Foreword

The purpose of this compilation is the tying together of the trade names, producers' designations, and specifications for stainless steels and superalloys, thus easing the problem of identifying some of these alloys. This publication is *not* intended as a procurement directory or buyer's guide.

The information contained in this compilation is based on the data supplied by 80 U. S. producers (usually melters) of stainless steels, corrosion and heat resistant castings, and superalloys. This revision also contains powder-metallurgy-produced products.

This document does not include information from processors such as forgers, rerollers, wire drawers, etc., since they are not primary metal producers.

INTRODUCTION

This compilation lists the compositions, applicable specifications, trade names, and manufacturers of commercial stainless steels and superalloys produced in the United States. The information included was obtained directly from the alloy producers. Materials covered include stainless steels, heat and corrosion resistant alloy castings, and superalloys (those alloys containing approximately 12 percent chromium and up). Thermocouple alloys, controlled-expansion alloys, and magnetic alloys are not included.

The users of public specification documents for metals and alloys have a persistent problem in the recognition of many alloys, particularly those which are proprietary, because the use of trade names is not permitted in these documents and because numeric designations have not been completely standardized. The situation is especially complicated in the case of the stainless alloys and superalloys where various trade names and numeric designations are often used for the same alloy.

Since trade names may not be used in ASTM specifications to identify an alloy, the chemical composition, an arbitrary number, or some industry-wide accepted designation, such as AISI or ACI numbers, must be used. In turn, the users of the specifications are faced with the tedious task of correlating the ASTM designations with their more familiar trade names. In some Committee A-10 specifications "XM" numbers have been used to identify proprietary alloys. The XM numbers and chemical requirements are given in the Appendix.

Because of this situation, Committee A-10 initiated a program to identify, collect, and list the various designations and trade names used for the metals and alloys within the A-10 scope (there are also a few alloys under ASTM Committee B-2 jurisdiction in this compilation). The aim was to list the alloys by their usual or trade designation and show the various producers' trade names, the approximate chemical composition, and the applicable public specifications, in the hope that a useful index to these alloys would result.

Organization

The organization of this revision remains unchanged, but the format has been modified to conserve space by using a tabular arrangement of the information. The tabular format also should be easier to use.

The alloys have been separated into seven groups, but there are no sharp dividing lines between the groups and some alloys have been placed arbitrarily.

In general, the alloys in each group are arranged alphanumerically, although some closely related alloys are located in the compilation near similar compositions. For instance, alloys with designations resembling AISI numbers are located with the AISI alloys.

Group 1, the AISI stainless steels, is based upon the AISI Steel Products Manual -- Stainless and Heat Resisting Steels (April, 1963), and Supplementary Information (February, 1969).

The steels listed in the AISI Manual are considered to be AISI Standard Types and are identified as AISI Type XXX in the alloy designation column in this compilation. The AISI 600 series numbers* are not "standard" AISI designations, but they have been included in this compilation since they are sometimes used for identification purposes.

Alloy Designations

Each alloy in this compilation is listed by its commonly used designation, or if it is a proprietary alloy, by the designation used by the proprietor, usually a trade name. Other often used designations, other than trade names, have also been included in the listing. For example, the listing for the cobalt-base alloy, Crucible WF-11, also shows L-605 and AISI 670. Information available to the authors regarding proprietorship is not complete, but an effort has been made to identify proprietary alloys. Whenever the information was made available to the authors, proprietary alloys were identified by a letter P in the Alloy Designation column and again in the Producer Designations column to indicate the proprietor.

Chemical Composition

Either the nominal chemical composition or the compositional ranges given in one of the applicable specifications have been used. In the latter case, the compositional limits for some of the alloys, particularly the stainless steels and corrosion or heat resistant castings, may differ slightly depending upon which specification was used. No attempt has been made to show the compositional variations intended to produce optimum properties for specific purposes. For the standard AISI types, the compositions used are from Table 2-1 of the AISI Steel Products Manual - Stainless and Heat Resisting Steels.

Applicable Specifications

Applicable public specifications (limited to ASTM, AMS, Military and Federal), as identified by the producers, have been included. As an aid to ASTM specification users and ASTM specification writing committees, the ASTM specifications have been identified according to product form.

Producer Designations

For a particular material, the designations or trade names used by the various producers are shown followed, in parentheses, by producer code numbers from Table 1.

In some cases, a producer manufacturing a proprietary alloy under license from the proprietor may use the proprietor's trade-name to identify the alloy. This constitutes a misuse of the proprietor's trade name. In this revision of DS 45, the authors have avoided this type of misuse of trade names.

Also, in the interests of uniformity and brevity, the myriad of trade names related to the "standard AISI" or closely related steels in Group 1 have not been listed.

INDEX

This index consists of an Alloy and Producer Designations Index, and a Specifications Index.

Alloy designations are listed in **Bold Face Type**. Producer designations (when different from the Alloy designation) are listed in *Italic Type*. Alloy designation prefixes "AISI Type" and "ACI" are not included in the index listing.

The Specification Index is intended primarily for the proprietary alloys, therefore, only Groups 3-7 are included.
