

Master Tung's Acupuncture for

Difficult Cases

A quick clinical reference for Acupuncturists Lecture Notes

by Robert Chu, PhD, L.Ac., QME

Revision 3.3

[©] Copyright Robert Chu, PhD, L.Ac., QME March 2011 – No photocopying or duplication without prior consent of the author in writing. All proceeds of these lecture notes go to the Medicine Dharma Wholistic Ministry, a 501 c 3, non-profit organization devoted to treating the needy with acupuncture, herbs and counseling.

Disclaimer

Please note that the author and publisher of these lecture notes are NOT RESPONSIBLE in any manner whatsoever for any injury that may result from practicing the techniques and/or following the instructions given within. Since the material deals with prior knowledge of acupuncture described herein, it will be too complex in nature for some readers to engage in safely, and it is essential that a licensed acupuncturist be consulted prior to application.

These lecture notes are to be used as a supplement when taking a course with Robert Chu and are not to be distributed to others who have not taken the course on **Master Tung's Acupuncture for Difficult Cases** with Robert Chu.

Note of Abbreviations used in this text

In this text we use the following abbreviations for the various channels:

Lu = Lung Channel

LI = Large Intestine Channel

St = Stomach Channel

Sp = Spleen Channel

H = Heart Channel

SI = Small Intestine Channel

UB = Urinary Bladder Channel

K = Kidney Channel

Pc = Pericardium Channel

SJ = Sanjiao Channel

GB = Gallbladder Channel

Liv = Liver Channel

Ren = Ren Channel

Du = Du Channel

[©] Copyright Robert Chu, PhD, L.Ac., QME March 2011 – No photocopying or duplication without prior consent of the author in writing. All proceeds of these lecture notes go to the Medicine Dharma Wholistic Ministry, a 501 c 3, non-profit organization devoted to treating the needy with acupuncture, herbs and counseling.

Author's Preface:

Although Master Tung's Acupuncture has been in the public domain since his untimely passing in 1975, very little information is available publicly on how to use the system in a practical and systematic way in English. In these lecture notes, I hope to guide my fellow colleagues into the intricacies of applying Master Tung Acupuncture in the clinic. Since I am also a practicing martial artist and deal with internal medicine problems, sports injuries, pain management, and worker's comp injuries quite frequently, I wrote these lecture notes based on my clinical experience based on the protocols that I use daily. Each of these protocols has been personally used by me one time or another in the clinic.

Since I am a visual person, and I like things in a simple manner, I have placed the pictures of the points indicated for the various ailments together, to make it as simple as possible for the practicing acupuncturist to use in his or her clinic. I dislike overly drawn out discussions on theory, but prefer that application be one's guide. I also dislike secrecy, so I hold back no "alleged" secrets from anyone who wants to learn the real art. My goal is to help end suffering in the world and help English speaking acupuncturists improve their proficiency through the vehicle of Master Tung's Acupuncture.

Many get overwhelmed when they refer to other media on Master Tung's Acupuncture. The existing numbering system is poor and nonsensical, the names of the points are all in Chinese, and the English translations of the names are poorly selected, and even worse, point locations are off. Some have deliberately tried to differentiate Master Tung's Acupuncture and regular acupuncture by stating that it is "non-channel acupuncture" - nothing could be further from the truth!

[©] Copyright Robert Chu, PhD, L.Ac., QME March 2011 – No photocopying or duplication without prior consent of the author in writing. All proceeds of these lecture notes go to the Medicine Dharma Wholistic Ministry, a 501 c 3, non-profit organization devoted to treating the needy with acupuncture, herbs and counseling.

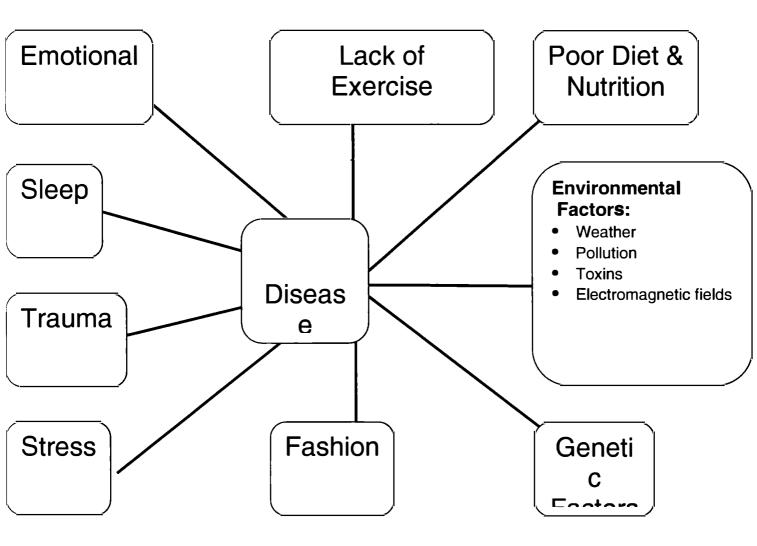

Also, little is done to approach the body of work on Master Tung's Acupuncture in a practical manner, and for one to use clinically on a daily basis. It is hoped that the reader can use these few points here and achieve amazing results in his or her practice, as these are the same points I use in my own practice daily with amazing results! In this book, I use a lot of standard acupuncture points along with Master Tung's acupuncture and emphasize the use of channels and imaging for optimal clinical use. If a practitioner can use this work, they can have a turnkey approach in the clinic, simply by implementing these acupuncture and herbal protocols.

In future revisions of this work, I will further explain the use of the points and their application in more difficult diseases. It is hoped that reader's questions and interest will lead to new revisions of these lecture notes.

I would like to thank my teacher, Dr. Young Wei-chieh, for instructing me in this method that he learned from Master Tung Ching-chang, and I would like to acknowledge Esther Su, a renowned master of Tung's Acupuncture, for her generous help. I would also like to thank my students Jack Chang, Kari Purhonen, Robert Ting, Dave McKinnon and Theodore Zombolas for their wonderful photography and artwork!

Putting it all together

In the practice of Acupuncture, clinical efficacy is the real goal.

