting faddish approaches or muddling along without a clear goal or a disciplined regimen. Even those who seem to be making good spiritual progress may be missing opportunities for even greater personal growth” (1997, p. viii).

The discourses of religion and spirituality represent different, but often overlapping, understandings of self and world. The language of “religion” points to the shared past of particular groups as a basis for living now. It includes well-honed doctrines and disciplines. It tells devotees how the world is and how they should live in it. Many of the new spiritualities are eclectic, adopting texts and practices from various sources to fashion something that works for the individual. Eclecticism can be offensive to those from whom it borrows. Workshops in the United States that use Native American traditions have drawn the ire of Native people who object, for example, that their purificatory sweat lodge ceremonies have been removed from traditional social and religious contexts and inserted into the New Age seeker’s repertoire. Native American scholars, including Christopher Ronwanièn:te Jocks, have called appropriators of indigenous traditions, such as Carlos Castaneda and Lynn Andrews, to task for their distortion of Native traditions.

The late twentieth-century discourse of spirituality reflected the struggle of people seeking authenticity and wanting to affirm a meaning to life, but not willing to concede control over meaning to religious institutions. The disavowal of doctrine may, indeed, be a hallmark of their spirituality. Among emerging forms of spirituality were New Age, Wiccan, feminist, twelve step, and earth spiritualities. Many, too,

saw spirituality expressed through sport, music, art, and other aspects of cultural life. Thus, jazz, with its improvisational direction, was seen as a manifestation of the spirit of the twentieth century. Not everyone who sought spirituality joined a group, while others went from group to group or belonged to several simultaneously. Seekers of spirituality, usually committed to authentic living, may exhibit great courage in pursuing a life that is faithful to family, friends, and environment.

At least since Friedrich Nietzsche (1844–1900), modern Western culture has spoken of the death of God or the absence of God. As the theologian Wolfhart Pannenberg noted in his Taylor lectures at Yale Divinity School, “Talk about the death or the absence of God points to the fact that the interpretation of the world, as well as the behavior of human beings in the everyday life of modern culture, gets along without reference to God” (1983, p. 71). Similarly, it seems that many human beings can get along without reference to religion, the system that in Western cultures is built around commitment to God. Roots of secular spirituality in Western cultures can be found both in ancient Greek philosophy and in Enlightenment thinkers who were concerned with linking the self to the larger whole without recourse to religion. While the classic usage of the term *spirituality* remains, the term has broadened so that in popular usage spirituality has become something that one might embrace not as a discipline of religion or as a characteristic style of religion, but instead of religion. Spirituality has come to denote a realm of concern with nonmaterial life that may include both religious and secular attitudes. Given the increasing scholarly attention in conferences and publications to the role of spirituality in contemporary culture, it is clear that the academy has recognized spirituality as a subject of study both within and independent of the study of religion.

MARY N. MACDONALD (2005)

**SPITTLE AND SPITTING.** In the past, spittle was generally believed to have magical properties. Early humans, seeing themselves at the center of the universe, perceived connections between their own bodies and cosmic bodies, gods, and demons. They related parts of their bodies to colors, plants, elements, and directions. Spittle, blood, sperm, sweat, nails, and hair became magical substances not only as a result of this unity but also because, after leaving the body, they would retain some essence of that person. Spittle could therefore be positive or negative, depending on the intent of the spitter. Spitting and blood rites have many parallels, since both involve holy fluids that signify psychic energy and are necessary for sustaining physical life. Connections are still made between body fluids and feelings: anger makes one’s blood “boil”; people spit from contempt or “spit out” words in hatred; and our mouths water at the thought of some delight or become dry from fear.

In early myths, life created by spitting is equivalent to the breath of the creator or the divine word. In one version of an Egyptian creation myth, the primeval god Atum spits out his children Shu and Tefnut. Shu was the god of air (e.g., breath), Tefnut was the goddess of moisture (e.g., spittle), and the mouth was their place of birth.

In Norse mythology a being called Kvasir was formed from the spittle of the gods. To commemorate a peace treaty

among them, all the gods spat into a jar, and from this mixture Kvasir was created. He was so wise that there was no question he could not answer. Later he was slain by two dwarfs who mixed his blood with honey and concocted the mead of inspiration. By cunning, the high god Odin swallowed every drop of the mead, changed himself into an eagle, and returned to the waiting gods, who were holding out vessels for Odin once again to spit out the mead. A drink of this mead bestowed the gift of poetry on men. On his flight back, however, Odin had lost some of the mead when pursued by a giant who had also assumed the form of an eagle. This part of the mead became known as the fool-poet's portion.

In this myth, the holy spittle and blood have become identical, one being transformed into the other. Mead, blood, and spittle are three familiar sources of inspiration, here combined in one myth. The Norse gods' making a covenant by spitting is related to the custom of becoming blood brothers. Similarly, to spit into each other's mouth is a way to pledge friendship in East Africa.

To transmit something of themselves, holy persons in their blessings will use some form of physical contact. Muḥammad spat into the mouth of his grandson Ḥasan at his birth. Similarly, at ordination the priest or exorcist in ancient Babylon acquired his powers by having his mouth spat into, presumably receiving the spittle of the god. Among the Luba of present-day Zaire, a candidate being initiated into the order of sorcerers drinks a brew containing spittle from each of the elders; he becomes, thereby, not only blessed with their power but also placed forever under their control.

The role of saliva as a part of healing is well known all over the world. Sometimes the emphasis is on the curative effect of the spittle itself, which is known from the fact that wounds in the mouth heal faster. The observation of wild animals licking their wounds added to this belief. Spittle of people fasting is widely reported to be particularly effective, and it has even been thought strong enough to kill snakes.

Particular significance has been attributed to the spittle of people with unique powers. In his healing, Muḥammad mixed clay with spittle. Similarly, Christ made mud of spittle and clay and anointed the eyes of a blind man, thus restoring his sight. When he spat and touched the tongue of a mute (presumably with saliva) the man could speak. Conferring power of speech on an object spat upon is found in many folk tales.

Sickness is often considered a form of possession by demons who can be exorcised by spitting. In the Babar archipelago of Indonesia, all the sick people expectorate into a bowl that is then placed in a boat to be carried out to sea. In one Buddhist tale, even sins and misfortunes vanish, if one spits upon a holy ascetic.

Spittle is also a protective agent. In southern Europe, praise is sometimes accompanied by spitting to avert the evil eye. Fear of the gods' envy makes some people spit three times, since three is a lucky number. Seeing a black cat or

maggies (animals associated with witches), hearing names of dead people (for fear they might return), or smelling a bad odor (to avoid contamination) are all occasions when spitting becomes a safeguard. Before discarding hair or nails, one should spit so as to prevent their being used by witches in black magic. Because of the same belief that something of the person continues to exist in the saliva, great care was taken not to be seen spitting. Behind the custom of spitting on money found in the street lies the fear that, as a fairy gift, it might disappear.

Good luck can also be invoked by spitting. And the familiar custom of spitting on one's hands before starting a strenuous task, thus adding power, also reveals some lingering faith in the magic of spittle.

#### BIBLIOGRAPHY

A. H. Godbey presents a well-documented study of various customs involving spitting in his article "Ceremonial Spitting," *The Monist* 24 (January 1914): 67–91. Additional material can be found in three encyclopedic works: James G. Frazer's *The Golden Bough*, 3d ed., 13 vols. (New York, 1955), relates principles of magic and religion to local customs and rituals; *The Mythology of All Races*, 13 vols., edited by Louis Herbert Gray and George Foot Moore (Boston, 1916–1932), gives numerous examples of the spitting motif in myths throughout the world; and the *Encyclopaedia of Religion and Ethics*, edited by James Hastings, vol. 11 (Edinburgh, 1920), offers an extensive article on saliva, concentrating on superstitious beliefs.

**SPORTS AND RELIGION.** Throughout human history, sports and religion have been closely linked. Like religion, sports convey important lessons about values and culturally appropriate behavior. The lessons they teach are similar, and both religion and sports use symbols as their primary means of communication. In most of the contemporary world, however, religion and sports occupy separate but complementary conceptual realms. Religion focuses on the idea that, as one anthropologist put it, "there is something more to the world than meets the eye" (Bowen, p. 4). In religion, that "something" is the domain of the divine or of spirit beings; in sport, that "something" is the triumph of the human spirit.

Scholars from a variety of disciplines typically describe religion as operating in the realm of the sacred and as addressing the relationship of human beings to the supernatural or the transcendent. In modern terms, sport is seen as a secular pursuit, concerned with the relationship of human beings to each other. In fact, sport and religion are closely related on a number of levels:

1. Historically, many sports developed as part of religious festivals;

2. Sport is often used as a metaphor for religious striving;
3. Sporting events evoke passionate commitment similar to that of religious festivals;
4. Religion and sport are symbolic systems that emphasize similar values and goals, including transcendence of limited personal desires in favor of nonmaterial achievements or experiences and an emphasis on cooperation and personal sacrifice for the good of the group;
5. Both religion and sport convey their message by means of powerful symbols.

**NATIVE AMERICANS AND ANCIENT GREEKS.** The Central American ball game, played by both the Aztec and Maya before the arrival of Spanish conquistadores in the sixteenth century, was associated with the ritual of human sacrifice. Ball courts were commonly located in the temple complex near the racks where skulls of human sacrificial victims were displayed. Players were sacrificed as food for the gods. The divine origins of the ball game are recounted in the Mayan creation myth *Popol Vuh*, which describes the defeat in a ball game of the underworld gods of sickness and death by the hero twins Hunter (Hun Hunahpu) and Jaguar Deer (Xbalanke). In *The Blood of Kings* (1986), Linda Schele and Mary Ellen Miller suggest that, among the Maya, the ritual ball game provided a conquering ruler with a means of validating his reign and a defeated rival with an opportunity to achieve an honorable death.

The four great games of ancient Greece—the Olympian, the Pythian, the Isthmian, and the Nemean—were associated with worship of the gods. The Olympian games were held in honor of Zeus, ruler of the sky, whose worship was centered on Mount Olympus, also the site of his marriage to Hera. The Pythian games were held at Delphi, the site of Apollo's oracle, and were said to have been established by the god as compensation for his killing of the great serpent Python. The Pythian games eventually came to include both physical and intellectual competitions, including musical, literary, and dramatic events. The stadium at Delphi was also the site of religious rituals.

The Isthmian games, held on the Isthmus of Corinth every second year, included poetic and musical competitions as well as athletic events. According to one legend, the Isthmian games were initiated by the Greek hero Theseus, who slew the Minotaur. Theseus was fabled to be the son of Poseidon, and the Isthmian games were dedicated to this god. The legendary origins of the Nemean games are traced to an event in which an army led by Polynices, a son of Oedipus, slew a serpent that had killed the infant Opheltes (Snake Man). The Nemean games, held in honor of Zeus, also included poetry and music competitions in addition to athletic contests.

Greek athletes were sometimes accorded the status of gods. Theogenes excelled both in boxing and the pankration, a virtually no-holds-barred sport that combined elements of boxing and wrestling. He was the son of a priest at a temple

dedicated to Herakles in Thasos, on an island in the Aegean Sea. Theogenes, whose name means "god-born," claimed that he was the son of Herakles rather than the priest. Statues of Theogenes were erected at Olympia, Delphi, and Thasos. By all accounts, Theogenes was an arrogant and unpleasant man who earned the wrath of a number of enemies. During his lifetime his enemies were powerless against him, but after his death, one of them sneaked out at night and flogged his statue at Thasos. The statue fell on the man and killed him. Since the statue was guilty of the man's death, it was taken out to sea and thrown overboard. Soon afterwards, Thasos was plagued by crop failures resulting in famine. A consultation with the oracle at Delphi resulted in the order that Thasians should recall their political exiles. All living political exiles were duly recalled, but the famine continued. Another consultation with the oracle at Delphi produced the reminder that Theogenes remained at large. The statue of the athlete was restored to its base, and the famine ended.

Foot races were part of religious rituals among a number of Native American groups, and there were secret running societies throughout the Americas. Prior to the introduction of the horse by the Spanish, swift runners were important for carrying messages between groups and during times of battle. Within twenty-four hours of the landing of Hernán Cortés (1485–1547) on the east coast of what is now Mexico in May 1519, local runners had described his ship, men, horses, and guns to Moctezuma (1466–1520) at Tenochtitlán, 260 miles away. Ceremonial runners among the Mesquakie in Iowa took a vow of celibacy, adhered to strict dietary rules, and dedicated their lives to running. In many cases, runners represented their clans in races and in religious rituals. Zuni runners painted the symbol of their matrilineal clan on their chests and the symbol of their father's clan on their back. The ball was believed to hold magical power that pulled the runner along with it.

The Rarámuri, or Tarahumara (which may be translated as "foot runners"), of the Sierra Madre in Mexico incorporate wrestling matches in their Easter rituals, which are aimed at protecting God and his wife Mary from his evil rival the Devil. The Rarámuri were introduced to Roman Catholicism in the seventeenth century, and their Easter rituals exhibit a syncretism of Christianity and their own religious symbols. Since Rarámuri social life centers on the family, they cannot conceive of God as being a bachelor, because that would consign him to a lower social status. In "God's Saviours in the Sierra Madre" (1983), the anthropologist William L. Merrill states that the idea that Christ died on the cross to redeem the sins of the world makes little sense to the Rarámuri, so they have adapted his strange (to them) story to their own vision of the relationship between God and the Devil, which is that the Devil and his family threaten the well-being of God and his family. Ultimately, though they fight on behalf of God, Merrill suggests, the Rarámuri believe they must appease both God and the Devil.

**CHRISTIAN AND PERSIAN THOUGHT.** Even where sport is not a part of religious ritual, it is metaphorically linked to

religion. The apostle Paul compared religious discipline to sport on several occasions. In his first epistle to the Corinthians he writes, "Do you not know that in a race all the runners compete, but only one receives the prize? So run that you may obtain it" (*I Cor.* 9:24). Later he includes the metaphor of boxing: "I do not run aimlessly," he writes, "I do not box as one beating the air; but I pummel my body and subdue it, lest after preaching to others I myself should be disqualified" (*I Cor.* 9:26–27). In summing up his evangelical career, Paul writes, "I have fought the good fight, I have finished the race, I have kept the faith" (*II Tm.* 4:7).

Sport involves an all-out effort toward achieving an elusive goal. Thus, it is an appropriate metaphor for the spiritual quest or for the often elusive goals of life itself. The Persian poet Nizami (c. 1141–1203 or 1217) compared life to a polo game: "The Horizon is the boundary of your polo ground, the earth is the ball in the curve of your polo stick. Until the dust of non-existence rises from annihilation, gallop and urge on your steed because the ground is yours."

**HINDU DOCUMENTS.** The *Rgveda*, perhaps the oldest of Hindu documents, draws on the chariot race as a metaphor for the pursuit of immortality. Hymn 3.31 of the *Rgveda* says: "Soon, Indra, make us winners of cows." Winners of chariot races won prizes of cows, whose milk is a symbol of immortality. This verse, which asks "Make us victors among men; make us more like you, O powerful one; and bring us immortality," can be interpreted, and no doubt was intended, to evoke multiple levels of meaning. In the *Rgveda*, milk is associated with seed, semen, and rain, all life-giving forms.

The *Upaniṣads* are Hindu sacred documents, the oldest of which may date from as early as the sixth century BCE. The *Mundaka Upaniṣad* urges readers to aim for unity with Brāhmaṇ, the creative energy underlying the universe:

Affix to the Upanishad, the bow, incomparable, the sharp arrow of devotional worship; then, with mind absorbed and heart melted in love, draw the arrow and hit the mark—the imperishable Brāhmaṇ. OM is the bow, the arrow is the individual being, and Brāhmaṇ is the target. With a tranquil heart, take aim. Lose thyself in him, even as the arrow is lost in the target.

Though this translation by Swami Prabhavananda and Frederick Manchester refers to Brāhmaṇ as "him," Brāhmaṇ has no gender, since it is the source of all being, male and female.

**JAPAN, THE UNITED STATES, AND EUROPE.** In the preceding examples, sport is a metaphor for religious striving. However, Zen archery, or *kyudo*, is a ritual, a religious act. In the Japanese tradition of Zen Buddhism, the object of *kyudo* is to achieve a balance among mind, body, and bow, which gives rise to a unity that links the spirit to the target. Achieving this balance is more important than hitting the target, though hitting the target is expected to follow naturally from achieving a balance among mind, body, and bow. The ritual includes practicing correct breathing techniques to control the mental and physical force—or *ki*—believed to be centered below the navel. Proper technique ultimately leads to

perfect serenity. Zen archery proceeds through eight smoothly executed stages which seem to flow as a single unit. At the sixth stage, the body of the archer is on a line with the target. The name of this stage is *kai*, or "meeting." Release of the arrow at the seventh stage is seen as an act of volition by the archer rather than the arrow:

Like a heavy drop of water. . . that decides to be free, the arrow liberates itself.

The term for the seventh stage is *hanare*, or "release." At this point, it is believed that there is an explosion of energy flowing through the body of the archer.

The martial art of kung fu was believed to have been developed by the Bodhidharma (d. c. 530), the legendary founder of Zen (Chan) Buddhism at the Shaolin Monastery in China. It is said that the Bodhidharma meditated for long hours in a cave and developed *kung fu* as a means of keeping his body flexible after long, motionless meditation.

In his book *Mountaineering Essays* (1980), John Muir (1838–1914) describes his explorations with religious fervor, often using religious terminology. He writes of Cathedral Rock in California's Sierra Nevada Mountains:

No feature, however, of all the noble landscape as seen from her seems more wonderful than the Cathedral itself, a temple displaying Nature's best masonry and sermons in stones. How often I have gazed at it from the tops of hills and ridges, and through openings in the forests on my many short excursions, devoutly wondering, admiring, longing! This I may say is the first time I have been at church in California, led here at last, every door graciously opened for the poor lonely worshiper. In our best times everything turns into a religion, all the world seems a church and the mountains altars. And lo, here at last in front of the Cathedral is blessed cassiope, ringing her thousands of sweet-toned bells, the sweetest church music I ever enjoyed. (p. 19)

This passage is comparable in religious fervor to writings of such mystics as Teresa of Ávila (1515–1582), who describes her feelings after a vision in which she was cautioned against her longing to escape city life for meditation in the desert:

Here suddenly came upon me a recollection with an interior light so great it seemed I was in another world. And my spirit found within itself a very delightful forest and garden, so delightful it made me recall what is said in the Song of Songs: *Veniat dilectus meus in hortum suum.* (From Song of Solomon 5:1: I am come into my garden, my sister, my spouse. . . .)

**MODERN SPORTS.** In his book *From Ritual to Record: The Nature of Modern Sports* (1978), Allen Guttmann describes the secularization of sport as though it were a fall from grace. When it had its original close link to religion, Guttmann suggests, sport was a meaningful enterprise that upheld the noblest ideals of a group and was integral to other activities of the group. Modern sports, Guttmann writes, have become centered on the quest for quantification in the form of setting distance or other records and evaluating performance in terms of statistical data:

The bond between the secular and the sacred has been broken, the attachment to the realm of the transcendent has been severed. Modern sports are activities partly pursued for their own sake, partly for other ends which are equally secular. We do not run in order that the earth be more fertile. We till the earth, or work in our factories and offices, so that we can have time to play. (p. 26)

In his *Homo Ludens: A Study of the Play Element in Culture* (1950), the Dutch historian Johan Huizinga describes humans as “Homo ludens,” the player, and asserted that all of culture has its origins in the spontaneous activities of play. Like Guttman, Huizinga considers the rules and regulations characteristic of sports to be antithetical to the spirit of play, and he blames what he regards as the deplorable conditions of modern sports on the English. He attributes the rise of ball games to English competitions between villages and schools; to “the specifically Anglo-Saxon bent of mind” (p. 197); to the emphasis on “association and solidarity” occasioned by English social life; to the need for physical exercise in the absence of obligatory military training; and to the English terrain, which provided ideal playing fields. Huizinga sums up the English sensibility for sport: “Everybody knows the delightful prints from the first half of the 19th century, showing the cricketers in top hats. This speaks for itself” (p. 197). He adds:

The great competitions in archaic cultures had always formed part of the sacred festivals and were indispensable as health and happiness-bringing activities. This ritual tie has now been completely severed; sport has become profane, “unholy” in every way and has no organic connection whatever with the structure of society, least of all when prescribed by the government. The ability of modern social techniques to stage mass demonstrations with the maximum of outward show in the field of athletics does not alter the fact that neither the Olympiads nor the organized sports of American Universities nor the loudly trumpeted international contests have, in the smallest degree, raised sport to the level of a culture-creating activity. However important it may be for the players or spectators, it remains sterile. The old play-factor has undergone almost complete atrophy. (p. 198)

Huizinga acknowledges that his view of modern sport may not be a popular one: “This view will probably run counter to the popular feeling of today, according to which sport is the apotheosis of the play-element in our civilization. Nevertheless popular feeling is wrong” (p. 198).

Although Guttman agrees with Huizinga in general, he acknowledges that even modern sport sometimes has its moments of transcendence: “It is actually one of the happier ironies of modern sports that we can lose ourselves in play and forget the creative and sustaining (and restricting) social organization and cultural assumptions that have been a central concern of this book” (p. 160).

Those who bemoan the secularization of sport do not express similar criticisms of other aspects of human social

life. Modern sports, which are largely the product of western Europe, have undergone secularization at the same time as other institutions. European governments became secularized as monarchs broke away from the authority of the Roman Catholic Church. The United States was founded on the ideal of separation of church and state. This was an attempt to avoid the religious rivalries and persecution that drove a number of groups to leave their European homes and settle in the land that became the United States. The French achieved their ideal of separation of church and state only in the early twentieth century, a hard-won accomplishment that in 2004 led the French government to ban religious apparel in the public schools. Modern science emerged as such thinkers as Nicolaus Copernicus (1473–1543) and Galileo Galilei (1564–1642) supplanted religious dogma with empirically derived data. At the time of the Enlightenment in the late eighteenth and early nineteenth centuries, writers such as Voltaire (1694–1778) rejected the domination of ecclesiastical authority. In the process, theater, the visual arts, literature, and music became secularized.

Scholars generally regard the secularization of government, education, science, and the arts as positive, since it liberates these institutions from the constraints of dogma and subjugation to religious hierarchies. Why then, do Guttman and some other scholars bemoan the secularization of sport? In their view, sport alone seems to call for an alliance with an institutionalized moral and religious order. In *Sport as Symbol: Images of the Athlete in Art, Literature and Song*, Mari Womack argues that the secularization of sport is commonly viewed as degradation rather than liberation precisely because sport has retained its close symbolic ties to religion, whereas the other institutional forms have drifted further away.

Athletes may no longer be viewed as gods, but they retain their role as heroes. Athletes are held to higher standards than musicians, actors, artists, or writers. Only government officials, educators, and religious leaders excite similar degrees of outrage in the wake of scandal. American sportswriters often lament the behavior of athletes who violate cultural norms, but in fact the failures of heroes in all domains often educate us as much as their successes. Could any sermon teach the perils of arrogance and hubris better than the fictional baseball hero in Ernest Lawrence Thayer’s 1888 poem, “Casey at the Bat”? In a similar situation, the real-life baseball hero Babe Ruth (1895–1948) succeeded where Casey failed. The Sultan of Swat called his shot during the fifth inning of the third game of the 1932 World Series, in what has been called “the most magnificent gesture ever made on a baseball diamond.” (Durant and Bettman, p. 239). It was a grudge match between the New York Yankees and the Chicago Cubs at the Cubs’ own Wrigley Field:

The score was tied at four runs each when Babe Ruth came up to bat for the Yankees. He was greeted by a barrage of abuse from the Chicago bench. He took a strike and then defiantly pointed to the centerfield

bleachers. He took another strike and again indicated his target as Cubs players jeered from the bench. On the next pitch, he hammered the ball to the deepest part of the centerfield bleachers, the exact spot he had indicated. Unlike Casey, the mighty Babe Ruth did not strike out. (Womack, 2003, p. 150)

In this case, Babe Ruth taught a different lesson: he defied the unsportsmanlike behavior of the opposing team and demonstrated a form of valor that is undeterred by opposition. Womack writes, "The same existential conflict that lies at the heart of religion also gave rise to the sporting contest" (2003, p. 220). "Sports symbolism," she states, "usually expresses themes of epic proportions: responsibility to oneself and others, the moral choice of Right and Wrong, the dilemmas of power, and the agony of loss and betrayal. Often, it is clear that the 'game' is life itself, played out in a hazardous universe" (2003, p. 14).

In a pluralistic society, sport makes mythological themes accessible to people from many different backgrounds. It is a fact of modern life that no one religion has a secure hold on the imagination of its adherents. No matter how strongly one believes, one knows that others do not believe. This challenges the absoluteness of one's faith. The various competing religions do not provide an overarching symbolic system that explains ultimate reality, including right and wrong, for all members of the group. Precisely because it is secularized, sport provides a symbolic system that unifies rather than divides. It addresses overarching symbolic themes, not specific theological issues. It deals not with the nature of God, but with the nature of human beings.

- Bowen, John R. *Religions in Practice: An Approach to the Anthropology of Religion*. 2d ed. Boston, 2002. Rather than attempting to develop a unitary definition of religion, Bowen surveys consistencies and variations in the practice of religion in a variety of contexts.
- Durant, John, and Otto Bettman. *Pictorial History of American Sports*. Cranbury, N.J., 1952. The authors do not deal specifically with the relationship between sport and religion, but their richly illustrated book eloquently demonstrates the historical role of sport in American life.
- Guttman, Allen. *From Ritual to Record: The Nature of Modern Sports*. New York, 1978. Guttman notes that sport in what he calls primitive societies was integral to other activities, whereas modern sport, with its rules and regulations, is antithetical to spontaneous play.
- Harris, H. A. *Greek Athletes and Athletics*. Bloomington, Ind., 1964. Harris provides a comprehensive overview of the four Greek athletic games—the Olympic, the Pythian, the Isthmian, and the Nemean—with particular emphasis on the events held at each. He also links the athletic contests to the esteem in which athletes were held, as well as the celebration of athletic victors in the poetry of Pindar.
- Hoffman, Shirl J., ed. *Sport and Religion*. Champaign, Ill., 1992. Hoffman has compiled essays dealing with various aspects of the relationship of religion to sports, including ethics, sport as ritual, the use of rituals by professional athletes, and such experiential aspects of sport as runner's high. Christianity is the only religion considered in any depth.
- Huizinga, Johan. *Homo Ludens: A Study of the Play Element in Culture*. Boston, 1950. Huizinga asserts that all cultural forms arise from play, and from this he deduces that play is older than culture. He then analyzes play as a "civilizing function" with respect to law, war, poetry, philosophy, and art while taking a less positive view of sport, which he considers antithetical to the spontaneity of play.
- Merrill, William L. "God's Saviours in the Sierra Madre." *Natural History* 93, no. 3 (1983). The Rarámuri (Tarahumara) of Mexico's Sierra Madre have adapted the essential message of Christianity to their own experience of the relationship between good and evil. Merrill notes that the Rarámuri see themselves as the protectors of God and his family against the designs of the Devil and his family. However, the Rarámuri consider it necessary to placate both God and the Devil.
- Morford, Mark P. O., and Robert J. Lenardon. *Classical Mythology*. 4th ed. New York, 1991. The authors include a brief summary of the importance of the Olympic and Pythian games for Greek symbolism in their analysis of the complexities of relationships among the gods of Greece.
- Muir, John. *Mountaineering Essays*. Salt Lake City, Utah, 1980. Muir describes in religious terms his awe at exploring the natural wonders of the West.
- Scarborough, Vernon L., and David R. Wilcox, eds. *The Mesoamerican Ballgame*. Tucson, Ariz., 1991. Scarborough and Wilcox have compiled a comprehensive analysis of the ritual, representation, and social context of the Central American ball game based on the archaeological evidence, ranging from the American Southwest to Central America.
- Schele, Linda, and Mary Ellen Miller. *The Blood of Kings: Dynasty and Ritual in Maya Art*. Fort Worth, Tex., and New York, 1986. Schele and Miller conclude that ball games played in the Maya sphere dramatize the military and religious might of Mayan rulers, adding that the outcome of the ball game was prearranged to result in the victory of the ruler and the sacrifice of his opponent. Thus, the symbolic victory of the ruler in the ball game dramatized his military victory over his rival on the battlefield.
- Womack, Mari. "Risk and Ritual in Professional Sports." Paper presented at the meeting of American Anthropological Association Meeting, Los Angeles, California, 1981. This paper examines the conditions of risk in professional sports competition that give rise to uncertainty and anxiety. It concludes that rites of preparation aid performance in competition by giving the athlete a sense of control over his surroundings, which reduces anxiety and allows the athlete to focus on the game.
- Womack, Mari. "Religion and Sport: Sacred and Secular Rituals of Conflict." UCLA Center for the Study of Religion, 1991. This paper defines aspects of contesting in sport that involve three types of opponents: the opponent in nature, the human opponent, and the enemy within. Ultimately, sport is closely allied to religion because the essence of all sport is the contest against the treacherous aspects of our selves.
- Womack, Mari. *Sport as Symbol: Images of the Athlete in Art, Literature, and Song*. Jefferson, N.C., 2003. Illustrated through-

out with black and white reproductions of art from a range of traditions, this book considers imagery relating to the hunt, bullfight, martial arts, ball games, racing, and contests of grace and beauty. It discusses the role of the sports hero in culture and explains the relationship of the athlete to society in general.

MARI WOMACK (2005)

**SPURGEON, CHARLES HADDON** (1834–1892), was an English Baptist popularly known as “the prince of preachers.” The son and grandson of Congregationalist pastors, Spurgeon was converted in 1850 at a Primitive Methodist chapel and joined a Baptist church in 1851. At age sixteen, circumstances compelled him to preach unprepared in a cottage near Cambridge, England. Word of his oratorical skill and evangelical fervor spread. He was called to pastorates at Waterbeach (1852) and at New Park Street Chapel in London (1854). His preaching attracted such large crowds that it was necessary to rent public accommodations seating up to ten thousand people. In 1861 the Metropolitan Tabernacle was completed in London, and there Spurgeon ministered until his death. By age twenty-two he had become the most popular preacher of his day. He established several institutions, including orphanages and a pastors’ college, the latter being the matrix for the founding of numerous churches and Sunday schools.

Although throughout his career Spurgeon preached to large audiences, his greatest immediate influence was through his weekly published sermons, numbering 3,561, which are estimated to have had more than a million regular readers. These sermons eventually amounted to sixty-three volumes, entitled *New Park Street Pulpit* (1855–1860) and *Metropolitan Tabernacle Pulpit* (1861–1917). By 1899 more than a hundred million copies of his sermons had been printed in twenty-three languages. Among his many works was the seven-volume *The Treasury of David*, a commentary on *Psalms*. He also edited a monthly magazine, *The Sword and the Trowel*, for twenty-seven years.

Spurgeon’s preaching was massive in scope and narrow in doctrine. Staunchly Calvinistic, he was called by some “the last of the Puritans.” From his earliest ministry until his death, he consistently maintained the gospel of grace without deference to increasingly influential high-church and liberal teachings. In 1864 his sermon against “baptismal regeneration” excited a hearty controversy that resulted in his withdrawing from the Evangelical Alliance. During the last decade of his life, Spurgeon fought against what he called the “downgrade movement,” that is, the rise of higher criticism, liberalism, and rationalism within Baptist circles in England. So firmly were such views entrenched there that he withdrew from the Baptist Union in 1887, remaining independent but a Baptist until his death. Although he never sought controversy, he never shied from it. In his own words, “Controversy for the truth against the errors of the age is . . . the peculiar duty of the preacher.”

Within the confines of a thoroughly evangelistic Calvinism, Spurgeon’s works include such an enormous variety of topics congenial to the mainstream of orthodoxy that his writings, especially his sermons, have been valued by Christians of diverse creeds. While his influence, particularly in evangelical circles, continued through the first half of the twentieth century, in the 1960s interest in Spurgeon began to grow. All sixty-three volumes of his sermons have been reprinted, and more than 150 of his other writings are in print.

#### BIBLIOGRAPHY

Spurgeon’s *Autobiography, Compiled from His Diary, Letters, and Records by His Wife, and His Private Secretary*, 4 vols. (London, 1897–1900), has long been out of print. An abridged and supplemented edition has appeared in two volumes: vol. 1, *The Early Years, 1834–1859* (London, 1962), and vol. 2, *The Full Harvest, 1860–1892* (Edinburgh, 1973). The standard biography is G. H. Pike’s *The Life and Work of Charles Haddon Spurgeon*, 6 vols. (London, 1894). For an appreciation of Spurgeon by a noted German theologian, see Helmut Thielicke’s *Encounter with Spurgeon* (Philadelphia, 1963).

DARREL W. AMUNDSEN (1987)

#### SRI AUROBINDO SEE AUROBINDO GHOSE

**ŚRĪ VAIṢṆAVAS.** The Śrī Vaiṣṇava Sampradāya, one of six major Hindu denominations devoted to Viṣṇu, is the community of those who worship Viṣṇu (also called Nārāyaṇa) in conjunction with his consort Śrī (Lakṣmī), the goddess of auspiciousness and prosperity, along with Bhūdevī, the goddess of the earth, and Nīlā, more generally known by her Tamil name of Nappinai, the human wife of the young Kṛṣṇa. The community is strongest in the South Indian state of Tamil Nadu, but it also has many adherents in the three other South Indian states and some in other parts of India. *Brahmans* are strongly represented and have most positions of leadership.

Śrī Vaiṣṇavas are adherents of the philosophy of Rāmānuja and describe their theological position as Ubhaya Vedānta, “dual theology” or “theology of the two scriptures,” for, in addition to regarding as authoritative the Vedas (including the Upaniṣads) and other scriptures written in Sanskrit, the Śrī Vaiṣṇavas consider sacred the Tamil hymns of the poet-saints called the Ālvārs (those “immersed” in God) and treat the long poem called the *Tiruvāymolī* as equal in value to the Upaniṣads. Both divisions of the present community trace their spiritual lineage back to still earlier *ācāryas* (teachers), and then through Nammālvār, the author of the *Tiruvāymolī*, to the Goddess, Śrī, and Viṣṇu-Nārāyaṇa himself.

The Sanskrit canon of the community includes, in addition to the Vedas, the two great epics, the treatises on social morality and ritual, and the summary of the Upaniṣadic

teaching called the *Vedānta Sūtra*. These scriptures are themselves interpreted by a host of commentaries and didactic treatises in Sanskrit, and there is a corresponding, though much smaller, group of commentaries and treatises in Tamil. In both languages there are also a number of hagiographies of the Ālvārs and ācāryas; greatest attention is given to Rāmānuja (traditional dates 1017–1137), who wrote only in Sanskrit but who is represented in the biographies as commenting on the *Tiruvāymoli* in Tamil and assigning his cousin and disciple Piḷḷān the task of producing a written commentary on this long poem. It was Piḷḷān who first called the members of the community “Śrī Vaiṣṇavas” and demonstrated the confluence of the Sanskrit and Tamil “Vedāntas.” Three later commentaries are also considered authoritative.

By the end of the twelfth century there was an increasing shift in emphasis on works of a different kind, treatises on the secret meanings (*rahasyas*) of the three central mantras (ritual formulas) that specified the spiritual path and more fully discussed the doctrine of divine grace. These treatises stressed the indispensable role of Śrī as mediatrix (*puruṣakāra*). Since she is always full of maternal love, her favor should be sought first; she can persuade the Lord, who as a father must balance justice and mercy, to the side of mercy. Similarly one first humbly petitions one’s own *gurū*, who is already connected with the chain of grace, for his recommendation in approaching the Lord.

The various stories about the twelve Ālvārs assign them very ancient dates. Nammālvār, for example, is said to have lived some five thousand years ago, at the very beginning of the present, evil age, the *kalīyuga*. Modern historical scholarship places them from the sixth to ninth centuries CE. In contrast, the ācāryas are assigned dates that are accurate within one or two generations. The first ācārya, Nāthamuni (late ninth or early tenth century), received from Nammālvār in a yogic trance the entire corpus of hymns; he then arranged them to accompany Sanskrit verses in the temple liturgies. Still more stories are told about Nāthamuni’s brilliant grandson Yāmuna (916–1036), but the largest part of the hagiographies focuses on the life of Rāmānuja.

The gradual splitting of the community into the Vaṭakalai (“northern culture”) and Teṅkalai (“southern culture”) subjects is only in part related to the relative emphasis on the Sanskrit and Tamil scriptures; the two groups understand differently the relation of divine grace to human response. Both groups affirm the primacy of divine grace in rescuing souls from their bondage in the world and maintain that all seekers of salvation should solemnly surrender, first to the goddess Śrī and then to Lord Viṣṇu. The great Vaṭakalai teacher Vedānta Deśika believed that the act of surrender gives the Lord a pretext or occasion (*vyūjja*) for saving the soul, so that grace is not arbitrary. His contemporary, the Teṅkalai teacher Piḷḷai Lokācārya, on the other hand, considered it presumptuous for human beings to think they could make any contribution whatsoever to their salvation. Even “surrender,” he taught, is not to be regarded as such

an act; it is merely the acknowledgement of what the Lord has already done. The nicknames “monkey-hold” and “cat-hold” applied to the two groups come from a Teṅkalai source. The Teṅkalai claim that the Vaṭakalai theology likens the soul’s position to that of a baby monkey, which has to hang on to its mother as she swings from tree to tree, while the Teṅkalai’s own view makes the soul resemble the kitten, whose mother picks it up by the scruff of the neck without any effort on the kitten’s part.

For neither group does the doctrine of grace lead to an antinomian lifestyle. On the contrary, the lives of Śrī Vaiṣṇavas are full of ritual injunctions and social obligations, but neither their good deeds nor scholarly attainments—not even emotional participation in intense devotion to God—can bring about their salvation. Their ritual act of surrender is the outward sign of a lifelong surrender of their worldly ambitions—even quite proper ones—to God’s disposal. Having solemnly petitioned God’s mercy, and having confidently expressed total reliance on that mercy, the devotee ought not to ask for anything else. This is clearly a difficult ideal to follow, the more so since the majority of their fellow worshipers at Viṣṇu temples are not initiated “surrendered ones” (*prapannas*) but Hindus from all walks of life who confidently ask the Lord and his consorts for all manner of material blessings.

Much of the spiritual leadership in the community is provided by various *maṭhas*, which are not communities of ascetics but groups of householder disciples of a *gurū* who becomes a *sannyāsin* after being chosen to head the *maṭha*. These *gurūs* perform the formal initiation of *prapatti*, bestow spiritual blessings and deliver courses of lectures on periodic tours to visit their followers, and frequently give individuals practical advice in private audiences.

The key words in Śrī Vaiṣṇava worship are *darśana*, the reverent beholding of the image form of the Lord; *smaraṇa*, the remembrance of the Lord’s gracious deeds, and *seva* or *kainkaryā*, service to the Lord and to the Lord’s disciples. While in their own homes Śrī Vaiṣṇavas perform the lengthy daily worship privately, in the 108 major Śrī Vaiṣṇava temples in South India (including the all-Indian pilgrimage center of Tirupati and the central temple at Śrīraṅgam), and in many more minor ones, they are part of a mixed company. Their joining in the Tamil and Sanskrit chanting of the liturgy is for them a confident anticipation of their participation, after this present earthly life, in the eternal chorus of praise in the Lord’s heavenly home.

**STANNER, W. E. H.** William Edward Hanley Stanner (1905–1981) was born in Sydney, Australia, and spent much of his childhood playing on the shores of Sydney Harbor and the surrounding bushland. On leaving school Stanner worked as a bank clerk, a job he tired of quickly, before training as a journalist. In 1926 a life-changing encounter with A. R. Radcliffe-Brown, the newly appointed foundation chair of anthropology at Sydney University, saw Stanner return to school to matriculate, eventually enrolling in a degree program with a major in anthropology and economics.

After completing his degree with first class honors, Stanner was encouraged by Radcliffe-Brown to consider a career in anthropology. He undertook his first fieldwork in the Daly River region of north Australia in 1932, and he returned to this area from 1934 to 1935 to undertake more lengthy research for his Ph.D. He would return to the Daly River region throughout his life, in the 1950s undertaking the work that would most fully inform his writings on Murrinh-pata religion.

On completing his Ph.D. at the London School of Economics under the supervision of Bronislaw Malinowski and Raymond Firth, Stanner joined an anthropological survey team in East Africa. On the outbreak of war he returned to

Australia. His most noted wartime contribution was as leader of the North Australia Observer Unit. He also worked on a series of postwar reconstruction programs in Europe and the Pacific. In 1949 Stanner was appointed reader in comparative social institutions in the Research School of Pacific Studies at the newly established Australian National University, Canberra, where he remained for the rest of his working life. In the 1960s and 1970s Stanner rose to public prominence as a government adviser, and his engagements in Aboriginal affairs became more consciously political.

Stanner's works on religion, the most important being a series of essays republished in 1963 as the monograph *On Aboriginal Religion*, simultaneously serve as a broad critique of structural-functionalist approaches to the study of society and culture. He was extremely critical of earlier anthropological accounts of Aboriginal religion influenced by the work of Émile Durkheim and Radcliffe-Brown that categorized religion as merely one of a series of elements in a bounded social system. These writers had overlooked the experiential and emotional sensibilities associated with religion. Stanner argued that religion was significant in its own right, not as a subset of society or anything else. Murrinh-pata religion contained objects and symbols "beyond egotism, beyond social gain." The great symbols he observed, were "valued for their own sakes." As he sought to elucidate Murrinh-pata religious systems as "expressions of human experience of life; as essays of passion, imagination, and striving," Stanner concurrently sketched the frame of a new theoretical approach to the study of society (Stanner, 1965, p. 222). He saw human affairs not in terms of persisting social structures and enduring relations between persons in role positions, but rather as "a structure of operations in transactions about things of value." His "operational anthropology" would study real relations—"giving, taking, sharing, loving, bewitching, fighting, initiating"—and "make human sense of their cultural varieties" (Stanner, 1963, p. ii).

While seeing the definition of religion as beyond the task of anthropology, Stanner argued that Aboriginal religion must be grasped as a rich and multilayered entity: it was at once an ontological system, a moral system, a "contemporary form of thought and feeling toward the whole of reality," and "content for a devotional life" (Stanner, 1963, p. vi). He rejected Durkheim's dichotomy of secular and sacred as a framework for comprehending Aboriginal religion, arguing that it necessarily was both. Where the functionalists had offered up a desiccated view of Aboriginal religious systems as lacking imaginative and intellectual substance, or as reducible to the study of totemism, magic, and ritual, for Stanner, Murrinh-pata religious belief and practice provided a window onto all manner of aspects of Murrinh-pata being. It was in Murrinh-pata rites that one witnessed "a genius for music, song, and dance applied with skill and passion" (Stanner, 1963, p. 18). Moreover, Murrinh-pata religion was not a "dead plane of uniform changelessness" but a dynamic system, its content being enacted and articulated variably by

differently gifted performers, and transformed according into the changing needs and circumstances of each generation (Stanner, 1963, p. 84).

Stanner's work contributed much to contemporary understandings of "The Dreaming," the linkage of specific Aboriginal persons, places, fauna, and flora in the present in identifiable groupings extending back to a timeless conception. Within this ontological frame, Stanner argued, there was no tension between past, present, and future. He teased out aspects of this logic and its narrative content in Murrinh-pata myth to illustrate the basis of Aborigines' acceptance of reality as a necessary connection between life and suffering. In the Murrinh-pata theory of reality, life was conceived "as a joyous thing with maggots at the centre" (Stanner, 1963, p. 37).

Critics argue that Stanner failed to fully transcend the limitations of structural-functionalism and sufficiently integrate his theoretical ideas with his ethnography. He shied away from analyzing those aspects of his material—the conjunction of religion and politics—that would have furnished the development of a theory of action. Stanner himself regarded his work as unfinished. It was a contribution to a general reappraisal of Australian Aboriginal religion that would "require the efforts of many scholars." A humanist with untiring commitment to social justice, a campaigner for land rights, a sensitive intercultural interpreter with a great gift for writing, Stanner sought to conjure up the richness and philosophical depth of Aboriginal religious systems.

MELINDA HINKSON (2005)

**STANTON, ELIZABETH CADY.** Elizabeth Cady Stanton (1815–1902) was a principal leader and philosopher of the American woman's rights movement of the nineteenth century. Her religious importance derives from *The Woman's Bible* (1895–1898), written and edited late in her career, and from her influence in inspiring feminism to a rational, anti-dogmatic attitude to faith.

Stanton was born in Johnstown, New York. Her father, Daniel Cady, was a prominent lawyer, congressman, and judge. When none of her brothers lived to maturity, Elizabeth wanted to become like a son to please him. Although she never succeeded in satisfying her father, her precocious intellect did gain the notice of her family's Scottish Presbyterian minister, Simon Hosack, who tutored her in ancient languages. Her father's profession also shaped her sensitivity to legal protection and political details. Shocked by women's lack of rights in divorce and custody cases, she prioritized such issues throughout her career, directly challenging traditional bastions of male authority. Her analysis and thorough articulation of structural sexism were exemplary, and they were complemented by her abilities as a polemical writer.

Stanton experienced the tumult of the Second Great Awakening preacher Charles Finney while a student at Emma Willard's school in the early 1830s. The young Elizabeth felt susceptible to his rhetoric because of her "gloomy Calvinistic training," but upon becoming one of Finney's "victims" she noted, and regretted, the "dethronement of my reason." She deemed herself saved by intellection, by science, rationality, and progress.

After her schooling was finished, Elizabeth became involved with the antislavery movement. Through her cousin, Gerrit Smith, she met her future husband, Henry Stanton (1805–1887), one of the Lane Seminary rebels and an ardent abolitionist. Though her father objected to the marriage, it went forward in 1840, with a significant change in the marriage vows: Elizabeth refused to "obey" an equal, so that command was dropped. Their honeymoon brought more substantive change, as the couple attended the 1840 World's Anti-Slavery Congress in London. Some American groups included women delegates, but the British hosts refused to seat them. However, it was here that Stanton met the Quaker Lucretia Mott, who embodied a fuller range of possibilities for women. While living in Boston, Stanton's liberal religious outlook was reinforced as she absorbed Unitarian and transcendentalist ideas, and as she met more women leaders, including Lydia Maria Child and the Grimké sisters.

Stanton's own fame blossomed with the fulfillment of plans she and Mott had formulated to hold a woman's rights conference. This finally occurred in 1848, when the first

Women's Rights Convention in the United States was held in Stanton's new hometown of Seneca Falls, New York. Stanton wrote the convention's bold Declaration of Sentiments, adopting the rhetoric of the Declaration of Independence and condemning male usurpation of authority over women in matters religious, "when that belongs to her conscience and her God."

Stanton's 1850 meeting with Susan B. Anthony marked a turning point in the women's rights movement. Their ardent friendship lasted over fifty years and became one of the most productive partnerships in American political history. Due to child-care and household concerns (the Stantons had seven children), Stanton emerged as the writer of the pair, while Anthony traveled and lectured for women's rights. While they prioritized voting rights, they never made this the exclusive focus of their wider goal: recognizing women's full humanity.

During the Civil War, Anthony and Stanton formed the Loyal League, which urged the immediate emancipation of slaves. Stanton herself began to travel and speak during this period, developing into an accomplished orator. In the post-war period, however, serious splits occurred among progressive advocates of increased voting rights. Angered by what they saw as a betrayal of women by those who advanced suffrage for African American men only, Stanton and Anthony allied themselves with racist and xenophobic forces. Stanton argued explicitly for the fitness of educated white women as voters over freed slaves and immigrants, whom she caricatured as "Sambo" and "Yung Tung." Stanton's rhetoric alienated former allies, including Mott, Lucy Stone, and Wendell Phillips. This period has compromised Stanton's legacy and fueled ongoing conflict in American feminism over class and race. The woman suffrage movement broke into two competing organizations in 1869: the National Woman Suffrage Association (led by Anthony and Stanton) and the rival American Woman Suffrage Association. By the time the organizations were reunited in 1890, the woman suffrage cause was bereft of its abolitionist roots.

The visibility of the woman suffrage movement increased through the last quarter of the nineteenth century, as did its sense of its own history. With Anthony and Matilda Joslyn Gage, Stanton edited and wrote the first three volumes of the *History of Woman Suffrage* (1881–1887), an admirably exhaustive chronicle of the movement. Opposition, and occasional support, from religious leaders mark many of its pages.

Stanton had always scrutinized legal restrictions on women, but became increasingly concerned with religious limitations. In her last twenty years she wrote two major texts: her autobiography, *Eighty Years and More* (1898), and *The Woman's Bible*, which she wrote and edited. These texts reveal her religious stance. Her autobiography presents her tireless opposition to superstition and her lifelong embrace of liberal religious inquiry—her freethinking mind investi-

gated theories of Charles Darwin, the matriarchate, and theosophy.

Stanton planned *The Woman's Bible* as a commentary and analysis on scriptural passages concerning women. She invited many women religious leaders and intellectuals to participate, but only a handful responded, fearing a backlash from a conservative religious public would damage the suffrage cause. Prominent contributors included Eva Parker Ingersoll and Gage (author of another stinging critique of patriarchal religion, *Woman, Church, and State* [1893]). In her commentaries, Stanton praises strong women (her assessment of Eve's "courage" and "ambition" is justly famous), condemns inconsistencies as "a great strain on credulity," rejects auto-validating claims of inspiration, and urges women to self-sovereignty rather than self-sacrifice. Stanton and her collaborators used humor, science, logic, common sense, and principles of justice to read against the grain of traditional biblical interpretation.

During Stanton's lifetime, *The Woman's Bible* met a chilly reception. It was parodied, denounced, or belittled by reviewers. The crushing blow came when the organization Stanton herself had led, now called the National-American Woman Suffrage Association, officially dissociated itself from the book. Despite the eloquent plea of Susan B. Anthony in her defense, this 1896 vote effectively ended Stanton's official role in the suffrage movement.

*The Woman's Bible* remained forgotten until the women's liberation movement of the 1970s. Feminist scholars and practitioners of religion found its method and content congenial: it was collaborative, questioned received authority, established a feminist legacy of biblical interpretation, and outlined how gender bias shaped sacred texts. However, *The Woman's Bible* has had its modern critics, particularly over its anti-Catholic and anti-Jewish biases.

At her death in 1902 many of Stanton's contemporaries memorialized her as an undaunted leader, while ignoring her analysis of belief and scripture. Yet her religious critique may well ensure her importance to future generations.

#### BIBLIOGRAPHY

Three editions of *The Woman's Bible* are available: *The (Original) Feminist Attack on the Bible (The Woman's Bible)*, edited by Barbara Welty (New York, 1974); *The Woman's Bible: Part 1: The Pentateuch; Part 2: Judges, Kings, Prophets, and Apostles*, edited by the Coalition Task Force on Women and Religion (Seattle, Wash., 1974); and *The Woman's Bible*, foreword by Maureen Fitzgerald (Boston, 1993). Kathi Lynn Kern's *Mrs. Stanton's Bible* (Ithaca, N.Y., 2001) is an excellent full-length study. Two commentary projects motivated by Stanton's Bible were published by feminist scholars on its one hundredth anniversary: *The Women's Bible Commentary*, edited by Carol A. Newsom and Sharon H. Ringe (London and Louisville, Ky., 1992; expanded ed., 1998), and *Search-*

*ing the Scriptures*, 2 vols., edited by Elizabeth Schüssler Fiorenza (New York, 1993–1994).

Many of Stanton's works are being issued in a proposed six-volume critical edition, with Ann D. Gordon serving as editor: *The Selected Papers of Elizabeth Cady Stanton and Susan B. Anthony*; Vol. 1: *In the School of Anti-Slavery, 1840 to 1866* (New Brunswick, N.J., 1997); Vol. 2: *Against an Aristocracy of Sex* (New Brunswick, N.J., 2000). The contemporary edition of Stanton's autobiography, *Eighty Years and More: Reminiscences, 1815–1897* (Evanston, Ill., 1993), includes essays by Gordon and Ellen DuBois.

Biographical studies of Stanton include Alma Lutz, *Created Equal: A Biography of Elizabeth Cady Stanton, 1815–1902* (New York, 1940); Elizabeth Griffith, *In Her Own Right: The Life of Elizabeth Cady Stanton* (New York, 1984), and Lois Banner, *Elizabeth Cady Stanton: A Radical for Women's Rights* (Boston, 1980). The biography assembled by her children Theodore Stanton and Harriot Stanton Blatch, *Elizabeth Cady Stanton as Revealed in Her Letters, Diary, and Reminiscences* (New York, 1922) is heavily edited and unreliable. For general background on the suffrage movement, Ellen DuBois's *Feminism and Suffrage: The Emergence of an Independent Women's Movement in America, 1848–1869*, 2d ed. (Ithaca, N.Y., 1999) remains the basic work on the period, while the book accompanying Ken Burns's documentary, Geoffrey C. Ward's *Not for Ourselves Alone: The Story of Elizabeth Cady Stanton and Susan B. Anthony* (New York, 1999), provides a good introduction for the general reader. James E. Goodman, "The Origins of the 'Civil War' in the Reform Community: Elizabeth Cady Stanton on Woman's Rights and Reconstruction" in *Critical Matrix* 1, no. 2 (1985): 1–29, presents a detailed account of the immediate post-Civil War divisions.

JENNIFER RYCENGA (2005)

**STARBUCK, E. D.** (1866–1947), was a prominent figure in the early academic study of the psychology of religion in the United States and the first scholar to use the phrase "psychology of religion." Edwin Diller Starbuck was born in Indiana to a devout Quaker farming family. After undergraduate work at Indiana University, he went on to Harvard University, from which he received his master's degree in 1895, and then to Clark University, where in 1897 he received his doctorate. In 1890 he was stirred by F. Max Müller's *Introduction to the Science of Religion* and decided to start studying religion. In 1893, at Harvard, he circulated two questionnaires, one on sudden conversion and the other on "gradual growth" toward religious commitment. In 1894 and 1895 he presented papers on his research before the Harvard Religious Union. After graduating from Clark University, he remained there as a fellow in the late 1890s, together with James H. Leuba.

Starbuck's 1899 book *The Psychology of Religion* was based on studies he started at Harvard under William James and continued at Clark under G. Stanley Hall; it enjoyed three editions, was reprinted several times, and was translated

into German in 1909. Starbuck had the support and encouragement of James in his work, but as Starbuck himself reports in a frank autobiographical statement, there was some tension in his relationship with Hall, and mutual criticism is much in evidence.

After the turn of the century, Starbuck devoted most of his creative energy to "character training" and devised selections of fairy tales, novels, and biographies that would contribute to the moral education of the young. He taught a variety of subjects at a number of institutions, including philosophy at the State University of Iowa (1906–1930), and philosophy (1930–1938) and psychology (1938–1943) at the University of Southern California. Starbuck's important contribution remains his early survey of conversion cases, which work was immortalized by James, who used Starbuck's data in *The Varieties of Religious Experience* (1902). While the basic findings of the survey have been accepted, and seem to fit with classical and modern notions of conversion, the theoretical construction seems hopelessly naive today. Together with Hall, Starbuck regarded conversion as an adolescent phenomenon, and had the data to show it. His findings are still quoted today, and are beyond dispute, but his psychology and his definition of religion as an "instinct" no longer find serious adherents.

Starbuck's attitude toward religion was clearly positive, and he saw the importance of the psychology of religion as contributing to religious education. According to James, Starbuck's aim in starting his research in the psychology of religion was to bring about reconciliation in the feud between science and religion. According to Starbuck's autobiographical account, his interest in religion was very much an attempt to answer, via systematic study, both doubts and curiosities about religion. If one attempts an evaluation of Starbuck's work from the perspective of several generations, one might conclude that it will be remembered more by historians of the field than by practitioners. His work may belong with the classics of the field, but it must be numbered with the unread classics, even among scholars.

**STAR OF DAVID** SEE MAGEN DAVID

**STARS.** In all times and places, the starry night sky has both challenged and satisfied the human need to order, categorize, and standardize the unknown. In their efforts to make the night sky a familiar place, ancient civilizations imposed on groups of stars the outlines of mythical and historical figures, thus linking the celestial and terrestrial realms. The two terms used for these star groups are *constellation* and *zodiac*. Constellations are groups of stars held together by the human mind and eye. While certain of them may be related mythologically, such as the Pleiades and Orion, they are essentially autonomous and not limited in number. The zodiac is an integrated system of twelve constellations, referred to by astrological signs, that forms a backdrop to the movements of the sun, moon, and planets. Each zodiacal sign is also associated with a part of the human body and thereby serves to link the celestial and terrestrial planes. Aries, the first sign, represents the head; Pisces, the feet; the ten remaining signs between them represent other parts of the body in descending order. While scholars credit Babylonia with devising the zodiac (c. 700–420 BCE), the Babylonians themselves in their creation epic, the *Enuma elish*, credit the god Marduk with that invention.

The ancient Egyptians also developed an integrated system of star organization. Here, the thirty-six decans, or star groups, each ten degrees in width and each named for a deity, served two purposes. The heliacal rising (first appearance in the dawn sky) of the leading star of each decan was noted, then used to mark out the twelve-month Egyptian calendar. At night, the decans functioned as a star clock, enabling priests to know the correct time for the performance of religious observances. In this way the temporal rhythms of the earth were linked to those of the sky.

In Indian tradition the Nakṣatras, or lunar mansions, comprise another integrated system of stars. The passage of the moon through the sky was charted as the journey of the god Soma through his “resting places.” Each star is thought to be inhabited by one of the twenty-eight wives with whom Soma spends one night each month.

**THE SKY IN MYTH.** In religions around the world, the sky symbolizes transcendence and sacrality, stretching and satisfying the human imagination. Whether it is understood as the home of the gods, the resting place of heroes, or the land of the dead, the sky is often envisioned as the transcendental model for human existence. The powers of the stars watch and guide people in life and welcome them in death. As the land of the ancestral dead, the stars represent the place of future human existence and reward. In them humans will endure forever, see and know all, thus also becoming godlike.

On the terrestrial plane, everything exists in a state of constant change. Nature is unpredictable—sometimes benign and sometimes malevolent. The sky alone remains

constant, predictable, beyond change. Since the distant sky gods are usually the lawgivers of a culture, establishing order in human society, the celestial-terrestrial relationship is a reciprocal one: Humans order the uncharted night sky by imposing images on it, while the heavens, in return, impose lawful order on human society.

Catasterisms, tales in which either humans or animals achieve immortality by becoming stars, express the notion of the stars as the home of heroes. Catasterisms present a permanent image of the reward for heroic feats while providing an etiological explanation for the existence of individual stars and constellations. These tales exist in such diverse cultures as Australia, where a man becomes a star to avoid the wrath of the irate husband chasing him, and Greenland, where a group of lost seal hunters become stars. The Greeks and the Romans were the most prolific creators of catasterisms.

These stories relate that after death the soul becomes a star, a notion that originated with the Pythagoreans. The belief that only heroes become stars leads to the use of star groups such as Herakles and the Pleiades as models for heroic effort and reward. Star groups such as Andromeda and Orion, by contrast, serve as demonstrations of the lasting punishment given for the sin of hubris. The star Antinoüs was named in 132 CE in honor of Hadrian’s young lover who drowned himself in the belief that he could thereby add the years allotted to him to Hadrian’s life.

The Milky Way, which is frequently called the River of Heaven or the Celestial Road, is connected with the notion of the stars as the land of the dead. In Norse mythology it is the road of the ghosts going to Valhøll; in Celtic lore it is created by Gwydion so that he can use it to seek his son’s soul in the heavens; in Islam it is said that Muḥammad walked on it to reach God; in Akkad it was called the River of the Divine Lady and was traveled by ghosts; in eastern Washington state the Sanpoil Indians place the land of the dead at the end of it; the Pawnee say it is the path followed by the spirits of the dead, and the Lakota add that travel to the Spirit Land is interrupted just before arrival by an old woman who checks for wrist tattoos; those without tattoos are sent back to earth as ghosts.

**TEMPLES AND THE STARS.** The most concrete way to establish the importance of the stars in the ancient world is to study the alignment of temples with particular stars. As sacred structures, temples—especially those dedicated to sky gods—are designed according to a celestial pattern. In 1894 J. Norman Lockyer published his research on Egyptian temples, under the title *The Dawn of Astronomy*. With the advent of modern technology, much of Lockyer’s dating has been called into question, but his general theory of celestial alignment is still operative. In England, the Americas, and the ancient Near East there is evidence of such alignment. Ancient temples were most commonly constructed in relation to the sun’s position at the solstice or equinox, but there are significant instances of design with relation to individual stars.

Astral alignments are established by astroarchaeologists, who calculate the age of a site from its remains and then use computers to recreate the star patterns visible at the time the site was built. England's Stonehenge (construction started c. 2800 BCE) is a good model. There, the large standing stones were arranged against the horizon to function as foresights; smaller stones served as backsights. In order to mark the passage of the sun, the astronomer-priest would fix a spot on which to stand to observe the sunset against the foresight stones. As the sun changed its course during the year, it would set to the right or left of these stones, its extremes marking the solstice and equinox points. Stonehenge was used as an elaborate observatory for marking the important celestial events of the year. The movements of the sun, moon, planets, and important star systems such as the Pleiades and especially the heliacal risings of the stars and planets were all noted there.

The same principle was employed in Mesoamerica, most dramatically at Tenochtitlán, the political and religious capital of the Aztec, where the course of a river was altered in order to create the desired alignments for observing the rising sun at the equinox and solstice and the heliacal rising of the Pleiades. Other Mesoamerican sites were also constructed with relation to the Pleiades, as well as to the stars Capella and Sirius and the planet Venus.

Gerald Hawkins (in *Stonehenge Decoded*, Garden City, N.Y., 1965), using modern techniques, has checked Lockyer's thesis at several sites in Egypt. While disagreeing with some of Lockyer's findings, he does establish that Egyptian temples are aligned with certain stars. Edwin C. Krupp (1978) has made a connection between the alignments of the pyramids and the cult of Isis and Osiris, represented respectively by the stars Sirius and Orion. First, he notes that all stars are invisible for approximately seventy days when their light is lost in the brighter light of the sun; he finds it significant that the ancient Egyptians called this time "being in Duat" (i.e., the underworld). Krupp sees a relation between this time span and the period allotted for embalming: Seventy days were required to prepare a body for burial. Because the stars are often thought of as the land of the dead, Krupp suggests further that the shafts in the pyramids aligning with Sirius and Orion were constructed so as to allow the souls of the pharaohs to rise up to these stars, the souls' final resting place.

In North America there are few sites of astronomical interest, but where they exist the myths and legends of the people also show astronomical characteristics. The *kivas* of the Anasazi, ancestors of the modern Pueblo, show some evidence of astral alignment, and modern Pueblo rituals preserve astral timings. Among the Plains Indians, medicine wheels constructed of large and small stones arranged in the shape of a wheel with spokes establishing alignments, mark the solstices. In Saskatchewan, Canada, the Moose Mountain Medicine Wheel is also aligned to the heliacal rising of the bright summer stars Aldebaran, Rigel, and Sirius.

**THE POLESTAR.** Sometimes diverse cultures use similar images to describe the same star. The polestar, or North Star (the position held today by the star Polaris in Ursa Minor), because of its relative lack of motion as compared to other stars, is important for both land and sea navigation. In many cultures it is seen as the center of the universe.

Norse people believed that the gods ordered the universe by driving a spike through the earth and causing the heavens to revolve around this axis. The end of this spike was fastened to the polestar. For the Mongols, the polestar was the golden peg or nail that holds the turning heavens together. In India it is called the "pivot of the planets" and is represented by the god Dhruva, who was so immovable in his meditation that he became the polestar shining about Mount Meru, the center of the world. Because Dhruva began his meditation in a search for constancy after having been disappointed by the unsteadiness of his father's love, the star is worshiped in India as a source of constancy both in meditation and in marriage. The Mandaeans, along the Tigris and Euphrates rivers, worshiped the polestar as the central star around which all other heavenly bodies move; their sanctuaries were built so that persons entering them faced the polestar. Worshipers prayed facing it, and the dying were positioned so their feet and eyes were aligned with it.

The constancy of the polestar also led to its popularity among sailors, as the epithets Steering Star, Lodestar, and Ship Star show. (Strabo, the Greek historian and geographer of the first century BCE, attributed its use among Greek sailors to Thales, the astronomer and philosopher of the sixth century BCE.) The constant position of the polestar made it useful to land travelers as well. In Mesoamerica it was thought both to protect and to guide traveling merchants, who burned copal incense in its honor. The Arabs used the polestar to navigate across the desert and believed further that fixed contemplation of it would cure itching of the eyelids. For the Chinese, the polestar was secretary to the Emperor of Heaven and as lord of the dead punished the dead according to their deeds.

**THE PLEIADES.** Even in societies where little attention was paid to the stars, the movements of the Pleiades were noted. For instance, the Bantu-speaking peoples of southern Africa regulated their agricultural calendar by them, and in Bali the Pleiades and Orion were used to keep the lunar calendar. In Australia, where the first annual appearance of the Pleiades coincides with the beginning of the rainy season, the Aborigines consider these stars the source of rain and curse them if rain does not follow their appearance. In general, the last visible rising of the Pleiades after sunset is celebrated all over the southern hemisphere as beginning the season of agricultural activity.

Where myths have developed about the Pleiades, these stars are generally associated with women. In the Greco-Roman world, these stars were called the "seven daughters of Atlas," and in China they were worshiped by women and girls as the Seven Sisters of Industry. In Australia, they are

seen as young girls playing instruments for a group of dancing young men, the stars of the Orion group. In the Solomon Islands they are called a “company of maidens,” and among the Yurok of North America they are thought of as six women. In India they had a rich and varied identity as the nurses of Skanda, the infant god of war, and as the seven wives of the seven sages of Ursa Major. Myths in which they are depicted as wives describe the reasons for their being changed into stars as either punishment for infidelity or as a reward for fidelity. In one positive reading, the star Arundhati is considered the ideal Indian wife because her virtue was great enough to resist the god Śiva’s attempt at seduction. Like the polestar, she is worshiped by married couples as a symbol of constancy.

The Pleiades also played a central role in the religious life of the Aztec. The fifty-two year cycle of their calendar was measured by the Pleiades. Indeed, legend recalls that the destruction of the world in a past age occurred at such a moment. The ceremony at the end of the cycle, the “Binding of the Years,” established that the movements of the heavens had not ceased and that the world would not end but was guaranteed to last for another fifty-two years. Not only was one of the alignments of the Aztec city of Tenochtitlán to the Pleiades, but a further clue to the importance of these stars is the fact that at the time of the city’s erection (c. 150 CE), the heliacal rising of the Pleiades occurred on the same day as the first of the sun’s annual passages across the zenith, a day of great importance in demarcating the seasons, and the day when the sun in Mexico casts no shadow at high noon. Additionally, this was the beginning of the rainy season so important to agriculture.

The Inca called the Pleiades the “stars of summer” and believed that their appearance on the first sighting predicted the success of the crops. If the stars were large and bright when they first appeared, the crops would be successful; if they were small and dim, the crops would fail. This connection to the agricultural season in part explains the emphasis placed on the Pleiades. In Greece the Pleiades presage temperate weather: The name of one of the stars of this group, Alcyone, is connected, by derivation, with the term “halcyon days,” a clement and temperate time. In ancient Greece the season safe for navigation began in May with the heliacal rising of the Pleiades and closed with their setting in late autumn. In the Hervey Islands of the South Pacific they are the favorite guides for night sailing and are worshiped by sailors.

In North America the Blackfeet use the Pleiades to regulate their most important feast, which includes the blessing and planting of the seed. The Navaho believe the Pleiades appear on the forehead of their principal deity, Black God. **SIRIUS.** Regarded as one of the most important stars in ancient Egypt, Sirius played a role there similar to that of the Pleiades among the Aztec. Sirius’s heliacal rising at the summer solstice coincided with the annual inundation of the Nile, thus beginning the Egyptian year. Seen as the goddess Sothis by the Egyptians, Sirius was also connected with the

goddesses Hathor, Sekhet, and Isis and was generally considered to be the resting place of Isis’s soul. Also called the “Nile star,” Sirius had a dog for its hieroglyph and to this day is widely known as the “dog star.” In ancient Rome, when the sun approached conjunction with Sirius at a festival for the protection of grain, farmers sacrificed a fawn-colored dog to the god Robigus. The Dogon of Africa also connect Sirius with a grain called po, and Po is their name for Sirius’s smaller, darker companion star. That companion was first seen by Western astronomers in 1962, yet the Dogon discussed the star with Western anthropologists as early as 1940. Claiming to have known of the companion star for eight centuries, the Dogon correctly estimated that its orbit around Sirius took fifty years.

A Finnish tale explains the brightness of Sirius by the story of the lovers Zulamith the Bold and Salami the Fair: When they finally completed a bridge to each other (the Milky Way) after a thousand years of separation, they rushed into each other’s arms and melted into one.

**COMETS, METEORS, AND SHOOTING AND FALLING STARS.** Noticeably short-lived celestial phenomena such as comets and meteors (shooting and falling stars) share in the sacred nature of the sky and add to the meaning of the “permanent” stars. The abruptness of their passage often made them seem to be omens full of meaning for good or ill. The American writer Mark Twain said of himself that he was born when Halley’s comet approached the earth, and he correctly predicted his death upon its return. A comet recorded in 431 BCE gave support to the notion that Julius Caesar had become a comet upon his death a year earlier. Shakespeare made dramatic use of this idea when he wrote “When beggars die, then are no comets seen; / the heavens themselves blaze for the death of princes” (*Julius Caesar* 2.2).

In ancient Greece and Rome, comets were generally thought to portend unfortunate events. The astronomer Ptolemy (second century) said that the meanings of comets could be discerned by their individual shapes; their color revealed what they would bring (generally wind and drought), and their position in the zodiac indicated the country that would be affected. Pliny, the Roman writer of the first century CE, also believed that comets signaled disaster and specified, for example, that a comet in Scorpio portended a plague of reptiles and insects, especially locusts. Seneca the Younger, writing in the first century CE, following Aristotle, said that comets were portents of bad weather during the ensuing year.

Such ideas persisted after the rise of Christianity. In the third century CE, the church father Origen held that comets appear on the eve of dynastic changes, great wars, and other catastrophes but also may be signs of future good: He seems to have taken the star of Bethlehem, which announced Christ’s birth, to be a comet. The German philosopher Albertus Magnus (d. 1280) wrote that comets signified wars and the death of kings and potentates. According to Ptolemy of Lucca (d. 1377), a comet portended the death of Pope Urban IV in 1264. The pope had sickened as soon as the

comet appeared and had died three months later, on the very day it disappeared. Elizabeth I of England gained great prestige by manifesting her indifference to the comet of 1557. When her courtiers tried to deter her from looking at the dreaded object she advanced boldly to the window, declaring, "the die is thrown." Seventeenth-century Christian preachers declared that comets were sent by God to draw human beings to repentance, and as late as 1843 the Millerites thought a comet confirmed their belief in the immediate destruction of the world.

Among the Aztec similar notions prevailed. They called comets "stars that smoke" and thought they usually signified the impending death of members of nobility; the death of the ruler of Tenochtitlán followed the appearance of a comet, and another was said to have predicted the fall of Moctezuma II. The Plains Indians also connected appearances of comets with disaster and misfortune.

In the Society Islands, comets (along with meteors) were believed to be the tails of gods, and when they were seen, the people threw off their upper garments (the mark of respect shown to gods and sacred head chiefs) and exclaimed, "A god! A god!" But in Samoa comets were believed to predict the death of a chief, or some other calamity such as war or bloodshed. The Indian astronomer and astrologer Varahamihira (sixth century CE), while generally concurring with such theories, developed an elaborate system of analysis to predict the three types of events comets can bring: auspicious, inauspicious, and having mixed effects.

Shooting and falling stars, meteors, and meteorites have in common the sacred quality of having come from the heavens, whether for good or ill. Like comets they are preeminently seen as signs and portents. Ptolemy says they indicate the coming of winds and storms, while Seneca links them to violent political events. By contrast, some believed them to be connected with healing. Pliny preserved the notion that a corn may be successfully extracted at the time of a shooting star; the physician Marcellus (fourth century CE) says the same of warts, adding that if you start counting while a star is falling, the number will equal the number of years you will be free of sore eyes. In India falling stars are thought of not only as reincarnating souls traveling back to earth, but also as demons who love the night and who are connected in a negative way with the souls of the dead. Such beings are especially dangerous to pregnant women.

Among the most famous meteorites in religious history is the Ka'bah of Mecca, which tradition says was brought to earth by the archangel Gabriel. Also important is the meteorite of the goddess Cybele of the Phrygians. It arrived in Rome in 204 BCE, when Rome was being threatened by Hannibal. The Sibylline Books, which had been consulted after a meteorite shower, foretold that a foreign army could be driven from Italy if Cybele's symbol, a meteorite, was brought to Rome. It was, and Hannibal was defeated. The Romans expressed their gratitude to the goddess by erecting a temple

to her on the summit of the Palatine and held an annual celebration to commemorate her arrival.

The alignments of temples, the long history of astrological beliefs, and the abundance of myths and folktales about the stars provide ample evidence for the existence in many cultures of the notion "as above, so below." This view of the universe, in which the terrestrial and celestial realms are recognized as interrelated, has been a source of great richness to the cultural and religious experience of the human race.

## BIBLIOGRAPHY

The best collection of myths surrounding the stars, constellations, and zodiac is Richard Hinckley Allen's *Star Names: Their Lore and Meaning* (1899; reprint, New York, 1963). Allen makes no attempt to synthesize his material, which is arranged in alphabetical order. For the various astral systems of the ancient world, see Robert Brown's *Researches into the Origin of the Primitive Constellations of the Greeks, Phoenicians and Babylonians*, 2 vols. (London, 1899–1900); for their scientific background, see Otto Neugebauer's *The Exact Sciences in Antiquity* (1951; New York, 1969); while Ptolemy's *Tetrabiblos*, translated by F. E. Robbins (Cambridge, Mass., 1940), remains the starting place for Western views. For the Nakṣatras and general Indian views, see *The Brihajjātakam of Varāha Mihira*, 2d ed., translated by Swami Vijnanananda (New Delhi, 1979), and Robert De Luce's *Constellational Astrology according to the Hindu System* (Los Angeles, 1963). The decans are covered by Wilhelm Gundel in *Dekane und Dekansternebilder* (Hamburg, 1936). Lynn Thorndike's *A History of Magic and Experimental Science*, 8 vols. (New York, 1923–1958), remains a valuable resource on the West up to the medieval period.

On the issue of alignments, Joseph Norman Lockyer's *The Dawn of Astronomy: A Study of Temple Worship and Mythology of the Ancient Egyptians* (1894; Cambridge, Mass., 1964), while challenged today, helped to create the field of astroarchaeology. This work is continued in *In Search of Ancient Astronomies*, edited by Edwin C. Krupp (Garden City, N.Y., 1978), which also contains excellent essays on ancient astronomy, and in *Native American Astronomy*, edited by Anthony F. Aveni (Austin, 1977), which treats archaeological sites in North and South America.

Finally, in part 4 of *The Raw and the Cooked* (1969; Chicago, 1983), Claude Lévi-Strauss provides an interesting comparison of similar myths of particular constellations, such as the Pleiades, in South America and ancient Greece.

SERINITY YOUNG (1987)  
*Revised Bibliography*

**STCHERBATSKY, THEODORE** (1866–1942), was a Russian Buddhologist and Indologist. Fedor Ippolitovich Shcherbatskii, who signed his non-Russian writings “Th. Stcherbatsky,” was born in Kielce, Poland, and died in Borovoi, Kazakhstan. He studied philology and Indology in Saint Petersburg under I. P. Minaev, Sanskrit poetics in Vienna with Georg Bühler, Indian philosophy in Berlin with Hermann Jacobi, and Sanskrit and Tibetan logic with pandits in India and lamas in Mongolia. From 1900 to 1941, Stcherbatsky taught at Saint Petersburg (later Leningrad) State University. His students included O. O. Rozenberg, E. E. Obermiller, and A. I. Vostrikov. The Russian Academy of Sciences named Stcherbatsky corresponding member (1910), academician (1918), director of the Institute of Buddhist Culture (1928–1930), and head of the Indo-Tibetan section of the Institute of Oriental Studies (1930–1942). He helped S. F. Ol’denberg produce the academy’s “Bibliotheca Buddhica” series of texts, translations, and monographs (1897–), which included several of Stcherbatsky’s own works.

Although Stcherbatsky wrote widely on Indology and philology, his works on Buddhist philosophy were most influential. Stcherbatsky relied on Sanskrit and Tibetan, not Pali, sources and preferred *śāstras* (scholastic treatises) to *sūtras* (canonical texts), considering them to be, respectively, technical and popular works, differing in style, not doctrine. Skeptical of the search for “original Buddhism,” he investigated pluralist, monist, and idealist phases of Buddhism. Early Buddhist “pluralism” replaces substances (soul, God, matter) with innumerable, interdependent, momentary *dharmas*, which attain cessation in *nirvāṇa*. Stcherbatsky saw in later *abhidharma* literature, especially Vasubandhu’s *Abhidharmakośa*, the epitome of early Buddhist philosophy. (Stcherbatsky’s works emphasized traditional Buddhist scholarship and Tibetan sources but neglected modern historical criticism.) He began publishing the *Abhidharmakośa* and its commentaries in the “Bibliotheca Buddhica,” summarized it in *The Central Conception of Buddhism and the Meaning of the Word “Dharma”* (1923), and translated its final section as “The Soul Theory of the Buddhists” (*Izvestiia Rossiiskoi Akademii nauk*, ser. 6, vol. 13, 1920, nos. 15, pp. 823–854, and 18, pp. 937–958).

According to Stcherbatsky, Mādhyamika “monism” sees interdependent, momentary *dharmas* as unreal or empty. Emptiness (*śūnyatā*) and interdependence (*pratītyasamutpāda*) are identified as “relativity.” *Nirvāṇa* is the realization of this one reality underlying an unreal plurality. Stcherbatsky’s main work on Mādhyamika, *The Conception of Buddhist Nirvāṇa* (1927), was a rejoinder to *Nirvāṇa* (1925)

by Louis de La Vallée Poussin (see Guy R. Welbon’s *The Buddhist Nirvāṇa and Its Western Interpreters*, 1968). Stcherbatsky later reinterpreted Mādhyamika as “relativism,” reserving “monism” for the Yogacara (see the preface to *Madhyānta-Vibhāṅga: Discourse on Discrimination between Middle and Extremes*, 1936).

Yogācāra “idealism” rejects pluralism and relativism. Subject and object, separately unreal, are really inseparable. Everything exists relatively, yet relativity really exists as the true nature of consciousness. This “idealism” led to the epistemology of Dignāga and Dharmakīrti (Stcherbatsky’s “Buddhist logic”), which admits only two modes of valid cognition: non-conceptual “perception,” and conceptual “inference.” Stcherbatsky is best known for his work on this school: his earlier *Theory of Knowledge and Logic According to the Doctrine of the Later Buddhists*, and his magnum opus, *Buddhist Logic* (2 vols., 1930–1932). Stcherbatsky, admiring both philosophers, called Dharmakīrti “the Indian Kant.” This comparison, and the Kantian language of *Buddhist Logic*, should be taken cautiously.

Stcherbatsky lacked sympathy for Buddhism as religion but admired Indian philosophy as rigorous philosophy. Refuting the common misconception of Indian thought as vague mysticism, his works challenge Western philosophers to acknowledge their Buddhist and Indian colleagues.

#### BIBLIOGRAPHY

Stcherbatsky’s *Teoriia poznaniia i logika po ucheniiu pozdneishikh buddistov* (Theory of Knowledge and Logic according to the Doctrine of the Later Buddhists), 2 vols. (Saint Petersburg, 1903–1909), has been translated into German as *Erkenntnistheorie und Logik, nach der Lehre der späteren Buddhisten* (Munich, 1924) and into French as *La théorie de la connaissance et la logique chez les bouddhistes tardifs* (Paris, 1926). *Buddhist Logic*, 2 vols. (Leningrad, 1930–1932), is available in two reprint editions; other English works cited in the text are available in Indian reprint editions. The complete “Bibliotheca Buddhica” has been reprinted in Germany (1970) and in Japan (1971). For shorter Russian works in English translation, see two books edited by Debiprasad Chattopadhyaya and translated by Harish Chandra Gupta: *Papers of Th. Stcherbatsky*, “Soviet Indology Series,” no. 2 (Calcutta, 1969), and *Further Papers of Stcherbatsky*, “Soviet Indology Series,” no. 6 (Calcutta, 1971). The former contains bibliographical and biographical information from Russian sources, partially contradicting the obituary in the *Journal of the Royal Asiatic Society* (1943): 118–119.

BRUCE CAMERON HALL (1987)  
*Revised Bibliography*

**STEINER, RUDOLF** (1861–1925), who wrote more than 350 volumes on philosophy, science, and the arts, was the originator of an esoteric form of spiritual teaching called anthroposophy, which he defined as meaning both “knowledge of the human being” and “human knowledge.” Steiner was born in Kraljevec on Murr Island, Hungary, on February 25, 1861. He was educated in Austria, lived in Germany in his middle years, and lived in Dornach, Switzerland, during the last twelve years of his life. From 1900 to 1924, in virtually every major city in Europe, he delivered over six thousand lectures, some to an audience of a dozen and others to several thousands.

From an early age, Steiner experienced access to spiritual realities, including experiences of the dead; the inner, or “etheric,” forces of the plant world; and the living power of symbolic forms. At age twenty-two he was appointed editor of the natural scientific writings of Johann Wolfgang von Goethe, which were published in five volumes (1883–1897).

Beginning in 1900, at the age of thirty-nine, Steiner began to teach a Western Christian-Rosicrucian esotericism. He served as the head of the Berlin branch of the Theosophical Society from 1902 to 1911. He continued to speak about H. P. Blavatsky (1831–1891), the founder of the society, with great respect, but in contrast to the primarily Hindu-Buddhist orientation of the Theosophical Society, Steiner emphasized both the central role of Christ in the evolution of consciousness and the importance of thinking for the *karma* of the West. Steiner’s doctoral dissertation, published as *Truth and Knowledge* (1892), in combination with *The Philosophy of Freedom* (1894), prepared the way for the theory of cognition that characterizes his later thought. In 1904 Steiner published two of his foundational esoteric works: *How to Know Higher Worlds* and *Theosophy*. The third foundational text from that period was *An Outline of Esoteric Science* (1909). Collectively, these three works present Steiner’s fourfold theory of human nature (physical, etheric, astral, and Ego), his detailed account of the evolution of earth and humanity, guidance on the path of initiation, and his description of the workings of *karma* and rebirth. Some of the ideas in these basic anthroposophical texts can be found in Hindu and Buddhist scriptures and in the esoteric teachings of Blavatsky, but Steiner sought to establish them in the Western, specifically Christian, tradition.

In response to requests from his followers for guidance, Steiner delivered more than six thousand lectures on disparate topics in the sciences, the social sciences, the arts, education, and on many of the founders and leaders of different religious traditions. In the tradition of Goethe, Steiner showed how imaginative seeing can illuminate the natural world, especially plants and the world of color. He generated myriad insights into the inner dynamics of the natural world, including metals, crystals, plants, soil, and particularly the human body. He described in detail the effects of spiritual, astral, and etheric forces on planetary bodies, the earth, and human beings.

Steiner bequeathed a host of insights concerning color theory, painting, sculpture, and architecture. Many of his contributions in these areas are exemplified in the two Goetheanum buildings in Dornach that he designed. The first Goetheanum, for which construction began in 1913, was nearly finished when it was destroyed by fire in 1922. The second Goetheanum serves as the spiritual center for the General Anthroposophical Society. In the years 1910–1914 Steiner taught several courses on speech formation that were based on his esoteric knowledge of the human larynx, and he wrote and directed four dramas in which he attempted to use those innovations in speech to express the inner realities of human and spiritual beings. In 1912 Steiner began teaching a series of lessons for a discipline of his own invention called *eurythmy*. Using his knowledge of language and sound, he showed how the human body, particularly the limbs, can express in visible form the varied meanings of consonants, vowels, and musical notes.

Steiner posited three principal divisions of society: the economic, the political, and the spiritual-cultural. He argued that these three realms should be regarded as separate but related and of equal importance. This social theory has profound implications for Steiner’s approach to education, which he placed in the spiritual-cultural sphere, essentially removed from economic and political (including governmental) influence. Steiner’s attempt to develop an approach to education that would be modern, spiritual, and centered on the needs of the child dates to his lecture series of 1907, *The Education of the Child in the Light of Anthroposophy*, and it finds full expression in the Waldorf approach to education.

Waldorf Schools (named after the school in Stuttgart that Steiner founded in 1919 for the children of workers in the Waldorf-Astoria tobacco factory) employ a curriculum based on what Steiner saw as the seven-year cycles through which a child develops and on the cultivation of the child’s scientific and artistic imagination. On Steiner’s recommendation, Waldorf teachers strive to “receive the child in reverence, educate the child in love, and send the child forth in freedom.”

Steiner delivered more than a dozen lecture series on the spiritual and esoteric revelations that he gleaned from the events depicted in the Christian scriptures. Although he emphasized that the primary spiritual path for modern humanity ought to be spiritual science, or anthroposophy, in 1922, in response to an appeal for help from German and Swiss pastors and theology students, Steiner provided the spiritual foundation for a church called the Christian Community. During Christmas week in 1923, Steiner reorganized the Anthroposophical Society with the Goetheanum as its spiritual and physical center. He died at the Goetheanum on March 30, 1925.

**BIBLIOGRAPHY**

More than two hundred volumes by Steiner and an equal number concerning anthroposophy by other authors, including Christopher Bamford, Owen Barfield, Sergei Prokofieff, M. C. Richards, and Valentin Tomberg, are available from Anthroposophic Press/Steiner Books at [www.anthropress.org](http://www.anthropress.org). The following books are published by Anthroposophical Press/Steiner Books, Great Barrington, Massachusetts.

Bamford, Christopher, ed. *Spiritualism, Madame Blavatsky, and Theosophy*. Great Barrington, Mass., 2001.

Barnes, Henry. *A Life for the Spirit: Rudolf Steiner in the Crosscurrents of Our Time*. Hudson, N.Y., 1997.

Prokofieff, Sergei. *Rudolf Steiner and the Founding of the New Mysteries*. East Sussex, U.K., 1986.

Steiner, Rudolf. *An Autobiography—Chapters in the Course of My Life: 1861–1907*. Translated by Rita Stebbing, Herndon, Va., 1999.

ROBERT A. McDERMOTT (1987 AND 2005)

**STHIRAMATI.** Although he was born in India, Indian Buddhist literature has almost nothing to say about Sthiramati (470–550). Therefore, Tibetan and Chinese sources must be relied on for information on his life. According to Tibetan Buddhist historians, Sthiramati was born in Daṇḍakarānya, the son of a *sūdra*, and as a child studied under Vasubandhu (c. mid-fourth to mid-fifth centuries). Both Chinese pilgrim scholars Xuanzang (600?–664) and Yijing (635–713) mention Sthiramati as one of the great Buddhist philosophers and that he was a disciple of Guṇamati (c. 420–500). In addition, in *Chengweishilun shuji*, Kuiji (632–682), a disciple of Xuanzang, gives short biographies of the ten great Buddhist masters. He includes Sthiramati and names him as a student of Guṇamati. Kuiji also reports that Sthiramati hailed from the state of Laṭā in southern India and was an older contemporary of Dharmapāla (530–561). Also, in the opening section of the Uighur translation of his *Abhidharmakośabhāṣyaṭīkā Tattvārthanāma* Sthiramati states explicitly that Guṇamati was his teacher. This is significant evidence to confirm the Chinese scholars' account that Sthiramati was a disciple of Guṇamati, not of Vasubandhu as the Tibetan historians asserted.

Both Tibetan and Chinese sources note that he dwelled at Nālandā. However, Sthiramati's name is closely associated with the city of Valabhī, and the fact that Sthiramati was one of the most renowned Buddhist masters at Valabhī is attested to by both Chinese Buddhist sources and historical documents. Regarding the dates of Sthiramati's life, Ui Hakuju suggested 470 to 550 whereas Erich Frauwallner suggested 510 to 570. Ui's date appears to be more plausible as a working hypothesis than the one established by Frauwallner because he based his calculation on Xuanzang, who, in turn relied on the dates of Dharmapāla as well as Śīlabhadra (529–645). Ui also relied on the date of Guṇamati, which he established as around 420 to 500.

**EXTANT WORKS.** Sthiramati is mostly known through his two extant works in Sanskrit that have been edited and partially translated into western languages: the *Madhyāntavibhāṅgaṭīkā* and the *Trīṃśīkābhāṣya*. However, the Tibetan tradition attributes thirteen works to the name Sthiramati. Among them seven are Tantric texts, although it is almost impossible to know whether the author of these works is the same Sthiramati. Of the remaining six, two are Tibetan translations of the *Madhyāntavibhāṅgaṭīkā* and the *Trīṃśīkābhāṣya*, and four are works of which the Sanskrit originals are lost, namely, *Sūtrālamkāravṛttibhāṣya*, *Pañcaskandhaprakaraṇavibhāṣa*, *Abhidharmakośabhāṣyaṭīkā Tattvārthanāma*, and *Ārya Mahāratnakūṭadharmaparyayaśatasāhasrikā Kāśyapaparivartatīkā*. The Chinese canon also contains four works under the name Anhui (Sthiramati): *Jushelun shiyishu*, *Dacheng zhongguan shilun*, *Dacheng apidamo zajilun*, and *Dacheng guang wuyunlun*. Among these the *Jushelun shiyishu* and the *Dacheng guang wuyunlun* appear to correspond respectively to the *Abhidharmakośabhāṣyaṭīkā Tattvārthanāma* and the *Pañcaskandhaprakaraṇavibhāṣa* (although they are different in contents), whereas the *Dacheng apidamo zajilun* and the *Dacheng zhongguan shilun* are works extant only in Chinese translation. Thus, in all, there are eight non-Tantric works that can be attributed with some certainty to Sthiramati.

Sthiramati was primarily a commentator and did not compose any independent treatise. His most significant contribution is in the field of Yogācāra philosophy. In his commentaries Sthiramati appears as a thinker who was mainly concerned with clarifying and systematizing Yogācāra philosophy, and, although he did have his preferences, he was not particularly interested in sectarian controversy. Sthiramati's commentaries on major Yogācāra texts, including the *Mahāyānasūtrālamkāra* and the *Madhyāntavibhāṅga*, show that one of his main intentions was to elucidate the Mahāyāna concept of enlightenment (*bodhi*) or buddhahood, expressed by the term *dharmadhātu*, and its soteriological implications as the ultimate goal of the Buddhist path. These issues are discussed at great length in his two larger works: the *Madhyāntavibhāṅgaṭīkā* and the *Sūtrālamkāravṛttibhāṣya*.

**YOGĀCĀRA THOUGHT.** Sthiramati's systematic understanding of Yogācāra philosophy is found most succinctly in his *Trīṃśīkābhāṣya*. According to this, ordinary people are inclined to impose the concepts of persons (*pudgala*) and phenomena (*dharmā*) on the realities that in truth consist of moment-to-moment processes of cognitions (*citta* or *vijñapti*) caused by their own conditions. The view of self (or person) constitutes afflictive obstruction (*kleśāvaraṇa*) that hinders liberation (*mokṣa*) whereas the construct of phenomena leads to cognitive obstruction that hinders omniscience (*saravajñatva*). The teaching of mind-only (*cittamātra*) or cognition-only (*vijñaptimātra*) is to enable unenlightened people to understand the selflessness of persons (*pudgalanairātmya*) and the selflessness of phenomena (*dharmānairātmya*). The constructed duality of persons and phenomena

(*grābhakagrāhyadvaya*) is of imagined nature (*parikalpitasvabhāva*) and is ultimately nonexistent. However, this dualistic concept is constructed based on the transformation of consciousness (*viññānaparināma*) or cognition-only (*viññaptimātra*), which is of a dependent nature (*paratantrasvabhāva*). To see that realities are cognition-only and free from the superimposition of the duality of persons and phenomena is to realize their true nature (*parinānasvabhāva*). Because the knowledge of the selflessness of persons is an antidote to the false view of self and because the knowledge of the selflessness of phenomena is an antidote to cognitive obstructions, to remove afflictive and cognitive obstructions is to achieve liberation and omniscience or buddhahood.

According to Sthiramati, the teaching of *viññaptimātra* (i.e., things do not exist with intrinsic natures but are only the transformations of consciousness) is to refute the errors of the two extreme views: (1) that the objects, like consciousness (*viññāna*), are real; and (2) that, like the objects, consciousness only exists conventionally but not ultimately.

Due to the lack of translation of his works into Chinese, Sthiramati did not get as much appreciation as Dharmapāla in the Chinese tradition. Chinese Buddhists' interpretations of Sthiramati's views on Yogācāra tend to be fragmentary and at times unfounded, and his more important contributions went unknown.

**STIGMATA** SEE BODILY MARKS

**STOICISM** is a philosophy related to the ancient Greek Stoic school, which took its name from the painted "porch" (*stoa*) on the northern side of the Athenian Agora (now ruins partially excavated along Hadrianos Street), where teachers and students of the school initially met. Later, however, lessons were also held in more suitable public buildings (cf. Diogenes Laertius, 7.184).

**HISTORICAL SURVEY.** The founder of the Stoic school was Zenon (c. 335–263 BCE). Born in Cithium, Cyprus, he traveled for business to Athens in his thirties and came in contact with Socratic circles there. Zenon devoted himself to philosophy and worked out a comprehensive and ethically oriented world vision, entirely different in its ontological framework from those Plato and Aristotle had produced a few decades earlier. Having lived a successful life in Athens, whose municipality honored him with a statue, Zenon committed suicide. According to Stoic doctrine, suicide is a proper way to end one's life when circumstances (chronic illness, external pressure, etc.) prevent one from continuing to live as a wise person.

Cleanthes (c. 331–232 BCE), a student of Zenon's from Assos (not far from ancient Troy), led the school until he let himself starve to death, having reached almost one hundred years of age. Cleanthes is believed to have been interested in religion, an opinion due apparently to his famous "Hymn to Zeus" (*Stoicorum veterum fragmenta [SVF]* 1.537). In fact, Cleanthes occupied himself with a wide range of philosophical topics, including logic as well as psychology.

The third head of the Stoa was Chrysippus (c. 280–208 BCE), who came from Soli, near modern Mersin, in Cilicia (southwestern Anatolia, bordering Syria). Chrysippus was a natural scholar who wrote numerous books (only fragments are extant) by which he improved the Stoic system in all branches of philosophy. Most of what is known as Stoicism comes from him. After his death the Stoa was directed by Diogenes of Seleucia-on-the-Tigris and, later, by Antipater of Tarsus. These Stoic leaders of the first half of the second century BCE left the system set up by Chrysippus unchanged, for they were occupied in rebuking critics from rival schools, such as the Epicureans, the Peripatetics (Aristotle's followers), and especially Carneades of Cyrene, the director of the Academy (Plato's former school).

The two major Stoic figures of the following period, which August Schmekel labeled the Middle Stoa, are Panaetius of Rhodes (c. 185–c. 109 BCE) and Posidonius of Apamea, Syria (c. 135–c. 50 BCE). Both were worldly philosophers who developed friendly ties with high-ranking politicians and intellectuals in Rome. Panaetius was mainly concerned with issues of a moral and social nature; in religious matters he seems to have expressed agnostic views. Posidonius, who was endowed with an encyclopedic mind, wrote books on cosmology, geography, and history, and he restyled the Stoic system. Several tenets of Posidonius's system differed from Chrysippean "orthodoxy." For example, Posidonius accepted the existence of an "irrational" part of the

soul, following a rather Platonic psychological view (*Fgm.* 150 to 169, Edelstein-Kidd). Unlike Panaetius, Posidonius also had a genuine interest in theology and religious phenomena.

During the period of Panaetius's and Posidonius's leadership, Stoicism became one of the most followed philosophical trends of late Republican and early Imperial Rome. Representative of Roman Stoicism are Vergil's *Aeneid*, Seneca's moral essays, and the emperor Marcus Aurelius's *Meditations*. All these works exhibit a consistently Stoic inspiration, although it was developed in a personal, nonprofessional way. Little is known about the internal life of the school in later times. The Athenian Stoa apparently ceased to function as a center after the mid-first century BCE, and many anonymous private teachers carried Stoic philosophy throughout the Hellenistic world. Only a few of their names have come down to us, the most famous being Epictetus of Hierapolis (Phrygia; c. 50–130 BCE), whose *Manual* was long admired as an outstanding outline of the Stoic moral attitude.

In 175 CE Marcus Aurelius established—in Athens, the cradle of ancient Greek culture—a school for the study of literature (rhetoric) and the four main philosophical trends, including Stoicism. Thus, Athens became once again the official seat of Stoicism, but no information about the names and activity of the appointed Stoic teachers has survived. This imperial school was ordered closed in 527 by the Christian emperor Justinian, after allegations that it was a haunt for pagan propaganda.

Both Jewish and Christian thinkers, including Philo, Clemens and Origen of Alexandria, Tertullian, and Augustine of Hippo, were well acquainted with Stoic philosophy and appreciated its doctrine of providence and its high ethical standards. But as a whole, Stoicism was rejected because of its alleged materialism, and Platonism seemed, for Christianity, a much better choice. Stoicism is rarely mentioned in the literature of the Middle Ages, although it should have been known through Latin sources. Additionally, it was no longer qualified as a philosophical movement or school. Only in the Renaissance did the ancient Stoa tradition find renewed appreciation. Blaise Pascal's assessment (suggested by Montaigne) of the Stoic as a person who confidently trusts in himself rather than God provoked a negative reaction from the Christian point of view. Stoic elements can be recognized in Barukh Spinoza's *Ethics* and in Immanuel Kant's moral theory.

**MAIN DOCTRINES.** The chief concern of ancient Stoic philosophy, as with other Hellenistic schools, was to lead human beings to happiness (*eudaimonia*), which for the Stoics consists of moral virtue (*aretē*)—that is, pursuing on every occasion what is *kalon* (good, or, originally, well-done). The wise, well-behaved person (*sophos*) enjoys perfect happiness, for he is always coherent, firm, and internally appeased (*SVF* 3.29–67; 548–588). However, the sage's art of good living (*eu zēn*, *SVF* 3.16) requires a correct understanding of the nature of things and of the place of human beings in the world.

The Stoic approach is essentially a dynamic one. Reality, or nature, is a net of mutual interactions explaining the “growth” (the original meaning of *phusis*), change, and decay of individual things. Every “real” entity must therefore be a body, because only a bodily being can act on other beings and be affected by them. The pure logical formulas are not bodily, as they do not exist anywhere (for instance, an utterance can be logically right, even though its content may never have taken place); they are simply something “one can say” (*lekton*). Yet being “bodily” does not equal being material: in this sense Stoicism is not a materialistic theory like Epicureanism. The Stoics distinguished two aspects in reality as a whole: the active and the passive. The former is a producing principle, the “force” (*dunamis*) or God—or, as Chrysippus and Posidonius put it, the “spirit” (*pneuma*). The second aspect is proper matter (*hylē*); that is, the underlying material for the spirit's activity. Both aspects are intrinsically united: the spirit includes a material component of “fire,” “heat,” or “ether,” while matter is always pervaded and shaped by spirit (*SVF* 2.299 to 313).

As a compound of matter and spirit, the world is represented by the Stoics as an organic, harmonic, and perfect living being (*SVF* 2.633–641), in which each part has a mutual “solidarity” with all others (*sumpatheia*, *SVF* 2.475, 534, 546). The spiritual principle operating inside reality receives, in the Stoic system, various names according to its manifold functions. It is primarily the “reason” (*logos*) through which all things of the world are brought about and linked in the most rational way (*SVF* 1.85, 160, 493, 2.1051). Each phenomenon takes its own place in a serial connection of causes and effects, but the particular causal chains, heterogeneous though they may appear in detail, all hang from one single principle and deploy themselves in conformity with a world plan laid down in the Logos at the beginning; thus the interlacing of all causes displayed by reason represents the all-determining “fate” (*heimarmenē*, *SVF* 2.912–938; cf. Posidonius, *Fgm.* 377, Theiler).

