

Designation: E 1761 – 95 (Reapproved 1999)

Standard Guide for Recommended Formats for Data Records Used in Computerization of Fatigue and Fracture Data of Metals¹

This standard is issued under the fixed designation E 1761; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

- 1.1 This guide covers recommended formats for the recording of fatigue and fracture test data for inclusion in computerized material property databases. From this information, the database designer should be able to construct the data dictionary preparatory to developing a database schema. Not covered within the scope of this guide are guidelines for the identification of the materials themselves, or descriptions of the materials, or both. Those guidelines are covered in separate standards, such as Guides E 1338 and E 1339.
- 1.2 The recommended format specified in this guide is suggested for use in recording data in a database, that is different from contractual reporting of actual test results for a specific lot of material. The latter type of information is specified in materials specifications shown in business transactions and is subject to agreement between supplier and purchaser.
- 1.3 This guide is specific to plane-strain fracture toughness test data based on Test Method E 399, fatigue crack growth rate test data based on Test Method E 647, and strain-controlled fatigue testing based on Practice E 606.
- 1.4 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

3. Terminology

- 3.1 Definitions:
- 3.1.1 Computer-related technical terms in this guide are defined in Terminologies E 1443, E 1013, and other standards referenced in those terminologies.
- 3.1.2 Technical terms related to fracture testing procedures are defined in Terminology E 616.
- 3.1.3 Technical terms related to mechanical testing and mechanical procedures are defined in Terminology E 6.

4. Significance and Use

- 4.1 Because of the intense activity in building computerized materials databases and the desire to encourage uniformity and ease data comparison and data interchange, these recommended formats provide for the inclusion of specific elements of test data in such databases.
- 4.2 This guide defines the principal data elements that are considered important and worth recording and storing permanently in computerized data storage systems from which machine-readable databases will be developed. These data

¹ This guide is under the jurisdiction of ASTM Committee E08 on Fatigue and Fracture and is the direct responsibility of Subcommittee E08.02 on Standards and Terminology.

³ Annual Book of ASTM Standards, Vol 14.02.

⁴ Annual Book of ASTM Standards, Vol 14.01.

⁵ Discontinued. See 1996 Annual Book of ASTM Standards, Vol 14.01.

elements are not intended to be requirements of any specific or single database, but if available, are likely to be valuable for building databases for various applications and so should be recorded and stored in the primary data storage file.

- 4.3 This guide has no implication on data required for materials production or purchase. Reporting of actual test results shall be as described in the actual material specification or as agreed to by the supplier and purchaser as shown on the purchase order and acknowledgment.
- 4.4 This guide is designed to encourage the builders of databases to include sufficiently complete information so that comparisons among individual sources may be made with ensurance that similarities and differences in the test procedures and conditions may be determined. Comparisons of data from various sources will be most meaningful if all of the elements are available.
- 4.5 The guide is designed to provide sufficient detail so that every testing variable that influences a test result is recorded.
- 4.6 The data elements included in this guide are presented recommended formats. These data elements provide sufficiently complete information that users may be confident of their ability to compare sets of data from individual databases and to make the database useful to a relatively broad range of users.
- 4.6.1 The data elements in the recommended formats are designed to be used in constructing the data dictionary preparatory for developing a database or other data storage system. Use of these data elements will facilitate comparisons among data in different databases.
- 4.6.2 Many databases are prepared for specific applications, and individual database builders may elect to omit certain data elements considered to be of no value for that specific application.
- 4.6.3 A number of data elements are considered essential to any database and need to exist in the database. These data elements must be completed to make the record meaningful according to the pertinent guidelines or standard. Data elements are considered essential if they are required for the user to have sufficient information to interpret the data and to make a comparison of data from different sources meaningful. A comparison of data from different sources may be possible if essential information is missing but the value of the comparison may be greatly reduced. In the recommended formats, these data elements are marked with asterisks. Note that situations do arise where essential data are not available. For example, failure strain cannot be provided if the strainmeasuring device is not functioning when the test specimen fails. The database design and the engineer recording test data must use their judgment for such cases.
- 4.6.4 These recommended formats do not represent a requirement that all the data elements must be included in every database. Rather these recommended formats are guides as to those data elements that are likely to be useful to at least some users of most databases.
- 4.6.5 Not all of the data elements recommended for inclusion will be available for all databases; this fact should not discourage database builders and users from proceeding so

long as the essential data elements are included (the items noted by the asterisks).

- 4.6.6 In some cases, additional data elements of value to users of a database may be available. In those cases, databases builders are encouraged to include them with the data elements in the recommended formats.
- 4.7 The recommended data recording formats do not include the recommended material description or the presentation of other specific types of test data. This information is covered by other recommended formats, including Guides E 1338 and E 1339.

