Manual of Petroleum Measurement Standards Chapter 17.1

Guidelines for Marine Inspection

SIXTH EDITION, JUNE 2014

AMERICAN PETROLEUM INSTITUTE

Special Notes

API publications necessarily address problems of a general nature. With respect to particular circumstances, local, state, and federal laws and regulations should be reviewed.

Neither API nor any of API's employees, subcontractors, consultants, committees, or other assignees make any warranty or representation, either express or implied, with respect to the accuracy, completeness, or usefulness of the information contained herein, or assume any liability or responsibility for any use, or the results of such use, of any information or process disclosed in this publication. Neither API nor any of API's employees, subcontractors, consultants, or other assignees represent that use of this publication would not infringe upon privately owned rights.

API publications may be used by anyone desiring to do so. Every effort has been made by the Institute to assure the accuracy and reliability of the data contained in them; however, the Institute makes no representation, warranty, or guarantee in connection with this publication and hereby expressly disclaims any liability or responsibility for loss or damage resulting from its use or for the violation of any authorities having jurisdiction with which this publication may conflict.

API publications are published to facilitate the broad availability of proven, sound engineering and operating practices. These publications are not intended to obviate the need for applying sound engineering judgment regarding when and where these publications should be utilized. The formulation and publication of API publications is not intended in any way to inhibit anyone from using any other practices.

Any manufacturer marking equipment or materials in conformance with the marking requirements of an API standard is solely responsible for complying with all the applicable requirements of that standard. API does not represent, warrant, or guarantee that such products do in fact conform to the applicable API standard.

Classified areas may vary depending on the location, conditions, equipment, and substances involved in any given situation. Users of this Standard should consult with the appropriate authorities having jurisdiction.

Users of this Standard should not rely exclusively on the information contained in this document. Sound business, scientific, engineering, and safety judgment should be used in employing the information contained herein.

API is not undertaking to meet the duties of employers, manufacturers, or suppliers to warn and properly train and equip their employees, and others exposed, concerning health and safety risks and precautions, nor undertaking their obligations to comply with authorities having jurisdiction.

Information concerning safety and health risks and proper precautions with respect to particular materials and conditions should be obtained from the employer, the manufacturer or supplier of that material, or the material safety data sheet.

Where applicable, authorities having jurisdiction should be consulted.

Work sites and equipment operations may differ. Users are solely responsible for assessing their specific equipment and premises in determining the appropriateness of applying the Standard. At all times users should employ sound business, scientific, engineering, and judgment safety when using this Standard.

Foreword

Nothing contained in any API publication is to be construed as granting any right, by implication or otherwise, for the manufacture, sale, or use of any method, apparatus, or product covered by letters patent. Neither should anything contained in the publication be construed as insuring anyone against liability for infringement of letters patent.

Shall: As used in a standard, “shall” denotes a minimum requirement in order to conform to the specification.

Should: As used in a standard, “should” denotes a recommendation or that which is advised but not required in order to conform to the specification.

This document was produced under API standardization procedures that ensure appropriate notification and participation in the developmental process and is designated as an API standard. Questions concerning the interpretation of the content of this publication or comments and questions concerning the procedures under which this publication was developed should be directed in writing to the Director of Standards, American Petroleum Institute, 1220 L Street, NW, Washington, DC 20005. Requests for permission to reproduce or translate all or any part of the material published herein should also be addressed to the director.

Generally, API standards are reviewed and revised, reaffirmed, or withdrawn at least every five years. A one-time extension of up to two years may be added to this review cycle. Status of the publication can be ascertained from the API Standards Department, telephone (202) 682-8000. A catalog of API publications and materials is published annually by API, 1220 L Street, NW, Washington, DC 20005.

Suggested revisions are invited and should be submitted to the Standards Department, API, 1220 L Street, NW, Washington, DC 20005, standards@api.org.

Contents

Introduction

These guidelines are intended to encourage uniform inspection practices for marine petroleum and chemical cargo quantity and quality control. Use of these guidelines will simplify the making of agreements for transferring petroleum and chemical cargoes and help ensure that the agreements can be clearly interpreted and executed between parties. The recommendations provided here are not intended to interfere in any way with provisions contrary to these guidelines that may exist in any contract or applicable recommended practices of other regulatory or standards bodies, nor are they intended to interfere with safety and environmental considerations or local conditions. These guidelines are not promulgated as the only acceptable method of custody transfer measurement or inspection practices. Guidelines for the inspection of marine cargo are subject to ongoing reappraisal and periodic change.

Measurement and sampling activities to be performed on board a vessel shall be accomplished in the presence of, or with the express permission of, the vessel's master or other appropriate authority. Activities to be performed at the loading and discharge shore facilities shall be accomplished in the presence of, or with the express permission of, the appropriate shore supervisory personnel.

For reasons of safety, only appropriate and approved equipment should be used. Local jurisdictional regulations regarding loading and unloading also shall be followed.

Guidelines for Marine Inspection

1 Scope

These guidelines specify the policy and minimum recommended practices for the manual and automatic measurement, sampling, and accounting for bulk quantities of crude oil (including spiked, blended, and reconstituted crude oil), petroleum products, and chemicals that are transported on marine vessels. The activities described in these guidelines include actions by producers, buyers, sellers, terminal operators, vessel owners and their crews, customs authorities, independent inspectors, and other parties with an interest in measurements.

Certain vessel or terminal configurations and cargo characteristics, particularly chemicals, may require extensive procedures and calculation methods not covered in this chapter.

Cargo calculations should be performed independently by the responsible parties and/or by their authorized representatives. The results of the quality determinations and quantity calculations should be compared and any differences resolved without delay. Each party involved in a custody transfer is responsible within their domain for contributing to a reconciliation of vessel and shore quantities and for seeking explanations for any discrepancies.

Any discrepancies relating to quality determination and/or calculated quantities should be recorded and reported to all interested parties. This procedure may be accomplished by issuance of a Letter of Protest (LOP) or Notice of Apparent Discrepancy. Every effort should be made to resolve discrepancies before the vessel departs.

The independent inspection report for the cargo custody transfer should be issued and distributed promptly.

These procedures are equally valid and applicable for either metric or customary units of measurement, provided that the same types of units are used consistently.

2 Normative References

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms and Definitions

For the purposes of this document, the following definitions apply.

3.1
API Gravity
A means used by the petroleum industry to express the density of petroleum liquids. The relation between API Gravity and relative density (formerly called specific gravity):

API Gravity at 60 °F = 141.5/(Relative Density 60 °F/60 °F) – 131.5

3.2
automatic sampler
A device used to extract a representative sample from the liquid flowing in a pipe. The automatic sampler generally consists of a probe, a sample extractor, a flow meter, a controller, and a sample receiver.

3.3
ballast
The water that is taken on when a vessel is empty or partly loaded to increase draft to properly submerge the propeller, maintain stability and trim, or meet air draft restrictions.

3.4
Cargo Quantity Option Certificate
A certificate signed by vessel and shore representatives acknowledging the amount of cargo intended to transfer. Generally, most product cargoes have a tolerance based on either supplier, receiver, or vessel capabilities. Each party involved with the transfer shall agree to the quantity to be transferred.