Moreover, insofar as the spirit is identical with God, the Logos is the same as God's mind, and fate equals divine providence (*pronoia*). The Stoics strongly stressed the rationality of the arrangement of the world and the providential disposition of all things, aimed ultimately at the wealth of humankind; a set of Stoic arguments thereon, recycled by Christian authors, provided the bulk of what was called *theodicy* in the seventeenth century (*SVF* 2.1106 to 1186). The existing world is, for the Stoics, neither infinite nor everlasting. The same spirit that produced it once and led its development will absorb it again in its original fire in due time, by means of an all-destroying conflagration (*ekpurōsis*). Soon afterwards, another world will be shaped by it, similar to the preceding one, and so forth cyclically. This is because the spirit's Logos, and hence the resulting fate, cannot change (*SVF* 2.596–632). This theory of “eternal recurrence” is a historical antecedent to Friedrich Nietzsche's ideas.

Rival schools objected that the Stoic doctrine of fate would abolish the human freedom of the will, but the Stoics

denied it. As Chrysippus explained (see Cicero, *On Fate* 18–19), fate does not have to be identified with a necessity that compels a person to do something he or she would not otherwise consent to do. Of course the environment lays down certain necessary conditions, but consent (*sunkatathesis*) to action comes from the person's own nature. Fate does not fulfill its plan automatically, but coordinates the freely chosen actions of humans with the circumstances. For instance, it was fated for Oedipus to be born, but that would not have occurred if his parents had not decided to have intercourse. Their actions were spontaneous and, at the same time, “co-destined” (*suneimarmenon*) in order to accomplish fate's end (Cicero, *On Fate* 13, cf. *SVF* 2.940). Augustine's late standpoint admitting compatibility between divine predestination and human free will was heavily influenced by this Stoic concept.

From an ethical point of view, a person's behavior, either right or wrong, depends on the strength of the soul's leading principle (*hegemonikōn*), which is the spark of universal reason. The aim of human existence is to live in accordance with reason or nature (*homologoumenōs*), that is, in a rational way. Evil doings and passions are the consequence of a degenerated rationality, not of an independent irrational faculty (*SVF* 3.456 to 480), an opinion from which Posidonius diverged. Even if fate has programmed everything, the human subject remains responsible for his or her actions and should be either blamed or rewarded by social authorities (in any case, the wicked are always unhappy). The Stoics did not believe in the immortality of the soul, but they allowed souls to survive for a while apart from their bodies, before melting away into the cosmic spirit (*SVF* 2.809 to 822).

**RELIGION AND THEOLOGY.** The early Hellenistic religious mentality was by no means an otherworldly one; religion was rather a consolidated social institution, and philosophy had to take it into account. The Stoa, and all other schools, recognized this common heritage and recommended that traditional polytheistic cults be preserved, although the philosopher should approach them rationally, not with superstition. Chrysippus in particular was eager to save the supposed “rational” meaning of the ancient myths, giving them an allegorical explanation, in most cases as if they were hinting at natural or astronomical phenomena—a method similar to the one already applied to the interpretation of the Homeric poems (*SVF* 2.1066–1100; see also Cornutus, *Theology*). Moreover, on behalf of the concepts of solidarity, fate, and providence, the Stoics supported the reliability of forecasts of the future both by means of divinatory techniques and through superhuman revelation in dreams and visions (*SVF* 2.1187–1216). According to Posidonius (*Fgm.* 106, Edelstein-Kidd), the godhead does not simply intervene occasionally when a forecast is sought—for instance, shaping instantly the liver of every single victim in order that it may signify something—but the cosmic *sumpatheia* and the order of fate arrange things from the beginning in such a way that

a determinate liver with its natural appearance will also be a sign related to a determinate incoming event.

Theology (in the Greek sense of “talking about the gods”; see Plato, *Republic* 379a) belongs to the part of the Stoic system named “physics” (the other two parts being “logic” and “ethics”), that is, to the doctrine of reality (*phusis*). The supreme God, namely Zeus, is said in religious speech to be the all-pervading and life-giving spirit of nature. Chrysippus etymologized quite falsely the two available accusatives of the God's name, *Dia* and *Zēna*, respectively, from the Greek preposition *diā* (throughout) and the verb *zēn* (to live) (*SVF* 2.1069). Zeus alone represents the ruling reason, which continues shaping the cyclically recurrent worlds. He is, in a sense, a unique eternal being. All other gods are perishable beings because they exist merely in the framework of a single world and will be wiped out, as will everything else, by the final conflagration (*SVF*, 2.1049, 1055). Of course they will reappear, exactly the same, in the subsequent cosmic cycle. These gods were thought of as earthly elements and forces, or even as stars and planets (*SVF* 1.510, 2.613, 1009, 1076).

Stoic theology is a puzzling philosophical construction, as its contemporaries pointed out (see the discussion in Cicero, *On Gods*). Since spirit and matter are but two aspects of the same reality, the godhead can also be considered a simultaneously spiritual and material being. God is both soul and body of the universe—reason, mind, and fate, and also the natural substance with all its parts, phenomena, and functions (*SVF* 2.1041, 1077, cf. Diogenes Laertius, 7.147). It is not surprising that Posidonius (*Fgm.* 369, Theiler) claimed the contemplation of heavenly bodies to be the true religious act, which uncultivated people had distorted in the worship of images. Some Stoic philosophers, however, demonstrate a less abstract idea of God and a more devotional attitude. Cleanthes, for example, spoke of Zeus as a personal ruler of the universe, whose fatal law everyone had to follow willingly; Seneca's writings exhibit a deep religious feeling, which led early Christians to imagine a friendship between him and the apostle Paul.

**ALLEGED SEMITIC ROOTS.** Max Pohlenz (1959) raised the question of whether Stoicism may have undergone a Semitic influence due to the Eastern origin of most of its leaders. This assumption is groundless. In the globalized Hellenistic world, the Middle East did not mean what it does in today's geopolitical context, and local provenance made little, if any, difference. The only “Semite” in the history of the Stoa was Zenon, who belonged to the Phoenician Aramaic-speaking minority of the island of Cyprus; other Stoics came from Greek colonies or from highly Hellenized areas of Asia Minor, such as Cilicia. Diogenes and Posidonius were indeed Syrian, but their native cities had been founded by Seleucid kings and populated with Macedonian military settlers. In any case, all philosophers of this age, even if they were born near Palestine (e.g., Antiochus of Ascalone, Philodemus of Gadara), had an entirely Greek education and way of life.

It is even less likely that a “Semitic” background can be understood as a source of “Jewish” influence. The Stoic “spirit” has nothing to do with biblical *ruah*, being rooted in the concept of warm breath as theorized by Greek medical science. Cleanthes’ “Law of Zeus” is no philosophical Torah, because Stoic morality was not grounded in specific precepts or forbiddances. It is plausible that no Stoic teacher ever held a Bible in his hands. Posidonius, for instance, is assumed to have had somewhat anti-Jewish feelings (*Fgm.* 278, Edelstein-Kidd; 133, Theiler). One could more reasonably argue that some features of ancient Stoicism suggest Indian philosophy—the immanence of God in the universe, the conflagration, the imperturbability of the sage—but there is a lack of evidence to elaborate the issue.

ALDO MAGRIS (2005)

**STONES.** Sacred stones have been known from the earliest times, and they occur all over the world in different cultures and religions. Often they are used as objects of sacrifice, elements in various magical rites, or instruments of divination. They may also serve practical purposes as witness or boundary stones, or as memorials; in such cases they may also evoke religious veneration. The unseen powers that are represented by such monuments are of as many different kinds as the reasons why people turn to them.

The general term *stone* includes many different objects, some of them characterized by names of Celtic origin: menhirs (tall, upright monumental stones); cromlechs (circles of standing stones); dolmens (table stones or large, flat, unhewn stones resting horizontally on upright ones); and cairns (heaps of stones). These four types as well as other monuments shaped like pillars or columns are all raised up or built by humankind (see Eliade, 1978, secs. 34ff.). But natural rocks that, in whole or in part, have peculiar or startling shapes or otherwise contrast with a flat or desolate landscape may also be venerated as sacred. Smaller, movable stones can serve as cult objects at home or can be carried as magical protection.

The symbolic meaning of sacred stones is not fixed. They may represent qualities such as firmness or barrenness but they also may represent fertility. Interpretation is made difficult by the fact that many sacred stones come to us from religions and cultures for which there is little or no literary evidence. Under such circumstances, it is understandable that historians of religion have applied many different theories to such ancient religions, speaking of ancestor cults, nature worship, fetishism, noniconic (nonfigurative) cults, animism, and dynamism. If written sources are lacking (as in the case of prehistoric times) or few (as generally occurs with ancient historic cultures), the field is open for sheer speculation. Oral traditions recorded from illiterate peoples who are still living—or who lived into comparatively recent times—contain much detailed and valuable information that may throw light on older times. Treating primitive material in

this way means, however, that one adopts the much-criticized survival theory, although this theory seems to be more applicable in the case of sacred stones than in other cases. Altogether, the immensity and variety of the material illustrates well the difficulties of a phenomenological method (see Eliade, 1958, secs. 74ff.; Heiler, 1961, pp. 34ff.). In the following discussion, I shall restrict myself to observations on sacred stones from various cultures for which there is at least some literary evidence to guide the interpretation.

**ANCIENT WESTERN TRADITIONS.** Stones or stone pillars (Heb., *matsevah*, from the Semitic *ntsb*, "to stand") figure prominently in the biblical story of the patriarch Jacob. When his wife Rachel died, Jacob erected a funerary stele on her grave (*Gn.* 35:20), probably as a memorial to keep her name alive. Such a pillar could also commemorate an important event, such as the pact between Jacob and the Arameans (*Gn.* 31:43ff.). However, the cultic use of stones was most common. During Jacob's flight from the wrath of Esau, God appeared to him in a dream, and he was struck with awe. Jacob took the stone that had served him as a pillow, raised it as a pillar, anointed it with oil, and called it *beit-El* (Bethel), the "house of God" (*Gn.* 28:16ff., 35:14). In this case, the stone appears to have signified the presence of God.

Such cultic pillars could be connected with altars as in *Exodus* 24:4. Such use was proscribed by the Deuteronomic Code (see, for example, *Dt.* 16:22) as a consequence of the polemics against the corresponding Canaanite cult that was condemned as the worship of pagan gods. Indeed, archaeologists have frequently overinterpreted large, upright stones from the early Palestinian excavations as cult pillars from ancient Canaan. More critical study has unveiled them as, for example, ruins of mortuary shrines or remnants of Iron Age house structures. Actual pillars were discovered at Beit She'an and the ancient city of Megiddo in Israel, and at Jubayl, the ancient Byblos, in Lebanon; their meaning, however, is still not quite clear. The earliest pillar of this kind was discovered in 1933 at ancient Mari, a site on the Middle Euphrates, now in Syria (Tell Hariri). It dates from the Old Akkadian period, circa 2300 BCE (Kennedy and Wevers, 1963).

Light may be thrown on the cult of sacred stones in the ancient Near East by the later, rich material from pre-Islamic Arabia collected by the authority on Arab paganism Ibn al-Kalbī (737–829?). Sacrificial stones are alluded to in the Qurʾān (70:43), and they are explicitly forbidden by Muḥammad (5:490–492). Observations by ancient Greek authors confirm the existence of sacred stones among the Arabs from much earlier times (Buhl, 1936; see also Clement of Alexandria, *Prorepticus* 4, 46). The rites that take place around the Kaʿbah in Mecca represent a legitimated survival of the ancient worship of *ʿansāb* (stones). As elsewhere, such worship originally existed together with the veneration of trees, wooden trunks, and posts, or has been interchangeable with such veneration (Höfner, in Gese et al., 1970, pp. 359ff.).

It is uncertain whether the ancient Greek *baituloi* ("animated stones," i.e., meteorites) can be compared to the Aramaic-Hebrew *beit-El* (Fauth, 1964). But the Greek author Theophrastus (fourth century BCE) characterizes the superstitious person as one who dares not pass the already oily stones at the crossroads without prostrating himself and pouring oil on them (*Characters* 16). These quadrilateral pillars, sometimes ending in a head and surrounded by a heap of stones (Gr., *hermaios lophos*) were called "herms." This name is identical to that of the god Hermes, which etymologically means "stone." He is the stone as god or the god in stone. The various specialties of Hermes may derive from his role as god of the crossroads. As such, he is the guide of those traveling on the road and therefore a protector of commerce and illegal business. He is a messenger too, and as a guide he develops into a psychopomp who accompanies the souls of the dead to the underworld. In his connection with border stones, Hermes becomes a god of the land and thresholds and finally a patron of the entire community. The ithyphallic form of the erected stone (also observed in the Hindu *lingas*) represents both the fertility and apotropaic powers of the god, which in turn make him a patron of the shepherds (Herter, 1976).

There were other gods of the ancient Greek pantheon who could also be represented by either uncut or sculptured stones. To the latter belong the common sacred column, tapered to a point and called Apollo Aiguieus ("of the road"), commonly found set up in the street in front of a house door. They were anointed with oil, decorated with ribbons, and identified as altars. In the old gymnasium of Megara, the capital of the province Megaris to the west of Attica, was a small pyramidal stone that bore the name of Apollo. But the best-known sacred stone of ancient Greece was the conical stone of Apollo, the *omphalos* ("navel"), at Delphi. The poet Pindar (522–438 BCE) explains its sanctity with the belief that the sanctuary of Delphi is situated at the exact center of the earth. This interpretation might be secondary, however; the discussion of this Greek material reminds us of the difficulties of distinguishing earlier from later phases in historical development (cf. Hartland et al., 1920, p. 870, and Eliade, 1958, secs. 81f.).

**MADAGASCAR.** On Madagascar there exists a richly developed stone cult. The traditions explaining why these monuments were raised and the rites and practices associated with them have continued to exist right down to the present time. They present a great richness of variations, a fact that constitutes a warning against simplified reconstructions when, in other places, only archaeological memorials survive.

According to the report of a Norwegian missionary, the most common practice involving these stones takes place in the context of an ancestor cult. A man who is prominent and rich calls together his extended family before he dies and decrees as follows: "My body shall certainly die and be buried, but my spirit shall always remain with you, my children. When you are eating, set out a little food in that place where

I usually eat. And what I wish for you to offer up as a sacrifice to me is the following: [At this point, he names whatever he is fondest of, such as rice, meat, liquor, eel, different kinds of fish, or honey.] And should anyone fall sick or lack for anything or suffer bad luck, then call upon us, and we shall help you. We shall protect you, sending riches, good harvests and many children." The old man lists the taboos to be observed and states where the stone or altar shall be raised and its size, which corresponds to his own importance. He himself will live in the memorial monument and accept the sacrifices. The choice of this stone, its difficult transport, and its establishment on a raised spot near the village are accompanied by many rites before the ceremonial dedication is accomplished (Ruud, 1947, pp. 117ff.). A French researcher, Charles Renel, has carefully recorded the occurrence, within the separate geographical tribal territories, of stones associated with bequests, graves, memorials, and sacrifice and the different, indigenous names that correspond to their changing appearance and varying functions. As gravestones, they are usually raised to the east on the location of the corpse's head, which is also called the grave's head. The stones are smeared with fat, flour, and the blood of sacrificed animals, and at the foot of the stone sacrificial gifts are deposited.

The older stones are generally uncut; the sculptured stones belong to more recent times. Both are called, among other things, "stone-upright" or "stone-man." Wooden scaffolding, occasionally freestanding, may sometimes have been built over them, and on these the skulls of animal sacrifices are placed. The height of the stone can vary with the social level of the deceased and sometimes directly corresponds to his physical stature; thus, the stone also acquires the character of a more or less nonfigurative statue or memorial. In this case, it may also be set up independently of the burial site. When the deceased has died in a foreign country or for other reasons has not been able to be buried, the importance of the local stone as a memorial becomes even more marked. Nevertheless, it can still be used religiously; one goes to it to make a vow, to leave a sacrificial gift, or to carry out a bloody sacrifice.

In some parts of Madagascar, wooden poles are used in place of stones and are called "intermediaries" or "transferrence vessels" of the spirits of the dead. A heap of stones of varying size can also be substituted for the single stone, often at the request of the deceased himself. Sometimes, passersby throw a new stone on the heap with a prayer to the unknown spirit for a fortunate journey or for protection against unknown powers reigning over the road. But most often it is relatives or fellow tribesmen who carry out this ritual piling of stones in connection with a sacrificial vow. The worship at stone heaps that are associated with particular persons is believed to promote success in love or fertility. Thus, votive gifts can consist of wooden carvings representing the male or female sexual organs, depending on the sex of the supplicant.

Other holy stones have functioned as coronation stones, for example, Stone-Holy and Stone of the Red Head in An-

tananarivo (formerly Tananarive). During his coronation, the king placed himself on each stone in turn to signify that his sovereignty extended over both halves of the kingdom. At the same time, the stones were associated with his ancestors, so that in touching them he assumed the strength and holiness of his forefathers. This hereditary ceremony was carried out as late as 1883 by Queen Ravanalona III, despite her conversion to Christianity.

However, not all Malagasy menhirs are connected with the dead, ancestors, or spirits. Some of them commemorate special events, certify a treaty, or mark a boundary. Such monuments are called “stones-planted.” But these, too, have been dedicated with religious rituals; for example, a stone was raised in 1797 to the memory of a royal wedding that united two tribes. The king called on the Holiness of his ancestors, the Holiness of the twelve mountains, and the Holiness of heaven and earth. Then a deep pit was dug, into which the king threw a silver coin and red coral beads. After the stone had been raised, they killed a black ox with a white face and also an unruly bull. The king took their blood, smeared his forehead, neck, and tip of his tongue, and then poured the rest over the base of the stone. Meanwhile he spoke to the two tribes and commanded them to be one, just as he and his queen were one, to endure as long as the stone lasted.

Other menhirs can symbolize the royal power present and prevailing among the people. In other cases, cults center around natural cliffs of peculiar appearance that are connected with divination. For example, women come to pray for children at the “stone with Many Breasts.” They smear the “breasts” of the cliff with fat, then touch their own, and throw a stone toward the protuberances of the cliff. Should it strike a large protuberance, it is said that the child will be a girl; if a small one, it will be a boy. Should the devotee come to the cliff with a health problem, a votive vow is made that is to be discharged after one has regained one’s health. Hunters pray for success in the hunt to the spirit dwelling in another holy cliff said to protect wild game. Each hunter in turn whistles as he walks around the cliff; if they are all able to hold the note, it is a good omen for the presence of quarry. On their return, they sacrifice the finest wild ox as a thanks offering, burning its fat and its liver at the foot of the cliff. The meat is eaten on the spot by the hunters and their families (Renel, 1923, pp. 94–111).

**THE SAMI.** The holy places of the pre-Christian Sami (Lapps) in northern Scandinavia and on the Kola Peninsula have been thoroughly investigated. Five hundred and seven of them are registered in Swedish Lapland (Manker, 1957), 229 in Norway, 80 to 90 in Finland, and about 10 in Russia west of the White Sea. If restricted to the material from Sweden, the cultic sites are of various kinds: 149 hills and mountains; 108 steep cliffs, caves, springs, waterfalls, rapids, and lakes; 30 islands, skerries, peninsulas, meadows, and heaths. But the largest number consists of venerated stones or cliffs, of which there are 220. In this group, 102 examples are un-

derstood to be naturally occurring, uncut images of a deity; in only two cases are there indisputable traces of human intervention. In general, the majority are massive stones. These cult objects are called *seites*, a term of disputed meaning and origin that occurs in different dialectal forms.

Literary sources from the sixteenth century on, combined with anthropological records from the nineteenth century, provide a rich commentary on the *seite* cult, which, in some cases, has been directed toward wooden trunks, stumps, or sculptures in addition to the stone *seite*. A detailed Swedish account from 1671 describes the ritual slaughter of a reindeer behind a tent. Afterward the *seite* is approached by the Sami, who takes off his cap, bows deeply, and smears the *seite* with blood and fat from the animal. The prime cervical vertebrae, the skull, and the hoofs are offered to the deity, as are the horns, which are piled up behind the stone. In one such “horn yard” thousands of horns may be seen. The meat of the animal is eaten by the participants in the sacrifice. Then the drum tells them what kind of game they will capture and assures them of good luck with their reindeer (Manker, 1957, p. 306; cf. Holmberg, 1964, p. 109).

The god of the *seite* can also appear in human shape to his worshiper. Another seventeenth-century account tells how such a god showed himself as a tall, well-built man dressed in black like a gentleman, with a gun in his hand. A similar vision is transmitted from eighteenth-century Norway: “Then a being in human form, like a great ruler, extremely good to look at, dressed in expensive garments and trinkets, appears and sits down to take part in their meal, speaks with them and teaches them new arts, and says that he lives in the stone or mountain to which they sacrifice” (Holmberg, 1964, p. 105).

Omens are taken in connection with the sacrifice, not only with the help of the drum. From the 1670s in Finland, there is a story of a movable little stone god called *Seite* or *Råå* (“owner”). Holding this god in his hand, the Sami utters his prayers with great veneration and lists his requirements. If he then cannot lift his hand it is a bad omen, but he repeats his wishes again and again until the stone in his hand becomes so light that his hand leaps upward. When the Sami has received what he wishes, he asks the god what kind of thanks offering he wants, using the same method to get an answer (Manker, 1957, p. 314).

When compared with the stone worship of Madagascar, the Sami cult lacks a clear connection with ancestors, concerning itself instead with the “owners” of the land and the lord of animals. On the African island, the sacred stone monuments are generally erected or constructed by human hands; but in Lapland, the veneration of natural boulders, often left from the glacial epoch, predominates. The belief is common here as elsewhere that the pillars or rocks are inhabited by unseen powers, or, in Mircea Eliade’s words: “The devotion of the primitive was in every case fastened on something beyond itself which the stone incorporated and expressed” (1958, sec. 74).

**AMERICAN INDIANS.** Sacred rocks and stones together with their spirits are highly venerated by the Indians of both North and South America. One volcano in Ecuador has even received human sacrifices by the Puruhá. The Dakota have decorated and painted great boulders, praying to them and sacrificing dogs upon them. The Crow keep small, animal-shaped stones as powerful medicine. The Algonquin around Lake Mistassini in Canada dare not cross the waters before having sacrificed to the spirit who inhabits a massive, anomalous block. Southward, in the United States, higher, personalized gods are also believed to dwell in stones. The Kiowa in Texas possess a little stone god to whom they pray during the Sun Dance. The Tao in New Mexico venerate at the foot of a sacred mountain the "stone men" who represent two war gods. The Pueblo Indians believe that the hunter's good luck depends on his possession of stones of a curious shape.

The statuettes of the West Indian Taino consist of slightly sculptured stones that are venerated in caves. Among the South American Indians of the Andes, stone worship is very common, but stone gods are found also in the tropical region to the east. The mother goddess of the Jivaroan people in northern Peru and the supreme being of the Warao of the delta of the Orinoco are both represented by stones (Hultkrantz, 1979, pp. 60ff.).

This little catalog needs a supplementary description of the modes of worship, but it can nevertheless be compared (at least in part) with the corresponding examples from the Saami. The ecological environment of North America and Lapland is the same, both with regard to natural objects of veneration and with regard to the motives for worship, primarily to ensure good hunting and fishing.

CARL-MARTIN EDSMAN (1987)

Translated from Swedish by David Mel Paul and Margareta Paul

#### STORM GODS SEE METEOROLOGICAL BEINGS

**STRAUSS, DAVID FRIEDRICH** (1808–1874), German biblical critic, man of letters, and freethinker. Strauss is best known for his monumental book *The Life of Jesus* (1835). In some fifteen hundred pages, half of which are devoted to an analysis of the miracle and the death-resurrection stories in the New Testament, he argued that neither a supernaturalistic nor a rationalistic interpretation of them is credible. Rather, these narratives should be regarded as the results of a naive, primitive mentality whose natural form of expression is myth. Under the flush of religious enthusiasm, messianic fervor, and the personal influence of Jesus, the early Christians applied specifically messianic myths and legends to Jesus. In short, the "logic" of the New Testament narratives is this: "When the expected messiah comes, he will do all these miraculous things; Jesus is the messiah; therefore, Jesus must have done these things." In a

concluding section of the book, Strauss explored the implications of his historical-critical work for Christian theology. He argued that it is contradictory and untenable to attribute divine predicates to a single person, Jesus, but not to the entire species, humanity. It is humanity as a whole in which the infinite incarnates itself.

The book was an immediate sensation and provoked a century-long “quest for the historical Jesus” involving much controversy over the New Testament sources and the historical inferences legitimately to be drawn from them. It is often regarded as a watershed in the development of New Testament criticism, as well as the earliest significant statement of the importance of the eschatological element in the preaching of Jesus. Even though Strauss made concessions to his critics in two later editions of the book, he bitterly withdrew these in the final, fourth edition after being denied a professorship. For a brief period in the late 1830s, he identified himself with the Young Hegelians by contributing to Arnold Ruge’s journal *Hallische Jahrbücher*, but he soon became disillusioned with their political radicalism.

Even though theologically radical, Strauss was always politically conservative and unhappy with the revolutionary tendencies in German society that erupted in 1848. “A nature such as mine was happier under the old police state,” he once wrote. He briefly engaged in political affairs as a member of the Württemberg Landtag but resigned after a parliamentary dispute. He wrote several biographies of well-known historical figures, and in 1864 published a more popular *Life of Jesus for the German People*, which he expected would bring him acclaim but did not. He became increasingly more nationalistic and a supporter of German unification under Bismarck.

In his last book, *The Old Faith and the New* (1873), Strauss set forward his own worldview, which he believed to be representative of his time. He argued that an educated person can no longer be Christian but can be religious in the sense of having a piety toward the cosmos. He proposed a humanistic ethic compounded with his own conservative social views. The book was attacked by Christians but even more savagely by the young Nietzsche, who thought it to be the epitome of German cultural philistinism.

#### BIBLIOGRAPHY

The standard German collection of Strauss’s works is *Gesammelte Schriften*, 12 vols., edited by Eduard Zeller (Bonn, 1876–1878). Only three of Strauss’s books are readily available in English. A new edition of George Eliot’s famous translation of the fourth German edition of *The Life of Jesus Critically Examined*, edited, with critical notes and an introduction, by Peter C. Hodgson (Philadelphia, 1972), discusses and compares the various editions of the work. *In Defense of My “Life of Jesus” against the Hegelians* (Hamden, Conn., 1983) is a translation, with a very useful introduction, by Marilyn C. Massey of several of Strauss’s polemical writings defending his famous work. The third is *The Christ of Faith and the Jesus of History: A Critique of Schleiermacher’s The Life of Jesus*,

translated and edited, with an introduction, by Leander E. Keck (Philadelphia, 1977). *A New Life of Jesus*, 2 vols., was translated anonymously in 1865 (London), and *The Old Faith and the New*, translated by Mathilde Blind, appeared in 1874 (New York); both these works have long been out of print. The most extensive and eloquent discussion of the significance of Strauss’s *Life of Jesus* for nineteenth-century theology and biblical criticism is found in Albert Schweitzer’s famous work *The Quest of the Historical Jesus: A Critical Study of Its Progress from Reimarus to Wrede*, translated by William Montgomery, 2d ed. (London, 1911). A useful short discussion of Strauss’s significance for the Young Hegelians appears in William J. Brazill’s *The Young Hegelians* (New Haven, 1970). The best biography of Strauss in English is by Horten Harris, *David Friedrich Strauss and His Theology* (Cambridge, 1973).

VAN A. HARVEY (1987 AND 2005)

#### STRUCTURALISM [FIRST EDITION].

In their widely read anthology of this topic, Richard T. De George and Fernande M. De George (1972) note that “bibliographies on structuralism can be virtually endless if one succumbs to the temptation to include everything related to the topic,” but they claim that the following authors “are almost certain to be included in any list of structuralists” (p. vii): Karl Marx, Sigmund Freud, Ferdinand de Saussure, Roman Jakobson, Claude Lévi-Strauss, Roland Barthes, Louis Althusser, Michel Foucault, and Jacques Lacan. This may be so, but the term *structuralism* was not used before 1950, and each of the last three individuals named has repudiated the label. Moreover, the list need not begin with Marx; my own favorite protostructuralist is Giambattista Vico (1668–1744). My problem, therefore, is to indicate the core of the structuralist position within a very wide range of variation. The De Georges’ formula can serve as a starting point: “An enterprise which unites Marx, Freud, Saussure and modern structuralists [is] . . . the attempt to uncover deep structures, unconscious motivations, and underlying causes which account for human action at a more basic and profound level than do individual conscious decisions” (p. xii).

**HISTORY OF THE TERM.** The word *structure* has a much longer academic history than does *structuralism*. The symposium papers edited by Roger Bastide (1972) explore the use of *structure* in linguistics, ethnology, art history, economics, politics, law, psychology, psychoanalysis, social psychology, sociology, and history throughout the present century. But that was not the beginning. The ambitious prospectus for Herbert Spencer’s system of philosophy which dates from 1858 refers to “The Inductions of Sociology—General facts, structural and functional, as gathered from a survey of Societies and their changes” (Rumney, 1934, p. 300). What Spencer had in mind was that human societies are naturally existing whole units which can be directly observed out there in the real world. The sum of the individual members of such a society is not just an aggregate crowd but a self-sustaining

totality, analogous to a biological organism, in which individuals are linked together in a network of person-to-person relationships. In the positivist tradition, Spencer assumed that there are discoverable general laws which apply to all such social organisms.

**“Structural Functionalism.”** Structuralism of the sort associated with the name of Lévi-Strauss, which is central for the present discussion, developed within the general field of sociocultural anthropology in dialectical opposition to the “structural functionalism” postulated by Spencer, which in the early 1950s had become especially associated with the name of A. R. Radcliffe-Brown. At this period British social anthropologists used the expression *structural analysis* (and sometimes the term *structuralism* itself) to refer to the work of Radcliffe-Brown and his close associates rather than to that of Lévi-Strauss. Although this usage was dropped after 1960, the contrast is illuminating.

In Radcliffe-Brown’s vocabulary *social structure* denoted a set of key, enduring relationships, perpetuated from generation to generation, which express the bonds of jural obligation that link together the individual members of a particular society. He maintained that these relationships are empirical phenomena which can be directly observed in the mutual interactions of individual members of the system. Social structure, in this sense, was considered to typify the morphology of the society in question, much as the bony structure of a vertebrate animal provides the principal basis for fitting a particular species into the Linnaean taxonomy of all species. Indeed, Radcliffe-Brown believed that a taxonomy of all human societies could be constructed from a comparison of their social structures, societies with similar social structures being placed in the same taxonomic class.

**Lévi-Strauss’s formulation.** Claude Lévi-Strauss’s radically different view of social structure was first formulated in 1945, but the nature of that difference was not immediately apparent. His 1953 conference paper entitled “Social Structure” was an attack on Radcliffe-Brown’s position, but the printed discussion (Tax, 1953, pp. 108–118) suggests that none of the American and British anthropologists who heard it understood what was at issue. This is not surprising, since parts of the argument are notably obscure and oracular.

This has remained a characteristic, and perhaps essential, feature of Lévi-Strauss’s numerous pronouncements about the nature of structuralism. There are many possible interpretations of his thesis, so that even his closest disciples are often at loggerheads with one another.

Perhaps the key point is that, whereas Radcliffe-Brown’s social structure was “out there” in the world, supposedly accessible to direct observation, Lévi-Strauss’s social structure was, as he put it, “a model in the human mind.” The general idea was borrowed from Roman Jakobson’s theory of distinctive features (Lévi-Strauss, 1945).

According to Jakobson, our human capacity to encode and decode sound patterns into meaningful speech forms de-

pends on a capacity (which is innate in all human beings) to discriminate sounds as bundles of binary oppositions. For example, in English we discriminate the phoneme /p/ in *pin* from the phoneme /b/ in *bin* because, in the matrix of distinctive features representing these sounds, /p/ is unvoiced and /b/ is voiced, as shown in table 1.

Altogether there are about thirty such distinctive features, though any particular language makes use of only about half that number. The details need not concern us, though it is important to note that the speakers and auditors who encode and decode sound patterns in this way are quite unconscious of what they are doing or how they are doing it.

Lévi-Strauss initially adapted this theory to his anthropological purposes by claiming that many of the nonverbal elements of human culture—such as cosmologies, art styles, architectural design, the layout of villages, and rules concerning descent, residence, and the regulation of marriage, all of which were prominently featured in most ethnographic monographs published during the first half of the twentieth century—can similarly be broken down into sets of cultural distinctive features which are recognizable as binary oppositions. As in the case of phonology, it is the matrix combination of sets of such distinctive features which determines the characteristics of a cultural feature in any particular ethnographic setting.

In effect, Lévi-Strauss was maintaining that when anthropologists engage in cross-cultural comparison, it is not the contrast in manifestly observable social relationships that is of interest (as was maintained by Radcliffe-Brown), but rather the contrast of patterns of “relations between relations” which can be discovered by analysis yet are unconscious phenomena so far as the human actors are concerned. The theory seems to presuppose that at a very rudimentary level the variant possibilities of human culture are innate, or at any rate that human beings are innately predisposed to build up cultural constructs out of paired oppositions of a very simplistic kind, such as animate/inanimate, human/nonhuman, male/female, above/below, we/they, and symmetrical/asymmetrical.

There are other versions of modern structuralism, such as those of A. J. Greimas and Tzvetan Todorov, which similarly seem to require that the “sociologic” of the human mind contain a wide variety of innate (i.e., species-wide) binary oppositions of this sort, though there is a notable lack of consensus as to what they might be (see Hawkes, 1977, pp. 88, 95–96). Many critics would regard any such proposition as entirely implausible, but it cannot be dismissed out of hand. Shorn of its highly sophisticated elaborations, Greimas’s version of distinctive-feature (*sémique*) theory requires only that the brain should have an innate propensity to make two associated types of discrimination, such that any entity held within the field of perception will always be associated with

Matrix of Distinctive Features of Speech							
	Consonantal	Coronal	Anterior	Voiced	Nasal	Strident	Continuant
/p/	+	-	+	-	-	-	-
/b/	+	-	+	+	-	-	-
/s/	+	+	+	-	-	+	+
/k/	+	-	-	-	-	-	-

TABLE 1.

both its “opposite” and its “negation” (Greimas, 1966, pp. 18–29).

Furthermore, there is now increasing evidence that all normal operations of the brain are computer-like, in that information is passed from one part of the organism to another in a digital binary code of on/off signals. If your biological processes are controlled in this way, it seems highly probable that processes by which thoughts are generated in the brain are of the same general kind.

But while at one level Lévi-Strauss is arguing that the reality of culture is “a model in the mind” rather than out there in the world, he is also claiming that the patterns of relationship that can be recognized in cultural phenomena out there in the world are directly linked, by transformation, with this preexisting model in the mind. Human culture and human society are made by men, but what is made is a projection of a structure which already exists in the maker’s mind.

**Saussure’s structural linguistics.** This aspect of the theory was derived, through Jakobson, from the structural linguistics of Ferdinand de Saussure (1916), which included two further types of paired opposition, both of which have been adopted in one form or another by nearly all modern structuralists.

First, there is the notion of the linguistic sign, which is a totality composed of two interdependent parts: (1) the concept in the mind (the signified) and (2) the sound pattern on the breath, which is out there in the world and which constitutes the linguistic signal (the signifier). The concept is a transformation of the sound signal, and vice versa. It is a crucial feature of Saussure’s argument that, where concepts form part of a system, they are “defined not positively, in terms of their content, but negatively by contrast with other items in the same system. What characterizes each most exactly is being whatever the others are not” (Saussure, 1983, p. 115).

Lévi-Strauss argues in exactly the same way both with regard to the relationship between the components of his cultural “model in the mind” and the components of objectively observable culture out there in the world, and also with regard to the significance of cultural elements stemming from differentiation. The meaning of any member of a set

of components is determined by whatever all other members of the set are not.

The other type of paired opposition that Lévi-Strauss and most other modern structuralists have taken over from Saussure is the contrast between syntagmatic (metonymic, melodic) relations and associative (paradigmatic, metaphorical, harmonic) relations. In the first case the relations are those of contiguity: the links between elements are as in a chain. The sequence of words in a sentence provides the prototype of such a chain. In the second case the relations are those of asserted similarity: “My love is like a rose.” All forms of linguistic utterance employ both these polar types of relationship, but whereas rational and scientific statements are heavily biased toward metonymy, poetic and religious utterances are biased toward metaphor.

In Lévi-Strauss’s work these distinctions are particularly important for his analyses of myth, a concept which he discusses at enormous length but never defines. In practice, a Lévi-Straussian myth is almost invariably a story (or rather a set of stories) about “impossible” happenings, as when birds and animals talk like men, men fly like birds or are transformed into fish. Such transformations are metaphorical, but the society of birds, fish, or whatever which is then described is spoken of “as if” it were a society of human beings. The metaphor entails a transposition, as with a musical change of key. Social relations among real human beings are primarily relationships of contiguity depending upon metonymy; relationships among individual characters in myth are likewise metonymic. By implication, the stories are about men even when, in explicit terms, the characters are non-men. In many cases this is obvious, but the point about anthropological structuralist analysis is that intuitions of this sort can be systematized and shown to conform to unexpected regularities of pattern.

**The question of validity.** Admittedly, at the conclusion of a structuralist analysis the reader will often be left with a feeling that he has been told no more than what he knew already. But the exercise may still have been worthwhile, if what was originally no more than intuition has now become grounded in reason. Moreover, there are some occasions when a structuralist analysis will provide quite unexpected

insights which are thoroughly convincing. The analogy with psychoanalytic procedures is very close.

But this immediately raises doubts about validity. In psychoanalysis the fact that a particular interpretation of dream material is acceptable to the dreamer does not mean that the interpretation has any truth outside the context of the immediate psychoanalytic session. Even the most celebrated examples of structuralist interpretation of myth are open to similar objections; they may be convincing, but they cannot be shown to be true in any objective sense. A hard-nosed empiricist can always find good grounds for rejecting the argument lock, stock, and barrel.

Part of this skepticism arises because of the form in which Lévi-Strauss has cast his argument. His enduring anthropological purpose was to engage in cross-cultural comparison on a very large scale. His book *Les structures élémentaires de la parenté* (1949) is concerned with most of the recorded kin-term systems of East Asia and Oceania, while his *Mythologiques* (1962–1971) ranges all over the Americas and even beyond. He therefore needed to assume that the “mind” in which his transformational structuralist “model” is located is a human universal, and it is precisely this which the skeptics find unacceptable. It is one thing to suppose that we are genetically endowed with the capacity to encode speech sounds, but it is quite another to claim that, at some abstract level, the elementary structures of total cultural systems are innate.

If, however, we take a more modest view of what structuralist analysis might reveal, many of these difficulties disappear. It is part of Lévi-Strauss’s thesis that different manifest features of the same cultural system may be metaphorical transformations of the same internalized unconscious “model in the mind.” For a proposition of this sort to make sense, it is not necessary for the mind in question to be an innate human universal. If the territorial scope of the generalization is restricted, it will suffice if the postulated unconscious model is located in the multiple individual minds of the members of a single society. It seems perfectly plausible that a set of individuals who have all been reared in the same cultural milieu might have the capacity to generate identical or very similar unconscious models in the mind in the way that the theory requires. But the innate components of such models could be very limited indeed.

My personal view is that structuralist method is ill adapted to cross-cultural comparison on a grand scale. It becomes illuminating for an anthropologist only when it is able to show that contrasted patterns in very different aspects of the same cultural system are logically consistent transformations/transpositions of the same abstract structure of ideas. Christine Hugh-Jones’s *From the Milk River* (1979) provides an excellent example of an anthropological monograph which adapts Lévi-Straussian theory in this way. It provides a deep structuralist analysis of a single cultural system as opposed to a grand-scale rampage right across the map.

**Lévi-Strauss’s conservatism.** The reader of this article should appreciate that, although most of the key doctrines of modern structuralism are to be found in prototypical form in the writings of Lévi-Strauss, many of his followers and imitators, especially those who have adapted the theory for purposes of literary criticism and the analysis of religious texts, have deviated from Lévi-Straussian orthodoxy on important issues.

Lévi-Strauss is a very conservative anthropologist. Unlike most of his contemporaries, he draws a sharp distinction between “primitive” and “modern” societies. He does not say that “primitive” societies are better or worse than “modern” societies, but he does assert that they are fundamentally different in kind, primarily in three binary dimensions. Primitive societies are nonliterate, nonindustrial, and “cold.” They are like machines (e.g., clocks) “which use the energy with which they are supplied at the outset and which, in theory, could go on operating indefinitely . . . if they were not subject to friction and heating; . . . they appear to us as static societies with no history.” On the other hand, modern societies are literate, industrial, and “hot.” They are like thermodynamic machines, “they interiorize history, as it were, and turn it into the motive power of their development” (Lévi-Strauss, 1961, chap. 3).

Now Lévi-Strauss’s structuralism is, as we have seen, heavily indebted to the linguistic theories of Saussure, who drew a sharp distinction between diachronic linguistics, which studies the changes of speech forms over time, and synchronic linguistics, which is concerned with structuralist issues such as the relation between thought and organized sound, and the contrast between syntagmatic and associative relations discussed above. In imitation of this dichotomy, Lévi-Strauss has insisted that his own kind of structuralist analysis is appropriate only for the synchronic study of cultural phenomena. He assumes that the cultural systems of “primitive” societies are sufficiently static to be studied as total synchronic systems in this way. By contrast, he assumes that the value attached to diachronic historical change in modern society implies that the cultural data of modern society fall outside the scope of structuralist analysis.

**Lévi-Strauss’s successors.** Here, as elsewhere, Lévi-Strauss’s doctrinal pronouncements, as well as his practical structuralist experiments, are elusive and inconsistent. With rare exceptions, he himself has confined his use of structuralist analysis to ethnographic data of the classic anthropological sort, but his imitators have not accepted this self-imposed restriction.

The first general handbook of structuralist method was Roland Barthes’s *Elements of Semiology* (1964). In this book and in all his subsequent contributions to structuralist/semiotic analysis, Barthes concerned himself with materials drawn from contemporary Western culture and recent European literature.

In recent years structuralism, considered as a special style of analysis, has had a greater influence on literary criti-

cism than on anthropology. Here, however, the formal structures discussed in the work of Lévi-Strauss and Greimas have been transformed into the Nietzschean exaggerations of Jacques Derrida's theories of poststructuralist deconstruction. Elaborations of this sort cannot be brought within the scope of the present article, though I shall make some reference to the way these writers discuss texts as objects to be interpreted and recreated by the reader rather than as channels through which an author communicates to potential readers.

Structuralist analyses of a quite conventional sort have been used with success in a number of other more immediately relevant fields. Marcel Detienne and his close colleagues have applied Lévi-Strauss's methodology to materials from ancient Greece (see Gordon, 1981); Wendy Doniger O'Flaherty (1973) has used an undiluted version of the theory to analyze a vast range of classical Indian texts; and Claude Chabrol and Louis Marin (1974), among others, have explored the applicability of the method to the analysis of biblical texts.

**Continuity versus discontinuity.** It is time to show why an essay on structuralism, primarily of the Lévi-Straussian sort, should have a place in an encyclopedia of religion. First, however, attention should be drawn to a modification of the more orthodox binary-opposition versions of structuralist theory which is particularly relevant in applications of this type of theory to religious materials.

Lévi-Strauss writes of reality being a model in the mind made up of a network of relations between discontinuous mental entities linked in binary pairs. But the reality which is out there in the world and which we perceive through our senses is certainly not of this kind. It is continuous in both time and space. It is not naturally made up of separate things and separate events; the appearance of discontinuity is imposed on our experience by the way we perceive it and, more particularly, by the way we use words to describe it. We feel that there is a disjunction between day and night because we have these two words, *day/night*, linked in binary opposition; in our ordinary experience, however, daytime just fades into nighttime and vice versa.

Structuralist theorists have handled this incompatibility between the continuities of experience and the discontinuities of conceptual thinking in a variety of ways, but several anglophone writers, including Mary Douglas (1966), Victor Turner (1969), and myself (1976) have emphasized the relevance of the arguments of Arnold van Gennep (1909).

Van Gennep originally applied his arguments to rituals marking a change of social status. In the world of experience out there, time is continuous. When a husband dies, there is no chronological discontinuity between the moment when his wife is his wife and the subsequent moment when she has become his widow. But in social time things are quite different: society imposes an intermediate stage of mourning when the wife/widow is removed from ordinary social relations and is subject to various kinds of restrictions. During this inter-

mediate phase she is subject to taboo and is treated as a sacred person.

Van Gennep's insight can be generalized in a variety of ways. First, it is empirically the case that social transitions nearly always have a triadic structure which van Gennep himself described as (1) the rite of separation, (2) the marginal state (*rite de marge*), and (3) the rite of aggregation. Second, it is also an empirical fact that not only is the marginal state regularly marked by taboo, but that all forms of holiness, whether applied to particular persons or particular places or particular times, can be shown on analysis to be marginal; they represent an interface between two nonholy categories which we are thereby able to perceive as separated from each other. The argument is that, at the level of the model in the mind, the impression of disjunction is achieved either by suppressing all consciousness of the ambiguities that lie at the margin or by treating the margin as belonging to a different order of reality: sacred-extraordinary-supernatural versus profane-ordinary-natural.

**IMPLICATIONS FOR THE STUDY OF MYTH AND RITUAL.** To judge by the titles of their books, structuralist authors are quite centrally concerned with the analysis of myth, but they rarely explain what they mean by this elusive concept, and the definitions that have been offered are seldom mutually compatible. I must therefore offer my own.

To live comfortably in society, every individual must have access to a cosmology—an ordered set of topological, physical, and metaphysical ideas which make sense of immediate experience. The cosmology is not naturally known; it is given to us by the conventional assumptions of the cultural system in which we live; it is taught to us as part of the complex process by which we are transformed from animals into socialized human beings. Furthermore, as an adjunct to learning what the cosmos is like, we also learn how to behave in particular contexts of time and place and interpersonal relationship. These rules of behavior likewise derive from the process of individual socialization.

Both the cosmology and the rules of behavior have to be justified. They are justified by stories about the past which explain how things came to be as they are, and by stories of a rather similar kind which provide precedents for culturally approved behavior or, alternatively, precedents for the supposedly dire consequences of ignoring local cultural conventions. The entire corpus of such validating stories is myth.

**Universal versus local applicability.** Viewed in this way, myth has moral value. It is sacred for those who accept the validity of the cosmology and the associated customary rules, but in itself it is of strictly local validity. Anthropologists like me who accept the empirical evidence that there are no cultural universals which are not entirely trivial are likely to reject the view of Lévi-Strauss, Freud, and many others who argue that there is a universal human mythology associated with universal, unconscious motivations shared by all individual human beings.

It is important to notice that there is nothing in this context-restricted, functionalist definition implying that myth is fanciful or untrue in a realistic, positivist, historical sense. This point needs emphasis and exemplification.

The biblical story of the garden of Eden is a myth for devout Jews and Christians because of its cosmological and moral implications, and not because it contains such "untrue" incidents as God and the serpent both conversing with Adam and Eve. Likewise, the stories that are told about the signing of the Magna Carta at Runnemedede near Windsor in 1215 are myth for all contemporary anglophone upholders of parliamentary democracy. In this case there is very little in the basic story which is obviously untrue (in the talking-serpent sense). Indeed, some parts of it are demonstrably true in a historical sense, since copies of the original document still exist. Yet the story is nonetheless a myth, because it is made to serve as a precedent for customary political conventions which are still significant in the societies in question.

In this approach to myth, the social context in which the stories are told is fundamental; a myth story isolated from its proper context is devoid of meaning. It follows that those who think about myth in this way are bound to regard Lévi-Strauss's extraordinary four-volume *Mythologiques* as largely a waste of time, since the whole exercise is devoted to the cross-cultural comparison of very abbreviated versions of manifestly untrue stories completely isolated from their very diverse original social settings.

Some of the myth analyses which Lévi-Strauss published prior to 1962 took note of a functional (contextual) factor, but in his later work he seems to assume that myth is an undifferentiated, species-wide phenomenon which the human mind is predisposed to generate, in much the same way as it is predisposed to generate speech. He seeks to show how the patterning and combination of myth stories are capable of conveying meaning, but the meaning in question is very general and not context-determined. The superficial differences between the myths of various cultures are treated as comparable to the differences of phonology and grammar in different human languages. At the level of innate capacity, the deep structure is always the same. The myths that appear in ethnographic records are all transformations of a single universal myth which, like phonology, is structured according to a system of distinctive features based on binary oppositions. It follows that the themes with which this mythology is concerned are ultimately human universals of a physiological kind such as sex, metabolism, orientation, and life/death, rather than the solution of local, culturally determined moral issues.

This view of what mythology is about will not be congenial to anthropologists who feel that their basic concern is with cultural diversity, but it is not necessarily unacceptable to the students of universalist religions who may likewise feel that the metaphysical reality to which religion responds is always the same reality, no matter what its cultural form may be. And even those who, like me, believe that myth has a

local rather than a universal significance, have much to learn from Lévi-Strauss about the way the messages conveyed by myth are embedded in the patterning and structure of the presentation, rather than in the manifest content of the stories themselves.

This contrast of view among structuralists as to whether myth has universal or local significance is also found in their view of ritual. For the universalists, ritual equates with non-verbal communication; what can be said about it is not very different from what can be said about language as verbal communication. The study of ritual is seen as a branch of a more general zoological field, the study of animal behavior. By contrast, those who see ritual as a localized, culturally determined phenomenon link it quite directly to the local mythology and to particular rather than general cosmological assumptions. Myth and ritual are mutual transformations; each validates the other in its local setting. But in either case the generalizations of the structuralists concerning binary oppositions, transformations, combinations, metonymic and metaphorical associations, and marginal states can prove illuminating.

**Myths and rituals as related sets.** One particular structuralist proposition is especially relevant for my present purposes: the thesis that mythical stories or sequences of ritual behavior can never be decoded when considered in isolation but only when considered as related sets. A myth story does, of course, always have a manifest meaning considered as a folk tale or as a record of an incident in history. In the same way, an isolated ritual sequence can always be viewed as a dramatic performance which the local customary rules require to be performed at a particular time and place. But the structuralists assume that there is always another deeper, unconscious meaning which is of equal or perhaps greater significance. The structuralist thesis is that such deeper meanings are apprehended by the listener to a myth, or by the participant-observer in a ritual situation, at a subliminal, aesthetic or religious level of consciousness. Structuralist analytical procedures are supposed to make such hidden meanings explicit.

The structuralists' thesis is that the auditor of a myth (or the participant in a ritual) is able to take account of many other myths and rituals with which he or she is familiar. The interpretation applied to the text of any particular story will then be influenced by the moral and aesthetic implications of other such stories.

Thus, devout Jews and Christians will associate any particular story from the Old Testament with a host of other stories both canonical and noncanonical, and it is the structure of the total set of such stories which carries implication. Invariably, analyses of myth in the structuralist manner derive their inferences from a comparison of a number of different stories treated as members of a single set. At the end of the analysis, it is the differences and not the similarities among the stories that prove to have been treated as significant.

This goes right back to the grounding of structuralism in phonological distinctive-feature theory: it is finely discriminated differences between sounds which allow us to discriminate the words of which they form a part, as for instance *bin/pin*. But there are great practical difficulties. In phonology the units that are discriminated fall within a limited set of possible phonemes specified by a limited set of phonological distinctive features. But if we use this mental process as a model for the analysis of myth, we need first to agree about the units of discussion. Within any particular story, how is the overall text to be cut up into segments for purposes of comparison? And among several stories which differ in detail but which seem to have a certain overall similarity, how is the analyst to decide whether any particular story is or is not a member of the same set? The structuralists' failure to formulate any rules about how such questions should be answered seems, on the face of it, to be a very serious defect in their methodology.

In practice, the procedure is intuitive. For those who consider that a structuralist methodology is appropriate to the analysis of religious literature, one obvious set of primary units consists of all the stories in the Bible, while another such set is provided by all the stories about Śiva in the classical Vedic and Puranic literature of the Hindus. The bulk of the materials thus specified is enormous; any practical analysis would have to restrict the scope of the investigation still further by *ad hoc* criteria. But it is easier to justify arbitrary limits of this sort than Lévi-Strauss's universalist practice, which allows him to put into one set stories drawn at random from any part of the world and any cultural context.

It should be noted that the arbitrariness of structuralist analysis connects up with certain of the arguments of poststructuralist literary criticism. Myths (however defined) and sacred books and works of art in general, including music, drama, dance, and the plastic arts, can be regarded as text without authors. The message in the text is what the reader (or auditor or participant-observer) discovers. It is treated as the word of God, but it is an aesthetic response, something in the reader's own unconscious mental processes, which makes the discovery. Thus any "text" is polysemic, a multiple combination of signs; it has many possible meanings, and no particular possibility has any special authenticity that the others lack.

This is what makes sectarian diversity in literary religions so very common. The devotees may all share the same sacred book, but there are vast numbers of different ways to put an authentic interpretation on what it contains. Structuralist and poststructuralist theorizing have provided a sort of rational explanation for this all-too-obvious phenomenon of history.

**Prerequisites for structural analysis.** A convincing structuralist analysis of even a very abbreviated set of texts takes up a great deal of space, so that in an article of this sort exemplification is hardly possible. The following three prerequisites are essential.

1. The total text under consideration must contain a number of separate segments (stories) which differ in detail but which are also in some respects similar. Taken together, these similar stories form a set. The items in the set can be compared and contrasted. A case in point is provided by the four Gospels of the New Testament. At a certain level each of the Gospels tells the same story, yet the details differ and are in some respects radically contrasted. Whereas orthodox Christian biblical criticism has assumed that these contradictions are of minor significance, or can be satisfactorily explained away to leave a residual unitary account of what really happened in real historical time, the structuralist assumes that it is precisely in the differences that the message of the Gospels, considered as a set, is likely to be found. Within the total text thus considered, all parts of the text have equal value; it is quite inappropriate to the method to discriminate among different kinds of story element under such labels as *parables*, *historical narratives*, and *folk tales* (see Leach and Aycock, 1983, chap. 5).

2. The major segments (stories) must themselves be segmentable into elements (incidents in the stories, motifs). There is a pattern of relationships between the elements in any one story. The patterns differ in the different stories. The analysis calls for a comparison of these differences. In other words, as in phonology, the coding of the total system is assumed to be a structure of relationships between relationships.

3. The establishment of the patterns and the contrasts between them call for close attention to very fine details in the texts under consideration. Ideally, the analysis should take account of every detail; it is a presupposition of the distinctive-feature thesis that, while the text may contain redundancies, it cannot contain accidents. Every detail adds something to the cogency of the message.

**Examples of structuralist analysis.** Multifaceted structuralist analyses often turn out to be more interesting than those confined to a single dimension. As we have seen, the structuralist thesis is that the fundamental pattern of the structure under examination is "in the mind." The patterns that can be observed out there in the world of cultural experience—in speech or written text or musical performance or ritual sequences, in the design of works of art and buildings, or in the layout of cultural space—are all transformations of the same mental structure. Thus, at one remove, they should also be transformations of each other. If structuralist analysis has application to religious studies, its principal value might be to give unexpected insight into how the aesthetic imagination is able to carry out these transformations from one artistic medium to another.

All this is very laborious. The linguistic analogy is with the parsing of a sentence, first into words related in a grammatical structure, and then into phonemes related in a phonological structure, and then into the patterns of distinctive features that constitute the phonemes. The skeptic needs to

be persuaded that the demonstration of such a fine-grain hierarchy of relations could possibly be worthwhile.

I would not myself want to suggest that skepticism should be wholly abandoned, but I recommend a close reading of O'Flaherty's *Asceticism and Eroticism in the Mythology of Śiva* (1973), taking special note of the pull-out Chart of Motifs and of the complexities of Appendix A (pp. 319–320), which together show what I mean by saying that, in structuralist analysis, it is assumed that the message is embedded in relationships between relationships. This is a one-dimensional study, but it is a very distinguished example of its kind.

My own favorite definition of myth is that of Julius Schiewind: "Mythology is the expression of unobservable realities in terms of observable phenomena" (Bartsch, 1953–1962, p. 47). This puts myth at the very core of all forms of religious expression. In the five pages of her concluding chapter, O'Flaherty provides as good an argument as any that I know for saying that a structuralist analysis of a corpus of mythology can show us how these unobservable realities become apprehensible through close familiarity with a set of stories which on the face of it are mutually contradictory.

But the determined skeptic can find reassurance in the fact that competent structuralists analyzing the same materials seldom arrive at the same conclusions. Chabrol and Marin's *Le récit évangélique* (1974) is a multiauthored structuralist monograph on the theme of the New Testament parables. Their work derives its theoretical basis from the semiotic theories of A. J. Greimas. Leach and Aycock's *Structuralist Interpretations of Biblical Myth* (1983, chap. 5) is a much shorter structuralist essay but is also concerned with New Testament parables, and the underlying theory is similar in many respects. The argument which Chabrol offers in his essay "De la sémiotique en question" (Chabrol and Marin, 1974, pp. 193–213) overlaps at many points with what I have been saying in the present article. Yet with the possible exception of Chabrol himself (see p. 135), the various French authors all agree that *parable* is a meaningful genre for structuralist purposes, while I, in the work cited above, argue quite specifically that it is not. A critical comparison of the arguments offered in these two, in some ways very similar, contributions might be of value for those who find the structuralist/semiotic treatment of religious texts too slippery to handle.

**Conclusion: The Sistine Chapel.** I shall conclude by offering the skeleton of part of one of my own essays showing how works of art, literary texts, and church practice can be combined in a meaningful structural pattern.

The nine main panels in the ceiling of the Sistine Chapel in the Vatican are of world renown. They are grouped in three sets of three, a cross-reference to the Holy Trinity. At the altar end, God as Creator and Light of the World appears alone without man; at the opposite end are three panels depicting Noah/Adam, the sinful but potentially redeemable

man without God. At the center are three scenes where man and God are together: the creation of Adam, the creation of Eve, and the temptation of Adam and Eve and their expulsion from paradise.

The Sistine Chapel, which is the personal chapel of the pope, is dedicated to the Virgin Mary of the Assumption as Queen of Heaven. The Virgin in this role is the Second Eve; she also stands for the church itself. In the center panel the figure of the newly created Eve is at the exact center of the entire ceiling. In the panel depicting the Fall, the serpent coiled around the tree of life is doubled and effectively cruciform. It has two humanoid heads. One, which forms a branch to the left, is that of the temptress who grasps the voluptuous but still innocent Eve by the hand. The other, which forms a branch to the right, is that of the angel armed with the flaming sword which drives the now haggard sinners into the wilderness. The face of the serpent-temptress is like that of the newly created Eve, but it looks in the reverse direction; the face of the voluptuous, innocent Eve is that of the uncreated Eve who appears wrapped in the womb of time in the panel showing the creation of Adam. According to a medieval legend, the cross on which Christ died was cut from the tree of life that had grown in the garden of Eden.

The cruciform depiction of this tree with its double-headed serpent was originally positioned so as to be directly above the screen dividing the secular antichapel from the sacred chapel proper. In a more ordinary church of the period, this position would have been filled by a crucifix standing above the rood screen.

The theme of the double-headed serpent turned into a crucifix recurs in the corner panel to the right of the altar, where the manifest depiction is the story of the healing of the sinful Israelites smitten by a plague of serpents in the wilderness. In this case there is a direct cross-reference to the passage in the *Gospel of John* that reads: "And as Moses lifted up the serpent in the wilderness, even so must the Son of man be lifted up: That whosoever believeth in him should not perish, but have eternal life" (*Jn.* 3:14–15).

This is only a partial outline. Even in minimally convincing form, full analysis calls for an essay substantially longer than the whole of the present article. Many of the themes in this analysis have also appeared in other interpretations of Michelangelo's iconography, but some are a peculiar product of structuralist methodology. Some art historians, theologians, and literary critics find the results convincing. Such is the only justification which I can put forward for structuralism in general. If some readers of structuralist analyses feel that they have thereby gained insights which they did not have before, the exercise has been worthwhile.

#### BIBLIOGRAPHY

In no sense at all should the bibliography which follows be regarded as a guide to the literature of structuralism, or even to that part of structuralist literature concerned with religious studies. It simply lists references mentioned in the foregoing

- article. Those who wish to pursue the fundamentals further could hardly do better than to consult the richly annotated twenty-six page bibliography and reading guide appended to Hawkes's *Structuralism and Semiology* (cited below), though since its publication there has been a further huge expansion of the relevant literature.
- Barthes, Roland. *Éléments de sémiologie*. Paris, 1964. Translated by Annette Lavers and Colin Smith as *Elements of Semiology* (New York, 1964). A good guide to the fundamentals of Saussure's structuralism, though the terminology in the English version is very confusing.
- Bartsch, Hans Werner, ed. *Kerygma and Myth: A Theological Debate*. 2 vols. Translated from German by Reginald H. Fuller. New York, 1953–1962. A discussion of Rudolf Bultmann's views concerning mythology in the New Testament.
- Bastide, Roger, ed. *Sens et usages du terme structure dans les sciences humaines et sociales*. 2d ed. The Hague, 1972. A set of papers offered at a colloquium held in Paris under the patronage of UNESCO in January 1959. Émile Benveniste notes that the term *structuralism*, which he puts between inverted commas or in italics, is so recent that it is not included in a French dictionary of linguistic terminology published in 1951.
- Chabrol, Claude, and Louis Marin, with the collaboration of Alain J. Cohen, Christian Mellon, and François Rastier. *Le récit évangélique*. Paris, 1974. A collection of structuralist essays in the manner of A. J. Greimas that are concerned with biblical materials, especially New Testament parables.
- De George, Richard T., and Fernande M. De George, eds. *The Structuralists: From Marx to Lévi-Strauss*. New York, 1972. An anthology showing that a common structuralist theme can be found in work by Marx, Freud, Saussure, Jakobson, Lévi-Strauss, Barthes, Althusser, Foucault, and Lacan. The introduction offers a helpful overview.
- Douglas, Mary. *Purity and Danger: An Analysis of Concepts of Pollution and Taboo*. London, 1966. Contains, as chapter 3, the author's well-known but badly flawed essay "The Abominations of Leviticus," which has had considerable influence on later discussions of biblical food taboos.
- Gennep, Arnold van. *The Rites of Passage* (1909). Translated from French by Monika B. Vizedom and Gabrielle L. Caffee. London, 1960. Van Gennep's theory has been greatly extended by later authors; the original is now of historical interest only.
- Gordon, R. L., ed. *Myth, Religion and Society*. Cambridge, 1981. Representative essays by an important group of French classical scholars (Marcel Detienne, Louis Gernet, Jean-Pierre Vernant, and Pierre Vidal-Naquet) who employ structuralist techniques of analysis. With an introduction by R. G. A. Buxton and an extensive and valuable bibliography.
- Greimas, Algirdas Julien. *Sémantique structurale: Recherche de méthode*. Paris, 1966. An early work by an influential structuralist theorist. Not recommended for novices.
- Hawkes, Terence. *Structuralism and Semiology*. New York, 1977. The best short guide to the subject in the English language. Excellent bibliography.
- Hugh-Jones, Christine. *From the Milk River: Spatial and Temporal Processes in Northwest Amazonia*. Cambridge, 1979. An ethnographic account of the Barasana Indians of the Vaupes region of Colombia that successfully combines the empirical approach of traditional British social anthropology and an idealist model-in-the-mind style derived from the structuralism of Lévi-Strauss. See also the companion volume by Stephen Hugh-Jones, *The Palm and the Pleiades: Initiation and Cosmology in Northwest Amazonia* (Cambridge, 1979).
- Jakobson, Roman, and Morris Halle. *Fundamentals of Language*. The Hague, 1956. Most of Jakobson's huge oeuvre is somewhat inaccessible for the ordinary reader. This well-known work contains a useful but incomplete account of phonological distinctive-feature theory.
- Leach, Edmund. *Genesis as Myth and Other Essays*. London, 1969. All the essays in this collection apply a structuralist style of analysis to biblical materials. The title essay, which dates from 1961, was one of the earliest of this genre.
- Leach, Edmund. *Culture and Communication: The Logic by Which Symbols Are Connected; An Introduction to the Use of Structuralist Analysis in Social Anthropology*. Cambridge, 1976. The long-winded full title of this widely read work is self-explanatory. The range is narrower and rather different from Hawkes's comparable *Structuralism and Semiology*. Chapter 18 is entitled "The Logic of Sacrifice."
- Leach, Edmund, and D. Alan Aycock. *Structuralist Interpretations of Biblical Myth*. Cambridge, 1983. Five essays by Leach and two by Aycock on themes comparable to those in Leach's *Genesis as Myth and Other Essays*.
- Lévi-Strauss, Claude. "L'analyse structurale en linguistique et en anthropologie." *Word: Journal of the Linguistic Circle of New York* (1945): 33–53. An English version, somewhat revised, appears as chapter 2 of Lévi-Strauss's *Structural Anthropology*, translated by Claire Jakobson and Brooke Grundfest Schoepf (New York, 1963). The 1945 version was Lévi-Strauss's first thoroughgoing application of structuralist method. His debt to Roman Jakobson is explicit. This essay introduced the celebrated, though much criticized, concept of "the atom of kinship."
- Lévi-Strauss, Claude. *Les structures élémentaires de la parenté*. Paris, 1949. The first magnum opus of anthropological structuralist literature. Its merits and limitations are still hotly debated by professionals in the field.
- Lévi-Strauss, Claude. "Social Structure." In *Anthropology Today: An Encyclopedic Inventory*, edited by A. L. Kroeber, pp. 524–553. Chicago, 1953. Now only of historical interest. Connects with Tax's *An Appraisal of Anthropology Today*.
- Lévi-Strauss, Claude, in collaboration with Georges Charbonnier. *Conversations with Claude Lévi-Strauss* (1961). Translated from French by John Weightman and Doreen Weightman. London, 1969. A series of radio interviews given when Lévi-Strauss was at the peak of his celebrity.
- Lévi-Strauss, Claude. *Mythologiques*. 4 vols. Paris, 1964–1971. Translated by John Weightman and Doreen Weightman as *Introduction to a Science of Mythology*, 4 vols. (London, 1970–1981). An obsessional masterpiece reminiscent of the unabridged edition of James G. Frazer's *The Golden Bough*. Nonspecialists can find the important parts of the argument published elsewhere in shorter form.
- O'Flaherty, Wendy Doniger. *Asceticism and Eroticism in the Mythology of Siva*. London, 1973. A successful adaptation of Lévi-Strauss's method of myth analysis to a large body of classical Indian textual material.

- Rumney, Jay. *Herbert Spencer's Sociology*. London, 1934.
- Saussure, Ferdinand de. *Cours de linguistique générale*. Lausanne, 1916. Translated, with annotation, by Roy Harris as *Course in General Linguistics*, edited by Charles Bally and Albert Sechehaye, with the collaboration of Albert Reidlinger (London, 1983). The best English edition of a major structuralist classic.
- Tax, Sol, et al., eds. *An Appraisal of Anthropology Today*. Chicago, 1953. Lévi-Strauss's "Social Structure" is discussed on pages 108–118.
- Turner, Victor. *The Ritual Progress: Structure and Anti-Structure* (1969). Ithaca, N.Y., 1977. Although Turner is often called a structuralist, his style of analysis differs widely from that of Lévi-Strauss.

EDMUND LEACH (1987)

**STRUCTURALISM [FURTHER CONSIDERATIONS].** In 1970, Sir Edmund Leach wrote in his book about Claude Lévi-Strauss (1908–) that structuralism was held by many to be a new philosophy. "Lévi-Strauss," he stated, "is regarded among the intellectuals of his own country as the leading exponent of 'Structuralism,' a word which has come to be used as if it denoted a whole new philosophy of life on the analogy of 'Marxism' or 'Existentialism.' What is this 'Structuralism' all about?" (1970, p. 15). Leach has answered the question himself in a number of publications. His characterization may certainly be an apt impression of what was "in the air" in the 1960s. Later this was to change, but it is not quite off the mark to say that post-structuralism—sometimes presented as postmodernism—has since been highly advertised as much more than a method or a fashion; it has been heralded as grasping the very spirit of the age. It may seem so if one discusses the latest trends in late modern societies, but when applied to religion and the study of religion, the attractiveness of the latest intellectual fashions fade. Religions and religious traditions are much more conventional, traditional, and ritualized than late modern trends and fashions, and it therefore makes good sense to study religions and matters pertaining to religion in a structuralist framework.

It is the basic premise of structuralism that human sociocultural products, such as language and religion, are sign systems in which any entity becomes meaningful only in relation to the system and its rules and against a structured background. The structures and rules are mostly followed unconsciously. Ironically, post-structural phenomena may thus also be analyzed in structuralist terms.

Thus, structuralism is by no means exhausted as an approach to human cultural and social formations. The long philosophical debate over whether the structures retrieved in analysis are preeminently to derive from minds producing culture or are to be located in the products themselves dissolves to an extent in a structuralist perspective. That is because all cultural products, be they language, symbolism, reli-

gion, or any other aspect of culture, are and must be structured if they are to be understandable by and meaningful to other humans. This leads to an evaluation of structuralism as more than simply one method among others of equal standing. It has been suggested by Peter Caws (1997) that structuralism may indeed be *the* philosophy for the human sciences. That the term *structuralism* covers a wide array of subjects is evident from the introduction by John Lechte in his *Fifty Key Contemporary Thinkers* (1996) to many of the prominent thinkers in the history of the structuralist movement, from the earliest inspirations to the later postmodernist phases.

**REVISIONS AND CRITICISMS.** As scholars pick up the structuralist tradition as an approach in the study of religion, they are able to review, revise, and continue to develop the structuralist approach. Although the earlier stage of structuralist scholarship was much concerned with exegeses of the most "canonical" writing of, especially, Lévi-Strauss, subsequent research has not been uncritical of the "masters," and it has also been able to advance and transform the initial inspirations and to solidify and justify the structuralist paradigm (Johnson, 2003).

One of the critical points in the early structuralist period was a rather consistent criticism concerning the validity and replicability of structural analysis and the more practical issues of method: How does one proceed and where are structures to be found? Are they part of the "native's reality"—are they in the human mind or in sociocultural products? Are they conscious or subconscious representational models or are they analytical and explanatory models made by the analyst? Leach's suspicion was quite clear:

In all his writings Lévi-Strauss assumes that the simple first-stage "model" generated by the observer's first impressions corresponds quite closely to a genuine (and very important) ethnographic reality—the "conscious model" which is present in the minds of the anthropologist's informants. . . . It seems all too obvious that this initial model is little more than an amalgam of the observer's own prejudiced presuppositions. (1970, p.12)

Leach also remarks that Lévi-Strauss "consistently behaves like an advocate defending a cause rather than a scientist searching for ultimate truth" (1970, p. 12). Although "ultimate truth" seems outside the range of human knowledge, the implications are clear enough. On the other hand, since the days when it was necessary to defend structuralism as a new approach, analyses have proved quite fruitful in many areas of the human sciences, from social anthropology to media studies to biblical scholarship. As Stanley J. Tambiah has illustrated in his *Edmund Leach* (2002), Leach's own production is a fine example of this fruitfulness, especially in relation to cultural codes, classificatory systems, and ritual formations. Further, it should be emphasized that semiotics, discourse analysis, and a range of other approaches would have been unthinkable without the influence of structuralism.

As the structuralist theoretical inspiration has proved highly consequential for many of the human sciences, a number of works have appeared that critically review and revise the earlier reading and understandings of the groundbreaking effort of the founders. Among these, Paul J. Thibault's *Re-reading Saussure* (1997) stands out as he demonstrates how Saussure's ideas about language were not simply formal and abstract but much more concerned with how meaning is produced in social life. Thibault thoroughly criticizes the more conventional readings of Saussure. Roy Harris's work is also highly interesting for its analyses of the ways in which Saussure's intellectual legacy has been handled.

**STRUCTURALISM AS METHOD AND THEORY IN THE STUDY OF RELIGION.** Jeppe Sinding Jensen's article "Structure" in *Guide to the Study of Religion* (2000) traces the development of structuralism in the human sciences with a special emphasis on the ramifications for the study of religion. Hans H. Penner forcefully advocates structuralist theory for the study of religion in his *Impasse and Resolution: A Critique of the Study of Religion* (1989). Penner disproves the thesis set forth by Leach and others about the probable weakness concerning the validity and replicability of structuralist methodology. Penner demonstrates how scholarship on, for example, Buddhism and Hinduism has benefited from structuralist analyses by discovering the underlying regularities of the symbolic systems. However, the most central issue in structuralist analysis is myths and mythologies. Here, Penner agrees with Lévi-Strauss, writing that "it is very dangerous if not erroneous to view myths as symbolic representations of actual social realities or of some cultural psyche, whatever that may mean. Furthermore, it is also a mistake to study myths as concealing some hidden 'mystical' meaning. The meaning of a myth is given in its concrete relations with other versions. Thus, it is clearly a misunderstanding to call this type of analysis reductionistic" (p. 176). In his later anthology, *Teaching Lévi-Strauss* (1998), Penner took up the problem of teaching structuralism, which has been fraught with difficulties arising from the many criticisms and misunderstanding of Lévi-Strauss's work: "From my own study of this thought I believe it is fair to say that the charges of 'anti-history,' 'idealism,' and the impossibility of verifying or falsifying his work are simply false. Nevertheless, these charges were leveled at the very beginning of his publications and as usual they were then used by many who seem to have not read his publications. . . . For many in the study of religion he was simply put down as a 'reductionist'" (p. x).

Others have wanted to know how one could "prove" the existence of structures, and many simply confused structure as an abstract term for a set of relations with more empirical manifestations of systems and design, such as the structure of government or of a building, for example. Earlier structuralists were suspected by their more empiricist counterparts of being too philosophical, idealist, or rationalist, and thus of generating scholarship that was not grounded in "reality."

**STRUCTURALISM IN EMPIRICAL STUDIES.** Over the years, more empirical and subject-oriented research in a structuralist frame of mind has replaced the style of the earlier programmatic and more technical essays. Structuralism has become ordinary, legitimate, and mainstream in the study of religion to the extent that terms such as "structural," "structuralist," or "structuralism" do not appear in the title of works that draw on the structural heritage. There are certain traits that can disguise the fact that an argument in the study of religion has come from structuralism, including: notions of systemic relations and of synchronicity; the idea of there being no firm foundations and definite pristine historical origins; and the absence of single or direct references for meanings and semantic contents. It is also a structuralist idea that elements and meanings are neither fixed nor given but always depend on relations to other elements and meanings—that is, the notion of systemic relations between elements. A further trait of a hidden structural argument occurs when the text metaphor is extended to cover actions and institutions, which thus become "readable" because of the rules of composition (constitutive and regulatory) that govern their functions. Another keyword is *transformation*, which structuralists use instead of *change* or *influence* to stress the way in which something novel is always created or produced in relation to a given structure; thus, it can also be shown that, for example, syncretism is not simply a hodge-podge of singular elements but a cultural creation with certain structural properties.

An instructive empirical example of "implicit structuralism" is given by Louise Bruit Zaidman and Pauline Schmitt Pantel in *Religion in the Greek City* (1994). In their study of the Greeks' "figuration of the divine," they point out that a remarkable feature of Greek culture is:

the large degree to which all their systems of representation—pantheons, myths, visual images—were mutually supportive. If there was a logic at work behind the constitution of the pantheon and the elaboration of myths, this was no less true of the creation of the visual images of the divine that populated the Greek city. Moreover, these systems of representation cannot be separated from the rituals which gave expression to the underlying systemic structures. It is clearly impossible, for example, to study a statue in isolated abstraction from the ritual use to which it was put. (p. 228)

Other religions and cultures of the Indo-European language family have been subjected to various structural approaches from early on, as in the approach of Georges Dumézil concerning the relations between the ideological roles of rulers, warriors, and peasants in the mythologies of traditional Indo-European societies. However, Old Norse mythology has also proven a field well-suited to structural analysis. The value of structural analysis in the study of myth, ritual, and other sociocultural institutions in the Hindu religious traditions has also been demonstrated. Thus, whenever we talk about such issues as the Confucian concept of *li* (propriety), the Muslim system of *tahara* (purity), or similar sets of so-

ciocultural codes of conduct, we may perceive the validity of structural approaches. E. Thomas Lawson and Robert N. McCauley demonstrate in *Rethinking Religion* (1990) that this goes for rituals as well. In a number of studies of religious traditions, implicit structuralism has made its impact. This may also be in the mode of a pragmatic structuralism working from the positions of Michel Foucault and Pierre Bourdieu. In some areas, such as studies of the Muslim tradition, these inspirations have made an obvious impact—Talal Asad's *Genealogies of Religion* (1993) is an example. The “systematicity” argument may of course be overstated, and there is a problem if one suggests that entire systems should be present in every human actor's individual mind—and consciously so. This is not the case, for the structuralist argument presupposes that competence is largely unconscious, in the sense that speakers may talk without explicit knowledge of the linguistic rules they obey or violate.

**THE SURVIVAL OF STRUCTURALISM IN SEMIOTICS AND SEMANTICS.** It is frequently assumed that the advent of post-structuralism indicated the demise of structuralism. This may have been the case in literary theory and criticism, where other reading strategies have replaced structural analysis. But, there is even a “post” post-structuralism—or is there? As it turns out, post-structuralism is a continuation of structuralism, but with an emphasis on self-critical and reflexive thought. However, the field has been bursting with near-perplexing jargon, and the consequences for the human and social sciences of applying postmodernist theory have been quite uncertain to many. It is understandable when scholars of religions are uneasy with post-structuralism and postmodernist skepticism about realism and the idea that all claims to truth are but power games. Students of religion are quite sensitive to the differences between religious and scholarly discourse. The crucial questions also involve the problem of representation, that is, about who speaks how about whom, and here the “post” movements present both problems and solutions. There is the problem that profound difference makes us all different, while at the same time it also makes us all equal—and game for comparison and analysis.

Semiotics, the study of signs and signification, also arose out of the structuralist milieu, and in the French tradition it represented, as “structural semantics,” attempts toward developing a formal science of meaning. In the study of religion, semiotics evolved into a more practical approach, demonstrating the heuristic capacities of the methodology. The field of biblical studies has, on the whole, proven fertile ground for structuralist and semiotic analyses, as witnessed by the appearance of journals such as *Semeia: An Experimental Journal for Biblical Criticism* and *Linguistica Biblica*. In a more general vein, Richard Parmentier's *Signs in Society* (1994) concerns semiotics in the anthropology of culture.

Semantics, the study of meaning in philosophy and linguistics, is also generally an heir to structuralist notions, as the general theory of meaning in the wake of analytic philosophy has turned towards holistic perspectives, as shown in

Jensen's “On a Semantic Definition of Religion” (1999). This is also forcefully demonstrated in *Language, Truth, and Religious Beliefs* (1999), edited by Nancy K. Frankenberry and Hans H. Penner, a reader on relevant positions for this discussion. How semantics and structuralist thought have converged on the philosophy of language is also the topic of Jaroslav Peregrin's important work, *Meaning and Structure* (2001), in which a number of postanalytic philosophical and holistic positions are reviewed. Holistic methodology is consonant with the general structuralist tenet that elements of a system (words, terms, concepts, and so on) do not have meaning in themselves but only in relation to other elements and the larger system that they constitute—such as in a language or a “form of life,” as Ludwig Wittgenstein later termed the preconditions for mutual understanding. What goes for conceptual systems in general also goes for the study of religion, as the notions, models, and theories employed in that activity are also interdependently defined.

In direct relation to methodology in the study of religion, mention must be made of Gavin Flood's *Beyond Phenomenology* (1999), where the author proposes a shift in philosophical basis away from the subject and toward a philosophy of signs as the “first philosophy” for the study of religion. This idea is precisely in accordance with the fundamental tenets of the structuralist paradigm.

**MEANINGS, MINDS AND SYMBOLIC WORLDS.** Holistic and structuralist theory is also opposed to the “mentalist” point of view, where meanings must necessarily and only be located in individual minds. However, the thought that meanings are somehow related to what individuals “have in mind” is obvious, not only from common experience, but also on the basis of cognitive theories and research; however, the precise way in which symbolic systems, meaning, and the mental and cognitive are related is a complex question over which there is considerable controversy. The concept of the “human mind,” as used by Lévi-Strauss and others, has caused consistent confusion, since in French it would mostly refer to something social and public, but in English it would refer to a mental realm. There is no doubt, however, that the “universes of the mind,” as they have been called by the semiotician Yuri Lotman (1990), must not only be in minds, but must also be abstract systems of signs so that they may “circulate” between minds and thereby be involved in the creating of worlds of meaning.

All this may seem suggestive of idealism. If so, it is not a problem. For, as Peter Caws argues in his *Structuralism* (1997), “a form of idealism that may be philosophically suspect if applied to the world of nature may be exactly appropriate when applied to the world of society, since although the existence of nature cannot reasonably be supposed to be dependent on minds (the New Physics to the contrary notwithstanding), the existence of society as society can” (p. 17). It is only when humans invent, construct, and make some things “count as” other things that society, culture, and language come into existence—with art, politics, money,

rules about ritual purity, and all that it takes to make human and symbolic worlds meaningful. And in making those worlds, we also make ourselves—would we be thoughtful humans if we were not full of thoughts?

## STUDY OF RELIGION

This entry consists of the following articles:

- AN OVERVIEW
- THE ACADEMIC STUDY OF RELIGION IN AUSTRALIA AND OCEANIA
- THE ACADEMIC STUDY OF RELIGION IN EASTERN EUROPE AND RUSSIA
- THE ACADEMIC STUDY OF RELIGION IN JAPAN
- THE ACADEMIC STUDY OF RELIGION IN NORTH AFRICA AND THE MIDDLE EAST
- THE ACADEMIC STUDY OF RELIGION IN NORTH AMERICA
- THE ACADEMIC STUDY OF RELIGION IN SOUTH ASIA
- THE ACADEMIC STUDY OF RELIGION IN SUB-SAHARAN AFRICA

### STUDY OF RELIGION: AN OVERVIEW

Unlike theology, the academic study of religion seeks to provide accounts of the world's religions from perspectives that have no confessional (religious) ground or agenda. As an empirical pursuit, it is concerned with understanding and explaining what people actually think and do without establishing or enforcing norms for that thought and behavior. It takes the entire universe of religions as its object of study; classically educated scholars were once fond of quoting the Roman playwright Terence (c. 186–159 BCE), a freed slave from North Africa: "*homo sum; nihil humanum mihi alienum puto*" ("I am a human being; I consider nothing human foreign to me"). It also aspires to treat all religions equally. Of course, these characterizations are subject to critical interrogation, both in terms of the degree to which individual works live up to them and the degree to which they are themselves philosophically defensible.

Despite the field's universal reach, Europeans and North Americans have tended to conceive of the study of religion ethnocentrically. Although the objects of study—religious people—have been universal, the subjects—the people doing the studying—have not. When they did not physically reside in Europe or North America, they were intellectually, if not biologically, of European or North American descent. They studied religions—as a young scholar in the Middle East recently described his professional activity in correspondence with this author—from a Western perspective.

The pervasiveness of European and North American political and economic colonialism and cultural influence gives some credence to this conception. Nevertheless, a view of the academic study of religion excessively centered on the so-called West also takes several risks. It risks ignoring antecedents of that study in various parts of the globe that predate or do not depend upon the European Enlightenment. It risks neglecting vigorous traditions of that study that are emerging in various parts of the world. And it risks impoverishing that study by looking only to Europe and North America for theoretical and methodological inspiration. In other words, it confines the academic study of religion not within the boundaries of a religious community, as in the case of theology, but within those of a culture or civilization.

The entries that follow treat the academic study of religion throughout the world. It has seemed expedient to divide the articles in terms of large geographical regions arranged alphabetically, but one should remember that these regions are themselves somewhat artificial. The entries seek to address how religious studies has come into being in different ways in different academic settings. They treat the contribution of scholars in each region to the study of religions that are found outside as well as within the regions. Thus, the entry on South Asia, for example, treats the manner in which South Asians have studied religions, not the study of South Asian religions. The remainder of this entry offers more general observations about the emergence of the study of religion, its development, and its methods.

### THE EMERGENCE OF THE ACADEMIC STUDY OF RELIGION.

According to a well-worn German cliché, *Religionswissenschaft*—the comparative study of religion, the history of religions, the academic study of religion—is a child of the Enlightenment. Insofar as this cliché invites us to disregard intellectual developments outside of Europe, it issues an invitation that we should decline. But it does begin to identify the conditions under which the academic study of religion appeared in Europe, and in doing so it invites us to reflect more generally on the conditions under which that study has emerged.

There are many kinds of knowledge about religions. Before the emergence of the academic study of religion, people learned about their own religions from people such as relatives, neighbors, priests, shamans, teachers, preachers, monks, nuns, and maybe even philosophers and theologians. They learned about other religions from similar sources, along with proselytizers, apologists, polemicists, and here-siologists, who provided information about the practices and beliefs of other people but also gave reasons either to adopt those beliefs and practices, to disregard them, to fear them, or even to persecute and kill the people who adhered to them. In addition, travelers like Herodotos (c. 484–between 430 and 420 BCE), Xuanzang (602–664), and Ibn Battuta (1307–1377), at times less interested in specific religious agendas, provided knowledge of the practices and beliefs of people who lived in more remote lands. All of these people and others as well, such as foreign service officers and journalists, may provide information about religions, but that information does not in itself constitute the academic study of religion. In order for that study to emerge, at least three conditions need to be met.

First, the academic study of religion encompasses only certain kinds of knowledge, namely, those kinds associated with institutions devoted to the professional production and dissemination of knowledge, such as universities. These kinds of knowledge derive their authority in part from the application of approved procedures. Scholars self-consciously pursue methods that are presumed to eliminate mistakes and errors that plague ordinary knowledge and/or that produce accounts that have the appearance of greater-than-average sophistication. These kinds of knowledge also derive their authority in part from various forms of institutional validation: material support for those who produce and transmit knowledge by approved means; the certification of those who have mastered both the techniques and content of the produced knowledge; and the codification and preservation of the knowledge produced—either in human memory, as in the case of *sūtras* and *śāstras*, or via external media such as handwritten, printed, or, increasingly, electronic books and journals. One condition for the emergence of the academic study of religion, then, is the development of such institutions of knowledge, as has happened for example among Mahāyāna Buddhists in north India in the first few centuries CE, in the Middle East toward the end of the first millennium CE, and in Europe beginning in the thirteenth century CE.

The mere existence of institutions such as universities is not, however, sufficient for the emergence of the academic study of religion. In Europe, for example, an interval of over half a millennium intervened between the development of the medieval universities and the emergence of the academic study of religion. (By contrast, in sub-Saharan Africa that study has been a component of such institutions almost from the very beginning.) At least two other conditions are necessary.

The first of these conditions requires thinkers to class practices, claims, and forms of association together in ways similar to the ways in which they are classed together by the term “religion” in English and other European languages today, and then to view the resulting set as a proper object for study by a distinct group of scholars. Martin Riesebrodt has argued that this classification is not as culturally limited as it may at first seem. He has pointed out that people have grouped together phenomena that German (and English) speakers think of as religious even without having a generic notion of religion. For example, Aśoka’s edicts treat *brāhmaṇas* (early Hindus) and *śrāvāṇas* (early Buddhists, Jains, and other renunciants) as if they belonged to the same class. Polemicists at Chinese courts during the first millennium CE also thought of Buddhist, Daoist, and Confucian teachings as of similar kind. Nevertheless, the manner in which such classes are conceptualized—whether as *dharm[a]* in Sanskrit-based languages, *dīn* in Arabic, *shūkyō* in Japanese, or something else—may present difficulties for the emergence of the academic study of religion. For example, the traditional institutionalized study of *dharma*, whose sense in Sanskrit we might convey by terms such as *statute*, *ordinance*, *law*, *duty*, *justice*, *virtue*, and *morality* as well as *religion*, bears little resemblance to anything that we would know as either the academic study of religion or theology, as even a passing acquaintance with the *Dharmaśāstras* makes clear. Abraham Khan suggests that this term’s meaning has in fact hampered the emergence of the academic study of religion as a single, independent academic pursuit in India. Japanese scholars in the Meiji era and later wrestled with the meaning of the term “religion” in a somewhat different way. In order to endorse the politically desirable view that Japan was a secular state, they had to separate into religious and nonreligious spheres beliefs and practices that had customarily been classed together as Shintō. In the second half of the twentieth century, Africans, reacting to imported European concepts, questioned the extent to which the term “religion” really worked in African contexts. Although in North America and Europe the academic study of religion is fairly widely established today, some scholars in that region, too, have questioned the extent to which the category “religion” is applicable across cultures. In doing so, they have seemed to call the legitimacy of that study as a distinct field into question.

The combination of the institutionalization of knowledge and the identification of religion as a fit object of study does not inevitably lead to the emergence of the academic

study of religion. It might just as well lead to apologetics, as happened in Middle Eastern and European universities during the medieval period, or to a global theology or religious philosophy, such as the *philosophia perennis* that attracts thinkers around the world today. At least one further condition is necessary for the emergence of the academic study of religion. That is the relinquishing of interest in establishing traditional religious claims and turning instead to understanding and explaining religious phenomena, regardless of provenance, through nonconfessional models. Herodotus displays something of this attitude, in the absence of the other two conditions, when he remarks that all people know equally (little?) about the gods, so he is simply going to talk about human affairs and customs.

Academic communities may adopt these pluralistic, humanistic projects via different tracks. In contexts within which one religion, such as Christianity or Islam, is considered to be uniquely true, an important step between apologetics and the academic study of religion may be the conviction that all religions share a basic core, rooted somehow in the essence of humanity. This step is transitional, because it leaves in place a tension between the concerns of a global religious philosophy or theology on the one hand, and understanding and explaining religions through nonconfessional models on the other. Europe and its cultural descendants largely followed this track. European thinkers such as Herbert of Cherbury (1583–1648) responded to the wars of religion by formulating the notion of a “natural religion” common to all people. The Romantics responded to Enlightenment rationality by celebrating universally human “intimations of immortality” and of other religious profundities. Both laid the foundations for the emergence of a comparative study of religion whose character as a global theology was expressed well in the dying words of an early Swedish scholar who also happened to be a Lutheran archbishop, Nathan Söderblom (1866–1931): “I know God exists; I can prove it from the history of religions.” Tensions between the comparative study of religion as a global theology and an academic study of religion that is more self-consciously humanistic remain especially strong in North America, in part as a result of the profound influence once exercised by Mircea Eliade (1907–1986).

In contexts in which traditional claims to religious exclusivity are lacking and all religions are somehow seen as manifestations of religious truth, a different track for the emergence of the academic study of religion is probably necessary. That is because in these contexts it would simply be a task of the local equivalent of theology or religious philosophy to elucidate the common core of truth that all religions share. Precisely what forces have stimulated a shift to the use of nonreligious models in these areas remains a question for future research. One certainly cannot overlook the importance of external stimuli, especially in regions that were heavily colonized (sub-Saharan Africa) or that saw themselves engaged in military and cultural competition with Europeans

and U.S. Americans (Japan). At the same time, it may not do justice either to scholars who have urged the adoption of humanistic models or to their situations simply to refer to them as “westernized.” On the one hand, “Western” models of education, such as Britain introduced into colonized Africa, were actually heavily theological. On the other, some non-Westerners like early Japanese scholars of religions have criticized Westerners for blurring the distinction between the academic study of religion and theology.

#### DEVELOPMENT OF THE ACADEMIC STUDY OF RELIGION.

The preceding section contains unmistakable resonances with the thought of Max Weber, especially his notions of routinization, rational-bureaucratic authority, and the disenchantment of the modern world. Of the three conditions discussed above, however, perhaps only the second is actually distinctively modern, and that only if we extend modernity back into the immediate post-Reformation period, as historians of philosophy usually do. Nevertheless, the emergence of the academic study of religion as a result of the confluence of these three conditions is in fact a modern—or more recent—development. Individual entries will summarize regional histories in more detail. Here it may be helpful to venture a few signposts.

A tradition common in Europe and North America attributes the birth of the “science of religion,” as it was called, to the comparative philologist Friedrich Max Müller (1823–1900), who referred to it for the first time in the 1867 preface to his *Chips from a German Workshop*. Nevertheless, several factors complicate this birth story. First, Europeans before Müller had done philological, ethnographic, and theoretical work that might just as well be considered a part of the academic study of religion, e.g. the work of Eugène Burnouf in the study of Buddhism. Second, inasmuch as Müller’s own vision of the science of religion, informed by German idealism, sought a scientific means to religious truth, it is not clear that his science is precisely what we mean by the study of religion. Third, traditions in the Middle East, Japan, and perhaps elsewhere, too, that predate Müller’s talk can claim equal regional significance in moving toward a science of religions. In short, the birth of this field of study is attributable not to a single event but to an extended and complex series of events in several regions.

One major player in the European buildup to the study of religion was philology. During the humanist movement of the fifteenth century, Europeans learned Greek and Hebrew and critically edited ancient biblical manuscripts. In the late eighteenth and nineteenth centuries they followed a similar pattern with regard to a broader range of materials. They learned the “classical” languages of the Middle East and Asia and set themselves to work on the “sacred books” written in these languages, a move that some connect with a residual Protestantism. They further deciphered ancient writing—hieroglyphics, cuneiform—and opened new vistas in what they saw, somewhat oddly, as their own antiquity, especially prebiblical civilizations in the Middle East and the linkage

of European languages to Sanskrit and Old Iranian. Within Europe incipient cultural nationalisms, inspired in part by J. G. Herder (1744–1803), stimulated the collection, and at times the wholesale invention, of local folklore. At the same time, ethnographic reports of ideas and practices elsewhere—custom reserves for Bronislaw Malinowski (1884–1942) the honor of being the first actual anthropological fieldworker—poured into Europe. European thinkers filtered all this material through mental sieves that sought to retrieve the essence of religion and its earliest or primal forms, resulting in once well-known theories such as fetishism, solar mythology, totemism, animism, pre-animism or dynamism, primitive monotheism, and the magic-religion-science schema of James George Frazer (1854–1941). These theories, in turn, provided a context for the reflection of thinkers such as Emile Durkheim (1858–1917), Max Weber (1864–1920), and Sigmund Freud (1856–1939).

Alongside philological, ethnographic, and folkloristic studies, liberal Protestant theology played a major role in the development of the academic study of religion in Europe and North America. Inspired by Friedrich Schleiermacher (1768–1834), liberal theologians attempted to rescue Christianity from the critical results of natural science, history, and ethnography by appealing to a supposedly universal religious experience of which Christianity was the supreme manifestation. The result in the first half of the twentieth century was a phenomenology of religion as developed by Nathan Söderblom, Rudolf Otto (1869–1937), Friedrich Heiler (1892–1967), Gustav Mensching (1901–1978), Gerardus van der Leeuw (1890–1950), and their associates, and, with less Christian emphasis, the similar endeavors of thinkers like C. G. Jung (1875–1961) and Mircea Eliade. While philologists, ethnographers, and folklorists were often content to work within academic units defined either by language and culture (e.g., East Asian Languages and Civilizations) or by a more general method (e.g., Cultural Anthropology), the phenomenologists generally favored the placement of the academic study of religion in a single, autonomous academic unit or department.

Although the political convictions of individual scholars varied, none of these moves happened in a political vacuum. For example, Michel Despland has discussed the relationship between the policies of the July Monarchy in France and a hermeneutically oriented study of religious texts. David Chidester has noted similarities between Britain’s management of colonized peoples and its management of their religions. What Europeans and North Americans have noticed less, perhaps, is how the encounter looked from the other side.

Colonial mastery provided Europeans with ready control over an extremely wide variety of materials not so easily available to the colonized. It provided the motivation to study those materials by making knowledge of the people to whom they had belonged desirable. It also provided a safe space from which scholars could examine the materials but

ignore the claims they made—or even become enamored with them without surrendering any real sense of identity or control. At the beginning of the twentieth century colonial endeavors presented Japanese scholars with similar opportunities, although their range was more limited.

For the colonized the situation was different. Quite aside from possessing different histories of the formulation and organization of knowledge, people on the receiving end of the colonial project did not need to develop academic fields to learn about the “sacred books of Europe.” Missionaries were more than willing to provide that knowledge, even if colonial governments did not always appreciate their efforts. And far from being able to study the claims and practices of the colonial rulers from the detached perspective of a supposedly disinterested, value-free science, colonized people were forced to define themselves over against claims by representatives of a dominant power that threatened to undercut their traditional identity and destroy their intellectual autonomy.

The early leaders in the academic study of religion were in fact the Europeans, with help from the Japanese and North Americans. Nevertheless, it would be simplistic to see the study of religion merely as a colonialist enterprise. It may also be seen as in part a response in the arena of reflection on religion, and not always the dominant one, to fundamental infrastructural changes that made colonialism as well as nationalism possible: the increasing compression of space and time as a result of ever more rapid technologies of transportation and communication. The results of this space-time compression include increased personal contacts between peoples previously separated, closer economic, political, and cultural interdependence, and substantial increases in the scale of institutions of knowledge as well as manufacturing and trade. This compression facilitated the appearance of an academic study of religion not simply by granting greater access to data but also by making confessional frames for knowledge less convincing—although they certainly remained convincing to many—and creating a context in which knowledge of religion not limited by confessional boundaries became more desirable. It did so under the shadow of increased nationalism and colonialism, which both resulted from and enforced inequitable control of new technologies as well as intellectual and cultural activities.

From a long perspective, what may be remarkable about the institutionalization of the academic study of religion is not that it first took place in Europe, Japan, and North America but how quickly it occurred all over the world. (That occurrence should not be isolated from the simultaneous emergence of many other aspects of contemporary life, from scientific medicine to weapons technology.) The institutionalization of the study of religion came in two waves. The first wave occurred in the late nineteenth and early twentieth centuries, when Europeans along with North Americans and Japanese took the lead in establishing university positions and programs (Lausanne 1871; Boston 1873;

Tokyo 1903) as well as professional societies (United States 1890 [dissolved ten years later], Europe [International Association for the History of Religions] 1900, Japan 1930) for the study of religion. (In 1905 only the Tokyo chair carried the title “science of religion.”) Research and publication were, of course, the inevitable concomitants of such foundations—in one sense they were their *raison d'être*—symbolized but certainly not exhausted in the English-speaking world by the massive *Sacred Books of the East* series. The second wave, which came in the third quarter of the twentieth century in the wake of decolonization and the cold war, was much more wide-ranging. It saw the development of programs for the academic study of religion in sub-Saharan Africa; Australia, New Zealand, and Oceania; Latin America; and to a limited extent South Asia and the Middle East, along with the founding of new programs in Europe as well as a burgeoning of programs in the United States.

These efforts have met with varying success. Despite a long tradition, Japan has programs in the academic study of religion in only about one percent of its universities; by contrast, by the 1970s the corresponding number in the United States was about one third. Such efforts have also encountered a variety of challenges. For example, programs in sub-Saharan Africa have suffered from a lack of infrastructure as well as a loss of intellectual talent to more prosperous parts of the globe. In most places a primary challenge has come from dominant religions and ideologies. French institutions have been adamantly secular for over a century, but elsewhere in Western Europe dominant programs in Christian theology have outdone the academic study of religion in competition for scarce resources and public status; for example, in the United Kingdom the leading programs have been in so-called new universities (Lancaster, Manchester, Stirling), and a similar pattern is visible to some extent in Germany (Bayreuth, Bremen), despite traditions in older universities (Berlin, Bonn, Marburg, Tübingen). Programs in Eastern Europe and China have had to negotiate a state ideology antagonistic to religion, while programs in the United States, which blossomed during the cold war, have needed to negotiate a state ideology whose opposition to “godless communism” favored religious commitment. In the Middle East, space-time compression has brought about a very different relationship with the rest of the world: the rerouting of formerly vigorous, intercontinental trade either around or, in the case of air travel, over the region and a shift to oil as a source of wealth, often actually or seemingly controlled by foreigners. This context has encouraged a religiously defined cultural loyalism. Although some programs in the academic study of religion have arisen in the region, most work takes place in the context of the presumed superiority of Islam as God’s final revelation.

The academic study of religion has often justified itself in terms of its public utility. For example, in Japan before 1945 some advocated pursuing it as a contribution to national unity. In postcolonial Africa scholars turned to the study

of indigenous religions as a means to foster independent political and cultural identities. More broadly, Mircea Eliade aspired to revive culture through the formulation of a “new humanism.”

