Publication numbering

As from 1 January 1997 all IEC publications are issued with a designation in the 60000 series. For example, IEC 34-1 is now referred to as IEC 60034-1.

Consolidated editions

The IEC is now publishing consolidated versions of its publications. For example, edition numbers 1.0, 1.1 and 1.2 refer, respectively, to the base publication, the base publication incorporating amendment 1 and the base publication incorporating amendments 1 and 2.

Further information on IEC publications

The technical content of IEC publications is kept under constant review by the IEC, thus ensuring that the content reflects current technology. Information relating to this publication, including its validity, is available in the IEC Catalogue of publications (see below) in addition to new editions, amendments and corrigenda. Information on the subjects under consideration and work in progress undertaken by the technical committee which has prepared this publication, as well as the list of publications issued, is also available from the following:

- **IEC Web Site (www.iec.ch)**
- **Catalogue of IEC publications**

The on-line catalogue on the IEC web site (www.iec.ch/searchpub) enables you to search by a variety of criteria including text searches, technical committees and date of publication. On-line information is also available on recently issued publications, withdrawn and replaced publications, as well as corrigenda.

- **IEC Just Published**

This summary of recently issued publications (www.iec.ch/online_news/_justpub) is also available by email. Please contact the Customer Service Centre (see below) for further information.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

**HELICAL-SCAN COMPRESSED DIGITAL VIDEO CASSETTE SYSTEM
USING 6,35 mm MAGNETIC TAPE – FORMAT D-7 –****Part 1: VTR specifications****FOREWORD**

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC provides no marking procedure to indicate its approval and cannot be rendered responsible for any equipment declared to be in conformity with an IEC Publication.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 62071-1 has been prepared by technical area 6: Higher data rate storage media, data structures and equipment of IEC technical committee 100: Audio, video and multimedia systems and equipment.

The text of this standard is based on the following documents:

CDV	Report on voting
100/900/CDV	100/984/RVC

Full information on the voting for the approval of this standard can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

IEC 62071 consists of the following parts, under the general title *Helical-scan compressed digital video cassette system using 6,35 mm magnetic tape – Format D-7*:

Part 1: VTR specifications

Part 2: Compression format

Part 3: Data stream format

This part 1 describes the VTR specifications which are tape, magnetization, helical recording, modulation method and basic system data for video compressed data.

Part 2 describes the specifications for encoding process and data format for 525i and 625i systems.

Part 3 describes the specifications for transmission of DV-based compressed video and audio data stream over 270 Mb/s and 360 Mb/s serial digital interface.

The committee has decided that the contents of this publication will remain unchanged until the maintenance result date indicated on the IEC web site under "<http://webstore.iec.ch>" in the data related to the specific publication. At this date, the publication will be

- reconfirmed;
- withdrawn;
- replaced by a revised edition, or
- amended.

A bilingual version of this publication may be issued at a later date.

HELICAL-SCAN COMPRESSED DIGITAL VIDEO CASSETTE SYSTEM USING 6,35 mm MAGNETIC TAPE – FORMAT D-7 –

Part 1: VTR specifications

1 Scope

This part of IEC 62071 specifies the content, format and recording method of the data blocks containing video, audio, and associated data which form the helical records on 6,35 mm tape contained in cassettes as specified in SMPTE 307M.

In addition, this standard specifies the content, format, and recording method for longitudinal cue and control tracks.

One video channel and two independent audio channels are recorded in the digital format for 25 Mb/s VTRs and one video channel and four independent audio channels for 50 Mb/s VTRs. Each of these channels is designed to be capable of independent editing.

The video channel records and reproduces a component television signal in the 525-line system with a frame frequency of 29,97 Hz (hereinafter referred to as the 525/60 system) and the 625-line system with a frame frequency of 25,00 Hz (hereinafter referred to as the 625/50 system).

Prior to recording, the digital signal is compressed to a DV-based 25 Mb/s bit stream with 4:1:1 sampling or a DV-based 50 Mb/s bit stream with 4:2:2 sampling.

The standard includes the process required to decode the DV-based 25 Mb/s bit stream and 50 Mb/s bit stream into output video, audio, and data.

2 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

AES3:2003, *AES Recommended Practice for Digital Audio Engineering – Serial transmission format for two-channel linearly represented digital audio data*

SMPTE 12M: 1999, *Television, Audio and Film – Time and Control Code*

SMPTE 259M: 1997, *Television – 10-Bit 4:2:2 Component and 4fsc NTSC Composite Digital Signals – Serial Digital Interface*

3 Abbreviations and acronyms

AAUX	Audio auxiliary data
AP1	Audio application ID
AP2	Video application ID
AP3	Subcode application ID
APT	Track application ID

Arb	Arbitrary
AS	AAUX source pack
ASC	AAUX source control pack
B/W	Black and white flag
CGMS	Copy generation management system
DBN	DIF block number
DCT	Discrete cosine transform
DIF	Digital interface
DSF	DIF sequence flag
ECC	Error correction code
EFC	Emphasis channel flag
EOB	End of block
ID	Identification
IDP	ID parity
ITI	Insert and track information
LF	Locked mode flag
PF	Pilot frame
QNO	Quantization number
QU	Quantization
Res	Reserved for future use
SMP	Sampling frequency
SSA	Start sync area
SSYB	Subcode sync block number
STA	Status of the compressed macro block
Syb	Sync block number
TF	Transmitting flag
TIA	Track information area
Trp	Track pair number
VAUX	Video auxiliary data
VLC	Variable length coding
VS	VAUX source pack
VSC	VAUX source control pack
VSM	Vibrating sample magnetometer

4 Environment and test conditions

4.1 Environment

Tests and measurements made on the system to check the requirements of this standard shall be carried out under the following conditions:

- Temperature: $20^{\circ}\text{C} \pm 1^{\circ}\text{C}$
- Relative humidity: $(50 \pm 2)\%$
- Barometric pressure: from 86 kPa to 106 kPa
- Tape conditioning: not less than 24 h
- Centre tape tension: $0,09\text{ N} \pm 0,02\text{ N}$ (see Annex A)

4.2 Reference tape

A blank tape for reference recordings shall be available from the format holder or approved source.

4.3 Calibration tapes

The calibration tapes meeting the requirements of 4.3.1, 4.3.2, and Clause 5 shall be made available from manufacturers who produce digital television tape recorders and players in accordance with this standard.

4.3.1 Record locations and dimensions

Calibration tape shall be manufactured to tolerances shown in Table 1 or Table 2 for 25 Mb/s format or Table 3 or Table 4 for 50 Mb/s format but with these tolerances reduced by 50 %.

4.3.2 Calibration signals

Two sets of signals shall be recorded on the calibration tape:

- a) – Video: 100 / 0 / 100 / 0 colour bars
 - Audio: 1 kHz tone at 20 dB below full scale on each audio channel
 - Cue: 1 kHz and 6 kHz tone at the analogue recording reference level;
- b) A signal of constant recorded frequency (i.e. the Nyquist frequency) for the purpose of mechanical alignment. The recording level shall conform to 7.1.4.3

5 Tape

5.1 Base

The base material shall be polyester or equivalent.

5.2 Width

The tape width shall be 6,350 mm \pm 0,005 mm.

The tape, covered with glass, is measured without tension at a minimum of five different positions along the tape using a calibrated comparator having an accuracy of 0,001 mm (1 μm). The tape width shall be within the aforementioned specification at any measuring position.

5.3 Width fluctuation

Tape width fluctuation shall not exceed 5 μm peak-to-peak. Measurement of tape width fluctuation shall be taken over a tape length of 900 mm. The tape width fluctuation shall be within the aforementioned specification at each of ten equally spaced points in the 900 mm span.

5.4 Reference edge straightness

The reference edge straightness maximum deviation is 6 μm peak-to-peak. Edge straightness fluctuation is measured at the edge of a moving tape guided by three guides having contact on the same edge and having a distance of 85 mm from the first to second guide and 85 mm from the second to third guide. Edge measurements are averaged over a 10 m length and are made 5 mm from the midpoint between the first and second guide towards the first guide.

5.5 Tape thickness

The total tape thickness shall be $8,8^0_{-0,8}$ μm and $6,7^0_{-0,4}$ μm .

NOTE Tape of either thickness may be used for 25 Mb/s or 50 Mb/s formats.

5.6 Transmissivity

Transmissivity shall be less than 5 %, measured over the range of wavelengths 800 nm to 1 000 nm.

5.7 Offset yield strength

The offset yield strength shall be greater than 3 N. The force to produce 0,2 % elongation of a 1 000 mm test sample with a pull rate of 10 mm per minute shall be used to confirm the offset yield strength. The line beginning at 0,2 % elongation parallel to the initial tangential slope is drawn and then read at the point of intersection of the line and the stress-strain curve.

5.8 Magnetic coating

The magnetic layer of the tape shall consist of a coating of metal particles or equivalent.

5.9 Coating coercivity

The magnetic coating coercivity shall be a class 2300 (approximately 2300 Oe / 184000 A/m), with an applied field of 10000 Oe / 800000 A/m measured by a VSM.

6 Helical recordings

6.1 Tape speed

The tape speed for the 25 Mb/s format shall be 33,8201 mm/s for the 525/60 system and 33,8539 mm/s for the 625/50 system. The tape speed for the 50 Mb/s format shall be 67,6401 mm/s for the 525/60 system and 67,7077 mm/s for the 625/50 system. The tolerance shall be $\pm 0,2$ % respectively.

6.2 Sectors

Each recorded track contains an ITI sector, an audio sector, a video sector and a subcode sector.

6.3 Record locations and dimensions

Record locations and dimensions for continuous recording of 25 Mb/s format shall be as specified in Figures 1 and 3, and Table 1 (525/60 system) or in Figures 1 and 3, and Table 2 (625/50 system). In recording, sector locations on each helical track shall be contained within the tolerance specified in Figure 1 and Table 1 (525/60 system) or in Figure 1 and Table 2(625/50 system).

Record location and dimensions for continuous recording of 50 Mb/s format shall be as specified in Figures 2 and 3, and Table 3 (525/60 system) or in Figures 2 and 3, and Table 4 (625/50 system). In recording, sector locations on each helical track shall be contained within the tolerance specified in Figure 2 and Table 3 (525/60 system) or in Figure 2 and Table 4 (625/50 system).

The reference edge of the tape for dimensions specified in this standard shall be the lower edge as shown in Figures 1 and 2. The magnetic coating, with the direction of tape travel as shown in Figures 1 and 2, are on the side facing the observer.

As indicated in Figures 1 and 2, this standard anticipates a zero guard band between recorded tracks, and the nominal record head width shall be equal to the track pitch of 18 µm. The scanner head configuration should be chosen so that the recorded track widths are contained within the limits of 16 µm to 20 µm.

The format requires flying erasure for recording. In insert editing, this standard provides a guard band of $3 \mu\text{m} \pm 1,5 \mu\text{m}$ between the previously recorded track and the inserted track at editing points only. A typical track pattern for insert editing is shown in Figures B.1 and B.2 of Annex B.

6.4 Helical track record tolerance zones

In the case of 25 Mb/s format, the centre of two consecutive tracks starting at the first track in each video frame shall be contained within the pattern of the two tolerance zones established in Figure 4. Each zone is defined by two parallel lines which are inclined at an angle of 9,178 4° basic with respect to the tape reference edge. The centrelines of each zone shall be spaced apart 18,0 µm basic. The width of zone 1 shall be 3 µm and the width of zone 2 shall be 5 µm. These zones are established to contain track angle errors, track straightness errors, and vertical head offset tolerances (the measuring technique is shown in Annex C).

In the case of 50 Mb/s format, the lower edge of four consecutive tracks starting at the first track in each video frame shall be contained within the pattern of the four tolerance zones established in Figure 5. Each zone is defined by two parallel lines which are inclined at an angle of 9,1784° basic with respect to the tape reference edge. The centrelines of each zone shall be spaced apart 18,0 µm basic. The width of zone 2 shall be 3 µm and the width of zone 1, 3 and 4 shall be 5 µm. These zones are established to contain track angle errors, track straightness errors, and vertical head offset tolerance.

6.5 Relative positions of recorded information

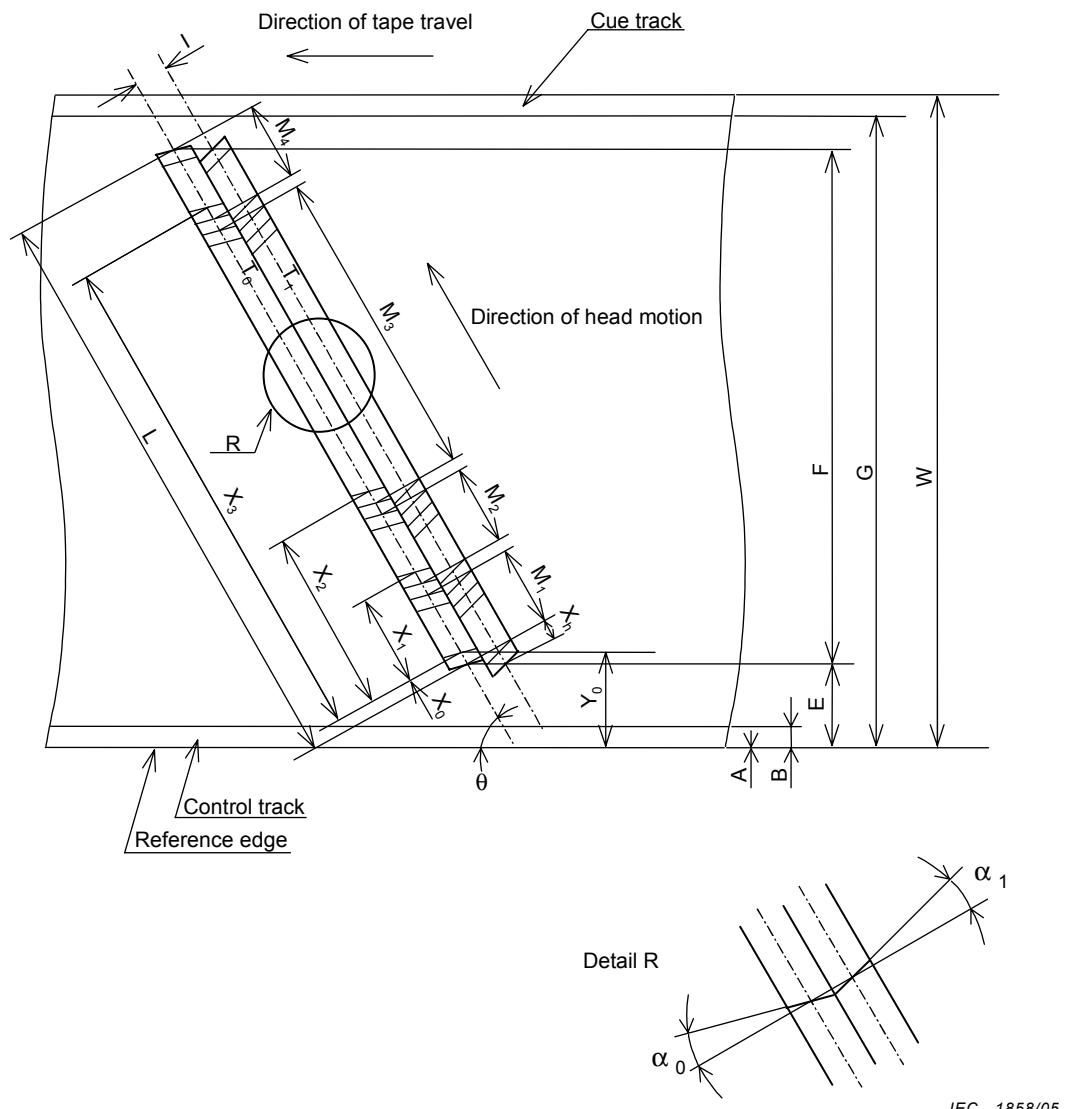

6.5.1 Relative positions of longitudinal tracks

Audio, video, control track and cue track with information intended to be time coincident shall be positioned as shown in Figures 1 to 3.

6.5.2 Programme area reference point

The programme area reference point is determined by the intersection of a line parallel to the reference edge of the tape at a distance Y_0 from the reference edge and the centreline of track 0 in each ITI sector (see Figures 1 to 3).

The end of the preamble and beginning of SSA in the ITI sector shall be recorded at the programme area reference point, and the tolerance of dimension X_0 . The locations are shown in Figures 1 to 3; dimensions X_0 and Y_0 are specified in Tables 1 to 4. The relationship between sectors and contents of each sector is specified in Clause 7.

NOTE 1 M_1 is an ITI sector.

NOTE 2 M_2 is an audio sector.

