Date of Issuance: June 25, 2007

This Standard will be revised when the Society approves the issuance of a new edition. There will be no addenda or written interpretations of the requirements of this Standard issued to this edition.

Periodically certain actions of the ASME B29 Committee may be published as Cases. Cases are published on the ASME Web site under the Committee Pages at <http://cstools.asme.org> as they are issued.

ASME is the registered trademark of The American Society of Mechanical Engineers.

This code or standard was developed under procedures accredited as meeting the criteria for American National Standards. The Standards Committee that approved the code or standard was balanced to assure that individuals from competent and concerned interests have had an opportunity to participate. The proposed code or standard was made available for public review and comment that provides an opportunity for additional public input from industry, academia, regulatory agencies, and the public-at-large.

ASME does not "approve," "rate," or "endorse" any item, construction, proprietary device, or activity.

ASME does not take any position with respect to the validity of any patent rights asserted in connection with any items mentioned in this document, and does not undertake to insure anyone utilizing a standard against liability for infringement of any applicable letters patent, nor assume any such liability. Users of a code or standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, is entirely their own responsibility.

Participation by federal agency representative(s) or person(s) affiliated with industry is not to be interpreted as government or industry endorsement of this code or standard.

ASME accepts responsibility for only those interpretations of this document issued in accordance with the established ASME procedures and policies, which precludes the issuance of interpretations by individuals.

No part of this document may be reproduced in any form,  
in an electronic retrieval system or otherwise,

## FOREWORD

Preparatory work during the late 1930s and early 1940s by the Silent Chain Division of the Association of Roller and Silent Chain Manufacturers (ARSCM, now the American Chain Association) resulted in agreement on standardization of silent chain primarily on the basis of standardized sprocket tooth design. Since individual chain manufacturers employed various chain joint designs, it was agreed that standards on chain detail would be limited to ensure interchangeability of chains on sprockets of any number of teeth. At a meeting of representatives of all major American silent chain manufacturers in September 1944, under the auspices of the ARSCM, recommended "Engineering Standards for Industrial Silent Chain and Sprockets" were agreed upon. Formulas for sprocket design were expanded into tables, which were approved and adopted by the ARSCM in April 1945. Supplementary information on sprocket tooth cutters was added, and all of the data were incorporated in a comprehensive report, Industrial Standards for Industrial Silent Chains, Sprockets, and Cutters. This report, with further refinements by minor revisions in 1949 and 1950, was then submitted to the Sectional Committee for review and approval as an American Standard.

The Sectional Committee accepted the recommendations with some minor revisions in 1950 and referred it to ASME and The Society of Automotive Engineers (SAE) for their approval as sponsors of the Committee, with subsequent transmission to the American Standards Association (ASA) for final acceptance as an American Standard. After approval by ASME and SAE, it was accepted by ASA on November 9, 1950 as American Standard B29.2.

In 1956, the Sectional Committee authorized a revision to the standard to bring it up to date. The revised standard was approved by the American Standards Association on July 11, 1957. This revision was in use for many years and was reaffirmed by ANSI on January 4, 1971. (ASA became ANSI in 1969.)

In 1945, the formulation of a recommended standard for "small pitch" silent chain (pitch sizes less than  $\frac{3}{8}$  in.) and sprocket tooth form became a matter of consideration by ARSCM's Silent Chain Division. As in the case of the larger chain series, the objective was to provide interchangeability of chains on sprockets and the development of recommended practices for power transmission ratings and selection procedure. After a number of years of usage as an ARSCM Industrial Standard, the recommendations became American Standard B29.9 in 1958. Although it was originally anticipated that there might be a need for two or three pitch sizes of the miniature silent chains, only one, the  $\frac{3}{16}$  in. size, has been developed. The information that has heretofore been published as B29.9 was incorporated in the basic Silent Chain Standard, B29.2, as part of the 1982 revision.

In 2006, the B29 Committee undertook a review of the B29.2M Standard and adjusted the contents consistent with developments in industry since the standard had been most recently revised. The list of chain widths was modified to eliminate the  $1\frac{1}{4}$  in. pitch and some uncommon chain sizes. The illustrations of the side guide silent chain and center guide silent chains were revised; tables of service factors and horsepower rating per inch of chain width were revised, with the  $1\frac{1}{4}$  in. pitch deleted in the latter listing; and the errata sheet of the previous revision was corrected in the formula for  $G$  (max.).

This Standard was approved by ANSI on February 12, 2007.

# ASME B29 COMMITTEE

## Chains, Attachments, and Sprockets

### for Power Transmission and Conveying

(The following is the roster of the Committee at the time of approval of this Standard.)