3.5
clingage
The liquid film that adheres to the inside surface of a container after it has been emptied.

3.6
crude oil washing
COW
See **tank washing**.

3.7
draft
The depth of a vessel below the water line measured from the surface of the water to the bottom of the vessel's keel.

3.8
free water
FW
The volume of water present in a container that is not in suspension in the contained liquid (oil). [See the definition of **sediment and water (S&W)**.]

3.9
gross observed volume
GOV
The total volume of all petroleum liquids and S&W, excluding free water (FW), at observed temperature and pressure.

3.10
gross standard volume
GSV
The total volume of all petroleum liquids and S&W, excluding FW, corrected by the appropriate volume correction factor (Ctl) for the observed temperature and API Gravity, relative density, or density to a standard temperature such as 60 °F or 15 °C. If applicable, correct with pressure correction factor (Cpl) and meter factor.

3.11
gross standard weight
GSW
The total weight of all petroleum liquids and S&W (if any), excluding FW, as determined by applying the appropriate weight conversion factors to the gross standard volume (GSV).

3.12
indicated volume
The change in meter reading that occurs during a receipt or delivery.

3.13
inerting
A procedure used to reduce the oxygen content of a vessel's cargo spaces by introducing an inert gas such as nitrogen, carbon dioxide, or a mixture of gases such as processed flue gas.

3.14
innage gauge [dip (sounding)]
The measured distance from the surface of the liquid to a fixed datum plate or to the tank bottom.

3.15
Letter of Protest (LOP) or Notice of Apparent Discrepancy
A letter issued by any participant in a custody transfer citing any condition in dispute. This serves as a written record that the particular action or finding was questioned at the time of occurrence.

3.16
line fullness verification
Verifying the fill condition of the shore and vessel cargo transfer lines before and/or after a cargo transfer (see API *MPMS* Ch. 17.6).

3.17
list
The leaning or inclination of a vessel, expressed in degrees port or starboard away from the vertical.

3.18
list correction
The correction applied to the observed gauge or observed volume when a vessel is listing, provided that liquid is in contact with all bulkheads in the tank. Correction for list may be made by reference to the vessel's list correction tables for each tank or by mathematical calculations.

3.19
load on top
Defined as both a procedure and a practice.

<practice>
Load on top is the act of commingling onboard quantity (OBQ) with cargo being loaded.

<procedure>
Load on top is the shipboard procedure of collecting and settling water and oil mixtures resulting from ballasting and tank cleaning operations (usually in a special slop tank or tanks), and subsequently loading cargo on top of slops and pumping the mixture ashore at the discharge port.

3.20
net standard volume
NSV
The total volume of all petroleum liquids, excluding S&W and FW, corrected by the appropriate volume correction factor (Ctl) for the observed temperature and API Gravity, relative density, or density to a standard temperature such as 60 °F or 15 °C. If applicable, correct with pressure correction factor (Cpl) and meter factor.

3.21
net standard weight
NSW
The total weight of all petroleum liquids, excluding S&W and FW, determined by deducting the S&W weight from the gross standard weight (GSW).

3.22
observed reference height
The distance actually measured from the tank bottom or datum plate to the established reference point.

3.23
onboard quantity
OBQ
The material present in vessel's cargo tanks, void spaces, and pipelines before the vessel is loaded. OBQ may include any combination of water, oil, slops, oil residue, oil/water emulsions, and sediment.

3.24
reference height
The distance from the tank bottom or datum plate to the established reference point or mark.

3.25
reference point
The point from which the reference height is determined and from which the ullage/innages are taken.

3.26
remaining on board
ROB
The material remaining in a vessel's cargo tanks, void spaces, and pipelines after the cargo is discharged. ROB quantity may include any combination of water, oil, slops, oil residue, oil/water emulsions, and sediment

3.27
sediment and water
S&W
The non-hydrocarbon solid material and water in suspension in petroleum liquid. S&W is measured by the techniques described in API *MPMS* Ch. 10.1, Ch. 10.2, Ch. 10.3, Ch. 10.4, Ch. 10.5, Ch. 10.6, Ch. 10.7, Ch. 10.8, and Ch. 10.9.

3.28
slops
Oil, oil/water/sediment, and emulsions contained in slop tanks or designated cargo tanks. The mixture usually results from tank stripping, tank washing, or dirty ballast phase separation.

3.29
stop gauge
A pre-transfer determination of a specific volume of cargo represented by a specific tank level, which, when reached, results in cargo completion of the transfer. This determination may be done by either shore or vessel personnel.

3.30
tank washing
Divided into the following two types of activities.

a) Water washing involves the use of a high-pressure water stream to dislodge clingage and sediment from the bulkheads, bottom, and internal tank structures of a vessel.

b) Crude oil washing (COW) involves the use of a high-pressure stream of the crude oil cargo to dislodge or dissolve clingage and sediment from the bulkheads, bottom, and internal tank structures of a vessel during the discharge operation.

c) Other types of vessel tank washing involve the use of a high-pressure stream of cargo or various agents to dislodge or dissolve clingage and sediment from the bulkheads, bottom, and internal tank structures of a vessel during the discharge operation.

3.31
total calculated volume
TCV
The total volume of all petroleum liquids and S&W, corrected by the appropriate volume correction factor (Ctl) for the observed temperature and API Gravity, relative density, or density to a standard temperature such as 60 °F or l5 °C. If applicable, correct with pressure correction factor (Cpl) and meter factor and all FW measured at observed temperature and pressure (GSV plus FW).

3.32
total observed volume
The total measured volume of all petroleum liquids, S&W, and FW at observed temperature and pressure.

3.33
trim
The condition of a vessel with reference to its longitudinal position in the water. It is the difference between forward and aft drafts and is expressed “by the head” or “by the stern.”

3.34
trim correction
The correction applied to the observed gauge or observed volume when a vessel is not on an even keel, provided that the liquid is in contact with all bulkheads in the tank. Correction for trim may be made by referencing trim tables for each tank or by mathematical calculation.

3.35
ullage gauge (or outage)
The measured distance from the cargo liquid surface to the reference point.

3.36
Vessel Experience Factor
VEF
A compilation of the history of the total calculated volume (TCV) vessel measurements, adjusted for OBQ or ROB, compared with the TCV shore measurements. (See API *MPMS* Ch. 17.9/IP HM 49 for details.)

3.37
wall wash test
The procedure for washing selected areas such as the interior bulkheads, tank bottoms, and sumps of cargo tanks with an appropriate medium and testing the wash liquid for the presence of material that might contaminate cargo to be loaded (see API *MPMS* Ch. 17.8).

3.38
water-cut measurement
The procedure for locating the oil/water interface for the purpose of determining the volume of FW in a shore tank or vessel compartment. The term is also used to refer to the line of demarcation of the oil/water interface.

3.39
wedge formula
A mathematical means to approximate small quantities of liquid and solid cargo and FW on board prior to loading and after discharge based on cargo compartment dimensions and vessel trim. The wedge formula is to be used only when the liquid does not touch all the bulkheads of the vessel's tank.

3.40
wedge table
A precalculated vessel table based on the wedge principle and displayed much like the vessel's usual innage/ullage tables. These tables, however, are for small quantities (OBQ, ROB) when the cargo or FW does not touch all the bulkheads of the vessel's tank.