Application is the guide, and function rules over form. We do not rely on empirical knowledge exclusively. We are a flexible, dynamic system that unites the best of all acupuncture systems and are not bound by any particular method. We also do not have a specific preference of a particular method of acupuncture, as there will be many teachers who can explain their method and it can fit into at least one of the pillars that we teach.

The following lists the methods of applying the Master Tung
Acupuncture system in clinical practice.

- 1. Select the channel(s) that is/are affected.
- Select any acupoints on that/those channel(s) that pertain to the disease. We apply the most appropriate Acupuncture point selection strategies according to skill in means.

[©] Copyright Robert Chu, PhD, L.Ac., QME March 2011 – No photocopying or duplication without prior consent of the author in writing. All proceeds of these lecture notes go to the Medicine Dharma Wholistic Ministry, a 501 c 3, non-profit organization devoted to treating the needy with acupuncture, herbs and counseling.

For example, if the patient was diagnosed with a Lung Excess condition, select the Lung (or related Channel), and sedate it. We can also choose the Acupoints that may sedate Metal.

- Select any secondary channels and treat the channels accordingly to the secondary disease.
- 4. Retain the needles for 28.8 minutes.
- 5. Remove the needles, and check with the patient regarding their signs and symptoms.

In general, an acute condition may take only a few visits to resolve completely. A chronic disease will certainly take longer. In general, painful conditions should be seen at least 3 times a week, sometimes everyday, if indicated. A chronic disease should be seen at least twice a week for a treatment course of 10 –12 sessions, then tapered down to once a week, then once every 2 weeks, finally ending with a follow up visit once a month until completely resolved. I believe it every medicine has it's proper dosage and that in general,

[©] Copyright Robert Chu, PhD. L.Ac., QME March 2011 – No photocopying or duplication without prior consent of the author in writing. All proceeds of these lecture notes go to the Medicine Dharma Wholistic Ministry, a 501 c 3, non-profit organization devoted to treating the needy with acupuncture, herbs and counseling.

Acupuncturists do not see their patients often enough. The proper dosage of acupuncture is at least 1 treatment every 72 hours.

Difficult Cases

1. Bronchitis

S/S: Acute bronchitis:

- Hacking cough.
- Yellow, white, or green phlegm, usually appearing 24 to 48 hours after a cough.
- · Fever, chills.
- Soreness and tightness in chest.
- Some pain below breastbone during deep breathing.
- Some shortness of breath.

Chronic bronchitis:

- Persistent cough producing yellow, white, or green phlegm (for at least three months of the year, and for more than two consecutive years).
- Wheezing, some breathlessness.

2. Edema of Lower Limbs

S/S: Lymphedema is a collection of fluid that causes swelling (edema) in the arms and legs. Normally, lymph nodes filter fluid as it flows through them, trapping bacteria, viruses, and other foreign substances, which are then destroyed by special white blood cells called lymphocytes. Without normal lymph drainage, fluid can build up in the affected arm or leg, and lymphedema can develop. Medications such as tamoxifen (Nolvadex), radiation therapy, and injury to the lymph nodes can also cause lymphedema. This type is called secondary lymphedema. (From WebMD)

7. **Diabetes mellitus**

S/S: Common symptoms of diabetes are increased thirst, frequent urination, increased hunger, unusual weight loss, extreme fatigue, and irritability. However, in type 2 diabetes, blood sugar levels rise so slowly that a person usually does not have symptoms and may have had the disease for many years before diagnosis.

Type 2 diabetes is the most common type of diabetes. People who develop type 2 diabetes are often overweight and not physically active. It is most common in people over the age of 40 but is becoming more common in children. (From Web MD)

Complications include:

Diabetic retinopathy which can lead to vision loss, blindness, cataracts or glaucoma, Diabetic nephropathy which can lead to kidney failure, blood vessel damage (macrovascular disease) which can lead to heart attack, stroke, or circulation problems in the legs, further leading to amputation. Diabetic neuropathy which can lead to a variety of problems, including: Peripheral neuropathy (affecting sensations and touch) along with blood vessel disease in the legs can lead to foot problems, including a deformity called, or osteomyelitis (Charcot foot), a severe bone infection that may require amputation. Autonomic neuropathy (affecting internal functioning) which can lead to gastroparesis, hypoglycemia unawareness, and erection problems.

9. Herpes zoster

S/S: Shingles (herpes zoster) is a viral infection of the nerve roots. It causes pain and a band of rash that spreads on one side of your body. It is caused by the same virus that causes chickenpox, as the virus lies dormant (inactive) in your nerve roots. Shingles is caused by the reactivation of the virus. In some people, it stays dormant for the rest of their lives. In others, the virus can be reactivated when the immune system is weakened, possibly by disease, aging, or stress. (From WebMD)

10. Hyperlipidemia (High Cholesterol)

S/S: Cholesterol is a lipid that your body needs for many important functions, such as producing new cells. If you eat too many high-cholesterol foods and/or too much saturated fat or you have an inherited tendency to make too much cholesterol, your cholesterol levels may be too high. This increases your risk for hardening of the arteries, or atherosclerosis, and can lead to life-threatening illnesses, such as coronary artery disease, heart attack, or stroke.

Total cholesterol (mg/dL)	Classification	Total cholesterol (mmol/L)
less than 200 mg/dL	desirable	5.17
200 to 239	borderline- high	5.17 - 6.18
240 or higher	high	6.21 or higher

11. Benign prostatic hypertrophy/Prostatitis

Prostatitis S/S:

- A frequent urge to urinate, although you may only pass small amounts of urine.
- A burning sensation when urinating (dysuria).
- Difficulty starting urination, interrupted flow (urinating in waves rather than a steady stream), weaker-than-normal urine flow, and dribbling after urinating.
- Excessive urinating at night (nocturia).
- A sensation of not completely emptying your bladder.
- Pain or discomfort in your lower back, in the area between the testicles and anus, in the lower abdomen or upper thighs, or above the pubic area. Pain may become worse during a bowel movement.
- Pain or vague discomfort during or after ejaculation.
- Pain in the tip of your penis.