#### STANDARDS COMMITTEE OFFICERS

**C. G. Springman**, *Chair*  
**G. Osolsobe**, *Secretary*

#### STANDARDS COMMITTEE PERSONNEL

**W. C. Hall**, Ramsey Products Corp.  
**G. Osolsobe**, The American Society of Mechanical Engineers  
**E. Pawlicki**, Drives, Inc.  
**J. R. Wilbur**, *Alternate*, Drives, Inc.  
**V. D. Petershak**, Consultant  
**D. W. Egbert**, *Alternate*, Hitachi Maxco Ltd.  
**R. A. Reinfried**, Conveyor Equipment Manufacturers Association  
**S. Rhoad**, Webster Industries, Inc.  
**K. J. Smith**, Ken Smith & Associates  
**J. A. Spencer**, Renold Jeffrey Corp.  
**C. G. Springman**, Diamond Chain Co.  
**J. L. Wright**, Consultant

# CORRESPONDENCE WITH THE B29 COMMITTEE

**General.** ASME Standards are developed and maintained with the intent to represent the consensus of concerned interests. As such, users of this Standard may interact with the Committee by proposing revisions and attending Committee meetings. Correspondence should be addressed to:

Secretary, B29 Standards Committee  
The American Society of Mechanical Engineers  
Three Park Avenue  
New York, NY 10016-5990

**Proposing Revisions.** Revisions are made periodically to the Standard to incorporate changes that appear necessary or desirable, as demonstrated by the experience gained from the application of the Standard. Approved revisions will be published periodically.

The Committee welcomes proposals for revisions to this Standard. Such proposals should be as specific as possible, citing the paragraph number(s), the proposed wording, and a detailed description of the reasons for the proposal, including any pertinent documentation.

**Proposing a Case.** Cases may be issued for the purpose of providing alternative rules when justified, to permit early implementation of an approved revision when the need is urgent, or to provide rules not covered by existing provisions. Cases are effective immediately upon ASME approval and shall be posted on the ASME Committee Web page.

Requests for Cases shall provide a Statement of Need and Background Information. The request should identify the standard, the paragraph, figure or table number(s), and be written as a Question and Reply in the same format as existing Cases. Requests for Cases should also indicate the applicable edition(s) of the standard to which the proposed Case applies.

**Attending Committee Meetings.** The B29 Standards Committee regularly holds meetings, which are open to the public. Persons wishing to attend any meeting should contact the Secretary of the B29 Standards Committee.

# INVERTED TOOTH (SILENT) CHAINS AND SPROCKETS

## 1 SILENT CHAINS

### 1.1 Nomenclature

(a) Silent chain is a series of toothed links alternately assembled with pins or a combination of joint components in such a way that the joint articulates between adjoining pitches. As shown in Fig. 1, illustration (a), side guide silent chain has guide links which straddle the sprocket sides to control the chain laterally. As shown in Fig. 1, illustration (b), center guide silent chain has guide links which run within a circumferential groove or grooves for lateral control.

(b) *Typical Links.* Since joint components, connectors, and offset sections vary with each manufacturer, these items are not included in this Standard. See Fig. 2 for examples of typical links.

### 1.2 General Configuration

Link contour may vary but must engage standard sprocket teeth so that joint centers lie on sprocket pitch circle.

(a)  $\frac{3}{8}$  in. *Pitch Chain and Larger.* Chain widths equal to, or exceeding, two times the pitch have center guides. Narrower chains may be side guide or center guide. Chain widths exceeding 16 times the pitch are not recommended.

(b)  $\frac{3}{16}$  in. *Pitch Chain.* Chain may be side guide or center guide as indicated in para. 1.8.

(c) *Maximum Chain Width.* Maximum chain width should be limited to approximately eight times the pitch.

### 1.3 Numbering System

(a)  $\frac{3}{8}$  in. *Pitch Chain and Larger.* Two letters (SC) as a prefix, one or two numerals indicating pitch in eighths of an inch, and two or three numerals indicating nominal chain width in quarters of an inch. Thus, SC302 designates a silent chain,  $\frac{3}{8}$  in. pitch by  $\frac{1}{2}$  in. nominal width, and SC1012 designates a silent chain,  $1\frac{1}{4}$  in. pitch by 3 in. nominal width.

(b)  $\frac{3}{16}$  in. *Pitch Chain.* Two letters (SC) as a prefix, a zero followed by a numeral indicating pitch in sixteenths of an inch, and two numerals indicating nominal width of chain in thirty-seconds of an inch. Thus, SC0309 designates a silent chain,  $\frac{3}{16}$  in. pitch by  $\frac{9}{32}$  in. nominal width.

NOTE: Where links are all of equal thickness 0.03 in. (0.76 mm), it is understood that the width indication also designates the total number of links across the width of the chain.

### 1.4 Tolerance for Chain Length

(a)  $\frac{3}{8}$  in. *Pitch Chain and Larger.* Chains will be designed and manufactured to fit gage sprockets. Tolerance for chain length for new chains may be over nominal length 0.03 in./ft (0.76 mm/m) but must not be underlength.

(b)  $\frac{3}{16}$  in. *Pitch Chain.* Chain length tolerance is 0.02 in./ft (0.51 mm/m) over nominal length but must not be underlength.