3.41
wipe test
The procedure of physically wiping random interior areas and steam coils of the vessel's tanks with absorbent white rags. This procedure is used to test the tank's coating for possible color contamination.

4 Safety and Health Considerations

4.1 General

Personnel involved with the gauging and sampling of petroleum and petroleum-related substances should be familiar with their physical and chemical characteristics, including potential for fire, explosion, and reactivity, and with the appropriate emergency procedures as well as potential toxicity and health hazards. Personnel should comply with the individual company safe operating practices and with local, state, federal, and national regulations, including the use of proper protective clothing and equipment.

Personnel involved in inspection, measurement, and/or sampling on board a vessel shall at all times be accompanied by a designated ship's representative.

4.2 Static Electricity Hazards

If the tank is in a non-inert condition, specific precautions will be required with regard to safe measurement and sampling procedures when handling static accumulator oils. These are generally as follows; during loading, and for 30 minutes after the completion of loading, metallic equipment for dipping (gauging), ullaging, or sampling shall not be introduced into or remain in the tank. Examples of equipment include manual steel ullage tapes, portable gauging devices mounted on deck stand pipes, metal sampling apparatus, and metal sounding rods.

Nonconducting equipment with no metal parts may, in general, be used at any time. However, ropes or tapes used to lower equipment into tanks shall not be made from synthetic materials. After the 30-minute waiting period, metallic equipment may also be used for dipping (gauging), ullaging, and sampling, but it is essential that it is effectively bonded and properly grounded before it is introduced into the tank and that it remains grounded until after it has been removed.

Operations carried out through stand pipes are permissible at any time because it is not possible for any significant charge to accumulate on the surface of the liquid within a correctly designed and installed stand pipe. A stand pipe should extend the full depth of the tank and be effectively bonded and earthed to the tank structure.

4.3 Health Hazards

Petroleum vapor dilutes oxygen in the air and may also be toxic. Hydrogen sulfide (H_2S) vapors are particularly hazardous. Petroleum vapors with relatively low concentrations of hydrogen sulfide may cause unconsciousness or death. During and after the opening of any tank or vapor control valve, personnel should position themselves to avoid any gas which may be released. Harmful vapors or oxygen deficiency cannot always be detected by smell, visual inspection, or judgment. Appropriate precautions should be used for the protection against toxic vapors or oxygen deficiency. It is recommended that users always wear gas monitors that, as a minimum, measure gas concentrations of H_2S.

Procedures should be developed to provide for the following:

a) exposure monitoring,

b) need for personal protective equipment, and

c) emergency rescue precautions.

When necessary, suitable fresh air breathing equipment should be worn prior to entering the gauge site and during the gauging and sampling procedure.

This discussion on safety issues is not exhaustive and the appropriate API or Energy Institute publications, together with the International Safety Guide for Oil Tankers and Terminals (ISGOTT) [3], Safety of Life at Sea (SOLAS) [5], and Oil Companies International Marine Forum (OCIMF) [4] publications should be consulted for applicable safety precautions.

5 General Information

Gauging may be performed manually or by automatic systems in accordance with procedures appropriate to the type of vessel, cargo, and location (see API *MPMS* Ch. 3.1A, Ch. 3.1B, Ch. 3.4, Ch. 3.5, Ch. 17.2, Ch. 17.10.1, Ch. 17.10.2, Ch. 17.11, and Ch. 17.12).

All responsible parties should be informed if any of the gauging equipment or tank or meter facilities have a known bias. Documentation of these deviations should be available for inspection by all responsible parties and should be used in preparing volume reconciliation. Possibilities for known bias error includes but are not limited to water, snow, ice, or debris on floating-roof tanks.

The procedures described in this publication should be performed by properly trained personnel. If the procedures cannot be performed for any reason (such as safety, environmental, or physical constraints; governmental restrictions; conflicts with contractual agreements; or other problems), the inspection report should include a complete, detailed explanation. Measurement personnel are responsible for ensuring the use of proper safety, measurement, and sampling equipment.

The vessel's master and/or designated representative, the shore supervisory personnel, and the measurement personnel conducting the inspection should be familiar with the scope of the cargo inspection procedures and aware of the safety procedures unique to the product being transferred.

If simultaneous ballasting or deballasting is performed during cargo operations, record this fact and the reasons for it in the inspection report and, comment on the degree of segregation that was maintained during the operation.

Petroleum products and chemicals require stringent quality control during loading, transport, and discharge operations. Vessels designated to carry these products should meet compatibility criteria. They should also be inspected for cleanliness prior to loading so that the shipment will not be contaminated (see API *MPMS* Ch. 17.8). If there is any question concerning compatibility or contamination, all interested parties should be notified and the questions resolved prior to commencement of loading.

6 API *MPMS* Chapter 17 Standards Overview

6.1 General

Chapter 17.1 is a summary of the remainder of API *MPMS* Chapter 17. This section presents a brief description of the content of each of the other Chapter 17 standards.

6.2 Chapter 17.2—*Measurement of Cargoes on Board Tank Vessels*

Provides guidelines and procedures to accurately gauge, sample, and calculate the quantity and quality of cargo on a marine vessel. Automatic and manual vessel gauging methods are discussed. Measurement of pressurized or refrigerated cargos is not discussed.

6.3 Chapter 17.3—*Guidelines for Identification of the Source of Free Waters Associated with Marine Petroleum Cargo Movements*

Provides guidelines for identifying the source of free water associated with marine petroleum cargo movements. Basic sampling, on-site testing, analytical procedures, and examples are discussed. This procedure should be considered when FW is detected or suspected on a marine petroleum cargo movement.

6.4 Chapter 17.4—*Method for Quantification of Small Volumes on Marine Vessels (OBQ/ROB)*

Provides guidelines and procedures to allow for the measurement of small quantities of cargo on marine vessels, which may require special strapping tables, gauging locations, and adjustments. Information and calculation examples are included.

6.5 Chapter 17.5/EI HM 64—*Guidelines for Cargo Analysis and Reconciliation of Cargo Quantities*

Provides guidelines and procedures for the reconciliation of marine cargo quantities throughout a voyage. The standard contains an example Voyage Analysis Report (VAR), which helps to identify the source of quantity differences (gains/losses).

6.6 Chapter 17.6—*Guidelines for Determining the Fullness of Pipelines Between Vessels and Shore Tanks*

Provides guidelines and procedures for determining the fill condition of pipeline systems used for the transfer of liquid before and after the liquid is loaded onto or discharged from marine vessels.

6.7 Chapter 17.7—*Recommended Practices for Developing Barge Control Factors (Volume Ratio)*

Provides guidelines and procedures to calculate a control factor for inland waterway barges when a reliable VEF is not available. The barge control factor allows for barge to shore volume comparisons for inland barges only. All other vessels should use the VEF method found in API *MPMS* Chapter 17.9.

6.8 Chapter 17.8—*Guidelines for Pre-loading Inspection of Marine Vessel Cargo Tanks*

Provides guidelines and procedures to determine that cargo tanks and transfer equipment are suitably clean. Vessel and shore responsibilities are outlined.