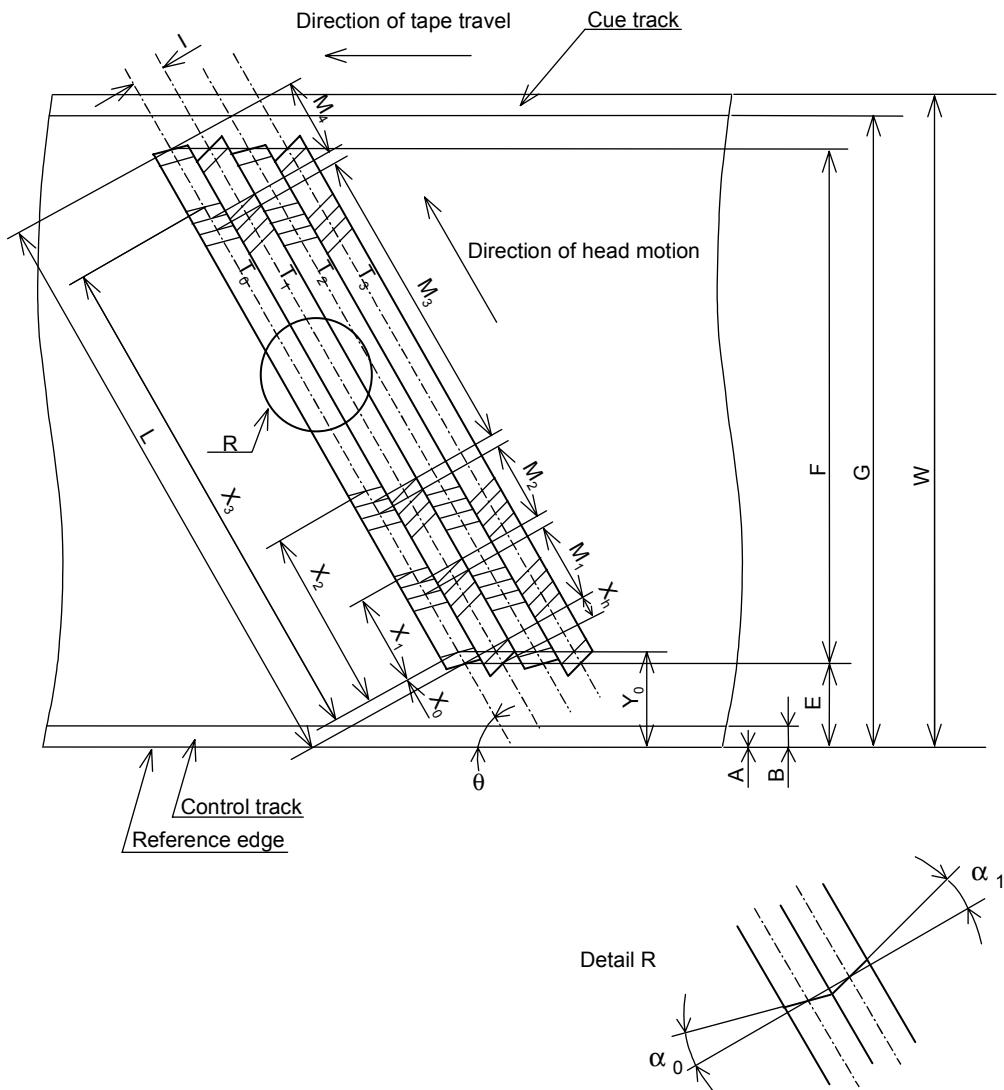

NOTE 3 M_2 is a video sector

NOTE 4 M_1 is a subcode sector

NOTE 5 Tracks viewed from magnetic coating side

NOTE 6 Dimension X_1 to X_4 are determined by the programme reference point as defined in Figure 3.

Figure 1 – Locations and dimensions of recorded tracks of 25 Mb/s format

NOTE 1 M_1 is an ITI sector.

NOTE 2 M_2 is an audio sector.

NOTE 3 M_3 is a video sector.

NOTE 4 M_4 is a subcode sector.

NOTE 5 Tracks viewed from magnetic coating side.

NOTE 6 Dimension X_1 to X_3 are determined by the programme reference point as defined in Figure 3.

6.6 Gap azimuth

6.6.1 Cue and control track

The azimuth angle of the cue and control track head gaps used to produce longitudinal track records shall be perpendicular to these recorded tracks.

6.6.2 Helical track

The azimuth of the head gaps used for the helical track shall be inclined at angles α_0 and α_1 as specified in Tables 1 to 4 with respect to a line perpendicular to the helical track. For 25 Mb/s format, the azimuth of track No.0 for every field shall be oriented in a clockwise direction with respect to a line perpendicular to the helical track direction when viewed from the side of the tape containing the magnetic record. For 50 Mb/s format, the azimuth of tracks No. 0 and No. 2 for every field shall be oriented in a clockwise direction in the same manner.

6.6.3 Transport and scanner

The effective drum diameter, tape tension, helix angle, and tape speed taken together determine the track angle. Different methods of design and/or variations in drum diameter and tape tension can produce equivalent recordings for interchange purposes.

A possible configuration of the transport uses a scanner with an effective diameter of 21,700 mm. Scanner rotation is in the same direction as tape motion during record mode. In 25 Mb/s format, data are recorded by two heads each mounted 180° apart. Figure 6 shows a possible mechanical configuration of the scanner and the relationship between the longitudinal heads and the scanner. Table 5 shows the corresponding mechanical parameters.

In 50 Mb/s format, data are recorded by two pairs of heads each mounted 180° apart. Figure 7 shows a possible mechanical configuration of the scanner and the relationship between the longitudinal heads and the scanner. Table 6 shows the corresponding mechanical parameters.

Other mechanical configurations are allowed provided the same footprint of recorded information is produced on tape.

Table 5 – Parameters for a possible scanner design of 25 Mb/s format

Parameters	525/60 system	625/50 system
Scanner rotation speed (rpm)	9 000/1,001	9 000
Number of tracks per rotation		2
Drum diameter (mm)		21,700
Centre span tension (N)		0,09

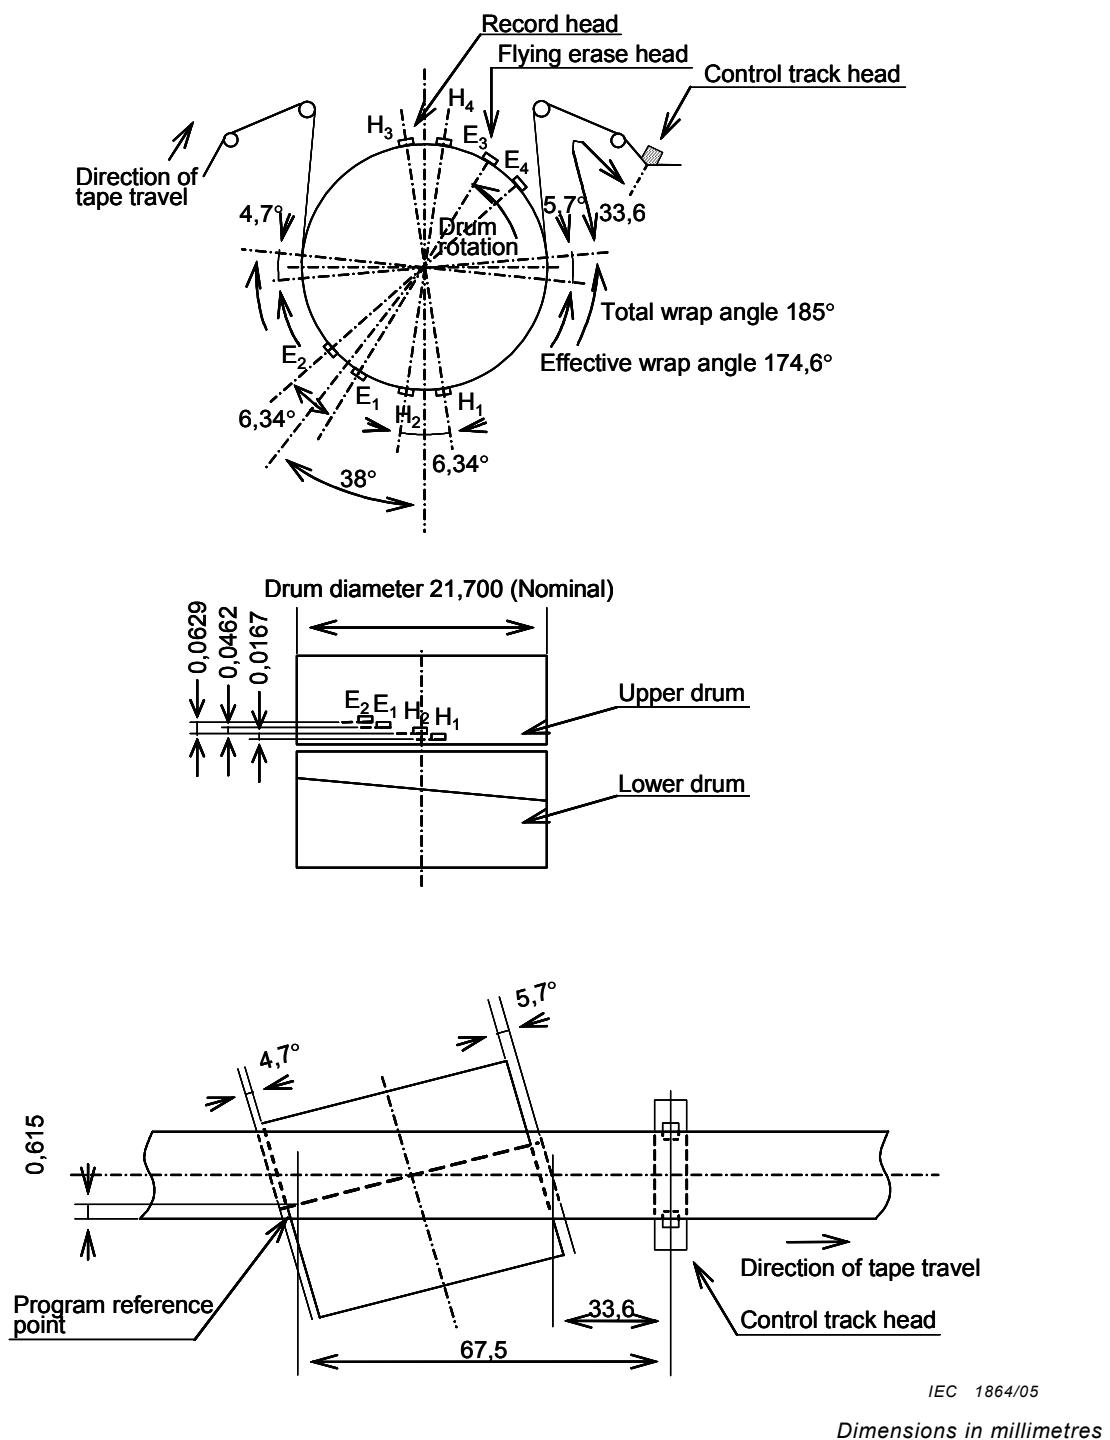

Figure 7 – A possible scanner configuration and tape wrap of 50 Mb/s format

7 Programme track data

7.1 General

7.1.1 Overview

For the 25 Mb/s format, each television frame is recorded on 10 tracks for the 525/60 system or 12 tracks for the 625/50 system. For the 50 Mb/s format, each television frame is recorded on 20 tracks for the 525/60 system or 24 tracks for the 625/50 system. The helical tracks contain digital data from the ITI sector, video sector, audio sector, and subcode sector.

The ITI sector contains the start sync and track information. The subcode sector contains the time and control code data and it may also include other optional data.

Figure 8 shows a typical block diagram of the recording circuit. All edit gaps between sectors accommodate timing errors during editing. Figure 9 shows the arrangement of the ITI sector, video and audio sectors, and the subcode sector on the tape.

For the generation of low frequency tracking information, the helical data stream is converted by 24/25 modulation to obtain the following conditions:

- Track F₀: Attenuation of f₁ and f₂ frequency components by at least 9 dB;
- Track F₁: Generation of f₁ component of at least 16 dB, but not more than 19 dB;
- Track F₂: Generation of f₂ component of at least 16 dB, but not more than 19 dB
where

$$f_1 = f_b / 90 \text{ (Hz)}$$

$$f_2 = f_b / 60 \text{ (Hz)}$$

f_b = bit frequency: the frequency whose period is a time interval of one channel bit (Hz).

Tracks are recorded in the repeated cycle of F₀ – F₁ – F₀ – F₂ sequence.

In the 525/60 system for the 25 Mb/s format, PF shows the frame information for the second track of each frame. Figures 10 and 11 and Tables 7 and 8 show the arrangement of the pilot signals of the 25 Mb/s format. Figures 12 and 13 and Tables 9 and 10 show the arrangement of the pilot signals of the 50 Mb/s format. The frequency characteristics and the recorded level of the low frequency pilot signals shall be chosen in accordance with Figure 14.

The recommended frequency characteristic of the F₀ track is specified in Annex D.

7.1.2 Labelling convention

The most significant bit is written on the left and first recorded to tape. The lowest numbered byte is shown at the left/top and is the first encountered in the input data stream. Byte values are expressed in hexadecimal notation unless otherwise noted. An h subscript indicates a hexadecimal value.

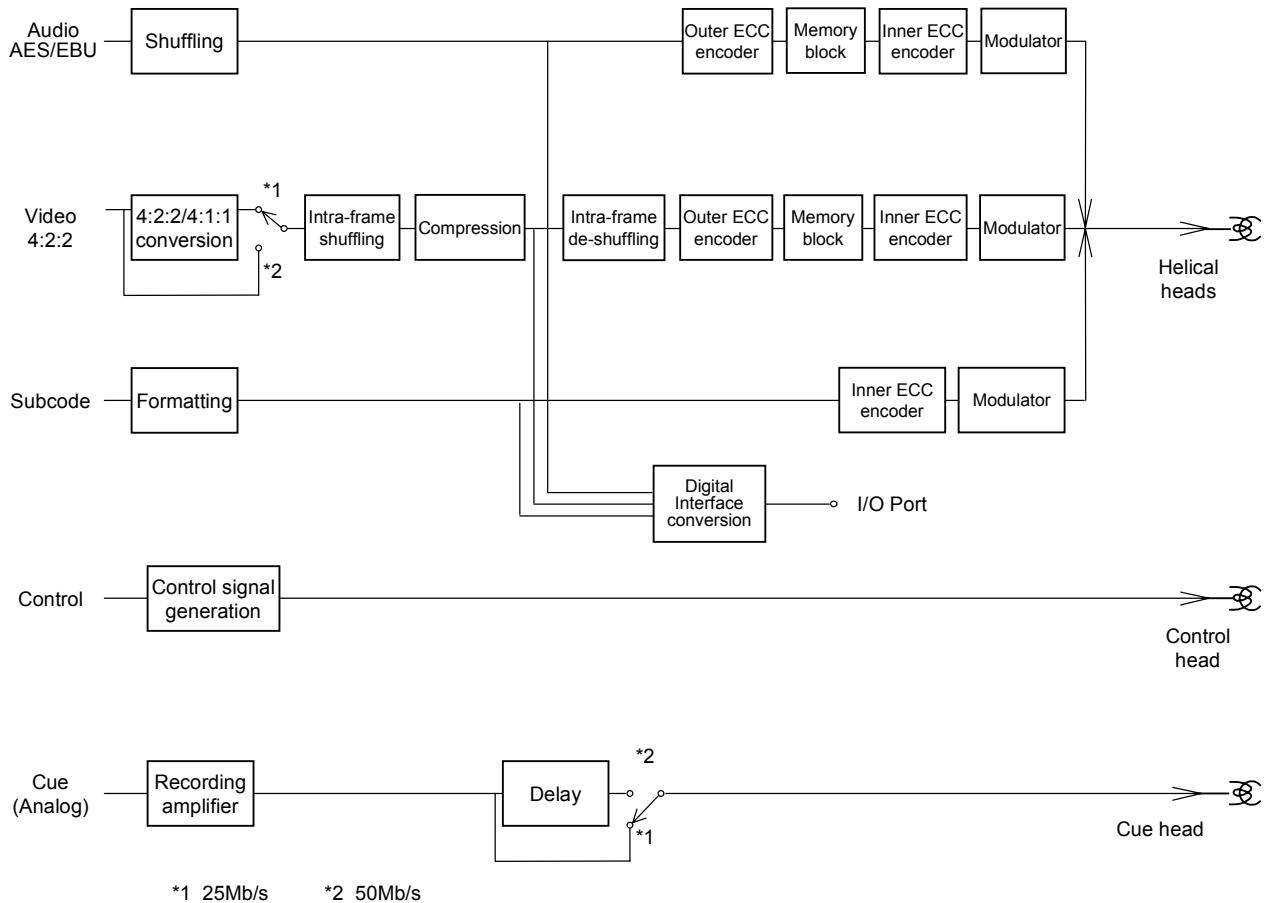

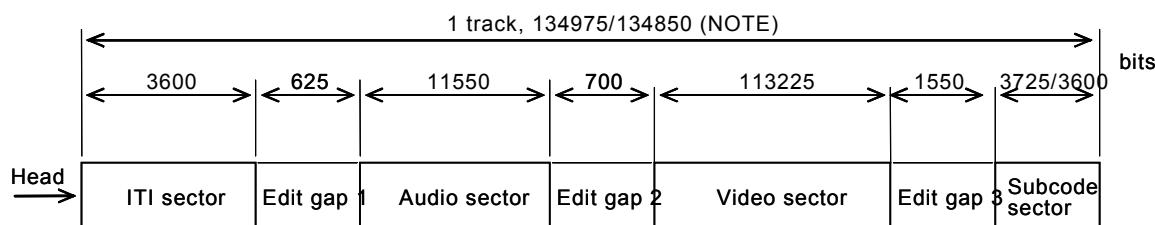

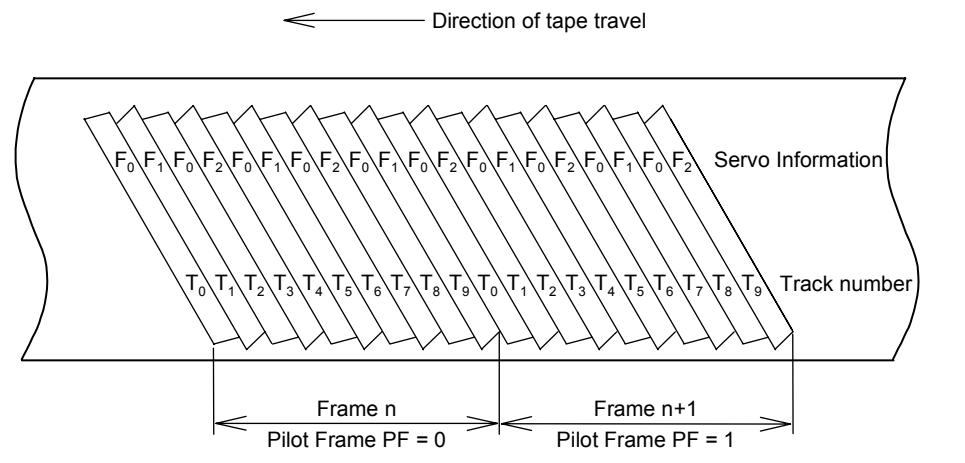

Figure 8 – Possible recording system configuration with digital interface port (informative)

