

Standard Specification for Glazed Brick (Single Fired, Brick Units)¹

This standard is issued under the fixed designation C1405; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope*

1.1 This specification covers brick, having a ceramic glaze finish fused to the body during the same process as the unit body firing, that are intended for use in masonry and supplying structural or facing components, or both, to the structure. This specification does not cover double-fired glazed brick. Some double-fired decorative glazes have physical properties, which vary from those of single-fired glazes due to the lower temperatures used in applying the decorative coating.

1.2 The property requirements of this specification apply at the time of purchase. The use of results from testing of brick extracted from masonry structures for determining conformance or nonconformance to the property requirements of this specification is beyond the scope of this specification.

1.3 Glazed brick are prismatic units available in a variety of sizes, textures, colors, and shapes. Glazed brick are manufactured from clay, shale, or similar naturally occurring earthy substances and subjected to a heat treatment at elevated temperatures (firing). The heat treatment shall develop a fired bond between the particulate constituents to provide the strength and durability requirements of this specification (see Terminology C1232).

1.4 Glazed brick are shaped during manufacture by molding, pressing, or extrusion, and the shaping method is a way to describe the brick.

1.5 Glazed brick are classified into one of two grades, one of two types, one of two classes, and one of three divisions.

1.6 Opacity of the glaze is not required unless specified by the purchaser.

1.7 The text of this standard references notes and footnotes that provide explanatory material. These notes and footnotes (excluding those in tables and figures) shall not be considered as requirements of this standard.

1.8 The values stated in inch-pound units are to be regarded as standard. The values given in parentheses are mathematical

conversions to SI units that are provided for information only and are not considered standard.

1.9 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

3. Terminology

3.1 *Definitions*—Terms used in this specification are defined in accordance with Terminology C1232.

4. Classification

4.1 *Grades*—Grades classify glazed brick according to their permissible variation in face dimension as follows. When grade is not specified, the requirements for Grade S govern.

¹ This specification is under the jurisdiction of ASTM Committee C15 on Manufactured Masonry Units and is the direct responsibility of Subcommittee C15.02 on Brick and Structural Clay Tile.

Current edition approved June 1, 2016. Published July 2016. Originally approved in 1998. Last previous edition approved in 2015 as C1405 – 15. DOI: 10.1520/C1405-16.

³ Available from National Fire Protection Association (NFPA), 1 Batterymarch Park, Quincy, MA 02169-7471, <http://www.nfpa.org>.

⁴ Available from Underwriters Laboratories (UL), 333 Pfingsten Rd., Northbrook, IL 60062-2096, <http://www.ul.com>.

4.1.1 *Grade S (Standard)*, units for use where standard dimensional tolerances are desired.

4.1.2 *Grade SS (Select Sized)*, units for use where a higher degree of precision and lower permissible variation in size are desired.

4.2 *Types*—Two types of glazed brick are covered. When type is not specified, the requirements for Type I govern.

4.2.1 *Type I (Single-Faced Units)*, for general use where only one face is finished.

4.2.2 *Type II (Two-Faced Units)*, for use where two opposite faces are finished.

4.3 *Classes*—Two classes of glazed brick are covered. When class is not specified, the requirements for Class Exterior govern.

4.3.1 *Class Exterior*, for exterior applications.

4.3.2 *Class Interior*, for interior applications.

4.4 *Divisions*—Three divisions of glazed brick are covered. Divisions identify the amount and placement of hollow spaces (cores, cells and deep frogs) in the cross section of the unit. In the Division nomenclature, H shall be understood to mean hollow, and V shall be understood to mean void.

4.4.1 *Division Solid*—Brick with void area less than or equal to 25 % of its gross cross sectional area, measured in any plane parallel to the surface containing the cores, cells, or deep frogs.

4.4.2 *Division H40V*—Brick with void area greater than 25 % but less than or equal to 40 % of its gross cross sectional area, measured in any plane parallel to the surface containing the cores, cells, or deep frogs.

