Subject: 11 AM UPDATE--TROPICAL STORM MARIA -- THU SEPT 8

At 11 am today, the center of Tropical Storm Maria was located near 13 degrees North, 51.2 degrees West or about 971 miles east-southeast of St. Croix. Tropical Storm Maria is moving to the west at 22 miles per hour. This general motion should continue today followed by a turn to the west-northwest with a decrease in forward speed on Friday.

Maximum sustained winds are near 45 miles per hour with higher gusts and Maria could be de-generating into a tropical wave later today. However, there is the strong likelihood of regeneration during the next day or two. No matter the status of the storm system, tropical storm force winds extend outward up to 115 miles to the north and east of the center.

It is important to note that the forecast track has been adjusted by the National Hurricane Center more to the south--- now putting the entire territory in the path of tropical storm force winds.

On the forecast track, the center of Maria is now projected to pass within 10 miles of St. Croix at 7 pm Saturday; 39 miles southwest of St. John at 9 pm Saturday and 30 miles southwest of St. Thomas at 10 pm Saturday.

Tropical storm force winds, winds in excess of 39 miles per hour are now expected to affect St. Croix for ten hours beginning at 11 am Saturday; for ten hours across St. John beginning at 2 pm Saturday and for 11 hours across St. Thomas beginning at 2 pm Saturday.