(From WebMD)

Benign Protatic Hypertropy/Hyperplasia S/S -

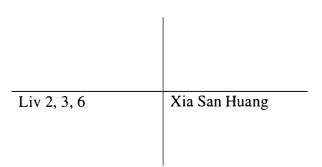

Symptoms related to bladder emptying include:

- Difficulty starting a urine stream (hesitancy and straining).
- Decreased strength of the urine stream (weak flow).
- Dribbling after urination.
- · Feeling the bladder is not completely empty.
- The urge to urinate again soon after urinating.
- · Pain during urination (dysuria).

12. Prostate Cancer

S/S: Prostate cancer often does not cause symptoms for many years. By the time symptoms occur, the disease may have spread beyond the prostate. When symptoms do occur, they may include:

- Frequent urination, especially at night
- Inability to urinate
- Trouble starting or holding back urination
- A weak or interrupted urine flow
- Frequent pain or stiffness in the lower back, hips, or upper thighs

Two tests are commonly used to detect prostate cancer in the absence of any symptoms. One is the digital rectal exam, in which a doctor feels the prostate through the rectum to find hard or lumpy areas. The other is a blood test used to detect a substance made by the prostate called prostate specific antigen (PSA).

13. Hepatitis B

S/S: Hepatitis B is a liver disease caused by infection with the hepatitis B virus (HBV). Hepatitis B is one of the most easily spread (contagious) forms of viral hepatitis. However, hepatitis has many other causes, including some medications, long-term alcohol use, and exposure to certain industrial chemicals.

All types of hepatitis damage liver cells and can cause the liver to become swollen and tender. Some types can cause permanent liver damage.

Hepatitis B can be a short-term (acute) or long-term (chronic) infection.

- An acute infection usually goes away on its own without treatment. Some people have no symptoms. Most people who develop symptoms feel better in 2 to 3 weeks and recover completely after 4 to 8 weeks. Other people may take longer to recover. Once an acute infection is over, you are no longer contagious. You also develop antibodies against HBV that provide lifelong protection against future infection. Most people who have hepatitis B have acute hepatitis B and do not develop chronic hepatitis B.
- Chronic infection occurs when the hepatitis B virus continues to be present in your liver and blood for 6 months or more.
 Chronic hepatitis B puts you at increased risk for developing serious liver diseases such as cirrhosis and liver cancer (hepatocellular carcinoma).

14. **Gout**

S/S: Gout is a form of arthritis that causes sudden, severe attacks of pain, tenderness, redness, warmth and swelling (inflammation) in some joints. It usually affects one joint at a time. The large toe is most often affected, but gout also can affect other joints in the leg (knee, ankle, and foot) and, less often, joints in the arm (hand, wrist, and elbow). The fingers are rarely involved and the spine is almost never affected. One may find:

- Sudden, intense joint pain, which often first occurs in the early morning hours
- Swollen joint that is warm to touch
- · Red or purple skin around the joint

15. Obesity

S/S: Obesity means having too much body fat (adipose tissue). Obesity generally is determined by calculating your body mass index (BMI), which measures weight for height and is stated in numbers. A BMI of 30 or higher is considered obese in adults—you are at a higher risk for certain health problems than those with a lower BMI. As BMI increases, your risk of health problems increases.

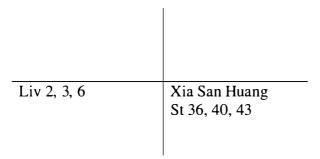

Obesity is considered a long-term, complex disease. Many factors are involved in determining why some people are heavier than others and how much risk they have for developing other health conditions. Some of these factors are genetic (you have inherited them) and others have to do with your culture, environment, and behavior.

If your BMI is between 25 and 30, you are considered overweight (and also at increased risk for certain diseases).

Obesity can lead to type 2 diabetes, high blood pressure, coronary artery disease (CAD), stroke, and sleep apnea.

16. Renal Calculi

S/S: Kidney stones (renal calculi or nephrolithiasis) are made of salts, minerals, and other substances normally found in the urine that stick together and build up on the inner surfaces of the urinary system. Stones can develop in the kidney, the ureter, or the bladder. About 80% of kidney stones contain calcium compounds, mostly calcium oxalate, and are called calcium stones. Factors that affect the normal balance of the urine can lead to kidney stone formation. The most common cause of kidney stones is decreased fluid intake (dehydration). When you become dehydrated, the salts, minerals, and other substances in the urine are more likely to stick together and form a stone.

18. **Psoriasis**

S/S:

- Bright red areas of raised patches (plaques) on the skin, often covered with loose, silvery scales. Plaques can occur anywhere, but commonly they occur on the knees, elbows, scalp, hands, feet, or lower back. Nearly 90% of people with psoriasis have plaque-type psoriasis.
- Tiny areas of bleeding when skin scales are picked or scraped off (Auspitz's sign).
- Mild scaling to thick, crusted plaques on the scalp.
- Itching, especially during sudden flare-ups or when the psoriasis patches are in body folds, such as under the breasts or buttocks.
- Nail disorders. Nail disorders are common, especially in severe psoriasis. Nail symptoms include:
- Tiny pits in the nails (not found with fungal nail infections).
- Yellowish discoloration of the toenails and sometimes the fingernails.
- Separation of the end of the nail from the nail bed.
- Less often, a buildup of skin debris under the nails.
- Other symptoms of psoriasis may include:
- Similar plaques in the same area on both sides of the body (for example, both knees or both elbows).
- Flare-ups of many raindrop-shaped patches. Called guttate psoriasis, this condition often follows a strep infection and is the second most common type of psoriasis. It affects less than 10% of those with psoriasis.
- Joint swelling, tenderness, and pain (psoriatic arthritis).

19. **Acne**

S/S:

Acne develops most often on the face, neck, chest, shoulders, or back and can range from mild to severe. It can last for a few months, many years, or come and go your entire life.