4.4.3 *Division H60V*—Brick with void area greater than 40 % but less than or equal to 60 % of its gross cross sectional area, measured in any plane parallel to the surface containing the cores, cells, or deep frogs. The shell thicknesses shall comply with the requirements in Table 1. See Fig. 1.

5. Physical Properties

5.1 *Durability*—Glazed brick shall conform to the physical properties requirements for the class specified as prescribed in Table 2 or in 5.1.1 or 5.1.2. For the compressive strength requirements, test the unit with the compressive force perpendicular to the bed surface of the unit, with the unit in the stretcher position.

NOTE 1—The physical property requirements for durability are based upon correlation of these physical properties and freeze-thaw testing of units in standard production. They indicate durability. Conformance with these property requirements provides a reasonable level of confidence as to durability in lieu of freeze-thaw testing.

FIG. 1 Types of Hollow Glazed Brick Units

5.1.1 *Strength and Absorption Requirements Alternate*—The saturation coefficient requirement for Class Exterior does not apply, provided the average compressive strength of a random sample of five brick equals or exceeds 8000 psi (55.2 MPa) with no individual strength less than 7500 psi (51.8 MPa). Additionally, the 24-h cold water absorption of each unit shall not exceed 6.0 %.

5.1.2 *Freezing and Thawing Alternative*—The requirements for cold water absorption (5.1.1) and absorption and saturation coefficient (Table 2) for Class Exterior do not apply, provided a sample of five brick, meeting the strength requirements of Table 2, passes the freezing and thawing test as described in the Rating Section of the Freezing and Thawing test procedures of Test Methods C67.

NOTE 2—The 50 cycle freezing and thawing test is used as an alternative only when units do not conform to either Table 2 requirements for maximum water absorption and saturation coefficient, or to the

TABLE 1 Division H60V—Hollow Glazed Brick Minimum Thickness of Face Shells and Webs, in. (mm)

Nominal Width of Unit	Face Shell Type		End Shells
	Solid	Cored or Double Shell	
3 and 4 (76 and 102)	3/4 (19.0)	...	3/4 (19.0)
6 (152)	1 (25.4)	1 1/2 (38.1)	1 (25.4)
8 (203)	1 1/4 (31.8)	1 1/2 (38.1)	1 (25.4)
10 (254)	1 3/8 (34.9)	1 5/8 (41.3)	1 1/8 (28.6)
12 (305)	1 1/2 (38.1)	2 (50.8)	1 1/8 (28.6)

TABLE 2 Physical Requirements

Designation	Minimum Compressive Strength, psi (MPa), Gross Area		Maximum Water Absorption by 24-h Cold, 7°	Maximum Saturation Coefficient ^A	
	Average of 5 Brick	Individual	Individual	Average of 5 Brick	Individual
Class Exterior	6000 (41.4)	5000 (34.8)	7.0	0.78	0.80
Class Interior	3000 (20.7)	2500 (17.2)			

^A The saturation coefficient is the ratio of absorption by 24 h submersion in cold water to that after 5 h submersion in boiling water.

requirements of the Strength and Absorption Alternate in 5.1.1.

5.1.2.1 Class Exterior: Breakage and Weight Loss Requirement—No individual unit separates or disintegrates resulting in a weight loss greater than 0.5 % of its original dry weight.

5.1.2.2 Class Exterior: Cracking Requirement—No individual unit develops a crack that exceeds, in length, the unit's least dimension.

5.2 Strength—When glazed brick are required having strengths greater than prescribed by this specification, the purchaser shall specify the desired average compressive strength and the individual minimum compressive strength.

5.3 Initial Rate of Absorption (IRA)—Determine results for IRA in accordance with Test Methods C67 and furnish results at the request of the specifier or purchaser.

NOTE 3—Initial Rate of Absorption (Suction)—IRA is not a qualifying condition or property of units in this specification. This property is measured in order to assist in mortar selection and material handling in the construction process.

6. Efflorescence

6.1 When the brick are tested in accordance with Test Methods C67, the rating for efflorescence shall be: “not effloresced.”