At the beginning of the twenty-first century scholars of religions were pursuing yet another public role: providing the general public and more specifically mass communications media with reliable information about religions (Japanese scholars after the Aum Shinrikyō attacks; ReMID in Germany and INFORM in the United Kingdom; the information bureau of the American Academy of Religion). In addition, many countries have been wrestling with ways to make their traditions of religious education in schools more pluralistic. Although some have adopted a pluralistic confessional approach, as in Germany, where students choose an education in either Catholicism, Protestantism, or a more general ethical culture, others, such as South Africa, have at least proposed replacing confessionally based education with a pre-university public education in the academic study of religion.

**METHODS AND ISSUES IN THE ACADEMIC STUDY OF RELIGION.** There is still very little by way of a universally acknowledged theoretical or methodological canon in the academic study of religion. One positive result is that the field admits a considerable amount of creativity. Another result, however, is that the remarks that follow will inevitably be idiosyncratic, reflecting regional and personal preferences at least as much as any greater unity. They touch briefly upon commonalities that unite the academic study of religion, methods and theories of that study, and recent trends.

**Commonalities.** In the English-speaking world, there has been considerable uncertainty about both the name and character of the academic study of religion. In the last one hundred years scholars have called this pursuit the science of religion, comparative study of religion(s), history of religion(s), religious studies, (more colloquially) world religions, and the academic study of religion(s). The terminology used in this set of entries, “the academic study of religion,” remains ambiguous. For example, in those parts of the world where Christianity is the dominant religion, biblical studies are traditionally a part of theology. As sometimes practiced, however, biblical studies might just as well be seen as a highly developed subfield within the academic study of religion.

Uncertainty about the name of this study finds a reflection in uncertainty about its character. Is it an academic discipline, united in the application of a specific method, or is it an unruly, polymethodic field, including any and every academic pursuit that somehow treats religious data? Is the object of study—“religion”—a category *sui generis*, which must be studied on its own terms, or does it conveniently bring together elements from different areas of life, permitting the reduction of the religious to the nonreligious? Is the goal to understand human religious insights or symbols as they come to expression in human speech and action, as one understands the meanings of books, or is it rather to provide

explanations for various occurrences along the lines of the social and natural sciences? Does one require a special sympathy for religion in order to make sense out of it, or is one required to be an outsider—a “methodological” if not actual atheist or agnostic—in order to see clearly? Arguments about these and similar questions have perhaps generated more heat and smoke than they have light. Nevertheless, one might detect a trend in the late twentieth and early twenty-first centuries toward a conception of the study of religions that is polymethodic, explanatory, at least methodologically agnostic, and sees religion simply as a convenient category.

If the efforts of a century and a half have had uncertain results in precisely denoting or defining the academic study of religion, they have been somewhat more successful in creating a common language for it. Scholars have abandoned earlier, almost Linnæan attempts to group religions into meaningful classes—natural religions, national religions, prophetic religions, ethical religions, world religions, and so on—as a preliminary to locating them in grand developmental schemas. They have also abandoned attempts, inspired by Hegel, to identify the essence of each religion in a simple term or proposition (for example, Zoroastrianism as “the religion of struggle,” Christianity as the “religion of love” [van der Leeuw]). But other efforts have been more successful. Consider the matter-of-factness with which we now speak of various religions as givens—Hinduism, Buddhism, Daoism, Shintō, and so on—where, at least from a Christian or Muslim perspective, these now distinct religions were once simply paganism and idolatry. Scholars have also created the rudiments of a technical vocabulary, in which the terms *myth*, *ritual*, *rite of passage*, *sacrifice*, and perhaps *symbol* may be the most widely successful terms. Other terms that were once prominent, such as *experience*, *numinous*, *sacred*, and *profane*, not to mention older creations like *totem* and *taboo*, now seem characteristic of disputed or discarded positions. Since the 1980s, however, studies have appeared that vigorously seek to deconstruct these common categories, both in terms of descriptive and conceptual inadequacy and political disutility. Although these studies often present compelling analyses, they have as yet had only a limited effect on actual linguistic usage. Scholars now seem, however, to be abandoning the term “myth.”

**Methods and theories.** At the beginning of the twenty-first century there is some consensus that the academic study of religion is a polymethodic field. There is also some consensus about some of the “approaches” or “perspectives” that this field contains. Almost invariably mentioned, along with other approaches, are history, psychology, sociology, and comparative studies or phenomenology; the meaning of the last term varies considerably. Although one might define these approaches primarily in terms of problems and theories, in the way, for example, physicists and sociologists delineate their fields, scholars of religions have generally begun instead with the ideas of “great thinkers,” for example, William James (1842–1910), Sigmund Freud, and C. G. Jung

for psychology; Karl Marx (1818–1883), Max Weber, and Émile Durkheim for sociology; Gerardus van der Leeuw and Mircea Eliade for phenomenology. Work in the related field of anthropology has received similar treatment, although the “great thinkers” there may be somewhat more recent (Bronislaw Malinowski, E. E. Evans-Pritchard [1902–1973], Claude Lévi-Strauss [b. 1908], Clifford Geertz [b. 1926]).

In addition to knowing the ideas of these “great thinkers” and their epigones, the common expectation today is that scholars of religion will also know the languages of the people whose religions they study. Such expectations provide a clue to the methods that scholars of religions actually employ. Work in the field tends to depend upon textual analysis, ethnographical observation, or both, combined with a generous amount of theorizing to set the context for the application of these methods. It less frequently analyzes non-verbal artifacts with the methods of archaeology, art history, and musicology, a tendency some attribute to a residual Protestantism. Such a *modus operandi* assures that scholars are attuned to the richness of their data. It also means, however, that work in the field tends to consist of anecdotal observations coupled, in the best instances, with sophisticated reasoning. Scholars of religions have had relatively little interest in the formulation of generalizations based on a statistical analysis of data. They tend to regard such generalizations as overlooking complexity and to relegate them to the “social scientific” study of religion, located in other academic departments, professional associations, and journals.

**Trends.** Readers looking for specific topics that interest scholars in the academic study of religion probably do best to consult the topical outline of this encyclopedia, but it may be helpful here to note some broader trends. One is the increasing specialization that has taken place over the last one hundred years. The demand that scholars possess sophisticated linguistic and cultural knowledge, coupled with the increase in the number of people who have such knowledge for different languages and cultures, has resulted in specialization by areas, such as South Asian religions, Islam, and Buddhism, along with subdivisions of these larger groups, like Vedic studies, contemporary Islam, and Japanese Buddhism. Other kinds of specialized groupings—women and religion, religion and literature—exist, although they often straddle the divide between the academic study of religion and theology. Specializations defined by applying specific methods to theoretical issues, as in, for example, the distinction between physical and organic chemistry, are much less common.

A second trend has been an emerging tension between two broad orientations within the field, critical theory and science. The former is the more established, growing out of the field’s traditional interpretive interests and relying heavily on the French “philosophers of 1968,” such as Jacques Derrida (1930–2004) and Michel Foucault (1926–1984), as well as postcolonial thought, most notably, perhaps, the thought of Edward Said (1935–2003). These scholars have focused on the conditions in which knowledge is produced,

critiquing claims to objectivity and universal validity. They embrace a wide variety of positions, but among common tendencies we might note the following: the conviction that knowledge is a culturally limited social construction; an emphasis on the inevitable distortions of translation tending to an assertion of incommensurability between languages, cultures, and communities; the interrogation of the cultural rootedness of the categories and methods of scholarship; the deconstruction of general groupings in favor of particularity and difference; an interest in the corporeal and material as opposed to the ideational that presupposes at the same time as it critiques a Cartesian dualism or Platonic idealism; a preference for the marginal, variously defined by race, gender, class, and other categories as well; the identification of political, economic, and social domination as the actual if unstated goal of social science and scholarly endeavors more broadly; an insistence upon plurivocality and an experimentation with nontraditional, non-monographic literary forms; and—despite the generalizations implicit in some of the preceding characteristics—a rejection of the possibility of formulating adequate generalizations about cultural materials.

More recently, voices have arisen claiming to produce just the sorts of knowledge that the critical theorists find untenable. This trend has been strongest, perhaps, among those who claim to have found in cognitive science a ground for universals that transcend the limitations of social construction. (Cognitive science itself arose as an alternative to behaviorism in psychology and philosophy.) When those who favor science do not simply dogmatically insist upon science as the most compelling form of contemporary knowledge, they may emphasize considerations like the following to justify their approach: the large amount of shared mental content which the intersubjective communication that we appear to observe presupposes; the evolutionary demands that require communication and commensurability for the survival of the species; the ability of controlled, cross-cultural experimentation to establish adequate generalizations about universal mental structures; the need to postulate these structures in order to explain various human abilities, such as the learning of language; the tendency of critical-theoretical accounts to overlook commonalities and overstate differences and so make generalizations seem implausible; the apparent logical fallacies, such as the genetic fallacy of rejecting categories on the basis of their prior history, and self-contradictions within the critical theorists’ approach; and the tendency of critical theorists to exempt their own scholarly efforts from the scathing criticisms that they direct at others. At present the lines between critical theory and science are sharply drawn, and it is impossible to predict what the future of this tension might be.

Finally, one might note a growing awareness of the global character of the academic study of religion, as witnessed in part by the entries that follow. The International Association of the History of Religions now boasts affiliates in such diverse places as Cuba, Indonesia, Nigeria, and New

Zealand and has been very active in hosting conferences outside of Europe and North America. The International Committee of the American Academy of Religion has sought to foster connections between scholars in North America and other parts of the world. The impetus for both sets of activities remains, however, largely European and North American.

One would anticipate that a growing self-consciousness among scholars of religions in regions outside Europe and North America would lead them to explore their own traditions of knowledge about religions which predate European contact, as literary scholars have begun to do (e.g., Ganesh N. Devy, *After Amnesia: Tradition and Change in Indian Literary Criticism* [Bombay, 1992]; cf. Japan; North Africa and the Middle East). At the same time, scholars will need to reflect critically on the extent to which a regionalized view of the academic study of religion will remain expedient. For example, are South Asian scholars fascinated with Marx “Westernized,” or does that label, or more broadly does the consideration of the academic study of religion region by region, obscure what may be alternative and ultimately more compelling interests uniting groups of scholars across regional boundaries?

#### STUDY OF RELIGION: THE ACADEMIC STUDY OF RELIGION IN AUSTRALIA AND OCEANIA

Aside from literature reinforcing the Christian and Jewish ways of life, studies in religion in the Oceanic region began with reports on the customs and beliefs of “savage” or “native” peoples in and near European colonies. Along with the published diaries of early explorers, whose observations were highly cursory, most of the early commentators were missionaries, including the Spanish Jesuit Juan Antonio Cantova, who wrote about the Caroline Islands as early as the 1720s; William Ellis of the London Missionary Society, who documented various Polynesian cultures by 1829; and the German Lutherans Carl Ottow and Johann Geissler, who described the New Guinea Biak people in 1857. In addition, visitors who utilized missionary informants—such as the French captain François Leconte, who wrote about northern New Caledonia in 1847—also recorded events of interest to the study of religion in the region.

**PIONEER MISSIONARIES' REPORTS.** Although evangelization was their main priority, many pioneer missionaries were surprisingly interested in gaining knowledge of the peoples they encountered. Such concepts as *mana* and *taboo*, destined to stimulate Western theories about the origins of religion, hailed from the Pacific mission field. In the 1770s, after Captain James Cook's brief notations on the meaning of taboo in Tahiti and Hawai'i, the term became associated with biblical prohibition in evangelistic discourse and was thereafter incorporated into European vocabularies. The priest-academic Robert Codrington introduced the notion of mana as manipulated “spirit power” after investigating Banks Islander beliefs (New Hebrides, now Vanuatu) in the 1870s, at a time when he headed the Anglican Melanesian Mission. Totemism became an acclaimed feature of Aboriginal (and thereby very primitive) religion; the earliest significant account of an Australian native protecting an animal (a *goanna*) as his “brother” was made by a London Missionary Society delegate in 1834. Ideas about high gods, again important for origins theories (e.g., Andrew Lang in the 1890s), arose out of Aboriginal talk of the All-Father, which was in all likelihood an innovative indigenous concept to make sense of missionary teachings about the one God.

That Polynesia could match Europe and Asia for sacralized royalty, moreover, was made plain by the Hawaiian king Kalakaua's eulogistic *Legends and Myths* (1888). With this background, a professional competitiveness sometimes arose when secular anthropologists entered the region. There was no love lost, for example, between the Lutheran Carl Strehlow, a missionary to the Aranda in central Australia, and Baldwin Spencer, the leader of the 1894 Hort Expedition and later Chief Protector of the Aborigines (1911–1912), who divulged many secrets about Aranda religion that Strehlow had honored. In another case, Bronislaw Malinowski, allegedly the first true field anthropologist, was told nothing about the coastal Mailu by his initial host, the London Missionary Society missionary William Saville (1914–1915), who wanted to write up his own findings. Disappointed,

Malinowski moved on to the Trobriand Islands. Although Oceania was home to a quarter of the world's discrete religions and research material was plentiful, this professional tension lasted through the years leading up to World War II.

In a number of places, missionary scholarship was utterly determinative. For example, the Dutch relied on church initiatives to carry missionaries into Irian Jaya, the far and dangerous frontier of Indonesia. The church also had a singular influence across equatorial Polynesia as illustrated by the work of Wyatt Gill in Rarotonga (the capital of the Cook Islands) and Father Sebastian Englert on Easter Island. Elsewhere a mixture pertained, and government-sponsored anthropology was sometimes evident. In the more colonized Polynesia, for example, the one-time British governor of New Zealand, Sir George Grey, adopted a policy of collecting Maori lore that lasted up until the 1890s, and during the 1910s the U.S. Bureau of Indian Affairs, otherwise focused on mainland cultures, encouraged Nathaniel Emerson to document the Hawaiian *hula*. Between World War I and World War II, Francis Williams, the most reputable of all government anthropologists, worked in coastal parts of Australia's Territory of Papua (now Papua New Guinea), although his brief included cooperation with the missions. The Anglican cleric Adolphus Elkin, who served as a professor of anthropology at the University of Sydney from 1934 to 1956 and founded the journal *Oceania*, was welcomed by the Australian government as adviser on Aboriginal issues during the 1940s.

**EARLY INTELLECTUALS.** Interest in the wider world of comparative religion came late in the colonial histories of Australia, New Zealand, and also Hawai'i, which matched other southeast Pacific museum constructions with its own Bernice P. Bishop Museum as early as 1885, before American annexation. A key impetus to study other religions was provided by the Theosophical Society, starting in Australia by 1895 and possessing an impressive center in Sydney during the 1910s. In New Zealand during the 1920s, a circle of study formed around Elsdon Best, cofounder of the *Journal of the Polynesian Society* in 1898, who likened the Maori cult of Io to a removed Gnostic-looking deity with layers of beings that separated him from the earth. At the same time, more critical scholarship emerged: The Australian surgeon Grafton Elliot Smith became a chief instigator of the Egyptocentric Diffusionist school in the 1920s, after having been anatomy professor in Cairo, and Samuel Angus of Scotland, a graduate of the universities of Princeton and Berlin (under Adolf von Harnack, 1851–1930, and Gustav Adolf Deissmann, 1866–1937), took up a professorship in New Testament and historical theology at the University of Sydney in 1915 and quickly emerged as an eminent authority on Greco-Roman mystery religions.

This coming and going of “imported” and “exported” intellectuals was typical well into the post-World War II period. Scholars writing on non-Christian traditions usually ar-

rived from outside. Among provocative Germanics was the economist Kurt Singer, who wrote from Sydney that the Zoroastrian stress on the battle between good and evil added to problem of human conflict, and Peter Munz, who sought to better the theories of myth formulated by James G. Frazer (1854–1941) and Claude Lévi-Strauss (b. 1908) from Dunedin, New Zealand. British scholars Raynor Johnston (comparative mysticism) and John Bowman (Samaritans) went to Melbourne, and George Knight (Semitics) went first to Dunedin and later to Suva, the capital of Fiji. In return, Australia and New Zealand lost various experts in Christianity to overseas postings, including the theologian Colin Williams to Yale University, where he became dean of the divinity school; the church historian George Yule to the University of Aberdeen; the New Testament specialists John O'Neill and Graham Stanton to the University of Edinburgh and Cambridge University, respectively; and the interfaith specialist John D'Arcy May to Dublin University. Some expatriate dons came as long-term (and often highly productive) visitors; yet, as time went on, homegrown scholarship firmed up and the Pacific eventually became established on its own as a region of scholarly prowess.

**EARLY ACADEMIC PROGRAMS.** With university courses in Asian studies—especially on Middle Eastern and Indic civilizations—being set in place during the late 1950s and the 1960s, the time was ripe for historical and comparative studies of religions to enter the academic forum. Among the faculty of Australian National University's new oriental studies program were Indologist A. L. Basham, Buddhologist Jan De Jong, and Islamicist Antony Johns, as well as the region's leading scholar in the sociology of religion, Hans Mol. Similar studies were also implemented at the University of Melbourne, where the journal *Milla wa-Milla: The Australian Bulletin of Comparative Religion* made its appearance in 1961 and the first of the Charles Strong Lectures, designed by a liberal Protestant cleric to be on non-Christian traditions, took place. These were followed up by the publication of *Essays on Religious Traditions of the World*, initiated in 1970 by the Anglican priest George Mullens, a scholar in Japanese Buddhism. The first department of religious studies in the region, however, was not institutionalized until 1971, and then at Victoria University in Wellington, New Zealand, although New Zealand's programs at the University of Canterbury in Christchurch, New Zealand, and the University of Otago in Dunedin foreshadowed this, with Albert Moore's 1966 University of Otago lectureship in the history and phenomenology in religion being the discipline's first generically significant appointment for Australasia. The foundation professor at New Zealand's University of Wellington was Lloyd Geering, a renowned liberal Christian theologian.

Intriguingly, Geering remains the only memorable classic-looking theologian born and bred in the whole South Pacific region. Theologically engaged Australians who possess genuine international acclaim have simply not worked on mainstream matters—John Eccles's work on synoptic theory

and Charles Birch's work in process thought are two obvious cases. However, Australia is a more secular country, and Eric Sharpe, the first chair of the religious studies department at the University of Sydney (1977–1996), was by no means a practicing theologian. Sharpe secured the Sydney chair primarily on the basis of his work *Comparative Religion: A History* (1975). This volume established him as one of the world's leading methodologists in the comparative and historical study of religions, a reputation that emanated from Australia and was consolidated by such later works as *Understanding Religion* (1983) and *Nathan Söderblom and the Study of Religion* (1990).

An Englishman, Sharpe had strong connections to the University of Manchester (especially John Hinnells) and Lancaster University (especially Ninian Smart) and served as chair of the history of religion department at Sweden's Uppsala University from 1980 to 1981. Although Sharpe could have been enticed back into the transatlantic center of theoretical debate, he decided to remain in Australia and consolidate his new department. He consistently published research on Western interpretations of Hinduism and brought to Sydney brahmin Indologist Arvind Sharma, who founded the journal *Religious Traditions* in 1978 and the *Journal of Studies in the Bhagavadgītā* in 1981. Sharpe also continued conducting historical studies of Christian missionary approaches to other religions. At the 1988 Chicago symposium on his opus, Sharpe acquitted himself artfully against younger critics' suggestions that he was a closet theologian, and as the years went on he defined himself more as an historian of ideas about religion than anything else. Interestingly, in 1995 his first academic appointee and protégé Garry Trompf took a chair in the History of Ideas beside him at the University of Sydney.

Trompf had previously held the first of two lectureships in religious studies in Australia, in the not-yet-independent Territory of Papua New Guinea, where he taught alongside the Semiticist and fellow Australian Carl Loeliger. Australia's north was to yield the earliest formal developments in the discipline, with the first autonomous department emerging at the University of Queensland in 1975, before Sharpe arrived in Sydney. Although begun under the early leadership of the Englishman Eric Pyle, Queensland was to wait until 1981 for an established chair. That the Australian-born Francis Andersen took the position was significant nationally, but it was also indicative of the weight of interests in the department. He was a fine biblical scholar amid others, including the American Edgar Conrad as a fellow commentator on Hebrew prophetism and the Irishman Seán Freyne and the German-Australian Michael Lattke as scholars of New Testament times. Queensland, however, was also to secure a special reputation for Buddhist studies. Buddhism had already been of wide attraction, including the popular writings by the early feminist-lawyer Marie Byles from 1957 to 1965, the founding of the *Journal of the Oriental Society of Australia* in Sydney in 1963, and the various textual studies

and translations, especially those of Peter Masefield. Special distinction was also given to the work of the Australian Philip Almond on the history of Buddhism's Western interpretations and Rod Bucknell's work on meditative practice.

Almond, who succeeded Andersen as professor after the latter moved to the University of California at Berkeley, can be credited with a distinctly Australian contribution to the theory of religion. He was crucial among revisionist thinkers in deconstructing Western scholarly reifications and popular representations of significant Eastern traditions. In *The British Discovery of Buddhism* (1988), he argued that Buddhism, as it is popularly defined in most textbooks, was a Western invention. At a slightly later stage, Almond went on to ponder the Victorians' invention of Islam, and his work compared with Edward Said's deconstruction of Orientalism. In other writings, especially *Mystical Experience and Religious Doctrine* (1982) and those appealing to the methodological insights of Rudolf Otto (1869–1937), Almond doubted that mysticism could be apprehended with the kinds of objectivist treatment beginning to dominate his discipline.

At the University of Sydney, research into the religions of Oceania was a forte, with Trompf returning to Australia in 1978. Like Sharpe and Almond, Trompf was, admittedly, better equipped to write on Western theoretical ideas. A practicing historian who later served as a professor of history at the University of Papua New Guinea from 1983 to 1985, he was the beneficiary of a very strong tradition of religious history in Australia, if one considers such lights as the German Hermann Sasse, the Britisher John McManners, the New Zealander Edwin Judge, and the Australian Bruce Mansfield, who founded the internationally acclaimed *Journal of Religious History* from Sydney in 1960. This background helps explain Trompf's books on Western historiography and religious ideas, particularly his volumes on *The Idea of Historical Recurrence* (1979). However, prior training in prehistory and ethnohistory and over ten years of intensive research in Melanesia (Fiji, Papua New Guinea, Solomon Islands, Vanuatu, and New Caledonia) allowed him to produce the first major monographs—*Melanesian Religion* (1991) and *Payback* (1994)—to address one of the most complex religious scenes in the world. A distinctively home-grown contribution to the theory of religion developed from these combined interests that dealt with “the logic of retribution” (i.e., those aspects of religious life concerned with revenge, reciprocity, and the explanation of events in terms of praise and blame, reward and punishment).

Scholarship set on understanding Melanesia's religious life seems to have involved one of the largest conglomerates of social-scientific endeavor ever undertaken. Important theoretical positionings were forged out of the region's great cultural diversity: the Polish anthropologist Bronislaw Malinowski's school of functionalism derived from his Trobriands research; the English proto-structuralist A. M. Hocart read Fijian chieftainship as a basic model of sacral leadership; in his studies in Houailou, New Caledonia, Lévi-

Strauss's predecessor Maurice Leenhardt framed early body theory as a self-awareness process running from cosmomorphism to anthropomorphism; the Hungarian Géza Róheim and the Englishmen John Layard tried substantiating Freudian and Jungian insights, respectively, from coastal Papua and Malekula; and Margaret Mead (1901–1978) and Gregory Bateson worked together to formulate theories of gender and social divisiveness from the Sepik area. Important contributions to particular religio-ethnologic issues have also been drawn from Melanesia, mainly by European and American researchers. Topics that have been addressed include head-hunting by Jan van Baal, cannibalism by Marshall Sahlins, grand ceremonial exchanges by Andrew Strathern, initiatory disclosures by Fredrik Barth, ritual homosexuality by Gilbert Herdt, sorcery by Reo Fortune and the Australian Michele Stephen, and sacral legitimation of leadership by Jean Guiart and Maurice Godelier. Melanesian cargo cultism produced various theories, such as cosmic regeneration by Mircea Eliade (1907–1986), proto-nationalism by the neo-Marxist Peter Worsley, the dream of a perfected reciprocity by Kenealm Burrige, new explanations of a changing cosmos by Peter Lawrence, a rite of passage into modernity by Patrick Gesch, and a search for salvation by John Strelan. The conversion processes among Melanesians also attracted mission historians such as the Australians Niel Gunson on Polynesia, David Hilliard on the Solomons, and David Wetherell on Papua; missiologists such as the eminent Australian scholar Alan Tippett, as well as Theo Ahrens, Ennio Mantovani, Friedgard Tomasetti, Darell Whiteman, and Mary MacDonald; and analysts of indigenizing Christianity such as John Barker and the Australian Bronwyn Douglas. Part of Trompf's vision has been to assess Melanesian religion in all its aspects to find the means of representing all this scholarship synoptically and to facilitate indigenous scholarly writing on religion.

An early graduate of the Sydney department, Tony Swain confirmed its strength in indigenous studies by writing the first exhaustive account of theories about Australian Aboriginal religion and the first history of Aboriginal religion since outside contact in *A Place for Strangers* (1993). He questioned Eliade's stress on cosmic axis and accounted for more diffuse notions of space and one's belongingness to land. He also disputed that there were any traditional Aboriginal notions of Mother Earth and denied that high gods were honored before outside pressures from Melanesia and then white colonization. Again, Swain benefited from important predecessors that included, aside from those already mentioned, the Australians Ronald Berndt and Ted Strehlow (both with German backgrounds), W. E. H. Stanner of Australian National University, and the Victorian Max Charlesworth. Swain and Trompf's *Religions of Oceania* (1995) revealed the extraordinary international interest in the Pacific religious scene. Sometimes disproportionate group interest is found, such as Germanic scholarship on the Aborigines and Americans on Micronesia, but some unusual individual achievements by outsiders stand out. For example, the Italian

Valerio Valeri wrote a detailed account of Hawaiian religion; the German Hans-Jürgen Greschat wrote a thorough ethnography of taboo; and the Finn Jikka Siikala wrote an authoritative account of new religious movements in central Polynesia.

**ACADEMIC PROGRAM DEVELOPMENT.** Other intellectual and institutional developments within the whole Australo-Pacific region make for a complex story. In Victoria, programs for studying religion were successively established at LaTrobe University, Deakin University, and Monash University. At LaTrobe the sinologist Paul Rule researched Western images of Confucianism; Gregory Bailey studied ancient Indian ideologies; and the Australian dean of patristics, Eric Osborn, researched select pre-Nicene Church Fathers. Deakin possessed the philosophers Max Charlesworth and Ian Weeks. Charlesworth, who had already taught a religious studies course at Melbourne University as early as 1970—basically in the philosophy of religion—was to institutionalize his dream as professor at Deakin (in Geelong) and he went on to write incisively about methodology issues in *Religious Inventions* (1997). In Victoria, interestingly, there has been sympathy for the idea of a *philosophia perennis* behind spiritual traditions, revealed not only in Kenneth Oldmeadow's fine exposition, *Traditionalism: Religion in the Light of Perennial Philosophy* (2000), but also among philosophers attracted by Eastern, especially Indian, metaphysics, including Ian Kesarcodi-Watson and Purussotima Bilimoria, founder of Australian Society for Asian and Comparative Philosophy and editor of the journal *Sophia*.

Further afield in Australia, Adelaide is most important. With the change in institutional status that produced the University of South Australia came the largest department of religion studies in the country in 1991. This was spearheaded by Professor Norman Habel, the brilliant expositor of the book of Job and founder of the Earth Bible project. With liberal philosophical theologian Vincent Hayes, he founded the Australian Association for the Study of Religions in 1975, which came to oversee the Charles Strong Lectures and built up its own publications, including the journal *Australian Religion Studies Review*, first published in 1988. The Association's concern with a variety of religions demarcated it from the Theological Association of Australia and New Zealand, which is linked to the journals *Colloquium*, *Australian Biblical Review*, and *Pacifica*.

New Zealand benefited from Paul Morris, who returned to Wellington from Britain in 1993 to take over the chair from Geering. Already established in Judaic studies, Morris went on to edit impressive collections on modernity and postmodernity (and New Zealand religious verse). He worked with James Veitch, a critical thinker inspired by Geering with an eye for crises produced by environmental degradation and ideologies of terror. Also worthy of mention are the well-known Africanists Elizabeth Isichei, who was for a time at Wellington, and Harold Turner, who has worked primarily from Britain. Other New Zealand scholars of note

are Albert Moore, an authority on religious art; Brian Colless, a patrologist; and Peter Donovan, an instructor in philosopher of religion. Of journals published in New Zealand, Auckland's *Prudentia* stands out, although its special issues brought together classicists, philosophers, theologians and religionists from across the Tasman Sea and were dominated by Australians, especially the patrologist Raoul Mortley and the historian of philosophy David Dockrill.

Although Mark Jurgensmeyer wrote his first book on religion and politics, *The New Cold War?* (1993), from the University of Hawai'i, in the Pacific Islands more broadly the history and phenomenology of religion has chiefly focused on traditional and changing religious life. Although they also have pastoral agendas, the Melanesian Institute's journals *Catalyst* and *Point* provide valuable information, and the Micronesian Seminar, a research institute founded by the Catholic Church in 1972, contributes to scholarship in the north Pacific. The CORAIL colloquia in Nouméa have been a key outlet for research in French dependencies, as fixtures in Hawai'i have been for American scholars, such as the East-West Center and Brigham Young University's journal *Pacific Studies*. Overall, indigenous writing in religion has been more consistently theological; major forums are the *Journal of Melanesian Theology* and *Journal of Pacific Theology*.

**BIBLICAL SCHOLARSHIP.** To conclude, one cannot underestimate the continuing strength and color of biblical scholarship in Australasia (e.g., authors such as Robert Maddox, John Painter, Robert Barnes, and the controversial Barbara Thiering), and their impact on religious institutions. The same may be said of regional church (and school) historians (e.g., Ian Breward, Hilary Carey, and Susan Emilsen) and public-policy philosophers (e.g., Graham Little and Robert Gascoigne). Apart from the more comparativist volume *Reclaiming Our Rites* (1994), most feminist and gender-related works about religion betray women's hopes for greater opportunities within the Christian churches. Even Aboriginal womanist writers such as Anne Pattel-Gray and Lee Skye have been theologically oriented. Although the creation of religious studies departments threatened divinity boards, theological colleges held their own, and in some universities, theological studies discovered new life (e.g., Flinders, Monash, and the Australian Catholic University). Pauline Allen from the Australian Catholic University was rewarded with the presidency of the International Patristics Association in 2003 for groundbreaking (and liturgically relevant) publications on early Christian prayer and spirituality.

Much sociology of religion has been crucial for religious organizations to ponder their constituencies and demographic possibilities. Over and above valuable theoretical work on religion as identity and anchorage—such as *Identity and the Sacred* (1976)—Hans Mol heralded the more statistical approach found with Alan Black, Gary Bouma, Trisha Brombery, and Philip Hughes. Some sociology is more internationalist: Rowan Ireland on Brazilian spirit movements; Rachael Kohn on self religions, and the Sydney branch Center for

Millennial Studies on comparative chiasm. Impressive empirical and clinical work in Australia also led to the publication of the *International Journal of the Psychology of Religion* by Lawrence Brown of the University of New South Wales in 1991. Intense research into ancient Gnosticisms by Samuel Lieu, Majella Franzmann, and Iain Gardner, and into later esoterico-theosophic currents by Gregory Tillett and John Cooper, have been reflected in the Australian cofounding of the monograph series *Gnostica* in 1997. Interest in religion and science was greatly boosted by cosmologist Paul Davies' arrival in Adelaide in 1990, and religion and politics received a boost with the introduction of the monograph series *Religion, Politics, and Society* in 2001. Clearly, at the beginning of the twenty-first century, the critical study of religions is most certainly in blossom in Australia and Oceania.

#### STUDY OF RELIGION: THE ACADEMIC STUDY OF RELIGION IN EASTERN EUROPE AND RUSSIA

In most European countries, the study of religion developed during a period of transition between the nineteenth and twentieth centuries. It was a time when scholars were attempting to categorize and examine the full range of human activities. The study of religions emerged then as a specifically modernistic, empirically oriented discipline focusing on culture, and concerned first and foremost with the human being. Individual researchers gained academic standing and recognition not by reason of nationality or citizenship but rather by virtue of their academic credentials, their interests and affinities for specific schools of thought, as well as by trends within the field of religious studies—all factors that have little to do with geopolitical principles. In an examination of the course of the development of religious studies in Europe, which may be subdivided into the continent's eastern and western spheres, much depends on political developments in Europe during the Cold War period. European reli-

gious studies stands in an objectively identical context: over the course of many centuries, Europe's religious situation was determined by a single religion, and this fact also restricted, in a fundamental way, the modes of access to religion that were open to theoretical and methodological research.

In contrast, it was European expansionism that brought knowledge of non-European religions, and which consequently contributed decisively to the creation of a common material basis for research within the field of religious studies. With the exception of Soviet Russia, this religious-scientific material was appraised in the other countries now designated as "eastern European" by such methods commonly deployed by religious-studies scholars in general. These include comparative methods, religious-historical methods, religious-phenomenological methods, religious-critical methods, and others. Moreover, with these methods, similar results were also achieved. Only after 1945, when these states came under Soviet domination, did the situation change. This change was due to the application of powerful political and ideological constraints. As a result, however, no distinctively Eastern European variant of religious studies has come into existence, and Eastern Europe was also thereby prevented from becoming a place of academic self-identification. On the contrary, the academic study of religion was eradicated almost entirely behind the Iron Curtain, though it did manage to retain a certain form in Poland. It was replaced during the Cold War era by the ideology of so-called scientific atheism.

**THE EMERGENCE OF RELIGIOUS STUDIES IN EASTERN EUROPE AND RUSSIA.** The beginnings of religious studies in Eastern Europe, as elsewhere on the continent, occurred during the last third of the nineteenth century, when new efforts were undertaken in religious research. These new directions were influenced by new currents of thought, including positivism and evolution theory, as well as from the positive impact of new information from the ethnological, religious-historical, and archaeological spheres. However, the study of religion was not established as an institution (i.e., as a relatively independent field of academic investigation) until the period following World War I. Therefore, in the comparison to Western Europe, the scientifically ascertainable history of religious studies in Eastern European countries is shorter by approximately two generations of researchers. However, this applies primarily to Poland, the Czech Republic (formerly Czechoslovakia), and to some extent even in Hungary. But in Russia, and in a large portion of the Balkans, the academic study of religion studies was not firmly established as an institution until the political changes that came after 1989. Consequently, the development of religious studies in the eastern half of Europe must be viewed in an entirely different manner from its progress in Western Europe.

The early history of religious studies in Poland, the Czech Republic, and Hungary is connected with an interest in folklore that emerged in the nineteenth century. Scholars sought traces of religious traditions and mythologies in an-

cient folk legends. The tradition of comparative mythology—from which, in the first half of the twentieth century, the methods of the comparative study of religion arose—is rooted here. One must count among the best-known researchers of this period in Poland the ethnologist and religious historian Jan Aleksander Karłowicz, the historian of Christianity Ignacy Radlinski, and the Asian studies specialist Andrzej Niemojewski. In the Czech Republic the ethnologically oriented mythology researchers František Ladislav Čelakovský and Josef Jungmann were noteworthy pioneers. In Hungary, the academic exploration of religion was fostered from the circle of theologically educated members of the clergy, and was characterized as strongly Christian. In the middle of the nineteenth century, the study of religion had traditionally been identified with apologetics. Occupying the preeminent place among Hungarian researchers of this time are the linguist Zsigmond Simonyi, who also translated into Hungarian for the first time the work of Max Müller in 1876, and the founder of Islamic studies in Hungary, I. Goldziher. It was Goldziher who made the first mention in Hungary, in 1881, of a new discipline called comparative religious studies.

The truly formative period of religious studies occurred in the years after World War I, and developments in Eastern Europe revealed specific trends pertinent to each country. Even the conceptualizing of religious concepts proceeded in a different manner. The differences are strictly tied to the disparate historical development of these countries. For example, a long-standing Protestant tradition prevailed in the Czech Republic, but Poland was shaped by the strictest Roman Catholicism. Thus even the fundamental conception of religious studies, not to mention an understanding of other religions, differed between the two lands. Schematically expressed, in the Czech Republic religion was considered a component of public culture, and from the very beginning one devoted oneself to the investigation of religion, from differing technical points of view. Thus linguistics, historical sciences, psychology, ethnology, and religious philosophy all played a role, but this was true of theology only to a lesser degree. This diversity of approaches has exerted a profound influence, which extends down to the present time and finds expression in the quest for answers to the questions of what the scientific study of religion is, how one can classify it, and by which rationality paradigm it is sustained. The supreme embodiment of this quest is the work of the actual founder of Czech academic religious studies, the Indologist Otakar Pertold, who in 1920 published *Základy všeobecné vědy náboženské* (Foundations of the universal study of religion).

Religious studies in Poland, by contrast, tended toward a Catholicized view, which understood religion in several more distinctive forms as the phenomenon *sue generic*, and in religious history worked with the conception of Christianity as the exemplar. There also arose the so-called leizistic study of religion, that is, freethinking and anti-clerical reli-

gious studies, which attempted to examine religions objectively in their plurality, free of any religion-based bias. This inner split endured in Poland into the twenty-first century. Catholicism exerted a similarly formative influence on the development of Hungarian religious studies. The study of religion was conducted only within the theological seminaries and institutions, and efforts in the direction of a secular research, such as the suggestion by Ernst Troeltsch that an independent college for the academic study of religion be established at every university, were strictly rejected. Among those who rejected a secularized study of religion was the Catholic professor Aladár Zubriczky, who concerned himself with the parallels between Christianity and other religions, and who viewed Christianity as the veritable paragon of what a religion should be.

During the period between the two world wars, academic activities in these three countries kept pace with those in other comparable states (e.g., the Netherlands, France, and Finland), and had good prospects for further development. However, the decisive break came after World War II, when Eastern Europe came under Soviet domination. At that point, the academic study of religions was prohibited and suppressed. In places where the study of religion was already in existence in the form of established institutions—as for example in the Czech Republic—these institutions were uprooted. Scientific atheism became the sole method according to which the essential nature of religions was to be interpreted. In many cases religious-studies researchers were personally persecuted, driven from the universities by the dozens, and forced into punitive hard labor; the Czech historian of religion Závěš Kalandra, who specialized in ancient Slavic mythologies, was even sentenced to death in a sham trial and executed in 1950.

As a consequence of these developments, the academic study of religion almost totally vanished from Eastern European academic life for the next four decades, and survived only in theological seminaries and institutions, where it was pursued under the guise of the theological disciplines. Specifically, this development went forward in Poland, where internal political forces were not as thoroughly devastating as elsewhere in the Soviet bloc and where, consequently, the publication of religious-scientific works as well as translations remained a possibility. In principle, it can be said that this period entailed significant setbacks, not only because of the near-total extermination of religious studies as a field, but also because of the further theologization of religious studies in those places where it partially survived. This resulted in great difficulties in the theoretical-methodological realm and in the struggle to achieve self-understanding in which religious studies engaged after the sweeping political changes that occurred after 1990.

The time after the change was one of revival for the academic study of religion. There had been evidence that it was still nominally active, though dormant, back in the late 1960s during a period of political thaw, and again thanks to

developments that occurred when Soviet leader Mikhail Gorbachev instituted a policy of perestroika in the 1980s. Because of this, religious studies as a discipline was able to officially establish itself relatively quickly. Religious-studies departments returned to the universities; national societies for the academic study of religion were established; magazines, books, and translations in the field of religious studies were published; attempts were also made to re-establish international academic contacts. However, the relatively long cultural isolation into which the totalitarian states had been driven, which was true of the academic research in general within these countries as well, had a lingering negative impact on the field which endured into the twenty-first century.

In Soviet Russia, the development proceeded along far different lines. From the year 1917 onwards, the doctrine of scientific atheism was regarded as sacrosanct, and its declared goal was not knowledge, but rather the total abolition of religion from social life, along with every tradition having anything in common with religion. As attested by the literature of the era, research was not supposed to have been “objective”—that is, as impartial as possible—but rather was to direct itself according to the principles of the class struggle, and thus in accordance with subjective-ideological interests. Although there were attempts at a so-called “Marxist study of religion,” such as Dmitrii Modestovich Ugrinovich’s 1973 work *Introduction to the Theoretical Study of Religion*, these political restrictions were not overcome until the latter part of the 1990s. However, after the formation of the Russian Federation in 1993, an entirely different set of problems arose. These involved legal measures vis-à-vis religious liberty, freedom of conscience, the position of the churches in society, and the role of churches in religious and ethical instruction within the schools. Consequently, the establishment of religious studies as a field along standard academic principles was persistently delayed.

**CONTRIBUTIONS.** In spite of these unfavorable conditions, a large number of religious-academic works by Eastern European scholars have been published since the first two decades of the twentieth century. Individual researchers concerned themselves with a wide range of problems from the history of religion. There also emerged highly specialized schools of Polish and Czech Arab/Islamic studies, as well as Polish, Hungarian and Czech Asian studies; moreover, both Czech Egyptology and Hungarian Tibetan studies are well-known throughout the academic world. Separate Jewish, Hindu, Buddhist, and biblical fields of study are all well developed. The psychology of religion, sociology of religion, and religious geography are also established in the field. A certain peculiarity makes for an ongoing interest in the philosophy of religion as an auxiliary discipline. Philosophy of religion admittedly belongs to the philosophical rather than religious-scientific disciplines, but it is nonetheless highly valued; this is due to its conceptual nature, and to the possibility of taking advantage of its theoretical-methodological approaches.

Among Hungarian researchers, the following should be mentioned: Károly Kerényi, *Einführung in das Wesen der Mythologie* (Introduction to the nature of mythology, written with Carl Jung, 1951); *Die Religion der Griechen und Römer* (The religion of the Greeks and Romans, 1963); Sándor Bálint, *Tanulmányok a magyar vallásos népelet köréből* (Essays on folk religion in Hungary, 1943); Instván Hahn, *Istenek és népek* (Gods and peoples, 1968); *Hitvilág és történelem: Tanulmányok az ókori vallások köréből* (Religion and history: Essays concerning ancient religions, 1982); Imre Trencsényi-Waldapfel, *Vallástörténeti tanulmányok* (Studies on the history of religion, 1959); and Sir Mark Aurel Stein, *Innermost Asia: Detailed Report of Exploration in Central Asia, Kansu and Eastern Iran I–IV*, 1921.

From among the many Polish contributions, the following should be mentioned: Tadeusz Margul, *Sto lat nauki o religiach świata* (One hundred years of the scientific study of religion, 1964); Franciszek Adamski, editor, *Socjologia religii* (Sociology of religion, 1983); Zgymunt Poniatowski, *Religia i nauka* (Religion and science, 1960); Jan Szmyd, *Teorie i doświadczenie* (Theory and proof, 1966); and Witold Tyloch, editor, *Current Progress in the Methodology of the Science of Religion*, 1984; *Studies on Religions in the Context of Social Sciences: Methodological and Theoretical Relations*, 1990.

In the Czech Republic there arose, among others, Josef Tvrđý, *Filosofie náboženství* (Philosophy of religion, 1921); Frantisek Lexa, *Náboženská literatura staroegyptská I–II* (Ancient Egyptian religious literature, 1921); Vincenc Lesný, *Buddhismus* (Buddhism, 1948); Josef Kubalík, *Dějiny náboženství* (The history of religion, 1984); Dusan Zbavitel, *Hinduismus a jeho cesty k dokonalosti* (Hinduism and its path to perfection, 1993); Zbynek Žába, *Les Maximes de Ptahotep*, 1956; *Rock Inscriptions of Lower Nubia*, 1968; Miroslav Verner, *Ancient Egyptian Monuments as seen by V. R. Prutky*, 1968; Bretislav Horyna and Helena Pavlincová, *Filosofie náboženství* (Philosophy of religion, 1999); *Dějiny religionistiky* (The history of religious studies, 2001); Dusan Lužný, *Náboženství a moderní společnost* (Religion and modern society, 1999); and Luboš Bělka, *Tibetský buddhismus v Burjatsku* (Tibetan Buddhism in Buryatia, 2001).

Works devoted to the conceptualizing of religious studies, and of religious ideas, merit careful attention. The first theoretical-methodological work in Eastern Europe was Pertold's book *Základy všeobecné vědy náboženské* (Foundations of the universal study of religion). This author considers religion to be an emotion-based awareness of dependence on that which currently transcends the limits of all possible human knowledge. Under the influence of positivism and evolution theory, he distinguished between so-called primitive religions (i.e., ancestor worship, animism, pre-animism, fetishism, shamanism), theistic religions (i.e., polytheistic and monotheistic religions), and new religious forms that come into existence through the decay of monotheism (sects, magic, folk religion). He subdivided the scientific study of

religion into what he called concrete religious studies, which deals with religious facts, and so-called abstract religious studies, whose task is to classify and evaluate the knowledge gained from the history of religion.

The first introduction to religious studies after World War II appeared in Poland with Poniatowski's *Wstęp do religioznawstwa* in 1959. This work was essentially oriented toward religious theory to accommodate the interest of the Polish Academy's workgroup for religious theory, which was created in 1957. In the Czech Republic, only one introduction was written prior to 1989, *Nástin religionistiky* (Overview of the scientific study of religion) from Jan Heller and Milan Mrázek in 1988. This, however, is written from a theological point of view. The first introduction that conformed to the requirements of the academic study of religion was Horyna's 1994 work *Úvod do religionistiky* (Introduction to the study of religions). Here the scientific study of religion was represented in a manner comparable to that of other standard works of Western European scholarship; questions of religious-scientific theory were stressed, as well as questions concerning the internal structuring of religious studies, its conceptual foundations, and religious-scientific metalanguage. In Russia, theoretical problems of religious studies have been reflected with delay and with many obscurities; this was a legacy of Marxist ideology.

**SCHOLARLY ORGANIZATIONS AND PUBLICATIONS.** Colleges for the scientific study of religion first came into existence in Poland and the Czech Republic shortly after World War I. The first college for the history of religion dates back to 1918 at Poland's University of Lublin; its dean was Josef Archutowski. The first college for religious studies came into existence in 1923 at the Wolna Wszechnica Polska in Warsaw, with Stefan Czarnowski as its dean. In 1937, Wiesław Niemczyk appointed himself the first professor of religious studies in Poland at the University of Warsaw. In the Czech Republic, Pertold appointed himself the first professor of comparative religious studies at Charles University in Prague, where the College of Religious Studies was established in 1934 within the philosophy department. However, this college was dissolved by Communist order in 1948, so that no direct line of successorship exists between it and the post-1989 colleges.

Pertold attempted to incorporate Czech religious studies into international research circles, and participated in the year 1912 in the Fourth International Congress for the History of Religion in the Dutch city of Leiden. His work, however, went unrecognized until 1990 at the Sixteenth Congress of the International Association for the History of Religions (IAHR) in Rome, where the newly established Czech Society for Religious Research was admitted to the regular membership ranks. In contrast, the Polish Society for the Scientific Study of Religion dated back to 1958, and had been admitted to IAHR ranks at the Twelfth Congress in Stockholm, Sweden. In other Eastern European countries, the scientific study of religion as an institutionalized field of

university education existed neither during the period of Communist rule nor prior to that time. It was only after 1990 that the scientific study of religion began to develop in a dynamic fashion. In Hungary, there are three colleges for religious studies: at the Catholic College in Vác, at the University of Pécs, and at the University of Szeged, which emerged as the center of Hungarian religious studies. The Romanian Society for the History of Religion (RAHR) is a member of the IAHR. The situation is also similar in Russia—although here the circumstances are in part unclear—and in the former Soviet Union satellite states of Lithuania, Estonia, Latvia, and the Ukraine, though swift academic advances occurred during the post-1989 era.

Professional journals in the field of religious studies are published in almost all Eastern European countries. The most traditional of these periodicals is the Polish publication *Euhemer. Przegląd Religioznawczy* (Euhemer. Representation of the scientific study of religion), which was founded in 1957 and since 1991 has appeared under the title *Przegląd Religioznawczy* (Representation of the scientific study of religion). In 1991, the specialist publishing house NOMOS was established in Krakow, Poland, to issue technical literature in the field of religious studies. The leading Czech journal is *Religio. Revue pro religionistiku* (Journal for the scientific study of religion), founded in 1939; it serves as the central organ of the Czech Society for the Scientific Study of Religion, which is headquartered in Brno. At Masaryk University in the same city, the periodical *Religionswissenschaft* (Religious Studies) is also published, which brings together the most important religious-scientific works from both domestic and foreign contributors. After the break-up of the former Czechoslovakia into two independent states in 1993, the Slovak Society for Religion Research—publisher of the periodical *Hieron*—became an independent entity. At the University of Szeged in Hungary, the journal *Vallástudományi periodika* (Religious-Scientific Periodical) is available in an online version (<http://www.vallastudomany.hu/liminalitas/index.php>).

**PERSPECTIVES.** Religious-scientific cooperation in the eastern European countries—as in the whole of Europe—is hampered by enormous linguistic and cultural differences. It seems unlikely that a supra-national Eastern European religious-scientific organization could come into existence, and the individual representatives of religious studies in the former Eastern bloc countries show no initiative in this direction. The IAHR and the European Association for the Study of Religions (EASR) serve as the common foundation for cooperation. The same diversity prevails in a thematic sense. Over the course of time, the political differences that caused academic progress in Eastern Europe to lag were remedied. The research focuses on the history of religion, new religious movements in Europe, enculturation of non-European religions in Europe, which include Buddhism, Islam, Asian religions, and new religious phenomena.

The significance attached to the theory of religious studies is also constantly increasing; its identity problems,

which have to do with the deficient methodological equipment; deductive procedures; object and meta-theory; principles of epistemological formalization; the logic of linguistic means of expression, particularly in religious-scientific definition procedures; criteria-formation in the realm of the semantic completeness of religious-scientific concepts; possibilities for the creation of disciplinary, fundamental, and practice-oriented religious-scientific axiomatics.

The question “What is the scientific study of religion?” is pursued with the same seriousness as is the question “What is religion?” Furthermore, the more recent history of Western religious studies is being absorbed, and instruction concerning methodological difficulties—and their possible resolution—is being sought within it. It is possible to conclude that there is no longer any significant difference between European religious studies in the eastern and western halves of the continent, or in any case that if differences do remain they are few in number. This is true as regards topics and the dynamics of development, as well as social resonance. Few seem cognizant of these facts, however. For example, in the most recent and modern introduction to religious studies, written by Hans G. Kippenberg and Kocku von Stuckrad (Munich 2003), not a single word is devoted to Eastern European religious studies.

#### STUDY OF RELIGION: THE ACADEMIC STUDY OF RELIGION IN JAPAN

The study of religion in Japan is probably best known to Western people for D. T. Suzuki and the Kyoto School.

However, it would be too Orientalistic to assume that the modern Japanese study of religions has been predominated by Zen Buddhist philosophy with a somehow mystical method of intuition. Japanese students majoring in *shūkyōgaku* (the study of religion) have been reading classic and contemporary works that are more or less similar to those on the reading lists at Western graduate schools. Moreover, the earliest Japanese scholars of religion regarded themselves as more scientifically objective than their Western counterparts who were struggling to detach themselves from the influence of Christian theology. Although those Japanese scholars were, in reality, far from ideologically neutral, the establishment of the study of religion as a nonconfessional university department (at Tokyo Imperial University in 1905) and of an academy of religion (in 1930) were quite early in comparative terms. In addition, the ninth Congress of the International Association for the History of Religions took place in Tokyo in 1958. Nevertheless, the study of religion has never been granted a high status in Japan. Whereas the number of academy members had reached 2,000 by the end of the twentieth century, less than ten universities had departments of *shūkyōgaku*, that is, only 1 percent of all four-year universities and colleges in Japan. This paradoxical position of the Japanese study of religion reflects the sociopolitical contexts of religion in modern Japan.

**PREHISTORY OF THE STUDY OF RELIGION.** It is commonly accepted that the modern study of religion in Japan started in the Meiji era (1868–1912), after Japan opened its doors to the Western world. The Japanese word for religion, *shūkyō*, was also coined at the beginning of the era as a translation of the Western term. This does not mean that there were neither precursors of *shūkyōgaku* nor concepts similar to religion before Japan became fully exposed to Western culture. Nakamoto Tominaga (1715–1746) is one of the Japanese scholars who developed comparative, historical, and critical approaches to religion without Western influences. Tominaga's rational thinking derived from Confucian education, which was promoted by the Tokugawa government. Rather than defending Confucianism, however, Tominaga compared it with Buddhism and Shintō, and then attempted to present a new teaching that surpassed all three. Like the Western thinkers of the Enlightenment, he criticized existing religions by exposing the historically conditioned nature of their ideas and scriptures.

Tominaga's comparative study of religion was not unique; it was a common practice among scholars at that time to consider Shintō, Buddhism, and Confucianism as related concepts. However, there was no fixed word, like the later *shūkyō* (religion), that placed them in a single category. Sometimes people called them *kyō* ("teaching") in order to emphasize their doctrinal aspects; at other times they used a word with more practical connotations, *dō* (*tao*, "way").

This terminological ambiguity indicates that a generic category called religion was not yet needed. Japanese scholars in those days did not ask the question that was central to the

Enlightenment and gave rise to the modern study of religion in the West: what is the essence of religion? Nor was there any further development in methodology, in contrast to the West, where the methodology of the humanities was polished through imitating and challenging the methods of the rapidly progressing natural sciences. Although the Japanese did access the abundant data about the various religions found within their religiously pluralistic country, they did not embark on the systematic study of comparative religion by themselves.

A drastic change to this situation came about at the outset of the Meiji era. "Religion" was developed as a formal concept, initially to serve political and juridical needs. In order to integrate the country as a nation-state, the Meiji government adopted an imperial system and chose Shintō as its moral guideline. The government then defamed Buddhism, which was once amalgamated with Shintō, while reaffirming the long-standing ban on Christianity. At the same time, however, the government strove to modernize Japan by following Western systems, and in so doing it soon realized that religious freedom was regarded as one of the requirements of a modern society. The government was pressed to permit the freedom of religion yet sought to maintain the special status of Shintō. It managed to solve this problem by making rhetorical use of the concept of religion. The concept, which was an import from the West, was modeled after Christianity, in particular belief/doctrine-centered Protestantism. In light of this definition of religion, Shintō, which mostly consisted of ritual practices, was termed non-religious. The government declared that Shintō was not a religion, but a system of state rituals superior to individual religions. "Non-religious" was promoted as a positive virtue rather than implying something less than a religion. This was the rhetoric used to legitimize what later was called State Shintō. The government insisted that it was different from state religion and thus compatible with freedom of religion. Not all Japanese were convinced by this reasoning, and a heated dispute arose when the *Kyōiku chokugo* (Imperial rescript on education) was enacted in an effort to infuse all schoolchildren with national morality shaped by Shintō ideas.

Scholars debate what other effects were caused by the conceptualization of religion in the Meiji society. The consensus is that practice-based folk religions were suppressed, being categorized as superstitions. Established religions such as Buddhism imitated the modern features of religion epitomized in Protestantism for the sake of survival. In addition, Japan was unique among the cultures encountering the modern West in the failure of Christian missionaries to expand Christianity in the country, which was supposed to be perfectly religious already, according to the newly adopted concept of religion. It was under these circumstances that the study of religion gradually took its form in Japan.

**EARLY DEVELOPMENTS (1905–1945).** Toward the end of the nineteenth century, universities modeled after Western,

particularly German, institutions began to be founded in Japan. While there were a number of private universities, some of which had either Buddhist or Christian backgrounds, a few national universities were granted a leading position in research and teaching. In 1890 Tetsujirō Inoue (1855–1944) delivered a lecture on comparative religion and Eastern philosophy at Tokyo Imperial University, Japan's first national university. In 1905 Masaharu Anesaki (1873–1949) was appointed to the first professorship in religious studies at the university, and the first department for the study of religion was established. Other national universities, which were independent of any religious organization, followed suit. The early scholars emphasized the importance of free inquiry and a comparative approach.

Nevertheless, their scholarly research was guided by significant practical concerns alongside the scientific ideal of objectivity. The fundamental question about the nature of religion had been evoked in the debate on the legitimacy of State Shintō, and the public came to expect scholars of religion not only to offer a professional definition of religion but also to present a blueprint for religion's future. Their recommendations varied. Inoue supported the Imperial rescript on education in the debate. His goal was to replace all religions with national morality and rational philosophy. He believed that existing religions would become outdated in the process of modernization.

While rationalist scholars such as Inoue thought that society would ultimately be able to dispense with religion, most scholars of religion, including Anesaki, hoped to secure the role of religion in contemporary and future society. They therefore defended religion against modern secularism. Still, it was self-evident to almost all of them that religion could serve to consolidate and expand their new nation-state, and in that aspect of national loyalty they were not much different from right-wing nationalists who promoted the Imperial rescript on education.

In this process of describing religion in comparison to other categories such as education and morality, they came to presuppose the *sui generis* quality of religion, and different scholars presented various universal definitions of religion, which were also assumed to be its origin. Their views of religion can be described, overall, as psycho- or subject-centered. For example, Manshi Kiyozawa (1863–1903) defined religion as “a mental faculty or disposition which enables man to apprehend the Infinite” (in *The Skeleton of Philosophy of Religion*, an essay in English distributed to attendees at the World Parliament of Religions held in Chicago in 1893). Many Japanese scholars, even those with religious affiliations, regarded the divine being as a projection of human feelings, desires, or life forces. Interestingly, they did not think that such views would undermine religion. They were in fact optimistic about religion, believing in its evolution. Although these tendencies were distinct, it is difficult to discern how many of them were derived from their contemporary Western thoughts or from the indigenous tradition of Buddhism or animistic Shintō.

Twenty-five years after the first department for the study of religion was established, The Japanese Association for Religious Studies was founded, the first nationwide academic organization in the field. At that time there were strong antireligious movements inspired by Marxism, which was one of the causes that led scholars of religion to unite to defend religion. During the same period Japan became an imperialistic power and started to expand its colonies from Korea to other parts of Asia. In a parallel to Western scholarship, Japanese scholars developed ethnographic studies based on fieldwork in the new colonies in Asia, aware that studying the religions of diverse ethnic groups would serve Japan's colonial policy. It is often pointed out that the Kyoto School, the well-known group of religious philosophers from Kyoto Imperial University, justified Japanese imperialism with their ideas of Buddhism as postmodern, post-Western wisdom. Scholars of religion who supported Japanese imperialism ideologically were not limited to the Kyoto School, however. Moreover, many scholars found their freedom of research being increasingly restricted.

**DEVELOPMENTS SINCE 1945.** With the end of the Second World War, it was publicly admitted that State Shintō was, indeed, a religion. The Shintō Directive, which specified the occupation policy on religion, was issued in 1945 to abolish the entire system of State Shintō. At the same time the imperial family was demythologized to allow a democracy to be established. In the postwar period the influence of the United States became immense, both politically and culturally. It was ironic, therefore, that many Japanese remained skeptical about religion throughout the Cold War, despite their living in a capitalistic society. Traumatic memories of religious totalitarianism continue to influence the Japanese to separate religion from politics, to an extent that they often feel uncomfortable about the religious aspect of U.S. politics, often called the civil religion of the United States. In addition, opinion polls indicate that a large number of Japanese have a strong distrust of any religious organization.

Under these circumstances, the scholars of religion in postwar Japan became more careful to maintain scientific neutrality than had been the prewar scholars, who were socially engaged in defending religion. This neutral attitude culminated in the work of Hideo Kishimoto (1903–1964), a leading postwar scholar who sharply contrasted the study of religion as a purely empirical science with the study of theology. It does not mean that the postwar study of religion had no perspectives. Many scholars took an interest in minor, or what are called “little,” religious traditions, the religions of the populace, whereas prewar scholars more often investigated the religious elites. This new tendency reflected the politically liberal atmosphere that spread through the humanities and social sciences in the 1950s. It was also a result of differentiating the study of religion itself from studies of Buddhist, Shintō, or Christian religions that focused on textual studies and elitist traditions. It may also be true that cross-religious categories like folk religion were more suited

to comprehending the syncretic pluralism of Japanese religions.

In these respects, the Japanese study of religion has many things in common with the history of religions, a term often used to describe a humanistic tradition within the study of religion in the West. Nonetheless, most Japanese scholars have never identified themselves as historians of religions in this sense. The reason for this may be largely institutional. Since the study of religion has been a small field, it has never become too compartmentalized; those researching new religious movements, for example, worked closely with field workers studying folk religions. In addition, Japanese scholars in other departments such as sociology used to pay little attention to religion due to the pervasive indifference to religion in Japan. Rivalry with those scholars also helped to unite the field.

Because of these factors, the Japanese study of religion developed by embracing psychology, sociology, anthropology, and other approaches to religion. In the process, Japanese scholars readily adopted Western theories such as functionalism and structuralism, but they also found Christian influences in the Western study of religion and elaborated original theories of religion from their point of view. To take a few examples, whereas the Western study of religion used to emphasize the mind or the mind-body dichotomy in religion, Kishimoto rehabilitated the aspect of the body in religion as seen in ascetic practices, and Keiichi Yanagawa (1926–1990) presented a definition of religion as human relationships, in sharp contrast to the monotheistic idea of religion.

The Japanese study of religion differs from its Western, and particularly American, counterparts in a number of other respects. The Japanese scholarly view of religion tends to be ritual-centric rather than myth-centric. Studying myth is relatively unpopular partly because of the sensitive nature of Japanese mythology, which was once believed to be the historical truth about the origins of the imperial family, and partly because of the lack of a strong tradition of Greco-Roman classical studies. Instead, the study of rituals such as festivals and shamanic practices is prevalent. It is also noteworthy that the philosophy of religion has always been much more existentialistic, as represented by the Kyoto School tradition, than Anglo-American. In addition, the study of religion in Japan used to center more on modernization than secularization. Although secularization did become a central theme in the sociology of religion, it was the problem of modernization that evoked lively cross-disciplinary discussions in postwar Japan. Scholars first ascribed the problems of the prewar political system to the immaturity of Japan as a modern society. Long discussions followed as to whether Japan had remained half feudalistic or had achieved modernization in its own unique way. It was in this context that Robert Bellah's *Tokugawa Religion*, which analyzed the relationships between Japanese religious ethics and industrialization, attracted attention.

The debate on modernization was, in a sense, a question of Japanese identity. The postwar quest for national identity was satisfied on a popular level by Japanese studies (*nihonjinron/nihonbunkaron*), which overly emphasized the uniqueness of Japanese culture, including religion, based on the stereotypical contrast of the Orient and the Occident. On a more academic level, Japanese folklore studies, a neighboring field to religious studies founded by Kunio Yanagita (1875–1962), has most often been charged with ethnocentrism. It is considered to have originated in the Kokugaku (National Learning) movement, a nativistic movement based on philological study of Norinaga Motoori (1730–1801), an apologist for Shintō. At the same time, the work of Yanagita, who had been a private scholar, was reevaluated in the context of the counter-culture movements in the late 1960s and 1970s as an alternative to the established modern sciences of the universities.

The counterculture movements led to postmodernism in the 1980s. The trend was best embodied by Shinichi Nakazawa (b. 1950), a scholar of religion who had a Carlos Castaneda-like experience with a guru in Tibet and later wrote books that combined his experiences with postmodern thought like that of Julia Kristeva. Whereas the Western postmodern study of religion tended to be critical of religion from a Freudian or a Marxist perspective, its Japanese equivalent could slide into Buddhist supremacism. This echo of wartime ideology resurrected a tough question as to whether the idea of the triumph of Eastern thought over Western thought was a mere reversal of Orientalism or if it had a certain validity.

It was no accident, therefore, that the new religion Aum Shinrikyō grew during the decade. Aum's release of Sarin gas in Tokyo subway stations in 1995 profoundly shocked Japanese scholars of religion. The incident forced them to seriously reconsider what the public role of the study of religion should be. Despite the overall lack of interest in religion among the Japanese public, new religious movements had been active, and the study of new religious groups had become quite popular in the postwar period. Scholars of religion treated new religions as Western historians of religions were treating indigenous religions, reevaluating them on their own merits instead of dismissing them as primitive. Accordingly, after Aum's gas attack, they faced criticism for having been standing on the side of new religions.

The postcolonial critique also raised the same question about the social role of the study of religion. Scholars started looking closely at diversity within the minor religious traditions, particularly in terms of gender and ethnicity, and problematizing the long neglect of oppressed minorities both by society and by the academy. Japanese feminist and gender-based studies of religion derive from the second wave of Japanese feminism in the 1970s. Interest in these studies has been high despite the twin difficulties of male domination of Japanese religious traditions and the lack of interest in religion within Japanese feminist movements.

In order to study the ongoing interactions between contemporary society and religions, new scholarly organizations were established in the 1990s. The most notable is the Japanese Association for the Study of Religion and Society (JASRS), founded in 1993. The International Institute for the Study of Religion (IISR), originally set up in 1953, was also reorganized in 1993, along with the Religious Information Research Center (RIRC).

At the beginning of the twenty-first century, popular issues in the mainstream of the Japanese study of religion include religion in practice (*seikatsu no shūkyō*), globalization/localization and religion, religion and violence, and the concept of religion and Orientalism. New impulses are emerging from the question of whether the study of religion should be more socially engaged rather than assuming neutrality. The responses to this question range from critical approaches following Saidian-Foucaultian reflections about knowledge and power to religious approaches following Nakazawa's attempt to guide the individual's spiritual quest.

Last but not least, all Japanese universities have recently been asked to reform themselves structurally to become more globally competitive. This movement is represented by the Twenty-First Century Center of Excellence (COE) program, a funding system that rewards selected universities and research institutions. The program is administered by the Japan Society for the Promotion of Science with the support of the Japanese government. It encourages research that will directly contribute to society, which has promoted the idea of applied sciences even among traditional humanistic disciplines; the study of bioethics is one example within the field of religious studies. With this new focus, the study of religion is once again facing a challenge to serve public and national interests without losing its critical stance.

### STUDY OF RELIGION: THE ACADEMIC STUDY OF RELIGION IN NORTH AFRICA AND THE MIDDLE EAST

The academic study of religion in North Africa and the Middle East builds upon a long and rich tradition of comparison and analysis of the history, beliefs, and practices of different religious communities. Most of the major universities in the region currently teach the comparative study of religion within an Islamic studies curriculum, whether or not the uni-

versity and its programs are intended to be secular. Despite the relatively limited visibility of the comparative study of religions in regional institutions, the scholarly discipline can be traced back to a vigorous and creative scholarship that flourished at least as early as the tenth century.

The disciplinary approach and institutional organization of the study of religion in the Middle East and North Africa is based largely on a scholarly tradition developed in the premodern period, particularly during the eleventh, twelfth, and thirteenth centuries. Several well-known scholars wrote far-reaching and influential works during this period that still serve as the basic textbooks for the contemporary university study of religion.

**AL-BĪRŪNĪ.** Perhaps the single best example of the study of religion within Islamic civilization comes from the penetrating works of al-Bīrūnī (973–1050). Attached to the Ghaznavid court in what is today Afghanistan, al-Bīrūnī produced two important works studying ancient and contemporary religions. The first, titled *Book of the Remains from Bygone Centuries*, contains al-Bīrūnī’s account of pre-Islamic civilizations. The second, titled the *History of India*, is an encyclopedic catalog and analysis of the culture of South Asia. The information in al-Bīrūnī’s study of India comes both from firsthand observations in northwest India and from his extensive study of Sanskrit and related Indian languages and texts. Combining both ethnographic and textual research, al-Bīrūnī’s work is primarily descriptive, though a rudimentary analytical framework utilizing more generic categories such as “ritual” and “belief” is evident from al-Bīrūnī’s observations.

**MILAL WA NIHAL.** Most influential in many contemporary university programs in comparative religion is a body of scholarship known under the Arabic term *al-Milal wa al-Nihal*, roughly translated as “Sects and Heresies” and is often understood as heresiographical or doxographical in nature, though individual authors provide different rationales for their works. In general, this scholarship presents an overview of beliefs attributed to different groups both historically and contemporaneous with the writers. These beliefs are often grouped into three broad categories: Islamic beliefs and sects, beliefs and sects of “People of the Book” (Arabic, *ahl al-kitāb*) or “revealed” religions, and everything else, including other religions and philosophers. Sometimes this categorization is reduced to Muslim and non-Muslim beliefs, as in the work of Fakhr al-Dīn al-Rāzī in which he discusses Jews, Christians, Mazdaeans, dualists, Sabians, and philosophers.

**Ibn Hazm.** Abū Muhammad Alī Ibn Aḥmad, known as Ibn Ḥazm (994–1064) was one of the most prolific writers on other religions and their relationship to Islam. In his *al-Milal wa al-Nihal* work, Ibn Ḥazm discusses doctrines pertaining to Islam, Mazdaeans, Christians, Brāhmaṇs, Jews, various philosophers, dualists, and others. The book is organized according to specific topics rather than particular religious groups, but the topics themselves are loosely arranged according to what Ibn Ḥazm sees as sectarian divisions aris-

ing from adherence to certain beliefs. For example, Ibn Ḥazm has a general section on Christianity followed by more specific discussion of the nature of Christ, those who deny prophethood and the angels, and the difference between miracles and magic. In his discussion of Judaism Ibn Ḥazm mentions that the Jews reject the trinitarianism of Christians but faults them for using a Torah that does not contain an accurate record of the revelation given to Moses. Zoroastrians are faulted for insisting upon the prophethood of Zoroaster while denying the equality of other prophets.

Ibn Ḥazm spends considerable attention detailing examples of how the stories of the prophets in the Jewish Torah and the Christian New Testament contradict what is known from the Qurʾān and Islamic tradition. In addition to his criticism of the sources and redaction of the Bible used by Jews and Christians, Ibn Ḥazm wrote extensively on Islamic law. He was a strong proponent for the notion that the Qurʾān and the *sharīʿah* derived from it superseded all earlier older legal codes, to the extent that the revelation of the Qurʾān abrogated all parts of the Bible that it did not specifically confirm. Although he is apparently well informed about the different religious ideas he catalogs, Ibn Ḥazm's main interest is in a defense of Islam as providing a holistic interpretation of the world fully compatible with history and rationality. His *al-Milal wa al-Nihal* work also includes a section mentioning what is known about certain biblical prophets and the veneration due to them, followed by discussions of beliefs concerning the creation of heaven and hell, the resurrection of the dead, the punishment of the tomb, and repentance. In his final sections he treats a number of individual issues not necessarily associated with any particular group such as visions, the created nature of certain things, and the relationship of body and soul.

**Abū al-Maʿālī.** Abū al-Maʿālī Muḥammad bin ʿUbayd Allāh (c. 1092) produced one of the earliest Persian works in the *al-Milal wa al-Nihal* tradition. His book, titled *Explanation of Religions*, treats a number of religions that came before Islam, including ancient Arab religion, Greek philosophy, Judaism, Christianity, Zoroastrianism, Mazdakism, and Manichaeism. He separates this group of religions from “idolatrous” religions such as Hinduism. Abū al-Maʿālī's main focus in the book appears to be his conviction that all people, even non-Muslims, hold a belief in a creator being, which he claims proves the existence of God.

**Shahrastānī.** Muḥammad bin ʿAbd al-Karīm al-Shahrastānī (1086–1153) lived near Khurāsān and wrote a well-known *al-Milal wa al-Nihal* work. Shahrastānī states that he wrote the book in an attempt to document “the religious beliefs of all the world's people.” Shahrastānī divides these religious beliefs into two main categories: ideas derived from revealed books and ideas derived from elsewhere. The first category is further subdivided into Muslims and People of the Book. People of the Book include the Jews (Kairites, Isawiyah, Samaritans), Christians (Chalcedonians, Nestorians, Jacobites), and the people of a “false book” such as the

Zoroastrians and the dualists, under which category he places the Manichaeans. The second category of beliefs originating from nonrevealed sources includes the Sabians of Harran, philosophers (Greek and Islamic), pre-Islamic Arab religions, and the beliefs of Indians (Brāhmaṇs, adherents to spirits, star worshipers, and idol worshipers). He follows this by a brief discussion of philosophical ideas among the Indians.

The longest section in the book is that on the philosophers and their ideas. Shahrastānī describes the different religious ideas within the Islamic framework of revealed and nonrevealed corresponding to the general Qurʾānic notion of the People of the Book following prophets with divine messages. Shahrastānī conceives of God as a unitary being from whom creation proceeds in a fashion that gained him as reputation as adhering to Nizārī Ismāʿīlī doctrines of emanation and incarnation. This allows him to see truth in ideas derived both directly and indirectly from God. A similar approach is found in the *Hikmat al-khālidah* of Miskawayh and the *Ṭabaqāt al-umam* of Saʿīd al-Andalusī, where it is argued that God gave each of the world's peoples certain intellectual and civilizational gifts that they retain despite their straying from the directly revealed truths of Islam.

**HISTORY.** Medieval Muslim historians often write about the history of different religions. In the course of his history of the world, for example, Muḥammad bin Jarīr al-Ṭabarī (839–923) recounts numerous traditions from both Muslim and pre-Islamic sources concerning the religious beliefs and practices of Iran, Arabia, Egypt, Mesopotamia, and the Fertile Crescent. Later historians, such as Ibn al-Athīr, built upon Ṭabarī's work and repeated much of his information, sometimes with their own additions. Other historians provide detailed historical backgrounds to explain the origins of religious groups present in their time. Aḥmad b. Abd al-Qādir al-Maqrīzī (1364–1442), well-known historian of Egypt, includes an especially long section on the different groups among the Jews of his time. He uses a variety of medieval, late antique, and Hellenistic sources, including the medieval Hebrew translation of Josephus.

**Stories of the Prophets.** Equally important are the historical and mythological accounts pertaining to what is called the “Stories of the Prophets” in Muslim histories and Qurʾān commentaries. Although regarded as “Muslim” prophets by these writers, the cycle of stories associated with such pre-Islamic figures as Abraham, Moses, and Jesus were told often in conscious comparison to Jewish and Christian accounts of the same figures. Scholars such as Ibn Kathīr specifically compare passages from the Bible and from Jewish and Christian interpretation with the Qurʾān and its interpretation by Muslims. In addition to major prophetic figures, other characters also appear in these stories, including Samson, St. George, and the Seven Sleepers. Such scholarship frequently reflects a relatively sophisticated approach to textual criticism and the burgeoning of a sort of comparative mythology.

**TRAVEL AND GEOGRAPHY.** The approach and content of most *al-Milal wa al-Nihal* and historical scholarship is fo-

cused on literary sources and doctrinal questions. Descriptions of practices, largely drawn from ethnographic-type observations comparable to those found in the histories of Herodotus, can be found in the large collection of travel accounts produced by Arab and Muslim scholars in the medieval period but continuing through to the nineteenth century.

One of the best-known travelers is Ibn Baṭṭūṭa (1304–1368) who left from Tangiers and traveled throughout the Middle East, East Africa, Asia Minor, Central Asia, India, Sri Lanka, Bengal, Sumatra, and China. Ibn Baṭṭūṭa's travel account, as well as those of many others, are expanded journals of pilgrimage journeys. During the travels described in his account, Ibn Baṭṭūṭa made pilgrimage to Mecca at least four times. Ibn al-Jubayr (1145–1217) was one of the first to leave a long account of his journeys in the Middle East while on pilgrimage to Mecca, which includes his firsthand observations on the beliefs and practices he encountered. Travel accounts and guides written for pilgrims visiting regional sites in Syria, Lebanon, and Palestine, such as those of al-Harawī and Ibn al-Ḥawrānī, constitute a valuable record not only of Muslim practices and beliefs but also myths and rituals associated with certain sites by other religious groups in the area.

Other scholarship focused on geography includes a great deal of information on religious practices and beliefs. Scholars such as Yāqūt, Ibn al-Faqīh, and al-Bakrī compiled geographical dictionaries that contain a wealth of information derived from a variety of sources on the religious traditions associated with certain cities, shrines, mountains, and places of pilgrimage. Scholars such as al-Qazwīnī produced works examining the “wonders” (*‘ajā'ib*) of the world, compiling and comparing mythologies associated with different locations, often utilizing historical, linguistic, and ethnographic approaches. Other early “wonders” accounts focused specifically on India and China. Similar approaches can be found in the large collection of works focused on the “virtues” (*fada'il*) of cities such as Jerusalem, Damascus, and Mecca. These *fada'il* works bring together from various types of sources historical and mythological traditions associated with the origins of sanctuaries, certain ritual practices, and beliefs connected to particular peoples and locations.

**JEWISH AND CHRISTIAN STUDIES OF ISLAM.** Jewish and Christian scholars also wrote extensively on Islam, and on their own religions, not always with the simple aim of discrediting others but rather in formation of their own distinct identity. This is particularly true where the Muslim majority was and is still in close contact with large non-Muslim minorities, in Spain, Yemen, Egypt, Lebanon, and the Fertile Crescent. Much of this went on in the area of comparative scriptural exegesis, with Jews, Christians, and Muslims interpreting what amounts to a common scriptural tradition, though the identity and authority of different texts (i.e., Qur'ān, Bible) was often the issue in such discussions. This sort of more direct polemic continues today and is not often

overt, strongly influenced by perceptions of the political situation between Israel and the Palestinians.

**MODERN AND CONTEMPORARY STUDY OF RELIGION.** In the modern period, many state-sponsored and private universities include the comparative study of religion as part of the regular curriculum. There are few independent departments devoted to the comparative study of religion, with the exception of departments of *da'wa* (proselytizing) at some regional universities. Separate departments of *da'wa* can be found at some universities such as the Islamic University of Medina and the Department of Da'wa and Religious Fundamentals (*uṣūl al-dīn*) founded in 1991 at the Umm al-Qura University of Mecca. The curriculum emphasizes the comparative study of religions as a means to allow students to contextualize their own religious traditions within a global religious community.

The Amir 'Abd al-Qadir University in Constantine, Algeria has a Department of Creed and Comparative Religion (al-'Aqīdah wa Muqārinah al-Adyān). Ain Shams University in Cairo offers the comparative study of religious traditions within the various language and literature departments in the Faculty of Arts, including the languages of Islamic nations, and Hebrew language and literature. The Center for Oriental Studies at the University of Cairo offers a number of courses and a publication series in Comparative Religion. The University of Mauritius offers a degree program in history and heritage studies that incorporates Islamic studies into a broad spectrum of cultural and religious influences on Mauritius history. Individual courses teaching Islamic studies within a comparative, liberal arts framework can also be found at the University of the United Arab Emirates, Sidi Muḥammad b. 'Abdallah University in Fes, the American University of Beirut, Sultan Qabus University in Musqat, Bogazici University in Istanbul, and the American University of Cairo.

*Uṣūl al-dīn.* Other universities devote departments and colleges to the general study of religion, within the framework of an Islamic studies curriculum. The department of *uṣūl al-dīn* at the University of Jordan, for example, teaches the standard subfields within Islamic studies, including *al-Milal wa al-Nihal* studies as well as individual courses in comparative religion and Muslim-Christian dialogue. A similar curriculum exists university-wide at Omdurman Islamic University in the Sudan, and al-Quds University in Jerusalem includes an Islamic studies department within liberal arts and a separate Islamic Research Center established in 1987 with a broad, comparative scope. Within its *uṣūl al-dīn* faculty, al-Azhar University offers a comparative curriculum devoted to the study of religions (Christianity, Judaism, Hinduism, pre-Islamic Arab religions, Buddhism, Confucianism, and ancient Egyptian religions) with courses examining the origins of religion, the connections between religion and society, and the history and importance of the study of different religions from an Islamic perspective.

**Sharī'ah colleges.** Most comparative studies of religion within the universities of the Gulf region are housed within separate colleges devoted to the study of *sharī'ah* (Islamic law) and Islamic studies. The department of *uṣūl al-dīn* in the College of Sharī'ah at the Imam Muḥammad bin Sa'ūd University was established in the 1950s. The faculty of *sharī'ah* and *uṣūl al-dīn* at the King Khalid University was founded in 1976, and in the 1990s Islamic studies (including the comparative study of religions under the heading of *al-Milal wa al-Nihal*) was moved into the College of Sharī'ah and Islamic Studies at Kuwait University. Iranian universities, such as the Bu Ali Sina University and Shiraz University offer degree programs in Islamic law through the faculties of law at each institution.

Despite their separate institutionalization, these colleges of *sharī'ah* and Islamic studies are often more akin to a North American "divinity school" with a more diverse curriculum than a "seminary"-style college. Other colleges of *sharī'ah* and Islamic studies are more strictly preprofessional, however. The Salahaddin University in Arbil, Iraq, was established in 2003 with the aim of preparing *imāms* for service in the Kurdistan region of Iraq. The faculty of *sharī'ah* and Islamic studies at Yarmouk University in Irbid, Jordan, was established in 1991, merging the then existing Islamic Studies Center into a college designed for professional training. A similar situation pertains to the college of *sharī'ah* at al-Ahqaf University in the Ḥaḍramawt region of Yemen.

**CHALLENGES AND CURRENT TRENDS.** Today the basic focus of most regional programs in the comparative study of religion is historical and doctrinal. The more differentiated conception of religion as inclusive of practices and beliefs outside of canonical texts and officially sanctioned venues has suffered in the modern period. Modern Muslim scholars of religion tend to isolate what they consider to be religion (Arabic, *dīn*) from tradition and culture (Arabic, *turāth*, *thaqāfah*). The broad view taken by premodern travelers, historians, and *al-Milal wa al-Nihal* scholars, as well as the more self-critical approach to canonical Islamic texts and doctrines, has largely been replaced by a less complex cataloging of accepted beliefs and practices.

The major challenge facing the study of religion in Arab universities is the perception that comparison and theoretical models represent a challenge to indigenous methods and approaches to the study of religion. This is particularly evident in the defensive and protective posture taken by scholars of the major foundational subjects in classical Islam, especially the historical study of the Prophet Muḥammad and the interpretation of the Qur'ān. Such a defensive stance sometimes has the unfortunate result of stifling discussion and use of the rich comparative approaches developed by premodern Muslim scholarship.

Scholars trained largely in European and North American institutions have introduced innovative approaches to regional studies of religion. This includes, for example, perspectives adopted from the history of religions, text-critical

studies, philosophy of religion, and anthropology. Scholars using such approaches are not always successful given the institutional and intellectual barriers in regional universities. Reactions range from the establishment of institutions to the publication of monographs criticizing particular schools of thought and individuals, but sometimes reactions have taken the form of threats and outright violence against particular individuals. The banning of certain publications, both classical and modern, is not uncommon in the region, including the expurgation of passages from classical texts and modern textbooks for K–12 education.

Where European and American models have been most influential is in the areas of archaeology and textual-historical studies. Archaeologists from the King Sa'ūd University in Riyadh, for example, have produced a number of excellent analyses of pre-Islamic Arabian religion, and indigenous scholarship on antiquities in other areas, especially Egypt and Jordan, is world class. The German approaches associated with *Religionswissenschaft* and *Religionsgeschichte* are more easily integrated into regional curricula, perhaps because of the emphasis, familiar from the classical Islamic tradition, upon history and doctrine. Within the context of other disciplines, religion is treated with more theoretical ingenuity, as a variable in anthropological, art historical, and political scientific studies.

**Centers for comparative religion.** Since the 1970s a number of initiatives have created regional centers and brief runs in journals and other periodicals devoted to the relations of Muslims and non-Muslims. Most of this has focused on Muslim-Christian dialogue, such as the programs at the Centre d'Études et de Recherches Économiques et Sociales in Tunis, the joint visits between the Vatican and al-Azhar officials, and the Seminar on Islamic-Christian dialogue founded in Tripoli, Libya, in 1976. These initiatives, however, appear to have been more concerned with political relations than with the academic study of religion.

More recently, as a reaction to the more insular attitude of some regional scholars, a number of regional institutions and centers specifically devoted to the comparative study of religions have been established. A prime example of this is the Royal Institute for Interfaith Studies (Arabic, Maḥad al-Malakī li-Dirāsāt al-Dīnīyyah) founded by Prince Ḥasan bin Talal in 1994 in Amman, Jordan. The RIIFS, devoted primarily to the study of Judaism, Christianity, and Islam, publishes quarterly journals in English and Arabic and sponsors lectures and visiting scholars from around the world. Other state-supported and private institutions in the region have begun to cultivate more active and creative programs in the comparative study of religion as a means to broaden both academic and popular conceptions of religious identity and civil cooperation.

Another example of this is the Department of Theology and Religions at Qum University in Iran, founded in 2001 with the stated aim of "highlighting the role of religion in dialogue among civilizations. . . for the purpose of under-

standing one another. . . .” Associated centers in Iran include the Institute for Dialogue among Religions in Tehran and the Bureau for Knowledge and Religions at the Research Center for Human Sciences and Cultural Studies. Since 2001, al-Azhar University has introduced an English-language unit for Islamic studies, and Tashkent Islam University implemented a revised curriculum in the study of world religions. This corresponds with the growing number of Turkish and North African universities that have begun to offer a curriculum aimed explicitly at participating in dialogue with non-Muslim societies.

Such initiatives should not be seen as novel undertakings but rather represent a reinvigoration of the fertile indigenous tradition of the comparative study of religion from the classical Islamic period.

BRANNON WHEELER (2005)

#### STUDY OF RELIGION: THE ACADEMIC STUDY OF RELIGION IN NORTH AMERICA

North American intellectuals, poets, and scholars have shown considerable enthusiasm in exploring religion dating back to the nineteenth century. This spirit flourished in scholarly, theological, philosophical, and artistic investigations.

#### THE EARLY ROOTS OF THE ACADEMIC STUDY OF RELIGION.

Academic study in the nineteenth century was often tied to Christian theological interests and institutions, but this is not to say that all religious study was simply apologetics. Early scholars in the emerging field of North American comparative religions included James Freeman Clark (Harvard Divinity School), who published *Ten Great Religions: An Essay in Comparative Theology* in 1871. Between the 1860s and 1900 several religiously oriented university chairs were appointed at places such as Harvard, Boston University, Princeton, and Cornell—Clark’s appointment as “Professor of Natural Religion and Christian Doctrine” at Harvard being one example. Although these chairs did not represent a full-fledged comparative religion such as was emerging in Europe, they did portend a trend away from singly theological reflections and apologetics. In addition to Clark, other scholars included W. D. Whitney, James Freeman Clarke, and George Foot Moore. In 1892 T. W. Rhys Davids, a British scholar of Buddhism, was invited to lecture at the newly established “American Lectures on the History of Religions,” a joint venture among several colleges and universities. In the same year the University of Chicago established a department devoted to the study of comparative religion.

Outside of universities, Ralph Waldo Emerson (and other transcendentalists), Walt Whitman, and John Burroughs represent just a few of the voices among amateur Orientalists, philosophers, poets, and theologians interested in religious experience, mysticism, religious psychology, and religious pluralism. On the level of popular culture, Chicago’s World Parliament of Religions in 1893 offered a plurality of different Christian congresses and lectures and introduced many Americans to what became the earliest understandings of Buddhist Theravāda and Zen as well as Hindu Vedānta. These events and thinkers held the common interest in religion and trust in “modern” scholarly methods to reveal the origins, meanings, and truths of the myriad human behaviors deemed religious.

These forces—as well as a plurality of religious groups examining their own theology—created a diversity of ideas,

interpretations, and reflections on institutional religions (such as Christianity and Buddhism), on religious texts (such as the *Bhagavadgītā* and the Bible), and on the role of religious practices and claims in society (such as religion and law or psychology of religion).

This early phase of amateur and academic study of religion was wide-ranging, yet disciplinary identity and overall theoretical coherence were still in development. Often uneasy (even antagonistic) mixtures of theology, history, and social sciences evolved in this early academic study of religion. Even though clear disciplinary identity was lacking, active study proceeded in several areas. Unique among these was the American school of psychology of religion. Stanley Hall (1884–1924)—trained at Wilhelm Wundt’s laboratory of experimental psychology in Leipzig—brought European psychology to the United States and set the stage for the development of an original American psychology of religion by James H. Leuba (1868–1946), Edwin Diller Starbuck (1866–1947), William James (1842–1910), and others. Positivism and American “pragmatism” were this new psychology’s orientation, questionnaires and surveys became one of its primary methods, and the psychology of religious conversion was one of its early foci. Leuba addressed conversion from the psychological point of view and as a scientific rationalist in his 1896 dissertation in psychology (written at Clark University under Stanley Hall). Starbuck and James, from different perspectives, were more accepting of transcendental realities and distinctly “religious” experience, but nonetheless their approaches were thoroughly scholarly in Starbuck’s *The Psychology of Religion* and James’s *The Varieties of Religious Experience*.

Another fruitful area of research was in the emerging discourses of American anthropology. North American scholars and professional (and amateur) ethnologists had a long encounter with indigenous Americans. Franz Boas, Robert H. Lowie, Paul Radin, Alfred L. Kroeber, and Clyde Kluckhohn (to name a few) all showed significant interest in religious aspects of Native American cultures (worldviews, ceremonies, and myths). Boas (1858–1942) at Columbia University trained numerous anthropologists (Lowie, Radin, and Kroeber among them) who tended to work from the basic assumption that understanding native cultures required careful study of their “religions” (rituals, myths, and customs). The influence of Native American studies and American anthropology had wider impact than just the Americas, being of interest to both anthropologists and scholars of religion in Europe. Whereas such thinkers as the French Lucien Lévy-Bruhl tended toward the philosophical and theoretical, American anthropologists contributed a strong emphasis on empirical fieldwork and (following Boas), a keen sense of history, and even a distrust of overtheorizing the data.

One of the peculiarities of American higher education is that the major universities have not been—and arguably still are not—state institutions as they have been in most parts of the world. The development of divinity schools at

such institutions as Chicago, Harvard, Yale, and Princeton led the early- and mid-twentieth-century development of the academic study of religion. Whereas social sciences (psychology, anthropology, sociology) were contributing both data and theories to the study of religion, it was often these divinity schools that led the self-conscious pursuit for an American “comparative religion” or “history of religions.” Harvard and Chicago are two notable examples, training many of the historians and comparativists who populated the many departments of religious and cultural studies of the 1960s, 1970s, and following decades.

**RELIGIOUS STUDIES AND RELATED DISCIPLINES.** Following the lead of these divinity schools, “religious studies” emerged as an academic discipline during the 1960s and 1970s in private and state universities. Religious studies include disciplinary approaches such as anthropology, sociology, history, and philology. Other approaches are geographic or chronological, such as religion in America, East Asian cultures and religions, and ancient Near Eastern studies. Others are drawn from doctrinal or community boundaries, such as Buddhist, Hindu, Islamic, or Christian studies.

After World War II, following the earlier interests of Clark, James, and Boas and even such thinkers as John Dewey, several new voices and schools of thought spoke from within the emerging field of religious studies. Prominent among them were Erwin R. Goodenough (Yale), Wilfred Cantwell Smith (Harvard), Joachim Wach (responsible for the program at Brown and for shaping the program at the University of Chicago), Mircea Eliade (following Wach at the University of Chicago), and the Scottish-born Ninian Smart (University of California, Santa Barbara). From different perspectives, their approaches tended to treat the topic of religion as a self-generated category whose study was an act of interpretation and understanding. Their interests (philosophy, sociology, history, and phenomenology) and area studies backgrounds (Christianity, Hinduism, and Buddhism) varied. Eliade was particularly prominent among these mid-century voices. He tended to look at religious products (myths and rituals) as manifestations of sacred (or mystical) reality that originated outside of human experience. Thus he collected vast amounts of diverse cultural material into general categories, such as “myth,” as exemplified in his *Patterns in Comparative Religion* (1958). Even though this kind of study brought together broadly divergent materials into overarching categories, there was also a strong sense of contextual history in the Chicago school of the history of religions. The Chicago journal *History of Religions*, begun in 1961 at the height of Eliade’s prominence, has tended to publish detailed and context-rich historically grounded studies.

The approaches of these mid-century thinkers varied widely but might be described as treating religious institutions and behaviors as phenomena similar to literature, a music composition, or a performance. Following the analogy of the arts, a particular religious ritual must be interpreted

(appreciated, criticized) much like a musical performance or an artifact. Study of this kind might include, for example, encouraging the practice of Zen meditation in addition to studying Zen texts on meditation or interviewing Zen monks. Ninian Smart referred to this kind of study as “participatory” and insisted that the study of religion need be polymethodic and interdisciplinary because in order to understand religion the scholar must be simultaneously inside and outside of the subject of study. Smith, Eliade, and Smart all argued that the academic study of religion needed to be a broad utilitarian and humanistic study and not some kind of strictly (and only) objective historical study of particular traditions.

The mid-century study of religion also boasted several “popular” trends in books and media. The works of the literature scholar Joseph Campbell and the Bollingen Foundation are examples of the extensive study of comparative mythology that—although occurring outside of religious studies or divinity schools—brought a vast amount of religious materials to popular audiences in books and media, such as Campbell’s *Hero with a Thousand Faces* and *The Masks of God* and the PBS series *Moyers: Joseph Campbell and the Power of Myth*. While many scholars of religion view Campbell’s work as “popular” and “literary” instead of historical or scholarly, this does not downplay the influence of such work in bringing comparative religious materials to large audiences (many of whom might never have studied religion in universities). The religion scholar Huston Smith, author of *The World’s Religions: Our Great Wisdom Traditions* (1958) and other textbooks and general works on religion, hosted film and television presentations of religions and the psychology of religious experiences that, like Campbell’s work, presented comparative religions to large popular audiences.

At the same time American social scientific studies of religion viewed religion not as self-generated phenomena understandable only on its own terms but as a cultural product. Human beings generate the varied religious practices and beliefs that they employ for a variety of contingent, political, personal, and social purposes. This kind of science is described as reductive: it examines religion not as a special subject but as a product of social life that can be explained with the same intellectual tools as other human phenomena, such as political parties, psychological pathology, or marketing trends. Although this orientation grew out of American social scientific concerns for “religion in culture,” it echoed in many ways Europe’s “scientific study of religion” more than the “history of religions” and “religious studies” common in North American divinity schools and religious studies departments. Some of the North American scholars who approached religion in these ways included Peter Berger, Thomas Luckmann, Bryan Wilson, and Robert Bellah as well as others in sociology who devoted significant attention to the study of religion. The works of Clifford Geertz, Mary Douglas, and Victor Turner contributed both description and theory to the anthropological study of religion.

**CONTEMPORARY TRENDS.** The intermixture of humanities and social sciences approaches and the additions of original approaches from cultural studies in the late twentieth- and early twenty-first centuries has led to considerable diversity in the discussions and discourses on religion. It is not possible to collect a canon of a dozen authors and thereby gain an overview of North American academic approaches to religion. In this broadly diverse and creatively rich context, all scholars share, in principle, an insistence on intellectual rigor and critical self-awareness. The lack of an all-encompassing theme in the field reflects the shared insistence on focusing on religion in specific historical contexts (regardless of the analytical and intellectual methods employed). Significant in this American trend is the plethora of critical examinations of the role of subjectivity in all productions of knowledge (in universities and popular culture). Scholars of previous generations often critically examined political authority or religious truth claims, yet they sometimes failed to use these same critical methods to examine their own productions of knowledge about complex human phenomena (whether religion, culture, or politics). Beginning from different backgrounds and presuppositions, contemporary scholars employ the principle of contesting and examining everything, not just the subject matter but also scholarship and the academy itself.

The combination of area study with the study of disciplinary history is a primary manifestation of this trend toward rigorous disciplinary self awareness. Steven M. Wasserstrom (Judaic studies), Robert A. Orsi (religion in America), Sam D. Gill (religion and cultural studies), and many others practice this new trend in their scholarship and published works. Wasserstrom’s *Religion after Religion: Gershom Scholem, Mircea Eliade, and Henry Corbin at Eranos* (1999) carefully explores the mystical and poetic influences on the formation of the discipline in the works of three scholars (of Judaism, history of religions, and Islamic studies respectively). Part of understanding how to practice the study of religion is through understanding the genealogy of the study itself in North America. Gill’s *Storytracking: Texts, Stories, and Histories in Central Australia* (1997) presents several aspects of the contemporary trend to careful contextual research and self-critique. *Storytracking* presents the worldview of Australian Aboriginal religion by applying the Aboriginal peoples’ own methods of narrative to the study of Australian Aboriginal culture and thereby also provides critique of previous scholarship that distorted the data. As such it provides both an original study of Aboriginal culture and a critique of the academic study of religion.

Bruce Lincoln (myth, ritual, and ideology), Charles Long (religion in the contemporary world), and Jonathan Z. Smith (Judaism’s myth and ritual) are prominent scholars and teachers who reflect on the topic of religions and the study of religions and contribute significant applications of these reflections and theories to area studies. These three thinkers’ contributions cover extensive and detailed philo-

logical, historical, and cultural studies touching almost all aspects of the academic study of religion from ancient Israel, Africa, and Europe to contemporary religious, political, and cultural issues in North America and abroad. Diana L. Eck (Hinduism and religious pluralism) and Martin Marty (Christianity and religion in the contemporary world) continue and defend the humanistic concerns of the mid-century thinkers that religion is a kind of personal, irreducible human experience also through careful awareness and critique of previous scholarship and through specific contributions to Hindu and Christian studies.

Some scholars directly pursue this disciplinary self-awareness by addressing the theoretical basis of the academic study of religion and the constitution of the field (especially under the rubrics of method, theory, or metatheory). In many cases these approaches focus less on critiquing the discipline through specific area studies than on the academic study of religion itself as their area study. Some prominent voices are Hans Penner, Donald Wiebe, Catherine Bell, and Russell McCutcheon.

Contributions continue to come from outside of religious studies as well. Examples include Edward Said (post-colonial theory) and Talal Asad (anthropology, especially religion and secularism in the Middle East), whose writings contribute to specific study of the Middle East while also providing extensive theoretical and philosophical contributions on the study of culture. Works from such contributors include Asad's *Formation of the Secular: Christianity, Islam, Modernity* (2003), which is of interest to anthropologists, scholars of religion, and area specialists, and a broad general readership as well. Rodney Stark (sociology, especially rational choice theory of religion) represents different, strictly social scientific principles by offering comprehensive social scientific theories to explain religion.

At one time the study of religion could be divided into either history or sociology or according to intellectual trends, such as functionalism, structuralism, or phenomenology. There is no single or dominant trend in the contemporary study of religion, although postcolonial studies, critical theory, performance studies, religion and ecology, feminism, subaltern studies, and cognitive science inform the traditional orientations of history, philology, and the social sciences. As a field religious studies constantly battles to remain relevant to the wider public and maintain rigorous scholarly study while also being subject to intellectual, political, and cultural fads, trends, and moods.

**INSTITUTIONAL TRENDS IN COLLEGES AND UNIVERSITIES.** In the late 1960s and early 1970s colleges and universities established departments of religious studies as part of larger cultural trends. The "red scare" and anticommunist political mood encouraged interest in and defense of religion as a defining feature of the democratic cultures. It was also a time of assertive revivalism, creativity, and change within traditional American religious communities. Vatican II and liberal Protestant theology revitalized Christian interests in "religion."

A new conservatism that emphasized historical and textual study also emerged. The 1960s counterculture was fascinated with so-called exotic traditions, such as Buddhism and yoga, and also antitraditional explorations of occultism. Changing immigration policies and patterns, the proliferation of media, international affairs, and geopolitical interests in the Middle East and Asia all contributed to a vast increase in international and multicultural interests. U.S. and Canadian trends in higher education reflected these social and intellectual trajectories, and the result was an explosion of liberal arts and cultural studies programs (religious, women's, ethnic, and others).

By the 1970s institutional boundaries were drawn more strictly between theology and the secular study of religion. Conservative Protestant colleges remained committed to theological study of religion focused on the active promotion of their particular religious views. Roman Catholic colleges and universities tended before the 1970s to offer courses in theology but generally did not offer majors and minors in the study of religion. Since that time many Catholic institutions have developed religion programs, and although in many ways unlike the conservative Protestant colleges, they are generally aimed at preparing students for occupations within religious industries (churches and counseling). Mainline Protestant colleges developed along parallel patterns with public institutions, adopting ecumenical outlooks and secularizing trends (such as in the divinity schools mentioned above).

During the 1980s and afterward programs expanded to include a broader range of approaches, especially those of the social sciences and cultural studies. Religious studies scholars now regularly employ fieldwork, ethnography, statistical analysis, demographics, cultural criticism, and performance studies. These developments have extended the boundaries of religious studies beyond traditional categories, such as "scripture" or "Hinduism." Women's issues, the politics of religious violence, religion and medicine, and religion and the body are particular examples of these transformations.