### 1.5 Measuring Loads

(a)  $\frac{3}{8}$  in. *Pitch Chain and Larger.* Chain should be measured under load of  $25 \text{ lb} \times \text{pitch in inches} \times \text{width in inches} + 20 \text{ lb}$  ( $0.1724 \text{ N} \times \text{pitch in mm} \times \text{width in mm} + 89 \text{ N}$ ). Length measurements are to be taken over a length of at least 12 in. (300 mm).

(b)  $\frac{3}{16}$  in. *Pitch Chain.* The measuring load for  $\frac{3}{16}$  in. pitch silent chain shall be approximately equal to 1 lb (4.45 N) for each link in the total chain width, i.e., the load for SC0315 would be 15 lb (67 N). Length measurements are to be taken over a length of at least 12 in. (300 mm).

### 1.6 General Chain Dimensions for $\frac{3}{8}$ in. Pitch Chain and Larger

See Fig. 3 and Tables 1 and 2.

### 1.7 Chain Widths and Sprocket Face Profiles for $\frac{3}{8}$ in. Pitch Chain and Larger

See Fig. 4 and Tables 3 and 4.

### 1.8 Chain Widths and Sprocket Face Profile for $\frac{3}{16}$ in. Pitch Chain

See Fig. 5 and Tables 5 and 6.

## 2 SPROCKETS

### 2.1 Tooth Form Dimensions for $\frac{3}{8}$ in. Pitch Chain and Larger

See Fig. 6.

### 2.2 Tooth Form Dimensions for $\frac{3}{16}$ in. Pitch Chain

See Fig. 7.

### 2.3 Diameters and Measuring Dimensions for $\frac{3}{8}$ in. Pitch Chain and Larger

The following dimensions apply to Fig. 8:

$$PD = \frac{P}{\sin \frac{180 \text{ deg}}{N}}$$

$$D_p = 0.625P$$

$$OPD \text{ (even number of teeth)} =$$

$$PD - 0.125P \csc \left( 30 \text{ deg} - \frac{180 \text{ deg}}{N} \right) + 0.625P$$

$$OPD \text{ (odd number of teeth)} = \cos \frac{90 \text{ deg}}{N}$$

$$\times \left[ PD - 0.125P \csc \left( 30 \text{ deg} - \frac{180 \text{ deg}}{N} \right) \right] + 0.625P$$

$$O.D. \text{ (rounded teeth)} = P \left( \cot \frac{180 \text{ deg}}{N} + 0.08 \right)$$

$$O.D. \text{ (square teeth)} = 2 \sqrt{X^2 + L^2 - 2XL \cos \alpha}$$

where

$$L = Y + E/2 \text{ (see Fig. 6 for } E)$$

$$X = Y \cos \alpha - \sqrt{(0.15P)^2 - (Y \sin \alpha)^2}$$

$$Y = P(0.500 - 0.375 \sec \alpha) \cot \alpha + 0.11P$$

$$\alpha = 30 \text{ deg} - 360 \text{ deg}/N$$

$$G \text{ (max.)} = P \left( \cot \frac{180 \text{ deg}}{N} - 1.16 \right)$$

### 2.4 Diameters and Measuring Dimensions for $\frac{3}{16}$ in. Pitch Chain

The following measurements apply to Fig. 9:

$$D_p = 0.667P$$

$$OPD \text{ (even number of teeth)} =$$

$$PD - 0.160P \csc \left( 35 \text{ deg} - \frac{180 \text{ deg}}{N} \right) + 0.667P$$

$$OPD \text{ (odd number of teeth)} = \cos \frac{90 \text{ deg}}{N}$$

$$\times \left[ PD - 0.160P \csc \left( 35 \text{ deg} - \frac{180 \text{ deg}}{N} \right) \right] + 0.667P$$

$$O.D. \text{ (nominal rounded teeth)} = P \left( \cot \frac{180 \text{ deg}}{N} - 0.032 \right)$$

$$G \text{ (max.)} = P \left( \cot \frac{180 \text{ deg}}{N} - 1.20 \right)$$

### 2.5 Tolerances for Diameters, Over Pin Dimensions, and Eccentricity for $\frac{3}{8}$ in. Pitch Chain and Larger

See Tables 7 and 8.

### 2.6 Tolerances for Diameters, Over Pin Dimensions, and Eccentricity for $\frac{3}{16}$ in. Pitch Chain

See Tables 9 and 10.

### 2.7 Hub Diameters for $\frac{3}{8}$ in. Pitch Chain and Larger

See Table 11. [For other pitches ( $\frac{3}{8}$  in. pitch and larger), multiply these values by pitch.]

### 2.8 Tabulation of Pitch Diameter, Outside Diameter, Over Pin Dimensions, and Guide Groove Diameter for Chain of Unity Pitch (Applicable to $\frac{3}{8}$ in. Pitch Chain and Larger)

See Table 12. [For other pitches ( $\frac{3}{8}$  in. pitch and larger), multiply these values by pitch.]