7. Dimensions and Permissible Variations

7.1 The dimensions of brick shall be as specified by the purchaser. In a sample of ten brick selected to represent the extreme range of sizes of brick to be supplied, no brick shall depart from the specified dimensions by more than the individual tolerance for the grade specified as prescribed in Table 3, Column A. The average size of ten brick sample shall be determined, and no brick in the job lot (delivered brick) shall vary from this average size by more than the individual

tolerance for the grade specified as prescribed in Table 3, Column B. No individual brick in the job lot shall fall outside of the dimensional tolerances of Table 3.

7.2 Warpage—Tolerances for warpage of surfaces or edges intended to be exposed in use of individual brick from a plane surface and from a straight line, respectively, shall not exceed the maximum for the grade specified as prescribed in Table 4.

7.3 Out-of-Square—The maximum permitted dimension for out-of-square of the exposed face of the brick is $\frac{3}{32}$ in. (2.4 mm).

NOTE 4—Linear dimensions and flat surfaces of specially shaped brick shall meet the requirements for size and warpage, respectively, of the specified grade. Tolerances for size and warpage of nonlinear dimensions and surfaces, and out-of-square shall be determined by agreement with the manufacturer.

8. Finish and Appearance

8.1 The body of the units shall be free of defects, deficiencies, and other imperfections that would interfere with the proper setting of the brick or significantly impair the strength or performance of the construction.

8.2 The color, color range, and texture shall be specified by the purchaser. The stretcher face of the brick and the exposed face(s) of shapes shall have the same general texture, color range, and glaze as the approved sample. The texture of the glazed surfaces shall conform to an approved sample of not less than four stretcher brick, each representing the texture desired. The color range shall be indicated by the approved sample.

8.2.1 Where brick are required having faces glazed other than those identified by type (Section 4), the purchaser shall specify faces to be glazed and the quantity of brick needed.

NOTE 5—Special brick shapes may be desired by the purchaser that do not meet all of the requirements of this specification (see 8.2.1). Consult

TABLE 3 Tolerances on Dimensions

Specified Dimension or Average Brick Size in Job Lot Sample, in. (mm)	Maximum Permissible Variation in Dimensions, in. (mm) plus or minus from:			
	Column A (for Specified Dimension)		Column B (for Average Brick Size in Job Lot Sample) ^A	
	Grade S	Grade SS	Grade S	Grade SS
3 (76) and under	$\frac{1}{16}$ (1.6)	$\frac{1}{16}$ (1.6)	$\frac{1}{16}$ (1.6)	$\frac{1}{16}$ (1.6)
Over 3-4 (76-102), incl	$\frac{3}{32}$ (2.4)	$\frac{1}{16}$ (1.6)	$\frac{1}{16}$ (1.6)	$\frac{1}{16}$ (1.6)
Over 4-6 (102-152), incl	$\frac{1}{8}$ (3.2)	$\frac{1}{16}$ (1.6)	$\frac{3}{32}$ (2.4)	$\frac{1}{16}$ (1.6)
Over 6-8 (152-203), incl	$\frac{9}{32}$ (4.0)	$\frac{1}{16}$ (1.6)	$\frac{3}{32}$ (2.4)	$\frac{1}{16}$ (1.6)
Over 8-12 (203-305), incl	$\frac{7}{32}$ (5.6)	$\frac{1}{16}$ (1.6)	$\frac{1}{8}$ (3.2)	$\frac{1}{16}$ (1.6)
Over 12-16 (305-406), incl	$\frac{9}{32}$ (7.1)	$\frac{1}{16}$ (1.6)	$\frac{3}{16}$ (4.8)	$\frac{1}{16}$ (1.6)

^A Lot size shall be determined by agreement between purchaser and seller. If not specified, lot size shall be understood to include all brick of one size and color in the job order.