6.9 Chapter 17.9/EI HM 49—*Vessel Experience Factor (VEF)*

Provides guidelines and procedures for calculating a VEF, guidance for data collection, and instructions for more complex VEF calculations. The standard contains an example VEF calculation.

6.10 Chapter 17.10.1/ISO 10976—*Measurement of Cargoes on Board Marine Gas Carriers, Part 1— Liquefied Natural Gas*

Provides guidelines and procedures to vessel and shore personnel for determining quantities of liquefied natural gas cargoes on board marine gas carriers. It includes recommended methods for measuring, sampling, documenting, and reporting quantities on board these vessels.

6.11 Chapter 17.10.2/EI HM 55—*Measurement of Refrigerated and/or Pressurized Cargoes on Board Marine Gas Carriers, Part 2—Liquefied Petroleum and Chemical Gases*

Provides guidelines and procedures to vessel and shore personnel for determining quantities of liquefied petroleum and chemical gas cargoes on board refrigerated and pressurized gas carriers. It includes recommended methods for measuring, sampling, documenting, and reporting quantities on board these vessels.

6.12 Chapter 17.11/EI HM 52—*Measurement and Sampling of Cargoes on Board Tank Vessels Using Closed and Restricted Equipment*

Provides the safety precautions, equipment, guidelines, procedures, and limitations of closed and restricted measurement and sampling equipment.

6.13 Chapter 17.12/EI HM 51—*Procedure for Bulk Liquid Chemical Cargo Inspection by Cargo Inspectors*

Provides guidelines and procedures for safety, marine loading, and unloading for the transfer of bulk liquid chemicals. Guidelines and procedures related to the maintenance of chemical quality are specifically outlined.

7 Operations Overview

7.1 General

Before operations begin, one or more meetings should be held among cargo inspectors, vessel representatives, and shore operational personnel who are involved in the cargo transfer operation. At these meetings, key operational people are identified, responsibilities are defined, safety risks are identified, communication procedures are arranged, and everyone concerned reviews transfer procedures and plans to ensure a full understanding of all activities.

7.2 Key Meeting

The following items should be discussed at the key meeting.

Loadport:

— All parties shall be advised of local safety procedures, vessel safety procedures, required PPE, and hazards associated with the cargo.

— All parties should agree on the cargo's quality specification and quantity (see Cargo Quantity Options Certificate, Annex A).

— An agreement should be reached on whether shore or ship personnel will terminate the loading.

— If applicable, the vessel's representative should confirm the vessel's ability to heat the cargo as instructed.

— Check with the vessel's representative for reports of any unusual events that may have occurred during the sea passage or at the previous port and that may require special vigilance during loading.

— Check with shore personnel to agree on procedures for handling any special conditions that exist on shore that may adversely affect the loading activity or measurements.

— Agreement should be reached on the method to be used to determine line fullness and the agreed tolerance (see API *MPMS* Ch. 17.6).

— Determine which vessel tanks will be loaded, the capacity of the tanks, the condition of the lines, the nature of the vessel's last three cargoes, and the method of cleaning the cargo tanks (see API *MPMS* Ch. 17.8).

— If "first-foot" samples are required, a decision on the tanks to be used for such samples and the quantity of cargo to be loaded for the sampling should be made.

— Issue LOP to any party failing to comply with recommended procedures.

The Inspection Checklist (see Annex A) or a similar document should be used.

On multigrade vessels, it may be necessary to load the vessel's tanks in a certain order to avoid contamination and to comply with vessel operational requirements. This should be discussed and the order by grade and/or product should be agreed upon before loading operations begin.

Caution—Product contamination may result in an unsafe condition for the terminal and/or the vessel.

If blending on board the vessel, it is critical that all volumes loaded are consistent with the proportional hand-blend before loading. If the material contained in shorelines is to be loaded as part of the blend, a line sample should be taken and tested.

To aid blending, the heaviest component may be loaded first, followed by the lighter components. The volume may be gauged after each component is loaded. The contents of the shoreline, the vessel's previous cargo, and any OBQ should be taken into consideration for their effect on the blending operation. Blends may require adjustment to maintain the mutually agreed upon blend specifications.

NOTE Due to incomplete mixing, sampling limitations, and other operational restrictions, vessel tank samples may not be representative of proportional hand-blends tested at the port of loading.

Disport:

— All parties shall be advised of local safety procedures, vessel safety procedures, required PPE, and hazards associated with the cargo.

— All parties should agree on the cargo's quality specification and quantity.

— An agreement should be reached on whether shore or ship personnel will terminate the discharge.

— If applicable, the vessel's representative should confirm the vessel's ability to heat the cargo as instructed.

— Check with the vessel's representative for reports of any unusual events that might have occurred during the sea passage or at the previous port and that may require special vigilance during discharge.

— Check with shore personnel to ensure that no special conditions exist on shore that may adversely affect the discharge activity or measurements.

— Agreement should be reached on the method to be used to determine line fullness and the agreed tolerance, if applicable (see API *MPMS* Ch. 17.6).

— Determine which shore tanks will receive cargo, the capacity of the shore tanks, and the condition of the shore lines.

— Issue LOP to any party failing to comply with recommended procedures.

The Inspection Checklist (see Annex A) or a similar document should be used

8 Vessel/Shore Communication and Operations

A reliable means of communication between the shore and vessels should be arranged. Vessel, shore, or measurement personnel who notice an event during any stage of the transfer that could affect subsequent events should promptly notify all key personnel so that timely action can be taken. Record these events in the inspection report.

When more than one product and/or grade of product is to be transferred, close communication shall be maintained between personnel on shore and on the vessel in order to avoid contamination and off-specification material. This is of special importance when switching from one product and/or grade to another.

If any event occurs that could affect subsequent procedures at any stage of the cargo transfer operation, all key personnel involved should be notified promptly so that necessary timely action can be taken. Any action or refusal to act that is not in accordance with API procedures or specific prior contractual agreements will be reported to the parties concerned and may be documented by the issuance of an LOP.

9 Vessel Inspection and Sampling

9.1 Vessel Inspection

9.1.1 Draft, Trim, and List

Record the draft, trim, and list on both the port and starboard sides. Visually verify vessel drafts when possible. When vessels have no list or trim correction tables, refer to API *MPMS* Ch. 12.1.1. The preferred condition of the vessel is to be on an even keel (i.e. with zero trim and list), which eliminates the need for any trim or list corrections to be applied to the gauge readings.

9.1.2 Vessel Gauges

Take gauges, water cuts, and temperatures on all cargo compartments at the reference point indicated on the vessel's capacity tables. Vessel capacity tables should be certified by the shipbuilder, classification society, independent inspection company, or other approved competent third party for accuracy of use on board the particular vessel for which they are issued. The report should indicate whether measurements were manual or automatic, whether tanks on the vessel were inerted during gauging, and if manual (open) or closed/restricted equipment was used (see API *MPMS* 17.11).

Inspect for the presence of cargo in nondesignated cargo spaces, ballast tanks, cofferdams, and void spaces. If cargo is found, measure it in the same manner as the petroleum in cargo compartments (see API *MPMS* Ch. 17.2) and notify all concerned parties.

Observed gauge heights should be recorded and compared to reference gauge heights. Investigate and report any discrepancies. The location of the reference gauge point should be noted in the inspection report.