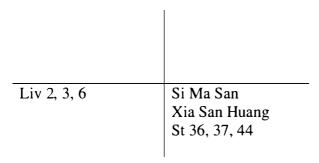

Mild acne usually causes only whiteheads and blackheads. At times, these may develop into an infection in the skin pore (pimple).

Severe acne can produce hundreds of pimples that cover large areas of skin. Cystic lesions are pimples that are large and deep. These lesions are often painful and can leave scars on your skin.

Acne can lead to low self-esteem and sometimes depression. These conditions need treatment along with the acne.

20. Epilepsy

S/S:

- Generalized seizures: All areas of the brain (the cortex) are involved in a generalized seizure. Sometimes these are referred to as grand mal seizures.
- To the observer, the person experiencing such a seizure may cry out or make some sound, stiffen for some seconds, then have rhythmic movements of the arms and legs. Often the rhythmic movements slow before stopping.
- Eyes are generally open.
- The person may not appear to be breathing. The person is often breathing deeply after an episode.
- The return to consciousness is gradual and should occur within a few moments.
- Loss of urine is common.
- Often people will be confused briefly after a generalized seizure.
- Partial or focal seizures: Only part of the brain is involved, so only part of the body is affected. Depending on the part of the brain having abnormal electrical activity, symptoms may vary.
- If the part of the brain controlling movement of the hand is involved, for example, then perhaps only the hand may show rhythmic movements or jerking.
- If other areas of the brain are involved, symptoms might include strange sensations or small repetitive movements such as picking at clothes or lip smacking.
- Sometimes the person with a partial seizure appears dazed or confused. This may represent a partial complex seizure. The term complex is used by doctors to describe a person who is between being fully alert and unconscious.
- Absence or petit mal seizures: These are most common in childhood.

[©] Copyright Robert Chu, PhD, L.Ac., QME March 2011 – No photocopying or duplication without prior consent of the author in writing. - Impairment of consciousness is present with the person often staring blankly.
- Repetitive blinking or other small movements may be present.
- Typically, these seizures are brief, lasting only seconds. Some people may have many of these in a day.
- Other seizure types exist particularly in very small children.

Neuromusculoskeletal problems:

1. Bell's Palsy

S/S: Bell's palsy is a paralysis or weakness of the muscles on one side of your face. It results from damage to the facial nerve that controls muscles on one side of the face, causing that side of your face to droop. The nerve damage also affects taste sensation and tear and saliva production. This condition comes on suddenly, often overnight, and usually resolves on its own within a few weeks.

4. Migraine Headaches

S/S: Migraines are painful, sometimes debilitating headaches often accompanied by nausea, vomiting, and sensitivity to light, noise, and smell. These throbbing headaches usually occur on only one side of the head, although the pain can shift from one side of the head to the other, or can occur on both sides simultaneously. Migraines involve changes in chemicals and blood vessels in the brain, which trigger pain signals leading to headache and other symptoms.

Migraines run in families, and a genetic link has been identified. However, it is not entirely clear why some people get migraines and others do not.

Migraines seem to develop from overactive electrical impulses in the brain that increase blood flow and cause widening (dilation) of blood vessels and inflammation. This activates pain signals and other symptoms, such as nausea. The more inflammation there is, the more intense the migraine.

7. Lumbago/Low Back Pain

S/S: The lower back is an elegant construction of bone, muscle, and ligament. Because the lower back is the hinge between the upper and lower body, it is especially vulnerable to injury when you are lifting, reaching, or twisting.

Up to 85% of all people have low back pain at one time or another. Each year, about 2% of American workers are compensated for disability caused by back pain. Low back pain is often triggered by some combination of overuse, muscle strain, or injury to the muscles and ligaments that support the spine. Less commonly, low back pain is caused by illness or spinal deformity.

Back pain can be: **Acute**, lasting less than 3 months. Most people gain relief after 4 to 6 weeks of home treatment. **Recurrent**, a repeat episode of acute symptoms. Most people have at least one episode of recurrent low back pain. **Chronic**, lasting longer than 3 months.

8. Sciatica

S/S: Sciatica is pain, tingling, or numbness produced by an irritation of the sciatic nerve. The sciatic nerve is formed by the nerve roots coming out of the spinal cord into the lower back. Branches of the sciatic nerve extend through the buttocks and down the back of each leg to the ankle and foot. The most common cause of sciatica is a bulging or ruptured disc (herniated disc) in the spine pressing against the sciatic nerve. However, sciatica also can be a symptom of other conditions that affect the spine, such as narrowing of the spinal canal (spinal stenosis), bone spurs (small, bony growths that form along joints) caused by arthritis, or nerve root compression (pinched nerve) caused by injury. In rare cases, sciatica can also be caused by conditions that do not involve the spine, such as tumors or pregnancy. (From WebMD)

9. Restless Leg syndrome

S/S: Restless legs syndrome (RLS) is a sleep disorder in which a person experiences unpleasant sensations in the legs described as creeping, crawling, tingling, pulling, or painful. These sensations usually occur in the calf area but may be felt anywhere from the thigh to the ankle. One or both legs may be affected; for some people, the sensations are also felt in the arms. These sensations occur when the person with RLS lies down or sits for prolonged periods of time, such as at a desk, riding in a car, or watching a movie. People with RLS describe an irresistible urge to move the legs when the sensations occur. Usually, moving the legs, walking, rubbing or massaging the legs, or doing knee bends can bring relief, at least briefly. RLS symptoms worsen during periods of relaxation and decreased activity. (From WebMD)

Some Common Symptoms of RLS Include:

- Unpleasant sensations in the legs (sometimes the arms as well), often described as creeping, crawling, tingling, pulling, or painful;
- Leg sensations are relieved by walking, stretching, knee bends, massage, or hot or cold baths;
- Leg discomfort occurs when lying down or sitting for prolonged periods of time;
- The symptoms are worse in the evening and during the night.

Other Possible Characteristics Include:

- Involuntary leg (and occasionally arm) movements while asleep;
- Difficulty falling asleep or staying asleep;
- · Sleepiness or fatigue during the daytime;
- Cause of the leg discomfort not detected by medical tests;
- Family members with similar symptoms.