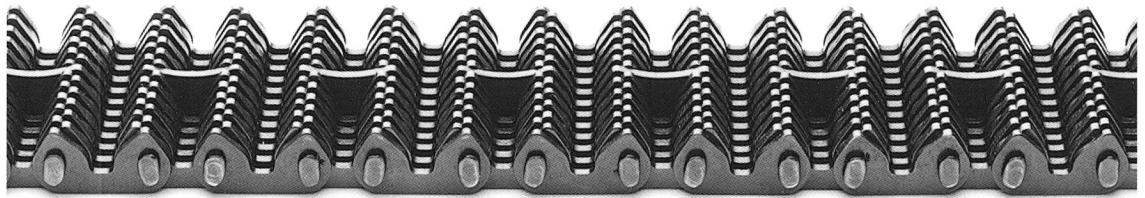

### 2.9 Tabulation of Pitch Diameter, Outside Diameter, Over Pin Dimensions, and Guide Groove Diameter for $\frac{3}{16}$ in. Pitch Chain

See Tables 13 and 14.

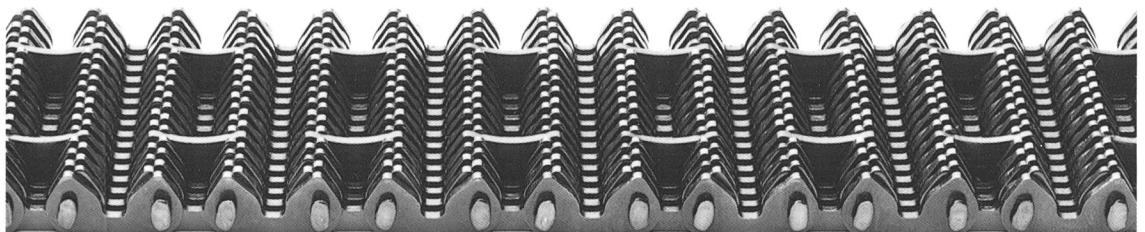

**Fig. 1 Silent Chain**

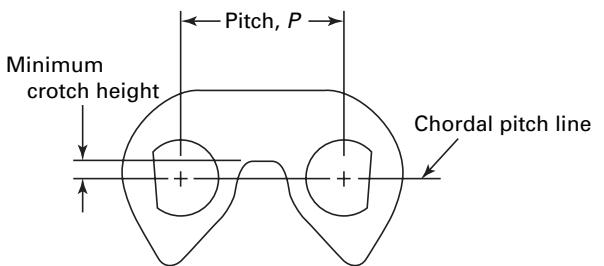

(a) Side Guide Silent Chain

(b) Center Guide Silent Chain

(c) Two Center Guide Silent Chain

**Fig. 2 Typical Links****Fig. 3 Link Form**

GENERAL NOTE: Minimum crotch height =  $0.062 \times$  chain pitch.

