its a great wiring diagram,, doesn't seem like only a two way two lane highway, , no matter how many makes and models traverse, it . what do we know about lesions in the area.. , why do they connect the vns so high , close to the brain, , why does it only inhibit heart rate.

the issue with coma is that there are structural, metabolic, vascular and other reasons for coma that all act different.
people have tried to argue a "final common pathway" idea when they study consciousness but not sure that holds water.
maybe

human studies of coma patients with VNS would be super cool but would never pass IRB (human subjects). I would do it in a second.
For four years I tried to convince the IRB to let me put a coma patient's hand in ice water while doing a SPECT scan (that we were already doing for diagnostic reasons) and it never got approved
Coma patients are super hard

BTW I have the largest data base of coma patients since I have kept every image and record of all patients i've seen. Two years ago I saw my 1,000th coma patient.
Give lots of lectures on coma.

i don't think so. , i would like to know how it behaves when disconnected.. if it is only telemetry , all things should go dead,. if it is fact calculating and inhibitoing locally,, no need for telemetry alone. I think it is brain ,
I am surprised that we only have one brain,, it makes little sense where everything should be redunadant , degenerative. it would explain coma behavior. . main brain down, etc. i would like to see vns aplied to coma patients.