IEC 1871/05

NOTE 1 $f_1 = f_b / 90$ (Hz) $f_2 = f_b / 60$ (Hz) f_b is the frequency whose period is a time interval of one channel bit(Hz)Resolution bandwidth = $f_b / 20925$ (Hz)

Data is obtained by integration over 30 repeated cycles

NOTE 2 $CNR = [S - (N_1 + N_2) / 2] \text{ (dB)}$ Depth of notch with peak = $[(N_1 + N_2) / 2 - (D_1 + D_2) / 2] \text{ (dB)}$ Depth of notch without peak = $[(N_1 + N_2) / 2 - D] \text{ (dB)}$ N1 is defined as an average value over $f_L \pm f_b / 2000$ (dB)N2 is defined as an average value over $f_H \pm f_b / 2000$ (dB) f_L is defined as $f_c - f_b / 400$ (Hz) f_H is defined as $f_c + f_b / 400$ (Hz) f_c means a peak or notch frequency (Hz)

Figure 14 – Frequency characteristics of tracks

7.1.3 Signal processing

Figures 15 to 17 show the processing of modulation related to the recorded signals. The programme track data with the exception of ID0 shall be processed through three operations as shown below:

- randomization;
- 24-25 modulation;
- pre-coding.

The programme track data of ID0 shall be processed through two operations as shown below:

- randomization;
- pre-coding.

Figure 18 shows a possible block diagram of the process.

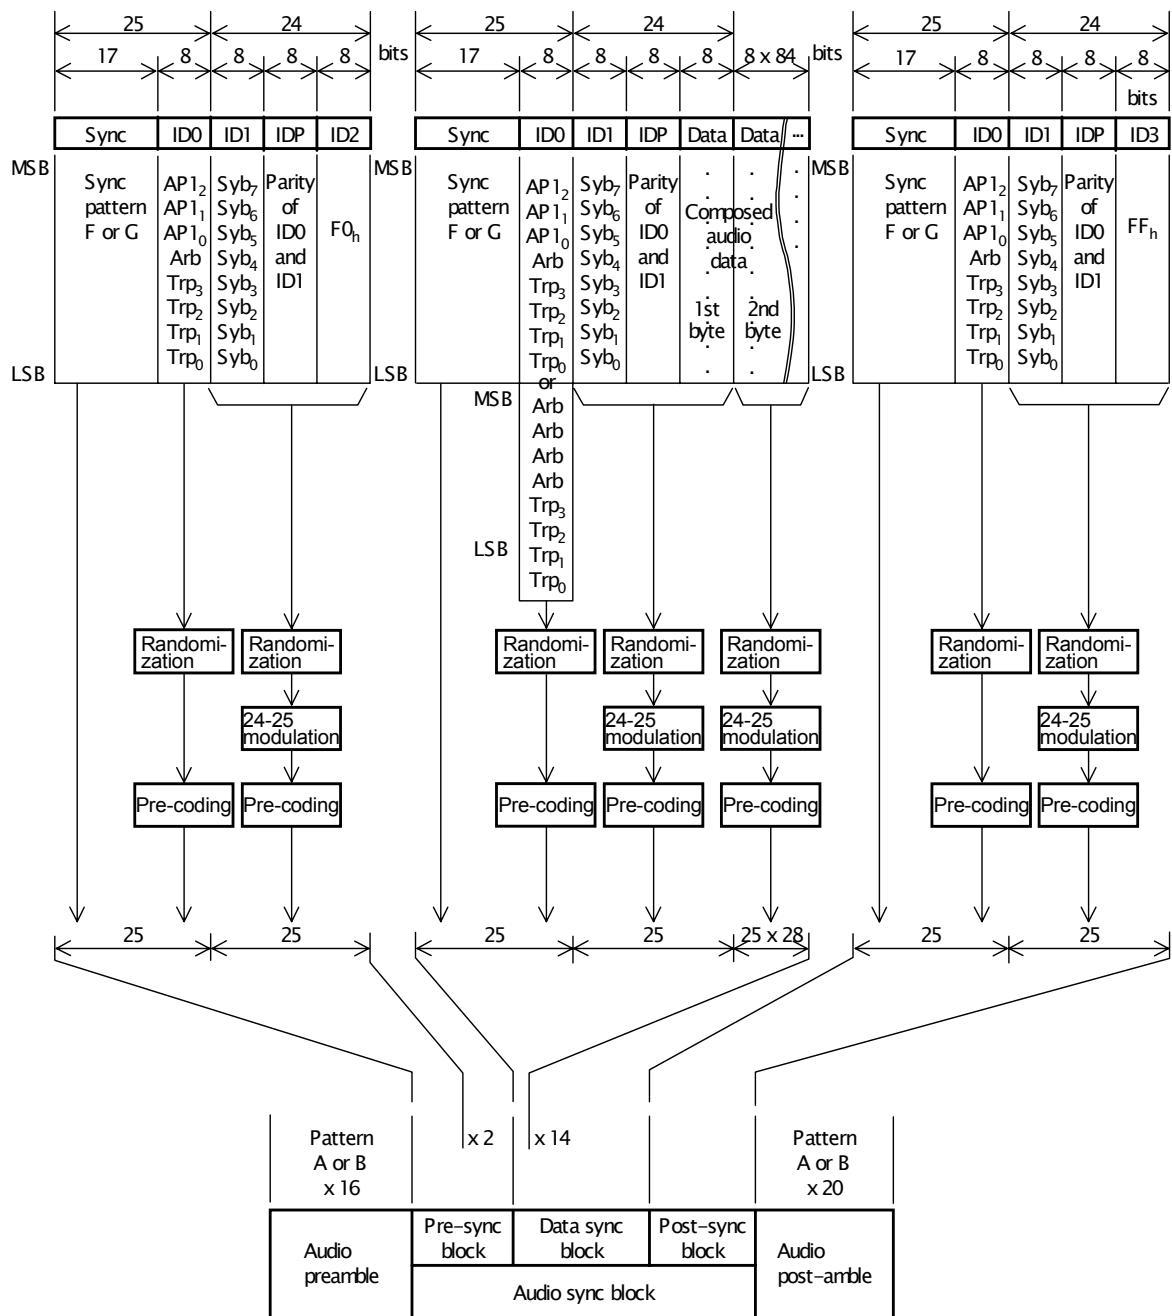

Figure 15 – Modulation for audio sector

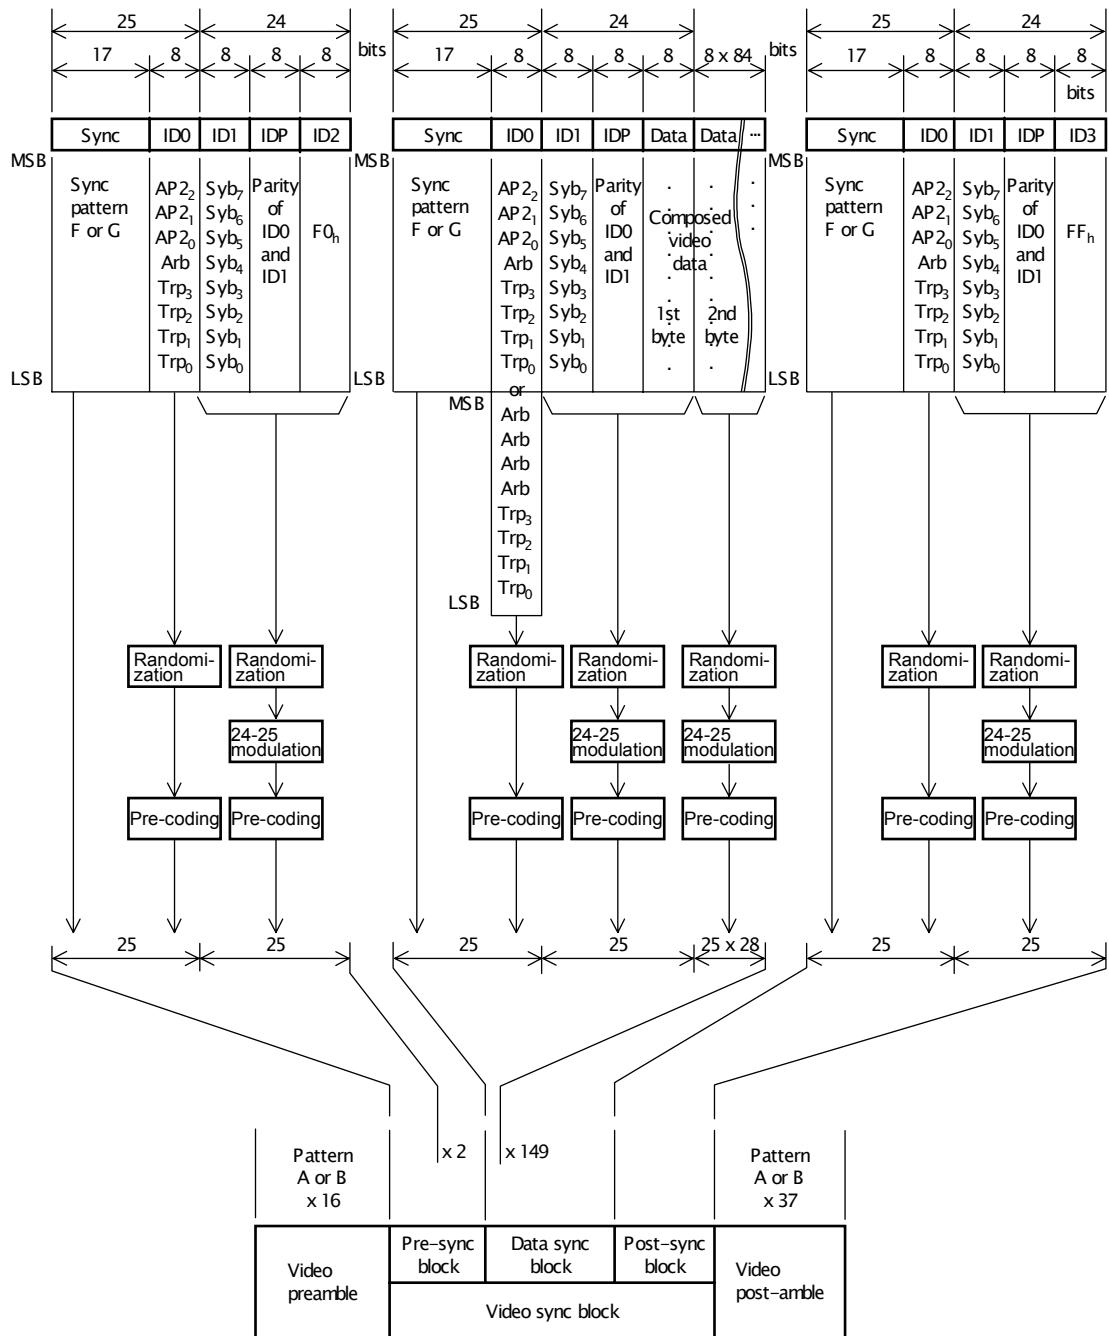

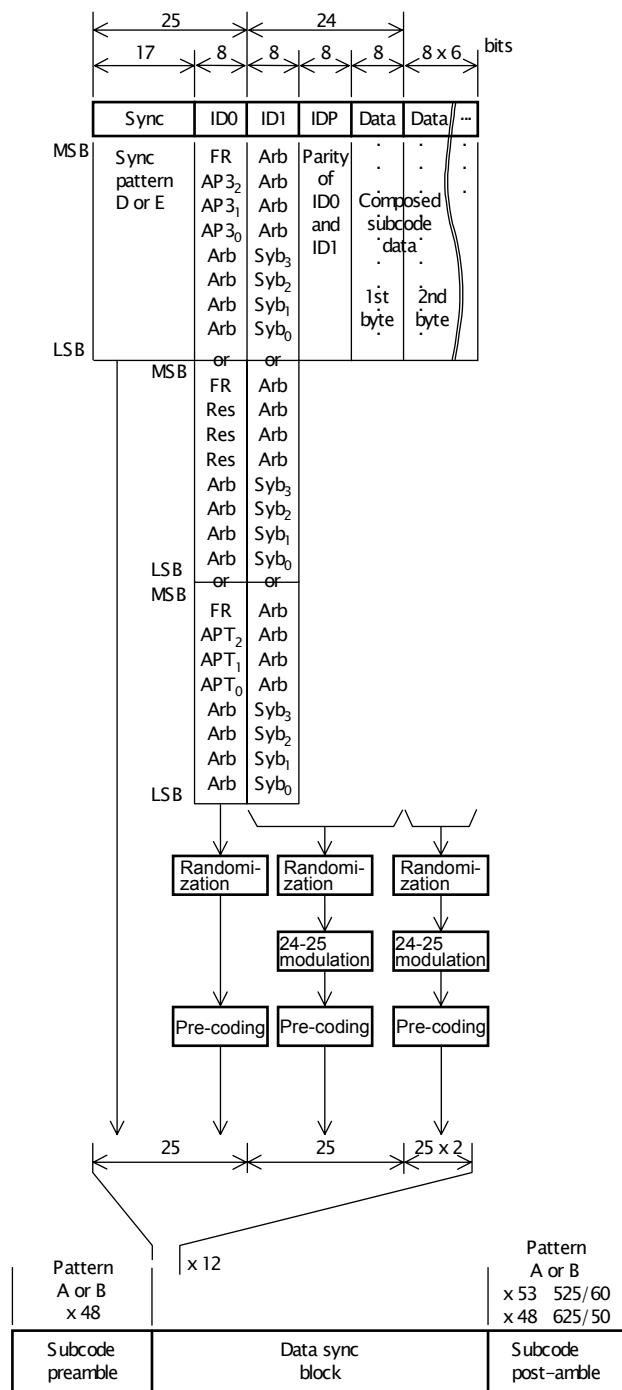

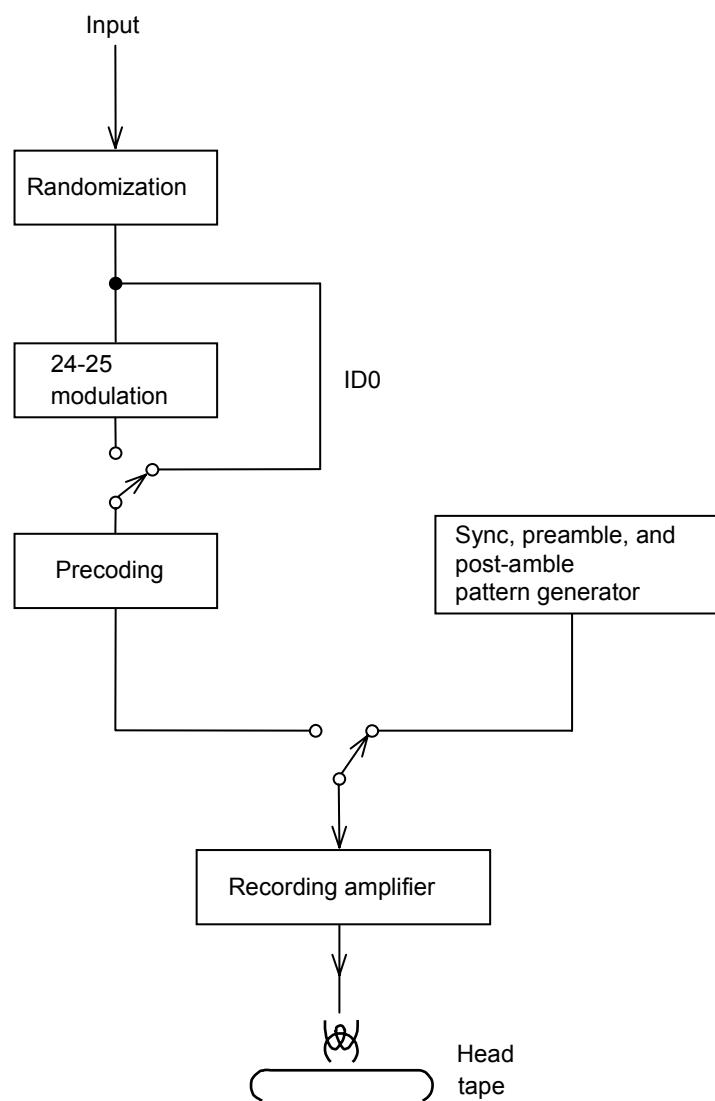

Figure 16 – Modulation for video sector

**Figure 17 – Modulation for subcode sector**

IEC 1875/05

Figure 18 – Possible block diagram for signal processing

7.1.3.1 Randomization

Bit streams of data except sync patterns shall be randomized. The randomizing is equivalent to performing the exclusive-or operation between the serial data stream and the serial stream generated by the polynomial function below:

$$X^7 + X^3 + 1$$

where X^i are place-keeping variables in GF(2), the binary field. The first term is the most significant and the first to enter the division computation. The randomizing is reset at ID0.