After the 1980s some programs in religious studies continued to grow and prosper, whereas others suffered due to political changes and fiscal constraints in higher education. Changes in public and private funding and the adoption of corporate business models by many universities have caused departments and programs to defend their existences based on costs and enrollment. In these environments religious studies programs must compete with other departments for students, funding, and faculty appointments. Many programs have coped with these fiscal realities by shifting their emphasis away from competing for majors and minors through reframing their place within university-wide programs, such as providing courses for general education, multicultural and international initiatives, and other circumstances in which religious studies is not the students' major program of study.

A different trend in the study of religion is the formation of centers that focus on religious topics but draw faculty from numerous departments. Such centers capitalize on the inherent interdisciplinary nature of the field drawing on scholars from multiple disciplines. Harvard's Center of the Study of World Religions, Toronto's Department and Center for the Study of Religion, and the University of Chicago's Martin Marty Center (and institute devoted to relating the scholarly study of religion to wider public audiences) are three examples. There has also been a rise of "centers" that focus on a geographic area (culture, religions, politics, history, and languages). An example is the Center for Sikh and Punjab Studies at the University of California, Santa Barbara. Some centers focus on an issue, such as conflict studies or women's studies, or a specific time period. For example, Trinity College's Leonard E. Greenberg Center for the Study of Religion in Public Life focuses on religion in the contemporary world. Other disciplines and cultural studies programs also contribute significant studies of religious subject matters. One example is the Department of Cultural Studies and Comparative Literature at the University of Minnesota.

**PROFESSIONAL ORGANIZATIONS, PROJECTS, AND PUBLICATIONS.** Professional organizations in the study of religion arrange conferences (regional, national, and international), disseminate information, support various publications (books, conference volumes, and journals), and publicize the field. The American Academy of Religion (AAR), founded in 1909 and incorporated in 1964, includes scholars from several disciplines and promotes reflections and teachings focusing on a critical understanding of religious traditions, issues, questions, and values. The AAR collects and publishes data and statistics about theology and religious studies programs and sponsors the publication of the *Journal of the American Academy of Religion (JAAR)*. The North American Association for the Study of Religion (NAASR), formed in 1985, is devoted to historical, comparative, structural, theoretical, and cognitive approaches to the study of religion. The NAASR is affiliated with the International Association for the History of Religions (IAHR). Its journal *Method and Theory in the Study of Religion (MTSR)* examines theoretical issues and pedagogical and research methods. The Canadian Corporation for Studies in Religion (CCSR) is a consortium of several other academic societies in the field of religious studies (including the Canadian Society for the Study of Religion and the Canadian Society of Biblical Studies). It coordinates research and publications and was originally formed in 1971 to coordinate research among the different societies and to publish the bilingual (French and English) journal *Studies in Religion/Sciences Religieuses (SR)*. The Society for the Scientific Study of Religion (SSSR) was founded in 1949 by scholars in religious studies and social sciences. Its *Journal for the Scientific Study of Religion (JSSR)* generally focuses on sociological approaches to the study of religion. There are additional organizations that support or publish academic studies of religion either from outside the field (such as those devoted to anthropology or literature) or from area studies

within the field. Area and topical studies organizations are numerous. Examples include the Society of Biblical Literature (SBL), the American Schools of Oriental Research (ASOR), and the Society for Tantric Studies (STS). Numerous other journals publish religious studies topics, such as *History of Religions*, *Religion*, and *Journal of Hebrew Scriptures*.

Publications are an intense area of academic interest. In addition to scholarly monographs, edited works, and journals, North Americans have contributed significantly to the publication of encyclopedias, dictionaries, and textbooks in the field of religion. Encyclopedias of religion, religion and nature, religion and ecology, mythology, ritual, Christianity, and many area studies works have been published in single- and multivolume sets and electronically. Textbooks arranged topically, geographically, and historically offer a broad and creative area of introductory and advanced sourcebooks for scholars and students. North America has been a leading contributor in this last area, offering, for example, Mark Taylor's edited text, *Critical Terms for Religious Studies* (1998), and Daniel L. Pals's *Seven Theories of Religion* (1996).

### STUDY OF RELIGION: THE ACADEMIC STUDY OF RELIGION IN SOUTH ASIA

The locus for the academic study of religion in South Asia is found in a network of university departments and scholarly sites rather than in departments of religious studies or comparative religion within individual universities. The network also includes scholars located in nonuniversity settings: theological institutions, research institutes in social sciences, and specialized scholarly centers with a tradition of respected publications in academia.

The South Asian region includes at least 330 state-supported universities, of which 275 are in India, 17 in Pakistan, 18 in Bangladesh, 15 in Sri Lanka, and 5 in Nepal.

Institutions with a multidisciplinary focus in India include the National Institute of Advanced Studies (natural and social sciences and technology) and the Christian Institute for the Study of Religion and Society in Bangalore; the Centre for the Study of Developing Societies in Delhi; and the Indian Institute of Advanced Studies in Shimla. Pakistan has the Christian Study Centre, located at Rawalpindi, an ecumenical research and fact-finding site focusing on Islamization, interfaith dialogue, women and minorities, and conflict prevention and management among different religious groups in the region. In Sri Lanka the Ecumenical Institute for Study and Dialogue, located in Colombo, offers Buddhist studies, comparative religion, and studies of church and society. Scholars at these institutions have produced distinguished comparative and interpretive studies related to the different religious traditions of South Asia.

The South Asian strand of this field, beginning in a Western historical context, has for its antecedents in South Asia a form of study expressed most notably by two North Indian rulers. One is the emperor Aśoka (c. 265–238 BCE), who sought to respect and protect all religions, and the other is the emperor Akbar (1542–1605 CE), whose religious dialogues at Fatehpur Sikri encouraged debates among different religions with a view to synthesizing them into a single religion. In modern times the South Asian strand of the academic study of religion can be usefully delineated in the context of three historical conferences held between 1960 and 2003 in Marburg in Germany and in Bangalore and Delhi in India.

**THE IAHR CONGRESS, MARBURG, 1960.** The International Association for the History of Religions Congress was held in Marburg, West Germany, in 1960. The prospect of holding an IAHR Congress in India was raised by Swami B. H. Bon Maharaj, the rector of the Institute of Oriental Philosophy in Vrindavan, India. In March 1960 he had founded the Indian national group that sought and obtained affiliation with IAHR. This proposal was unwelcome to some of the

European members because they felt the Indian representatives were confused about the history of religion as an academic field. As R. J. Zwi Werblowsky's report on the congress noted, South Asian representatives showed what others considered to be a misunderstanding of Western scholarship in their failure to distinguish between studying religion and the study of religion. The Indian scholars felt their own tradition of philosophizing about religion and studying it as part of a religious discipline should be known to the West.

The parochial views expressed at the congress failed to do justice to the South Asian intellectual tradition, which has a long association with historical research and scientific thought. That tradition has produced monographs and scholarly papers in Indology, archeology, history, and sociology relating to functional and causal questions on matters that now fall under the category of the study of religion. Still the objective study of religion, as opposed to a moral study, has been slow to gain recognition in South Asian academia, and the region has a comparatively insignificant representation at international conferences on the academic study of religion. India's secularist politics are largely responsible and have provided a model for its universities. The Indian constitution, though tolerant of all religions and showing sensitivity to religious values, explicitly prohibits favoring any one of India's many religious traditions. This prohibition caused a reluctance among state-funded institutions to introduce religion as a subject in their curricula.

The avoidance of religion in any state-funded college curriculum can be seen as early as 1882, when a government commission recommended teaching the principles of natural theology, which favored no single religious tradition, in public and private colleges. One of the commission members objected on the grounds that this, far from satisfying the religious camp, would be a step backward on the secular side. In 1903 the Indian Universities Commission rejected the idea of introducing a course on the theology of any one religion into the state curriculum. Later commissions sought to preserve the religious neutrality of the state while becoming more sympathetic to religious studies. A commission chaired by Sarvepalli Radhakrishnan in 1948–1949 pointed out that to be secular did not mean to be religiously illiterate. The report of the Secondary Education Commission (1952–1953), headed by A. L. Mudaliar, agreed that secularism did not mean there was no place for religion. The Sri Prakasa Committee (1959–1960) report recommended an objective, comparative, and systematic study of the important religions of India. The report of the Kothari Commission (1964–1966) drew a distinction between religious education and education about religion and suggested establishing chairs in comparative religion at the universities at a time when the debate in North America was just beginning as to whether the academic study of religion should remain a secular study independent of religio-theological approaches.

**THE BANGALORE CONSULTATION, BANGALORE, 1967.** The study of religion in Indian universities was addressed at the

1967 Bangalore Consultation, a milestone event in the academic study of religion in South Asia. Two of the presentations were by the North American scholars John Carman and Wilfrid Cantwell Smith, who respectively considered the study of religion at Indian universities and in a global context. Presentations at the conference helped move discussion among Indian academics to a more critical and analytical level. The paper by T. M. P. Mahadevan, the director of the Centre for Advanced Study at the University of Madras, outlined principles governing the teaching of religion at the university level. One of them was the encouragement of “the method of objective criticism.” He also recommended that “the stress should be on the teaching of moral and spiritual values, and not on dogmas and particular rituals” (Seminar on the Study of Religion in Indian Universities, 1968, p. 55). The effort to reconcile two opposite and contradictory approaches, the secular and the religio-theological, reverberated in presentations calling for the establishment of comparative religion as a university subject.

The prevailing view conceived of the study of religion as a means of promoting moral and spiritual values. Much-needed perspective was added by the inaugural address, presented by the vice chancellor of Bangalore University, V. K. Gokak, who pointed out that if the objective of teaching religion was to promote spiritual values, then it could not be done through either an eclectic philosophical approach dealing with “elements of reality that each philosophic system accepts” or the scientific study of religion that “refines away the essence of religion itself to vanishing point the awareness of spirit and all that it implies” (Seminar on the Study of Religion in Indian Universities, 1968, pp. 28, 30). By recalling that the scientific study of religion already operated in the context of existing departments of history and sociology, the inaugural address took the position that the study of religion should serve “secularity or tolerance, not spirituality” (Seminar on the Study of Religion in Indian Universities, 1968, p. 32). The presentation by J. L. Mehta of the Centre of Advanced Study in Philosophy at Banaras Hindu University proposed that one of the tasks of the study of religion in India was to aid in understanding the “other . . . within the complex fabric which is the heritage of the Hindu student of religion” and that for such an understanding “detached and disciplined academic energy and attention” are required (Seminar on the Study of Religion in Indian Universities, 1968, pp. 39, 40).

What is important to note about the level of dialogue that characterized the Bangalore Consultation is that it was accomplished in concert with scholars from North America and showed Indian scholars to be mindful of the Western intellectual tradition. In particular Mehta’s presentation, referring to the task of coming “to closer grips with the truths of other religious traditions” and of understanding one’s own religious and cultural tradition, introduced a discussion of hermeneutic as a methodology in the study of religion (Seminar on the Study of Religion in Indian Universities 1968,

p. 39). In this respect, the reflections at the conference approximated the discussion occurring outside India on the direction and scope of the academic study of religion.

**Comparative religion.** The Bangalore Consultation involved more than theoretical discussions of the study of religion. It also marked a shift to the use of the term *comparative religion*, which implied a preference for a study of the different religions of India. That perspective introduced the element of dialogue as a methodology suited to learning about other religions’ traditions from the perspective of their own adherents and representatives. The impetus for this conceptualization arose from the dialogue between Indian and Western scholars who wanted to see a recognition of India’s moral and religious values. Carman and Smith stressed the importance of understanding the outward expression of a religious tradition and its inner meanings for its adherents, for whom the traditions may have supreme significance. Methodologically this approach is unlike that taken by either philosophy or theology, both of which are concerned with ideas rather than their adherents. A dialogue allows room to consider the views of the reflective and articulate practitioner. In this respect comparative religion became a method in the study of religion as well as a discipline. Ultimately, however, it did not gain any significant momentum among South Asian institutions of learning.

Smith was among the advocates of this method, and in 1965 he recommended to the Kothari Commission that chairs and degrees in comparative religion be established. The University Grants Commission and the Education Commission accepted his recommendation, which was implemented at Punjabi University at Patiala and at Visva-Bharati University at Santiniketan in its philosophy department. A comparative religion department was already in place at Osmania University as a result of a 1949 reorganization, but due to lack of support from the university, it was later divided into two independent departments: Islamics and Indology.

Radhakrishnan, chair of the 1948–1949 University Education Report, characterized comparative religion in his *East and West in Religion* as a means for different religions to share their visions, insights, hopes, fears, and purposes. He also believed comparative religion could serve as a prophylactic against claims of exclusivity by any one religious tradition. This functional view was later accommodated by Smith’s conceptualization of comparative religion as both a discipline and a subject. But the momentum for establishing comparative religion as a university discipline ultimately rested on asking and finding answers to the fundamental question of what religion really is. Given that only a handful of South Asian universities offer courses on religion at undergraduate and postgraduate levels, it may well be that the question has failed to become as important to scholars in South Asia as it is to their Western counterparts.

Still the drive to have comparative religion instituted as a discipline within a university setting persists in South Asia

and may perhaps be due largely to the Indological works and wider academic interests of F. Max Muller, who is associated with the founding of comparative religion as a scholarly discipline.

**Hindrances to the academic field.** One reason the South Asian approach to the study of religion differs from the Western approach is that the South Asian worldview sees *dharmā* or religion configured in a different way. The dichotomy between the sacred and the secular does not exist in South Asia as it does in the West. Among Western academics, the study of religion is understood to deal with the outward expressions of a social reality and the production of data about it. The tendency in South Asia is to focus on understanding the inner meaning of that social reality in peoples' lives and in that respect comes to be seen and taught as an aspect of Indian philosophy. It approximates in the West that which is known as philosophical theology, having philosophy as its academic mother.

Another factor mitigates against the establishment of religious studies departments in Indian universities: aspects of religion as a subject matter are already considered by various different departments, thus making a separate department redundant. The field of anthropology, for example, is frequently occupied with aspects of the study of religion. But anthropologists generally have little interest in understanding religion as a phenomenon, and their study seldom shifts from descriptive accounts to explanatory and theoretical ones. On the other hand, there is little significant momentum in existing comparative religion departments to broaden the study as a subject matter and a discipline comparable to that found in the West.

**THE IAHR REGIONAL CONFERENCE, DELHI, 2003.** The Indian Association for the Study of Religion (IAHR) Regional Conference took place in Delhi, India, in December 2003. One of its aims was to restructure and strengthen the Indian Association for the Study of Religion in recognition of the fact that India was comparatively underrepresented in the scholarly study of religion on the international level. The restructuring of the existing national association was intended to encourage wider participation in the study of religion beyond a handful of scholars working in anthropology, especially on tribal and folk religions.

The conference, whose theme was "Religions and Cultures in the Indic Civilization," brought together some three hundred scholars, roughly 20 percent from the West. Many of the participants focused attention on the relevance of the study of religion and its future direction. In the inaugural session Bhikhu Parekh delivered an address titled "The Role and Place of Religion," which was followed by Ashis Nandy's "A Modest Plea for Learning the Language of Religion." In one workshop four papers dealt with teaching a basic course on the academic study of religion in an Indian context. In another session the theme was promoting the study of religion in Indian universities. Papers presented included "Political Implications of Changes in Religious Demography in

India," "Language and Religion as Sites of Struggle," "Women Regaining a Lost Legacy: The Restoration of Bikkhuni Order in Sri Lanka," suggesting a shift away from a normative to a nonnormative approach as practiced at secular universities in the West. Interestingly the majority of participants came from outside departments of comparative religion or philosophy. Conference participants expressed interest in establishing an Indic studies network, raising hopes that a stronger South Asian presence will emerge to make a distinct contribution to the academic study of religion.

**RELIGIOUS STUDIES IN MODERN SOUTH ASIA.** Thirteen institutions of higher learning on the Indian subcontinent offer one or more courses on the study of religion as a subject either at the undergraduate or at the postgraduate level, according to the 2003–2004 *Commonwealth Universities Handbook*. India has a total of nine universities that offer degrees either at the undergraduate, masters, or doctoral level. This does not include schools focusing on a specific religion or tradition. Sri Lanka has two universities that offer courses in the study of religion at the undergraduate level. In Pakistan only the Lahore School of Management, in its social science department, offers a course at the undergraduate level. In Bangladesh there is growing interest in courses and programs on world religions. Dhaka University in Bangladesh established a Department of World Religions in 2000, offering two-year master's and master of philosophy degrees. Small private universities in Bangladesh also offer programs in comparative religion.

In the Muslim world of South Asia, the academic study of religion is comparatively slow in gaining recognition. Most teaching focuses on the classical and modern perspectives of Islamic thought and contemporary movements and issues related to the Muslim world. Interfaith dialogue is limited to Islamic forms of religious consciousness and the desire to perpetuate traditional Islamic values without going beyond a normative approach. As Smith suggested at the Bangalore Consultation in 1967, "Muslim society here is on the whole too frightened to be interested in other men's faith; and too bewildered to ask systematic questions about its own."

**Religion and politics.** The emergence of national politics in the postindependence era in South Asia has historicized and contextualized academic study of religion on the subcontinent. In particular religion has become intertwined with nationalist politics, resulting in religious communalism, the rejection of the concept of a modern nation-state as understood in the West, and resistance to modernization and secularization as indicators of social development. For some, religion has become a means to overcome a disenchantment with modernity and to reinstate South Asia's cultural and spiritual heritage. Neither political Islam nor political Hinduism can be discounted in the subject matter of academic studies of religion. Nor can the temper of such religious movements, linked to transcendent values, be understood

solely in terms of Western democratic models of party politics or polity.

The phenomenon of religion in South Asia has become subject matter for scholars not only in political science but also in economics, geography, sociology, and cultural studies. Many have a Marxist orientation seldom found among academics in the West. Thus the study of religion in South Asia is characterized by certain broad themes reflected by contemporary scholars, such as Madhu Kishvar and Asgar Ali Engineer, and in some of the works presented at the 2003 Delhi Conference cosponsored by IAHR. Themes include women's and minority rights, nationalism and identity, diaspora and ethnicity, peace and conflict studies, rethinking of secularization and globalization with respect to Indic cultural heritage, and ethnic politics and religious empowerment.

**History and the future.** Historical context distinguishes South Asian concepts of the study of religion from either the North American or European approaches. As a secular state, India is impartial to expressions of religion in its secular institutions of learning. It has a history of resisting the study of religion as a subject matter but allows for the study of the phenomenon under existing departments, such as sociology and anthropology. In this unique environment South Asian scholars from different disciplinary fields will undoubtedly continue to bring their unique perspectives and worldviews to the study of religion, approaching it from a historical, phenomenological, and structural perspective. Those with a philosophical bent may move the study from descriptive accounts to explanation and theory. The inseparable connection between religion and philosophy explored by scholars such as Sarvepalli Radhakrishnan, T. R. V. Murti, T. M. P. Mahadevan, Daya Krishna, and Muhammad Iqbal continues as a tradition of scholarly investigation. Methodological and theoretical studies have their antecedents in studies by scholars such as K. N. Jayatilleke, Ananda Coomaraswamy, M. N. Srinivas, Aziz Ahmad, Fazlur Rahman, and T. M. Madhan.

Though the prospect of a burgeoning rise of departments of religion in South Asia, and, for that matter, of student enrollment, seem dim, the indications are promising for an increased interest in the academic study of religion: interaction and dialogue occurring between Western and South Asian academics at international conferences, visiting scholar arrangements, and joint academic projects and publications. In such encounters each side clearly becomes exposed to the influence of the other, thereby keeping alive in the academic study of religion the idea of comparative religion as method and discipline, and providing impetus for the rethinking and reconceptualizing of the engagement between the philosophy of religion and the history of religions.

#### STUDY OF RELIGION: THE ACADEMIC STUDY OF RELIGION IN SUB-SAHARAN AFRICA

The academic study of religion has emerged as a vibrant discipline in some parts of sub-Saharan Africa. Although the discipline was heavily influenced by developments in western Europe and North America, it had gained a distinctive identity by the 1980s. The region made significant contributions to the overall character of religious studies, particularly in the area of method and theory in the study of indigenous religions. Scholars in sub-Saharan Africa interacted with the dominant questions that have shaped the field. Operating in a context characterized by a plurality of religions, they offered valuable reflections on the character of religion. Some scholars from outside the African context also settled in the region and used the richness of the material on religion to explicate the significance of the complex phenomenon. Notable local and regional traditions of the study of religion were established in sub-Saharan Africa by the late 1990s. Although significant differences could be identified in the execution of the task in this vast region, the emphasis on the importance of religion to Africans was a salient point uniting scholarly reflections. Most scholars in the academic study of religion devoted their resources to an analysis of the three dominant religious traditions. Studies on African traditions, Christianity, and Islam constituted the bulk of the material on religious studies in sub-Saharan Africa. Abstract methodological reflections were limited, perhaps reflecting the abundance of the data on religion.

Many scholars in the study of religion argued that religion was a critical variable in efforts to understand the lives of most Africans. The academic study of religion was predicated on the assumption that religion was central to most endeavors to establish the meaning of existence in an African context. In this pursuit, multiple methodological strategies were employed. Sociological, psychological, anthropological, and phenomenological approaches were used to locate the significance of religion to Africans. African scholars provided impressive descriptions of the major religions, alongside other migrant religions like Hinduism, Buddhism, and others. In their edited volume *The Historical Study of African Religion, with Special Reference to East and Central Africa* (1972), Terence O. Ranger and Isaria N. Kimambo bemoaned the lack of historical sensitivity in the study of indigenous religions. However, this criticism was taken seriously and African scholars produced many impressive monographs on the history of the various religions of Africa by the late 1970s. Although this review concentrates on the efforts of scholars based in departments of religious studies, it is important to acknowledge that creative writers, political scientists, and scholars based in other departments made valuable contributions to the study of religion in Africa.

**THE EMERGENCE OF RELIGIOUS STUDIES IN SUB-SAHARAN AFRICA.** While the academic study of religion became an established academic discipline in many African universities by the latter half of the twentieth century, various categories of writers had provided useful information on the religions of Africa much earlier. Travelers, missionaries, amateur ethnologists, and other nonspecialists had written reports on various aspects of religion in Africa in the nineteenth century. Although indigenous religions suffered at the hands of casual observers, the earlier writers preserved valuable information. Missionaries like Henri A. Junod (1863–1934), who operated in Mozambique from 1907 onward, provided sound descriptions of local religious beliefs and practices. Earlier, John William Colenso (1814–1883), who was ordained as the bishop of Natal in 1853, had identified Zulu names for god in the context of a general theory of comparative religion. By the time the discipline found its way to African shores, the reality of religious pluralism had anticipated it.

The academic study of religion in sub-Saharan Africa is inextricably intertwined with the political history of the region. The experience of colonialism, from around 1880 to 1960, shaped traditions of the study of religion for most African nations. Former British colonies tended to have lively departments of religious studies because religious education was popular in secondary schools, whereas in Francophone countries such traditions were suppressed. Similarly, religious studies departments did not emerge in former Portuguese colonies like Angola and Mozambique. Zambia provided a unique case of a former British colony that did not develop a department of religious studies, although the faculty of education at the University of Zambia at Lusaka offered courses on aspects of the discipline.

Historical experiences like the struggles for political independence and assertions of nationhood in the postcolonial period are indelibly printed on the study of religion in the region. After the realization of the importance of education for Africans by both missionaries and the colonial state, colleges and universities were gradually established. Most of the universities were instituted after World War II, although Fourah Bay College in Freetown, Sierra Leone, was founded by the Church Missionary Society in 1827. In Kampala, Uganda, Makerere University, later to be influential in the study of indigenous religions, started off as a technical college in 1922. Although initially university colleges in African countries were affiliated to universities in metropolitan centers, the decolonization process in the 1960s led to the emergence of national universities in independent countries. Such universities promoted the study of religion for ideological purposes.

It is worthwhile to observe that some departments of religious studies were established in West Africa before any such departments existed in Britain. Scholars from outside Africa were influential in the setting up of nonconfessional departments of religious studies. Geoffrey Parrinder was instrumental in the creation of the religious studies department at the University College of Ibadan in Nigeria in the late 1940s. Noel King was actively involved in the emergence of the department for the study of religions at the University of Ghana, Legon. Harold Turner and Andrew Walls taught at the University of Nigeria, Nsukka, before the civil war in 1967. They went on to have impressive academic careers in Europe, using their knowledge of the religious situation in Africa.

The dominance of missionaries in the field of education contributed to the greater attention that Christianity enjoyed in the study of religion in sub-Saharan Africa. Many departments concentrated on church history and theology, reflecting their earlier identity as departments of theology. Most scholars were themselves adherents of Christianity or Islam, engendering the committed approach. However, most African countries renamed departments of theology or divinity as departments of religious studies to reflect the pluralist environment that had been established in most countries. They also placed special emphasis on the study of indigenous religions in an effort to develop a distinctive African identity.

**Contributions.** The achievements of African scholars in the study of religion may be located in many areas. However, the most notable areas include theoretical reflections on the meaning of religion, critique of the centrality of scripture, and suggesting new approaches to the study of religion. African scholars also put the study of indigenous religions firmly on the agenda of religious studies. African scholars refined the debate on insiders and outsiders in the study of religion by insisting that they were better placed to understand traditional religions, as opposed to European scholars. In the 1960s and 1970s, African scholars like John S. Mbiti, E. B. Idowu, Kwesi Dickson, and others published significant

works on various aspects of indigenous religions. Other West and East African scholars maintained that African scholars were strategically located to provide objective descriptions of the religions of their own people.

African scholars questioned the definition of religion as the opposition between the sacred and the profane. In his *African Religions and Philosophy* (1969), Mbiti remarks that such a distinction did not apply to traditional African contexts, where religion permeated all spheres of life. This initiated debate over whether the Western definition of religion satisfied the criterion of cross-cultural applicability.

Religious studies in the West have tended to emphasize scripture in the world's religions. Frederick Maximilian Muller (1823–1900) initiated the interest in scripture with *The Sacred Books of the East* (1879–1910). African scholars drew attention to the absence of sacred writings in indigenous religions, noting that these religions remained vibrant nonetheless. Thus, the presence of scripture did not accord a religion any special status, African scholars maintained. This led to some relativization of the significance of scripture in the discipline.

African scholars also highlighted the importance of oral traditions to the study of religion. While textual analysis had featured prominently in religious studies in the West, no such texts existed in most parts of Africa. The historical study of indigenous religions had to grapple with the issue of oral sources. Fieldwork became a critical aspect of religious studies in Africa. Other researchers into African Independent Churches, such as Marthinus Daneel and Gerardus Oosthuizen, also used this approach. Some African scholars who participated in indigenous religious practices, such as the traditional healer and anthropologist Gordon Chavunduka of Zimbabwe and Wande Abimbola, an Ifa priest and Nigerian scholar, also drew attention to the body of knowledge that was found in indigenous religions. They called for alternative approaches that were not dependent on Western models of scientific rationality.

In their descriptions of the various religions of Africa, scholars in Africa have also sought to discern the meaning of religion. In his *Religion and Ultimate Well-Being: An Explanatory Theory* (1984), the South African scholar Martin Prozesky concludes that the search for ultimate well-being was the driving force behind religion. Laurenti Magesa (1997) also argues that indigenous religions were inspired by the search for abundant life. Detailed descriptions of the religions of Africa and methodological reflections were part of the African contribution.

**Major Challenges.** The religious commitment of most African scholars resulted in theological works that sought to promote Christianity or Islam. African phenomenological scholars like Jacob Olupona and Friday Mbon of Nigeria and J. S. Kruger of South Africa protested against the encroachment of theology in the 1980s. Earlier, Okot p'Bitek had criticized the application of Christian concepts in *African Re-*

*ligions in Western Scholarship* (1971). The hegemony of Christian and, to a lesser extent, Islamic theology remained intact. Subsistence to Western methodologies and research interests by some African scholars also stifled creativity.

The shortage of books and journals threatened the viability of religious studies in the region. Many departments operated with ill-equipped libraries. Significant journals like the *Journal of Religion in Africa* were inaccessible to most students and lecturers. Most established scholars relocated to Western countries such as Canada, the United Kingdom, and the United States in search of better career opportunities. Poor remuneration and oppressive regimes contributed to such developments. The worst affected countries included Nigeria, Kenya, Zimbabwe, and others—countries that had developed impressive traditions in the academic study of religion. However, institutions in some countries, such as South Africa, Botswana, and Namibia, managed to retain their staff. In most parts of the continent, departments of religious studies have struggled to justify their relevance amid incessant calls by governments to reduce costs. Between 2003 and 2004, South African departments of religious studies were forced to merge.

Gender imbalances have also been noticeable in the discipline in the region. Few female scholars have participated, with Christian theologians dominating. Mercy Amba Oduyoye of Ghana, Isabel Phiri of Malawi and South Africa, and Musa Dube of Botswana analyzed the religious experiences of African women in the late 1990s. The shortage of scholarships in religious studies, as opposed to theology, resulted in the low numbers of African female scholars of religion.

**INSTITUTIONALIZATION OF THE ACADEMIC STUDY OF RELIGION IN SUB-SAHARAN AFRICA.** The study of religion took place at various levels of educational achievement during different historical periods. Arabic schools, bible colleges, and primary and secondary schools offered subjects that provided some knowledge about the religious context. Teacher training institutions introduced students to the various religions of the world by emphasizing the divergent approach, which does not seek to convert students to a specific religion. In some countries, such as Zimbabwe, the diploma in religious studies has offered graduates a number of career opportunities in the civil service and the private sector. The effects of HIV/AIDS in sub-Saharan Africa in the 1990s and beyond has led some nongovernmental organizations to recruit graduates trained in the study of religion.

Aspects of the academic study of religion were also found in some church-sponsored universities and theological colleges in the 1980s. Although Christianity received preferential treatment, comparative religion was an integral part of the curriculum. In southern Africa some theological colleges sought to establish associate status with national universities in an effort to maintain high academic standards. Courses on the history of religions exposed students to religious pluralism. Although the popularity of the discipline varied

among the different countries, it continued to attract significant numbers of students.

**Scholarly Organizations and Publications.** The high number of lecturers in the discipline facilitated the emergence of scholarly organizations. These included the Nigerian Association for the Study of Religions, founded in 1976; the Association for the Study of Religions in Southern Africa, initiated in 1979; and the African Association for the Study of Religions (AASR), formed in 1992. The AASR has regional chapters and publishes a newsletter that keeps African scholars abreast of developments in the field. It has also sponsored a few monographs and books that are widely distributed in Africa. Other theologically oriented organizations like the Association of Theological Institutions in Southern Africa and the Ecumenical Association of Third World Theologians have contributed to the publication of some valuable monographs on Christianity and indigenous religions. These regional groupings have facilitated interaction across national boundaries and rescued the study of religion from narrow nationalistic agendas.

Despite the shortage of books, some impressive initiatives have been witnessed on the publication front. Following the demise of apartheid in South Africa, a number of texts that sought to describe religious pluralism in the country were published, such as Martin Prozesky and John W. de Gruchy's edited volume *Living Faiths in South Africa* (1995). Launched in the 1990s in Malawi, the Kachere book series sought to capture the religious scene in the country, covering aspects of Christianity, indigenous religions, and other themes. In Kenya, Acton Publishers, an initiative by the scholar Jesse N. K. Mugambi, was launched in 1992. Mambo Press of Zimbabwe publishes books on religion in the region. Scholars like James Amanze of the University of Botswana, Peter Kasenene in Swaziland and Uganda, and Patrick Maxwell in South Africa produce material within the discipline of religious studies. Monographs and articles on Islam, indigenous religions and churches, new religious movements, and other aspects of religion in Africa are also being produced.

Among African countries in the 1990s, South Africa had the highest number of journals that appeared consistently. These include the *Journal for the Study of Religion, Missionalia, Religion and Theology, Scriptura*, and others. Although some of the journals have a theological slant, they publish useful articles on the academic study of religion. In Nigeria, the journal *Orita* has defied the odds and continues to publish articles on the three dominant religions.

**Contextualization.** Although some scholars, such as Donald Wiebe in *The Politics of Studying Religion* (1998), have insisted on a rigid separation between the discipline and communities of faith in the region, close cooperation has existed since the 1960s. Organized religious groups have used scholarly services, with scholars responding to the felt needs of the communities among whom they operated. They have also published on those issues that were relevant to their con-

texts. Religious violence in Nigeria precipitated research into the role of religion in curbing extremism. The reality of HIV/AIDS in the region in the 1990s prompted research into the appropriation of religion in the struggle against the pandemic. In their pursuit of contextual relevance, most African scholars have remained in dialogue with scholars from other parts of the world through publications, conference attendance, and other modern communication facilities.

Despite major challenges, the academic study of religion in most parts of sub-Saharan Africa continue to be encouraging. In their investigations into the religions of Africa and methodological reflections, African scholars provide alternative interpretations regarding the nature and purpose of religious studies. Although they can be abrasive in the study of indigenous religions and militant in protesting against their peripheral position in global religious studies, they are contributing to the shape of the field. Their commitment to producing works of high quality in contexts characterized by resource deficiencies provides indications that a new era of promise is dawning on the academic study of religion. Often marginalized and portrayed as uncritical consumers of methodological tenets developed elsewhere, scholars in sub-Saharan Africa are taking up the challenge of interpreting the significance of religion as full members of the guild.

EZRA CHITANDO (2005)

**STUPA WORSHIP.** The Sanskrit term *stūpa* first occurs in the Vedas, where it conveys the meaning “knot of hair, top,” or “summit.” It is unclear how the term came to be used by Buddhists to refer to the mounds erected over the relics of Śākyamuni Buddha, but this usage can be traced back to early Buddhism, as can the practice of worship at stupas. The Jains too built stupas, but these postdate the earliest Buddhist structures. The terms *thūpa* (*thūba*) and *dhātugabbha* (Skt., *dhātugarbha*) are attested in Pali sources. This latter term derives from references to the Buddha’s relics as a *dhātu* (“element”) and to the dome or “egg” (*aṇḍa*) of the stupa as a *garbha* (“womb” or “treasury”).

According to the *Mahāparinibbāna Suttanta*, after Śākyamuni Buddha achieved final *nirvāṇa* his body was cremated and stupas were erected to receive his remains. Śākyamuni’s cremation and the installation of his relics in stupas are probably historical facts. The early Buddhists erected stupas because they believed that Śākyamuni had freed himself from the cycles of birth and death. Had Śākyamuni died and remained within those cycles it would have been pointless to build a stupa for him, for not only would the place of his rebirth be unknown, but one could not have expected him to act on the requests of his believers. According to the *Mahāparinibbāna Suttanta*, stupas could be built to receive the remains of the following four types of

people (known as *thūparahā*, “worthy of stupas”), all of whom had transcended the cycles of birth and death (*saṃsāra*): *tathāgatas* (buddhas), *paccekabuddhas* (self-enlightened buddhas), *tathāgataṣṣa sāvakaṣ* (“hearers of the Buddha”), and *rājā cakkavattis* (“universal rulers”).

Such sages could be enshrined in stupas because they had entered *nirvāṇa*. In the Āgamas, such people were said to have realized *diṭṭhadhamma-nibbāna* (“*nirvāṇa* in this world”) or *saūpadisesa-nibbāna* (“*nirvāṇa* with remainder”). *Nirvāṇa* was also called the “*dharma* realm” (*dhammadhātu*). Such terms suggest that *nirvāṇa* was not always viewed as extinction but often as an actual state or realm a person enters upon realizing enlightenment.

When the Buddha died, he was said to have entered *parinibbāna* (“complete *nirvāṇa*”) or *anupādisesanibbāna-dhātu* (“*nirvāṇa* without remainder”). Thus, even after the Buddha died he was not viewed as having completely ceased to exist; rather, he was thought to exist in the realm of *nirvāṇa*. Consequently, believers could worship and offer their prayers to him through the medium of the stupa. It was at this time that the belief that the Buddha could respond to the petitions of his worshipers probably developed. If “*nirvāṇa* without remainder” had been considered a completely quiescent state, then such responses by the Buddha would have been impossible. Thus, the people who worshiped at Buddhist stupas seem to have believed that the Buddha continued to be active. This belief later led to Mahāyāna doctrines about the *dharmakāya*’s activity in the world.

During the early period of Buddhism offerings to the Buddha’s relics (*śarīra-pūjā*) were made by laypeople. According to the *Mahāparinibbāna Suttanta*, the Buddha was asked by Ānanda what type of ceremony should be held for the Buddha’s remains. The Buddha replied, “You should strive for the true goal [*sadattha*] of emancipation [*vimokṣa*].” The Buddha thus prohibited monks from having any connection with his funeral ceremonies and instead called upon wise and pious lay believers to conduct the ceremonies. According to this same text, it was the Mallas of Kusinārā who conducted the cremation. The Buddha’s remains were then divided among eight tribes in central India and stupas were built.

Closely related to the stupa in functional terms is the *caitya* (Pali, *cetiya*). *Caityas* are similar to stupas, although originally the two were distinct entities. In Buddhism, the term *caitya* referred originally to a place that was sacred. In the *Mahāparinibbāna Suttanta* *caityas* are described as places that men and women of good families “should see so that feelings of reverence and awe will arise.” Four of these are mentioned in the text: the Buddha’s birthplace at Lumbinī, his place of enlightenment at Bodh Gayā, the site of his first sermon at the Deer Park (in Banaras), and the place where he entered “*nirvāṇa* without remainder” (Kusinagara). Because the pilgrims who visited these sites were called *caitya-cārika*, the sites must have been known as *caityas*. Sa-

cred objects of worship that helped people remember the Buddha were both present at and themselves identified as *caityas*. For example, in Bodhi Gayā pious pilgrims could worship at the bodhi tree or the Adamantine Seat (*vajrasana*) on which the Buddha sat when he realized enlightenment. Because the stupa was an object of worship, it too could be called *caitya*. The difference between stupas and *caityas* is explained in the *Mohesengqi lü* (*Mahāsāṃghika Vinaya*): “If the Buddha’s relics are enshrined, the site is called a *stūpa*; if the Buddha’s relics are not enshrined, it is called a *caitya*” (T.D. 22.496b). This explanation suggests that by the time the Vinaya of the Mahāsāṃghikas was compiled, *caityas* and stupas had the same exterior shape. As time passed, the Buddha’s relics became increasingly difficult to obtain and other objects were enshrined when stupas were constructed. Thus, the distinction between stupas and *caityas* gradually vanished.

After the Buddha’s death, stupa worship became increasingly popular. With King Aśoka’s (r. 268–232 BCE) conversion to Buddhism, stupa worship spread throughout India. Aśoka ordered that the eight stupas erected after the Buddha’s death be opened and that the relics within them be removed, divided, and enshrined in the many new stupas that he had commissioned to be built throughout India. These events are described in the *Ayuwang zhuan* (*Aśokarājāvādāna*; T.D. 50.102b) and in the *Ayuwang jing* (*Aśokarājā Sūtra*?; T.D. 50.135a–b). In the records of his travels in India, the Chinese Buddhist pilgrim Xuanzang mentions the stupas constructed by Aśoka, many of which have been identified in modern times by archaeologists.

**THE FORMATION OF BUDDHIST ORDERS AROUND STUPAS.** Little is known about the history of stupa worship during the 250 years between Aśoka’s reign and the rise of Mahāyāna Buddhism at approximately the beginning of the common era. However, archaeological evidence from this period indicates that stupas were built in many areas in India and that stupa worship was a growing practice. Clearly, religious orders must have formed around some of these stupas and doctrinal developments reflecting the increasing importance of stupa worship undoubtedly occurred. Although most of the stupas are in ruins today and little is known of these doctrines, the new teachings associated with stupa worship contributed much to the rise of Mahāyāna Buddhism.

Buddhism has long been formulaically defined in terms of the so-called Three Jewels: the Buddha, the Dharma, and the Order (*saṃgha*). Apart from the Mahīśāsaka and Dharmaguptaka schools, which held that the Buddha was a part of the jewel of the *saṃgha*, most schools argued that the Three Jewels were distinct elements, with stupas belonging to the jewel of the *saṃgha*. In fact, stupas and sects (i.e., the monastic order) do seem to have developed separately. Economic considerations played a role in this doctrinal debate. Given that the Three Jewels were separate, alms donated to the jewel of the Buddha could only be used for the jewel of the Buddha (i.e., stupas), not for the jewel of the Order

(i.e., Buddhist sects). Thus, monks were not allowed to use items that had been offered at stupas, that is, to (the jewel of) the Buddha.

Originally, stupas were institutions independent of the Hīnayāna schools. Archaeological evidence reveals that the stupas were constructed and administered by lay believers and were not affiliated with any particular school or sect. However, as stupa worship continued to flourish, stupas came to be constructed within monastic compounds and monks began to worship at them. Yet even after stupas came to be affiliated with sects in this way, alms given to the stupa still had to be used for the stupa alone and could not be used freely by the monks. Monks who had received the full Vinaya precepts (*upasampadā*) were not allowed to live within the confines of stupas or to take custody of their assets. Thus, although a stupa might be affiliated with a particular sect, a clear distinction was maintained between the property and site of the stupa and those of the order of monks. However, as stupa worship became more popular and more alms were offered at stupas, the schools suffered adverse economic effects. To counter this, the schools argued that little karmic merit would result from such offerings; some even openly opposed stupa worship.

Once a stupa accumulated alms, believers began to live around it and use the food and clothing that had been offered at it. These believers, who were considered religious specialists in their own right, probably assisted pilgrims who came to the stupa by finding lodgings for them, giving instructions about worship, and explaining the carvings of the Buddha’s life and of the *jātakas* (“birth tales”) inscribed there. They probably preached about the greatness of Śākyamuni’s personality, compassion, and power to help save sentient beings and formulated doctrines concerning these subjects that were independent of sectarian (*nikāya*) opinion. Of course, these doctrines differed from those that had been originally preached by Śākyamuni.

The religious specialists who lived around the stupas resembled monks and nuns in many ways. They served as leaders of orders, teaching lay believers and receiving alms from them. However, although these religious specialists led lives similar to those who had abandoned the life of a household, they still were not monks (*bhikṣus*). Because they had not taken the full set of precepts (*upasampadā*), they did not belong to the jewel of the *saṃgha* and thus were permitted to live at the stupas.

Because they felt that certain religious experiences were necessary if they were to teach others, these religious specialists not only taught lay believers but also engaged in strict religious practices. Consequently, they imitated the practices performed by Śākyamuni Buddha and strove to attain an enlightenment identical to that which Śākyamuni had experienced. Because Śākyamuni had been called a *bodhisattva* before he had realized enlightenment, they too called themselves *bodhisattvas*. The term *bodhisattva*, which had originally been used to refer to the period of practice prefato-

ry to becoming a Buddha, was now used to refer to *all* religious practitioners who, unlike Hīnayāna devotees, aspired to realize the supreme enlightenment of the Buddha rather than arhatship.

The orders of religious practitioners that sprang up around the stupas were thus vitally interested in two major doctrinal themes: the Buddha's ability to save sentient beings and the types of practices that would enable people to realize Buddhahood. The religious activities of these *bodhisattvas* eventually led to the development of Mahāyāna Buddhism. Indeed, it is difficult to conceive of these doctrines developing among Hīnayāna monks. Because Hīnayāna monks respected Śākyamuni Buddha as a great teacher and believed that he taught the path of the arhat for their enlightenment, they probably would not have used a term such as *bodhisattva* to refer to themselves because it would have placed them on a level equal to that of Śākyamuni. In following the practices of the arhat, they had little reason to be concerned with new doctrines about the ways in which the Buddha could save sentient beings. However, lay believers, who were unable to follow the austere regimen of the monks, would have been vitally interested in teachings about how the Buddha could save them. The new doctrines that developed in the orders around the stupas did not stress the importance of observing the full set of precepts and performing all the practices required of a monk; rather, in these doctrines, a form of Buddhism for lay believers, one that emphasized faith (*śraddhā*) in the Buddha, was described.

**MAHĀYĀNA BUDDHISM AND STUPAS.** At least some varieties of Mahāyāna Buddhism arose from the orders around stupas. Stupa worship continued to develop even after Mahāyāna Buddhism had begun to take form. Although the orders associated with stupas are not clearly described in Mahāyāna literature, the existence of such groups can be clearly inferred from these texts. Only a few do not mention stupa worship. The "Chapter on Pure Practices" of the *Buddhāvataṃsaka Sūtra* contains a detailed description of *bodhisattva* practices, many of which focus on stupa worship (T.D. 9.430ff.). According to the *Ugradatta-paripṛcchā* and the *Daśabhūmikavibhāṣā*, *bodhisattvas* could practice either at stupas or in the forest (Hirakawa, 1963, pp. 94–98). They were to meditate and perform austerities in the forest, but if they became ill, they were to return to a stupa in a village to be cured. Thus, *bodhisattvas* went to stupas for many reasons besides worship, including recovering from illness, nursing the sick, making offerings to teachers and saints (*āryapudgala*), hearing discourses on doctrine, reading scriptures, and preaching to others.

Stupas were more than objects of worship. They also served as centers for Mahāyāna practitioners, with quarters for devotees located nearby. These early Mahayanists abandoned their lives as lay believers, wore monastic robes, begged food, read sūtras, and studied doctrine under the guidance of preceptors. They also meditated, worshiped, and prostrated themselves at the Buddha's stupas. An important

part of stupa worship was the circumambulation of the stupa (usually three times) while chanting verses in praise of the Buddha.

Two types of *bodhisattvas* are mentioned in early Mahāyāna texts: monastic (i.e., renunciant) *bodhisattvas*, who lived and practiced at the stupas, and lay (i. e., householder) *bodhisattvas*, who made pilgrimages to the stupas in order to worship at them. Lay *bodhisattvas* placed their faith in the Three Refuges (or Three Jewels), observed the Five Precepts (*pañca śīlāni*) or the Eight Precepts (*aṭṭhaṅgikāṃ uposathāṃ*), and performed religious practices. In many ways, their practices resembled those of Hīnayāna lay believers. However, the two groups had very different objectives in their practice. While Hīnayāna lay believers (m., *upāsaka*; f., *upāsikā*) sought a better rebirth, Mahāyāna lay *bodhisattvas* strove to attain buddhahood and based their practices on the Mahāyāna position that helping others results in benefits for oneself.

*Bodhisattvas* often observed a set of Mahāyāna precepts called the Path of the Ten Good Acts (*daśakuśala-karma-pathā*). However, according to some later Mahāyāna texts, monastic *bodhisattvas* were to receive full monastic ordination (*upasampadā*). Thus, at a later date monastic *bodhisattvas* began to use the complete set of precepts from the Vinaya for their ordinations. In such cases, they probably did not use monks from the Hīnayāna sects as their preceptors (*upādhyāya*), because qualified preceptors could be found in the Mahāyāna orders.

According to the *Saddharmapuṇḍarīka Sūtra*, worshiping and making offerings at stupas were practices that led to buddhahood. In the *Upāyakaūśalya-parivarta* (Chapter on expedient means), a variety of practices leading to buddhahood are discussed. These include not only the practice of the six perfections (*pāramitās*) but also the building of stupas, the carving of images, and acts of worship and offering made at stupas (T.D. 9.8c–9a). Because the realization of buddhahood was the primary goal of Mahāyāna practice, stupa worship clearly had a close relationship to Mahāyāna beliefs.

The stupa also provided a model for many elements in Amitābha's Pure Land (Sukhāvātī). The Pure Land was said to have seven rows of railings (*vedikā*); railings were an important architectural component of the stupa. Other elements of stupas were also found in descriptions of the Pure Land, including rows of *tāla* trees (*tāla-paṅkti*), lotus ponds (*puṣkariṇī*), halls (*vimāna*), and towers (*kūṭāgāra*). Thus, the portrayal of the Pure Land was apparently based on an idealized view of a large stupa. Moreover, according to the early versions of the *Emituo jing* (the smaller *Sukhāvātīvyūha Sūtra*), the *bodhisattva* Dharmākara vowed that anyone who worshiped or made offerings at stupas would be reborn in his Pure Land (T.D. 12.301b). This vow was eliminated in later versions of the sūtra, suggesting that, as time passed, Amitābha worship developed independently of stupa worship.

The evidence from these sūtras suggests that the relationship between Mahāyāna Buddhism and stupa worship was very close. Even the Perfection of Wisdom literature, which emphasized the memorization and copying of sūtras, did not deny that merit was produced by offerings at stupas. Rather, it maintained that stupa worship produced less merit than copying the scriptures. Thus the origins of the Perfection of Wisdom tradition as well are related to stupa worship.

For a detailed study of the role of the stupa in the formation of Mahāyāna Buddhism, see my article "The Rise of Mahāyāna Buddhism and Its Relationship to the Worship of Stūpas," *Memoirs of the Research Department of the Tōyō Bunko* 22 (1963): 57–106. André Bareau's "La construction et le culte des stupa d'après les *Vinayapīṭaka*," *Bulletin de l'École Française d'Extrême Orient* 50 (1962): 229–274, provides a wealth of detail on Buddhist cultic life at the stupas, as does Prabodh Chandra Bagchi's "The Eight Great Caityas and Their Cult," *Indian Historical Quarterly* 17 (1941): 223–235. For the *Mahāparinibbāna Suttanta*, see the translation by T. W. Rhys-Davids in volume 3 of *Dialogues of the Buddha*, in "Sacred Books of the Buddhists," vol. 4 (1921; reprint, London, 1973), pp. 71–191.

HIRAKAWA AKIRA (1987)

*Translated from Japanese by Paul Groner*

**SUÁREZ, FRANCISCO** (1548–1617), was a Spanish Jesuit philosopher, theologian, and jurist. Francisco de Suárez was born on January 5, 1548, at Granada, where his father was a wealthy barrister. Destined by his family to an ecclesiastical career, he prepared for it by studying canon law at the University of Salamanca. In 1564 he joined the Society of Jesus. From 1566 to 1570 he was a student of theology at the same university at a time when it was undergoing a lively Thomist revival.

In 1571, the year before he was ordained priest, Suárez was assigned to teach philosophy at Segovia, and over the next decade he taught both philosophy and theology at various Jesuit colleges in Castile, including Valladolid, where he delivered a set of celebrated lectures on the first part of Thomas Aquinas's *Summa theologiae*. Called to Rome in 1580, he continued the series at the Roman College, where his subject was the second part and where, it is said, Pope Gregory XIII was occasionally in attendance. Uncertain health brought Suárez back to Spain in 1585, to Alcalá, and here his lectures on the *Summa*, specifically on the third part, were concluded. He transferred to Salamanca in 1592, and in 1597, at the instance of Philip II of Spain (now also king of Portugal), he went to Coimbra, where he taught until 1616. He died a year later in Lisbon.

Suárez's first published work, *De deo incarnato*, which grew out of his lectures on the third part of the *Summa*, ap-

peared in 1590, and his last, *De defensione fidei*, a tract directed against the views on the divine right of kings held by James I of England, in 1613. In between he published eleven other works, of which the most popular and influential, *Disputationes metaphysicae* (1597), went through eighteen editions in the course of the seventeenth century. Ten more works were published posthumously before 1655, under the direction of the Portuguese Jesuits. The passage of time did not lessen interest in Suárez's writings; editions of his *Omnia opera* were published in Venice in 1747 and in Paris in 1856.

Suárez's thought was expressed always within a scholastic context, and he professed to be a Thomist. Certainly the work of Thomas Aquinas was basic to his own, but he often deviated from classical Thomism, a fact stressed particularly during the Thomist revival of the early twentieth century. Suárez, for example, did not admit the real distinction between essence and existence, and his metaphysics was more a self-contained whole than a mere elaboration of Aristotle. He viewed philosophy in any case as a basis for theological research.

In the quarrel between the Jesuits and the Dominicans over the problem of the relationship between grace and free will he took no formal part, though during the crisis of the first decade of the seventeenth century he was active behind the scenes promoting the more liberal Jesuit position. Similarly, he did much to establish the moral school of probabilism, which was later associated with Jesuit confessional practice. As a jurist Suárez did much to elaborate the notion of penal law and the juridical force of custom. He was a powerful advocate of the principle of subsidiarity in civil society, and he insisted that the powers of the state were rooted in the free consent of the governed. His doctrine of *ius gentium*, based upon the precept of universal love that transcends national or racial divisions, contributed to the development of international law.

Suárez was probably the greatest of all the Jesuit theologians, and as such he has had continuing importance within the intellectual life of the Catholic church. But he was influential far beyond his own order or his own communion. Spinoza, Leibniz, Berkeley, and Vico have all acknowledged their debt to Suárez. The title given him by Pope Paul V—Doctor Eximius ("distinguished scholar")—seems even now appropriate.

For a good synopsis of Suárez's teaching, see René Brouillard's article "Suarez, François," in *Dictionnaire de théologie catholique* (Paris, 1941). A longer study, with biographical details, is Raoul de Scorraillé's *François Suarez de la compagnie de Jésus*, 2 vols. (Paris, 1912–1913). Two useful special studies are *Francisco Suárez: Addresses in Commemoration of His Contribution to International Law and Politics*, edited by Herbert Wright (Washington, D.C., 1933), and José Hellín's *La analogía del ser y el conocimiento de Dios en Suárez* (Madrid, 1947).

MARVIN R. O'CONNELL (1987)

**SUBALTERN STUDIES.** What does it mean when a peasant resistance movement and a religious movement are one and the same phenomenon? In the last three decades, three different themes have surfaced in the interface between the study of religion and Subaltern Studies: (1) the idea of religion as a function of the Marxist/Gramscian view of early Subaltern Studies; (2) the changing debates about religion as the Subaltern Studies project became more involved with cultural studies, postmodernism, and the postcolonial project; and (3) the approach to Subaltern Studies within the study of religion.

**THE IDEA OF RELIGION AS A FUNCTION OF THE MARXIST/GRAMSCIAN VIEW OF EARLY SUBALTERN STUDIES.** Subaltern Studies began in India with an explicitly but not exclusively Marxist and Gramscian focus. It analyzes and advocates for the “bottom layer of society” by challenging capitalist logic (Spivak, 2000, p. 324); thus it has both a negative task of undoing capitalist assessment of the underclass as well as a positive task of describing acts of agency and independence and resistance. Inspired in part by the work of E. P. Thompson, and carried on by the work of scholar and editor Ranajit Guha, the publication of the nine-volume series *Subaltern Studies* comprises a great bulk of the theoretical and topical work. Subaltern Studies began in the late 1970s and early 1980s with Indian, European, and American scholars who turned toward understanding peasant consciousness in India, in so far as any and all consciousness was a product of material conditions. Consciousness, here, is broadly viewed by Subaltern writers in the traditional Marxian sense as a manner of thought determined by one’s place in the production system; yet at the same time, these writers also view consciousness as a form of subjectivity which can and does develop modes of resistance to that system. Since then, the concerns of Subaltern Studies have blossomed into a global phenomenon with strong institutional support from mainstream academia in Africa, South America, Ireland, and China, as well as India, Europe, and America. Moreover, Subaltern Studies’ focus is no longer exclusively South Asian, but spans communities around the globe, and scholars in the field produce articles written in a large variety of vernacular languages besides English.

Subaltern Studies has been confronted from the very beginning with the problem of how to account for the ongoing role of religion, and the related issues of caste and kinship, in a nonessentializing way. Its source of intellectual inspiration, Antonio Gramsci, as well as others, were careful to point out that, in the absence of a socialist party to support the peasant class, religion was not simply self-deception or false consciousness. Rather, religion could be viewed as “a specific way of rationalizing the world and real life,” and “a framework of real political activity” (Gramsci, 1971, pp. 326–327, 337). E. P. Thompson, who addressed the Subaltern Studies conference in its formative stages, also reminded Subaltern Studies thinkers that one should not be surprised at the persistent role of loyalties of religion as well as of caste and kinship in shaping working-class consciousness

(Thompson, 1991, p. 92). Indeed, as Rajnarayan Chadavarkar argued, the very presence of these factors made the idea of a working class in India a completely different enterprise than that of Thompson’s England, inspired as it was by the artisan class and peculiarly British challenges of polity and organization (Thompson, 2000, p. 57).

In light of this Gramscian tension between acknowledging the role of religion in peasant consciousness and being careful not to reify it, early Subaltern Studies showed varying approaches to the topic. As early as 1974 R. Hilton argued in a European context that the capacity for organization in pursuit of social and political demands arose naturally from the experience of peasant. Thus, by implication, religious rites closely linked to agricultural cycles and subsistence needs, such as rainmaking ceremonies in times of drought and ceremonies to contain epidemics, gave expression to the collectivity of the Indian peasant village (Hilton, in Landsberger, 1974).

Others argued that to invest in the idea of strong primordial ties to community, religion, caste, and kinship is to obscure the complexity of the urban working classes in India. For them, it was not a matter of simple transfer, of bringing a simple, rural peasant consciousness to the factories in urban centers throughout the subcontinent. The conflicting identities, catalyzed by industrial competition as well as by the influences of urban neighborhoods, regionalisms, and nationalisms, must also be added to the mix. Such complexities demanded a culturally specific sociological discipline whereby religion could never play a primordial, but only a contingent, role (Chandravarkar).

Other Subaltern Studies scholars focused on how activists attempted to appropriate religious imagery for their own ends. Gyan Pandey’s study of the *swaraj* (self-rule) movement and Shahid Anin’s study of the Gorakhpurians’ interpretation of Gandhi are excellent examples of this approach (Pandey; Anin). Gyan Pandey argues that peasant movements such as the Eka and the Kisan Sabha in 1921 were not Congress-inspired and therefore “top down,” but rather motivated by a structure of land ownership that led to land shortages and high rents. Relatedly, Anin specifically addresses the ways popular peasant culture is made out of religious symbolism. In Anin’s view, Gorakhpur villagers did not simplistically respond to the “holy man” Mahatma Gandhi, but rather developed a kind of millennialism whereby *swaraj* figured directly as a form of local political agency.

These early attempts to deal with religious aspects of peasant consciousness led to the problem of the Subaltern Studies’ relationship to conventional Marxist theory. Early on, Partha Chatterjee argued that peasant modes of being cannot be called simply class consciousness, but are more complex types of consciousness and practice (Chatterjee, 1983, pp. 58–65). Rosalind O’Hanlon also put forward the view that changes in religion, as well as other essentialized categories, such as caste or nation, present the scholar with “the problem of mapping what on the surface look like fun-

damental transformations of mentality.” She also noted that Subaltern Studies must trace the origins of such transformations in their relationship to the state or to organized religions, without slipping into a rigid teleology or a denial of historical specificity (O’Hanlon, 2000, pp. 92–93).

**CULTURAL STUDIES, POSTMODERNISM, AND THE POST-COLONIAL PROJECT.** This concern grew even stronger as Subaltern Studies became deeply inflected with postmodern cultural studies, especially in the United States. Many assessments of this trend trace its beginnings to the publication of Edward Said’s *Orientalism*, a hugely influential work concerned with Western intellectual tradition’s representation of its colonial subjects, particularly those in the Middle East. Said’s *post-Orientalist* perspectives then combined with contemporary postmodern concerns with textual and discourse analysis; through this confluence *postcolonial* studies became the reigning episteme through which much of the Subaltern was then studied. Leading writers in the field of postcolonial studies, such as Homi Bhabha, Gayatri Spivak, Gyan Prakash, Dipesh Chakrabarty, and many others, are concerned with philosophical issues of cultural representation. From this postcolonial perspective, they have argued forcefully for several basic changes in the study of Third World histories: (1) explorations of cultural difference (inspired in part by Jacques Derrida’s (1930–2004) idea of *differance*); (2) nonessentialized cultural categories; and (3) the writing of a postfoundationalist as well as a postnationalist historiography (Chakrabarty, 1992, pp. 1–26; Chakrabarty, 2000; Spivak, 1985, pp. 120–130 and 330–363; Bhabha, 1994; Prakash, 1992, 1994, 1996). Among many other priorities, these writers state the need for writing a history which is influenced neither philosophically by an idea of a single cultural mind which applies to all members of a society, nor anachronistically by a false idea of a unifying nation or set of origins set somewhere in a hoary past.

Given these views, many subaltern writers are overtly suspicious of disciplines and fields such as religious studies in the Western academy. Such a field is, in their view, prone to hegemonic and essentializing constructions of the *other* under a dominant institutionalized gaze. However, subaltern theorists are also concerned amongst themselves about the reification of religion in their own writings. Some later postmodern writers, such as Dipankar Gupta, have criticized the tendency in subaltern writers to attribute primordiality to the masses, or to assume a traditional consciousness, or even primordial loyalties of religion, community, kinship, and language (Gupta, 1985). Many subaltern writers have wondered aloud whether subaltern ideas of a moral community, albeit in the guise of folk religious values of peasant community, are nonetheless well on their way to yet another essentializing category. If peasant or worker consciousness can be reified and severed from history in this way, why not caste, nation, or religious community? Thus, the problem remains. As one Subaltern Studies critic put it, although many subaltern writers accept the autonomy of peasants, their accounts are ultimately not that different from the processes of San-

skritization, Islamicization, or popularization—ideas which have all come under fire for essentializing and reifying historical processes of change (Bayly, 2000, p. 122). How can subaltern writing avoid the problem of making the community an “it” with firm boundaries and, as Marxist secularists increasingly suspect, expressing a sympathy for the religious as a way of defining that community (Spivak, 2000, p. 326)?

**SUBALTERN STUDIES WITHIN THE STUDY OF RELIGION.** The reaction of the religious studies scholarly community to Subaltern Studies has been markedly different from the reaction of Subaltern Studies to it; one might even go so far as to say that they are “mirror images” of each other. Although the Subaltern school, even in its more marked “cultural studies” form of later years, is mostly ambivalent, if not downright hostile, to the idea of religion as a category of analysis, religious studies students have welcomed the category of the subaltern wholeheartedly. Indeed, they have embraced much of the Gramscian tradition with fairly enthusiastic vigor in two significant ways: (1) Subalternist writing can further define and criticize religious studies’ own Orientalist perspectives, both colonial and postcolonial; and (2) more postcolonial writing in Subaltern Studies can help religious studies scholars to nuance their descriptions of the cultural identity of the religious groups with whom they concern themselves.

Marxist scholars of religion such as Bruce Lincoln, Timothy Fitzgerald, and Russell T. McCutcheon, would certainly embrace Subaltern Studies as part of a larger, generally Marxist perspective with which to criticize religious practices as one among many forms of cultural hegemony (Lincoln, 1994; Fitzgerald, 2000; McCutcheon, 2001, 2003). Although differing in outlook, these thinkers see this kind of critique as the primary obligation of the scholar. Others are concerned with Subaltern Studies’ later, more postmodern incarnations: Richard King’s work, *Orientalism and Religion: Post-Colonial Theory, India and the Mystic East* (1999), masterfully outlines some of the issues in the relationship between religious and postcolonial studies.

Many scholars of religion, such as those mentioned above, as well as their numerous area-studies counterparts, would not fundamentally disagree with the premises of later Subaltern School works on religion, such as those essays found in the 1992 volume of *Subaltern Studies*: Partha Chatterjee’s study of the Ramakrishna movement as a religion of urban domesticity; Terence Ranger’s study of the Matobo in South Africa; and Saurabh Dube’s study of the construction of mythic communities in Chhattisgarh (Chatterjee, 1992; Ranger, 1992; Dube, 1992). Each of these essays attempts to combine class, caste, and religious consciousness in such a way that, even if class concerns win out, the dynamics of particularly religious world views have been thoroughly analyzed. Relatedly, many scholars of religion have used Subaltern Studies as a way to analyze the colonial strategies of missionary movements, such as Malagasy Christianity (Larson), Latin American and other Spanish Colonial Catholicisms

(Rabasa, 2000; Rafael, 1998), and the interactions of Christianity with indigenous traditions in India (Dube, 1998; Clarke, 1998).

In addition, Subaltern Studies provides a remarkably suitable framework to study the resistant practices of particular religious groups in the category of contemporary subaltern, such as South Asian Muslims in America (Mohammad-Arif, 2002), Dalit traditions in India, Native American (Arnold, 2001; Bays and Wacker, 2003) or Santeria traditions in North America (Hackett, 1999; Harding, 2000; Campbell, 1987;), or minorities in China (Dirlik, 1996; Gladney, 2003). This intellectual move has also gained institutional support, for instance with the American Academy of Religion's 2004 initiative, "Contesting Religion and Religions Contested: The Study of Religion in a Global Context." In addition to the already established Indigenous Religious Traditions group, the project's major concerns include the funding of studies from below, the representation and inclusion of Third World scholars, and the examination of the effect of the study of religion on the communities it has engaged, particularly communities from traditionally disempowered populations. Another move toward institutional support was Claremont-McKenna's initiative, "Theorizing Scriptures," inaugurated by Vincent Wimbush in 2004. In this conference, scriptural interpretation "from below" is acknowledged and engaged as a serious intellectual endeavor. Here, the view of scriptural hermeneutics held by Native-American, African American, Australian, Latino, Dalit, Chinese, Muslim, and many other less mainstream religions is given voice and careful analysis. This initiative also highlights women's voices of scriptural interpretation, thus joining critiques of Subaltern Studies that call for a more explicit focus on gender than has been the case in the past three decades (Spivak, 1991, 2002).

Whatever the nascent institutional support for the study of these forms of agency, for many scholars religion plays a central role in certain kinds of resistance—one that cannot be ignored. Indeed, one scholar, Sathianathan Clarke, has gone so far as to coin the term *Subaltern theology* to describe the particular political and religious practices of Dalit Christians against both Hindu and state hegemony. Oddly enough, this explicitly religious usage is somewhat consonant with Gayatri Spivak's rather remarkable statement that "subaltern theology" (religious thought as a form of political resistance) cannot be ignored, for if it is, then Subaltern Studies becomes a matter of law enforcement rather than "agency in the active voice" (Spivak, 1999). This historical moment represents a rather tense and at the same time fruitful crossroads between the two fields, where both Marxist and religious studies scholars struggle to understand religion when it emerges as a form of resistant and political agency in its own right.

#### BIBLIOGRAPHY

What follows is a basic overview of major works and authors in the field, whose bibliography is now voluminous. For a basic

introduction to the major authors in Subaltern Studies, see Ania Loomba, *Colonialism/Postcolonialism* (London, 1998); David Ludden's *Reading Subaltern Studies* (Delhi, India, 2001); and Ranajit Guha, ed. *A Subaltern Studies Reader (1986–1995)* (Minneapolis, Minn., 1997). *Key Concepts in Post Colonial Studies*, by Bill Ashcroft, Gareth Griffiths, and Helen Tiffin (London, 1998), is also helpful for basic terminology, as is Bart Moore-Gilbert's *Postcolonial Theory: Contexts, Practices, and Politics* (London, 1997). Vinayak Chaturvedi's *Mapping Subaltern Studies and the Postcolonial* (London, 2000) gives an excellent historical overview of the field, as do the introductions to the nine volumes of the Subaltern Studies Series.

- For a review of the turn to the postmodern, begin with Edward Said's *Orientalism* (New York, 1978), as well as the significant reviews by James Clifford (*History and Theory* 19:2 [1980]: 204–223), Victor Browbeat (*American Scholar* [Autumn, 1979]: 532–541), and J. H. Plumb (*New York Times Book Review* [February 18, 1979]: 3.28). Said's own "Orientalism Reconsidered" in *Race and Class* 7:2 [1985]: 1–15 gives some of his own thoughts about the pitfalls of the post-Orientalist project. Major monographs in the 1990s include Nicholas Dirks, ed., *Colonialism and Culture* (Ann Arbor, Mich., 1992); Homi Bhabha, *The Location of Culture* (New York, 1994); Partha Chatterjee, *The Nation and its Fragments: Colonial and Postcolonial Histories* (Princeton, 2004); Gyan Prakash, *After Colonialism: Imperial Histories and Postcolonial Displacements* (Princeton, 1995); Arif Dirlik, *The Postcolonial Aura: Third World Criticism in the Age of Global Capitalism* (Boulder, Colo., 1997); Gayatri Spivak, *A Critique of Postcolonial Reason: Toward a History of the Vanishing Present* (Cambridge, Mass., 1999); and Dipesh Chakrabarty, *Provincializing Europe: Postcolonial Thought and Historical Difference* (Princeton, N.J., 2000). Numerous essays and more specialized monographs have appeared from these authors in the early 2000s as well. Major critiques of the Subalternist/postcolonial project include that of Aijaz Ahmad, *In Theory: Classes, Nations, and Literatures* (London, 1992), and Sumit Sarkar, *Writing Social History* (Delhi, India, 1997), especially "The Decline of the Subaltern in Subaltern Studies." Laurie Louise Patton (2005)

**ŚUBHĀKARASṂHA** (637–735), Indian monk and missionary, was the founder of the Zhenyan school in China. Śubhākarasṁha (Chin., Shanwuwei) arrived in the Chinese capital, Chang'an, in 716. A missionary of Vājayana Buddhism, he was followed in 720 by Vajrabodhi and his disciple Amoghavajra. The three *ācāryas* ("teachers") established Zhenyan as the dominant form of Buddhism at the court.

Śubhākarasṁha was born a prince in a small royal family near Magadha in North India, supposedly a descendant of Śākyamuni's uncle, Amṛtodana. The family migrated to Orissa, where Śubhākarasṁha's succession to the throne at age thirteen plunged him into a struggle with his brothers. Although victorious, Śubhākarasṁha's piety led him to renounce the throne in favor of his elder brother, and he became a monk. He led a life of wandering, seeking out teachers in the "south seas," and he learned the craft of making stupas and other castings. Making his way to the monastic university of Nālandā, Śubhākarasṁha became a disciple of Dharmagupta and was initiated into the Vajrayāna teachings of the *dhāraṇīs*, *yoga*, and the Three Mysteries. He debated with heretics and finally was sent by Dharmagupta as a missionary to China.

After his arrival in Chang'an, the emperor Xuanzong (r. 713–756) lodged Śubhākarasṃha in the Ximing Temple. There, Śubhākarasṃha translated a text aimed at the procurement of wealth, which apparently led to the emperor's order impounding the monk's Sanskrit manuscripts. Sometime later the texts were returned and the monk Yi Xing was ordered to assist in Śubhākarasṃha's translation work. The emperor was especially interested in texts dealing with magical and astronomical lore. In 724 Śubhākarasṃha accompanied the emperor to the eastern capital, Loyang, and was commissioned to translate the *Mahāvairocana Sūtra* (T.D. no. 848), which, along with the *Sarvatathāgatattvasaṃgraha* (T.D. no. 866), translated by Vajrabodhi, forms the basis of East Asian Vajrayāna. Yixing composed the first six of seven volumes of the *Commentary* (T.D. no. 1796) on the *Mahāvairocana Sūtra* before he died. The final volume (T.D. no. 1797) was completed by the Korean monk known in Chinese as Bukesiyi. The massive *Commentary* contains Śubhākarasṃha's oral explanations of passages in the *Mahāvairocana Sūtra* and represents a creative interpretation of the Vajrayana for a Chinese milieu. Śubhākarasṃha also translated the *Susiddhikāra Sūtra* (T.D. no. 893), a compendium of rituals. In 732 Śubhākarasṃha petitioned the emperor, requesting that he be allowed to return to India, but his request was denied and he died in 735. Śubhākarasṃha's body was embalmed and a stupa erected in his honor near the Longmen caves.

Śubhākarasṃha's importance lay in his translation into Chinese of key texts of the Vajrayana tradition, including the *Mahāvairocana Sūtra* and the *Susiddhikāra Sūtra*, and in his establishment of the Zhenyan school in the Chinese court. Through his oral teachings contained in the *Commentary*, Śubhākarasṃha initiated a tradition of careful adaptation of Indian Vajrayana ideas and practices for the East Asian milieu. In its original, and in its revised edition of Wengu and Zhiyan, the *Commentary* was a source of creative interpretation for both Zhiyan and, later, Japanese Shingon and the Esoteric branches of Tendai. Finally, Śubhākarasṃha applied his supernormal "powers" (*siddhi*) as a means of building political support for Zhenyan. He was a *siddha*, or "wonderworker," as well as a translator, and his exploits caught the imagination of both courtiers and masses. Years after his death, emperors and officials visited his tomb to pray for rain.

**SUFFERING.** Suffering may be defined as the experience of organisms in situations that involve physical and mental pain, usually attended by a sense of loss, frustration, and vulnerability to adverse effects. As a fact of sentient life, pain is a phenomenon concomitant to existence itself and yet, on the human level at least, it is one that is inextricably linked with the sense of one's individuality. As such, pain can only be defined subjectively, and because of its implications for the survival of the individual, the experience of pain often provokes questions about the meaning of life itself.

The effort to understand the meaning of pain is natural, as is the human attempt to mediate painful experiences through recourse to secular or religious symbol systems. A major reason for the enormous influence of science and technology and the esteem in which they are currently held lies in their success in giving human beings power, or the illusion of power, over forces that adversely affect them. However, while science, technology, and social institutions have done much to alleviate suffering, these means, even at their most beneficent, can eliminate only some aspects of pain, but not all.

Thus suffering, more than any other fact of human life, raises the philosophical questions that religion is customarily called upon to answer. When stricken with grief, we question the purpose of life and look for meaning in a universe that harbors such pain. Traditionally, religions have responded to the problem of suffering in two ways: first, by trying to place the human experience of pain within the context of an overall understanding of the universe and, second, by showing ways to overcome or transcend suffering through faith, piety, appropriate action, or change in perspective. Within this broad response, religions have worked out varied systems of answers to the questions and challenges posed by the problem of human suffering.

**JUDAISM.** Jewish tradition reflects a number of approaches to an assessment of the nature and meaning of suffering and offers a selection of options for transforming painful experiences in order to make them comprehensible. Basically, Judaism sees suffering as man's vulnerability to the negative effects of any number of occurrences over which he has little or no control; in other words, much suffering arises simply from being human.

In a brief review of some of the Jewish explanations for the fact of suffering, two categories emerge. The first attributes suffering either to sin or to ignorance of the right path that should be followed; the second postulates that suffering may attend spiritual progress.

It has been generally recognized in rabbinic Judaism that suffering is largely due to one's own misconduct. Numerous passages throughout both biblical and rabbinic literature indicate that suffering results from wrongdoing and is thus a punishment for sin (*Prv.* 22:8). A direct relationship exists between suffering and wrongdoing, on the one hand, and between joyfulness and right action, on the other. Suffering may also arise from a misconception about the true nature of the self, which leads to a course of action that is ultimately self-destructive rather than self-fulfilling. In the stories of Jacob and Joseph, for instance, suffering comes about because one does something fundamentally wrong or alien to one's being. In such cases, suffering may function as the means by which one comes to terms with one's true self. This view suggests that self-knowledge, as well as a proper understanding of the world and of truth, can come only through struggle and through becoming sensitized to things that one would not have been fully aware of without first having suffered.

Many rabbinic and biblical passages indicate that suffering does not simply punish, but also serves an educational purpose. For example, *Deuteronomy* 4:20 reads: "He brought you out of the iron furnace of Egypt to be his people." Here, Rashi (Shelomoh ben Yitshaq, 1040–1105) interprets "iron furnace" to mean a furnace made of iron for the purpose of refining a precious metal such as silver or gold. Samuel David Luzzatto comments that it is a furnace for smelting iron, emphasizing the purificatory purpose of suffering. We find a similar idea in *Jeremiah* 11:4 and in *Isaiah* 48:10, which states: "Behold, I have refined thee but not with silver, I have chosen thee out of the furnace of affliction." Suffering gives special insight and leads to self-transcendence and concern for others; without suffering, man is insensitive and given to self-interest and self-centeredness. As *Exodus* 23:9 admonishes: "Do not oppress a stranger, for you know the feelings of a stranger, since you, yourselves, were strangers in the land of Egypt."

There is another way in which suffering is understood in Jewish tradition: one may suffer not because one has done wrong but, on the contrary, because one has done right. Here a distinction is made between suffering that results from sin and suffering that results from acting virtuously. Having recognized one's responsibilities through one's own suffering, one is confronted with a new form of suffering that arises from the assumption of the burdens of others. In this respect, suffering is a necessary part of the burden of ascent, since it results from the assumption of tasks that the righteous take upon themselves. Acting virtuously necessarily entails suffering—not a slight, passing discomfort, but intense, agonizing suffering. The doctrine of chastisements of love affirms that

God gives special burdens to those who have an unusual capacity to endure them. The righteous bear the burden of ascent; according to *Psalms* 11:5, "The Lord tries the righteous." In a rabbinical interpretation of this text, Rabbi Yonatan writes:

The Lord tries the righteous (Ps. XI, 5). The potter does not test cracked vessels; it is not worthwhile to tap them even once because they would break; but he taps the good ones because, however many times he taps them, they do not break. Even so God tries not the wicked, but the righteous. Rabbi Joe b. Hanina said, "The flax dealer who knows that his flax is good pounds it for it becomes more excellent by his pounding and when he knocks it, it glistens the more. But when he knows that his flax is bad, he does not knock it at all, for it would split. So God tries, not the wicked, but the righteous." R. Elazar said, "A man had two cows, one strong and one weak. Upon which will he lay the yoke? Surely upon the strong. So God tests the righteous." (*Gn. Rab.*, 32.3)

The idea that those who are able to bear the burden are the ones who should carry it is interpreted by Henry Slonimsky to be the heart of the Midrashic teaching on suffering. He states: "The answer to the question why the good must suffer for the inadequacies of the world would be the fact that the world is growing, developing, and therefore inevitably defective, and there must be someone noble enough to assume the burden, as exemplification of a new insight, namely that nobility obligates, noblesse oblige" (Slonimsky, 1967, p. 39). Taking on the burdens of others can only be done by those individuals who are made capable by their own experience and understanding of suffering. Several *midrashim* indicate how dear and precious are these shattered ones of God. In the name of Rabbi Abba' bar Yudan, the Midrash states: "Whatever God has declared unfit in the case of an animal he has declared desirable in the case of man. In animals he declared unfit the 'blind or broken or maimed or having a wen' [*Lv.* 22:22], but in man he has declared the broken and contrite heart to be desirable." Also, Rabbi Yehoshu'a ben Levi said, "He who accepts gladly the sufferings of this world brings salvation to the world" (B. T., *Ta'an.* 8a).

A sublime individual response to suffering is seen in an incident in Rabbi Zusya's life:

When Rabbi Shemlke and his brother visited the *maggid* of Mezritch, they asked him the following. "Our sages said certain words which leave us no peace because we do not understand them. They are that men should praise and thank God for suffering just as much as for wellbeing, and receive it with the same joy. Will you tell us how we are to understand this, Rabbi?" The *maggid* replied, "Go to the House of Study. There you will find Zusya smoking his pipe. He will give you the explanation." They went to the House of Study and put their question to Rabbi Zusya. He laughed. "You certainly have not come to the right man! Better go to someone else rather than to me, for I have never experienced suf-

fering.” But the two knew that, from the day he was born to this day, Rabbi Zusya’s life had been a web of need and anguish. Then they knew what it was to accept suffering with love. (Buber, 1947, pp. 217–218)

Innumerable *midrashim* embrace the doctrine of vicarious suffering. With regard to the *Song of Songs*, Raba states: “As the dove stretches out her neck to the slaughter, so do the Israelites, for it was said, ‘For thy sake we are killed all day long’ (*Ps.* 44:22). As the dove atones for sins, so the Israelites atone for the nation.”

In this process of the transformation of the world through vicarious suffering, the role of the suffering individual and that of the prophet become linked with the idea of the suffering people. This concept appears in the passages in *Isaiah* 53 on the suffering servant, who is the great symbol of vicarious suffering. The controversy over whether the phrase *suffering servant* refers to an individual or to the people as a whole can be resolved once it is seen that it stands for both: the prophet is to the people as Israel is to the nations. Just as the nations resist the witness of Israel, so the people resist the word of the prophet.

Jewish tradition affirms that there is a correlation between one’s suffering and one’s actions, that suffering is self-inflicted. There is, therefore, a just order of things, in the sense that evil acts bring about evil consequences. However, in late biblical and postbiblical Judaism, the doctrine of immortality and resurrection was introduced to account for the suffering of the innocent, which saves the justice of God by positing perfect retribution and reward in the world to come. It is often suggested that the wicked flourish because they are allowed to consume, while still in this world, whatever reward may be due to them, and the righteous suffer because they are exhausting whatever penalties they may have incurred. In qabbalistic (mystical) Judaism, the doctrine of reincarnation was accepted as a means of solving this problem, in that human souls were given repeated chances to atone in this world before a final judgment.

Nevertheless, Judaism finds suffering to be a very harsh, crippling, and disastrous experience—one that a person should strive to avoid whenever possible. Throughout their long history of suffering, persecution, exile, torture, and death, the Jewish people have wrestled with the perplexing problem of why they seem to have experienced such a degree of suffering. Even “the resolve to observe the commandments was, in itself, the cause of death and suffering” (Urbach, 1975, p. 442). Faced with the choice of disobeying God or submitting to the ultimate suffering of martyrdom, the rabbis refused to be swayed into any kind of masochistic fervor; they still realistically recognized how dreadful suffering is. All sufferings, as well as terrible martyrdoms, were not simply acquiesced to, but fiercely questioned.

Jewish teaching clearly acknowledges that there is great injustice in the world and great suffering on the part of the innocent. The pain and death of children is a frequent example, as is the slaughter of millions in wars, political upheavals,

and concentration camps. Jewish tradition deals with this problem of mass suffering, of the undifferentiated fate of the innocent and the guilty, by claiming that this is an unfinished world in which justice and peace are not given, but have to be won. Suffering is a necessary part of completing this world, and the individuals who take up the burden of striving to perfect it also suffer.

Such a concept, however, does not explain why God would so constitute the world, nor does it fully account for the sufferings of those ordinary people who are caught up in wars, earthquakes, or other human or natural catastrophes. Therefore, a tendency can be found in the rabbinic tradition to consider the problem of suffering as one of the areas beyond full human comprehension. In the popular tractate *Avot* (c. 200 CE), a portion of the Mishnah, Rabbi Yanna’i states: “It is not in our power to explain either the prosperity of the wicked or the affliction of the righteous” (4.19). The terrible death by torture of the venerable ‘Aqiva’ ben Yosef at the hands of the Romans (second century CE) illustrates the point. It is said that, on Sinai, Moses was granted a vision of the learning and wisdom of ‘Aqiva’ in expounding Torah and then was given another vision of the rabbi’s martyrdom. When Moses protested to God, “Master of the Universe, is this the Torah and this its Reward?” he was told, “Be silent, for this is the way I have determined it” (B. T., *Men.* 29b).

God also suffers: he is a God who cares for his creatures and yet is unable to prevent their suffering. He is so intimately concerned with human destiny that what men and women do affects him directly: “In their afflictions I was afflicted” (*Is.* 63:9; cf. *Ps.* 91:15, *Gn.* 6:5–6). This is also poignantly illustrated in various *midrashim* where God is pictured as weeping and needing consolation because of all the suffering and tragedy in the world: “When God remembers his children who dwell in misery among the nations of the world, he causes two tears to descend to the ocean and the sound is heard from one end of the world to the other” (B. T., *Ber.* 59a).

**CHRISTIANITY.** Many of the same responses to suffering found in Judaism are also quite understandably evidenced in Christian thought. For example, the statement in *Proverbs* 22:8 that one brings about one’s own suffering (“He that soweth iniquity shall reap calamity”) is paralleled in *Matthew* 26:52: “They that take the sword shall perish with the sword.” In his letter to the Galatians, Paul concurs: “Whatever a man soweth, that shall he also reap” (*Gal.* 6:7). Numerous passages, both in the New Testament and in other Christian writings, indicate that suffering is the just payment for sin. Such a penalty may even come in the form of a swiftly executed death sentence, as in the cases of Ananias and Sapphira (*Acts* 5:1–11) and the profanation of the eucharist (*1 Cor.* 11:29–30). However, in *John* 9:3, Jesus specifically rejects the notion that suffering is always the result of sin, asserting that a man’s blindness was caused neither by his own nor his parents’ sin.

Explicit both in the New Testament and in other Christian literature is the secondary understanding that suffering may serve a disciplinary function. As Paul states: "Suffering produces endurance, and endurance produces character, and character produces hope" (*Rom.* 5:3–4). Such learning experiences are designed to conform the Christian to the image of Christ himself. This sense of suffering as a way in which God disciplines believers is echoed both in *Hebrews* 12:3–13 and in *James* 1:2–4. A corollary concept, which is also present in Jewish thought, holds that suffering may also be seen as a preventive dose of spiritual medicine, intended, as it were, to forestall the germination of sin.

Christianity absorbed other interpretations of suffering that are Jewish in origin. For example, in the Jewish tradition, suffering is a part of the prophetic situation that is a characteristic of the burden of ascent. In a development of this idea, *Acts of the Apostles* 20:23 states that Paul's sufferings—stonings, imprisonments, and other afflictions—resulted from his missionary activity. Paul himself states that the sufferings he endured resulted from his faithfulness to his task of bringing the Christian message to the whole world.

Upholding one's beliefs, it was acknowledged, would bring on the opprobrium of the world. The writer of *Matthew* warns: "Then they will deliver you up to tribulation, and put you to death; you will be hated by all nations for my name's sake" (*Mt.* 24:9); and, "They will deliver you up to councils and flog you in their synagogues" (*Mt.* 10:17). *Acts* relates that the apostles who had been imprisoned and beaten "left the presence of the council, rejoicing that they were counted worthy to suffer dishonor for the name" (*Acts* 5:41). Not just individuals, but whole Christian communities were persecuted and suffered for their beliefs.

From a Christian perspective, suffering is something that is both inevitable and welcome—something to be confronted rather than avoided. In *2 Corinthians* 12: 9–10, Paul exults: "Most gladly therefore will I rather glory in my infirmities, that the power of Christ may rest upon me. Therefore I take pleasure in infirmities, in reproaches, in necessities, in persecutions, in distresses for Christ's sake, for when I am weak, then I am strong." The sense that suffering is inescapable appears in Jesus' experience in the Garden of Gethsemane, where on the eve of his crucifixion, he prays: "Father, if thou be willing, remove this cup from me; nevertheless, not my will, but thine, be done" (*Lk.* 22:42).

In both Christianity and Judaism, the peak of suffering is reached when an individual (or a people) prefers to give his or her own life rather than transgress God's commandments or forsake and repudiate true religion. Many passages in Jewish literature are devoted to martyrologies (especially those detailing the martyrdoms of Rabbi 'Aqiva' and of H̄anina' ben Teradyon), noting the martyrs' strong affirmations of faith at the time of their deaths. Christianity relates similar examples of the religious courage of the faithful, most notably Jesus himself. In the gospels of Matthew and Mark, Jesus asks, "My God, why hast thou forsaken me?" (*Mt.*

27:46, *Mk.* 15:34); in the gospel of Luke he adds, "Father, forgive them, for they know not what they do" (*Lk.* 23:24). According to all three accounts, Jesus died as a martyr to his messianic mission.

Paul's theme of the necessity of sharing in the sufferings of Christ (*Rom.* 8:15) as a prerequisite of sharing in the glories of Christ was carried to extremes by some of the early church fathers. Ignatius of Antioch went so far as to suggest that martyrdom is the only way to become an authentic Christian and thus ensure one's arrival in the presence of God. In fact, Ignatius willingly embraced his own martyrdom to the extent that he encouraged his fellow believers not to do anything that might prevent it from taking place, so convinced was he of the necessity of imitating "the passion of my God" in order to ensure his salvation.

Jesus represents the Gospel's embodiment of the concept of the suffering servant. Seeing Jesus not only as the suffering servant, but also as the Messiah, the Gospel writers fuse these two roles into a synthesis that does not, however, occur in the Hebrew scriptures, where the two remain distinct. A corollary to this fusion of the Messiah and suffering servant is the view of Christ's crucifixion as a vicarious atonement both for the sinful nature of humankind as well as for the sinful acts of each individual: "The Son of man came not to be ministered unto, but to minister, and to give his life as a ransom for many" (*Mk.* 10:45; see also *Jn.* 1:29, 3:5). The writers of the synoptic gospels view Jesus as the Messiah who has been sent into the world to bring about repentance and salvation and to usher in God's kingdom. Jesus' prediction of his own passion occurs throughout the synoptic gospels: his particular passion that is depicted at the end of each gospel portrays him as the being who, by his suffering, crucifixion, and resurrection, becomes the symbol through whom human beings may hope for a similar fate for themselves.

A different and distinctively Christian (as opposed to Jewish) view of suffering can be found in the Pauline writings. In working out his theology, Paul strives to answer certain questions concerning the role of suffering. First, why is there suffering in a world created by a good God who cares for and loves his creatures? Second, why must God not only allow the suffering of his chosen, but why must the best—like Job, or the suffering servant, or the prophet—suffer such grievous fates? Most particularly, for the Christian, why must God's plan include the passion, suffering, and death of the individual designated to be the only begotten Son of God, Jesus the Christ?

In his discussion of Pauline theology in *Theology of the New Testament*, Rudolf Bultmann writes: "The death and the resurrection of Christ are bound together in the unity of one salvation-occurrence: 'he who died' is also 'he who was raised up' (*Romans* 8:34; *2 Corinthians* 5:15, 13:4). Similarly, 'as God raised Christ, so He will also raise us' (see *1 Corinthians* 6:14, *2 Corinthians* 4:14)." Bultmann then claims that the incarnation is also a part of that one single salvation process, referring to biblical assertion that "he who gave himself

up to die is no other than the preexistent Son of God" (*Phil.* 2:6ff., *2 Cor.* 8:9, *Rom.* 15:3). According to Bultmann, the incarnation is never accorded a meaning independent of the crucifixion.

In fact, Christ's death is seen as the merger of propitiatory and paschal sacrifices. As a propitiatory sacrifice, Christ's blood expiates sin and achieves forgiveness for the believer (*Rom.* 3:25). That Jesus' death was viewed by the early church as such a propitiation is seen in the liturgy of the Lord's Supper (*1 Cor.* 11:24), not merely in Palestinian congregations, but also in the newly evangelized Hellenistic churches. Jesus' death is also viewed as significant for the congregation of the people of God as a paschal sacrifice (*1 Cor.* 5:7, *Heb.* 13:12). The vicarious nature of that sacrifice is reiterated in *2 Corinthians* 5:21: "He made him who was unacquainted with sin to become sin in our stead."

Christ died in the place of all, then, and for the sake of all. According to Paul's view, Christ's death is not to be seen either as a merely propitiatory or vicarious sacrifice, but as a colossal cosmic occurrence. Salvation signifies release from death and sin. This release from sin, in turn, is seen in terms of release from the law. Hence, centuries later, Bultmann could claim that the sacrifice of Christ's death does not merely cancel the guilt and punishment of sin, but also is the means of release from law, sin, and death. Bultmann believes that Paul viewed the powers of the age in a gnostic light, and in this sense the Redeemer becomes a cosmic figure and his body a cosmic entity. Thus, those who are bound up with him in one body share in a redemption from the sinister powers of this world.

For Paul, apparently, Christ Jesus is the means by which the suffering of this world, man's inherent sinfulness, and death itself can be overcome. By being at one with he who suffered, a person is able to finally achieve a state that is free both from suffering and from death. In *2 Corinthians* 1:5, Paul avers: "As we share abundantly in Christ's suffering so through Christ we share abundantly in comfort too." More explicitly, in *Philippians* 3:8–10, he asserts: "I have suffered the loss of all things . . . in order that I may gain Christ and may be found in Him . . . that I may know him and the power of his resurrection and may share his sufferings, becoming like him in his death, that if possible I may attain the resurrection from the dead." At present, he who is one with—or in the body of—Christ will indeed continue to suffer. He has the promise, however, that he will not be left to suffer continually, but will eventually overcome that suffering through his faith in Christ. Christ himself is the evidence that, as he overcame suffering and death, so may the worshiper.

In his letter to the Romans, Paul exposes man's plight—bondage to the law of sin—which makes a man a miserable wretch groaning for deliverance from the body of death. In Christ, however, man achieves true freedom through the law of the spirit of life. Thus, salvation is to be seen as an eschatological occurrence insofar as it is not merely a historic fact,

but a reality that is continually being renewed in the present. Hence, the prospect of overcoming sin, suffering, and death is available to those who decide to reorder their previous self-understanding and their past existence from one of egocentrism to one of radical surrender to the grace of God through Christ.

In short, according to Paul, it was necessary for Jesus to have been incarnated, crucified, and resurrected—that is, to have suffered and died—because this is the only way in which the individual might believe that his own suffering and death can, through faith in the risen Christ, be overcome. A god who simply promises redemption cannot engender the same depth of conviction as a God who not only promises but, as it were, delivers. God's birth into a human body and his suffering, together with his resurrection, are evidence of the possibility that believers, too, can hope to transcend sin, suffering, and death.

**ISLAM.** Islamic views of suffering may be categorized broadly under two headings. The first is that of suffering as the punishment for sin; the second, of suffering as a test or trial. The Qur'an repeatedly stresses that all who do evil will be punished for their actions in this world and the next. This doctrine is associated with an emphasis on the perfect justice of God, which is to be vindicated on Judgment Day, when the evildoers will be thrown into the fires of Hell (surah 52). Sin is associated with disbelief, which is the root of misconduct. Unbelievers suffer as they learn of their mistakes. Thus, the punishment of sin through suffering may serve an educational function—namely, to show unbelievers the truth of God's word. The idea that lack of belief is a root of evil reveals a central precept of Islam on the subject of suffering. This precept may be expressed as the belief that evil is found within man, and that subsequently the punishment of suffering is also found there. It is written in the Qur'an: "God dealeth not unjustly with [unbelievers]; but they injure their own souls." Just as sin is inextricable from punishment in the moral system of Islam, the unbeliever always condemns himself to suffer, for, in the final analysis, disbelief is the greatest suffering—the suffering of the soul.

Equally important to the Muslim perspective on suffering is the idea that suffering is a test of man's belief. This concept is premised upon the belief that the true Muslim stands by his faith despite his woes. Suffering not only tests men's strength of faith, it also reveals their hidden feelings, allowing God to look into the innermost depths of their souls. The judgment of and distinction between the righteous and the impious are central to God's universe. As the Qur'an points out, God "hath created the heavens and the earth . . . that he might prove you, and see which of you would excel in works" (surah 11). Suffering is incorporated into the fabric of the world and is instrumental to the purposes of God. Suffering both separates good and evil men and serves as the punishment and teaching for the unbeliever.

The response to suffering that Islam advises is a complex one and is essentially different from either the Jewish or Christian viewpoint. In Islam, suffering is not a welcome way of proving one's faith, as in Christianity; neither is it something that should be avoided whenever possible, as in Judaism. Rather, Islam sees suffering as a necessary though unfortunate component of man's life that should be alleviated where possible and endured otherwise.

According to Bowker (1970), Islam advocates both an active and a passive response toward suffering: one should not only endure one's own suffering, but also perform good works to alleviate the suffering of others. Both responses are required of the true believer. The passive response to suffering is based on the idea of suffering as a test of one's belief in God. One must live through suffering, accepting it as God's will and having faith that God will not force any soul beyond its capacity. Nonetheless, one should not surrender to fatalism when facing suffering, but should always keep hope and faith in God. This opinion is implied by the Qur'an's argument against suicide: God's plans will justify and vindicate the righteous in the end, and to deny this by suicide is to blaspheme against him.

The active response to suffering is grounded in the Islamic belief that man is the cause of his own suffering. Islam considers good those things that rid the world of suffering. The man who helps others is a righteous man; the true believer is revealed by his good works as well as by his acceptance of suffering. Moreover, if suffering is punishment for sin, then doing good works will alleviate this punishment.

Within Islam there is a problematical contradiction between the belief in God's omnipotence and recognition of the existence of suffering. All suffering is believed to be part of God's overall design, and is thought to have a distinct and undeniable purpose. This has tended to lead to a determinist view of existence; the free will of man is questioned. Such a tendency was prominent in the early period of the development of Islam but was later challenged by several schools of thought. The Qur'an is ambiguous on this issue and points to both the designs of God and the free will of man as causes for suffering.

JACK BEMPORAD (1987)

**SUFISM.** One of the truly creative manifestations of religious life in Islam is the mystical tradition, known as Sufism. The term derives most probably from the Arabīc word for wool (*ṣūf*), since the early ascetics of Islam (Ṣūfīs) are said to have worn coarse woolen garments to symbolize their rejection of the world.

**ORIGINS.** Muslim mystical writers such as Abū Bakr al-Kalābādī (d. 990/5) and 'Alī al-Hujwīrī (d. 1071/2?), nonetheless, have proposed a number of etymologies for Ṣūfī: *ṣaff*, "rank," implying that Ṣūfīs are an elite group among Muslims; *ṣuffab*, "bench," alluding to the People of the Bench, the intimates of the prophet Muḥammad who gathered at the first mosque in Medina; *ṣāfa'*, "purity," focusing on the moral uprightness essential to the Ṣūfī way of life. The resolution of the etymological debate is less critical than the recognition that the terms *Ṣūfī* and *Sufism* evoke complex layers of meaning in Islam, including the denial of the world, close association with the Prophet and his message, and a spiritual attainment that raises one to a rank of unique intimacy with God.

Some earlier Western scholars of Sufism concluded that mysticism is incompatible with the Muslim perception of an almighty, transcendent God with whom one shares little intimacy. In their opinion Ṣūfī mysticism was born of Islam's contact with other major world religions, especially Christianity and Buddhism. This theory is no longer considered viable for two reasons: First, the Qur'anic perception of the relationship of the individual to God is quite complex, highlighting both immanence and transcendence, and second, while no one denies that Islam evolved in a religiously pluralistic environment, one need not conclude that phenomena common to both Islam and other traditions are therefore derivative.

The vision of the God-man relationship in the Qur'an offers a study in contrasts. On the one hand God is the almighty creator and lord of the cosmos who sustains the universe at every moment (Qur'an 10:3 ff.); men and women are but servants—finite, vulnerable, and prone to evil (2:30 ff. and 15:26 ff.). God is both lawgiver and judge (surahs 81

and 82); whatever he wills comes to be (2:142; 3:47; 3:129; 5:40; 13:27). Servants of God are enjoined to embrace his will, not question its import, for men and women will be rewarded or punished according to their deeds. To breach the lord-servant (*rabb-‘abd*) relationship leads easily to the cardinal sin of *shirk*, substituting some other power for that of God.

On the other hand the inaccessibility of the transcendent Lord must be understood in the context of those Qur’anic verses that speak of his abiding presence both in the world and in the hearts of the faithful. For did he not actually breathe his own spirit into Adam at creation (Qur’an 15:29, 38:72)? And is he not closer to man than his own jugular vein (50:16)? God’s presence is all-pervasive, for to him belong the East and the West, the whole of creation,

. . . and wherever you turn, there is God’s face. Truly God is omnipresent, omniscient. (2:115)

The Qur’an enjoins on every Muslim the practice of recollecting God (33:41), for the peaceful heart is one in which the remembrance of God has become second nature (13:28–29). The most crucial Qur’anic verse for Ṣūfīs, however, describes the establishment of the primordial covenant between God and the souls of men and women in a time before the creation of the cosmos:

And when your Lord took from the loins of the children of Adam their seed and made them testify about themselves (by saying), “Am I not your Lord?” They replied, “Yes, truly, we testify!” (7:172)

This unique event, which confirms the union between God and the souls of all men and women, has become known in Ṣūfī literature as the “Day of *Alast*,” the day when God asked “*Alastu bi-rabbikum*” (“Am I not your Lord?”). The goal of every Muslim mystic is to recapture this experience of loving intimacy with the Lord of the Worlds.

The experience of mystical union need not, therefore, be seen as foreign to Islam. On the contrary, interior spiritual development becomes a concern at a relatively early date in the writings of important Qur’anic commentators. Of the two traditional methods of Qur’anic exegesis predominating in Islam, *tafsīr* emphasizes the exoteric elements of the text: grammar, philology, history, dogma, and the like, while *ta’wīl* stresses the search for hidden meanings, the esoteric dimensions of the Qur’anic text. It is among Ṣūfīs (and Shī‘ī Muslims) that *ta’wīl* has found special favor.

Early commentators such as Muqātil ibn Sulaymān (d. 767) often combined literalist and allegorical methods depending on the nature of the verse in question. More important is the contribution of the sixth imam of the Shī‘ah, Ja‘far al-Ṣādiq (d. 765), who stressed not only the formal learning of the commentator but also his spiritual development. An individual’s access to the deeper meanings of the Qur’an is dependent, therefore, on his or her personal spiritual development. Since text and commentator interact dynamically as living realities, the Qur’an reveals more of itself

to the extent that the Muslim makes progress in the spiritual life. The power of the text is such that for many later Ṣūfī commentators such as Sahl al-Tustarī (d. 896) simply hearing the recitation of the sacred text could induce ecstatic states in the soul of the listener.