[©] Copyright Robert Chu, PhD, L.Ac., QME March 2011 – No photocopying or duplication without prior consent of the author in writing. All proceeds of these lecture notes go to the Medicine Dharma Wholistic Ministry, a 501 c 3, non-profit organization devoted to treating the needy with acupuncture, herbs and counseling.

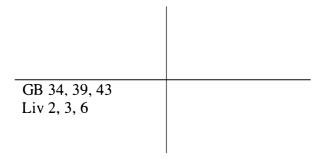

Although the cause is unknown in most cases, certain factors may be associated with RLS:

- Family history. RLS is known to run in some families -- parents may pass the condition on to their children.
- Pregnancy. Some women experience RLS during pregnancy, especially in the last months. The symptoms usually disappear after delivery.
- Low iron levels or anemia. Persons with these conditions may be prone to developing RLS. The symptoms may improve once the iron level or anemia is corrected.
- Chronic diseases. Kidney failure quite often leads to RLS. Other chronic diseases such as diabetes, rheumatoid arthritis, and peripheral neuropathy may also be associated with RLS.
- Caffeine intake. Decreasing caffeine consumption may improve symptoms.

(From WebMD)

Chinese Medicine looks at RLS as Internal Wind, or Qi And Blood Deficiency, or Liver/Kidney Yin Deficiency

10. Peripheral neuropathy

S/S: peripheral neuropathy refers to the variety of conditions that result when the nerves from the rest of the body that connect to the brain and spinal cord are damaged. The most common symptoms of polyneuropathy are tingling, numbness, burning pain and loss of sensation in the arms and legs. Because people with chronic polyneuropathy often lose their ability to sense temperature and pain, they can burn themselves and develop open sores as the result of injury or prolonged pressure. If the nerves serving the organs are involved, diarrhea or constipation may result, as well as loss of bowel or bladder control. Sexual dysfunction and abnormally low blood pressure also can occur.

Neuropathies occur by one of three methods:

Acquired neuropathies, for example, are caused by environmental forces like poisoning, trauma, infection, diabetes, and other illnesses.

Hereditary neuropathy is not as common. It is caused by inherited genetic defects.

Idiopathic neuropathy is from an unknown cause. As many as a third of all neuropathies are classified this way, where the cause can't be explained.

What Causes Peripheral Neuropathy?

Many things can cause peripheral neuropathies. It is often difficult to discern the cause. In fact, in up to one in three cases, the cause cannot be determined. Diabetes is responsible for another third. Other known causes include several rare inherited diseases, alcoholism, toxins and certain environmental agents, poor nutrition or vitamin deficiency, trauma due to compression, herniated discs in the back, certain kinds of cancer, conditions where nerves are mistakenly attacked by the body's own immune system or damaged by an overaggressive response to injury, particular medications, kidney

disease, thyroid disease, and infections such as Lyme disease, shingles, or AIDS.

Symptoms of peripheral neuropathy usually begin gradually and include:

- A tingling sensation in the toes or in the balls of the feet that eventually spreads up the legs toward the trunk. Less commonly, the sensation may begin in the hands and spread up the arms.
- Numbness in the hands and feet that spreads up the arms and legs.
- Weakness or heaviness in muscles throughout the body. This
 may be accompanied by cramping, especially in the feet, legs,
 and hands.
- Sensitive skin that may be painful to the touch. Prickling, burning, tingling, or sharp stabbing sensations may occur spontaneously and usually worsen at night.
- A foot-drop walking gait and/or problems with balance or coordination.

Endocrine issues:

1. Hypothyroidism

S/S: Hypothyroidism is a lack of thyroid hormone. It develops when the thyroid gland does not produce enough of the hormone, which controls the way the body uses energy. A lack of thyroid hormone affects all body systems.

The risk of developing hypothyroidism tends to increase with age; older women have the highest risk. Rarely, hypothyroidism occurs in infants and children. Infants will grow and develop normally if hypothyroidism is treated within the first month of life. Untreated hypothyroidism in infants can cause brain damage, leading to mental retardation and developmental delays. Every state in the United States tests newborns for hypothyroidism.

Teens with hypothyroidism typically look much younger than their age. With proper treatment, a teen will catch up in weight and height to healthy teens of the same age.

In adults, untreated hypothyroidism can cause several complications, including fluid around the heart and an increase in the levels of cholesterol and triglycerides (increasing the risk of coronary artery disease and stroke). Severe hypothyroidism can cause a lifethreatening condition called myxedema coma.

Symptoms in adults may include:

- · Coarse and thinning hair.
- · Brittle nails.
- · Dry skin.
- A yellowish tint to the skin.
- · Slow body movements and speech.
- · Inability to tolerate cold.
- Feeling tired, sluggish, or weak.
- · Memory problems, depression, or difficulty concentrating.

2. Hyperthyroidism

S/S: Hyperthyroidism develops when the thyroid gland produces too much thyroid hormone. Thyroid hormones regulate your metabolism—how your body burns calories to produce energy—and influence all of your body processes, including heart rate, digestion, muscle and bone strength, and cholesterol levels.

Graves' disease, also known in Europe as von Basedow's disease, is the most common cause of hyperthyroidism. Other causes include thyroid nodules—growths in the thyroid gland—and thyroiditis, inflammation of the thyroid gland.

This topic focuses on the diagnosis and treatment of hyperthyroidism caused by Graves' disease.

What are the symptoms of hyperthyroidism?

The most common symptoms of hyperthyroidism include:

- Nervousness, mood changes, weakness, and fatigue.
- Hand tremors; a rapid, pounding, and irregular heartbeat; and shortness of breath, even when resting.
- Excessive sweating, and warm, flushed skin that may be itchy.
- · An increased number of soft stools.
- Fine, soft hair and hair loss.
- Loss of appetite.
- Weight loss.

Allergies/Immune system problems:

1. Eczema

S/S: Eczema is a skin condition caused by inflammation. Atopic dermatitis is the most common of the many types of eczema. While the word "dermatitis" means inflammation of the skin, "atopic" refers to an allergic tendency, which is often inherited. These eczema sufferers have a higher risk of developing other allergic conditions (like asthma or hay fever).