5. Recording of Test Data

- 5.1 The following types of data elements are included in the recommended format for each test method; multiple data elements may be required to cover some categories satisfactorily:
 - 5.1.1 Test identification,
 - 5.1.2 Specimen information,
 - 5.1.3 Test parameters and procedures,
 - 5.1.4 Test results and analysis, and
 - 5.1.5 Test validation.
- 5.2 The linkage of a data record for one or more test results with a data record for a material is done during the development of a database schema using these recommended formats and guides with recommended formats specific to the identification and description of materials.
- 5.2.1 A database builder has considerable flexibility in developing the database schema and the recommended formats contained in this guide are intended to support that flexibility.
- 5.3 It is often helpful to know values of related mechanical properties for the material in question when evaluating or interpreting fatigue and fracture data. The recommended data formats do not include fields for these related properties unless they are required for calculations given in the ASTM test methods. Therefore, it is recommended that the development of a database schema provide linkages between fatigue and fracture test records and summary values of the following properties for each material:
 - 5.3.1 Hardness,
 - 5.3.2 Yield strength,⁶
 - 5.3.3 Compressive yield strength,
 - 5.3.4 Ultimate tensile strength,
 - 5.3.5 Percent reduction of area,
 - 5.3.6 Percent elongation,
 - 5.3.7 True fracture stress,
 - 5.3.8 True fracture strain,
 - 5.3.9 Elastic modulus,⁷ and
 - 5.3.10 Poisson's ratio.8

6. Recommended Formats for Standard Data Records

6.1 The recommended formats for recording test data are listed in the appendixes that follow and include four columns

⁶ Included as a data element in Appendix X1.

⁷ Included as a data element in Appendix X1 and Appendix X3.

⁸ Included as a data element in Appendix X3.

of information: data element number, data element descriptive name, data type, and category sets, value sets, or units as listed:

- 6.1.1 *Data Element Number*—A reference number for ease of dealing with the individual data elements in this guide. The data element number has no permanent value and does not become part of a database itself.
- 6.1.2 Data Element Descriptive Name—The complete and unambiguous name, descriptive of the data element, descriptive of the data element being identified in the data format.
- 6.1.3 *Data Type*—The kind of data to be included in the data element, such as the type of numbers, character strings, logical values, date, and time.
- 6.1.4 Category Sets, Value Sets or Units—A listing of the types of information that would be included in the data element or, in the case of properties or other numeric data elements, the units in which numbers are expressed.
- 6.1.4.1 A category set is a closed set listing all possible values the data element may take. Category sets are usually given in separate tables in the recommended format.
- 6.1.4.2 A value set is a representative set listing sample, but not necessarily all, acceptable values that the data element may take. Value sets may be given as separate tables in the recommended format.

- 6.1.4.3 The units listed are SI, according to Practice E 380, followed by inch-pound (U.S. customary) units in parentheses (except for test methods that have both a metric and an inch-pound version).
- 6.2 Worksheets—Worksheet versions may be desirable for various purposes, such as for use in a testing laboratory for recording original test data. The worksheet set-up is not critical if all of the available data elements are recorded.

7. Summary Tables

- 7.1 Though this guide primarily is concerned with the recording and storage of test data upon generation, the analysis and presentation of data are also of concern. Often this takes the form of summary tables for compiling results of many tests. Depending on the design of the database system, summary tables might also be used to enable correlations between test data from a particular test method and other related properties.
- 7.2 Such summary tables are likely to require space for derived values, such as averages, or for statistically or parametrically generated property values.
- 7.3 Since the recommended formats used in summarizing, compiling, and presenting multiple test results will vary greatly with the specific application, guidelines for such tabulations are not presented herein.

APPENDIXES

(Nonmandatory Information)

X1. RECOMMENDED FORMAT FOR COMPUTERIZATION OF PLANE-STRAIN FRACTURE TOUGHNESS TEST DATA BASED ON TEST METHOD E 399

X1.1 This recommended format is for plane-strain fracture toughness data generated by Test Method E 399. The recommended format does not include the recommended material description or the presentation of other specific types of test data. These items are covered by separate formats to be

referenced in material specifications or recommended formats for other test methods.

X3. RECOMMENDED FORMAT FOR COMPUTERIZATION OF STRAIN-CONTROLLED FATIGUE TEST DATA

X3.1 This recommended format is for strain-controlled fatigue test data generated by Test Method E 606 and other test methods. The recommended format does not include the recommended material description or the presentation of other

specific types of test data. These items are covered by separate formats to be referenced in material specifications or recommended formats for other test methods.

TABLE X3.1 Recommended Standard Data Format for Computerization of Strain-Controlled Fatigue Testing per Test Method E 606

No. ^A	Data Element Name and Description	Data Type ^B	Category Sets, Value Sets or Units
	Record and Test Ide	ntification	
(1)*	Type of Test	STRING	Strain-controlled fatigue
(2)*	ASTM, ISO, or other applicable standard method number	STRING	for example, ASTM E 606

