Jeffrey

I met several times with Zed and Ed with Boat.

The concept is to build a rear seat deck that houses 3 Batteries, 3 oil filters and 15 gallon fresh water wash tank. This will be located under the permanent rear seat deck, along with ManHole access points for maintenance excess. Strong consideration will be taken so these access points do not rattle in heavy seas.

Forward of the rear deck, Zed will fabricate four removable fiberglass seat bases, 2 on each side to make the "U" shape seating area,.

The idea will be to have the option of removing these seat bases if you require large luggage loads

Is this correct approach?