Typically, eczema causes skin to become itchy, red, and dry -- even cracked, blistery, and leathery. Eczema most frequently appears on the face, wrists, elbows, and knees, but it can show up in other areas, too.

Typically, eczema shows itself as:

- Patches of chronically itchy, dry, thickened skin, usually on the hands, neck, face, and legs. In children, the inner creases of the knees and elbows are often involved.
- Skin lesions, patches of redness, scaling, and in dark-skinned people, changes in skin color.

2. Asthma

S/S: People with asthma experience symptoms when their airways tighten, swell up, or fill with mucus. Common symptoms include:

- · Coughing, especially at night
- Wheezing (a high-pitched whistling sound when breathing out)
- Shortness of breath
- Chest tightness, pain, or pressure

Common triggers for asthma:

- Infections (colds, viruses, flu, sinus infection)
- Allergens such as pollens, mold spores, pet dander and dust mites
- Irritants such as strong odors from perfumes or cleaning solutions, air pollution,
- Tobacco smoke
- Exercise or exertion
- Weather -- changes in temperature and/or humidity, cold air
- Strong emotions such as anxiety, laughter or crying, stress

3. Chronic Fatigue Syndrome

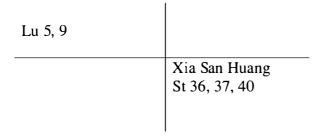

S/S: Chronic fatigue syndrome (CFS) is a condition that causes fatigue severe enough to interfere with your ability to participate in normal work, recreational, or social activities. Fatigue caused by CFS does not improve substantially with rest.

Symptoms may include sleep problems, a decreased ability to think clearly and concentrate, memory problems, fever, headaches, muscle and joint pain, sore throat, and tender glands in the neck or armpits. Symptom flare-ups may follow periods of previously well-tolerated mental or physical activity and can last for several days.

CFS may also have long-term symptoms such as:

- Forgetfulness, memory loss, confusion, or difficulty concentrating.
- Sore throat.
- Tender lymph nodes in the neck or armpits.
- Muscle pain.
- · Joint pain without redness or swelling.
- · New headaches.
- Unrefreshing sleep (waking up feeling tired or unrested).
- Fatigue that lasts more than 24 hours after exercise or exertion at a level that you were able to do in the past without fatigue.

4. Fibromyalgia

S/S: Fibromyalgia is a chronic disorder that causes widespread pain and tenderness in the muscles and soft tissue as well as sleep problems, fatigue, and a variety of other symptoms. These problems can be severe enough to disrupt a person's work and daily activities. Fortunately, the condition does not permanently damage the muscles, joints, or internal organs.

Fibromyalgia is a syndrome of chronic pain, not a disease or a psychological disorder.

Tender points are specific sites on the body that cause pain when pressed. The pain may spread when a tender point is pressed and cause pain in a larger area (for example, down the leg, arm, or back).

There are 9 pairs of tender points. Each pair has one point on each side of the body, for a total of 18 points. These pairs are located:

- 1. Just behind the ear where the neck muscles attach to the base of the skull.
- 2. About halfway between the base of the neck and the tip of the shoulder.
- 3. At the spot where the back muscles attach to the shoulder blade, just below the second tender point.
- 4. On the front of the neck above the collarbone.
- 5. Just to the right and left of the breastbone (sternum) about 2 in.(5.08 cm) below the collarbone.
- 6. On each forearm just below and to the outside of the crease of the elbow.
- 7. Just above and to the outer right and left of each buttock.
- 8. On the outer upper leg just behind the bony part of the hip (this point is easier to find when standing).
- 9. On the inside of each knee.

[©] Copyright Robert Chu, PhD, L.Ac., QME March 2011 – No photocopying or duplication without prior consent of the author in writing. All proceeds of these lecture notes go to the Medicine Dharma Wholistic Ministry, a 501 c 3, non-profit organization devoted to treating the needy with acupuncture, herbs and counseling.

To clearly diagnose fibromyalgia, a person must have pain at 11 or more of the 18 tender points. In practice, however, many people with fibromyalgia have fewer than 11 tender points.

The variety and severity of symptoms caused by fibromyalgia vary from person to person. Widespread, chronic pain is the most common symptom. It usually develops gradually.

Other symptoms that commonly occur in addition to pain include: Fatigue that interferes with work and daily activities.

 Sleep problems (difficulty falling or staying asleep, waking up feeling tired).

Less commonly people with fibromyalgia may have:

- Morning stiffness lasting less than an hour.
- Headaches.
- Constipation or diarrhea related to irritable bowel syndrome.
- Memory problems and difficulty concentrating.
- Numbness or tingling in the hands and other parts of the body. The skin may be ultrasensitive, reacting to a firm touch with tingling, numbness, or a "pins and needles" sensation.
- A circulatory problem that affects the small blood vessels of the skin (Raynaud's phenomenon).
- · Anxiety or depression.

5. Irritable Bowel Syndrome

S/S: Irritable bowel syndrome (IBS) is a disorder of the intestines that causes abdominal pain or discomfort. The pain may occur alone or along with constipation or diarrhea. Other symptoms include bloating, mucus in stools, or a sense that you have not completely emptied your bowels.

In irritable bowel syndrome, the movement of the digestive tract is impaired but doctors can find no change in physical structure, such as inflammation or tumors. The symptoms of IBS are thought to be related to abnormal muscle contractions in any part of the intestines.

IBS is believed to be caused by increased sensitivity of the bowel. It is not known why some people's intestines are more sensitive than those of other people. Psychological stress and eating may bring on the symptoms. Managing stress and changing your diet are the main treatments for the condition. Medications may be used to treat severe symptoms that interrupt daily activities.

Gynecological:

1. Fibroids

S/S: FIBROIDS ARE BENIGN (noncancerous) tumors that grow inside your uterus. They can be miserable to have, but they usually don't pose any danger to your gynecological health and are quite harmless. It is not the fibroids themselves that are questionable and controversial—instead, it is the method used to treat them. A hysterectomy is still the treatment recommended for most women with fibroids. In fact, fibroid tumors are the most common reason for hysterectomies in North America, accounting for 30 percent of all hysterectomies performed in the country, about 200,000 hysterectomies per year.