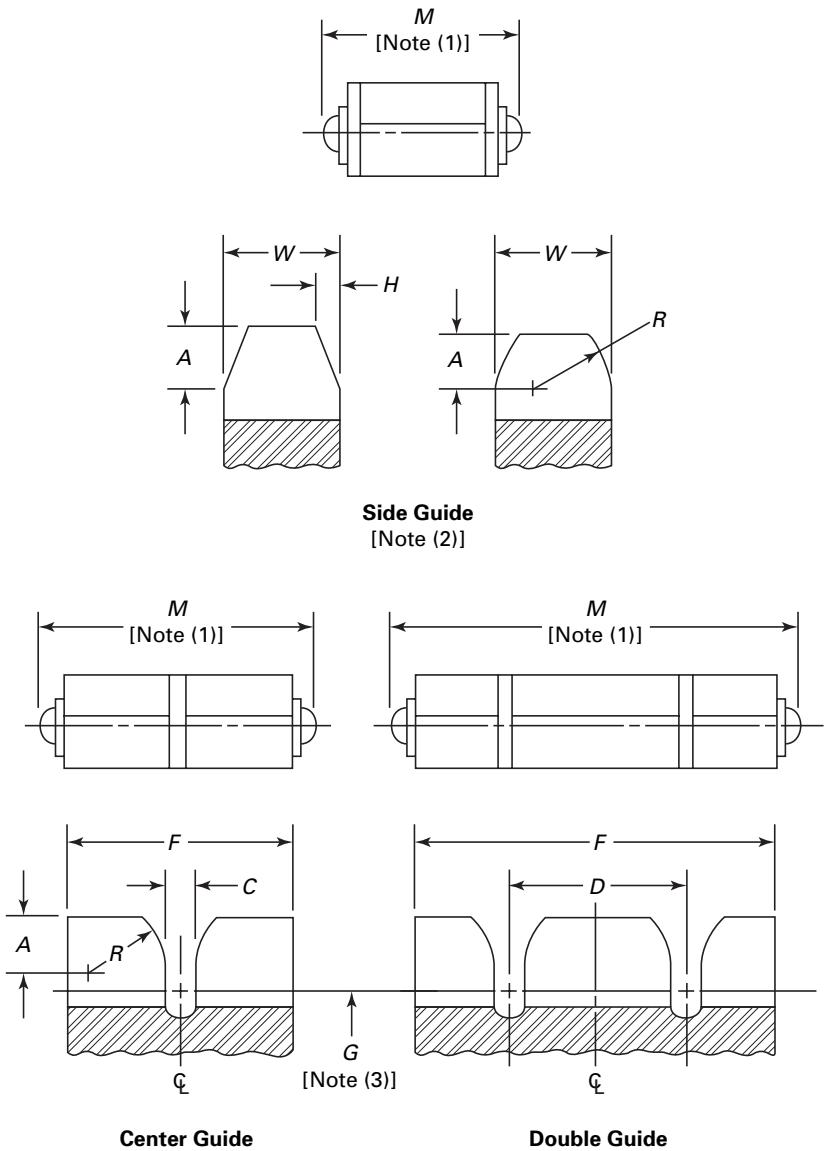

**Table 1 Chain Link Data, in.**

Chain Number (Width in $\frac{1}{4}$ in.)	Chain Pitch	Stamp	Minimum Crotch Height
SC3	0.375	SC3 or 3	0.0232
SC4	0.500	SC4 or 4	0.0310
SC5	0.625	SC5 or 5	0.0388
SC6	0.750	SC6 or 6	0.0465
SC8	1.000	SC8 or 8	0.0620
SC10	1.250	SC10 or 10	0.0775
SC12	1.500	SC12 or 12	0.0930
SC16	2.000	SC16 or 16	0.1240

**Table 2 Chain Link Data, mm**

Chain Number (Width in $\frac{1}{4}$ in.)	Chain Pitch	Stamp	Minimum Crotch Height
SC3	9.52	SC3 or 3	0.589
SC4	12.70	SC4 or 4	0.787
SC5	15.88	SC5 or 5	0.985
SC6	19.05	SC6 or 6	1.181
SC8	25.40	SC8 or 8	1.574
SC10	31.76	SC10 or 10	1.968
SC12	38.10	SC12 or 12	2.302
SC16	50.80	SC16 or 16	3.149

**Fig. 4 Chain Widths and Sprocket Profiles for  $\frac{3}{8}$  in. Pitch and Larger****GENERAL NOTES:**

- All sprockets should be marked with complete chain number and number of teeth. Example: SC304-25.
- The maximum radius over a new chain engaged on a sprocket will not exceed the sprocket pitch radius plus 75% of the chain pitch.

**NOTES:**

- $M$  = maximum overall width of chain.
- Side guide chains have single outside guides of same thickness as toothed links.
- Grooving tool may be either square end or round end, but groove must be full width down to diameter  $G$ . For values of  $G$ , see Table 12.

**Table 3 Chain Widths and Sprocket Face Dimensions for  $\frac{3}{8}$  in. Pitch and Larger, in.**

## NOTES:

- (1) Consult manufacturers' catalogs for available widths.
- (2)  $M$  = maximum overall width of chain.
- (3) Side guide chains have single outside guides of same thickness as toothed links.

## NOTES:

- (1) Consult manufacturers' catalogs for available widths.
- (2) M = maximum overall width of chain.
- (3) Side guide chains have single outside guides of same thickness as toothed links.

**Fig. 5 Chain Widths and Sprocket Profiles for  $\frac{3}{16}$  in. Pitch****GENERAL NOTES:**

- (a) Sprocket face widths are established:
 
$$W = 0.0315 \text{ in. } (N-2) - 0.020 \text{ in.}$$

$$W = 0.8001 \text{ mm } (N-2) - 0.51 \text{ mm}$$
 where  
 $N$  = the total number of links wide
- (b) Face width tolerance is  $\pm 0.003$  in. ( $\pm 0.08$  mm).

**NOTES:**

- (1)  $M$  = maximum overall width of chain.
- (2) Grooving tool may be either square or round end, but groove must be full width down to diameter  $G$ . For values of  $G$ , see Tables 13 and 14.

**Table 5 Chain Widths and Sprocket Face Dimensions for  $\frac{3}{16}$  in. Pitch, in.**

## GENERAL NOTES:

- (a) Tolerance for outside diameters of sprockets with square top teeth = +0.000;  $-0.050 \times$  pitch, in.
- (b) Tolerance for outside diameters of sprockets with rounded top teeth is the same as over pin diameter tolerance.
- (c) Tolerance for guide groove diameter  $G$  = +0.000;  $-0.030$  in. (0.76 mm).
- (d) Tolerance for maximum eccentricity (total indicator reading) pitch diameter with respect to bore =  $0.001 \times PD$ , in., but not less than 0.006 nor more than 0.032.
- (e) All tolerances are negative. Tolerance =  $(0.004 + 0.001P\sqrt{N})$  in., where  $P$  = chain pitch,  $N$  = number of teeth.