TABLE 4 Tolerances on Warpage

Maximum Dimension, in. (mm)	Maximum Permissible Warpage, in. (mm)	
	Grade S	Grade SS
8 (203) and under	1/16 (1.6)	1/16 (1.6)
Over 8-12 (203-305) incl	3/32 (2.4)	3/32 (2.4)
Over 12-16 (305-406) incl	1/8 (3.2)	3/32 (2.4)

the manufacturer for the availability of specialty units suitable for the intended purposes.

8.3 The face(s) to be glazed shall be covered with a ceramic glaze of uniform quality. The glaze shall be free of chips, crazes, blisters, crawling, or other imperfections detracting from the appearance of the designated sample when viewed under diffused lighting from a distance, at right angles to the sample, of 15 ft (4.57 m) for Class Exterior units and 5 ft (1.52 m) for Class Interior units.

8.4 Overspray of glazes onto adjacent faces of the units shall be regulated by the manufacturer. Residue resulting from the glazing operation shall not interfere with the proper setting of the units or significantly impair the strength or performance of the construction.

NOTE 6—Consult the manufacturer for the extent of overspray common in production. Should other limits on allowable overspray be desired, the manufacturer shall be consulted for availability.

8.5 The number of glazed brick in a delivery that are broken or otherwise fail to meet the requirements for chippage and tolerances shall not exceed 5 %.

8.6 After brick are handled by the purchaser, the manufacturer or the manufacturer's agent shall not be held responsible for compliance of brick with the requirements of this specification for chippage and tolerances.

8.7 Properties of Glaze:

8.7.1 *Imperviousness*—When tested for imperviousness, 11.1.1, no stain that can be seen from a distance of 5 ft (1.5 m) shall remain on or beneath the surface, except a slight discoloration in the depressions on matt, stippled, or mottled glazes and in the crevices formed into the unit face(s) providing surface features.

8.7.2 *Resistance to Fading*—When tested for chemical resistance, 11.1.2, the color of the glaze shall not change from the approved sample.

8.7.3 *Resistance to Crazing*—When tested for crazing, 11.1.3, the glaze shall not craze, spall, or crack when subjected to one cycle of autoclaving.

8.7.4 *Flame Spread Index (FSI) and Smoke Density Index (SDI)*—Body and finish shall withstand temperatures up to 1900°F (1037.8°C) without distortion or melting and rate “non-combustible.” When tested in accordance with the provisions of Test Method E84, glazed brick shall measure 0 flame spread index and 0 smoke density index.

NOTE 7—This test method is similar to that specified in NFPA No. 255 and UL No. 723.

8.7.5 *Fumes*—Under thermogravimetric analysis (TGA), in a flowing air atmosphere, weight loss due to release of gases from the body and glaze finish shall not exceed 0.2 % of dry weight at temperatures up to 1800°F (982.2°C).

NOTE 8—See Practice E2105 for TGA only. TGA test results can be a measure of sample combustibility coupled with low flame spread index and smoke density index.

8.7.6 *Scratch Resistance and Hardness*—Glaze shall resist scratching by ordinary glass or steel and be rated above five on the Mohs Hardness Scale. Finishes of metallic or special decorative glazes shall not be required to meet this requirement.

8.7.7 *Opacity*—When opacity of the glaze is specified, discoloration of the body shall not be visible through the glaze when tested for opacity, 11.1.4.

NOTE 9—Opacity (8.7.7) is not a required property of clear and translucent glazes. The fading resistance (8.7.2) and hardness and abrasion resistance (8.7.6) properties are not required for metallic glazes. If those properties are important for glazes, consult the manufacturer for availability and suitability for the intended purpose.

9. Coring and Frogging

9.1 *Cores*—Brick are cored at the option of the manufacturer. Special coring configurations or 100 % solid units shall be specified by the purchaser and shall meet all other requirements of this section. The distance of any core (void space having a cross-sectional area equal to or less than 1 1/2 in.² (9.68 cm²)) from any exposed edge of the brick shall be not less than 3/4 in. (19 mm) for Division Solid brick nor 5/8 in. (16 mm) for Division H40V and H60V brick, except for cored-shell hollow brick.