TABLE X3.1 Continued

No. ^A	Data Element Name and Description	Data Type ^B	Category Sets, Value Sets or Units
(146)	Maximum total strain (repeatable data element)	REAL	
(147)	Minimum total strain (repeatable data element)	REAL	
	Relaxation Data for Hold-Time Tests: The Next Block of Data Elements Repre	sent Sets of Data, One Se	et for Each Specimen:
(148)	Cycle number associated with this entry	INTEGER	
(149)	Hold time for this load application	REAL	S
(150)	Relaxed tensile stress during hold time at maximum strain application	REAL	MPa (ksi)
(151)	Relaxed compressive stress during hold time at minimum strain application	REAL	MPa (ksi)
(152)	Change in inelastic strain during hold time at maximum strain application	REAL	
(153)	Change in inelastic strain during hold time at minimum strain application	REAL	
(154)	Remarks about the results	STRING	
	Data Reduction		
(155)	Method to compute inelastic strains	STRING	see Table X3.20
(156)	Cyclic strain-hardening exponent (n') (ASTM E 606)	REAL	
(157)	Cyclic strength coefficient (K') (see ASTM E 606)	REAL	MPa (ksi)
(158)	Independent variable to compute K' and n'	STRING	see Table X3.21
(159)	Data reduction method to compute K' and n'	STRING	
(160)	Cyclic yield strength	REAL	MPa (ksi)
(161)	Cyclic yield strength—percent offset	REAL	%
(162)	Fatigue strength coefficient – σ_f (ASTM E 606)	REAL	MPa (ksi)
(163)	Fatigue strength exponent – b (ASTM E 606)	REAL	
(164)	Specimens used to compute σ_f and b	STRING	
(165)	Independent variable used to compute σ_f and b	STRING	see Table X3.22
(166)	Data reduction method to compute σ_f and b	STRING	
(167)	Fatigue ductility coefficient – ϵ_f (ASTM E 606)	REAL	
(168)	Fatigue ductility exponent – c (ASTM E 606)	REAL	
(169)	Specimens used to compute ϵ_f' and c	STRING	
(170)	Independent variable used to compute ϵ_f and c	STRING	see Table X3.22
(171)	Data reduction method to compute ϵ_f and c	STRING	
(172)	Properties σ_f , b , ϵ_f , and c based on initiation (N_i) or separation (N_f)	STRING	Ni or Nf
(173)	Remarks about data reduction	STRING	

^A Data element numbers are for reference only. They do not imply a necessity to include all these data elements in any specific database nor imply a requirement that data elements used be in this particular order.

TABLE X3.2 Value Set for Specimen Types

Uniform-gage test section (ASTM E 606) Hour-glass test section (ASTM E 606) Sheet specimen (ASTM E 606) Non-standard

TABLE X3.3 Value Set for Specimen Location

Center of thickness Quarter thickness Surface

TABLE X3.4 Value Set for Specimen Orientation

Longitudinal
Long transverse
Short transverse
Tangential
Radial

TABLE X3.5 Value Set for Strain Measuring Methods

Longitudinal displacement measurement Diametral displacement measurement

^B Units listed first are for SI; those in parentheses are English.

^{*} Denotes essential information for computerization of test results.

TABLE X3.6 Value Set for Strain Measuring Equipment

Strain gage Displacement LVDT

Displacement transducer

Other

TABLE X3.7 Value Set for Fixturing Techniques

Button-head fixture Efficiency button-head fixture Threaded specimen fixture Sheet specimen fixture

Straight-sided (cylindrical) specimen fixture

Wood's metal pot

TABLE X3.8 Value Set for Recording Systems

Potentiometric X-Y recorder Oscilloscope with camera storage Oscilloscope digital X-Y plotter

Computer data acquisition system

Other

TABLE X3.9 Value Set for Types of Test

Total strain control
Continuous plastic strain control
Load or stress control
Pseudo-strain control or strain limit control
Displacement control
Other

TABLE X3.10 Value Set for Control Parameters

Strain Plastic strain Displacement Load (elastic strain) Other

TABLE X3.11 Value Set for Waveform

Sine Triangle Square Trapezoid Other

TABLE X3.12 Value Set of Types of Strain at First Quarter Cycle

Tensile Compressive

TABLE X3.13 Value Set for Environment Characterization

Brine solution Inert gas Pure water Acidic solution Vacuum

Other

TABLE X3.14 Value Set for Environmental Flow

Static Dynamic

TABLE X3.15 Value Set for Pure Water Sources

Bottled Distilled Other

TABLE X3.16 Value Set for Crack Shapes

Semi-circular surface crack Semi-elliptical surface crack Circular embedded crack Elliptical embedded crack Other

TABLE X3.17 Value Set for Methods to Monitor Microcracks

Optical (microscope) Replica Compliance ac electrical potential dc electrical potential Crack growth gage Acoustic emission Other

TABLE X3.18 Value Set for Fracture Locations

Gage section Knife edge Other

TABLE X3.19 Value Set for Causes of Failures

Wear mark Inclusion Grain boundary Casting pore Surface scratch Surface defect Other

TABLE X3.20 Value Set for Methods Used to Compute Inelastic Strains

Hysteresis loop width
Total strain—elastic strain

TABLE X3.21 Value Set for Independent Variables Used to Compute K' and n'

Inelastic strain Stress

TABLE X3.22 Value Set for Independent Variables Used to Compute $\sigma_{f^{'}}$ and b or $\epsilon_{f^{'}}$ and c

Strain Reversals

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.