The randomization limits the run length of the same binary value.

7.1.3.2 24-25 modulation

The 24-25 modulation is applied to the randomized data bit stream. An extra bit is inserted into the bit stream at the beginning of three consecutive randomized bytes, as shown in Figure 19. The modulation output, 25 bits data, is referred to as a code word. The following criteria are used to insert a bit 1 or 0 at the beginning of each three consecutive bytes:

- a) if the run length of 1s or 0s, including the extra bit to be inserted at the junction, is shorter than 9, a bit generating the required pilot frequency is inserted;
- b) if the run length of 1s or 0s, including the extra bit to be inserted at the junction, exceeds 10, a bit which breaks the run continuation is inserted;
- c) including the extra bit to be inserted at the junction, and the run length of both 1s and 0s exceeds 10, a bit generating the required pilot frequency is inserted.

7.1.3.3 Pre-coding

The modulated bit stream shall be converted to interleaved NRZI as shown in Figures 15 to 17 and Figure 20.

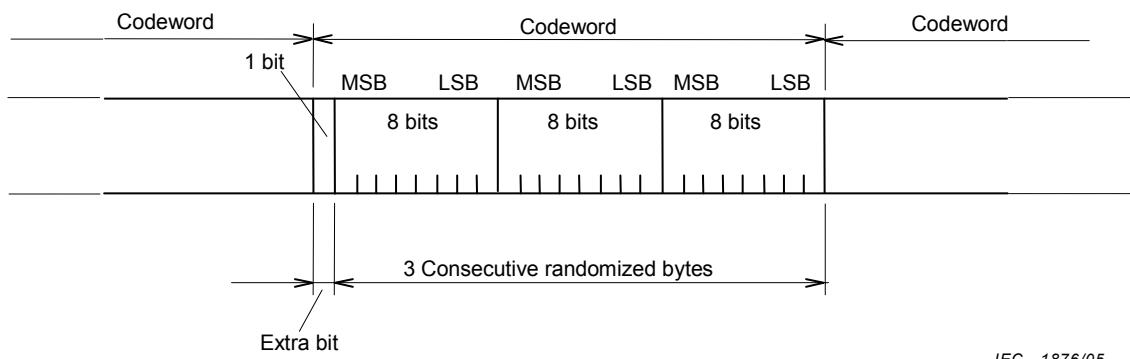

Figure 19 – Bit stream before interleaved NRZI modulation

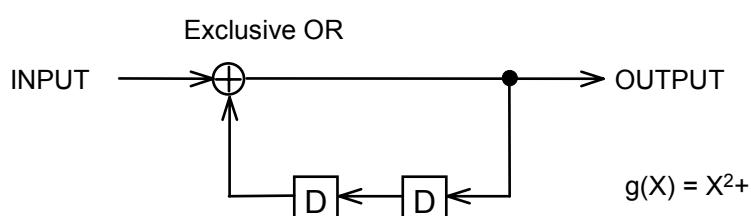

Figure 20 – Pre-coding

7.1.4 Magnetization

7.1.4.1 Polarity

The recorder shall operate in reproduction without regard to the polarity of the recorded flux on the helical tracks.

7.1.4.2 Record equalization

The record current shall generate a record head gap flux level that is constant within ± 1 dB between f_1 and $f_b/2$.

7.1.4.3 Record current level

The optimum record current is 6 dB higher than the lower side of the current value producing 1 dB below the maximum playback output at $f_b/2$.

7.2 Insert and track information (ITI) sector

7.2.1 Structure

The ITI sector is located at the entrance side of each track for accurate placement of the reproducing

head. The ITI sector, after initial recording, is not replaced in an editing operation.

The ITI sector contains the following elements:

- ITI preamble;
- Start sync area (SSA);
- Track information area (TIA);
- ITI post-amble.

Figure 21 shows the structure of the ITI sector.

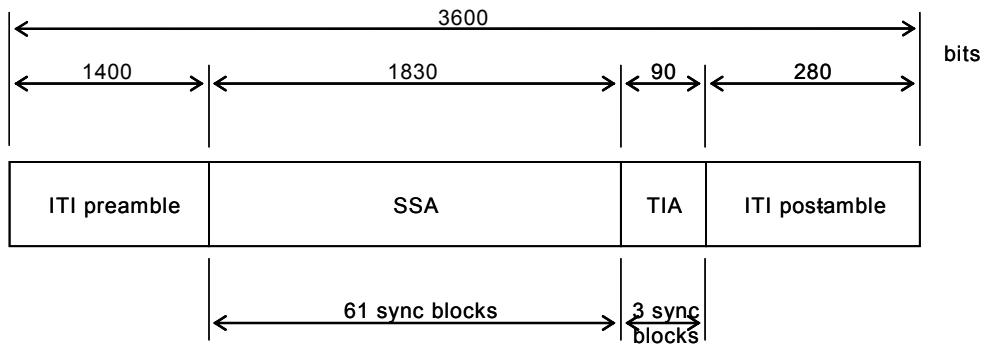

7.2.2 ITI preamble

The bit stream of the ITI preamble before the recording shall be defined as in Tables 11 to 13 in accordance with the low frequency appropriate pilot tone signal for each track. The length of the ITI preamble shall be 1400 bits as recorded on tape.

7.2.3 Start sync area (SSA)

SSA consists of 61 sync blocks and each sync block consists of 30 bits. Every start-sync block has a number which indicates the position of the sync block from the beginning of the SSA from zero.

The bit stream of the SSA after the modulation shall be as defined in Tables 14 to 16 in accordance with the low frequency pilot signals. The length of the SSA shall be 1830 bits as recorded on tape.

NOTE Each sync block has 30 bits.

IEC 1878/05

7.2.4 Track information area (TIA)

Track information area (TIA) consists of three sync blocks. Each sync block consists of 30 bits as shown in Figure 22. Every sync block has the same track information. Before the randomization, application ID of the track information shall be defined as in Table 17. The pilot frame shall be assigned as in Table 18.

Before the recording, the bit stream of the TIA shall be as defined in Tables 19 to 21 in accordance with the low frequency pilot signals. The length of the TIA shall be 90 bits as recorded on tape.

7.2.5 ITI post-amble

The bit stream of the ITI post-amble before recording shall be as defined in Tables 22 to 24 in accordance with the low frequency pilot signals. The length of the ITI post-amble shall be 280 bits as recorded on tape.

7.3 Audio sector

7.3.1 Structure

The audio sector consists of the following elements:

- audio preamble;
- audio sync block;
- audio post-amble.

The audio sync block contains the following elements:

- pre-sync block;
- data sync block;
- post--sync block.

Figure 23 shows the structure of an audio sector.

The audio data in data sync block are described in Clause 8. The audio pre- and post-amble are described in 7.3.2 and 7.3.4 respectively. The audio sync block are described in 7.3.3.

7.3.2 Audio preamble

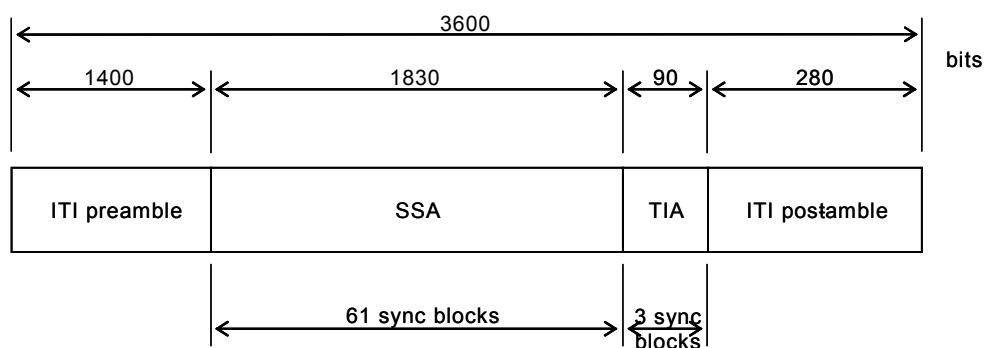

Two types of the audio preamble pattern are defined as shown below:

MSB	LSB
Pattern A: 0 0 0 1 1 1 0 0 0 1 1 1 0 0 0 0 0 1 1 1 0 0 0 1 1	
Pattern B: 1 1 1 0 0 0 1 1 1 0 0 0 1 1 1 1 1 0 0 0 1 1 1 0 0	

Before the recording, a preamble pattern shall be chosen from the above two sequences according to the criteria as described in 7.1.3.2. The length of the audio preamble shall be 400 bits as recorded on tape.

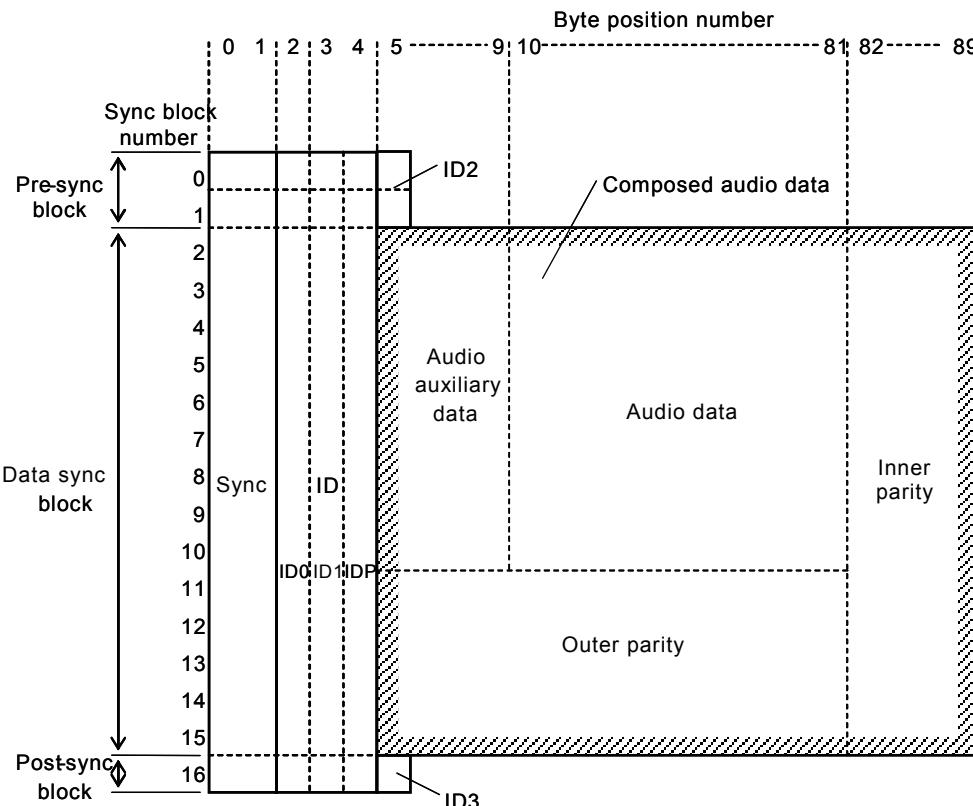

7.3.3 Audio sync block

Three components, two pre-sync blocks, 14 data sync blocks, and one post-sync block constitute the overall audio sync block structure. Each of the two pre-sync blocks consists of a two-byte sync word and a four-byte ID word comprising ID0, ID1, IDP, and ID2. The post-sync block consists of a two-byte sync word and a four-byte ID word comprising ID0, ID1, IDP, and ID3. The audio data sync block consists of a two-byte sync word, a three-byte ID, and 85 bytes of audio data including inner parity, or 85 bytes of outer and inner parity data, as shown in Figure 24.

IEC 1880/05

Figure 23 – Structure of audio sector

IEC 1881/05

NOTE Sync in byte position 0 and 1 shows the position. It is 17 bit pattern as specified in 7.3.3.1.

Figure 24 – Structure of sync blocks in audio sector

7.3.3.1 Sync

Two types of sync patterns are defined as shown below:

MSB	LSB
Sync pattern F : 0 0 0 1 1 1 1 1 1 1 1 1 0 0 0 1	
Sync pattern G: 1 1 1 0 0 0 0 0 0 0 0 0 0 1 1 1 0	

A sync pattern to be recorded shall be chosen from the above two sequences according to the criteria as described in 7.1.3.2. The length of the sync shall be 17 bits as recorded on tape.

7.3.3.2 ID

The ID consists of ID data (ID0, ID1) of 2 bytes, and ID parity (IDP) of 1 byte. As shown in Tables 25 to 28, the ID data consists of the audio application ID ($AP1_2, AP1_1, AP1_0$), track pair number ($Trp_3, Trp_2, Trp_1, Trp_0$), and sync block number ($Syb_7, Syb_6, Syb_5, Syb_4, Syb_3, Syb_2, Syb_1, Syb_0$).

– ID0

ID0 contains the information defined in Table 25. The length of ID0 shall be 8 bits before modulation. Audio application ID shall be as given in Table 26. The track pair number shall be as defined in Table 27 or 28.

Table 25 – ID0 in audio sector

	Sync block number 0, 1, 11 to 16	Sync block number 2 to 10

21					1	0	1	0
22	Non-existent				1	0	1	1
23					1	0	1	1

NOTE Track numbers as shown in Figure 12 or 13.

– ID1

ID1 contains the sync block number defined as follows:

The length of ID1 shall be 8 bits before modulation.

The sync block numbers shall be numbered from 0 to 16 as shown in Figure 24.

Modulation shall be applied together with ID1, IDP, and ID2 or ID3 or the first audio data as shown in Figure 15. The following operations shall be performed:

- randomization: see 7.1.3.1;
- 24-25 modulation: see 7.1.3.2;
- pre-coding: see 7.1.3.3;
- IDP.

IDP is a parity byte of ID0 and ID1. The length of the IDP shall be 8 bits before modulation.

IDP is defined as a (12, 8, 3) BCH code of which the generator polynomial is $X^4 + X + 1$. The ID code is divided into two ID codewords (ID-CW0, ID-CW1). The bit assignment of ID codewords is shown in Table 29.

ID-CW0: C14, C12, C10, C8, C6, C4, C2, C0, P6, P4, P2, P0
 ID-CW1: C15, C13, C11, C9, C7, C5, C3, C1, P7, P5, P3, P1

Parity bits P0 to P7 are given by the following equations:

$$\begin{aligned}
 P6 &= C14 \oplus C10 \oplus C6 \oplus C4 \\
 P4 &= C14 \oplus C12 \oplus C8 \oplus C4 \oplus C2 \\
 P2 &= C14 \oplus C12 \oplus C10 \oplus C6 \oplus C2 \oplus C0 \\
 P0 &= C12 \oplus C8 \oplus C6 \oplus C0 \\
 P7 &= C15 \oplus C11 \oplus C7 \oplus C5 \\
 P5 &= C15 \oplus C13 \oplus C9 \oplus C5 \oplus C3 \\
 P3 &= C15 \oplus C13 \oplus C11 \oplus C7 \oplus C3 \oplus C1 \\
 P1 &= C13 \oplus C9 \oplus C7 \oplus C1
 \end{aligned}$$

where \oplus is the symbol of an exclusive -or.