9.1.1 Cored-shell hollow brick shall have a minimum shell thickness of 1 1/2 in. (38 mm). Cores equal to or greater than 1 in.² (6.45 cm²) in cored shells shall be not less than 1/2 in. (13 mm) from any edge. Cores not greater than 1 in.² (6.45 cm²) in shells cored not more than 35 %, shall be not less than 3/8 in. (10 mm) from any edge.

9.2 *Cells*—The distance of cells (void spaces having a cross-sectional area greater than 1 1/2 in.² (9.68 cm²)) from any exposed edge of the brick shall be not less than 3/4 in. (19 mm), except for double-shell hollow brick.

9.2.1 Double-shell hollow brick with inner and outer shells not less than 1/2 in. (13 mm) are permitted to have cells not greater than 5/8 in. (16 mm) in width nor 5 in. (127 mm) in length between the inner and outer shells.

9.3 *Webs*—The thickness of webs shall be not less than 1/2 in. (13 mm) between cells, 3/8 in. (9.5 mm) between cells and cores, or 1/4 in. (6 mm) between cores.

9.4 *Unexposed Face*—The distance of hollow spaces to grooves recessed 1/2 in. (13 mm) or greater, shall be not less than 1/2 in. (13 mm). See Fig. 2.

9.5 *Frogging*—Brick are frogged at the option of the manufacturer; brick required to be without frogs shall be specified by the purchaser and shall meet all other requirements of this section. One bearing surface of each brick shall be permitted to have a recess (panel frog) or deep frogs, or both. The recess or panel frog shall not exceed 3/8 in. (9.5 mm) in depth and no part of the recess or panel frog shall be less than 3/4 in. (19 mm) from any edge of Division Solid brick nor 5/8 in. (16 mm) from any edge of Division H40V and H60V brick. In brick containing deep frogs, frogs deeper than 3/8 in. (9.5 mm), any cross-section taken through the deep frogs parallel to the

FIG. 2 Unexposed Face, Distance to Voids

surface containing the deep frogs shall conform to the maximum area and edge distance requirements of 4.4.1 and 9.1.

9.6 *Special Shapes*—Special shaped glazed brick are permitted to have hollow spaces not conforming to the requirements of 9.1 to 9.5. Variations occur due to the method of forming and orientation of the shape in relation to the wall plane (see Note 5).

10. Sampling and Testing of Clay Bodies

10.1 For size, compressive strength, absorption, freeze-thaw, and efflorescence, sample and test brick in accordance with Test Methods C67. Do not use brick tested for compliance with Section 11.

11. Sampling and Testing of Glazes

11.1 For the imperviousness, chemical resistance, crazing, and opacity tests, select a representative sample of five units for lots of 1 000 000 units, or fraction thereof. For larger lots, select five additional specimens from each additional 500 000 units, or fraction thereof.

NOTE 10—Unless otherwise specified in the purchase order, the cost of tests is typically borne as follows: If the results of tests show that the brick do not conform to the requirements of this specification, the cost typically is borne by the seller. If the results of the tests show that the brick do conform to the requirements of this specification, the cost typically is borne by the purchaser.

11.1.1 *Imperviousness Test*—Apply permanent blue-black fountain pen ink liberally to the glazed surface of five dry specimens and allow to remain for 5 min. Wash the surface with a wet cloth and running water, and examine from a distance of 5 ft (1.52 m) for staining of the finish.

11.1.2 *Chemical Resistance Test*—Submerge an end portion of two whole specimens with the glazed surface exposed to a minimum depth of 1½ in. (38.1 mm) in a 10 % solution of hydrochloric acid (HCl) for 3 h. Submerge the opposite end portions of the glazed surfaces of the same specimens similarly in a 10 % solution of potassium hydroxide (KOH) for 3 h. Maintain these solutions at a temperature of 60 to 80°F (15 to 27°C). Rinse, dry, and examine for changes of texture and changes of color, if any.