Vessel measurements taken through non-slotted standpipes are inaccurate and shall not be used for custody transfer purposes. Additional measurements may be needed from other locations when this condition exists. Note in the report the existence of this condition and notify all concerned parties.

In the case of heavy viscous materials, air and/or inert gases may be entrained in the product. An appropriate settling time should be allowed, if possible.

In operations involving lightering, both vessels should be gauged before and after lightering.

Vessel measurements should not be taken during bunkering operations.

9.1.3 Load on Top

If a load-on-top procedure is followed, a Load-on-Top Monitoring Record (see Annex A) should be filled out.

9.1.4 Vessel Lines and Tanks

All vessel tanks, including cargo, ballast, and cofferdams, should be inspected before and after the cargo transfer operation.

Before measuring OBQ/ROB, the condition of the vessel's lines should be determined. The inspector may request that the vessel lines be drained and the valves opened. Caution should be exercised on multigrade cargoes in order to avoid commingling the line contents of different products. Measure the amount of cargo or ballast water drained into the tank and sample, if possible. Record the capacity of the lines that were drained. Report the transfer of any engine room slops or other liquid into the cargo or slop tanks.

If the previous cargo poses a safety or contamination problem, all lines and pumps should be cleaned thoroughly and drained. Note on the inspection report how cleaning and draining was accomplished.

When the vessel is inspected for tank acceptability prior to loading, tank inspection should be performed in accordance with API *MPMS* Ch. 17.8.

9.1.5 OBQ Measurement

Obtain and record reference heights from the calibration tables prior to taking opening gauges and water cuts. Record the observed gauge heights; investigate and report any discrepancies between the reference and observed gauge heights. Determine the amount and nature of any material on board (OBQ) prior to loading including all in-transit cargo and material in nondesignated cargo spaces (see API *MPMS* Ch. 17.4). Describe and report the OBQ and FW (see 9.2.6 for slop tanks).

9.1.6 ROB Measurement

After discharge, verify the condition of the cargo lines; if cargo lines are not drained, the quantity of cargo in the lines should be accounted for as ROB. Determine the amount and nature of any material ROB. Include in-transit cargo that was not discharged and material in nondesignated cargo spaces (see API *MPMS* Ch. 17.4 and Ch. 17.11). Describe material found in the bottom of tanks as liquid material, nonliquid material, or FW. If inspection, measurement, and bottom sampling reveals that any cargo remains on board, concerned parties should determine whether further attempts should be made to pump the remaining quantities ashore. If this is not done, report the reasons. An LOP should be issued if applicable.

9.1.7 OBQ/ROB Volume Calculation

The OBQ/ROB Report is to be completed prior to loading or after discharging. Determine the OBQ/ROB as specified in API *MPMS* Ch. 17.4. Gauging OBQ/ROB at several points in a vessel compartment is very useful to establish

whether material is or is not evenly distributed across a tank bottom. When multiple gauging points in a compartment are available, manual gauges from each gauge point should be taken and recorded.

a) For liquid material and water, use trim/list corrections if the liquid is in contact with all bulkheads in the compartment and the vessel is not on an even keel. Use a wedge formula if the liquid does not touch all the bulkheads of the vessel's compartments.

b) For nonliquid material, multipoint gauging is recommended to determine if a wedge condition exists. If the material measured is not a wedge, the average of the multiple readings should be used for volume determination. However, if only one gauge point is available, the material shall be assumed to be evenly distributed over the tank bottom.

For additional information refer to API *MPMS* Ch. 17.4.

NOTE All non-load-on-top compartments from the load port should be measured to determine whether any volumes have changed. These measurements should be reported and should not be included in the ROB determination. If there is a change in these volumes, ascertain the reason and, if necessary, notify all interested parties immediately.

9.1.8 Small Volume (OBQ/ROB) Temperatures

Temperatures shall be obtained, recorded and used for cargo volume correction whenever depth of material and the nature of the material permits. If the temperature cannot be measured, the gross observed volume (GOV) shall be reported as GSV.

Temperature measurements shall be obtained in accordance with API *MPMS* Ch. 7, Ch. 17.2, Ch. 17.11, and Ch. 17.12.

9.1.9 Small Volume (OBQ/ROB) Sampling

When OBQ/ROB is accessible, samples shall be obtained from all compartments containing liquid volume. An attempt should also be made to sample nonliquid volumes. Samples taken should be in sufficient quantity to permit any required analysis. Samples shall be taken in accordance with API *MPMS* Ch. 8.1, Ch. 8.2, Ch. 8.3, and Ch. 8.4.

9.1.10 Free Water Measurement

Measure the FW during the course of gauging each compartment. Record the type/brand of water-finding paste(s) or device used to determine the oil/water interface. Record the interface and any oil emulsion that is detected. FW shall be sampled when possible (see API *MPMS* Ch. 3.1A and 17.3).

Products with densities heavier than water may need to be water cut on top of the product. If it proves impossible to take a water-cut measurement, then alternative sampling measures should be taken (see API *MPMS* Ch. 3.1A).

When FW is detected in products whose specifications are sensitive to the presence of FW, the vessel should be given an LOP on that account and all interested parties should be notified immediately.

9.1.11 Vessel Temperature

Individual compartment temperatures on the vessel should be taken concurrent with ullaging. Single or multilevel temperatures may be required as outlined in API *MPMS* Ch. 7, Ch. 17.2, or Ch. 17.11, as applicable. Measurements shall be averaged to determine the temperature of each compartment. The temperature measurement device shall have a calibrated range of accuracy that meets the desired temperature range of the material to be checked.

NOTE Temperatures taken at or near heating elements may distort temperature profiles.

9.2 Vessel Sampling

9.2.1 General

Samples should be taken from each vessel compartment in such a manner that a volumetric composite sample, intended to represent the total of each grade of cargo, may be prepared for testing (see API *MPMS* Ch. 8.1). This composite will be made by combining the vessel's individual tank samples in proportion to the volume of each tank to the total volume of the grade of cargo loaded. An appropriate container shall be used that does not contaminate the samples.

When the material is known or suspected to be stratified, individual level samples may be drawn and analyzed to determine the degree of stratification. Due to incomplete mixing, sampling limitations, and other operational restrictions, vessel tank samples often will not be representative of proportional hand-blended samples that were tested at the port of loading. All interested parties should be notified accordingly.

When sampling individual tanks, it is important that each container be flushed with the product before the sample is drawn in order to ensure the cleanliness of the sample containers. Care shall be taken to handle samples in a manner that does not compromise the analysis. Commingling of samples of different products and/or grades shall be avoided (see API *MPMS* Ch. 8).

Immediately label each sample with the appropriate tank number and other pertinent data.

If the presence of FW is found or suspected, every effort should be made to obtain samples of any FW in the cargo compartment in accordance with API *MPMS* Ch. 17.3.

Samples should be obtained to meet the requirements of interested parties and regulatory agencies. Interested parties generally specify sampling and testing requirements. Identical samples should be provided for the following:

a) the loading terminal;

b) the receiving terminal via the vessel master;

c) the independent inspector;

d) all other parties designated to receive the samples.