**The Ascetic movement.** The early catalysts for the development of mysticism in Islam, however, were not all spiritual in nature. The dramatic social and political changes brought about by the establishment of the Umayyad dynasty in the mid-seventh century also played a pivotal role. The capital of the empire was moved from Medina to the more opulent and cosmopolitan Damascus, and the rapid spread of Islam introduced enormous wealth and ethnic diversity into what had originally been a spartan, Arab movement. In reaction to the worldliness of the Umayyads, individual ascetics arose to preach a return to the heroic values of the Qur’an through the abandonment of both riches and the trappings of earthly power. The three major centers of the ascetic movement in the eighth and ninth centuries were Iraq, especially the cities of Basra, Kufa, and Baghdad; the province of Khorasan, especially the city of Balkh; and Egypt.

*Ḥasan al-Baṣrī.* A leading figure of the period was Ḥasan al-Baṣrī, who was born in Medina in 642 but settled in Basra, where he died in 728. Ḥasan was renowned for his almost puritanical piety and exceptional eloquence. At the heart of his preaching was the rejection of the world (*al-dunyā*), which he described in a letter to the Umayyad caliph ‘Umar ibn ‘Abd al-‘Azīz (r. 717–720) as a venomous snake, smooth to the touch, but deadly. Ḥasan contrasts this world of transiency and corruption with the next world, which alone is a realm of permanence and fulfillment.

The extreme to which Ḥasan’s anti-worldly stance led him is reflected most vividly in this same letter where he implies that the creation of the world was a mistake. From the moment God first looked on his handiwork, Ḥasan insists, God hated it. Such a theological position runs counter to the basic understanding of the value of creation that Islam shares with Judasim and Christianity. As *Genesis* 1:31 affirms, “God saw all that he had made, and it was very good.” To speculate on the origins of Ḥasan’s gnosticlike condemnation of the material world would take us beyond the objectives of this present article; suffice it to say that ambivalence toward materiality remained a significant aspect of later Islamic mysticism. The impact of gnostic ideas, however, continued to mold later Sufism, especially in the eastern provinces of the empire. The work of Henry Corbin has done much to open for the student of Sufism this complex world of Ṣūfī, and especially Isma‘īlī, gnosis.

Ḥasan al-Baṣrī’s asceticism, although world-denying, did not entail the total abandonment of society or social structures. On the contrary, Ḥasan functioned as the moral conscience of the state and fearlessly criticized the power structures when he felt they overstepped moral bounds. He eschewed the role of the revolutionary and refused to sanc-

tion movements designed to overthrow irreligious politicians. In Socratic fashion, Ḥasan preferred to work for the ruler's change of heart through persuasion, not violence. Ḥasan's dedication to ascetic ideals did not, moreover, lead him to forsake family life. He married and raised a family, albeit in straitened circumstances. While Ḥasan al-Baṣrī is considered a pivotal figure in the early development of Sufism, he is also noted as a transmitter of traditions (*ḥadīth*) and as a defender of human freedom in the early theological debates of Islam.

*Ibrāhīm ibn Adham.* While there are some extant written materials attributable to Ḥasan al-Baṣrī, textual sources for the lives and teachings of many early ascetics are of questionable value. Often the dearth of authentic historical sources makes it difficult, if not impossible, to distinguish between facts and pious embellishments. A prime example is the life of the famous ascetic Ibrāhīm ibn Adham (d. 770?). Ibrāhīm was said to be a prince of the formerly Buddhist city of Balkh; he gave up his throne in order to pursue the path of asceticism. Some Western commentators have pointed to the possible parallel between his life story and the Buddha legend.

The fables about Ibrāhīm highlight his generosity, altruism, and, most important, his complete trust in God (*tawakkul*). Ibrāhīm's quietism, however, did not lead him to depend on others for his subsistence. He preferred to work and scorned those who relied on begging. It would seem to be fact that he served in two naval battles against the Byzantines; while fighting in the second, he lost his life.

Many tales of Ibrāhīm's life stand out because of the ascetic practices they describe. He cherished ridicule and humiliation; more startling is his joyous acceptance of physical abuse—bloody beatings, being dragged by a rope tied round his neck, being urinated upon, and the like. Clearly such stories are later additions by hagiographers. Nonetheless these grotesque, seemingly masochistic acts are accepted as integral elements of his life history by many Ṣūfī writers. And such tales have helped to shape later authors' understandings of asceticism in this early period of Sufism.

*Rābī'ah al-'Adawīyah.* The actual transition from asceticism to true love mysticism in Islam is documented in the spiritual theory of one of the first great female Ṣūfīs, Rābī'ah al-'Adawīyah (d. 801). Sold into slavery as a child, she was eventually freed because of the depth of her piety. Rābī'ah's focus was not on asceticism as an end in itself, but rather on its ability to help foster a loving relationship with God. Asceticism was only one of the means necessary for the attainment of union; to make ascetic practices themselves the goal, and not intimacy with the Beloved, was, in her estimation, a distortion of the Ṣūfī path.

The love Rābī'ah nurtured was completely altruistic; neither fear of Hell nor desire for Paradise were allowed to divert her gaze from the Beloved.

Rābī'ah's vision of altruistic love (*maḥabbah*) and mystical intimacy (*uns*) are preserved in beautiful prayers and

poems attributed to her. These represent some of the earliest aesthetic expressions of mystical experience in Islam.

One particularly vivid body of fables scattered throughout the Muslim sources centers on the spiritual rivalry between Rābī'ah al-'Adawīyah and Ḥasan al-Baṣrī. The problem with these tales, however, is that they describe a relationship that was historically improbable. Ḥasan died in 728, when Rābī'ah was at best in her early teens. Despite its questionable historicity, the Ḥasan-Rābī'ah cycle provides a valuable insight into male-female relationships in early Ṣūfī circles.

In the vast majority of these didactic tales Rābī'ah's spiritual insight and emotional maturity set her far above her male rival, Ḥasan, whose naiveté and presumptuous self-confidence are held up to ridicule. On occasion the conflict is described in actual male-female terms, with Ḥasan and his male Ṣūfī companions insisting that no woman has the ability to match a man's spiritual perfection. While Rābī'ah proves them wrong beyond the shadow of a doubt, there remains the fact that her success is due partially to the abandonment of the traditional female role and the assumption of more male characteristics. For example, she is said to have repeatedly refused Ḥasan's marriage proposals and remained celibate and childless throughout her life.

*Dhū al-Nūn al-Miṣrī.* A number of early Ṣūfīs such as Rābī'ah evinced a sophistication of esthetic expression and theoretical speculation that laid a solid foundation for later work by Ṣūfī mystics. Pivotal figures such as Dhū al-Nūn al-Miṣrī (d. 859) were both poetic stylists and theoreticians. Although no complete text of his mystical writings has survived, many of his logia, prayers, and poems have been preserved by later writers. He was master of the epigram and an accomplished poetic stylist in Arabic. The full force of his literary talent comes to light, however, in his prayers.

The child of Nubian parents, Dhū al-Nūn was born in Upper Egypt at the end of the eighth century. While many of the factual details of his life are often indistinguishable from pious fiction, a reliable kernel of historical data emerges. Although he lived in Cairo, Dhū al-Nūn traveled extensively, and during one of his sojourns in Baghdad, he ran afoul of the caliph al-Mutawakkil (r. 847–861). The confrontation was sparked by his refusal to accept the Mu'tazilī doctrine of the createdness of the Qur'ān. For this act of defiance, Dhū al-Nūn was imprisoned; during his heresy trial, however, he so affected the caliph with his *apologia* for the Ṣūfī life that al-Mutawakkil released him unharmed.

The preserved sayings of Dhū al-Nūn attest to the profundity of his mystical insight and to the skill with which he developed terminology and structures to analyze the mystical life. He excelled at elucidating the nuances of the various stages (*maqāmāt*) and states (*aḥwāl*) encountered by the mystic along the Ṣūfī path. To him is attributed the first construction of a coherent theory of *ma'rifaḥ*, spiritual gnosis, which he contrasts with *'ilm*, the more traditional path of discursive reason.

A pivotal aspect of Dhū al-Nūn's mysticism is the *coincidentia oppositorum*, the "conjunction of opposites." The God who pours out his love upon the faithful Ṣūfī wayfarer is, in Dhū al-Nūn's view, the same God who afflicts his lover with pain and torment. God is, at one and the same time, *al-muhyī*, "the giver of life," and *al-mumīt*, "the one who kills." Legend has it that at his death the following words were found inscribed on his forehead:

This is the beloved of God,  
who died in God's love.  
This is the slain of God,  
who died by God's sword.

**Mystical ecstasy.** The evolution of ascetic and theoretical principles to guide the Ṣūfī wayfarer, and the growing sophistication of aesthetic expressions of love mysticism were not the only signs of a maturing mystical tradition in Islam. An additional area of creative exploration by a number of ninth- and tenth-century Ṣūfīs centered on refining the understanding of what actually constitutes the goal of mystical experience.

Rābi'ah's articulation of the primacy of love in mystical union provided a general framework for discussion; it did not, however, resolve the most vexing question. Does union entail the complete obliteration of the lover's soul in the Beloved or is the object of mysticism a loving relationship in which both lover and Beloved preserve their independence? Expressed more technically, of what do the experiences of mystical annihilation (*fanā*) and persistence in union (*baqā*) consist?

*Abū Yazīd al-Bisṭāmī.* The debate was brought to a head in dramatic fashion by a number of mystics whose ecstatic utterances provoked and scandalized the traditional elements both within and without the Ṣūfī movement. One of the earliest ecstasies was Abū Yazīd (known also as Bāyazīd) Ṭāyfur ibn 'Isā al-Bisṭāmī (d. 874), who lived in seclusion at Bisṭām in the province of Qūmis. Few details of his life are known, but it is said that he was initiated into the subtleties of mystical union by one Abū 'Alī al-Sindī and that he developed a friendship with Dhū al-Nūn.

Muslim hagiographers and spiritual writers have preserved, nevertheless, many of the ecstatic utterances (*shataḥāt*) attributed to Abū Yazīd. These sayings differ from earlier Ṣūfī expressions of union because of their seeming affirmation of the total identification of lover and Beloved. Cries of "Subḥānī!" ("Glory be to me!") and "Mā a'ẓamā sha'nī!" ("How great is my majesty!") shocked the uninitiated because they smacked of *shirk*, associationism, and aroused many Muslims' suspicions that Sufism was a heretical movement.

In a famous text, considered spurious but existing in several versions, Abū Yazīd vividly describes his reenactment of the Prophet's night journey (*mi'rāj*) as a mystical ascent during which his "I" is gradually absorbed into the "He" of the Beloved. Eventually "He" and "I" become interchange-

able, for in reality the attributes of Abū Yazīd's essence have been subsumed into God.

This particular understanding of mystical annihilation (*fanā*) is characteristic of Abū Yazīd's mystical theory. Complete *fanā* is attained only after the most arduous stripping away of one's attributes. Nothing is spared, neither personality nor spiritual attainments. Abū Yazīd compares the process to the snake's struggle to slough off its skin, or to the blacksmith's violent manipulation of red-hot iron. The mystic experiences the most dramatic shifts of emotion and spiritual experience; the soul vacillates between the expansive rapture of *baṣṭ*, in which the self appears literally to fill a room, and the implosion of *qabd*, in which the self seems reduced to the size of the tiniest sparrow.

Because of the apparent extremism of his ecstatic utterances, al-Bisṭāmī was revered by later Ṣūfīs as the advocate of the path of intoxication (*sukr*) in contrast with the path of sobriety (*ṣaḥw*) associated with the famous Baghdad Ṣūfī Abū al-Qāsim al-Junayd (d. 910). The division between sober and intoxicated Ṣūfīs was to remain an important one throughout the history of Islamic mysticism.

*Al-Ḥallāj.* Despite their dramatic power, the ecstatic utterances of Abū Yazīd al-Bisṭāmī are overshadowed by those of the most famous of the Baghdad mystics, Ḥusayn ibn Manṣūr al-Ḥallāj. He was born in 857 at al-Ṭūr, in the Iranian province of Fārs. His initiation into Sufism began early in life, while he was still a teenager. For more than twenty years he lived in seclusion and was trained by a number of the great Ṣūfī masters of the period: Sahl al-Tustarī, 'Amr al-Makkī, and al-Junayd.

Eventually, however, al-Ḥallāj broke away from his teachers and became an itinerant preacher. His wanderings led him through Arabia and Central Asia to the Indian subcontinent. He came into contact with sages and mystics from a number of other religious traditions who expanded the horizons of his own religious experience. As he continued to mature spiritually al-Ḥallāj attracted increasingly larger numbers of disciples. He became known as *ḥallāj al-asrār*, "the carder of consciences," a play on the family name al-Ḥallāj, which meant "cotton carder."

The core of al-Ḥallāj's preaching was a call to moral reform and to the experience of intense union with the Beloved. Among al-Ḥallāj's poetic and prose writings, one phrase stands out as the paradigmatic expression of mystical ecstasy, his famous "Anā al-Ḥāqq!" ("I am the divine Truth!"). To the ears of non-Ṣūfīs and of more sober elements in Sufism, al-Ḥallāj's self-divinizing cry was tantamount to *shirk*, if not a bald rephrasing of the Christian notion of incarnation (*ḥulūl*).

It is very doubtful that al-Ḥallāj wished to be considered primarily a metaphysician. Consequently the charges leveled against him were due to misperceptions of the intent of his mystical expressions. It would remain for later Ṣūfīs to articulate philosophically a doctrine of identity between God and

creation. Al-Ḥallāj's expressions of ecstasy, on the contrary, are part of a tradition whose main goal was to celebrate the transforming power of the experience of mystical union with the Beloved; secondarily the concern was to contribute to the growing body of technical terminology and theoretical speculation about the nature of mysticism.

Many scholars have considered al-Ḥallāj's proclamation of unique intimacy with the divine to be one of the main causes of his eventual imprisonment and execution at the hands of the Abbasid authorities. There is no doubt that al-Ḥallāj's ecstatic utterances and his reinterpretation of certain elements of Islamic ritual practice were objects of violent criticism by many of the religious hierarchy. His execution, however, was as much the result of politics as of mysticism.

Al-Ḥallāj's insistence on announcing publicly his vision of mystical union transgressed a cardinal principle of the great Ṣūfī masters of his generation. The accomplished mystic was never to divulge to the uninitiated experiences that were beyond their comprehension; the true nature of union was to be discussed only with one's fellow adepts or not at all. Such elitism did not conform to al-Ḥallāj's more populist notion of mysticism. For his lack of prudence he was ostracized by his former teacher al-Junayd and was branded a political threat and rabble-rouser by the secular authorities.

Finally, al-Ḥallāj found himself embroiled in caliphal politics during the reign of al-Muqtadir (908–932). He was lionized and defended by one vizier and condemned by the next, protected by the caliph's mother, but finally sentenced to death by the son. Al-Ḥallāj spent about eight years in prison before he was eventually executed in 922. The gruesome details have been recorded by his disciples: Al-Ḥallāj was flogged, mutilated, exposed on a gibbet, and finally decapitated. The body was then burned. For al-Ḥallāj, however, death was not a defeat; on the contrary, he desired fervently to become a martyr of love. Al-Ḥallāj was convinced that it was the duty of the religious authorities to put him to death, just as it was his duty to continue to preach aloud the unique intimacy he shared with the divine:

Kill me, my trusted friends,  
for in my death is my life!  
Death for me is in living, and  
life for me is in dying.  
The obliteration of my essence  
is the noblest of blessings.  
My perdurance in human attributes,  
the vilest of evils.

The creativity of al-Ḥallāj's work is reflected perhaps most strikingly in his ingenious use of the science of opposites. In his *Kitāb al-tawāsīn* al-Ḥallāj describes his two role models in mysticism as Iblīs (the devil) and Pharaoh. Both suffered condemnation at the hands of God, al-Ḥallāj attests, yet neither swerved from his appointed course. The Qur'anic text affirms on several occasions that Iblīs, who was chief of the angels and the most dedicated of monotheists, was com-

manded by God to bow to the newly created Adam. He refused, despite God's threat to condemn him forever, and chose, like al-Ḥallāj, to become a martyr of love.

My refusal is the cry, "Holy are you!"  
My reason is madness, madness for you.  
What is Adam, other than you?  
And who is Iblīs to set apart one from the other?

All three are outcasts who have transgressed the law to attain a higher goal. Yet the reason for the transgression is each one's love relationship with God, which functions as a higher law for the perfected Ṣūfī.

My friend and my teacher are Iblīs and Pharaoh. Iblīs was threatened with the fire, but he did not go back on his preaching. And Pharaoh was drowned in the Red Sea, but he did not acknowledge any mediator at all. . . . And if I were killed, or crucified, or if my hands and feet were cut off, I would not go back on my preaching.

'*Ayn al-Quḍāt*. An even more subtle treatment of the science of opposites (*coincidentia oppositorum*) is evident in the work of another martyr-mystic of Islam, 'Ayn al-Quḍāt al-Hamadhāni, who was born in western Iran in 1098. He proved himself a brilliant student as a young man, mastering the traditional Islamic religious sciences. He was also recognized for the quality of his literary style in both Arabic and Persian. The most influential Ṣūfī master in his spiritual formation was Aḥmad al-Ghazālī (d. 1128), a preeminent teacher and the brother of the most famous mystic-theologian in Islam, Abū Ḥamid al-Ghazālī (d. 1111). Aḥmad's own contribution to Sufism is considerable, especially his classic treatise on mystical love, *Sawānih*.

As 'Ayn al-Quḍāt's fame grew, his disciples increased and, like al-Ḥallāj, he soon incurred the wrath of the religious and political authorities. He was accused of a number of heretical ideas, the most serious being the claim that there was a complete identity between the Creator and his creation. Imprisoned in Baghdad, 'Ayn al-Quḍāt was later transferred to his native city of Hamadhān where he was put to death in grisly fashion in 1131; he was only thirty-three years of age.

The conjunction of opposites, according to 'Ayn al-Quḍāt, is reflected in the very notion of the God of Islam. One need look only to the Muslim confession of faith (Shahādah) for confirmation: "Lā ilāha illā Allāh" ("There is no god but God!"). *Lā ilāha* ("there is no god") is the realm of the malevolent divine attributes, which spawn falsehood and which seduce the soul of the mystic away from the truth.

To pass from *lā ilāha* to the realm of *illā Allāh* ("but God") requires that the Ṣūfī wayfarer confront God's chamberlain, who stands guard at the threshold of *illā Allāh*. Who is this chamberlain? None other than the devil Iblīs.

In the same way that al-Ḥallāj in his *Kitāb al-tawāsīn* purports that the devil Iblīs is a model of piety, 'Ayn al-Quḍāt employs this paradoxical motif to dramatize the

tension of opposites in God. He links Iblīs with Muḥammad, claiming that both are but different aspects of the same divine reality. Iblīs is described as the black light of straying while Muḥammad is the white light of truth and gnosis; both spring, however, from the same attribute of God, namely his power. Muḥammad is the guiding light of God's power while Iblīs is its destructive fire.

Perhaps the most creative symbols employed by 'Ayn al-Quḍāt to capture the conflict within God are those of the curl and the mole that lay upon the face of the Beloved. The lock of hair that hangs in an arrogant curl over the cheek of the Beloved enjoys a privileged state of intimacy. Instead of driving away the seeker from the threshold of *illā Allāh* with the sword of divine power, or deceiving the soul with black light, the Iblīs-curl distracts and seduces the Ṣūfī with the amorous gestures of the coquette, thus entangling the soul in lesser spiritual attainments.

The image of the Iblīs-curl must, of course, have its Muḥammad counterpart. In addition to the curl, the mistress possesses another mark of beauty, a black mole on the cheek that is equated with Muḥammad. Both curl and mole, however, spring from the face of God; the curl is seducer while the mole is the guide to Truth.

All of the paradoxical images used by 'Ayn al-Quḍāt—the tension between curl and mole, black light and white light, between *lā ilāha* and *illā Allāh*—point to the fact that God himself is the source of paradoxes. Moreover 'Ayn al-Quḍāt is convinced that both poles of the paradox must be experienced if one is to attain true spiritual gnosis:

Unbelief and faith are two veils beyond the throne between God and the servant, because man must be neither unbeliever nor Muslim.

**MYSTICAL LITERATURE.** The science of opposites, with its rich symbolism and provocative speculation, appealed only to a small number of Ṣūfīs because of the level of intellectual sophistication it demanded and because of its esoteric quality. In contrast, beginning in the late ninth century, a number of texts began to appear that were aimed at a broader spectrum of the Muslim faithful and functioned as training guides for men and women interested in cultivating mystical experience.

**The manual tradition.** The emphasis of the manuals was not on the arcane dimensions of Sufism, but on its accessibility and its conformity with Islamic orthodoxy.

One of the earliest manuals addressed to a Ṣūfī novice is the *Kitāb al-ri'āyah* (Book of consideration) of Abū 'Abd Allāh al-Ḥārith ibn Asad al-Muḥāsibī (d. 857). He is remembered particularly for his skill in developing the examination of conscience as an effective tool for advancement in the spiritual life.

Among the classics of this genre of religious literature in Sufism are the *Kitāb al-ta'arruf* (Book of knowledge) of Abū Bakr Muḥammad al-Kalābādhī (d. 990 or 995), the

*Kitāb al-luma'* (Book of concise remarks) of Abū Naṣr 'Abd Allāh ibn 'Alī al-Sarraḡ (d. 988), *Al-risālah al-qushayrīyah* (The Qushayrīan letter) of Abū al-Qāsim 'Abd al-Karīm al-Qushayrī (d. 1074), the *Kashf al-mahjūb* (Unveiling of the veiled) of 'Alī ibn 'Uthmān al-Jullābī al-Hujwīrī (d. 1071/2?), and the *Qūt al-qulūb* (Nourishment of the heart) of Abū Ṭālib Muḥammad ibn 'Alī ibn 'Aṭīyah al-Ḥārithī al-Makkī (d. 996).

**Spiritual guidance.** Doubtless the primary goal of these manuals was to serve as guides for novices newly embarked upon the Ṣūfī path. The literary structure reflected this; often the conceit was that of the master writing to, or answering the questions of, a particular disciple. The internal composition of the texts varies considerably from one author to the next. Some are collections of insights strung together like random pearls; others, such as the *Kashf al-mahjūb* of al-Hujwīrī, present a coherent and systematic analysis of Sufism.

Earlier Ṣūfīs had relied heavily on the personal relationship of master (shaykh, *pir*) with disciple (*murid*, *ṭālib*) to provide the guidance necessary for spiritual progress. But as the number both of disciples and of famous shaykhs increased, written manuals became invaluable supplements to personal spiritual direction. The manuals preserved the teachings of many of the greatest Ṣūfī guides and made their wisdom available to a larger number of the brethren. While Ṣūfī manuals never supplanted the master-disciple relationship, they did attain a permanent place of influence and honor among Muslim mystics.

In addition to providing spiritual guidance, the Ṣūfī manuals also addressed a number of subsidiary issues of critical importance. The first was the need to legitimize the place of Sufism in the broader spectrum of Islamic religious life. To this end authors such as al-Kalābādhī and al-Qushayrī made deliberate efforts to demonstrate that Sufism was in conformity with the orthodox theological synthesis, namely Ash'arism. Al-Sarraḡ as well took pains to prove that Sufism was completely in tune with the Qur'ān, *ḥadīth*, and Islamic legal tradition (*sharī'ah*).

A further cause of heightened tension between Ṣūfīs and the champions of orthodoxy concerned the possible conflict between the roles of Ṣūfī saint and traditional prophet. Sunnī Islam presumed that prophethood was the pinnacle of spiritual perfection, exemplified by Muḥammad himself. To substantiate this claim, Muslim theology asserted that all prophets possessed the special gift of impeccability (*'iṣmah*); each had the power, moreover, to perform a unique miracle (*mu'jizah*) in order to verify his mission.

Some Ṣūfīs, on the other hand, suggested that sainthood was an even more elevated spiritual rank than prophethood because it presumed a unique intimacy with the divine. Most manual writers, however, evolved a less polemical stance, one designed to reinforce the mainstream character of Sufism. They concluded that the highest level of saint-

hood was only the first level of prophethood. While the prophet was impeccable from birth, the saint was only protected (*mahfūz*) from committing serious sin, and this only after he or she had attained sainthood. Whereas the miracles of the prophets were unique and indisputable, the miracles of the saints (*karāmāt*) were repeatable and subject to satanic influence.

A common objective of all the Ṣūfī manuals is to analyze in depth the various stages and states that make up the Ṣūfī path. Stages are considered by spiritual writers to be levels of permanent growth in the mystical life; states represent the more transient emotional and psychological experiences associated with the various stages. The process of scrutinizing in analytic fashion the stages and states of mystical experience resulted in the creation of a sophisticated technical vocabulary that provided a basis for common discourse among Ṣūfis of every generation.

The exploration of the stages and states of mystical experience resulted, as well, in the development of highly refined theories of spiritual psychology. Ṣūfī psychologists aimed first and foremost at providing trainees with the means to gain control over the *nafs*, or lower soul (see surah 12:53), which was identified as the satanic element within men and women. Al-Makkī describes the *nafs* as arrogant, deceptive, envious, a beast that wallows in excess.

The Ṣūfī novice was not helpless, however, in his confrontation with the *nafs*. Men and women possessed an angelic force (*malak*) sent by God to do battle with the *nafs* in the arena of the heart (*qalb*). As al-Muḥāsibī indicates, both *malak* and *nafs* employ similar weapons, notably the various internal impulses (*khawāṭir*) that arise in the heart urging one to good or evil.

On occasion the various movements in the heart are quickly identifiable either as the satanic whisperings (*waswasah*) of the *nafs* or as the impulses of the *malak*. Much more difficult, however, are those times when the origin of the *khawāṭir* is unclear. For the devil-*nafs* excels at deluding the soul of the Ṣūfī and seducing him or her to actions that, while not sinful, deflect the Ṣūfī from the road to the greater good. It is in dealing with these spiritual dilemmas that the techniques of Ṣūfī psychology articulated in the manual tradition demonstrate their subtlety and true sophistication.

*Al-Ghazālī.* The effort of many of the manual writers to legitimize Sufism's place in Islam culminates in the work of a man whose contribution to the Islamic religious sciences ranges far beyond mysticism. Abū Ḥāmid Muḥammad ibn Muḥammad al-Ghazālī was born at Ṭūs near the modern Iranian city of Mashhad in 1058. His early training was in jurisprudence (*fiqh*), but he soon excelled in theology (*kalām*) and eventually in Arabic philosophy (*falsafah*), which was exemplified by the Neoplatonism of al-Fārābī and Ibn Sīnā (Avicenna).

A recurring theme in al-Ghazālī's work is the relationship between reason and revelation. The great Arab philoso-

phers tilted the balance in favor of reason, insisting that truth was attainable without the aid of revelation. The conclusions arrived at by philosophers, however, did not always conform to the standard orthodoxy derived from the Qur'ān. For example, dogmas on the creation of the world from nothing, the resurrection of the dead, God's knowledge of particulars as well as universals—all were called into question by the philosophers.

Al-Ghazālī championed the truth of revelation over that of philosophical speculation. He was not, like some fundamentalist extremists, antiphilosophical however. On the contrary, al-Ghazālī's fascination with philosophical logic is manifested in many of his works, for he was convinced that philosophy could contribute substantially to Muslims' understanding of law and theology. It was only against the excesses of philosophy that he railed in his *Tabāfut al-falāsifah* (The incoherence of the philosophers), not against philosophical reasoning per se.

Al-Ghazālī's influence was enhanced by the political support he received from the ruling authorities, especially the Seljuk vizier Nizām al-Mulk, who appointed him professor at the Nizāmīyah *madrasah* in Baghdad in 1091. It was during his professorship at Baghdad, however, that a personal crisis radically transformed the future shape of al-Ghazālī's career. Whereas his earlier concerns had been with more theoretical and speculative issues, the focus now shifted to the role of religious experience in the life of the Muslim.

In 1095 al-Ghazālī experienced what can only be called an emotional and psychological breakdown. As he described it later in his autobiography, *Al-munqidh min al-dalāl* (The deliverer from error), his state of anxiety left him almost catatonic. He suffered terrible doubts about his ability to arrive at any religious truth; more important he was overwhelmed by the emptiness of external religious ritual and law. Al-Ghazālī abandoned his teaching career and sought a solution to his doubts in Sufism, which, he hoped, would provide him with the personal experience of truth or *dhawq* (lit., "taste").

The success of his quest is attested by his later writings, which foster the integration of an interior life with the life of external observance. Alone, each leads either to excess or to spiritual myopia; together, however, they constitute a life of balance and dynamic spiritual growth. To this end al-Ghazālī wrote what was to be his most influential work, the *Ihyā' 'ulūm al-Dīn* (Revivification of the religious sciences), which epitomizes his vision of Islamic life and which remains an integral part of the training of Muslim scholars to this day.

After eleven years of absence from teaching, al-Ghazālī was persuaded to return once again to the classroom by the vizier Fakhr al-Mulk, son of his late patron, Nizām al-Mulk. His second career lasted only several years, for he retired to a Ṣūfī convent at Ṭūs before his death in 1111. The measure of his impact on the intellectual life of Islam is impossible

to calculate. In the history of Sufism, however, he is especially remembered for having contributed substantially to the acceptance of mystical experience as an integral dimension of Islamic religion.

**Other genres.** In addition to the Šūfī manuals, other important genres of mystical literature developed in the classical period. Fables, epigrams, epic poems, poetry, aphorisms, all were creative vehicles for mystical expression. Early Qurʾān commentators and street preachers had focused on the lives of the prophets for inspiration. This spawned the *Qiṣaṣ al-anbīyaʾ* (Tales of the prophets), collections of lively didactic stories, often with moral themes. In similar fashion the lives of famous Šūfīs were assembled by mystical writers into biographical dictionaries, which evolved into important companion volumes to the manuals.

Despite the fact that authors rarely distinguished between historical fact and pious fiction, these hagiographic compendia are crucial for current knowledge of the lives and teachings of the great masters of classical Sufism. Individual compilers, moreover, offer important critiques of a number of Šūfī movements, mystical theories, and the like.

The first systematic history of the lives of Šūfī mystics is ascribed to Abū ʿAbd al-Raḥmān al-Azdī al-Sulamī (d. 1021). His *Ṭabaqāt al-šūfīyah* (Generations of the Šūfīs) became the basis for the expanded versions of two later Šūfīs, the *Ṭabaqāt al-šūfīyah* of Abū Ismāʿīl Abd Allāh Anṣarī (d. 1089) and the *Nafāḥat al-uns* (Wafts of pleasure) of Nūr al-Dīn ʿAbd al-Raḥmān ibn Aḥmad Jāmī (d. 1492). The most comprehensive work of Šūfī hagiography, however, is the prodigious, multivolume *Ḥilyat al-awliyāʾ* (Necklace of saints) of Abū Nuʿaym al-Iṣfahānī (d. 1037). Later writers continued the tradition, including Farīd al-Dīn ʿAṭṭār (d. 1221?) with his *Tadhkirat al-awliyāʾ* (Biographies of the saints).

*ʿAbd Allāh Anṣarī and the epigram.* Many of these authors excelled at more than one genre of mystical literature. ʿAbd Allāh Anṣarī of Herat, a city in present-day Afghanistan, for example, is noted for important works on mystical theory but most especially for his epigrams, the *Munajat* (Intimate conversations). This tiny book, a milestone in Šūfī literature, is the *vade mecum* of countless Persian-speaking Muslims. Although the text appears deceptively simple it contains the kernel of Anṣarī’s complex vision of mystical union.

To appreciate Anṣarī’s contribution to Islamic mysticism, it is essential to place him in the context of the theological debates that resulted in the classical synthesis of al-Ashʿarī (d. 935) and his school. Controversies arose in the ninth century over differing interpretations of the Qurʾānic verses dealing with freedom and predestination, the nature of divine attributes, and the origins of good and evil. The most influential group defending radical freedom and moral responsibility were the Muʿtazilah, whose views were strongly influenced by Greek thought. Since human beings are re-

sponsible for their deeds, they insisted, God cannot be blamed in any way for human turpitude. Reward and punishment are absolutely just because God himself is just. Furthermore God’s justice requires that actions have an intrinsic moral worth that can be recognized by men and women.

The logic of the Muʿtazilī view, nevertheless, was challenged by verses in the Qurʾān itself that emphasize God’s complete omnipotence and question human beings’ ability to determine their fates, for God “leads astray whomever he wills and guides whomever he wills” (16:93). A solution proposed by al-Ashʿarī and his followers was to choose neither radical freedom nor complete predestination, but rather to affirm both as true. This use of paradox as a hermeneutical tool permeates both theology and mysticism in Islam.

It must be admitted, however, that al-Ashʿarī’s views leaned more in the direction of predestinarianism than of freedom. He was a staunch proponent of God’s complete control over human actions; freedom is little more than God’s willingness to allow people to participate in their determination of their fate. It is God alone who first creates human actions and then ascribes them to humans.

Even secondary causality is called into question because to assert that nature functions independently according to its own laws seems to ascribe to nature an independent power separate from God, a position smacking of *shirk*. In defending God’s absolute omnipotence, furthermore, al-Ashʿarī was obliged to deny the intrinsic goodness or evil of human actions. An action is good or evil only because God has determined it to be so. Lying, for example, is evil because God has so decreed; if he changed his mind lying would be right.

Anṣarī’s theological views were even more conservative than those of al-Ashʿarī. As a follower of Aḥmad ibn Ḥanbal (d. 855), Anṣarī defended the most literalist interpretations of the Qurʾān. Whereas the Muʿtazilah allegorized the anthropomorphic descriptions of God’s attributes in the Qurʾān, and the Ashʿarīyah affirmed their existence, albeit in a way beyond the grasp of human reason, Anṣarī and the Ḥanabīlah insisted that the verses must be taken at face value. Consequently his positions appeared even more paradoxical than those of the more moderate Ashʿarīyah.

As Anṣarī indicates in the *Munājāt*, God commands people to obey him and then prevents their compliance. Adam and Eve, for example, are seduced not by Satan, but by God. Their seduction is predestined and they are obliged to participate. Despite the seeming victimization of humans by God, however, the Šūfīs are not to conclude that they are absolved of responsibility for their evil deeds. Paradoxical as it may sound, Anṣarī recommends that the true attitude of the devoted mystic is that taken by Adam and Eve when they were confronted with the tragedy of their sin. They realized they were God’s pawns but blamed themselves for the deed: “And they both said, ‘O Lord, we have wronged ourselves!’” (surah 7:23).

Anṣarī moves naturally in the *Munājāt* from a discussion of the paradoxical tension between freedom and predest-

tionation to that between good and evil. And he reflects an attitude toward ethics that is characteristic of many of the ecstatic Ṣūfīs: Whatever God wills for the mystic, be it blessing or curse, intimacy or separation, is good because it comes from God. Such a stance runs counter to the mainstream ethics of Sunnī Islam, which locate the guide for human action and the determination of moral worth in the synthesis of Qurʾān, *ḥadīth*, and *sharīʿah*.

For the perfected Ṣūfī, however, there is a higher law, namely the love relationship, that determines action and provides the means to evaluate the goodness or evil of particular behavior. The upshot is that, for the Ṣūfī elite, certain practices are permissible that would be disproved according to the religious law of the community.

Such an attitude has often been cited as proof of the dangerous antinomian tendencies endemic to Sufism. On closer examination, however, such behavior is not that far removed from the classical Ashʿarī synthesis. Al-Ashʿarī, as has been seen, claims that actions are good or evil because God determines them to be so; moreover, if he changed his mind about a particular action its moral worth would change. What one finds in the behavior of a number of Ṣūfīs is, in fact, the acting out of this hypothetical case, for the Ṣūfī elite insist that the quality of their love relationship with the divine raises them to a higher tier of ethics, one at times radically different from the lower tier. Anṣarī counsels the Ṣūfī to move beyond the everyday concerns with reward or punishment, and beyond the common notions of good and evil. The goal is to please the Beloved; that is what constitutes the good.

Anṣarī goes so far as to claim that the lover-beloved relationship moves one to a plateau on which even the five pillars of Islam appear superfluous. The pilgrimage to Mecca is an occasion for tourism; almsgiving is something that should be left to philanthropists; fasting is an ingenious way to save food; and ritual prayers should be left to old crones. The focus of the mystic should not be the laws and ritual structures of the Islamic community (*ummah*); it is the love relationship that supersedes all.

Anṣarī is a dramatic example of the mystic whose basic theological and religious conservatism do not bar him from the most exuberant expressions of union. He is not, however, alone in perceiving that the Ṣūfī adept must often move beyond the constraints of Islamic law. Abū Saʿīd ibn Abī al-Khayr (d. 1089) of Mayhana in Khorasan, for example, mirrors as well the same paradoxical approach to religious practice. He began his life as a violent ascetic, isolating himself from normal social intercourse and faithfully observing the obligations of the law. It is said that he was discovered by his father hanging upside down in a pit, reciting the Qurʾān.

At the age of forty, however, Abū Saʿīd attained gnosis (*maʿrifah*) and his actions changed dramatically. He and his followers became renowned for their feasting. In place of ritual prayer, communal Ṣūfī devotions were substituted.

Once, when questioned by a non-initiate about his attitude toward the pillars of Islam, especially the pilgrimage to Mecca, he replied that it was a waste of time to travel so far simply to circumambulate a stone house (the Kaʿbah). Rather, the sacred cube should circumambulate him! These statements, shocking though they were to non-Ṣūfīs and even to some of the more sober mystics, were not intended to flout the law. On the contrary, the privileged spiritual elite understood their behavior as that which was enjoined on them by the Beloved.

*The mathnavī: Farīd al-Dīn ʿAṭṭār.* The epigrams of ʿAbd Allāh Anṣarī, succinct and accessible to a wide range of people, are in sharp contrast with the poetic genre of *mathnavī*, which was introduced into Sufism by the Ghaznavid poet Ḥakīm Abū al-Majd Majdūd ibn Adam Sanāʾī (d. 1131?). The rhyming couplets of the *mathnavī* had previously been made famous in secular literature by the renowned Persian poet Firdawsi in his *Shāh-nāmāh* (The epic of the kings). The general structure of Sanāʾī's mystical *mathnavīs*, the most famous of which is the *Ḥadīqat al-ḥaqīqah* (The garden of truth), is imitated by later Ṣūfī authors. The framework consists of mystical teachings interspersed with illustrative fables, anecdotes, proverbs, and the like. The different *mathnavīs* vary, however, in length, the quality of their style, and in the organization and development of their themes.

Important as Sanāʾī's introduction of the *mathnavī* into Sufism was, he is not remembered as a great stylist. For a true master of the *mathnavī* form one must turn to the Persian poet and spiritual guide, Farīd al-Dīn ʿAṭṭār (d. 1221?). ʿAṭṭār lived most of his life in and around the city of Nishapur, near the modern Iranian city of Mashhad. It is reported that he was killed during the Mongol sack of the city. His name indicates his occupation, that of apothecary, and it appears that he continued in his profession even as he composed his mystical treatises.

It is evident from ʿAṭṭār's work that he was a man learned in both the religious sciences and secular literature. He demonstrates enormous perspicacity in his treatment of the subtleties of the spiritual life. ʿAṭṭār's success, however, is due equally to the fact that he possessed the requisite literary skills to mold his ideas into an aesthetic whole of genuine quality. ʿAṭṭār is poet, storyteller, and spiritual theorist; he entertains, cajoles, and leads the reader through numerous levels of spiritual awareness.

Of his *mathnavīs* the best known is the mythic fable *Manṭiq al-ṭayr* (The conference of the birds). The text operates on a number of levels. On the surface it is a lively fable about a group of birds who decide to seek out their king, the Sīmurgh, of whom they have only the barest recollections. The journey is long and arduous, the path uncertain. Many birds abandon the quest out of weakness, apathy or fear; others perish along the way. Finally thirty birds arrive at the palace of the Sīmurgh. This event constitutes the pun on which the story is based, for "thirty birds" in Persian is *sī murgh*.

The far more serious level on which the fable operates is that of an elaborate analysis of the Šūfī path. Asceticism, illumination, and finally union are explored in depth. The internal structure of the work resembles an ascending spiral staircase. The bird-souls progress upward, often returning to an earlier point, except now at a more advanced level. The birds are not uniform souls but mirror a variety of human personality types. Their strengths and difficulties reflect, moreover, the issues faced by a wide variety of Šūfī seekers.

The overall power of the work is due to its meticulous organization. It is necessary to study the text closely to appreciate the care with which ‘Aṭṭār develops his multileveled thematic structure. The last section of the work describes the seven valleys through which the tested remnant must pass in order to reach the Simurgh. The final valley is that of *fanā*, “annihilation,” where the thirty birds merge with their beloved Simurgh as the moth merges with the flame.

**Lyric and mathnavī: Jalāl al-Dīn Rūmī.** Despite ‘At-tar’s obvious literary and analytic skills, his work is surpassed by the greatest of the Persian mystical poets, Jalāl al-Dīn Rūmī (known as Mawlānā, “our master”). Rūmī was born in Balkh in 1207, the son of Bahā’ al-Dīn Walad, who was himself a noted legist, teacher, and spiritual guide. Around 1219, however, Bahā’ al-Dīn left Balkh because of the threat of invasion by the Mongols. The family set out on pilgrimage to Mecca, passing through the city of Nishapur where, it is reported, Bahā’ al-Dīn and his young son met ‘Aṭṭār, who predicted Rūmī’s future greatness.

Bahā’ al-Dīn settled eventually in Konya in Anatolia (known as Rūm, hence the name Rūmī). He was warmly received by the ruling Seljuk authorities and resumed his career as teacher and shaykh. Following in his father’s footsteps, Jalāl al-Dīn became well versed in the Islamic religious sciences and philosophical theology. After Bahā’ al-Dīn’s death in 1231, Jalāl al-Dīn assumed his father’s teaching post.

Rūmī’s Šūfī training progressed in serious fashion under the tutelage of Burhān al-Dīn Muḥaiqqiq, one of his father’s disciples. The critical moment in Rūmī’s spiritual development, however, was his meeting in 1244 with Shams al-Dīn of Tābriz. For two years they were inseparable, Rūmī finding in Shams the vehicle through which to experience the true ecstasy of mystical love. Their relationship was a source of jealousy and scandal among Rūmī’s family and followers. Abruptly, Shams departed Konya for parts unknown.

Rūmī was disconsolate, but, with the help of his son Sulṭān Walad, he engineered Shams’s return. Rūmī’s rekindled joy was shortlived, however, because Shams disappeared for the last time in 1248, and there is persuasive circumstantial evidence that Shams was murdered, perhaps with the connivance of Rūmī’s family.

The intense love relationship Rūmī shared with Shams was the catalyst for the creation of some of the most extraordinary poetry in the Persian language. Rūmī was prolific; his poetic verses number close to forty thousand, collected in a

work that bears the name of his beloved, the *Divāni Shams-i Tabrīzī*. He is a master of imagery, ranging from the mundane realities of food, weaving, and the like to more subtle treatments of nature, music, and religious symbols. Prominent, of course, is the image of Shams, “the sun,” in whose brilliance and intensity Rūmī loses himself. Both the agony of separation and the exhilaration of union ebb and flow throughout his poetry. The emotions evoked run the gamut of human experience. Rūmī does not hesitate to shock; anger, cruelty, and vulgar sexuality share the stage with the ecstasy of annihilation in the Beloved, proving that the Šūfī quest must not be romanticized. Love not only has the potential to fulfill; it also destroys.

Rūmī’s other masterpiece, his *Mathnavī-yi ma’navī* (Spiritual Couplets), was written at the urging of his cherished disciple Ḥusām al-Dīn Chelebī. Ḥusām al-Dīn, like many Šūfīs of the period, discovered in the *mathnavīs* of Sanā’ī and ‘Aṭṭār a wealth of spiritual wisdom. It was imperative, Ḥusām al-Dīn believed, for his revered shaykh to preserve his teachings in similar fashion for posterity. Thus Rūmī was persuaded to dictate his *Mathnavī* to Ḥusām al-Dīn, who transcribed the text and read it back to his master for correction. The final product is substantial, six books totaling almost thirty thousand verses. Several of Rūmī’s lesser works—letters, discourses, and sermons—have been preserved as well.

Whereas ‘Aṭṭār’s works, especially his *mathnavīs*, are noted for their clear structural development, those of Rūmī resemble more the stream-of-consciousness style. One must be steeped in Rūmī’s work before daring to analyze his thought.

The statement is often made that Rūmī’s *Mathnavī* is the Qur’ān of the Persians. While the main point is the enormous popularity the text has had, and continues to have, in the Persian-speaking world, there is another level on which the comparison is apt. The Qur’ān communicates itself primarily in individual, sometimes self-contained, units, not as a structured whole. Similarly, many segments of the *Mathnavī* have an internal unity of their own. Yet the sections of the text are strung loosely together like a string of pearls of different sizes, shapes, and hues. Themes appear and disappear, only to be addressed again from a different perspective. To seek out a unifying structural element in the *Mathnavī* is perhaps to do an injustice to the intent of the author. Its appeal lies in its fluidity and allusiveness. True, this can be frustrating at times; frustration, however, soon turns to fascination as the reader is lured once again into the complex web of Rūmī’s thought.

**GNOSIS AND IBN ‘ARABĪ.** The history of mysticism in Islam is replete with individuals of brilliance and creativity. Among these exceptional personalities, however, one stands out from the rest because of his unique genius. Abū Bakr Muḥammad ibn al-‘Arabī al-Ḥātimī al-Ṭā’ī was born at Murcia in Muslim Spain in 1165. He is honored with the titles “Al-Shaykh Al-Akbar” (“*doctor maximus*”) and “Muḥyī al-Dīn” (“the re-

vivifier of religion”). Eventually he came to be known under the name Muḥyī al-Dīn ibn ‘Arabī.

While still a child, Ibn ‘Arabī and his family moved to Seville, where he received the greater part of his education in the traditional Islamic religious disciplines. He was greatly influenced in his spiritual development by two female Ṣūfīs, especially Fāṭimah of Cordova. A great deal of his mystical insight, however, evolved from visionary experiences, the first occurring during an illness in his youth. Throughout his life he continued to have visions on which he placed a great deal of reliance.

Ibn ‘Arabī’s visionary bent is equally evident in his claim to have been initiated into Sufism by the mythic figure Khidr, a mysterious being, said to be immortal, associated with a Qur’ānic fable (*sūrah* 18) and pre-Islamic legends. Khidr is renowned in Sufism as a saint and guide of exceptional spiritual power; to be chosen as one of his disciples is a rare privilege.

In his early twenties Ibn ‘Arabī traveled extensively throughout Spain and North Africa and broadened his intellectual perspectives. He describes a unique meeting in Cordova with the greatest of the Muslim Aristotelian philosophers, Ibn Rushd (known as Averroës in the Latin West). The encounter is heavy with symbolism, for Ibn Rushd represents the total reliance of philosophers on reason (*‘aql*), while Ibn ‘Arabī champions gnosis (*ma‘rifah*) as the only means to experience the fullness of truth.

In 1201 Ibn ‘Arabī left Spain and North Africa for the last time, undertaking travels that brought him to many important centers of Islamic learning. In 1223 he settled in Damascus, where he remained until his death in 1240. His mausoleum continues to be an important pilgrimage center.

Ibn ‘Arabī is unique because he was both an original thinker and synthesizer. Many of his ideas resonate with earlier intellectual developments in Sufism and in philosophical theology. His greatness, however, lies in his ability to systematize Ṣūfī theory into a coherent whole with solid metaphysical underpinnings. Ibn ‘Arabī, therefore, should not be viewed as an eccentric outside of the mainstream, but rather as the genius who was able to gather together various strains of mystical philosophy and to mold them into an esthetic whole.

The corpus of Ibn ‘Arabī’s work is massive, which complicates considerably any attempt at a comprehensive analysis of his thought. In addition his style is often dense, reflecting the esoteric nature of his ideas. Two of his most influential works are *Al-futūḥat al-makkīyah* (The Meccan revelations), which he was ordered to write in a visionary experience while on pilgrimage, and *Fuṣūs al-ḥikam* (The bezels of wisdom).

**Waḥdat al-Wujūd.** The central concept in Ibn ‘Arabī’s system is *waḥdat al-wujūd*, “unity of being.” Scholars have debated whether Ibn ‘Arabī intends this term to describe a monist system, where nothing exists but the One. An affirmative response does not indicate, however, a dramatic shift

in Muslim metaphysics because, in reality, Ibn ‘Arabī is only taking the Ash‘arī synthesis to its logical extreme. The Ash‘arī insistence on God’s total omnipotence and control over the universe implies that God is the only true agent. It is not illogical, therefore, to suggest, as Ibn ‘Arabī does, that God must also be the only true existent.

The divine essence in itself is completely transcendent; it is, in fact, unknowable, the *lā ilāha* (“there is no god”) of the Muslim confession of faith. This plane of unconditioned unity (*aḥadīyah*), however, is not the only plane on which divine reality exists. The plane of oneness (*wāḥidīyah*) is characterized by a unity in plurality, a unity in which the qualities of all possible existents reside. Once again the ultimate solution is paradox. The divine is undifferentiated and totally transcendent; yet in the divine are discovered the qualities of all potential beings.

Reality, therefore, is tiered, a progression of spiritual manifestations. Ultimate reality is the *theos agnostos*, the “unknown God,” from which emerge the different planes of divine existence, culminating in the God of revelation, Allāh, the *illā Allāh* (“but God”), of the confession of faith. The creation of the cosmos occurs, not out of nothing (*creatio ex nihilo*) as traditional Western theology would have it, but because of the yearning of the unknown God to escape from isolation. A *ḥadīth* dear to Ṣūfīs encapsulates God’s intent: “I was a hidden treasure and I desired to be known, so I created the creation in order that I might be known.”

Creation, therefore, is the manifestation of the One in the plurality of created beings. God’s sigh of longing breathes forth the universe, the mirror in which he comes to know himself. The agency through which the cosmos is produced is the divine creative imagination. The process is not static but dynamic, for in the same way that God exhales, he inhales, drawing creation back to its source in the One. Gnosis for the Ṣūfī, therefore, entails progress along the path from illusion (the naive conviction that he is an independent reality distinct from God) to insight into creation’s identification with God’s self-revelation.

**The Perfect Human Being.** The mirror that the One projects forth is not uniformly polished. The created being in which the Absolute becomes most fully conscious of itself is man. And there is in every generation *al-insān al-kāmil*, the Perfect Human Being, who is the link between Absolute Being and the created realm. Through the mediacy of the Perfect Human Being the dynamic process of emanation and return takes place. In fact, the process would be impossible without that being, the most perfected Ṣūfī, the *quṭb* (“pole”), the axis around which the cosmos revolves.

Ibn ‘Arabī’s emanationist view of creation reinterprets, moreover, the traditional understanding of the goal of mysticism in Islam. Many early Ṣūfīs described the path as a growth in loving union between a soul, which retains its essential independence, and the Beloved who, while being the source of creation, is distinct from it. For Ibn ‘Arabī and his

followers, the goal is not primarily love but wisdom, to move from the illusion of plurality to the gnostic insight that one has always been, and will continue to be, totally united with the source of all being.

*Wahdat al-wujūd* has enormous implications, furthermore, for the Ṣūfī understanding of human freedom and ethics. Nothing manifests itself in creation unless God wills it. This is an axiom of both Ibn ‘Arabī and traditional Islam. In Ibn ‘Arabī’s system, the archetypes of all potential beings exist in the One. When these potential realities are actualized in the illusory realm of plurality, they function completely in accord with their celestial archetypes. In the realm of the created world, therefore, individual free choice is illusory. All change is predetermined by the archetype of the particular reality. Freedom exists only insofar as all creatures participate in the freedom of the One, with which they are ultimately identified.

Ethics, in addition, must be seen in the light of the determinative power of the celestial archetypes. In the realm of creation, the law (*sharī‘ah*) delineates what actions are in accord with God’s revelation. From the perspective of the One, however, all actions are good since they are manifestations of the divine creative imagination and are in accord with the celestial archetypes. Culpability is relative because it is operative only in the realm of created illusion. Eventually all return to the undifferentiated One; thus there is no eternal reward or punishment in the traditional sense.

The complexity of Ibn ‘Arabī’s thought defies summation in a few brief paragraphs. Nor have scholars in the field yet gained sufficient mastery of his work to unravel his convoluted and sometimes contradictory ideas. What is clear, however, is the pervasive influence of Ibn ‘Arabī and his school on later Sufism. Disciples such as Ṣadr al-Dīn Qūnawī (d. 1274) in Anatolia and commentators on his work such as ‘Abd al-Rahmān ibn Aḥmad Jāmi (d. 1492) in Persia disseminated his ideas throughout the Islamic world.

**ṢŪFĪ FRATERNITIES.** The history of Sufism is much more than the history of mystical theory and expression. There is a significant social dimension to Islamic mysticism that must be explored if the picture is to be complete. Even many of the early Ṣūfīs, individualists though they were, sought out the advice and counsel of their fellow wayfarers. From the very beginning, therefore, companionship (*ṣuḥbah*) was considered essential for progress in the spiritual life.

Fluid interaction among Ṣūfīs soon evolved into the more structured relationship of master and disciple, adding a new level of social complexity. Not only would disciples visit their masters, but many also took up residence with them. The earliest formal Ṣūfī convent seems to date from the latter part of the eighth century CE, on the island of Abadan.

Political changes in the Islamic empire contributed to the stabilization of Ṣūfī institutional structures. In the mid-eleventh century the Seljuks wrested control of the Abbasid

caliphate from the Shī‘ī Buyids. The Seljuks were staunch Sunnīs who took over the religious educational system of the *madrasahs* in order to reindoctrinate the intelligentsia with Sunnī orthodoxy. The public support they provided for Ṣūfī establishments afforded the Seljuks more control over the type of Ṣūfī piety inculcated in the new recruits, but at the same time, government patronage ensured the survival of the various Ṣūfī institutions.

By the thirteenth century, several types of Ṣūfī establishments had evolved, each with a different general purpose. The *ribāṭ* was a residence or training center, which originated in the Arab regions of the empire. *Khānqāhs* were similar establishments rooted in the more persianized environment of Khorasan; they eventually spread, however, into the Arab centers. The more serious training took place in the *zāwīyahs*, which usually housed a teaching shaykh; *khalwah* is the name given to the retreat of a single Ṣūfī or dervish. (Dervish is derived from the Persian word for Ṣūfī, *darvīsh*, “poor,” “beggar.”)

More important than the physical environment in which Ṣūfīs congregated is the evolving infrastructure of the Ṣūfī communities themselves. In the eleventh century, fluid organizations continued to predominate; their common link was the desire for *ṣuḥbah* and for the guidance of a shaykh. Frequently, a master and his disciples remained a cohesive social unit only until the death of the master, after which the group disbanded.

By the thirteenth century the situation had altered significantly. Many Ṣūfī groups became self-perpetuating social organizations whose central focus was the founder and his teaching. No longer was the survival of the group dependent on a particular living shaykh; authority was passed from shaykh to disciple, thus providing a stable structural basis for the continued growth and development of the community. The new master was the chief custodian of the founder’s spiritual legacy and, on occasion, an innovator in his own right.

**Silsilahs.** These stable social organizations came to be called *ṭarīqahs* (“ways”), known in English as Ṣūfī orders, fraternities, or brotherhoods. Each founding shaykh had his *silsilah* (“chain”), his spiritual lineage which contributed substantially to his stature in the Ṣūfī community. The *silsilah* is, more precisely, a genealogy, tracing the names of one’s master, of one’s master’s master, and so on back through history. Often a prominent shaykh would have been initiated more than once, by a number of illustrious Ṣūfīs, thus adding additional stature to his spiritual pedigree.

There are two main *silsilah* groups, which later subdivided into literally hundreds of Ṣūfī fraternities. The first chain, generally considered the more sober of the two, traces its links back to Abū al-Qāsim al-Junayd, the famed spiritual guide from whom al-Ḥallāj eventually broke away. The second, and more intoxicated, *silsilah* derives from the first great Ṣūfī ecstatic, Abū Yazīd al-Bisṭāmī. These designations are very general, and membership in either group indicates only

a spiritual genealogy, not necessarily an actual attitude toward mystical experience.

The members of the Biṣṭāmī branch are often called Malāmātī, “blameworthy.” The appellation, however, can be overstressed, for it does not mean that they scorned Islamic law. On the contrary, many were meticulous in their observance. But eventually the name came to describe, in broad terms, those Ṣūfīs who eschewed completely all of the public trappings of Sufism and of piety in general; they were characterized by the virtue of absolute sincerity (*ikhhlās*). The Malāmātīyah rejected Ṣūfī initiation and the guidance of a shaykh, nor would they engage in public devotional practices common to Ṣūfīs. Whatever ritual acts they performed were carried out in private. Their individualism made them appear to some as suspicious and marginal. The Malāmātīyah, nevertheless, should be clearly distinguished from the Qalandarīyah, or wandering dervishes, many of whom did engage in practices that made mockery of the religious law and of traditional morality.

The centrality of *silsilabs* in Ṣūfī fraternities is not completely unique. One discovers an analogous emphasis in the *ḥadīth* literature, where the literary structure of a *ḥadīth* has two parts: the chain of transmitters (*isnād*) and the body of the text (*matn*). According to Muslim tradition, the authenticity of the *ḥadīth* is guaranteed by the reliability of the *isnād*. In the same way that the power of sacred word in the *ḥadīth* has been preserved by the chain of transmitters, so too do the teachings and powers of a particular shaykh remain alive through his *silsilah*.

Whether or not the *isnāds* are historically reliable is not a question that need be discussed here. Suffice it to say that the importance of *isnāds* for Muslims is to ground *ḥadīths* solidly in the period of the original revelation. Thus there can be no question that the teachings of the *ḥadīths* are innovations; rather *ḥadīths* are but more detailed insights into God’s will already expressed in general terms in the Qur’ān.

In similar fashion the *silsilabs* of Ṣūfī shaykhs provide them with religious legitimacy. Even though the Ṣūfī orders may vary considerably in their teachings and attitudes toward mystical experience, they each can claim, through their spiritual genealogies, to be solidly based upon the foundations of Sufism.

**Veneration of saints.** The institutionalization of *ṭarīqabs* and the emphasis on *silsilabs* enhanced substantially the religious and political position of the master. Whereas in the past the shaykh functioned primarily as an expert and confidant, he now became a repository of spiritual power as well. A shaykh’s lineage did not provide simply a list of teachers; it implied that the spiritual power of each of these great Ṣūfīs had been transmitted to this last member of the line.

The shaykhs of the great Ṣūfī orders, therefore, took on superhuman qualities. They became known as *awliyā’* (sg., *walī*), intimates or friends of God. Their spiritual perfection raised them far above the level of their disciples and of the

masses of Muslim faithful. The spread of Ibn ‘Arabī’s teaching, particularly the notion of the Perfect Human Being, which was elaborated upon by Ibn ‘Arabī’s intellectual disciples, especially by ‘Abd al-Karīm ibn Ibrāhīm al-Jīlī (d. 1428), provided an intellectual framework within which to explain this cosmic role of the saintlike shaykh. Many of the shaykhs of important orders were acknowledged by their followers as the *quṭb*, the “pole” or “axis” around which the cosmos revolves, the Perfect Human Being, the point at which the divine Creative Imagination most fully manifests itself in the world of illusion. The fact that a number of individuals claimed this status at one and the same time was cause for a certain amount of friction and rivalry among the powerful fraternities.

The concept of *quṭb* is linked by Ibn ‘Arabī and his predecessors with a whole hierarchy of cosmic beings. Al-Hujwīrī describes them as the officers of the divine court, made up of three hundred *akhyār* (“excellent ones”), forty *abdāl* (“substitutes”), seven *abrār* (“piously devoted ones”), four *awṭād* (“pillars”), three *nuqabā’* (“leaders”), and one *quṭb* (known also as *ghawṭh*, “succor”). Ibn ‘Arabī’s hierarchy is somewhat different in structure. The *quṭb* is joined by two *a’immah* (“guides”), four *awṭād*, seven *abdāl*, twelve *nuqabā’*, and eight *nujabā’* (“nobles”). The cosmic hierarchy, regardless of its particular description, is the spiritual power through which the order and continued existence of the cosmos are ensured.

The term *walī* is often translated as saint; this is misleading because there is no religious hierarchy in Islam empowered to canonize individuals as saints, as one has, for example, in Roman Catholicism. Rather, the status of *walī* is attained through public acclamation. There are, nevertheless, analogies between Christian saints and Muslim *awliyā’*, insofar as both possess spiritual power that is capable of being transmitted to disciples or devotees. In Islam this power is called *barakah* (“blessing”). The *barakah* of a *walī* has the potential to transform an individual spiritually as well as to provide concrete material blessings. *Barakah* should be understood as concretely as possible. It is often transmitted through the power of touch, similar to the laying on of hands or the application of relics, practices common in other religious traditions of the West.

The perfected shaykhs are objects of veneration both during their lives and after their deaths. It is generally accepted that they possess the power of miracles (*karāmāt*), although their miracles are subject to satanic influence in a way that the miracles of prophets are not. The extraordinary powers of the *awliyā’* are not diminished in any way after their death; on the contrary, their intercession often appears more efficacious. Consequently the tombs of great Ṣūfī *awliyā’* are vibrant pilgrimage centers to this day.

**Ritual practice.** Much has been said thus far about the shaykhs of Ṣūfī orders. What were the general patterns of life of the members of these communities? It is difficult to generalize because of the different character of the various brother-

hoods. There are, however, some areas of commonality. The full members of the fraternities committed themselves in obedience to the shaykh, who initiated them into the order and bestowed upon them the patched frock (*khirqah*), the sign of their entry onto the Ṣūfī path. They were encouraged to subject themselves completely to the master's will, to be like dead bodies in the hands of the body-washers. Some members of orders remained celibate while others married; some lived lives of extreme poverty while others had a very comfortable existence. Common to most of the Ṣūfī fraternities were ritual practices called *dhikr* ("remembrance") and *samā'* ("audition").

**Dhikr.** The impetus for the practice of *dhikr* is derived from those Qur'anic verses that enjoin the faithful to remember God often. Among Ṣūfīs this duty evolved into a complex exercise performed by an individual or group. Many fraternities put their own particular stamp on the *dhikr* exercise. Most *dhikr* techniques, however, involve the rhythmic repetition of a phrase, often Qur'anic, in which one of the names of God appears. In Islam, Allāh has one hundred names, ninety-nine of which are known; the hundredth name is hidden. Certain Ṣūfīs who ascribed to themselves the rank of *qutb* claimed to have been blessed with this most precious secret.

The more sophisticated methods of *dhikr* usually involve breath control, body movements, and a number of other complex techniques to gain control over the five senses as well the psyche and imagination. In some Ṣūfī groups, such as the Naqshbandīyah, *dhikr* is a private exercise. The goal is to move from vocal *dhikr* to silent *dhikr*, with each stage representing a more intense level of union with the Beloved until, at the final stage, *dhikr* moves to the innermost recesses of one's being and one can no longer distinguish between the one remembering and the Remembered.

**Samā'.** Like *dhikr*, *samā'* has become identified with Ṣūfī ritual practice. It involves listening to music, usually with a group. The music is often accompanied by Qur'ān chants and/or the singing of mystical poetry. The recital is intended to spark a mystical experience within the auditors. Those most affected by the *samā'* rise up to dance in unison with the music. Depending on the Ṣūfī group, the dance can be a marvel of aesthetic movement or the frenetic writhings of the seemingly possessed.

From its inception *samā'* has been controversial among Ṣūfīs. No one questions the efficacy of chanting the Qur'ān. The doubts arise with music and the singing of mystical love poetry. Music and singing were considered by many shaykhs to be amoral: neither good nor evil by nature. *Samā'* possesses the power, however, to engulf the spirit of the disciples and to seduce them to immoral behavior. Consequently many shaykhs, if they approve of *samā'* at all, insist that only accomplished Ṣūfīs be allowed to participate. Novices are warned to beware.

*Dhikr* and *samā'* have served an important function outside of the ranks of the full-fledged members of the Ṣūfī

orders. The theoretical developments in Sufism from the thirteenth century onward were shaped by the work of Ibn 'Arabī and his interpreters. The complex and esoteric nature of this school of Ṣūfī thought, however, placed it far beyond the reach of most Muslims. It was the ritual exercises of the orders that helped fill the gap and minister to the immediate spiritual needs of the faithful. Thus Sufism came to represent, for many, not abstruse theory but concrete practice that was accessible to all.

The emphasis on *dhikr* and *samā'* has helped to blur the distinction in popular Sufism between mystical experience that is attained after serious spiritual training and experience that is self-induced. Unsophisticated sessions of *dhikr* and *samā'*, to this day, often consist of self-hypnosis, hysteria, drug-induced states, and other violent emotions that pass for mystical experience. Despite accusations of vulgarization, *dhikr* and *samā'* remain important emotional outlets in the Muslim community and are unique sociological events during which various levels of society find themselves interacting on an equal footing. And in the hands of spiritual adepts, *dhikr* and *samā'* remain potent tools for creating an ambiance in which to attain heightened levels of religious experience.

The widespread interest in *dhikr* and *samā'* among the Muslim faithful has resulted in increased membership in the Ṣūfī fraternities. These new members, however, should more properly be called affiliates. They perhaps take some training from a shaykh; their primary vehicle for contact with the group, however, is attendance at periodic sessions of *dhikr* and *samā'*. Otherwise they lead the normal life of a layman or woman. In parts of the Islamic world today, membership in one Ṣūfī order or another has become for many a social obligation, even though those so affiliated have little interest in, or understanding of, mysticism.

Particular orders became associated with different strata of society, geographical regions, and guilds. The Suhrawardīyah, for example, were extremely influential in court circles in thirteenth-century Delhi, while orders such as the Bektāshīyah and Khalwatīyah in Turkey had a more popular appeal. The identification of order with social group became so complete that one could be said to be born into a particular fraternity. This did not, however, prevent an individual's eventual shift from one order to another.

**The orders: individual characteristics.** The role of the shaykh and the ritual exercises of *dhikr* and *samā'* are integral elements in almost all of the Ṣūfī orders. The distinctive personalities of the fraternities, however, are as significant as their similar structures and practices. The contrasts are often striking. In Anatolia, for example, the Mawlawīyah (or Mevleviye) and the Bektāshīyah represent opposite ends of the spectrum.

**Mawlawīyah and Bektāshīyah.** The Mawlawīyah trace their *silsilah* to the mystic and poet Jalāl al-Dīn Rūmī. Rūmī himself, however, did not establish a formal *ṭarīqah* during

his lifetime; rather, it was his son, Sulṭān Walad, who took upon himself the task of organizing the order. The Mawlawīyah are known for their aesthetic sophistication, both in ritual practice and in mystical poetry. The order's particular identity is derived, of course, from Rūmī's *Mathnavī* and the *Divāni Shams-i Tabrīzī*.

Perhaps the most famous aspect of the Mawlawīyah is its ritual *samā'*, an exquisite combination of music, poetry, and whirling dance (hence their name in the West, "Whirling Dervishes"). It is hard to capture in words the refinement of the choreography. The rhythmic, turning movements of the adepts are mesmerizing and executed with a subtle grace and precision equal to the best of European classical dance. The serene faces of the Ṣūfīs, moreover, reflect the depth of the spiritual rapture achieved by the practitioners.

In contrast, the Bektāshīyah takes its name from a shadowy figure, Ḥajjī Bektāsh of Khorasan (d. 1337?). At first the group was loosely organized, but by the fifteenth century it had developed a highly centralized structure. The Bektāshīyah are noted for their syncretism; the rituals and beliefs of the order represent an amalgam of Shiism, Byzantine Christianity, esoteric cults, and the like. By the end of the sixteenth century, the Bektāshīyah had become associated with the Janissary corps, an elite military unit of slave-soldiers established by the Ottoman sultan Murād I (1360–1389). Despite the heterodox practices of the Bektāshīyah, their identification with the powerful and much-feared Janissaries provided them with security from persecution by the orthodox religious authorities. Where the Mawlawīyah attracted a more educated elite, the Bektāshīyah appealed to the less literate masses who were fascinated with the magic-like rituals and political power.

*Suhrawardīyah and Rifā'īyah.* In Iraq, as well, there arose two fraternities with diametrically opposed interpretations of religious experience. The genealogy of the Suhrawardīyah begins with Abū al-Najīb al-Suhrawardī (d. 1168), who was a disciple of Aḥmad al-Ghazālī. Abū Najīb is the author of an important rulebook for novices, *Kitāb ādāb al-murīdīn* (Book of the manners of the disciples). The text evinces Abū Najīb's long experience as a director; his rules are strict and comprehensive, yet attuned to the human frailties of the young and untutored.

The fraternity that bears the name Suhrawardī was founded by Abū al-Najīb's nephew, Shihāb al-Dīn Abū Ḥafṣ 'Umar al-Suhrawardī (d. 1234). Shihāb al-Dīn, the author of the extremely influential work, *'Awārif al-ma'arif* (Masters of mystical insights), is remembered in Ṣūfī circles as a great teacher. Teaching, in fact, became a characteristic note of the fraternity. The Suhrawardīyah made significant inroads into the Indian subcontinent, where its ranks included such important figures as Bahā' al-Dīn Zakarīyā of Multan (d. 1268).

While the ethos of the Suhrawardīyah is characterized by serious training in the classical Ṣūfī tradition, the

Rifā'īyah or "Howling Dervishes" focus primarily on dramatic ritual. This fraternity springs from the marshlands of southern Iraq, where its founder, Aḥmad ibn 'Alī al-Rifā'ī (d. 1182), spent most of his life. Contemporary observers describe vividly the bizarre practices engaged in by members of the fraternity: fire-eating; piercing ears, hands, necks, and penises with iron rings; biting heads off live snakes, and so forth. Clearly the appeal of the Rifā'īyah is primarily emotional.

*Shādhilīyah.* A fine example of a fraternity that responded to the religious needs of the larger community while cultivating a solid intellectual base in mystical theory is the Shādhilīyah. Abū al-Ḥasan al-Shādhilī (d. 1258) began his religious career at Tunis, where he was well known as a preacher. It was there that he founded his order in 1227. Impelled by a vision, he traveled eastward and settled eventually in Egypt, where the Shādhilīyah order came to flourish.

The most famous of the early Shādhilī shaykhs is not the founder but the third leader of the group, Ibn 'Aṭā' Allāh (d. 1309). He was born in Alexandria and spent his early years in the study of *ḥadīth* and the law. Ibn 'Aṭā' Allāh's training in the traditional religious sciences made him wary of any involvement with Sufism. His attitude eventually mellowed, and for twelve years he placed himself under the direction of the second shaykh of the order, Abū al-'Abbās al-Mursī (d. 1287), whom he eventually succeeded.

Ibn 'Aṭā' Allāh's writings epitomize the spirit of the Shādhilīyah order. On one hand his work is very much in the intellectual tradition of the Ibn 'Arabī school. For example his book, *Laṭā'if al-minan* (Subtle graces), written in defense of the fraternity and its practices, emphasizes the exalted role of the shaykh as *walī* and *qutb*. On the other hand, the true genius of Ibn 'Aṭā' Allāh is most evident in his collected aphorisms, the *Ḥikam* (Maxims). They remain to this day one of the most popular Ṣūfī texts in the Islamic world. Combining the erudition of the scholar with the vibrant, persuasive language of the enthusiast, Ibn 'Aṭā' Allāh succeeds in communicating complex ideas in a way that is accessible to a wide range of individuals. Like the *Munājāt* of 'Abd Allāh Anṣarī, the *Ḥikam* of Ibn 'Aṭā' Allāh must be savored time and time again, for their richness seems almost inexhaustible.

In the same way that Ibn 'Aṭā' Allāh, through his writings, made the Sufism of the orders more accessible to larger numbers of Muslims, his fraternity as a whole adopted a structural form more in tune with the lives of the laity. Whereas some brotherhoods insisted on the abandonment of one's profession and even of family life, the Shādhilīyah allowed its members to remain involved in the secular world. In this respect, they were precursors of a similar development in the Christian West, when, in the sixteenth century, Ignatius Loyola founded the Society of Jesus, or Jesuits, whose members contrary to traditional monastic structures, were intent on fostering *contemplatio in actione*, contemplation while remaining fully involved in the secular world. Ibn 'Aṭā'

Allāh's *Hikam* has a place of honor in Islamic spirituality equal to that of Loyola's *Spiritual Exercises* in Christianity.

There is not sufficient space to describe even briefly all of the great *ṭarīqahs* that have become part of mainstream Sufism since the thirteenth century. The Qādirīyah, whose eponymous founder, ʿAbd al-Qādir Jīlānī (d. 1116), is perhaps the most widely revered saint in all of Islam; the Naqshbandīyah, whose stern Sunnī spirit, disseminated in Central Asia and the Indian subcontinent, has spawned political movements and great poets such as Mīr Dard (d. 1785); the music-loving Chishtīyah, Kubrawīyah, and so forth—all have played pivotal roles in the formation of Islamic religious life.

**Decline of the orders.** The nineteenth and twentieth centuries, however, have not been kind to Sufism, especially the Sufism of the orders. A number of factors contributed to the decline: the general secularization of world culture; colonialism, with its concomitant critique of Islamic religion and society; the response of Islamic modernism; and the rise of Islamic fundamentalism.

The changing political climate had profound effects on the Ṣūfī orders. In Turkey, for example, they were abolished by Mustafa Kemal Atatürk in 1925 because they represented to him all that was corrupt and backward about Islam. Atatürk was in the process of transforming Turkey into a modern nation state from the rubble of the Ottoman empire. The traditional power of the Ṣūfī shaykhs and orders was incompatible with nationalism; the orders, therefore, were eliminated as public institutions.

At times, however, the orders were not victims of political change but its instigators. The Tijānīyah of West Africa and the Sanūsīyah of North Africa are prime examples. The Tijānīyah were militant revivalists. They fought bravely against the French in West Africa and eventually established a kingdom of their own during the latter part of the nineteenth century.

The Sanūsīyah were similarly fundamentalist and militant. For decades they were at odds with Italian colonial power in North Africa. As a counterbalance they sided with the British who eventually invested the shaykh of the Sanūsīyah with authority in the region. The transformation of the shaykh into king of Libya and the accompanying solidification of political power eventually led to the decline of the Sanūsīyah as a Ṣūfī movement.

Despite the fact that many nineteenth- and twentieth-century Ṣūfī groups reflected fundamentalist tendencies, they still became the objects of attack by the ultra-orthodox, of whom the Wahhābīyah of Saudi Arabia are but one example. Among such groups, any ritual practice not explicitly sanctioned by religious law is anathema. The very premise on which Sufism is based, namely union with God, is rejected as un-Islamic. One sees today in many of the most vibrant Islamic revivalist movements a similar tendency to espouse the most puritanical forms of literalist religion. In such a world Sufism has little place.

In the Indian subcontinent, the involvement of many hereditary pirs (i.e., shaykhs) with Sufism has been based, in the modern period, more on family status, wealth, and influence than on any serious interest in mysticism. A backlash was inevitable. Muhammad Iqbal, one of the fathers of modern Muslim intellectual life in the subcontinent, rejected Sufism because of the corruption he perceived. He also reacted strongly against the Ṣūfī doctrine of *waḥdat al-wujūd*, because it entailed the negation of the self: If the self is nonexistent, why confront the problems of human existence? Nevertheless, his *Reconstruction of Religious Thought in Islam*, published in 1930, reflects Ṣūfī emphases on interiority, although his goal was to reinterpret Islam in humanistic terms that harmonized the spiritual and material realms of existence.

Attacks on Sufism are not new; they have occurred throughout the history of the tradition. The dramatic decline of Sufism in the modern period, however, is due as much to external as to internal forces. The intimate contacts between the Islamic world and the European West resulted in virulent critiques of Islamic religious practice, especially devotionalism. Muslim reactions were varied: Some accepted the critique and mimicked Western secular societies (Atatürk's Turkey, for example); some reasserted their identity by returning to what was believed to be true Islam, devoid of Ṣūfī accretions (the Wahhābīyah, for example); others, such as the Muslim modernist Muhammad ʿAbduh and his successors, proposed various more moderate plans for the adaptation of Muslim society to the demands of the modern world.

All of these responses, however, possessed anti-Ṣūfī elements, for most rejected Ṣūfī ritual practice and devotionalism as either non-Muslim or antimodern. Moreover, the power of the Ṣūfī shaykhs over masses of the faithful was seen by most to be counterproductive to modernization and to the development of a functioning secular state, for the shaykhs were often perceived as proponents of superstition, religious emotionalism, and outmoded power structures.

Mysticism in modern Islam is not an arid wasteland but rather more like a fallow field. There have been important modern teaching shaykhs such as Aḥmad al-ʿAlawī (d. 1934), whose influence is still felt in North Africa. Moreover, the popular piety of Sufism still flourishes in many parts of the Islamic world, including North Africa, Egypt, the Indian subcontinent, and Indonesia. The great tradition of vernacular poetry, established by master artists such as the Turkish mystic Yunus Emre (d. 1321), continues to produce a rich literature. Central Asia, the Indian subcontinent, Africa, Indonesia—every corner of the Islamic world has produced its local poet-saints.

Doubtless Sufism has become increasingly more identified with popular ritual practice than with formal spiritual training. The transformation of Sufism into a mass movement could not help but lead to a certain vulgarization. There continue to arise, nevertheless, individual masters whose commitment to the path is reminiscent of the great

figures of the classical period. Classical Şūfī literature survives because it still has the ability to touch the spirits of modern men and women. It is in this continued interaction between shaykh and *murīd* that hope for the future of Sufism resides.

### BIBLIOGRAPHY

By far the best introduction to Sufism in English is Annemarie Schimmel's *Mystical Dimensions of Islam* (Chapel Hill, N.C., 1975). Other introductory texts of interest are A. J. Arberry's *Sufism: An Account of the Mystics of Islam* (1950; reprint, London, 1979) and Reynold A. Nicholson's *The Mystics of Islam* (1914; reprint, London, 1963). The most astute treatment of the development of early Sufism, especially its relationship to Qur'anic exegesis, is Paul Nwyia's *Exégèse coranique et language mystique* (Beirut, 1970).

There are a number of monographs dealing with one or other of the early Şūfī ascetics. Margaret Smith's two works, *Rābī' a the Mystic and Her Fellow-Saints in Islam* (Cambridge, 1928) and *An Early Mystic of Baghdad: A Study of the Life and Teaching of Ḥārith b. Asad Al-Muḥāsibī, A. D. 781–A. D. 857* (1935, reprint, New York, 1973), are both excellent, as well as Nicholson's study of Abū Sa'īd ibn Abī al-Khayr in *Studies in Islamic Mysticism* (1921; reprint, Cambridge, 1976).

There are two excellent English translations of Şūfī manuals, Nicholson's translation of al-Hujwīrī's *Kashf al-Mahjūb: The Oldest Persian Treatise on Sufism*, 2d ed. (London, 1936), and Arberry's translation of al-Kalābādhī's *Kitāb al-ta'arruf* under the title *The Doctrine of the Sufis* (Cambridge, 1935). Several chapters of Seyyed Hossein Nasr's *Sufi Essays* (London, 1972) deal with stations and states and the master-disciple relationship.

No study of the ecstasies in Sufism is complete without Louis Massignon's extraordinary work on al-Ḥallāj, translated into English by Herbert Mason as *The Passion of Al-Hallāj: Mystic and Martyr of Islam*, 4 vols. (Princeton, N. J., 1982). Carl W. Ernst's *Words of Ecstasy in Sufism* (Albany, 1984) is extremely helpful as well. Reynold A. Nicholson's *The Idea of Personality in Sufism* (1964; reprint, Lahore, 1970) is a lucid exploration of the psychology of ecstatic utterances.

There is an excellent translation by Wheeler Thackston of Anṣarī's *Munājāt* in *The Book of Wisdom and Intimate Conversations*, translated and edited by Wheeler Thackston and Victor Danner (New York, 1978). The premier scholar of Anṣarī is Serge de Laugier de Beaurecueil, whose bibliography of Anṣarī provides much useful information and some fine translations: *Khawāḍja ʿAbdullāh Anṣarī, 396–481 H./1006–1089: Mystique Hanbalite* (Beirut, 1965).

There are a number of fine translations of ʿAṭṭār's *mathnavīs*: *The Ilāhī-nāma or Book of God*, translated by J. A. Boyle (Manchester, 1976); *Le livre de l'épreuve (Musibatnāma)*, translated by Isabelle de Gastines (Paris, 1981); and *The Conference of the Birds*, translated by Afkham Darbandi and Dick Davis

(London, 1984). The best comprehensive study of ʿAṭṭār and his work remains Helmut Ritter's *Das Meer der Seele* (Leiden, 1955).

Henry Corbin has written extensively on Islamic gnosticism, Islamic Neoplatonism, and Ibn ʿArabī. Works such as *Creative Imagination in the Şūfism of Ibn ʿArabī* (Princeton, N.J., 1969) demonstrate his extraordinary erudition and propose provocative syntheses that must be evaluated with care. A new translation of Ibn ʿArabī's *Fuṣūṣ al-ḥikam* by R. W. J. Austin under the title *The Bezels of Wisdom* (New York, 1980) is excellent. Toshihiko Izutsu's comparative study of Sufism and Taoism, *A Comparative Study of the Key Philosophical Concepts in Sufism and Taoism* (Tokyo, 1966), also serves as an excellent introduction to Ibn ʿArabī's thought. Finally, in his *Studies in Islamic Mysticism* (1921; reprint, Cambridge, 1976) Reynold A. Nicholson provides a very lucid analysis of the idea of the Perfect Human Being as it originated with Ibn ʿArabī and was later developed by al-Jīlī.

The best translations of Rūmī's work are by Reynold A. Nicholson, especially *The Mathnawi of Jalālūddīn Rūmī*, 8 vols. (London, 1925–1971). Annemarie Schimmel's *The Triumphal Sun: A Study of the Works of Jalāloddin Rumi* (London, 1978) is a solid introduction to his writings, as is William C. Chittick's *The Sufi Path of Love: The Spiritual Teachings of Rumi* (Albany, N.Y., 1983). Schimmel's *As Through a Veil: Mystical Poetry in Islam* (New York, 1982) places Rūmī in the wider context of the poetic tradition in Sufism.

There are many studies of individual Şūfī orders. The best general work, however, is J. Spencer Trimingham's *The Sufi Orders in Islam* (New York, 1971). The role of the fraternities in the Indian subcontinent is extremely well presented in Annemarie Schimmel's *Islam in the Indian Subcontinent* (Leiden, 1980). An English translation by Victor Danner of Ibn ʿAṭā' Allāh's *Ḥikam* can be found in Thackston and Danner's *The Book of Wisdom and Intimate Conversations* (cited above). A superb French translation and commentary of the same text, together with a thorough analysis of the early development of the Sha-dhiliyah can be found in Paul Nwyia's *Ibn ʿAṭā' Allāh et la naissance de la confrérie šādilite* (Beirut, 1972). One of the more interesting treatments of a Şūfī in the modern period is Martin Lings's study of the life and writings of Shaykh Aḥmad al-ʿAlawī, *A Moslem Saint of the Twentieth Century*, 2d ed. (Berkeley, Calif., 1973).

PETER J. AWN (1987)

**ŞUHBAH** (lit., “companionship”). In mystical parlance, *şuḥbah* can refer to (1) a mystic's return from seclusion (ʿuzlah) to human society; (2) the company of the spiritual mentor, which a new entrant to the mystical fold needs for spiritual training; and (3) social contact with all human beings. The value of *şuḥbah* was first to be appreciated when those near the Prophet became known as *şahābah* (“companions”), since they had the privilege of being in his company. Thereafter mystics looked upon the “company” of a superior mystic-master as a way to spiritual development. The spiritual guide (pir or shaykh) came to occupy a high position on account of his capacity to influence the thought and character of those who came near him.

Abu al-Ḥasan al-Hujwīrī (d. 1079) identified three types of companionship that he considered inseparable and interconnected: (1) companionship with God, the awareness of God's presence at all times, which controlled and determined every detail of external behavior; (2) companionship with one's own self, which dictated the avoidance in one's own company of all that was improper in the company of others and unbecoming in the presence of God; and (3) companionship with fellow creatures. Operating within such a comprehensive concept of *ṣuḥbah*, mystical writings include the totality of a mystic's life—prayers and penitence, travels, sojourns in hospices, dealing with fellow mystics, relations with kin and friends, methods of earning a livelihood, marriage or celibacy—as aspects of that person's *ṣuḥbah*. As such, the principles of *ṣuḥbah* came to determine mystical actions in all their details, and many brochures and treatises were written on the subject. Notable works include al-Junayd's *Tashīḥ al-irādah* (The rectification of discipleship), Aḥmad ibn Khadrūyah Balkhī's *Al-ri'āyah bi-ḥuqūq Allāh* (The observance of what is due to God), and Muḥammad ibn 'Alī Tirmidhī's *Ādāb al-murīdīn* (Rules of conduct for disciples). Al-Sulamī's *Kitāb ādāb al-ṣuḥbah* (Book on the rules of company), al-Qushayrī's *Risālah* (Epistle), al-Hujwīrī's *Kashf al-mahjūb* (The unveiling of the veiled), and Abu al-Najīb Suhrawardī's *Ādāb al-murīdīn* neatly consolidate all the information available in earlier works.

In the initial stages of mystical development in Islam, the term *ṣuḥbah* was used in a limited sense to mean the company of the mystic teacher only; elaborate rules of residence and discipline were developed later. When Sufism came out of its first phase, designated by Reynold A. Nicholson as "the period of the Quietists," the value of companionship was emphasized and seclusion was considered of little significance in the building up of a spiritual personality. In mystical discipline, companionship and seclusion were paired as complements and supplements to each other. Shaykh Abū al-Ḥasan ibn Muḥammad al-Nūrī (d. 907) remarked: "Beware of seclusion for it is connected with Satan, and cleave to companionship for therein is the satisfaction of the merciful God." Among the eleven veils that have to be lifted before gnosis can be attained, Al-Hujwīrī considered companionship the ninth. Meticulous care in the performance of duties pertaining to *ṣuḥbah* could lift this veil and make gnosis possible.

Islamic mysticism, particularly before the organization of the Ṣūfī orders (*ṭuruq*; sg., *ṭarīqah*), considered travel an essential part of mystical discipline. The rules of *ṣuḥbah* therefore deal with both residents (Pers., *muqīmān*) and travelers (Pers., *musāfirān*). Regarding those who undertook travel as part of their spiritual training, rules were laid down about articles they took along, people with whom they could keep company, places where they could stay, and the way they had to conduct themselves while staying in a mosque, in a Ṣūfī center, or in an educational institution (*madrasah*). The main principle governing behavior in all these spheres was that a mystic did not forget God while involved in any

of these activities and could utilize travel as a means for breaking undue attachment to material assets and family, for learning to live with complete resignation to the will of God, and for trying to develop a spirit of adjustment to different conditions of life and company.

Life within the Ṣūfī centers is similarly defined by elaborate rules of *ṣuḥbah*. Residents had to share responsibility for running the center; travelers were treated as guests for three days but after that they too were obliged to do some work to lighten the burden of the permanent residents. The Ṣūfī centers that provided facilities for *ṣuḥbah* were of different types: *khānagāhs* where separate accommodation was generally provided for all inmates; *jamā'at-khānabs*, where all lived a communal life under one roof and slept on the ground; *zāwiyahs* and *dā'irahs*, smaller institutions where persons of one affiliation lived in order to devote their time to meditation. Mystics following different masters laid down principles of *ṣuḥbah* according to the basic teachings of the order to which they belonged, but the 'Awārif al-ma'ārif of Shaykh Shihāb al-Dīn Suhrawardī (d. 1234) was generally accepted as the model on which *khānagāh* life could be organized and the basic objectives of *ṣuḥbah* achieved.

#### BIBLIOGRAPHY

For a brief mention of *ṣuḥbah* in the larger context of Ṣūfī thought and practice, see Annemarie Schimmel's *Mystical Dimensions of Islam* (Chapel Hill, N.C., 1975). Al-Hujwīrī's discussion of *ṣuḥbah* can be found in *The Kashf al-Mahjūb, the Earliest Persian Treatise on Sufism*, translated by Reynold A. Nicholson, new ed. (1936; reprint, London, 1976), pp. 334–366. Abū al-Najīb Suhrawardī's *Kitāb ādāb al-murīdīn* has been translated in abridged form by Menahem Milson as *A Sufi Rule for Novices* (Cambridge, Mass., 1975). Important compendia of Ṣūfī practice available in Arabic include al-Qushayrī's *Al-risālah al-qushayrīyah* (Cairo, 1966), Shihāb al-Dīn Suhrawardī's 'Awārif al-ma'ārif (Beirut, 1966), and al-Sulamī's *Kitāb ādāb al-ṣuḥbah* (Jerusalem, 1954).

KHALIQ AḤMAD NIZAMI (1987)

#### SUHRAWARDĪ, SHIHĀB AL-DĪN YAḤYĀ.

Shihāb al-Dīn Yaḥyā ibn Ḥabash ibn Amīrak Abū al-Futūḥ Suhrawardī (AH 549–587/1170–1208 CE) was born in a village near Zanjan, a northern Iranian city. He began his studies at an early age when he went to the city of Maragheh to study philosophy with Majd al-Dīn al-Jīlī, and then traveled to Iṣfahān, where he pursued his advanced studies in philosophy and *al-Baṣā'ir* (The observations) of 'Umar ibn Salān al-Sāwī with Zāhir al-Dīn al-Fārsī.

Suhrawardī traveled to Anatolia and Syria, where he met Malik Zāhir, son of the famous Ṣalāḥ al-Dīn Ayyūbī, in Aleppo in 1200. Suhrawardī's openness to other religious traditions, especially Zoroastrianism, as well as his keen intel-

ligence and esoteric orientation, antagonized the orthodox jurists at Malik Ḥāhir's court, who declared Suhrawardī to be a heretic. They asked Malik Ḥāhir to put Suhrawardī to death, and when he refused they signed a petition and sent it to Ṣalāḥ al-Dīn Ayyūbī, who ordered his son to have Suhrawardī killed. Malik Ḥāhir reluctantly carried out his father's order and Suhrawardī was killed in 1208. For this reason he has received the title *al-Maqtūl* (the Martyr).

Not much is known about Suhrawardī. It is said that he lived somewhat of a monastic life and shied away from people. One day he would dress in court style and the very next day as a wandering dervish. Suhrawardī lived at a time when the influence and power of the rationalist theologians (Mu'tazilites) had been substantially curtailed by the more faith-based Ash'arites. While the debate among the advocates of intellectual sciences continued, philosophical and theological schools were also challenged by the mystics of Islam, the Ṣūfīs. At the center of these controversies stood Avicenna (Ibn Sīnā) with his powerful philosophical paradigm. Avicenna's philosophy by Suhrawardī's time had lent itself to different interpretations, and this brought about a number of schools that were essentially Avicennian, though each emphasized different aspects of his ideas.

First, there was the purely Aristotelian aspect of Avicenna's philosophy. Next, there were exponents of theology (*kalām*) who found Avicenna's logic and metaphysics to be a useful means of analysis and therefore adopted them. Finally, there was the mystical aspect of Avicenna, which received less attention than his rationalistic writings. In these types of writings, such as *Ḥay ibn Yaḡzān* and the final chapter of the *Ishārāt*, the mystical and Neoplatonic aspects of Avicenna's philosophy are most apparent. Suhrawardī was well aware of such writings. For example, in his *al-Ghurba al-gharbiyah* (The occidental exile) he continues Avicenna's story using some of the same metaphors.

Suhrawardī's project was to bring about a rapprochement between rationalism, mysticism, and intellectual intuition within one single philosophical paradigm and to bridge the deep division between different schools in the Islamic intellectual tradition. He called his school of thought *al-ḥikmah al-ilahiyah* (transcendental philosophy) or *Ḥikmat al-ishrāq* (philosophy of illumination), and it is for this reason he has been called "Shaykh al-ishrāq" (Master of Illumination). Suhrawardī argued that the application of reason as a means of discovering the truth is limited, and that one has to rely on an experiential wisdom to comprehend the truth completely. In a mystical state, Suhrawardī compared his findings through logic and discursive reasoning to his mystical vision; he accepted those that corresponded with one another, and others he rejected. For Suhrawardī, reason, mystical experience, and intellectual intuition are ultimately reconcilable.

Suhrawardī's writings are diverse (i.e., Peripatetic, mystical, and illuminationist [*ishrāqī*]). They include his four large treatises that are of doctrinal nature: *al-Talwihāt* (The

book of intimation), *al-Muḡawamāt* (The book of opposites), *al-Muṭārahāt* (The book of conversations), and finally *Ḥikmat al-ishrāq* (The philosophy of illumination), which is his magnum opus. The first three of these works are written in the tradition of the Peripatetics, with commentaries and criticism of certain Aristotelian concepts, such as the epistemic function of definition.

There are shorter works, some of them written in Arabic and some in Persian. These works are also of a doctrinal nature and should be regarded as further explanations of the larger doctrinal treatises. They are: *Ḥayākil al-nūr* (Luminous bodies), *Alwāḥ 'imādiyyah* (Tablets of 'Imād al-Dīn), *Partaw nāmah* (Treatise on illumination), *I'tiqād fī -al-ḥukamā'* (On the faith of the hakims), *al-Lamaḥāt* (The flashes of light), *Yazdān shinākht* (Knowledge of the divine), and *Bustān al-qulūb* (The garden of the heart).

Suhrawardī wrote a number of treatises of an esoteric nature in Persian. These initiatory narratives contain highly symbolic language and incorporate Zoroastrian and Hermetic symbols, as well as Islamic ones. These treatises include: *'Aql-i surkh* (Red intellect), *Āwāz-i par-i Jibrāil* (Chant of the wing of Gabriel), *Qiṣṣat al-ghurba al-gharbiyah* (Story of the occidental exile), *Lughat-i murān* (Language of the termites), *Risālah fī ḥalāt al-tufūliyyah* (Treatise on the state of childhood), *Rūzī bā jamā'at-i Ṣufiyān* (A Day among the Ṣūfīs), *Ṣafir-i simūrg* (The Sound of the griffin), *Risālah fī -al-mi' rāj* (Treatise on the nocturnal ascent), and *Partaw nāmah* (Treatise on illumination). These treatises are intended to demonstrate the journey of the soul toward unity with God and the inherent yearning of humans toward gnosis (*ma'rifah*).

There are also a number of treatises of a philosophic and initiatic nature. These include his translation of *Risālat al-ṭāir* (Treatise of the birds) of Avicenna and the commentary in Persian on Avicenna's *Ishārāt wa-al-tanbihāt*. There is also his treatise *Risālah fī ḥaqīqat al-'ishq* (Treatise on the reality of love), which is based on Avicenna's *Risālah fī -al-'ishq* (Treatise on love) and his commentaries on verses of the *Qur'ān* and the *ḥadīth*. Also, it is said that Suhrawardī may have written a commentary upon the *Fuṣūṣ* of al-Fārābī, which has been lost. Finally, there is the category of his liturgical writings, *al-Waridāt wa-al-taqdisāt* (Invocations and prayers), which consists of prayers, invocations, and litanies.

Mahdi*, edited by Charles E. Butterworth (Cambridge, Mass., 1992), pp. 304–344; and Ja'far Sajjādī, *Shihāb al-Dīn Suhrawardī wa sayrī dar falsafah-yi ishrāq* (Tehran, 1984).

MEHDI AMINRAZAVI (2005)

**SUICIDE.** The topic of religiously motivated suicide is a complex one. Several of the major religious traditions reject suicide as a religiously justifiable act but commend martyrdom; among them are Judaism, Christianity, and Islam. These religions distinguish between actively willing to end one's life in suicide and passively accepting one's death as the divine will by means of martyrdom at the hands of another. Nonetheless, the actions of some of the early Christian martyrs and the deaths of the Jews at Masada in 74 CE blur this distinction.

In contrast to religiously motivated suicide one may speak of heroic and altruistic suicide, the act of a person who decides that he or she has an ethical responsibility to die for the sake of community or honor. One must also differentiate between religiously motivated suicide and suicide that may be virtually forced upon an individual by the norms of society and may constitute either a duty or a punishment. One thinks of *satī*, widow burning in India, and of *seppuku*, self-disembowelment, when it occurred as a punishment in Japan. In these cases too, however, no simple distinction holds true. *Satī* became an accepted practice within medieval Hinduism, upheld by the brahmins, and accounts indicate that even into modern times it was often a voluntary practice. By her self-sacrifice the widow both achieved an honored status for herself and atoned for the sins and misdeeds of herself and her husband. *Seppuku* was often the voluntary last act of a defeated warrior who chose to demonstrate both his fealty to his lord and his mastery over himself.

Like the major Western traditions, both Buddhism and Confucianism condemn suicide, but there are examples of self-immolation by Buddhist monks and of the seeking of honorable death by Confucian gentlemen. In contrast to these traditions, Jainism regards favorably the practice of *sal-lekhana*, by which a Jain monk or layperson at the end of his lifetime or at the onset of serious illness attains death by gradual starvation.

These few examples demonstrate the complexity of the topic of religiously motivated suicide and the difficulty in

distinguishing it from martyrdom or sacrifice, on the one hand, and from heroic or altruistic suicide, on the other. In addition, the occurrence in 1978 of the mass suicides at Jonestown, Guyana, raises the question of the relation between religious motivations for suicide and general fear of persecution, combined with mass paranoia. This question applies equally well to the mass suicide of Jews faced with persecution in York, England, in 1190 and to the mass suicides of Old Believers in Russia in the late seventeenth century.

On the whole, what may be termed religiously motivated suicides constitute but a small proportion of the total number of suicides. In his classic work *Le suicide*, Émile Durkheim discussed the social causes for egoistic, altruistic, and anomic suicides. His work and that of many other scholars demonstrate that suicide has most often occurred for reasons other than religious ones. These include the desire to avoid shame, to effect revenge, to demonstrate one's disappointment in love, and to escape senility and the infirmities of old age. Suicide as a means of avoiding shame and upholding one's honor was considered a creditable act in societies as different as those on the Melanesian island of Tikopia, among the Plains and Kwakiutl Indians of North America, and in ancient Rome.

Scholars have argued that the incidence of and attitude toward suicide are largely dependent on the individual's and society's view of the afterlife. Where death is perceived as a happy existence, scholars such as Jacques Choron believe, there is an inducement to suicide. In the first known document that apparently reflects on suicide, the Egyptian text entitled *The Dialogue of a Misanthrope with His Own Soul*, death is seen as attractive because it will lead to another and better existence. The tendency toward suicide is strengthened when suicide is regarded either as a neutral act or as one worthy of reward. Suicide rates also increase when this life is regarded as no longer acceptable or worthwhile. For example, Jim Jones, the founder of the Peoples' Temple, urged his followers in Guyana to commit suicide in order to enter directly into a new and better world, where they would be free of persecution and would enjoy the rewards of the elect. In the Jonestown community, suicide on a mass scale was appreciated as a religiously justifiable act that would be rewarded in the afterlife.

**ANCIENT GREEK AND ROMAN CIVILIZATION.** While the ancient Greek writers and philosophers did not consider suicide an action that would lead to a better existence, they did see it as an appropriate response to certain circumstances. The fact that Jocasta, the mother of Oedipus, chose to commit suicide upon learning of her incestuous relationship with her son was understood and appreciated by the ancients as an appropriate response to a disastrous situation. Heroic suicide in the face of a superior enemy and the choice of death to avoid dishonor or the agony of a lengthy terminal illness were accepted as justifiable actions. Through the voice of Socrates, Plato in his *Phaedo* did much to form the classical attitude

toward suicide. Socrates himself chose to drink the hemlock, but he also affirmed the Orphic notions that humans are placed in a prison from which they may not release themselves and that they are a possession of the gods. The decision to commit suicide is thus an act against the gods, depriving them of their prerogative to end or to sustain human life. The key word for both Plato and Socrates is *necessity*. A person may appropriately end his life only when the gods send the necessity to do so upon him, as in fact they did to Socrates. Plato's disciple, Aristotle, argued even more strongly against suicide. He regarded it as an offense against the state, since by such an act a person fails to perform his obligations as a citizen. Thus it became a social outrage—a view that has continued to dominate thought in the West until the most recent times.

Whereas the Pythagoreans and Epicureans opposed suicide, the Stoics regarded it favorably under certain circumstances. The Stoic was obliged to make a decision that properly addressed the demands of the situation; at times the decision might be to commit suicide. Both Zeno and his successor, Cleanthes, are reported to have done so.