Fibroid tumors are one of the most common gynecological complaints. For the majority of women, fibroid symptoms are minor or nonexistent, but 40 percent of women who have fibroids experience such symptoms as an enlargement of the uterus, abnormal uterine bleeding, pelvic pain, and infertility. The size of uterine fibroids can vary from that of a pinhead to larger than a melon. In fact, fibroid weights of more than twenty pounds have been reported.

Most fibroids occur in women of reproductive age; they are diagnosed in African American women two to three times more frequently than in Caucasian women. It is currently believed that obesity has a lot to do with fibroid development. Because fat cells make estrogen, women who are obese are more prone to estrogen-dependent conditions, which include fibroids. It has also been observed that women who have never been pregnant are at higher risk for fibroids than women who have had children; this has to do with the fact that women who have not had children have not had a break from ovulation and, hence, estrogen production.

Although there are some fibroid cases that do warrant a hysterectomy, with current technology most women with fibroids can avoid radical surgery and their reproductive organs can be left intact.

[©] Copyright Robert Chu, PhD, L.Ac., QME March 2011 – No photocopying or duplication without prior consent of the author in writing. What Are Fibroids?

The term *fibroid* is actually medical slang. The correct medical term for what we've come to know as a fibroid is *leiomyoma uteri*. The word *fibroid* is really just an adjective that refers to anything fibrouslike or resembling a fibroma, a benign tumor made of connective tissue, like muscle. So, describing a tumor as "fibroid" is like describing a sweater as "cotton"—it's simply referring to the fabric of which the tumor is made. This means that a fibroid tumor can exist anywhere in the body, not just in the uterus.

Leio means "smooth," my means "muscle," and oma means "benign growth." In general, muscle tumors called leiomyoma can also be found in the stomach and other parts of the body, but the uterus is the most common site. In fact, the uterus consists mainly of muscle. A tumor is essentially a clump of abnormal cells that form a lump, cyst, or mass. It usually starts with one cell that reproduces again and again. Why these cells develop in the first place is still a mystery. When these cells are benign, they are harmless. When these cells go awry, however, they develop into a clump within the myometrium, the smooth muscle coat of the uterus, which forms the main part of the organ. Fibroid tumors are therefore a collection of innocent uterine muscle cells that form a noticeable hard lump.

Fibroids develop most commonly in women who are in their thirties and forties, but they can also develop earlier or later than this. In fact, about 30 percent of all women will develop fibroids by the time they reach thirty-five. An estimated 20 percent of white women and 50 percent of black women over thirty years old have fibroids.

Fibroids are grayish white, firm, round, and ring shaped. They come in all sizes, and it's common to have several fibroids growing at once. The main problem is that once fibroids develop, they may continue to grow, and even if they're surgically removed, there's a 10 percent chance they'll grow back. This is the main reason why so many doctors recommend hysterectomies for women with fibroids.

[©] Copyright Robert Chu, PhD, L.Ac., QME March 2011 – No photocopying or duplication without prior consent of the author in writing. All proceeds of these lecture notes go to the Medicine Dharma Wholistic Ministry, a 501 c 3, non-profit organization devoted to treating the needy with acupuncture, herbs and counseling.

Fibroids are classified by location:

- Intramural or interstitial: fibroids in the outer or innermost layer of the uterus.
- Subserous/serosal: fibroids that protrude into the abdominal cavity and can be pedunculated (they grow on a stalk, like broccoli).
- Submucosal: fibroids that invade the endometrium.
- Parasitic: fibroids that migrate out of the uterus and invade the cervix or other pelvic organs, developing their own blood supply.

2. Menopausal Syndrome

S/S: Menopause is a normal condition that all women experience as they age. The term menopause is commonly used to describe any of the changes a woman experiences either just before or after she stops menstruating, marking the end of her reproductive period.

Menopause, when it occurs after the age of 40, is considered "natural" and is a normal part of aging. But, some women can experience menopause early, either as a result of a surgical intervention, such as hysterectomy, or damage to the ovaries, such as from chemotherapy. Menopause that occurs before the age of 40, regardless of the cause, is called premature menopause.

For women undergoing natural menopause, the process is gradual and is described in three stages:

- Perimenopause. Perimenopause begins several years before menopause, when the ovaries gradually produce less estrogen. Perimenopause lasts up until menopause, the point when the ovaries stop releasing eggs. In the last one to two years of perimenopause, the decrease in estrogen accelerates. At this stage, many women experience menopause symptoms (see below).
- Menopause. Menopause is the point when a woman has her last menstrual period. At this stage, the ovaries have stopped releasing eggs and producing most of their estrogen.
 Menopause is diagnosed when a woman has gone without a period for 12 consecutive months.
- **Postmenopause.** These are the years after menopause. During this stage, menopausal symptoms, such as hot flashes, ease for most women. However, health risks related to the loss of estrogen increase as the woman ages.

Most women going through menopause will experience hot flashes, a sudden feeling of warmth that spreads over the upper body that is

[©] Copyright Robert Chu, PhD, L.Ac., QME March 2011 – No photocopying or duplication without prior consent of the author in writing. often accompanied by blushing and some sweating. The severity of hot flashes varies from mild in most women to severe in others.

Other common symptoms include:

- Irregular or skipped periods
- Insomnia
- Mood swings
- Fatigue
- Depression
- Irritability
- Racing heart
- Headaches
- Joint and muscle aches and pains
- Changes in libido (sex drive)
- Vaginal dryness
- Bladder control problems

Not all women get all of these symptoms. In fact, less than 2% of women get symptoms severe enough to interfere with daily activities.

3. Infertility

S/S: Infertility is defined as a couple's inability to become pregnant after 1 year of sex without using birth control. When considering whether you may have an infertility problem, however, bear in mind that "normal fertility" is defined as the ability to naturally conceive within 2 years' time.