Modulation shall be done together with ID1, IDP, and ID2 or ID3 or the first audio data as shown in Figure 15. The following operations shall be performed:

- randomization: see 7.1.3.1;
- 24-25 modulation: see 7.1.3.2;
- pre-coding: see 7.1.3.3.

Table 29 – Bit assignment of ID codewords

	C9	C1	P1				
	C8	C0	P0				
LSB							

7.3.3.3 Additional ID (ID2, ID3)

Byte position number 5 of the pre-sync blocks (ID2) shall be set to F0_h before modulation. Byte position number 5 of the post-sync block (ID3) shall be set to FF_h before modulation.

The following operations shall be performed on additional ID together with ID1, IDP, and ID2 or ID3 or the first audio data:

- randomization: see 7.1.3.1;
- 24-25 modulation: see 7.1.3.2;
- pre-coding: see 7.1.3.3.

7.3.3.4 Composed audio data

As shown in Figure 24, composed audio data contain the audio data, audio auxiliary data, inner error code, and outer error code.

The composed audio data length shall be 85 bytes. By including the last two bytes of the ID, the length of the composed audio data shall be 87 bytes, divisible into 3-byte length sections for additional processing as described below:

- randomization: see 7.1.3.1;
- 24-25 modulation: see 7.1.3.2;
- pre-coding: see 7.1.3.3.

7.3.4 Audio post-amble

The audio post-amble shall be the same as the audio preamble described in 7.3.2 except for the length. The length of the audio post-amble shall be 500 bits as recorded on tape. The following operations shall be performed:

- randomization: none;
- 24-25 modulation: see 7.1.3.2;
- pre-coding: none.

7.4 Video sector

7.4.1 Structure

The video sector contains the following elements:

- video preamble;
- video sync block;
- video post-amble.

The video sync block contains the following elements:

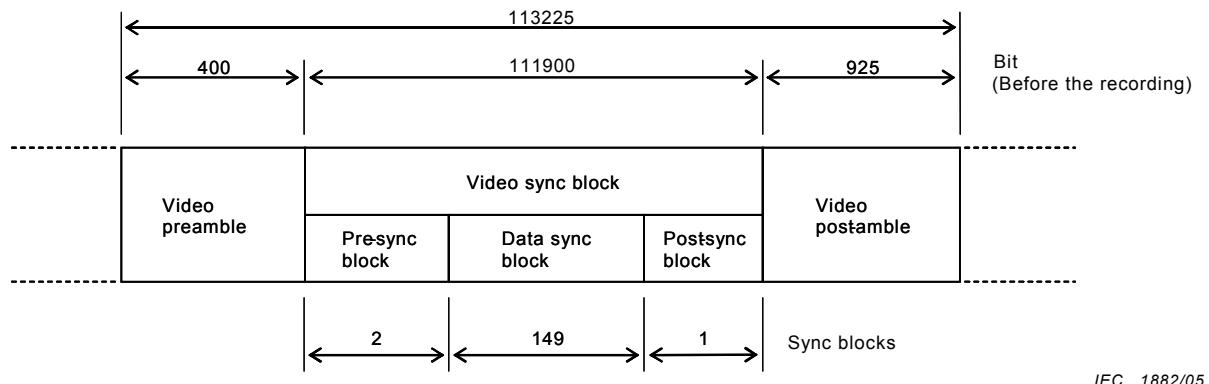

- pre-sync block;
- data sync block;
- post-sync block.

Figure 25 shows the structure of the video sector.

The video data in data sync block are described in Clause 9. The video pre- and post-amble are described in 7.4.2 and 7.4.3.5 respectively. The video sync block is described in 7.4.3

7.4.2 Video preamble

The video preamble pattern shall be the same as that of the audio preamble described in 7.3.2. The length of the video preamble shall be 400 bits as recorded on tape.

**Figure 25 – Structure of video sector**

7.4.3 Video sync block

Three components, two pre-sync blocks, 149 data sync blocks, and one post-sync block constitute the overall video sync block structure. Each of the two pre-sync blocks consists of a 2-byte sync word and a 4-byte ID word comprising ID0, ID1, IDP, and ID2. The post-sync block consists of a 2-byte sync word and a 4-byte ID word comprising ID0, ID1, IDP, and ID3. Each data sync block is comprised of either 1) 2-byte sync block word, 3-byte ID, 77 bytes of data and 8 inner parity bytes, or 2) 2-byte sync block word, 3-byte ID, 77 bytes of outer parity, and 8 inner parity bytes, as shown in Figure 26.

7.4.3.1 Sync

Sync shall be the same as the audio sync described in 7.3.3.1. The length of the sync shall be 17 bits as recorded on tape.

7.4.3.2 ID

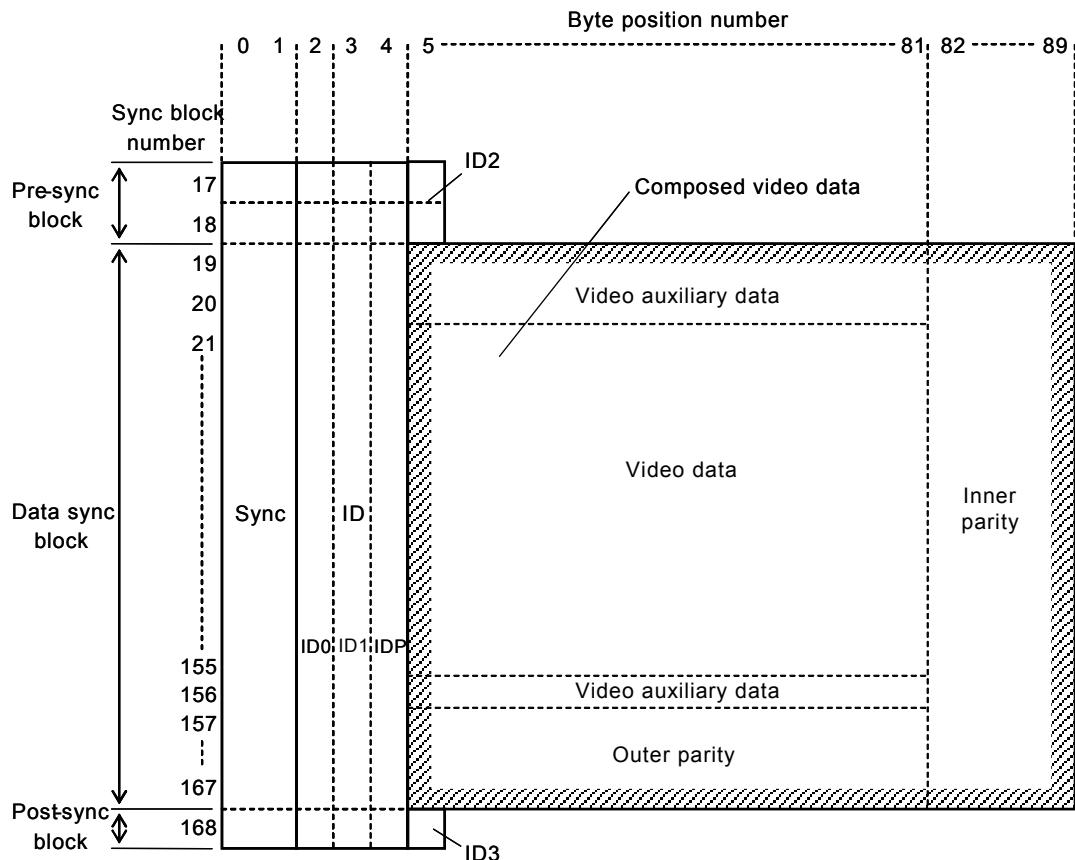

ID consists of ID data (ID0, ID1) of 2 bytes and ID parity (IDP) of 1 byte. ID data consist of the video application ID ($AP2_2$, $AP2_1$, $AP2_0$), track pair number (Trp_3 , Trp_2 , Trp_1 , Trp_0), and sync block number (Syb_7 , Syb_6 , Syb_5 , ..., Syb_0).

– ID0

ID0 contains the information given in Table 30. The length of ID0 shall be 8 bits before modulation.

Video application ID shall be as specified in Table 31. The track pair number shall be the same as that indicated in Table 27 or 28. The following operations shall be performed:

- randomization: see 7.1.3.1;
- 24-25 modulation: none;
- pre-coding: see 7.1.3.3.

IEC 1883/05

NOTE Sync in byte position 0 and 1 shows the position. It is 17 bit pattern as specified in 7.3.3.1.

Figure 26 – Structure of sync blocks in video sector

Table 30 – ID data in video sector

Bit position	Sync block number 17 to 18 and 157 to 168		Sync block number 19 to 156	
	ID0	ID1	ID0	ID1
b7	AP2 ₂	Syb ₇	Arb	Syb ₇
b6	AP2 ₁	Syb ₆	Arb	Syb ₆
b5	AP2 ₀	Syb ₅	Arb	Syb ₅
b4	Arb	Syb ₄	Arb	Syb ₄
b3	Trp ₃	Syb ₃	Trp ₃	Syb ₃
b2	Trp ₂	Syb ₂	Trp ₂	Syb ₂
b1	Trp ₁	Syb ₁	Trp ₁	Syb ₁
b0	Trp ₀	Syb ₀	Trp ₀	Syb ₀

– **ID1**

ID1 contains the sync block number defined as follows:

MSB	Syb ₇	Syb ₆	Syb ₅	Syb ₄	Syb ₃	Syb ₂	Syb ₁	LSB
	Syb ₇	Syb ₆	Syb ₅	Syb ₄	Syb ₃	Syb ₂	Syb ₁	Syb ₀

The length of ID1 shall be 8 bits before modulation.

The sync block numbers shall be numbered from 17 to 168 as shown in Figure 26.

The length of the composed video data shall be 85 bytes before modulation.

Modulation shall be done together with ID1, IDP, and ID2 or ID3 or the first video data, and/or followed every 3 video data bytes as shown in Figure 16. The following operations shall be performed:

- randomization: see 7.1.3.1;
- 24-25 modulation: see 7.1.3.2;
- pre-coding: see 7.1.3.3.

– **IDP**

IDP shall be the same as that given in 7.3.3.1. The length of the IDP shall be 8 bits before modulation.

The length of the composed video data shall be 85 bytes before modulation.

Modulation shall be done together with ID1, IDP, and ID2 or ID3 or the first video data, and/or followed every three video data bytes as shown in Figure 16. The following operations shall be performed:

- randomization: see 7.1.3.1;
- 24-25 modulation: see 7.1.3.2;
- pre-coding: see 7.1.3.3.

Table 31 – Video application ID

Video application ID			Format type
AP2 ₂	AP2 ₁	AP2 ₀	
0	0	0	Not used
0	0	1	D-7
0	1	0	Reserved
0	1	1	
1	0	0	
1	0	1	
1	1	0	Not used
1	1	1	

7.4.3.3 Additional ID (ID2, ID3)

Byte position number 5 of pre-sync blocks (ID2) shall be set to F0_h before modulation. Byte position number 5 of post-sync block (ID3) shall be set to FF_h before modulation.

7.4.3.4 Composed video data

Composed video data contains the video data, video auxiliary data, inner error code, and outer error code as shown in Figure 26.

The composed video data length shall be 85 bytes. By including the last two bytes of ID, the length of the composed video data shall be 87 bytes, divisible into 3 byte-length sections for additional processing as described below:

- randomization: see 7.1.3.1;
- 24-25 modulation: see 7.1.3.2;
- pre-coding: see 7.1.3.3.

7.4.3.5 Video post-amble

The video post-amble shall be the same as the audio preamble described in 7.3.2 except for the length.

The length of the video post-amble shall be 925 bits as recorded on tape.

7.5 Subcode sector

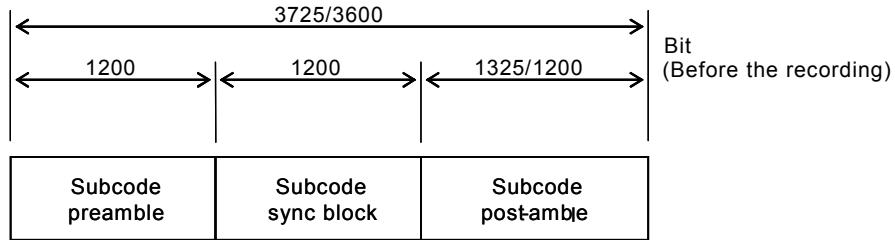

7.5.1 Structure

The subcode sector contains the following elements:

- subcode preamble;
- subcode sync block;
- subcode postamble.

Figure 27 shows the structure of a subcode sector.

The subcode data in data sync block are described in Clause 10. The subcode preamble and post-amble are described in 7.5.2 and 7.5.3.4 respectively. The subcode sync block is described in 7.5.3.

IEC 1884/05

NOTE This refers to 525/60 system / 625/50 system.

Figure 27 – Structure of subcode sector

7.5.2 Subcode preamble

The subcode preamble pattern shall be the same as the audio preamble pattern described in 7.3.2 except for the length.

The length of the subcode preamble shall be 1 200 bits as recorded on tape.

7.5.3 Subcode sync block

The subcode sync block contains 12 sync blocks. Each sync block contains sync of 2 bytes, ID of 3 bytes, and composed subcode data of 7 bytes. Figure 28 shows a structure of the subcode sync block.

7.5.3.1 Sync

Two types of sync patterns are defined as shown below:

MSB	LSB
Sync pattern D : 0 0 0 0 0 1 1 1 1 1 1 1 1 1 1 0 1	
Sync pattern E : 1 1 1 1 1 0 0 0 0 0 0 0 0 0 0 1 0	

A sync pattern to be recorded shall be chosen from the above two sequences according to the criteria described in 7.1.3.2. The length of the sync shall be 17 bits as recorded on tape.

7.5.3.2 ID

The ID consists of ID data (ID0, ID1) of 2 bytes and ID parity (IDP) of 1 byte. ID data consists of the FRID, sync block number (Syb₃, Syb₂, Syb₁, Syb₀), and/or subcode application ID (AP3₂, AP3₁, AP3₀), and/or track application ID (APT₂, APT₁, APT₀).

Table 32 defines the contents of ID0 and ID1.

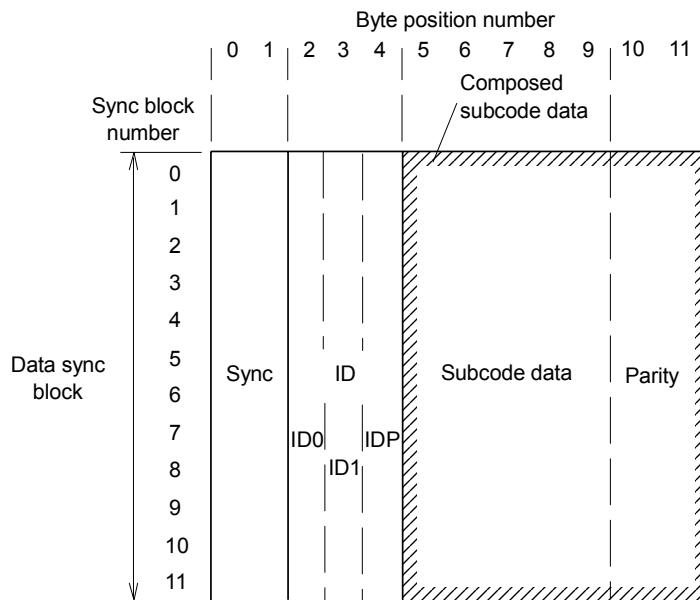

The subcode application ID shall be as defined in Table 33.

The length of the ID shall be as follows:

- ID0: 8 bits;
- ID1: 8 bits;
- IDP: 8 bits before modulation.

Modulation shall be applied together with ID1, IDP, and the first subcode data as shown in Figure 17. The following operations shall be performed:

- randomization: see 7.1.3.1;
- 24-25 modulation: see 7.1.3.2;
- pre-coding: see 7.1.3.3.

IEC 1885/05

NOTE Sync in byte position 0 and 1 shows the position. It is 17 bit pattern as specified in 7.5.3.1.