**Table 8 Over Pin Diameter Tolerances for  $\frac{3}{8}$  in. Pitch and Larger, mm**

Pitch	Number of Teeth									
	Up to 15	16–24	25–35	36–48	49–63	64–80	81–99	100–120	121–143	144 Up

## GENERAL NOTES:

- (a) Tolerance for outside diameters of sprockets with square top teeth = +0.000;  $-0.050 \times$  pitch, in.
- (b) Tolerance for outside diameters of sprockets with rounded top teeth is the same as over pin diameter tolerance.
- (c) Tolerance for guide groove diameter  $G$  = +0.000;  $-0.030$  in. (0.76 mm).
- (d) Tolerance for maximum eccentricity (total indicator reading) pitch diameter with respect to bore =  $0.001 \times PD$ , in., but not less than 0.006 nor more than 0.032.
- (e) All tolerances are negative. Tolerance =  $(0.004 + 0.001P\sqrt{N})$  in., where  $P$  = chain pitch,  $N$  = number of teeth.

**Table 9 Over Pin Diameter Tolerances for  $\frac{3}{16}$  in. Pitch, in.**

Pitch	Number of Teeth									
	Up to 15	16–24	25–35	36–48	49–63	64–80	81–99	100–120	121–143	144 Up
0.1875	0.004	0.004	0.004	0.004	0.004	0.005	0.005	0.005	0.005	0.005

## GENERAL NOTES:

- (a) Tolerance for guide groove diameter  $G$  = +0.000 in.;  $-0.015$  in. (0.38 mm).
- (b) Tolerance for maximum eccentricity (total indicator reading) pitch diameter with respect to bore is 0.004 in., up to and including 4 in. diameter, and 0.008 in., over 4 in. diameter.
- (c) All tolerances are negative.

**Table 10 Over Pin Diameter Tolerances for  $\frac{3}{16}$  in. Pitch, mm**

Pitch	Number of Teeth									
	Up to 15	16–24	25–35	36–48	49–63	64–80	81–99	100–120	121–143	144 Up
4.76	0.10	0.10	0.10	0.10	0.10	0.13	0.13	0.13	0.13	0.13

## GENERAL NOTES:

- (a) Tolerance for guide groove diameter  $G = +0.000$  in.;  $-0.015$  in. (0.38 mm).
- (b) Tolerance for maximum eccentricity (total indicator reading) pitch diameter with respect to bore is 0.004 in., up to and including 4 in. diameter, and 0.008 in., over 4 in. diameter.
- (c) All tolerances are negative.

**Table 11 Maximum Hub Diameter for Sprocket of Unity Pitch**

Number of Teeth	Hob Cut	Straddle Cut
17	4.019	4.099
18	4.341	4.421
19	4.662	4.742
20	4.983	5.063
21	5.304	5.384
22	5.626	5.706
23	5.946	6.026
24	6.265	6.345
25	6.586	6.666
26	6.905	6.985
27	7.226	7.306
28	7.546	7.626
29	7.865	7.945
30	8.185	8.265
31	8.503	8.583

## GENERAL NOTES:

- (a) Equations for calculating maximum hub diameters ( $MHD$ ):

$$MHD \text{ (hobbed teeth)} = P \left( \cot \frac{180 \text{ deg}}{N} - 1.33 \right)$$

$$MHD \text{ (straddle cut teeth)} = P \left( \cot \frac{180 \text{ deg}}{N} - 1.25 \right)$$

$MHD$  for other methods of cutting teeth may differ from the above.

- (b) Good practice indicates that teeth of sprockets up to and including 31 teeth should have a minimum Rockwell hardness of C50.

# NONMANDATORY APPENDIX A

## SUPPLEMENTARY INFORMATION

### A-1 CHAIN SELECTION

#### A-1.1 Design Factors

The horsepower ratings in the following tables apply to lubricated standard silent chains and are based on a width of 1 in. For chain ratings of other widths, multiply the table rating by the actual chain width. Also, the ratings are based on a service factor of 1, the use of recommended lubrication methods, and a drive arrangement where two aligned sprockets are mounted on parallel shafts in a horizontal plane. In some instances, when full load operation is encountered only during a portion of the drive's duty cycle, speeds and loads that exceed ratings can be utilized. Drives with more than two sprockets, idlers, composite duty cycles, or other unusual conditions often require special consideration. It is beyond the scope of this Standard to present selection procedures for all conditions, and it is advisable to consult chain manufacturers for selections of this nature.

**A-1.1.1 Drive Selection.** Drive selection consists of choosing the appropriate chain and sprockets for the space, loads, and speeds involved. Often, more than one pitch and width will work in a given situation. Where minimal noise or extra-smooth operation is desired, a smaller pitch chain and larger diameter sprockets may be beneficial.