NOTE 11—A 10 % solution of HCl is prepared by volume using for example, 10 mL of concentrated HCl (12 N or 37.0 %) diluted to a volume of 100 mL with distilled water.

11.1.3 *Autoclaved Crazing Test*—Make the crazing test on three whole dry units previously tested for imperviousness of finish (11.1.1). Do not use specimens subjected to the chemical resistance test (11.1.2). Use an autoclave with sufficient capacity to contain all the units of the same texture, color, and size. Equip the apparatus with a safety valve, blowoff valve, thermometer, and pressure gauge accurate within 2 % of the scale range, and a heater or other means of sufficient capacity to ensure constant steam pressure within the autoclave (**Warning**—See Appendix X1 for safety precautions pertaining to the use of autoclave equipment). Place the specimens loosely above the water in the autoclave at room temperature. After fastening the autoclave head in place, heat the water in the bottom from an external source. Keep the blowoff valve open until steam begins to escape, thereby expelling most of the air. After closing the blowoff valve, keep the water boiling and increase the steam pressure at a uniform rate until it reaches 150 psi (1.03 MPa) within a period of not less than 60 min nor more than 1½ h. Apply sufficient heat to maintain a constant pressure of 150 ± 5 psi (1.03 ± 0.04 MPa) for an additional hour. Shut off the heater and release the steam pressure slowly in not less than 30 min by opening the blowoff valve. Loosen the autoclave head, but do not remove it, and permit the specimens to cool gradually to room temperature in a period not less than 3 h. Remove the specimens and rub permanent blue-black fountain pen ink upon the glazed surfaces to aid in the detection and examination of failures.

11.1.4 *Opacity Test*—Conduct the opacity test on three dry specimens by applying permanent blue-black fountain pen ink liberally to the body along a 2-in. (50.8-mm) length of the edge of the finished surface. After 5 min, examine the finish for opacity. When the same three specimens are to be subjected to both opacity and crazing test (11.1.3) make the opacity test first.

11.1.5 *Precision and Bias*—No information is presented about either the precision or bias of the test methods for measuring imperviousness, chemical resistance, crazing, or opacity because the test results are nonquantitative.

11.2 Flame Spread Index and Smoke Density Index shall be based on tests of glazed brick of any configuration or dimension made with the same materials and base glaze composition. Testing shall be conducted in accordance with Test Method E84.

11.3 Testing for release of fumes shall be based on tests of glazed brick of any configuration or dimension made with the same materials and base glaze composition. Testing shall be conducted in accordance with Practice E2105.

11.4 Sample and test brick for hardness and abrasion resistance in accordance with Federal Standard No. 141.

12. Keywords

12.1 brick; ceramic glaze; glaze properties; glaze test; physical properties; single fired

APPENDIXES

(Nonmandatory Information)

X1. SAFETY PRECAUTIONS FOR AUTOCLAVE EQUIPMENT AND OPERATION

X1.1 The autoclave pressure gauge should have a range from 0 to 600 psi (4.13 MPa) and should be maintained in accordance with Practice **C1093**.

X1.2 If an automatic control is used, it should be maintained in proper working order.

X1.3 The safety valve should be maintained in accordance with Practice **C1093** and set to relieve the pressure at about 20 psi (0.13 MPa) above the 155 psi (1.07 MPa) maximum specified in **11.1.3**. The discharge should be directed away from the operator.

X1.4 During the test, a thermometer always should be used as a safety pressure check.

X1.5 Precautions should be taken at all times for unexpected developments. The operator should be completely alert

and thoroughly familiar with all operations.

X1.6 Suitable gloves should be worn when loosening bolts and removing autoclave top at the completion of the test. The vent valve should be directed properly and the lid tilted so that escaping steam is discharged away from the operator.

X1.7 The return of the gauge hand to the initial rest or starting point does not necessarily indicate zero pressure within the autoclave; there may still remain appreciable pressure.

X1.8 A few drops of kerosene placed in the vent valve about once a week will aid in keeping the needle clean and in good working condition.