Samples that are placed on board the vessel for delivery to the representative at the discharge port (consignee) should be sealed and acknowledged with a receipt signed by the vessel's representative. A copy of the signed receipt should be included in the loading inspection report.

The length of time for samples to be retained should be established in a manner that is consistent with the circumstances, experience, and the policies of the parties involved in the custody transfer.

9.2.2 Volume Calculations

Report both the actual innage/ullage as measured and the innage/ullage corrected for trim and list; include the measurement and quantity of FW, the GOV, and the temperature for each compartment on the vessel. Calculate the GSV for each tank, using the average temperature for each tank and the supplied density. Do not use an average temperature for the entire vessel.

9.2.3 Vessel Experience Factor (VEF)

Data on previous voyages shall be obtained for use in calculating the VEF (see API *MPMS* Ch. 17.9/EI HM 49). Vessel/shore data provided should be verified with the chief officer's cargo log book. Record any comments about

previous vessel/shore comparisons contained in the vessel's records. Valid VEFs should be used for volume reconciliation.

9.2.4 Remaining Ballast (Loading Operation)

For most cargos, there should be no ballast remaining in the cargo tanks, lines, or pumps. Any ballast on board should be totally segregated. Measure and record the quantity of any ballast left on board prior to loading. Record the presence of and sample any measurable petroleum in ballast tanks. If simultaneous deballasting is performed during loading operations or inspection, determine the reason from the vessel's representative and record it on the inspection report. Indicate single/double valve separations, if any, between clean/dirty ballast and cargo systems.

9.2.5 Ballast Tanks (Discharge Operation)

Inspect ballast tanks and record the quantity of ballast aboard. Report the presence of any measurable cargo in any ballast tanks and obtain samples if possible. Notify all interested parties and issue an LOP as appropriate. A Vessel Ullage/Sounding and Capacity Report (see Annex A) should be used to record these measurements. If simultaneous ballasting is performed during discharge operations or inspection, determine the reason from the vessel's representative and record it in the inspection report. Indicate single/double valve separations, if any, between the clean/dirty ballast and the cargo system.

9.2.6 Slop Tanks

Measure the contents of slop tanks to determine the interface and the separate quantities of FW and slop oil. Take the temperature of and sample the oily layer. Take a separate sample of the water layer. If possible, calculate the quantities; if any slops are to be commingled with the subsequent cargo, they are to be treated as OBQ and recorded appropriately. Keep slops samples separate from cargo samples.

9.2.7 Sea Valves

Confirm in the presence of the vessel's personnel that sea valves and overboard discharge valves are in the closed position and sealed before and after cargo transfer. Seal valves to the extent possible, so as to be able to determine whether they were used during the cargo operation. Record the seal numbers.

If previously sealed valves are not intact, attempt to ascertain why the seals were broken and, if appropriate, notify all interested parties. Record the findings in the inspection report. Seal numbers should be recorded and reported on a Vessel Ullage/Sounding and Capacity Report (see Annex A). If these numbers differ from those recorded at the load port, ascertain the reason for the discrepancy and notify all concerned parties.

9.2.8 Bunker Inspection

A bunker inspection should, when necessary, be performed before and after the cargo transfer operation.

Vessel gauging should not be performed during bunkering operations.

9.2.9 Crude Oil Washing (COW)

During the discharge operation, indicate on a Time Log (see Annex A) when the vessel started and stopped the COW procedure. Indicate in the inspection report which tanks were washed with crude oil, the material used as an agent, and the extent of the washing.

9.3 During Transfer

9.3.1 Line Sample

Line samples are normally taken for quality control purposes. For some products, it is necessary to draw a line sample at the commencement of loading. Line samples can be inspected visually or by laboratory testing. Line samples should be retained.

9.3.2 First-foot Sample

During loading, if a first-foot sample is required, it should be taken when approximately 1 ft (0.3 m) of cargo has been loaded into the tank. A sample is then drawn from the tank. The sample should be examined or tested to determine conformity with cargo specifications. If the sample indicates potential contamination, cargo transfer operations should be suspended and all interested parties shall be promptly notified before resuming operations.

9.3.3 Line Pressure

The line pressure and flow rate information should be obtained and reported on a Vessel Discharge Record (see Annex A). Indicate the place where the vessel's line discharge pressure was measured.

10 Shore Inspection and Sampling

10.1 Shore Lines

Determine the nature and quantities of material in the shorelines up to the vessel's flange. When line contents are questionable or when the possibility of cargo contamination exists, line samples should be tested to verify compatibility with the cargo that will be transferred. Alternatively, shoreline contents may be loaded into one cargo compartment on the vessel to be gauged, sampled, and tested. Line samples may not be representative due to sample location limitations.

Determine the fullness of the shore line(s) (see API *MPMS* Ch. 17.6) before and after transfer. Record the method used for line verification and the line condition. Additionally, record and report the total capacity of the shorelines used. If the line condition after transfer differs from the condition before transfer, record and notify all interested parties.

It is the terminal's responsibility to ensure that all lines and valves are set in the correct position for the operation. When practical, these settings should be confirmed by the inspector and valves sealed when appropriate. After the transfer, verify that all seals installed remain intact.

When nondedicated lines are used, consider transfer sequences of products flowing through the lines in order to minimize the potential for contamination caused by displacement of line contents. This determination should include an agreement on how the lines will be displaced and/or how the different product interfaces will be handled.

If the cargo requires heating, report whether the shore lines are insulated and record the line temperature if possible.

10.2 Shore Tank Gauges

10.2.1 Manual Gauges

Record the reference height from the tank capacity tables before gauges and water cuts are taken. Take gauges, temperatures, samples, and water measurements of each tank to be used in the transfer. Any difference between the observed reference height and the reference height shown on the tank capacity tables should be noted and investigated (see API *MPMS* Ch. 17.2, Section B.3).

All gauges should be recorded only after securing two identical readings, or three consecutive readings to be within a range of 3 mm ($^1/_8$ in.). If two of the three consecutive readings are identical, this reading shall be reported; to the nearest 1 mm if metric gauge tapes are used or to the nearest $^1/_8$ in. if customary gauge tapes are used. If all three readings are used, they should be averaged. If the tank contents are determined to be in motion and waiting for equilibrium is not possible, the tank measurements should be recorded and all parties advised. If the situation cannot be resolved, an LOP should be issued. Record the automatic gauges for purposes of comparison (see API *MPMS* Ch. 3.1A).

Document whether or not the tank has a slotted or unslotted standpipe (still pipe, or guiding pole). In the case that the tank still pipe is unslotted, measurements from the tank shall not be used for custody transfer (see API *MPMS* Ch. 3.1A).

In the case of tanks with floating roofs, gauging should be avoided while the roof is in the critical zone. The placement of roof legs in high or low position and the critical zone shall be recorded.

The heavy nature of some products may require that an ullage measurement be taken. When obstructions, debris, or solid bottoms are observed, ullage measurement may be required. Products with densities heavier than water may need to be water cut on top of the product.

Any incrustation that forms on top of the product may produce inaccuracies in measurement. If this condition exists, all parties should be notified and the condition shall be recorded.

10.2.2 Automatic Gauges

Automatic gauging systems with accuracy tolerances, measurement tolerances, and calibration records consistent with API *MPMS* Ch. 3.1B may be used for custody transfer by mutual agreement among the parties involved.

