## **Summary of average stress rupture properties of wrought steels for boilers and pressure vessels**

*Résumé des caractéristiques moyennes de contrainte de rupture pour les aciers corroyés pour chaudières et appareils à pression*

The information given in this document was obtained by co-operative testing amongst a number of the ISO member bodies represented in ISO Technical Committee 17, Steel. It was used as a basis for establishing International Standards ISO 2604/I to 2604/IV, which specify quality requirements for the various forms of the steels concerned. Because of the potential usefulness of the experimental data themselves, the ISO Council decided to publish them in a reference document.

This first edition of ISO/TR 7468 contains new and revised data, as described in the Introduction. It cancels and replaces the first and the second edition of ISO/DATA 1 which were published in 1975 and 1978.

# Summary of average stress rupture properties of wrought steels for boilers and pressure vessels

## INTRODUCTION

ISO DATA No. 1 published in 1975 contained average stress rupture values for 19 grades of steel. Since that time, additional data have been analysed or assessed for several of these grades, and for 3 further grades. The new and revised stress rupture values and updated asterisks, as indicated in the following table, agreed by ISO/TC 17/SC 10 in May 1975, are included in this document, which therefore contains the stress rupture values for all boiler and pressure vessel steels at present in ISO 2604/I to ISO 2604/IV (1975). The master curves used for the derivation of the values, for times of 10 000 to 250 000 h, are also shown. The values contained in this document will be subject to review as more data become available.

## Notes on tables

### 1 Chemical composition

The limits of chemical composition for which the properties apply are the ranges of chemical composition of the test material used in the assessment, except where these fall within the relevant range specified in ISO 2604/I to ISO 2604/IV (1975). In such cases the specified limit is listed.

### 2 Quantity and duration of data

The quantity and duration of data in these tables are the data used to derive the values in the average rupture stress tables. The asterisks in the average rupture stress tables are based on the total data available, which are given in the appropriate ISO/TC 17/SC 10/ETP documents, reference to which is made at the top of each set of tables.

### 3 Extrapolation

The values given in the tables are average stress rupture values derived in accordance with ISO/TC 17/SC 10/ETP – SG/N 58, and the data show a  $\pm 20\%$  scatter about this average value.

The extent to which test data can be reliably extrapolated depends on the number and duration of the tests. Three basic factors are involved : temperature, time and stress. Experience suggests that reliable extrapolations may be made, covering a range of  $\pm 25^{\circ}\text{C}$  about each test temperature, on the basis of a series of tests from at least five casts of steel, the longest test of each series exceeding a certain minimum duration.

#### a) EXTENDED TIME EXTRAPOLATION

The confidence which can be placed upon such properties will be related to the extent of extrapolation, and extrapolations exceeding approximately three times the above minimum duration are described as "extended time extrapolations". Stress rupture properties are normally listed at the time intervals shown in the table below, which defines where "extended time extrapolation" is applied.

| Test duration (in hours) exceeded by data points from 5* casts at temperatures within $25^{\circ}\text{C}$ of that specified | 80 000  | 70 000  | 50 000  | 30 000  | 20 000 | 10 000 |
|--|---------|---------|---------|---------|--------|--------|
| Durations (in hours) beyond which the term "extended time extrapolation" is applied  | 250 000 | 200 000 | 150 000 | 100 000 | 50 000 | 30 000 |

\* Results from tests in progress may be included if above the lower 20 % scatter band limit at the appropriate duration. Values which have involved "extended time extrapolation" are marked with an asterisk in the table of estimated average rupture stresses contained in this report. When such values are used, account should be taken of the quantity and duration of the test data on which they are based.

#### b) EXTENDED STRESS EXTRAPOLATION

This applies where values have been obtained by extending the parametric master curves to stresses beyond the range for which tests were carried out. Such values, which are subject to greater uncertainty compared with other values, are shown in parentheses. The numbers of test points shown in the tables of quantity and duration of data include results from tests still in progress where these lie above the lower 20 % scatter band limit.