When making drive selections, it is important to consider the load characteristics of the power source and the specific application. This is done by sizing components based on the drive's design power, which is obtained as follows:

$$\text{design power} = \text{power to be transmitted} \times \text{service factor}$$

Next, consult the power tables, and find the chain power capacity per inch of width, based on the size and speed of the smaller sprocket. From this, calculate the required chain width.

$$\text{required chain width} = \frac{\text{design power}}{\text{power capacity}}$$

#### A-1.2 Lubrication

Proper drive lubrication is essential for a long service life. When used in sufficient quantities, lubricants protect against corrosion, dissipate heat, cushion impact, and flush away debris. The horsepower rating tables presume that adequate lubrication is used.

For most applications, a good grade of nondetergent, petroleum-based oil is recommended. Multiviscosity oils are not recommended. Generally, greases and high-viscosity oils are too thick to penetrate chain joints and should be avoided. Chain drives should also be protected against dirt and moisture, and the oil supply should be kept free of contamination. The following table shows recommended lubricant viscosities for a variety of temperatures:

Ambient Temperature, °F	Recommended Lubricant
<40	SAE 5 [Note (1)]
40–90	SAE 10 [Note (1)]
>90	SAE 20

NOTE:

(1) Type A or B automatic transmission fluid may be substituted.

Systems for applying chain lubricant are grouped into three categories: Types I, II, and III. Oil stream lubrication, Type III, is optimum. Type I or II lubrication may be acceptable, depending on chain speed. The horsepower rating tables show the minimum lubrication requirements for various sprocket and speed combinations. In general, the better the lubrication, the longer the chain life. For this reason, the best available method of lubrication should be used whenever possible.

**A-1.2.1 Type I — Drip and Manual Lubrication.** There are two different kinds of Type I lubrication: drip and manual.

*drip lubrication:* oil drops are applied, preferably to the inside surface of the chain, using a drip lubricator. The volume and frequency should be sufficient to prevent discoloration of lubricant in the chain joints. Care should be taken to prevent oil drops from being misdirected by chain windage.

*manual lubrication:* oil is applied with a brush or spout. The volume and frequency of application should be sufficient to prevent overheating of the chain or discoloration in the chain joints.

**A-1.2.2 Type II — Bath or Disk Lubrication.** There are two different kinds of Type II lubrication: bath and disk.

*bath lubrication:* the lower strand of chain runs through a bath of oil. When the chain is operating, the oil level should reach the pitch line of the chain at its lowest point.

**disk lubrication:** a rotating disk picks up oil from a sump and deposits it onto the chain, usually by means of a trough. The diameter of the disk should be sized to produce rim speeds between 600 ft/min minimum and 8,000 ft/min maximum. The chain operates above the oil level.

**A-1.2.3 Type III – Oil Stream Lubrication.** A continuous stream of oil is applied to the chain, usually by means of an oil pump. Lubricant is typically recirculated and filtered. The oil should preferably be directed at the slack strand and applied evenly across the chain's inside surface.

### A-1.3 Sprockets, Installation, and Alignment

**A-1.3.1 Sprockets.** The dimensions and tooth form of sprockets operating with standard chain should conform to this Standard. For maximum service life, sprockets should have hardened teeth. In cases where speeds are low, large diameter sprockets with unhardened teeth may provide satisfactory life. Normally, large sprockets should not exceed 120 teeth.

**A-1.3.2 Center Distance.** In general, a center distance of 30 to 50 chain pitches is most desirable. The distance between sprocket centers should provide at least 120 degrees of chain wrap on the smaller sprocket.

**A-1.3.3 Center Distance Adjustment.** Drives may be installed with either adjustable or fixed center distances. Adjustable centers simplify the control of chain slack and may prolong chain life. Some fixed center drives employ an adjustable idler or shoe to control chain slack. These devices may also be used to control backlash or ensure adequate chain wrap around sprockets. Chain enclosures should be designed to provide adequate clearance for chain slack that may develop over time.

**A-1.3.4 Alignment.** Proper alignment of shafts and sprocket tooth faces provides for uniform load distribution across the entire chain width and is important for

prolonging drive life. Periodic maintenance should include inspections to ensure that alignment is maintained.

### A-1.4 Service Factors

The service factors in Table A-1 are for normal chain loading. For unusual or severe operating conditions, it is desirable to use larger service factors.

### A-1.5 Horsepower Tables

To properly use the horsepower ratings, the following factors must be taken into consideration:

(a) *Service Factors.* See Table A-1.

(b) *Lubrication.* The horsepower established from the sprocket and speed combination of the drive under consideration will indicate a method of lubrication. This method or a better one must be used to obtain optimum chain life. Types of lubrication as indicated on Tables A-2 through A-9 are as follows:

- (1) *Type I:* manual, brush, or oil cup
- (2) *Type II:* bath or disk
- (3) *Type III:* circulating pump

## A-2 SPROCKET-CUTTING TOOLS FOR $\frac{3}{8}$ in. PITCH CHAIN AND LARGER

### A-2.1 Straddle Cutters for $\frac{3}{8}$ in. Pitch Chain and Larger

Basic data on straddle cutters are included in Fig. A-1 and Tables A-10 and A-11.