Figure 28 – Structure of sync blocks in subcode sector

Table 32 – ID data in subcode sector

Bit position	Sync block number 0 and 6		Sync block number 1 to 5 and 7 to 10		Sync block number 11	
	ID0	ID1	ID0	ID1	ID0	ID1
	b7 (MSB) FR	Arb	FR	Arb	FR	Arb
b6	AP3 ₂	Arb	Res	Arb	APT ₂	Arb
b5	AP3 ₁	Arb	Res	Arb	APT ₁	Arb
b4	AP3 ₀	Arb	Res	Arb	APT ₀	Arb
b3	Arb	Syb ₃	Arb	Syb ₃	Arb	Syb ₃
b2	Arb	Syb ₂	Arb	Syb ₂	Arb	Syb ₂
b1	Arb	Syb ₁	Arb	Syb ₁	Arb	Syb ₁
b0 (LSB)	Arb	Syb ₀	Arb	Syb ₀	Arb	Syb ₀

FR: the identification for the first or second half of each channel

1 = the first half of each channel

0 = the second half of each channel

Table 33 – Subcode application ID

Subcode application ID			Format
AP3 ₂	AP3 ₁	AP3 ₀	type
0	0	0	Not used
0	0	1	D-7
0	1	0	
0	1	1	
1	0	0	Reserved
1	0	1	
1	1	0	
1	1	1	Not used

IDP shall be the same as that in 7.3.3.2.

Modulation shall be applied together with ID1, IDP, and the first video data as shown in Figure 17. The following operations shall be performed:

- randomization: see 7.1.3.1;
- 24-25 modulation: see 7.1.3.2;
- pre-coding: see 7.1.3.3.

7.5.3.3 Composed subcode data

Composed subcode data structure consists of 12 subcode data blocks. Each subcode data block is composed of a 2-byte sync word, 3-byte ID, and 7 bytes of subcode data and parity. Three bytes consisting of ID1, IDP, and the first video data byte shall be processed through the following three operations:

- randomization: see 7.1.3.1;
- 24-25 modulation: See 7.1.3.2;
- pre-coding: see 7.1.3.3.

7.5.3.4 Subcode post-amble

The subcode post-amble shall be the same as the audio preamble described in 7.3.2 except for the length. The length of the subcode post-amble shall be 1 325 bits for the 525/60 system and 1 200 bits for the 625/50 system as recorded on tape.

7.6 Edit gap

The space between areas on a track is used to accommodate timing errors during editing. In an original recording the edit gap shall record concatenations of run patterns A and B defined as follows:

MSB	LSB
Run pattern A: 0 0 0 1 1 1 0 0 0 1 1 1 0 0 0 0 0 1 1 1 0 0 0 1 1	
Run pattern B: 1 1 1 0 0 0 1 1 1 0 0 0 1 1 1 1 1 0 0 0 1 1 1 0 0	

During an edit, the edit gap may be partially rewritten with the above concatenations provided that the preamble and post-amble of adjacent unedited areas are not overwritten.

Each preamble of areas except area 0 begins with run-up. Each postamble of areas except area 0 ends with the guard area. The run-up and the guard area shall be recorded concatenations of run patterns A and B.

Run patterns A and B are already modulated patterns under the rule of interleaved NRZI modulation. The choice of a run pattern between A and B depends on the restriction described in 7.1.3.2.

The length of the edit gaps shall be as follows:

- edit gap 1: 625 bits;
- edit gap 2: 700 bits;
- edit gap 3: 1550 bits as recorded on tape.

8 Audio processing

8.1 General

Audio data accompanying the video frame is processed simultaneously. The audio data shall be recorded on 10 consecutive tracks in each frame for the 525/60 system and 12 consecutive tracks in each frame for the 625/50 system for 25 Mb/s format. The audio data shall be recorded on 20 consecutive tracks in each frame for the 525/60 system and 24 consecutive tracks in each frame for the 625/50 system for 50 Mb/s format.

Each audio sector consists of audio data, audio auxiliary data (AAUX), and inner and outer parity data as shown in Figure 24. Audio data are shuffled within the audio data block of 77 columns x 9 rows prior to the addition of parity data. Each audio channel is identically but independently processed. Audio data are modulated by 24-25 code prior to recording. The total audio data processing sequence is shown in Figure 8.

8.2 Encoding mode

8.2.1 Source coding

Each audio input signal is sampled at 48kHz, which is locked to the video signal, with 16-bit quantization. The system provides two-channel simultaneous recording for 25 Mb/s format and four-channel simultaneous recording for 50 Mb/s format.

Audio data is processed in frames. Each frame contains 1602 or 1600 audio samples (525/60 system) or 1920 audio samples (625/50 system) for an audio channel with associated status, user, and validity data. For the 525/60 system, the number of audio samples per frame shall follow the five-frame sequence as shown below:

1600, 1602, 1602, 1602, 1602 samples.

Audio recording capacity is 1620 samples per frame for the 525/60 system or 1944 samples per frame for the 625/50 system. The unused space at the end of each frame is filled with arbitrary values.

In addition, a number of control and user words are added to the data.

8.2.2 Emphasis

Audio encoding is carried out with the first order pre-emphasis of 50/15μs. For the analogue-input recording, emphasis should be off in the default state.

8.2.3 Audio error code

In the audio encoded data, 8000h shall be assigned as the audio error code to indicate the invalid audio sample. This code corresponds to the negative full-scale value in ordinary two's complement representation. When the encoded data include 8000h, it shall be converted to 8001h before audio processing and recording.

8.2.4 Relative audio-video timing

The audio frame duration equals the video frame period. An audio frame begins with the audio sample acquired within the duration of minus 50 samples to zero samples from the first pre-equalizing pulse of the vertical blanking period of the input video signal. The first pre-equalizing pulse means the beginning of line number 1 for the 525/60 system, and the middle of line number 623 for the 625/50 system.

8.3 Audio shuffling

The 16-bit audio data word is divided into two bytes; the upper byte which contains the MSB and the lower byte with the LSB, as shown in Figure 29. Audio data shall be shuffled over tracks and data-sync blocks within a frame. The data bytes are defined as D_n ($n = 0, 1, 2, \dots$) which is sampled at nth order within a frame and shuffled by each D_n unit.

The data shall be shuffled through a process as expressed by the following equations:

525/60 system:

$$\begin{aligned} \text{Track number: } & (\text{INT}(n/3) + 2 \times (n \bmod 3)) \bmod 5 && \text{for CH1} \\ & (\text{INT}(n/3) + 2 \times (n \bmod 3)) \bmod 5 + 5 && \text{for CH2} \\ & (\text{INT}(n/3) + 2 \times (n \bmod 3)) \bmod 5 + 10 && \text{for CH3} \\ & (\text{INT}(n/3) + 2 \times (n \bmod 3)) \bmod 5 + 15 && \text{for CH4} \end{aligned}$$

$$\text{Sync block number: } 2 + 3 \times (n \bmod 3) + \text{INT}((n \bmod 45) / 15)$$

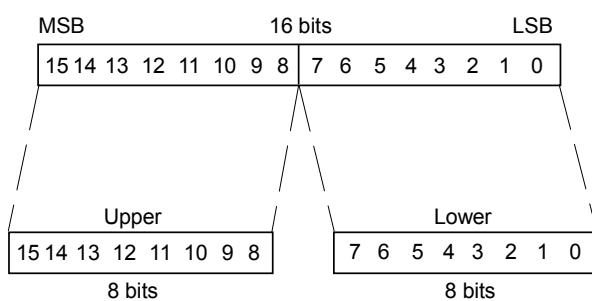

$$\begin{aligned} \text{Byte position number: } & 10 + 2 \times \text{INT}(n/45) && \text{for the most significant byte} \\ & 11 + 2 \times \text{INT}(n/45) && \text{for the least significant byte} \\ & \text{where } n = 0 \text{ to } 1619 && \end{aligned}$$

625/50 system:

$$\begin{aligned} \text{Track number: } & (\text{INT}(n/3) + 2 \times (n \bmod 3)) \bmod 6 && \text{for CH1} \\ & (\text{INT}(n/3) + 2 \times (n \bmod 3)) \bmod 6 + 6 && \text{for CH2} \\ & (\text{INT}(n/3) + 2 \times (n \bmod 3)) \bmod 6 + 12 && \text{for CH3} \\ & (\text{INT}(n/3) + 2 \times (n \bmod 3)) \bmod 6 + 18 && \text{for CH4} \end{aligned}$$

$$\text{Sync block number: } 2 + 3 \times (n \bmod 3) + \text{INT}((n \bmod 54) / 18)$$

$$\begin{aligned} \text{Byte position number: } & 10 + 2 \times \text{INT}(n/54) && \text{for the most significant byte} \\ & 11 + 2 \times \text{INT}(n/54) && \text{for the least significant byte} \\ & \text{where } n = 0 \text{ to } 1943 && \end{aligned}$$

IEC 1886/05

Figure 29 – Sample to audio data bytes conversion

8.4 Audio auxiliary data (AAUX)

AAUX shall be added to the shuffled audio data as shown in Figure 24. The AAUX packet shall include a pack header, the data of the AAUX source pack (AS), and AAUX source control pack (ASC). The length of AS and ASC shall be a fixed value of 5 bytes as shown in Figure 30, which shows the AAUX pack arrangement for each track. One audio auxiliary data packet consists of nine sync blocks, numbers 2 through 10. Byte positions 5 through 9 of each sync block constitute the data, with byte position 5 the pack header. Therefore, there are nine packs in each track. Packs are numbered 0 to 8 from the entrance side of the audio sector in the order as shown in Figure 30. This number is called the audio pack number.

Table 34 shows the AAUX data which include the AAUX source pack and the AAUX source control pack.

AAUX has a reserved data area as shown below:

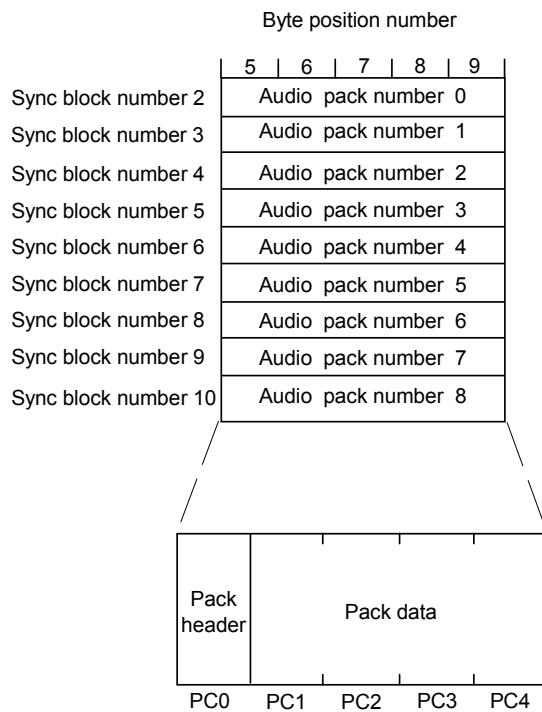

25 Mb/s format

- 525/60 system: 5 bytes x 7 packs x 10 tracks x 30 frames = 10500 bytes/s
- 625/50 system: 5 bytes x 7 packs x 12 tracks x 25 frames = 10500 bytes/s

50 Mb/s format

- 525/60 system: 5 bytes x 7 packs x 20 tracks x 30 frames = 21000 bytes/s
- 625/50 system: 5 bytes x 7 packs x 24 tracks x 25 frames = 21000 bytes/s

The reserved area shall be filled up by FFh.

IEC 1887/05

NOTE 4 25 Mb/s format 525/60 system Track A: Track number 0, 2, 4, 6, 8 Track B: Track number 1, 3, 5, 7, 9 625/50 system Track A: Track number 0, 2, 4, 6, 8, 10 Track B: Track number 1, 3, 5, 7, 9, 11 50 Mb/s format 525/60 system Track A: Track number 0, 2, 4, 6, 8, 10, 12, 14, 16, 18 Track B: Track number 1, 3, 5, 7, 9, 11, 13, 15, 17, 19 625/50 system Track A: Track number 0, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22 Track B: Track number 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23		

8.4.1 AAUX source pack (AS)

The AAUX source pack shall be configured as shown in Table 35.

Table 35 – Mapping of AAUX source pack

	MSB								LSB								
PC0	0	1	0	1	0	0	0	0	0	0							
PC1	LF	Res	AF SIZE														
PC2	0	CHN			0	AUDIO MODE											
PC3	Res	Res	50/60	STYPE													
PC4	Arb	Res	SMP			QU											
NOTE Res means reservation for future use. Hereinafter, the default value of Res shall be set to 1.																	

LF: Locked mode flag

Locking condition of audio sampling frequency with video signal

0 = Locked mode
1 = Reserved

AF SIZE: The number of audio samples per frame

0 1 0 1 0 0 b = 1 600 samples / frame (525/60 system)
 0 1 0 1 1 0 b = 1 602 samples / frame (525/60 system)
 0 1 1 0 0 0 b = 1 920 samples / frame (625/50 system)

CHN: The number of audio channels within an audio block

0 0 b = One channel per audio block
 Others = Reserved

The audio block is composed of five audio sectors in five consecutive tracks for the 525/60 system; six audio sectors in six consecutive tracks for the 625/50 system.

AUDIO MODE: The contents of the audio signal on each channel

0 0 0 0 b = CH1(CH3)
 0 0 0 1 b = CH2(CH4)
 1 1 1 1 b = Invalid audio data
 Others = Reserved

50/60:

0 = 60-field system
 1 = 50-field system

STYPE: STYPE defines audio blocks per video frame

0 0 0 0 0 b = 2 audio blocks
 0 0 0 1 0 b = 4 audio blocks
 Others = Reserved

SMP: Sampling frequency

0 0 0 b = 48 kHz
 Others = Reserved

QU: Quantization

0 0 0 b = 16 bits linear
 Others = Reserved

8.4.2 AAUX source control pack (ASC)

Table 36 shows a mapping of the AAUX source control pack.

Table 36 – Mapping of AAUX source control pack

EDIT ST: Start position of insert edit

0 0 b = Unedited portion
 0 1 b = Editing point without fading
 1 0 b = Editing point with fading
 1 1 b = Reserved

The duration of recording EDIT ST shall be one audio block period for each channel.

EDIT END: End position of insert edit

0 0 b = Unedited portion
 0 1 b = Editing point without fading
 1 0 b = Editing point with fading
 1 1 b = Reserved

The duration of recording EDIT END shall be one audio block period for each channel.

CGMS: Copy generation management system

0 0 b = Copy free
 Others = Reserved

EFC: Emphasis channel flag

0 0 b = Emphasis off
 0 1 b = Emphasis on
 Others = Reserved

EFC shall be set for each audio block.

8.5 Error correction code addition

Audio data are protected by inner and outer error correction codes.

8.5.1 Inner error correction code

The inner parity as shown in Figure 24 is defined as the codeword of an inner error correction code.

The inner error correction code is a (85, 77) Reed-Solomon code in GF(256) of which the field generator polynomial is:

$$X^8 + X^4 + X^3 + X^2 + 1$$

where X^i are place-keeping variables in GF(2), the binary field.

The generator polynomial of the code in GF(256) is:

$$g_{in}(X) = (X + 1)(X + \alpha)(X + \alpha^2)(X + \alpha^3)(X + \alpha^4)(X + \alpha^5)(X + \alpha^6)(X + \alpha^7)$$

where α is given by 2_h in GF(256).

The inner parity bytes $K_7, K_6, K_5, K_4, K_3, K_2, K_1, K_0$ as shown in Figure 31 are given by the equation:

$$K_7X^7 + K_6X^6 + K_5X^5 + K_4X^4 + K_3X^3 + K_2X^2 + K_1X + K_0$$

which is a residue of $X^8D(X)$ divided by $g_{in}(X)$, where the data polynomial $D(X)$ is defined as:

$$D(X) = D_{76}X^{76} + D_{75}X^{75} + \dots + D_2X^2 + D_1X + D_0$$

and the codeword polynomial is given by the following equation for every column of the byte position number 5 to 81:

$$D_{76}X^{84} + D_{75}X^{83} + \dots + D_1X^9 + D_0X^8 + K_7X^7 + K_6X^6 + \dots + K_1X + K_0$$

8.5.2 Outer error correction code

The outer parity as shown in Figure 24 is defined as a codeword of an outer error correction code.

The outer error correction code is a (14, 9) Reed-Solomon code in GF(256) of which the field generator polynomial is:

$$X^8 + X^4 + X^3 + X^2 + 1$$

where X^i are place-keeping variables in GF(2), the binary field.

The generator polynomial of the code in GF(256) is:

$$g_{aout}(X) = (X + 1)(X + \alpha)(X + \alpha^2)(X + \alpha^3)(X + \alpha^4)$$

where α is given by 2_h in GF(256).