Heroic suicide and suicide to avoid dishonor or suffering became frequent within the society of the Roman empire. Seneca, in particular, moved beyond the insistence on a divine call or necessity for suicide to the assertion that suicide at the appropriate time is a basic individual right. For Seneca, the central issue was freedom, and he affirmed that the divine had offered humankind a number of exits from life; he himself chose to exercise the right to suicide. His successor, Epictetus, placed more limits on suicide, stressing again the belief that one must wait for the divine command before acting: The suffering that is a normal part of daily life for much of humanity does not of itself constitute a sufficient reason for suicide—although exceptional pain and suffering offer justifiable cause. For Epictetus, Socrates was the best model and guide in deciding when one might legitimately choose to end one's life.

**JUDAISM.** Whereas suicide was at the very least tolerated, and often applauded, among the ancient Greeks and Romans, the Hebrew people disapproved of it. Judaism draws a clear distinction between suicide, which it defines as self-murder, and martyrdom, which it defines as death on behalf of one's faith and religious convictions. Nonetheless, the Hebrew scriptures, which contain few references to dying by one's own hand, do describe several instances of heroic suicide. The king Abimelech, gravely wounded by a woman, called upon his armor-bearer to kill him (*Jgs.* 9:52–54). Although he did not literally kill himself, his command to his aide may be regarded as effecting what he could not perform himself, so that he might not die in dishonor. The death of Samson (*Jgs.* 16:28–31) may certainly be judged a heroic suicide, since by his act he brought about the demise of a large number of the enemy Philistines. The gravely injured Saul fell upon his own sword in order to avoid a disgraceful death at the hands of his enemies (*1 Sm.* 31:4), and his armor-bearer,

who had failed his master's request to kill him, then fell upon his own sword. The death of Ahithophel, the counselor to David and then to David's son Absalom, would appear to be a suicide motivated by disgrace. When Absalom refused to follow the advice Ahithophel gave him regarding his battle with David, Ahithophel returned home, set his affairs in order, and hanged himself (*2 Sm.* 17:23). The last suicide recorded in the Hebrew scriptures, the death of the king Zimri, occurred because of the loss of a decisive battle (*1 Kgs.* 16:18).

Although Hebrew scriptures do not explicitly forbid suicide, the Judaic tradition came to prohibit it, partly in the belief that God alone gives life and takes it away, and partly on the basis of the sixth commandment, which forbids unjustified homicide. However, rabbinic law regards persons committing suicide as most frequently being of unsound mind and thus not responsible for their actions. Under these circumstances, they may still receive normal Jewish burial rites. Furthermore, suicides committed under duress, as for example to avoid murder, idolatry, or adultery, were considered blameless and indeed even praiseworthy. The mass suicide at Masada in 74 CE and other mass suicides in Europe during the Middle Ages were considered in this light.

Concerning Masada, the historian Josephus Flavius recounts, on the basis of the report of a few survivors, that on the eve of the Roman assault on that hill the leader of the vastly outnumbered Jewish resistance, El'azar ben Ya'ir, called the community together and reminded them of their vow not to become the slaves of the Romans. That night many of the soldiers killed their families and committed suicide. Others drew lots to decide who would kill his fellows and then die by his own hand. It is impossible to say how many of the more than nine hundred defenders allowed themselves to be killed and how many ended their lives by suicide. In spite of the Jewish prohibition against suicide, Masada came to be regarded as a heroic sacrifice, and it remains a living symbol of a people's response to oppression.

Although accounts of individual suicide within Judaism are rare, there are examples of mass suicides during times of persecution. During the First Crusade, in 1096, Jews who had obtained sanctuary in the bishop's castle at Worms chose mass suicide over baptism; similar instances of suicide to avoid baptism occurred in various Rhineland towns, such as Mayence, and in York, England, where in 1190 some 150 Jews set fire to the building in which they had sought safety and then consigned themselves to the flames. Yet other instances of mass suicide occurred during the Black Death, when popular superstition blamed the outbreak of the plague on the Jews. Although abuse and persecution were certainly major motivating factors during the periods of the Crusades and the Black Death, these mass or multiple suicides appear to have arisen from a deep religious desire to remain true to the faith. They point again to the difficulty in distinguishing between, on the one hand, suicides motivated by fear of persecution and, on the other, suicides motivated by religious

convictions and ideals, deaths that in the latter case the tradition judges to be acts of martyrdom. Certainly the deaths at Masada must be regarded as both faithful obedience to religious affiliation and identity and the culmination of a desire to give the Jews' enemies a hollow victory.

**CHRISTIANITY.** Christianity repudiates suicide on much the same biblical grounds as does Judaism. The only suicide recorded in the New Testament is that of Jesus' betrayer, Judas Iscariot; it is described in such a way as to indicate that it was a sign of repentance for his deed (*Mt.* 27:3–5). The church father Tertullian referred even to Jesus' death as voluntary—a description approximating that of suicide, since clearly a divine being controls his own life. In his book *Conversion* (1962), Arthur Darby Nock points to the “theatricality” present in some of the actions of the early martyrs, as in “the frequent tendency of Christians in times of persecution to force themselves on the notice of the magistrates by tearing down images or by other demonstrations” (p. 197). Bishop Ignatius of Antioch, writing to his fellow Christians in Rome, pleaded that they do nothing to hinder his martyrdom but allow him to be consumed entirely by the beasts. But whereas Tertullian asserted that only martyrs would reach paradise before the Parousia, Clement of Alexandria sought to stem the tide of those rushing to martyrdom by differentiating between self-motivated suicide and genuine martyrdom for the faith.

In his *City of God*, which appeared in 428 CE, the church father Augustine wrote against suicide in a way that became determinative for the tradition. He discussed various situations in which a Christian might find himself or herself, and concluded that suicide is not a legitimate act even in such desperate circumstances as those of a virgin seeking to protect her virtue. Augustine argued that suicide is a form of homicide, and thus prohibited by the sixth commandment; that a suicide committed in order to avoid sin is in reality the commission of a greater sin to avoid a lesser; and that one who commits suicide forfeits the possibility of repentance. Subsequent church councils, as well as such eminent theologians as Thomas Aquinas in the thirteenth century, sided with Augustine. Suicide, in contrast to martyrdom, came to be regarded as both a sin and a crime. Dante placed suicides in the seventh circle of the inferno in his *Divine Comedy*, and popular opinion throughout Christian Europe regarded suicides in the same light as witches and warlocks. Indeed, their corpses were treated in a similar manner: Suicides were frequently buried at crossroads with stakes driven through their hearts to prevent their ghosts from causing harm. The last recorded instance of such a burial in England occurred in 1823, and the law mandating confiscation of the property of a convicted suicide remained on the books until 1870.

In spite of ecclesiastical censure, religious impulse did lead to suicides, sometimes on a mass scale. Some thirteenth-century Cathari or Albigensians may have chosen suicide by starvation. Even more dramatic are the accounts of the Old Believers (*raskol'niki*) in late-seventeenth-century Russia

who chose death by fire over obedience to liturgical changes introduced by the archbishop Nikon, with the subsequent backing of the tsars. According to tradition, on several occasions one to two thousand people who had been besieged by government troops, as at Paleostrovskii monastery in 1688, locked themselves within chapels or monasteries and burned them to the ground, consigning their own bodies to the flames.

Although martyrdom as a testimony to one's faith continues to be honored within Christianity, suicide as an individual act undertaken for nonreligious motives is regarded as a sin, and until recently it was regarded as a crime unless done in ignorance of its implications or in a state of lunacy. Few Christian theologians and philosophers challenged this view. John Donne, who served as dean of Saint Paul's in London, was a notable exception. In his book *Biathanatos*, written in 1608 but not published until 1644, Donne challenged the Augustinian belief that suicides cannot repent; he argued that a totally negative attitude toward suicide places limitations on the mercy and charity of God. New attitudes toward suicide were subsequently expounded by a variety of philosophers such as David Hume, who argued that suicide is not a crime. However, although the Christian attitude toward suicide may now be characterized as more compassionate than during earlier periods, the act of suicide, in contrast to martyrdom, continues to be regarded as a serious sin.

**ISLAM.** Islam joined Judaism and Christianity in prohibiting suicide (*intihār*) while glorifying those who die the death of a martyr (*shahīd*) or witness to the faith. While scholars debate whether or not the Qur'an itself specifically forbids suicide, they agree that the *hadīth*, the traditions that preserve the words of the Prophet on a wide variety of issues, prohibit suicide. According to these sources, Muḥammad proclaimed that a person who commits suicide will be denied Paradise and will spend his time in Hell repeating the deed by which he had ended his life. By the tradition's own standards, religiously motivated suicide is an impossibility, since the taking of one's own life is both a sin and a crime. Nonetheless, as with Judaism and Christianity, the line between suicide and martyrdom is not clear. Since it is believed that the Muslim martyr who dies in defense of the faith is rewarded with immediate entrance into Paradise, where he or she will enjoy great pleasures and rewards, it would not be surprising if some Muslims readily participated in battles even when badly outnumbered, in the hope that they might die while fighting.

Within Islam the Shi'ī sect emphasizes the self-sacrifice and suffering of its imams, the successors to Muḥammad. The death of Ḥusayn, the grandson of the Prophet, and the third imam, was regarded by his followers as an act of voluntary self-sacrifice that could be termed a religiously motivated death. Although he died on the battlefield, his death was subsequently interpreted as a goal he both desired and actively sought; the passion play enacted as the climax of 'Āshūrā' (tenth of Muḥarram) depicts his death as actively willed. In

a translation of this play (*Muhammedan Festivals*, edited by G. E. von Grunebaum, New York, 1951) Husayn says: "Dear Grandfather [Muḥammad], I abhor life; I would rather go visit my dear ones in the next world" (p. 92). Within Shiism, and the Ismā'īlī sect, Ḥasan-i Sabbāḥ in the twelfth century formed the order of the Assassins, which was devoted to establishing its own religious and governmental autonomy, in part by killing both Crusaders and Sunnī Muslims. The death of a member of this order was regarded not as a suicide, even when his mission had been one almost certain to result in his death, but rather as a glorious martyrdom that would earn him both the veneration of society and the delights of Paradise. The tradition cites many accounts of a mother who rejoiced on hearing of the death of her son, only to put on mourning clothes when she learned subsequently that he had not died and thus had not attained the glorious state of martyrdom.

**HINDUISM AND JAINISM.** In discussing Judaism, Christianity, and Islam, this article has pointed to the close relationship between suicide and martyrdom and the difficulty frequently encountered in distinguishing between them. Regarding the religions of the East, the difficult issue is the relation between suicide and sacrifice. In Hinduism, the Brāhmaṇas laid the foundation for religiously motivated suicide by declaring that the fullest and most genuine sacrifice is that of the individual's self. The *Śatapatha Brāhmaṇa* outlines the procedure by which one renounces the world, forsaking one's belongings and departing into the forest. Certainly Hinduism affirms that suicide must be a thoughtful decision—as in the resolve of a person to end the sufferings of old age—or that it must be a religiously motivated act. One Upaniṣad condemns those who attempt suicide without having attained the necessary degree of enlightenment. The Dharmasūtras firmly prohibit any suicide other than one religiously motivated. In ancient and medieval Hinduism a number of methods of committing suicide were regarded favorably, such as drowning oneself in the Ganges, jumping from a cliff, burning oneself, burying oneself in snow, or starving oneself to death. Various places of pilgrimage, such as Prayāga (present-day Allahabad) or Banaras, were seen as particularly auspicious places for ending one's life.

Two types of suicide in Hinduism, very different in form and intention, are worthy of special examination. The first is the death by suicide of the enlightened person, the world renouncer. Such a person, in his or her quest for release from *samsāra*, has been devoted to increasingly difficult acts of penance and to a thorough study of the Upaniṣads. Once this person has attained the goal of freedom from all desires, he or she may begin the great journey in the direction of the northeast, consuming nothing other than air and water. According to the lawgiver Manu, a brahman might also follow this procedure when beginning to be overcome by a serious illness.

The second form of suicide in Hinduism that deserves special attention is *satī*, widow burning. It appears to have

been a form of suicide motivated by both social and religious considerations. Although the custom is not unique to India, it nonetheless was practiced there most frequently and over the longest period of time. The practice may go back as far as the fourth century BCE, but it began to grow in popularity only after about 400 CE. According to Upendra Thakur in his study *The History of Suicide in India*, "*satī* in its latest forms was a mediaeval growth though it had its germs in ancient customs and rituals" (1963, p. 141). The practice of *satī* might take one of two forms. In one, *sahamarāṇa*, the woman ascended the funeral pyre and was burned alongside the corpse of her husband. In the second, *anumarāṇa*, when the wife learned that her husband had died and his body had already been cremated, she would ascend the pyre and die alongside his ashes, or with some belonging of his. Certainly, at least in some cases, *satī* was motivated by genuine feelings of grief and affection on the part of the widow. Although the practice remained voluntary, in some areas social pressure may have made *satī* more the rule than the exception. No doubt the practice also gained popularity because the life of a widow was both lonely and degrading. On the other hand, the blessing or curse of a woman on her way to perform *satī* was believed to be very powerful, and her act of sacrifice was believed to purify both herself and her husband. Thus, although the act of *satī* may not always have been religiously motivated, it did have its religious reward. The British, during their rule of India, made a determined effort to abolish the practice, finally outlawing it as homicide in 1829.

Perhaps the tradition that most explicitly condones religiously motivated suicide is Jainism. Following the teaching of their saint Mahavira, who lived in the sixth century BCE, the Jain monk and the Jain layperson lead, in differing degrees, a rigorously ascetic life in order to attain liberation and to free the soul from karma. Members of the laity as well as monks are encouraged to practice *sallekhanā* (austere penance), in order to attain a holy death through meditation. Jains believe it is their duty to prevent disease or the infirmities of old age from undermining the spiritual progress they have attained through asceticism and meditation. Jainism prescribes strict rules for when *sallekhanā* is appropriate. As Padmanabh S. Jaini indicated in his book *The Jaina Path of Purification*, Jainism distinguishes between impure suicide, by which the passions are increased, and pure suicide, the holy death attained with "inner peace or dispassionate mindfulness" (Jaini, 1979, p. 229). *Sallekhanā* involves gradual fasting, often under the supervision of a monastic teacher, until the stage is reached whereat the individual no longer consumes any food or drink and thus gradually attains death by starvation. Jains perceive *sallekhanā* to be the climax of a lifetime of spiritual struggle, ascetic practice, and meditation. It allows the individual to control his own destiny so that he will attain full liberation or at the very least reduce the number of future reincarnations that he will undergo.

**BUDDHISM AND CONFUCIANISM.** Turning to Buddhism and Confucianism, one finds that suicide is legislated against in both traditions, but that there are notable exceptions involv-

ing religiously motivated suicide. Gautama Buddha, in his personal search for salvation, deliberately chose against the practice of fasting unto death. Nonetheless, under certain extraordinary circumstances, Buddhists see religiously motivated suicide as an act of sacrifice and worship. Indications of this positive attitude toward suicide, or self-sacrifice, are found in some of the accounts of the Buddha's previous lives contained in the Jatakas (Birth Tales). The stories of the Buddha's previous lives as a hare (*Saśa Jātaka*) and as a monkey (*Mahākapi Jātaka*) both describe suicide as an act of self-sacrifice to benefit another, and only in the story of the monkey does this act lead to death. Another famous account is that from the *Suvarṇaprabhāsa*, a Mahāyāna *sūtra*, which describes the suicide or sacrifice of the Buddha, during his life as the prince Mahāsattva, in order to feed a hungry tigress unable to care for herself. Following this model, Buddhism in its various forms affirms that, while suicide as self-sacrifice may be appropriate for the person who is an *arhat*, one who has attained enlightenment, it is still very much the exception to the rule.

Confucianism based its attitude toward suicide on another consideration, that of filial piety and obligation. The person who commits suicide robs his ancestors of the veneration and service due them and demonstrates his ingratitude to his parents for the gift of life. The duty of a gentleman is to guide his life according to *li*, the code or rules of propriety. In rare cases, suicide was required of the gentleman who failed to uphold these rules. In some instances a gentleman might commit suicide to protest improper government, since above all a gentleman was obliged to uphold the virtue of humaneness. Thus, in these unusual instances suicide was the correct way to demonstrate adherence to the precepts of Confucianism.

Although the Japanese tradition of *seppuku*, or *harakiri*, should be regarded in its voluntary form as heroic rather than as religiously motivated suicide, it nonetheless does contain certain religious elements. The standard by which all acts of *seppuku* (disembowelment) were judged was set by the heroic Minamoto Yorimasa during a desperate battle in 1180. While suicide was usually performed as an individual act by a noble warrior or *samurai*, there are examples in Japanese history of mass suicides, such as that of the forty-seven *ronin* who accepted the penalty of *seppuku* in order to avenge the death of their lord in 1703.

While Christian missionaries in Japan, from the time of the arrival of the first Jesuits, sought to prevent *seppuku*, the Zen Buddhist tradition continued to regard it as a form of honorable death. The selection of the *hara*, or belly, as the point at which the sword was plunged into the body reflected the belief that the abdomen is the place where one exercises control over one's breathing and is, indeed, the central point of self-discipline. More generally, as Ivan I. Morris states in his book *The Nobility of Failure*, the abdomen was considered in the Japanese tradition as "the locus of man's inner being, the place where his will, spirit, generosity, indigna-

tion, courage, and other cardinal qualities were concentrated" (Morris, 1975, p. 367). Thus, by committing oneself to the performance of *seppuku*, which became a clearly defined ritual, one demonstrated in this final act the greatest degree of self-control, discipline, and courage.

**CONCLUSION.** This article has focused directly on religiously motivated suicide. It has omitted references to suicide among elderly Inuit (Eskimo) and among young Tikopia islanders, to cite only two examples from a vast number of possibilities. In these cases, as in many others, although the suicides may be heroic or altruistic, they do not demonstrate a clear religious motivation. Suicides by reason of financial failure, or loss of honor or of a loved one, occur among the Kwakiutl and Iroquois Indians, as well as among Bantu-speaking peoples of Africa. Occurrences of suicide are not limited by geography or time, but of the many suicides that have taken place throughout the ages, only a small proportion can be judged to be religiously motivated.

The examples of religiously motivated suicide discussed here demonstrate the wide variety of forms and purposes that the act may take. Many of the examples, from both East and West, illustrate the difficulty in distinguishing between suicide that is religiously motivated and suicide that is motivated by heroism, altruism, or fear of persecution and suffering. The deaths at Jonestown in 1978 raise anew the problem of how to differentiate between religiously motivated suicide and suicide induced by paranoia and terror. There is no simple distinction between suicide and martyrdom, on the one hand, or between suicide and sacrifice, on the other. In formulating these distinctions and in evaluating the morality and religious value of certain acts that result in death, each person brings to bear his or her own religious and ethical values and tradition. Such personal judgment must, however, be conjoined with the awareness that what may be perceived by one observer as needless self-sacrifice or even self-murder may be judged by another as the noblest example of religiously motivated suicide in behalf of beliefs, values, or tradition.

**SEE ALSO** Martyrdom.

## BIBLIOGRAPHY

There is a vast literature on suicide, but relatively little of it focuses on the act as religiously motivated. Any student of the topic must begin with Émile Durkheim's *Le suicide*, translated by John A. Spaulding and George Simpson as *Suicide: A Study in Sociology* (New York, 1951). It is the classic work on the varieties of suicide analyzed from a sociological viewpoint. Jacques Choron's chapters on "Suicide in Retrospect" and "Philosophers on Suicide" in his volume *Suicide* (New York, 1972) are quite helpful in understanding the place of suicide in the West at different times. A volume edited by Frederick H. Holck, *Death and Eastern Thought: Understanding Death in Eastern Religions and Philosophies* (Nashville, 1974), contains several chapters that refer to suicide. Alfred Alvarez also discusses the themes of religious motivation for suicide and religious prohibition of the act in his book *The Savage God:*

*A Study of Suicide* (London, 1971). He includes personal reflections on his own suicide attempt, and describes his friendship with the poet Sylvia Plath, who committed suicide in 1963.

Among the older studies of the topic, still useful are *Suicide: A Social and Historical Study* by Henry Romilly Fedden (London, 1938) and *To Be or Not to Be: A Study of Suicide* by Louis I. Dublin and Bessie Bunzel (New York, 1933).

There are relatively few sources that consider religiously motivated suicide in specific traditions. For the Western religious traditions, the reader should refer to the bibliography of the article *Martyrdom* as well as to the various primary sources mentioned throughout this article. In addition, for Judaism, the reader will find useful Yigael Yadin's *Masada: Herod's Fortress and the Zealots' Last Stand* (New York, 1966) and Cecil Roth's *A History of the Jews in England* (Oxford, 1941), which discusses the events at York. On Christianity, particularly informative is Samuel E. Sprott's *The English Debate on Suicide from Donne to Hume* (La Salle, Ill., 1961). William A. Clebsch has prepared a new edition of John Donne's work, translated as *Suicide* (Chico, Calif., 1983), with a very helpful introduction. Robert O. Crummey presents a fascinating account of suicides among the Raskol'niki in his book *The Old Believers and the World of Antichrist: The Vyg Community and the Russian State, 1694–1855* (Madison, Wis., 1970). See especially his chapter entitled "Death by Fire." On Islam, the most useful secondary source remains Franz Rosenthal's "On Suicide in Islam," *Journal of the American Oriental Society* 66 (1946): 239–259. For the Assassins, one should consult the comprehensive historical account by Marshall G. S. Hodgson in *The Order of Assassins: The Struggle of the Early Nizārī Ismā'īlīs against the Islamic World* (1955; New York, 1980).

For the Eastern traditions, in addition to the volume edited by Holck and the primary texts mentioned in the article, the following books are useful sources for individual traditions. For Hinduism, see both the older account by Edward Thompson, *Suttee: A Historical and Philosophical Enquiry into the Hindu Rite of Widow-Burning* (London, 1928), and the more comprehensive study by Upendra Thakur, *The History of Suicide in India: An Introduction* (Delhi, 1963). For Jainism, Padmanabh S. Jaini offers a detailed account of *sallekhanā* in his book *The Jaina Path of Purification* (Berkeley, 1979). The Buddhist account entitled "The Bodhisattva and the Hungry Tigress" may be found in the volume edited by Edward Conze, *Buddhist Scriptures* (Harmondsworth, 1959). For the Japanese attitude toward suicide and death, see the fascinating work by Ivan I. Morris, *The Nobility of Failure: Tragic Heroes in the History of Japan* (New York, 1975), and for the study of *seppuku* among the warrior class, see *The Samurai: A Military History* by S. R. Turnbull (New York, 1977).

*Revised Bibliography*

**SUKKOT** is the Hebrew name for the Jewish autumnal festival, also called the Festival of Booths, or Tabernacles. Sukkot begins on the fifteenth day of the month of Tishri and lasts for seven days, followed by an eighth day called 'Atseret (possibly meaning "assembly"; see *Lv.* 23:36, *Nm.* 29:35). (Outside Israel, 'Atseret is observed also on the ninth day.) Thus, according to Jewish tradition, there are really two distinct but interconnected festivals: Sukkot proper and Shemini 'Atseret ("eighth day of 'Atseret"). The Sukkot rituals are carried out only on Sukkot proper; two are essential. The first is to dwell in booths or tabernacles (*sukkot*; sg. *sukkah*) as a reminder of the dwellings in which the Israelites lived at the time of the Exodus from Egypt (*Lv.* 23:33–44). The second is derived from the biblical verse regarding four plants: *lulav* (palm branch), *etrog* (citron), *'aravot* (willows), and *hadassim* (myrtles) (*Lv.* 23:40). It is traditionally understood that these four plants are to be ritually held in the hand. Sukkot, as the culmination of the three pilgrim festivals, is the season of special rejoicing (*Dt.* 16:13–17) and is referred to in the liturgy as "the season of our joy."

**THE SUKKAH.** The main symbol of the festival is a hut, having at least three walls, no roof, but covered with leaves or straw. During the seven days of the festival, all meals are eaten in the *sukkah*. Many Jews, especially those living in warm climates, sleep there as well. In addition to the biblical reason, medieval thinkers saw the command to dwell in the *sukkah*, a temporary dwelling, as a reminder to man of the transient nature of material possessions, and an exhortation that he should place his trust in God. According to the mystics, the *sukkah* is visited on each of the seven days by a different biblical hero—Abraham, Isaac, Jacob, Moses, Aaron, Joseph, and David. It is the custom among many Jews to recite a welcoming formula to these guests (*ushpizin*) as if they were real persons visiting the *sukkah*.

**THE FOUR SPECIES.** The rite of the four plants consists in taking them in the hand during the synagogue service and waving them above and below and in the four directions of the compass. The stated reason is to dispel harmful “winds” and to acknowledge God as ruler over all. Various interpretations have been given of why it is commanded to take these four plants. For example, it has been said that they represent the human backbone, heart, eye, and mouth, all of which must be engaged in the worship of God. Moses Maimonides (1135/8–1204) treated these as homiletical interpretations and suggested as the true reason a means of thanksgiving to God for the harvest. The harvest motif is also observed in the custom of having a procession in the synagogue while holding the four plants on each day of Sukkot. During the procession the Hoshānah (“save now”) prayer for a good harvest in the year ahead is recited. On the seventh day there are seven processions, hence the name of the day, Hoshānah Rabbah (“great Hoshānah”). At the end of the service on this day, the ancient custom of beating bunches of willows on the ground follows. On Shemini ‘Atseret a special prayer for rain is recited. In a later development within Jewish tradition, Hoshānah Rabbah is seen as setting the seal on the judgment made on Yom Kippur, so that the day is a day of judgment with prayers resembling those offered on Yom Kippur. There is a folk belief that if a person sees his or her shadow without a head on the night of Hoshānah Rabbah, that person will die during the year.

**SHEMINI ‘ATSERET.** The last day of the festival has acquired a new character from medieval times. The weekly Torah readings—from the beginning of *Genesis* to the end of *Deuteronomy*—are completed on this day and then immediately begun again, so that the day is both the end and the beginning of the annual cycle. The day is now called Simḥat Torah (“rejoicing of the Torah”). In the Diaspora, Simḥat Torah falls on the second day of Shemini ‘Atseret (23 Tishri). In Israel, Simḥat Torah coincides with the one-day celebration of Shemini ‘Atseret on 22 Tishri, the day also observed by Reform Jews, who no longer observe the additional second day of festivals traditionally observed by Diaspora Jews. The person who has the honor of completing the reading is called the “bridegroom” of the Torah, and the one who begins the reading again is the “bridegroom” of *Genesis*. On this joyful

day the scrolls of the Torah are taken in procession around the synagogue, and the “bridegrooms” invite the congregation to a festive repast.

#### SUMERIAN RELIGION SEE MESOPOTAMIAN RELIGIONS

**SUN.** There can hardly be anyone on earth who has not been profoundly aware of the apparent progress of the sun across the heavens and who has not related to it, either personally or as a numinous force. The rising and setting of the sun provides one of the primal dichotomies, parallel to those between day and night, light and darkness, warmth and cold, life and death, *yang* and *yin*. Night is mysterious, dangerous, akin to the darkness of the womb. Daylight symbolizes renewed life, truth, logic. In modern thinking, the sun often stands for individual consciousness, and the moon (or night) for the unconscious, the ocean, or the feminine principle. In children’s drawings, a happy scene includes a huge round sun with rays like hair. Unhappy and frustrated children produce an entirely black sky. Mentally disturbed patients often draw their own bodies as the sun’s disk, complete with arms and legs like rays.

In classical poetry birth is described as “reaching the shores of light.” In the *Eumenides* of Aeschylus, the conflict is between the fearsome Furies, avengers of the mother’s blood, who constantly invoke the “dark mother,” and the shining Apollo, revealer of truth and righteousness (and symbolic of paternal predominance). The west, where the sun sets, in most rituals represents death; the east, where the sun rises, life and birth. Even Neanderthal burials were oriented according to east and west. When a Greek priest faced north in sacrifices, the right hand, stretched toward the east, represented the fortunate side, the left, the “sinister.”

In many primitive mythologies, the sun is an object tossed up or hung in the sky by mortals or trickster figures.

The Hopi Indians claim that they made their sun themselves, by throwing into the sky a shield made of buckskin together with a fox skin and a parrot's tail to make the colors of sunrise and sunset. The San of Africa believe that the sun was once a mortal who gave out light from his armpit. In order to make the light brighter, some children threw him into the sky, whereupon he became round and shines now for all humankind. Among the Tatars, the culture hero Porcupine took some fire on his sword and threw it up into the sky to make the sun. For the moon, he thrust his sword into the water; thus the sun is hot and the moon cool. The famous American Indian trickster Coyote is said to have sent the wolf to bring him fire to make the sun. In one of the Oceanic myths that describe life beginning inside a shell, the creator, Spider Woman, opened the shell and then threw up two snails to make the sun and moon. In Norse mythology the sun and moon are sparks from Muspelheim, the realm of fire. The gods, however, anthropomorphized them and set them to drive chariots across the sky.

In more sophisticated societies, the luminaries were set in the heavens by the high god. Sometimes, they represented his eyes. In ancient Egypt the sun was sometimes called the eye of Re; in northern Europe, the eye of Óðinn (Odin); in Oceania, the eye of Atea.

The creation myth of Mesopotamia, *Enuma elish*, relates how the conquering god Marduk, who had solar characteristics himself, "set up stations for the gods in the sky, determining the year by setting up the zones." According to the *Book of Genesis* "God made the two great lights, the greater light to rule the day, and the lesser light to rule the night. . . . And God set them in the firmament of the heavens to give light upon the earth, to rule over the day and over the night, and to separate the light from the darkness" (1:16–18). In Plato's great myth the *Timaeus*, "the Demiurge [the creator] lit a light which we now call the sun. . . to shine through the whole heaven and to enable the living creatures to gain a knowledge of numbers from the uniform movements. In this way there came into being night and day, the period of the single most intelligent revolution" (39c). Thus the Demiurge, having set out all the heavenly bodies, put them in motion and brought time into being.

More often, the sun is anthropomorphized, sometimes as a female but more frequently as a male. He crosses the sky by the appropriate means of locomotion. In ancient Sumeria, he walked. In ancient Egypt, he sailed in a boat like the ones on the Nile, in company with some of the other gods and the pharaoh. When the horse was domesticated, about the beginning of the second millennium BCE, the sun drove a chariot pulled by white or flaming horses. The horse, the sacred animal of the Indo-Europeans, was one of the animals most closely connected with the sun and was often sacrificed to it. Another creature associated with the sun was the bird—a falcon, raven, or eagle, or, of course, the fabulous phoenix, which dies and is born again from the fire every five thousand years. The wings of birds are attached to the sun's

round form to produce the winged disk so common in solar iconography. In Africa and India the tiger and especially the lion are sun animals; in the Americas, the eagle and the jaguar. Leo is the zodiacal sign for the fiercest summer month; the lion is the royal animal on all the kingly architecture of the ancient Near East. The many representations of a lion attacking a bull may, some have surmised, reflect the heat of summer routing spring, represented in the zodiac by Taurus, the bull, or the paternal cult, attacking the female horned moon.

Eclipses of both sun and moon were experienced with great dread. The Tatars believed that an eclipse meant that the sun was attacked by a vampire who lived in a star. In Norse myth the sun was pursued by a supernatural wolf who will devour it when the world ends. The ancient Egyptians believed that a demon—the Chinese, a dragon—was attacking the sun. Some North American Indian tribes, on the other hand, believed that the sun and moon were eclipsed when they held their infants in their arms. In Tahiti it was believed that eclipses occurred when the sun and moon were mating.

Many devices were employed to "cure" eclipses, such as the beating of drums or the making of other loud noises or the shooting of arrows at the sun. "Snaring the sun" is one of the most widespread sun myths in Oceania and North America. This is one of the exploits of Maui, the Polynesian culture hero, for instance, who caught the sun and beat it so that it would not go so fast. It has been conjectured that stories of this kind are explanations for the solstices, when the sun is perceived to stand still for several days. The high cultures of the Inca and of Mesoamerican peoples were familiar with the stations of the sun, and the Pueblo measured sunrise points on the eastern horizon to divide the year. The Zuni used as a gnomon an erect slab with a solar effigy on top, and the sun temple at Cuzco, like Greek temples, was so oriented that the sun at the solstice would penetrate the shrine.

There seems to be no doubt that the impressive monument at Stonehenge in England was set up to mark the solstices and equinoxes as well as the stations of the moon. New carbon 14 readings indicate that Stonehenge is at least as old as the first pyramids, ruling out influence from the East on its construction. In view of the tremendous labor involved in moving and setting the megaliths, which occurred in three stages several centuries apart, there can hardly be any question that religious motivation was involved. Diodorus Siculus, writing in the first century BCE, described a "spherical temple to Apollo among the Hyperboreans," which may be a reference to Stonehenge as a great temple to the sun. Recent research has turned up other observatories in Scotland, the Orkneys, and even in Carnac in Brittany. Gold and bronze disks engraved with crosses and spirals, daggers and horse trappings with the same designs, and amber disks with gold rims, all contemporary with the last phase of Stonehenge, have been found in the British Isles and in Scandinavia. It is tempting to imagine a crowd of people, each carry-

ing a sun amulet, waiting for the summer sunrise at Stonehenge.

A spectacular object confirming northern sun worship is the famous disk found in Trundholm in northern Zealand, plated with gold and decorated with circles and spirals; it is set on wheels and drawn by a bronze horse, probably one of a pair. In all the Scandinavian countries have been discovered objects and rock carvings decorated with disks, boats, and scenes of humans raising their arms to a disk. Sometimes there are men in the shape of disks, carrying weapons. These have been interpreted as solar deities or mortals wearing the sun's emblem. The wheel, the boat, the cross in a circle, and the swastika (a moving wheel) can all be seen as sun symbols.

The summer solstice in northern Europe today is marked by bonfires and the rolling downhill of flaming wheels, as it was no doubt millennia ago. The winter solstice is a time to encourage the sun to grow again, represented by the burning of the Yule log, the Hanukkah light, and the lighted candles of Saint Lucy in Sweden. The boar's head at the Christmas feast represents the old year, or the old sun, and the suckling pig with the apple of immortality in its mouth is the new sun.

It was the tendency of nineteenth-century scholars to search for a single key to the understanding of all mythology. One of the most popular of these keys was the concept of the sun hero, a ubiquitous figure who was either the sun itself or an offspring of the sun. It has become clear over the years that all myths cannot be traced to one source. Yet there are some elements of myth that do seem to have solar references in common, perhaps formulated by the ancients at the time when astral religion invaded the Mediterranean world. It has been pointed out (by Joseph Campbell, for instance, in *The Hero with a Thousand Faces*) that in most myths heroes have one divine parent and that they wander about on the earth and make at least one trip to the underworld. Also, most myths describe a wandering sun, which goes under or behind the earth at night, and in most myths the divine parent is perceived as a sun figure. One instance is the Greek Perseus, whose mother, an underground divinity, was impregnated by a shower of gold, the sun's metal. Another is the Irish Cú Chulainn, who is explicitly a son of Lugh Lamfhada, "Lugh of the long hands," an epithet that is reminiscent of the long rays that end in human hands pictured at Amarna in Egypt. Lugh was a god of brightness and the sky and, like Apollo, master of all crafts. He fought at the mythical battle of Moytura, where he vanquished his grandfather, the giant Balor, who had one eye in the middle of his forehead, like the cyclopes, who were also sun figures. The Welsh counterpart of Lugh is Llew Llaw Gyffes, or Lludd. Lludd had a temple at Lydney in England near the Severn where he is portrayed, perhaps through Roman influence, as a young man with a solar halo driving a chariot. The Samson of *Genesis*, a mighty and short-tempered Herakles figure, has a name derived from the Hebrew word for "sun." Samson's fight with a lion, and his birth, which is connected with a supernatural figure

who vanishes in flames, seem to point to other solar connections.

Homer's Odysseus has been interpreted as a sun figure, since he wanders for nine years, which is the period the Greeks used to correlate solar and lunar calendars. He finally reaches his Penelope, who weaves by day and unravels by night. Most replete with sun details, however, is the story of Herakles, son of the sky god Zeus, who wanders the earth to perform his deeds, returns unhurt from the underworld, dies in a fire, and is taken up to heaven. He not only lives on in heaven but also has a shade who lives on in the underworld. Herakles' labors were perhaps limited to twelve (although others have been recorded) in order to fit them into the zodiac.

As an all-seeing eye who travels the world, the sun acquired the character of a spy for the gods and therefore a stern judge of humankind. When the heavenly bodies began to be seen as parts of a well-ordered and consistent system, more pure and dependable than that of the old gods, the sun, an obvious leader in the sky, took his place as a symbol of the newly emerging royal power. Thus, organized cults of the sun are strongest in the great civilizations, which were often kingships. A new sense of power and organization, as well as a new sense of justice, found its central source in kingship, just as the harmony of the heavens was centered in the sun. "It is a remarkable coincidence," writes Jacquetta Hawkes, "that a discovery and an invention attendant on the creation of Bronze Age civilization came just in time to provide symbols of the sun gods and their temples. These were gold and the wheel" (Hawkes, 1962, p. 73). Since its discovery, gold has been the royal metal, as well as the sun's. The sun royal was adopted by all kings but never so completely as by the Sun King, Louis XIV (r. 1643–1715). Elizabeth II of England at her coronation in 1952 wore a golden gown under her robe, and her archbishop prayed that her throne "may stand fast in righteousness forevermore, like the sun before her and as the faithful witness in heaven." One must thus look to the high civilizations and imperial kingships to find the most highly developed cults of the sun.

**ANCIENT EGYPT.** Very early in its history, somewhere in the fourth millennium BCE, Egyptians broke away from a moon calendar and organized time around the heliacal rising of the star Sirius, which occurs about July 19. This date coincided with the yearly inundation of the Nile, the most important period in the agricultural life of a country that has no rainfall and no seasons. From that time on the year was divided into twelve months of thirty days each, with a five-day intracalendarical period. Whether or not this arrangement affected the religious life of the Egyptians, as some have argued, the sun in various aspects became the dominant figure in Egyptian religious life, combining with, and in some cases supplanting, other deities.

One of the earliest manifestations of the sun was the falcon god Horus, who appears on the famous palette of Narmer, the unifier of the two lands that became Egypt. Horus

was probably an ancient sky god, seen as a soaring bird who was manifest in the sun itself; he was known as Re-Harakhty, the god of the horizon, or sunrise. He was at first the son of the sky goddess Hathor (in Egypt the sky is female and the earth male). Later, as the tendency to group the important gods into families developed, he was known as the son of Osiris, the god of fertility and the underworld. Osiris' sister-wife, Isis, mourns for her dead husband and secretly raises their son Horus to do battle with Osiris' murderer, his brother Seth. In this family, the sun god, Re, was combined with an older creator god, Atum. In Heliopolis, a temple compound just north of modern Cairo near the old capitol of Memphis, a powerful priesthood built up the cult of Re-Atum, beginning at least in the fourth dynasty (2600 BCE). This is the period in which were built the first great pyramids, which pointed toward the sun. In the mythology developed at Heliopolis, the creator Re-Atum produced land from the surrounding waters. A mound in the temple was known as the Ben-Ben and was supposed to represent the semen of Re. Out of his own substances the creator god made sky and earth, air and water, and finally the four divinities: Osiris, Seth, and Isis and Nephthys, their wives.

The powerful priesthood at Heliopolis proclaimed the pharaoh the son of the Sun. It seems likely that the earlier pharaohs had themselves represented the Sun, and that they lost power under the growing influence of the priesthood. It was also possible for the priests to control the selection of the pharaoh's divine successor from among his offspring.

The history of ancient Egypt is neatly divided into the Old, Middle, and New Kingdoms, with two intervening periods of anarchy. After the first intermediate period, a new royal house arose in the south, at Thebes. There, Re was combined with a local god, Atum, the "Hidden One," probably representing the air. This god flourished throughout the New Kingdom, when Egyptian power spread into Asia. The great temples at Karnak and Luxor testify to the power and enormous wealth of the sun cult.

The sun was usually pictured as sailing across the sky in a boat, with various attendants and sometimes with the pharaoh himself. At other times the sun is seen sailing up the leg and belly of the sky goddess, who bends over the earth or straddles it in the form of a cow. Or the sun was swallowed at night by the sky mother and is born each morning from between her thighs. The sun was symbolized by a falcon but more notably by the mythical phoenix, which alighted on the Ben-Ben every five hundred years, was consumed in fire, and rose again. Another important symbol of the sun was the scarab, the dung beetle Khepri, which supposedly created itself by rolling its eggs in balls of dung. The obelisks, as well as the gold-topped pyramids, point toward the sun. On the early squat obelisk of the fifth dynasty, the sun is pictured as creator of life and lord of the seasons.

In the reign of Amunhotep III (1417–1439 BCE), the actual disk of the sun, called the Aton, began to appear as a numinous symbol. It was the pharaoh's son Amunhotep

IV (1379–1362 BCE), however, who attempted, in one of the great religious revolutions of history, to convert the entire nation to monotheistic worship of the Aton as sole god. Whether he was religiously motivated or whether he wished to break the power of the enormously wealthy priesthood, he sought to abolish all other worship in favor of the Aton, the sun's disk. He changed his name to Akhenaton ("Aton is satisfied") and built a new capital at Amarna. In this city he supported a new school of art, which pictured him in naturalistic style with his beautiful wife Nefertiti and his five daughters, all under the brilliance of the sun, which reached down to earth with long rays ending in human hands. Akhenaton has left a well-known hymn to the Aton as creator of all the beauties of the world: "How manifold are your works. They are mysterious in men's sight, O sole incomparable god, all powerful. You created the earth in solitude as your heart desires. Men you created, and cattle, whatever is on earth." Akhenaton's revolution failed, and after his mysterious death the priesthood reclaimed their power, and a young man (probably his son-in-law) resumed the worship of Amun, adopting the name of Tut-Ankh-Amun (or Tutankhamen).

**MESOPOTAMIA.** In the land between the Tigris and Euphrates rivers, where are found the earliest traces of urban living, writing, kingship, and an organized priesthood, the sun was at first subordinate to the moon. To the first recorded inhabitants, known as the Sumerians, the chief god was An, a sky god who had retired from active control and left the rule of the universe to his son, Enlil, the Air. A son of Enlil was the important moon god, Nanna, whose children were the Sun—Utu—and the Evening Star—Inanna. In Sumerian times, the regions were divided into a series of independent cities, each devoted to the worship of a patron god. Only two minor cities, Larsa and Sippar, worshiped Utu, the Sun.

The Semitic-speaking states that followed the Sumerians took over the religious organization they found, calling the moon Sin and the sun Shamash. In that dangerously torrid land, the sun was considered a baleful god. But since he traveled continually across the sky, he was considered a spy for the high gods and a stern judge of humankind. Travelers prayed to him before setting out on a journey, and armies before an expedition. He was thus a warrior god and leader of armies. In the quest of the hero Gilgamesh for the secret of immortality, it was the Sun who guided him on his journey. Originally the Sun walked across the heavens; in later times he rode a cart drawn by onagers, wild asses from the desert. Still later, the horse drew the Sun's chariot. The Sun in his chariot appeared in the morning at the eastern gate on the Mountain of Sunrise, in the evening arrived at the Mountain of Sunset, and then passed through to the underworld. Because of his appearance in the underworld, the Sun was sometimes pictured in company with Tammuz, the Mesopotamian dying god, who dies and is reborn. There was very little concern for judgment of the dead in Mesopotamia, and Shamash's character as judge was thus reserved for the

upper world. At Ur, it was the Sun who punished a corrupt judge for taking bribes and oppressing the people.

Shamash was the god of oracles and was supposed to inscribe the signs that the diviners read in the intestines of sheep. Soothsayers claimed they were descended from a king of Sippar, who lived before the flood; the diviners were the most prestigious of the priests in that city of the Sun. From Assyrian times are preserved a number of questions asked of the Sun concerning the state and the royal family. The diviner read the answers in the entrails of dissected sheep. Probably a result of this activity was the Sun's power to control witches and demons.

Shamash was also invoked to heal the sick, free captives from bondage, and help women in labor. One prayer reads, "O Shamash, lofty judge . . . may the knot that impedes her delivery be loosed . . . may she bear. May she remain in life and walk in health before the godhead." The Sun, in other words, brings the unborn to light. He was also asked to deliver victims of spells, curses, and ghosts: "O Shamash, may I be strong and face the authors of my enchantment!"

The sun god is pictured as an old man with a long beard; sunbeams radiate from between his shoulder blades. He is seen sitting on a throne or sometimes on a horse. His special symbols are a four-pointed star in a disk with flames shooting out from between the points of the star and, of course, the winged disk, which was set above representations of royalty.

The study of heavenly bodies, conducted in Mesopotamia from at least 2000 BCE, led to a belief in an ordered universe and in the important position of the sun among the planets. Thus, with the rise of centralized imperial power in Assyria and Babylonia, the sun came into prominence as a symbol of royal power. The lawgiver Hammurabi (c. 1750 BCE) calls Shamash "great judge of heaven and earth" and proclaims that it was from Shamash that he received his laws. The sun god is seen seated on a throne, handing Hammurabi a ring and a staff. The sun temple at Babylon was known as "the house of the judge of the world."

Warlike Assyrians claimed Shamash as a great god of battles, almost the same as their own Ashur. Assyrian kings called themselves "suns of the world." Marduk, hero of the New Year festival at Babylon and a grandson of the high gods, is shown as a heavily bearded god with sun rays emanating from his shoulders. Thus the Sun in Mesopotamia, first perceived of as judge, lawgiver, and governor of magic, illness, and prophecy, grew into an image of the Sun Royal.

**THE INDO-EUROPEANS.** About the beginning of the second millennium BCE, people speaking related languages spread across western Asia into Europe, bringing similar pantheons into India, Iran, Asia Minor, and most of Europe. Their high god was a sky god—Dyaus, Pitar, Zeus, or Jupiter. But in many cases this high god tended to fade out of the pantheon, leaving the universe to his offspring, sometimes the sun god. This process, known as solarization, brought the sun to the fore as creator and ruler of the gods.

The most cherished animal of the Indo-Europeans was the horse, and they perhaps introduced the chariot to the western world. From this time on the sun is pictured as driving a chariot across the sky, and the horse became one of the sun's animals, often sacrificed to him.

In ancient Indian and Iranian texts appear the names *Varuṇa* and *Mitra*, which seem to mean respectively "the sky" and "the light of day." *Mitra* faded out in India, but in Iran, as *Mithra*, he was the subject of many hymns in the sacred writings, the Avesta. *Mithra* is said to represent celestial light, which appears before sunrise on the mountains, whence it crosses the sky in a chariot. He is said to be neither sun, moon, nor star, but with his hundred eyes he constantly keeps watch on the world. None can deceive him, so he is viewed as a god of truth and righteousness. He is the enforcer of oaths and contracts and is also called "lord of the wide pastures who giveth abundance and cattle." He combats the forces of evil, spies out his enemies, swoops down and conquers them, and is the ally of the faithful in their wars. Thus *Mithra*, though not identified with the sun, shares all the attributes of the Mesopotamian Shamash. When the Persians conquered Babylon the name *Mithra* was translated as *Shamash*. A large number of the names of Persian aristocrats are compounds of *Mithra*.

The Greek historian Herodotus relates that the Persians sacrificed to the sun as well as to earth, fire, and water and that leprosy was thought of as punishment for a sin against the sun (*Histories* 1.138). When Xerxes was leading his huge army through Asia Minor to attack Greece, he waited on the Asiatic shore until sunrise and then poured a libation from a golden cup, which he threw together with a golden scimitar into the sea (7.54). Xerxes' army was accompanied by a riderless chariot drawn by eight white horses, which Herodotus says was sacred to Zeus, the sky god. It was followed by a chariot of the sun, also drawn by white horses. Herodotus also tells us that along the route were led horses that were intended to be sacrificed to the sun. Horse sacrifices have been recorded from India to Ireland and have commonly accompanied the coronation of kings.

A true sun hymn occurs in the Avesta: "Unto the undying, swift-horse sun be propitiation and glorification. . . . When the sun rises up, the earth, made by Ahura, becomes clean. . . . Should the sun not rise up, the demons would destroy all things." Every layman in ancient Persia was required to recite a prayer to the sun at sunrise, at noon, and at three in the afternoon. Persian deities were established in Lydia, Cappadocia, and Armenia by Iranian officials, and it is probably through Persian influence that the sun god became prominent in places like Emesa, Baalbek, and Palmyra in Syria.

In India, the same divinities, *Varuna* and *Mitra*, are called in the *Rgveda* "kings of gods and men." They drive chariots across the sky and live in heavenly palaces with a thousand gold columns and a thousand doors. Ten hymns of the *Rgveda* are devoted to the sun under the name of

Sūrya, who seems to represent the actual disk of the sun. Sūrya had the power to drive away darkness, witches, and evil dreams; he is also a healing god, particularly effective against jaundice. He is the husband of Dawn and drives a chariot, sometimes with one and sometimes with seven horses. Another name for the sun is *Savitṛ*. Sometimes it is said that the sun is Savitṛ before his rising and Sūrya afterward. Savitṛ “brings all men and animals to rest; men lay down their work and birds seek their nests.” Among other names given to the sun in the ancient poems is that of Viṣṇu, because “he strode across the sky in three giant steps” to ward off demons from humankind. Viṣṇu, of course, came to be one of the three great gods of Hinduism, the one especially benevolent to humankind.

**ANCIENT GREECE.** In Hesiod’s *Birth of the Gods* (c. 750 BCE) Helios is the son of Hyperion, also a sun figure, and is the brother of the Moon (Selene) and of the Dawn (Eos). He is not included in the family of Olympians who came into prominence after Homer and Hesiod (from about 800 BCE), but belongs to an older, less-well defined group that was closely connected with natural phenomena. In Homer (c. 800 BCE), Helios reveals to Hephaistos the adultery of his wife, Aphrodite. In the Demeter myth he reports that Hades has carried off to the underworld Demeter’s daughter, Persephone. The chariot of the sun is mentioned not in Homer but in the so-called Homeric Hymns (c. 700 BCE). Demeter stands before the chariot as she begs for help. According to the Homeric *Hymn to Helios*, “as he rides in his chariot, he shines upon all men and deathless gods, and piercingly he gazes with his eyes from his golden helmet. He rests upon the highest point of heaven until he marvelously drives down again from heaven to the Ocean.” The poet Mimnernus (c. 630 BCE) describes the sun as floating back through the subterranean ocean in a golden bowl made for him by the divine smith Hephaistos. These descriptions laid the foundations for the hundreds of depictions of the sun in his chariot in Greek art, continuing into Roman times.

As in Mesopotamia, the Sun in Greece is involved in oaths and is a god of vengeance. In Aeschylus, Prometheus, bound upon his crag, calls upon “the all-seeing circle of the sun” to witness his woes. In *Oedipus of Colonus*, by Sophocles, Creon drives his brother-in-law out of the house so that “the sun may not look upon such a wretch.” Cassandra in Aeschylus’s *Agamemnon* calls upon the Sun for vengeance on her murderers. Medea in Euripides’ play makes Aegeus swear by earth and sun that he will protect her. In the *Argonautica* of Apollonius Rhodius (third century BCE) she swears by the Sun and Hekate. In the *Iliad*, 19.196, a boar is sacrificed to Zeus and the Sun in confirmation of an oath.

There was little direct worship of the sun in ancient Greece, though there are traces of earlier rites. Plato says the earlier Greeks made obeisance to the rising and setting sun. Pausanias in his guidebook to Greece (second century BCE) mentions several shrines to the sun in remote places. For instance, the people of a little town north of Corinth, when

suffering from a plague were told by the Delphic oracle to sacrifice a goat to the Sun. When they did, and the plague stopped, in gratitude they sent a bronze goat to the oracle, which many people, says Pausanias, thought was the Sun itself. Corinth itself was originally sacred to the Sun and, according to Pausanias, was called Heliopolis (“city of the sun”). Later the Sun gave the city to Aphrodite.

The island of Rhodes, however, had a true cult of the sun, influenced perhaps by the sun worship of the East. In legend, the island was brought up out of the sea to compensate Helios for his exclusion from the heavenly lottery. It was on Rhodes that Helios loved the nymph Rhoda and begot the seven wise men of the ancient world. An impressive festival of the sun, held on Rhodes every four years, included athletic games and a chariot race. Every year the Rhodians threw into the sea a chariot drawn by four horses. The famous colossus of Rhodes, one of the seven wonders of the world, erected in 284 BCE, was a figure of the sun god. Pliny recounts that it was 105 feet high and that one of its fingers was larger than most statues. It was thrown down by an earthquake sixty-six years after it was erected.

In addition to being an all-seeing eye and god of vengeance, the sun in Greece has a connection with magic. Among his children were Aeetes, king of Colchis, Circe, the witch of the *Odyssey*, and Pasiphae (“all-shining”; perhaps a reference to the moon), who bewitched her husband, Minos of Crete. Most famous of the sun’s lineage is Medea, daughter of Aeetes, whose enchantments form the plot of Euripides’ play.

The *Odyssey* tells the story of the cattle of the Sun, which were taboo to mortals. They roamed on the island of Trinacria, seven herds of fifty each, tended by two daughters. Odysseus had been warned not to touch the cattle, but his marooned sailors were starving and killed and ate some. The flesh on the spits writhed and lowed. The Sun appealed to Zeus for vengeance and threatened to go down and shine in the underworld if he were not appeased. Zeus therefore hurled a thunderbolt, which destroyed the ship and left only Odysseus alive in the water. These cattle have been interpreted in various ways: Some say that they are the clouds that gather at sunrise and sunset, and Aristotle thought they stood for the days of the lunar year.

In ancient Greece, Apollo was a god of prophecy, sickness, healing, and death. He is connected by the historian Herodotus with the Hyperboreans, people of the north or east, who sent mysterious offerings to Apollo at Delphi. From the fifth century BCE on, there are suggestions that link Apollo to the sun. The best known myth of the sun from ancient Greece is the story of Phaethon, who begged to drive the chariot of the sun, lost control of it, and would have scorched the earth if he had not been killed by a thunderbolt. In a fragment of Euripides, the mother of Phaethon says that the true name of the sun is *Apollo*, meaning “the destroyer,” since he had destroyed her son. The Orphic poets, as well as the Cynic philosopher Crates (c. 300 BCE), called the sun

Apollo. Cornutus, writing about Greek mythology in the first century BCE, says that the sun is Apollo and the moon is his sister Artemis. In Roman times, after the names of the Greek gods reached Italy, this identification was taken for granted. The first Roman emperor, Augustus, favored the worship of Apollo, built a temple to him on the Palatine, and had the poet Horace, in his secular hymns, speak of the sun as Apollo and the moon as Diana (identified often with Greek Artemis).

As the intellectual life of philosophy developed, the Olympians lost their appeal. Philosophers substituted for them the “visible gods,” the fixed heavenly bodies. In Plato’s *Laws* (10.3) Socrates prays to the rising sun. Star lore from Mesopotamia combined with Greek mathematics to produce astrology, which gave impetus to the tendency to believe that the heavens had a meaningful relationship with humans. Many philosophers opposed astrology, but the Stoics embraced it as an example of the pantheism they advocated. The sun was obviously the most important of the planets, and in the growing mysticism of the Roman era became the final destination of souls freed from the wheel of fate.

**ANCIENT ROME.** As in Greece, sun festivals are rare in ancient Rome, but there are indications of the early worship of Sol Indiges, that is, an original and native god. There was a public sacrifice to this god on the Quirinal on the ninth of August. Varro’s book on agriculture (first century BCE) says he will mention not the city gods but those who are the best guides of the farmer, the sun and moon, “whose seasons are observed at seedtime and harvest.” Varro believed that the Sabine king Tatius, a contemporary of the founder Romulus, brought to Rome the worship of the sun and moon. He also stated that the ancient family of the Aurelii (whose descendants founded the cult of Sol Invictus) came from the Sabine country and that their name was originally Ausel, the Sabine word for “sun.”

The sun and moon were deities of the chariot races. It is possible that the famous “October horse” ritual, held on the ides of October, was originally a sacrifice to the sun. This ritual involved a sacrifice of the outside winning horse; a similar ritual occurred in March, and thus these rituals marked the planting and the harvest seasons. The Sun had a temple on the Aventine near the Circus, from which spectators could watch the races. The Sun’s image in gold was on the roof, since it was not proper to display the Sun indoors. It was to that temple that offerings were made when a conspiracy against Nero was revealed, since the Sun had discovered the plot (Tacitus, *Annals* 15.74). Augustus, returning from the conquest of Egypt, brought with him two obelisks with inscriptions declaring that he dedicated them to the sun, one of which he set up in the Campus Martius and the other in the Circus. They are now in the Piazza di Monte Citorio and the Piazza del Popolo.

Under the empire, various forms of sun worship spread into Rome from the East, imported both by slaves and by the Roman legions. The cult and mysteries of Mithra were

the most widespread of these, apparently first taken up by soldiers of Pompey from Cilician pirates. The cult was obviously derived from the older Iranian cult, but from the two intervening centuries that separate these cults little is known about Mithra; the cult spread, however, to all areas of the empire. It involved initiation in a simulated cave; immortality was promised to initiates as a reward for the soldierly qualities of courage and discipline. Some astral features were collected along the way, and the degrees of initiation were known by the names of the planets. Mithra, who was said to be a special comrade or son of the sun, was born from a rock and sacrificed a bull, from which all creation sprang. After his deeds on earth were accomplished, he partook of a special love feast with the sun god before being carried up to heaven in a fiery chariot. The initiates imitated the love feasts in *mithraea*, underground shrines, which can still be found wherever the legions went. In death they were to be carried to the sun in Mithra’s chariot. It became traditional for steles of the emperor to depict this journey upward in the sun’s chariot.

One of the more lurid incidents in the late Roman empire involved the short reign of a young man who called himself Elagabalus, or Heliogabalus, after his god. A relative of Septimius Severus (r. 193–211 CE) on his Syrian wife’s side, the youth was the hereditary priest of a sun god who was worshiped at Emesa in Syria in the shape of a black meteorite. After the death of Severus and his son Caracalla, the ladies of the court contrived to have the youth named emperor, though he was then only fourteen years old. He brought his black stone to Rome and built for it a magnificent temple on the Palatine. In front of his temple every day the youth burned incense, poured wine, offered bloody sacrifices, and—most difficult for the Romans to accept—danced Oriental dances. According to the time-honored fate of unsuitable emperors, the young man was assassinated after four years of rule.

The final victory at Rome of the sun god came about through the emperor Aurelian, who in 270 CE assumed the task of reconquering those parts of the empire that had defected. Aurelian’s mother is said to have been a priestess of the Sun in the village in which he was born, from the old Sabine family of the Aurelii. The time was ripe for a new supreme deity who would symbolize imperial power, the person of the emperor, and the new astral religion. Aurelian found such a god in Palmyra, the oasis city in the Syrian desert. Aurelian dedicated a fortune in gold, silver, and jewels from his plunder to restore the temple of the Sun in Palmyra. In 274 CE he established Sol Invictus (“the invincible sun”) as the official religion of the Roman empire, and was the first emperor to wear Oriental robes and the diadem, a sun symbol. Sol Invictus continued as supreme god and patron of emperors until Constantine, who started his reign as a sun worshiper and later turned the empire over to Christianity. The coins of Aurelian and of succeeding emperors show the Sun offering the ruler, as Preserver of the World, a globe.

The Sun portrayed in these coins is not Oriental; he has the features of the Greek Apollo, wearing a crown with solar rays. Sometimes he drives a chariot drawn by four horses. Such coins read: "To the Invincible Sun, companion of Augustus."

Julian, called the Apostate, in his brief reign (359–362) tried to bring back the worship of the sun. "From my childhood," he writes in his prose hymn to the sun, "an extraordinary longing for the rays of the sun penetrated my soul" (*Hymn to King Helios* 130c). The Neoplatonists, with whom Julian identified the leading philosophical school of the late empire, believed in one supreme ineffable god but were able to accept the sun as a symbol, "offspring of the first god." According to Julian, "His [Helios's] light has the same relation to the visible world as truth to the intelligible world" (ibid., 133a). Julian recognized three aspects of the sun god: the sun of the intelligible world, of the intellectual world, and of the sensible world, which last he identified with Mithra.

The birthday of Sol Invictus and of Mithra were celebrated on December 25, close to the time of the winter solstice. In 353 or 354 CE Pope Liberius set this date as the Feast of the Nativity, and a few years later he founded the Church of Santa Maria della Neva, now known as Santa Maria Maggiore, which became the center of the Roman celebration of Christmas. The Nativity gradually absorbed or supplanted all the other solstice rites. Solar imagery came increasingly to be used to portray the risen Christ (who was also called Sol Invictus), and the old solar disk that had once appeared behind the head of Asian rulers became the halo of Christian saints. Excavations under Saint Peter's Basilica, undertaken in hope of finding the tomb of Peter, found a very early Christian mosaic that showed Christ driving a chariot, with rays above his head.

**JAPAN.** The national religion of Japan, Shintō, is an extraordinary combination of myth, national feeling, ancestor worship, and highly sophisticated mysticism. Japanese writers on the subject assert that theoretical analysis in the Western style is quite unsuitable for Shintō; it is rather a system of rites, feelings, and intense poetic appreciation. There is no doubt that the performance of the rites has over the centuries given the Japanese people a confidence in themselves and their place in society and the universe. The sun appears on the Japanese flag today, but the epithet "Land of the Rising Sun" was perhaps invented by the Chinese.

Japanese cosmogony, first recorded in the seventh century CE, relates how the islands came to be formed out of the primeval waters by a celestial couple, who gave birth to many other natural features. When the wife was burned and died in giving birth to fire, her husband, fleeing from the sight of her decomposing body, stopped to purify himself, and in the process produced from his right eye the Sun (female) and from his left eye the Moon (male). The Moon plays very little part in the mythology, but from the nose of the original husband was produced Susano-o no Mikoto, who represents violence, earthly qualities, and death, while the sun goddess,

Amaterasu, stands for light and purity. Susano-o no Mikoto, realizing that the earth could only be created and peopled if the two powers cooperated, tried to force his way into the abode of Amaterasu, whereupon she hid in a cave and left the world in darkness. There are a number of caves in modern-day Japan that are identified as the cave where the goddess hid herself. Eventually the other gods persuaded Amaterasu to emerge. Among the sacred regalia they employed to ensure her emergence was a mirror—the mirror that is said to be part of the ritual at the famous Ise Shrine.

Shintō teaching maintains that Amaterasu and Susano-o no Mikoto represent not good and evil but complementary qualities that are necessary to produce life on earth. Eventually the world as it stands was completed, and Amaterasu became the ancestor of the first emperor of Japan. The sun goddess is the center of Shintō worship, which is intended to bind the people together in reverence for her earthly representative. The goal of Shintō is the maintenance of harmony among humankind, nature, and the gods. The greatest reality visible in the heavens becomes the symbol of the greatest reality known and revered on earth.

The earliest records of Shintō derive from the seventh century BCE, when writing was introduced, but the roots of the system may stretch much further back. In the Middle Ages, it was much influenced by Buddhism, but the two became distinct in the eighteenth century. In 1946, the American occupation forces demanded that the emperor renounce his divine status as part of their abolition of the state religion. It appears that the formal renunciation has had little effect on the symbolic relationship that has endured for centuries between the sun goddess and the imperial family. On the other hand, the retreat of state Shintō, which had highly politicized overtones and which was the basis for a fanatical militarism, in a sense returned the religion to the people. The priests, without government support, turned to the population. When it became time for the reconstruction of the Grand Shrine at Ise, which is prescribed every twenty years, there was an unprecedented outpouring of donations from the entire populace. More than fifty million people contributed to the rebuilding of the shrine in 1953, even more in 1973.

The rituals have continued and the emperor has participated in the divine nature of his ancestors by praying for the well-being of his people. In the great ceremonies at the end of June and December (the solstices), the imperial families and ministers of state pray for purification from sin for the entire country.

**THE AMERICAS.** Many native North Americans regarded the Sun as their supreme deity. In the Plains, the Crow thought of themselves as descendants of the Sun and swore by it. In lower Mississippi, the Natchez maintained a total theocracy; their priest-chieftain was a substitute on earth for their supreme being, the Sun. For the Pueblo, the Sun is a powerful deity but subordinate to others, such as the Corn Goddess. They perform ceremonies at the summer solstice to slow

down the sun and at the winter solstice to hasten his progress toward spring. It is presumed that these rites are a projection of the same religion that is a basis for the sun cults of the high cultures of Mexico and Peru.

**Mesoamerica.** The Maya of Mesoamerica developed a complex civilization that to date has not been entirely revealed to modern researchers. There are still discoveries to be made in the huge structures now in ruins; they are probably not cities in a real sense but religious establishments where a priestly caste expended tremendous energies on mathematical study and on astronomical observations. They invented a sign for zero and produced two complicated calendars, which come together every fifty-two years. The site of one of their complexes was itself a huge calendar by which they could determine solstices and equinoxes. Since the Maya hieroglyphics have not been entirely deciphered, and since many of their sacred books were destroyed by the Spaniards, there is no clear picture of their complex religious pantheon, which involved four aspects for each deity (for the four points of the compass), or of the characteristics of their gods, which changed from one area to another. The supreme deity seems to have been a sky god, pictured as an old man with a Roman nose; he often performed as a sun god and was married to the Moon. Rain gods and fertility gods were also part of the pantheon. It is still unknown why the Maya civilization collapsed, although many theories, such as climatic change, conquest, or peasant revolt, have been suggested.

In the tenth century CE, conquering Toltec from Tula in central Mexico moved into Maya territory, took over the city of Chichén Itzá, together with many of the Maya achievements. The Toltec brought with them their culture hero, the Feathered Serpent, but also their belief that the sun god died every night and had to be resuscitated every morning with human blood. They established two priestly warrior groups, the Eagles, representing the sun in the daytime, and the Jaguars, representing the sun in the underworld. A frieze at Chichén Itzá from Toltec times shows members of the groups presenting a human heart to the sun. The sacrifice was often succeeded by a cannibalistic feast in which pieces of the victim, if he had been a great warrior, were passed out to the elite. A priest donned the skin of the victim and danced before the people.

The Toltec had perhaps been driven out of the valley of Mexico by the Aztec, who settled on islands in Lake Texcoco and built their elaborate city Tenochtitlán on the site that is today known as Mexico City. They took over from their predecessors the temple architecture, their fifty-two-year calendar, and the sacrifice to the sun, which they carried to even more grisly lengths. On some occasions as many as twenty thousand victims were sacrificed on the sun pyramid. The Aztec believed that on their journey north, their sun god, Huitzilopochtli, who took the form of a hummingbird, led them in the day, and the fearsome Tezcatlipoca, the sun of the underworld, led them at night. A third form of the

sun represented the physical disk of the sun, under the name of Tonatiuh. He appears on the huge calendar stone, thirteen feet across, that is now in the Museo Nacional de Antropología. This stone pictures the four suns that the Aztecs believed had existed before them and the fifth, under which they lived. The former suns had been destroyed by storms, floods, and darkness, and the present sun, represented by Tonatiuh, was to end in an earthquake. The whole calendar is circled by fire serpents, which the Sun uses to fight his enemies at night. The entire religion of the Aztec was suffused with the battle between light and darkness and life and death. The universe, they believed, would fall into ruins if they did not feed the "skeleton" sun every morning as he rose.

It seems to have been the priesthood, possibly under the influence of psychedelic drugs, who drove the armies to seek increasing numbers of conquests in order to provide prisoners for the sacrifices. Huitzilopochtli is said to have proclaimed, "My principal purpose in coming and my vocation is war." All young Aztec were educated for war and taught to endure pain. There is a story told of the gladiatorial battle that followed the morning sacrifice in which a captive was tied to a stone and given four staves to defend himself against two Eagle and two Jaguar knights. Once, a captive miraculously won his battle and was released, but he returned to die on the stone so that he would not lose the privilege of accompanying the sun across the sky every morning. In the afternoon, the sun was followed by women who had died in childbirth, for they had also died "taking a man prisoner."

**Peru.** In Mexico the Sun became one of the most bloodthirsty of all divinities, but the sun god of the Inca of Peru was an autocratic but paternalistic deity, who planned for the welfare of his people while controlling their every action. In the high civilization of Peru, the sun again symbolized royal power; images of the sun were emblazoned with the most lavish display of the sun's metal ever seen. In Peruvian society there was no trade in (as there was among the Aztec) nor use for metal, except for extravagant adornment of the gods and royal personages.

A number of Spanish chronicles have recorded Inca rule as one of the most orderly and regulated in the world. All land was owned by the state and was divided into church, state, and peasant holdings. Inca territory was divided into four quarters ruled by governors, who were subordinate to the emperor, the son of the Sun. The emperor controlled the priesthood, usually making his brother high priest.

The leading tribes that formed the Inca empire seem to have arrived in Cuzco from somewhere around Lake Titicaca. Their legend told that the founder and his sister, children of the Sun, were set down by their father on an island in the lake. The first emperor is said to have been sent by his father, the Sun, to establish a city at the place where the golden wand the Sun carried struck the ground. This site was Cuzco, at eleven thousand feet above sea level. It was apparently the custom for each new emperor to build his own palace, so that the site became a maze of buildings, temples, and palaces,

lavishly decorated with gold. In the main square, the Inca emperor himself was enthroned during festivals. From that square it was possible to see the sun columns on the hills east and west, markers of the solstices. The mummified figures of past emperors were seated, robed in gold, around the temple of the Sun, with their wives between them. The temple was called the Place of Gold and was so arranged that sunrise fell on a gold-sheathed solar disk and filled the whole temple with reflected light. On festival days the mummies were paraded around the city, preceded by the emperor on a palanquin, honored as if he were a god. Tradition held that the emperor married his sister, who represented the moon, but a large number of "virgins of the Sun" were available to him, so that he had many descendants. These were the "children of the Sun," the rulers of the bureaucracy, who paid no taxes. Others of the virgins were used for sacrifice or kept in seclusion, weaving or making brew.

The temple also housed the gods of conquered peoples, who were allowed to visit their gods and pay homage to them, although there was a strong missionary pressure on them to honor the sun god. By practicing efficiency and good military discipline, the Inca established an empire that stretched from Ecuador to northern Chile and that had just reached its height at the time of the Spanish conquest.

In the last century of the empire one of the Inca, by the name of Pachacuti, introduced a new high god, Viracocha, as creator. The legend relates that Pachacuti had a vision that prompted this religious revolution. He came to believe that the sun worked too hard on his daily journey to have created the universe. Viracocha may have been a local god from another tribe. Another possibility is that the new god was more acceptable to some of the conquered people, such as the Chimú of the coast, who worshiped the moon and the sea. It is recorded that they complained, "The sun is dangerous to us." A gold statue of the new deity was placed in the Sun's temple as an addition to its other resplendent embellishments.

Great Inca festivals consisted of dances, processions, prayers, and sacrifices, usually of llamas and guinea pigs but sometimes of human beings. The four chief festivals were those of the solstices and the equinoxes, the most important of which was the winter solstice. On this day, considered New Year's Day, all fires were relit by a piece of cotton kindled by the sun's rays. The relit fire was used for the sacrifices and then handed over to the Virgins of the Sun to be guarded until the next year. If the day was cloudy, the fire had to be kindled by friction and there was great anxiety among the people. At the summer solstice, the population gathered in the central square clothed in feathers and golden robes to watch the Inca emperor pour a libation to the Sun from a golden vase.

The priesthood, like all the other members of Inca society, were organized in a strict hierarchy. Many were engaged in divination and in curing the sick. They divined by reading the intestines of llamas and the flight of birds. To cure the

sick, they engaged in rites of exorcism. Public confessions were an important part of religious life. Anyone who was malformed or had lost children was considered to have sinned against the Sun and to have disobeyed the Inca emperor. It was necessary for the sinner to confess; he would then be given a penance by the priest and be purified in running water. Anyone who did not confess was believed to be destined for a place deep in the earth where there were only stones for food. Those who confessed, as well as those who had led blameless lives, were promised a happy afterlife in the Sun's heaven. The Children of the Sun and the Inca emperor himself were, as a matter of course, believed to live with the Sun forever.

#### BIBLIOGRAPHY

Since there are few books devoted entirely to the religious and mythological aspects of the sun, most of the material must be extracted from religious writings, encyclopedias, and histories of the religion of the different regions. A highly respected source for ancient Rome is Franz Altheim's *History of Roman Religion* (New York, 1938). Of the many works on Egyptian religion, a good summary is Ann Rosalie David's *The Ancient Egyptians* (London, 1982). The *Dictionnaire des antiquités grecques et romaines*, vol. 4, edited by Charles Daremberg and Edmond Saglio (Paris, 1911) contains an article "Sol" by Franz Cumont, which treats both Greek and Roman sun worship with a wealth of detail. A comprehensive picture of the religion of Britain and Ireland can be found in Jan de Vries's *Keltische Religion* (Stuttgart, 1961). An essay called "The Sun and Sun Worship," in *Patterns in Comparative Religion* by Mircea Eliade (New York, 1958), provides many insights into various aspects of the subject. The article "Christmas," in the *Encyclopaedia of Religion and Ethics*, edited by James Hastings, vol. 3 (Edinburgh, 1910), details the many theories on the origin of the solstice festivals. A very lengthy chapter on the sun in James G. Frazer's *The Worship of Nature* (London, 1926) is packed with data from primitive sources and makes a point of criticizing the pansolism of the nineteenth century. In *The Chariot of the Sun* (New York, 1969) Peter Gelling and Hilda R. Ellis Davidson have produced a useful account of sun worship in the Bronze Age in northern Europe. *Man and the Sun* (New York, 1962) by the archaeologist and historian Jacquetta Hawkes is an accurate and sensitive treatment of sun worship in the ancient world and the Americas. Unfortunately, it does not contain a bibliography or notes. Jean Herbert, in *Shintō* (London, 1967), presents a worthy effort to make the Japanese cult available to the Western world. It contains many translations of ancient literature and more recent Japanese commentaries. In *The Religions of the American Indians* (Berkeley, 1979), Åke Hulkrantz gives a concise but thorough summary of the beliefs of the American Indians, both north and south. A work on astroarchaeology, *In Search of Ancient Astronomies*, edited by Edwin C. Krupp (Garden City, N.Y., 1978), treats, among others, the work of Atkinson, Hawkins, and Thom on the megaliths of the British Isles. The most recent and ful-

lest account of the religions of the ancient Near East is to be found in Thorkild Jacobsen's *The Treasures of Darkness: A History of Mesopotamian Religion* (New Haven, Conn., 1976). An extremely useful collection of material from all over the world, both ancient and primitive, is the *Mythology of All Races*, 13 vols., edited by Louis H. Gray (Boston, 1916–1932), published under the auspices of the Archaeological Institute of America. Martin P. Nilsson brings to his *Geschichte der griechischen Religion*, 3d ed., 2 vols. (Munich, 1967–1974), a wealth of information from archaeology and comparative religion. Still the most complete collection of mythological material is to be found in *Ausführliches Lexikon der griechischen und römischen Mythologie*, edited by W. H. Roscher (1866–1890; Hildesheim, 1965), in articles entitled “Helios,” “Sol,” and “Sonnenkulten.” The “Sacred Books of the East” series, containing the religious writings of India and Persia collected by F. Max Müller in 1884, has been reissued (Delhi, 1965). Maarten J. Vermaseren, in *Mithras, the Secret God* (New York, 1963), presents a detailed account of the cult of Mithra in the Roman world.

JEAN RHYS BRAM (1987)  
Revised Bibliography

**SUN DANCE [FIRST EDITION]** is currently used as a generic term having reference to a rich complex of rites and ceremonies with tribal variations specific to at least thirty distinct tribal groups of the North American Plains and Prairie. Although tribal variations of beliefs, traits, and the structuring of ceremonial lodges are significant and of great importance to the groups concerned, there are nevertheless sufficient similarities to justify use of the generic term. Since these distinct tribal groups represent at least seven mutually

unintelligible language families, understandably there is also present the once-universal sign language, a rich means by which even subtle and complex matters could be communicated to all the tribes. Traditionally the peoples have been divided into four major groupings: the northern tribes; the southern tribes; the village, or eastern, tribes; and the Plateau, or western, tribes. Each tribe within these groups gives the Sun Dance its own specific term, which has reference to particular ritual emphases. The Shoshoni and Crow, for example, refer to the complex as the Thirst Lodge, or Thirst Standing Lodge; for the Cheyenne it is the Medicine Lodge; and for the Siouan peoples it is known as the Dance Gazing at the Sun.

The precise tribal origin of the Sun Dance within the North American Plains groups cannot be determined with certainty, in part because calendric rites of world and life renewal involving sacrificial elements and shamanic-type acts of healing are very widespread throughout North America. Leslie Spier's extensive yet inconclusive study (1921) suggested that the complex possibly originated among—or diffused from—the Arapaho and Cheyenne. In terms of more ancient origins outside North America there are compelling parallels with the Tunguzic peoples of Siberia, who had new year festivals of renewal with ritual emphasis on a world tree as axis joining heaven and earth; offerings made of ribbons and sacrificed animal skins were made to this tree. Other shamanic elements described by A. F. Anisimov involve the rhythmic power of drums, the inducing of trances, visions, and curing ceremonies, all of which are strongly reminiscent of the North American Plains Sun Dance traits (Anisimov, 1963).

It is unfortunate that the early anthropological accounts of Native American religious practices were usually flat, ignoring or paying insufficient attention to the spiritual realities underlying religious beliefs and practices as the peoples themselves understood them. The rich values and sacred meanings encoded within cultural forms such as the arts, crafts, and architecture were also largely ignored. Even Robert Lowie, who was very familiar with the early history of the Crow Sun Dance, was able to write in 1915 that the Sun Dance “in large measure served for the aesthetic pleasure and entertainment of the spectators.” The Swedish scholar Åke Hulkrantz, commencing his early studies in 1947, challenged these prevailing reductionist perspectives; by giving proper recognition to religious beliefs and practices of primal origin and by integrating the perspectives and methodologies of both anthropology and the history of religions, an approach now found increasingly within current ethnohistorical studies. It is essentially this approach that is respected in the following descriptions.

The rich diversity of beliefs and traits specific to the Sun Dance traditions in some thirty distinct tribal groups, each of which manifests varying levels of acculturation and creative adaptations, can hardly be encompassed within a brief essay. Judicious selection must therefore be made of essential

elements across a fair sampling of tribal groups. Attention will also be given to contemporary movements among many Native American peoples for revitalization of traditional sacred values and practices. Indeed, it is primarily the Sun Dance that, as its popularity increases, is acting as model and stimulus for traditionalist movements extending even to non-Plains tribes and to disenchanting non-Native Americans who are seeking examples of what true religious traditions really are.

**GENERAL DESCRIPTION.** The major Sun Dance celebrations take place for all the tribal groups in late June or early July, “when the sage is long” and “the chokecherries are ripe,” or, as some put it, in “the moon of fattening.” In the times when these peoples were nomadic pastoralists, the grasses of the prairies would during these months be sufficient to feed the great herds of horses belonging to the tribal bands, who often were joined in the circles of camps with allied tribes. These springtime ceremonies (in the past they may have been held earlier than June) were actually the climax of an annual cycle of minor rites and meetings of many types. Among the Crow, for example, “prayer meetings” take place regularly at the time of the full moon; among all the tribes, groups of singers meet periodically around their drums in order to practice and to instruct younger singers in the extremely difficult and subtle Sun Dance songs, many of which have been faithfully transmitted from ancient times. There are also contemporary songs that have come out of an individual’s sacred experiences or that have been learned from other tribes, for today there is much exchange of songs and other cultural elements in the course of the more popular pan-Indian summer powwow circuit. However, all songs that are used in the Sun Dance lodge must accord with particular styles and rhythms, since clear distinctions are made between ceremonial and social dance songs.

Given the complex logistics of the Sun Dances, with encampments of large numbers of people, many people volunteer or are selected during the year to fulfill a wide range of duties. Usually a sponsor coordinates the many details and materials for the construction of the sacred lodge or the provision of the feast at the end of the ceremonies, both of which are accomplished at considerable expense and sacrifice. The most important person however, is the spiritual leader, a “medicine person,” who is guardian of the sacred lore and who usually has received special powers through the vision quest (or who may have received the authority to lead the ceremonies from a retiring elder who has passed on his sacred powers). These spiritual leaders have traditionally been recognized as holy people, for they know and live the sacred traditions and have powers for curing those who are ill in body or spirit. Such shamanic figures have been greatly respected as leaders within the tribe, or they have been feared because of the great strength of their mysterious powers. Such leaders should not be considered as belonging only to the past, however, for new leaders are taking their places. Indeed, there are today a growing number of such leaders, including younger men and women who have attempted to become accultur-

ated within the dominant society but, often finding this to be a process of diminishing returns, have gone back to the wise elders for help in reestablishing traditional values in their contemporary ways of life.

Those who participate in the actual ceremonies within the sacred lodge are often individuals who were previously in situations of extreme danger, perhaps as members of the armed forces in wars the United States has conducted overseas, and who vowed that if they should survive they would participate in the next Sun Dance upon returning home. Paradoxically, their experiences in foreign wars have acted as a stimulus for the continuation, and indeed intensification, of the Sun Dance traditions into the present.

To those sacrificing in the lodge for the first time are assigned mentors who are experienced in the Sun Dance rituals and who—having known the suffering of being without food or water for a period of three or four days—are able to counsel and give support to the novice in the lodge. Other camp duties are taken care of by special “police” who see that proper conduct and respect for sacred matters are observed, functions once fulfilled by the warrior societies. A camp crier is also named, who has the responsibility of encircling the camp on horseback in the very early mornings and in the evenings, of chanting instructions to the people, or of giving useful information concerning the day’s activities. On occasion such criers might relate humorous incidents, intending to bring great laughter from the circles of lodges, or from the wall tents used today. For in Plains life, now as in the past (and even in the context of the most serious affairs), humor has a legitimate and effective purpose—not just the momentary relief of tensions accompanying the enactment of sacred rites, but also the opening of the human person to deeper modes of understanding.

**LODGE CONSTRUCTION.** Once the Sun Dance encampment has been established at an appropriate place where there is good water and pasturage, the first ritual act is to select a special cottonwood tree with branches forking at the top. The tree is then cut in a ceremonial manner, the first blow of the ax often being given by a young woman who has been chosen for her virtue and purity (if any man present knows that she has been unfaithful he has the right and obligation to denounce her publicly). The tree must be felled in a specific direction and is not allowed to touch the ground; it is then carried on poles, with songs, ritual acts, and prayers performed along the way. The cottonwood tree is finally placed in a hole prepared at the center of what will be the sacred lodge, which is itself at the center of the encampment. The selected tree is now understood as the axis at the center of the world. It links heaven and earth, thus giving the people access to spiritual realities and conveying the images of the center and the heavens above, together with their larger implications. For most peoples who practice the Sun Dance, this special tree is understood as a “person.” In a way akin to human participation in the sacrifice, the tree transmits to those who sacrifice in the lodge the cooling powers of the

moisture it has gathered from the stream near which it grew, and then it dies.

The tree thus recapitulates the major themes of the Sun Dance, which involve the alternations of dry and moist, ignorance and wisdom, and death and life—for if there is to be life there must also be death. Once the tree has been ceremonially raised, offerings are placed at its base, and in its fork is put a nest of cherry or willow branches in which may be placed sacred offerings or, often, rawhide effigies. Colored ribbons, signifying heaven and earth, may be tied high on the tree's forking branches. Each tribal group has its own color symbolism and specific manner of dressing the tree. Among the Crow, for example, the head of a bull buffalo is placed, facing east, on the tree, and in the branches there is an eagle, both symbols recapitulating the theme of heaven and earth. Around the tree as spiritual center the circular lodge is then constructed in accord with symbolical variations specific to each of the tribal groups.

The general architectural design for most tribal Sun Dance lodges is the central tree around which are twenty-eight vertical, forked poles associated with the twenty-eight days of the lunar month. This circle of forked poles is then joined together by horizontal poles laid into the upright forks. In addition the Shoshoni, Crow, and Arapaho lodges have twenty-eight very long poles extending from the forks at the circumference and then all laid into the crotch high on the central tree, a structure that resembles a spoked wheel. The Siouan lodges do not have poles radiating out from the center; a distinctive feature of their lodge, in accord with their ceremonial usage, is the construction of a continuous overhead shade arbor around the inner periphery of the lodge. All styles of lodges, however, have entryways facing the east, the place of the rising sun, and brush is usually placed loosely around the outer walls for the greater privacy of the participants within. For all tribal groups, the lodge is not merely understood as a "symbolic model" of the world, but rather it is the world, universe, or created cosmos. Since construction of the lodge recapitulates the creation of the world, all acts in this process are accompanied by prayers and powerful songs associated with ancient myths of origin and creation. The occasion, reminiscent of a primordial time, is solemn, dignified, and of great beauty.

Around the sacred lodge in concentric circles the camps of family units are set up in accord with long-established protocol. At Sun Dance encampments the doorways of many tipis or wall tents are not toward the east, as is customary in daily usage, but rather toward the sacred lodge and tree at the center of the circle. To the west of the sacred lodge there are usually special tipis in which private ceremonies take place exclusively for those who will sacrifice in the lodge. Sweat lodges are also set up, but apart from the camp circle, so that those who have made their vows may be purified before entering the lodge.

**TYPICAL PERFORMANCES.** Even though there are many commonalities in all Plains Sun Dance ceremonies, there are also

tribal variations that are of great importance to the peoples concerned. In the Siouan form, for example, which has been described by the Lakota Black Elk in *The Sacred Pipe* (Brown, 1952), there are at least two distinctive and central sacrificial elements, one of which is described by the Lakota term for the Sun Dance, *wiwanyag wachipi* ("dance gazing at the sun"). Here, during one complete daylight cycle, the dancers, who are also observing a total fast, move periodically around the inner periphery of the lodge in sunwise manner so that they are always gazing at the sun—a cause, no doubt, of intense suffering.

A second Lakota or Siouan emphasis, also involving sacrificial elements, is the practice of certain dancers, in accord with earlier vows, to have the muscles of the chest pierced by the presiding spiritual leader, who inserts wooden skewers by which they are tied with raw-hide thongs to the central tree. These people then dance, encouraged by the drums and the songs of warriors (brave songs), pulling back on the thongs until the flesh and muscles tear loose. In addition to elements of self-sacrifice, there are spiritual implications of being physically tied to and thus identified with the tree as sacred center. A similar theme is also expressed by the ceremony wherein individuals have skewers inserted into both sides of the shoulders and into the muscles of chest and back. The thongs are then attached to posts set up to represent the four directions. The individual is thereby identified with the center in relation to the four horizontal directions of space. Such sacrificial acts are not just of former times, but are in increasing use today among a number of Siouan peoples. In distinction from prevailing traits and themes of the Siouan Sun Dance, which are strongly reminiscent of elements from earlier military complexes, the Arapaho, the Cheyenne, and the tribes of the Blackfoot Confederation place emphasis on rites of world and life renewal, employing ritual objects that include sacred medicine bundles whose contents have reference to the origins of the tribes.

Finally, emphasis should be given to critical elements in the history of the Sun Dance and to a modified Sun Dance movement that originated among the western Shoshoni and has been transmitted to the Crow. In 1881 the United States government attempted to ban all Sun Dances, believing that they were "demoralizing and barbarous." It was not until 1904, however, that the dances were rigorously prohibited by the Commissioner of Indian Affairs. However, because these ceremonies were central to spiritual needs, they continued to be practiced in secret or in modified forms by almost all the Plains tribes with the exception of the Crow, who had already abandoned the ceremonies in 1875. One of the still continuing modified Sun Dances was that of the Wind River Shoshoni, whose version spread to the Northern Ute in 1890, to the Fort Hall Shoshoni and Bannock in 1901, and to the Shoshoni of Nevada in 1933. With the Indian Reorganization Act of 1934, however, open practice of the dances commenced, but now in forms that gave greater emphasis to spiritual elements rather than to the extreme tortures associated with the earlier military societies.

In 1941 the charismatic Shoshoni Sun Dance leader John Truhjuo brought the Sun Dance back to the Crow through the support of the tribal superintendent Robert Yellowtail. A tradition that had been abandoned for more than sixty-six years was thereby reinstated. In January of 1985 Truhjuo died at the age of approximately 105, having transferred his sacred powers to Thomas Yellowtail, brother of the former superintendent. It is the Sun Dance in this particular form, faithfully led by Thomas Yellowtail to the present time, that has become for the Crow, as well as for many other tribes, an example and stimulus giving continuity and viability to the essentials of the spiritual heritage of the Plains peoples.

In this Shoshoni/Crow Sun Dance the dancers take positions in arbors that surround the inner periphery of the lodge, with the presiding spiritual leader, or "medicine man," always at the west. Women, who are allowed within the lodge to fast, take places slightly to the north of the east-facing entrance. The large ceremonial drum and the alternating teams of drummers and singers have their place a little to the south of the entrance, and they are surrounded by strong-voiced older women who help to sing the sacred songs. The dance's spiritual force resides in the movements of the fasting participants, who for the three or four days' duration of the ceremony are always oriented to the central tree, toward which they dance as often or as little as they wish. They blow on eagle-bone whistles tipped with eagle down, as if they themselves were eagles; then they dance backward to their stalls, still facing the central tree. The rhythmic movements of the dancers are dignified, and their concentration on the tree is continual and intense; for them this is the center and source of life, and the lodge symbolizes the totality of creation. In the course of the ceremonies, participants often receive sacred visions; when they sleep—never for more than a few hours at a time—dreams of special meaning may come.

An especially powerful and beautiful ceremony central to the Sun Dance takes place every morning just before sunup, when all the dancers, under the direction of the group's spiritual leader, face the direction of the rising sun, moving slowly to the beat of the drum and blowing softly on eagle-bone whistles. As the sun rises the drum and the sunrise greeting-song come to a crescendo. Eagle plumes tied to the wrists of the dancers are held out to the sun's first rays and are then touched to parts of the body so that the dancer may receive purifying blessings. Once the sun is above the horizon, the dancers sit wrapped in their blankets while very ancient sacred songs are sung and communal prayers are offered. On the second or third day of the dance, people who are ill come into the lodge and stand at the sacred tree to receive help from the spiritual leader, who prays over them and often draws out the illness with the aid of an eagle-wing fan. Accounts of cures are legion. At the conclusion of the Sun Dance, water that has been blessed is ceremonially passed around among the participants, who have taken no food or

water since they first entered the lodge. Thereafter, many people from the camp bring valuable gifts into the lodge, sometimes even horses loaded with blankets and beadwork, which are given away to particular persons who are called forward to receive them. The dancers themselves usually complete the ceremonies with a purifying sweat bath at a nearby creek or river, and in the evening there may be a special feast for all.

The power of sacred traditions of primal origin cannot be compromised by time, place, or number of participants, for in themselves the values and realities concerned are of timeless and universal validity. Though a world of other priorities ignores or neglects such values they may nevertheless be rediscovered as still enduring, even increasing in meaning into the present day. The history of the Plains Sun Dance is continuing witness to this reality.

JOSEPH EPES BROWN (1987)

**SUN DANCE [FURTHER CONSIDERATIONS]**. The Plains Indian Sun Dance is typically a ceremony of about twelve days duration. Three to four days of this period consist of the dance itself, danced by men (and, increasingly, women) who commit themselves to a self-sacrificing discipline of abstinence from both food and water throughout the dance. Typically, the four days before the dancing are set aside as a period of preparation and purification and the four days following are set aside for a series of ceremonies that bring the whole to a close.

The historical tradition was to hold the Sun Dance in an elevated place, usually on a plateau. With the advent of the reservation era and federal prohibitions against observing the ceremony, the sites were often moved to sheltered and hidden places in physical depressions in the landscape where the ceremony could avoid easy detection.

The Sun Dance in the contemporary period has functioned as a stimulus for the growing traditionalist movement in many tribal communities, and it continues to be appealing to many non-Indians who are disenchanted with their own religious traditions. To the regret of many Indian leaders and scholars, this same attraction has influenced a transformation of Native American traditions toward a certain mimicry of the religious traditions disavowed by their white adherents. The relatively famous (or infamous) Lakota Sun Dances can attract hundreds of dancers, all ready to go to the tree and offer their flesh for the piercing rite. At the same time there are a plethora of other Sun Dances held that are so small as to render them invisible in the non-Indian landscape.

Enormous commitments of resources and time are always a factor in the ceremony. Even the smallest Sun Dance requires the sustained efforts of a variety of people: to cut timbers and leafy coverings for the shade arbor for supporters; to cut wood and then tend the fire day and night for the duration of the ceremony; to collect the necessary "medicines" needed to sustain the dance and provide healing to those who come; to provide and prepare the food to feed the people; and to complete a great variety of other detailed tasks.

In most tribal traditions, the ceremony can be completed with the fulfillment of a commitment by a single dancer, the tree, and a single singer. In reality, while the number of dancers may have always been small historically, the full number of participants regularly included the whole of a tribe's community in these various supporting roles. Lakota peoples, for instance, would congregate annually in the Black Hills for the Sun Dance as a ceremony that brought together

all of the disparate bands. In the modern world it has become commonplace for as many as a hundred or more to commit to dancing this strenuous and demanding ceremony.

The Sun Dance is traditionally a men's ceremony. The single most characteristic feature is the sustaining of life or, as Lakota people often say, "That the people might live." The blood that flows in the piercing rite of many tribal traditions marks the ceremony as a male rite. Indeed, this sacrifice has been characterized as men's attempt to gain some sense of equality with women and their natural life-giving character signified by the monthly flow of blood in menstruation. If women bring new life into the community, men contribute to the maintaining of life through the Sun Dance ceremony.

While much of the professional literature misrepresents the piercing as self-torture or self-mutilation, for Indian communities it is always seen as a personal sacrifice offered on behalf of the people. In any event, participants invariably report that the piercing itself is not the most difficult aspect of this demanding ceremony, but rather comes as a climactic resolution that brings relief to the tension of one's prayers. The real focus of the ceremony is always the prayers of the dancers.

Many Sun Dance leaders emphasize strongly that, like all other key ceremonies, the Sun Dance ought always be done according to the direction of a particular vision given to someone in a particular time and place. Hence, each Sun Dance is a discrete phenomenon. One constant in all tribal variants is that there is a tree. Everything else is based on the particular vision and can vary from tribe to tribe and from one Sun Dance leader to another within a tribe.

Many tribes continue to practice a form of the Sun Dance that is still a tribal ceremony. That is to say that the tribal community sponsors only one Sun Dance each year and that it is a ceremony performed by and for the tribe as a whole. The ceremony held at Ethete, Wyoming, is an example. A high percentage of the Northern Arapaho population is involved, and the tribe's government extends certain privileges to those who are principal participants. These ceremonies function in the modern world as spiritual events that provide social cohesion for the tribe.

Other tribes, particularly the Siouan group of Lakota and Dakota, have engaged in a substantial transformation of their ceremonial life and its intent. One could argue that these tribes have moved towards the individualization represented by missionary Christianity. As such, these Sun Dance ceremonies tend today to proliferate into individual and family events that can even be seen as competing with one another for adherents. These ceremonies form around specific spiritual leaders, and many are increasingly open to anyone, Indian or non-Indian, who will make the personal commitment to a particular spiritual leader.

Ultimately, the proliferation of Sun Dances on Lakota reservations reflects back the denominational variety of missionary religion, which has historically functioned to divide

Indian communities and to break down tribal cohesion by introducing Western religious choice and the paradigm of denominationalism. It can also be argued, of course, that traditional Lakota culture allows for the making of these sorts of leadership choices. While leadership was hereditary, it was always possible for any members of a band or group to follow another leader should they decide that they disagreed with the direction of leadership.

In any case, the contemporary result has been that there is no longer a "Lakota" tribal Sun Dance; instead, more than two dozen Sun Dances have been reported at the Oglala reservation at Pine Ridge over a single recent summer, with a similar number at the neighboring Rosebud and Cheyenne River reservations. The shift, however, has become more pronounced as Lakotas and Dakotas have invited more and more non-Indians as participants into their tribal ceremonial rites.

TINK TINKER (2005)

**SUNDANESE RELIGION.** Although the Sundanese of West Java, Indonesia, consider themselves Muslims, many pre-Islamic ideas still permeate their religious life. A key point in understanding Sundanese relations to the supernatural is the relationship between the soul and a creative or generative power that animates the universe. This power, *anu ngayuga* ("that which creates") is limited and is contained to varying degrees in the elements that make up the cosmos. The amount of power in a person is determined by ancestry and the time, place, and conditions of birth. It may further wax or wane according to the state of ritual or moral purity of the person (see Anderson, 1972).

**SOUL.** The Sundanese have two ideas of soul: *nyawa* and *semangat*. Other words such as *roh* and *jiwa* are occasionally used, but these are adoptions from the Arabic and Sanskrit, respectively, and overlap in meaning between *nyawa* and *semangat*. *Nyawa* is simply life or breath, existing only while the person lives. *Semangat*, on the other hand, is that aspect of soul that connects a person to the ancestors and gives him or her various capabilities and strengths. It is the whole of a person's spiritual life. Provencher (1975) relates *semangat* to the Melanesian and Polynesian mana.

The *semangat* belongs with the person, but may occasionally leave if frightened or if a taboo is broken. In this case the person's soul must be coaxed back, or illness and death may follow. The *semangat* is also considered to be able to travel away from a person during sleep, making it dangerous to awaken him suddenly, and may further transmigrate and enter an animal such as a tiger.

The amount of *semangat* in a person is not constant but may be added to through study, especially of sacred texts and magic, as well as through the acquisition of sacred objects and heirlooms. It may also be diminished through impure and worldly actions. There must be an inner balance between the *semangat* and the social persona of the person. Too much or too little of it to fit the situation makes the person uncomfortable and may lead to disquietude or illness. These last two aspects of *semangat* are much like the cosmic power mentioned above, and one may see *semangat*, then, as the unique expression of cosmic creative power (*anu ngayuga*) in individuals.

*Semangat* is located throughout the body, although it seems to be focused on the navel. The Sundanese take care to bury brushed-out hair and nail clippings, as these are parts of the person and thus contain soul substance that may be used against one in magic. Amulets are worn around the waist, protecting the center of the soul.

The placenta (*ari ari*) is considered to be the elder sibling of the person. It is also believed that the same placenta comes back to the mother as she bears each successive child, creating a spiritual or soul bond between siblings.

The father, who planted the seed and made the body, is responsible for its physical maintenance. The soul is said to come from the mother, and she is responsible for the spiritual makeup of the child. For this reason there is a *tali batin* (spiritual tie) between the mother and her children and between the children via the shared placenta.

This connection goes back to the ancestors as well. Ancestral graves are visited and the ancestors are notified when a ritual is to take place or when one goes on an extended journey. Ancestral spirits may also be consulted in times of need. They are often associated with a particular piece of land. Traditionally, people were buried on family land, and inherited land could not be sold to outsiders. Placentas, especially those of infant girls, are also often buried on family land, with which the soul is thus intimately connected (Mus, 1975).

Ancestral souls may also be called on for aid in times of trouble, in which case the ancestor may appear in the form of a tiger. Deceased rulers are said to guard their realms in this form; shamans are said to be able to take on tigrine form while curing.

**THE WIDER SUPERNATURAL WORLD.** The shaman (*dukun, kuncen*) is the vehicle for dealing with the wider supernatural world. Aside from being human soul stuff, cosmic power is also found in animals, plants, and the like. Like ancestral graves, places such as caves and mountains can be strongly imbued with it. Since this power is amoral, it may be dangerous to ordinary people. Through their craft, shamans are able to interact with these forces and thereby protect the community.

Ordinary people may make requests from these powers, which are often manifested as spirits or magical animals, after

being introduced by the *kuncen*. Incense is burned and magical formulas (*jampes*) pronounced, after which the supplicant awaits the arrival of the power. If the power grants the petitioner's request, it may demand in return that the petitioner agree to be turned into a pig, a monkey, or a snake after death or that a human life be sacrificed to it annually.

Other supernatural forces include place spirits (*jurigs*), which may be seen as disembodied bits of cosmic power. They tend to exist on boundaries such as the water's edge or in secluded, quiet places. One does not make requests of these spirits, but only takes care not to bother them excessively. They are said to be generally harmless, though some delight in frightening people, and one type of water spirit (*lulun samak*) sometimes grabs people and drowns them.