X1.9 All additional safety precautions, as contained in the autoclave manufacturer's literature and specific operating instructions, should be carefully observed at all times.

X2. GLAZED BRICK MASONRY EXTERIOR WALL DESIGN

X2.1 *Scope*—This appendix provides information to allow more knowledgeable decision making when designing exterior wall systems utilizing glazed brick masonry.

X2.2 *Significance and Use*—Ceramic glazed brick have been an integral part of building design for many decades. They have performed in all climatic conditions. Glazed brick exterior walls can be used successfully through the use of conventional drainage wall types that allow the brick to dry from their unglazed surfaces. Material selection, detailing, proper construction, and proper maintenance practices are essential to ensure successful performance.

X2.3 Moisture Detailing

X2.3.1 *Wall System*—Due to the imperviousness of the ceramic finish, glazed brick exterior walls are recommended to be designed to drain water that enters the wall system. This water source may be wind-driven rain or condensation. It is recommended, for glazed brick exterior walls, that a drainage type wall system with a vented air space be designed, detailed, and constructed. This will accommodate the proper control of migrating water within the wall's cross section. While model building codes typically require a minimum 1 in. (25 mm) open air space between the facing wythe and back-up system for water drainage, a 2 in. (50 mm) open air space is recommended behind glazed brick facing wythes, given the need for both water drainage from and air circulation in the space. Two common examples of drainage walls include the cavity and veneer designs.

X2.3.2 *Flashing, Weepholes, and Vents*—In either design, flashings and weepholes need be provided at the wall base,

under sills, over lintels and shelf angles, and under masonry or stone caps and copings. Flashings should be continuous around the building perimeter at the wall base, shelf angles, and copings. Isolated flashing locations, such as window sills and lintels, should have end dams. Open head-joint weepholes (typically with inserts) are located in head joints directly on top of all flashings. It is recommended that weepholes be used in conjunction with vents to achieve air circulation behind the glazed brick wythe. For drainage and air circulation, open head joint weepholes should be spaced at a maximum of 24 in. (600 mm) on center. At the top of a wall, vents should be incorporated to allow air circulation in the drainage space. These vents should be located approximately 8 in. (200 mm) below the next flashing or coping location and have a maximum spacing of 48 in. (1200 mm) on center, depending on the interior humidity in the structure. Higher interior humidity environments, such as gymnasiums, museums, pools, restrooms, and so forth, may require a maximum spacing of 24 in. (600 mm) on center.

X2.4 Movement Detailing

X2.4.1 *Expansion Joints*—Glazed brick masonry walls move with changes in temperature and moisture content. Wall detailing for the drainage type walls utilizing a glazed brick facing wythe needs to incorporate room for brick's growth. These movement joints, placed vertically and horizontally, segment the wall into panels. The panel lengths should be limited to a length of 26 ft (8.0 m) to ensure stress in the masonry is below cracking levels, based on a joint size of 1/2 in. (12 mm). Panel heights will vary with the building and wall design; however, horizontal joints should be placed to create

minimum ¼ in. (6 mm) soft-joint under each shelf angle used to support the brick at story levels.

X2.4.2 Expansion Joint Placement—The building geometry and openings indicate locations for vertical expansion joints in glazed brick walls. These locations include; corners (2 to 10 ft (0.6 to 3 m) from the corner on one side), changes in wall

height, and offsets in the wall plane. All vertical expansion joints should extend full height from foundation to wall top, or from shelf angle to shelf angle. All expansion joints should be free of incompressible materials. For protection against water penetration, expansion joints are finished with a backer-rod and elastic joint sealant.

SUMMARY OF CHANGES

Committee C15 has identified the location of selected changes to this standard since the last issue (C1405 – 15) that may impact the use of this standard. (June 1, 2016)

(1) Revised **8.7.4**, **8.7.5**, and **11.2** based on current ASTM E84 practices; and references to E84 for toxic fumes were deleted.

(2) Added **Note 8** and **11.3**.

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.