Infertility does not cause physical symptoms. Infertility is a general term for a couple's inability to start a pregnancy after 1 year of having sex 2 to 3 times a week without using birth control methods.

For women younger than 30, some health professionals will diagnose a couple with infertility and offer treatment only after 3 years of trying to become pregnant. For women over 35, some health professionals encourage beginning testing and treatment after 6 months of trying to become pregnant.

Breast Cancer

S/S: Breast cancer is a disease in which cells in the breast start to grow abnormally in an uncontrolled manner.

Breast cancer is the most common type of cancer in women, although lung cancer remains the leading cause of cancer deaths in both men and women. About 1% of all breast cancer occurs in adult men.

Early breast cancer is often detected by a mammogram before any symptoms are present. The most common symptom is a painless lump. However, painful lumps are sometimes caused by breast cancer. Symptoms of breast cancer include:

- A lump or thickening in the breast or armpit that is new or unusual.
- A change in the size or shape of the breast.
- Skin changes, such as a dimple or pucker in the skin of the breast.
- Discharge or bleeding from the nipple that comes out without squeezing the nipple (spontaneous discharge).
- A change in the nipple, such as a nipple that is now drawn inward (retraction or inversion).
- Scaling or crusting of the nipple.
- A change in the color or feel of the skin of the breast or the darker area around the nipple (areola).
- A breast lump in an adult man. About 1% of all breast cancer occurs in adult men.

Uterine Cancer

S/S: Cancer of the uterus is the most common cancer of the female reproductive tract. Symptoms include: Abnormal vaginal bleeding, especially after menopause, is the most common symptom of uterine cancer. Bleeding may start as a watery, blood-streaked flow that gradually contains more blood. Although uterine cancer usually occurs after menopause, it sometimes occurs around the time that menopause begins. Abnormal bleeding should not be considered simply part of menopause; it should always be checked by a doctor.

A woman should see a doctor if she has any of the following symptoms:

- Unusual vaginal bleeding or discharge
- Difficult or painful urination
- · Pain during intercourse
- · Pain in the pelvic area

These symptoms can be caused by cancer or other less serious conditions. Most often, they are not cancer, but only a doctor can tell for sure.

About the Author:

Robert Chu is a Licensed Acupuncturist and Herbalist, specializing in the Master Tung painless Acupuncture methods in which he effectively treats pain, neuromusculoskeletal disorders, and a wide variety of internal diseases including high blood pressure, high cholesterol, diabetes, gynecological disorders, Parkinson's Disease and side-effects from cancer treatments. He is appointed by the Industrial Medical Council as a Qualified Medical Evaluator (QME).

Dr. Chu was formerly affiliated with the **St. Vincent Medical Center**, as the first fulltime Acupuncturist on staff and treated cancer patients with Acupuncture, Herbal Therapy, Qigong and Tai Chi. Dr. Chu regularly volunteers at **Pasadena's Wellness Community**, where he does a weekly Qi Gong/Stress reduction class and monthly lifestyle/nutrition class. In addition, he also volunteers at **Huntington Memorial Hospital** teaching a weekly qigong class for those with Parkinson's Disease. He has also been featured as a speaker for the **American Cancer Society**. In July of 2004, Dr. Chu was selected as the Acupuncturist to Olympic athletes at the **Olympic Trials** held in Sacramento, CA.

Dr. Chu also lectures nationally and abroad on Acupuncture and Chinese Medicine to provide continuing education to MD's and Acupuncturists. In 2005, he founded ITARA – International Tung's

[©] Copyright Robert Chu, PhD, L.Ac., QME March 2011 – No photocopying or duplication without prior consent of the author in writing. Acupuncture Research Association, to preserve, standardize, educate, and research new applications of the Tung family system of Acupuncture with integrity, and open sharing. ITARA has now grown with branches throughout the United States, Canada, U.K. and Finland.

He has been decorated as an honorary member of the Finnish

Traditional Chinese Medicine Society of Acupuncture and Herbs
and a therapist member of the National Register of Acupuncture

Therapists in Finland. He has lectured at Samra University,

Emperor's College, SCUSOMA, ACAOM, CSOMA, AAOMA and
other functions as a dynamic and entertaining speaker.

Robert was awarded a Ph.D. in Ayurvedic Medicine. Dr. Chu is also a Diplomate of Clinical Hypnotherapy and Neurolingustics Master Practitioner, and also does Life Coaching. He also holds a Diplomate of Clinical Homeopathy from the American Academy of Clinical Homeopathy.

He is presently on the faculty at Emperor's College in Santa Monica, teaching students in the Doctorate program.

In the martial arts world, he specializes in combat application and health aspects with a focus on the Yip Man Wing Chun Kuen system as taught by Hawkins Cheung and the Yuen Kay-San and Gulao

[©] Copyright Robert Chu, PhD, L.Ac., QME March 2011 – No photocopying or duplication without prior consent of the author in writing. Wing Chun Kuen systems as taught by Kwan Jong-Yuen. He is the co-author of Complete Wing Chun, (Charles E. Tuttle Co., Inc., 1998), author of The Essence of Wing Chun (3 volumes, 2004) and has written many articles for *Inside Kung Fu*, *Martial Arts Legends*, Inside Martial Arts, Martial Arts Combat Sports and other publications. Dr. Chu was featured in the book, *Kung Fu Masters* (CFW Enterprises), in 2002. Robert Chu has been formally involved in the martial arts since 1972, specializing in wing chun kuen and its weapons. Having learned Yip Man wing chun kuen from several prominent instructors such as his current teacher, Hawkins Cheung, and the Yuen Kay-San and Gulao systems from his good friend and teacher Kwan Jong-Yuen, he has also researched several other branches. In addition, he has a background in the empty hand fist and weapons sets of Hung ga kuen under Yee Chi Wai, and the Lama martial arts as taught by Chen Tai Shan. He is one of the last disciples and a successor to Lui Yon-Sang's flying dragon tiger gate combat pole in the United States.

Robert can be reached at: (626) 345-0441 chusauli@gmail.com 2502 E. Washington Blvd, Pasadena, CA 91104 or for more information on the internet, please see:
