Given positional nature and leakage it sounds like low pressure csf headache. And she may have a small subdural or hygroma. Could be some other things and it might make sense to get another neuroradiologist to read films.

She also needs a spinal tap.

Has anyone tested the fluid from her nose? Is it blood or csf or both? Ask her to drip the leakage onto a brown paper napkin. And see if it looks like a drop or a target (with concentric rings). Sort of like a poor mans HPLC. If she has csf leakage from orbitofrontal olfactory turbinates ENT best.