Also to be reckoned with are the *silumans*, the spirits of those who have died an unnatural death; and the *kuntianaks*, the spirits of women who have died in childbirth. *Silumans* often inhabit caves and are then said to be the entities that make such places foreboding. The *kuntianak* is a danger to women who are about to give birth by causing difficulties that may lead to the woman's death; she would then become a *kuntianak* herself. For this reason, an expectant mother must take special precautions, such as carrying a sharp metal instrument and not going near the water alone during the last month of her pregnancy. Further magical precautions are taken by the *paraji*, the midwife.

Like the *jurig*, the *siluman* and *kuntianak* may be seen as disembodied cosmic power. This power is dangerous because it must be contained, and in its search for an envelope may possess a person. For this reason also, these powers are found in caves because caves make good containers.

Plants are also imbued with cosmic power—especially rice, trees, and bamboo. Rice, which is the personification of the rice goddess Dewi Sri, is said to have a soul. Care must be taken not to offend the goddess, and offerings are made both in the rice field and in the storage room (*goah*). Offerings in the field are made by the *wali puhun*, the shaman who ensures the fertility of the field. When cutting down trees or large bamboo, permission must be asked from the spirit inhabiting either the area or the tree; otherwise this spirit is likely to cause mischief or to possess someone.

**CEREMONIES.** Most ceremonies are conducted inside the house, which may be seen as a model of the cosmos itself. Ancestral spirits are invited to these ceremonies and thereby both add their power to the event and give it their blessing. The core of all ceremonies is the *hajat*, a ceremonial meal. Here the shaman, speaking for the householder, states the purpose of the occasion. Blessings from God (Allāh) are invoked, incense is burned while magical formulas are spoken, and then the food is consumed.

Each year on the birthday of the prophet Muḥammad, a *hajat* is held during which heirlooms and amulets are cleaned and restored. These items are said to contain cosmic power that may be added to by chanting over them during

the ritual. On the same night, graves visited for help during the year are chanted over in order perhaps to infuse them with the power inherent in the Prophet's birth. This is also a good night to call up one's tiger ancestor, as such spirits are about, on their way to the ancient center of the Sundanese kingdom of Pajajaran at Pakuan near Bogor.

ROBERT WESSING (1987)  
*Revised Bibliography*

**SUNDÉN, HJALMAR.** Hjalmar Sundén (1908–1993) was a Swedish psychologist of religion. Sundén was

born in Eksjö, Sweden, the son of a lieutenant-colonel and a homemaker. The peak of Sundén's academic career came late in life. He became a professor at the age of fifty-nine and retired eight years later, a much-appreciated mentor and friend to half a dozen postgraduates, some of whom became professors in the psychology of religion. Sundén remained active as a writer and speaker at symposia, enjoying great academic success during the last twenty-five years of his life. He died at the age of eighty-five.

Sundén was educated in Stockholm, at Norrmalm upper-secondary school and University College, obtaining his master of philosophy degree in 1930. He continued his studies at Uppsala, where he graduated from the Faculty of Theology. His rare gift for languages—he spoke German, French, and English fluently—made it easy for him to learn Hebrew, ancient Greek, and Latin. After only two years of study he received his master's degree in theology in 1932. The following year he was ordained a priest in the Swedish Lutheran Church.

Sundén was given a personal chair in the psychology of religion at the University of Uppsala by special parliamentary decree in 1967, after having worked for years as a priest, a teacher of religion in secondary schools, a psychologist in the state police academy, a psychologist of religion at the University of Stockholm, and a docent in the history of religion, including the psychology of religion, at Uppsala. He was a brilliant speaker, in demand all over Sweden. His lecture tours gave him profound knowledge of the questions that concerned ordinary people. Far removed from scholastic exercises, he always had a deep empathy and respect for ordinary popular piety. This approach and insight proved to be decisive in his later research and academic career.

In his doctoral thesis on the philosopher Henri Bergson, *La théorie bergsonienne de la religion* (1940), Sundén critically reviewed the then-prevailing theories in relation to Bergson's two sources of morality and religion: one rooted in intelligence that also results in science and its static, mechanistic ideal, and the other based on intuition, finding expression in the free creativity of art and philosophy and the mystical experience of the saints. It was the latter that caught the eye of the future psychologist of religion and occupied his thoughts for the rest of his life—his last article was on Teresa of Avila.

Sundén asked simple but profound questions. How is it that people experience existence as religious? Why is it that some people conceive of existence in terms of pure chance, some speak of the interplay of contingencies, while still others prefer to use the word *fate*? Then there are those who perceive an intention in the experiential, contact with the "other" or "another." How is an experience of the world in religious terms psychologically possible?

The answers to these questions are to be found in Sundén's main contribution to the psychology of religion, his magnum opus *Religionen och rollerna* (Religion and roles,

1959). Here he elucidates his understanding of religious experience through role theory, which is based on the discovery that all sacred texts contain descriptions of pious people who have acted in relation to God or gods. The biblical tradition provides people with behavior and role models of how Christians have been in dialogue with God and experienced his presence. When reading the *Psalms*, people are inadvertently absorbed into the mythic figure of David, thereby finding themselves within a specific interactional system, the human role in relation to the divine partner, God. The thinking is: as God saved then, he will also do so now if people trust and rely on him. No matter how hopeless the situation may seem, the promises are eventually expected to be fulfilled.

Contrary to previous theories, Sundén argues that religious experience does not consist of specific feelings, nor is it independent of cultural tradition. It does not emerge from empty nothingness or from any inner mysterious psychic layer. It is rather a matter of perception, the process whereby sensory stimulation is translated into organized or meaningful experience: the intuitive recognition of an existential "truth." Learning is a decisive factor, providing *un système aperceptif* for the soul to be touched and moved by a personal living God. Religious experience is thus reproducible and not the subjective phenomenon to which some scholars have wanted to reduce it.

Sundén integrated the structural-analytic, the interactionist, and the perceptual analytical models from the major research traditions within the social sciences into a psychology of religion, and he based this on his profound knowledge of the history of religions and contemporary theories and methods. His great knowledge of religious texts, and his empathy for them, enabled him to fashion role theory into a powerful hermeneutical tool, especially for the psychological interpretation of autobiographies and other types of personal documents, such as diaries, journals, and letters.

Sundén has rightly been regarded as the founder of the psychology of religion in the Nordic countries. When his magnum opus was translated into German as *Die Religion und die Rollen* (1966), his ideas quickly found fertile soil in Germany, the Netherlands, and Belgium, as well as in the United States in the late 1980s. For many years Sundén chaired the International Association for the Psychology of Religion. His role theory has had the same influence among European psychologists of religion as Gordon Allport's religious-orientations theory had among American psychologists.

#### BIBLIOGRAPHY

Hjalmar Sundén has written extensively on role theory, but the most elucidating of all his presentations still remains the first essay he ever wrote on the subject in his collection *Sjuttitredje psalmen och andra essäer* (Psalm seventy-three and other essays; Stockholm, 1956). For those who cannot read Swedish, his article "Saint Augustine and the Psalter in the Light of Role-Psychology," published in the *Journal for the Scientific Study of Religion* 26, no. 3 (1987): 366–412 (an

- issue dedicated entirely to Sundén's role theory), provides an eloquent substitute.
- Holm, Nils G. "Role Theory and Religious Experience." In the *Handbook of Religious Experience*, edited by Ralph W. Hood, pp. 397–420. Birmingham, Ala., 1995. This essay provides a thorough presentation of Sundén's role theory.
- Holm, Nils G. "An Integrated Role Theory for the Psychology of Religion: Concepts and Perspectives." In *The Psychology of Religion: Theoretical Approaches*, edited by Bernard Spilka and Daniel N. McIntosh, pp. 73–85. Boulder, Colo., 1997. In this essay, Holm elaborates Sundén's role theory towards an analysis of what he calls an "inner existence space."
- Holm, Nils G., and J. A. Belzen, eds. *Sundén's Role Theory: An Impetus to Contemporary Psychology of Religion*. Åbo, Finland, 1995. Sundén's pupils collected their latest essays in the memory of their mentor and friend.

RENÉ GOTHÓNI (2005)

**SUNNAH.** In every "founded" religious tradition, maintaining proximity to the founder has been an important source of legitimacy and authority, just as arguments about how to establish that proximity have been a source of conflict. In the Islamic tradition, the word *sunnah* has been the focal point of such issues. A word with a very old history in the Arabic language, *sunnah* comes from a root that is concretely associated with honing or molding, with something firmly rooted, like a tooth (*sinn*). *Sunnah*, by extension, came to mean habitual practice, customary procedure or action, norm, standard, or "usage sanctioned by tradition."

**EARLY EVOLUTION.** Among pre-Islamic Arabs, *sunnah* had the force of what anthropologists would call "tribal custom," that is, the generally agreed upon "thing to do" in matters of piety, morality, and social activity. In fact, it was the *sunnah* of the prophet Muḥammad's Arab compeers that initially led them to reject him, since the habitual social and spiritual practices of their ancestors were incompatible with his vision and demands. And it was his reinterpretation of their *sunnah* that helped him win them over, for he "reminded" them successfully that what they took to be true tradition (polytheism, for example) was what modern scholars would call "invented tradition," and that the true *sunnah* of their ancestors was the same Abrahamic ethical monotheism that he was announcing, in that he called upon his listeners to fulfill Abraham's moral contract with the one God.

The Qur'anic revelations themselves did not establish an unequivocal meaning for *sunnah*. They referred either to

the *sunnah* of those of old (the wrongheaded customs of Muḥammad's Arab brethren) or to the *sunnah* (or *sunan*, pl.) of God, namely his punishment of that other *sunnah*. The Qur'ān's flexible usage of the word *sunnah* never disappeared, but *sunnah* quickly came to be associated with the exemplary, imitable, normative words, deeds, and silent approval of the Prophet himself, whose behavior was assumed to be consistent with all previous prophets. In the sense of Muḥammad's exemplary pattern, *sunnah* took on an extraordinarily positive coloration and a predominant place in Muslim piety. The *sunnah* of the Prophet (*sunnat al-nabī*) began to preempt tribal *sunnah*; the new "tribe," the Muslims, acquired a new pattern of established practice. That development, along with the simultaneous revelation of the sacred text, the Qur'ān, through Muḥammad produced one of these dynamic paradoxes that have enriched the histories of all the major religions: the relationship between Muḥammad's roles as vehicle of revelation and as exemplar of the most important *sunnah*. Muḥammad was only a man, receiving but not authoring God's word. Yet that word was difficult to follow without its bearer's example and explication; the Qur'ān itself urged Muslims to follow God and his Messenger. Although the injunction not to deify Muḥammad was taken seriously, he was still a man set apart from others by his special intimacy with God and his role as the Seal of the Prophets. Some may also have attributed to him the special, magical powers they would have previously expected from any holy person. In his mission, Muḥammad was, more than many prophets, both messenger and exemplar, because he was a temporal as well as spiritual leader. There was always a thin line between emulation and veneration, between making him an ideal exemplar and dehumanizing him into a perfect man. One could imitate him, but not completely, because he was too special; but one could not make him so special that he was not human. Within this range, myriad authentic pious responses have flourished.

Furthermore, although scriptural religions have always developed sources of commentary that involve the founder, Muslims relied unusually heavily on Muḥammad. They produced a massive, multifunctional, multifaceted corpus of "news" or "reports" (*ḥadīth*) from the companions of the Prophet, whose humanness, though exceptional, had to be maintained. It is true that the *ḥadīth* did not establish Muḥammad as an exemplar apart from his role as bearer of revealed truth; but, ironically, it was the very denial of his divinity that made him so imitable, that allowed personal details to accumulate to a level almost unmatched in the history of religion, with the possible exception of the personality of Mohandas Gandhi. Ironically, too, it may have been the very size of the corpus that not only encouraged selectivity but also promoted, and reflected, disagreement about the norms to be derived from it.

**SUNNAT AL-NABĪ.** In time, and especially under the pressure of practical necessity, the two parts of Muḥammad's mission coalesced into two separate oral and written bodies of texts: (1) revelation (*wahy*), that is, divine word or Qur'ān; and (2)

inspired prophetic example (*sunnat al-nabī*). The most common literary vehicle of the *sunnat al-nabī*, the *ḥadīth*, functioned to maintain proximity to Muḥammad's *sunnah* in much the same way as the *ayyām*, a pre-Islamic literary form for preserving noble tribal exploits, had kept tribal *sunnah* alive. The early Muslim community, whose *sunnah* was based on that of Muḥammad, preserved the *sunnat al-nabī* through the memorization and transmission of *ḥadīth*. Some Muslims said that *sunnat al-nabī* had been revealed along with the Qur'ān, as has sometimes been said of the oral law and the written law (Torah) in Judaism; others have even relied on *sunnah* more than on the Qur'ān.

The range covered by the *sunnat al-nabī* was as broad as that of oral law too: food and eating, manners, clothing and jewelry, hygiene and grooming, social behavior, forms of greeting, and etiquette, as well as weightier religious, political, or economic matters. Consequently, the *sunnah* of the Prophet and the early community came to play a major role in the development of the Islamic legal system (*sharī'ah*) and systematic discussion about God (*kalām*). (This usage of the term *sunnah* should not be confused with the technical sense in which it is also used within the *sharī'ah* for a certain level of permissibility of acts.)

*Sunnah* also came to function in various extralegal, extratheological ways. The quoting of *ḥadīth* could have a performatory quality: the mere act of citing an apt *ḥadīth* could help one manage a given situation or display one's piety. Through literary presentations of Muḥammad's life pattern, or *sīrah*, which also came to be the name of a biographical genre, the *sunnah* was spread even wider. The use of *ḥadīth* as primary sources for the writing of historical narrative became common. Muḥammad's various roles, especially that of societal reformer, became paradigms for the behavior of many later leaders. At the popular level and especially among Ṣūfīs (mystics), Muḥammad became the soul's guide and the perfect universal human, showing people how to behave in the presence of God; numerous poetic genres emerged to capture this side of him. Above all, the cultivation of the *sunnat al-nabī*, not just in legally binding matters but in the smallest details of mundane daily existence, took on the salvific quality present in orthodox Jews' observance of *ḥalakhab* (law).

Until recently, most Western scholars have focused on the authenticity and reliability of these materials. There is an old academic tradition that views the *ḥadīth*-based picture of the *sunnat al-nabī* as a *post hoc* creation of the second and particularly third centuries of Islam, when the major authoritative collections of *ḥadīth* were compiled. More recent scholarship has argued that *ḥadīth* emerged very early, in written as well as oral form, and that the very earliest Muslim community assumed sincerely that its *sunnah* was continuous with that of the Prophet.

Scholars have also disagreed about how closely to connect *ḥadīth* and *sunnah*. Although the derivation of *sunnah* for legal purposes depended heavily on the study and explica-

tion of *ḥadīth*, the two were not coterminous. The *ḥadīth* were simply verbal reports, tens of thousands of them, about something Muḥammad said or did. They contained many, many potential norms or standards, but those had to be derived or actualized to have legal force. Some matters that were traditionally agreed upon as *sunnah* were contradicted by particular *ḥadīth* or had no basis in *ḥadīth*. Furthermore, individual Muslims could easily disagree with one derivation of a norm and prefer another or prefer one *ḥadīth* to another or reject one and accept another. Finally, the *ḥadīth* format came to be used for conveying all sorts of information not directly related to the life of the Prophet.

As the *sunnah* gradually acquired the meaning of the received, recognized, normative practice of Muḥammad and, to an extent, his companions, its opposite came to be represented by the word *bid'ah* (literally, "starting new," "innovation"). It first became significant as a critique of the behavior of the Marwanid caliphs (685–750), who were seen to have deviated from the ideal of Muḥammad and his companions. Some Muslims always used the word in a negative way—to refer to something beyond the parameters of the acceptable. For others, *bid'ah*, like *sunnah*, can be good or bad—bad if it contradicted the accepted *sunnah*, good if it was consistent with it, even if not contained in it, and promoted the good of the community.

Western scholars often translate *bid'ah* as "heresy" when applied by Muslims to unacceptable religious practices and beliefs. However, "heresy" obscures the pragmatic bent of the Islamic tradition in favor of a dogmatic bent more appropriate to a tradition such as Christianity, which had, unlike Islam, institutionalized theological ways in order to judge and control deviation. The charge of *bid'ah* referred not so much to the content of beliefs as to their practical consequences; it was often made by rulers to reprove certain members of society and dissuade them from adopting socially appealing ideas that disrupted the status quo.

**SUNNĪ AND SHĪ'Ī.** During the first 120 years of Islamic history, disagreements emerged about how best to derive, understand, and be true to the Prophet's *sunnah*. Through a series of internal conflicts, sides and positions shifted frequently. By the time the Abbasid dynasty of caliphs overthrew and replaced the Umayyads (750), two major orientations had begun to crystalize, both of which were addressed by the Abbasid platform. For some, Muḥammad's unifying and law-giving function was primary to his *sunnah* and would be best preserved if his community (*jamā'ah*) were kept together at all costs, in two ways: (1) by providing a system of rules (*sharī'ah*) as close as possible to those he brought, with a body of learned men ('*ulamā*') to manage it; and (2) by providing a "nomocratic" leader (*khalīfah*) who would "stay close" to Muḥammad by uniting the community physically, by guaranteeing its security, and by ensuring a proper Muslim environment through protection of the *sharī'ah* and its learned managers. Muḥammad's charismatic function would not be imitated by a person but, rather, routinized in the law.

Another group found proximity to Muḥammad in a different device—physical descent. For them, maintaining proximity to his *sunnah* depended on recapturing his intimacy with God and his closeness to and divinely guided designation of a relative, his cousin and son-in-law ‘Alī, to succeed him. Although they too gathered *ḥadīth*, established *sunnah*, and worked out shariah, for them it was all unusable without a continuation of the charismatic interpretation the Prophet had provided. They had sought, unsuccessfully, to provide the community with a theocratic ruler (*imām*) who could incorporate the nomocratic functions of the *khalīfah* but whose legitimacy would not depend on doing only that. Muḥammad’s charismatic function would not be duplicated by the *imāms* but, rather, transformed and kept alive by them on the basis of their special inherited inner skills.

Although affection for the family of the Prophet was diffused throughout the Muslim community, this group carried partisanship further. In their hearts and minds, certain descendants of the Prophet through his cousin ‘Alī (*imāms*) partook of Muḥammad’s special qualities; yet they suffered and were frequently martyred at the hands of wrongful rulers. The passing over of ‘Alī for the caliphate the first three times it was awarded and the martyrdom of the third of their line, Ḥusayn ibn ‘Alī, at the hands of the fifth caliph, Yazīd (r. 680–683), as well as subsequent misfortunes, predisposed them to support the Abbasids, who claimed to represent the innate right of the family of the Prophet over those who had usurped it.

However, after they came to power, the Abbasids rejected the special claims of this group, which had generally been known as the partisans (*shī‘ah*) of ‘Alī, in favor of the nomocratic style favored by the majority, who styled themselves “the people of the *sunnah* and the community” (*ahl al-sunnah wa-al-jamā‘ah*). Although the short form Sunnī stuck to them, as did Shī‘ī to the others, nomenclature should not imply that only they were committed to *sunnah* and *ḥadīth* as sources of knowledge. Rather, they established proximity to the *sunnah* by maintaining a consensual *jamā‘ah*, whereas the Shī‘ah stayed close to it by resisting the decisions of the misguided *jamā‘ah* and by trying to substitute what they saw as a more profound, esoteric understanding and style of leadership.

Subtle interpretations aside, however, “Sunnī” came to stand, in different senses, for the majoritarian, mainstream, “orthoprax” style of Islamic piety, especially among those who adhered to it (more than 90% throughout history). By the time of the influential legal theorist and schematizer al-Shāfi‘ī (d. 820), an unsystemic and sometimes imaginative derivation and use of *ḥadīth* about Muḥammad’s and his community’s *sunnah* had become commonplace among the several early Jamā‘ī-Sunnī “schools” of *fiqh* (jurisprudence), as had many other legal techniques. Simultaneously, intellectually important movements like Shiism and Mu‘tazilī rationalism had developed modes of reasoning that downplayed the authority of a *ḥadīth*-borne *sunnat al-nabi*.

Responding to these and other factors, al-Shāfi‘ī sought to rationalize and circumscribe the legitimate roots or sources (*usūl*) of jurisprudential deliberation. These he limited to a hierarchy of four, each of which had a fixed relationship to the one(s) before: Qur’ān, *sunnah*, *ijmā‘*, and *qiyās*. The starting point had to be the Qur’ān. However, where the *sunnah* could explain or supplement revealed truth, it became a second source by virtue of a frequent Qur’anic injunction, “Obey God and his Messenger.” The *sunnah* had to be based on *ḥadīth* traceable back to the Prophet himself or a companion through the supporting (*isnād*) of an unbroken chain (*silsilah*) of reliable transmitters. Thus did al-Shāfi‘ī solidify for Jamā‘ī-Sunnī Muḥammad’s role as uniquely authoritative exemplar.

Furthermore, where the entire community, as represented by its learned men (*‘ulamā’*), had reached consensus (*ijmā‘*), that too became law if it was consistent with the first two sources. In justifying the use of *ijmā‘*, al-Shāfi‘ī had recourse to a famous *ḥadīth*, “My community will never agree on an error.” *Ijmā‘* sometimes sanctioned, for example, the Arab custom of male and female circumcision, which in turn came to be known as *sunnah* too. Finally, the *‘ulamā’* could make adaptive extensions of the first three sources by using personal judgment limited to analogy (*qiyās*) to something in the other three sources. They were equipped to perform their functions not because they possessed any innate characteristics but because they had acquired, through devoted study of Qur’ān and *ḥadīth*, the knowledge (*‘ilm*) of what is right.

Deserving of comment is the relationship between this approach to *ḥadīth* and *sunnah* and *tradition*, a word that is often used to translate them. Al-Shāfi‘ī’s *ḥadīth*-oriented approach was actually antitraditionalist. By insisting on the use of texts in the form of *ḥadīth* that were traceable to Muḥammad, he was restricting the role “tradition” had been playing among legists because, by the second Islamic century, many things that had become “traditional” among legists had no textual base or were contradicted by the texts.

Al-Shāfi‘ī’s approach should more properly be viewed as “textualist”: he accepted practices not because they were customary but because they were documented. Not long after his death, the *ḥadīth* began to be compiled into a series of six major authoritative collections. Although some of them may have reflected “traditions” in the narrower sense, the impact of this whole series of developments was to control the traditional in favor of what was based on a text and to undermine contemporary rulers’ attempts to legitimize custom based on the court rather than *sunnah* based on *ḥadīth*.

**Emergence of schools.** Gradually, four major Jamā‘ī-Sunnī “schools” (sg., *madhhab*; pl., *madhāhib*) of law, all influenced by al-Shāfi‘ī’s system, formed around the teachings of four leading early figures: Ahmad ibn Ḥanbal (780–855), Mālik ibn Anas (715–795), Abū Ḥanīfah (699–767), and al-Shāfi‘ī himself. Eventually, standardization set

in to the point at which, by the fourteenth century, no further significant variation was anticipated—a situation expressed by the phrase “the closing of the gate of *ijtihād*” (individual inquiry).

*Sharīʿah*-oriented Jamāʿī-Sunnism came to focus on the establishment of communal consensus and the maintenance of the public order—in worship, in marketplace behavior, or on the highways and frontiers. Judges (*qāḍīs*) judged what was brought to their attention, not what they ferreted out privately. Books of law focused on ritual obligations (summarized by the five pillars—confession of faith, daily prayer, alms, fasting during the month of Ramaḍān, and pilgrimage to Mecca) as well as on family and personal status law and economic and political matters. This style of piety came to accept as ruler (*khalīfab*) whomever the great majority of the community accepted and to define him as guarantor of physical security and provider of an atmosphere in which the *sharīʿah* could prevail.

Some Jamāʿī-Sunnīs also used *ḥadīth* and *sunnah* as the basis for *kalām* (speculative discussion about God), although others viewed *kalām* itself as *bidʿah*, by virtue of its presumptuous attempt to prove what had already been revealed as true. By the eleventh century, two major *ḥadīth*-oriented schools—the Māturīdī (named after Abū Manṣūr al-Māturīdī, d. 944) and the Ashʿarī (named after Abū al-Ḥasan al-Ashʿarī, d. 935)—had won out over more rationalistic groups such as the Muʿtazilah. The Ashʿarīyah and Māturīdīyah emphasized emotional faith as opposed to the mere assent of intellectualized belief and relied on Muḥammad’s own faith and the *ḥadīth* that expressed it as the best guides. They favored an exoteric (*ẓāhirī*) style of reading the Qurʾān and *ḥadīth*. Although they insisted on the unity of God, they accepted the existence of his attributes as mentioned in the Qurʾān, asserting that those attributes were not part of his essence. They emphasized that God exercised power over human action through continuous atomistic creation, though they did not remove the power of human choice altogether. They set limits on speculation by accepting many difficult Qurʾānic points outright, without regard to how they were true.

**Sufism.** Despite the emphasis of Jamāʿī-Sunnīs on *sharīʿah*, they also began by the twelfth century to partake of mystical piety (Sufism), partly because of the accomplishments of al-Ghazālī (d. 1111), the *kalām* teacher and self-styled Ṣūfī. Al-Ghazālī managed to make a place in Jamāʿī-Sunnī legalism for the more spiritualized, ineffable qualities of the Ṣūfīs. Organized groups of Ṣūfīs (*ṭarīqahs*) of great scope and variety gradually appeared and expanded so that by the sixteenth century much if not most of the adult male Sunnī population may have belonged to one or the other of these groups.

Jamāʿī-Sunnism has been described as the “piety of solidarity.” Its emphasis on the universal applicability and accessibility not only of the Qurʾān but also of Muḥammad’s *sunnah* has promoted remarkable cultural homogeneity among

the many diverse peoples who have come under the Islamic umbrella during the past fourteen centuries.

#### BIBLIOGRAPHY

Two Arabic sources available in English translation give textured evidence for how the *sunnah* evolved: Alfred Guillaume’s *A Translation of [Ibn] Ishāq’s Sīrat Rasūl Allāh* (1955; reprint, Lahore, 1967) is an early biography of Muḥammad that shows how accounts of his life and portrayal of his *sunnah* did not depend on *ḥadīth* alone; *Islamic Jurisprudence: Al-Shāfiʿī’s Risālah*, translated by Majid Khadduri (Baltimore, 1961), offers a classic statement on the role of *ḥadīth* in formulating *sharīʿah*.

Although many excellent works have been written about *sunnah* and *ḥadīth*, William A. Graham’s *Divine Word and Prophetic Word in Early Islam* (The Hague, 1977) is particularly useful. In this pathbreaking study, Graham argues that the role of Muḥammad’s *sunnah* as a norm goes back to his own lifetime and that it developed much more continuously than past scholars have thought. Ignác Goldziher’s *Muslim Studies*, 2 vols., translated by C. R. Barber and S. M. Stern (Chicago, 1967), is an erudite study of various aspects of Islam and a good example of a legalistic approach to *ḥadīth* and *sunnah*; Goldziher tends to be skeptical about their reliability, however. The first chapter of volume 1 is especially useful. Another important work is Nabia Abbott’s *Studies in Arabic Literary Papyri*, 2 vols. (Chicago, 1957–1967), a detailed study of early Islamic written texts. Professor Abbott includes evidence that *ḥadīth* were committed to writing much earlier than scholars had previously argued. See also A. J. Wensinck’s article “Sunna,” in *Shorter Encyclopaedia of Islam* (Leiden, 1974); James Robson’s “Tradition, the Second Foundation of Islam,” *Muslim World* 41 (1951): 22–33; and Josef van Ess’s *Zwischen Ḥadīth und Thēologie* (Berlin, 1975).

For Shīʿī developments and approaches to *sunnah* and *ḥadīth*, S. H. M. Jafri’s *The Origins and Development of Shiʿa Islam* (London, 1979) is a solid chronological history of Twelver Shiism, with a good analysis of the Twelver attitude to and concern for *sunnah*. Marshall G. S. Hodgson’s “How Did the Early Shiʿa Become Sectarian?” *Journal of the American Oriental Society* 75 (1955): 1–13, is a seminal article that manages to convey the fluidity of pre-Abbasid politics as well as the reasons for the consolidation of Twelver Shiism in the late eighth century.

On *bidʿah*, see D. B. Macdonald’s article “Bidʿa” in *Shorter Encyclopaedia of Islam* (Leiden, 1974), a brief survey with good basic information and unfortunately few nuances, and Bernard Lewis’s “Some Observations on the Significance of Heresy in Islam,” *Studia Islamica* 1 (1953): 43–63, a more subtle interpretation of *bidʿah* than usual, in a nondogmatic context.

MARILYN ROBINSON WALDMAN (1987)

**ŞÜNYAM AND ŞÜNYATĀ.** “Empty,” “open,” “devoid,” “nothing,” and “nonexistent” are words used to

translate the term *śūnyam*. “Emptiness,” “openness,” “nothingness,” “nonsubstantiality,” “relativity,” and “the inexhaustible” have been used to translate *śūnyatā*. These two terms, of major importance in Buddhism, have been used to express a philosophical idea, a focus of meditation, a religious attitude, and a manner of ethical action. “Emptiness” may thus indicate deprivation (or self-substantiated reality in conventional experience), a complex implicit interrelatedness of all existing things, or blissful perfect freedom (from anxiety, anger, and pain). As general religious terms, *śūnyam* and *śūnyatā* are used in an attempt to indicate and incite an awareness of “the way things really are” (*yathābhūtam*). The complexity of the concept expressed as “emptiness” derives from the recognition in Buddhism that teaching the truth about life is urgent for alleviating suffering, but that implicit in thinking and speaking resides a tendency to create an illusion (of self-sufficient realities) that is itself the cause of that suffering. The teaching of “the emptiness of things” is a medicine for the spiritual illness seen wherever there is greed, hate, and self-delusion; it is a response to a universal, problematic condition that is found in particular specific forms and thus requires different kinds and levels of correction. Assertions about the empty nature of existence pertain to different objects of concern, for example, conventional phenomena, the basic (usually hidden but more fundamental) causal factors of existence, the highest mode of perceiving phenomena, or the nature of everything. Similarly, different Buddhist schools have recognized the value of different interpretations but have judged the value of a particular interpretation on a scale from the most superficial understanding (for beginners) to the most profound (for spiritual adepts). In all the interpretations and explanations, however, there is a clear recognition that the notion of emptiness is closely tied to the practice of perceiving existence in an “empty manner,” which, in turn, results in behavior typified by patience, compassion, strength of character, and morality.

**TEACHING OF EMPTINESS AS PART OF THE BODHISATTVA PATH.** During the second century BCE, Buddhist teachers in India emphasized “emptiness” as a basic description of the nature of existing things. They were known as “teachers of emptiness” (*śūnyavādins*). Their approach to enlightenment is dramatically portrayed in the Prajñāpāramitā Sūtras (The perfection of wisdom discourses). These *sūtras* maintain that the teaching and meditation training of the contemporary traditional masters, as depicted in the analysis of the Abhidharma Piṭaka, resulted in only a partial enlightenment. The Abhidharma masters had insight only into the emptiness of “the self” and general empirical phenomena, which they could perceive by breaking up conventional perceptions of oneself and “the objective world” into their fundamental causal factors (*dharmas*). While reviewing the *dharmas* was recognized to be a monastic skill that provided the foundation for the cultivation of nonattachment to the self and the world, the “teachers of emptiness” held that such a review, with its emphasis on attaining *nirvāṇa* by avoiding attachment to the “constructed world,” could itself become a subtle

attachment. To prevent attachment to *dharma* analysis and the expectation of an individual *nirvāṇa* they insisted that even the *dharmas*, together with their identifying characteristics, had to be seen as empty. All distinctions, including those between *nirvāṇa* and the world in flux (*samsāra*) and between enlightenment and non-enlightenment, were empty of inherent characteristics. The emptiness of all things is a significant part of the Bodhisattva Path to enlightenment in Mahāyāna (Great Vehicle) Buddhism (which developed in northern India and spread to China, Korea, Japan, and Tibet). This path is a spiritual training that begins with instruction of the Buddha’s Middle Way to avoid attachment to “the appearances of the world” and acquisition of self-constricting energy (*karman*). The path includes putting the teaching into practice (perhaps through many lifetimes and even aeons of time) by meditation, by moral action that results in “seeds of virtue,” and eventually by the formation of “the thought of enlightenment” (*bodhicitta*) and the earnest resolution (*prañidhāna*) to work for the welfare of all living beings. Progress on the path includes the perfection of charity, morality, effort, and wisdom. A distinguishing character of this wisdom is that the recognition of emptiness is combined with compassion for all living beings. Such wisdom is cultivated through a skill (*upāyakauśalya*) to fully engage the conditioned world (*samsāra*) without being tainted by its evil, delusion, and compulsive drivenness toward pain. The Bodhisattva Path is elaborated in subsequent centuries in such texts as the *Madhyamakāvātāra* (Entering the Middle Way) by Candrakīrti (sixth century CE), the *Śikṣāsamuccaya* (Compendium of Precepts) by Śāntideva (eighth century CE), and the *Bhāvanākrama* (The course of spiritual development) by Kamalaśīla (eighth century CE). In claiming to perfect the meditational practice of the Abhidharma masters within the Indian Buddhist community, the composers of the Prajñāpāramitā Sūtras claimed—as did the composers of such other early Mahāyāna discourses as the *Saddharma-puṇḍarīka Sūtra* (Lotus of the good law discourse) and the *Vimalakīrtinirdeśa Sūtra* (Exposition by Vimalakīrti)—that their teaching of emptiness was consistent with, and indeed the deepest comprehension of, the earliest recorded doctrine of the Buddha. The earlier recorded discourses (*nikāyas*) had already used the notion of emptiness to describe the ephemeral quality of phenomena, especially the lack of permanence and self-existence of perceived objects. During meditative quieting of the mind, and through a descriptive analysis of the many factors that constitute perceived objects, the monk sought to remove mental and emotional disturbances that arose from false expectations of permanence. Though everyday phenomena “exist” in a composite, conditioned manner, they are empty of anything that is permanent or self-existent. In articulating this path of nonattachment to mental, emotional, or material “things,” the *nikāyas* use designations such as “empty,” “impermanent,” and “nonessential”; however, they are aware that in conventional speech an assertion implies the denial of its opposite claim. To avoid such implications they also warn that enlightenment is not the same as

holding a *view* of emptiness, of nonexistence rather than existence, of “it is not” rather than “it is.” Rather, one should avoid clinging to ideas or apprehensions that divide one’s experience into “is” and “is not,” “being” and “nonbeing,” or “if not this, then that.” The path to enlightenment, expounded by the “teachers of emptiness” in the Prajñāpāramitā Sūtras, absorbed the earlier Buddhist recognition that the self and objects of perception are empty of self-existence. The “teachers of emptiness” extended the awareness of the empty nature to everything. Thus the *dharma*s (causal factors of existence), the Buddha’s teaching, the path to liberation, the beings who seek liberation, liberation, and “emptiness as a teaching” were all viewed as being empty—all viewed in an empty manner. The Bodhisattva Path was described as “no-path” or “non-coursing”; the Buddha’s position was “having no place to stand.” The attainment of enlightenment was “no-attainment.” There was no defilement, no purification; no arising and no dissipation of existence; and no release from existence to attain *nirvāṇa*—because all these are empty of self-substantiated reality, inherent characteristics, and essential value. This kind of teaching was meant neither for the “worldling” attached to the things of existence nor even for a novice in the Buddha’s Middle Way. Such people as these might become fearful and despondent or might interpret the teaching as a nihilistic view or simply as a negative expression of a transcendent essentialism. Only courageous pursuers of truth who had accumulated a resource of spontaneous virtue and clarity of perception could see that such “non-coursing” implies complete interrelatedness with all living beings and that the deepest cognition of emptiness is expressed as compassion.

**THE MĀDHYAMIKA SCHOOL.** The effort to formulate and justify the insight that all things are empty while living in a spontaneous, comprehensively caring manner was systematized differently by two Indian schools of Buddhism, the Mādhyamika (“middle way”) and the Yogācāra (“yoga practice”) schools. Nāgārjuna (late second century CE) is often regarded as the founder of the Mādhyamika school. The invocation of one of his major writings, the *Mūlamadhyamakārikās* (The Fundamentals of the Middle Way), includes a summary of “eight negations” that has epitomized the emptiness teaching for subsequent generations: no origination, no dissipation; no permanence, no ending; no differentiation, no identity; no coming (into existence), no going (from existence). Throughout this work, Nāgārjuna analyzes basic philosophical notions and views, for example, causal conditions, time, *karman*, self (*ātman*), the fully enlightened one (*tathāgata*), and *nirvāṇa*. He shows that none exists in the sense of self-sufficient existence (*svabhāva*) and, thus, that each is empty (of self-sufficient existence). At the same time, he demonstrates that all phenomena exist because emptiness is the same as dependent co-origination (*pratītya-samutpāda*). As radical relational existence, emptiness is identical to existence. Contrary to the claim of his opponents that to designate everything as “empty” is to say that nothing exists, Nāgārjuna insists that one can account for

changing existence or enlightenment only if one recognizes that these lack self-existent reality (i.e., emptiness as dependent co-origination).

To perceive all existing things as dependently co-originating, or empty, requires a shift from the conventional mode of perception. Conventional experience divides the world into likes and dislikes, desires and fears, and “you” and “me” as separate entities. This hides the fact that these perceptions can exist only in interrelationship. To perceive through the deep awareness of emptiness, people must become aware of how they construct attachments and fears while perceiving, conceptualizing, and judging. Concepts and language create the places for sensations and emotions “to reside.” Therefore, they are a prime focus for dissipating attachments. Nāgārjuna and his followers in the Mādhyamika school use a critical dialectic to show how concepts that presume to describe independent, self-sufficient reality are illusory. The general structure of this dialectic is to assert that any self-subsistent, independent entity is unchanging and unrelated; to claim that such an entity accounts for any phenomenon in the continually changing world is either logically contradictory or contrary to common experience. Likewise in this dialectic is a rejection of the common assumption that any denial of something logically requires the opposite positive assertion. That is, when denying that an entity has “being,” a person implicitly asserts that the entity has “nonbeing.” Thus in the Mādhyamika dialectic a common argumentative procedure is the denial of “four alternatives” (*catuṣkoti*). For example, in discussing the nature of the perfectly enlightened one (*tathāgata*), Nāgārjuna states: “One can say neither ‘empty’ nor ‘non-empty’; nor both, nor neither. The purpose of these designations is for communication only” (*Mūlamadhyamakārikās* 22.11). The religious significance of the critical dialectic is to show the “non-abiding” character of “the way things are.” The empty character of existence cannot be encapsulated in language or in any perception that implicitly assumes permanent essential qualities or substances. By dislodging a person’s hope that language or logic can capture the empty, or intrinsically relational dynamic of existence, one can avoid the delusion of permanence as a condition for happiness and serenity. The use of logic to justify the emptiness of experienced “things,” juxtaposed with the assertion that language distorts a true cognition of emptiness, led to the doctrine of two levels or modes of truth. The notion of two modes of truth recognizes that logic, metaphor, or verbal description has use in conventional day-to-day experience but that such conventional use also hides and distorts a deeper (or higher) cognition known through an immediate, direct, intuitive awareness. For the Mādhyamika, emptiness was the object of highest knowledge and, at the same time, accounted for the possibility of the conditioned, conventional forms in everyday life. However, to say that emptiness is “the object” of knowledge does not mean at the highest level of truth that emptiness exists as a separate entity. This is the realization of the “emptiness of emptiness.” Because “the two modes of

truth”—like everything else—are related but distinct, the systematic formulation of how they were to be defined and related became a focus of much subsequent discussion and writing throughout the millennia. Within the Mādhyamika school and between various schools or lineages of teaching in India, Tibet, China, Korea, and Japan, there were various understandings of the two levels of truth and the meaning of emptiness in the context of realizing the highest truth. Within Mādhyamika, the subschool called Prāsaṅgika (from *prasaṅga*, a logical method of “necessary consequence”) stressed the distorting character of all concepts and logic. Its adherents applied their rigorous “consequential dialectic” to all concepts that purported to express the highest truth, in order to dislodge any pretense of language to do so. Language and logic are, nevertheless, important tools to show the self-contradictory and distortional character of conceptual formulation. In his *Prasannapadā* (Clearly worded commentary), on Nāgārjuna’s *Mūlamadhyamakakārikās*, Candrakīrti advocates this position, emphasizing that the awareness of emptiness is the destruction of *all* views or formulations. Even the negation of self-existent reality (*svabhāva*) is not a positive cognition of anything. In his commentary, Candrakīrti argues against Bhāvaviveka, an important spokesperson for the other Mādhyamika subschool, the Svātantrikas (“Independents”). The Svātantrikas held that language and logic cannot express the most profound aspects of the highest truth but that some assertions express the truth of emptiness more accurately than others. Further, the accurate statements are amenable to verification within conventional rules of logical justification. This discussion continued outside India, especially in the development of Tibetan Buddhist lineages. For example, the Prāsaṅgika position was elaborated by the Sa skya and later by the Rnying ma pa commentators, while the Svātantrika position was advocated by the Dge lugs pa lineage, including the great master Tsong kha pa (1357–1419 CE). The Tibetan monasteries developed their own lineages by drawing on ideas and interpretations from various earlier schools. They attempted to synthesize the teachings from different sources and thus develop a more complete view, while the Prāsaṅgika view is said to be the basis for knowing emptiness and is found in all four divisions of the *tantras* (“deep meaning texts”).

**THE YOGĀCĀRA SCHOOL.** The ideas of the other major Indian school of Mahāyāna Buddhism, the Yogācāra, were systematically formulated during the fourth century CE by the two monks Asaṅga and Vasubandhu. Like the Mādhyamikas, the Yogācāras also recognize that all phenomena are empty (i.e., conditioned, without selfsubsisting reality). However, they insist that the “coursier in wisdom” should positively affirm the ultimate reality of consciousness. It is consciousness that is empty and that knows in an empty or delusive manner. All living beings, Asaṅga claims in his *Madhyānta-vibhaga* (Distinguishing between the middle and extremes), have the capacity to pervasively construct “that which is not there” (*abhūta-parikalpa*). This capacity artificially divides the interdependent world into many dualities,

for example, subject and object, being and nonbeing. The elimination of dualistic fabrication is true emptiness. Consciousness, in Yogācāra reflection, is the comprehensive reality and is composed of three kinds of reality: completely fictive or illusory (*parikalpita-svabhāva*), dependent or conditioned (*paratantra-svabhāva*), and truly real or nondual (*pariṇiṣpanna-svabhāva*). Through the practice of the Bodhisattva Path the illusory reality is recognized for what it is: nonexistent. This recognition purifies the conditioned existence, which itself is not a real object but a modality of consciousness. When this is realized, the nonduality (or emptiness) of all things is manifest and exists as the ultimate reality (*paramārtha sat*). Whereas the Mādhyamikas stress that both the conditioned forms and the unconditioned reality are empty, the Yogācāras emphasize that the true reality is neither empty nor nonempty.

Another aspect of the Yogācāra emphasis on consciousness, found in several Indian discourses that contributed to the Mahāyāna understanding of ultimate reality, was the notion of the “matrix of enlightened reality” (*tathāgata-garbha*). Vasubandhu had described the basis of multiple kinds of consciousness as a “store consciousness” (*alaya-vijñāna*). This store consciousness contains both pure and impure “seeds” (*bījas*) that influence subsequent consciousness. Similarly, the *tathāgata-garbha* is the womb, or matrix, from which pure consciousness in the manifested world arises. Such a Mahāyāna text as the *Srīmālādevī-siṃhanāda Sūtra* (The lion’s roar of Queen Srimala) equates the *tathāgata-garbha* with emptiness. Here “emptiness” means both “being devoid of impurities” and the natural “power of enlightenment” to produce nonattached consciousness in worldly forms. The ultimate nature of the *tathāgata-garbha* is perfect purity. It is manifested in forms as well as being the formless reality. However, enlightened reality—also called “the Buddha nature”—is said to be nonempty in respect to the virtues of Buddhahood, which are manifested in the phenomenal world. Insofar as there is a strong emphasis on enlightened reality, which is manifest in particular concrete forms, the *tathāgata-garbha* is said to be neither simply empty nor simply nonempty. In India during the second half of the first millennium CE, in China beginning in the fifth century CE, and in the development of the Tibetan lineages, Buddhist scholars developed several formulations of the relation between the conditioned and the unconditioned realities, between the pure and the impure conditioning influences, and between emptiness and conditional form.

**EMPTINESS IN CHINESE AND JAPANESE SCHOOLS.** In China the Mādhyamika school maintained a teaching lineage for several centuries from the fifth century CE on as the Sanlun (“three [middle way] treatises”) school. The teachings of the Mādhyamika were studied in Japan from the seventh century CE on but without a separate community following a lineage succession. The Yogācāra doctrine was transmitted to China through the translation of texts and a lineage of teachers that became known as the Faxiang (“characteristics of dharma”) school. This school was transmitted to Japan during the sev-

enth and eighth centuries CE, where it was known as the Hossō school. The Chinese Mahāyāna Buddhists, during the fifth and sixth centuries, wrestled with the cognition of emptiness first in relation to Neo-Daoist notions of nothingness (*kong*), which implied that emptiness is a primary source from which all phenomenal forms arise. In the flowering of Buddhism in China (from the sixth century CE through the first half of the ninth century CE), Buddhist scholars understood emptiness within the context of the broad-based Chinese philosophical problem of the relation between the substance or foundation (*ti*) of everything and its function or appearance (*yong*) in the changing world. Within the Sanlun school, contrasting understandings of this relation between substance and function are found in the writings of Sengzhao (374–414 CE) and of Jizang (549–623 CE). Sengzhao assumed the identity of substance and function, affirming that emptiness is the foundation of all things that appear through dependent co-arising and is the nature of insight that recognizes the illusory (empty) character of phenomena; thereby the enlightened person abides in non-abiding (emptiness) and moves (in an empty manner) in conditioned existence. Jizang, on the contrary, held that substance and function need to be clearly distinguished, and emphasized that the highest truth is manifest when the conventional truth is negated. Emptiness is basically the dialectical negation of both being and nonbeing and of both affirmation and negation. The highest truth is known in conditioned existence when names and characteristics of things are negated or transcended in nonphenomenal awareness. During the sixth and seventh centuries CE, the Chinese Buddhists synthesized the notions of emptiness, multiple kinds of truth (reality), and dependent co-arising within a cosmological context in developing two distinctly Chinese schools or teaching lineages. These were Tiantai, formulated by Zhiyi (531–597 CE), and Huayan, systematized by Fazang (643–712 CE). Both are attempts to relate substance and function in one harmonious and interrelated matrix of reality. Chih-i held that there was a threefold truth—the empty (*kong*), the provisional (*jiā*), and the middle (*zhong*)—and that these three parts are reciprocally identical and simultaneous. Rather than view the truths in a lower-to-higher order, he presented them as different modalities of one universal consciousness. While they appear to be separate processes, he maintained, in their deepest character of interrelatedness they are one undifferentiated matrix whose principle is beyond dualistic or linear comprehension. Fazang held that the “nature of things” was emptiness, by which he meant the harmonious interdependent co-arising of particular, concrete phenomena. Such a universe is “the body of the *tathāgata*.” Rather than devaluing particular phenomena because they are conditioned (non-eternal), his system insists that each has supreme value in its interrelatedness to everything else. Fazang held that the three natures (levels of awareness) proposed by Yogācāra teachers are intrinsically interrelated, and together form a whole, because they are all empty. The most profound nature is the incomprehensible “suchness” (formless emptiness), which is also

the emptiness of the interrelatedness of conditioned existence (dependent co-origination); this, in turn, is also the non-self-substantial (empty) nature of illusory mental construction. To know the intrinsic emptiness (“suchness”) of all forms is the highest awareness. However, most people do not see the complex emptiness of everything. At a lower level of awareness, one can also say that the evil and pain experienced in the world represent only the potential for realizing incomprehensible “suchness” and that the *tathāgata-garbha* causes the transformation of enlightenment in particular minds and moments of consciousness. Nevertheless, in reality, the world is an inconceivably vast expression of emptiness that is the glorious manifestation of unchanging fullness, an overbrimming potential of “openness.” Another very important expression of emptiness is found in the “Meditation school,” which is known as Chan in China and Zen in Japan. The focus in Chan communities has been, and is, on “the practice of emptiness.” The basic negation of concepts as inadequate communication of “the way things are” and an emphasis on quieting the mind and extending the empty mode of perception into daily life continue the themes found in the Bodhisattva Path as portrayed in the Prajñāpāramitā Sūtras. Zen masters have commented on these discourses as well as on the central Mādhyamika and Yogācāra treatises and on the poems and comments of previous Zen masters. Zen is the practice of manifesting “the Buddha mind,” which is also “no-mind.” The realization of “no-mind” is the loss of attachment to conventional perceptions, theoretical concepts about reality, and self-images. In that state of awareness, a Zen practitioner is directly confronted with emptiness—not as an idea or as the denial of an idea but as “what is at that moment.” Many Zen masters have emphasized that the notion of emptiness is misleading or useless when it is used to describe a distinctive quality of experience. At the same time, “emptiness” is prominently used as a focus of meditation, in which the meditator is called on to “become emptiness.” Basically, it is a mental tool to dissipate attachment to images and concepts. In the contemporary discussion of cross-cultural philosophy and interfaith dialogue in which Buddhists are involved, the notion of emptiness and the negating dialectic are important points of engagement with other philosophies. The empty perception of “the way things are” has been compared with the critique of reason given by the eighteenth-century German philosopher Immanuel Kant and with the distorting character of language described by the twentieth-century philosophers Ludwig Wittgenstein and Martin Heidegger. The claim that all things are dependently co-originated is compared with similar concepts in “process philosophy,” as expounded, for example, in Alfred North Whitehead’s *Process and Reality*. The notion of emptiness forms a central concern in the philosophical thought of the contemporary Japanese philosophers Nishida Kitarō and Nishitani Keiji as they discuss the nature of goodness, existence, and selfhood in a cross-cultural philosophical context. In interfaith dialogue, emptiness is a major topic in the Christian and Buddhist discussion of the nature

of ultimate reality, human nature, and religious awareness. Likewise, the empty apprehension of oneself that is best manifested in compassion is compared with mystical disciplines that require the love of others found in various religious traditions. As a fundamental and multidimensional concept, emptiness continues to engage reflective people who pursue the tantalizing question of the nature of things.

#### BIBLIOGRAPHY

A good historical introduction to the development of the “teaching of emptiness” in India is Edward Conze’s *Buddhist Thought in India* (London, 1962); his translations of the Prajñāpāramitā Sūtras, especially *The Perfection of Wisdom in Eight Thousand Lines and Its Verse Summary* (Bollinas, Calif., 1973), are basic for understanding how the term “empty” functions in communicating the Bodhisattva Path. A standard philosophical analysis of Indian Mādhyamika thought, emphasizing the logical dialectic, is T. R. V. Murti’s *The Central Philosophy of Buddhism*, 2d ed. (London, 1970), and a useful linguistic and philosophical analysis of the translation of the Indian Mādhyamika into Chinese thought is found in Richard H. Robinson’s *Early Mādhyamika in India and China* (Madison, Wis., 1967). In my book *Emptiness: A Study in Religious Meaning* (New York, 1967) I compare the religious language structure of the term “emptiness” and the Indian Mādhyamika dialectic with other kinds of religious expression in order to delineate their religious meaning. A collection of essays edited by Minoru Kiyota, *Mahāyāna Buddhist Meditation* (Honolulu, 1978), contains several excellent essays on the meaning of emptiness in Buddhist theory and practice in India, Tibet, China, and Japan. An introduction to the understanding of emptiness within the meditative practice of Tibetan Buddhism is *Practice and Theory of Tibetan Buddhism*, edited and translated by Geshe Lhundup Sopa and Jeffrey Hopkins (New York, 1976). A lengthy explanation of the realization of emptiness according to the texts and oral traditions of the Prāsaṅgika-Mādhyamika tradition in Tibet is Jeffrey Hopkins’s *Meditation on Emptiness* (London, 1983). Two different and complementary interpretations of emptiness in Huayan Buddhism are found in Garma C. C. Zhang’s *The Buddhist Teaching of Totality* (University Park, Pa., 1971) and Francis H. Cook’s *Huayan Buddhism* (University Park, Pa., 1977). A classic introduction to the Zen negation of mental images is D. T. Suzuki’s *The Zen Doctrine of No-Mind* (London, 1949), which is also found in an abbreviated form in *Zen Buddhism: Selected Writings of D. T. Suzuki*, edited by William Barrett (Garden City, N.Y., 1956). Nishitani Keiji’s *Religion and Nothingness*, translated by Jan van Bragf (Berkeley, Calif., 1982), is a prime example of a contemporary philosophical use of the notion of emptiness to explore the deepest awareness of existence.

Revised Bibliography

**SUPERNATURAL, THE.** Mysterious occurrences and beings that habitually or occasionally impinge upon one’s everyday experience are called “supernatural.” It is commonly said that belief in the supernatural characterizes all religions and that belief in the supernatural wanes in modern societies.

**HISTORICAL DEVELOPMENT OF THE NOTION.** The term *supernatural* was given wide currency by Thomas Aquinas (1225–1274) and the Scholastics, but it had numerous antecedents in the idiom of the Hellenistic thinkers and church fathers. Neoplatonists in particular accumulated superlatives to speak of the realm of the divine: It was above the highest heaven, beyond the world, and even beyond being. Christians spoke of God as being above nature: He had not grown out of anything but was eternally self-subsistent. They also spoke of Christ as bringing to humankind benefits that were above nature, that is, benefits that were beyond what human beings could reach with their own powers. This link between grace and the supernatural became firmly entrenched in scholastic theology. Thomas taught that in the Fall humanity was hurt in its very nature (that is, weakened as a being) and lost its supernatural gifts, especially its access to the vision of God. God, according to Thomas, in his grace gratuitously heals the wounds (and thus restores to humans what naturally belongs to them) and reopens humanity’s path to his supernatural end, thus restoring access to the added bliss of life with God. This theology expresses a constant theme in the Christian faith: The natural and the supernatural are at odds; the sacred and the profane are estranged. God, who is quite separate and distinct from the world, is not responsible for this state of affairs, and his intention is to rectify it. Nature and supernature will, in time, be reconciled.

The word *supernatural*, however, left the confines of the schools and began to lose its precise technical meaning. It became associated with the unusual, the marvelous, the surprising. Robert Lenoble (1968) has shown a continuity, from antiquity to the present day, in what he calls “marvel psychology.” Popular thought makes rough distinctions between what is natural, what is artificial, and what is miraculous: Water flows down into valleys, human beings build dams, and the Virgin diverts floods from villages when dams break down. What characterizes common thinking about the subject is uncertainty about the precise borders between the natural, the artificial, and the miraculous. When the dam breaks down, does it do so by itself, through wear and tear, or because some man has put explosives in it or some woman has cast a spell upon it? And does the water spare the village because of its situation—the village is on high land—or because of divine intervention? While medieval theologians had used the term *supernatural* to refer to the moral and spiritual dynamics of salvation, ordinary Christians came to call supernatural any extraordinary occurrence that could not be accounted for by the usual explanations at hand.

The scientific revolution of the seventeenth century radically transformed the idea of cognition. With the mechanistic revolution came, certainly for some human beings, a precise knowledge of the limits of the natural. “Natural” causes have come to explain increasing amounts of experience, and it is commonly assumed that in time, natural causes will be found for events that currently resist explanation. Nature is seen to be a rigid, coherent system that works like a clock, does not pursue moral ends, and is indifferent to human aspirations. Modern humans know how to build dams that are fail-safe; they know for sure that those dams cannot be destroyed by spells; and they do not count on the Virgin to intervene in the event of an accident. Nature, then, always works according to rigorous laws and, by definition, excludes the miraculous. (The older nature was malleable: It was quite willing to see God—who ruled over it—reorder its workings momentarily or locally to bring about a miracle for some special purpose.) At first, the new nature was deemed to magnify God even more than the older one: Its strict regularity and its order seemed to testify to the awesome grandeur of its creator. That it was not a model and had nothing to teach humanity was deemed at first only to serve the interests of the dialogue between man and God. René Descartes (1596–1650) taught that human beings and God are alike in that both are spirits. The human being, a finite spirit, cannot create *ex nihilo*, but like an engineer, can shape everything: The whole of nature is matter in his hands (Lenoble, 1968).

At the same time, however, for reasons that had to do with the aftereffects of the wars of religion, the rise of the modern state, and the new demands for social conformity, the Baroque taste spread in Christian lands. What was infinite, awesome, powerful, overwhelming, and stunning was considered to convey a sense of God. Religious architecture and furniture became calculatedly impressive; oratory be-

came stately. Miracles as powerful disruptions of nature’s laws appeared, then, necessary to the cause of religion. Many theologians thus taught that human beings must regard the supernatural as contrary to nature: God, they said, intervenes providentially, and occasionally suspends the course of nature; he also reveals supernatural truths that humans must obediently accept even though their truth is not manifest to one’s unaided reason. Rare were the theological voices like that of William Law (1686–1761), who taught that “there is nothing that is supernatural but God alone.” Since it was evident that nature would always be what Newton said it was, salvation tended to become less cosmic and more interior. Nature and grace remained isolated: Humans only enjoy redeemed existence only in heaven. Eighteenth-century philosophers such as Voltaire, Hume, and Gibbon, for their part, gave currency to the idea that the supernatural was a notion accepted only by the ignorant and the credulous.

The far-reaching impact of the Baroque on sensibilities may be observed in the novel, a literary form whose real development began in the eighteenth century. The supernatural, the Gothic, and the fantastic were predominant themes in early examples of this mass-appeal genre. Suspense, terror, and pleasure were sustained by stories of desolate houses, mysterious dogs, vampires, murderous plants, doomed infants, premature burials, and preternaturally lascivious monks. An abundance of torture, carnality, magic, and solitary horror placed the protagonist and the reader in a world totally unlike the safe everyday middle-class world, and kept them thrilled, constantly on the verge of terrifying doom or unspeakable bliss. There was also a constant epistemological suspense, a specifically modern feature in fantastic tales: Were the events or apparitions caused supernaturally, or were they in reality some clever manipulation of appearances? The protagonist’s and the reader’s senses of reality were kept constantly off balance, precisely at a time when science and society worked together to give them a world as safe as possible (Penzoldt, 1952). The entry of the supernatural into literature raised interesting questions: Did readers who enjoyed these novels believe in the existence of supernatural beings and the possibility of supernatural occurrences? One might agree that people believe anything while they are reading it, but what happens to their belief when they are not reading but instead dealing and coping with their everyday world?

**APPLICATION OF THE NOTION TO THE STUDY OF RELIGIOUS AND CULTURAL SYSTEMS.** Among scholars of the nineteenth century it came to be commonly admitted that belief in what Herbert Spencer has called “the supernatural genesis of phenomena” characterized religious people. All religions were said to feature belief in supernatural beings. Émile Durkheim (1858–1917) noted that religion thrives on the sense of things surpassing human knowledge, and he quoted Spencer’s reference to the omnipresence of something inscrutable. But Durkheim also stressed that the idea of the supernatural appeared only very late in religious evolution, and that many

Christians were confident that God and nature were as one, or that dogma and reason fully agreed. The idea that belief in the supernatural was characteristic of religion remained, however, firmly entrenched. Lucien Lévy-Bruhl (1857–1939) in his early influential work argued that the primitive mind believed in “mystical,” not “physical,” influences, whereas practically all contemporaries recognize a clear line of demarcation between the supernatural (rejected by all except the credulous) and the data furnished by everyday ordinary sense experience and the broad light of day. R. R. Marret (1866–1943) confirmed that the notion gives a good minimal definition of religion. He classified the supernatural according to negative modes (taboo) and positive modes (mana). The sense of the supernatural, Marret stressed, is an existential and affective reality, a response to the extranormal and the uncanny, and is thus not related to a reasoned theory of nature. “Power belongeth unto God,” and the sense of the supernatural is the sense of the nearly overwhelming presence of great power. Paul Radin (1883–1959) argued against Lévy-Bruhl and spoke of the supernatural as arising against a background of inevitable fears (stemming from economic and psychic insecurity) that he found to be present in all human beings, primitive and modern. He saw in the modern West a decline in religion and in recourse to supernatural beings for help, because other means of emphasizing and maintaining life values were available and on the ascendant. Revision of the initial positivist separation between credulous and rational people reached a climax with Lévy-Bruhl’s famous reversal, recorded in his *Notebooks* (posthumously published in 1949): “Primitives reject contradiction, just as we do, when they perceive it.” Lévy-Bruhl developed comparative epistemology, according to whose tenets anthropologists were to compare modes of thought, psychic capacities, and mental categories without assuming at the outset that they themselves were in possession of a language that could adequately give an account of everything other minds did (Needham, 1972).

While this should be admitted, scholars today should still try to speak adequately of the varieties of admittedly extreme and nonverifiable languages people have recourse to when they express their reaction to situations that have powerful impact on them but remain opaque in their meaning, or desperately baffling in their consequence. Light can be derived from recent developments in anthropology that have profited from comparative studies in mythology, literature, and folklore. In all cultures stories abound, ranging from myths to folk legends, that tell the adventures of heroes in a world or worlds teeming with supernatural beings and awe-inspiring circumstances.

Consider the example of the *Odyssey*, a fairly typical tale. (Supernatural occurrences there, however, are among the milder ones, and the range of unusual creatures is somewhat narrow: There is a shortage of evil spirits and demons such as abound in other types of literature.) In his travels Odysseus has to deal with (1) the remote but supreme authority

of the king of the gods; (2) the support or enmity of powerful gods who have influence at court (Athena); (3) the support or enmity of powerful gods who rule in some corner of the world (Poseidon); (4) minor gods or goddesses (Calypso, who enjoys a perpetual vacation at her seashore home); (5) human beings with magical powers (Circe); (6) monstrous beings with terrifying powers (the Sirens); (7) powerful giants (the Cyclops); and (8) very unusual human beings (the lotus-eaters, who are more strange than ordinary foreigners). The hero himself is endowed with exceptional powers of endurance and prowess at the bow; he performs an extraordinary feat (he returns from Hades) and thus represents here the ninth type of being. Other heroes in such tales can fly, change their size, and so on. All nine types of beings may be called supernatural or said to have supernatural traits, although all may also be characterized by terms other than *supernatural*. Only the first three are the object of religious devotion or have cults. The fourth type, while divine, may be outside the religious world. Sirens and witches have powers ordinary human beings do not have, while giants (like dwarfs) have only their unusual size in their favor.

There is thus a whole range of modes of being and modes of power, finely shaded, for all these beings, and a whole range of appropriate human responses to them. The hero is the person best equipped to survive in this perilous world, who possesses an appropriately wide range of skills and attitudes. Senior gods are to be honored with sacrifices and piety. Sirens are simply to be avoided. One can do business with the Cyclops, but the game is dangerous. Transactions with Calypso and Circe are profitable and agreeable, provided the hero keeps them at arm’s length or has some special protection. There is also a whole range of modes of belief, and only one part of it is appropriately labeled religious belief. The hero does not believe in Zeus in the same way that he believes in the Sirens. And it should not be immediately clear to us what it means to attribute belief to the bards who recite such tales and to the audiences that hear them. Whether a man believes in Zeus may be tested: Does he perform the appropriate ritual, and does he exhibit the appropriate attitudes? But how can one verify behaviorally a belief in sirens? How often are human beings confronted with apparently beautiful women half visible above reefs? Needham (1972) has successfully argued that statements of belief are the only available evidence of the phenomenon. Both theologians and anthropologists, he maintains, have taken too much for granted and have been too quick to specify what beliefs other people have and what difference these beliefs make.

Belief in anything, including supernatural beings, is thus a very elusive phenomenon. The Dorze of Ethiopia say that the leopard became a Christian and so eats no meat on the fast days of the Coptic church. Nevertheless, they watch their cattle just as carefully on those days. And they are baffled when the anthropologist professes to see a contradiction in this. So what does go on in their minds when they say the

leopard fasts on Wednesdays and Fridays? Among contemporaries, not everyone who reads horoscopes will profess belief in them, and among those who do profess such a belief, how many are actually to be found making a decision on a primarily astrological basis? It would be safer to characterize religion by attitudinal factors and ritual practice rather than by belief. And any statement of belief should be taken with a grain of salt. People like, for adaptive or escapist purposes, to tell and hear stories that provide a map clarifying the configuration of forces in the world, that show modes of coping with those forces, and that do not demand any firm commitment to belief and ensuring action. Children everywhere acquire their bearing in reality from fairy tales. What beliefs they fleetingly entertain or settle on matter less than the inferences they learn to draw about possible realities. The highly imaginative stories of primitives abound in wit and irony and cannot be pinned down with the psychology of belief common among sober scientists (whose thinking often reflects the easy and moralistic recourse to expressions of belief characteristic of early modern theologians).

**SYSTEMATIC CONSIDERATIONS.** The human being has in its favor a quick mobile mind, but it is frail and its body is destined to contract disease and, ultimately, to die. Men and women are thus constantly the potential victims of aleatory events that can be painful to them. Fearful of impending disasters, they seek the protection of stronger human beings. As infants and children they start life with such protection. Later they attach themselves to strong persons whom they count on to be successful and wise so that they themselves can live in a secure world, one without interstices from which unpredictable attacks might come. When successful, these strong ones ward off actual dangers. When unsuccessful, as they inevitably will be, the strong ones, if wise, will be an authority providing cognitive and affective reassurance: Yes, loss and pain have occurred, but they are on the right path; it was inevitable, some good may come of it, and, in any case, there is lasting value in the new attitude gained and the new turn taken (Sennett, 1980). Priests, who are typical examples of strong ones, are also thinkers. They teach survival skills and provide ritual and verbal comfort when these skills fail, as necessarily they must. Strong ones are therefore in touch with suitable explanations that ideally can help in those boundary situations that occur when one's ordinary world falls apart.

Strong ones, in turn, feel themselves in touch with a strength or with other real and enduring strong ones who are beyond society, beyond this world, be they spirits, gods, God, history, or "the way things are." The label "supernatural" is appropriately attached to that strength or those preeminently strong beings that are not within the daily and social range of interaction. The authority of the social strong ones is thus always transitory and relative, more or less plausible. The limits to their authority stem from one's own willingness or ability to trust them; but one's trust rests on one's sense of their reliability: Are they in touch with the enduring strength so that they can help one to keep in touch with it,

or do they devour one's trust for their own petty human benefit?

The modern concept of nature and natural causes firmly supports a reality principle: When physically sick (or, today, even when anxious) people mainly turn to scientific medicine. Fear of and belief in supernatural agencies do not color in any significant way their sense of what is feasible in their embodied condition. But people hold on to some nonscientific health lore passed on through oral, unofficial channels, and nostalgically transmit recipes for more natural care of the human body and its ailments. Alternative "soft" medicines prosper. In matters of wealth, prestige, and happiness there is no scientific establishment that rules over one's expectations; unproved arts and pleasurable illusions abound. The reality principles that set limits to one's desires are socially determined: Rules are prescribed according to what is socially admitted, rewarded, or punished.

Human beings want both to be believed and to be understood, but usually not at the same time and not by the same people. Individuals want their words and their symbols (1) to be believed and accepted and (2) to create reality, a safe common reality that is not limited to the individual alone. Thus, individuals want to be supported and upheld, but they also want to be understood. They want to share something of their complex and problematic rapport by means of their words and symbols. Thus individuals want the liveliness of their consciousness to be acknowledged. When they want to be believed, they construct presumably strong structures (which are cemented by or rest upon strong ones) that they then deconstruct in the process of understanding. The characteristic feature of modern society is not fewer beliefs in supernatural beings but the variety of strong ones turned to and included in one's world for different purposes and at different times, and the variety of the structures of plausibility that buttress them.

Thus, somewhat polytheistically, in matters of health people turn to state-supported hospitals and the health-food stores of the counterculture; they believe in public schools and in private ones; they read mainstream literature and avant-garde poems; they watch television and go to art films; they attend institutionalized churches and buy books about spirituality in the free market of ideas. Alternative modes of knowledge prosper in the margins left by the dominant scientific or nonscientific modes. The symbolization of humanity's relation to the ultimate conditions of its existence is no longer the monopoly of any group explicitly labeled "religious." And, heroic or not, humans, like the hero of many folk tales, have no permanent master to guide their steps through all the perils of life. Everyone must encounter directly the Circes and Poseidons of this world. At different times they turn to different masters for help and protection. But in the present libertarian society the quality of their services is uncertain, and, in any case, the good ones can help only as long as one asks them to.

MICHEL DESPLAND (1987)  
Revised Bibliography

**SUPERSTITION.** *Superstition* is a judgmental term traditionally used by dominant religions to categorize and deni-

grate earlier, less sophisticated or disapproved religious attitudes and behavior. A belief is perceived as superstitious by adherents of a particular religious orthodoxy, and it is from their perspective that the category acquires its meaning. An anthropological description of the same belief would use different, nonjudgmental language drawn from the perspective of people engaged in the beliefs and practices condemned as superstitious by others. The use of the term *superstition* is inevitably pejorative rather than descriptive or analytical, for superstition is defined in opposition to a given culture's concept of true religion. Its specific meanings vary widely in different periods and contexts, so that a survey of its historical application rather than an abstract definition is the best approach to the concept of superstition.

**ORIGIN AND CLASSICAL USAGE.** The classical world criticized certain religious behaviors as irrational, or as reflecting an incorrect understanding of both nature and divinity. Greek writers from Theophrastus to Plutarch mockingly described a cringing, obsessive fear of the gods (*deisidaimonia*) as an inappropriate religious attitude. Roman philosophers sometimes echoed this theme, but the etymology of the Latin word *superstitio* (from *superstes*, "surviving, witnessing") indicates a separate evolution from a possibly neutral meaning of divination to a pejorative term. According to Émile Benveniste, *superstitio* included the idea of surviving an event as a witness and referred originally to divination concerning the past, the power to witness a distant event as though it were present. In its earliest Latin literary usage by Plautus and Ennius, *superstitio* was already a negative term describing divination, magic, and "bad religion" in general. Cicero gives a concrete example, explaining that "those who spent whole days in prayer and offered sacrifices, that their children might outlive them, are called superstitious" (*On the Nature of the Gods* 2.28). For classical Roman observers like Seneca, Lucretius, and Cicero, *superstitio* meant erroneous, false, or excessive religious behaviors stemming from ignorance of philosophical and scientific truths about the laws of nature. Such ignorance was associated with the common people (*vulgus*) and with the countryside (*pagus*), so that superstitious behavior had a social locus in the uneducated, lower orders of Roman society. As the empire expanded, the term *superstitio* was applied to exotic foreign religions of which the Romans disapproved, such as the Egyptian cult of Isis and later the Jewish sect of Christianity. Its meaning became more collective, referring to the "religion of others" in pejorative terms rather than to an individual Roman's inappropriate or exaggerated religious attitudes.

**EARLY CHRISTIANITY.** The early Christians adopted this collective meaning, turning the category of superstition back on the Romans. In the period after the second century, pagans and Christians reciprocally condemned each other's religious beliefs and ceremonial practices as the superstitious cult of false deities. But the militant monotheism of Christianity intensified the negative meanings of these charges. The church fathers interpreted Roman statues as idols, their sacrifices as offerings to the devil, and their oracles as the voices of de-

mons. Such false beliefs did not deserve the name of religion, for, as Lactantius explained, “religion is the worship of the true, superstition is that of the false” (*Divine Institutes* 4.28). Wishing to condemn the pagans out of their own mouths, Augustine of Hippo quoted Cicero’s description of superstitious attitudes among the Romans, but he rejected Cicero’s distinction between religion and superstition as an inadequate attempt “to praise the religion of the ancients which he wishes to disjoin from superstition, but cannot find out how to do so” (*City of God* 4.30). This use of *superstitio* to categorize the whole of classical pagan religion as idolatrous and even demonic constitutes a basic core of meaning that persists throughout the common era.

**MEDIEVAL CHRISTIANITY.** The religions of the Germanic tribes were perceived in a similar way by the Christian missionaries who undertook the conversion of these so-called barbarians in the period following the fall of the Roman Empire. The cure for their idolatry and superstition was baptism and the acceptance of Christianity as the true religion. But even after the evangelization of whole tribes, attitudes, beliefs, and practices associated with pre-Christian religions persisted. Early medieval denunciations of such paganizing observances in sermons and treatises against the *superstitiones rusticorum* were frequent. The epistle *On the Correction of Rustics* (c. 572) by Bishop Martin of Braga condemned popular magical practices, divination, and the worship of “rocks, trees and springs” as apostasy to the devil. Not all superstition was rustic, however. Martin also rejected the use of Latin calendrical vocabulary, since the days of the week were named after pagan gods (in his view demons) like Mars, Jove, and Venus. The limited, local success of such polemics is witnessed by the fact that Portuguese, alone among the emergent European vernaculars, purged this ancient vocabulary under church pressure.

The difficulties of weaning newly evangelized peoples from their old ways led Pope Gregory I (590–604) to suggest a gradualist approach to their conversion. Writing to Augustine of Canterbury, a missionary in England in the early seventh century, he acknowledged that “it is doubtless impossible to cut out everything at once from their stubborn minds” (Bede, *History of the English Church and People* 1.30). Gregory proposed that heathen shrines be reconsecrated as churches and that existing days of celebration be adapted to the Christian calendar. The Feast of Saint John the Baptist, for instance, was fixed on the former date of a midsummer festival. These syncretic fusions of old and new religious observances were often the target of later reformers’ campaigns against “pagan survivals” within Christianity. Throughout the medieval period, church councils and synods condemned paganizing and superstitious observances in an effort to complete the process of Christianization by enforcing more orthodox standards.

Scholastic theologians brought the analysis of superstitious error to a new level of thoroughness and sophistication. Thomas Aquinas (1225–1274) defined superstition as “the

vice opposed to the virtue of religion by means of excess . . . because it offers divine worship either to whom it ought not, or in a manner it ought not” (*Summa theologiae* 2.2.92.7). The idea of “undue worship of the true God” revived the classical meaning of exaggerated or overscrupulous religious behavior, now seen as occurring within Christianity rather than wholly or partially outside of it. Aquinas’s systematic exposition also classified idolatry, divination, and magical practices in general as superstitious by virtue of the inappropriate object (demons rather than God) toward which they were directed. The Scholastic theory of the diabolical pact as the causative mechanism behind magical effects assured that superstition in its medieval version was perceived as neither “harmless” nor inefficacious. Even if a magical procedure did not directly invoke the power of the devil to gain its ends, it nevertheless drew on forces outside those controlled or sanctioned by the church and was therefore presumptively diabolical.

The gradual extension of the medieval Inquisition’s jurisdiction to include cases of superstition as well as heresy was a turning point in the European attitude toward magical beliefs. Founded in the early thirteenth century to combat organized heretical groups such as the Waldensians and the Albigensians, the Inquisition was initially empowered to hear only those cases that involved an explicit diabolical pact and therefore “manifestly savored of heresy.” Infrequent fourteenth-century sorcery trials involved literate men accused of conjuring demons or casting spells by using the techniques of learned, ritual magic associated with handbooks like the *Key of Solomon*. By the fifteenth century, however, the theory of the implicitly diabolical pact was invoked to extend inquisitorial jurisdiction to the magical activities of the illiterate population. As a result, the “new crime” of witchcraft emerged in this period, combining existing peasant beliefs in the possibility of magical harm (*maleficium*) with the scholastic theory of the implicit diabolism of all magical effects.

While customary law in many parts of Europe had treated magical harm (*maleficium*) like any other crime causing physical harm to persons, livestock, or crops, without attention to the fact that such harm was alleged to have occurred through magical means, the new theological approach focused directly on the means employed, not the end pursued. All magical activity implied that the perpetrator had obtained the power to achieve those effects by apostasy to the devil. Superstitious offenses were no longer simply the topic of pastoral reprimand by bishops and synods. By the late Middle Ages such activities had been criminalized, and they were increasingly prosecuted in both secular and church courts during the late sixteenth and the seventeenth century.

This campaign against popular magic emphasized those activities that were, in Aquinas’s terms, superstitious by virtue of their presumptively diabolical object. The humanist and Protestant reform movements of the early sixteenth century stressed another meaning of the term *superstitio*. Many traditional Catholic religious observances were now judged

superstitious because of the “inappropriate manner” in which they offered worship to God. The Catholic humanist reformer Desiderius Erasmus (1466–1536) denounced the externalized ceremonialism of the late medieval church as a superstitious deformation of the true religion. His *Praise of Folly* satirized clerical attachment to repetitious prayer, fasting, and other ascetic practices as well as popular devotion to relics, saints, and shrines. A character in his *Colloquies* observes that “Of all Our Ladies, I like best Our Lady of Walsingham,” to which his companion replies, “And I Our Lady of Mariastein.” These attitudes constituted, in Erasmus’s view, a series of distractions from the central moral teachings of Christianity. People might travel to see a saint’s bones, he complained, but they did not attempt to imitate the saint’s holy life.

**CATHOLICISM AND THE PROTESTANT REFORMATION.** The Protestant Reformation intensified humanist critiques of Roman Catholicism. Starting with Martin Luther’s attack on indulgences in the *Ninety-Five Theses* (1517), the new theology of justification by faith rather than by works provided the theoretical basis for rejecting Roman Catholic reliance on external devotions as “works righteousness.” To John Calvin, superstition was the “pharisaical opinion of the dignity of works” maintained by the “false religion” of Rome. Having rejected most of the ceremonial aspects of Catholicism, from holy water and saints’ cults to transubstantiation and the Mass, Protestants of all denominations agreed in their denunciations of the papist religion as magical and superstitious. The term was also used to describe backsliding within the reformed camp, whether high-church fondness for vestments and incense or lingering attachments to rosaries and shrines among the less advanced segments of the population. In the extensive vocabulary of sixteenth-century religious polemics, one of the most common charges was that of superstition.

Although the Roman Catholic Church had finer lines to draw in deciding what was and was not superstitious, a parallel effort to identify and eliminate popular “ignorance and superstition” became a major preoccupation after the Council of Trent (1545–1563). Responding in part to humanist criticism, the church discouraged exaggerations of orthodox observances, such as the “desire for fixed numbers of candles and Masses” described as superstitious in the Tridentine decrees. The definition adopted by the Council of Malines in 1607 expressed the Counter-Reformation position: “It is superstitious to expect any effect from anything, when such an effect cannot be produced by natural causes, by divine institution, or by the ordination or approval of the Church.” This ultimately jurisdictional approach left intact the indulgences and exorcisms condemned as “ecclesiastical magic” by the Protestants, but it rejected popular magic by asserting an institutional monopoly on access to the supernatural.

Following the anti-Protestant heresy trials of the mid-sixteenth century, the Holy Offices of Spain and Italy turned

their attention to the suppression of popular beliefs and practices categorized as superstitious. Trials for magical healing, divination, and love magic occupied a prominent place in inquisitorial prosecution throughout the seventeenth century. This campaign against superstition occurred in different forms in both Protestant and Catholic countries as part of a wider “reform of popular culture,” a systematic attempt by members of the clerical and lay elites to raise the religious and moral level of the European population. Historical studies of early modern Europe have shown that these efforts to suppress popular magical beliefs were not wholly successful; the persistence of magical assumptions among the peasantry has also been documented by twentieth-century anthropological field studies.

**ENLIGHTENMENT AND POST-ENLIGHTENMENT ATTITUDES.** If the Protestant Reformation viewed the entire Roman Catholic religion as superstitious, the radical anticlerics of the French Enlightenment used the term in an even wider sense, dismissing all traditional religions as superstitious. Voltaire’s *Philosophical Dictionary* (1764) asserts that “superstition was born in paganism, adopted by Judaism and infested the Christian church from the beginning.” In place of the fanaticism and intolerance associated with organized religion, the *philosophes* proposed a “natural religion” that would acknowledge a supreme being but regard his creation as sufficient revelation. The scientific study of nature was thus proposed as a new cultural orthodoxy, and the concept of superstition was redefined to fit this frame of reference. From “bad religion” it came to mean “bad science,” assuming its modern sense of misplaced assumptions about causality stemming from a faulty understanding of nature. Thus magical beliefs and practices continue to be regarded as superstitious, although the original religious sense of the diabolical efficacy of such practices has been replaced with a scientific sense of the impossibility of magical effects in a universe governed by natural law.

#### BIBLIOGRAPHY

- A general history of Western concepts of superstition has yet to be written. Such a history can be reconstructed with the aid of the primary materials presented by Lynn Thorndike in *A History of Magic and Experimental Science*, 8 vols. (New York, 1923–1958), and by Henry C. Lea in *Materials toward a History of Witchcraft*, 3 vols. (New York, 1939).
- A succinct, careful review of the etymology and history of the term in classical Roman literature is provided by Denise Grodzynski in “Superstitio,” *Revue des études anciennes* 76 (January–June 1974): 36–60. In *The Cult of the Saints: Its Rise and Function in Latin Antiquity* (Chicago, 1981), Peter Brown argues convincingly against interpreting the cult of saints as a superstitious deformation of the original Christian message.
- The uses of the concept in medieval canon law and ecclesiastical literature receives thorough, systematic attention in Dieter Harmening’s *Superstitio: Überlieferungs- und theoriege-*

*schichtliche Untersuchungen zur kirchlich-theologischen Aberglaubensliteratur des Mittelalters* (Berlin, 1979). The medieval condemnation of learned and popular magic as superstitious is the subject of Edward Peters's *The Magician, the Witch, and the Law* (Philadelphia, 1978).

The Protestant expansion of the term during the Reformation to include Roman Catholicism is described by Jean Delumeau in "Les réformateurs et la superstition," in *Actes du Colloque l'Amiral de Coligny et Son Temps* (Paris, 1974), pp. 451–487. Keith Thomas provides a magisterial analysis of the survival and suppression of magical beliefs after the Reformation in *Religion and the Decline of Magic: Studies in Popular Beliefs in Sixteenth and Seventeenth Century England* (New York, 1971). The sixteenth-century effort to achieve a "reform of popular culture" is described as a "battle between Carnival and Lent" by Peter Burke in *Popular Culture in Early Modern Europe* (New York, 1978). The Roman Catholic campaign against superstition is examined by M. O'Neil, "Sacerdote ovvero strione: Ecclesiastical and Superstitious Remedies in Sixteenth Century Italy," in *Understanding Popular Culture*, edited by Steven L. Kaplan (New York, 1984).

E. William Monter chronicles the prosecution of superstitious offenses by post-Reformation religious orthodoxies and describes also the Enlightenment assault on superstition and religious intolerance in *Ritual, Myth and Magic in Early Modern Europe* (Athens, Ohio, 1983). A study of the meaning of superstition in the modern world is undertaken by Gustav Jahoda in *The Psychology of Superstition* (London, 1969).

*Revised Bibliography*

**SUPREME BEINGS** are divinities whose nature reveals a unique quality of being—generally, a transcendent spiritual power—in a culture's religious system. Such divine beings figure in many different religious systems, yet they manifest values and symbolic associations that display remarkable similarities. The first section of this article presents, in a general way, the power, attributes, and values common to a large number of supreme beings. The second section illustrates these features by referring to specific historical forms of supreme beings. The final section summarizes the history of scholarly interpretations of the origin, nature, and meaning of these singularly important and complex supernatural beings.

**GENERAL FEATURES.** A supreme being is generally described in symbolic terms that reflect the values most highly ap-

praised in a specific historical situation. Considering the complexities of any culture's history, it is extraordinary that a comparative discussion of the nature of supreme beings constantly returns to the same cluster of religious ideas. Without prejudice to one or another aspect of supreme being highlighted in one historical moment or another, this article presents here a general view of the kinds of power and value revealed in supreme beings. It should be noted that the intricacies of history make general statements a source of great controversy. The supremacy of these divine figures marks with an appropriate intensity the heat of debate over their origin, nature, and form. Since each supreme being is a creative and unique composition of elements, the attributes described herein best serve to define the general category of supreme being, and, as shall be seen, apply to specific beings only in one degree or another.

The power of supreme beings is inherently ambivalent, because they manifest their potent omnipresence in a passive mode. Unlike the activities of culture heroes, which are abundantly described in epic cycles of myth, the presence of supreme beings is generally acknowledged in mythology only in brief accounts. In contradistinction to the dramatic activities of vegetation deities, totems, ancestors, and solar and lunar divinities, supreme beings occupy almost no place in scheduled public cults. It has long been acknowledged that sky divinities, or "high gods," admirably reveal many of the central attributes and powers of supreme beings.

Not limited to any single sphere of concern or influence (e.g., fertility of plants or of animals), supreme beings are omnipresent and omnipotent, but, by that very fact, they remain uninvolved with particular activities. Their power—unreckoned by time, unbounded by space—applies to all spheres of life and not to any one alone. Great power and presence reside in a supreme being's inactive transcendence of historical particularities. This remoteness relates to the power of permanence that often reveals itself in symbolisms of the sky and heavenly heights. Standing immutable since before time began, supreme beings remain uninvolved with change. Their steadfastness and eternity go hand in hand with their relative withdrawal from the detailed alterations of historical circumstances. The uniqueness of their infinite character is often portrayed in myth as a kind of loneliness. By their very nature, they stand apart from creation. Nevertheless, they seldom withdraw altogether from the world; they withdraw only to that level that suits their infinite, omnipotent, omniscient character.

Transcendence enables supreme beings to see and to know everything. This strongly colors the nature of their spiritual force: By seeing and understanding all, they can do everything. In keeping with their passive nature, it is the omniscient thought of supreme beings that "actively" expresses their infinite knowledge. As creators, supreme beings create preeminently, but by no means exclusively, by the power of thought or word alone—*creatio ex nihilo*. Their word is creatively powerful.

If supreme beings know all things in the world and even think them into existence, such knowledge is not reciprocal. Knowing everything, they often pass beyond the comprehension of lesser beings. Once again, paradox pervades the nature of supreme beings. Present everywhere, they remain inaccessible. Seeing all, they may remain invisible. In relation to knowledge, supreme beings are the clearest revelation of mystery—a sacred meaning that can never be exhaustively known, despite its uninterrupted presence. Full knowledge of a supreme being always remains hidden. In this connection, supreme beings are often associated with religious specialists and esoteric societies, whose knowledge of special mysteries is made known in elaborate and secret initiations.

The majestic omnipresence of supreme beings involves them in all that is. Their involvement with being as such takes several particular expressions. They may create the universe directly, or they may create it indirectly through supernatural agents over whom they exercise control. In religious systems in which supreme beings have not bequeathed creation to the guardianship of other supernatural beings, they may be viewed as sustaining all life, assuring the fruitfulness of creation, or owning all that exists. As the foundation of all that is real, they may be the sovereign upholders of the world order, rulers of all beings, and even providers of moral commandments and socioethical mores. As guarantors of good order, supreme beings punish transgressions in passive ways, by withholding fertility (famine), health (epidemic), or the process of the seasons (drought). As creators and maintainers of life, they fertilize the vital forms of the universe. Although a supreme being may be prayed to spontaneously by individuals at any time and in any place, public invocation is often limited to times of calamity when life itself seems threatened.

One response consonant with the enigmatic, transcendent, and passive power of supreme beings is the human tendency to replace them with other religious conceptions. In fact, supreme beings per se do not usually dominate the religious imagination. When myths recount the withdrawal to the transcendent heights appropriate to their nature, they are replaced in importance by more active religious forms: gods who specialize in fertilizing activity, vegetation deities, storm gods, culture heroes, divine twins, ancestors, the dead, world rulers, theological abstractions of virtues, or metaphysical principles of cosmic law. The passive is overtaken by the active. Transcendent station yields to the processes of the concrete world. Infinity gives way to the here and now. Yet, supreme beings reveal the very meaning of transcendence and infinity in all its forms: omnipresence, omniscience, omnipotence.

**HISTORICAL FORMS.** Although essential elements of the power and structure of supreme beings may be recognized and isolated for the sake of analytic discussion, it must be acknowledged that they have appeared across human history in complex forms that differ greatly in specific composition from one culture to another. Their manifestations are not

limited to one or even several places on the globe. Nor does geographic distribution entirely explain the process of the historical development or diffusion of this religious idea. No matter how marginal to the history of technological development a culture might appear to be (e.g., the hunting cultures of Tierra del Fuego), that culture's complex notions of supreme being give evidence of a lengthy and complicated history. There appear to be no social or economic factors that determine, in cause-and-effect fashion, the compound of elements that constitute the form through which a supreme being reveals itself in a culture. After lengthy debate among scholars, little doubt remains that sophisticated theologies of supreme being predate the introduction, through missionary or colonial influence, of theological ideas from historical monotheisms. Because arguments based solely on geographic and historical evidence have failed to be convincingly clear, the survey of supreme beings presented here follows the logic of the structures that are evident in the forms of supreme beings themselves. Structures exemplified briefly include (1) attributes, (2) activities, (3) relationships to other divinities, and (4) the place of supreme beings in cult.

**Attributes.** Even when the forms of supreme beings are only poorly outlined, they are more than vague supernatural forces. Supreme beings are divine persons, with names and epithets that convey their attributes and reveal something about their nature. In addition to personality, their characteristics include celectiality, primordality, and omniscience; associations with creation and death; remoteness and symbolic means of access; and their tendency to be replaced by other concepts.

**Celestiality.** The names of numerous supreme beings refer to their connections with the sky. Among the Samoyeds, the supreme being is called Num ("sky"). Along the Australian coast in the vicinity of Shoalhaven Bay, the name *Mirirul* ("sky," or "he who is in the sky") indicates the supreme beings found among the Yuin and their neighbors. In Africa, one of the names for the supreme being of the Galla and other Oromo peoples is Waq ("sky"), as in the phrases *guraci waq* ("dark sky") and *waka kulkullu* ("calm sky"). He is also called Cólók ("the sky"). Among some Ewe peoples, the universal father is called Dzingbe ("sky"); his wife is the earth. Northeast of the Ewe live the Akposo people, who call the supreme being Uvolovu ("the high one," or "the regions above"). Among the Selk'nam hunters of Tierra del Fuego, the name of the supreme being is Témaukel ("the one up there"), although this name is seldom uttered aloud. In its place, one uses the circumlocution *so'onh-haskan* ("dweller in the sky") or *so'onh kas pémer* ("he who is in the sky"). Among the Tsimshian south of the Tlingit, an irascible supreme being named Laxha (also called Laxhage or Laha, "sky") deluges the earth. The Haida of Queen Charlotte Islands call the supreme being Siñ or Sing ("bright sky"). The connection of supreme beings with the sky is not exhausted by the direct translations of their names. More important, in accounts that describe them as dwelling in the sky, or as

expressing themselves through celestial elements such as the stars and the rains, these associations are extended.

**Primordiality.** Another large number of names refer to the antiquity of supreme beings, who often reveal, as part of their own nature, the meaning of what is primordial, most fundamental, a part of the nature of existence from its earliest beginnings. Primordiality is thus part of a supreme being's nature. The Yahgan of Tierra del Fuego call their supreme being Watauineiwa ("the primeval," or "the ancient one"). The Botocudo of eastern Brazil believe in a supreme being who lives in heaven and is called Old Man or Father Whitehead. During the great August sacrifices in Cuzco, Viracocha, the supreme being of the Inca, was praised as the one "who exists from the beginning of the world to its end."

**Omniscience.** A large body of epithets refers to the omniscience and omnivoyance of supreme beings. Baiame, supreme being of the Kamilaroi, Wiradjuri, and Euahlayi of New South Wales, sees and hears everything, especially at night, with his many eyes and ears. Daramulun, according to the Yuin, can observe all human action from his position in heaven. In Assam, the Khasis of the Mon-Khmer nucleus of Indochinese peoples believe in a female supreme being and creator who dwells in heaven and who sees and hears all that happens on earth. On Madagascar, the supreme being Andriamanitra sees all those things that lie hidden. In the Avesta, Ahura Mazda is described as *vouru casani* ("widely seeing").

The clarity of a supreme being's knowledge may be manifested in the light of the bright sky, which, by virtue of its own luminosity, sees and knows all existence that lies below. The Altai Tatars call upon their supreme being as the Ak Ajas ("white light"). The Khanty refer to Ajas Kan ("the bright leader"). Buriats speak of the dwelling of their celestial god as "a house ablaze with silver and gold." For the Mansi, Tārem is a "good golden light on high." In Sumerian, the divinity is described as *dingir* ("shining, bright"), and in Akkadian, *ellu* expresses the same meaning.

**Cosmogonic power.** Other names refer to supreme beings as the source of all life and power. The Warao of the Orinoco Delta refer to Kanobo ("great father") as the author of life. Also in Venezuela, the Yaruro people believe in a great goddess who created the world. Everything sprang from her, and everything living returns to the western paradise where she now lives. The Calíña and Galibi peoples from the Surinam coast maintain that the goddess Amana ("she without a navel") was not born but has lived forever. All life comes from her, for she begets and contains everything that comes to be. Her twin sons assist in creation. The supreme deity of the Koghi (Cágaba) of Colombia is also a universal mother who gives birth to all creation. She rules the cycles of life, death, and rebirth for all creatures. The mother is omnipresent. Life is an intrauterine existence. Among the Mbyá, a Guaraní people of Paraguay, the supreme being gives life to the world and continues to extend goods in the form of game and health. The Tupinamba of the southern Brazilian coast

conducted a search for the land of Tamoi, the supreme being whose name means "great father." He created life and now governs a distant paradise wherein there is no death. In Australia, the supreme being's role as life-giver is recognized in the epithets extended to Baiame, who is addressed as Mahmanmu-rok ("our father") among the Kamilaroi and as Boyjerh ("father") among the Euahlayi. Among the Yuin, Daramulun is spoken to as Papang ("father"). The Kurnai use Mungan-ngaua ("our father") as the proper name of their supreme being.

Specific references to supreme beings as creators occur in many cultures. By way of brief illustration one may mention examples from North America, Oceania, Africa, Australia, and South America.

Native American creator gods include Awonawilona, the Zuni supreme being whose solar associations are sublimated almost to the point of becoming a speculative philosophical principle of life. He creates the clouds and the waters of the world from the breath of his own heart. Tirawa Atius of the Pawnee lives above and beyond the highest heaven. The wind is his breath. Tcuwut Makai, supreme being of the Pima, dwells in the west, governing rain and winds. His first creation was crushed when he pulled the sky too close to the earth. In his second attempt, he fixed the stars and the Milky Way in the sky. Ahone is a sky-dwelling creator of sun, moon, and stars. The existence of belief in him is documented among peoples of the Virginia Colony in 1610. He had no cult to speak of; instead, sacrifices were made to Oke, a god who punished people with hurricane winds to make their crops suffer.

In Oceania, one may call attention to Tangaroa (Tangaloa, Ta'aroa, and many other variants), a widely known Polynesian divinity of the sea; Agunua, the supreme spirit of San Cristobal in the Solomon Islands; Yelafaz, the anthropomorphic sky-dwelling god of Yap; Djohu-ma-di-hutu ("lord above"), believed in by the Alfuri of Molucca; Qat, lunar supreme being of the Banks Islands; Hintubuhet ("our bird-woman"), supreme being in New Ireland; and Ndengei (Degei), the great serpent-god of Fiji. Ndengei usually lies immobile in his cave on Mount Kavandra on the northeast coast of Viti Levu, but occasionally, when he is stirred, he causes earthquakes and heavy rains.

African supreme beings who are creators include Deng, the omniscient "free-divinity" of the Dinka people, who is identified as Nhialic Aciek ("god the creator"). The term *nhial* ("up," or "above") is associated with multiple modes of supernatural expression. Among the Western Dinka, Deng has no shrines but is honored in sacrifice together with Nhialic ("divinity itself," an appellation applied to Deng) and the ancestors. Also in Africa, one may point to Cagn, the mantis-shaped creator of the San people; Kosane, the vaguely defined supreme being of the Venda; Olorun, high god of the Yoruba; Katonda, supreme being of the Ganda; Lugaba, supreme creator divinity of the Hima; and Ngai, supreme being of the Maasai.

In South America, too, there is no shortage of supreme beings who are creators. Among them one may mention Pelepelewa, god of the Trio of Surinam; Kamuscini, the talking sky-god of the Bakairi; Karu of the Mundurucú of the Tapajós River; and El-al, a supreme being known in Patagonia. In Australia, one finds many creator supreme beings celebrated in scholarly literature. Among those not mentioned above are Bunjil of the Kulin, Nurrundere of the Narrinyeri, Mangarrara of the Larrakia people, and, as a collective name for the high god of the Aboriginal peoples of southeastern Australia, the All-Father.

Such examples by no means exhaust the number of supreme beings whose complicated nature includes the role of creator. The supreme beings mentioned above seem principally interested in the creation of the sky, the stars, the earth, and meteorological phenomena. They concern themselves with the creation of vegetation only in a secondary way. However, other creators, a smaller group of supreme beings, interest themselves particularly in the creation of trees, vines, herbs, grasses, and other forms of vegetation.

In general, this second group is more dramatically involved with rain than with other, more ethereal celestial elements. Among many such supreme beings one may mention uNkulunkulu of the Zulu peoples; Bego Tanutanu, the creator of the landscape, source of foods, plants, and instruments of culture at Buin in the southern Bougainville straits; Tsui //goab, Khoi celestial god who unites the clouds and swells the rains; Teharonhiawakhon, the Iroquois twin divinity who holds heaven at two points (or with his two hands); and Yuskeha, the parallel Huron divinity who sends good weather for crops and enjoys sexual relations with Ataentsic ("she whose body is ancient"), who is also called "the dark one" (i.e., the earth). One notices that supreme beings who are creators of vegetation tend to absorb or acquire attributes more commonly seen among culture heroes, specialized deities of vegetation, and storm gods.

Control over life is also reflected in the supreme beings' ability to end life when they will. For example, among the Yámana of Tierra del Fuego, the supreme being is called "slayer in the sky"; among the Maidu of north-central California, he is also called "a slayer." Supreme beings often figure in deaths that are mysterious, summary, and sudden. Celestial supreme beings strike humans with their thunderbolts. The Semang of Kedah believe that the supreme being Kari created everything except the earth and humankind. These last were fashioned by Ple, a subordinate deity. Kari sees everything from on high and punishes humans by dropping on them a flower from a mysterious plant. Where the flower lands, fatal lightning strikes. The Apapocúva-Guaraní supreme being, Nanderuvucu ("our great father"), withdrew long ago into a distant dark country where the only light that exists comes from within his chest. Eventually, it is believed, he intends to destroy the world and thereby bring about the end of time.

*Remoteness.* More often than not, the sky is the principal manifestation of supreme being. From this preponderance of historical facts has come the term *high god*, over whose origin and nature the controversy surrounding supreme being once raged. Scholars have made clear the fact that supreme being is not a simple personification of the "natural" object, the sky. Rather, a supreme being is a distinct divine personality who reveals himself or herself in the power of the sky. Many peoples are careful to make the same distinction in various ways, speaking of their supreme being as dwelling beyond the sky, or as the invisible sky that lies beyond the visible one, or as wearing the sky for a vestment. Puluga, in the Andaman Islands, is said to reside in heaven. The sky is his house. For Baiame, an Australian high god, the sky is a campground, brightened with stars that serve as campfires and traversed by the river of the Milky Way. Num, the Samoyed divinity whose name means "sky," lies in the seventh heaven, but he cannot be a simple personification of the natural sky, for he is also believed to be the earth and the sea. For many Ewe-speaking populations, the blue color of the heavens is a veil that Mawu uses to shield her face, and the clouds are her clothing.

Because a supreme being dwells in inaccessible heights and displays a passive and transcendent character, his outline tends to be left undefined. Although his personality is awesome and powerful, he often avoids dramatic action in favor of inert omnipresence. He may remain mysterious and vaguely delineated. Such is the case with Moma ("father"), the supreme being of the Witóto of Colombia. Associated closely with the power of the word in rituals and chants, he created all things in the world from the mere "appearance" (*naino*) of each thing's "nonexisting substance." Moma calls himself Nainuema ("he who is or possesses what is not present," that is, illusive appearance). According to the Witóto, Moma captured the specter of appearances in his dream and pressed it to his breast until he could transform it into the earth. Earthmaker, supreme being of the Winnebago, comes to consciousness in the primordium in order to make the world keep still. He then remains aloof. What Earthmaker was like, or what there was before he came to consciousness, the Winnebago do not know. The Pawnee contend that Tirawa Atius ("father on high") is in everything. However, no one is able to know what he looks like.