Automatic tank gauging systems should be verified in accordance with API *MPMS* Ch. 3.1B. If an automatic tank gauging system is used and the readings are not verified by manual measurements, record in the inspection report the last two times that the automatic system and the manual measurements were compared. Record on the inspection report that automatic gauges were used.

10.3 Shore Tank Temperatures

10.3.1 General

Temperature measurements shall be taken in accordance with API *MPMS* Ch. 7. Heavy cargoes, heated cargoes, blended cargoes, and cargoes in unheated tanks in very cold weather are more susceptible to temperature stratification. When this situation is determined, extra temperature measurements should be taken.

NOTE Temperatures taken at or near heating elements may distort temperature profiles.

10.3.2 Portable Electronic Thermometer (PET)

The PET is the preferred equipment for obtaining temperatures.

The PET shall have a calibrated range of accuracy that meets the desired temperature range of the material from which a temperature is to be taken (see API *MPMS* Ch. 7).

10.3.3 Liquid-in-Glass Thermometer

Thermometers shall remain in the liquid long enough to reach the temperature of the liquid that is being measured (see API *MPMS* Ch. 7). With regard to liquids in which temperature stratification may occur, the time constraints involved in using a liquid-in-glass thermometer to profile a tank may necessitate the use of a PET.

10.3.4 Dynamic Temperature Measurement

If a temperature probe in the shore line is used to determine the temperature for the correction of metered quantity transferred, verify and record in the inspection report the last two times that the probe was checked for accuracy (see API *MPMS* Ch. 7).

10.3.5 Automatic Temperature Systems

Automatic temperature systems with accuracy and/or measurement tolerances consistent with API *MPMS* Ch. 7.3 may be used for custody transfer by mutual agreement among the parties involved.

Automatic temperature systems should be verified in accordance with API *MPMS* Ch. 7.3. If an automatic temperature system is used and the readings are not verified by manual measurements, record in the inspection report the last two times that the automatic system and the manual measurements were compared and if any differences were noted. Record on the inspection report that automatic temperatures were used.

10.4 Sampling

10.4.1 General

Immediately label each sample with the appropriate date, time, tank number, and other pertinent data. If required, seal the container and record the seal numbers.

Laboratory analysis shall be used to ensure that quality specifications are met before transfer. Product nominated for transfer shall meet the quality specifications as agreed by all parties.

10.4.2 Manual Tank Sampling

The objective of manual sampling is to obtain a small portion (spot sample) of material from a selected area within a container that is representative of the material in that area, or in the case of running or all-levels samples, a sample whose composition is representative of the total material in the container. A series of spot samples may be combined to create a representative sample.

Each shore tank to be used in the transfer should be sampled to meet the requirements of interested parties and regulatory agencies. Sample containers shall be clean and, in the case of petroleum products, should be flushed with product prior to drawing the sample. Sample containers shall meet the requirements of API *MPMS* Ch. 8.1. Containers that are used for transport and storage of samples shall meet appropriate regulatory requirements.

When nonhomogeneous products are sampled, upper, middle, and lower spot samples are usually obtained. If stratification is suspected, it is strongly recommended that spot samples from additional levels are taken. If product will only be transferred from part of a tank, then the spot samples representative of the levels transferred may be used for quality purposes; however, the entire tanks contents should still be sampled and retained in case they are needed. In the case that the tank standpipe (still pipe, or guiding pole) is unslotted, samples shall not be used for custody transfer purposes.

Specify in the inspection report the tank locations and methods used to obtain samples. The inspection report should also state whether the tank was equipped with mixers, a circulating system, or aerators.

10.4.3 Automatic Sampling

Automatic sampling is the preferred method of sampling a marine cargo transfer. If an automatic sampling system is installed, it should be proved and operated in conformance with API *MPMS* Ch. 8.2. The sampler shall be properly set up and cleaned in preparation for taking a sample, and a visual inspection of the sample container shall be made. Ensure that the grab rate is correct to collect a sufficient amount of sample to meet requirements without overfilling

the container. Indicate whether the automatic sampler used was flow-proportional or time proportional. Any deficiencies should be reported. Record the last time that the automatic sampler was proved.

If an automatic sampler is used, ascertain that the correct sample volume was obtained (see API *MPMS* Ch. 8.2). Witness the mixing of the contents of the sample receptacle and the withdrawal and, if required, testing of the sample. Gather data necessary to calculate automatic sampler performance report. Report any difficulties that occur with relation to the in-line sampling procedures.

10.5 Meters

Terminal operators are responsible for the operation of their meters and meter provers. If meters are to be used for custody transfer, meters shall be proved in accordance with API *MPMS* Ch. 4, Ch. 5, Ch. 12.2.4, and Ch. 12.2.5. Proving data shall be provided to the inspector and reported.

Prior to transfer, record the opening meter readings. Meter measurement tickets shall be provided for each custody transfer and will include the information required in API *MPMS* Ch. 12.2.2. Terminal operators or inspectors who are aware of factors that could affect the accuracy shall report the problem immediately to all parties involved in the custody transfer. The incident and any resolution shall be recorded in the inspection report.

If manual and/or automatic shore tank measurements are taken, report a comparison with metered volumes. If volumes cannot be reconciled, recheck meter data, shore tank measurements, and calculations. Report all results in the inspection report.

11 Voyage Analysis and Reconciliation

11.1 Shore and Vessel Transferred Volume Calculations

After the shore tank or vessel tank is gauged, the quantities of petroleum in each tank shall be calculated according to the guidelines in API *MPMS* Ch. 12.1.1 and Ch. 12.2.1. If meters are used, the calculation methods in API *MPMS* Ch. 12.2.2 shall be followed and meter factors shall be calculated according to the guidelines in API *MPMS* Ch. 12.2.3.

11.2 Load Port Voyage Analysis

Compare the shore's TCV delivered with the vessel's TCV received, corrected by a valid VEF when available. If the difference exceeds contractual limits or company policies, recheck all measurements and calculations in an attempt to identify the cause of the discrepancy. If the differences cannot be reconciled, the inspector should notify the interested parties and issue an LOP or a Notice of Apparent Discrepancy (see Annex A) to vessel and terminal representatives.

When the Bill of Lading and vessel volumes are compared, any discrepancies among the GSV, net standard volume (NSV), density, temperatures, or any other specification should be investigated and brought to the attention of the appropriate interested parties.

11.3 In-transit Difference

Compare the TCV, GSV, and FW at the load port prior to sailing with the TCV, GSV, and FW prior to discharge. If the total volume of cargo quantity varies more than the amount specified by the interested parties, notify the vessel's representative and recheck the vessel. If the discrepancy remains after the vessel is rechecked, issue an LOP to the vessel's representative and notify all interested parties (see API *MPMS* Ch. 17.5).