#### Abbreviations used in the tables

|     |                          |
|-----|--------------------------|
| AC  | air cooled               |
| FC  | furnace cooled           |
| Q   | quenched                 |
| OQ  | oil quenched             |
| WQ  | water quenched           |
| T   | tempered                 |
| iso | isothermally transformed |
| thk | thickness                |
| dia | diameter                 |
| sq  | square                   |

**Symbols used in the equation of the parametric master curve**

$P(\sigma)$  creep rupture parameter

$T$  temperature, K

$\log t$   $\log_{10}$  of time to rupture, h

$\sigma$  stress, N/mm<sup>2</sup>

**NOTES**

1 Values read off the graphs presented in this report may be subject to discrepancies introduced by the method of reproduction. In all cases the values presented in tabular form should be taken as being correct.

2 Throughout this document, a point is used as the decimal sign.

Note: \* Values which have involved extended time extrapolation ) See notes on page 2  
 () Values which have involved extended stress extrapolation )

$$P(\sigma) = \frac{\log t - 10.656877}{T - 500} = a + b (\log \sigma) + c (\log \sigma)^2 + d (\log \sigma)^3 + e (\log \sigma)^4$$

ALL C-Mn STEELS - TEMPERATURE RANGE 380-520°C

(R/2166)

CARBON STEEL

Semi killed, Si killed and Si + Al killed.  
 Tempered stress relieved, or post weld heat treated  
 for times in excess of 3 hours at 620°C.

Properties agreed: May 1975

In the case of carbon steels which have been tempered,  
 stress relieved or post weld heat treated for times in  
 excess of 3 hours at 620°C or equivalent times at other  
 temperatures, the average rupture stresses should be  
 taken as 10% lower than the values given for Si + Al  
 killed carbon steels as indicated below.

| Temperature<br>°C | Estimated Average Stress (N/mm <sup>2</sup> ) to Produce Rupture in: |          |          |           |           |           |           |

In analysing the data on austenitic steels, the Secretariat made no differentiation between boron-containing and boron-free casts. However, attention is drawn to the fact that boron-containing steels normally exhibit higher properties than boron-free steels.

\* Values which have involved extended time extrapolation ) see notes on page 2

( ) Values which have involved extended stress extrapolation )

18% Cr 8% Ni STEEL  
Temperature Range 550-700°C

(7918)

18% Cr, 12% NiMo STEEL

Properties agreed May 1975

(Based on ISO document ISO/TC17/SC10/ETP-SG(Secretariat 27) 32)

Updated as ISO document ISO/TC17/SC10/ETP-SG(Secretariat 104) 138

In analysing the data, the Secretariat made no differentiation between boron-containing and boron-free steels. However, attention is drawn to the fact that boron-containing steels normally exhibit higher properties compared with boron-free steels.

Note: \* Values which have involved extended time extrapolation ) See notes on page 2  
 ( ) Values which have involved extended stress extrapolation )

18% Cr, 12% NiMo STEEL - TEMPERATURE RANGE 550-750°C

(R/7919)

18Cr 10NiTi STEEL (Solution treated 950/1070°C)

Properties agreed May 1969

(Based on ISO document ISO/TC17/SC10/ETP-SG (Secretariat 18) 23)

In analysing the data on austenitic steels, the Secretariat made no differentiation between boron-containing and boron-free casts. However attention is drawn to the fact that boron-containing steels normally exhibit higher properties than boron-free steels.

- \* Values which have involved extended time extrapolation      ) See notes on page 2
- ( ) Values which have involved extended stress extrapolation      )

18% Cr 10% Ni-Ti STEEL (SOLUTION TREATED 1070/1140°C)  
Temperature Range 570-700°C

(7920)

18Cr 12NiNb STEEL

Properties agreed May 1969  
 (Based on ISO document ISO/TC17/SC10/ETP-SG (Secretariat 19)24)

In analysing the data on austenitic steels, the Secretariat made no differentiation between boron-containing and boron-free steels. However, attention is drawn to the fact that boron-containing steels normally exhibit higher properties than boron-free steels.