The remoteness of the power of a supreme being may even be portrayed as indifference. When the passivity of a supreme being is exaggerated to the point of his extreme withdrawal from creation, he takes the form of a *deus otiosus*, a god who has retired himself and his unique powers from the active world. He no longer captures the religious imagination in the commanding way of more dramatic supernatural beings. He may, nevertheless, remain the ground for all created and creative possibilities. The Lenape (Delaware), a southern Algonquin group, believe that Gicelamu'kaong ("he who created us through his thought") entrusted his supernatural responsibilities to subordinate beings: the winds, the lord of

animals, the sun, the moon, and the thunder. He then withdrew to the twelfth heaven. Nonetheless, he looks over human activities, especially the longhouse ceremonies, for the center post of the cult house is the staff that he keeps in his hand. Témaukel remains rather indifferent to the affairs of the Selk'nam of Tierra del Fuego. He did not complete the work of creation but deputized Kénos, the mythical ancestor, to raise the sky and provide moral instruction. He now lives in the stars. Absent from cult, he still interests himself in moral behavior and punishes the wayward with sickness and premature death. The pre-Zoroastrian conception of Ahura Mazdā depicted him as a divine being who creates only through the mediation of the *spenta mainyu* ("good spirit").

The paradoxical coupling of power and passivity within the supreme being of the sky may be made known in sexual terms. Or the coupling of power and passivity may be expressed in terms of the alternations of the bright sky of day and dark sky of night. Thus Puluga, though omniscient, knows the thoughts within human hearts only in the light of day. In the Banks Islands, it is believed that at the beginning night did not exist. Qat spread the night over the earth so that creation remained obscure. However, after a while the situation did not suit him, and, with a red obsidian knife (dawn), he cut into the darkness. The rays of sunlight that enter through the roof of a house are said to be his spears. Among a western group of San, the supreme being, called Kággen, produces darkness by spreading the bile that spills when he splits open the gallbladder of an antelope. Upset by the darkness, he creates the moon.

The power of transcendent height is continued in the supreme beings who dwell on the tops of mountains. Well known are Mount Olympus of Greek mythology and Harabrazaiti in Iranian belief. In Palestine, Mount Tabor and Mount Gerizim stand as high holy places. Himinbjörg ("heaven's mountain") figures importantly in the Norse Eddas. Ngenéchen, divinity of the Araucanians of Chile and Argentina, lived on top of volcanoes with his wife and children. In the same area, the god Pillán, who lives on mountains in the middle of the sky, seems to have served as a model for Ngenéchen.

Just as mountains symbolically express access to the transcendent realms of infinite power, so other paradigmatic symbols reveal the place of contact with the otherwise inaccessible source of life. In particular, the cosmic tree or world tree is a startling image of access to the dwelling of the high god. Flathead Indians believe that the roots of the cosmic tree reach down into the dwelling place of the evil being, Amtep. At the upper end lies Amotken ("the old one"), a good celestial creator. Rites are often celebrated in connection with an image of the cosmic tree. Thus, during the Turco-Tatar horse sacrifice, the shaman carries the soul of the victim to Ülgen, the supreme being, by scaling nine notches cut into a birch tree. Ascending the tree, the shaman reports his voyage through the nine heavens. Contact be-

tween this world and the celestial powers is reflected also in images of the Milky Way, the ladder reaching to heaven, and the liana. The *climax* ("ladder") in the mysteries of Mithra had seven rungs fashioned of seven different metals. Cultures in North America, Oceania, Africa, and ancient Egypt all possess myths concerning ascent to heaven along a cosmic ladder.

In Misminay, near Cuzco in Peru, the Milky Way is conceived of as a stream of semen that flows through the center of celestial space just as the Vilcanota River, its terrestrial counterpart, flows through the center of the earth. As the Milky Way encircles the world, it descends into the ocean in the west, absorbing the earth's waters, and travels underground to rise in the eastern sky. Taking the form of rain, fog, and hail, the heavenly water-semen falls into the headwaters that feed the Vilcanota River. The Milky Way also contains female elements, the *yana phuyu* ("dark spots"), which are the sources of various animal species.

Celestial bodies and elements are often portrayed as the more active constituents and expressions of a supreme being himself. Nurrundere, thunder-voiced god of the Australian Narrinyeri, produces the rainbow when he urinates. The Xhosa of southern Africa believe that hail falls when Utikxo arms himself for battle. On Timor, monsoon rains come forth from Usi Neno, a supreme being with strong solar aspects, as a result of the effort he expends in his intercourse with Usi Afu, goddess of the earth. In Indonesia, in the Ambon Islands, the supreme being called Upu Lanito ("lord heaven") sets stars in the sky as a sign that he has gone to warn the sun and moon about an impending attack of *nitu* ("spirits"). There are abundant accounts that describe the sky as the face of a supreme being; the sun and moon are his eyes.

It shall be seen that the more active divinities tend to specialize in one life-giving activity or sphere (e.g., crops, animals, the dead, military organizations, cosmic laws, or the laws of a kingdom) rather than to remain, as do supreme beings, vague and passive sustainers of life in general. In many instances, their activities are expressed in independent mythologies of active supernatural beings who overshadow the remote and transcendent supreme being. The end result is that there exist religious systems wherein the supreme being is supplanted by more active and specialized deities or, alternatively, wherein the formal expression of the supreme being itself is presented not as remote and transcendent but as quite intensely involved with the specific life processes of the universe. In the latter case, the form of the supreme being absorbs attributes from other important and more active supernatural beings like the culture hero, the trickster, or fertility gods.

**Activities.** It has been seen that supreme beings are supreme by virtue of their unique nature, not necessarily by virtue of their achievements or exploits. Supreme being, by its very nature, underlies all that is; its character stands in a direct relationship to what exists, what is ontologically true. In this connection, supreme beings are often invoked as witness

to oaths, as witness to what is. In northwestern Sumatra, among the Batak peoples, reference is made to Debata. When he smiles, his mouth opens to reveal his teeth in the form of lightning. He is invoked in oaths taken over serious matters. He punishes perjury with bolts of lightning. On Ceram, people swear to the truth by Upu Langi (“lord heaven”) and his female counterpart, Upu Tapene. Otherwise, there seems to be no regular cult offered to them. Swahili speakers frequently testify to the truth of an assertion by swearing to “Mungu mmoja” (“the one god”) or by saying “Mungu anaona” (“God is watching”).

By no means are supreme beings always portrayed as creators. Nevertheless, cosmogonic activity is the single activity that befits their foundational character, their role as the ground of all existence. Some supreme beings leave no room for doubt about their cosmogonic activity. Their powerful thought alone brings the world into being. Such is the manner in which Wakonda, the Omaha supreme being, created the world. At first, all things were in his mind. The same is true of the Winnebago creator, Earthmaker. Creation proceeds from his thought. When he wishes something, it comes to exist, just as he wishes. It has already been seen how the Witóto supreme being, called Nainuema (“he who is appearance only”), ties a phantasm to his breast with his dreamthread in order to create the world. The Maidu of California believe that Ko’doyanpe (“earth namer”) brought about creation after long and intense thought. Likewise, Dasan, the high god-ancestor of the northern Pomo, called the world into being with his words. Whether such sublime notions are preserved from the most archaic traditions or whether they are the fruit of more recent theological speculations that have purified and rarefied earlier ideas is a matter of some dispute.

As evident in several examples above, supreme beings’ involvement with creation may be more subtle and complicated. They may take responsibility only for the initial creative impulse toward form, leaving the final shaping of the world to other supernatural beings, especially to a “transformer,” or culture hero. In many cases, the supreme being is only indirectly involved in creation. He engenders, empowers, or presides over those beings who create the world and its creatures. His creative activity remains supervisory. In other instances, he may create in cooperation (or in competition) with other powerful beings. In any case, a supreme being appears to be more than a rational “first cause” of creation. Life and existence, as a whole, stem from and are maintained in accordance with his own inner nature. I do not speak here of a necessary pantheism or emanationism, since a supreme being is a distinct personality who remains distinguishable from creation.

Regardless of the degree of his active participation in creation, once the universe exists a supreme being’s major job is done. He then “retires” at some remove, often to the heavenly heights, where he devotes himself to the passive and transcendent pursuits of maintaining and sustaining life. He may thus leave the world to powers who preside directly over

specific domains that are less than cosmogonic in scope and whose activities—the accomplishment and functioning of specific world processes—make sense in a world that already exists. Myths often recount the withdrawal of the high god as the event that marks the end of the primordium.

**Relationship to other divinities.** A supreme being rarely occupies the dominant position in a pantheon or a divine hierarchy. Once creation has ended, if indeed he was involved actively in the cosmogony, the supreme being yields the mythical stage to more active beings whose personalities are more clearly delineated.

A supreme being’s link to the very foundations of being is often expressed in temporal terms (for example, he may exist before the other gods exist). Consequently, in the cases in which more active beings take over the religious imagination, his eventual passivity in relation to them may be expressed in terms of old age and its inactive fragility. In the Akkadian text *Enuma elish*, the primordial couple, Apsu and Tiamat, now grown old, are nettled by the noise and games of younger divinities, by whom they are eventually destroyed. The god El, as reported in the Ugaritic texts, is weak and senile. While in his palace in Mount Tsafon, El is attacked by Baal. The younger god not only usurps the previously dominant position of the supreme being but routs him to the farthest reaches of creation. In explicitly sexual terms, younger gods may deprive a supreme being entirely of his no longer exercised potency by castrating him. Ouranos, the Greek cosmocrat and husband of Gaia (Ge), was castrated by his son and successor Kronos. This event interrupted the unbroken coitus between sky and earth during the primordium. When his sexual organs were tossed into the sea, Aphrodite came into being. In the Hurrito-Hittite theogony, which appears to bear North Syrian and Sumerian influences, Alalu was replaced by the god Anu. After nine years had passed, Anu himself was attacked by Kumarbi, who bit Anu’s loins. Swallowing part of the god’s sexual organ, Kumarbi became pregnant with three children. These violent divine beings express attributes quite different from those of the unchanging supreme beings. Their dynamism tends to alienate still further from myth and cultic activity the transcendent and passive character of supreme beings. Supreme beings are thus often obscured and their power eclipsed.

As is characteristic in the above examples, the younger, “champion” divinities who usurp a supreme being’s position are often associated with the fertility of fields and animals. In their connection with agriculture and fecundity, they are often known in the violent but necessary manifestations of weather and storm gods. Their character is bound up with tempestuous change, the violence of concrete life processes that make fertility of seed and stock possible but unforeseeable. Such violence is one important aspect of Indra, hailed as “bull of the world,” “lord of the plow” (*śiraspati*), and “master of the fields” (*ūrvavapati*). He uses his *vajra* (thunderbolt) to kill the monstrous Vrta and thereby release the waters. Also in South Asia one finds Parjanya, son of the sky

and god of hurricanes. He unleashes the rains and assures fertility for animals, crops, and humans. In Iran, the meteorological divinity Verethraghna is dramatic and fertilizing. As illustrated by creators specializing in vegetation, the form of a supreme being may itself contain aspects of these fecundator beings. In such cases supreme beings maintain a more active role in the mythic imagination, but at the cost of losing something of their unchanging nature.

On the one hand, the passive involvement of a supreme being in the very ground of being in all its forms may give rise, eventually, to his usurpation or transformation by dynamic figures specializing in one or another specific life form or process: fertility and fecundator gods. On the other hand, in a parallel but separate development, a supreme being's supervisory capacity, his general omniscience passively expressed, may develop into more active and concrete expression in the form of a sovereign god. Whether such a sovereign god is the result of a process in which a supreme being, for example a sky god, absorbs the traits of a cosmocrat, or vice versa, must be reviewed on a case-by-case basis. In all these cases, however, the emphasis of the resultant form no longer falls on the supreme being's transcendent supervision of the universe but on his active guardianship of the norms of world order.

Certain sovereign divinities enforce the most general cosmic or "natural" laws inherent in the structures of the universe. Varuṇa, called Sahasrākṣa ("thousand-eyed") in the *Rgveda*, is the universal king (*saṃraj*), who guards the norms of world order. By virtue of his own nature, his power is over all existence. Unlike the champion gods of fertility, who violently conquer their specialized domains, Varuṇa reigns through his innate relationship to *ṛta* (the cosmic, ethical, and ritual order of the universe) and through his mastery of magico-spiritual influence (*māyā*), which allows him to bind with his "nets," "ropes," and "knots" those who transgress that order. In other cases, a sovereign divinity may be interested less in cosmic processes than in human moral action. In such instances, he may send forth moral commandments and laws and punish breaches of the ethical order. As sovereign, a supreme being may even interest himself in the details of socioethical behavior, upholding the proper performance of customs and mores.

The cosmic pillar that upholds the universe, or the *columna universalis*, is often associated with the sovereign being, himself the upholder of cosmic order. As an *axis mundi*, like the cosmic tree and mountain, it points to aspects of the sovereign that preserve celestial powers and associations. During their Winter Ceremonial, the Kwakiutl people of the northwest American coast wrap a cedar "cannibal pole" in red-cedar bark to endow it with *nawalak* ("supernatural power"). Projecting through the roof of the house, the forty-foot post is considered to be the Post of the World and the insignia of the great divinity Baxbakualanuxsiwae ("man-eater at the mouth of the river"). It is an image of the great copper pole that upholds the heavens and pro-

vides passage between the spatial realms of the cosmos. The Saxons maintained a cult of a cosmic pillar called Irminsul, one image of which Charlemagne destroyed in the village of Eresburg in 772. It was the "pillar of the universe" that supported all existing things. Horace reports the existence of such a pillar and similar associated beliefs among the Romans. In Vedic India, as reported in the first book of the *Rgveda*, a similar pillar was called the *skambha*. The Achilpa, an Aranda group of Australia, carry a sacred pole that they call *kauwa-auwa*, and they wander in the direction in which it leans. It is a replica of the pillar fashioned by the god Numbakula who, after covering it with blood, ascended along the *kauwa-auwa* until he disappeared into the sky.

**Cult.** In his most removed form, as noted above, a supreme being usually inspires no regular public cult. A relative absence of cult seems to characterize many of those celestial supreme beings whose passivity borders on otioseness. To a great degree this is true of Thakur (among the Santāl of India), Synshar (among the Khasis), Kari (among the Semang), Sammor or Peng (among the Sakai of the Malay Peninsula), Pirman (among the Benwa-Jakun of Johore), Tuhan Allah (also among Jakun groups), Muladjadi (among the Batak of central Sumatra), Petara (among the Sea Dyaks of Borneo), Opo-geba-snulat (on the Indonesian island of Buru), Lowalangi (on the island of Nias in Indonesia), Hintubuhet (in New Ireland), Ndengei (in Fiji), Takaro (on Malo Island, near Malekula), Gueggiahora (among the Camacães in Bahia, Brazil), Wendé (among the African Kaguru), Zame Asizame Oyô (among the Fang of West Africa), Mpambe (among the Anjanja south of Lake Malawi), Ruwa (among the Chagga of Mount Kilimanjaro), and Yela-faz (on the island of Yap).

In fact, those celestial supreme beings who do call forth a regular cult seem to be exceptional cases. Among them are Agunua, venerated at Haununu on the southwest coast of San Cristobal in the Solomon Islands, and Tabuarik, who, together with his lightning-wife, De Itji, is celebrated in a cult that features sacred stones (for instance, on Nikunau in the Gilbert Islands). More often supreme beings are invoked spontaneously, and even frequently, by individuals or by a community in extreme circumstances of famine, earthquake, drought, and so on. When this irregular aspect of worship first came to scholarly attention, it led investigators to undervalue the importance of supreme beings. Unable to take seriously the profound truth of myth, early investigators were incapable of seeing that the absence of regular public cult was related to the supreme beings' associations with the ground of all being.

A supreme being is often associated with initiatory societies that focus on the knowledge of mysteries. In such secret initiations, many of a supreme being's celestial attributes are maintained. Such appears to be true among Native American tribes of California who possessed what was called the Kuksu cult, wherein the masked initiates impersonated spirits of the dead. The sound of a bull-roarer imitated the voice

of the supreme being and other spirits. The area in which this secret society flourished coincides roughly with the area in which there are clearly delineated concepts of a high god (e.g., among the Maidu). However, this connection is a complicated one. Among the Yahgan of Tierra del Fuego, the *ciexais* puberty initiations involve themselves deeply with Watauineiwa, the supreme being who established them. In the *kina*, the secret society rituals of the Yahgan, however, no mention is made of him. Nor does the supreme being figure in the Selk'nam esoteric initiations (*klóketen*), on which the Yahgan probably modeled the *kina*. Although knowledge of a supreme being may be transmitted, refined, and reshaped in secret societies, it is unwarranted to draw the more general conclusion that supreme beings are the creation of such elites.

Among those supreme beings who merge with or yield to more active forms, there exists a tendency toward a more scheduled public cult. This can be seen in cults dedicated to solarized supreme beings. Although solarized supreme beings share something of the sacrality of the sky, their potency and periodic activity often highlight the manifest rational order of regulated life processes, which outshines the mysterious and unfathomable order of being commonly associated with celestial supreme beings.

**Summary.** The attributes and powers of supreme beings, often reflected in their very names, are most clearly made known in sky divinities. The activity that best suits the infinite and omnipotent nature of supreme beings is the creation of the world. Often, but not always, they create the world through thought, a *creatio ex nihilo*, which is in keeping with their passive nature. After creation, a supreme being often retires on high and becomes even more transcendent a power. When supreme beings do take a more active role, their form tends to merge with or yield to other divine forms. Such is true, on the one hand, with sovereign divinities who ruled the world and, on the other hand, with fecundators and "champion" divinities. Knowledge of a transcendent and mysterious supreme being is often better preserved in initiatory secret societies than in the public cults that surround the more active expressions of sun god, storm god, or meteorological beings.

There is no doubt that many forms of supreme being, as known today, have been influenced by the religious ideas of historical monotheisms. Such contacts reveal themselves in the very names of many supreme beings, not to mention the influences brought to light in careful study of the histories and religious ideas of cultures around the globe. However, the impact of such historical change ought not to be exaggerated. In the first place, no culture's religious ideas have remained without change through history. Even those forms held by scholars to be most archaic give evidence of complicated historical processes that involve borrowing, deterioration, new inspiration, and reconstitution. The contemporary era ought to be seen as a further instance of a much larger historical process. In the second place, in those areas where

absorption of ideas from monotheisms is clearly evident, one does not generally find inert imitations of monotheisms but lively new syntheses, often in terms that are best understood as part of the religious history of a local culture's conception of supreme being.

**SCHOLARLY THEORIES.** In the development of the discipline of history of religions, the investigation of supreme beings has occupied a special place. For more than a century, three factors have especially affected the scholarly debate about the nature of supreme beings: the provenance of the materials studied; the dogmatic concerns of the investigators, whether theological or scientific; and the judgments in vogue regarding the nature of religious expressions. On the most general plane, one may distinguish four important positions taken during the study of supreme beings over the past 120 years.

**Four main views.** The first point of view, exemplified in the work of Leopold von Schroeder, interested itself in the sky gods known through sacred texts in the Indo-European family of languages. Interest in such exalted forms of supreme being was eclipsed when attention turned to the ethnographic data pouring in from cultures outside the Indo-European sphere. This second position, developed most successfully by E. B. Tylor, held that it was impossible to see supreme being as anything but a most recent religious form in human history. Tylor considered the idea of supreme beings to be a rational elaboration of simpler and earlier religious notions. The third perspective began with Andrew Lang, who called attention to the authentic existence of supreme beings outside Indo-European and ancient Near Eastern culture history, principally in Aboriginal Australia. Taking his cue from Lang, Wilhelm Schmidt carried on an intense and comprehensive investigation of supreme beings in traditional cultures of the Americas, Oceania, Australia, Asia, and Eurasia.

Regardless of their judgment on the antiquity and meaning of the various forms of supreme being, these three views of the issue never succeeded in detaching the inquiry into the nature of supreme being from the question of the appearance of historical monotheism with its concomitant theological constructs of revelation, creator (or first cause of creation), and moral rectitude. A historicist search for simple origins, an exaggerated rationalism in defining religion, and a dismal appraisal of the nature of myth are common to all three approaches.

It fell to Raffaele Pettazzoni to take a fourth position by reinstating a consideration of the supreme being of the sky, this time in a framework that treated the history of monotheism as a particular, even if related, historical instance. Drawing upon data from all over the world, Pettazzoni centered his research on what were called the "primitive" religions. Taking Pettazzoni's insight about the celestial being as a starting point, Mircea Eliade has presented a morphology of supreme beings that serves as the foundation for his comparative historical studies of religion. In addition to these general positions and their principal protagonists, a large number

of scholars interested themselves in one or another specific aspect of the problem and contributed to the understanding of supreme beings.

**Early studies.** During the nineteenth century many scholars of religion investigated religious texts from cultures in the Indo-European language family. Their main concerns were philological. When they investigated the meaning of specific religious images and forms, they took a special interest in those forms that were associated with natural phenomena. Nevertheless, the comparative philology of Indo-European languages pointed to the existence of a supreme sky god. The identification of the Indo-European radical *dei-wos* ("sky") in designations meaning "god" (for example, in Old German *tivar*, Lithuanian *dievas*, Latin *deus*, Iranian *div*, and Sanskrit *deva*) lent support for a theory like that of Charles Ploix, who contended in *La nature des dieux: Études de mythologie greco-latine* (1888) that the sky was the principal subject of myth and religion.

In this way, the nineteenth-century attempt to discover a theory of origins of religion in natural phenomena made way also for a sky-dwelling supreme being. Unfortunately, a shallow understanding of myth in general led to the conclusion that supreme beings were merely personifications of one or another natural phenomenon. In *Die Herabkunft des Feuers und des Göttertranks* (1859), Adelbert Kuhn gave a privileged place to meteorological phenomena such as rain, lightning, storms, and thunder, holding that these celestial phenomena were responsible for the development of mythological themes.

In *Die Geschichte der Religion* (1869), Otto Pfleiderer also laid great stress on the importance of a celestial supreme being. He considered the sky god a natural starting point for the development of monotheism. By postulating that the origins of religion lay in the personification of natural phenomena in the heavens and by hypothesizing about the connection between the sky god and monotheism, he provoked reactions from investigators with theological concerns. E. G. Steude, in *Ein Problem der allgemeinen Religionswissenschaft und ein Versuch einer Lösung* (1881), argued that early belief in a sky god, although a vague form of monotheism, might easily degenerate into polytheism through the personification of other celestial phenomena. Therefore, "primitive" belief in a supreme being ought not to be judged a true monotheism.

F. Max Müller, the foremost spokesperson of the school of nature mythology, attempted to avoid the theological pitfalls by positing the origin of religion in an innate capacity of the human soul to respond to the infinite. Consequently, in his studies of comparative mythology Müller placed great stress on those objects that are wholly intangible and that best express infinity: the sun, the dawn, and the sky. The experience of the infinite made available in the contemplation of these intangible objects (*numina*) ultimately gave rise to their designation by name (*nomina*). Through a "disease of language," the named objects were personified as gods,

whose exploits were recounted in myths. According to Müller, the origin of supreme being lies neither in polytheism nor in monotheism but in what he termed "kathenotheism," the tendency of the religious perception to treat any particular god as the only one in any specific moment.

Much of the early interest in Indo-European supreme beings culminated some years later in the work of Leopold von Schroeder. In the first volume of his *Arische Religion* (1914), he presents in an exhaustive fashion the instances of supreme sky beings: Indian Dyaus-pitr, Latin Jupiter, Greek Zeus Pater, Scythian Zeus-Papaius, Illyrian Daipatures, and Thracian-Phrygian Zeus-Pappos. However, by the time von Schroeder's useful collection of researches had been gathered together, the investigation of supreme beings in the history of religions had already passed beyond the relatively narrow confines of Indo-European texts. An increasing amount of reliable ethnographic data and a better awareness of the enormity of culture history demanded that the question be debated on wider grounds. Rather than a contribution to the general history of supreme being, von Schroeder's work became a masterful synthesis of a generation of research by specialists in only one area of religion.

**Evolutionary theories.** At the end of the nineteenth and the beginning of the twentieth century, when scholars turned systematic attention to the history of religions outside Indo-European cultures, interest in the nature and meaning of supreme being waned. In their enthusiasm for evolutionary theories of the development of human ideas, various schools of scientific thought placed the concept of supreme being on the opposite end of history from the origin of religious thought. The idea of supreme being and its manifold forms were thus deprived of the prestige of origins.

Sir John Lubbock, for example, contended that the earliest stages of human development gave evidence of a total absence of religion. Religious inclinations began with a belief in fetishes and arrived at the concept of a supreme being only after passing through the intervening stages of totemism, worship of nature, shamanism, and anthropomorphism (idolatry). In a similar way, Herbert Spencer attributed the origin of religious ideas to a vague belief in ghosts, which culminated in ancestor worship. The worship of distinguished ancestors eventually gave rise to the notion of supernatural beings. Ultimately, the concept of supreme being was the outcome of a lengthy historical process of reflection on human personalities such as a chief famous for strength and bravery, a medicine man of high esteem, or a stranger with superior knowledge of arts and inventions.

Various evolutionary theories found it inconceivable that an exalted notion of supreme being could exist in antiquity. Instead, religious history was seen as a development from simple ideas to more complex ones. In this way, the "origin" of supreme beings was postulated in animal totems, rudimentary human emotions, the human will at work in primitive magic, or a vague universal magic force.

The most popular of these theories was that of animism, set forth by E. B. Tylor in *Primitive Culture: Researches into the Development of Mythology, Philosophy, Religion, Art and Custom* (1872). For Tylor, the idea of supreme being was only the last in a long series of developments of religious ideas, which ultimately began with the idea of the human soul. The doctrine of a supreme being emerged only in the “later stages” of human history after it had been transformed, rationally projected on nature, and developed throughout a stage of ancestral worship and idolatry. Eventually it emerged in the form of a “pure” spirit that took its place in a polytheistic pantheon over which it gradually stood supreme.

The enthusiasm that greeted animism and other evolutionary theories succeeded in displacing scholarly interest in supreme beings. In placing the idea of supreme being in the most recent stages of human history, these theories implied or stated explicitly that the concept of supreme being was introduced into the cultures of Aboriginal Australia, Africa, and Native America by Christianity or Islam. In the opinions of these evolutionary theorists, the concept of supreme being was not an authentic local tradition. Scarcely heard in the din of scientific enthusiasm were opinions like those of the theologian C. von Orelli. Examining beliefs in supreme beings in Africa, Australia, and North America in his *Allgemeine Religionsgeschichte* (1899), von Orelli concluded that the original form of religion was a monistic belief in a celestial divinity, whose nature was known through revealed truth.

**Andrew Lang.** A disciple of Tylor, Andrew Lang called for a reconsideration of supreme beings in the light of materials from southeastern Australia as reported by A. W. Howitt. Lang pointed to the authentic existence of the idea of supreme being among Australian Aborigines, Andamanese pygmies (Negritos), and certain peoples of Africa and the Americas, whose life-ways were deemed most simple and whose religious ideas were therefore considered most archaic. He thus questioned one of the fundamental presuppositions of the animistic theory.

Lang never abandoned totally the evolutionary scheme, but he did challenge its overall simplicity. He argued that the idea of supreme being stood quite apart from the religious conceptions of soul and spirit that emerged in response to such phenomena as death, illness, and dreaming. A supreme being was an entity with a quality of being unique unto itself. It could not be an elaboration of earlier and simpler notions, for, in some cases, the idea of supreme being exists where no evidence of ancestor worship is found.

In *The Making of Religion* (1898), Lang presents the supreme being as a deathless “maker” of all creation that is not fashioned by human hands. Lang considered the idea of supreme being a sublime religious conception that the human intellect was capable of conceiving at any stage of its historical development. Though recognized by the religious intellect, a supreme being was a creative power that the imagination eventually encrusted with mythical elements. Consequently, although the conception of a creator was ex-

alted, the forms into which mythic fancy cast supreme beings were often erratic and degrading.

Lang’s insistence on the authentic existence of a sublime supreme being in the religious thought of cultures that animists deemed “lower” or “savage” races met with little success during his lifetime. Nor was his the only voice to fall on deaf ears. As early as 1860, in his second volume of *Anthropologie der Naturvölker*, Theodore Waitz-Gerland had argued for the existence of an indigenous African religion whose ideas of supreme being were so exalted that they approached the limits of monotheism. In his *History of Religion* (1906), A. Menzies, too, had concluded that there existed a widespread belief in a vague and remote divinity who managed the world but found no place in cult, but he was not sure how archaic the form was.

**Wilhelm Schmidt.** In the very year of Lang’s death, Wilhelm Schmidt published the first volume of *Der Ursprung der Gottesidee* (1912), a twelve-volume work that was to occupy him for the next forty years. An ethnologist of uncommon energies and linguistic abilities, Schmidt studied supreme beings in a comprehensive fashion. Although he acknowledged his debt to Andrew Lang for having recognized the existence of supreme beings outside historical monotheisms, his main thrust was to situate the study of supreme beings in a more accurate historical framework than the one provided by an ideology of evolution.

Following Fritz Graebner and Bernard Ankermann, Schmidt attacked theories of a unilinear and evolutionary development of religious history. He argued convincingly that human history was a more complicated reality. In the place of simple unilinear development, Schmidt, following the trend of continental historical tradition, proposed the existence of a number of culture circles (*Kulturkreise*), each with distinctive ecological, economic, political, social, and ideological components that developed in relative independence of one another. By first delineating the characteristics of supreme beings found in each culture circle and by comparing those traits seen to be common to distinct culture circles, Schmidt hoped to arrive, through reliable empirical and historical methods, at that original configuration of the idea of God existing in the common archaic culture (*Urkultur*). In this way, Schmidt argued that the contemporary societies of Oceania, Africa, the Americas, and Asia ought not to be ranked in any temporal order on a unilinear time line. On the other hand, features common to many of them pointed to the existence of a temporally earlier culture of shared beliefs.

Like Lang before him, Schmidt emphasized the moral and rational capacities, reflected in the conceptions of supreme beings, of those peoples who had been dubbed “savage” or “primitive.” In fact, Schmidt exaggerated the importance of rationality in the nature of religion, for he held that supreme beings were inextricably bound to the rational process of inquiry into the first causes of the universe.

By studying those features common to the religions of African and Asian pygmies, Schmidt postulated the existence

of shared religious beliefs stemming from the earlier historical stratum that he called the religion of Archaic Pygmy Culture (*Religion der Pygmäischen Ur-kultur*). Abstracting from American and Arctic materials in the same manner, Schmidt outlined the beliefs in a supreme being that characterized a hypothetical Archaic Arctic-American Culture. Finally, by comparing his constructions of Archaic Pygmy and Arctic-American cultures with religious beliefs in southeastern Australia, Schmidt postulated the “historical outlines” of earliest belief in a supreme being.

What Schmidt found in the reconstructed primordial culture was a supreme being whose nature satisfied all human needs, in particular, the need for a rational first cause of the universe and its creatures. In this way, the supreme being was viewed as the father and founder of social realities, the family, and kin alliances as well as the author of moral realities in his role as lawgiver and ethical judge, who is himself free from all moral corruption. Schmidt argued that the belief that the supreme being was a protective father, supportive of the virtues of trust and love, provided archaic humans with the capacity to live and work toward supramundane goals. Rendering labor significant and providing a sense of responsibility, the belief in a supreme being proved to be an effective impetus for the forward struggles of human history.

Thus, the supreme being of Archaic Culture was the lord of human history because he was seen to fill all time and was the source of the beginnings of human life as well as the judge at its end. Furthermore, since the supreme being was believed to fill all the space of the universe, Archaic Culture could conceive of the existence of only one supreme being, unique and without peer. This being reigned as sovereign over all peoples of the earth. In short, through his historical investigation of ethnographic data, Schmidt contended that the religion of the most archaic human culture was a primordial monotheism (*Urmonotheismus*), whose existence could best be explained through a primordial revelation (*Uroffenbarung*) of the supreme being itself at the beginning of time.

Recognizing that the high god is found in contemporary cultures with less frequency than in the primordial culture, and acknowledging that the contemporary high god is often absent from scheduled cult and manifest in many obscure forms, or even supplanted by other divine figures, Schmidt attributed this degeneration to the very march of history, to the effects of change on human life and thought. Lang had made the same point. Where Lang had attributed the withdrawal of the high god to the cloak of mythic fancy put on over time, Schmidt also considered the economic and social realities of culture history. Thus, the experiences of matrilineal agrarian societies stressed the importance of a female supreme being, lunar associations, and blood sacrifices. Patri-lineal totemic cultures contributed emphases on solar symbolism of a male supreme being. Patriarchal cattle-breeding cultures underlined the supreme being as a sky god, the highest in a pantheon of ranked beings increasingly associated with natural phenomena. Through such a historical

process, the kernel idea of a primordial supreme being weakened over time, even while the images of supreme being multiplied themselves in number and breadth of special application. History took its greatest toll on the idea of supreme being in those cultures with a long history of ethnological change. For this reason, Schmidt laid great stress on the study of cultures that remained on the margins of technological change.

Schmidt’s historical extrapolations from ethnographic materials drew criticism from anthropologists. His assertions of the existence of a primordial monotheism and revelation disturbed theologians. From the point of view of history of religions, Schmidt’s greatest shortcoming would prove to be his lack of appreciation of religious elements other than strongly rational ones. In short, although he helped break the stranglehold of evolutionary theories and renewed serious study of supreme being, he continued a rational tradition of interpretation that found it impossible to appreciate the many existential dimensions of myth subsequently disclosed by a more profound hermeneutics of religion. For these reasons, his ideas never gained widespread acceptance. Nevertheless, Schmidt’s mammoth studies of supreme beings stand as a monument to his industry and to the existence of the concept of supreme beings in the general history of cultures.

**In Schmidt’s wake.** A distinguished school of culture history grew up around the researches of Wilhelm Schmidt. Although his disciples were very careful to emend or even to reject his historical conclusions about a primordial Archaic Culture and his theological conclusions about a primordial monotheism, they did continue to hold that the investigation of supreme beings outside monotheism constituted a high priority of research. In particular, the researches of Wilhelm Koppers, Josef Haeckel, and Martin Gusinde confirmed the importance of the position of supreme beings in many of the cultures that Schmidt had studied.

Reactions to Schmidt came from both theological and ethnological quarters. In general, his critics raised their objections on the basis of material from one special field or another. For the most part, however, other investigators—Preuss, Radin, Lowie, Söderblom, and van der Leeuw among them—agreed with Schmidt in recognizing the existence and importance of a supreme being in many cultures around the world.

In “Die höchste Göttheit bei den kulturarmen Völkern” (1922), Konrad T. Preuss claimed that supreme beings did not form a late stage of human development but rather the foundation of human thought. In *Glauben und Mystik im Schatten des höchsten Wesens* (1926), Preuss pointed out that the separate ideas concerning the world are woven into a universal scheme personified by the supreme being of the sky. Paul Radin, in *Primitive Man as Philosopher* (1927), put forward the idea that a supreme being was a creation of a special type of religious person, one inclined toward intellectual reflection. Speculative thought inclined itself toward an unapproachable, abstract divinity, absent from cult and from the

contamination of mythic fancy. Radin opposed this sublime figure to the figure of the transformer, a nonethical, materialistic, and dynamically dramatic figure who fascinated the more pragmatically inclined religious mind. Robert H. Lowie, who examined supreme beings in his *Primitive Religion* (1924), was not so much concerned with the historical origin of the idea of supreme being. Admitting its antiquity, he insisted on the need to consider it as an idea on its own merits, quite apart from notions of spirit, ghost, ancestor, or *mana*.

Nathan Söderblom, a great specialist in Iranian religions, also abandoned the quest for the historical origins of religion in favor of a threefold typology of religions distinguishing ethnic religion from mysticism of infinity and from prophetic revelation. He denied any connection between what he termed “primitive high gods” and the supreme beings of monotheisms. Since the high gods remained remote from their world and absent from cult, they appeared to him to be abstract reflections upon the origin of creation. Far from being true divinities, they were a rational construct of an “originator” (*Urheber*). In *Das Werden des Gottesglaubens: Untersuchungen über die Anfänge der Religion* (1926), he postulated a different origin in human experience for the idea of a supreme being in the religions “of the Book.” In these traditions, prophets interpreted their experience of a divine will making itself felt in both the legal and political arenas of daily life as an experience of the supreme (that is, most powerful and authoritative) being. This contrasts with the primitive notion of supreme being, which was, in his view, developed in response to questions about the origins of things.

Gerardus van der Leeuw employed several of Söderblom’s key concepts in his treatment of supreme beings in “Die Struktur der Vorstellung des sogenannten Höchsten Wesens” (1931). Later, in *Phänomenologie der Religion* (1933), van der Leeuw extended the basic cognitive categories that Söderblom thought lay behind the concept of supreme being into a more refined Gestalt psychology of religion. The supreme beings outside monotheisms were an outgrowth of the basic cognitive structure of origination. Following Preuss, van der Leeuw also argued that these supreme beings, these high gods, preserved the world order by serving as systematic expressions of the mystical unity on which the conception of the world of everyday experience was grounded.

Like Söderblom and Preuss, van der Leeuw considered the question of the nature and structure of supreme beings in isolation from the history of the idea and the historical situations of particular expressions of supreme beings. An intrinsic element of such supreme beings is their otiosity, their remoteness. Whatever form a supreme being may take, whether sky god, weather god, or animal in form, it is always a form that remains in the background of the religious psyche. According to van der Leeuw, the supreme being created the world but now remains uninvolved with it in any practi-

cal way. He is looked upon as a being who in the past accomplished something extraordinary but who will never act in such a way again. Whereas Andrew Lang and Wilhelm Schmidt believed that the supreme being suffered mythic distortions accrued throughout history, van der Leeuw argued that the supreme being, as a structure of the religious psyche, exists outside history.

**Raffaele Pettazzoni.** It was Raffaele Pettazzoni who proposed that ambivalence is an essential component of the structure of supreme beings. Reappropriating the historical vision of Giovanni Battista Vico, who emphasized that every religious phenomenon is also a “genomenon” (something with a temporal history of development) and that the truths of human history are especially accessible through ideas forged in the symbolic terms of their time (“verum et factum convertuntur”), Pettazzoni embarked on an enormous study of the historical expressions and forms of supreme beings. Nonetheless, he respected the efforts and contributions of phenomenologists, who studied the forms of supreme beings in their essential structures.

The essentially ambivalent structure of supreme beings emerged from Pettazzoni’s study of their historical forms. On the one hand, one finds relatively inactive creators who have retired to inaccessible regions once their acts of creation have been accomplished. On the other hand, one finds in history testimonies to supreme beings who are extremely dynamic overseers of the moral order. These active and omniscient sky gods often intervene directly in the course of human affairs by punishing transgressors of the statutes of social order with the weapons of weather and flood so characteristic of their own tempestuous natures.

Over the course of time, Pettazzoni argued, these historically separate features combined into a basic phenomenological structure of a dualistic nature. Their common meeting ground is the sky. Pettazzoni pointed out the primordial and cosmic quality of the remote and inactive creator. In his view, those features of a supreme being that emphasize his transcendence of the world are best suited to express his conservation of the very conditions that guarantee its existence and endurance. Once the world is fashioned, the function of the creator can only be to prolong its duration and ensure its stability. Further action would endanger it. Creativity and passivity are thus indissolubly, if paradoxically, linked with one another. In this way, Pettazzoni rejected the hypothesis of Andrew Lang and Wilhelm Schmidt that the remoteness of the creator is a historical development of mythic fantasy.

On the other hand, criticizing the view held by van der Leeuw and Söderblom, which claimed that the dynamic features of supreme beings are foreign to the otiose figure of a primordial creator, Pettazzoni asserted that moral omniscience is also fundamental to the structure of supreme being. The capacity for moral supervision renders a supreme being morally relevant to historical and social order. Arguing that it is not only the God of historical monotheism who actively involves himself in the course of human events, Pettaz-

zoni documented the existence of all-seeing, celestial supreme beings in Australia, Asia, Indonesia, Melanesia, Africa, and the Americas. Cultures in all of these places provide evidence of the existence of an ambivalent supreme being, both passive creator and omniscient sky god, who oversees the moral order and who is inclined to cede his place to more specialized forms of weather divinities.

Pettazzoni's contribution to the study of supreme beings was his positive evaluation of myth. Rather than viewing it as a degeneration or trivialization of a pure and primordial rational idea, Pettazzoni considered myth the most suitable vehicle for the expression of the sublime and exalted truth contained in the nature of the transcendent and omniscient supreme being. The full existential meaning of supreme being is manifest in myth as in no other form of rational discourse.

**Mircea Eliade.** In several of his studies in the history of religions, Mircea Eliade has given priority to the investigation of supreme beings. In his great morphological treatise, *Patterns in Comparative Religion* (1958), the nature and meaning of supreme being becomes the foundation stone for his approach to the study of religion. Observing the results of earlier investigations, Eliade concludes that in every instance supreme being is a complex figure representing a very involved historical process of religious experiences, revelations, and theoretical systematizations. Nonetheless, Eliade agrees with Pettazzoni that supreme being best manifests its unique spiritual quality as a hierophany of the sky. Height and infinite space become especially suitable manifestations of what is transcendent and supremely sacred. Such supreme beings are primordial; they preexist the world as it is now known, and they act as creators who are beneficent and eternal. They establish the order of creation and become the upholders of its laws. Consequently, Eliade holds that supreme beings are more than simple hierophanies of the sky. Instead, they possess a quality of being that is uniquely their own.

Eliade's special contribution to the study of supreme beings is his illumination of the process of their withdrawal or disappearance. He draws attention to the fact that myth often narrates the withdrawal of a supreme being to remote heights, whence he presides over the larger contours of life, destiny, and the afterlife of the soul, without, however, assuming any dominant role in public cult. In retirement, supreme beings are often replaced by other religious forms: by divinities of nature, by ancestors, by powers of fertility, by solar or lunar divinities, and so forth. Eliade contends that this tendency to give way to more concrete and dynamic forms is an essential element of the structure of supreme being.

Further, Eliade holds up the withdrawal of supreme beings as the exemplary model for the very process of the religious imagination in history. Considering "the sacred" as a structure of human awareness, he points to its historical occultation or withdrawal even as it manifests itself in concrete and, one could say, profane forms. The withdrawal of the su-

preme manifestation of being and the occultation of its fullness before active but more circumscribed divine appearances lead to a process of experimentation with sacred forms. This process constitutes the history of religious experience: a religious quest for the full manifestation of supreme being, which myth describes as existing "in the beginning."

Eliade has made a historical application of his morphological analysis of supreme beings in *Australian Religions: An Introduction* (1973), in several articles on South American religions, and in *A History of Religious Ideas* (1978–1986) as well as in other works. At first, Eliade draws attention to the replacement of supreme beings by other divine forms that share the celestial sacrality of supreme being even though they lose something of its transcendent omnipotence: weather, storm, solar, and lunar gods as well as universal sovereign gods who reign from on high. To this extent he develops suggestions made by Pettazzoni. However, his more general point is that supreme being is replaced in the religious imagination by a range of epiphanies of elementary life forces that come to compose a cosmic sacrality: water, stone, earth, vegetation, and animals. These epiphanies reveal themselves as particular modes of being of which a supreme being is the fullest manifestation. Because of this relationship to supreme being no longer fully manifest in history, each cosmic religious form tends, by "imperial" expansion of its meaning to all realms of life, to express itself as a revelation that, like supreme being, includes all other possibilities. However, these limited revelations are, by their very nature, incapable of expressing fully the sacred. They provoke the need for the experience of other forms.

**Concluding remarks.** Understanding the nature, structure, and meaning of supreme beings outside monotheism has remained a priority for scholars who study religion in a comparative and historical frame of reference. The study of this important being has played a singular role in expunging several futile assumptions that plagued the early stages of investigation. Specifically, the naive premises that the origins of religion might be found in a single simple cause, that valid religious experience might be exhausted through rationalistic explanations, and that religious history is a unilinear progressive development had all to be abandoned. In their place, the study of supreme beings has substituted a deeper appreciation of the complexities of human experience in all cultures and in all times and a more profound understanding of the wider existential dimensions of mythic truth.

In particular, better acquaintance with supreme beings has underscored not only the inestimable value of the religions of Asia, Africa, Oceania, the Americas, and archaic cultures but also the inescapable need to know them well in order to understand the religious experience of humankind.

## BIBLIOGRAPHY

### General Works

A number of important studies treat the general investigation of supreme beings on a large scale. In addition to their theoretical and historical value, these works also provide ample bibliographies on the subject. Mircea Eliade's *Patterns in Comparative Religion* (New York, 1958) deals at length with the question of supreme beings in chapter 2, "The Sky and Sky Gods." There follow twelve pages of bibliography containing some three hundred entries grouped by geographic and culture area. For a brief synthesis of Raffaele Pettazzoni's view on the issue, see his "The Supreme Being: Phenomenological Structure and Historical Development," in *The History of Religions: Essays in Methodology*, edited by Joseph M. Kitagawa and Mircea Eliade (Chicago, 1959), pp. 59–66. Other important works by Pettazzoni include *Dio: Formazione e sviluppo del monoteismo nella storia delle religioni* (Rome, 1922); "Allwissende höchste Wesen bei primitivsten Völkern," *Archiv für Religionswissenschaft* 29 (1930): 108–129, 209–243; and *L'omni-scienza di Dio* (Turin, 1955). A wealth of material is contained in the eleven thousand pages of Wilhelm Schmidt's *Der Ursprung der Gottesidee*, 12 vols. (Münster, 1912–1955). Other general works central to the discussion of supreme beings include Nathan Söderblom's *Das Werden des Gottesglaubens: Untersuchungen über die Anfänge der Religion*, 2d ed. (Leipzig, 1926); Gerardus van der Leeuw's "Die Struktur der Vorstellung des sogenannten Höchsten Wesens," *Archiv für Religionswissenschaft* 29 (1931): 79–107; Carl Clemen's "Der sogenannte Monotheismus der Primitiven," *Archiv für Religionswissenschaft* 27 (1927): 290–373; and Paul Radin's *Monotheism among Primitive Peoples* (London, 1924).

### Specific Studies

Most of the recent works on the subject make no attempt to encompass the wide parameters of the nature and meaning of supreme beings. Any list of these studies specializing in the supreme being of one culture area could become inordinately long. The following works, not included in the bibliographies of the general treatises cited above, serve as illustrations of the kind of works that bring clarity to the state of the question in their particular field.

LAWRENCE E. SULLIVAN (1987)  
*Revised Bibliography*

**SŪRDĀS** (also called Sūr Dās and Sūradāsa; c. 1483–1563), a North Indian devotional poet. Known for his brilliant *padas* (lyrics) in the Braj dialect of Hindi, Sūrdās is one of the most popular poets of Kṛṣṇa *bhakti* (devotion) in the North Indian heartland.

The traditionally accepted story of his life has come down through the hagiographic accounts of the Vallabhite sect of Kṛṣṇa *bhakti*, which claims Sūrdās as the first of its "eight seals"—eight poets who lived during the early days of the sect and whose compositions are part of the sect's daily liturgy. According to these accounts, Sūrdās was born near Delhi in 1478, the same year as Vallabhācārya, the founder of the sect, and, like him, was of the Sārasvat Brāhmaṇ caste. Reputedly blind from birth, he was endowed with miraculous gifts of clairvoyance as well as great musical talent. At a young age, he left home to become an ascetic, eventually settling near Agra. There he composed devotional songs and attracted a following. In 1510 Vallabhācārya came through on one of his preaching tours and met Sūrdās. Until that time, all of Sūrdās's compositions had been of the *vinaya* type—hymns of supplication and humble pleas for salvation. Vallabhācārya taught him the story of Kṛṣṇa as embodied in the tenth chapter of the *Bhāgavata Purāṇa*, instructed him in his doctrines, and enjoined him to sing about the *līlā* (divine play) of Kṛṣṇa. He then brought Sūrdās to the sect's newly established Shrīnāthjī temple in Govardhan and put him in charge of composing songs for the liturgy. In this setting, where he spent the remainder of his life, Sūrdās composed the *Sūrsāgar*, a retelling of the *Bhāgavata Purāṇa* in twelve chapters of verse. He died, according to Vallabhite sources, shortly before the death of Vallabhācārya's son, Viṭṭhalnātha, in 1585, his life thus spanning that of both the founder of the sect and his immediate successor.

Serious scholarly doubt has been cast on this account. Another nonsectarian Hindu tradition suggests that Sūrdās's dates are 1483 to 1563, that he was by caste a Bhāṭ (panegyrist), and that he became blind only later in life. The issue is further complicated by references in Muslim sources to a renowned singer named Sūrdās at the court of the emperor Akbar (r. 1556–1605). The somewhat subordinate ranking of this Mughal Sūrdās—he is far less celebrated than his father, a certain Rāmdās—and a disagreement among the royal chroniclers as to whether Rāmdās hailed from Gwalior or Lucknow makes it unlikely, however, that this Sūrdās is the same as the renowned Vaiṣṇava poet. The early-seventeenth-century *Afsānah-i-Shāhān* of Muḥammad Kabīr also mentions a Sūrdās, who is referred to as a performer at the court of the Afghan ruler Islām Shāh (r. 1545–1555). This Sūrdās—who sounds more likely to be "our" man—is in-

cluded in a select list of "accomplished scholars and poets" whose luster was intended to burnish the reputation of Islām Shāh a half century or more later. Sūrdās is the only non-Muslim to be included in the group.

This image of Sūrdās as a court poet is entirely at variance with the Vallabhite account that has become so standard. But the most serious challenge to the Vallabhite view comes not from alternate biographies, Vaiṣṇava or otherwise, but from the textual history of the *Sūrsāgar* itself. Though the present-day standard edition of nearly five thousand *padas* is indeed divided into twelve chapters following the *Bhāgavata Purāṇa*, the oldest extant manuscripts, which contain only a few hundred *padas*, are not. Nor do the older manuscripts follow the Vallabhite liturgical calendar, use the characteristic theological terminology of the sect, or group the *vinaya* lyrics at the beginning as a distinct genre. The present-day *Sūrsāgar* is thus the product of gradual addition to an original core of episodic lyrics, and of the imposition of a systematic framework by a self-conscious sectarian tradition. A critical edition prepared by Kenneth E. Bryant in cooperation with Vidyut Aklujkar and others is shortly to be published and will force a radical reevaluation of the text, at least in scholarly circles.

Despite the incorporation of Sūrdās into the history and liturgy of the Vallabhite community, his importance as a religious figure extends far beyond the sectarian. His name has become a household word used to refer to blind persons, especially blind mendicant singers, while the *Sūrsāgar*, whose lyrics are sung by Indians of all sectarian persuasions, is considered one of the literary and devotional treasures of the Hindi-speaking area. Sūrdās's lyrics touch on all aspects of the Kṛṣṇa story, but he is best known for his depiction of Kṛṣṇa's childhood and adolescence. Among the poems on Kṛṣṇa's childhood, those dealing with Kṛṣṇa as the butter thief are among the favorites. Also popular are the lyrics that describe the irresistible attraction of Kṛṣṇa's flute-playing and how it draws the cowherd women (*gopīs*) from their homes. Sūrdās's second most beloved theme is that of the pain of separation (*viraha*) felt by Rādhā and the cowherd women after Krishna leaves them and settles in Mathura, resuming the royal station he was forced to abdicate at birth. Among these *viraha* poems are the famous "bee songs," in which the cowherd women mock the cold monistic philosophy of Kṛṣṇa's emissary Uddhav and assert the superiority of their loving personal devotion to Kṛṣṇa. Sūrdās's third most popular theme is that of *vinaya*, in which he turns from dramatic third-person description and narration to the intimate first-person voice of the devotee praying to his god for salvation, sometimes humbly, sometimes with reckless abandon. The *Sūrsāgar* also contains *padas* that plumb Kṛṣṇa's activities as a mature adult—stories associated with the great *Mahābhārata* epic—as well as a number that celebrate Rāma and Sītā, as in the *Mahābhārata*'s parallel epic, the *Rāmāyaṇa*.

Finally, there are poems that function as verbal icons, as in the following example. Here, one young woman catches

a glimpse of Kṛṣṇa playing his flute Muralī and shares her vision with a friend, likening her mind and eyes to two birds: the *chātak*, which survives on raindrops, and the *chakor*, which lives on moonbeams:

Look, friend: look what a mass of delight—  
 For my *chātak*-bird mind, a cloud dark with love;  
     a moon for my *chakor*-bird eyes.  
 His earrings coil in the hollows of his neck,  
     gladdening his tender cheeks,  
 As crocodiles might play on a nectar pond  
     and make the moonlight shudder in their wake.  
 A wealth of elixir, his mouth and lips,  
     and little Muralī perched in his hands  
 Seems to be filling that pair of lotus vessels  
     with still more of that immortal liquid.  
 His deep-toned body, sheathed in brilliant silk,  
     glitters with a garland of basil leaves  
 As if a coalition of lightning and cloud  
     had been ringed by parrots in flight.  
 Thick locks of hair; a lovely, easy laugh;  
     eyebrows arched to a curve—  
 To gaze upon the splendor of the Lord of Sūr  
     is to make one's wishes lame.  
 (Hawley and Bryant), *Sūr's Ocean*, §41

The *Sūrsāgar* is a work of remarkable range, yet it is important to keep in mind that, at least until the eighteenth century, it was composed entirely of independent lyrics such as the one above, most of them quite short and all of them intended to be sung. The poet's task was not to retell a sustained narrative but to allow his audiences to experience familiar episodes in a fresh way, either by introducing some novel vignette or perspective, by phrasing his poems as puzzles, by assembling metaphors and allusions in new ways, or by seducing his listeners into a languorous lethargy from which he could then awake them. The hagiographer Nābhādās, writing early in the seventeenth century, summed up the views of many subsequent listeners, performers, and critics when he observed that what set Sūrdās apart was his status as a poet's poet: "What poet, hearing the poems Sūr has made, will not nod his head?"

#### BIBLIOGRAPHY

For a brief overview of the traditional understandings of Sūrdās and his relationship to the Vallabhite sect, see S. M. Pandey and Norman Zide's "Sūrdās and His Krishna-Bhakti," in *Krishna: Myths, Rites, and Attitudes*, edited by Milton Singer (Chicago, 1966), pp. 173–199. Vrajeśvara Varmā's *Sūrdās*, 2d ed. (Allahabad, India, 1979), is a balanced and thorough study of Sūrdās's life and poetry. *Pastorales par Soûr-Dās*, translated and edited by Charlotte Vaudeville (Paris, 1971), contains representative *padas* and a critical introduction. Kenneth E. Bryant's *Poems to the Child-God* (Berkeley, Calif., 1978) is a rhetorical study of Sūrdās's poetic strategies

and breaks new ground in the analysis of Indian devotional poetry. In "The Early *Sūr Sāgar* and Growth of the Sūr Tradition," *Journal of the American Oriental Society* 99, no. 1 (January–March 1979): 64–72, John Hawley presents for the first time the manuscript evidence that challenges the traditional view of the *Sūrsāgar*. Other essays by Hawley on various aspects of Sūrdās's life and works are collected in his *Sūr Dās: Poet, Singer, Saint* (Seattle, Wash., 1984); these are supplemented by a further set that appear in *Three Bhakti Voices* (Delhi, 2005). The most extensive translations of poems attributed to Sūrdās are by Jaikishandas Sadani (*Rosary of Hymns*, New Delhi, 1991), A. J. Alston (*The Divine Sports of Krishna*, London, 1993), Krishna P. Bahadur (*The Poems of Sūradāsa*, Delhi, 1999), and J. P. Srivatsava (in *Medieval Indian Literature: An Anthology*, vol. 2, edited by K. Ayyappa Paniker, New Delhi, 1999). The most ambitious critical assessment by Indian authors writing in English is K. C. Sharma, K. C. Yadav, and Pushpendra Sharma's *Sūradāsa: A Critical Study of His Life and Work* (Delhi, 1997).

The standard edition of the *Sūrsāgar*, upon which many authors rely, is the Nagari Pracharini Sabha's *Sūrsāgar*, 2 vols. (Varanasi, India, 1948, with subsequent reprints). Partial editions have also been produced by Javāharlāl Chaturvedī (Calcutta, 1965) and Mātāprasād Gupta (Agra, India, 1979). A full-scale critical edition of Sūrdās poems that can be traced to the sixteenth century has recently been completed by Kenneth Bryant and will be published as volume two of *Sūr's Ocean* (forthcoming). In the first volume of that work, John Hawley provides a translation and poem-by-poem analysis of compositions included in the Bryant edition, with extensive introduction. Bryant and Gopal Narayan Bahura have performed a valuable service by publishing a facsimile edition (*Pad Sūradāsajī kā*, Jaipur, India, 1982) of the earliest extant manuscript containing poems attributed to Sūrdās. Written at Fatehpur in 1582, it contains 239 Sūrdās *padas*.

 JOHN STRATTON HAWLEY (2005)

#### SŪRYA SEE SAURA HINDUISM

**SUSANO-O NO MIKOTO**, one of the major deities in Japanese mythology, offspring of Izanagi and Izanami, and brother of Amaterasu. The meaning of the word *susano-o* is interpreted as either "a terrible man," or "the man of Susa," with *susa* read as a place-name. (*Mikoto* is a suffix used for a respected person or deity.) The character of Susano-o is extremely complex because he is an amalgam of several local and national deities. Although this deity personifies evil, several of his acts have an unmistakably beneficent character.

Susano-o caused the most dramatic event in Japanese mythology when he angered Amaterasu. He first aroused her wrath by emptying his bowels in the palace. But when Amaterasu was injured as a result of Susano-o's misbehavior she forthwith entered the Rock Cave of Heaven, and having fastened the Rock Door, dwelt there in seclusion. Eight hundred myriad deities then gathered to consider how to lure her

out and restore light to the world. Their solution was to have Ame no Uzume, a female deity, perform an erotic dance in front of the cave. This caused laughter among the deities, and Amaterasu, curious about the noise outside, opened the door a crack and peered out. Then Tajikara no Kami (god of strength) took her by the hand and led her out, and the radiance of the supreme deity filled the universe. For his role in provoking this event, the deities punished Susano-o on the sacred ground. They cut off his beard and his fingernails and toenails, and expelled him from the heavenly world. Because of the banishment of Susano-o, the evil deity, a good crop was expected in the coming new season.

In this myth, Susano-o plays a negative role, but his later activities are more positive. Following his expulsion from the realm of the gods, Susano-o descended to the province of Izumo, which was located in western Honshu, the main island of Japan. There he learned that an eight-headed serpent appeared in Izumo each year to devour a young girl. Susano-o intoxicated the serpent with liquor and killed it. As he cut into the serpent's body, the blade of his sword broke. Thinking this strange, he cut open the flesh and discovered a sword within. The sword, called Kusanagi no Tsurugi, became one of the Three Imperial Regalia. After this incident, Susano-o became the ancestor god of Izumo.

Susano-o is also the most important deity of northern Kyushu. Three female descendants of Susano-o were enshrined at Munakata, a religious center of that region. Thus there is a link between the Munakata and Izumo shrines, not only because Susano-o was the ancestor god of the female deities but also because Ōkuninushi, the son of Susano-o, married Takiribime, one of the three Munakata deities. The Munakata deities also had ties to western Honshu, for the deity enshrined at Itsukushima, near present-day Hiroshima and south of Izumo, is Itsukushima-hime, one of the three Munakata deities.

This geographical pattern suggests that Susano-o and his children were the deities of northern Kyushu and the western tip of Honshu. In sharp contrast, Amaterasu was originally the goddess of Yamato Province in central Japan. Susano-o and Amaterasu might therefore represent two separate political forces before the emergence of a unified Japanese kingdom—the one centered in northern Kyushu, the other in Yamato. When the rival forces merged, the myths were combined as they are found today in the *Nihongi* and the *Kojiki*. The *Kojiki* states that when Susano-o went to the heavenly world, there was consternation and alarm. Amaterasu said of the ascent of Susano-o that there was “surely no good intent. It is only that he wishes to wrest my land from me.” Her reaction is understandable if the two deities were rivals before they were united as brother and sister.

Susano-o was also the god of the sea. Itsukushima-hime, one of his three daughters, was also enshrined at Okinoshima, located in the Tsushima Strait north of Kyushu. In ancient times, when the government sent missions to Korea or China, prayers for a safe voyage were offered at Okinoshima.

This supports the *Nihongi*'s description of Susano-o as ruler of the sea.

KAKUBAYASHI FUMIO (1987 AND 2005)

**SŪTRA LITERATURE.** The Sanskrit term *sūtra* means “a thread”; it is also used, however, to refer to a short, aphoristic sentence and, collectively, to a work consisting of such sentences. Sūtra literature, as distinguished from *śāstra* literature, is in prose. The *sūtra* style, characterized by *laghutva* (“brevity, conciseness”), is a mnemonic device that attempts to condense as much meaning as possible into as few words, even syllables, as possible.

The most important sūtra texts in the context of the religious literature of India are the Kalpasūtras. The term *kalpa* has been variously explained by different traditional and modern scholars, but can best be rendered as “ritual.” *Kalpa*, together with *śikṣā* (phonetics), *chandas* (prosody), *nirukta* (etymology), *vyākaraṇa* (grammar), and *jyotiṣa* (astronomy), is one of the six Vedāṅgas, or branches of learning auxiliary to the Vedas. The Kalpasūtras are closely connected with the individual Vedic schools (*śākhās*). (Even though not all the texts have survived, it may be assumed that at one time each Vedic school had not only its own *saṃhitā*, *brāhmaṇa*, *āranyaka*, and *upaniṣad* but also its own *kalpa-sūtra*.) There are three main classifications of Kalpasūtra: Śrautasūtras, Gṛhasūtras, and Dharmasūtras.

The ritual performances described in the Śrautasūtras distinguish themselves by their—often extreme—complexity. First, in addition to the *yajamāna* (patron of the sacrifice) and his wife, for whose benefit the ritual is performed, *śrauta* ritual can involve the presence of up to sixteen specialized priests. Second, it requires an elaborately laid-out sacrificial area in which three sacred fires are kept burning continually. Third, *śrauta* ritual includes not only *ekāha* (“one-day-long”) ceremonies but also *ahīna* rituals, which last up to twelve days, and *sattra* “sessions,” which can extend over several years. Large sections of the Śrautasūtras are devoted to the Agniṣṭoma sacrifice, which is the prototype (*prakṛti*) for

many variant forms of soma sacrifices collectively called *jyotiṣṭoma*, among which are the seventeen-day-long Vajapeya and the Rājasūya, the royal consecration. Other well-known *śrauta* rituals are the sacrifices to the new and full moons (Darśapūrṇamāsau), the horse sacrifice (Aśvamedha), and the animal sacrifice (Paśubandha). Some Śrautasūtras end in more or less independent appendices called *śulbasūtras*; because they describe the exact layout of the sacrificial area (*vedi*), they are, in effect, the earliest Indian texts on geometry and mathematics.

In addition to rites that are part of the daily life of the householder and rituals on such occasions as building a house or digging a tank, the Gṛhyasūtras principally deal with the *saṃskāras*. These are the rites of passage that guide a Hindu through the various stages of his life, from conception until death, especially the Upanayana (his second birth, at which time he begins the study of the Veda and is invested with the sacred thread) and marriage. Many topics treated in the Gṛhyasūtras also appear in the Dharmasūtras, although the latter expand their teachings to cover all the duties and obligations of the different *asramas* (“stages of life”) and *varṇas* (“classes of society”). The Dharmasūtras, in prose, are considered to be the precursors of the versified Dharmaśāstras.

Treatises in sūtra style also form the basic texts for the six Hindu *darśanas* (orthodox philosophical systems). They are Jaimini’s *Pūrvamīmāṃsā Sūtras*, Bādarāyaṇa’s *Uttaramīmāṃsā Sūtras*, or *Vedānta Sūtras*, Gautama’s *Nyāya Sūtras*, Kaṇāda’s *Vaiśeṣika Sūtras*, Kapila’s *Sāṃkhya Sūtras*, and Paṭāñjali’s *Yoga Sūtras*. Some of these philosophical sūtras are so concise that they have lent themselves to divergent interpretations, and they have thus become the authoritative texts for very different philosophical systems. Bādarāyaṇa’s sūtras, for example, are the common source for all later schools of Vedānta, including Śaṅkara’s Advaita, Rāmānuja’s Viśiṣṭādvaita, and Madhva’s Dvaita. The sūtra style was also adopted in certain Buddhist and Jain scriptures.

The area of sūtra literature in which the ideal of brevity and conciseness has been realized most perfectly is the grammatical literature, which technically belongs to the Vedāṅgas, mentioned earlier. Pāṇini’s *Aṣṭādhyāyī* not only uses as few words as possible; it has recourse to all kinds of devices to abbreviate the sūtras, such as the replacement of longer grammatical terms with shorter symbols. The commentators on Pāṇini’s work go to great length to account for the presence and meaning of each and every syllable in the *Aṣṭādhyāyī*.

It would be misleading to suggest specific dates for the Kalpasūtras and for sūtra literature generally. The texts clearly belong to the end of the Vedic period, and they are thought to be earlier than the epic period. Allowing for exceptions belonging to earlier or later dates, the major part of the sūtra literature may be safely situated in the second half of the first millennium BCE.

SEE ALSO Śāstra Literature.

## BIBLIOGRAPHY

The most recent, informative, and comprehensive book on the Kalpasūtras is Jan Gonda’s *The Ritual Sutras* (Wiesbaden, 1977), vol. 1, pt. 2, of *History of Indian Literature*, edited by Jan Gonda. Some of the Gṛhyasūtras and Dharmasūtras are available in English translation in volumes 2, 14, 19, and 30 of the series “Sacred Books of the East” (Oxford, 1879–1910), edited by F. Max Müller.

LUDO ROCHER (1987)  
*Revised Bibliography*

**SUZUKI, D. T.** (1870–1966), also known as Suzuki Daisetsu Teitarō, Buddhist scholar, prolific author, and itinerant lecturer, remains the single most important figure in the popularization of Zen in the twentieth century. At the time of his death in 1966, Suzuki had authored dozens of volumes on Zen and Buddhism in English and had produced an even greater oeuvre in his native Japanese. His writings on Zen remain influential in the West, and translations of his work into Korean, Chinese, and other Asian languages have contributed to a resurgence of popular interest in Zen throughout East Asia. Suzuki’s accomplishments as a scholar, popularizer, and evangelist are remarkable, given that his philological skills were acquired largely on his own and that he had no formal credentials as a Zen teacher. (Whereas he was a serious lay practitioner, he neither ordained as a priest nor received Dharma transmission.) He owed his success to his considerable intellectual and linguistic gifts, his seemingly boundless enthusiasm and energy, his prodigious literary output, and his having the right message at the right time.

**EARLY YEARS.** Born Suzuki Teitarō in the town of Kanazawa (Ishikawa prefecture) on October 18, 1870, Suzuki was the youngest of five children. (The name Daisetsu or “great simplicity” was given to him later by his Zen teacher Shaku Sōen [1859–1919].) Suzuki’s family belonged to the Rinzaï sect of Zen, but Suzuki credited his own serious interest in Buddhism to the influence of his high-school mathematics teacher Hōjō Tokiyori (1858–1929), a student of the Zen master Imakita Kōsen (1816–1892). Hōjō was also responsible for introducing Zen to Nishida Kitarō (1870–1945), a classmate and friend of Suzuki who would later emerge as Japan’s preeminent modern philosopher.

Suzuki’s father, a physician, died soon after Suzuki’s fifth birthday, and in 1889 Suzuki was forced to leave school and a probable career in medicine owing to his family’s ongoing financial difficulties. Suzuki made a living for a while as a primary school English teacher and in 1891 entered the Tokyo Senmon Gakkō, later renamed Waseda University. Later that same year, at the urging of his friend Nishida, Suzuki transferred to Tokyo Imperial University, and at the

same time began to practice Zen with Kōsen at Engakuji, an important Rinzai monastery in Kamakura. When Kōsen died in 1892, Suzuki continued his Zen practice under Kōsen's successor, Shaku Sōen.

Both Kōsen and Sōen were pivotal figures in the revival of Zen following the government-sanctioned persecution of Buddhism in the 1870s. Progressives like Kōsen and Sōen sought to broaden Buddhism's appeal, opening the doors of their monasteries to laypersons, encouraging secular education, and promoting an ecumenical attitude toward other Buddhist schools. (Sōen himself spent three years in Ceylon studying Pali Buddhism with Kōsen's blessing.) Suzuki took advantage of the liberal atmosphere at the Engakuji *zendō* (meditation hall), and it was through Sōen that Suzuki, who had considerable facility in English, became familiar with Occidental writings on Buddhism.

**INFLUENCES.** Suzuki's life took a turn in the early 1890s when he became acquainted with the writings of Paul Carus (1852–1919), an offbeat German philosopher and writer who had emigrated to the United States and was working as a writer and editor for Open Court Press in La Salle, Illinois. Suzuki's contact with Carus came by way of Sōen, who met Carus at the 1893 Chicago World's Parliament of Religions. (Sōen attended as a member of the Japanese Buddhist delegation, and his speech to the Parliament had been translated into English by Suzuki.) Carus was in Chicago covering the Parliament for his journal, *Open Court*, and was so impressed by Sōen and the other Buddhist representatives that he became an ardent champion and exponent of Buddhism in his publications. Soon after the Parliament Carus sent Sōen some of his books, including a somewhat bowdlerized compendium of Buddhist scriptures entitled *Gospel of Buddha* (1894). Sōen, who knew little English, passed the *Gospel* on to Suzuki, who was immediately taken by Carus's depiction of the Buddha as an eminently rational figure who eschewed religious institutions and meaningless ritual. Suzuki produced a Japanese translation of the *Gospel* and wrote to Carus expressing praise for his understanding of Buddhism. Carus responded by sending Suzuki more of his publications, including his book *The Religion of Science* (1893). Shortly thereafter, at Suzuki's request, Sōen wrote to Carus saying that Suzuki "has been so greatly inspired by your sound faith which is perceptible in your various works that he earnestly desires to go abroad and to study under your personal guidance." Carus agreed at once to Sōen's request and promised to help Suzuki pay for the trip by offering him employment as his personal assistant.

It is not surprising that Suzuki, a talented student of Western philosophy and a lay practitioner of Zen, should have been attracted to Carus's writings. Carus was passionately devoted to the reconciliation of science and religion, and his approach to Buddhism rendered it wholly commensurate with the modernist, rationalist, and scientific outlook that dominated university campuses in Meiji, Japan.

Suzuki arrived in America in 1897 and went on to spend some eleven years in La Salle, earning his keep as translator and proofreader at the Open Court Press. His life there was by no means easy—he was obliged to perform domestic services for the Carus household and he was provided with little remuneration for the long hours he put in at the press. By the time Suzuki was ready to return to Japan, he appears to have grown disillusioned with his eccentric host, and he rarely mentions Carus in later writings.

Whatever Suzuki's personal relationship may have been with his employer, Carus's philosophy left its mark on him. Carus's interest in monism, his evolutionary approach to religion, and his attempt to reconcile religion and science are all in evidence in Suzuki's later writings on Buddhism. But Carus was not the only influence on Suzuki during his years in La Salle. Open Court Press published two leading intellectual journals, *Open Court* and *The Monist*, and through them Suzuki encountered the writings of many prominent philosophers of the day, including Charles Sanders Peirce (1839–1914) and William James (1842–1910). James's book *The Varieties of Religious Experience* (1902) was responsible in part for Suzuki's later emphasis on Zen as a form of religious mysticism predicated on "pure experience."

Upon returning to Japan in 1909, Suzuki held a series of lectureships in English at Gakushuin (1909–1921) and Tokyo Imperial University (1909–1914). In 1911 he married Beatrice Erskine Lane (1878–1939), a native of Newark, New Jersey, and graduate of Radcliffe College and Columbia University, whom Suzuki had met four years earlier in the United States. The two had a son named Paul, but not much more is known about Suzuki's relationship with his wife. Clearly, they had many interests in common: in addition to having studied Western philosophy with William James and Josiah Royce, Lane was a Theosophist and student of religious mysticism. In Japan she turned her attention to Shingon, a school of Japanese Esoteric Buddhism, and went on to publish some of the earliest work on the subject in English.

Suzuki shared his wife's interest in theosophy, and in the 1920s their Japanese home served as a meeting place for a branch of the Order of the Star in the East. (The Order, an offshoot of the Theosophical Society founded in 1911, continued until 1929 when it was disbanded by its spiritual leader, Jiddu Krishnamurti [1895–1986].)

Theosophy was fashionable at the time, as was Swedenborgianism, a Christian movement based on the writings of the Swedish mystic and theologian Emanuel Swedenborg (1688–1772). Suzuki was enamored of Swedenborg for several years and was instrumental in the introduction of Swedenborgianism to Japan, both as an active member of the Japanese Swedenborg Society and as translator of four of Swedenborg's works. In 1910 Suzuki traveled to London to attend the international Swedenborg conference in the capacity of "Vice President," returned again in 1912 to continue his work for the Swedenborg Society, and in 1913 wrote

his own Japanese introduction to Swedenborg's life and teachings, dubbing him "the Buddha of the North." Whereas his passion for Swedenborg later cooled, his interest in Christian mysticism did not; his writings following the war are filled with appreciative discussions of the medieval Dominican mystic Meister Johannes Eckhart (c. 1260–1327/8).

In 1921 Suzuki moved to Kyoto to take a position as Professor of Buddhist Philosophy at Otani University, a university affiliated with the Shin denomination of Japanese Buddhism. (Suzuki had a life-long interest in Shin Pure Land teachings and published many works touting the unity of Zen and Pure Land thought.) Inspired in part by his experience with *Open Court* and *The Monist*, at Otani Suzuki launched the journal *Eastern Buddhist*, which was intended to serve as a non-sectarian vehicle for the propagation of Mahāyāna Buddhism. "Our standpoint," wrote Suzuki in the second issue of *Eastern Buddhist*, "is that the Mahāyāna ought to be considered one whole, individual thing and no sects, especially no sectarian prejudices, to be recognized in it, except as so many phases or aspects of one fundamental truth. In this respect Buddhism and Christianity and all other religious beliefs are not more than variations of one single original Faith, deeply embedded in the human soul" (Suzuki, 1921, p. 156).

**PHILOSOPHY OF ZEN.** Virtually all of Suzuki's later writings are attempts to elucidate this "one single original Faith," which he would come to understand as grounded in a transcultural, transhistorical, nondual religious experience lying at the core of all the major religions. The word "Zen," insists Suzuki, refers precisely to this singular transformative experience. That is to say, Zen is not Buddhism, not religion, not philosophy, not really anything that can be talked about at all. In his *An Introduction to Zen Buddhism* Suzuki writes: "Zen has no God to worship, no ceremonial rites to observe, no future abode to which the dead are destined, and, last of all, Zen has no soul whose welfare is to be looked after by somebody else and whose immortality is a matter of intense concern with some people. Zen is free from all these dogmatic and 'religious' encumbrances" (Suzuki, 1934, p. 14).

The claim that true Zen is free of the trappings of religion might seem commonplace to contemporary students of Buddhism, but it is nonetheless a rather peculiar way to characterize a tradition that placed tremendous emphasis on monastic ritual and liturgy, on funerary rites for the welfare of the deceased, on literary accomplishment, and on the formal veneration of a host of buddhas, *bodhisattvas*, and religious patriarchs. Suzuki's characterization of Zen as something that transcends religious and cultural differences must be understood as the result of his life-long effort to synthesize a variety of religious and philosophical traditions, both Buddhist and non-Buddhist, Eastern and Western. If his presentation of Zen seems unremarkable to us today, it testifies to the enduring legacy of Suzuki and his intellectual heirs.

Suzuki's claim that Zen refers to a universal mystical experience is considered by many modern scholars and Zen

masters alike as an oversimplification, however well intentioned. More troubling, however, is Suzuki's insistence that Zen constitutes the very essence of Japanese culture. Suzuki began emphasizing the connection between the Japanese cultural experience and the experience of Zen in the 1930s as part of his claim that the Japanese are more evolved spiritually than other peoples, including their Asian neighbors. Japanese life is, according to Suzuki, inherently "Zen-like," and thus the Japanese are naturally predisposed to Zen understanding.

Suzuki's attempts to ennoble Japanese culture must be understood within the context of the times—his writings on the subject first appear just as Japan's imperial ambitions were reaching new heights, and their armies were driving deeper into Korea, Manchuria, and China. Suzuki's extensive writings touting the innate spirituality of the Japanese, and linking this spirituality with the warrior ethos, were in keeping with popular sentiments of the day. (The Zen establishment was, on the whole, an enthusiastic supporter of Japanese colonial expansion.) As the war progressed, so did the extravagance of some of Suzuki's claims. In 1944, for example, between trips to the air-raid shelter, Suzuki wrote a book called *Japanese Spirituality*, which argued that true Zen is not a product of China, much less India, but rather emerged out of the meeting of Buddhism and Japanese culture in the Kamakura period. Suzuki was fully aware of the Indian and Chinese roots of Zen, having written extensively on the topic, but here he insists that true Zen is not a "natural expression" of those cultures, and thus it was not until Zen came to Japan that it was fully realized. Besides, in Suzuki's mind Zen had long since disappeared on the continent. In so far as such statements would have lent credibility to Japan's sense of spiritual mission in Asia, Suzuki could understandably be construed as supporting the ongoing military campaign.

After the Japanese defeat, Suzuki claimed to have been opposed to the war; he said that he believed losing the war was in Japan's own best interests. Private letters to friends written prior to the war substantiate Suzuki's claims: they express his reservations about Japanese militarism, and his disgust with excessive public displays of patriotic zeal. Nevertheless, some Japanese intellectuals such as Umehara Takeshi (1925–) took umbrage with Suzuki: if Suzuki was so opposed to the war effort, why did he—a student of Zen who claimed to have attained satori—not speak out openly?

**IMPACT.** Be that as it may, Suzuki's lifelong effort to impart his love of Zen and Japanese culture must be deemed a resounding success. Following the war he continued to travel to Europe and America, sometimes for extended periods of time. He was a popular lecturer, speaking at college campuses around the world, and from 1951 to 1957 he held a series of professorships at Columbia University. And he was, above all else, an indefatigable writer, producing over thirty volumes in English and even more in Japanese. Whereas much of Suzuki's writings were intended for a popular audience,

he did make substantial contributions to Buddhist scholarship. His three-volume study of the *Laṅkāvatāra Sūtra* published in the 1930s, for example, remains the most comprehensive work on the subject to date, and Zen scholars continue to consult his editions of important Dunhuang manuscripts.

Suzuki's work made a significant impact not only among those interested in the study of religion, but also among theologians, philosophers, writers, artists, and musicians. In his preface to *Outlines of Mahāyāna Buddhism* Alan Watts reported that as early as 1927 James Bissett Pratt had observed "there are two kinds of cultured people: those who have read Suzuki and those who have not" (Suzuki, 1963, p. xv). By the 1950s there seem to have been relatively few of the latter, as is evident from the flattering profile of Suzuki in the August 31, 1957, issue of the *New Yorker*. His influence on the beat poets is well known. According to William Barrett in his *Zen Buddhism: Selected Writings of D. T. Suzuki*, the German philosopher Martin Heidegger (1889–1976) remarked, "If I understand this man correctly, this is what I have been trying to say in all my writings" (Barrett, 1956, p. xi). Suzuki's English works, such as *Zen and Japanese Culture* (first published as *Zen Buddhism and Its Influence on Japanese Culture*, 1938)—a book that unapologetically celebrates the unique spiritual gifts of the Japanese and the sublime affinity between Zen and Japanese martial culture—continue to capture the imagination of new generations of readers. Whereas more traditional Zen teachers may dismiss Suzuki for his intellectualism or for his lack of proper Zen credentials, they have Suzuki to thank for the currency of Zen in the West.

ROBERT H. SHARF (2005)

**SUZUKI SHŌSAN** (1579–1655) was a Japanese Buddhist monk known for his advocacy of *Niō-zazen*, a meditative technique drawing upon both Zen and Pure Land methodologies. Shōsan was a bodyguard retainer (*hatamoto*) of Tokugawa Ieyasu and fought in the crucial battles that gave the Tokugawa family control of all Japan. In 1620, a few years after Ieyasu's death, Shōsan tonsured himself as a Zen monk, favoring the Sōtō sect. Yet he never formally became affiliated with any sect and soon set himself up as the master of a small temple and meditation center called Onshinji some miles out of Okazaki, near Asuke, his birthplace. After six or seven years there, he moved to the Edo (Tokyo) vicinity, where he lived the rest of his life as a semi-itinerant teacher and writer.

Although Shōsan was well known in Zen circles, his influence was negligible for two reasons: He never became an official member of any sect, and his meditational methods and emphasis were nontraditional. He became widely known then and later for his so-called *Niō-zazen*. This "method" takes its name from Shōsan's use as models for meditation the images of the two fierce warrior-gods (Niō) that guard the entrance of many Buddhist temples in Japan, rather than the quietly seated Nyorai image. He also suggested as a model Fudo, the "angry" Buddha portrayed as wreathed in flames and with sword and lasso in either hand.

The reasons for this advocacy are given clearly by Shōsan. For beginners in meditation—and he considered every contemporary, including himself, as such—the Nyorai model was too passive. It did not embody the fierce energy necessary for successfully engaging in the hand-to-hand combat with one's self-love, which is essential for productive meditation. Hence he recommended setting the back teeth, tightly clenching the fists, scowling with a warrior's fierce glare, and repeating the Pure Land Nembutsu vigorously, all the while thinking, "I am about to die."

Although unique to Shōsan, *Niō-zazen* was not simply a casual mixture of Pure Land and Zen methodologies, as his detractors in both sects have alleged. Rather, it was a tangible embodiment of his dominant conviction that the Buddhist *dharma* must be made available to the masses in the most effective form, regardless of sectarian tradition. He was persuaded that Buddhism was being misperceived and bypassed as a passive, other-worldly faith in favor of "practical" and "useful" Confucianism. *Niō-zazen* was one way of combating this. But even more fundamentally, he sought to integrate Buddhism into the daily life of samurai, farmer, artisan, and merchant. He preached the inherent sanctity of all honest labor as Heaven's appointment for earthly life. By so regarding it, and by combining daily activities with the continual saying of the Nembutsu, one could cut off evil thoughts, accumulate merit, and begin to walk the Buddha's way toward enlightenment. Hence he preached that all work could be made into Buddha work; that is, into genuine religious discipline.

This fusion of the sacred and the secular in daily life, made practical and specific in its form, was Shōsan's most important contribution to Buddhism. It is not to be seen as a mere assertion of the innate sacrality of the secular and the profane, regardless of religious tradition. It is an assertion of the potential sacredness of all human effort and a strong protest against a Buddhism interpreted as otherworldly detachment in the name of a religious transcendence of time and space.

#### BIBLIOGRAPHY

The English-language discussions of Suzuki Shōsan are meager. There is one volume, *Selected Writings of Suzuki Shōsan*, translated by Royal Tyler (Ithaca, N.Y., 1977), which is a serviceable treatment with substantial footnotes and a brief introductory treatment of Shōsan. Hajime Nakamura has dealt briefly with him in *A History of the Development of Japanese Thought*, vol. 2, *From 592 to 1868* (Tokyo, 1967), and "Suzuki Shōsan, 1579–1655, and the Spirit of Capitalism in Japanese Buddhism," *Monumenta Nipponica* 22 (1967): 1–14. Two essays, "Suzuki Shōsan, Wayfarer" and "Selections from Suzuki Shōsan," translated by Jocelyn and Winston King, appear in the *Eastern Buddhist* 12 (October 1979). See also my chapter "Practising Dying: The Samurai-Zen Death Techniques of Suzuki Shōsan," in *Religious Encounters with Death*, edited by Frank E. Reynolds and Earle H. Waugh (University Park, Pa., 1977), pp. 143–158, and my *Death Was His Kōan: The Samurai-Zen of Suzuki Shōsan* (Berkeley, Calif., 1985), which is a substantial treatment of Shōsan's life, thought, meditational method, and embodiment of Tokugawa social and religious values.

WINSTON L. KING (1987)  
*Revised Bibliography*

**SVENTOVIT** was the four-headed "god of gods" (*deum deus*) of the pre-Christian northwestern Slavs. His name, \**Sventovit*, is variously written—as *Sventovit*, *Svantevit*, *Suatovitus*, and, in the *Knythlingasaga* (c. 1265), *Svantaviz*—but his cult is precisely described in the *Gesta Danorum* (14.564) of Saxo Grammaticus (late twelfth century).

The center for the worship of Sventovit was in Arkona, on the Baltic island of Rügen. In the center of town was the citadel-temple, a wooden structure of consummate workmanship, built with logs and topped by a red roof. Inside the surrounding fence was a barbican, whose four posts stood free of the outer walls of the temple and adjoined some of the beams of the roof. The inner chamber, partitioned by heavy tapestries, held an enormous statue of Sventovit. Its four heads and necks were joined together: facing north, south, east, and west, they apparently corresponded to the four columns of the barbican. The faces were beardless and the hair short. The statue's right hand held a drinking horn inlaid with various metals; the left was set akimbo. A close-

fitting mantle, reaching to the idol's knees, was made of several kinds of wood. The idol stood on the temple floor, with its base hidden in the ground below. Nearby lay the god's bridle and saddle, along with an enormous sword whose blade and scabbard were richly chased and damascened with silver.

A retinue of three hundred horsemen served Sventovit, and the plunder they won in war went to the head priest. Saxo mentions that tribute was paid not only by the Wends but also by the Scandinavians. In time, a treasure of incredible value was amassed; when the Christian Danes stormed Arkona in 1168, they removed the statue and carried away seven boxes of treasure, including two gold beakers.

A white horse consecrated to Sventovit was venerated as an incarnation of the god himself. Success or failure in war was foretold through the horse in the following manner: three rows of palings or lances were laid by the priest in front of the temple; if the horse stepped across the first row with its right foot first, the omen was favorable. The prophetic role of the horse in the divination ceremonies of the northwestern Slavs is confirmed by its magic function in Russian popular tradition, particularly by the traditional horse epithet, *veshchii* ("seer"), which has an exact correspondence in the Avesta.

Shortly after harvest, a great festival was held in honor of Sventovit. Cattle were sacrificed, and prophecies were made from the quantity of mead that remained in the drinking horn held by the god: if the liquid had diminished during the previous year, a bad harvest was predicted for the next. At the end of the ceremony, the priest poured the old liquid out at the god's feet and refilled the vessel, asking the god to bestow victory on the country and to increase its wealth. Then a man-sized festal cake was brought in. Placing the cake between himself and the people, the priest asked if he was still visible; if the people answered in the affirmative, the priest expressed the wish that they would not be able to see him the next year. This ceremony was believed to ensure a better harvest for the following year. (Similar customs of foretelling the future from gigantic cakes are known among Belorussians and Russians in the twentieth century.)

Disposition of the Sventovit idol from Rügen is unknown. In 1857 a carved wooden post was discovered in Zbruch, near Husjatyn in southeastern Poland, that bears a striking resemblance to Saxo's description. Carved on all four sides, in four registers, it shows four terminal figures, one of which holds a drinking horn. Another four-headed statue, called Chetyrebog ("four-god"), stood in Tesnovka, near Kiev, until 1850. Prehistoric stone stelae depicting the same god, helmeted and holding a cornucopia in the right hand, and occasionally with a horse engraved on the back, are known from various Slavic territories. A stela from Stavchany, in the upper Dniester Basin, can be dated to the fourth to sixth century CE, but most of the finds are accidental and undated.

West Slavic four-headed military gods were variously named, but in fact they probably represent one multifaceted god, the archetypal Indo-European god of heavenly light. The gods Svarozhich, Iarovit, Porovit, and Sventovit, worshiped in West Slavic temples of the eleventh and twelfth centuries, seem to represent the seasonal aspects of the sun: the winter or “young” sun (Svarozhich), the spring sun (Iarovit), the summer sun (Porovit), and the harvest sun (Sventovit). The Roman Janus Quadrifons (“four-faced”) is a parallel, as is the Iranian four-faced warrior god Vere-thraghna.

MARIJA GIMBUTAS (1987)  
*Revised Bibliography*

**SWAMINARAYAN MOVEMENT.** Chronologically located between the “bhakti renaissance” of the medieval period and the early to mid-nineteenth-century Hindu revivalism of colonial India, the Swaminarayan movement is a devotional tradition rooted in Vaiṣṇavism and arising out of Gujarat in western India. The spread and transnational growth of specific Swaminarayan sects demonstrate how a regional expression of Hindu devotionalism, in accommodating to larger political and social changes, has succeeded in providing meaningful ways of being Hindu in the diasporic context.

**SWAMINARAYAN ORIGIN NARRATIVE.** All Swaminarayan sects connect their devotional tradition to the historical person of Sahajanand Swami (1781–1830 CE), who was born near Ayodhya, Uttar Pradesh, in northern India. His biography is the basis for the Swaminarayan origin narrative, one that combines hagiography with historically confirmed persons, events, and places.

According to Swaminarayan tradition, the young Sahajanand Swami was known as Ghanshyama. Following the death of his parents when he was eleven years old, he embarked on a phase of wandering. He attracted attention for his textual knowledge (evidenced by his winning debates with older religious scholars), asceticism (adoption of *brahmacarya* vows of celibacy), and performance of austerities (*tapas*), an example of which involved standing on one leg for four months while clad only in a loincloth. At the age of nineteen, Ghanshyama, now known as Nilkantha, arrived in Saurashtra, the peninsular area of southern Gujarat. Here he encountered Mukhtananda Swami, the senior ascetic of a group whose head preceptor (*guru*), Ramananda Swami, was temporarily away. He asked Mukhtananda the questions he had asked during his encounters with ascetics throughout India; receiving satisfactory answers, Nilkantha ended his period of wandering. On October 28, 1800, he was initiated by Ramananda Swami and given two names, “Sahajanand” and “Narayan Muni.” Not long thereafter Ramananda Swami, in spite of opposition from his followers, designated the young Sahajanand Swami as his successor.

The beginning of the Swaminarayan movement dates to 1801 when Sahajanand Swami became the leader of Ramananda’s group. Swaminarayan literature records that “Swami Narayan” quickly became known for his teachings, which emphasized moral, personal, and social betterment. He traveled throughout the Gujarat region, outlining his behavioral expectations along gender lines and according to social groups, from laity to ascetics and political leaders. Though his followers record that he was against caste, Sahajanand Swami’s teachings did not openly advocate the dissolution of caste or the abandonment of commensal rules. For both laity and ascetics, he supported *varṇāśramadharmā*, or the fulfillment of duties according to caste, social class, and gender. He prescribed nonviolence, abstinence from intoxicants, strict vegetarianism (including no onion or garlic), sexual continence, and frugal living. Sahajanand Swami’s social reform centered on the “uplift” of all peoples and ranged from the promotion of literacy for men and women to providing assistance to famine sufferers. By age twenty-five, he had an order of five hundred male *sādhus* (ascetics) who, notwithstanding the special rules requiring ascetics to avoid all contact with women, were responsible for spreading his message and consolidating the growing numbers of Swaminarayan *satsaṅgīs* (devotees).

During Sahajanand Swami’s lifetime Gujarat came under British control. The Swaminarayan movement became further known for its campaigns against early child

marriage, widow immolation (*satī*), and female infanticide, all practices that had excited concern among the indigenous intelligentsia and colonial administrators of the established Bengal Presidency. Because of his reputation for being a social progressive, Sahajanand Swami attracted the interest of and subsequently met Bishop Reginald Heber, the Lord Bishop of Calcutta, and John Malcolm, governor of the Bombay Presidency. By the time of his death at the age of forty-nine on June 1, 1830, Sahajanand Swami was considered by his many *satsaṅgīs* to be *Bhagavān* (Lord) Swaminarayan, the highest manifestation of reality.

**THE ORIGINAL SWAMINARAYAN MOVEMENT.** From its early days, the Swaminarayan movement was noted for its organizational capacities and rationalized methods for transmitting its practices and prescriptions. *Sādhus* compiled Sahajanand Swami's discourses, maintained records of his activities, and collected together commendatory letters written by colonial administrators. Among his innovations, Sahajanand Swami established an institutional structure that provided for the perpetuation of the Swaminarayan *satsaṅg*, the community of followers-in-truth. Two administrative seats (*gāddī*), outlined in the *Lekh*, a text written by Sahajanand Swami, were established by dividing India into northern and southern juridical territories. The Ahmedabad temple was designated administrative head of the northern seat and the Vadatal temple, the center for the southern seat. Being celibate, Sahajanand Swami installed two nephews as *ācāryas* (preceptors) in the administrative seats and specified that the sons of the *ācāryas* would preserve these hereditary positions. The two hereditary lines and *gāddīs* still exist, although the migration of devotees has necessitated their merger into one organization (the International Swaminarayan Satsang Organization) for the overseas communities. The *ācāryas* oversee the temples, *sādhus*, and *satsaṅgīs* in their respective *gādis*. Further duties include the administration of the Swaminarayan *mantra* for new male initiates, installation of temple icons, and management of the *gāddī*'s material wealth.

Another distinction of the Swaminarayan movement is the clear separation of men and women (*strī-puruṣa maryādā*) in all temple activities and to some extent in social life as well. Swaminarayan temples have separate entrances for men and women. Though women can take the vow of celibacy, there is no comparable order of *sādhvīs* (female renunciates). The wives of *ācāryas* have substantial duties paralleling their husbands: they are responsible for teaching and overseeing the activities of women *satsaṅgīs* and for administering the Swaminarayan *mantra* (for women only).

Whereas the early *satsaṅgīs* were from a wide variety of castes and class backgrounds, later members came increasingly from the emerging Patidar farmer caste, who were finding commercial success in agriculture and entrepreneurial activities. In the years following Sahajanand Swami's death, the cooperative relationship between Swaminarayan *ācāryas*, *sādhus*, and householders and the British allowed for favorable reciprocation such as temple land grants and festival per-

mits. Scholars of modern Gujarat history are critical of this cooperation, arguing that the Swaminarayan movement's alignment with the British reflected its bias toward promoting its own caste and class interests at the expense of other groups either unable or unwilling to yield to Anglo-colonial hegemony. Indeed, Swaminarayan history does not show much evidence of protest against the colonial presence.

**NEW SWAMINARAYAN SECTS.** As it happened, the greatest schism in the Swaminarayan movement was prompted not by outsiders but came from within. In 1906 a *sādbhu*, Swami Yagnapurushdas, left the Vadatal temple. In 1907 he established the first new Swaminarayan sect, the Bochasanwasi Shri Akshar Purushottam Swaminarayan Sanstha (BAPS). Headquartered in Ahmedabad, Gujarat, BAPS claims over one million followers worldwide including both laity and ascetics. With its religious leaders and membership drawn from a wide caste background, caste distinctions in this new sect are of less concern than in the original Swaminarayan *gāddīs*. As part of its social reform activity, BAPS has established temples and charitable projects in *dalit* (formerly referred to as Untouchables or *harijan*) and *adivasi* (autochthonous groups or tribal communities) villages in Gujarat. More so than the original sect, BAPS is a global movement and, early on, it embraced new technologies to support its transnational growth. It runs a large publishing house and music recording studio, and employs systematic methods for training *sādhus* and laity in Swaminarayan *bhakti*. Additionally, BAPS upholds the movement's connection to social reform through a variety of programs and campaigns, such as anti-addiction and anti-dowry events, disaster relief, temple building, and the sponsorship of public festivals. BAPS activities are not always without controversy, as in its open support of the Sardar Sarovar dam project in Gujarat. For its supporters, the Sardar Sarovar dam and the multi-dam Narmada Valley Development Project of which it is a key component are intended to increase power capacity and provide irrigation, cleaner drinking water, and flood control; for its opponents, the dam is environmentally and socially disastrous and is purchased at the cost of submerging a high percentage of *dalit* and *adivasi* villages. The wealthy BAPS organization is criticized by dam opponents for acting to protect its class interests, including those of its land holding members. In response, BAPS followers who are familiar with the Narmada controversy point to the various village relocation and community rehabilitation projects voluntarily instigated and funded by BAPS.

In addition to BAPS's break from the original Swaminarayan *satsaṅg*, other schisms have occurred. In 1966 a handful of East African BAPS followers broke away and founded the Yogi Divine Society. Additionally, *sādhus* from the original movement have left to form their own institutions that sometimes (e.g., Swaminarayan Gurukuls) but not always (e.g., Swaminarayan Gadi) retain an affiliation with their *gāddī*.

**SWAMINARAYAN TEXTS AND THEIR INTERPRETATION.** Two core texts, the *Vachanamritam* (*Vacanāmṛta*) and *Shiksha-*

*patri* (*Śikṣāpatri*), provide the foundation for Swaminarayan *bhakti*. Other important texts include hagiographies *cum* histories such as the *Satsaṅgīvanam*, which elaborate on Sahajanand Swami's life story and teachings. The *Vachanamritam* is the first Gujarati vernacular text and consists of 262 discourses given by Sahajanand Swami between 1819 and 1829 and recorded by senior *sādhus*. The *Shikshapatri*, authored by Sahajanand Swami in 1826 and originally written in Sanskrit, is a listing of 212 precepts, a code of behavior for Swaminarayan followers. As the most accessible of Swaminarayan texts, the *Shikshapatri* is also the most controversial: its precepts range from the practical to the political, from matters of bodily hygiene and money management, to advice on coping with unjust rulers. This small manual is accountable in part for the "puritanical" image of the Swaminarayan movement.

The philosophical foundation for Swaminarayan devotionalism is the *viśiṣṭādvaita*, or qualified non-dualism, of Rāmānuja (1017–1137 CE). Sahajanand Swami expanded Rāmānuja's delineation of three separate and eternal existential entities into five, namely *parabrahman*, *brahman*, *māyā*, *īśvara*, and *jīva*, but was most focused on the relationship between *parabrahman*, *brahman*, and *jīva*. As explained in the *Vachanamritam*, *parabrahman* (synonymous with *puruṣottama*) is the highest existential entity and is never formless: it possesses the power of immanence and action (*antaryāmīśakti*) and manifests itself in a distinctly human form. *Brahman* (synonymous with *akṣara* and *akṣara-brahman*) is the second-highest reality and, in its formless state, is known as *akṣaradhāma*, the all-prevailing and unfathomable abode of *parabrahman* and all released *jīva*. *Jīva* (also *ātman*) stands for the eternal, indivisible, and genderless entity, often translated as *soul*. Swaminarayan devotionalism offers release (*mokṣa*) attainable not through textual knowledge or correct ritual practices but through the recognition that Sahajanand Swami is himself *puruṣottama*, that is the highest existential reality, who appears in human form, and who resides in *akṣaradhāma*. As the highest reality, Sahajanand Swami is thus not an *avatāra* or descended form of a higher entity but the ultimate creator of all entities.

The most significant differences between the various sects in the Swaminarayan movement rest in the interpretation of who is *puruṣottama* and how to understand the relationship between this eternal entity with human-like form and *satsaṅgīs* whose devotional activities are motivated by the possibility that each individual *jīva* can potentially achieve eternal existence in *akṣaradhāma*, alongside *puruṣottama*. The *Vachanamritam*, *Shikshapatri*, and iconic representations in the six original Swaminarayan temples point to Kṛṣṇa (Krishna) as *puruṣottama*, the foremost entity to whom devotion must be directed. For original sect members, this does not necessarily disrupt the conviction that Sahajanand Swami is also *puruṣottama*, that is, Lord Swaminarayan, rather than an *avatāra* of Krishna. *Satsaṅgīs* explain this inconsistency by noting that Sahajanand Swami was careful to make

his divinity known only to those who were ready for this revelation. For the BAPS community, there is no ambiguity regarding the identities and relationship of *puruṣottama* to *akṣara*, the resolution of this distinction being the basis for the sect's founding.

In contrast to the textual interpretations of the original Swaminarayan *gāddī*, BAPS founder Swami Yagnapurushdas expounded a return to the "correct" understanding of Lord Swaminarayan's teachings, specifically that Sahajanand Swami is *puruṣottama* and his immanence is always present on Earth in the form of *akṣara* or *akṣarabrahman*, the "living guru." *Akṣara* is thus conceptualized as having two states, one with and one without form. In BAPS, the importance given to *akṣara* as form distinguishes its textual interpretation from the original *gāddīs*. *Akṣara* with form is visible and tangible as the contemporaneous living *guru*, the one who embodies *puruṣottama*'s immanence. Referred to variously as *akṣaraguru* and *akṣarabrahman* and commonly translated as "god-realized saint," the living guru and form of *akṣara* is always male.