The outer parity bytes K_4, K_3, K_2, K_1, K_0 as shown in Figure 32, are given by the equation:

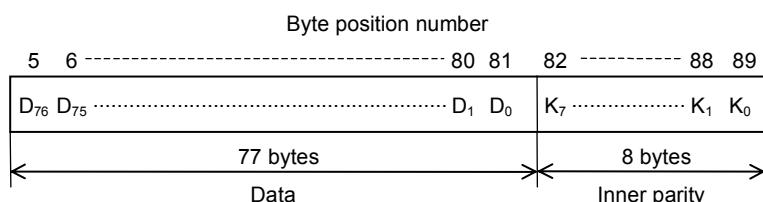

$$K_4X^4 + K_3X^3 + K_2X^2 + K_1X + K_0$$

which is a residue of $X^5D(X)$ divided by $g_{aout}(X)$, where the data polynomial $D(X)$ is defined as:

$$D(X) = D_8X^8 + D_7X^7 + \dots + D_2X^2 + D_1X + D_0$$

and the codeword polynomial is given by the following equation:

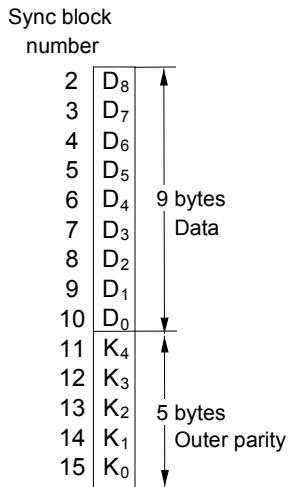

$$D_8X^{13} + D_7X^{12} + \dots + D_1X^6 + D_0X^5 + K_4X^4 + K_3X^3 + \dots + K_1X + K_0$$

NOTE D and K are in GF (256).

IEC 1888/05

Figure 31 – Data and inner parity of a data sync block

IEC 1889/05

NOTE *D* and *K* are in GF (256).**Figure 32 – Data and outer parity of a data sync block for audio sector**

9 Video processing

9.1 General

The video signal is compressed in compliance with part 2 of this standard and formatted into a recording stream.

Video auxiliary data (VAUX) are multiplexed with the compressed video data, and the multiplexed data are processed in a product block of 77 columns by 138 rows. The data in the product block are protected with the error correction codes added to the product block. Prior to recording, 24-25 modulation is applied (see Figure 9).

9.2 Compressed macro block and data-sync block

A compressed macro block data is distributed to data-sync blocks as shown in Figure 33. A compressed macro block whose compressed macro block number is CM *i*, *j*, *k* is distributed to a data-sync block of sync block numbers as follows:

$$\begin{aligned}
 & 27j + k + 21 \text{ of track } i \text{ where } i = 0, \dots, n-1 \\
 & j = 0, \dots, 4 \\
 & k = 0, \dots, 26 \\
 & n = 10 \times m \text{ for 525/60 system} \\
 & n = 12 \times m \text{ for 625/50 system} \\
 & m = 1 \text{ for 4:1:1 compression} \\
 & m = 2 \text{ for 4:2:2 compression}
 \end{aligned}$$

IEC 1890/05

Figure 33 – Relation between the compressed macro block number and the data-sync block

9.3 Video auxiliary data (VAUX)

VAUX shall be added to the compressed video data as shown in Figure 26.

VAUX is formed using the fixed length pack structure. Figure 34 shows the VAUX pack arrangement of each track. There are 15 packs following the ID code of the data-sync block of which the sync block number is 19, 20, and 156. Therefore, there are 45 packs in each track, and there are two reserved bytes in each data-sync block for VAUX. The default value of the reserved bytes is FFh. VAUX packs are sequentially numbered from 0 to 44 from the entrance side of the video sector in the order as shown in Figure 34. This number is called the video pack number.

Table 37 shows the VAUX data. The VAUX source pack and VAUX source control pack include mandatory data for playback video signals and shall be recorded.

The other area of VAUX consists of 43 packs per track, 430 packs per frame for the 525/60 system and 516 packs per frame for the 625/50 system of 25 Mb/s format, and 860 packs per frame for the 525/60 system and 1032 packs per frame for the 625/50 system of 50 Mb/s format.

The reserved area of VAUX is as follows:

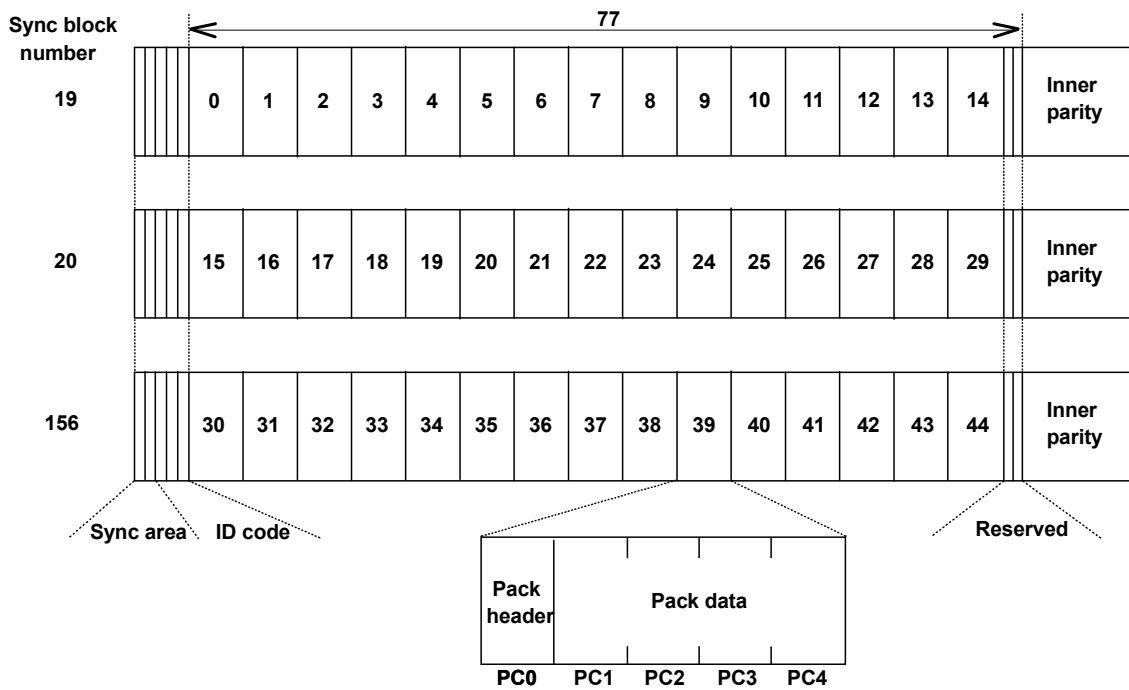

25 Mb/s format

- 525/60 system
 $(5 \text{ bytes} \times 43 \text{ packs} + 6 \text{ bytes}) \times 10 \text{ tracks} \times 30 \text{ frames} = 66300 \text{ bytes}$
- 625/50 system
 $(5 \text{ bytes} \times 43 \text{ packs} + 6 \text{ bytes}) \times 12 \text{ tracks} \times 25 \text{ frames} = 66300 \text{ bytes}$

50 Mb/s format

- 525/60 system
 $(5 \text{ bytes} \times 43 \text{ packs} + 6 \text{ bytes}) \times 20 \text{ tracks} \times 30 \text{ frames} = 132600 \text{ bytes}$
- 625/50 system
 $(5 \text{ bytes} \times 43 \text{ packs} + 6 \text{ bytes}) \times 24 \text{ tracks} \times 25 \text{ frames} = 132600 \text{ bytes}$

The reserved area shall be filled with FFh.

FF: Frame/Field flag

FF indicates whether two consecutive fields are delivered, or one field is repeated twice during one frame period.

0 = Only one of two fields is delivered twice.
1 = Both fields are delivered in order.

FS: First/Second flag

FS indicates a field which should be delivered during field one period.

0 = Field 2 is delivered.

1 = Field 1 is delivered.

FF	FS	Output field
1	1	Field 1 and field 2 are output in this order
1	0	Field 2 and field 1 are output in this order
0	1	Field 1 is output twice
0	0	Field 2 is output twice

FC: Frame change flag

FC indicates whether the picture of the current frame is repeated on the immediately previous frame.

0 = Same picture as the immediate previous frame

1 = Different picture from the immediate previous frame

9.4 Error correction code addition

Video data are protected by inner and outer error correction codes.

9.4.1 Inner error correction code

The inner parity as shown in Figure 26 is defined as the codeword of an inner error correction code. See 8.5.1 for the specification of this error correction code.

9.4.2 Outer error correction code

The outer parity as shown in Figure 26 is defined as a codeword of an outer error correction code.

The outer error correction code is a (149, 138) Reed-Solomon code in GF(256) of which the field generator polynomial is shown as:

$$X^8 + X^4 + X^3 + X^2 + 1$$

where X^i are place-keeping variables in GF(2), the binary field.

The generator polynomial of the code in GF(256) is:

$$g_{vout}(X) = (X + 1)(X + \alpha)(X + \alpha^2)(X + \alpha^3) \dots (X + \alpha^9)(X + \alpha^{10})$$

where α is given by 2h in GF(256).

The outer parity bytes, $K_{10}, K_9, K_8, K_7, K_6, K_5, K_4, K_3, K_2, K_1, K_0$ as shown in Figure 35 are given by the equation:

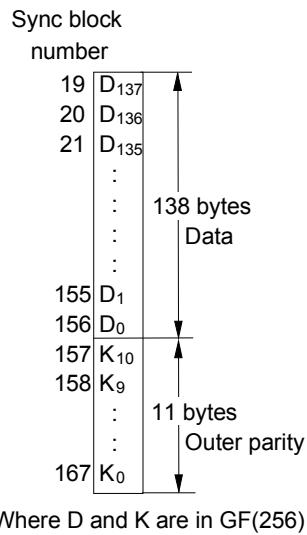

$$K_{10}X^{10} + K_9X^9 + K_8X^8 + K_7X^7 + K_6X^6 + K_5X^5 + K_4X^4 + K_3X^3 + K_2X^2 + K_1X + K_0$$

which is a residue of $X^{11}D(X)$ divided by $g_{\text{vout}}(X)$, where the data polynomial $D(X)$ is defined as:

$$D(X) = D_{137}X^{137} + D_{136}X^{136} + \dots + D_2X^2 + D_1X + D_0$$

and the codeword polynomial is given by the following equation for every column of the byte position number 5 to 81:

$$D_{137}X^{148} + D_{136}X^{147} + \dots + D_1X^{12} + D_0X^{11} + K_{10}X^{10} + K_9X^9 + \dots + K_1X + K_0$$

Where D and K are in GF(256)

IEC 1892/05

Figure 35 – Data and outer parity of a data sync block for video sector

10 Subcode processing

10.1 General

Subcode data is processed with every video frame. The subcode data shall be recorded 10 consecutive tracks in the frame for the 525/60 system and 12 consecutive tracks in the frame for the 625/50 system for 25 Mb/s format. The subcode data shall be recorded 20 consecutive tracks in the frame for the 525/60 system and 24 consecutive tracks in the frame for the 625/50 system for 50 Mb/s format.

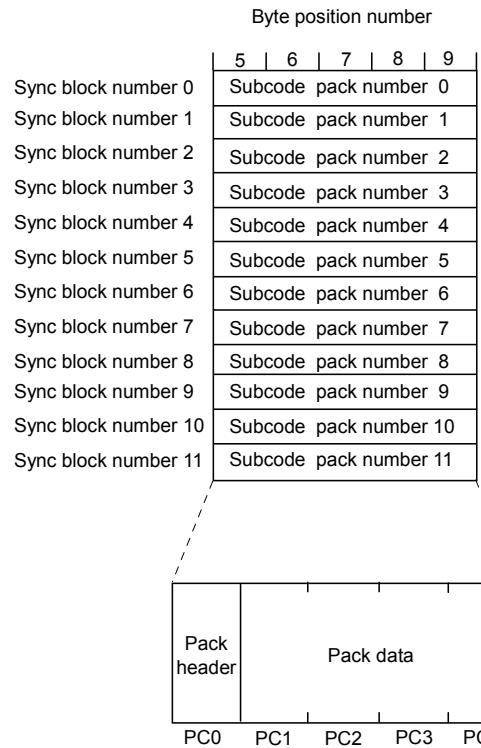

Each subcode sector is a block of 5 columns by 12 rows as shown in Figure 28.

Subcode data with the addition of an error correction code (ECC) shall be modulated prior to recording. A typical block diagram of the subcode processing is shown in Figure 8.

10.2 Subcode data

As shown in Figure 36, each subcode row consists of a pack header byte and 4 data bytes. Within the 12 columns of the subcode data pack, a time code pack (TC) and a binary group pack (BG) are included as shown in Table 40.

The time and control code, which is internally generated or externally input, shall comply with SMPTE 12M.

IEC 1893/05

BG: Binary group pack (pack header = 14 h)

25 Mb/s format

525/60 system

The first half of a video frame: Track number 0, 1, ..., 4

The second half of a video frame: Track number 5, 6, ..., 9

625/50 system

The first half of a video frame: Track number 0, 1, ..., 5

The second half of a video frame: Track number 6, 7, ..., 11

50 Mb/s format

525/60 system

The first half of a video frame: Track number 0, 1, ..., 9

The second half of a video frame: Track number 10, 11, ..., 19

625/50 system

The first half of a video frame: Track number 0, 1, ..., 11

The second half of a video frame: Track number 12, 13, ..., 23

The subcode data frame is provided with a reserved area as follows:

25 Mb/s format

525/60 system

5 bytes x 16 packs x 5 track pairs x 30 frames = 12 000 bytes

625/50 system

5 bytes x 16 packs x 6 track pairs x 25 frames = 12 000 bytes

50 Mb/s format

525/60 system

5 bytes x 16 packs x 10 track pairs x 30 frames = 24 000 bytes

625/50 system

5 bytes x 16 packs x 12 track pairs x 25 frames = 24 000 bytes

10.2.1 Time code pack (TC)

Table 41 shows the mapping of the time code pack.

Table 41 – Mapping of time code pack

625/60 system											
MSB								LSB			
PC0	0	0	0	1	0	0	1	1			
PC1	CF	DF	Tens of frames			Units of frames					
PC2	PC	Tens of seconds				Units of seconds					
PC3	BGF0	Tens of minutes				Units of minutes					
PC4	BGF2	BGF1	Tens of hours			Units of hours					
625/50 system											
MSB								LSB			
PC0	0	0	0	1	0	0	1	1			
PC1	CF	Arb	Tens of frames			Units of frames					
PC2	BGF0	Tens of seconds				Units of seconds					
PC3	BGF2	Tens of minutes				Units of minutes					
PC4	PC	BGF1	Tens of hours			Units of hours					

DF: Drop frame flag

DF = 0: Nondrop frame time code

DF = 0: Nondrop frame time code

CF: Colour frame

CF = 0: Unsynchronized mode

CF = 1: Synchronized mode

PC: Biphase mark polarity correction

PC = 0: Even

PC = 1: Odd

BGF: Binary group flag

10.2.2 Binary group pack (BG)

Table 42 shows the mapping of a binary group pack.

Table 42 – Mapping of a binary group pack

	MSB				LSB			
PC0	0	0	0	1	0	1	0	0
PC1	Binary group 2				Binary group 1			
PC2	Binary group 4				Binary group 3			
PC3	Binary group 6				Binary group 5			
PC4	Binary group 8				Binary group 7			

10.3 Error correction code addition

Subcode error correction code shall be a (14, 10) Reed – Solomon code on GF (16) of which the field generator polynomial is:

$$X^4 + X + 1$$

where X^i are place-keeping variables in GF(2) the binary field.

The generator polynomial of the code in GF (16) is:

$$g_{\text{sub}} (X) = (X+1) (X + \alpha) (X + \alpha^2) (X + \alpha^3)$$

where α is given by 2h in GF (16).

The subcode parity bytes, K_3, K_2, K_1, K_0 , as shown in Figure 37, are given by the equation:

$$K_3 X^3 + K_2 X^2 + K_1 X + K_0$$

which is a residue of $X^4 D (X)$ divided by $g_{\text{sub}} (X)$, where the data polynomial $D (X)$ is defined as:

$$D (X) = D_9 X^9 + D_8 X^8 + \dots + D_2 X^2 + D_1 X + D_0$$

and the codeword polynomial is given by the equation:

$$D_9 X^{13} + D_8 X^{12} + \dots + D_1 X^5 + D_0 X^4 + K_3 X^3 + K_2 X^2 + K_1 X + K_0$$

		Byte position number

IEC 1894/05

where $D_n = (d_{n,3} d_{n,2} d_{n,1} d_{n,0}) \quad 9 \geq n \geq 0$ $K_n = (k_{n,3} k_{n,2} k_{n,1} k_{n,0}) \quad 3 \geq n \geq 0$

Figure 37 – Bit assignment for subcode data and parity

11 Longitudinal tracks

11.1 Control track

11.1.1 Method of recording

The control track shall be recorded using the hysteresis (direct recording) method.

11.1.2 Servo reference pulse

The control track servo reference pulse, as recorded on the tape, shall be a series of pulses with a period of $673 \mu\text{s} \pm 10 \mu\text{s}$ as shown in Figure 38 (525/60 system) or $667 \mu\text{s} \pm 10 \mu\text{s}$ as shown in Figure 39 (625/50 system).

11.1.3 Flux polarity

The polarities of the recorded flux shall be as shown in Figure 3.

11.1.4 Flux level

The peak recorded flux level shall be greater than 500 nWb/m of the track width. The recording shall attenuate any previous recording by at least 25 dB.