11.4 Discharge Port Voyage Analysis

Complete the Voyage Analysis and Reconciliation Reports. All relevant data from loadport through discharge port should be assembled and an analysis should be made to provide an overall view of the voyage performance. Include on the Voyage Analysis and Reconciliation Report any relevant comments that may help to explain any discrepancies. Compare the shore TCV received (by shore tank or meter) with the vessel's TCV delivered. If the difference on the same comparison basis is greater than the difference specified by parties to the contract or by stated policies of those companies after application of the VEF, recheck all measurements and calculations in an attempt to identify the discrepancy. If the differences cannot be reconciled, the inspector should notify the interested parties and issue an LOP or a Notice of Apparent Discrepancy to vessel and terminal representatives (see API *MPMS* Ch. 17.5).

11.5 Qualitative Testing

The interested parties should specify testing and test methods used for analysis. Responsibility for testing rests primarily with the nominated laboratory. Interested parties or their representatives should be allowed to conduct the same tests on a duplicate sample or to witness the testing performed by the nominated laboratory. Any witnessed deviations from the specified testing procedures shall be included in the inspection report.

11.6 LOP or Notice of Apparent Discrepancy

In the event of any dispute, an LOP or a Notice of Apparent Discrepancy shall be issued. This serves as a written record that the particular action or finding was questioned at the time of occurrence.

11.7 Time Log

Report the time and date of the main operational events on the time log. Include the time and description of any unusual occurrences in the appropriate column of the time log.

11.8 Distribution of Documents

All pertinent documents relating to the transfer shall be distributed amongst all commercial parties and their representatives.

Annex A
(informative)

Sample Forms [3]

The following sample forms are designed to provide a guideline for recording and reporting essential data obtained during the marine cargo inspection procedure.

These forms were designed for a simple voyage and as such may not be suitable for all contingencies. Measurement personnel may use other forms and explanations where required to fully document the transfer operation.

Cross-cuts are provided on all suggested forms to accommodate the various systems of measurement.

The following forms, except form 6 (available with the purchase of API *MPMS* Ch. 17.5), are freely offered to all companies to use, with or without company identification logos.

Forms:

1) Report of Shore Quantity

2) Vessel Ullage/Sounding and Capacity Report

3) OBQ/ROB Report

4) Time Log

5) Vessel Experience Factor

6) Voyage Analysis Report (see API *MPMS* Ch. 17.5)

7) Sample Receipt

8) Laboratory Report of Quality

9) Metered Quantity Report

10) Meter Prover Report

11) Slops Record

12) Vessel Discharge Record

13) Bunker Inspection Report

14) Inspection Checklist

[3] Users of these forms should not rely exclusively on the information contained in this document. Sound business, scientific, engineering, and safety judgment should be used in employing the information contained herein.

Where applicable, authorities having jurisdiction should be consulted.

Work sites and equipment operations may differ. Users are solely responsible for assessing their specific equipment and premises in determining the appropriateness of applying the instructions. At all times users should employ sound business, scientific, engineering, and judgment safety when using this Standard.

15) Inspector's Worksheet

16) Cargo Quantity Options Certificate

17) Load-on-Top Monitoring Record

18) Sampler Performance Report (see API *MPMS* Ch. 8.2)

Letters:

19) Letter of Protest

20) Notice of Apparent Discrepancy

INSPECTION CHECKLIST

VESSEL NAME: _____
PORT/TERMINAL: _____
CARGO(ES): _____
DATE: _____

If an item listed below is completed in accordance with the procedures, check “yes”; if not, check "no" and explain under the comments section. If an item is not applicable, write “NA” (not applicable) next to it.

A completed copy of this checklist should be included with the measurement report.

ITEM	ACTION	YES	NO
	BEFORE TRANSFER		
1	Was a key meeting held with vessel representative and shore representative?		
2	Were all shorelines checked and shore tanks gauged?		
3	Were temperatures taken from all shore tanks?		
4	Was the temperature device checked prior to use?		
5	Were all automatic tank gauging and temperature readings recorded?		
6	Were all shore tanks sampled?		
7	Was an automatic sampler used?		
8	Were meters used for the transfer?		
9	Were vessel experience factors available on board?		
10	Were draft, trim, and list recorded?		
11	Was vessel completely deballasted?(Loading)		
12	Were all ballast tanks checked?		
13	Were vessel lines drained into the cargo compartments?		
14	Were on-board quanity gauges taken?		
15	Were wedge, trim or list corrections made?		
16	Were on-board quanity samples taken? (Loading)		
17	Were vessel samples taken from each compartment? (Discharging)		
18	Were load port samples collected from the vessel and a receipt issued?		
19	Were slops tanks measured?		
20	Were on-board quanity temperatures taken?		
21	Were sea valves sealed in the closed position?		
22	Was load-on-top procedure followed? (Loading)		
23	Were bunker quantities verified?		
24	Were sea valves found to be intact and seal numbers recorded?		
25	Were volume calculations completed before transfer began?		
26	Was the intransit difference determined?		
	DURING TRANSFER		
27	Were any difficulties/unusual problems encountered?		
28	Were line samples drawn?		
29	Were meters proved?		
30	Was a Vessel Discharge Record prepared? (Discharging)		
	AFTER TRANSFER		
31	Were draft, trim, and list recorded?		
32	Were vessel lines drained to compartments prior to ullaging?		
33	Were all vessel ullages, temperatures, and water measurements recorded?		
34	Were temperatures taken in all vessel compartments?		
35	Were ballast tanks inspected?		

36	Were samples taken from each vessel compartment?							
37	Were vessel sea valves inspected and confirmed closed?							
38	Were bunker quantities verified?							
39	Were vessel volumes recorded and calculated?							
40	Were all shorelines surveyed and quantities determined?							
41	Were all closing tank gauges taken?							
42	Were tank samples taken?							
43	Were proper automatic sampling and sample mixing performed?							
44	Were copies of meter tickets and proving reports obtained?							
45	Was a reconciliation made between vessel and shore?							
46	Was a voyage analysis prepared?							
47	Does the Bill of Lading agree with the vessel measurements?							
48	Was qualitative testing performed according to directions furnished by interested parties?							
49	Was a Time Log maintained?							
50	Were any Letters of Protest or Notices of Apparent Discrepancy Issued?							
51	Was the following information recorded from the shore tank(s) volume (strapping) tables:							
	S/T #	Type of Strapping Table: Inn. or Ull.	Volume: Gals., Bbls.or Cm's	Strapping Date	Standpipe: Slotted or Non-Slotted	Type of Measurement Taken: Manual, Closed or Automatic

LETTER OF PROTEST
(Duplicate to be signed and returned)

Date: _____

Address

To the Representative of _____ (vessel or port name)

In the Port of _____

(or designate the agents, owner's representative, owner, or operator)

Dear Sir or Madam:

On behalf of _____, we hereby notify you that on _____ day of _____, at ____ (a.m. or p.m.), the above named port caused (describe nature of the occurrence)

_____

_____

_____

at _____

in the city (or town) of _____

Accordingly, we are holding your port/vessel, the owners, charterers, operators, and other interested parties responsible for the loss and damage thereby sustained, as well as any consequential loss and damage arising therefrom.

Kindly acknowledge receipt on the copy thereof and return it to us. *The signatures thus obtained are for receipt only and in no way acknowledge responsibility for the incident.*

Please direct any written correspondence on this matter to:

_____

_____

_____

Receipt acknowledged:

_____

(owner, agent, other)

Very truly yours,

By _____

Title _____

cc: Port agent, owner, representative,

or operator (if different from owner)