### A-2.2 Hobs for $\frac{3}{8}$ in. Pitch Chain and Larger

Basic hob-generating data are included in Figs. A-2 and A-3 and Table A-12. When sprockets are cut, the over pin diameters in Table 12 must be used.

Lubrication	Type I							Type II				Type III

## GENERAL NOTES:

- (a) Type I: manual or drip feed, less than 1,000 fpm; Type II: bath or slinger disk, less than 2,500 fpm; Type III: forced feed, greater than 2,500 fpm.  
 (b) Smooth drive operation is promoted by using sprockets with 21 or more teeth.  
 (c) Lubrication methods indicated in the table represent minimal requirements.

**Table A-3 Horsepower Rating per Inch of Chain Width —  $\frac{3}{8}$  in. Pitch**

## NOTES:

(1) Range of teeth is indicated in the cutter marking.

(2) Suggested standard; bores other than standard must be specified.

**Fig. A-2 Hob-Generating Criteria for  $\frac{3}{8}$  in. Pitch and Larger****Fig. A-3 Hob Identification**

**Table A-12 Hob-Generating Data**

Chain Pitch	Hob Number	Basic No. of Teeth	Tooth Range of Hob	Generating Diameter	
				in.	mm
SC3 = 0.375 in. 9.52 mm	1	20	17-23	2.311	58.70
	2	28	24-32	3.247	82.47

## B29 AMERICAN NATIONAL STANDARDS – CHAINS, ATTACHMENTS, AND SPROCKETS FOR POWER TRANSMISSION AND CONVEYING

Inverted Tooth (Silent) Chains and Sprockets .....	B29.2M-2007
Leaf Chains, Clevises, and Sheaves.....	B29.8M-1993
Heavy Duty Offset Sidebar Power Transmission Roller Chains and Sprocket Teeth.....	B29.10M-1997 (R2002)
Steel Brushed Rollerless Chains, Attachments, and Sprocket Teeth.....	B29.12M-1997 (R2004)
Steel Roller Type Conveyor Chains, Attachments, and Sprocket Teeth.....	B29.15M-1997 (R2003)
Welded Steel Type Mill Chains, Attachments, and Sprocket Teeth.....	B29.16M-1995
Hinge Type Flat Top Conveyor Chains and Sprocket Teeth .....	B29.17M-1998 (R2004)
Welded Steel-Type Drag Chains, Attachments, and Sprocket Teeth .....	B29.18M-1993
700 Class Welded Steel and Cast Chains, Attachments and Sprockets for Water and Sewage Treatment Plants .....	B29.21M-1996 (R2003)
Drop Forged Rivetless Chains, Sprocket Teeth Drive Chain/Drive Dogs.....	B29.22-2001
Flexible Chain Couplings.....	B29.23M-1985 (R2004)
Roller Load Chains for Overhead Hoists.....	B29.24-2002
Fatigue Testing Power Transmission Roller Chain .....	B29.26-2001
Single-Pitch and Double-Pitch Hollow Pin Conveyor Chains and Attachments .....	B29.27-2002
Precision Power Transmission, Double-Pitch Power Transmission, and Double-Pitch Conveyor Roller Chains, Attachments, and Sprockets .....	B29.100-2002
Agricultural, Detachable, and Pintle Chains, Attachments, and Sprockets .....	B29.300-1998
Combination, "H" Type Mill Chains, and Sprockets .....	B29.400-2001

The ASME Publications Catalog shows a complete list of all the Standards published by the Society. For a complimentary catalog, or the latest information about our publications, call 1-800-THE-ASME (1-800-843-2763).

## ASME Services

ASME is committed to developing and delivering technical information. At ASME's Information Central, we make every effort to answer your questions and expedite your orders. Our representatives are ready to assist you in the following areas:

ASME Press	Member Services & Benefits	Public Information
<i>Codes &amp; Standards</i>	Other ASME Programs	Self-Study Courses
Credit Card Orders	Payment Inquiries	Shipping Information
IMechE Publications	Professional Development	Subscriptions/Journals/Magazines
Meetings & Conferences	Short Courses	Symposia Volumes
Member Dues Status	Publications	Technical Papers

### **How can you reach us? It's easier than ever!**

There are four options for making inquiries\* or placing orders. Simply mail, phone, fax, or E-mail us and an Information Central representative will handle your request.

<i>Mail</i>	<i>Call Toll Free</i>	<i>Fax—24 hours</i>	<i>E-Mail—24 hours</i>
<b>ASME</b> 22 Law Drive, Box 2900 Fairfield, New Jersey 07007-2900	<b>US &amp; Canada:</b> 800-THE-ASME (800-843-2763) <b>Mexico:</b> 95-800-THE-ASME (95-800-843-2763) <b>Universal:</b> 973-882-1167	973-882-1717 973-882-5155	Infocentral@asme.org

\* Information Central staff are not permitted to answer inquiries about the technical content of this code or standard. Information as to whether or not technical inquiries are issued to this code or standard is shown on the copyright page. All technical inquiries must be submitted in writing to the staff secretary. Additional procedures for inquiries may be listed within.