11.1.5 Pulse width

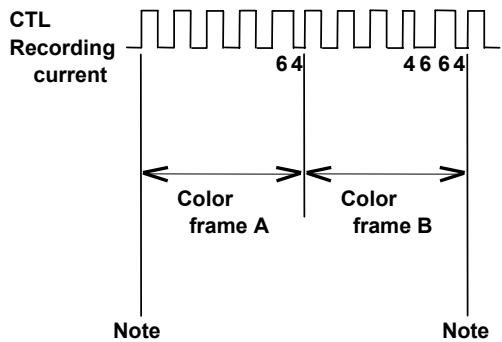

The recorded pulses shall have periods of 4T, 5T, or 6T where T equals $667,3 \mu\text{s}$ nominal (525/60 system) or $666,7 \mu\text{s}$ nominal (625/50 system). The rise and fall times of the record current (10 % to 90 % points) shall be less than $150 \mu\text{s}$.

11.1.6 Servo reference pulse timing

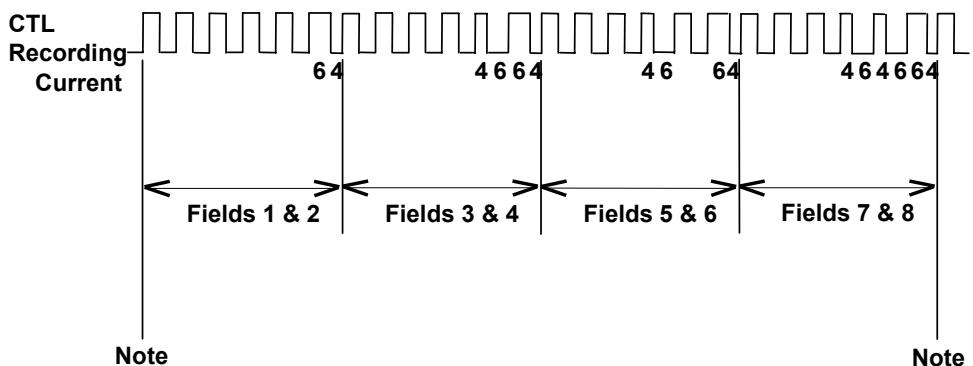

As shown in Figure 3, the servo reference pulse timing point and the helical track programme reference point shall be time coincident.

11.1.7 Colour frame indication

Information on the colour frame sequence, extracted from the input composite video signal, shall be encoded into the servo reference pulse as a pulse rise transmission point following the 6T or 4T duration pulse. Details are shown in Figure 38.

IEC 1895/05

NOTE Control track reference pulse position for measurement of P_1 .**Figure 38 – Recorded control code waveform timing (525/60 system)**

IEC 1896/05

NOTE Control track reference pulse position for measurement of P_1 .**Figure 39 – Recorded control code waveform timing (625/50 system)**

11.2 Cue track

11.2.1 Method of recording

The signals shall be recorded using the anhysteresis (AC bias) method.

11.2.2 Flux level

The recorded reference audio level shall correspond to an r.m.s. magnetic short-circuit flux level of $23 \text{ nWb/m} \pm 3 \text{ nWb/m}$ of track width at 1 000 Hz.

11.2.3 Relative timing

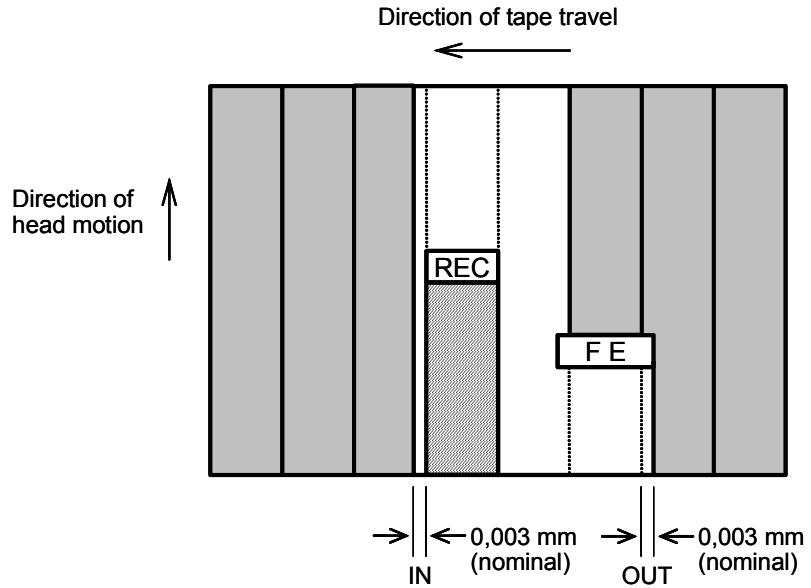

Cue information shall be recorded on the tape at a point referenced to the associated video information as defined by dimension P_2 of Figure 3 and Table 1 (525/60 system) or Table 2 (625/50 system).

Annex A
(normative)**Tape tension**

The value measured with a tension monitor on the entrance side of the scanner may vary among manufacturers, but would typically be $0,09 \text{ N} \pm 0,02 \text{ N}$.

Annex B
(normative)**Track pattern during insert editing**

A guard band of 3 µm (nominal) at editing points only is shown in Figures B.1 and B.2

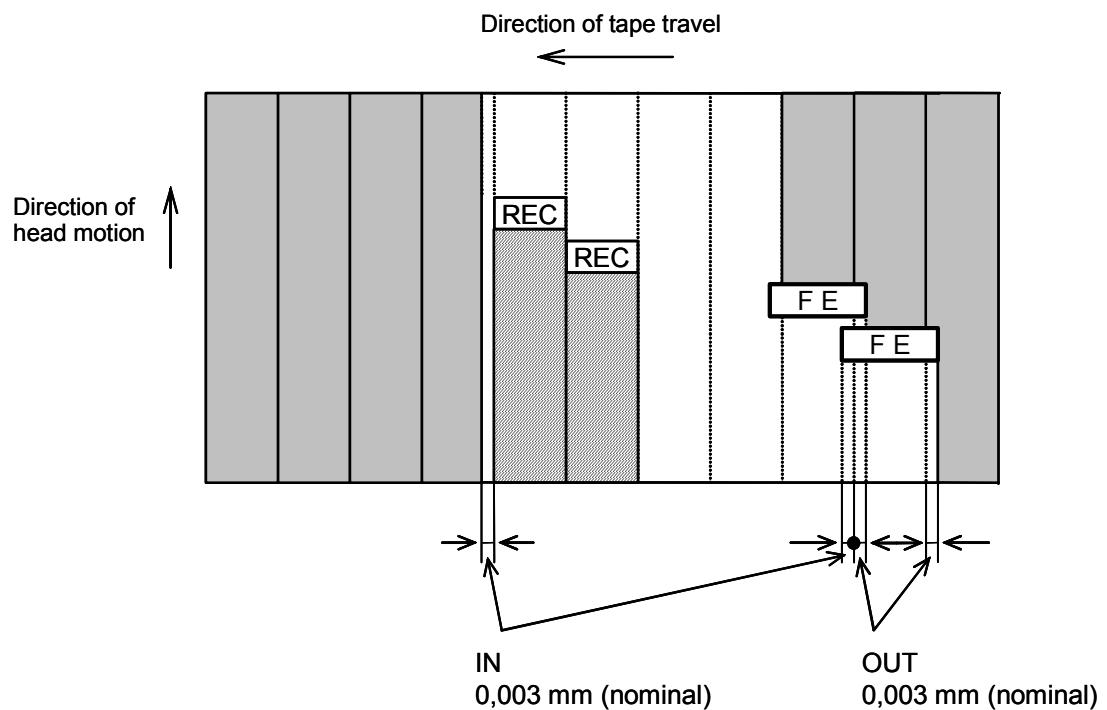

IEC 1897/05

NOTE 1 REC is a recording head.

NOTE 2 FE is a flying erase head.

Figure B.1 – Typical track pattern during insert editing for 25 Mb/s format

NOTE 1 REC is a recording head.

IEC 1898/05

NOTE 2 FE is a flying erase head.

Figure B.2 – Typical track pattern during insert editing for 50 Mb/s format

Annex C
(normative)**Cross-tape track measurement technique**

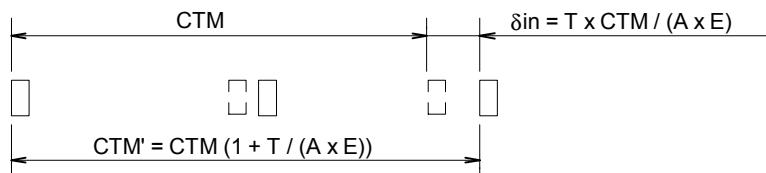

The cross-tape track measuring technique utilizes the fact that all tracks of a helical-scan video recording, recorded by the same head at constant tape speed, have the same longitudinal track pitch, the same track angle, and the same track curvature.

From a ferrofluid development, measurements are made of the actual track positions and the distance between a minimum of 300 control track pitches. All measurements shall be made under the environmental conditions described in 4.1 except that the measurements are made without tape tension (see Table C.1). The tape is then mathematically stretched to account for tape tension (see Figure C.1). The theoretical track position is calculated from the corrected longitudinal track pitch and the theoretical track angle. The track location error is calculated as the difference between the theoretical track position and the actual track position (see Table C.1 and Figure C.2).

Track location error, which shall be expressed by the error for the centre of the tracks, includes track angle errors, track straightness errors, and track pitch errors. The starting point for calculations and measurements is, for example, the cross point of the centre of the track containing the programme reference point and the line along the measurement path in Figure C.4. The values for each eighth track are the errors for tolerance zone one. Shifting one track, the second tolerance zone can be measured. It is not necessary to measure all tracks; a suitable number can be 35 samples per zone. A plot of the track location error against the track number must be computed (see Figures C.2 and C.3). The peak-to-peak value shall lie within the tolerance zones specified in 5.4.

Table C.1 – Nomenclature and calculation of track location error

Y_0	Programme area reference (basic)	0,615
θ	Track angle (basic)	9,1784 °
T	Tension	0,09 N
E	Young's modulus	8 000 N/mm ² for 8,8 µm tape
A	Cross-sectional area	Thickness × width
CTM	Distance of n control track pitches without tape tension	
CTM'	Distance of n control track pitches with tape tension	$CTM' = CTM(1 + T / (A \times E))$
λ	Longitudinal track pitch	$\lambda = CTM'/n$
i	Track number, $i = 0$ for track containing reference point	
Y_i	Measured position of track i at the recorded pattern	
ΔY	Cross-section track pitch	$\Delta Y = l \times \tan \theta$
Y_{it}	Theoretical position of track i at the recorded pattern	$Y_{it} = Y_0 + i \times \Delta Y$
I	Track pitch	$I = \lambda \times \sin \theta$
TLE	Track location error	$TLE = Y_i - Y_{it}$
Z	Tolerance zone for 25 Mb/s format Tolerance zone for 50 Mb/s format	$Z1 = 0,003 \text{ mm}$ $Z2 = 0,005 \text{ mm}$ $Z1 = 0,005 \text{ mm}$ $Z2 = 0,003 \text{ mm}$ $Z3 = 0,005 \text{ mm}$ $Z4 = 0,005 \text{ mm}$
<p>NOTE For the tolerance zone of 25 Mb/s format, $Z1: i = \dots -2, 0, +2, +4, \dots$ $Z2: i = \dots -1, +1, +3, +5, \dots$ For the tolerance zone of 50 Mb/s format, $Z1: i = \dots -4, 0, +4, +8, \dots$ $Z2: i = \dots -3, 1, +5, +9, \dots$ $Z3: i = \dots -2, 2, +6, +10, \dots$ $Z4: i = \dots -1, 3, +7, +11, \dots$</p>

IEC 1901/05

IEC 1902/05

NOTE The same head must be used for y_i measurement (i.e. every 8th track).

CTM is the distance of n control track pitches ($n = 300$ minimum).

Figure C.4 – Cross-tape measurement technique

Annex D (normative)

Frequency characteristics of F_0 track

The recommended frequency characteristics of the F_0 track shall be defined as follows:

$$[(N1+N2)/2] - [(NL+NH)/2] > 5 \text{ [dB]}$$

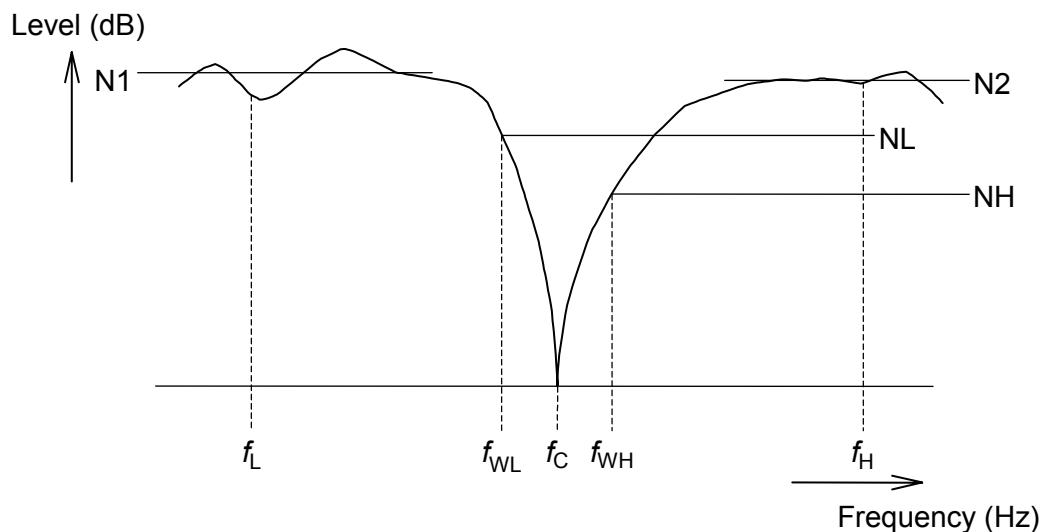

f_{WL} is defined as $f_c - f_b/4000$

f_{WH} is defined as $f_c + f_b/4000$

NL is defined as amplitude at the f_{WL}

NH is defined as amplitude at the f_{WH}

f_c means a notch frequency f_1 or f_2

IEC 1903/05

Figure D.1 – Frequency characteristics of F_0 track

Annex E
(informative)

Relationship between tape length and recording time

Table F.1 shows the relationship between tape length and recording time for M, L and EL cassette.

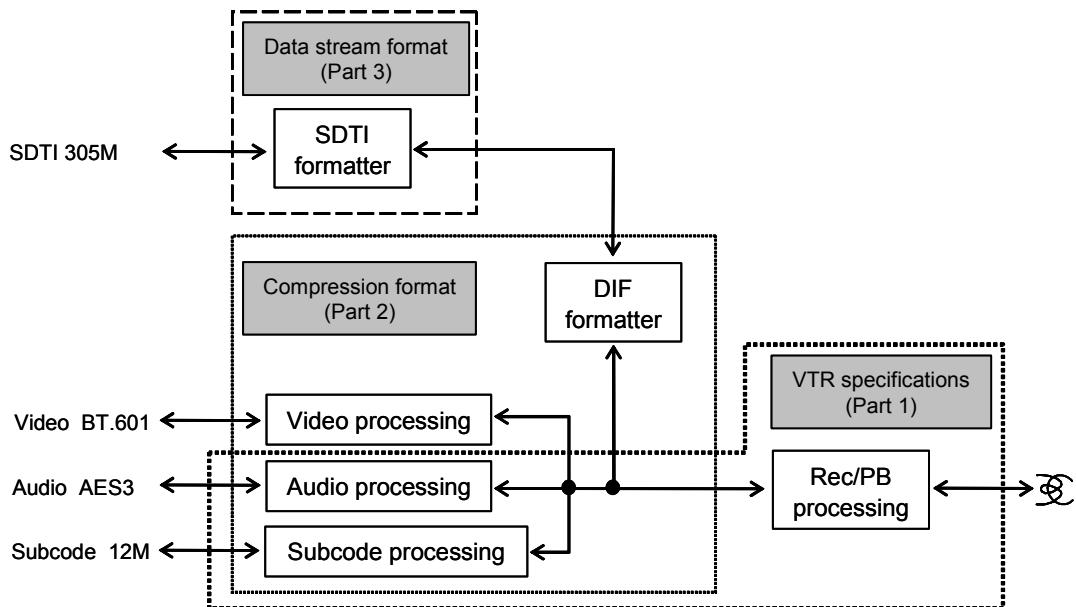

Table E.1 – Tape length and recording time

Cassette size	Tape thickness (μm)	Tape length (m)	Recording time (min.)	
			25 Mb/s	50 Mb/s
M	8,8	27	12	6
		51	24	12
		70	33	16
		96	46	23
		137	66	33
L	8,8	72	34	17
		137	66	33
		194	94	47
		259	126	63
EL	6,7	377	184	92
